I MAY, THROUGH OVERSIGHT, FAIL TO acknowledge properly here some of the many wonderful people who have helped me in the efforts that led to this book. If so, I hope I can be forgiven. The years grow long and memory short!

It is my wife, soul mate, and fellow adventurer, photographer Santha Faiia, to whom I owe the greatest debt. During the making of this book I suffered two terrifying episodes of seizures and loss of consciousness, as a result of which it is no longer responsible, or legal, for me to drive. So for all our thousands of miles of road trips through some of the most spectacular landscapes in California,

Arizona, New Mexico, Colorado, South Dakota, Wyoming, New Hampshire, Massachusetts, upstate New York, North and South Carolina, Louisiana, Mississippi, Arkansas, Alabama, Tennessee, Missouri, Illinois, and Ohio I was in the passenger seat and Santha was behind the wheel. I therefore want to thank my extraordinary wife for her grit in the face of adversity, for her inspiring presence, for her creative talent in always taking the right photograph at the right moment, and for her immense capacity for love. I would have stalled and come to a grinding halt long ago if not for you, Santha. Thank you. Thank you for EVERYTHING.

Aside from its photographic content, this book contains large numbers of designed images illustrating some of the more complex aspects of the argument. An art director was needed, and my son Luke took on this responsibility, working around the clock to prepare the graphics and illustrations that accompany the text. Gratitude and respect for an excellent job well done.

My research assistant, Holly Lasko Skinner, worked with me on gathering documentation and tracking down hard-to-find facts from the early days of this project. She brilliantly sought out, churned through, and made sense of bewildering masses of data, carefully checked all sources, and constantly alerted me to new scientific developments. Thank you, Holly.

Ross Hamilton, an inspiring teacher of the ancient mysteries, opened my eyes to the enigma of Ohio's Serpent Mound and helped me grasp the implications of its numinous connection to the summer solstice sunset.

William Romain, in my opinion the most important archaeologist presently studying the earthwork-building cultures of the Mississippi Valley, kindly took time to exchange views with me and granted me permission to reproduce a number of his excellent photographs and diagrams illustrating the archaeoastronomical implications of his research.

Gary David, whose work on the archaeoastronomy of the Southwest is of the first importance, generously shared his extensive knowledge and insights with me on a journey through Arizona and New Mexico.

I'm grateful to Randall Carlson, a true comrade in arms, and to Bradley Young and Camron Wiltshire, who all contributed to this project in different and important ways.

Special thanks to the scientists of the Comet Research Group whose groundbreaking Younger Dryas Impact Hypothesis provides the most complete explanation for the mysterious end of the last Ice Age and casts world prehistory in an entirely new light. Allen West, Al Goodyear, Chris Moore, and George Howard were particularly generous with their time.

I'm grateful to Tom Deméré, chief paleontologist at the San Diego Natural History Museum, for meeting with me and taking me behind the scenes to the archives to share the full implications of the discoveries at the Cerutti Mastodon Site. Indicative of a human

presence in North America at least 130,000 years ago, this is a find that rewrites prehistory.

Eske Willerslev of the University of Copenhagen, a world expert in the study of ancient DNA, patiently answered my questions and shared his thoughts on the anomalous Australasian genetic signal found among certain isolated peoples of the Amazon rainforest.

Meanwhile archaeological research of immense importance is under way across the Amazon, revealing the existence of stone circles and of hundreds of immense geometrical earthworks. In this context I'd like to thank Mariana Petry Cabral of the Universidade Federal de Minas Gerais, Sanna Saunaluoma, and Martti Pärssinen of the University of Helsinki, and Christopher Sean Davis of the University of Illinois, for the positive spirit with which they greeted my request to reproduce photographs and maps illustrating their findings.

For their thoroughly professional and friendly support with every aspect of our research visit to Denisova Cave in Siberia, huge

thanks to Sergey Kurgin, who organized the trip and did all the driving, and to Olga Votrina, our excellent interpreter. Thanks and appreciation also to the Siberian Branch of the Institute of Archaeology and Ethnography, Russian Academy of Sciences for their kind cooperation and for their permission to reproduce photographs of artifacts from Denisova Cave.

My editors, Peter Wolverton of St. Martin's Press in the United States and Mark Booth of Coronet in the United Kingdom, and my literary agent, Sonia Land, of Sheil Land Associates, have been superb allies and friends, giving me the benefit of their excellent advice and top-class professional expertise at every turn.

Any merits in *America Before* owe much to those named here, and to the many scientists and vocational researchers around the world whose discoveries are reviewed in the pages that follow. I have been diligent in my attempts to represent their work correctly, but if there are any errors or misinterpretations, then the responsibility is entirely my own.

Last but by no means least, I am blessed to be surrounded by a beautiful rainbow family without frontiers. Santha and Luke are mentioned here already, and now is the moment to put on record my love and appreciation for our other five grown-up children—Sean, Shanti, Leila, Ravi, and Gabrielle. I'm British, born in Scotland to an English father and a Scottish mother. I spent 4 years of my childhood in the Indian state of Tamil Nadu. Santha is of Tamil origin but was born and brought up in Malaysia. Sean and Leila are both half Somali and half British by birth. Shanti and Ravi are both half Tamil Malaysian and half Italian American by birth. Luke and Gabrielle are both British by birth. Leila's husband, Jason, is Greek; Ravi's wife, Lydia, is American; Luke's wife, Ayako, is Japanese; and they have gifted us with three magical grandchildren, Nyla, Leo, and Henry, who brighten our lives with their innocence, infant wisdom, and laughter.

INTRODUCTION

I HAVE IN MY SHELVES A renowned and much respected book titled *History Begins at Sumer*.[1] The reference, of course, is to the famous high civilization of the Sumerians that began to take shape in Mesopotamia—roughly modern Iraq between the Tigris and Euphrates rivers—around 6,000 years ago. Several centuries later, ancient Egypt, the very epitome of an elegant and sophisticated civilization of antiquity, became a unified state. Before bursting into full bloom, however, both Egypt and Sumer had long and mysterious prehistoric backgrounds in which many of the formative ideas of their historic periods were already present.

After the Sumerians and Egyptians followed an unbroken succession of Akkadians, Babylonians, Persians, Greeks, and Romans, and there were, moreover, the incredible achievements of ancient India and ancient China. It therefore became second nature for us to think of civilization as an "Old World" invention and not to associate it with the "New World" at all.

Besides, it was standard teaching in the nineteenth and twentieth centuries that the Americas—North, Central, and South—were among the last great landmasses on earth to be inhabited by humans, that these humans were nomadic hunter-gatherers, that most of them subsequently remained hunter-gatherers, and that nothing much of great cultural significance began to happen there until relatively recently.

This teaching is deeply in error and as we near the end of the second decade of the twenty-first century, scholars are unanimous not only that it must be thrown out but also that an entirely new paradigm of the prehistory of the Americas is called for. Such

momentous shifts in science don't occur without good reason and the reason in this case, very simply, is that a mass of compelling new evidence has come to light that completely contradicts and refutes the previous paradigm.

Everyone has and does their own "thing," and my own thing, over more than quarter of a century of travels and research, has been a quest for a lost civilization of remote prehistory—an advanced civilization utterly destroyed at the end of the Ice Age and somewhat akin to fabled Atlantis.

Plato, in the oldest-surviving written source of the Atlantis tradition, describes it as an island "larger than Libya and Asia put together"[2] situated far to the west of Europe across the Atlantic Ocean.[3] Hitherto I'd resisted that obvious clue which I knew had already been pursued with unconvincing results by a number of researchers during the past century.[4] As the solid evidence that archaeologists had gotten America's Ice Age prehistory badly

wrong began to accumulate in folders on my desktop, however, and with new research reports continuing to pour in, I couldn't help but reflect on the significance of the location favored by Plato. I had considered other possibilities, as readers of my previous books know, but I had to admit that an immense island lying far to the west of Europe across the Atlantic Ocean does sound a lot like America.

I therefore decided to reopen this cold case. I would begin by gathering together the most important strands of the new evidence from the Americas. I would set these strands in order. And then I would investigate them thoroughly to see if there might be a big picture hidden among the details scattered across thousands of scientific papers in fields varying from archaeology to genetics, astronomy to climatology, agronomy to ethnology, and geology to paleontology.

It was already clear that the prehistory of the Americas was going to have to be rewritten; even the mainstream scientists were in

general agreement on that. But could there be more?

This book tells the story of what I found.

The first survey map of Serpent Mound, made by Ephraim Squier and Edwin H. Davis in 1846 and published by the Smithsonian Institution in 1848, described the mound as “the most extraordinary earthwork thus far discovered in the West.”

1

AN ENCHANTED REALM

ARCHAEOLOGY TEACHES US THAT THE vast, inviting, resource-rich continents of North and South America were among the very last places on earth to have been inhabited by human beings. Only a handful of remote islands were settled later.

This is the orthodoxy, but it is crumbling under an onslaught of compelling new evidence revealed by new technologies, notably the

effective sequencing of ancient DNA. The result is that many of the most fundamental “facts” of American archaeology, many of the “ground truths” upon which the theories and the careers of its great men and women were built in the nineteenth and twentieth centuries, now stand exposed as fallacies.

Far from being very recent, it is beginning to look as though the human presence in the Americas may be very old—perhaps more than 100,000 years older than has hitherto been believed.

This greatly extended time frame, taking us back deep into the Ice Age, has profound implications for how we view, interpret, and date all the monuments of the Americas built before the time of Columbus. The possibility that they might have an unrecognized prehistoric backstory can no longer be discounted. Moreover, the New World was physically, genetically, and culturally separated from the Old around 12,000 years ago when rising sea levels submerged the land bridge that formerly connected Siberia to

Alaska.[1] This separation remained total until just 500 years ago when genetic and cultural exchanges restarted during the European conquest. It follows, therefore, that any deep connections between the Americas and the Old World that are not the result of recent European influence and that cannot be attributed to coincidence must be more than 12,000 years old.

It was with all this in mind, on June 17, 2017, that I made my first visit to Serpent Mound, a national historic landmark in southern Ohio described as "the finest surviving example of a prehistoric animal effigy mound in North America, and perhaps the world."[2]

It's in Adams County, about 75 miles east of Cincinnati and 7 miles north of the town of Peebles by way of SR-41N and OH-73W. With its rolling hills and green meadows, this is a predominantly rural, substantially forested part of the state, running northward from the Ohio River. On that vibrant summer day every tree was in

full, luxuriant leaf, every flower was in bloom, the fields glowed, and the winding lanes seemed part of a bucolic dream.

In some remote epoch, however, this entire idyllic area suffered a devastating cataclysm, the most striking remnant of which has all the features of a classic impact crater 14 kilometers in diameter with a pronounced central uplift, sunken inner ring-graben, transition zone, and outer rim.[3] Millions of years of erosion have softened its contours but Google Earth or an overflight reveal its obvious crater-like appearance. Most geologists agree that it is the result of some kind of explosive event but the nature of the explosion for a long while remained unsettled and there were heated arguments between those who favored volcanism and those who favored an impact by an asteroid or comet.[4] Because Serpent Mound is the best-known feature within it, and because of the uncertainty caused by the dispute, the crater was therefore officially known for many years as the "Serpent Mound Cryptoexplosion Structure."[5] Only since the

late 1990s has mounting evidence led to today's widespread consensus that it was, as many had long suspected, formed by a hypervelocity cosmic impact.[6]

Variously referred to as the "Serpent Mound Crypto-Explosive Structure" and as the "Serpent Mound Disturbance," most scientists now agree that the bizarre geological

feature within which the mound was built is an ancient impact crater with a diameter of around 14 kilometers.

As to timing, the impact was "later than Early Mississippian, because rocks of this age [about 345 million years old] were involved in the disturbance, and earlier than the Illinoian glaciation (125,000 years ago), because these sediments are undisturbed in the northern part of the structure."[7]

That's a pretty wide window! Nonetheless, most of the experts seem confident that the crater's age must be in the hundreds of millions, not just hundreds of thousands, of years.[8] And while it's thought unlikely that the Native Americans who built Serpent Mound could have known anything about cosmic impacts, many scholars speculate that as keen observers of nature they would certainly have noticed the curious, jumbled, cataclysmic, ringlike structure of the area and been impressed by it.[9]

“They had to know there was a significance to that spot,” says Ohio geologist Mark Baranoski. “They placed a deep reverence in old Mother Earth. It’s almost mystical that they built a spiritual site.”[10] Similarly, geoscientist Raymond Anderson of the University of Iowa describes Serpent Mound crater as “one of the most mysterious places in North America. The Native Americans found something mystical there. And they were right.”[11]

Dating back to the time of the impact, an intense magnetic anomaly[12] centered on the site causes compasses to give wildly inaccurate readings. There are also gravity anomalies caused by the impact and there are multiple underground caverns, streams, and sinkholes that, in the view of Ohio archaeologist William Romain, would have been seen by the ancients as entrances to the underworld: “Among many peoples, unusual or transitional areas such as this are often considered sacred. Indeed such places are often considered supernatural gateways, or portals, between the

celestial Upperworld and the Underworld. … One can only conclude that the Serpent Mound builders were aware of at least some of the more unusual characteristics of the area and that they located the effigy in this anomalous area for a very specific reason."[13]

As we drove the last few miles along OH-73W, I could reflect that we were entering the lair of the Serpent—a sacred domain where the forces of earth and sky had once collided with sufficient energy, according to the calculations of state geologist Michael Hansen, "To disturb more than 7 cubic miles of rock and uplift the central portion of the circular feature at least 1,000 feet above its normal position."[14]

One might expect the great effigy mound to be located on the high point of that central uplift, but instead it uncoils and undulates along a sinuous ridge in the southwestern quadrant of the crater near

the edge of the ring-graben. At the northern end of the ridge, where it takes a turn to the northwest, lies the serpent's head.

I'd seen it all in plan and maps many times before, but now, for the first time, I was about to see the real thing. I was traveling with my wife, photographer Santha Faiia, and with local geometrician and archaeoastronomer Ross Hamilton, who has devoted much of his life to the study of Serpent Mound and whose book on the monument is a thought-provoking reference on the subject.[15]

Not only here but elsewhere in the world I have noticed that very special ancient places such as Serpent Mound seem able to invoke mechanisms to protect themselves from human folly. Among these mechanisms, from time to time, a passionate and devoted individual will be prompted by a particular site to go forth as its advocate—Maria Reiche at the Nazca Lines, for example, or Klaus Schmidt at Göbekli Tepe—and ensure not only its preservation but also the dissemination of key knowledge about it.

For the past decades, with absolute commitment, lean and gray-bearded and ascetic as a Buddhist monk, Ross Hamilton has been that individual for Serpent Mound.

GROUND AND SKY

WE TURN OFF 73W JUST before Brush Creek and enter a manicured park, maintained by the Ohio History Connection. Leaving our vehicle, we follow the footpath through scattered stands of trees, pass the visitor center, and come after a few moments to a grass-covered embankment about three feet high.

"The tail of the Serpent," Ross says.

I frown. It's a bit of an anticlimax! I don't immediately see the mystic spiral I've been expecting from the plans I've studied. But

modern steps surmount the outer curve and from this vantage point the inner coils of the earthwork become visible.[16]

The effect remains underwhelming, largely because the present management of the site has allowed a thick clump of trees to block the view that would otherwise open up to the north across the full length of the Serpent's body from its tail to its head.

To see the immense effigy as a whole, therefore, rather than in isolated parts, we need to observe it from the sky. Fortunately, Santha has come prepared for this with a recently acquired MavicPro drone equipped with a high-resolution camera. She fires up the little quadcopter right away and suddenly we're looking down through the monitor from an altitude of 400 feet with the Serpent beneath us, unfolding outward from that coiled tail.

The site is almost deserted but there are a few people in the shot and they give me a sense of its scale. I know it already from my background research, but to see it with my own eyes is quite another

matter. This undulating Serpent, with its gaping jaws, is 1,348 feet long.[17] The earthwork mound that forms its body averages around 4 feet in height and tapers from a width of about 24 feet to about 22 feet through its seven principal meanders before narrowing farther into the spiral of the tail.[18] People beside it appear as midgets or elves in the shadow of a dragon and for the first time, with a shiver down my spine, I become aware—not in my intellect, but in my heart, in my spirit—that a mighty and uncanny power slumbers here.

From an altitude of 400 feet, the full form of the great Manitou of Serpent Mound becomes visible. PHOTO: SANTHA FAIIA.

Ross seems to read my mind. "Some call it a Manitou," he says. "But I'd go further. I'd say our Serpent is *Gitché Manitou*—the Great Spirit and ancestral guardian of the ancient people."

For those reared in the materialist-reductionist mind-set of Western science, the Native American notion of Manitou seems slippery and elusive. Though it may be materialized it cannot be reduced to matter. Nor can it be weighed, measured, or counted. It is an unquantifiable, formless but *sentient* force, "supernatural, omnipresent and omniscient,"[19] in one sense a spiritual entity in its own right, in another the mysterious, unseen power that animates all life and that can manifest both in natural phenomena and in man-made objects and structures that have been created with correct intent. "The profoundness of a spiritual presence of Manitou, and through it recognition of the supernatural," comments one authority,

“was and is a tangible entity seen and felt by hundreds of generations of the Indian people of North America. … In essence, Native people perceived a spiritual landscape imprinted on the physical landscape as both one and the same. This ‘duality’ of the natural world still inspires the Native population to revere as sacred certain places and rocks deemed to possess ‘Manitou.’”[20]

THE SERPENT AND THE EGG

WE BRING THE DRONE DOWN to earth for a battery change then send it back into the sky.

From an altitude of 400 feet it’s notable how the sinuous natural ridge on which Serpent Mound was built has distinct “head” and “tail” ends and how the head of the Serpent is placed at the “head”

end of the ridge, while the undulating body, all the way back to the tail, follows the contours of the ridge exactly.

Encouraged by the modern management of the site,[21] however, the luxuriant tree cover that prohibits observation along the main north–south axis also crowds the east and west sides of the body, seeming to hem in the great Manitou. A tangled mass of greenery chokes the steep western slope of the bluff down to Brush Creek, and I note how the tree growth is particularly tall and dense to the northwest, around the Serpent's head, as though intentionally allowed to flourish there to blind it.

I ask Santha to point the camera at the head—which is not a work of artistic realism but is instead a triangular geometric construct extending forward from the Serpent's neck and formed of the two gaping "jaws" with a curved earthwork running between them.

Height (m)
176m
167m
157m

By stripping out all trees, vegetation, and other surface features, Lidar offers views of the Serpent Mound Manitou and the sinuous natural ridge on which it stands that cannot otherwise be seen today. LIDAR GRAPHICS BY JEFFREY WILSON.

Partly within those gaping jaws sits a substantial and clearly defined ellipse. It's a feature that Ephraim Squier and Edwin Davis, the earliest scientific surveyors of the mound, were intrigued by. Writing in 1848, in the very first official publication released by the then newly established Smithsonian Institution, they observed that this curious structure was

> formed by an embankment of earth, without any perceptible opening, four feet in height, and … perfectly regular in outline, its transverse and conjugate diameters being one hundred and sixty and eighty feet respectively. The ground within the oval is slightly elevated: a small circular elevation of large stones, much burned, once existed at its centre; but they have been thrown down and scattered by some ignorant visitor, under the prevailing impression probably that gold was hidden beneath them. The point of the hill within which this egg-shaped figure rests, seems to have been artificially cut to conform to its outline, leaving a smooth platform.[22]

Squier and Davis go on to remind us that "the serpent, separate or in combination with the circle, egg, or globe, has been a predominant symbol among many primitive nations."[23] They draw our attention in particular to the southwest of England, where Stonehenge stands, and to the nearby great henge, stone circles, and serpentine causeways of Avebury, but nonetheless decline the twin challenges of tracing "the analogies which the Ohio structure exhibits to the serpent temples of England" and of pointing out "the extent to which the symbol was applied in America."[24] Almost wistfully, however, they describe such an investigation as "fraught with the greatest interest both in respect of the light which it reflects upon the primitive superstitions of remotely separated people, and especially upon the origin of the American race."[25]

Scholars in the nineteenth century, and indeed well into the early twentieth century, routinely applied words like "primitive" and "savage" to the works of our ancestors. At Serpent Mound,

however, as Ross Hamilton points out, these so-called superstitious primitives were demonstrably the masters of some very exacting scientific techniques. He gives me a penetrating look. “Just consider the precision with which they found true north and balanced the whole effigy around that north–south line. It was a long while before modern surveyors could match it. In fact everyone got it wrong until 1987, when William Romain carried out the first proper survey of the mound and gave us a map with correct cardinal directions.”

Connecting the hinge of the effigy’s jaws to the tip of the inner spiral of its tail, Serpent Mound’s meridian axis combines aesthetic refinement with astronomical and geodetic precision of a high order. Moreover, although they themselves took the matter no further, Squier and Davis were right to draw comparisons with Stonehenge and Avebury, for these great English earthworks, as we shall see in the next chapter, both bear the imprint of the same “artistic science.”

ELEVATION: 750-765 FEET ABOVE MEAN SEA LEVEL

William Romain's 1987 map revealed the precision of Serpent Mound's north–south axis.

2

A JOURNEY IN TIME

JOIN ME IN A TIME machine. I've set it to take us back to the peak of the last Ice Age 21,000 years ago and to bring us, on a midsummer's day, to the amazing, mysterious, and atmospheric location where the Great Serpent Mound National Historic Landmark can now be found.

Of course there was no “National Historic Landmark,” no such entity as the United States of America, and no Adams County in the very different world of 21,000 years ago. At that time, from roughly the Ohio and the Missouri Rivers northward, a wide horizontal strip of the United States, and all of Canada as far as the Arctic Ocean, lay beneath a giant shroud of ice.

At no point, however, even at the last glacial maximum 21,000 years ago, did the ice ever advance quite far enough to the south to bury the sinuous natural ridge on which Serpent Mound stands today.

We’ll get to the question of *when* the great effigy itself was first heaped up in the form of a serpent. But for now let’s step out of our time machine onto that serpentine ridge and breathe the crisp fresh air under the blue midsummer skies of an unpolluted world.

We might see some of the great beasts of the North American Ice Age—the famed “megafauna,” such as mammoths, mastodons, giant sloths, short-faced bears, and saber-toothed tigers. They

thrived at the last glacial maximum and would continue to do so for several more millennia until they were all swept from the earth between roughly 12,800 and 11,600 years ago in what is known as the "Late Pleistocene Extinction Event."[1] The creatures I've named were by no means its only casualties. All together thirty-five genera of North American megafauna (with each genus consisting of several species) were wiped out during this enigmatic cataclysm that brought the Ice Age to an end.[2] But all that was still far in the future 21,000 years ago, and we're not at Serpent Mound for the megafauna. Instead I want you to shade your eyes and look to the horizon, approximately a dozen miles to your north. There, armored in brilliant, scintillating, dazzling reflections, a spectacle awaits you the like of which exists nowhere in the world today outside of Antarctica. That sight, a sheer, looming, continuous cliff of ice rising more than a mile high and extending across almost the entire width of North America from the east coast to the west coast, marks

the southernmost extent of the ice cap in these parts. Elsewhere it stretched out its lobes and tongues a few tens of miles farther south, but here, just short of the outer rim of Serpent Mound crater, the advance was decisively stopped.

If humans had been present in Adams County 21,000 years ago to witness the phenomenon, what would they have made of it? Would they have thought this sudden halt of the march of the ice cliffs was random? Just one of those things that happen?

Or might it have seemed that some great Manitou protected this land?

Let's get back in our time machine.

I'm going to set it to stay in the same location but to jump 8,000 years forward to a midsummer's day 13,000 years ago, just a couple of hundred years before the onset of the Late Pleistocene Extinction Event.

The first thing you'll notice as we step out onto the ridge is that the world is warmer—indeed it has been warming steadily since

about 18,000 years ago and particularly dramatically since 14,500 years ago. In consequence, although it is still a giant force of nature, the ice cap has receded about 600 miles to the latitude of Lake Superior, and those looming ice cliffs that formed a massive artificial horizon just 12 miles north of Serpent Mound are completely gone. Minus the roads and telecommunications cables, therefore, the view that confronts us at midsummer 13,000 years ago is pretty much the same as the view at midsummer today where the natural horizon encircling the effigy is formed by broken and eroded ranges of low hills—themselves the remnants of the ancient hypervelocity cosmic impact that created this unique landscape.

So, a timeline for time travelers:

- 300 million years ago, or thereabouts, a giant cataclysm forms the Serpent Mound crater.
- 21,000 years ago, the North American ice cap reaches the

southernmost point of its advance, stopping just a few miles north of the eroded crater rim.

- By 13,000 years ago the ice cliffs are gone and Serpent Mound's natural horizon has been restored.

On June 17, 2017, I made my first research visit to Serpent Mound, reported in chapter 1, and on June 20, midsummer's eve, Santha, Ross Hamilton, and I returned to the site to fly the drone again and to observe sunset over the effigy from the viewpoint of the gods.

A MATTER OF PERSPECTIVE

MIDSUMMER—THE SUMMER SOLSTICE—IS the longest day of the year (presently June 20/21 in the Northern Hemisphere), when the sun rises at the farthest point north of east and sets at the farthest point north of west on its annual journey. It is also a particularly significant day at Serpent Mound—for it is on the summer solstice that the open jaws of the Serpent most directly confront the setting point of the sun, as though about to engulf it.

This is because the northern end of the ridge, which Squier and Davis believed had been terraformed ("artificially cut" as we saw in the last chapter), terminates in a pronounced turn to the west that defines the orientation of the Serpent's head. It seems implausible, whoever they may have been and whenever they first conceived of the mound (open questions, as we shall see), that the ancient builders were unaware that this natural westward curve aligned the leading edge of the ridge with the point of sunset on the summer solstice.

Serpent Mound alignment to the summer solstice sunset.

I believe they were acutely aware of it.

Indeed, the presence of the Serpent here, and the orientation of its head, bear all the hallmarks of great minds at work, manifesting a

carefully thought-out design not meant to stand alone but rather to enhance and elucidate the solstice alignment—the sacred communion of earth and sky—that nature had already put in place.

From the perspective of twenty-first-century science, the fact that the end of a natural ridge is oriented toward the summer solstice sunset is a matter of chance. It would be foolish to invest it with any significance—let alone with so much significance that it could motivate a huge construction project and bring it to triumphant completion.

We should keep in mind, however, that matters seemed very different to the ancients, who perceived the earth and sky as living spirits in communion with one another.

In our century, when technology is king and the majority of the human race live and die in cities, we cut down rainforests, pollute and defile the earth, and shun and scrape the sky. Serried blades of immense buildings dice our view of the horizon into jagged, glittering, meaningless origami, while light pollution is so intense

that we cannot see the stars. Ironically, however, any number of astronomy programs will bring those stars flickering into virtual reality on our computer screens. Ironically, too, ours is a culture that has advanced the scientific study of the cosmos to an exceptionally high degree.

It seems we want to see everything, but only at a distance, through a technological filter.

Little wonder, therefore, that, for so many of us, the sky has entirely lost the numinous aura that once clung about it, and has been reduced to a vague, out-of-focus, largely irrelevant, not even beautiful background to the much more important material business of our daily lives. Reared in a culture that focuses all its energies on the production and consumption of commercial goods and services, it just looks to us like bad business to commit huge resources, intelligence, and energy to building great monuments aligned—for example—to the rising or setting points of the sun on the equinoxes or on the summer or winter solstices.

Yet for thousands upon thousands of years this is exactly what happened all around the world.

WHERE HEAVEN AND EARTH MEET

GO TO THE CITY OF Luxor in Upper Egypt, place yourself at the western entrance of the great Temple of Karnak in the predawn on December 20/21 (the winter solstice and shortest day of the year in the Northern Hemisphere), and wait patiently until the sun appears. When it does you will see that its first rays shine directly down the kilometer-long axis of the temple that is oriented south of east at precisely the correct angle to target the rising point of the sun on that special day.

Or go to Stonehenge in the predawn on June 20/21, the summer solstice, enter the great stone circle, and face north of east along its

axis toward a rough, unquarried megalith—the Heel Stone—standing prominently outside the circle. As light floods the sky you will see how carefully and purposefully the Heel Stone seems to have been placed, almost like the front sight on the barrel of a rifle, to target the rising sun on that special day.

Or go to Angkor Wat in Cambodia and position yourself dead center at the western end of the entrance causeway of the great temple complex in the predawn on March 20/21, the spring equinox, or on September 20/21, the autumn equinox, when night and day are of equal length and the sun rises perfectly due east. On either of these two special occasions you will discover that the causeway and temple are so precisely oriented that the sun, as it rises, perches for a moment atop Angkor's central tower and lights up the entire majestic complex like a fairy-tale kingdom.

All these places are man-made sanctuaries that speak to the union of heaven and earth at key moments of the year. They might rightly be described as hierophanies because their fundamental purpose is

to reveal and manifest the sacred connection between macrocosm and microcosm, sky and ground, “above” and “below.”

Scattered around this majestic garden planet we call Earth, however, are other, even more powerful hierophanies, put in place not by human beings but by nature, where ground and sky whisper to one another with exceptional intimacy. Wise ancients, who knew the garden long before us, sought out such spots, which they held to be sacred, and when they found them they would sometimes modify them to honor and enhance the communion witnessed there.

Research published in 2018, though subject to further confirmation, suggests that Stonehenge may be one of them. Archaeologists have long believed that its taller, heftier pillars—the big limestone “sarsens”—did not occur locally on Salisbury Plain where Stonehenge stands but had to be dragged 18 miles from the Marlborough Downs.[3] The enduring mystery, therefore, was, why anyone would go through all that trouble and effort moving

megaliths weighing up to 50 tons to Salisbury Plain when Stonehenge could simply have been erected on the Marlborough Downs instead?

The new research offers a rather surprising answer. It seems that two of the sarsens—Stone 16 in the southwestern quadrant of the great circle, and the Heel Stone outside the circle to its northeast—were NOT after all brought here from the Marlborough Downs but have stood naturally on Salisbury Plain for millions of years.[4] What's magical about them, however, is their alignment. An observer behind Stone 16 looking **northeast** toward the Heel Stone at dawn on the summer solstice will see the sun **rise** behind it. Then 6 months later, at the winter solstice, an observer behind the Heel Stone looking **southwest** at Stone 16 will see the sun **set** behind it.

HEEL STONE
SOLSTICE AXIS
SARSEN STONE 16
N

New research indicates that Stone 16 and the Heel Stone were present on Salisbury Plain, aligned by nature to the solstices, before Stonehenge was built. IMAGE: DERIVATIVE OF "STONEHENGE" BY RUSLANS3D, CC BY 4.0.

Archaeologist Mike Pitts, who led the research, suggests that the way the alignment of these two sarsens signaled midwinter and midsummer would not have gone unnoticed by the ancient Britons, who would have accorded special significance to the site long before they planned the geometry of Stonehenge and raised up the whole spectacular complex of megaliths around the preexisting axis. Indeed, if Pitts is right, it is **because** of this natural solstice axis that Stonehenge was built here in the first place.[5]

Another example of humans sacralizing a place where earth speaks to sky is the Great Sphinx of Giza in Egypt, which is thought to have begun life as a "yardang"—a ridge of bedrock shaped by millennia of desert winds into a completely natural form somewhat resembling a lion.[6] Many such outcrops, described by European explorers of the eighteenth and nineteenth centuries as "sphinxlike"

and as resembling “lions,” exist in Egypt’s Western Desert.[7] But what was special about this one was its situation overlooking the Nile Valley and the curious fact that nature had oriented it, with considerable precision, to due east and thus to the rising point of the sun on the equinoxes. As suggested at Stonehenge, it looks like this celestial alignment is what attracted human beings to it in the first place, motivating them to transform it into a giant monolithic work of sculpture, first enhancing its naturally leonine form and much later, in the time of the pharaohs, recarving its (by then heavily eroded) leonine head into a human likeness.

Go to Giza at dawn on the winter solstice and you will see the sun rising far to the south of east, and thus far to the right of the gaze of the Sphinx. Go there at dawn on the summer solstice and you will see the sun rising far to the north of east, and thus far to the left of the gaze of the Sphinx. But go there at dawn on either the spring or the autumn equinox and you will witness the sacred communion of

heaven and earth, with the gaze of the Sphinx perfectly aligned to the disk of the sun as it rises.

Such enchanted but fleeting conjunctions of earth and sky are not confined to the Old World.

In the New World, Native Americans likewise built immense structures to honor and channel precisely the same moments and energies and sought out certain striking topographical features—regarded as sacred—through which the celestial and terrestrial spirits were already bound in intimacy. Thus, just as Egypt has its Great Sphinx, natural but modified and enhanced by humans to bind sky and ground at sunrise on the equinoxes, and just as the natural solstitial axis of Stonehenge has been modified and enhanced by humans with numinous and beautiful effect, so North America has its Great Serpent Mound, a natural ridge, modified and enhanced by humans to join heaven and earth at sunset on the summer solstice.

In their 1987 paper the Hardmans proposed a viewpoint near the center of the oval formation in front of the Serpent's head where an altar of large stones was reported to have remained in place until it was destroyed in the nineteenth century. From this viewpoint they settled on an alignment at azimuth 302 degrees targeting sunset on the summer solstice.

HERE COMES THE SUN

SERPENT MOUND'S STRIKING CONNECTION TO the summer solstice went unnoticed, unobserved, and unstudied by anyone in our era until 1987. That was the year in which the fall issue of the *Ohio Archaeologist* published a landmark paper by Clarke and Marjorie Hardman titled "The Great Serpent and the Sun."

In this paper, the ridge behind which the sun sets on June 20/21 as viewed from Serpent Mound was daringly renamed "Solstice Ridge" by the authors, and the orientation of the open jaws of the Serpent to the setting point of the sun on the summer solstice was recognized and made explicit for the first time.[8]

What has been seen cannot be unseen, even in an age so radically disconnected from the cosmos as our own. Thanks to the Hardmans, therefore, no one who takes a serious look at Serpent Mound can now fail to observe the way the Serpent's jaws line up to the setting summer solstice sun. Because those jaws gape wide, however, it's an alignment that would have been as general and obvious 13,000

years ago as it is today. The Hardmans therefore sought to refine it. As shown in the diagram above, they selected as their viewpoint the reported location, near the center of the oval formation in front of the Serpent's head, of the former "elevation of large stones" described by Squier and Davis as destroyed when they visited the site in the mid-nineteenth century.[9] The Hardmans argued that an observer who positioned himself in this location on the evening of the summer solstice would see the sun set at an azimuth of 302 degrees behind a specific feature on "Solstice Ridge"—a feature something like the front sight on a rifle that they nominated "Solstice Knob."[10]

The "azimuth" of an object is its distance from true north in degrees counting clockwise. North is nominated as 0 degrees, so azimuth 90 degrees is due east, azimuth 180 degrees is due south, and azimuth 270 degrees is due west. An azimuth of 302 degrees will therefore be 32 degrees north of west.

ROASTING THE HARDMANS

IT'S OFTEN THE CASE IN archaeological scholarship, and actually good science, that whenever an adventurous and unusual new thesis is published attempts will be made to falsify it. It was therefore only to be expected, as I turned to the winter 1987 issue of *Ohio Archaeologist,* that I would find a refutation of the Hardmans' work. Titled "Serpent Mound Revisited," the paper was written by William F. Romain, a very interesting and important researcher in this field.

On the assumption that Serpent Mound had been built around 2,000 years ago (the consensus archaeological opinion in the 1980s) Romain pointed out that the Hardmans proposed alignment had failed to take into account a well-established archaeoastronomical phenomenon, namely that the sun's rising and setting points along the horizon do not remain fixed but slowly change down the ages.[11]

This happens because sunrise and sunset positions are constrained not only by the latitude from which they are observed, but also by

the tilt of the earth's axis in relation to the plane of its orbit. Presently the angle of the tilt stands at around 23° 44'.[12] This angle, however, is not fixed but slowly increases and decreases in a 41,000-year "obliquity cycle" between a minimum of 22.1° and a maximum of 24.5°.[13] The resulting changes to sunrise and sunset positions along the horizon over long periods are "sizable," according to leading archaeoastronomer Anthony F. Aveni,[14] whose calculations Romain used in his 1987 paper to highlight what he believed was the fatal flaw in the Hardmans' case. They had accepted the epoch of 2,000 years ago for the construction of Serpent Mound, but their proposed sunset azimuth of 302° made no sense. Viewed from Serpent Mound 2,000 years ago, as Romain correctly pointed out, "the summer solstice sun would have set at an azimuth of about 300.4 degrees. … In other words, the summer solstice sun would have set roughly 1.6 degrees, the equivalent of 3 sun diameters, south of Solstice Knob."[15] If Serpent Mound really

was that far out of alignment 2,000 years ago when it was supposed to have been built, then only four logical conclusions presented themselves: (1) its builders were very poor astronomers; (2) they hadn't intended to orient the monument to the summer solstice sunset at all; (3) the Hardmans were right in their general thesis but had gotten the proposed observation point and sight line wrong; or (4) The alignment had not been made 2,000 years ago but at a completely different time.

In another paper, published in *Ohio Archaeologist* a year later, Robert Fletcher and Terry Cameron picked up where Romain had left off in a renewed roasting of the Hardmans. Noting that the summer solstice sun as viewed from Serpent Mound currently sets at azimuth 300° 05', and noting the effects of the obliquity cycle, they treat with sarcasm the Hardmans' claim that the Serpent's primary orientation was to azimuth 302°: "If a horizon marker at 302 degrees was used at one time to mark the summer solstice sunset position, the Serpent, by implication, must have been

constructed around 11,000 BC. There may be some who would have problems with that date."[16]

It's the last line that reveals the scorn.

You bet there would have been "some" in 1988 who would have had problems with that date! Indeed, not just some but all archaeologists would have regarded it as the province of the lunatic fringe to suggest that Serpent Mound might in any way go back as far as 11,000 BC, that is, to around 13,000 years ago.

In the 1980s, as we'll see in part 2, there was a general acceptance that humans might have first arrived in the Americas by 12,000 or even 13,000 years ago. But those earliest migrants were deemed by archaeologists to have been scattered hunter-gatherer groups, living from hand to mouth and lacking the vision, sophistication, and level of organization required to create a monument on the scale of Serpent Mound.

William Romain's summer solstice sunset alignment for Serpent Mound along azimuth 300.1 degrees. This alignment would have targeted the summer solstice sunset 2,000 years ago and differs by 1.9 degrees from the alignment proposed by the Hardmans.

The real implication of the Hardmans' "error"—the clue they'd inadvertently stumbled upon, of possibly much more ancient origins for the site—was therefore never followed up because the prevailing theory of the peopling of the Americas would not admit it as evidence.

Meanwhile, as the years passed, William Romain changed his mind. In 1987 he had written in his critique of the Hardmans that the orientation of Serpent Mound could be "better explained by a set of facts having nothing to do with the summer solstice."[17] By the year 2000, however, he was ready to accept as "unequivocal" an alignment from the head of the Serpent "through the oval embankment to the summer solstice sunset,"[18] and showed in a map

how this could be done to target azimuth 300.4 degrees, later revised to azimuth 300.1 degrees (personal communication October 31, 2018), where the summer solstice sun would have set 2,000 years ago.[19] He also reiterated the definitive north–south line he'd identified in 1987 running through the monument from the inner spiral of its tail to the hinge of its jaws.[20]

BUT IS THE SERPENT REALLY 2,000 YEARS OLD?

BACK IN THE 1980S, WHEN Romain first laid into the Hardmans, the one thing both sides agreed on was that Serpent Mound was about 2,000 years old and was one of the later works of "the Adena," a Native American culture thought to have flourished between

approximately 800 BC and AD 100.[21] Though no carbon dating had been done, this was the consensus view of almost all experts at the time, and Romain and the Hardmans not only accepted it without question but also used it as the basis for their own calculations of alignments.

Imagine their surprise, therefore, when Robert Fletcher of the University of Pittsburgh (one of the early critics of the Hardmans), William Pickard of Ohio State University, and Bradley T. Lepper of the Ohio Historical Society carried out the first carbon-dating of Serpent Mound and found it to be much **younger** than everyone had supposed—not 2,000 years old or more, but 1,000 years old or less.[22] To be precise, they concluded that the most likely date for its construction was 920 years (plus or minus 70 years) before the present,[23] and that it must therefore be the work of the so-called Fort Ancient culture thought to have flourished at around that time.[24]

Published in spring 1996 in a respected peer-reviewed journal, this notion of a much younger Serpent Mound went on to enjoy a level of widespread acceptance among American archaeologists that would certainly not have been accorded to it if the redating had gone in the other direction. Moreover, after being quickly and uncritically adopted into doctrine,[25] it was then disseminated to the public for most of the next 20 years as unquestioned historical fact.[26]

As part of this process, an Orwellian scene took place at Serpent Mound in 2003 when the official Ohio historical marker that had previously attributed the monument to the Adena culture was "unhappened" and replaced by another in which visitors were informed that the earthwork had been built "around 1000 A.D. by the Fort Ancient culture."[27]

Let's take a look at the evidence on which Fletcher, Pickard, and Lepper based the 1996 claim that so effectively redefined Serpent

Mound.

Part of it has to do with an *absence* of evidence of typical Adena cultural artifacts—indeed an absence of any artifacts—in those parts of the Serpent excavated prior to the 1990s.[28] As Fletcher & Co. rightly point out, it was only because a number of "definite Adena burial mounds" had been found nearby that Serpent Mound had been attributed to the Adena in the first place—an attribution that was therefore "somewhat tenuous."[29]

As to the positive evidence for their claim, Fletcher & Co. give special prominence to stone flakes and tools uncovered by their excavations at Serpent Mound, including "a classic Fort Ancient Madison point."[30] They also recovered twenty-nine pottery shards "assignable to some period between A.D. 350 and 950."[31] Finally—and clearly the clincher as far as they're concerned—they list the radiocarbon dates for three samples of charcoal retrieved during their excavations.

One, with a date of 2920 plus or minus 65 years before the present, they immediately dismiss because it came from a level "far below the estimated original surface upon which Serpent Mound was built."[32]

But the other two they like. Both were recovered from the "intact sediment used to create the effigy," and both returned the same calibrated radiocarbon date of AD 1070.[33]

These two identical dates, Fletcher, Pickard, and Lepper conclude, "Represent valid chronological evidence for the construction of Serpent Mound sometime during the Late Prehistoric or Early Fort Ancient periods."[34]

Lepper even speculates (he does admit it's speculation)[35] that the Serpent was made in response to the passage of Halley's Comet in 1066—recorded elsewhere as far afield as Europe and China: "It was a spectacular, fiery display. And it seems to me it's more than possible that the Native Americans may have viewed Halley's

comet as a serpent snaking across the sky. It's possible they looked up at it and recorded it as an omen and built the serpent."[36]

And that's it! With a wave of the archaeologist's magic wand, a fairy-tale castle of speculation is conjured into being on the foundations of just two tiny fragments of charcoal. In the process, while being rendered less old, less venerable, and less mysterious, the sublime artistry, astronomy, geometry, and imagination expressed in Serpent Mound are snatched from one culture and handed to another by the so-called experts of a third!

SKIN CHANGER

NORTH AMERICAN ARCHAEOLOGY HAS A long track record of wanting Native American sites to be young, as we'll see in part 2. In the case

of Serpent Mound, however, there were some archaeologists, notable among them William Romain, who were never happy with the "somewhat tenuous" nature of the evidence on which Fletcher, Pickard, and Lepper had built their castle in the sky. As Romain tactfully put it in 2011, "Since the charcoal that was dated did not come from a foundation feature or event, the A.D. 1070 date may not reflect when the effigy was actually constructed."[37]

Soon afterward Romain followed up his hunch by joining forces with a multidisciplinary team of fellow researchers "to re-evaluate when and how Serpent Mound was built."[38] It was a thorough, professional, long-term project deploying the latest technologies and involving fresh excavations, core sampling, and multiple radiocarbon dates. The results, published in the *Journal of Archaeological Science* in October 2014, thoroughly ripped the rug out from under the comfortable consensus of the previous 18 years

that the Serpent was around 900 or 1,000 years old and was the work of the Fort Ancient culture.

"We believe that taken as a whole," Romain and his colleagues reported, "our data strongly support that Serpent Mound was first constructed ~2300 years ago, rather than ~1400 years later. Our results indicate the presence of a pre-construction paleosol beneath Serpent Mound, and that charcoal from different locales along its surface dates consistently to ~300 BC. The youngest calibrated age within the 95% probability range is 116 BC and we obtained no dates associated with the later Fort Ancient occupation of the site."[39]

Charitably, however, there was no crowing in triumph, no pouring of scorn on Fletcher, Lepper, and Pickard. Instead Romain's team saw the real answer in a compromise:

> The evidence compiled by Fletcher et al. concerning the reliability of their C-14 ages is generally convincing and supports the charcoal as authentically related to a Fort Ancient (re)construction episode 900 years ago, which leaves the

> contradiction between the two initial construction chronologies unresolved. To settle this contradiction, we propose that Serpent Mound was constructed and then later modified during two distinct episodes: an Adena construction ~2300 years ago during which the mound was first built, followed ~1400 years later by an episode of Fort Ancient renovation or repair.[40]

Because their work was well done, their evidence solid, and their arguments compelling, but also because their "redating" was more of a return to the pre-1996 consensus than anything dangerously new or radical, the model proposed by Romain and his colleagues has subsequently displaced Fletcher et al. Serpent Mound has been returned to the Adena and, despite some unpersuasive protests from Bradley Lepper[41] and incomplete information foisted on the public at the site itself, few today would seriously attempt to argue that it is less than 2,300 years old.

The lingering question, though, is, could it be older?

Perhaps very much older?

After all, is it not the defining quality of the serpent that from time to time it sheds its skin? And is it not precisely on account of this that it served for many ancient cultures as a symbol of reincarnation?[42] It is therefore reasonable to ask how often Serpent Mound has shed its skin and renewed itself.

This noticeboard, which remained in place at the site in 2018, underinforms the public by making Serpent Mound more than 1,000 years younger than the most accurate carbon dates suggest. PHOTO: ROSS HAMILTON.

The 1996 and the 2014 studies, taken together, provide solid evidence of a change of skin around 900 years ago—a "renovation" project. However, largely because of the "pre-construction paleosol" (soil stratum laid down in an earlier age) forming the foundation of the mound,[43] it is taken for granted that the earlier episode at 2,300 years ago was the **birth** of the project. Setting aside the one anomalous charcoal fragment, dated to 2,920 years ago in the 1996 study, and the two fragments testifying to the Fort Ancient renovation, all the datable materials from the 2014 study, which clustered around 300 BC as we've seen, were found **above** this bed of ancient soil. "The sub-mound paleosol was buried," the archaeologists therefore conclude, "and Serpent Mound construction began … 2300 years ago during the Early Woodland (Adena) Period."[44]

It seems like a reasonable argument but it leaves another possibility unconsidered—namely that 2,300 years ago Serpent

Mound was **already** an enormously ancient structure, perhaps very much eroded and damaged, and that it was cleared down to the level of the paleosol and remade by the Adena culture at this time.

In that case the archaeologists behind the 2014 study would not have documented the birth of the Serpent but its **rebirth**—or reincarnation.

Why not?

The 2014 study did not gather the necessary data to confirm whether the mound was in continuous use from the Adena period 2,300 years ago until the Fort Ancient renovations 1,400 years later: "However, a possible erased coil near the head of the serpent indicates that other alterations, potentially several hundred years earlier than the Fort Ancient repairs, may also have occurred. This suggests a deeper, richer, and far more complex history for Serpent Mound than previously known."[45]

Again—why should this deeper, richer, far more complex history be limited to the relatively recent past? Since Romain and his coauthors are prepared to consider the possibility that Serpent Mound "was regularly used, repaired, and possibly reconfigured by local groups for more than 2000 years,"[46] then why not for longer?

Even Fletcher & Co. admit that their anomalous 2,920-year-old piece of charcoal, and nearby Adena burial mounds, are evidence of "the use of the area during the Early Woodland Period."[47] But why should such use have been "ephemeral," as they assert?[48] Why shouldn't those Early Woodland peoples also, like later cultures, have been present to tend to, maintain, restore, and sometimes reorient and reconstruct the great Manitou?

If so, and if others who came before them had done the same work in their time, inheriting that sacred responsibility from even earlier cultures and participating down the millennia in an irregular process of restoration and refurbishment, then the possibility cannot

be ruled out that the first incarnation of the effigy might indeed have been in the Ice Age 13,000 years ago. Were that to be confirmed, everything we've been taught about the state of early Native American civilizations and the global timeline of prehistory would have to be rethought.

3

THE DRAGON AND THE SUN

IN 2017 THE CLOSEST SUNSET to the precise astronomical moment of the summer solstice occurs on the evening of June 20—which is why Santha, Ross Hamilton, and I are back at Serpent Mound on that day rather than on the 21st, when the solstice is more often celebrated. Angles, calculations, and astronomical software are all very well, but nothing beats direct, on-the-spot observation. Our

project on the 20th, therefore, having familiarized ourselves with the site and its surroundings on our first visit on the 17th, is for Santha to fly the drone 400 feet above the great effigy, and photograph it at sunset from a point overlooking both its head and the horizon, commanding its field of view, so that we can see for ourselves what its alignment is really all about.

It's around 3 pm and the sky is cloudless, giving us hope of a clear horizon this evening. With more than enough time to spare on what, after all, is the longest day of the year, Ross beckons for us to follow him on a steep, winding path that leads down from behind the coiled tail of the Serpent through dense woods to the base of the ridge on which the great effigy stands. It's such a calm, clear, peaceful afternoon, filled with the sweet notes of birdsong and so poignant a dance of light and shadow between the leaves and the sun that the three of us fall silent, descending slowly and steadily, just breathing it all in. The path levels out along the bank of Brush Creek and we follow it toward the northwest. The creek is on our

left and the ridge looms 100 feet above us on our right. Its slope is not entirely overgrown. In places it is sheer, almost a cliff, on which the trees and bushes can get no purchase and the bare limestone bedrock is exposed.

As we walk Ross goes over the implications of his own investigations into the true age of Serpent Mound. I refer the reader to his masterwork, *The Mystery of the Serpent Mound,* for full details.[1] In brief, though, his view as to when exactly the effigy was first constructed is not derived from any of the radiocarbon assays, or from calculations to do with the azimuth of the summer solstice sunset. Instead he focuses on the *form* of the serpent, which he perceives as a terrestrial image of the constellation Draco.

صورة التنين على ما رى في الكرة

CAMELOPARDALIS

DRACO

In images from many cultures, Draco is depicted as a serpent.

I have my own history with Draco, as those who have followed my work over the years will know. In my 1998 book *Heaven's Mirror,* for example, I present evidence that this enormous constellation, widely depicted as a serpent by many ancient cultures,[2] served as the celestial blueprint according to which the temples of Angkor in Cambodia were laid out on the ground—with each temple "below" matching a star "above." The essence of my case is that the notion of "as above so below" expressed in the architecture of Angkor is part of an ancient globally distributed doctrine—or "system"—that set out quite deliberately to create monuments on the ground, all around the world, to mimic the patterns of certain significant constellations in the sky. Moreover, since the positions of all stars as viewed from earth change slowly but continuously due to the phenomenon called "precession," it is

possible to use particular configurations of astronomically aligned monuments to deduce the dates that they represent—that is, the dates when the stars were last in the celestial locations depicted by the monuments on the ground.

The constellation of Draco overlaid on Serpent Mound. The neighboring constellation is Ursa Minor, the Little Bear, which houses our present pole star, Polaris. LEFT: The accuracy of Romain's 1987 survey is demonstrated by the many-starred asterism of Draconis. Each point of light is given equal size in order to demonstrate the accuracy of the original designer's vision (Hamilton 1997, after Cambridge and Romain). RIGHT: The ancient north star Thuban, which preceded the present pole star Polaris (the dot touching the outside of the circle), is used as the center of this geometry. Both

ends of the Serpent are equal in distance from the center point, Thuban (Hamilton 1997, after Romain).

This process of constant change unfolds, of course, over a great cycle of 25,920 years and has nothing to do with the motions of the stars, or with the obliquity cycle. Its cause is another quite different motion of the earth driven by the contradictory pull of the gravity of the sun and the moon. The result is a slow circular wobble of the planet's axis of rotation, at the rate of one degree every 72 years, much resembling the wobble of a spinning top that is no longer upright. The earth is the viewing platform from which we observe the stars, so these changes in orientation cause changes in the positions of all stars as viewed from earth.

To envisage the process, picture the earth's axis passing through the geographical south and north poles and thence extended into the heavens. The south and north pole stars in any epoch are the stars at which the two "tips" of this extended axis point most directly.

Serpent Mound is in the Northern Hemisphere and the north

celestial pole is presently occupied by our "pole star" Polaris (*Alpha Ursae Minoris,* in the constellation of the Little Bear). The effect of precession, however, is to cause the tip of the axis to inscribe an immense circle in the heavens over the cycle of 25,920 years. Thus around 3000 BC, just before the start of the Pyramid Age in Egypt, the pole star was Thuban (*Alpha Draconis*) in the constellation Draco.[3] At the time of the Greeks it was *Beta Ursae Minoris*. In AD 14000 it will be Vega.[4] Sometimes in this long cyclical journey the extended north pole of the earth will point at empty space and then there will be no useful "pole star."

The constellation of Draco coils eternally around the pole of the ecliptic. Thuban, in

the tail of Draco, was the pole star in 3000 BC.

As one of the notable circumpolar constellations, and also one of the most widely recognized, and one of the oldest for which written records have survived,[5] what makes Draco particularly significant and remarkable was summed up in 1791 in two lines from a poem by Charles Darwin's grandfather, the physician and natural philosopher Erasmus Darwin:

> *With vast convolutions Draco holds*
> *Th' ecliptic axis in his scaly folds.*[6]

This "ecliptic axis"—astronomers today call it the "pole of the ecliptic"—is the still, fixed point in the celestial vault around which the vast circle of the north celestial pole makes its endlessly repeated 25,920-year journey. It is the one place in the sky that **never** moves or changes while everything else about it dances and

shifts, and once you recognize it for what it is—nothing less than the very heart of heaven—it's striking how the serpentine constellation of Draco seems to coil protectively around it.

If at Angkor that constellation was honored in the form of temples laid out in its image on the ground, then I could see no reason in principle why a similar project should not have been mounted in North America. In one case the medium was stone, with temples targeting the equinox sunrise. In the other it was a great earthwork targeting the summer solstice sunset.

In both cases the result was a symbolically powerful union of ground and sky—a union, according to Ross Hamilton, that was made manifest not 1,000 years ago, nor even 2,300 years ago, but around 4,800 to 5,000 years ago. That was the time when Thuban in Draco was the pole star. And at that same remote date, almost 1,000 miles to the south in Louisiana, a site now known as Watson Brake was built. I will have a great deal more to say about Watson Brake in part 5. As we shall see, it is indisputably 5,000 years old in its

present form, and it is Ross's argument that the same mysterious and as yet unidentified group of Native American geometers and astronomers who made Watson Brake also made the great Manitou at Serpent Mound.

As usual in these matters, however, there's complexity and nuance behind the headlines. So, yes, Ross **is** of the view that a major project was undertaken at Serpent Mound around 5,000 years ago. But as we talk now he clarifies what, for him, is obviously an extremely important point: "I always make an effort NOT to give people the impression that 5,000 years ago is when the first mound structure was built on this spot," he says emphatically:

> I believe it was a sacred place, with a structure upon it, its connection to the solstice recognised long before, but that it was remade, renovated, and renewed around 5,000 years ago, reinforcing the worn-down traces of older foundations unrealised by conventional dating methods.
>
> So there was something here already, a legacy from much earlier times, but 5,000 years ago or thereabouts a very well-developed version of the current serpentine effigy was created as an active, fully functioning Manitou. In accord

with Native American legend and mythology it would have been outfitted with the necessary accoutrements to facilitate earth–sky interaction phenomena, quite similar to the way some feel the Great Pyramid and its two sibling pyramids once operated.

The Cherokee say there was once a powerful crystal mounted at the head of the serpent—a crystal mentioned in Mooney's nineteenth-century collection of Cherokee "myths. …" That crystal put out a brilliant light that "sullied the meridian beams of the sun." As the story goes, the crystal was stolen and afterward the people fell into darkness. They revisited the former residences of their godly forebears whom they held in highest regard, and gradually took away relics of the remaining parts of the Serpent as well, leaving only dirt. Then they started taking the dirt also until the culture that archaeologists call the Adena decided to stop the practice and refurbish all the old sites with fresh earth and stone to ensure they would survive and that the people would have a living testament to the former glories of their ancestors. This reclaiming of the old holy sites began roughly around 2,500 to 2,300 years ago (in other words 2,500 years after the creation of the Manitou), and continued until about AD 500 when everyone mysteriously vanished or went their separate ways to look for other places in the Mississippi Valley to refurbish. The ancient country of Manitouba was vast, and so there were plenty of other sites to fix up and rededicate. Hence an explosion of remarkably adept architectural masterpieces all throughout much of the Great South and of the Mississippi as we approach the historic period—returning full circle to Ohio. In this model, the same wave of inspiration

refurbished the Manitou twice, the refurbishments 1,400 years apart, making it the oldest and youngest, the alpha and omega, of the Ohio Valley antiquities.

I'm doing the mental arithmetic. "So the 'Fort Ancient' work at Serpent Mound 1,000 years ago was the second of these restoration projects?"

"That's right," Ross replies, "as hopefully everyone, even the archaeologists involved in wrongly attributing the Mound solely to the Fort Ancient culture back in 1996, are now beginning to realize."

THE MANITOU AND THE MEGALITH

DEEP IN CONVERSATION, WE'VE WALKED along the bank of Brush Creek at the base of Serpent Mound ridge to its northwestern end where it comes to a point naturally targeting the summer solstice sunset.

Trees and bushes cover everything here except the snout of the ridge itself, which thrusts a gnarled and weathered limestone cliff forward through the green veil, revealing an overhang and hints of caves.

Ross stops and holds up a hand. “Do you see it?” he says.

I look around. I’m bad at tests! Then my eyes fall on a chunky, moss-covered limestone megalith leaning into the bank among the undergrowth. It’s not finely quarried but its relatively straight sides and corners, and the curved section cut out at one end, make it likely that humans have worked on it. It’s over 9 feet in length, about 2 feet wide and something more than a foot thick, almost big enough to stand in at Avebury or Stonehenge as a replacement for one of the smaller megaliths there.

ABOVE RIGHT: Unenhanced image (PHOTO: SANTHA FAIIA) of the Serpent's head simulacrum in the cliff directly beneath the head of Serpent Mound. ABOVE LEFT: An enhanced image helps to explain why many travelers, and the ancients before them, could imagine this natural rocky outcrop as the head of a serpent. BELOW: Juxtaposition of Serpent Mound and the ridge on which it stands with its natural "serpent-like head."

"Do you mean this megalith?" I ask.

"We'll come to that," says Ross, "but look past the megalith. Look above it."

"I see a cliff."

"But do you see the **face** in the cliff?"

The moment Ross says the word "face" everything swings into focus for me. It's not a human face but a serpent's face. That overhang is an upper jaw, there's the line of a mouth below it. Above the corner of the mouth to the right, much darker than the rest of the face, a distinct eye seems to gaze down at us.

In later research I'll find that many visitors have noticed the resemblance of this completely natural outcrop to the head of a

serpent. In 1919, for example, Charles Willoughby of Harvard University's Peabody Museum visited Serpent Mound and concluded:

> The site chosen for this great effigy was probably determined largely by superstitions which may have been connected with the headland upon which it was built. This headland, rising to a height of about 100 feet, gradually narrows and terminates in a cliff, bearing a certain resemblance to the head of a reptile. … The contour of the head, the muzzle, the eye and mouth are clearly indicated. The Indians may also have seen in the promontory extending backward from the head along the shore of Bush creek, the body of the serpent deity. Natural formations, peculiarly shaped stones, concretions, and other objects resembling human or animal forms or any of their parts were generally supposed to possess supernatural powers, and in this instance, with a little imagination, one can easily approach the Indian's point of view.[7]

Earlier, in 1886, archaeologist W. H. Holmes came away from Serpent Mound with a similar impression. "Having the idea of a great serpent in the mind," he wrote in *Science,*

> one is at once struck with the remarkable contour of the bluff, and especially of the exposure of rock, which readily assumes the appearance of a colossal reptile lifting its front from the bed of the stream. The head is the point of rock, the dark lip-like edge is the muzzle, the light coloured underside is the white neck, the caves are the eyes, and the projecting masses to the right are the protruding coils of the body. The varying effects of light must greatly increase the vividness of the impressions, and nothing would be more natural than that the Sylvan prophet … should recognize this likeness and should at once regard the promontory as a great Manitou. His people would be led to regard it as such and the celebration of feasts upon the point would readily follow.
>
> With a mound-building people, this would result in the erection of suitable enclosures and in the elaboration of the form of the reptile, that it might be the more real. The natural and the artificial features must all have related to one and the same conception. The point of naked rock was probably at first and always recognised as the head of both the natural and the modified body. It was to the Indian the real head of the great serpent Manitou.[8]

We're still standing by the megalith that first caught my attention. "What about this?" I ask. "Is this part of the Serpent Mound story or just a random chunk of rock?"

Ross shrugs. “Nobody knows for sure.” He pauses before adding, “I’ve got my own theory though.”

“Which is?”

“I think it’s one of the large stones that Squier and Davis reported had stood in the oval earthwork in front of the Serpent’s head in the nineteenth century.”

“The ones they said had been scattered by some treasure hunter?”

“That’s right,” Ross replies. “And if I recall correctly, they also said those stones had been arranged in a circle before they were thrown down.”

I know what Ross is reminding me of here is a connection he’s written about between the geometry of Stonehenge and the geometry of Serpent Mound, which he regards as “two elements comprising a larger picture pointing to a highly evolved school of astro-architecture, the origin of which is not known.”[9]

Graham Hancock (left) with Ross Hamilton (right) at Serpent Mound megalith.
PHOTO: SANTHA FAIIA.

Therefore, while he does not dispute that Serpent Mound was the work of Native American geometers and astronomers, he believes that they were members of a much older school and implementing a much older design which likewise—at many different times and in many different media—was brought into commission in many other parts of the world as well.

This fundamental, endlessly reiterated, endlessly reincarnated design, he says, "seems to have no home base—no specific country or culture responsible for its phenomenon."[10]

This, however, is precisely what we would expect if it's "home base" were a lost civilization destroyed so completely, and so deeply buried in time, that it has been reduced to the stuff of myths and legends.

WHAT THE SERPENT SEES

IN THE HOUR BEFORE SUNSET, as a refreshing chill enters the air, we're back at the upper level of Serpent Mound with all batteries charged and the drone ready to fly.

The sun, which rose north of east this morning, seems already drawn down low on its arc toward its setting point on the northwestern horizon, and again we notice the effective "blinding" of the serpent by the dense trees allowed to flourish along its line of sight as a matter of deliberate policy by the Ohio History Connection. It's obvious, if we did not have the drone, that we would get at best only faint impressions and hints of the alignment if a few scattered sunbeams somehow found their way through the thicket.

"This isn't how it's supposed to be!" I say to Ross. "It feels almost like sacrilege."

“But the good news is people are waking up again, here and everywhere else. Regardless of what the Ohio History Connection wants or does, or what the archaeologists tell us we should believe, we’re at one of those junctures in the cycle where the Manitou is reactivated as a source of knowledge and wisdom.”

With a soft buzz of its rotors, Santha’s little drone climbs into the sky and we cluster around the monitor to share the aerial view. It’s 7:55 pm and from an altitude of 400 feet uncluttered by trees, we can see that the sun still has some distance to travel before it conjuncts the range of hills forming the local horizon to the northwest. The warm, mellow light of the end of a summer’s day interspersed with patterns of cool, deep shade dapples the immense earthwork along its entire length and despite the trees closing in around its head it seems truly master of its enchanted kingdom.

Santha has the drone hovering in place near the back of the Serpent’s neck overlooking its open jaws, the great oval, the trees, and the horizon far beyond. It’s the perfect shot but by 8:12 pm, the

glare is so intense that it's difficult to be certain exactly where the sun now sits in relation to the horizon. There's a great scooped out hollow of silver light there and the sun's disk is somewhere in the middle of it. A shift in position of the drone, however, confirms that sunset is still some time off.

At 8:13 pm, we bring the device down for a battery change and relaunch it, but just 11 minutes later, at 8:24, the control panel lights up with a low-battery warning. The ponderous roll of the earth toward the east, the majestic descent of the sun toward the west, seem to have synced into a kind of slow-motion dream sequence and, with no alternative, hoping we have not miscalculated the timing of the universe, we bring the drone back to earth.

There's something seriously wrong with it. Not the battery problem—that was easily solved—but something in the communications between the control unit and the little quadcopter. In the 28 minutes it takes to fix it we can feel the light leaching out of the sky. The evening air grows cool and the shadows cast by the

trees lengthen. The sun's still in the heavens—somewhere!—but whether it has dropped behind the hills yet or whether we'll still have a chance to witness that moment is completely unclear when the drone finally starts to obey orders again and we're able to relaunch it at 8:52 pm.

Santha rockets it straight up to 400 feet, to the vantage point she'd found before, and we all give a cheer as we see in the monitor, as though by some miracle, that the sun is indeed still with us and poised exactly on the rim of the hills that the Hardmans dubbed "Solstice Ridge."

The next 3 minutes are magical as the great luminary, source of all life on earth, begins its final descent into night. It's a transformation and a transition rather than an abrupt change of state.

The glare that dazzled the camera earlier is much reduced now, and little by little the sky fills with the most seductive soft glow and the sun's disk seems to excavate a niche in the horizon, where, as

readers can confirm from the photographs, its setting is indeed in very fine alignment with the open jaws of the Serpent.

There it reclines, seemingly still, shedding its brilliance and beneficence across this golden land of bounteous fields and forests, as though in deep communion with the earth. I'm reminded of a passage from the *Ancient Egyptian Book of the Dead,* a hymn addressed to Ra the Sun God:

> Men praise thee in thy name "Ra" and they swear by thee, for thou art lord over them. Thou hearest with thine ears and thou seest with thine eyes. Millions of years have gone over the world; I cannot tell the number of those through which thou hast passed. … Thou dost pass over and dost travel through untold spaces requiring millions and hundreds of thousands of years to pass over; thou passest through them in peace and thou steerest thy way across the watery abyss to the place which thou lovest; this thou doest in one little moment of time, and then thou dost sink down and dost make an end of the hours.[11]

Over Serpent Mound the drama continues to unfold, this love affair of planet and star, ground and sky, above and below, this

beautiful and moving alignment sustained for a long, lingering interval as the sun continues its descent.

Half its disk has disappeared from view now, then three quarters, then just a glimmering, radiant shimmering sliver somehow enduring on the horizon, and then at last it's gone entirely but for a warm, all-embracing afterblush that blossoms in the gloaming.

OLD CERTAINTIES

IF SERPENT MOUND HAD BEEN kept clear of trees by the successive cultures that venerated and repeatedly restored the great effigy, then the alignment within the wide spread of the Serpent's jaws would always have been a striking feature here from the time of the retreat of the ice sheets more than 13,000 years ago. Because of the shifting tilt of the earth's axis, however, the exact point on the horizon

where the summer solstice sun would set would shift several degrees north and south of its present position over the 41,000-year obliquity cycle.

We've already seen how the Hardmans were taken to task in the 1980s for mistakenly proposing a summer solstice sunset alignment at an azimuth as viewed from Serpent Mound that—according to the calculations of their critics Fletcher and Cameron—coincided with a date of 11,000 BC. Archaeologists at the time considered that date far too early for any civilization capable of creating a structure of the scale and complexity of Serpent Mound to have evolved in North America and accordingly no further investigation of this rather intriguing anomaly was ever undertaken.

The 1980s are long gone, however, and in the twenty-first century, as we'll see in part 2, new evidence has emerged that calls all the old certainties into question.

PART II

NEW WORLD?

The Mystery of the First Americans

A PAST NOT SO MUCH HIDDEN AS DENIED

ALTHOUGH HE HIMSELF IS NOT an archaeologist, Tom Deméré, curator of paleontology at the San Diego Natural History Museum in California, does have occasion to work with archaeologists. I was therefore not surprised when his response to my request to interview

him and have him show me certain stones and bones in the museum's archives was declined. My initial approach was on September 18, 2017, and the polite refusal came on September 20, not from Dr. Deméré himself but from Rebecca Handelsman, the museum's communications director. "While we're unable to accommodate your request for a meeting," she wrote, "I'd like to share with you our online press kit which has a wealth of information about the project and the discovery."[1]

Though they have their place, press kits are low on my list of priorities when I'm researching books, and because of the very special nature of what Rebecca called "the project and the discovery," I was not going to be so easily fobbed off. Deméré had been closely involved from the outset with the excavation of a controversial site near San Diego and had published a paper in 2017 claiming that humans had been present there as early as 130,000 years ago.[2] The paper was a prominent one, since it appeared in the

prestigious scientific journal *Nature,* and almost immediately aroused the fury of archaeologists committed to a much later date for the peopling of the Americas.

Among them was Professor Donald Grayson of the University of Washington.[3] "I have read that paper," he sniped, "and I was astonished by it. I was astonished not because it is so good, but because it is so bad."[4]

In a response that was typical of many, David J. Meltzer, professor of prehistory at Southern Methodist University in Dallas, Texas, also dismissed the paper. "If you are going to push human antiquity in the New World back more than 100,000 years in one fell swoop," he said, "you'll have to do so with a far better archaeological case than this one. I'm not buying what's being sold."[5]

Gary Haynes, professor emeritus of anthropology at the University of Nevada, went so far as to accuse *Nature* of "an

editorial lapse in judgment" for publishing the paper at all.[6]

Jon M. Erlandson, director of the University of Oregon's Museum of Natural and Cultural History, said "the site is not credible."[7]

Earlier, foreseeing such reactions, George Jefferson, former associate curator of the Page Museum in Los Angeles, had warned Deméré that the archaeological community, invested in long-established notions of the recent peopling of the Americas, wasn't even close to being ready for a claim of antiquity as remote as 130,000 years. "Keep it under wraps," he advised. "No one will believe you."[8]

But Deméré was sure of the evidence and decided to go ahead. The *Nature* paper, published in April 2017, was the result and quickly caught my attention.

DON'T SAY A WORD ABOUT LOST CIVILIZATIONS

COULD DEMÉRÉ'S CLAIM BE TRUE? Rather than having been in America for 30,000 years or less, as archaeologists have recently been dragged kicking and screaming to accept, could our ancestors have populated the continent 130,000 years ago or more?

If the facts checked out (and, I had to keep reminding myself, despite the hostile reactions of some academics, that *Nature* would not have published the paper without having it thoroughly peer-reviewed first), then they raised serious question marks over how complete our understanding of prehistory really is.

In particular, and to get right to the point, what could those very early Americans and their descendants have been *doing* during all the tens of thousands of years that archaeologists insisted they weren't present at all? My whole focus, since long before the

publication of *Fingerprints of the Gods* in 1995, has been a quest for a high civilization of remote antiquity, a civilization that can rightly be described as "lost" because the very fact that it existed at all has been overlooked by archaeologists. I couldn't help but wonder, therefore, whether some traces of it might be found in those 100,000 lost years of the Americas.

So I persisted with Deméré, writing to him several times through the formidable Rebecca Handelsman, setting out the reasons why I wanted to interview him and providing more background on my own work. "Is it possible," I asked, "that missing pages in the story of the origins of civilization might await discovery in North America—the very last place, until now, that archaeologists have thought to look?"[9]

Pointing out that other, now-extinct human species had been present in the world 130,000 years ago and had interbred with anatomically modern humans, I also asked which *species* of human

he thought might have been involved at his site. “Were they anatomically modern? Were they Neanderthals? Were they Denisovans? Or were they one of the several other species of *Homo* that will likely be identified by further research in the coming years?”[10]

For days I heard no more and then, on October 2, 2017, Rebecca wrote again to report that Dr. Deméré had agreed to a “brief meeting” with me, that he was willing to discuss his site and the evidence for an early human presence that it yielded, but that he would not “speculate on what species it may have been or on broader topics/hypotheses re ancient civilizations.”[11]

I accepted these constraints and the interview was arranged for the next day, Tuesday, October 3. Whatever I got out of him it would surely add something to the museum’s press kit and, besides, Deméré’s reticence made perfect sense to me. The last thing he wanted while his own work was under attack was to be associated

with what archaeologists call “crackpot theories” about a lost civilization promulgated by a “pseudoscientist” like myself. If I were in his shoes, frankly, I would have been cautious, too. Indeed, I was quite surprised that he’d agreed to talk to me at all.

FORGOTTEN AMERICA

AT THE OUTSET OF THE twentieth century many scholars took the view that the Americas had been devoid of any human presence *until less than 4,000 years ago*.[12]

To put that in perspective, by 4,000 years ago the civilization of Egypt was already ancient, Minoan Crete flourished, and Stonehenge and other great megalithic sites had been built across Europe. Likewise, by 4,000 years ago, our ancestors had been in

Australia for about 65,000 years and had found their way to the farthest reaches of Asia at almost equally remote dates.[13]

So why should the Americas have escaped this global migration, and this seemingly unstoppable march toward high civilization, until so late?

The answer, perhaps, is that the most influential figure in disseminating and enforcing the view that the New World had only recently been populated by humans was a frowning and fearsome anthropologist named Aleš Hrdlička who, in 1903, was selected to head the newly created Division of Physical Anthropology at the Smithsonian Institution's National Museum of Natural History in Washington, DC. There he would remain until his death in 1943, deploying his intimidating authority as "the most eminent physical anthropologist of his time," "the gatekeeper of humankind's recent origins in the New World" to quash any and every attempt to suggest great human antiquity in the Americas.[14] Frank H. H.

Roberts, a colleague of Hrdlička's at the Smithsonian, would later admit of this period, "Questions of early man in America became virtually taboo, and no anthropologist desirous of a successful career would tempt the fate of ostracism by intimating that he had discovered indications of respectable antiquity for the Indian."[15]

But eminence can only suppress facts for so long, and throughout the 1920s and 1930s compelling evidence began to emerge that people had reached the Americas thousands of years earlier than Hrdlička supposed. Of particular importance in this gradual undermining of the great man's authority was a site called Blackwater Draw near the town of Clovis, New Mexico, where bones of extinct Ice Age mammals were found in 1929 and assumed, rightly, to be very old. The Smithsonian sent a representative, Charles Gilmore, to take a look at the site but—perhaps unsurprisingly under Hrdlička's malign shadow—he concluded that no further investigation was justified.[16]

Anthropologist Edgar B. Howard of the University of Pennsylvania disagreed.[17] He began excavations at Blackwater Draw in 1933, quickly finding quantities of beautifully crafted stone projectiles with distinctive “fluted” points—so-called on account of a characteristic vertical “flute” or channel cut into the base. The points were found in direct association with (and in a few cases even buried between the ribs of) extinct Ice Age fauna such as Columbian mammoth, camel, horse, bison, saber-toothed cat, and dire wolf.[18] In 1935, on the basis of these finds, Howard published a book in which he concluded that it was possible that humans had been in North America for tens of thousands of years.[19] Further seasons of meticulous fieldwork followed before he presented his findings, to widespread approbation and acceptance, at a prestigious international forum on Early Man and the Origins of the Human Race held in Philadelphia on March 18–20, 1937.[20]

Hrdlička was there. He gloweringly ignored the implications of the discoveries at Blackwater Draw and instead used his time onstage to reaffirm his long-held position that, for American Indians, “So far as skeletal remains are concerned, there is at this moment no evidence that would justify the assumption of great, i.e. geological, antiquity.”[21]

But the clock was ticking. Before and after 1943, the year in which both Howard and Hrdlička died, further discoveries of fluted points of the Blackwater Draw type—increasingly referred to as “Clovis points” after the nearby town of that name—continued to be made. This ever-accumulating mass of new evidence left no room for doubt and even the most stubborn conservatives (Hrdlička excepted) were eventually forced to agree that the Clovis culture had hunted animals that became extinct at the end of the last Ice Age and that humans must therefore have been in the Americas for at least 12,000 years.

This gave a huge boost to research, leading in the decades ahead to the discovery of around 1,500 further Clovis sites, and more than 10,000 Clovis points, at locations scattered all across North America.[22] As the net widened, however, a number of anomalies of the culture began to be identified. A confusing outcome of this is that there are now two schools of thought around its proposed antiquity and duration. The so-called long interval school dates the first appearance of Clovis in North America to 13,400 years ago and its mysterious extinction and disappearance from the archaeological record to around 12,800 years ago—a period of 600 years.[23] The "short interval" school also accepts 12,800 years ago for the end date of Clovis but sets the start date at 13,000 years ago—therefore allowing it an existence of just 200 years.[24] Both schools agree that this unique and distinctive culture must have originated *somewhere else* because, from the first evidence for its presence, it is already sophisticated and fully formed, deploying advanced weapons and

hunting tactics.[25] Particularly puzzling, since it is the archaeological consensus that the human migration into the Americas was launched from northeast Asia, is the fact that no traces of the *early* days of Clovis, of the previous evolution and development of its characteristic tools, weapons, and lifeways, have been found anywhere in Asia.[26] All we can say for sure is that once it had made its presence felt in North America the Clovis culture spread very widely across a huge swath of the continent,[27] with sites as far apart as Alaska, northern Mexico, New Mexico, South Carolina, Florida, Montana, Pennsylvania, and Washington state.[28] Such an expansion would have been extremely rapid were it to have occurred in 600 years and seems almost miraculously fast if it was in fact accomplished in 200 years.[29]

An array of Clovis points with a Clovis blade second from left. PHOTOS: SANTHA FAIIA AND, FAR RIGHT, NATURAL HISTORY MUSEUM OF UTAH.

THE LAND BRIDGE AND THE ICE-FREE

CORRIDOR

DURING THE 1940S AND 1950S, as the fame of Clovis continued to grow, no evidence was forthcoming—or, to state the matter more exactly, none that was generally accepted, approved, and confirmed by the archaeological community—of any kind of human presence in the Americas older than the earliest Clovis dates of around 13,400 years ago.

As regards the matter of general acceptance, despite a few dissenting voices[30] a consensus soon began to emerge that no older cultures would *ever* be found—and what is now known as the "Clovis First" paradigm was conceived. We might say, however, that it was not officially "born" until September 1964. That was when archaeologist C. Vance Haynes, today Regents Professor Emeritus of Anthropology at the University of Arizona and a senior member of the National Academy of Sciences, published a

landmark paper in the journal *Science*. Snappily titled "Fluted Projectile Points: Their Age and Dispersion,"[31] the paper presented, and persuasively supported, a number of key assertions.

First, Haynes pointed out that, because of lowered sea level during the Ice Age, much of the area occupied today by the Bering Sea was above water, and where the Bering Strait now is, a tundra-covered landscape connected eastern Siberia and western Alaska. Although not a particularly easy environment, it would, Haynes argued, "have presented no obstacle" to nomadic hunters who were already masters of the Siberian tundra and who would certainly have followed the herds of bison, deer, and mammoth that roamed across it.[32]

Once over the land bridge, however, it was Haynes's case that the migrant hunters could not have ventured very far before confronting the daunting barrier of the Cordilleran and Laurentide Ice Sheets, which were at the time merged into a single impassable

mountainous mass covering most of the northern half of North America.

They therefore had no access to the lands that lay beyond. As a result, prevailing in the ice-free southern half of North America

during this phase of the last Ice Age were "conditions as favorable to the existence of herbivorous megafauna, which man could hunt, as conditions during the time of the Clovis occupation, yet there is not the slightest evidence of man's presence."[33]

Things changed around 14,100 years ago, Haynes claimed, when a generalized warming of global climate caused an ice-free corridor to open up between the Laurentide and the Cordilleran ice caps, allowing entry for the first time in many millennia to the rich, unglaciated plains, teeming with game, that lay to the south.[34]

Some 700 years later, around 13,400 years ago, the stratigraphic record of those plains starts to include Clovis artifacts. Their "abrupt appearance," Haynes argued, supports the view "that Clovis progenitors passed through Canada" and that "from the seemingly rapid and wide dispersal of Clovis points … it appears these people may have brought the technique of fluting with them."[35]

As noted earlier, no Clovis points have ever been found in Asia,[36] but when Haynes published his landmark paper in *Science* in 1964 he reported correctly that four had been found "on the surface" in Alaska and another in the Canadian Yukon, all undated,[37] with the oldest dated points south of the former ice margin going back no further than 13,400 years. To Haynes this looked like the last link "in a logical sequence of events, and the pieces begin to fall into place. If Clovis progenitors traversed a corridor through Canada … and dispersed through the United States south of the … ice border in the ensuing 700 years, then they were probably in Alaska some 500 years earlier. … The Alaskan fluted points … *could* represent this occupation and *could,* therefore, be ancestral to Clovis points and blades."[38]

The paper was welcomed by archaeologists,[39] most of whom were already convinced that Clovis was "First," and virtually overnight what had been at best a persuasive and seemingly well-

constructed theory morphed into the new ruling orthodoxy. Worse, it soon became every bit as rigid and intolerant as the orthodoxy of Hrdlička's time and it would retain ultimate authority over archaeological careers and research priorities for decades to come with a grip every bit as firm as Hrdlička's iron fist.

In a familiar refrain, those who disagreed with "Clovis First," or were foolhardy enough to report possible pre-Clovis sites, did so "at significant risk to their careers."[40] Indeed by 2012 the bullying behavior of the Clovis First lobby had grown so unpleasant that it attracted the attention of the editor of *Nature,* who opined: "The debate over the first Americans has been one of the most acrimonious—and unfruitful—in all of science. … One researcher, new to the field after years of working on other contentious topics, told *Nature* that he had never before witnessed the level of aggression that swirled around the issue of who reached America first."[41]

CHALLENGING CLOVIS FIRST

TOM DILLEHAY, PROFESSOR OF ANTHROPOLOGY at Vanderbilt University in Tennessee, began excavations at Monte Verde in southern Chile in 1977 and found evidence that humans had been present there as far back as 18,500 years ago.[42] The progress of science eventually vindicated him, as we shall see, but before it did so Dillehay had to endure sustained and often deeply unpleasant personal attacks from Clovis Firsters for more than 20 years.

He was attacked because there are no Clovis artifacts at Monte Verde, it is 5,000 years older than the oldest securely dated Clovis sites, and it is located more than 8,000 miles south of the Bering Strait.

The reader will not have forgotten that the strait was dry during the lowered sea level of the last Ice Age—a tundra-covered land bridge across which the Clovis people were believed to have

migrated on foot from northeast Siberia and thence into the Americas through the ice-free corridor between the Cordilleran and Laurentide Ice Sheets. The credibility of Clovis First depends crucially on the supposed close chronological link between the opening up of that ice-free corridor around 14,100 years ago and the first appearance of Clovis artifacts south of the ice margin around 13,400 years ago. By putting humans in the Americas more than 4,000 years *before* the opening of the ice-free corridor, Monte Verde showed that "link" to be illusory. Moreover, by putting them not in North America but in South America, with no means of transport available to them other than boats of some sort, it questioned fundamental assumptions about the technical and organizational capacities of our ancestors, hitherto judged to be too low to allow such adventures at such a remote period.

Tom Dillehay's most dogged and determined critic, perhaps predictably, has been C. Vance Haynes, whose 1964 paper launched the Clovis First theory and who by 1988 had used his influence, and

his outreach in the scientific journals, to dismiss every case thus far made for supposedly pre-Clovis sites in the Americas.[43]

Except Monte Verde. Even for Haynes, this Chilean site was proving to be an exceptionally tough nut to crack. Realizing that the implications for American archaeology of Tom Dillehay being right were immense, Haynes wrote to David Meltzer at SMU to suggest that "a panel of objective conservatives should be formed and funded by NSF [National Science Foundation] to visit the site, examine it, take samples, etc. If a positive consensus results we can then accept the interpretation and formulate new hypotheses for the peopling of the New World. If not, Monte Verde will have to be relegated to the bin of possible pre-Clovis sites awaiting further data."[44]

James M. Adovasio, a world expert in perishable artifacts and former director of the Mercyhurst Archaeological Institute at Mercyhurst University in Erie, Pennsylvania, was closely involved

in the events that followed. He tells us that he would be remiss if he "did not point out that by the oxymoron 'objective conservatives,' Haynes meant himself and the Clovis First disciples."[45]

In the end, however, after 7 years of haggling, a balanced group was put together, "not configured as a panel of pre-Clovis skeptics or, conversely, pre-Clovis enthusiasts," says Adovasio: "rather, it was, as designed, a mixed bag reflecting a range of views."[46]

The site visit took place over 3 days in January 1997, and far from relegating Monte Verde to the "bin," all members of the group eventually signed on to an official report confirming that it was indeed an archaeological site and that Dillehay's dates were correct. The report was published in October 1997 in *American Antiquity* and left no room for any conclusion other than that Monte Verde predated Clovis; it even considered the "extremely intriguing" possibility that the human presence there might go back as far 33,000 years.[47]

In his important book *The First Americans,* Adovasio, who was present at the proceedings throughout, provides a blow-by-blow account of how the panel arrived at its conclusions, and of the follow-up.[48] It seems that Haynes was not happy, despite being a signatory to the report, and even as it appeared in print he began to voice doubts over it to colleagues, questioning again the antiquity of Monte Verde and "suggesting a wondrous new array of hypothetical events that could have contaminated the site in some previously unperceived way."[49]

Haynes and Adovasio had crossed swords before—over Meadowcroft, a site in Pennsylvania that Adovasio had excavated in the 1970s that revealed eleven well-defined stratigraphic units with evidence of human occupation "spanning at least 16,000 years and perhaps 19,000 years."[50] Inevitably, because it threatened Clovis First, this attracted the hostility of Haynes, who, in the years that followed, sought to quibble away almost every aspect of Adovasio's

evidence: “In scientific paper after scientific paper, Haynes … asked for yet another date, yet another study, raising yet other picayune and fanciful questions about Meadowcroft, most of which had been answered long before he asked them—not just in the original excavation procedures but in report after report.”[51]

Again, as was the case with Monte Verde, the constant quibbling and demands for ever more evidence, when the evidence in place was already more than adequate, was demoralizing and had the effect of slowing down the research effort but ultimately did not prevent formal recognition of Meadowcroft Rockshelter as a National Historic Landmark with an age of more than 16,000 years.[52]

Likewise, in the 1990s, Canadian archaeologist Jacques Cinq-Mars excavated Bluefish Caves in the Yukon and found evidence of human activity there dating back more than 24,000 years—older than Meadowcroft and much older than Clovis. The price he paid

was high. His competence and his sanity were questioned and when he attempted to present his findings at conferences he was ignored or insulted.[53] One colleague stated matters bluntly: "When Jacques proposed [that Bluefish Caves were] 24,000 [years old], it was not accepted."[54]

As a result of such attitudes, funding drained away and Cinq-Mars had to stop his work, only to be proved correct, many years later, by a new scientific study of the evidence from the caves published in January 2017.[55]

That study, one of several that confirmed the existence of pre-Clovis sites of increasingly ancient dates,[56] was titled *Earliest Human Presence in North America*.

Only 4 months later, on April 27, 2017, Tom Deméré's paper announcing the discovery of "a 130,000-year-old archaeological site in southern California, USA," appeared in *Nature*.[57]

That’s about ten times older than Clovis, eight times older than Meadowcroft, and more than five times as old as Bluefish Caves.

The resulting furor was, in retrospect, inevitable.

5

MESSAGE FROM A MASTODON

THE SAN DIEGO NATURAL HISTORY Museum, affectionately known to locals as “The Nat,” is situated in the lush gardens of Balboa Park, which served as the venue for the 1915 Panama-California Exposition. Originally called “City Park,” it was renamed for the exposition in honor of Spanish-born Vasco Nuñez de Balboa (1475–

1519), who conducted a murderous exploratory raid across Panama and became the first European to see the Pacific Ocean.[1]

Balboa Park was repurposed after the closure of the exposition and now hosts seventeen museums and cultural institutions, among which The Nat stands out for its excellent collections and for its research expertise. As Santha and I strolled toward it on a bright Southern California morning, we couldn't help but reflect on the irony. In a museum in a park named after an arriviste European adventurer, we were about to be shown evidence that might speak to the truly vast antiquity of Native Americans in the lands that Europeans had stolen from them with fire and sword.

Rebecca Handelsman had asked us to meet her at The Nat's south entrance but we were early so we spent some time in the north atrium first, which is dominated by a looming skeleton cast of an Allosaur, a predatory dinosaur a bit like its more famous younger cousin Tyrannosaurus rex.

Scientists now agree that *T. rex* and the entire nonavian Dinosauria clade became extinct virtually overnight after a large asteroid or comet—more likely the latter[2]—hit the Gulf of Mexico around 65 million years ago. There is also no doubt that it was this sudden and cataclysmic eradication of dinosaurs from the planet that opened the way for the rapid, uncontested expansion into new niches of the hitherto-insignificant mammalian line. We humans today are among the descendants of those early mammals.

It's thought-provoking, isn't it, that cosmic impacts, whether by asteroids or by comets, can sometimes be of such magnitude that they drastically redirect the evolutionary path of life on earth. It has happened more than once, as we shall see. However, a cataclysm was **not** to blame 130,000 years ago when a lone mastodon, perhaps old or sick, died on a floodplain in Southern California and was subsequently scavenged, with the carcass then quite rapidly covered by, and entombed in, a deposit of silty, sandy, fine-grained

sediment.[3] There it remained undisturbed until November 1992, when the California Department of Transportation undertook highway construction on State Route 54 where San Diego borders National City.[4] It was routine practice for paleontologists from The Nat to monitor road-grading in Southern California in case any important fossil material was exposed, and Richard Cerutti, the monitor on duty at SR 54, spotted the fossilized bones and the tusk of what he at first thought was a mammoth.[5] He halted construction in the immediate vicinity until a proper excavation could be undertaken, and called in his boss, Dr. Tom Deméré, to lead it.[6]

Working together with a team of other researchers from The Nat, Cerutti and Deméré very quickly established that the fossilized remains, including many bones, both tusks, and several of the animal's teeth, belonged to a mastodon.[7] Like the mammoths, to which they were closely related, mastodons were swept from the face of the earth in the sudden and mysterious extinction of

America's Ice Age megafauna that took place around 12,800 years ago[8]—the same epoch exactly that saw the equally abrupt and equally mysterious disappearance of the Clovis culture.

From quite early on both Cerutti—after whom the site is now named—and Deméré were intrigued by what the excavation revealed: "Many of the bones were strangely fractured—or missing entirely. And there were several large stones, found in the same sediment layer as the bones and teeth, that appeared out of place. It looked like an archaeological site—like the preserved evidence of human activity."[9]

As well as the hefty rocks, unusual in fine-grained sediment, smaller pieces of sharply broken stone were found peppered throughout the Cerutti Mastodon Site: "This is not typically something you would see as a result of normal geological processes. The combination of stones … together with broken bones was

interesting and instigated speculation regarding the possibility of human activity at the site."[10]

At first intriguing, the implications of the data grew worrying when it began to become obvious that the site was *extremely* ancient, lying embedded in sediments "that had been deposited much earlier, during a period long before humans were thought to have arrived on the continent."[11] In the early 1990s, radiometric techniques capable of peering much further back into the past than the standard 50,000-year limit for carbon dating[12] were already available. Unfortunately, however, they had not yet attained sufficient accuracy to give scientists a high level of confidence in the age range suspected for the Cerutti Mastodon Site.[13]

The end result, after key finds were moved to The Nat where they were housed in the archives, was that the site was reburied and abandoned. Despite its anomalous character and suspected importance, it was just too explosive to put before the scrutiny of

hostile archaeologists while the dates remained uncertain. “If you claim something is that old you get blasted,” Cerutti said, referring to the Clovis First lobby, “which is why some archaeologists stopped working on sites like this. They didn’t want to get blasted.”[14]

It wasn’t that the Cerutti Mastodon Site was completely forgotten in the 25 years after the excavation stopped. It’s on record that Tom Deméré invited several other researchers to study the collection of key finds kept at The Nat, but none did so.[15]

Robson Bonnichsen, founder of the Center for the Study of the First Americans, warned him that “research that contributes to First American Studies is a game of hardball.”[16]

Months ran into years with no journal article on the site even drafted, let alone published, nor any further investigation undertaken. Cerutti, reportedly, was so disappointed that he stopped

going anywhere near State Route 54.[17] The whole exciting matter seemed to have fallen into stagnation.

It was not until 2014, more than two decades after the mastodon's discovery, that the tide decisively turned.[18] Built on improved understanding of processes that incorporate natural uranium and its decay products in fossil bone, a newly enhanced technique, known as 230 Th/U radiometric dating, was now available that could settle the age of the Cerutti deposit once and for all. Deméré therefore sent several of the mastodon bones to the US Geological Survey in Colorado, where geologist Jim Paces, using the updated and refined technique, established beyond reasonable doubt that the bones were buried 130,000 years ago.[19]

Now things began to move much more swiftly and it was time to reexamine the strange fractures on some of the bones that had been noticed back in 1992 and also to take a much closer look at the "out of place" stones and rocks found in the same sediment layer. To this

end the large and eclectic team of investigators who would eventually coauthor the landmark 2017 paper in *Nature* had already begun to form. Tom Deméré and Richard Cerutti were at the heart of it but other members included Dr. Steve Holen, curator of archaeology at the Denver Museum of Nature and Science, a specialist in the ancient uses of bone, Professor Daniel Fisher of the Department of Earth and Environmental Sciences, University of Michigan, Dr. Richard Fullagar of the Centre for Archaeological Science, University of Wollongong, and Dr. James Paces, Research Geologist at the US Geological Survey.[20]

It was a formidable team, their work was meticulous, and publication of the paper in *Nature* meant that archaeologists, just then cautiously emerging from the shadow of the Clovis First paradigm and adjusting themselves with difficulty to ages in the few tens of thousands of years for sites like Monte Verde, Meadowcroft, and Bluefish Caves, were now obliged to contemplate a site dating

back to the Eemian, the last interglacial period that extended from roughly 140,000 years ago down to about 120,000 years ago when the Pleistocene ice sheets began to expand again.[21]

At that point in 2017 it was still believed—though new evidence would soon substantially change the picture[22]—that anatomically modern humans had not even left their African homeland 140,000 years ago.

So how could they possibly have gotten to America before they'd even set out on the epic migrations by which they populated the world?

Having researched the Clovis First wars, and indeed the whole story of prehistoric archaeology in the United States from the late nineteenth century onward, I was just beginning to realize how staggering the implications of all this really were.

TOM DEMÉRÉ'S BONES AND STONES

THE NAT'S MAIN ATRIUM, WHERE the allosaur lurks, is accessed through the museum's north entrance, so just before 11 am Santha and I walked around the west side of the four-story building and presented ourselves at the south entrance. Beyond it was a second atrium, where we were encouraged to see that much of the space was devoted to a well-attended exhibition honoring the Cerutti Mastodon Site.

Out of the crowd, Rebecca Handelsman appeared. Tom Deméré would join us in a moment, she said. While we waited, she walked us over to a display case containing a mock-up of the sediment matrix from the site into which, point down and visible through the glass side of the case, was set a mastodon tusk. It was a little shorter than my arm, but it was obviously not complete as the upper part had been crudely broken off.

“This is the tusk that first attracted Richard Cerutti’s attention,” Rebecca explained, and before I could ask she added, “Its upper part was clipped off by the backhoe before he could stop the construction work.”

“Is the way it’s displayed here the way it was found?” I asked.

“Exactly that way.” She paused and waved. “Look, here’s Tom. He can tell you all about it.”

Weaving through the crowd was a man of pleasant aspect, spare and lean after a lifetime of fieldwork, wearing blue jeans and a brick-red shirt. From my background reading I knew he was 69 years old, though he appeared younger, and as we shook hands I saw he had penetrating gray eyes and an easy smile. Despite the risk to his reputation of even talking to a “pseudoscientist” like me, he seemed relaxed and friendly.

I launched straight in on the subject of the tusk. “What’s so special about it?” I asked Tom.

“The way it was set into the ground so it would have stood upright. The other one lay in a natural horizontal position beside it but this one was found like you see it in the display. Vertical. And that, to us, immediately looked like an anomaly.”

“Why?”

“One suggestion is that it was perhaps left there as a marker to come back to the site on a floodplain where everything is low relief. … I mean, who knows? I don’t know what sort of noncultural process would put a tusk vertical. I just don’t understand it.”

“So what you’re saying is that this looks like the result of human behavior? That it’s evidence of a deliberate, intelligent act?”

“It seems like that to me, and to many others—though I have to say our critics aren’t persuaded!”

I take this as my cue to ask Tom if he and his team had been surprised by the level of skeptical response to the *Nature* paper.

“I expected we’d have pushback,” he replied. “I just hoped it would have been more objective.”

“I suppose that in any profession and any career people get very emotionally involved …”

“Apparently! I’m not used to it from a paleontological standpoint. I mean, there’s passion in paleontology, too, but I’m not used to this sort of thing.”

I restrain myself from stating my view that “this sort of thing”—namely sniping, quibbling, misrepresentation, straw-man arguments, and vituperative ad hominem attacks leveled against anyone suggesting deep antiquity for the First Americans—is perfectly normal among archaeologists, and Santha and I gratefully accept Tom’s offer to talk us through the exhibits.

The anomalous tusk is just a small part of the story, he says. The stronger evidence comes from the mastodon’s fossilized bones, and from the rocks and stones of various sizes found distributed around the site.[23]

In humans the femur is the long bone of the thigh. At its upper end it has a ball-like protrusion, the femur head, that articulates with a socket in the pelvis and thus—wondrous nature!—enables us to walk. Though they stood on four legs it was no different for mastodons. Their femora were their upper hind limbs and, just like our femora, were surmounted by ball-like heads set into their pelvic sockets.

Tom draws our attention to the hefty, almost hemispherical detached heads of the mastodon's two femora, one with the rounded end down, the other with the rounded end up, sitting side by side in a display case. "This is how they were found when we excavated them," he says. And he points out a rock next to them that he calls an "anvil stone," adding that there wasn't much left of the femora themselves.

The significance of this is not immediately obvious to me so I ask Tom to elaborate.

“We suggest that this was a work station,[24] that both femora were hammered and broken here on the anvil stone and that the heads were detached and just set off to the side. It feels purposeful, like the tusk. It feels like humans were breaking these bones and it’s not only what’s *here* that’s important but also what’s not here. I mean, originally the femora from which these heads came were three feet in length and massively thick, yet we have just a few pieces of them …”

“So that would suggest, what, that the other pieces were taken away?”

“Yes. I mean, if it was equipment damage, you’d think you’d have the whole femur, right? So the fact that we have missing bits suggests to us that they were taken away, which fits this idea of human processing and transportation.”

In the next display case are the few large fragments of femur that were found at the site and multiple smaller flakes of bone that were

found lying around them.

“We interpret these as cone flakes,” Tom explains. “So when a bone is struck by a stone hammer you have damage on the impact side but also you have these flakes come out on the other side. At the point of impact you have a small hole and the exit point of that impact is a larger hole, and so these are flakes that are created by impacts.”

“I suppose one question would be—they took away bits of the femora, so why didn’t they take the tusks? Because the tusks, presumably, would have offered them useful materials, too?”

“But they’re also heavy,” Tom points out. “Whereas bones are relatively transportable. We have a pattern and the pattern begs for an explanation and what we feel fits that pattern is human transportation.”

“Did you find anything that was obviously a tool?”

“No.” Tom appears untroubled by what some critics regard as a fatal argument against his case.

I seek clarification. “So if we’re saying that humans did this, then we’re saying that they just took advantage of natural rocks and they used those as hammers and anvils basically?”[25]

“That’s one of the problems the skeptics have,” Tom admits cheerfully, “that there are no fashioned tools, no flaked stone tools, that there are no knives, no scrapers, no choppers.”

“But if I’m correct, you’re arguing that can be explained—because what these ancient humans were doing was extracting the marrow from the bones.[26] They were smashing up the bones. They didn’t particularly need fine tools for this.”

“That’s what we’re saying. We’re saying that this was a carcass. It wasn’t killed by these humans. It wasn’t even butchered by these humans. Most likely it was a carcass at an advanced stage of decomposition but it still had potential for the extraction of marrow from the bones.”

“Some critics have claimed it was the backhoe or the grader or other equipment used in the roadworks that broke the bones,” I point out.[27] “Others have argued that they were broken by being rolled against rocks carried along in river water when the surrounding sediment was laid down.”[28]

Tom raises an eyebrow. “Flow velocities that are strong enough to transport rocks like the big anvil stones are going to carry all the finer material much farther away. And yet we still have all that fine material at the site—small stones, small bone fragments, and obviously the associated silt and sand, too. So there really is a disjunct in terms of the hydrology.”

Addressing the suggestion of Cerutti skeptic Gary Haynes that the bones were broken by the roadmaking equipment in 1992,[29] Tom launches into a long and detailed exposition. It’s too technical to try the reader’s patience with here, but the takeaway is that a recently broken, fossilized bone has a very different appearance to a

bone broken when it was still fresh, within a short time of the animal's death. Experiments carried out by Deméré's colleague Steve Holen on the bones of a recently deceased African elephant showed that the characteristic spiral fractures that occur when you deliberately and systematically break fresh bone between a stone hammer and a stone anvil in no way resemble the fractures caused by the teeth of scavengers or predators and simply cannot occur in fossilized bones.[30] The presence of spiral fractures among the bones of the Cerutti mastodon therefore leads to the inevitable conclusion that they must have been broken 130,000 years ago, when they were fresh.[31]

Meanwhile, the presence of the hammer and anvil stones, and the evidence of how they were used to break the bones, makes it equally certain that humans were involved.[32]

"Because," I muse, "nothing else is going to smash up those bones and take out the marrow in that way."[33]

“That’s how we see it,” Tom confirms, “but I’m a scientist so I’m open to alternative explanations if they fit the data better than ours. And so it’s possible that we are wrong. But the evidence suggests to us that the only explanation for the taphonomic data at this site is that humans were responsible.”

Taphonomy is the study of the circumstances and processes of fossilization, a field that is generally better understood by paleontologists like Tom than by archaeologists.

IF YOU DON’T LOOK, YOU WON’T FIND

AFTER WE’VE COMPLETED OUR TOUR of the exhibits Tom takes us behind the scenes at the museum into areas off-limits to the public. As we ride the elevator up to the fourth floor I ask him if it was a struggle to get the *Nature* paper accepted.

“Well, it was a yearlong review process,” he replies, “rigorous, which you’d expect. I’ve tried publishing in *Nature* before. It’s not an easy journal to get into. So we were excited when they sent it out for review. That’s really the first hurdle—if it gets off the editor’s desk. Then we went through several rounds of revisions and re-review and re-revision but eventually it was accepted. So that was really exciting. It’s a terrific journal. And that’s the other thing, of course, it’s *Nature,* it’s not some third- or fourth-tier publication.”

“Absolutely top tier,” I agree as we step out of the elevator, “which is why it’s had such a huge impact. … I’ve been following the story of the peopling of the Americas and for a very long while there was extreme resistance around the so-called Clovis First model. I mean, that was it. It was almost dangerous career-wise to propose anything else.”

“Apparently,” Tom says.

“And then the evidence starts to come in and starts to just overwhelm that paradigm. We begin to open up to the possibility of

14,000, 15,000, 18,000, 25,000 years. And you can see the archaeological community kind of reluctantly embracing that, but then you come along with 130,000 years and that is a time bomb. Literally. It's a huge explosion."

Tom's expression is rueful. "It wasn't our intention. It was just where the evidence led us."

We enter The Nat's archives where the larger part of the Cerutti mastodon collection is permanently stored in a secure room in three huge cabinets. An Indiana Jones moment follows as Tom grabs a four-spoked steel wheel and spins it. Soundlessly the cabinets slide apart, avenues appear between them and then Tom is opening drawers and showing us mastodon bones and mastodon teeth and more pieces of rock and stone while Santha takes photographs and we continue talking.

The more I see, the more persuaded I am and the better I understand why *Nature* published Tom's paper. Despite the whines and quibbles of the skeptics, the evidence, once it's laid out in front

of you, once you actually look at the bones and stones, and once the technical details are properly considered, is absolutely solid and convincing.

"What's next?" I ask. "How do you take this further?"

"Well, of course one of the things we've said all along to our critics is that if you don't look in deposits of this age with the idea in mind that evidence of humans could be there, then you're not going to find anything. So we're suggesting, as a challenge, that people should start considering, should start to look in these deposits, as a way of testing this hypothesis. I know that's a lot of work, but there are unexamined deposits of this age throughout the US."

"It's also good science," I comment. "I mean, not just to rest on a paradigm but to try to look for other possibilities. Again I'm struck by the emotional nature of the reaction your paper has provoked. Some people are quite reasonable but others almost insultingly reject the whole thing."

“Dismissive! So … I guess the reaction I was looking for was healthy skepticism but with the idea of—well, let’s look at this now, let’s consider this and what the implications are and what sort of predictions can we make about testing this. … But that’s been a minority of the reactions. We’ve seen the extremes of both. Some people say this is pure garbage and others say this is the find of the century, but what we’re saying to everyone, really, is open your mind to the possibility that instead of the peopling of the Americas being associated with the last deglaciation event [the so-called Bølling-Allerød interstadial, dated from around 14,700 years ago to around 12,800 years ago[34]] what we should actually be looking at is the deglaciation event *before that*—between 140,000 and 120,000 years ago. You get the same sort of scenario with a land bridge and ice sheets retreating and you get that same sweet spot between really low sea levels and a blockage by ice sheets, and ice sheets gone and the flooding of the land bridge.”

“And yet,” I reflect, “so much else changes if you’re right. The peopling of the Americas becomes a whole different story—much more complicated.”

“Well,” Tom suggests, “it becomes richer. …”

“A much richer and longer story. So much so, in fact, that it’s really hard for a lot of archaeologists to swallow when they’re committed to a shorter time frame.” I hesitate before raising my next point: “Look … I know we’re not supposed to talk about this but your date of 130,000 years ago raises the possibility that it might have been Neanderthals who were at your site, or Denisovans, or anatomically modern humans—because they were all in the world at that time.”

With this comment I’ve taken us into territory I’d specifically agreed would be off-limits when my request for an interview was accepted, but Tom seems happy to express his point of view. “As a paleontologist,” he muses, “I ask the question—why *weren’t* there humans here earlier? I mean, we have dispersal of Eurasian animal

species into North America and dispersal of North American species into Eurasia at earlier times. So why *shouldn't* humans have been here as well?"

"And now it looks like they were."

"I'm certain of that from our evidence."

"Which raises the question of why in 150 years of professional study archaeologists have failed to find similar evidence."

"There's always the possibility," Tom offers, "that our site witnesses a failed colonization attempt. So you had this dispersal event. It didn't take, maybe because population size wasn't great enough, and they quite quickly died out—in which case they would have left almost no trace of their presence for archaeologists to find. Then thousands of years later there was a successful colonization by other migrants and naturally they dominate the archaeological record."

"It could be like that," I concede. "But on the other hand, it could be there were people here all along and they've just been invisible

to archaeology because of the particular way archaeology works and the particular things archaeology looks for.”

“You’d have to ask the archaeologists.” Tom shrugs. “But like I say, if you go to a place and you absolutely rule out in advance that humans were there 130,000 years ago, then you’re clearly not going to find evidence that they were. But if you go with an open mind”—an impish smile—“and dig deep enough in the right places, then who knows what you might turn up?”

6

MILLENNIA UNACCOUNTED FOR

WHEN TOM DEMÉRÉ DUG DEEP enough he turned up evidence of humans in North America 130,000 years ago that was sufficiently robust to make it through *Nature*'s rigorous peer-review process and into print in April 2017.

By then it was no longer news that the New World had been peopled long before Clovis. In chapter 4 we saw that Monte Verde,

Meadowcroft, and Bluefish Caves had already pushed back the date of the "First" Americans from around 13,000 years ago to at least 24,000 years ago. These, however, are only three sites among a growing number that suggest a vast, complex, textured antiquity for the human presence in the Americas across ages when hitherto we've been asked to picture an uninhabited wilderness awaiting the arrival of Man. No matter how long it exists, an uninhabited wilderness will not produce a civilization, and it would make no sense to look for one there. But with new evidence continuing to pour forth, it's increasingly obvious that humans were in the Americas not just for thousands of years before Clovis, but for tens of thousands of years—all the way back to the Cerutti Mastodon Site or earlier—and thus had vast expanses of time at their disposal to develop in any direction they chose.

Wanting to get a better feeling for the time-depth of this mystery leads me, through various contacts and connections, to a walk in the South Carolina woods. It's early November, a sunny yet cold

morning. There's a mulch of fallen leaves underfoot but the trees around us are still in foliage, mostly green with muted hints of autumnal reds and yellows beginning to mottle the canopy. I'm with Albert "Al" Goodyear, professor of archaeology at the University of South Carolina. Around 70 years of age, cheerful and in rubicund good health, he's wearing a South Carolina Gamecocks baseball cap, a navy check shirt, a tweed jacket, and tough outdoor pants tucked into his hiking boots to keep ticks carrying Lyme disease at bay. Our ramble takes us close to the Savannah River, which here forms the border between the states of South Carolina and Georgia.

Al is a world expert on the Clovis culture and back in 1998, having excavated an extensive Clovis layer in these woods, he dug deeper. In the end, what he found was evidence that humans had been here 50,000 years ago, not as old as the Cerutti mastodon by any means, but still a good 37,000 years before Clovis.

Unsurprisingly, Clovis Firsters were adamantly opposed and launched a campaign to discredit the find.[1]

The site is now called Topper, after David Topper, a local forester. In 1981 he spotted stone tools on the ground here.[2] He notified Al, who a couple of years later launched a comprehensive archaeological survey of the Savannah River watershed. As part of this larger project, excavations began at Topper in 1986 and it was immediately obvious that Native Americans had been coming here for many thousands of years. Obvious, too, was the reason why—a huge outcrop of easily accessible chert, the raw material of a form of flint ideal for making stone tools.[3]

Al suddenly stoops and picks up a small, almost translucent piece of reddish flint from the ground at our feet. It is recognizably a fragment of an arrowhead, with a notch near the base. Al confirms my guess that it's not Clovis. "It's a nice piece," he says. "It's been heat treated. It's probably about 8,000 years old."

He draws my attention to an area off the path relatively free of fallen leaves where there's quite a scatter of stones, mostly small broken pieces like this one. Al refers to them as "debitage" (the technical term for lithic debris and discards found at sites where stone tools and weapons were made). "Every flake on the ground was struck off by a human," he says, "and you can roughly tell the age. With strong coloration they're more recent, but if they're white and creamy, they're weathered and older."

Our next stop is the chert quarry, the reason so much was going on around Topper for so long. "For them this was like aluminum bauxite or iron ore for our culture," Al explains. "They didn't have jackhammers. They didn't have crowbars. They just had to work what they could get off the surface; maybe set a fire or something to push it out. So we call this 'Topper Chert'—the chert source for the Topper site."

"I find it amazing," I say, "that there are still broken points 8,000 years old just lying around on the surface whereas you have to

excavate to reach other materials from that horizon."

The earth is a dynamic place, Al explains, with multiple different processes of deposition and erosion under way at all times. You can make guesses based on style and weathering, but fragments of worked stone that have been in the open for an unknown period can't be dated by their archaeological context, because there is none. Carbon-dating organic materials in the sediment in which they were found won't work, either, because they were never entombed and preserved in sediment. And in fact no other objective and widely accepted method of dating can tell us how old they are. For these reasons archaeologists have to discount artifacts found on the surface when coming to any conclusions about the age of a site, even though the artifacts themselves may obviously be ancient. Their presence, however, does serve as a clue that much more might be awaiting discovery underground—which was precisely why Al followed up on David Topper's 1981 suggestion to take a look.

THERE'S A FIRST TIME FOR EVERYTHING

AFTER THEIR FIRST SEASON OF excavation at Topper in 1986, Al and his team methodically worked their way down during the next dozen years through the levels of what was turning out to be a *very* extensive, detailed, and time-consuming excavation. There were a number of archaeological "horizons" here, stacked one above the other in nice, easily datable layers of sediment, containing the leavings of different cultures at different, and increasingly more ancient, periods of the past. "We found pottery down to about 2,000 years ago," Al says. "Below that there was no pottery but there were plentiful artifacts from the period we call the Archaic. So we kept on going down and we got into the Early Archaic [around 8,000 to

10,000 years ago[4]]. They made these beautiful little notched points. And then below that, in 1998—bingo!—we found Clovis."

Topper is the only Clovis site to be excavated on the coastal plains of Georgia and the Carolinas.[5] As though by way of compensation, however, the Clovis level at Topper turned out to be so massive that the excavations there would not be complete until 2013. As he tells me about the treasure trove of more than 40,000 Clovis artifacts that he and his team uncovered, Al radiates excitement. And rightly so! It was a tremendous achievement that continues to enjoy renown among archaeologists.[6]

The same, however, cannot be said for what happened next. "So we got down to the bottom of the Clovis level," Al continues, "and then we all voted to go deeper." For the next half meter or so there was just sand and small gravels, devoid of any evidence of human presence, and then suddenly the excavators found themselves among artifacts again.

I ask if there was a particular aha moment.

Al laughs. “My aha was more of an uh-oh! Everybody else was going aha but they weren’t going to have to stand up at national conferences and defend what we’d found.”

“Which was evidence of the presence of humans in America tens of thousands of years before Clovis?”

“Exactly. After we’d done a thorough lab analysis we were certain we were dealing with artifacts.”

I ask when he began to feel the inevitable wrath of the Clovis First lobby.

“Immediately!” he replies. “It began with ‘we don’t believe in pre-Clovis. There’s no such thing as a pre-Clovis culture.’ Then I think when it was realized we’d made a strong case that many of our flake-tool artifacts had been produced by the ‘bend-break’ technique, and that the media were already onto the potential significance of what we’d found, the critics moved the goalposts

and said things like ‘Okay, we understand bend-breaks but we don’t know of an assemblage anywhere that has so many bend-breaks.’”[7]

But the key issue remained the antiquity of the site:

> The *New York Times* was here, CNN, they were all holding their stories until the dates came back. And I was thinking maybe they’ll come back at 20,000 years ago maybe even 25,000 years ago, and I’ll be out of here clean. This is going to be easy. But the date that came back was 50,000[8]—ancient beyond all imagining and right at the limits of radiocarbon.[9] Since then we have OSL-dated the deposit and those dates also came back in the range of 50,000.[10] So we’ve got it dated two ways, but still the skeptics keep saying that what we’ve found can’t be a human site and that our artifacts must be works of nature because they’re so different from the artifacts found at other sites. To which my response is: “Well … you’ve never dug a 50,000-year-old site in America, right? There’s a first time for everything.”

THEY UNDERSTOOD THE PROPERTIES OF

STONE

AFTER OUR PLEASANT HIKE WE'VE reached the main excavation area, a large rectangular pit about 12 feet deep, 40 feet wide, and around 60 feet long, where the majority of the archaeology trenches have been left open, in their original condition, and the entire area covered over with a roofed shelter. It's tastefully done, allowing in plenty of light but keeping out rain, and it's an education to see the stratigraphy through which Goodyear and his team dug to reach the controversial pre-Clovis levels.

Although Topper is located on land owned by a specialty chemicals company and not open for public access, Al does occasionally bring interested groups here to explain the site to them, and to this end signs have been set up identifying the different levels. My eyes are drawn immediately to one that says "Clovis Level: 13,000 years." Farther down another reads "Pleistocene

Alluvial Sands, 16,000–20,000 years." We step down again to the excavation floor and I see the thick band of clay where the pre-Clovis artifacts were found, labeled "Pleistocene Terrace: 20,000–50,000 years."

Off to the side, laid out as a display, is a row of three or four chunky fist-size rocks. Al picks one up. "The more abundant pre-Clovis artifacts are fashioned from chert cobbles like this," he tells me, "but they're no good to anybody as they are. They have to be cracked open first. You have to get rid of all this"—he indicates the rough, heavily patinated surface of the cobble—"to get at the stuff inside that can be turned into tools. In experiments we've thrown cobbles like that, slammed cobbles like that against each other, and nothing breaks."

"So what does break them?"

"When we put an 8-pound sledgehammer on them, that did the trick."

“But presumably the pre-Clovis people didn’t have 8-pound sledgehammers?”

Al shrugs. “Maybe they did it the way the Australian aborigines used to deal with big slabs of quartzite. They didn’t have sledgehammers, either. They would light a small fire underneath a face of the quartzite and they would wait for it to get hot enough till they heard a *tink,* and then they would pull a slab off. So I think you could use fire to prepare the cobble and then maybe break it apart. The point is once you break open a piece of flint like that then you can do anything you want with it. All of the interior surfaces are susceptible to flaking but the cobble in its raw form is not. So when our critics say that cobbles like these maybe got broken by rolling down the slope of the escarpment our answer is no.[11] What you need is heat or something like an eight-pound sledgehammer—and even then we had to hit them several times before they broke.”

“In other words, only humans could have done this.”

“Right. Human beings who understood the properties of the stone and how to work it. If nature can’t break it, it can’t make it.”

None of the pre-Clovis tools have been left at the excavation, of course, but before we set out for the site this morning Al showed me examples kept at the South Carolina Institute of Archaeology and Anthropology exhibit at its nearby regional campus in Allendale. What quickly became clear, which Al willingly concedes, was that they were, without exception, extremely simple and generally quite small, with unifacial flake tools such as burins and small blades predominating.[12] The vast majority of the burins, more than 1,000 of them,[13] were created by the distinctive flint-knapping technique known as “bend-break,”[14] whereby two edges are “broken off at a 90 degree angle to form a sharp sturdy tip that may have been used in the engraving of bone, antler or wood.”[15] Flint cores left over after large flakes had been struck off were also found in close

proximity to a large anvil stone.[16] It appears there were several, separate rock-chipping stations like this, resembling workstations.[17]

A VERY LONG TIME

THE EXTENSIVE EVIDENCE FROM THE pre-Clovis levels at Topper clearly does *not* document the handiwork of any kind of lost advanced civilization. What it speaks to me of instead, like the Cerutti Mastodon Site, is a far more complex and nuanced past for the peopling of the Americas than has hitherto been properly contemplated.

I don't propose here to give a blow-by-blow account of the fifty or so sites in the Americas, with more found every year, presently claimed to be of pre-Clovis antiquity.[18] Not all are of the same

quality. Some may not be archaeological sites at all, their supposed "artifacts" perhaps being "geofacts." Others are very strong.

A measure of discernment is therefore needed along this continuum, and what I observe is that archaeologists who are open to the notion of greater antiquity (these days the majority apart from a few die-hards) consider the most important pre-Clovis sites in North America in addition to Cerutti and Topper to include: Hueyatlaco, Mexico;[19] Old Crow and Bluefish Caves, Canada; Calico Mountain, California; Pendejo Cave, New Mexico; Tula Springs, Nevada; Meadowcroft Rockshelter, Pennsylvania; Cactus Hill, Virginia; Paisley Five Mile Point Caves, Oregon; Schaefer and Hebior Mammoth site, Wisconsin; Buttermilk Creek, Texas; and Saltville, Virginia.[20] In South America, Pedra Furada in Brazil, Monte Verde in Chile, Taima-taima in Venezuela, and Tibito in Colombia are likewise singled out as convincing pre-Clovis sites of special interest.[21] However, other than some anomalies, indeed

some deep mysteries, connected to a select few of these sites—which we'll come to in later chapters—most feature only rudimentary stone-working technologies similar to those of pre-Clovis Topper, although with definite evidence of increasing refinement and improved techniques between early pre-Clovis and late pre-Clovis.[22] Early or late, however, the importance of all these sites, as I view them, has nothing to do with the level of technology they manifest, whether judged to be "low" or "increasingly refined"—or whatever. They really matter in that they offer compelling proof of the enduring presence of humans *of some kind* in the Americas from perhaps as far back as 130,000 years ago until today.

That's a very long time. It might even be long enough—speaking entirely hypothetically, of course—for something that we would recognize as an advanced civilization to have emerged in the Americas alongside the hunter-gatherers, foragers, and scavengers

whose simple tools dominate the pre-Clovis horizons so far excavated.

But if such a civilization was indeed present somewhere on the American landmass, how has it escaped the notice of archaeologists up to now while the hunter-gatherers have not? And isn't it grasping at straws in the first place even to suggest that an advanced civilization could have coexisted with hunter-gatherers during the Ice Age?

PRECONCEPTIONS ARE BLINKERS

LET'S CALL TO MIND HOW things are in our own globally connected twenty-first century. Rio de Janeiro, Bogotá, and Lima are, by any standards, advanced technological cities; yet on the same continent, in the depths of the Amazon rainforest, uncontacted tribes of hunter-

gatherers remain at a "Stone Age" level of technology.[23] Likewise, in Africa, Johannesburg, Cape Town, and Windhoek are advanced technological cities, yet you can walk from them to the Kalahari desert where San bushmen, though well aware of the technological world, choose to continue a hunter-gatherer and still largely "Stone Age" way of life.

There are no purely logical grounds, therefore, that can rule out the possible coexistence of an advanced civilization with hunter-gatherers during the Ice Age.

Nor can this—at first sight absurd—possibility be ruled out on archaeological grounds. For more than half a century, as we've seen, American archaeology was so riddled with pre-formed opinions about how the past *should* look, and about the orderly, linear way in which civilizations *should* evolve, that it repeatedly missed, sidelined, and downright ignored evidence for *any* human presence at all prior to Clovis—until, at any rate, the mass of that

evidence became so overwhelming that it took the existing paradigm by storm.

We thus find ourselves in a place now where “Clovis First” can quite definitely be ruled out, despite the fading protests of a very few zealots still clinging on to that discredited fantasy.[24]

At the same time no new ruling paradigm, let alone consensus, has yet taken its place. Several are vying for the crown, though all remain rooted in the preconception that what they must explain is limited to the presence of relatively “simple” and “unsophisticated” hunter-gatherers in the Americas much earlier than had previously been supposed. None have factored in the possibility—they would be puzzled at the very thought—that a lost civilization might be part of the missing picture as well.

I’m reminded of Tom Deméré’s point: “If you go to a place and you absolutely rule out in advance that humans were there 130,000

years ago, then you're clearly not going to find evidence that they were."[25]

By the same reasoning, if we don't ever *look* for a lost civilization—because of a preconception that none could have existed—then we won't find one.

Fortunately, as we'll see in part 3, geneticists have developed sophisticated techniques for studying ancient DNA that have overturned entrenched thinking and opened completely new and unexpected avenues of inquiry.

PART III

GENES

The Mystery in DNA

7

SIBERIA

ACROSS BOTH SOUTH AND NORTH America DNA studies have revealed that at some point in the remote past, in some unknown location or locations, the ancestors of Native Americans interbred with an archaic—and now extinct—human species. Only recently discovered, and closely related to the more famous Neanderthals who also produced offspring with our ancestors, geneticists have

named this species “the Denisovans.” Insufficient sampling has been done to establish exact levels but the current estimate is that 0.13 to 0.17 percent of Native American DNA is of Denisovan origin[1]—with indications in the data that some indigenous groups, for example, the Piapoco of Colombia and Venezuela in South America and the Ojibwa of northeastern North America, can be expected to have higher levels of Denisovan DNA than others.[2]

We know about the Denisovans because of paradigm-busting discoveries at the eponymous Denisova Cave in a region of rugged highlands known as the Altai at the extreme south of the Russian Federal District of Siberia. Bordered by Mongolia, China, and Kazakhstan, and extending from the Ural Mountains in the west to the Kamchatka Peninsula and the federal district of Chukotka more that 5,000 kilometers to the east,[3] Siberia covers 13.1 million square kilometers—around 77 percent of the total geographical area of Russia. The Urals form a prominent part of the dividing line

between Europe and Asia. Kamchatka and Chukotka stand at the junction of the Pacific and Arctic Oceans, with Kamchatka's coast washed by the waters of the Bering Sea while Chukotka commands the Bering Strait.

Presently 82 kilometers wide between Cape Dezhnev in Chukotka and Alaska's Cape Prince of Wales, during the last Ice Age the Strait was drained by lowered sea levels and a tundra-covered land bridge—"Beringia"—connected Chukotka with Alaska. In other words, at that time, Europe, Asia, and the Americas were one continuous landmass. Should you have had the inclination and the stamina, there were certain periods when it would have been technically possible to walk from the Atlantic coast of what is now Spain, across western and eastern Europe to the Urals, through the Urals, through Siberia, across "Beringia," into Alaska and Canada, down through the "ice-free corridor" dividing the two primary sheets of the North American ice cap, into the United States and thence through Central America into South America as far as Tierra del Fuego before again encountering another ocean—a narrow one during the Ice Age when Antarctica was much larger.[4]

No investigation of the human story in the Americas, therefore, can ignore the role of Siberia as a crossroads in the migrations of our ancestors. Moreover, despite the fact that only a tiny fraction of its vast area has yet been sampled by archaeologists, we already know that anatomically modern humans were present in both western and Arctic Siberia at least as far back as 45,000 years ago.[5] We know, too, that DNA studies have revealed close genetic relationships between Native Americans and Siberians that speak to a deep and ancient connection.[6]

ANOMALIES IN THE DATA

WITH A FEW NOTABLE EXCEPTIONS,[7] it was the consensus view of archaeologists and anthropologists during the period of "Clovis

First" dominance that the Americas were settled exclusively by the overland route from Siberia via "Beringia" and southward through the ice-free corridor. Despite the collapse of "Clovis First," this remains the consensus view today; however, it has been finessed to accommodate the discovery of ever more sites in North and South America predating the opening of the ice-free corridor that therefore could not possibly have been settled by migration through it.[8] In addition, several subsequent studies have pointed out that for much of its duration long stretches of the supposed ice-free corridor would have been completely uninhabitable and thus most unpromising territory for a lengthy migration.[9]

To explain how migration might have taken place *at all,* therefore, and to account for the growing mass of archaeological and genetic evidence suggesting that humans had been in the Americas, isolated from Asia, for thousands of years before Clovis, two theories have recently found favor:

1. A “Beringian standstill” model (within which scholars continue to debate) whereby, in the simplest terms, having crossed the land bridge into Alaska perhaps as much as 30,000 years ago, the migrants found their southward progress blocked by the conjoined Cordilleran and Laurentide Ice Sheets. More or less simultaneously their return to Siberia was interdicted by the expansion of glaciers in Siberia’s Verkhoyansk Range and in Alaska’s Mackenzie River Valley.[10] Their descendants were therefore obliged to spend between 10,000 and 20,000 years stranded in Beringia before further climate shifts allowed them to spread south into the Americas. During this “incubation period” the now isolated population experienced certain genetic changes that would distinguish them from their northeast Asian ancestors at the level of DNA while at the same time confirming their close ancestral relatedness.[11]

2. A “coastal migration” theory whereby the first migrants

were boat people who crossed the narrow island-strewn neck of the North Pacific from northeast Asia into the Americas.[12] This coastal theory relies heavily on the so-called Kelp Highway migration model, which notes that the deglaciation of North America's Pacific Coast presented migrants with a region rich in kelp and other aquatic resources that could support their journeys. The coastal model also relies on the unarguable presence, though scarce, of early Paleolithic northwest American archaeological sites. Such coasting could have been undertaken at any time during lowered Ice Age sea levels, particularly when Beringia was exposed, could have been achieved with extremely simple technology such as rafts and coracles, and often would not have required the migrants to lose sight of land. Since we know that other ancient peoples migrated by sea as much as 65,000 years ago—for example, the crossing of the Timor Straits by the first migrants to Australia[13]—

there can be no objection in principle to the Americas being inhabited in the same way.

All this seems thoroughly reasonable and I have no doubt that both things happened. Island-hopping migrants in simple vessels suitable for short open-water crossings did indeed contribute significantly to the peopling of Americas. Similarly, one need look no further than Jacques Cinq-Mars's excavations demonstrating a human presence 24,000 years ago at Bluefish Caves in the Yukon to confirm that there is truth to the Beringian Standstill model, too.[14]

But are these revised and finessed models, currently very much in vogue with archaeologists, sufficient to explain all the complexities and anomalies in the data that science offers on the peopling of the Americas?

SERGEY AND OLGA

IN EARLY SEPTEMBER 2017, A couple of months before visiting Topper with Al Goodyear and a month before meeting Tom Deméré at The Nat in San Diego, Santha and I applied for Russian visas and declared our destination as Denisova Cave in the Altai.

The visas were expensive, the dauntingly opaque application forms took a great while to fill out, and in the general fog of bureaucratic time-wasting we began to wonder if we might have to postpone the trip until the spring of 2018 when the Siberian winter would have come and gone. Russia is more efficient than it looks, however, and we had our visas within a week.

Still, it was going to have to be a very quick visit with a big American journey planned from the end of September through until close to the end of November. There was no time for sightseeing, therefore, when we flew to Moscow on September 12, overnighted

at Sheremetyevo, and caught a connecting flight the next morning to Novosibirsk, the Siberian capital, a four-hour flight and four time zones east of Moscow.

After landing and collecting our bags Santha and I were met groundside by our local connection, Sergey Kurgin. I say “connection” because you have to have one if you’re going to travel in Russia. You can’t just get up and go. Some solid citizen, or business, or tour operator must take responsibility for you and officially invite you, and you must have a prearranged and preplanned itinerary to preapproved destinations or your visa won’t be issued—nor, if you somehow manage to slip through the net, will any hotel accommodate you on your route.

Sergey owns a small private travel business called Sibalp, and I'd contacted him on the internet to help set up the trip. Negotiations were complicated by the fact that he spoke no English—he was perplexed that I spoke no Russian—but various translators got involved and a deal was done. Sergey would drive us the 600

kilometers or so from Novosibirsk to Topolnoye, a township in the Altai, where we would stay with a local family while we visited the cave about 20 kilometers farther on. When we were done he would drive us back to Novosibirsk. He would arrange all accommodation en route and find us an interpreter, without whom we would be unable to speak to anyone. Joining Sergey at the airport to meet us, therefore, was Olga Votrina, the bilingual student from Novosibirsk State University who'd be interpreting for us.

Novosibirsk is a city of monotone drabness with an oppressive, regimented, Soviet-era feel to it. Olga was cheerful and nervous, wanting very much to be a good interpreter and guide. Thickset and grizzled, Sergey was an older man perhaps in his seventies, but solid, gruff, and strong. He owned a four-wheel-drive Mitsubishi minivan that had at some point been imported, used, from Japan and thus had its steering wheel on the wrong side. It was battered and creaky with a pronounced and disconcerting tug to the right, but as

he drove us through the geometric grid of Novosibirsk's streets, Sergey assured us it was up to the journey ahead.

Our hotel was in the academic quarter, a stone's throw from the Museum of the Peoples of Siberia. We spent the following morning viewing artifacts from Denisova Cave, and in the afternoon we set off on the long road south beneath leaden, wide-open skies across a remarkably flat landscape relieved by patches of muted color—black earth here, green field there, rank upon rank of hay bales set upon yellowing stubble marching toward the remote horizon. There was something lulling and dreamlike about the whole scene; I drifted off to sleep and when I awoke, darkness had fallen.

Sergey was downing a can of Red Bull and gripping the juddering wheel tightly as he weaved in and out of the surprisingly heavy Siberian traffic. Despite his disadvantageous position on the wrong side of the road he was doing well and by midnight we had two-thirds of the journey behind us and stopped to sleep in the town of Biysk.

We were back on the road again early the next morning—a much brighter and more cheerful day—and drove 65 kilometers farther south to Belokurikha, near which there were rumored to be some intriguing megaliths that Sergey believed he would be able to locate.[15] Quite different from the flatlands of the day before, we were now on the borders of the Altai Mountains, and spent the next several hours in the region of Mt. Mokhnataya[16] driving off-road through fields, circling likely looking hills covered in outcrops of granitic rocks, and asking farmers for directions. Eventually we met a man who knew a man who knew the couple, Vladimir Illych and Raisa Stepenov, both in their late sixties, who were said to have discovered the alleged megaliths. An hour later we were sharing bread and honey with them in their home in the village of Nizhnekamenka. This was followed, quaintly, by a tour of their vegetable garden and an invitation—how could we refuse?—to pick

raspberries and blackberries from the briars growing in abundance there.

It was early afternoon by the time Vladimir and Raisa, their daughter Svetlana, and their strapping young grandson Maxim all crammed into Sergey's groaning minivan with us. It seemed we had been in *roughly* the right place all morning, missing the site only by about half a mile. I was excited that we were finally going to see it, but as we set out again on the bumpy off-road drive Vladimir advised me to lower my expectations. In his opinion the media coverage had been much ado about nothing and the so-called megaliths he was about to show us were natural rock formations.

BEHIND THE HEADLINES

THE INFORMATION THAT THERE MIGHT be ancient megaliths here in the Altai, quite close to Denisova Cave, had come to me by way of a news item in the English-language edition of *The Siberian Times* published on May 8, 2017. The rather compelling headline reported the discovery of "Dragon and Griffin Megaliths" dating back to the end of the Ice Age.[17] "Archaeological researchers" named Aleksandr and Ruslan Peresyolkov were cited suggesting the enigmatic monuments were likely to be at least 12,000 years old but that precise dating would be impossible until "the culture that created them is identified."[18]

This is always a problem with monuments carved out of stone. The cutting and shaping of the stone itself cannot be directly dated. What is needed is an archaeological context in which the monument is set—preferably with carbon-datable organic materials in situ—and from these the age of the monument may then usually be inferred. Since there was no excavation at Mt. Mokhnataya,

however, no context had yet been established and the archaeological researchers were surely right that precise dating was presently impossible.

But what sort of "archaeological researchers" had even these provisional assessments reported in *The Siberian Times* come from? The news item gave no information about their credentials, nor could I find any online. The only clue, and not necessarily a reliable one, was in the comments section where Ruslan Peresyolkov was described as "a little-known web-designer and not an archaeologist (not even an amateur*)*."[19]

We humans are hardwired for pattern recognition, so it's not surprising that people all over the world frequently detect patterns in nature that they believe are the work of men but later, on closer examination by cooler and more experienced heads, prove to be entirely natural. This happens particularly often with eroded outcrops of rock, notably with certain types of granite that can crack

and weather in ways that seem obviously designed but in fact are not.

Archaeologists are trained to be skeptical of such simulacra and their default position will be that a rock is just a rock until there is really hard and compelling evidence that humans shaped it. Needless to say, if the rock in question ended up as a granite statue of Ramesses II, the context and the style, plus any hieroglyphs engraved upon it, would tell you all you need to know. Granite boulders that have been sitting on an unexcavated hillside in the Altai for unknown thousands of years, however, are an entirely different proposition, and I wasn't inclined to take any opinion of them on trust whether expressed by a fully qualified archaeologist or by a web designer or, for that matter, by Vladimir.

I was just curious, and literally "in the area"—so why not take a look for myself?

MESSAGES OF EARTH AND SKY

WE DROVE AS CLOSE AS possible to a rugged hill that I recognized from our earlier search, and trudged across a field to get to it. Raisa, who'd recently had hip replacement surgery, remained behind in the Mitsubishi, but Vladimir, Svetlana, and Maxim joined us—the young man kindly offering to carry Santha's weighty bag of cameras.

We reached the base of the hill and began a long clamber up a steep slope thickly carpeted with wild grasses, heather, and clinging brambles. Svetlana warned us that the area was infested with snakes. "Always look before you step," she said.

The afternoon was sunny and surprisingly warm and the sky an eggshell blue with a few soft white clouds up high. At one point, pausing for breath, I turned and looked back. Behind us, dotted with lower mounds and hills, was a patchwork quilt of greens and

yellows spread out for 20 miles across the floor of a glorious valley. It was through this valley and around these hills that we had spent the morning fruitlessly driving. Now, from this new vantage point, I saw it was bounded to the east by the humped, tawny backs of a distant range of mountains. I watched for a moment the shadows of the clouds painting their own patterns across the landscape, struck by the poignant, fleeting beauty of it all.

We resumed the climb, close now to our first objective—an outcrop of rough, deeply fissured and fractured natural granitic bedrock, visible because the otherwise omnipresent undergrowth could find no purchase on it. It was red-gray in color, about 50 meters in length and 20 wide, obviously an integral part of the hillside itself, sloping at the same steep angle and surmounted at its upper end by a dense cluster of large boulders. “The tail of the dragon,” said Vladimir skeptically, pointing to the downslope sector of the outcrop, “and the head”—he indicated the boulders.

At first I didn't get it, but once we'd climbed above the outcrop and could look back and down on it, a figure began to emerge. I could just about make sense of the tail and I could see the head clearly—but not as the head of a dragon. Viewed very slightly turned in profile from where I stood it seemed to me much more to resemble the head and the left eye of some great serpent.

I was, of course, already sensitized and preconditioned to recognize the form of a serpent in the outcrop, perhaps a little by Svetlana's warning of snakes in the grass in these parts but also, in an even more visceral way, by what I had learned at Serpent Mound in Ohio.

The "language" that Serpent Mound speaks is hard to understand from the technological-materialist point of view. That view, so dominant and widespread today, is one in which there is no such thing as "spirit" and the earth is simply dead "matter" to be mined, exploited, and consumed. By contrast the ancient people to whom Serpent Mound addressed itself in clear and ringing tones not only

knew that all things, both animate and inanimate, were imbued with spirit but also lived close to the earth and were in touch with Her rhythms and awake to the manifold messages and signals and ciphers by which She spoke to them.

Among these were perfectly "natural" features of the landscape through which, whether on account of their special appearance, or location, or alignment, or some other remarkable quality, the spirit of the earth could manifest wisdom, beauty, and teachings. Serpent Mound is one of these "Manitou," and we saw how the presence there of a natural serpentine ridge, with a natural serpentlike "head" oriented toward the setting point of the sun on the summer solstice, offered an epiphany to the ancients of the union of earth and Sky and was their cue to create the great effigy mound that now commands the site and still "swallows the sun" on the longest day of the year.

Nearly 3 months had passed since that summer solstice at Serpent Mound. Now the autumn equinox was just a few days away and I

was very far from America, yet in a part of the world directly linked to the migrations of the ancestors of the First Americans. I was therefore not averse in principle to considering the possibility that this peculiar formation in the Siberian Altai might be another "Earth Serpent," enhanced and embellished by human beings attentive to the ciphers of nature.

But it equally might be how Vladimir saw it—simply one of those accidents of nature that give the illusion of a human hand at work.

From the rough bearings I was able to take, though I offer no guarantees, it seemed to me that the serpent's head (I could not see it as a "dragon!") was oriented more or less due west and thus aligned to the setting point of the sun on both the spring and the autumn equinoxes. About 2 meters high and 4 meters long to the base of the neck, the head was massive and possessed a distinct brow ridge overlying the firmly defined left eye. Moving forward, I

saw the mouth was present, the jaws clearly demarcated and slightly ajar. There was a peculiar cleft in the front of the lower jaw.

The Altai "dragon/serpent." Graham Hancock at the left side of the "head" with his

hand on its lower left eyelid. PHOTO: SANTHA FAIIA. INSET: An enhanced image helps to explain why recent visitors, and the ancients before them, could imagine this natural rocky outcrop as the head of a dragon or serpent.

View of the right side of the same structure. PHOTO: SANTHA FAIIA.

Much of this, apart from that odd gap, was moderately serpentlike—but only on the left side of the serpent's head. When I scrambled around to view the right side it was as though I were suddenly looking at a completely different structure—not a serpent at all but a megalithic wall built from ten hefty eroded but precisely interlinked granite blocks. Somehow, whether by nature or by human beings, a structure had been created that appeared to be a wall on one side and the head of a serpent on the other.

If this was done by humans, I reasoned, then surely they would have wanted to make both sides look the same?

On the other hand, if it was done by nature, how were we to account for the blocks—and, even more difficult—the combination of blocks and serpent simulacrum?

Either on its own might be explained by weathering, but for both to occur together in such a limited area seemed much less likely.

A few hundred meters farther up the hill the so-called griffin shed no greater light on the problem. Another rocky outcrop was involved, this time oriented south, and into its granite face, 3 meters tall from the base of its neck and 5 meters wide from the tip of its beak to the crest on the back of its head, was carved the likeness of some immense, mythical, hook-beaked bird—hence its designation as a “griffin.”

The Altai "Griffin." Natural? Or modified by human hands? PHOTO: SANTHA FAIIA.

Natural? Or modified by human hands?

An argument against it being man-made is the way that the lower part of the beak is unfinished and unseparated from the surrounding bedrock. An argument in favor of human enhancements of the natural bedrock is that directly beneath the crest are three small alcoves set side by side step fashion. It is difficult to envisage how nature alone could have achieved this effect. And, besides, there are similar rock-hewn structures in the high Andes of South America that are indisputably man-made.

As we climbed back down the hill Vladimir remained unpersuaded but I wasn't so sure and a few days later, after returning to Novosibirsk where we had access to fast internet again, I searched for information about the region's snakes.

What I learned was that there are six species of serpent in the Altai and that the largest, most venomous and most respected of these by far is *Gloydius halys,* the Siberian pit viper.

In my opinion its clearly defined eyes, its brow ridges, the general shape of its head, and the way that its forked tongue is

sometimes thrust out, allowing it to hang down over the middle of its lower jaw creating the illusion of a cleft in that jaw are all rather closely mimicked by the granite features of the “Earth Serpent” we trudged up and down that hill in the Altai to inspect.

But does that make it a remnant of a megalithic Ice Age civilization? Or even a megalith at all? Certainly not! And the same goes for the “griffin.” Yet they are set in the heart of a region of mystery where previously held certitudes about humanity’s past have been shattered by the discoveries at Denisova Cave.

After saying our good-byes to Vladimir, Raisa, Svetlana, and Maxim, as evening fell over that sunny Siberian day, we drove the remaining 80 kilometers south to Topolnoye, only 20 kilometers from the cave. There another friendly, down-to-earth couple waited to welcome us into their home and feed us not only bread and honey but milk fresh from the cow and other delicious, nourishing things.

ENTERING THE DENISOVANS' SECRET VALLEY

OUR NEW HOSTS WERE PAPIN Asatryan, dark-haired and bearded, a migrant to the Altai from Armenia when it was still part of the former Soviet Union, and his blond Siberian wife, Elena Darenskikh. They were both in their fifties, their children long ago grown up and fled the nest. Like most of the other 1,100 inhabitants of Topolnoye they had regular jobs (Papin was a builder, Elena an accountant), but also owned a few cows and goats and a fair-sized vegetable garden, growing enough food, it seemed, to make them self-sufficient in most essentials.

That night over a fantastic dinner I joked that if twenty-first-century civilization were to collapse it would be people like Elena and Papin who would survive—not people like me who've never hunted a deer or grown a cabbage or milked a cow in their lives.

“Don’t worry,” Elena said, “we will save you!”

Some eye-watering local vodka was served, followed by a surprisingly comfortable night’s sleep on bunk beds and a sunlit morning greeted with an ample breakfast of eggs, bread, jams, fruit, coffee, and a jug of clotted cream. Then Sergey fired up the Mitsubishi and we were off along a reasonably good road, graded but not paved, running beside the Anui River, fast-flowing with patches of white water, reminding me of the trout streams my grandfather used to fish in the Scottish Highlands where I would sometimes accompany him when I was a child.

For Santha the landscape had more of a “Tolkienesque” quality. Guarded by distant, soaring peaks, we were in a deep, hidden valley, sometimes darkly shadowed and enclosed, sometimes opening out suddenly and unexpectedly into undulating hills and hummocks where coppices of mixed autumnal woodland overlooked bright meadows at the river’s edge.

For geologists the landform here is known as “karst,” a special type of topography created by the random dissolution over millions of years of soluble, usually sedimentary rocks—in this case limestone. Like all such landscapes it is characterized by extensive underground drainage systems, sinkholes, and caves, of which Denisova Cave is just one among many. Some are already known to contain ancient human remains and artifacts, but far more have not yet been properly studied, or studied at all, by archaeologists.[20]

Sergey pulled the Mitsubishi over and parked beneath a freshly minted National Monument sign, painted brown and helpfully labeled “Denisova Cave” in both Russian and English. Narrow here between low banks, the river was behind us, forested to its edge on the far side and with a saw-toothed range of mountains rising in the distance beyond. On our bank the trees had been cleared and in front of us, across the road, rising steeply for about 200 meters, was a grassy slope with a wooden stairway constructed on its upper part

leading to a rugged silver-gray karst cliff at the base of which gaped the black, almost square mouth of the cave.

It is, arguably, the most important archaeological site in the world, and yet not a soul was here, not a scientist, not a tourist, not even a guard. The whole place was eerily deserted, silent but for birdsong and the gentle rustle of wind through the grass, marking time under the sun as it had done for millennia, the guardian of many mysteries still.

Not that I minded the solitude and the peace.

What a privilege, I thought, what a gift, to be here on this bright morning and to have this ancient place to ourselves.

8

HALL OF RECORDS

DENISOVA CAVE HAS HAD ITS modern name only since the early nineteenth century when a monk, *Dionisij*—Dennis—lived, meditated, and left his graffiti here.[1] Before that the peoples of the Altai used to call it *Aju-Tasch,* which means "Bear Rock."[2] We have no idea how far that nomenclature may go back. It is certain, however, that Denisova Cave has been used and occupied by

various species of human for at least 280,000 years, making it an unrivaled archive—a sort of "hall of records"—of our largely unremembered ancestral story.[3] Since excavations began in 1977 it has proved to be a gift that just keeps on giving as archaeologists have systematically combed out the secrets buried in its successive occupation levels.[4]

At the risk of stating the obvious, in an archaeological excavation through orderly and undisturbed stratigraphy of the kind that Denisova Cave generally exhibits, the upper levels are the youngest and the lower levels get progressively older the deeper down you dig. This, for example, is why archaeologists divide the period they call the Paleolithic (the "Old Stone Age," dating from roughly 3 million years ago until 12,000 years ago) into the Lower, Middle, and Upper Paleolithic, with the latter conventionally dated between 50,000 and 12,000 years ago.[5]

The first two trenches at Denisova Cave, both 4 meters deep, sliced down through the more recent levels and exposed artifacts beneath them dating back to the Upper Paleolithic. In the decades that followed these deposits proved to be rich, various, and well preserved and the cave became recognized as a prehistoric locality of great importance.[6] At certain times during the past 280,000 years, not continuously but at intervals, it had been occupied by Neanderthals[7]—our extinct cousins with whom, as is now widely known, our ancestors interbred and from whom some extant modern human populations have inherited as much as 1–4 percent of their DNA.[8] Neanderthals were probably still using the cave 50,000 years ago. It wasn't until 2010, however, when proof emerged that a human species hitherto unrecognized by science had been present at Denisova—a species now also known to have interbred with our ancestors[9]—that the true global significance of this very obscure and remote place could begin to be fully realized.

The sensational news was broken first in the pages of *Nature* in December 2010 in a benchmark paper, "Genetic History of an Archaic Hominin Group from Denisova Cave in Siberia."[10] Coauthored by a stellar team of biomolecular engineers, geneticists, and biologists, with a couple of anthropologists and archaeologists thrown in for good measure, the paper announced the discovery of "the distal manual phalanx [i.e., the fingertip] of a juvenile hominin. … The phalanx was found in layer 11, which has been dated to 50,000 to 30,000 years ago. This layer contains microblades and body ornaments of polished stone typical of the 'Upper Palaeolithic industry' generally thought to be associated with modern humans."[11]

The big surprise, however, following a thorough analysis of DNA from the fingertip, was that it didn't belong to an anatomically modern human, nor a Neanderthal, but to a species that had diverged from the common lineage leading to anatomically modern

humans and Neanderthals about 1 million years ago. This previously unknown species was judged to be “a sister group to Neanderthals.”[12]

PALEO-CSI

DNA WAS ON MY MIND as we scrambled up to the cave because a good way to get to grips with the challenge of Denisova is to think of it as a crime scene—a very old, neglected, contaminated, and long-unrecognized crime scene from which the physical evidence is mostly gone apart from a few bones and teeth but where just enough genetic material might remain to help us figure out what happened there.

Nonetheless, from the moment I entered the cave it impressed itself upon me first, foremost, and forcefully, as a sacred and mystical space. It faced roughly west, overlooking the steep slope leading down to the Anui River, and that morning, as no doubt on many mornings over many thousands of years, the brightness of the day outside was reflected back through the entrance to illuminate the spacious "Main Gallery" within. Looking up I saw that a narrow natural window opened in the ceiling 10 meters above the gallery's west side close to the entrance, admitting more light but also no doubt in ancient times serving as a chimney.

I paused to breathe in the cave air, cool and moist, and to look around, struck by the way the bone-white walls, stained by lichen and covered in the ugly scrawl of recent graffiti that defaced almost every exposed surface, nonetheless gathered about themselves a kind of somber, ancient magnificence. The effect was enhanced by soaring archways leading into the smaller, more intimate East and South Galleries, the side chapels to this prehistoric basilica. I deploy

the analogy deliberately because the Denisova Cave system does have a “cathedral-like” feel about it, but I do not claim that it was ever used for religious or spiritual purposes. It may have been, but what the mass of archaeological evidence suggests is that for extraordinarily long periods of time it functioned as a “factory” or “workshop,” and that raw materials were brought here from far-off places to be worked and fashioned.

This became clear during the brief visit we made to the Museum of the Peoples of Siberia in Novosibirsk before setting out for Denisova Cave. Director Irina Salnikova apologized that there was so little for us to see in the Denisova room of her museum, explaining that much of the collection was away at exhibitions or in laboratories for further investigation. What she was able to show us, however, as well as many stone tools at various stages of refinement, from extremely primitive to sophisticated, were some unusual and beautiful pieces of jewelry including pendants featuring biconical drilled-out holes, cylindrical beads, a ring carved from

marble, a ring carved from mammoth ivory, and bone tubes perhaps designed to hold bone needles so they could be carried safely.[13]

Many of the materials employed had been brought considerable distances to the cave,[14] and now that I had reached the cave itself I could see all three of the galleries in which they had been found and inspect the open excavation trenches with little tacks and tags left in place to mark the various occupation levels. It was the gaping rectangular trench in the center of the Main Gallery, however—I would guess it was 5 meters deep, 4 meters long, and 3 meters wide—that most clearly displayed Denisova's amazing time machine of stratification, with distinct Ice Age occupation levels numbered from 9,[15] the youngest, all the way down to 20, the oldest, right at the bottom.

The excavation had descended farther here, down to Level 22, but the tacks and tags for these last two lower and older levels, visible on early reports of the progress of archaeology in the cave,[16] were

no longer present. According to studies undertaken by the excavators, man-made tools and artifacts were found in these two exceedingly ancient layers, dated by radiothermoluminescence to between 155,000 and 282,000 years ago.[17] "The lithic [stone] industries recovered from strata 22 and 21 are characterized by Levallois and parallel strategies of stone reduction; the tool kit is dominated by sidescrapers and notch-denticulate tools."[18]

I knew that artifacts together with Neanderthal and Denisovan remains had been recovered in the excavations in all three galleries across multiple Paleolithic occupation levels. That morning, however, my focus was particularly on Level 11 in the East Gallery, where certain unusual and distinctive tools and pieces of jewelery had been found.

Some of these had the archaeologists scratching their heads.

USUAL THINGS AND UNUSUAL THINGS

ANNOYINGLY, I HAD BEEN UNABLE to view these special items during my visit to the Museum of the Peoples of Siberia. But I knew from my research that they'd been retrieved, together with other more "normal" and "usual" objects, from an almost exclusively Denisovan occupation level of the East Gallery, nominated Level 11 by the archaeologists and dated to the Upper Paleolithic between 29,200 and 48,650 years ago.[19]

After the first Neanderthal skeletal remains were identified in Europe in the nineteenth century it was, for a very long while, one of the fundamental unquestioned assumptions of archaeology, a matter taken to be self-evidently true, that other "older," "less-evolved" human species never attained, or even in their wildest dreams could hope to aspire, to the same levels of cultural development as *Homo sapiens*. During more than a century of

subsequent analysis, and despite multiple additional discoveries, the Neanderthals continued to be depicted as nothing more than brutal, shambling, stupid subhumans—literally morons by comparison with ourselves.[20] Since the beginning of the second decade of the twenty-first century, however, and with increasing certainty as the evidence has become overwhelming, a new "image" of the Neanderthals as sensitive, intelligent, symbolic, and creative beings capable of advanced thought processes and technological innovations has taken root among archaeologists and is set to become the ruling paradigm.[21]

There should be no objection in principle, therefore, to the notion that the anatomically archaic Denisovans, a close genetic "sister species" to the Neanderthals, might have been capable of creating the sorts of tools and symbolic artifacts that, a few decades ago, would automatically have been assumed to be the work of anatomically modern humans.

Yet a difficulty arises.

Among the more "unusual" and "unique" items excavated from the Paleolithic deposits within the entrance zone of the East Gallery, specifically from Level 11.1,[22] were two broken pieces of a dark green chloritolite bracelet. It would have measured 27-millimeter wide and 9-millimeter thick when intact, with an original complete diameter of about 70 millimeters.[23] A detailed use-wear analysis of the bracelet was undertaken and revealed something odd: "This artifact was manufactured with the help of various technical methods of stone working **including those that are considered non-typical for the Paleolithic period. …** The bracelet demonstrates a high level of technological skills."[24]

In their detailed scientific analysis published in the journal *Archaeology, Ethnology and Anthropology of Eurasia,* A. P. Derevianko, M. V. Shunkov, and P. V. Volkov draw our attention, in particular, to "a hole drilled close to one of the edges" of the

bracelet and report that "drilling was carried out with a stable drill over the course of at least three stages. Judging by traces on the surface, the speed of drill running was considerable. Vibrations of the rotation axis of the drill are minor, and the drill made multiple rotations around its axis."[25]

They therefore conclude that the bracelet "constitutes unique evidence of an unexpectedly early employment of two-sided fast stationary drilling during the Early Upper Paleolithic."[26]

This is a big deal!

What the investigators are getting at is how peculiar and misplaced in time the bracelet seems to be. It is not simply that it shows the application of skills and technologies that are "unique for the Paleolithic"[27] (i.e., to state the matter plainly, skills and technologies that had never before been seen in a Paleolithic context in any excavation) but also that at least some of these skills and technologies, like "stationary drilling" with the use of a bow drill

that does not leave signs of drill vibration,[28] would not be seen again until the Neolithic many thousands of years later. The bracelet thus refutes what the authors describe as "a common assumption" held by archaeologists that "stone drilling originated during the Upper Paleolithic, but gained the features of a well-developed technology only during the Neolithic."[29]

So not only was this curious bracelet unequivocally the work of anatomically *archaic* human beings—the Denisovans—but also it testified to their mastery of advanced manufacturing techniques in the Upper Paleolithic, many millennia ahead of the earliest use of these techniques in the Neolithic by our own supposedly "advanced" species, *Homo sapiens*. Also made crystal clear was the realization that the Denisovans must have possessed the same kinds of artistic sensibility and self-awareness that we habitually associate only with our own kind—for there can be no doubt that very real, conscious, aware, and unmistakably *human* beings had interacted

with this bracelet at every stage of its conception, design, and manufacture, all the way through to its end use.[30]

Though the outward structure of Denisovan skulls might have been rather different from ours (predictable for a “sister species” to the Neanderthals), the sense of style, design, and personal adornment manifested in the bracelet seems completely modern, and archaeological reconstructions show it to have been a beautiful thing.

Reconstruction: The bracelet formed a torque, slipped sideways onto the wrist.

Its calculated diameter of just 70 millimeters when intact would have made it "practically impossible to put even the thinnest hand into it."[31] The most likely solution, however, since it undoubtedly *was* worn, is that this stone bracelet originally took the form of a *torque*—not fully circling the wrist, but with a section removed: "The tips of the bracelet were likely cone-shaped. Such a shape of the ends of the bracelet makes it easy to put on a hand tangentially. … Judging by the size of the artifact and the signs of extensive use-wear on the interior surface close to the end, the bracelet sat tightly on the wrist."[32]

These signs included evidence of "long contact of the interior surface with human skin"[33] and, more intimately, "remains of … fat from human skin"[34]—details that reach across the ages and forge a poignant sense of connection. Indeed it dilates the imagination to

contemplate the identity of the person this bracelet was originally made for, who certainly—given the estimated diameter—must have had slim and graceful wrists to wear it well. It is unlikely to have been the property of a child because of its rarity, artistry, and high value. As the investigators report: “It brightly shimmers in broad daylight and reveals a rich play of hunter green shades in the light of a campfire. The bracelet was hardly an everyday item. Fragile and elegant, it was apparently worn on very special occasions. Given the utmost rarity of the material and the thorough finish, the bracelet was a prestigious ornament attesting to its owner’s high status.”[35]

All in all, it seems a fair speculation that the slim-wristed person who owned this bracelet so many millennia ago was a woman. If so, whoever she was, whatever position of status she may have occupied, we can also guess that she had quite an eye for beauty and a whimsical sense of style. A nice additional detail of the bracelet is

that for a long while the drilled hole held a leather strap from which was suspended a pendant.[36] Though neither the pendant nor the strap has survived, their presence left unmistakable polish marks around the hole: “The polished area is limited suggesting that the pendant was rather heavy and caused a strictly set amplitude of oscillation of the strap. The outlines of the polished area suggest the ‘up’ and ‘down’ sides of the bracelet and allow us to assume that the bracelet was worn on the right arm.”[37]

Again, there is that sense of contact, of intimacy, as though we’re separated by no more than a hair’s breadth from this ancient human. It must be admitted, however, that even here we’re speculating. We might not be dealing with a single individual at all. The bracelet might instead have been a treasured heirloom, passed down from mother to daughter across many generations.

Whatever the truth is, it was eventually broken—not once but twice. On the first occasion the break was evidently accidental and

it must still have been cherished because it was carefully repaired, literally put back together again, with some effective but as yet unidentified form of glue.[38]

The second occasion was very different. It appears that the bracelet was deliberately smashed—we can only guess at the motive—"by a blow against a hard surface."[39]

THE EYE OF THE NEEDLE

THE LOWER PART OF LEVEL 11 dates back, as we've seen, to around 50,000 years ago, but the bracelet was found in the upper part, officially designated Level 11.1 and provisionally dated to the Upper Paleolithic about 30,000 years ago[40]—making it, because of

its “Neolithic” characteristics, roughly 20,000 years ahead of its time.[41]

The reader will understand, therefore, why it was one of the frustrations of our trip to Siberia in September 2017 that I was not able to see, nor Santha to photograph, this enigmatic, intriguing, and profoundly out-of-place bracelet. Under normal circumstances it is kept at the Museum of the Peoples of Siberia in Novosibirsk, but as luck would have it, during our short visit there, it was out of town—indeed not only out of town but out of Siberia, out of Russia, and in fact in Paris, where it had been on show in an exhibition. When I said we’d travel there to see it, Irina Salnikova told us that it was no longer on public view and was under investigation by “an international team of archaeologists.”[42]

Gone with it was a second anomalous object, an exquisite bone needle 7.6 centimeters in length, with a near-microscopic eye less than 1 millimeter in diameter drilled out at the head.[43] Slightly

curved like a modern surgical suture needle, it was excavated from the lower part of Level 11 (Level 11.2) of the central chamber in the summer season of 2016.[44] No detailed analysis had been published before my visit to Novosibirsk in September 2017, but there was some coverage in the Russian media when the discovery was announced. “It is the most unique find of this season, which can even be called sensational,” commented Professor Michael Shunkov, coauthor of the report on the bracelet and director of the Institute of Archaeology and Ethnography at the Russian Academy of Sciences.[45] His colleague Dr. Maxim Kozlikin added, “It’s the longest needle found in Denisova Cave. We have found needles before, but in younger archaeological layers.”[46]

He was referring specifically to the upper part of Level 11 where the bracelet was found and where, indeed, other smaller bone needles had also been excavated some years before.[47] They, too, have fine drilled-out eyes of the type more usually seen in Neolithic

than in Paleolithic deposits and provided grounds for skeptics to suggest that the Denisovan dates might have to be revised.[48] The idea was floated that both the bracelet and the small needles must in fact be of Neolithic provenance but had somehow migrated downward through the deposits to end up in Level 11.1—a stratum, from the skeptical point of view, in which they were "obviously" too advanced and "untypical" to belong.

What put an end to such speculation was the discovery of the longer, even finer and more technically perfect needle in 2016 and its location not in the upper—younger—part of Level 11 near its contact with Level 10, but instead in the much older lower part near its contact with Level 12. As we've seen, this lower part of Level 11 has been dated by accelerated mass spectrometry to around 50,000 years before the present[49] (although it may be more ancient, given that 50,000 years is the limit of radiocarbon dating).

By the second half of 2016, therefore, far from proving *younger* as some had expected, the mysterious artifacts of Denisova Cave were beginning to look like they were much, much older. This impression was confirmed in 2017 with a shocking announcement. Level 11 had been reassessed and its various internal strata reexamined and re-dated. The result of these new investigations was that the bracelet was no longer thought to be 30,000 years old as had originally been supposed, but 50,000 years old![50]

This exquisite bone needle 7.6 centimeters in length, with a near-microscopic eye less than 1 millimeter in diameter drilled out at the head, was found at Denisova Cave in 2016. PHOTO: INSTITUTE OF ARCHAEOLOGY AND ETHNOGRAPHY, SIBERIAN BRANCH, RUSSIAN ACADEMY OF SCIENCES.

A year later the *Siberian Times* published speculation that it might be even older—perhaps as much as "65,000 to 70,000 years old."[51]

Professor Shunkov did not welcome the speculation and pointed out that the great antiquity of the bracelet was already a matter of global significance, with immense implications for the way archaeologists look at the past.[52] He wasn't about to commit to an older date before all the relevant experts had reached consensus. "Until then, I will refrain from saying anything," he explained, adding that some data was "ambiguous" and required clarification. "If or when we agree, we will have to prepare a publication first."[53]

I could understand his caution. It was the same sort of caution, for pretty much the same reasons, as Tom Deméré had felt for so long

before presenting his controversial evidence and conclusions about the Cerutti Mastodon Site in the pages of *Nature*. With discoveries like these that have the potential to disrupt years of comfortable scientific consensus it pays to take care, and to prepare the ground, before you go public.

Persistent rumors filter out of paradigm-busting new discoveries concerning the Denisovans and "multiple big headlines coming up."[54] Meanwhile that beautiful and haunting cave in the Siberian Altai was still, as I write these words in 2018, the only place on earth where physical remains of Denisovans have been confirmed.[55] Those so far recovered are few in number, but such are the wonders of genetic science that the fingertip we spoke of earlier, some teeth, some additional bone fragments, and even some dust from the cave floor allow us to be quite sure that Denisovans were in occupation here at least as early as 170,000 years ago and that they came back 110,000 years ago and again around 50,000 years ago.[56]

Just like the Neanderthals who overlapped with our ancestors and interbred with them, so, too, the Denisovans overlapped the Neanderthals and interbred with them while also, again like the Neanderthals, interbreeding with anatomically modern humans. Viable offspring capable of reproduction resulted from all these liaisons and in August 2018, Denisova Cave obliged yet again by yielding up a bone fragment, more than 50,000 years old and in sufficiently good condition for genome sequencing. It turned out to have belonged to a female, about 13 years of age, who had a Neanderthal mother and a Denisovan father.[57]

In consequence of such liaisons it's a tricky business, tens of thousands of years later, to unravel the tangle of inheritance—with gene flow going in both directions between Neanderthals and Denisovans, Neanderthals and anatomically modern humans, and Denisovans and anatomically modern humans. Thus, where Denisovan DNA is found in human populations today (to give just a

single example of the sorts of difficulties faced), researchers must be alert to the possibility that it may not have come directly from a Denisovan but via a Neanderthal who had inherited DNA from an earlier tryst, perhaps dozens of generations back, between a Neanderthal and a Denisovan. Multiple other bewildering combinations are also possible, but using powerful computers geneticists are able to disentangle this cat's-cradle of intertwining genes and lives.

What now appears to be certain is that Neanderthals, *Homo sapiens* (as modern humans are classified taxonomically), and Denisovans all shared and descended from a common ancestor a million years or so ago.[58] The divergence of the Neanderthal line from the modern human line began at least 430,000 years ago, and perhaps as early as 765,000 years ago.[59] The divergence of the Neanderthal line from the Denisovan line occurred between 381,000 and 473,000 years ago.[60] Humans today are therefore, to a greater

or lesser degree, hybrids who have inherited genes from Neanderthals, Denisovans, and archaic *Homo sapiens*.

CROSSING THE LINE

THE MODERN INHABITANTS OF THE Altai are notable in that they have inherited virtually no Denisovan DNA at all—just a tiny fraction of a single percent.[61] By contrast, the human populations with the highest percentage of Denisovan DNA today are found among "geographically isolated New Guinean and Australian aborigines (in the range of 3–4%)."[62]

The first detailed investigation went a little higher than this in some cases, concluding, for example, that the archaic Denisovan population "contributed 4–6% of its genetic material to the genomes

of present-day Melanesians."[63] Subsequently, varying levels of Denisovan admixture have also been identified in populations from eastern Indonesia, the Philippines, Near and Remote Oceania, and the Americas.[64]

At first this widespread heritage seems strange in view of the location of Denisova Cave itself, deep in the Altai Mountains of southern Siberia, thousands of miles from New Guinea and Australia and even farther from the Americas. But tens of millennia have passed since the Denisovans occupied the cave, occasionally interbreeding with Neanderthals and anatomically modern humans and passing on their genes through all kinds of convoluted liaisons and migrations. We don't even know—on the most recent evidence it seems unlikely—that the cave was in any way central to the Denisovan range. It could equally well have been some peripheral outpost and indeed a number of scientists, notable among them Alan Cooper of the University of Adelaide and Christopher Stringer of

London's Natural History Museum, have made a case that the ancient Denisovan homeland was not in Siberia, or indeed in Asia at all, but instead lay "east of Wallace's Line."[65]

A deep oceanic trough, notorious for its fast-flowing currents, Wallace's Line divides Asia to its west from Australia to its east. It is rightly recognized as "one of the world's biggest biogeographic disjunctions"[66] and even during the lowered sea levels of the last Ice Age it would always have confronted migrants seeking to travel in either direction with a challenging maritime crossing. Any who undertook it must not only have been intrepid explorers of unknown realms and lands, but must also have possessed sufficient sailing and navigational skills to cross 30 kilometers of deep and sometimes turbulent open water between Bali and Lombok and, in the case of those who reached Papua New Guinea and Australia, to cross again the wider gulf of the Timor Straits—a formidable barrier of 90 kilometers of open water even at times of lowest sea level.

Coupled with the presence very far to the west in Siberia of Denisovan artifacts as well as Denisovan physical remains yielding a fully sequenced genome, the prominent Denisovan genetic signal among Australian aborigines and Melanesians cannot be explained without invoking these open-water crossings. In remote antiquity **somebody** was certainly undertaking them, and in the process spreading Denisovan genes. What we don't know yet is whether this gene flow was the result of direct interbreeding with the Denisovans themselves, or with some perhaps as yet unidentified people whose own heritage included a significant admixture of Denisovan genes.

We also don't know, and can only guess, at the location of the lost homeland of the Denisovans. Was it east of Wallace's Line, as Cooper and Stringer have argued? Or might it not just as well have been west of the Line on the plains and savannas of the exposed Sunda Shelf during the lowered sea levels of the last Ice Age when

the Malaysian peninsula and the islands of Sumatra, Java, and Borneo all formed one continuous landmass?[67]

Wherever it was, we know that 90 kilometers of open water was no barrier to these people—so why not farther? Why should they not even have crossed to the other side of the Pacific Ocean, making landfall in the Americas?

9

THE STRANGE AND MYSTERIOUS GENETIC HERITAGE OF NATIVE AMERICANS

BY NO MEANS FULLY UNDERSTOOD yet despite the best efforts of Darwin and his successors, the process we call "evolution" combines continuous change with continuous conservation in an

endless, swirling, bewildering dance of almost unbelievable intricacy. Zoom in at sufficiently high resolution to the DNA that choreographs this dance, however, and certain distinct and identifiable patterns begin to emerge. Because we are all members of a single human family, these patterns can then be used to establish the degree of relatedness—and thus to track the prehistoric migrations and liaisons—of seemingly disparate populations, even if they now reside on opposite sides of the globe. It's an endeavor of great technical complexity, deploying the latest advances in twenty-first-century genomic science, but it reveals previously hidden clues to the lost story of our past and—potentially—offers us a way out of the cultural amnesia that has erased tens of thousands of years of ancestral experiences from our collective memory.

This is not a genetics textbook and I don't want us to get bogged down in superfluous details, but here are some essentials we'll need going forward:

1. DNA is the genetic mechanism of inheritance, and the various types of DNA present in our cells have, as a result of scientific advances in the late twentieth and early twenty-first centuries, been subject to close investigation by a range of highly sophisticated techniques.[1] The results of these investigations have shed light on the degree of genetic relatedness that exists between individuals and, on a larger scale, between entire populations.[2]

2. Located in the fluid surrounding the nucleus of every cell in our bodies, mtDNA (mitochondrial DNA) is inherited by both males and females but is passed on to offspring only by females.[3] MtDNA can identify lines of descent from shared maternal, but not paternal, ancestors.[4] What geneticists like about mtDNA is its abundance, being present in multiple copies per cell, giving plenty of material to work with.[5]

3. The same cannot be said of nuclear DNA, inherited equally

from both parents, which has only two copies per cell but which encodes far more genetic information than mtDNA, allowing for far more robust and precise analyses of genetic relatedness.[6]

4. Within the cell nucleus are also located the chromosomes—segments of DNA that determine sex. If you have two X chromosomes you're a female; if you have an X and a Y you're male. Y-DNA is passed on only by males, thus facilitating the determination only of shared paternal ancestry, whereas X-DNA is inherited both through the maternal and paternal lines (since males and females both have X chromosomes) and can therefore be useful in isolating shared common ancestors along particular branches of inheritance.[7]

Is it important to understand the technicalities of DNA and DNA analysis as a means of establishing degrees of relatedness?

By all means dig deeper if you wish to, for this whole area of science is a fascinating one. But don't feel you have to—any more, for example, than you might feel you must master plumbing in order to run water from a tap, or the intricacies of mechanical engineering in order to drive a car, or medical studies before undergoing surgery.

In other words, genetics, unlike archaeology, is a hard science where the pronouncements of experts are based on facts, measurements, and replicable experimentation rather than inferences or preconceived opinions. Mistakes *are* made by geneticists, of course, and profound disagreements are routinely thrashed out between colleagues in the professional journals. By and large, however, just as we trust the engineer, or the plumber, or the surgeon for their specialized knowledge (even though they sometimes get things wrong), it will streamline matters greatly here if we trust the conclusions of specialists working with the latest high-tech tools at the cutting edge of analysis of ancient DNA.

TWO SITES, TWO FAMILIES, ONE HUMAN RACE

MIND YOU, "SHOTGUN SEQUENCING" OF long strands of DNA and other similarly esoteric technologies are not required for us to connect—at a basic human level—with the story of our ancestors. Particularly poignant examples of what I mean here are provided at two ancient sites, one in Siberia and one in Montana.

The Siberian site lies to the west of Lake Baikal near the village of Mal'ta on the banks of the Bolshaya Belaya River. As the crow flies (and a great deal farther on foot through winding valleys and over high passes) this is a location more than 1,000 kilometers east of Denisova Cave. Its reach back into the human past does not extend as far as Denisova's. Still it has been recognized for many years as the home of an Upper Paleolithic culture—archaeologists call it the Mal'ta-Buret culture—that left behind many beautiful and

mysterious works of art thought to be more than 20,000 years old.[8] Among them, done in bone and mammoth ivory, are carvings of elegant, long-necked water fowl and a collection of thirty human Venus figures that are "rare for Siberia but found at a number of Upper Paleolithic sites across western Eurasia."[9]

The primary excavations at Mal'ta, which took place between 1928 and 1958,[10] also uncovered two burials, both of young children interred with curious and beautiful grave goods including pendants, badges, and ornamental beads.[11] One of these children, a boy aged 3–4 years and now known to archaeologists as MA-I, had been buried beneath a stone slab, there was a Venus figurine beside him,[12] and he was "wearing an ivory diadem, a bead necklace and a bird-shaped pendant."[13] Traces of pigmentation were found on his bones,[14] which presently reside in the Hermitage State Museum in St. Petersburg, where a high-level international team of investigators, prominently featuring geneticists and evolutionary

biologists, paid them a visit in 2009. The scientists drilled out a number of small samples from the bones and subjected them to accelerator mass spectrometry C-14 dating that showed them, give or take a few hundred years, to be 24,000 years old.[15] Detailed tests were then carried out on the samples and in due course the investigators announced that they had successfully sequenced MA-1's entire genome—making it, when a full account of the investigation was published in *Nature* in 2014, "the oldest anatomically modern human genome reported to date."[16]

We'll consider the implications of what was found in context also of the second site I mentioned above—located in Montana. Known to archaeologists as the Anzick-1 burial site and dated to 12,600 years ago (which makes it 11,400 years younger than MA-1), it is also a child's grave—in this case a boy aged 1–2 years who was interred with more than 100 tools of stone and antler, all sprinkled with red ochre.[17]

One thing we see for sure in both these ancient burials, separated by thousands of miles and thousands of years, is that the human capacity to love and cherish family members, and to regret and mourn those who pass prematurely, is not diminished by time; indeed, we instantly recognize and identify with it today because we share it. For convenience we'll continue to use the rather dehumanizing archaeological labels "MA-1" and "Anzick-1" here. But let's not forget the bereaved parents and family members as they gathered around those gravesides 24,000 years ago in Siberia and 12,600 years ago in Montana, and the care and thought, the symbolism and emotions, the love and the aching sense of loss that went into the careful preparation of the graves and the choice and placing of the grave goods in both cases.

Across the ages and regardless of geography, in everything that really matters, it bears repeating that we are all members of a SINGLE human family—a family of intrepid adventurers who have been exploring the world in one form or another for the best part of

a million years.[18] In the course of this long odyssey we've moved so far apart, across oceans, over mountains, and to the opposite ends of jungles, deserts, and ice caps that we've forgotten how closely related we in fact are. In this sense, like the simple human message of the burials, the message of genetics also speaks to a hidden unity within our apparent diversity—and sometimes in ways that defy our expectations.

ANCIENT EUROPEAN GENES

FEW HAVE COMMENTED ON THE obvious cultural similarities in burial practices, but as to genetics, all authorities agree that MA-1 and Anzick-1 are closely related, sharing large sequences of DNA.[19] Anzick-1, however, "belonged to a population directly ancestral to

many contemporary Native Americans" and thus, unsurprisingly—despite his proximity to MA-1—is "more closely related to all indigenous American populations than to any other group."[20]

Just as it was for so long an article of faith that the Americas were peopled exclusively by migrations from Siberia across the Bering land bridge, so, too, it was held to be self-evident that those Siberian migrants must have been most closely related to *east* Asians.[21] What did the Bering land bridge *do,* after all, if not connect the far north*east* of Asia with the far north*west* of North America?

But a surprise awaited the investigative team led by Maanasa Raghavan of the Centre for GeoGenetics at Denmark's Natural History Museum and Pontus Skoglund of Harvard Medical School's Department of Genetics. Instead of confirming the anticipated connection to east Asia, MA-1's Y chromosome (the male sex chromosome) turned out to be "basal to modern-day **western** Eurasians."[22] We have mentioned the limitations of Y-chromosome

analysis already, so it is good—and raises the confidence level all around—that this unanticipated and potentially boat-rocking finding was subsequently confirmed with autosomal evidence[23] (the best kind of DNA evidence, derived from the nucleus of the cell). "MA-1," the investigators repeat and reemphasize, "is basal to modern-day western Eurasians … with no close affinity to east Asians."[24]

Moreover—and most intriguingly—the investigators discovered that MA-1 also stands "near the root of most Native American lineages,"[25] and "14 to 38% of Native American ancestry may originate through gene flow from this ancient population [the population from which MA-1 stemmed]. This is likely to have occurred after the divergence of Native American ancestors from east Asian ancestors, but before the diversification of Native American populations in the New World."[26]

The final link in the chain of evidence emerged when MA-1's mitochondrial genome was sequenced, revealing the Siberian infant

to be a member of "haplogroup U, which has also been found at high frequency among Upper Paleolithic and Mesolithic European hunter-gatherers."[27]

"Our result," the investigators conclude, "therefore suggests a connection between pre-agricultural Europe and Upper Paleolithic Siberia."[28]

A genetic consequence of this previously unsuspected European/Siberian nexus, since as much as 38 percent of Native American ancestry is attributable to gene flow from MA-1's people, is that Native American DNA carries a strong and very ancient "European" signal.[29]

HIDDEN SOUTH AMERICAN ORIGINS OF CLOVIS REVEALED

SOMETHING I HAVEN'T MENTIONED YET—the ochre-dusted stone and antler tools found buried with Anzick-1 were unmistakably Clovis artifacts.[30]

There are two reasons why this "Clovis connection" is particularly noteworthy and relevant to our quest.

First, the Anzick-1 burial was originally dated to around 12,600 years ago—or, more exactly, within the limits of resolution of C-14, to between 12,707 and 12,556 years ago.[31] This suggested that the grave was dug and the grave goods placed with the remains of the deceased infant a century or two **after** the abrupt and mysterious disappearance of the Clovis culture from the archaeological record around 12,800 years ago.

That disappearance testifies to a sudden cessation of previously widespread cultural activities, suggestive of interruption by some far-reaching cataclysmic event. What it does **not** mean, however, is that every member of the Clovis population died out overnight.

Even if most did there would, undoubtedly, have been survivors—small groups coalescing into scattered, wandering tribes, whose members might have looked back on the achievements of their ancestors with awe.

One possibility that has been considered is that Anzick-1 himself may have belonged to just such a remnant group. This possibility was raised after a small but significant discrepancy was found between the dates of Anzick-1's bones and the dates of certain artifacts buried with him.

The artifacts, known as "foreshafts," are specially cut, shaped, and hollowed sections of red deer antler, each designed to hold a projectile point at one end and to clamp onto the tip of a wooden spear shaft at the other. As we've seen, Anzick-1's bones were initially dated between 12,707 and 12,556 years ago. The antler foreshafts among his grave goods are a century or two **older** than that—in the range of 12,800 to 13,000 years ago[32]—"a much more

typical and acceptable age for Clovis," as archaeologist Stuart J. Fiedel observes, than the "age attributed to the infant's bones."[33]

To resolve the discrepancy, Fiedel offers a simple but insightful reading of the evidence. The discordant data, he speculates in a paper published in *Quaternary International* in June 2017, would be reconciled if "the foreshafts were 100 to 200-year-old antique heirlooms interred with the infant by the very last Clovis folks in the region."[34]

Alternatively he suggests that due to contamination of the sample, "the infant bone dates may be slightly too young."[35]

A number of other researchers seized on the apparent temporal discrepancy to discount Anzick-1 as a Clovis individual,[36] but Fiedel's comment on contamination proved prescient. In June 2018, a year after his *Quaternary International* paper, a new study by scientists at the Oxford Radiocarbon Accelerator Unit was published in *Proceedings of the National Academy of Sciences*

(*PNAS*) under the headline "Reassessing the Chronology of the Archaeological Site of Anzick."[37] The study reminds us that "in radiocarbon dating, contamination can be a major source of error" but adds that "methodological improvements" since the original dating work at Anzick was done "have seen a significant effect in dating accuracy and reliability."[38] After applying these new methods the study concludes, contrary to previous findings, that "Anzick-1 is temporally coeval with the dated antler rods. This implies that the individual is indeed temporally associated with the Clovis assemblage."[39]

We'll return to the mysterious end of the Clovis culture in later chapters. Meanwhile there's a second reason why Anzick-1's "Clovis connection" is of immediate relevance to our quest here—which is that although Clovis did, at the limits of its range, extend into some northern areas of South America, its heartland was in North America.[40] Intuitively, therefore, we would expect the

Montana infant, a Clovis individual, to be much more closely related to Native North Americans than to Native South Americans. Further investigations, however, while reconfirming that Anzick-1's genome had a greater affinity to **all** Native Americans than to any extant Eurasian population,[41] revealed it to be much more closely related to native **South** Americans than to Native North Americans![42]

Morten Rasmussen of Denmark's Centre for GeoGenetics and Pontus Skoglund of the Department of Genetics at Harvard Medical School seek to explain the anomaly by arguing that the ancestors of the First Americans must have split into two separate groups—they label them "the NA and SA lineages"—before entering the Americas, "with the Anzick-1 individual belonging to the SA lineage."[43]

That seems reasonable enough on the face of things until we stop to consider the spectacle of these two groups, sharing common ancestry but already genetically distinct, racing into the Americas

on parallel and nonconverging tracks, one heading straight for South America, the other staying in North America—yet never, throughout this process, making sufficiently enduring contact with one another to compromise their separateness or leave a trace in the genetic record. This seems to deny human nature and simply doesn't make sense in lots of ways even before we get to the fact that Anzick-1, the most ancient representative of the "SA lineage" so far studied by science,[44] wasn't found anywhere near South America but in North America and, indeed, in Montana, which, 12,600 years ago, was about as far north as you could get before you hit the great Cordilleran ice sheet.

A PECULIAR SIGNAL FROM DOWN UNDER

IN SUMMARY, ANZICK-1 IS A paradox clothed in a conundrum, wrapped up in a mystery—an individual in a North American Clovis culture grave who is closely related to Native South Americans, to the Siberian Mal'ta population, and to ancient western Europeans. Because the South American lineage to which he belonged shared a common ancestor with the North American lineage, the geneticists found nothing in the data to challenge their long-held view that the settlement of the Americas, both North and South, had been accomplished from northeast Asia by a single founding population—albeit one that divided itself into two streams.

A year later, however, in September 2015, Pontus Skoglund, his senior colleague Professor David Reich of the Department of Genetics at Harvard Medical School, and other leading experts in the field announced in the pages of *Nature* that they had found new evidence in South America, and specifically in the Amazon rainforest, that called for a rethink:

> Here we analyse genome-wide data to show that **some Amazonian Native Americans descend partly from a Native American founding population that carried ancestry more closely related to indigenous Australians, New Guineans and Andaman Islanders than to any present-day Eurasians or Native Americans.** This signature is not present to the same extent, or at all, in present-day Northern and Central Americans or in a 12,600-year-old Clovis-associated genome, suggesting a more diverse set of founding populations of the Americas than previously accepted.[45]

We've already done the groundwork on the "12,600-year-old Clovis-associated genome" the researchers speak of here. The reference, of course, is to Anzick-1, that paradoxical infant, swaddled in mystery, who we know was more closely related to Native South Americans than to Native North Americans. What the new study adds to this is that there was a previously unsuspected structure within the SA lineage, including at least one sub-lineage—to which Anzick-1 did **not** belong—that was more closely related to Melanesian Papuans and Australian Aborigines than to **any** extant Native American population.

South Americans, notably in the Amazon rainforest, share ancestry with Australasian and Melanesian populations not seen in Mesoamericans or North Americans. (After *Nature,* "Genetic Evidence for Two Founding Populations of the Americas," September 3, 2015).

There is no trace of this lineage in most modern Native Americans, and—it's worth driving this point home—no trace either in the ancestral population represented by Anzick-1. Nevertheless, the investigators continued to be confronted by a peculiar and distinctive "Australasian signal," showing genetic relatedness to "indigenous groups in Australia, Melanesia, and island Southeast Asia,"[46] calling attention to itself in the genomes of Native Americans from the heart of the Amazon jungle. The Surui and Karitiana tribes, speaking languages belonging to the Tupi family, proved to have a peculiarly close connection to Australasians, as did the Ge-speaking Xavante of the central Brazilian plateau.[47]

Such a signal was completely unexpected given the vast distance between Australasia and the Amazon and the absence of any overland DNA trail. Skoglund and Reich therefore subjected it to particularly rigorous testing, applying four different methods of

statistical analysis to compare the genomes of 30 Central and South American peoples with the genomes of 197 other populations from around the world.[48] "We spent a really long time trying to make this result go away," Skoglund explained, "but it just got stronger."[49]

In the end "a statistically clear signal linking Native Americans in the Amazonian region of Brazil to present-day Australo-Melanesians and Andaman Islanders" was confirmed.[50]

"It's incredibly surprising," commented David Reich. "There's a strong working model in archaeology and genetics, of which I have been a proponent, that most Native Americans today extend from a single pulse of expansion south of the ice sheets—and that's wrong. We missed something very important in the original data."[51]

What was missed, Reich and Skoglund argue, was nothing less than the fingerprints of a lost lineage—a **second** founding population of the Americas. It is very old,[52] in their view, and almost all traces of it have been overwritten almost everywhere by

later genetic "noise." That we can still detect it at all among isolated peoples in the Amazon is probably because their genomes have been subject to less admixture and introgression than most.

The investigators have given their "putative ancient Native American lineage" a name: "Population Y" after *Ypykuéra,* which means "ancestor" in the Tupi language family."[53]

And they come to a very clear, if tantalizing, conclusion: "A Population Y that had ancestry from a lineage more closely related to present-day Australasians than to present-day East Asians and Siberians likely contributed to the DNA of Native Americans from Amazonia and the Central Brazilian Plateau."[54]

But how, when, and where did this contribution occur?

One possibility that Skoglund and Reich consider is that the patterns of genomic variation of present-day Amazonians could be explained if a large proportion—up to 85 percent—of their ancestry derived "from a population that existed in a substructured northeast

Asia, and was similar to the main lineage that gave rise to other Native Americans while retaining more Australasian affinity."[55]

In other words, congregating in that original northeast Asian—that is, Siberian—melting pot we are now being asked to envisage not only people with European genes and people with east Asian genes, but also people with Australasian genes. Neanderthals were part of the mix, too, interbreeding vigorously with *Homo sapiens,* and there were people carrying Denisovan genes and of course the Denisovans themselves. We're asked to see these groups as essentially divided and separate from one another—despite the obvious evidence of their liaisons—and we're asked to accept that they remained divided and separate, already conveniently prearranging themselves into what would become the "NA" and "SA" lineages, as they trekked across the Bering land bridge.

The endlessly flexible boundaries of such an improbable model seem perfectly adapted to explain away any potentially boat-rocking

data. It's not surprising, therefore, to find a hermetically sealed and hitherto invisible "Australasian lineage" being tacked on to the mongrel pedigree of the First Americans as soon as the inconvenient presence of Australasian genes in the midst of the Amazon jungle needed to be explained and normalized. Nor is it surprising to see the hypothetical "Population Y," identified as the bearer of those genes, depicted as heading straight to South America to oblige without leaving any of its DNA along the way among the North American populations with which it would surely have had to mingle.

Perhaps because of the impracticality of some of these ideas, Skoglund and Reich conclude with an offbeat alternative. "The patterns of genomic variation of present-day Amazonians," they point out, seemingly off the cuff, could also be explained "by as little as 2% admixture from an Australasian-related population, that would thus have penetrated deep inside the Americas without

mixing with the main ancestral lineage of present-day Native Americans."[56]

In other words, on this view, what has been preserved in those isolated, unadulterated Amazonian genomes that speaks to an ancient connection with Australasia might not be the traces of a full-scale *migration* but something more like a one-off settlement by a relatively small group.

In the next chapter we'll consider the profound implications of this scenario for our understanding of American prehistory.

10

A SIGNAL FROM THE DREAMTIME?

SKOGLUND AND REICH'S PAPER IN *Nature* reporting the presence of Australasian genes in certain populations in the Amazon is titled "Genetic Evidence for Two Founding Populations of the

Americas."[1] It was first published online on July 21, 2015 (ahead of the print edition, which appeared on September 3, 2015).

On precisely the same day (before appearing in print in the journal *Science* on August 21, 2015), another team of researchers, led by Maanasa Raghavan and Eske Willerslev, both of the Centre for GeoGenetics at the University of Copenhagen, published the online version of a paper titled "Genomic Evidence for the Pleistocene and Recent Population History of Native Americans."[2] Unlike Skoglund and Reich, who see two founder populations in the data, Raghavan and Willerslev see only one, arriving in "a single migration wave from Siberia no earlier than 23 thousand years ago and after no more than an 8000-year isolation period in Beringia."[3]

Raghavan and Willerslev several times drive home the point that the data they present "are consistent with a single initial migration of all Native Americans"[4] along a route from Siberia via Beringia and that "from that single migration, there was a diversification of

ancestral Native Americans leading to the formation of northern and southern branches."[5]

This is all very neat, tidy, and in certain ways reassuring for those American archaeologists—a majority—still reeling from posttraumatic shock following the collapse of the Clovis First dogma. Of course they would have to be in a state of rigid and unyielding denial to continue to shrug off the perfect storm of evidence from genetics and from sites like Topper, Cactus Hill, and Monte Verde that relegated Clovis to the trash can of history. But at least their favored route—from Siberia, across the Bering land bridge—remains intact and not only that, but Raghavan and Willerslev's paper also endorses the currently fashionable "Beringian standstill" model.

If only the geneticists had ended their paper there, archaeological contentment with it would have been complete. However, because they are good scientists, Raghavan and Willerslev—just like

Skoglund and Reich—could not ignore the persistent "Australasian signal" that kept cropping up in the data:

> We found that some American populations—including the Aleutian Islanders, Surui, and Athabascans—are closer to Australo-Melanesians as compared with other Native Americans, such as North American Ojibwa, Cree, and Algonquin and the South American Purepecha, Arhuaco, and Wayuu. The Surui are, in fact, one of the closest Native American populations to East Asians and Australo-Melanesians, the latter including Papuans, non-Papuan Melanesians, Solomon Islanders, and South East Asian hunter-gatherers such as Aeta.[6]

As we've seen in previous chapters, the archaeological mainstream is an intensely conservative and territorial scholarly community, resistant to change, whose deeply embedded prejudices deny that our "Stone Age" ancestors could have possessed anything other than the most primitive and rudimentary technological abilities. For orthodox thinkers, it is literally **inconceivable** that prehistoric settlers from the general vicinity of Papua New Guinea could have crossed the entire width of the Pacific Ocean to South

America, and thence made their way to the Amazon to leave evidence of their presence in the DNA of people still living there today.

What's paradoxical about this position is that—admittedly after a hard-fought struggle—no one in the mainstream now would seriously dispute that our ancient hominid ancestors were capable of undertaking successful open-water voyages to colonize new lands.[7] We've seen how the presence of Denisovan DNA on both sides of the Timor Straits and both east and west of the Wallace Line confirms that migrations across stretches of open water up to 90 kilometers wide were indeed taking place at least 60,000 years ago—a position already supported by a mass of other evidence.[8]

Likewise, and significantly earlier, bones and artifacts of *Homo erectus* dated to 800,000 years before the present have been found on the Indonesian islands of Flores and Timor, again making open-

water crossings by these supposed "subhumans" a certainty even during periods of lowered sea level.[9]

All of this has long ago been conceded. Despite the passage of close to a million years since *Homo erectus* first sailed to Flores, however, what archaeology does **not** concede is that the human species could have developed and refined those early nautical skills to the extent of being able to cross a vast ocean like the Pacific or the Atlantic from one side to the other. In the case of the former, extensive transoceanic journeys are not believed to have been undertaken until about 3,500 years ago, during the so-called Polynesian expansion.[10] And the mainstream historical view is that the Atlantic was not successfully navigated until 1492—the year in which, as the schoolyard mnemonic has it, "Columbus sailed the ocean blue."

Indeed, the notion that long transoceanic voyages were a technological **impossibility** during the Stone Age remains one of

the central structural elements of the dominant reference frame of archaeology[11]—a reference frame that geneticists see no reason not to respect and deploy when interpreting their own data. Since that reference frame rules out, a priori, the option of a direct ocean crossing between Australasia and South America during the Paleolithic and instead is adamant that all settlement came via northeast Asia, geneticists tend to approach the data from that perspective.

This is the case with Raghavan and Willerslev. First, as we've seen, they concede the presence within the data of "a distant Old-World signal related to Australo-Melanesians and East Asians in some Native Americans."[12] But, second, they go on to downplay the implications of this with the following interpretation:

> The widely scattered and differential affinity of Native Americans to the Australo-Melanesians, ranging from a strong signal in the Surui to a much weaker signal in northern Amerindians such as Ojibwa, points to this gene flow occurring **after** the initial peopling by Native American ancestors.[13]

Here's how they arrive at this interpretation of the data:

1. They trace the source of the strong Australasian signal in the Amazon to "gene flow"—the transfer of genetic variation from one population to another.[14]
2. They propose that this gene flow reached Amazonian peoples such as the Surui from northern Amerindian populations such as the Aleutian Islanders and the Athabascans, and they appear to favor particularly a "route via the Aleutian Islanders," since the latter "were previously found to be closely related to the Inuit who have a relatively greater affinity to East Asians, Oceanians, and Denisovans than Native Americans."[15] They hypothesize that the "complex genetic history" of the Aleutian Islanders perhaps "included input from a population related to Australo-Melanesians through an East Asian continental route [i.e., from Siberia across the Bering land bridge], and this

> genomic signal might have been subsequently transferred to parts of the Americas, including South America, through past gene flow events."[16]

The problem I have with all this is that these hypothetical "past gene flow events" somehow left a strong DNA signal in the Amazon, one of the remotest and most inaccessible parts of South America, while leaving next to no signal at all in North America, which—whether the genes were carried by people who traveled on foot or by people who island-hopped and coasted from the Aleutians in simple watercraft—would surely have involved interactions with North American populations before any interactions with South American populations took place—and therefore presumably should have left a DNA signal in North America at least as strong as the signal found in the Amazon.

Seeking clarification, I contacted Professor Willerslev directly at the University of Copenhagen on March 2, 2018, and asked what in

his data had led him and his coauthors to conclude that the gene flow bringing the Australasian signal to the Amazon had occurred **after** the initial peopling of the Americas. I also asked why they favored Aleutian islanders as the likely vector and whether it was not counterintuitive to propose such an extreme northern source for this gene flow. If a northern source had indeed been involved, I argued, then:

> wouldn't we expect to see a cline in the signal from strongest in the north, nearest the putative source, to weakest in the faraway south and particularly in remote South American regions like the Amazon? But my understanding of the data is that if there is a cline at all it is in the opposite direction—i.e., from strongest in the south to weakest in the north. Am I understanding correctly and if so how do you explain this counterintuitive cline? Are we to imagine Aleutians or Athabascans island-hopping and coasting down the entire Pacific coast of North America, absolutely not intermingling with anyone else or leaving any DNA traces along the way, until they arrive (presumably) at some point on the Pacific coast of South America whence they strike inland for the Amazon?[17]

Professor Willerslev replied:

> When you talk about a cline in contemporary data you assume peoples have stayed in the same place since the Pleistocene. We do not know that. Therefore I don't think it's a particularly good argument. A lot of stuff can happen over tens of thousands of years in regard to distribution of peoples. In principle the signature in the north could have been lost by replacement. We simply don't know.[18]

"Dear Eske," I responded (happily we had agreed to switch to first-name terms):

> I take your point, absolutely, on all of this. And I certainly don't imagine that peoples have stayed in the same places since the Ice Age. It's part of the essence of being human, I think, to move around, migrate, and explore. Still, will I be misrepresenting the facts if I were to state in my book, **with reference specifically to present-day populations,** that a cline of the Australasian signal is evident with a stronger signal in South America, particularly the Amazon, than anywhere in North America? And further, again with reference specifically to present-day populations, would I be misrepresenting the facts to say that the Australasian signal is stronger amongst the Surui than it is amongst the Aleutians and Athabascans and that the Surui's affinity to East Asians, Oceanians, and Denisovans is stronger than that of the Inuit?[19]

"No!" Eske replied, "I would not call it a cline.[20]… It's strongest in the Surui but stronger in Aleutians than in Athabascans … but these groups also contain more East Asian so it may simply reflect just that. The Denisovan signal is not stronger in the Surui than in the others (to my knowledge)."[21]

In summary, therefore, taking into account all of the above, the situation seems to be that the Denisovan signal remains at a constant and fairly low level throughout present-day indigenous populations so far sequenced in both North and South America.[22] The Australasian signal, by contrast, is definitely and notably much stronger among populations in the Amazon, such as the Surui, and much weaker among other Native Americans such as the Arhuaco (of non-Amazonian northern Colombia), the Wayuu (of non-Amazonian northern Venezuela), the Purepecha (of Mexico), and the Ojibwa, Cree, and Algonquin of north and northeast North America. While never reaching the high levels found among

Amazonian populations, the signal among Aleutian Islanders and Athabascans is relatively stronger than in other Native North American groups and relatively stronger in Aleutian Islanders than it is in Athabascans—though Raghavan and Willerslev warn in their *Science* paper that the Aleutian Islander data must be interpreted with some caution since it "is heavily masked owing to recent admixture with Europeans."[23]

"THE MOST PARSIMONIOUS SOLUTION . . ."

I NEXT REMINDED ESKE OF Skoglund and Reich's papers. In these, as the reader will recall, the authors contemplate the "formal possibility"[24] that the Australasian signal might reflect direct

settlement in the Amazon by an Australasian-related population "that would thus have penetrated deep inside the Americas without mixing with the main ancestral lineage of present-day Native Americans."[25] My question to Professor Willerslev, therefore, was whether there was anything in the genetic data that he was aware of that would effectively refute the notion of direct settlement.

His reply got straight to the point:

> Currently no one has a good explanation of the Australo-Melanesian signal. All that is put forward as possible explanations are purely speculative. So whether it's an old or a later event is unknown. What we do know is that it's present in some Native American groups particularly from Brazil. We also know it has to be pre-Columbian. We also know that it's not present in any of the ancient skeletons genome sequenced so far. Possible explanations can be: 1) It comes in after the initial peopling of the Americas e.g. by costal migrations that do not leave much trace behind in contemporary populations (e.g. they move quickly), or that we just haven't sequenced the populations in North America that hold the signal; 2) it's an old migration through Beringia before Native Americans but then it's strange they leave no signals in the ancient skeletons sequenced so far; 3) it's a structured initial Native American population moving south into the Americas of which

> some carry the signal but again then it's strange that there is no evidence of admixture between the two groups; 4) someone holding this signal comes into the Americas not through Beringia but crossing into South America across the Ocean. Based purely on the genetic data this is the most parsimonious explanation but it does not make practical sense; 5) Finally it's a possibility that the signal is a methodical artefact. That the methods are not behaving as we think they should do.[26]

Apart from point 5, which is above my pay grade to assess, it was refreshing to encounter such a straightforward admission that no good explanation has yet been offered for the Australo-Melanesian signal, and such willingness to consider a wide range of possibilities. Since I was already leaning toward the view that the signal is mysterious and might bear witness to a crossing of the Pacific Ocean followed by the settlement in the Amazon of a relatively small group, my eyes were naturally drawn to Eske's point 4. "Based purely on the genetic data," and invoking the parsimony principle (whereby the simplest scientific explanation that fits the evidence is preferred), it looked very much as if this

leading figure in the study of ancient genetics agreed with me! Where he and I parted company, however, was over the possibility that anybody could have made an oceanic crossing of thousands of kilometers during the Stone Age. For Eske such a proposition simply didn't make practical sense.

I sent him a follow-up mail to ask if he based this conclusion "on the archaeological consensus that our Upper Palaeolithic and early Holocene ancestors were incapable of undertaking long trans-oceanic voyages?"[27]

He replied, "In regard to crossing the Pacific. I'm not saying it did not happen but there is no evidence suggesting that humans were capable of such a journey until quite late in history (Polynesian expansion). It's a possibility and I'm open to the idea but there's not much evidence supporting it except going for the most parsimonious solution of the genetic data."[28]

So here again is a refreshing openness of mind so rarely seen among archaeologists. The best fit for the genetic data does indeed appear to be a transpacific voyage (or voyages) to South America by a group (or groups) of settlers carrying Australo-Melanesian genes. However, on the matter of the *practicality* of anyone undertaking transpacific voyages in the Stone Age, which has to do primarily with the level of technology attributed to our ancestors at that time, Professor Willerslev accepts, and builds into his own reasoning, the mainstream archaeological consensus that "there is no evidence suggesting that humans were capable of such a journey until quite late in history."

He is not to be blamed for doing so, since it is normal in the sciences for an expert in one field to trust and rely upon the conclusions of experts in other fields. Quite possibly Professor Willerslev is not aware—why should he be?—of how little like a science archaeology really is and how often the mainstream archaeological consensus has proved, after suppressing dissenting

opinions for decades, to have been fundamentally wrong all along. Recent examples include the hasty and forced addition of more than 5,000 years to the previously accepted chronology for the earliest megalithic sites after the discovery of 11,600-year-old Gobekli Tepe in Turkey,[29] the collapse of "Clovis First," and the comprehensive debunking of the long-held belief that the Neanderthals were incapable of art.[30] Clearly, the mainstream archaeological consensus is **not** always right in what it agrees upon and it may well turn out that it is not right on the matter of grand oceanic voyages during the Ice Age. Indeed, rather than being ruled out on the basis of a priori assumptions, perhaps that strange Australo-Melanesian genetic signal in the Amazon is part of the **proof** that such voyages must indeed have occurred.

Then there's the matter of the role of the Denisovans in all this. We know from the evidence of Denisova Cave itself that their technology—while undoubtedly "Stone Age"—was far ahead of its

time and in some ways much more akin to the Neolithic than to the Upper Paleolithic. We know that they could make sea crossings and that they ranged over a vast area, at least from the Altai Mountains in the west to Australo-Melanesia in the east. Last but not least, we know that their DNA survives most strongly today in people of Australo-Melanesian descent, and there's informed speculation that Australo-Melanesia may have been their original homeland.

It's strange, and evocative, that the mystery of the Denisovans and the mystery of the Australo-Melanesian genetic signal in the Amazon should collide in this way, and all the more so because, as Eske Willerslev makes clear, there's no especially strong Denisovan element in the signal. Perhaps further research will provide us with a higher-resolution picture, but from the data presently in hand it looks like the gene flow to the Amazon involved a population of Australo-Melanesians who had undergone little or no mixing with Denisovans. For such a people to have existed in the very area where the genetic evidence suggests the Denisovans were most

strongly congregated is itself somewhat mysterious and suggests some kind of selective process at work.

In previous books, in particular *Fingerprints of the Gods* and *Underworld,* I have given extensive consideration to the intriguing phenomenon of ancient maps that show the world as it looked during the last Ice Age and do so, moreover, with stunning longitudinal and latitudinal accuracy and with the use of complex spherical trigonometry. Though it would be superfluous to reproduce here evidence that I have already presented in such detail elsewhere, I include an appendix—appendix 2—that gives some indication of the richness and the significance of this overlooked material.

However many times by however many hands they have been copied and recopied down the ages, it is my contention that these anomalous maps can be traced back to lost source documents that could only have originated with a civilization at least advanced enough to have explored the world, and to have mapped and

measured it, when it was still in the grip of the Ice Age. A civilization capable of such feats must, at the very least, have had its own adepts in the techniques of boat-building, sailing, navigating, cartography, and geometry—none of these being among the skills that archaeologists are normally willing to attribute to Ice Age hunter-gatherers.

It is not inconceivable, however, if such a hypothetical civilization had existed, that it might have sponsored "outreach programs" to the hunter-gatherers who also lived in the world at that time, just as our own twenty-first-century technological civilization has "outreach programs" to hunter-gatherer tribes in the Amazon rainforest, the jungles of New Guinea, and the Namibian desert today—anthropologists, aid workers, resettlement experts, and so on and so forth. It's even conceivable that a hypothetical lost civilization of the Ice Age could have had "resettlement experts" of its own who were interested in the outcomes that might follow from physically removing people from one area—such as Melanesia, for

example—and resettling them in far-off places like South America. If a global cataclysm were to loom, threatening the annihilation of the civilization, such "outreach" initiatives might even have been accelerated to prepare hunter-gatherer populations to serve as refuges for the survivors.

This is all pure speculation, of course, but at least it's in good company. As Eske concedes, **all** of the explanations—including his own—that have so far been offered to account for the presence of Australasian DNA in the Amazon are "purely speculative."

And the mystery continues to deepen. In November 2018, two major new studies were published, one in the journal *Cell,* coauthored by Cosimo Posth, David Reich, and others, and the second in *Science,* coauthored by Eske Willerslev, J. Victor Moreno-Mayar, David Meltzer, and others.[31] These new studies found Australasian DNA already present in skeletal remains from Lagoa Santa, Brazil, dated to 10,400 years ago, and confirmed the

suspicion of the researchers that the anomalous genetic signal must have reached South America in the "Late Pleistocene"[32]—that is, near the end of the last Ice Age.

"How did it get there?" wonders geneticist J. Victor Moreno-Mayar, immediately answering his own question as follows: "We have no idea." Similarly, David J. Meltzer expressed amazement at the most peculiar character of the signal, so clearly present in South America yet "somehow leaping over all North America in a single bound."[33]

For the purposes of my own quest, however, that anomalous, unexplained signal had the effect of opening up a new and fruitful avenue of inquiry. With the archetypally North American Clovis culture now known to have South American genetic roots, it was becoming increasingly obvious that to explore the mysteries of one half of the megacontinent I could not be oblivious to what had happened in the other half.

My focus would remain on North America, to which we'll return in part 5, but I had a strong intuition that I might miss an important piece of the puzzle if I failed to investigate the Amazon first.

I resented the intuition, which felt like a diversion, but it was so insistent that ultimately I could not ignore it.

PART IV

MEMES

The Amazon Mystery

11

GHOST CITIES OF THE AMAZON

IN MY QUEST FOR THE traces of a lost civilization of prehistoric antiquity, the Amazon rainforest at first seemed to have little to offer. Without that teasing, tantalizing Australasian DNA signal I probably wouldn't have given it a second thought. But the signal was there, it was real, it was hugely anomalous, and it cried out for a deeper inquiry.

Along with much of the rest of the Americas, the Amazon entered European consciousness in the sixteenth century—the century of conquest. It was not a primary target. Mexico and Peru were hit first, their armies conquered, their wealth pillaged. Then rumors began to circulate of exotic civilizations rich in gold hidden in the jungles beyond the Andes Mountains. The greed of the Spaniards was aroused and in February 1541 Francisco de Orellana and Gonzalo Pizarro (the latter the brother of Francisco Pizarro, the conqueror of Peru) struck east from the city of Quito in Ecuador on a journey into the unknown.

Their mission was nothing less than to find the fabled El Dorado in the remote interior of South America and to loot the vast wealth they expected to find piled up there. In this they failed but in the grander scheme of things they succeeded mightily, for their expedition left us with the earliest surviving eyewitness account of the Amazon—unfortunately not of the *pre-Columbian* Amazon, which would have been ideal, but of the Amazon so soon after

contact that it remained, effectively, in its pre-Columbian state. As such, it has much to tell us about the lost prehistory of the Americas.

At the head of a force of more than 200 Spanish soldiers, Orellana and Pizarro descended from the Andes. Hacking their way through increasingly dense and difficult jungle and fighting multiple engagements with hostile tribes, they eventually reached the banks of the Coca River, a tributary of the Napo River that is, in turn, an important tributary of the great and majestic Amazon itself. The terrain made further overland travel almost impossible and, far from finding and reveling in the supposedly limitless riches of El Dorado, the conquistadors were by now depleted by illness and weak with hunger. Their solution was to build a fair-sized boat, which they named the *San Pedro*. In it, on Pizarro's orders, Orellana then embarked with a force of 50 men to seek out and raid local villages for food.

The agreement was that Orellana would return within 12 days with whatever supplies he could gather. Unfortunately, however, the Amazon River system hadn't been consulted when the plan was made, and the *San Pedro* was swept downstream at such a rate that very soon it was hundreds of miles away and the prospect of a return against the powerful currents was most uninviting. Besides, even if Orellana's force had been able to row the rough-and-ready craft upstream again there was no guarantee that they would ever find their way back to Pizarro through the maze of braided river channels in which one opening looked very much like the next.

They decided, therefore, to press on and, in the process, became the first Europeans ever to navigate the entire length of the Amazon River and to cross the full width of South America from west to east. This was barely 20 years after the Spanish brought smallpox to the "New World"—another first!—and the great pandemics that were to depopulate the Americas had not yet penetrated deeply (if at all) into the remote fastness of the Amazon jungle. The pale horse

of death would very soon follow, but Orellana's adventure took place at just about the last time that the cultures and civilizations that had thrived and prospered in the rainforest for thousands of years could ever be seen in something approaching their original form and context.

For that reason we are fortunate that Orellana and his murderous gang of mercenaries—often starving, often having to fight for their lives—were accompanied on this desperate voyage by Brother Gaspar de Carvajal, a literate and sensitive Dominican friar who kept a journal throughout. In it he describes himself as "a man to whom God chose to give a part in such a strange and hitherto never experienced voyage of discovery, such as this one which I shall relate from here on."[1]

The expeditionaries frequently faced extreme privations. On one occasion, for example, Carvajal reports that after many days without food,

> we were eating nothing but leather, belts and soles of shoes, cooked with certain herbs, with the result that so great was our weakness that we could not remain standing, for some on all fours and others with staffs went into the woods to search for a few roots to eat and some there were who ate certain herbs with which they were not familiar, and they were at the point of death, because they were like mad men and did not possess sense; but as Our Lord was pleased that we should continue our journey, no-one died.[2]

Whether by divine intervention or by good luck, or because of Orellana's effective leadership, none of his tough and resourceful men died of starvation on the voyage, and only a handful lost their lives due to infections, disease, and battle wounds. It was, all in all, a 7,000-kilometer journey, the whole of which, from departure from Quito in February 1541 to arrival at Marajo Island in the Amazon estuary on the Atlantic coast of Brazil in August 1542, took 18 months.

More important by far than his descriptions of the risks and dangers of the adventure, the great historical significance of Carvajal's journal is the shockingly counterintuitive picture it paints

of a vast and complex Amazon. Certainly there were regions of complete wilderness where the expeditionaries suffered badly—hundreds of kilometers of deserted riverbanks with no people, no crops, and apparently no wildlife. But we discover as we read on that these empty quarters were interspersed with regions of astonishing, heavily populated abundance, where "great cities" more than 20 kilometers from end-to-end, roughly the length of Manhattan, lined the riverbanks.[3] Here Carvajal reports that enormous expanses were given over to productive agriculture[4] and there were signs everywhere of large and well-organized political and economic systems linked to centralized states that were capable of fielding disciplined armies thousands strong.[5]

These last glimpses of the Amazon before the ruination of European contact hint at a glorious, sophisticated, and technologically advanced indigenous prehistory. Carvajal tells of one stretch of the mighty river, 80 leagues—possibly more than 500

kilometers[6]—in length, ruled by a "great overlord named Machiparo." Throughout his territories a single language was spoken and the towns and villages stood so close together that there was usually not more than "a crossbow shot" between them.[7]

A week later the Spaniards came to a "fortified village" and, finding themselves short of food they took it by storm, killing some of the inhabitants and forcing the remainder to flee into the jungle. They then "remained resting, regaling ourselves with good lodgings, eating all we wanted, for three days in this village. There were many roads here that entered into the interior of the land, very fine highways."[8]

Orellana took these latter as an ominous sign—the locals they had driven out of their homes might easily return with reinforcements—and the expedition sailed on, enjoying the abundant and varied foods that they now found everywhere on their route downriver.[9]

The next major halt was at "a village that was on a high bank, and as it appeared small to us the Captain ordered us to capture it, and also because it looked so nice that it seemed as if it might be the recreation spot of some overlord of the inland."[10]

The residents put up a tough fight but were eventually expelled:

> And we were masters of the village, where we found very great quantities of food of which we laid in a supply. In this village there was a villa in which there was a great deal of porcelain-ware of various makes, both jars and pitchers, very large, with a capacity of more than twenty-five arrobas [one hundred gallons], and other small pieces such as plates and bowls and candelabra of this porcelain of the best that has ever been seen in the world, for that of Malaga is not its equal, because this porcelain which we found, is all glazed and embellished with all colors, and so bright are these colors that they astonish, and, more than this, the drawings and paintings which they make on them are so accurately worked out that one wonders how with only natural skill they manufacture and decorate all these things making them look just like Roman articles; and here the Indians told us that as much as there was made out of clay in this house, so much there was back in the country in gold and silver.[11]

From this village, as from others through which they had passed, "there went out many roads and fine highways to the inland country."[12] Orellena had previously resisted the impulse to explore these enticing jungle thoroughfares but now, wishing to find out where they led to—perhaps even to El Dorado itself!—he took several companions with him and set out. Once again, however, discretion got the better of valor:

> He had not gone half a league when the roads became more like royal highways and wider and when the Captain had perceived this, he decided to turn back, because he saw that it was not prudent to go on any further.[13]

No doubt Orellana's prudence was among the reasons that so many of his men survived the perilous 7,000-kilometer voyage from the Andes to the Atlantic, but it is a matter of profound regret that he did not explore those "royal highways" through the jungle. In consequence, today we may only imagine where—and what—they led to.

UNPALATABLE TRUTHS

ALTHOUGH WIDELY DISCUSSED AT THE time, Carvajal's journal, the first eyewitness account of the full length of the Amazon in a near-pristine state, subsequently disappeared from public view for more than 300 years.[14] It only resurfaced in the nineteenth century following an exhaustive archival search by the Chilean scholar José Toribio Medina, who published it in 1895.[15]

Still it seemed that forces were at work to sideline Carvajal's uniquely important contribution to our understanding of the ancient Amazon. No sooner was the journal in print, at any rate, than it began to be "debunked" by scholars.[16]

For example, there were strident objections to a claim made at one point in Carvajal's account that statuesque female archers, whom the friar unhesitatingly calls "Amazons" after the warrior

women of classical Greek myth,[17] had participated in an attack on Orellana's expeditionaries.[18] Carvajal also states that many of the other peoples they met on the journey were "subjects of the Amazons" whose dominions were extensive and whose sumptuous capital city had five enormous temples at its heart:[19]

> In these buildings they had many gold and silver idols in the form of women, and many vessels of gold and silver for the service of the Sun.[20]

Such descriptions enjoyed wide currency and inflamed the public imagination in the years following the voyage.[21] As a result, the great river system Orellana explored is not today named after him, or some other Spanish adventurer, but called the "Amazon" instead.[22] To the skeptics of a later age, however, the link to the classical world that Carvajal suggested, and the notion of a lavish city in the depths of the jungle, seemed ridiculous.

Nor was this all.

What really stuck in the skeptical craw were the accounts Carvajal gave of the inhabitants of the rainforest, of the general level of their civilization, of the refinement of their arts and crafts, and particularly of the extent of their settlements—not only the fabulous capital of the Amazons but also other "very large cities," including some that "glistened in white."[23] By the 1890s the view had already set in among anthropologists and archaeologists that the Americas as a whole had only been peopled relatively recently—and it was strongly believed that one of the very last places to be settled, in this generally very late migration scenario, would have been the Amazon. As this view tightened its grip in subsequent decades, it began to seem obvious to all serious-minded researchers—so obvious as to be beyond question—that the Amazon could only been have been inhabited for about 1,000 years, and then only by very small groups of hunter-gatherers since the jungle was "resource-poor."[24] Indeed in this same vein, even as late as the

1990s, the rainforest was still being depicted by environmentalists as "a counterfeit paradise whose lush vegetation hid nutrient-poor soils incapable of supporting large populations and complex societies."[25]

The reason Carvajal's account was disbelieved for most of the twentieth century by almost everyone who reviewed it is therefore plain to see. The picture he painted of the pre-contact state of the peoples and cultures of the Amazon flew in the face of a dominant (and domineering) scholarly theory. Predictably, therefore, the first reaction of most archaeologists was not to question the theory in the light of the rediscovery, after long neglect, of an on-the-spot, eyewitness account. Instead they chose to defend the theory and undermine Carvajal by accusing him of lying in order to glorify the achievements of the expedition.

The friar gives us his word—no small matter for such a man—that he wrote only "the truth throughout."[26] But his accounts of

cities, huge populations, advanced ceramics ("surpassing those of Malaga"), and enormous, fertile agricultural lands along the course of the Amazon were too subversive to be accepted. Quite simply, if he was right about all this, then the modern "experts" were wrong—and that could not be tolerated.

Indeed the judgment that Carvajal was a fantasist and a liar, and that nothing he had said about the Amazon could be taken seriously, seemed about to be set in stone when the first shreds of the evidence that would ultimately exonerate him, proving that he had indeed told the truth throughout, began to emerge.

DID AMAZONIAN CITIES EXIST?

PROFESSOR DAVID WILKINSON OF UCLA, an authority on long-term and large-scale phenomena in world politics, including empires and

systems of independent states, has made a special study of the level of civilization in the Amazon prior to European contact.

> The key question for civilizationists is: were there Amazonian cities before European contact? "Civilizations" require "cities," and "cities" are the defining feature of "civilizations." And by "cities," we mean 4th magnitude settlements, i.e. settlements with a population of not less than the order of 10^4 (~10,000) … Did Amazonian cities exist?[27]

Judging from the earliest reports of Spanish and Portuguese expeditions, says Wilkinson, "the answer would certainly have to be in the affirmative."[28] He draws particular attention to one of the cities, mentioned earlier, that extended for more than 20 kilometers from end to end,[29] and to another settlement that Carvajal describes as "more than two leagues long."[30] The exact length of a league, Wilkinson notes, was "not a fully agreed-upon or stabilized physical distance, but was probably not less than 2.5 English statute miles nor more than 4."[31] A settlement of close-packed housing covering

2 leagues would therefore have been between 5 miles (8 kilometers) and 8 miles (13 kilometers) in extent. Here Wilkinson refers us to a study by an international team of anthropologists and geologists who focused on what is known about this settlement and calculated that it would have housed "perhaps 10,000 inhabitants."[32] As Wilkinson notes, this therefore makes it, by definition, a fourth-magnitude settlement—that is, a city, and "hence part of a civilization."[33] It follows that the larger settlement, with an extent of more than 20 kilometers, would likely have had at least twice as many inhabitants, that is, 20,000 or more.

It is instructive to compare these figures with those of "civilized" Europe in a similar time frame.[34] Certainly London, with a population estimated at 60,000 in the sixteenth century,[35] was larger than either of the two Amazonian cities we are considering here, but the difference was one of degree, not of kind. The British city of York, an established urban center since Roman times, had a

population estimated at between 10,000 to 12,000 in the sixteenth century[36]—very much on the same scale as the Amazonian cities—while in Spain, Toledo did not achieve a population of 13,000 until the mid-nineteenth century.[37]

On Carvajal's account, therefore, not only did the Amazon have cities but its cities were comparable in size to those of Europe at the same time. He also reports that the chieftain Machiparo ruled over "many settlements and very large ones which together contribute for fighting purposes fifty thousand men of the age of from thirty years up to seventy, because the young men do not go to war." Aside from the interesting anthropological observation about the age at which men in sixteenth-century Amazonian society went to war, this statement has important implications for our understanding of the population of the region. Machiparo's domain was just one among many through which the Orellana expedition passed, yet if Carvajal reported correctly it could muster an army 50,000 strong.

This is a greater number than Denmark and Norway combined, or Sweden and Finland combined, or Brandenburg-Prussia, or even the Tsardom of Russia, could field in the same period.[38]

A view of the Amazon as an "uncivilized" and "savage" place—indeed as the very epitome of savagery—has been deeply ingrained in the European psyche for centuries. It is therefore not surprising the Carvajal was disbelieved when his journal finally surfaced in 1895. Also disbelieved were the reports of the two similar adventures that followed—the Ursua expedition, which took place 20 years after Orellana's voyage, and the Teixeira expedition of 1637–38.

There was no official recorder for the Ursua expedition, but one of its officers, a certain Captain Altamirano, provides independent confirmation of Carvajal's observations when he speaks of settlements with populations of around 10,000 in the heart of the

Amazon jungle—at the lower end of the urban scale, but again, as Professor David Wilkinson notes, "city-sized."[39]

By the time of the Teixeira expedition the region had been riven by smallpox epidemics that caused depopulation across wide areas, and had also begun to suffer other negative effects of European penetration and exploitation. Nonetheless the expedition's Jesuit priest, Father Cristóbal de Acuña, who, like Carvajal, kept a journal, could report that "the river of Amazons waters more extensive regions, fertilizes more plains, supports more people, and augments by its floods a mightier ocean" than the Ganges, Euphrates, or Nile. Like Carvajal and Altamirano before him, Acuña, too, was still able to speak of an "infinity of Indians" and of inhabited areas hundreds of kilometers in extent where the settlements were packed "so close together, that one is scarcely lost sight of when another comes in view."[40]

“These testimonials,” Wilkinson writes, “would seem sufficient. With eyewitnesses reporting the size of settlements and the wealth of surplus food available to support dense populations (and social complexity), there could be, and apparently there was indeed, pre-Columbian civilization in the Amazon basin.”[41]

The problem, however, as Wilkinson immediately concedes, is that “serious doubts later arose.”[42]

The first element of doubt had to do with the accounts of subsequent penetrations of Amazonia—after the Orellana, Ursua, and Teixeira expeditions. In this regard the observations of Padre Samuel Fritz, a Jesuit preacher, are of particular significance.[43] He lived among the Omaguas, through whose domains along the banks of the Rio Napo, between the Coca and Aguarico, the Orellana expedition passed and which Carvajal (although he does not refer to the Omagua by name) describes as densely populated.[44]

Not so according to Padre Fritz! Between 1686 and 1715 he established thirty-eight Jesuit missions among the Omagua and noted on a map that the important settlements among which he had planted these missions had a combined total population of just 26,000 people[45]—quite a different matter from the hundreds of thousands reported by Carvajal. Let us note in passing—for there is a hint here of what was really going on—that Fritz's main preoccupation, other than preaching, was to advise "these small weak village communities on how to retreat and regroup upriver to evade continual Portuguese slave-raiding."[46]

Likewise, a little later—between 1743 and 1744—the French geographer Charles-Marie de la Condamine traveled through the region and reported no cities or armies in Amazonia, again in stark contrast to Orellana. For Condamine, the Omaguas were "a people formerly powerful" while along the entire river system he found "no

warlike tribes inimical to Europeans, all such having either submitted or withdrawn themselves to the interior."[47]

These reports, and many others like them as the eighteenth century merged into the nineteenth and the nineteenth into the twentieth, did serious damage to the credibility of the earlier explorers—to such an extent that Smithsonian Institution archaeologist Betty Meggers was still insisting, before she passed away in 2012, that Carvajal had either misunderstood everything he saw or, more likely, that his entire account was riddled with fantasy and invention.[48]

THE LONG SHADOW OF BETTY MEGGERS

THROUGHOUT HER WORKING LIFE MEGGERS was a passionate advocate of the view that no pre-Columbian Amazonian settlement could ever have supported even 1,000 people, let alone several thousands or even tens of thousands as Carvajal had reported. It was likewise her opinion that the level of sophistication Carvajal had described—the armies, the food storage, the porcelain specialists, and so on—was in fact completely **impossible** given the limitations of the Amazonian environment.[49]

Meggers's *Amazonia: Man and Culture in a Counterfeit Paradise,* published in 1971 (but expanding on work she had done and conclusions she had reached in the 1950s), has been described as possibly "the most influential book ever written about the Amazon."[50] And indeed, it was this book, and the "environmental limitation" movement that it spawned—because many other archaeologists, anthropologists, and ecologists simply followed Meggers without question—that for a long while served as the sole

acceptable reference frame through which the prehistory of the Amazon would be understood. As Professor Wilkinson puts it, “the meticulously careful and systematic researches of 20th century cultural-ecologist archaeologists” like Meggers created a consensus that “large-scale settlements and societies” could **never** have existed in what the environmental limitationists saw as the “wet-desert” of Amazonia.[51]

But as was the case with Vance Haynes and the mistaken Clovis First doctrine that kept so many locked in illusion for so long, so it was with the ideas of Meggers and her followers. A dominant individual, with a prestigious position, can delay the progress of knowledge for decades but ultimately cannot stop the buildup of contrary evidence and opinions that will lead to a new paradigm.

Predictably, therefore, as Wilkinson goes on to note in his study of Amazonian civilization:

> Towards the end of the 20th century, the archaeological pendulum began to swing back toward crediting the early explorers' accounts. Even Meggers [in *Amazonia: Man and Culture in a Counterfeit Paradise*] had passed on without comment a report [dated approximately 1662] by Mauricio de Heriarte that the capital of the Tapajós (at today's Santarem) could field 60,000 warriors. Any such number of militia would by … comparative-civilizational standards have implied an urban population of 300,000 to 360,000![52]

It is troubling, in retrospect, that Meggers knew of, yet did not consider, the implications of Heriarte's report—but, of course, had she done so, she would have been obliged to rethink her whole thesis. Within twenty years after the publication of *Counterfeit Paradise,* however, other scholars were actively doing the rethinking for her. Notable among them was Anna Curtenius Roosevelt, now professor of anthropology at the University of Illinois at Chicago. In 1993 she presented evidence that some pre-Columbian Amazonian settlements "held many thousands of people … from several thousands, to tens of thousands of individuals or more." And in 1999 she wrote, "In Amazonia, non-state societies

appear to have organized large, dense populations, intensive subsistence adaptations, large systems of earthworks, production of elaborate artworks and architecture for considerable periods of time."[53]

Likewise, in 1994, anthropologist Neil Whitehead concluded of the prehistoric Amazon, "We are dealing with civilizations of considerable complexity, perhaps even protostates."[54] And in 2001, Michael Heckenberger, James Petersen, and Eduardo Neves, facing criticism from Meggers, strongly defended their own by then well-established position that "there were past Amazonian societies significantly larger than anything reported in the past 100–200 years,"[55] that these societies included "chiefdoms" or "kingdoms,"[56] and that "lost civilizations" were indeed present in some parts of the Amazon before European contact.[57]

What are we to make of all this to-ing and fro-ing?

In summary, “to address the contradictions in the sources and among the authorities,” Wilkinson asks, “If there were Amazonian cities, where did they go? And, if there were Amazonian cities, how could they have subsisted?”[58]

He gives two two-word answers to these questions—“recurrent catastrophes” to the first and “exemplary agronomy” to the second.

EXTINCTION AND AMNESIA

WE’LL COME TO THE EXEMPLARY agronomy in a later chapter, but let’s deal with the recurrent catastrophes now.

Prior to the Orellana expedition, smallpox may already have found its way to the Amazon overland from Mexico where it had been introduced during the Spanish conquest a few decades

earlier.[59] If not, then the direct transmission of the disease to Peru in 1532–33 by Pizarro's conquistadors certainly brought it into the Andes Mountains in force, making it only a matter of time before it descended to the east side of the range and thoroughly infiltrated the rainforest.[60] Quite possibly, although there is no proof, the Orellana expedition may itself have been the first principal vector that carried the scourge into the heart of the Amazon but if so it was certainly not the last—nor was smallpox the only Old World disease to which Europeans possessed significant immunity while Native Americans did not. Measles, influenza, and other viruses also took a ghastly toll.

Wilkinson cites an important study by anthropologist Thomas P. Myers that documents "more than 30 epidemics—smallpox, measles, and other outbreaks—some 'on a massive scale'—in 16th–18th century South America."[61] Myers finds evidence of "very substantial depopulation between the Orellana and Teixeira

expeditions" and estimates that in many areas it ran as high 99 percent.[62] This, he further suggests, "may have been the reason why the missionaries later transmitted the idea of a relatively uninhabited Amazon region. The people they found were the survivors of the diseases and epidemics."[63]

The implications of the virtual extinction of the Amazon's pre-Columbian population are immense. If so many died, then we can be sure that much else died with them. As Wilkinson succinctly phrases it, "A small city of 10,000 that loses 99% of its inhabitants becomes a village of 100, that can do far less."[64]

Likewise, by extension, we can imagine what would have happened if that city were just a small part of a great and complex civilization of the Amazon and if that entire civilization were deprived of 99 percent of its warriors, 99 percent of its farmers, 99 percent of its hunters and gatherers, 99 percent of its astronomers, 99 percent of its healers and shamans, 99 percent of its architects,

99 percent of its boat builders, and 99 percent of its wisdom keepers. Of course, across the scale of the whole Amazon basin, this would not have happened overnight; likely it would have extended over a century or two—a creeping cataclysm rather than a single big hit. But the end result, whether it came slow or fast, would have been the same. Once left deserted, the great cities and monuments and other public works of any hypothetical Amazonian civilization would quickly have been encroached upon and soon completely hidden by the jungle while, at the same time, cultural memory banks would have been wiped almost clean and vast resources of skills, knowledge, and potential would have been lost forever.

Little wonder, then, that to this day amnesia, confusion, contradictions, and mystery confound the search for the truth of the Amazon's deep past.

12

THE ANCIENTS BEHIND THE VEIL

THE DNA EVIDENCE PRESENTED IN part 3 reveals an astonishing anomaly. At some point during the Ice Age, perhaps as early as 13,000 years ago, a group of people carrying Australo-Melanesian genes settled in what is now the Amazon jungle.

The Amazon basin today is a vast and diverse region encompassing almost 7 million square kilometers, of which

approximately 5.5 million square kilometers are still covered by rainforest.[1] The figures only become meaningful by comparison. The whole of India, with a total area of 3.29 million square kilometers, is less than half the size of the Amazon basin,[2] but Australia, at 7.7 million square kilometers, is bigger,[3] as are China (9.59 million square kilometers),[4] Canada (9.98 million square kilometers),[5] the United States (9.63 million square kilometers),[6] and Europe (10.18 million square kilometers).[7] All in all, then, it's fair to say that what the Amazon confronts us with is a truly gigantic landmass, on a similar scale to many of the world's largest countries and regions, extending for thousands of kilometers from north to south and thousands of kilometers from east to west.

There has been no lasting scholarly consensus on the climate, environment, vegetation, and tree cover of the Ice Age Amazon (see appendix 3 for details) but the situation is possibly even worse around the issue of the peopling of this immense region—and

indeed around the entire vexed question of how and when humans began to settle in South America as a whole.

The reader will recall from part 2 that it was Tom Dillehay, professor of anthropology at Vanderbilt University in Tennessee, who first put the cat among the Clovis pigeons with his excavations at Monte Verde in southern Chile. The excavations began in 1977 and continue to this day, with multiple reports and papers published in scientific journals. The story is therefore a long one, but to make it short let's just say that Dillehay's extensive and meticulous excavations initially revealed, in his own words:

> one valid human site (MV-II) dated ~14,500 cal BP. … Although bifacial projectile points, flaked debitage, and grinding stones were recovered, most lithic tools were edge-trimmed pebble flakes and sling and grooved bola stones.[8]

Seen through the distorting lens of the "Clovis First" belief system, Dillehay's date looked very threatening—in part because the artifacts, tools, and points found at Monte Verde had nothing to

do with Clovis whatsoever but more so because to have reached the far south of South America by 14,500 years ago meant that the ancestors of these settlers must have crossed the Bering land bridge (the full length of two continents away) long before that and therefore, by definition, that Clovis was very far indeed from being "first."

All Dillehay's battles with Vance Haynes and his supporters were over this relatively conservative date of 14,500 years ago—and as we've seen, Monte Verde was vindicated in that fight after a site visit in 1997 when the Clovis Firsters (begrudgingly) conceded defeat.

But the story was far from over and as the excavations at Monte Verde continued, deeper and older occupation levels began to be exposed, yielding increasingly more ancient dates. The results of these new studies were published by Dillehay in November 2015, confirming a revised age for Monte Verde of around 18,500 years[9]

and revealing that the site had been reoccupied several times thereafter over a period of more than 4,000 years.[10] Again in Dillehay's own words:

> The new evidence is multiple, spatially discontinuous, low-density occurrences of stratigraphic *in situ* stone artifacts, faunal remains, and burned areas that suggests discrete horizons of ephemeral human activity radiocarbon dated between ~14,500 and possibly as early as 19,000 cal BP.[11]

Nor, it seems, is Monte Verde quite done with surprising us. Even as he was reporting his first paradigm-busting date of 14,500 years ago for MV-II, Dillehay was already drawing attention, in a rather careful, noncommittal way, to the possibility that MV-I, another area of the site, might be older—and not just 18,500 or 19,000 years old but perhaps significantly more than 30,000 years old:

> MV-I dated ~33,000 BP … initially defined by scattered occurrences of three clay-lined, possible culturally produced burned areas and twenty-six stones, at least six of which suggest modification by humans. This … evidence from MV-I

> was too meager and too laterally discontinuous to falsify or verify its archaeological validity.[12]

This whole issue, which even the most adamant Clovis Firsters on the 1997 site visit had admitted was "extremely intriguing,"[13] was reexamined by Dillehay and his team in the 2015 study, across several areas of Monte Verde. Dates as tantalizingly ancient as 43,500 years ago were associated with the remains and artifacts unearthed, but Dillehay again carefully judged the finds to be "still too meagre and inconclusive to determine whether they represent human activity or indeterminate natural features. At present the latter case is perhaps more feasible given there is presently no convincing archaeological or other data to substantiate a human presence in South America prior to 20,000 years ago."[14]

ONE MORE LINE IN THE SAND CROSSED

DESPITE HAVING FOR SO LONG been a rebel on the subject of First Americans, despite having been vindicated in the end on his first date for Monte Verde, despite having then published new dates pushing the age of the site back further, and despite those "meagre" hints of even greater antiquity, it does sound very much as if Dillehay was imitating his former critics here. Just as they used to argue that there was no convincing archaeological evidence to substantiate a human presence in South America 14,500 years ago, now he was saying there was none prior to 20,000 years ago.

When, I wonder, will archaeologists take to heart the old dictum that absence of evidence is not the same thing as evidence of absence, and learn the lessons that their own profession has repeatedly taught—namely that the next turn of the excavator's spade can change everything? So little of the surface area of our

planet has been subjected to any kind of archaeological investigation at all that it would be more logical to regard **every** major conclusion reached by this discipline as provisional—particularly so when we are dealing with a period as remote, as tumultuous, and as little understood as the Ice Age.

I was therefore not at all surprised, after Dillehay had drawn his line in the sand at 20,000 years ago, that later research, published in August 2017, confirmed a human presence in South America even earlier in the Ice Age!

This followed decades of study by a team under the leadership of Denis Vialou of the Muséum National d'Histoire Naturelle in Paris at the Santa Elina rock shelter in the Brazilian state of Mato Grosso.[15] Located at the convergence of two major river basins, and roughly at the geographic center of South America as a whole, the shelter is known for its huge display of around 1,000 prehistoric paintings and drawings.[16] In the long rectangular habitation area

nearby, Vialou found and excavated a series of beautifully stratified deposits testifying to different periods of human occupation from 27,600 years ago down to 23,000 years ago.[17] Some very finely worked and drilled bone ornaments were among the objects discovered.[18]

PEDRA FURADA

MORE THAN 2,000 KILOMETERS NORTHEAST of Santa Elina, the eminent archaeologist Niède Guidon has spent 40 years excavating hundreds—literally hundreds!—of richly painted prehistoric rock shelters in Serra da Capivara National Park in the Brazilian state of Piauí. While everyone else is playing catch-up, she has long been confident that humans arrived in South America much earlier than 20,000 years ago. In 1986–3 years before Dillehay first began to offer his own cautious dissent from the Clovis First paradigm—she published a paper in *Nature* boldly titled "Carbon-14 Dates Point to Man in the Americas 32,000 Years Ago."[19] It was a report on her work at a particularly large and richly decorated rock shelter called Pedra Furada where she had excavated "a sequence containing abundant lithic industry and well-structured hearths at all levels" documenting continuous human occupation over the entire period

from 6,160 years ago to 32,160 years ago.[20] In addition, she found conclusive evidence that at least one of the spectacular rock paintings was 17,000 years old:

> This pictograph indicates the practice of rupestral art [i.e., rock art] at that time and makes the site of Pedra Furada the most ancient rupestral art site known in America and one of the most ancient in the world.[21]

But this was just the beginning, and in 2003 Guidon and other researchers completed a further study. The results pushed back the date of the human presence at Pedra Furada to 48,500 years ago,[22] and of the paintings themselves, to at least 36,000 years ago.[23]

Most archaeologists—particularly North American archaeologists still partially under the spell of Clovis First—have not embraced Guidon's interpretation of the evidence at Pedra Furada. This, however, does not mean that she is wrong, only that she is willing to think—and thoroughly investigate—outside the box. She is an acerbic critic of what she calls the "climate of scepticism attending

old dates"[24] that has haunted American archaeology for so long, and of the unquestioning acceptance of Beringia as "the only realistic route for human entry to the New World."[25]

Guidon does not see any reason why Beringia should have been the only route of entry:

> Everybody is willing to give humans the abilities necessary for voyaging across to Australia about 60,000 years ago. Why then would it have been impossible for them to pass from island to island along the Aleutians, just as one example? We have no justification for converting the humans who peopled the Americas to a single state of being, where they could do nothing but follow herds by a land route.[26]

In another paper anticipating the speculations of geneticists like Skoglund, Reich, and Willerslev by more than a decade, she goes even further, reminding us of the puzzling cranial morphology of certain ancient Brazilian skulls (reviewed in appendix 1) and concluding that, "although little probable":

> the possibility of migration from Australia and surrounding islands across the Pacific Ocean … more than 50 k years ago cannot be discarded.[27]

HIDDEN REALMS

IT IS IN THE AMAZON basin that the oddly misplaced Australasian genetic signal beats out its enigmatic pulse. As well as being very far indeed from Australia and Papua New Guinea, however, neither Monte Verde, nor Santa Elina nor Pedra Furada are in the Amazon Basin—though the latter two are closer than the former, being respectively about 515 kilometers and 625 kilometers as the crow flies from the Xingu River, a major southeastern tributary of the Amazon.[28]

The long-standing but now thoroughly discredited archaeological model whereby the Amazon was supposedly uninhabited by humans

during the Ice Age and remained so until less than 1,000 years ago inevitably had a chronic impact on research priorities and research funding. The result, relative to its importance in global ecology and its enormous land area, is that very little archaeology has been done in the Amazon basin at all and very little of what has been done—truly a tiny fraction—focuses on Ice Age occupation levels.

A refreshing exception, however, is the work of the ever open-minded Anna Curtenius Roosevelt, currently professor of anthropology at the University of Illinois, whom we encountered in chapter 11. On April 19, 1996, she and a group of coresearchers took to the pages of *Science* to publish the results of their study of Pedra Pintada, another beautifully painted rock shelter in Brazil but this time located right in the heart of the Amazon basin at the confluence of the Tapajos and Amazon Rivers.[29]

Here Roosevelt and her team excavated multiple occupation layers spanning the Holocene (our current era) and the late Pleistocene (the Ice Age), with the oldest and deepest turning out possibly to be as old as 16,000 years (according to thermoluminescence dating) and 14,200 years (according to radiocarbon dating).[30]

Conclusion?

> The human presence in Caverna de Pedra Pintada during the late Pleistocene is established by numerous artifacts. … The dated materials are associated in stratigraphic context at the beginning of a long cultural sequence. There is no pre-

> human biological material that could have mixed with the cultural remains, which are stratigraphically separated from later Holocene assemblages by a culturally sterile layer. … The discovery of Palaeoindians along the Amazon confirms earlier evidence that the Palaeoindian radiation was more complex than current theories provide for.[31]

Indeed so! And even in these days of man-made ecological disaster let us remind ourselves that 5.5 million square kilometers of the Amazon basin is still covered by rainforest. To put that in perspective, picture Mexico, Guatemala, Belize, Honduras, and El Salvador. Taken together they encompass 2.22 million square kilometers[32]—not nearly enough—so we will need to add on India with its 2.97 million square kilometers to get an imaginary realm almost equivalent in size to the Amazon rainforest.[33] My point here is that when we consider the Amazon as an archaeological project, its *scale* is comparable to Mexico, Guatemala, Belize, Honduras, El Salvador, AND India all added together, **and all, in addition, entirely covered by dense rainforest** and therefore difficult and

expensive to access. Moreover, unlike Mexico, Guatemala, Belize, Honduras, and El Salvador, where the famous Maya civilization flourished, and unlike India with its ancient cities and temples, there was, as we've seen, no inducement for archaeologists to invest scarce time and money on excavations in the Amazon while it was believed that nothing of great interest would be found there. At the close of the second decade of the twenty-first century no serious archaeologists are still thinking that way! The state of affairs they've inherited, however, means that huge swaths of the Amazon, encompassing millions of square kilometers, have never been subject to any kind of archaeological investigation at all.

This is a wider problem than the Amazon. For example, sea level rose 120 meters when the Ice Age came to an end with the result that 27 million square kilometers of land that was above water at the last glacial maximum 21,000 years ago is under water today.[34] These submerged continental shelves were prime seafront real estate

during the Ice Age, yet only a few tiny slivers of them have ever been subject to any kind of marine archaeological investigation. Again, this is because, like the Amazon, access requires special preparations, equipment, and transportation and also because of a similar belief that whatever would be found as a result of these costly investigations would not add greatly to what is already known.

I'll say nothing about Antarctica, with its 14 million square kilometers entirely virgin to the archaeologist's spade.[35] The almost universal agreement that humans could never have lived there in the past might or might not be correct, but we'll never know for sure unless we look.

We do know that the Sahara desert, presently occupying an area of about 9 million square kilometers,[36] had a very different climate during the Ice Age, and in the early millennia of the Holocene, than it experiences today and that there were long periods when it was

well watered and fertile, with extensive lakes and grasslands and abundant wildlife.[37] It is near enough to Egypt and the other great centers of early civilization in North Africa and the Middle East to have attracted the attention of archaeologists, but like the Amazon and like the submerged continental shelves, access is difficult and expensive, placing serious practical limits on what can be achieved.

Part of our predicament, therefore, as a species with amnesia, is that huge areas of the planet that we know for sure were used by and lived upon by our ancestors—the submerged continental shelves, the Sahara desert, the Amazon rainforest—have, for a variety of practical and ideological reasons, been badly served by archaeology. The truth is, we know VERY little about the real prehistory of any of these places, and the tiny patches that have thus far been surveyed and excavated within them are no legitimate basis upon which to draw conclusions and express certainties about the vast areas that remain unsurveyed and unexcavated.

Guatemala, in central America, was one of the six countries I suggested we put together to envisage the scale of the Amazon rainforest. Guatemala itself encompasses just under 109,000 square kilometers.[38] It's an indication of how pointless it is to take any so-called facts about the past for granted, however, that even in this tiny country, fifty times smaller than the Amazon, a huge archaeological surprise was unveiled in 2018.

"Everything is turned on its head," commented Ithaca College archaeologist Thomas Garrison on the results of a survey of 2,100 square kilometers of Guatemala's densely forested northern Peten region.[39] Deploying Lidar (Light Detection and Ranging) pulsed laser technology, what the survey revealed, in areas quite close to known and even famous and well-visited Mayan sites such as Tikal, were more than 60,000 previously unsuspected ancient houses, palaces, defensive walls, fortresses, and other structures as well as quarries, elevated highways connecting urban centers, and complex

irrigation and terracing systems that would have been capable of supporting intensive agriculture.[40] Previously scholars had believed that only scattered city-states had existed in an otherwise sparsely populated region, but the Lidar images make it clear, as Garrison puts it, that "scale and population density had been grossly underestimated."[41]

Katheryn Reese-Taylor, a University of Calgary archaeologist, adds:

> After decades of combing through the forests, no archaeologists had stumbled across these sites. More importantly, we never had the big picture that this data gives us. It really pulls back the veil and helps us see the civilization as the ancient Maya saw it.[42]

When pulling back the veil on the relatively recent Maya civilization in a small part of the tiny country of Guatemala can produce so many surprises, we may begin to imagine what "big picture" might come to light if the vastly larger and more opaque

veil that has covered the Amazon rainforest for so long were to be drawn back.

Hopefully the interest will be there and the funds made available for it to be drawn back thoroughly using the latest scanning technologies followed up by site surveys and excavations. Until that happens, however, no archaeologist is in any position to dismiss the possibility that the very old and very troublesome Australo-Melanesian genetic signal that has been detected among Amazonian populations might have gotten there by the “most parsimonious” route—namely, by a direct crossing of the Pacific from Australasia to South America.

That, in turn, would imply a civilization capable of great oceanic voyages and therefore by definition at a much more advanced stage of development than archaeologists are prepared to accept for any branch of humanity during the Ice Age.

13

BLACK EARTH

IT SEEMS TO ME TO be no longer in doubt that civilizations with true cities and mature polities did flourish in the Amazon before the European conquest. Less clear is how far back the story of these civilizations can be traced in this immense region where so little archaeology has been done.

Thanks to Anna Roosevelt's work we know, at the very least, that humans were present at Pedra Pintada at the Tapajoz/Amazon confluence by about 14,000 years ago and possibly significantly earlier.[1] With other more accessible painted rock shelters in Brazil dating back as much as 50,000 years, it is, I suspect, only a matter of time before evidence of at least equally great if not greater antiquity emerges from the Amazon itself.

But greater antiquity of what? Was it foragers and hunter-gatherers all the way back? Or was some advanced but unseen presence capable of spanning the globe at work behind the scenes of prehistory that might help to explain how Australasian genes reached the Amazon during the Ice Age? Again, the problem is complicated by the fact that few archaeologists other than Roosevelt have looked for evidence of humans in the Amazon at all at such a remote period, so we have very little to go on across thousands of years during which the data are sketchy and inconclusive.

But then out of that opaque interlude in the life of the prehistoric Amazon, quite suddenly and unexpectedly, the lineaments of a great mystery begin to materialize. It concerns the "exemplary agronomy" that UCLA's Professor David Wilkinson cites as his two-word explanation for how the cities of the rainforest were able to feed their large populations—because rainforests in general do **not** have good base soils but sustain their fertility in the mulch of plants and leaves above ground.[2] This is why, when areas of the Amazon are cleared for agriculture today—for example, to make way for soybean plantations—they become exhausted, infertile, and useless after only a few years.[3] But Wilkinson is not speaking of the base soils. His "exemplary agronomy," as we shall see, refers to an artificial, **man-made** soil that first suddenly and inexplicably appeared in the Amazon many thousands of years ago but that has such miraculous properties of self-regeneration that it is still in use for agriculture and still incredibly productive today.

It is called *Terra preta*. More than any other single factor, it is now understood by scholars to have been responsible for the astonishing and utterly anomalous agricultural productivity that allowed a population estimated at between 8 and 20 million people[4] to thrive for untold epochs in the Amazon before being overtaken by the cataclysm of the European conquest.

Terra preta feels like the work of scientists, but if there was a civilization in the Amazon, then why should we be surprised to find scientific achievements to its credit?

THE MYSTERY

THE EXISTENCE OF TERRA PRETA was first reported by Europeans in colonial-period Brazil who called it *terra preta de Índio* (Indian

Black Earth), "the reference to 'Indians' reflecting the presence of abundant pottery shards of evident pre-Columbian age on the surface of most known exemplars."[5] Today these special soils, described by one nineteenth-century explorer as consisting of "a fine, dark loam, a foot, and often two feet thick,"[6] are more often spoken of as "Black Earth," "Amazonian Anthropogenic Dark Earths,"[7] or simply as "Amazonian Dark Earths"—ADEs for short.[8]

Whatever we call them though, what are they, and why do they matter?

We've seen how, across immense areas, the natural *terra firme* (non-floodplain) soils of the Amazon are too poor to sustain intensive agriculture and thus to feed the large-scale populations that we now know inhabited the region in pre-Columbian times:

> With few available nutrients and having extremely high aluminum concentrations, one could not imagine a worse regime for productive agriculture.[9]

Indeed, the consensus of scholars is that even the floodplains with their better soils are high-risk areas for crop production "because of the unpredictability of the flood regime."[10]

But, and it's a big but, what are we to make of those early explorers' reports of dense settlements extending for kilometers along river bluff edges whence roadways branched out into the interior?

The remnants of some of these settlements are now being investigated by twenty-first-century researchers, no longer blinded by the prejudices of the past, who often refer to them as "garden cities" of the Amazon.[11] Invariably it turns out that they are associated, as one authoritative study puts it, with large acreages of "'Indian black earth' or *terra preta*. The heightened fertility status of these soils, generically termed 'dark earths …' has long been recognized by the indigenous inhabitants of the region, as well as by current colonists."[12]

Across the rainforest there are many **thousands** of expanses of terra preta on a similar range of scales, covering a total area that is in all honesty unknown but that various authorities have guesstimated at 6,000 km^2, 18,000 km^2, 154,063 km^2, and "an area the size of France" (i.e., around 640,000 km^2).[13] Whatever the true figure, these widely scattered plots of ADE—the rediscovered remnants of a once much more extensive system—are indeed actively sought out and productively cultivated by indigenous people to this day.

In the southeastern Amazon along the Xingu River, to give just one example, a recent study found that existing settlements, though on a much smaller scale than in the past, are still able to survive largely because of the accomplishments of their ancestors who had "continuously occupied, managed and modified" the soils over thousands of years. Almost without exception the riverine people of the Xingu today "inhabit and plant in dark earths," and make use of

resources, such as “Brazil nuts, babassu palm, dark earths and vine forests” that are “indicators or products of this earlier occupation.” Indeed, as Stephen Schwartzman, the research team leader, maintains, “Contemporary land use and resource management in the Xingu corridor is … significantly conditioned or made possible by mostly little-studied prehistoric land-use practices.”[14]

Particularly little studied and poorly understood are the practices that resulted in the so far unexplained inception in the Amazon, a very long time ago, of the incredibly fertile ADEs themselves. Nobody doubts that they are “anthropogenic”—man-made in some way[15]—and everyone agrees that they’re an amazing success story. So fecund is terra preta, even after thousands of years of use, that it can still regenerate barren soils it is added to, and has been described as “miracle earth.”[16]

The important questions therefore, are *how* was terra preta made, *why* was it made, *when* was it made, and *who* made it?

Part of the answer to the first question is often dug up by villagers along the Xingu River. In (and characteristic of) the patches of ancient terra preta where they plant their crops they "regularly encounter potsherds, stone axes, ceramics and figurines."[17]

Such "refuse" left behind by people of the remote past, seems to play an important role in the amazing fertility of the ADEs—but then so do all the other strangely jumbled and juxtaposed ingredients that typically also include compost, the feces and urine of humans and animals, and all sorts of organic "kitchen" waste, including bones, notably fish bones.

Most researchers believe that terra preta soils formed as composted material accumulated via **incidental** human activity (often in debris piles referred to as middens).[18]

University of São Paulo archaeologist Eduardo Neves reportedly favors a scenario in which successive generations could have swept

food refuse—especially fish and animal bones—from their dwellings and then added human and animal excrement.[19]

Elsewhere, in a paper published in the *Journal of Archaeological Science* in February 2014, Neves, Michael Heckenberger, and others develop this idea further. Their argument depicts the ancient Amazonians as living amid a shitscape (euphemistically referred to as a "middenscape"),[20] dumping their excretions, rubbish, broken crockery, and fish bones into the middens and—most importantly—burning wet vegetation on top of the middens, and always conscientiously making sure, without any long-term planning or purpose in mind, to keep the fires damped down under a blanket of dirt and straw.[21]

This method of cool-burning, explains Tom Miles, an expert in the combustion and gasification of biomass,[22] is known as "slash-and-char"—to distinguish it from the widely condemned "slash-and-burn":

> In slash-and-burn, dry brush and grass are burned in open fires, spewing vast quantities of carbon dioxide into the atmosphere and leaving only small amounts of nutrients in the ash that's then dug into the ground.
>
> By contrast, slash-and-char involves burning wet vegetation, so it smoulders underneath a layer of dirt and straw. Robbed of oxygen, the fire only partly burns any wood or stalks, leaving most as tiny chunks of charcoal. This bio-char is turned into the soil.[23]

In due course—entirely incidentally and accidentally according to most proponents of such views—these stinking, smouldering middens spread and alchemically transformed themselves into ADE, "the world's most fertile soil,"[24] without any deliberate human intervention at all.

I'd say it's an unlikely story!

I can't prove it but my bet is that terra preta is not an *accidental* by-product of shit, fish bones, broken pots, figurines, stone ax heads, and low-temperature fires. Just because it contains all those things doesn't inevitably make it fortuitous. I think the evidence supports another possibility—that this remarkable soil was *invented,*

making excellent use of freely available local resources, as an ingenious, low-tech, and environmentally friendly way to increase agricultural yield in areas that would otherwise not have been able to sustain agriculture, and thus large populations, even for a few decades, let alone for several thousands of years—as the Amazonian Dark Earths have consistently demonstrated a "miraculous" ability to do.

"What has been mysterious about these soils," Professor Antoinette WinklerPrins, director for environmental studies at Johns Hopkins University, admits, "is their ability to persist in a landscape that common ecological knowledge would dictate they could not.[25]… Why then have ADE's dated to have formed up to 2500 years ago, continued to exist?"[26]

It is not just a matter of 2,500 years ago—as we shall see, the origin of the Amazonian Dark Earths goes back much farther than that—but here's how Dr. WinklerPrins answers her own question:

> The unique nature of the carbon in these soils is the key to the stability of the organic matter in ADE's and the key to the mystery of the persistence of ADE's in this landscape.[27]

There appears—exceptionally—to be universal agreement among scientists on one point. This is that the explanation for all the useful qualities of terra preta "lies in large part with the char (or biochar) that gives the soil its darkness" and that is produced, as Tom Miles explained, by the smouldering (rather than hot burning) of organic matter in an oxygen-poor environment. The results are not properly understood, but, according to *Nature,* "The particles of char produced this way are somehow able to gather up nutrients and water that might otherwise be washed down below the reach of roots."[28]

William Balée, professor of anthropology at Tulane University, confirms these observations, adding that "microbial activity leads to increased carbon sequestration," and that "ADE is richer and more diverse in microbes than surrounding soils, even though millions of

these species remain to be identified precisely, and literally *a million separate taxa can be contained in only 10 grams of soil*. A significant proportion of the microbes in ADE are different from microbes in the surrounding primeval soils."[29]

Another authoritative study also focused on the surprising microbial vigor and utility for agricultural purposes of ADEs, noting a further connection with the managed use of fire. "Fire contributes charcoal and ash, which increase soil pH, thereby suppressing aluminum activity toxic to plant roots and soil microbiota."[30]

What is more, fire increases the capacity of the soils to retain nutrients, thus maintaining a "synergistic cycle of continued fertility."[31]

In summary, concedes Professor WinklerPrins, the microbial complexes associated with ADEs are "poorly understood" and "quite mysterious actually."[32] Likewise, even the authors of the shitscape/middenscape theory of ADE formation admit that "despite

the importance of research on *terra preta,* we still lack a firm understanding of the specific formation processes that led to the diversity inherent in these anthrosols."[33]

Yet all this mystery, all this effectiveness, all this efficiency, and all these remarkable contributions to welfare, we are asked to believe, came about as incidental by-products of human activity? They just *happened*—without any planning, or deliberation, or design at all?

I could see immediately why such ideas would give comfort to archaeologists whose roller-coaster ride thus far has taken them from a position where they had convinced themselves and their students that there could never have been any cities in the Amazon, to a position where they must now accept that the prehistoric rainforest once teemed with cities. This in itself has been a traumatic enough paradigm shift. I'm therefore not surprised that most archaeologists remain unwilling to go the extra mile needed to

view terra preta—that "miraculous" agent of fertility—as the product of deliberate, ingenious, organized, focused, *scientific* activity. It causes far less cognitive dissonance, for so naturally conservative and cautious a discipline, to conclude instead that it was the waste and refuse of those previously contested Amazonian cities with their very large populations that had accidentally fertilized the land and made possible the otherwise anomalous boost to agricultural productivity that had kept the stomachs of the otherwise anomalous urban populations full.

But isn't it much more likely that all this happened the other way around?

Surely it makes no sense that the large populations came first. If they did, how did they feed themselves while enough shit and fish bones were being accumulated to create the first patches of terra preta? Isn't it more logical that the settlement and expansion of human populations in the Amazon was a planned affair in which the

spread of terra preta was a *precondition* for the development of large settlements rather than a consequence of it?

Professor Balée, not an archaeologist, seems to be thinking somewhat along these lines when he cites the bizarre microbial differences between ADEs and the original, unenhanced soils that surround them as evidence for a deliberate human "contribution to microbial diversity in the Amazon, a remarkably intriguing and still living, even evolving legacy of the pre-Columbian Dark Earth people."[34]

REMARKABLE AND PRECOCIOUS SCIENCE

AS WITH SO MUCH ELSE that concerns the Amazon, the issue of **when**, exactly, terra preta first began to be created continues to be fogged by confusion and uncertainty.

A casual glance through the scientific literature might leave the reader with the impression that these exceptionally fertile anthropogenic soils are a phenomenon of the past 3,000 years only—with the great bulk of terra preta creation taking place between about 1,000 years ago and the time of the European conquest.[35]

Look closer, however, and you will discover that many of the same authorities are tiptoeing around the edges of another mystery here.

For example, while reemphasizing their satisfaction with the idea that Amazonian Dark Earths are "produced by human habitation but unintentionally,"[36] and noting that ADE formation "ceased in most, if not all, parts of Amazonia during the early Contact period,"

Eduardo Neves and his colleagues concede that "the initiation of ADE formation has been more difficult to explain so far."[37]

They choose to focus on the period from around 2,500 to 2,000 years ago but caution that earlier sites may have disappeared due to the dynamic landscape processes of the Amazon, or perhaps because "the soil organic matter in most older ADE sites has been mineralized, leaving only inorganic artifacts behind, without coloration of the substrate by organic matter, and thus, early sites are under-represented."[38]

But by no means all of the earlier sites have disappeared. Enough of the older plots remain for several of the leading authorities to agree that 2,500 years ago is nowhere *near* the beginning of the story. Neves himself accepts the existence of much older ADE sites, notably "the sites of the so-called Massangana phase … dated ca. 4,800 BP."[39]

These sites, which are about 300 years older than the orthodox date for the construction of the Great Pyramid of Giza, are located in southeast Amazonia in the Jamari River area. Unfortunately, they are no longer accessible, having been flooded by the construction of the Samuel hydroelectric dam.[40] It seems, however, that there are even older ADEs. In the *Proceedings of the Royal Society,* for example, Neves and others report Black Earths that are between 5,000 and 6,000 years old.[41] Elsewhere—in no less august a journal than *Nature*—we read of ADEs that "are thought to be 7000 years old."[42]

Nor does the trail leading back to humanity's time of amnesia quite fade from view even there. Specialists from Cornell University's Department of Crop and Soil Sciences, joined by Eduardo Neves and citing his "unpublished data," conclude in the *Journal of the Soil Science Society of America* that the man-made

Dark Earths of the Amazon in fact date back as far as 8,700 years ago.[43]

And again, Neves's own caution must surely apply—that even older sites than this may very well once have existed but have disappeared with the passage of time.

Given the incredible longevity of this soil and its extraordinary ability to regenerate its own fertility through microbial action, it is by no means beyond the bounds of reason to suppose that plots of terra preta dating back to the last Ice Age might *still* exist somewhere in the millions of square kilometers of the rainforest that have never been investigated by archaeologists at all.[44]

What is certain, however, is that a remarkable and precocious skill and competence in soil science—"exemplary agronomy" in Professor David Wilkinson's phrase—leaves its fingerprints in the Amazon at least 8,700 years ago. After that (and for how long *before* that we do not know) its use becomes integrated into the

harmonious and successful lifeways of ancient Amazonian civilization. This civilization thrives for millennia, long outlasting ancient Egypt and ancient Mesopotamia, doing very well for itself and for its people in just about every possible way, until the catastrophe of European contact that not only subjects it to genocide by sword and by epidemic, but also conspires to deny its very existence for centuries thereafter.

Reader, please note—when I speak of an "ancient Amazonian civilization" I am not under any circumstances claiming that this was **the** lost civilization I have spent much of my working life trying to track down! My suggestion, rather, is that, in weighing what happened in the Amazon from the Ice Age until the European conquest, we may find that certain striking anomalies such as the mysterious Australasian genetic signal, and indeed the Amazonian Dark Earths themselves, bear the fingerprints of that world-exploring, world-encompassing, world-measuring lost civilization of prehistoric antiquity. More specifically, the proposition we are

presently considering in this context is that the settlement and expansion of human populations in the Amazon was a planned affair in which the spread of terra preta was a *precondition* for the development of large population centers rather than a consequence of it.

It was, in other words, not something random at all but an integral part of a carefully thought-out project.

14

GARDENING EDEN

FURTHER INTRIGUING HINTS THAT SOME sort of intelligent, guided *project* was mounted in the Amazon thousands of years ago are to be found in recent studies of the species of trees that populate the rainforest. These studies demonstrate that far from being a "pristine" natural environment, the Amazon is largely a *human creation*.

Anna Roosevelt, whose sometimes radical views we've already encountered, criticizes other scientists for assuming—all too often—that the Amazon's forests are entirely works of nature "without conducting research to exclude a human influence."[1]

When that research is done, it turns out that while "Amazonian forests in different regions differ significantly from one another in topography, climate, geology, hydrology, structure, seasonality, and history," they nonetheless "often resemble each other" in showing a "pattern of unexpected dominance and density of a small group of plant species. This pattern has been found wherever Amazon forests have been inventoried and has yet to be explained by natural factors."[2]

The best current estimate is that the Amazon is presently home to about 16,000 woody tree species. Out of this total, however, "only 227 hyperdominant species dominate Amazonian forests."[3] These so-called oligarchs (from the Greek for "rule by a few") "make up

only 1.4% of all the Amazon forest species but almost half of the trees in any given forest."[4]

In 2017 a large international team of ecologists and archaeologists, led by environmental science researcher Carolina Levis of Wageningen University in the Netherlands, completed a study looking into this peculiar pattern of distribution. What immediately stood out in their data was that, among the oligarchs, "domesticated species are five times more likely than nondomesticated species to be hyperdominant."[5]

Moreover, in almost every case where clusters of hyperdominants were inventoried, ancient archaeological sites were found among them[6]—a correlation so frequent and reliable that the presence and concentration of oligarchs could, in theory, be used to "predict the occurrence of archaeological sites in Amazonian forests."[7]

The team's detailed analysis, published in *Science,* therefore concludes that "modern tree communities in Amazonia are

structured to an important extent by a long history of plant domestication by Amazonian peoples. … Detecting the widespread effect of ancient societies in modern forests … strongly refutes ideas of Amazonian forests being untouched by man. Domestication shapes Amazonian forests."[8]

We've seen that the question of exactly when human beings first arrived in the Amazon remains to be settled. So, too, does the question of exactly when they began to domesticate trees. The team's results suggest that "past human interventions had an important and lasting role in the distribution of domesticated species found in modern forests, despite the fact that the location of many archaeological sites is unknown."[9] On present evidence, however, adds Levis, all that can be said with certainty is that at some point "more than 8,000 years ago," Amazonian people were already focusing attention on certain trees that were particularly useful to them.

> They really cultivated and planted these species in their home gardens, in the forests they were managing.[10]

Among the favored species mentioned in the *Science* paper, now all hyperdominant, are *Bertholletia excelsa* (the Brazil nut tree), *Inga edulis* ("Ice-Cream Bean," a fruit tree), *Pourouma cecropiifolia* ("Amazon Grape," a fruit tree), *Pouteria caimito* (the abiu, a fruit tree), and *Theobroma cacao* (the cocoa tree—chocolate).[11]

Other prized Amazonian species domesticated in ancient times include the açai palm and tucuma palm, the peach palm, the Cupuaçu tree, the cashew tree, and the rubber tree.[12]

A MAJOR CENTER OF CROP DOMESTICATION

AS I RESEARCHED THIS MATERIAL I was initially surprised to learn that cocoa trees and rubber trees, both of which I'd wrongly believed were indigenous to and had been domesticated in Mexico, were in fact originally South American species and had been domesticated in the Amazon. I was equally surprised to learn that capsicum—chili peppers, red and green bell peppers, et cetera—which I had again wrongly thought were Mexican in origin, had likewise first been domesticated in the Amazon.[13]

Indeed, though often overlooked, Amazonia has rightly been described as "a major center of crop domestication" on a global scale.[14] Prior to the European conquest, according to Charles R. Clement of Brazil's National Institute of Amazonian Research, "at least 83 native species were domesticated to some degree, including manioc, sweet potato, cacao, tobacco, pineapple and hot peppers, as well as numerous fruit trees and palms, and at least another 55 imported neotropical species were cultivated."[15]

Pineapples! There was another surprise for me, as I had (again wrongly) always assumed that these tropical fruits grow on trees and had their origins in some Pacific archipelago, perhaps Hawaii. In fact, the pineapple plant with its long, spiky leaves, is not a tree. It grows close to the ground (with each plant producing a single pineapple), belongs to the Bromeliad family, and is indigenous to, and was first domesticated in, the Amazon rainforest.[16]

There is no firm information on *when* domestication was undertaken, but in Charles Clements's view, "The widespread distribution of the pineapple in the Americas at the time of the European conquest, the diversity and quality of the cultivars, not surpassed after one century of modern, intensive breeding, the diversity of uses, the economic and cultural importance of the crop, all point to a very ancient domestication."[17]

Out of the 83 crops native to Amazonia and the 55 "exotic" ones, a total of 138 crops in all, Clements and his colleagues classify 52,

including the pineapple, as fully domesticated. Of these, 14 (27 percent) are fruit or nut trees or woody vines. Among the 41 crops classified as semi-domesticated, 35 (or 87 percent) are fruit or nut trees or woody vines. Among the 45 crops classified as incipiently domesticated, all but 1 are fruit or nut trees:[18]

> Overall, 68% of these Amazonian crops are trees or woody perennials. In landscapes largely characterized by forest, a predominance of tree crops is perhaps not surprising. Nonetheless, the most important subsistence crop domesticated in Amazonia is an herbaceous shrub, manioc, and several other domesticates are also root or tuber crops, most of which are adapted to savanna-forest transitional ecotones with pronounced dry seasons.[19]

Think of it. The rainforest was coaxed, shaped, and transformed by what can only be described as scientific practices into a vast garden of useful and productive trees. But trees alone cannot feed large populations, so the prehistoric domestication program was extended on a massive scale to include agricultural species that were

then successfully incorporated, through the use of terra preta, into the Amazonian ecology.

THE MANIOC CONUNDRUM

MANIOC, THE KEY STAPLE, "THE most important food crop that originated in Amazonia,"[20] and on which the majority of the population of the Amazon still depend today,[21] is of particular interest for a number of reasons. Molecular analysis has confirmed that this woody shrub, cultivated for its edible roots, was domesticated in the Amazon basin, "most likely in the savannas, the Brazilian *Cerrado,* to the south of the Amazon rainforest,"[22] and more specifically "in northern Mato Grosso, Rondônia and Acre states, in Brazil, and adjacent areas of northern Bolivia.

Domestication must have started before 8,000 BP, as that is the earliest date reported from the Zana and Ñanchoc valleys of coastal Peru."[23]

Unlike the Amazon itself, large parts of which remain inaccessible to archaeologists, these two coastal Peruvian valleys have been well studied, yielding, as well as manioc, "evidence for radiocarbon-dated human cultivation of squash (9240 and 7660 yr B.P.), peanut (7840 yr B.P.), quinoa (8000 and 7500 yr B.P.), and cotton (5490 yr B.P.)."[24]

What is notable, however, is that all of these crops had **already** been domesticated elsewhere before being grown in coastal Peru.[25]

As with cocoa and chilies, I'd long been under the impression that the squash plant (*cucurbita*) was first domesticated in Mexico around 10,000 years ago, and indeed there is archaeological evidence to support this.[26] But now here it was turning up in Peruvian coastal valleys 9,240 years ago, and not only there but at

similar dates in the nearby sites of Paiján and Las Pircas.[27] An authoritative study published in *Science* suggests that these cultivated Peruvian squash plants may have been from a line that had originally been domesticated not in Mexico but in "southwestern Ecuador and the Colombian Amazon" as early as 10,000 to 9,300 years ago.[28]

What about the peanuts cultivated in the Zana and Ñanchoc valleys 7,840 years ago? They, too, it turns out, were domesticated east of the Andes in a region extending south from the southern edge of the Amazon basin.[29] This is broadly the same region in which manioc was also domesticated,[30] and in both cases we can only go on the dates of the earliest surviving materials—currently put at around 8000 years BP[31]—to guess when domestication in fact took place. Certainly it was before 8,000 years ago, but how long before is a matter largely of conjecture and some authorities are

already seeking to push the horizon back to at least 9,000 and perhaps 10,000 years ago.[32]

Manioc, also known as cassava, is a starchy crop, a good staple providing almost twice as many calories as potatoes weight for weight.[33] But it is also so low in protein content that, as one specialist warns, "in manioc-dominated diets, protein-deficiency can lead to malnutrition and also aggravate symptoms related to manioc cyanogenic toxicity."[34]

We'll return to that issue of toxicity in a moment but let's note, meanwhile, that peanuts have a very high protein content that makes them a perfect nutritional "complement to starchy manioc-based diets."[35] Several authorities have noticed the pairing of the two in ancient cultures and British botanist Barbara Pickersgill speculates that the wide prehistoric distribution of peanut cultivation may have accompanied the spread and uptake of manioc.[36]

Again I can't help but wonder if there might not have been something more active and intentional at work behind the scenes of this process than mere "accompanying." What I have in mind is the possibility that a deep knowledge of plants and of their nutritional and other properties might have *preceeded* the first domestication activities that we have evidence for. Surely it is only on the basis of such foreknowledge that crops like groundnuts and manioc could be selected, domesticated, planned, and planted to complement each other's nutritional contribution to human welfare?

This is pure speculation, of course. But it's strengthened somewhat by the curious nature of the manioc roots themselves, which (although there are many varieties) are classified into two main categories—"bitter" and "sweet." All contain compounds known as cyanogenic glucosides, found in low concentrations in the less popular sweet varieties and in very high concentrations in the greatly prized and more widely used bitter varieties.[37] The need-to-

know element here is that if you eat any of the "bitter" varieties, without first processing them in the correct way (extracting the glucosides), you will at least suffer from "cyanic intoxication, with symptoms like vomiting, dizziness, and paralysis," if not die of cyanide poisoning.[38]

Ignorant of this, several of the soldiers on Francisco de Orellana's sixteenth-century voyage down the Amazon ate unprocessed manioc roots. They survived but became mightily sick, near to death, as a result.[39] To avoid poisoning they would have had to peel the roots, then grate them, then strain and press the resulting mash to remove the hydrocyanic acid, and at last toast it to produce a fine faintly yellowish flour[40]—simple but absolutely essential procedures that the indigenous peoples of the Amazon have followed for thousands of years to make "bitter" manioc safe.

The fundamental question, however, is exactly how and when this processing system was first devised? Obviously since we have

evidence of the cultivation of domesticated manioc by 8,000, or perhaps even as much as 10,000 years ago, it follows that the ability to process it must already have been developed by then. It would make no sense to anybody to go to all the trouble of domesticating a species and then growing crops from that species that nobody could eat without getting horribly, and perhaps lethally, sick. That's why I keep coming back to the haunting possibility that some person or group of people with an interest in the Amazon *already* understood the potentials of manioc—and the exact steps that would have to be taken to avoid its dangers—long before they ever chose to domesticate it and put it under cultivation.[41]

Otherwise, frankly … why bother?

PLANT GNOSIS

THE MANIOC ISSUE LOOKS SIMPLE. You just need to peel it, grate it, soak it, strain it, and meticulously cook it to remove the poison, and it is transformed into a useful staple.[42] All steps of the processing seem rather obvious and basic in retrospect, but consider the amount of trial and error—the number of volunteers you would have had to make sick or kill—before you arrived at the right method.

And what would motivate you to start such a project in the first place, unless you already knew the potential of the wild progenitor that would eventually become domesticated manioc?

The same problem looms on an even larger and more complex scale with other plants of the Amazon, the uses to which they are put, and the processing they require. Anthropologist Jeremy Narby, author of *The Cosmic Serpent: DNA and the Origins of Knowledge,* draws attention to curare, the blow-gun and arrow poison, invented —we do not know when—in the ancient Amazon. It produces paralysis and death by asphyxiation as the muscles required for

breathing cease to function. It is used, Narby explains, because "it kills tree-borne animals without poisoning their meat while causing them to relax their grip and fall to the ground. Monkeys, when hit with an untreated arrow, tend to wrap their tails around branches and die out of the archer's reach."[43]

A very useful hunting aid, therefore, and one, moreover, that has been adopted into modern medical anesthesiology. But the real mystery, as Narby goes on to show us, is how it was ever invented in the first place. The consensus among scholars is that curare, of which there are forty types in the Amazon made from seventy plant species, was stumbled upon by chance experimentation.[44] Narby doubts this scenario:

> To produce it, it is necessary to combine several plants and boil them for seventy-two hours, while avoiding the fragrant but mortal vapors emitted by the broth. The final product is a paste that is inactive unless injected under the skin. If swallowed, it has no effect. It is difficult to see how anybody could have stumbled on this recipe by chance experimentation.[45]

The whole mystery of the Amazonian plant medicines, notably the vision-inducing brew ayahuasca (which itself is a mixture of several plants that are most unlikely to have been fortuitously brought together) is explored in depth in my 2005 book *Supernatural: Meetings with the Ancient Teachers of Mankind*. In these medicines, as in curare, as in terra preta, and as in the incredible burst of domestication of plants and trees in the Amazon that followed the end of the Ice Age, could we be looking at the cultural DNA not only of a civilization but of a sophisticated civilization that had developed sciences of its own that it began to share with other people—very much including the peoples of the Amazon basin—around the time that the last Ice Age came cataclysmically to its end?

Judging from the clues that lie scattered like tantalizing jewels across the Amazon, this hypothetical lost science of a hypothetical lost civilization would have looked very different from any of our own sciences, employing not only empirical methods but also

shamanistic techniques, vision quests, and out of body encounters in the "spirit world" that most modern Western intellectuals would regard as absurd. Again, however, if we go by the evidence of the Amazon, the plain fact is that the remnants and borrowings of this supposedly laughable form of science have again and again produced practical and down-to-earth results—domesticating and processing huge numbers of plants and trees, for example, or creating "miracle" soils that are still fertile after thousands of years of use, or inventing muscle relaxants like curare that inhibit acetylcholine receptors at the neuromuscular junction. Moreover, unlike Western technology, to which the earth is a dead thing, this ancient technology addresses all the needs, spiritual as well as physical, of the human creature. Again, though the skeptics will scoff, none of the many thousands of people who've had their lives transformed by ayahuasca in the past 20 years would deny that something very powerful and very hard to explain is at work here.[46]

15

SACRED GEOMETRY

FROM THE TIME OF ITS earliest appearance in the archaeological record (which is absolutely not the same thing as the time that it first took shape) Amazonian civilization is a continuum that does not break from the wisdom and insights of its founders. The same basic principles, defining the relationship between humanity and the cosmos continue to manifest and to be re-expressed over thousands

upon thousands of years, in some cases evolving and developing into strange new growths, in others devolving and decaying. But just like that enigmatic Australasian genetic signal still found among Amazonian peoples today, other traces of ancient and mysterious connections, though faint, have also survived.

For example, despite rejecting the old stereotypes of the "savage" and "primitive" Amazon, and despite knowing that prehistoric civilizations of some complexity had once flourished there, scientists at the beginning of the twenty-first century were nonetheless taken aback to be presented with overwhelming evidence of an ancient practice of *geometry* in the rainforest—and on a very ambitious scale.

Let's get one thing straight before we take a closer look at this mystery. Just because people live in a dense jungle, and haven't attended math classes in high school, does **not** mean they have no grasp of geometry—"one of the deepest and oldest products of

human reason."[1] On the contrary, though often wrongly attributed to Euclid, there is compelling evidence—mysterious in itself—that "the conceptual principles of geometry are inherent in the human mind."[2] This evidence comes from an isolated region at the heart of the Amazon where scientists from the Cognitive Neuroimaging Unit of the Collège de France led a study in which the indigenous Mundurukú people were tested on basic geometry skills. The study found that:

> Mundurukú children and adults spontaneously made use of … the core concepts of topology (e.g., connectedness), Euclidean geometry (e.g., line, point, parallelism, and right angle), and basic geometrical figures (e.g., square, triangle, and circle) … and they used distance, angle, and sense relationships in geometrical maps to locate hidden objects.[3]

In summary, therefore, isolated peoples in remote parts of the Amazon today, whose contact with technological civilization is extremely limited,[4] possess innate geometrical knowledge and are

able to deploy it "independently of instruction, experience with maps, or measurement devices."[5] No doubt their ancestors, and probably most humans always, have been blessed with the same neurological gift. Indeed, we see it made manifest down the ages in all kinds of man-made structures. Even the simplest wattle-and-daub hovels tend to be rectangular or square rather than randomly shaped. Likewise, from England's Stonehenge, to the Great Pyramid of Egypt, to India's Madurai Meenakshi Temple, to Borobudur in Indonesia, to Angkor Wat in Cambodia, to Tikal in Guatemala, to Tiahuanaco in Bolivia—and to countless other sites too numerous to mention—the design of the sacred architecture of the world is entirely governed by geometry.

The very universality of this geometry, as an innate faculty of the human mind, is not in doubt, but how it has been **expressed** by different civilizations in different epochs is culturally driven. Thus, Angkor Wat is not the Great Pyramid and the Great Pyramid is not

Stonehenge. All three, however, share the same fundamental geometries and connections to the cosmos that—I have long argued—were incorporated into a *system* of architecture central to the beliefs and lifeways of a lost civilization of remotest prehistory. When that civilization was destroyed in the series of cataclysms that brought the last Ice Age to an end, there were survivors who took the system with them, seeking to replant it in the many different parts of the world where they found refuge. In some it took root and flowered early, and over thousands of years it manifested in multiple different ways; in others it lay dormant for millennia before bursting into exuberant life.

Mainstream archaeology recognizes no such universal system, nor even the vestiges of one, and insists that there was no "diffusion" of ideas between these ancient cultures (*How could there be when Angkor is 3,500 years younger than the Great Pyramid?*). The point is fair but irrelevant to my proposition which does not require diffusion within the past 5,000 or even the past

10,000 years. Instead I suggest that the similarities and differences between certain ancient monumental structures, created around the world at different times by different cultures, are best explained by a remote common ancestor civilization that left a legacy of ideas and *knowledge* in which they all shared, which their priests, shamans, and sages sought to preserve, and which they in due course deployed in their own different ways.

One of the hallmarks of this worldwide "system," whether its widespread presence is coincidental or not, is geometry. And, in turn, whenever the geometry manifests on a monumental scale that could only be achieved by skilled specialists and a large, well-organized workforce, the obvious implication is that a fairly advanced civilization must have been involved.

That was why, when giant geometrical earthworks were discovered in the Rio Branco area of the Brazilian state of Acre in the southwestern Amazon in 1977 nobody at first paid much attention. This was the era when the Smithsonian's Betty Meggers

still reigned supreme over all things Amazonian. Her *Man and Culture in a Counterfeit Paradise* had been published just 6 years before and her view that the jungle could never have supported large populations or any form of civilization capable of monumental architecture was the full-blown dogma of the day. Little wonder then, although the Smithsonian had sponsored the National Program of Archaeological Research in the Amazon that found the first "geoglyphs," that it did not announce the discovery until 11 years later.[6]

Locations of principal earthwork sites in the southwestern Amazon discovered by 2018.

The young man who actually spotted the earthworks from a Smithsonian survey aircraft was Alceu Ranzi, and it was he who named them "geoglyphs."[7] His career took him elsewhere for the next two decades but his interest was sparked again after another overflight in 1999 and, now at the Federal University of Acre, he resumed his research together with colleagues Denise Schaan of the Federal University of Pará and Martti Pärssinen of the University of Helsinki.

Their first detailed results were published in the December 2009 issue of *Antiquity,*[8] which trailed the findings as evidence of the existence in ancient times of "a sophisticated pre-Columbian monument-building society in the upper Amazon Basin on the east side of the Andes. This hitherto unknown people constructed earthworks of precise geometric plan connected by straight orthogonal roads."[9]

At the outset of the paper, Ranzi, Schaan, and Pärssinen described “clusters of these monumental earthworks” mostly located on a 200-meter-high plateau:

> Formed by excavated ditches and adjacent earthen walls … the earthworks are shaped as perfect circles, rectangles and composite figures.[10]

But why had these stunning Amazonian geoglyphs first been noticed only a few decades previously?

Ranzi and his colleagues observe that while the geoglyphs were abandoned about 500 years ago, and then heavily overgrown, they have since been revealed by mass clearing of the forest for the cattle industry, thus becoming visible, especially from the sky, over the past 30 years. Indeed, the enormous size of the geoglyphs makes it easier to distinguish their shape and configuration from an aerial perspective than at ground level, and satellite imagery has been made freely available to researchers by Google Earth.[11]

NAZCA–AMAZON CONNECTIONS

TO THE EXTENT THAT THEY are best seen and understood for what they are from the air rather than from ground level, comparisons with the famous "Nazca Lines" of southern Peru were inevitable, and quickly began to be made—particularly so since, in addition to its giant images of animals and birds, the Nazca plateau also features many precise geometrical figures.[12]

Ranzi himself has invited the comparison by asserting that the Amazon geoglyphs are "as important as the Nazca Lines"[13] and, indeed, his own use of the term "geoglyphs" was, according to his colleague and coauthor Denise Schaan, inspired by the figures on the Nazca plateau. This, Schaan argues, is "unfortunate" because the Nazca Lines "are a different phenomenon. In the Nazca desert, geometric and zoomorphic figures were shaped by the displacement of dark, weathered rocks on the surface to expose a lighter

subsurface. In Brazil and Bolivia, however, the ‘figures’ were produced by the excavation of large, continuous ditches forming circles, rectangles, hexagons, octagons and other, nongeometric, shapes.”[14]

Nazca geometry. PHOTOS: SANTHA FAIIA.

I'm not persuaded by this distinction. Whether a painter uses oils or watercolors, the end result is still a painting. Likewise, although different techniques and materials were used—unavoidable given the very different environmental conditions of the Amazon and at Nazca—the end result in both cases is still a "canvas" decorated with immense geometric, as well as "nongeometric," shapes.

Though it is now more than quarter of a century in the past, I recall vividly my encounter with Maria Reiche, the venerable "lady of the lines," at her home in the town of Nazca where she had lived since 1945 surrounded by the ancient geoglyphs that it was her fate to study, protect, and introduce to the world. She had recently celebrated her ninetieth birthday when Santha and I met her in June 1993. Although bedridden with advanced Parkinsonism, her mind

was sharp and her voice clear when she shared with us her own view of the significance of the lines:

> They teach us that our whole idea of the peoples of antiquity is wrong—that here in Peru was a civilization that was advanced, that had an advanced understanding of mathematics and astronomy, and that was a civilization of artists expressing something unique about the human spirit for future generations to comprehend.[15]

I have already explored the mystery of Nazca in previous books so I won't go over old ground here except to note that among the most iconic of the Nazca geoglyphs, etched into the desert with a single unbroken line extending for more than a mile[16] and occupying an area of approximately 90 meters by 60 meters[17] is an image of a monkey. Its prehensile tail, stylized into a spiral, is a diagnostic feature of New World monkeys that distinguishes them from Old World monkeys.[18] However, no monkeys have ever lived in the Nazca desert. The nearest specimens, for example, capuchin

monkeys, spider monkeys, and woolly monkeys, are all native to the Amazon rainforest.[19]

TOP RIGHT: Nazca monkey. PHOTO: SANTHA FAIIA. TOP LEFT: Spiral Woolly Monkey tail. PHOTO: STEFFEN FOERSTER, DREAMSTIME.COM [26291981]. BOTTOM: Nineteenth-century illustration of Amazonian spider monkeys.

Another of the better-known Nazca geoglyphs looks like and is usually referred to as a spider. It has been suggested, however, that the huge 46-meter-long[20] image arguably does not depict a spider but a member of a closely related order of millimeter-sized arachnids, the "tickspiders" called Ricinulei.[21] More than seventy species have thus far been identified worldwide, not one of them in the Nazca desert. Nor should we expect any there. Ricinulei favor "tropical forests and caves"[22] and the nearest populations of this very peculiar creature to Nazca are in the Brazilian Amazon, specifically in central, eastern, and southern Amazonia.[23]

There are many strange things about the Ricinulei order, but strangest of all is a single feature that is regarded as its distinguishing anatomical characteristic.[24] As described by

Brazilian arachnologist Alexandre B. Bonaldo, this is its "system of sperm transfer, which is achieved by an elaborate copulatory apparatus in the male third leg."[25] Although barely a millimeter long, and difficult to discern without magnification, it was first pointed out by the late professor Gerald S. Hawkins of Boston University that this unusual reproductive extension, common to all Ricinulei species, is depicted in the correct place on the third leg of the Nazca "spider."[26]

Hawkins, however, was an astronomer, while Bonaldo, a real expert on South American spiders, disagrees, remarking in emails we exchanged in October 2018:

> The idea that the Nazca spider is a *Ricinulei* is kind of odd to me, since I always thought it was a myrmecomorphic spider such as the species of *Myrmecium* ... *Myrmecium* is an exclusive South American genus, being recorded from the Venezuelan Caribbean to southern Brazil, but the majority of the species (28 out of 38) are endemic to the Amazon Basin, including lower parts of the oriental Andean slopes in Peru, Ecuador and Colombia.

LEFT: Nazca "spider." PHOTO: SANTHA FAIIA. RIGHT: Greatly magnified, Myrmecium from the Amazon. PHOTO: ARTHUR ANKER.

I asked if I could quote him on this and he replied:

> Sure, you can quote it, if you want. I would add that that third leg "modification" shows no structures and is not bilateral. It appears to be just an extension of the drawing, as is common in other Nazca drawings.

Bonaldo then kindly referred me to Arthur Anker, a colleague of his who specializes in macrophotography, and Anker in turn provided me with the image of *Myrmecium* from the Amazon (specifically from the Tambopata Reserve, near Puerto Maldonado) that is reproduced here. It is, in my view, a far better candidate for the Nazca spider than Ricinulei—and once again what it suggests to me is that scientists, who observed nature closely, were at work in ancient South America. But let's lower our sights and simply say that the monkey and "spider" figures, with their Amazonian provenance, call, at the very least, for a rethink of Schaan's view that the Nazca Lines and the Amazon geoglyphs are unconnected phenomena.

SOME FACTS AND FIGURES ON THE AMAZONIAN GEOGLYPHS

WHAT IS THE GENERAL STRUCTURE and appearance of the geoglyphs uncovered in the southwestern Amazon in recent decades? In their 2009 paper in *Antiquity,* Schaan, Ranzi, and Pärssinen give us this broad overview:

> In general, the geometric figures are formed by a ditch approximately 11m wide, currently 1–3m deep, with adjacent 0.5–1m high earthen banks, formed by deposition of the excavated soil. Ring ditches have diameters that vary from 90 to 300m. … When there are two or more structures, they are usually connected by embanked roads. Some of the single rectangular structures may have short roads coming out of their mid-sides or corners. Composite figures include a rectangle inside a circle or *vice versa*.[27]

Some of the figures are quite roughly executed, others are extremely exact, and in some cases an exact figure is combined with

an inexact one in the same geoglyph, as at Santa Isabel, for example, where a large well-made octagon is juxtaposed with an imprecise circle.

By contrast, the geometrically austere Fazenda Parana site is "comprised of two perfect squares (200m and 100m wide) connected … by a 20m wide, 100m long causeway. The two squares are further connected to straight roads leading east and west, north and south."[28]

Fazenda Parana. **MAP AND PHOTO: MARTTI PÄRSSINEN.**

Fazenda Colorada. **MAP AND PHOTO: MARTTI PÄRSSINEN.**

More complex by far is the Fazenda Colorada site. Its geoglyphs consist of:

> one circle, a quadrangle and a double ditch structure which forms a three-sided square. The three-sided square double ditch is connected to a trapezoidal structure comprised by linear walls without ditches. Its south-western corner is open and connects to a *c*. 55m broad, avenue-like, road; on both sides of the entrance one can still see two high mounds, standing like towers. The road has embankments which border both sides, and, as it extends away from the entrance, it narrows, vanishing 600m further.[29]

Then consider the site known as Fazenda Atlantica. Here the principal geoglyph forms a square measuring 250 meters along each side. Quadrants are inscribed into the east and west corners and a circle 125 meters in diameter, connected to the square by a causeway 10 meters wide, lies 150 meters to the northwest.[30]

Magnetic North
3 50 100 200 Meters

Fazenda Atlantica. MAP AND PHOTO: SANNA SAUNALUOMA.

Defined by the avenue connecting the square and the circle, it is clear that the primary axis of Fazenda Atlantica runs northwest to southeast—an orientation that makes it a candidate for alignment to the setting sun on the June solstice and the rising sun on the December solstice. The reader will recall that Serpent Mound in Ohio is also aligned northwest to southeast to both these events. Its principal focus, signaled by its open jaws, is on the June solstice–midsummer in the Northern Hemisphere, where the Serpent is located, and midwinter in the Southern Hemisphere, where the Amazonian geoglyphs are located. Without an archaeoastronomical survey, however, it is impossible to say whether or not the general northwest to southeast alignment of Fazenda Atlantica is solstitial, and—if it is—whether any aspect of the site indicates priority given to one solstice over the other.

A similar northwest to southeast orientation is seen at Tequinho, another of the great Amazonian geoglyphs. When all its ancillary works were intact it extended over an area of 15 hectares (37 acres). What remains today are its two principal squares, the larger measuring 210-by-210 meters (with two further squares inscribed within it) and the smaller, which has suffered extensive damage, measuring 130-by-130 meters and enclosing one further square. Defining the ruling northwest axis of the site, the main entrance to the larger square is 40 meters wide and opens onto a causeway 1.5 kilometers long.[31] A proper survey will be required to establish whether or not there is any archaeoastronomical significance to the northwest orientation of Tequinho's main entrance and causeway.

Coquerial: The surviving ten mounds form the remains of an oval with its long axis oriented to the northwest. MAP AND PHOTO: SANNA SAUNALUOMA. ORIENTATION ARROWS ADDED.

What is already certain, however, is that a number of other Amazonian geoglyphs share the same general alignment. An example is Fazenda Iquiri II, which combines a square earthwork measuring 140 meters along each side with an oval earthwork formed by 25 adjoining mounds. The long axis of this oval, paralleling the axis of the square, extends for 180 meters and is oriented to the northwest,[32] making this site, too, a candidate for possible solstitial alignment if and when an archaeoastronomical survey is carried out.

Another candidate is the partially destroyed site of Coqueiral, which also consists of a series of adjoining mounds, of which ten survive out of an original total of eighteen. The remaining mounds form a partial oval with its long axis extending to approximately 100 meters oriented to the northwest.[33] As with Tequinho, as with Fazenda Iquiri II, and as with Fazenda Atlantica, a proper survey

will be required before any possible archaeoastronomical significance of the Coqueiral oval can be investigated.

Indeed, as I review the otherwise excellent science so far dedicated to the Amazonian earthworks, it is evident that the most serious and consequential lapse—which must be remedied if further progress is to be made—concerns this consistent blindness to possible archaeoastronomical connections. Not a single one of the many papers on the geoglyphs reviewed in this chapter has a word to say about astronomical alignments and, so far as I am aware at the time of writing, not one of the leading scholars has shown any interest in investigating the possibility that such alignments might exist. Ironically, however, the same scholars all agree:

> The geometric earthworks were constructed on carefully selected, elevated yet level surfaces. Their location on intefluvial plateaux provided good visible control over the surrounding terrain. … The carefully planned position of the earthworks in the landscape and the recurring geometric forms represented in earthwork architecture suggest functions that were part of a tradition of shared collective

> ideology related to the cosmology and/or socio-political concerns of the ancient peoples.

The irony is that there's an important clue here, hidden in plain sight. It's true that the choice of "elevated locations" giving "good visible control over the surrounding terrain" could have something to do with "the socio-political concerns of the ancient peoples." But because they offer an unobstructed view of the horizon, such locations are also very often what ancient astronomers looked for when they set out monuments on the ground—aligned, say, to the June solstice sunset or to the March equinox sunrise.

Perhaps it's partly in recognition of this that the passage cited above includes a token reference to "cosmology."

But token references are not enough.

Without a full-scale archaeoastronomical survey of the Amazonian geoglyphs we are, in my opinion, unlikely ever to get to grips with the full range of challenges—and opportunities—that they represent.

AN EVER-RECEDING HORIZON

HOW OLD ARE THE GEOGLYPHS?

In 2009 only a single carbon date had been established for the entire area surveyed, then "250 km across" and constituting "200 known sites with over 210 geometric structures."[34] The date was from Fazenda Colorada and proved to be quite recent—around 750 years before the present but with a margin of error that the investigators chose to average at AD 1283,[35] a date they believed to be "representative of a number of sites" since Fazenda Colorada "exhibits much of the variability seen for the region."[36] This date, they declare, "implies a late occupation … only around 300 years before the Europeans' arrival, but is consistent with the

development of complex societies in other areas of the Amazon between A.D. 900 and 1400."[37]

As we've seen so often with archaeology, new discoveries can change everything, and after just three more seasons of excavation, Ranzi, Schaan, and Pärssinen were singing a very different song. In a follow-up paper to their 2009 study, published in the *Journal of Field Archaeology* in 2012, they reported a greatly expanded survey area, now encompassing roughly 25,000 square kilometers.[38] Within it, 281 enclosures "formed by continuous ditches, in most cases surrounding a perfectly geometric inner plaza with an area of 1 to 3 ha" had been found "in various shapes," chiefly "circles, ellipses, rectangles and squares."[39]

Then came the first dynamite revelation. Fazenda Colorada had been thoroughly re-excavated and five additional radiocarbon samples, collected from different stratigraphic levels, were analyzed. Again, there are margins of error with C-14 dating, but

the bottom line is that the previous date of AD 1283, while fitting with preconceptions about when and where complex societies developed in the Amazon, was found to have been taken from organic materials deposited **very late** in the life of the site. What the new samples indicated was that Fazenda Colorada had been "consistently occupied" from as early as AD 25 until around the end of the fourteenth century.[40]

Organic materials from a number of other geoglyph sites were also excavated and dated, showing a similar profile, and the overall conclusion of the investigators across all the sites was that these "new radiocarbon dates place the initial stage of earthwork construction as early as 2000 BP."[41]

In summary, therefore, just 3 years of research between 2009 and 2012 witnessed a profound change in archaeological understanding of the geoglyphs of the southwestern Amazon. Previously they'd been thought to be just 750 years old; now, without any real

attention being drawn to the implications, they'd become 2,000 years old. To put this in context, an error and subsequent correction on a similar scale would certainly attract a great deal of attention if it concerned Western architecture—indeed it would be like discovering that the great Gothic cathedrals of Europe such as Chartres and York Minster were not, in fact, works of the late medieval period but had actually been built by the Romans.

What are we to conclude concerning mistakes of such magnitude, and the tendency of archaeologists to reach and propagate premature conclusions based on limited samples? For instance, the single AD 1283 date from Fazenda Colorada being allowed to stand for 3 years without corroboration as "representative of a number of sites"? And similarly at Serpent Mound in Ohio, where in 2018 a date of around AD 1000 was still being touted in official notices despite firm C-14 evidence, on the public record since 2014, that the structure is more than 1,000 years older than that?[42] Readers will

make up their own minds, but the uncertainty and the constant failure of old models (such as Clovis First in North America and Meggers's "counterfeit paradise" dogma about the Amazon) do not fill me with confidence about much else that this discipline has to say.

In particular, I am not persuaded by the new consensus that the geoglyphs of the southwestern Amazon are 2,000 years old. Other C-14 dates mentioned in the 2012 report already hint at a more complicated picture.

Take the site known as Severino Calazans, for example. Curiously, the square geoglyph the archaeologists excavated here has the same massive "footprint"—measuring 230 meters along each side[43]—as the Great Pyramid of Egypt.[44] Both monuments are also cardinally oriented—that is, their sides face the cardinal directions, north, south, east, and west.[45]

Two C-14 dates for Severino Calazans were cited by Ranzi, Schaan, and Pärssinen as further confirmation that the Amazonian geoglyph project began "about 2000 years ago."[46] Margins of error apply, but these dates were 159 BC (from excavation Unit 3) and 171 BC (from Unit 6B).[47] Fitting much less comfortably into the new hypothesis, however, were the two other dates from Severino Calazans. Again, there are margins of error, but these dates were, respectively, 1211 BC (from Unit 5) and **2577 BC** (from Unit 3)[48]—the latter suggesting that this geoglyph might not only have the same footprint as the Great Pyramid of Egypt but might also be about the same age.

We've seen how the existence of true civilizations in the Amazon before European contact has been cautiously embraced by archaeologists in recent years. Even so, few would yet be willing to accept that any Amazonian "civilization" worthy of the name might have existed as early as 2577 BC and certainly not one well-

organized and motivated enough to create a cardinally oriented geoglyph on the grand scale of Severino Calazans, where the full perimeter, defined by an enclosure ditch 12 meters wide, measures 920 meters—more than 3,000 feet.[49]

Unsurprisingly, therefore, Ranzi, Schaan, and Pärssinen conclude that the date of 2577 BC "is probably unrelated to the time of initial construction of the earthworks."[50]

All they're prepared to concede is that "this date suggests early human activity at the site."[51] They perhaps stick their necks out further than most of their peers would when they allow the possibility that the second anomalous date from Severino Calazans —1211 BC—"may be related to earthwork construction."[52]

But what is the logic of this? If we have dispensed with our former assertion that a date of AD 1283 was "somehow representative" of the geoglyphs in general, and if we are going to allow a possible start on this great regional project as early as 1211

BC, then why should we be unable to contemplate an even earlier start as far back as 2577 BC? Since so little of the Amazon has been surveyed by archaeologists, and since no theory about the character and constraints of its past cultures and civilizations has been able to explain all the data, it would surely be wiser to keep an open mind.

Besides, as Ranzi, Pärssinen, and Schaan themselves point out, they are working with **a very limited sample** of the potential data. Pärssinen at one point estimated that as many as 1,500 geoglyphs might ultimately be found,[53] and the authorities are in general agreement that "these earthworks, uncovered by modern deforestation … represent only a fraction of the total, which lie undiscovered beneath the intact seasonal southern Amazonian rainforests."[54]

It is therefore perfectly possible that multiple other sites, as yet unknown to archaeologists, will be discovered in the years to come. They might confirm the existing archaeological model that the

geoglyphs are about 2,000 years old, or they might turn out to reinforce that anomalous date of 2577 BC—or, who knows, they might even provide much older dates and reveal more sophisticated constructions.

Once again, whatever the facts are on the ground, we won't know for sure unless we look.

CURIOSITIES

IT'S A CURIOSITY—I CLAIM nothing more at this point—that the **square** enclosure ditch at Severino Calazans shares the ground plan, base dimensions, and cardinality of the Great Pyramid of Egypt, as well as a carbon date from the epoch of the Great Pyramid.[55] That epoch, moreover, around 2500 BC, coincides and overlaps with the

megalithic epoch in Europe, so another curiosity is the way that the **circular** geoglyphs of Amazonia resemble "henges"—the circular embankments with deep internal ditches that surround the great stone circles of the British Isles. The scale is very similar and the resemblance is so obvious that even the most sober archaeologists, usually wary of cross-cultural comparisons, are willing to remark upon it. For example, Dr. Jennifer Watling of the Museum of Archaeology and Ethnography at the University of São Paulo, author of an important study of the Amazonian earthworks published in the *Proceedings of the National Academy of Sciences* in February 2017, states frankly that the characteristics of the circular geoglyphs with their embankments and ditches "are what classically describe henge sites. The earliest phases at Stonehenge consisted of a similarly laid out enclosure. … It is likely that the geoglyphs were used for similar functions to the Neolithic causewayed enclosures, i.e. public gathering, ritual sites."[56]

A point of order here. A “henge” is a prehistoric earthwork formed by a circular embankment surrounding a ditch. Usually the embankment is heaped up from the soil removed to create the ditch. This is the case, for example, at the causewayed enclosure of Avebury, Europe’s largest henge, which has a diameter of approximately 420 meters.[57] Walking briskly it takes about half an hour to make a complete circuit of the lip of the Avebury embankment from which you look down, across the ditch, at the immense circular inner plaza that the ditch defines. Disposed at intervals around the outer perimeter of this plaza, set back a couple of meters from its edge, a complete ring of giant megaliths once stood in antiquity, encompassing two other stone circles placed side by side. Very few of the original megaliths now remain—the site having been used as a quarry in later times—but, although Avebury’s causeways are almost entirely gone, the henge is still there and it is still possible to make out the form of the great stone

circle that it encloses and the remnants of the paired inner circles. What cannot now be seen, but was discovered in 2017 by archaeologists using ground-penetrating radar, is the **square formation**, measuring 30 meters along each side, again defined by a perimeter of standing stones, that once occupied the center of the southernmost of the two inner circles.[58]

An impression by the antiquarian William Stukeley (early eighteenth century) of the complete Avebury complex as it would originally have appeared in its landscape. Approached by two monumental serpentine causeways, the great henge is top center, with its pair of inner circles clearly shown.

LEFT: Detail of the main henge at Avebury with its two inner circles. RIGHT: Reconstruction of Avebury's southern inner circle showing a composite of multiple phases of activity spanning up to 2,000 years. Based on M. Gillings et al. "The Origins of Avebury," in *Antiquity* (Cambridge University Press) [in press]. IMAGE COURTESY OF PROFESSOR MARK GILLINGS, SCHOOL OF ARCHAEOLOGY AND ANCIENT HISTORY, UNIVERSITY OF UEICESTER.

The Amazon: Squaring the circle at Jacó Sá. PHOTO: RICARDO AZOURY/PULSAR IMAGENS.

Strangely enough, at a site called Jacó Sá in the Amazon we also find a geoglyph in which circle and square are combined, but here it is the square that encloses the circle: "The square sides," report Ranzi, Schaan, and their colleagues, "are 140 m long, while the external embankment is 12 m wide and 1.6 m high. The circle contains an internal embankment, and is 100 m in diameter."[59]

This mention of embankments raises a more general point. Though Avebury is a true henge, Stonehenge—despite its name—technically is not. This is because its original great circular ditch was cut *outside,* not inside, its embankment.[60] As Jennifer Watling remarks, it's interesting to note that some of the Amazonian geoglyphs have this same format "with an outer ditch."[61] Some, like Jacó Sá, have both. As with the British henges, however, so with the

Amazon. Ranzi, Schaan, and Pärssinen confirm that "the ditches" of the Amazonian geoglyphs "are usually situated *inside* the embankments."[62]

A GLOBAL LEGACY?

JENNIFER WATLING'S PAPER, COAUTHORED WITH Denise Schaan, Alceu Ranzi, and others, describes circular geoglyphs of the Amazon "with ditches up to 11 m wide, 4 m deep, and 100–300 m in diameter."[63] The authors argue that these sites, "some of which have up to six enclosures … rival the most impressive examples of pre-Columbian monumental architecture anywhere in the Americas." Their excavations found "an almost complete absence of cultural material … within the enclosed areas." They conclude

that the earthworks "were built and used sporadically as ceremonial and public gathering sites between 2000 and 650 calibrated years before present, **but that some may have been constructed as early as 3500–3000 BP**."[64]

I've put the early dates in bold for two reasons.

First, because they are given in the paper at all. What we have here is a group of mainstream archaeologists sticking their necks out a little bit further in the pages of a prestigious journal on what, until now, would have been thought of as an impossible achievement for Amazonian societies 3,500 years ago.

Second, these same archaeologists are still being cautious. The period of 3500–3000 BP that they're prepared to entertain for the construction of at least "some" of the geoglyphs corresponds with Unit 5 at Severino Calazans, where a sample yielded a date, within the usual margins of error, of 1211 BC.[65]

The paper makes no mention, however, of the other much earlier date of 2577 BC that was retrieved from Unit 3[66]—the date that coincides with the epoch of Stonehenge, Avebury, and the Great Pyramid of Egypt.

Before I go further let me reiterate a key point about which it is important to be absolutely clear. It is NOT my purpose here to insinuate that the Amazonian geoglyphs were in any way inspired by Britain's stone circles, or by the Great Pyramid of Egypt or by other known Old World monuments—or, for that matter, vice versa. Where there are similarities, my suggestion is that it might be more fruitful to look for their origins in a remote ancestral civilization that passed down a common inheritance all around the globe—an inheritance of knowledge, an inheritance of science, an inheritance of "earth-measuring" that was then put into practice in many different environments by the many different cultures receiving it.

In some, the inheritance may have been rejected at the outset, or subsequently frittered away and lost. In others, as millennia passed, locally originated differences in expression multiplied to such an extent that they often almost completely obscured the underlying genetic connections to a remote common ancestor.

Nonetheless, dig deep enough and those connections—like recessive genes—sooner or later make themselves felt.

Not all the henges of the British Isles contain stone circles; many are simply gigantic earthworks like the geoglyphs of the southwestern Amazon. No megalithic monuments have yet been found in the Brazilian state of Acre where the geoglyphs proliferate—perhaps because of a lack of good natural materials, or perhaps because so much of the area has yet to be properly surveyed.

There **are** stone circles in the Amazon, however, as we shall see in the next chapter.

16

THE AMAZON'S OWN STONEHENGE

THE FIRST FOREIGN VISITOR TO mention the existence of megalithic circles in the Amazon was the Swiss zoologist Emílio Goeldi, who traveled up the Cunani River into what is now the northern part of the Brazilian state of Amapá, near its border with French Guiana, in

the late nineteenth century.[1] He makes no mention, however, of formations of huge granite blocks, obviously worked upon and moved into place by human beings, overlooking a stream called the Rego Grande.

In the 1920s Curt Nimuendajú, a German-Brazilian ethnologist, also visited megaliths in the region, but he likewise appears to have been unaware of the spectacular formations of Rego Grande. They were seen, however, and noted by Betty Meggers and her colleague Clifford Evans of the Smithsonian Institution in the 1950s[2] and now, at last, with the Smithsonian's resources, came the opportunity for a thorough investigation of the mysterious site. Predictably, what we might call "the curse of Meggers" descended upon the Rego Grande stone circles. These great formations of megaliths shouldn't have existed at all, according to her prejudices about the ancient Amazon, and were thus deemed unworthy of further excavation.[3]

Thereafter, lacking the Smithsonian's seal of approval, the interesting problem of Rego Grande was quietly set aside and ignored by archaeology **for the next 40 years** while the site itself fell back into its former state of absolute obscurity and was in due course forgotten.

But climates of opinion in scholarship from time to time undergo radical shifts, and forgotten things sometimes cry out to be remembered. Thus, just as the geoglyphs of Acre were first identified back in the 1970s in an area where swaths of formerly dense rainforest were being cleared for use by the cattle industry, so it was with the Rego Grande stone circles. They were rediscovered in the 1990s by ranch foreman Lailson Camelo da Silva, who was clearing land for pasture. "I had no idea that I was discovering the Amazon's own Stonehenge," he later told a reporter. "It makes me wonder. What other secrets about our past are still hidden in Brazil's jungles?"[4]

The publicity around Silva's "discovery," coupled with new insights into the complexity of ancient Amazonian civilization, led to a gradual reawakening of interest in Rego Grande. More research was done and out of roughly 200 prehistoric sites identified across the state of Amapá it was found that 30 had megalithic monuments of one kind or another.[5]

In 2005 archaeologists Mariana Petry Cabral and João Darcy de Moura Saldanha of Amapá's Institute of Scientific and Technological Research set about the task of surveying them all, with a particular focus on Rego Grande. There, the principal stone circle, which has a diameter of 30 meters, consists of 127 upright megaliths. Brought from a quarry 3 kilometers away, the megaliths weigh up to 4 tons each and stand between 2.5 meters (just over 8 feet) and 4 meters (just over 13 feet) tall.[6] Areas within the circle were used for elaborate human burials involving funerary urns and vases in a known pottery style of the region.

By 2011 a preliminary age of about 1,000 years was being suggested for the site. This was based, according to Mariana Cabral, on "three date checks on fragments of charcoal" found among pottery in the burial area.[7] Ten other prehistoric sites in the state of Amapá, three of them with megaliths, were also dated in the same way and "all seem to have been occupied between seven hundred and a thousand years ago."[8]

Much more work will have to be done before we can be sure that these dates will not be revised—like the ages of the geoglyphs—in the light of new evidence. Most important, meticulous care will have to be taken to be certain that the stone circle, on the one hand, and the burials from which the C-14 dates were derived, on the other, are works of the same period. The phenomenon of "intrusive burials" is one that archaeologists commonly encounter; particularly where an ancient, sacred site is involved there is a tendency for later people to want to bury and sanctify their dead there (such

anachronistic burials have been found, for example, at the Sphinx and at the Third Pyramid at Giza). The danger, therefore, is that an older site will be given a falsely young date based on materials from the intrusive burial.

Indeed, Cabral and Saldanha note that pottery of the same style and type as the pieces at Rego Grande from which the samples of charcoal were taken is common along "all of the northern coast of Amapá and in French Guiana" and has also been "regularly found in prehistoric sites that have no stone monuments."[9]

I'm therefore not convinced by the association of this pottery and carbon-datable charcoal with the original construction date of the stone circle at Rego Grande. That being said, however, it makes no difference to me if it **does** turn out to be of the same age as the burials. My argument is not that every mysterious monument now emerging from the depths of the Amazon must date back to the Pleistocene. I'm concerned here, rather, with the manifestation of a

legacy of **ideas** that may be of Ice Age antiquity—ideas involving geometry and ideas also very much involving **astronomy**. It's the ideas that matter, whether we encounter them in the Amazon, or at Serpent Mound in Ohio, or at Angkor in Cambodia, or at Stonehenge in the British Isles, or among the monuments of Egypt's Giza plateau. If mechanisms to carry, preserve, and transmit them down the generations have been introgressed into the local cultural DNA, then I see no reason why they should not manifest, and reveal their fundamental similarities, wherever and whenever conducive circumstances arise.

It therefore has to be of interest, whatever the age of the great stone circle at Rego Grande ultimately proves to be, that it appears to share a key "meme" with Stonehenge and with Serpent Mound.

The primary alignment of Serpent Mound is to the summer solstice sunset. But in the reverse direction the same alignment targets—and in a convolution of the Serpent's body recognizes—the winter solstice sunrise. Two other convolutions target, respectively, the equinox sunrise and the summer solstice sunrise.

Coined by Richard Dawkins in his 1976 book *The Selfish Gene,*[10] the word "meme" refers to "An element of a culture or system of

behavior passed from one individual to another by imitation or other non-genetic means."[11]

In the case of Stonehenge, Serpent Mound, and Rego Grande, the meme concerns the orientation of the sites—which in all three cases honors the sun on the June and December solstices. We reviewed these alignments for Stonehenge and Serpent Mound in part 1, and the reader will recall that they are reversible—that is, an alignment to the summer solstice sunrise is also, in the reverse direction, an alignment to the winter solstice sunset, while an alignment to the winter solstice sunrise is also, in the reverse direction, an alignment to the summer solstice sunset.

In the case of Rego Grande, it is the winter solstice that is the primary focus. Cabral and Saldanha point to a megalith that uses shadow effects to track "the sun's path throughout this day."[12] Two other granite megaliths close by, one with an artificial hole cut

through it, also line up to track the rising point of the winter solstice sun.[13]

The Rego Grande Stone Circle. PHOTO: MARIANA CABRAL. Stone 3 tracks the path of the sun throughout the day on the winter solstice. Stones 1 and 2 (the former with a sighting hole cut through it—see inset) line up to target the winter solstice sunrise.

The strong foundations of the site make it unlikely that the megaliths would have shifted position. Even blocks lying horizontally, it turns out, have not fallen but were purposefully placed:

> Those lying on the ground never stood upright. Instead, the layer of laterite [beneath them] was carefully dug so that they fit snugly with the ground. Excavations carried out … around the bottom of the standing stones also revealed small blocks of granite and laterite which were used to wedge the monoliths at this unusual angle.[14]

Cabral and Saldanha's conclusion is that all the angles were "carefully considered by those who conceived them."[15]

Archaeologist Manoel Calado of the University of Lisbon, an expert on Portuguese megaliths, agrees. "I'm sure," he said after a

visit to Rego Grande. “This is one of the aspects that makes the Amazon megaliths very similar to those in Europe.”[16]

Richard Callahan, professor of archaeology at the University of Calgary, is also on Cabral and Saldanha’s side:

> Given that astronomical objects, stars, constellations, etc., have a major importance in much of Amazonian mythology and cosmology, it does not in any way surprise me that such an observatory exists.[17]

For Eduardo Neves, too, “the idea of the place being a sort of observatory is a good one,” although he adds, quite rightly, that “we still need to test it.”[18]

PAINEL DO PILÃO

ONLY THE MOST RUDIMENTARY SURVEY has been undertaken at Rego Grande, enough to reveal the major solstitial focus of the great stone circle, but nothing more. Other, much richer information may or may not be concealed within the multiple alignments of the megaliths, as is the case at Stonehenge and Serpent Mound, but a major archaeoastronomical study will be required to settle the matter. As Jarita Holbrook, associate professor of physics at South Africa's University of the Western Cape, comments: "It takes more than a circle of standing stones to get a Stonehenge."[19]

I would add, however, that a circle of standing stones with a solstitial alignment is a pretty good start!

Moreover, and I suggest of great relevance given the uncertainty over the dates of Rego Grande, a major archaeoastronomical study **has** already been undertaken at another Amazonian site approximately 550 kilometers to the southwest. Named Painel do Pilão, it is located just 400 meters from Pedra Pintada, the painted

rock shelter investigated in 1996 by Anna Roosevelt. We saw in chapter 12 how she and her team excavated multiple occupation layers within the shelter, the oldest and deepest of which turned out to be perhaps as old as 16,000 years (according to thermoluminescence dating) and 14,200 years (according to radiocarbon dating).[20]

There has been no serious challenge to these dates but, following further work by Roosevelt, Pedra Pintada's rock art is now usually reported, reflecting the current cautious consensus of the archaeological community, to date between 13,630 and 11,705 years ago.[21]

Dates for the art at the nearby Painel do Pilão rock shelter, excavated by Christopher Sean Davis of Northern Illinois University, are closely similar, being variously given in his 2016 report at between 13,014 and 12,725 years ago, and between 13,135 and 12,810 years ago.[22] All together a total of four samples from

two adjacent excavation levels were subjected to C-14 testing. All were found, says Davis, “to be consistent and contemporary to Roosevelt’s paleoindian dates from Caverna da Pedra Pintada.”[23] His conclusion, therefore, is that the initial artworks of Painel do Pilão were created at “around the time that the area was first inhabited 13,000 years ago, and that those earliest images, which were probably retouched or traced more recently, were positioned in the most prominent wall locations and height.”[24]

Davis suggests that the rock wall itself, as well as the floor at its base, were deliberately leveled by the ancients to form a 90-degree angle to one another. The whole ensemble, he says, was “made straight and flat throughout” to configure a “platform stage from which an observer can view the rock art from a specific location.”[25]

Once standing in that location, Davis further notes, “the painting most central to the observer’s field of view is a grid image that has

individual boxes marked with mostly repetitive (but some varying) tallies.”[26]

Painel do Pilão "calendar." PHOTO: CHRISTOPHER SEAN DAVIS.

It looks like a calendar—and indeed, some years before Davis, Roosevelt was the first scholar to consider that possibility.[27] While recognizing that "alternative theories not related to astronomy cannot be ruled out," Davis reinvestigated the matter over the course of a solar year and noticed a possible pattern to do with

> [t]he intersection of the setting sun to a rocky perch in the near distance above and to the right of the painted outcrop.
>
> The annual movement of the sun relative to the rocky perch allows for the intersection of the setting sun through the center of the perch **approximately 18–20 days before and after the winter solstice** (which currently occurs on December 21). … If each box of the painted grid image represents one day of observing the setting of the sun relative to the rocky perch, 49 days after the day of the winter solstice, the sun sets too far to the north of the rocky perch, entirely missing the structure. The grid painting has 49 total boxes and the center boxes have tally marks that are simply vertical lines. Most other tally marks are crisscrosses. The rocky perch and the grid image might, therefore, have been **a**

way for paleoindians to foretell the winter solstice and the passage of a new year.[28]

Painel do Pilão painted outcrop with its rock art surface in the center-to-left foreground, and a rocky outcrop with a window-like feature at a distance in the top right background of the photo. The sun intersects this "window" in the early afternoon 18 to 20 days before and after the winter solstice. PHOTO: CHRISTOPHER SEAN DAVIS. ANNOTATION ADDED.

What adds to the likelihood that Davis is correct is that he and his team found other alignments at Painel do Pilão. For example, just as the orientation of what they call the "platform stage" suggests an ancient focus on the December solstice sunset, so, too, another prominent cluster of images aligns to the rising point of the sun on the June solstice.[29]

Meanwhile:

> A third astronomy alignment occurs with a single red pictograph discovered above the excavation unit on a vertical ledge on the underside of the painted outcrop. The ledge may have been intentionally altered, but further investigation is needed for certainty. The painted circle itself faces 270° [the azimuth of sunset on the equinox], but the shelter walls block all views of the western horizon or sky from

> this location. However, just beneath the circle and ledge is an opening that allows one to see through to the other side of the outcrop and the horizon beyond. This vantage point beneath the painted circle aligns to ~90°, the position of the rising sun on the equinox, which occurs on March 20 and September 23 currently.[30]

At the very least, says Davis, the rock art and alignments at Painel do Pilão tell us that cultures in the heart of the Amazon 13,000 years ago "engaged and utilized sophisticated knowledge of astronomy maintained through rock art and possibly shared or reimagined by more recent cultures who either inherited or rediscovered the ancient paintings."[31]

He's right to draw attention to the legacy aspect of all this—the possibility, long after the original painters and horizon astronomers of Painel do Pilão were gone, that later cultures might have inherited and reimagined the ancient ideas and obsessions manifested there. This is how we would expect carefully crafted and cleverly designed memes to propagate themselves down the ages, and it appears to echo *exactly* the process at Serpent Mound, which

was likewise maintained, renovated, and reimagined by successive cultures down the ages and which likewise signals the solstices and the equinoxes.

Painel do Pilão is important because it tells us that the “meme” of sacred structures aligned to the solstices and equinoxes, found in monumental art and architecture all around the world, has been present in the Amazon for at least 13,000-years and perhaps—we must await future discoveries in the unexplored reaches of the jungle—for far longer than that.

It also has wider implications. If people were capable of carefully marking, recording, and honoring these celestial events in South America 13,000 years ago, then there is no good reason to suppose they should not have done so in North America as well—and therefore no good reason to dismiss the possibility that Serpent Mound’s original alignments also go back to that distant epoch.

Archaeology says a firm NO to this, accompanied by guffaws of derision.

As we've seen, however, the archaeology of Serpent Mound is riddled with contradictions and uncertainties and appears to have produced dates marking various episodes of restoration and renovation rather than convincing evidence of when the monument was originally designed and founded.

HYPOTHESIS

IN HIS REPORT CHRISTOPHER DAVIS mentions Rego Grande, "presumed to be more recent" than Painel do Pilão, as another Amazonian site at which archaeoastronomical alignments have been investigated.[32] He draws no specific connection beyond that, but in my view the confirmation of a solstitial focus at both, as also at Serpent Mound

in Ohio, and Stonehenge and other megalithic sites worldwide, is noteworthy.

Moreover, although there is no henge at Rego Grande, we've seen that the solstitially aligned stone circle there shares the Amazon basin with huge numbers of hengelike earthworks. We've noted how these, too, have never been subject to any kind of rigorous archaeoastronomical investigation. Meanwhile, the total number of geometric ditched enclosures discovered in the southwestern Amazon survey area had increased from "over 210," the figure on record in 2009, to "over 450" by 2017.[33]

Then in 2018 a further study by Denise Schaan and colleagues reported an extension of the survey area across much of the southern rim of the Amazon basin:

> The results show that an 1800 km stretch of southern Amazonia was occupied by earth-building cultures.[34]

In one area alone, the Upper Tapajos Basin, 81 previously unknown pre-Columbian sites were discovered, with a total of 104 earthworks.[35] Among them were many complex enclosures including one, 390 meters in diameter, featuring 11 mounds circularly arranged at the center of the enclosure.[36]

The researchers suggest that at least 1,300 further sites remain hidden within the jungles of the Amazon's southern rim—a number, they add, that is "likely to be an underestimation"[37] while "huge swaths of the rainforest are still unexplored."[38] They remind us that the *terre firme* forests "that account for ~95% of the Amazon are particularly uncharted" because "these areas have been archaeologically neglected following traditional views that pre-Columbian people concentrated on resource-rich floodplains. However, the discovery of large pre-Columbian earthworks in *terra firme* along the Southern Rim of the Amazon undermines the

assumption that these areas were marginal in terms of past human impact and the development of complex societies."[39]

It is undoubtedly the case that many more structures remain to be found than have already presented themselves to science. Our entire understanding of this vast region is being transformed by new discoveries and, indeed, as we've seen, the notion of complex societies in the pre-Columbian Amazon is no longer anathema to archaeologists, some of whom now even dare to describe those societies as "civilizations."

Given that such civilizations existed in ancient Amazonia, and clearly had the capacity to manifest their ideas in great public projects, it is intriguing that the end result was the vigorous, flamboyant, and extensive expression of **the very same** architectural, astronomical, and geometrical "memes" that characterize sacred architecture in many other parts of the world, and at many different periods.

An analogy between genetics and culture—genes and memes—can serve us well here.

Let's say, purely hypothetically of course, that a system of ideas is transferred, by direct teachings, from one culture to another. The recipient society as a whole, however, may not yet be ready to put the teachings into practice. What is required, then, is that some sort of institution be set up that can recruit the brightest and the best from the local population. They, in turn, will draft new talent with each new generation, initiating them and training them in the essential details of the system—which will assume the character of a religion and will in due course integrate itself deeply into every level, even into the habits of thought, of the recipient culture. Eventually, when the right time for the next stage of the project is judged to have arrived—perhaps very soon, perhaps after thousands of years, depending on local circumstances—the religious leaders will mobilize the population to enact the great projects of sacred

geometry that had for so long remained encoded, but unexpressed, within their cultural DNA.[40]

It is, I emphasize, only a hypothesis. In this context, though, it's thought-provoking to consider an ethnographic report from 1887 written by a certain Colonel Antonio R. P. Labre after he had ascended the Madeira, the Beni, and the Madre de Dios Rivers and then crossed overland to the Acre River. His journey took him right through the heart of the geoglyph territory of Acre and involved numerous encounters with its inhabitants, the Araona people—who had, by that time, been reduced to a tiny remnant after hundreds of years of devastating epidemics, slave raids, and murderous attacks by commercial rubber tappers seeking to drive them off their land. "It was not uncommon," writes Denise Schaan, "for rubber tappers to capture native women for wives. The encroaching whites would frequently promote raids to enslave the native population for the

rubber industry, a situation that 40 years later would result in the near-extinction of tens of thousands of natives."[41]

Since all work on the geoglyphs had ceased hundreds of years previously, we can only guess how much of the past of their once great culture these harried, encroached-upon, and deeply endangered Aroanas remembered by the time of Labre's visit. We cannot even be sure that they were the direct descendants of the geoglyph builders (rather than of more recent migrants to the area).

Nonetheless, what Labre tells us feels significant. He didn't see the geoglyphs, which were then entirely overgrown by jungle, but he was in the midst of them on August 17, 1887, when he stayed overnight at an Aroana village called Mamuceyada. He describes there being, as well as plantations, "about 200 inhabitants … a form of government, temples and a form of worship"—from which, together with "knowing the name of the idols," women were

excluded. Of particular importance and relevance here is Labre's report:

> The idols are not of human form, but are geometrical figures made of wood and polished. The father of the gods is called Epymara, his image has an elliptical form, and is about 16 inches high. … Although they have "medicine-men" charged with religious duties and remaining celibates, the chief is nevertheless pontifex of the church.[42]

Consider the improbability of this if it does not arise from some real though forgotten connection. Here in a landscape mysteriously inscribed in antiquity with vast geometrical earthworks, at a time when the earthworks themselves had long since been swallowed by jungle, we find a Native American tribe whose gods take the form of polished wooden "geometrical figures." The tribal chief is the religious leader but there are also "medicine-men" who likewise have religious duties.

It already sounds exactly like the sort of institution for the replication and transmission of geometric memes that I proposed as a hypothesis earlier, but it gets even more interesting when the shamans involved, and often the population, are drinking ayahuasca.

17

THE VINE OF THE DEAD

WHAT ARE THE AMAZONIAN GEOGLYPHS? Why did the ancients go to such trouble to make these colossal earthworks? Why is geometry their most obvious theme? And to what extent, if any, since stone circles are frequently associated with similar earthworks elsewhere, does the presence of stone circles in the Amazon help us to understand the geoglyphs?

So far we have considered only geometry and certain cosmic alignments, but my hypothesis in both cases, and in the case of the extraordinarily similar earthworks of the Mississippi Valley that we'll explore in parts 5 and 6, is that we are dealing with "memes" here. Moreover, it is a phenomenon in itself that the same memes appear again and again among seemingly unrelated cultures of both the Old World and the New World, separated sometimes not only by thousands of miles but by thousands of years.

Much more work will be required to establish **when** the memes of geometry and cosmic alignment first took root in the Amazon. Archaeology on its own is of limited use to us here, since so little has been done even at the sites already discovered and since so much of the region has never been investigated at all. What would help would be a much more thorough and detailed archaeoastronomical survey of Rego Grande, and of other stone circles in its vicinity, than has already been undertaken. In parallel, as I argued earlier, an equally thorough archaeoastronomical survey

of the Amazonian geoglyphs is a must if we are to refine not only our understanding of their geometry but also to tease out any cosmic alignments they may contain. Since no such study has yet been undertaken all we can say for sure is that **some** of the geoglyphs reviewed in chapter 15 are, definitely, cosmically aligned.

We've seen, for example, that both Fazenda Parana and Severino Calazans consist of square geoglyphs. The first features two squares, one 200 meters along each side and the second exactly half that size, with an interconnecting causeway. Meanwhile, the second site has side lengths of 230 meters, giving it the same footprint as the Great Pyramid of Egypt. All four of these squares—the two at Fazenda Parana, the one at Severino Calazans, and of course the Great Pyramid itself, are cardinally oriented, that is, their sides face true north, south, east, and west. The most basic and obvious of the cosmic alignments shared across these sites are therefore to the celestial north and south poles (the points on the celestial sphere directly above the earth's geographic north and south poles, around

which the stars and planets appear to rotate during the course of the night[1]), and to the points of sunrise and sunset on the spring and autumn equinoxes (when the sun rises perfectly due east and sets perfectly due west).

We've also seen that other great earthworks of the Amazon feature strong northwest-to-southeast orientations. This would put the investigation of possible solstitial alignments and also of "lunar standstill alignments" (of which more in part 5) at the top of the list of priorities if any proper archao-astronomical survey should ever be undertaken.

I think it likely that such a survey of the Amazonian geoglyphs, as of the stone circles, would reveal many more (and far more intricate) cosmic alignments, perhaps even as subtle and complex as the multiple alignments found at the Great Pyramid, Stonehenge, and Serpent Mound. There's little point in speculating further on such matters when we don't yet have the necessary data from the

Amazon. For the sake of argument, however, let's assume that the memes of geometry and cosmic alignment **are** part of a connected system there, as they are in so many other parts of the world where the required research has already been done. In that case we can say, on the basis of the equinoctial and solstitial alignments at Painel do Pilão, the single Amazonian site where something approaching a thorough archaeoastronomical study has been undertaken, that the system must have reached Amazonia at least 13,000 years ago. That it should then have later iterations in different media, such as the stone circle at Rego Grande and the great cosmically aligned geoglyphs at Severino Calazans and Fazenda Parana, should not surprise us.

We are dealing, I believe, with **deliberately** created memes here —memes that have a deeply mysterious purpose and that function in ineffable ways. They are transmitted by repetition and replication, which explains their similarities. But cultures, once separated, tend to evolve and develop in their own distinctive and quirky fashion.

We can therefore expect that not only the media and materials through which the memes are made manifest, but also their local **interpretation**, will vary greatly through time and between one part of the world and another while nonetheless retaining a constant core of unvarying central ideas.

WESTERN SCIENCE WADES IN

THE FIRST EFFORTS OF WESTERN scientists to interpret the geoglyphs of Amazonia were predictably utilitarian and reductionist, with attempts being made to persuade us that the great geometrical earthworks must have been built for defensive purposes. But with no evidence of warfare around them, with the ditches clearly not "moats" (since so many of them are placed within the earthen embankments rather than outside them), and with no evidence of

palisade walls (for example, in the form of postholes or wooden remains), this theory soon lost favor.[2] Not only was there no evidence of warfare, but actually very little at all in the way of archaeological materials—pottery, figurines, refuse, et cetera—that would help to decipher the use, meaning, and purpose of the geoglyphs. The consensus now, therefore, is that they were created for "ritual," "spiritual," "religious," and "ceremonial" purposes.[3]

William Balée, professor of anthropology at Tulane University, is a supporter of this new consensus, but is doing no more than stating the obvious when he suggests that the spiritual/religious role of the Amazonian glyphs must in some way have involved "geometry and gigantism."[4]

Well, yes, professor. Obviously! But in what way? And to what purposes?

If we seek useful answers to such questions, rather than easy inferences or mere descriptions of these gigantic geometric patterns,

then we are going to have to do what a very few Western scientists, to their credit, are now doing—and that is to consult indigenous peoples still living in the Amazon today.

Finnish scholars Sanna Saunaluoma and Pirjo Kristiina Virtanen have led the way in this fresh approach. The cultural destruction of the past five centuries has wiped many of the tribal memory banks clean—the ongoing process of imposed amnesia that has left us so bereft of knowledge about the ancient Amazon. It is clear, however, that all is not yet lost.

In 2013, for example, Saunaluoma and Virtanen brought a group of five Manchineri—an indigenous tribe living today in the region of the earthworks—to visit Jacó Sá. This immense geoglyph, depicting a circle within a square, as the reader will recall, is located about 250 kilometers from their territory. The investigators report that the Manchineri "immediately reported feeling sensations of being in an ancient ritual atmosphere." Moreover, "They said that their ancestors had talked about these types of places, although they

could not offer any explanation as to why the earthwork ditches were so deep or even why they had been constructed."[5]

A second local tribal group, the Apurinã, "narrated that their parents had advised them to pass by the earthworks quickly and avoid their vicinity when possible because they signify difference, promote avoidance, and are regarded as 'enchanted,' or 'miraculous' places."[6]

Certainly, then, at least the traces of a memory of how significant the earthworks must have been in their prime, and of the awe that they formerly inspired, lingers on in local superstitions and folklore.

But a reservoir of much more detailed information has been stored away in the Amazon and here, too, Saunaluoma and Virtanen are pioneers in finding links to the earthworks.

THE SHAMANISTIC COSMOS

SOME OF THE CLUES THEY have drawn on have been available for more than 130 years.

They're found in the account, given in the last chapter, of the worship of "geometrical" gods by the Aroana people in the vicinity of the geoglyphs when Colonel Antonio R. P. Labre stayed among them in 1887. From Labre we also learn that the Aroanas had "temples and a form of worship" and that their religious officiants were "medicine men."

During the twentieth century the term "medicine men" went out of fashion and, where indigenous systems of spirituality are still practiced in the Amazon today, the majority of ethnographic and anthropological studies define the officiants as "shamans." This word is NOT derived from, or used, in any Amazonian language. It comes, instead, from the Tungus-Mongol noun *saman,* meaning, broadly, "one who knows."[7]

Its widespread use by anthropologists today—not only with reference to religious ritual functionaries in the Amazon but also to similar figures who are found in tribal and hunter-gatherer societies all over the world—has not come about because the Tungus mysteriously contacted and influenced other cultures but because Tungus shamanism was the first example of the phenomenon to be studied by European ethnologists. The Tungus word entered Western languages through their enthusiastic written reports and has subsequently continued to be applied in all parts of the world where systems very similar to Tungus shamanism have been found.

It is the shaman—usually a man but sometimes a woman—who stands at the heart of these systems. And what all shamans have in common, regardless of which culture they come from or what they call themselves, is an ability to enter and control altered states of consciousness. Often, but not always, psychedelic plants or fungi are consumed to attain the necessary trance state. Shamanism, therefore, is not primarily a set of beliefs, nor the result of purposive

study. It is, first and foremost, mastery of the techniques needed to attain trance and thus to occasion particular kinds of experiences—shamans call them "visions," Western psychiatrists call them "hallucinations"—that are then in turn used to interpret events and guide behavior:

> The true shaman must attain his knowledge and position through trance, vision and soul-journey to the Otherworld. All these states of enlightenment are reached … during a shamanic state of consciousness, and not by purposive study and application of a corpus of systematic knowledge.[8]

Such a method of knowledge acquisition seems absurd and fantastical to the "rational" Western mind. And indeed, underlying the whole notion of soul-journeys to the otherworld is a model of reality that is diametrically opposed in every way to the model presently favored by Western science. This remotely ancient shamanistic model holds our material world to be much more complicated than it seems to be. Behind it, beneath it, above it,

interpenetrating it, all around it—sometimes symbolized as being "underground" or sometimes "in the sky"—is an otherworld, perhaps multiple otherworlds (spirit worlds, underworlds, netherworlds, etc.) inhabited by supernatural beings. Whether we like it or not, we must interact with these nonphysical beings, which, though generally invisible and intangible, have the power both to harm us and to help us.

THE GEOMETRICAL PULSE

THE BIG PICTURE OF SHAMANISM, altered states of consciousness, and their immensely important place in the human story—was the focus of my 2005 book *Supernatural: Meetings with the Ancient Teachers of Mankind*.[9] I refer the reader to that book for a comprehensive

body of data that reinforces and underlines what I have to say in this chapter.

Meanwhile, the key point, standing right at the heart of the matter and nonsensical to "rational" Western minds, is the notion that the human condition requires interaction with powerful nonphysical beings. Across much of the Amazon the nexus that facilitates such interaction is the extraordinary visionary brew ayahuasca, a plant medicine that has been in use among the indigenous peoples of this vast region for unknown thousands of years. Its active ingredient, derived from the leaves of the chacruna shrub (botanical name *Psychotria viridis*) is dimethyltryptamine—DMT—an immensely potent hallucinogen. It is from the other ingredient, however, derived from the *Banisteriopsis caapi* vine, that the brew gets its name. The function of the ayahuasca vine in the brew is to transmit a monoamine oxidase inhibitor into the bloodstream of the recipient so that he or she may gain sustained access to the extraordinary effects of DMT—a substance that is normally neutralized in the gut

by the enzyme monoamine oxidase. There are other ways of accessing the visionary power of Amazonian plants rich in DMT—notably by snorting them as snuff—but the effects are short-lasting. Taken orally, in the form of the ayahuasca brew, however, the experience can last up to 6 hours, permitting a much more sustained and immersive trance "journey."

It is, in my view, a remarkable scientific feat that such a highly effective combination of just 2 out of the estimated 150,000 different species of plants, trees, and vines in the Amazon was discovered by mere trial and error. Nor if you ask Amazonian shamans, as I have done, how their ancestors made this discovery, will they admit to trial and error at all—or indeed to any other method that Western science would recognize as rational. What they claim, very simply—but unanimously—is that a variety of "plant spirits," among which ayahuasca is paramount, have taught them everything important they need to know about the properties of

other plants in the jungle, thus allowing them to make powerful medicines, to heal the sick, and, in general, to be good "doctors."[10]

Ayahuasca itself is said to be a "doctor," possessing a strong spirit, and is considered to be "an intelligent being with which it is possible to establish rapport, and from which it is possible to acquire knowledge and power."[11] The anthropologist Angelica Gebhart-Sayer, who studied the Shipibo-Conibo people of the Amazon, notes that under the influence of ayahuasca "the shaman perceives, from the spirit world, incomprehensible, often chaotic information in the form of luminous designs."[12] As Gebhart-Sayer sees it, it is the shaman's function to decode and "domesticate" this raw, unprocessed data beamed at him by the plant spirits by "converting it" into therapy for the tribe as a whole.

Very often these luminous designs, rich in data, take the form of **geometry**. I speak from experience, having participated in more than seventy ayahuasca sessions since 2003, continuing to work

with the brew for the valuable lessons it teaches me long after *Supernatural* was researched, written, and published. Here's part of my account of the first time I drank ayahuasca in the Amazon:

> I raise the cup to my lips again. About two thirds of the measure that the shaman poured for me still remains, and now I drain it in one draught. The concentrated bittersweet foretaste, followed instantly by the aftertaste of rot and medicine, hits me like a punch in the stomach. … Feeling slightly apprehensive, I thank the shaman and wander back to my place on the floor. …
>
> Time passes but I don't keep track of it. I've improvized a pillow from a rolled-up sleeping bag and I now find I'm swamped by a powerful feeling of weariness. My muscles involuntarily relax, I close my eyes, and without fanfare a parade of visions suddenly begins, visions that are at once **geometrical** and alive, visions of lights unlike any light I've ever seen—dark lights, a pulsing, swirling field of the deepest luminescent violets, of reds emerging out of night, of unearthly textures and colors, of solar systems revolving, of spiral galaxies on the move. Visions of nets and strange ladder-like structures. Visions in which I seem to see **multiple square screens** stacked side by side and on top of each other to form **immense patterns of windows arranged in great banks**. Though they manifest without sound in what seems to be a pristine and limitless vacuum, the images possess a most peculiar and particular quality. They feel like a drum-roll—as though their real function is to announce the arrival of something else.[13]

Other notes I made following my ayahuasca sessions in the Amazon refer to a "geometrical pulse,"[14] to "a recurrence of the geometrical patterns,"[15] to "a background of shifting geometrical patterns,"[16] and to "complex interlaced patterns of geometry. … I zoom in for a closer view. … They're rectangular, outlined in black, like windows. There's a circle in the centre of each rectangle."[17]

PATHS

THOSE SESSIONS TOOK PLACE IN January and February 2004 some years before I first learned of the existence of the great geometrical geoglyphs of the Amazon. The reader will understand, therefore, that when I began to research the glyphs in 2017 and to wonder about their meaning to whichever unknown peoples created them, it

was natural for me to consider ayahuasca as an inspiration. I can't confirm whether any circles within rectangles are among the more than 550 glyphs discovered by 2018, but Jacó Sá (where the Manchineri group brought by Saunaluoma and Virtanen reported sensations of being in an ancient ritual atmosphere) certainly gives us a circle within a square. And, while the geometrical patterns that I likened to "multiple square screens" and "banks of windows" might be described and manifested using very different materials in very different ways by people from different cultural backgrounds, what seems to stay constant throughout is the geometry.

Tukano sand painting of patterns seen in an ayahuasca vision. (After G. Reichel-Dolmatoff, *The Shaman and the Jaguar*, 1975, p. 46.)

It is the fundamental motif of the earthworks but it turns up in much else besides—for example in the ayahuasca-inspired art of the Tukano of the Colombian Amazon (where the brew goes by the name of *yajé*).[18]

The Tukano create geometrical patterns and abstract designs in sand, on fabrics and musical instruments, on their houses and on the communal *malocas* where they consume *yajé*.[19] Colombian anthropologist Gerardo Reichel-Dolmatoff reported the results of an intriguing experiment he carried out in which he asked members of a Tukano community to make crayon drawings of what they saw when they were drinking *yajé*. (The drawings were of course made from memory, after the drinkers had returned to everyday consciousness.)

The results, broadly identical to the designs on the houses and fabrics, included a triangle flanked by vertical lines ending in spirals, a rhomboid, a rectangular design filled with parallel lines, patterns of parallel undulating lines drawn horizontally, a number of different oval- and U-shaped elements, rows of dots or small circles, a vertical pattern of little dots, grid patterns, zigzag lines, nested rectangles, nested parallel arcs (catenary curves), and so on.[20]

Significantly, the Tukano also paint identical shapes and patterns on rock faces in the hills of the northwest Amazon.[21]

More than seventy different indigenous Amazonian cultures use ayahuasca—many giving different names to the brew (*yajé, natema, caapi, cipo, shori,* etc.).[22] Since almost all report seeing geometrical visions, I wasn't surprised to discover that Saunaluoma and Virtanen were already far ahead of me in contemplating a connection between ayahuasca visions as expressed in indigenous art and the immense geoglyphs now emerging from jungle clearances along the southern rim of the Amazon.

Of the contemporary Manchineri, for example (who live much closer to the ancient earthworks than the Tukano), they note in a 2015 paper that "certain geometric motifs," often expressed in ceramics and body paintings, "have meaning as signs of specific ancestors. Some ancestors possess their own geometric designs that

may appear in shamanic *ayahuasca* visions, transmitting ancestral knowledge and power."[23]

They therefore conclude that "not only using but also constructing geometric earthworks may have been important social intra-group or inter-group events."[24]

In a follow-up paper, published in *American Anthropologist* in August 2017, Saunaluoma and Virtanen take their analysis much further, proposing that the geoglyphs "were systematically constructed as spaces especially laden with visible and invisible entities."[25] Their argument is that, regardless of scale or medium, the whole process of materializing visionary iconography, in particular geometric patterns, is "related to the fluid forms inhabiting the Amazonian relational world. Different designs 'bring' the presence of nonhumans to the visible world of humans for a number of Amazonian Indigenous peoples, while perceiving geometric designs in Amerindian art as paths from one dimension to

another allows a viewer to shift between different worlds, from the visible to the invisible."[26]

Citing the work of their colleague Luisa Belaunde, Saunaluoma and Virtanen note that for the Shipibo-Conibo of the Peruvian Amazon, "the lines embody a package of ways in which beings move, travel, communicate between themselves, and transmit knowledge, objects, and powers. These paths exist everywhere, from macro to micro scales. Geometric designs are thus about certain ways of thinking, perceiving, and indicating invisible aspects so they can be seen."[27]

Saunaluoma and Virtanen further establish that, to the Shipibo-Conibo, the geometric lines open "a window to the macrocosmos" and allow "macrocosmic order" to be "iconically sketched in the microcosmos here, in landscape designs."[28]

As above, so below.

PORTAL

BY TAKING THE WORLDVIEW, INSIGHTS, and philosophies of indigenous peoples seriously in efforts to understand their past, Saunaluoma and Virtanen's research marks a refreshing change of note for Western science and offers rewarding insights into the realm of ideas underlying the geoglyphs. It is by no means a realm of "primitive" ideas. On the contrary: with its notions of pathways between dimensions, and of making visible the presence of usually invisible entities, there are aspects of thought surrounding the traditional use of ayahuasca that would not be out of place in a quantum physics laboratory.

Once again I suggest we are looking at the remnants of an advanced system that propagates itself through time and across cultures with powerful memes among which geometry and cosmic alignments take a large share. We do not know where or when this

system originated. In the ancient Amazon, however, to a greater degree than anywhere else, its dissemination became integrated with the use of vision-inducing plants—and there, up to the present day, the secrets of how to use these plants have been preserved and passed down within indigenous shamanic traditions.

The origin myth of the Tukano speaks of the time, eons ago, when humans first settled the great rivers of the Amazon basin. It seems that "supernatural beings" accompanied them on this journey and gifted them the fundamentals upon which to build a civilized life. From the "Daughter of the Sun" they received the gift of fire and the knowledge of horticulture, pottery-making, and many other crafts. "The serpent-shaped canoe of the first settlers" was steered by a superhuman "Helmsman."[29] Meanwhile other supernaturals "travelled by canoe over all the rivers and … explored the remote hill ranges; they pointed out propitious sites for houses or fields, or for hunting and fishing, and they left their lasting imprint on many

spots so that future generations would have ineffaceable proof of their earthly days and would forever remember them and their teachings."[30]

The slow, methodical progress of the serpent canoe, setting down its cargo of migrants here and there, explains anthropologist Gerardo Reichel-Dolmatoff:

> Was marked not only by the successive spots of debarkation but also by an advancing scale of human achievement. …
>
> The rules for the initiation into shamanism were laid down, accompanied by a large body of prescriptions, regulations and prohibitions that, from now on, were to guide and govern the life of the people.
>
> But above all … if mankind was to prevail and survive as part of nature, and was to pass on a true legacy to new generations, people had to assume responsibilities and find ways to control the organization of society so as to procure a balance between human needs and the resources available in nature.[31]

In this period "the spirit-beings prepared the land so that mortal human creatures might live on it."[32] Once that task had been

completed, however,

> the supernatural beings returned to their otherworldly abodes. Before leaving … they took care to provide mankind with the means of communication, of establishing contact with them whenever there should be need. Mortal men could not be left alone without the possibility of communing with the spirit-world. … It was essential, then, for the welfare of mankind to have at its disposal a simple and effective means by which, at any given moment, an individual or a group of people could establish contact with the supernatural sphere.[33]

It is rather brutally to compress many colorful and thought-provoking details to say that at the end of the lengthy myth, the "effective means" of contacting the spirit-world turns out to be … ayahuasca:

> A plant that opened the door into another dimension, a drug that produced visions in which the spirit-beings revealed themselves to men—talking, teaching, admonishing and protecting.[34]

There are multiple different elements intertwined in the Tukano story but three of them stand out for me.

First, what's being described is dressed up in the language and imagery of myth and may of course be "just a myth." What it sounds like, however, is a mythologized account of a settlement mission in the Amazon in which a group of migrants were accompanied by a number of more sophisticated people considered to be "supernatural" or "superhuman."

Though I don't want to put undue weight on it, I would be negligent if I failed to mention in passing that the Tukano, and the closely related Barasana, are among a number of Amazonian tribes whose distinctive "men's cults" are paralleled by virtually identical institutions in Melanesia, on the opposite side of the Pacific Ocean. As the reader will discover in appendix 1, the same secrecy surrounding male initiation rituals is found in both areas, the same exclusive possession of sacred flutes and trumpets that women are

forbidden to see,[35] the same belief that there was a time when women dominated men, and the same belief that men, either by trickery or force, had subsequently wrested power from women.

Second, the Tukano origin myth makes it completely clear that the "supernaturals" departed after they had completed their work of preparing the Amazon for settlement by the migrants in the serpent canoe.

Third, we are led to understand that direct contact between humanity and the spirit world would thereafter be broken. However a portal—ayahuasca—through which humans could still travel to the spirit world, and benefit from its teachings, would be left open.

THE LEAP TO THE MILKY WAY

ALTHOUGH ANY MEMBER OF THE Tukano community may drink ayahuasca, the deeper mysteries of the brew are primarily the work of the shaman—the *payé*—whose responsibility it is to travel through the portal whenever required to negotiate with powerful supernaturals on behalf of his community. Where matters of the greatest importance must be resolved, a group of *payé* will work together, consuming massive quantities of ayahuasca until they reach a point, lying in their hammocks, where they

> feel they are ascending to the Milky Way. … The ascent to the Milky Way is not easily accomplished. An apprentice will hardly ever be able to rise immediately to this … region but rather will learn to do so after many trials. At first he will barely rise over the horizon, the next time perhaps he will reach a point corresponding to the position of the sun at 9 a.m., then at 10 a.m., and so on until at last, in a single, soaring flight, he will reach the zenith.[36]

In summary, therefore, the shaman's visionary journey through the ayahuasca portal involves a leap or, after sufficient practice, a "soaring flight," to the Milky Way. It is not the final goal, however,

but a way station. “Beyond the Milky Way” lies the entrance to the Otherworld. As Reichel-Dolmatoff explains:

> It is said that the individual “dies” when he drinks the potion and that now his spirit returns to the uterine regions of the Beyond, only to be reborn there and to return to his ordinary existence when the trance is over. This then is conceived as an acceleration of time, an anticipation of death and rebirth.[37]

HIDDEN HAND

THE TUKANO OTHERWORLD IS DIVIDED into regions or districts and one of these, of particular interest to shamans, is the domain of *Vai-mahase,* the supernatural “Master of Animals.” It is a strangely geometrical “hill” in the form of a square with its four sides oriented to the cardinal directions.[38]

Is it an accident that geometry arises spontaneously in ayahuasca visions? And is it an accident that it does so not only among Amazonian peoples in the Amazon itself, but—as my own experiences and multiple scientific studies have proved—among peoples from industrialized cultures as well?[39] Whether you drink the brew in the rainforest, or in New York, London, Frankfurt, or Tokyo, it is a plain fact that sooner or later you are going to see geometry.[40]

Entrance to the "Otherworld" as depicted in Tukano visionary art. (After G. Reichel-Dolmatoff, *The Shaman and the Jaguar,* 1975, p. 174.)

Is the presence of some deeper enigma hinted at here—an enigma that the ancients had plumbed when they devised their memes and sent them ringing down the ages? Just because our high-tech civilization has demonized psychedelics for the last 50 years doesn't mean that other societies in the past did so. Indeed it's likely that

these powerful agents of transformation were used by ancient civilizations for profound and far-reaching inquiries into aspects of reality about which our own high-tech civilization remains willfully ignorant.[41]

We've seen that ayahuasca has many different names among the many different peoples who use it across the Amazon, but the word *ayahuasca* itself is from the Quechua language of the high Andes overlooking the western edge of the Amazon basin. This is the language that was spoken by the remarkable Inca civilization of Peru in the few short centuries before its destruction by the Spaniards. In that language what *ayahuasca* means is the "Vine of the Dead" or the "Vine of Souls."

The memes of geometry and cosmic alignments are not the only ones to have propagated from a so far unidentified common source. Intimately connected to them are other ideas that went "viral" in

both the Old World and the New, and that therefore somehow transcended the Ice Age separation of peoples.

LEFT: Plan (by Martti Pärssinen) of Fazenda Colorada, Upper Amazon Basin geoglyph site (see chapter 16). TOP RIGHT: Tukano visionary art depicting the entrance to the "Otherworld," said to lie "beyond the Milky Way." BOTTOM RIGHT: Detail (rotated) from Fazenda Colorada.

The central focus of all these ideas concerns the mystery of death, and anthropologists have long been aware that the Quechua name ayahuasca is entirely appropriate since "in the indigenous context Ayahuasca is intimately related to death."[42]

In parts 5 and 6 our investigation returns to North America, where eerie doppelgängers of the great earthworks of the Amazon haunt the Mississippi Valley. As we'll see, it's almost as though what we're dealing with are the faint surviving traces of an immensely ancient and deeply thought-through system of knowledge and initiation, perhaps arising from direct investigations using vision-inducing plants, in which profound notions of the afterlife destiny of the soul were stitched together with the geometry and cosmic alignments into a single "blueprint" that was then

hastily replicated and urgently distributed to the remotest corners of the earth.

PART V

STUFF JUST KEEPS ON GETTING OLDER

The Mystery of the Primeval Mounds

Six thousand kilometers as an aircraft flies from the heart of the Amazon to the heart of the Mississippi.

18

SUN

FROM THE CITY OF MANAUS, at the heart of the Amazon River basin in South America, it's a journey of about 6,000 kilometers by air to reach the city of St. Louis in the heart of the Mississippi River basin in North America. On the way you'll cross the Equator and the Tropic of Cancer. Google informs me that the flight time will be about 11 hours, including a stopover in the Dominican Republic.

It wasn’t so simple in the ancient world. Although sections of the journey could have been made by sea most of the route would have been overland through some geographically very challenging parts of Central America and involving, ultimately, much more than 6,000 kilometers.

This is not to say that such a great distance must necessarily have ruled out any communication and interchange between the two regions. On the contrary, it is not in dispute that the peoples of South and North America are more closely related genetically to each other than they are to anyone else, that there are some linguistic connections, and that crops such as maize or manioc that had been domesticated in one region were also grown in the other—though sometimes with a significant time lag. In summary, the evidence confirms that there were contacts but it also suggests that they were random and infrequent rather than regular and sustained.

The two giant river basins of the Americas (note, maps not to scale). The Amazon River basin (left) has a total area of 7.5 million square kilometers. The Mississippi River basin (right) has a total area of 2.9 million square kilometers.

What, then, are we to make of the fact that stunningly similar earthworks repeating stunningly similar geometric themes on a

stunningly similar scale to those of the Amazon River basin are also found in the Mississippi River basin?

Are the resemblances coincidental?

Or did they arise during one of the random and infrequent episodes of contact?

Or is there some other explanation?

It's June 14, 2017, a week before the summer solstice, and I'm chewing over these questions with Santha while we stand on top of an earthwork called "Monks Mound" at the sacred heart of the ancient Mississippian city of Cahokia.

Looking southwest from this vantage point what stands out, about 8 miles away, are the twin A-shaped support towers and cable ties of the Stan Musial Veterans Memorial Bridge, joining Illinois to Missouri across the Mississippi River, and a couple of miles farther south along the Mississippi waterside the glittering, stainless-steel Gateway Arch of the city of St. Louis. Conceived as "a public memorial to the men who made possible the western territorial

expansion of the United States,”[1] the arch reaches a height of 630 feet and is claimed to be the tallest man-made monument in the Western Hemisphere and the tallest arch in the world.

The contrast between old and new is abrupt—for the ancient mounds and earthworks of the Mississippi Valley, even gigantic sites like Cahokia, have an understated quality. They don’t radiate the brash and boastful self-importance of so many of our modern structures—such as the skyscraper One Metropolitan Square, which at 593 feet high seems to do battle with the Gateway Arch to dominate the St. Louis skyline. Neither do they overwhelm you with their grandeur and their majesty, like the pyramids of ancient Egypt and Mexico. Nor do they wear their mysteries in full view like the great moai of Easter Island. Instead an elegant synthesis between heaven and earth seems to have been sought out. In consequence even Monks Mound, on the 100-foot-tall summit of which we’re

now standing, is so seamlessly integrated with its setting that it seems almost as much a work of nature as of man.

Indeed this was precisely the view of Dr. A. R. Crook, director of the Illinois State Museum and a geologist by training, who undertook the first "scientific" investigations of Monks Mound in 1914. His theory, shared by many of his colleagues at the time and perhaps colored by an underlying prejudice that prehistoric Native Americans would not have been capable of building on such a scale, was that the mounds of Cahokia were entirely natural "erosional remnants." In 1914 Crook drilled twenty-five shallow augur holes into the north face of Monks Mound, found nothing to change his view and—as late as 1921—was continuing to declare, as though it were an established and objective fact, that the mounds were merely glacial and alluvial deposits and thus of no archaeological interest.[2]

This mattered because other, wiser, scholars were already absolutely certain that the Cahokia complex was man-made and of

outstanding archaeological interest and had mounted a campaign to save the mounds from further destruction at the hands of farmers and industrialists. Crook's claims that they were natural formations were therefore most unhelpful and had to be refuted before further progress could be made.

This challenge was duly taken up by archaeologist Warren T. Moorehead, who joined forces with geologist Morris Leighton to undertake a much more thorough investigation of the mounds in 1922 than Crook had mounted in 1914. After several test pits had been dug on the Fourth Terrace and on the east side of Monks Mound, including auguring to a depth of 20 feet, the results, in the form of artifacts and exposed construction levels, were too conclusive and compelling to be dismissed.[3] Even Crook was convinced and thereafter abandoned his position that the mounds were natural features[4]—a position that today, in the light of

subsequent extensive excavations around Cahokia and at Monks Mound, seems absurd.

Nonetheless, there remain many who would seek by one means or another to take Cahokia away from the Native Americans who built it. Since it can no longer be credibly claimed as a natural erosional feature, the fallback position, popular in the late nineteenth and early twentieth centuries but repeatedly returned to even now, is that the great city, and others like it up and down the Mississippi Valley, must have been the work of some superior "master-race" of white-skinned foreigners who reached America in antiquity and built the mounds with their advanced skills and techniques but were then driven off or wiped out by native "savages."[5]

Frequently compounded by rumors of "giants" or "aliens," such reasoning has already been comprehensively refuted by excavations proving to the satisfaction of anyone capable of logical thought that

the mounds, including Monks Mound—that "stupendous pile of earth" as one early explorer described it[6]—are indeed the work of Native Americans.[7]

The very name of the great mound, however, demonstrates the effects of the ongoing casual misappropriation of indigenous achievements. It bears that name simply because a group of Trappist monks—immigrants from France—grew vegetables on its terraces for a few years either side of AD 1810,[8] but it was built around AD 1050 by the Native American civilization archaeologists call the Mississippians.[9]

We don't know what the people of that civilization called themselves and we don't know what they called Monks Mound. We do know, however, that they thought and worked on a grand scale, as I shall show, and that they made use of the same kinds of geometry and astronomy deployed at Serpent Mound, 420 miles to

the east, and in the great earthworks and mounds of the Amazon thousands of miles to the south.

TWO VALLEYS

DESPITE THE PROMISING CLUES OFFERED by ethnographic research into the likely role played by vision-inducing plants and shamanic experiences, the fact remains that we are confronted across huge expanses of the Amazon by such severely limited archaeological data that it's impossible to give responsible, informed answers to three fundamental questions:

- What motivated the creation of the mounds and geoglyphs?
- When were the very first structures of this kind made?

- Where and how were the requisite design, planning, engineering, and architectural skills developed?

In the Amazon, on all three counts, we simply don't know. Moreover, our ignorance is compounded by the absence of any detailed geometrical or archaeoastronomical surveys of the earthworks and mounds thus far discovered and by the fact that millions of square kilometers of the rainforest have never been studied by archaeologists at all.

It's quite a different story in the Mississippi Valley, which is not veiled by vast areas of near-impenetrable jungle and where mounds and earthworks remarkably similar to those now coming to light in the Amazon have been the subject of more than 170 years of intensive archaeological investigation.[10] Because they were always in plain view, however, and because they often occupied land that was desirable for agricultural or industrial purposes, the vast majority of the immense prehistoric structures of the Mississippi

Valley no longer exist. An estimated 90 percent are gone—either partially or completely demolished and cleared away in the obliteration of North America's past that began with the European conquest.

So just as archaeologists in the Amazon have only a limited database from which to construct their theories, because the jungle covers so much, it's also the case that archaeologists in the Mississippi Valley have only a limited database because so much has been destroyed. Still, they've achieved a great deal with the roughly 10 percent of the original total of sites that have survived and it may not be too much to hope that their discoveries could shed light on the mysterious counterpart mounds and earthworks of the Amazon.

EARTH ISLAND, SKY WORLD

FROM CHAPTER 16, THE READER may recall Severino Calazans, an Amazonian earthwork with the same 13-acre footprint and the same orientation to the cardinal directions as the Great Pyramid of Giza. Though rectangular rather than square (910 feet from north to south and 720 feet from east to west), Monks Mound has a 14-acre footprint.[11]

Considered as a pyramid—and it is indeed a form of step pyramid—it comes third in the Americas after the Pyramid of Quetzalcoatl at Cholula and the Pyramid of the Sun at Teotihuacan,[12] both of which are stone-reinforced monuments and significantly taller.

Considered an earthwork, and echoing that early explorer's report, Monks Mound has been described as "stupendous in many ways. It is the tallest mound, covers the most area and contains the most volume of any prehistoric earthen monument in the Americas."[13] It is, moreover, part of a giant complex with multiple different elements including more than 100 subsidiary earthen

mounds, the archaeological traces of what was once a spectacular circle of huge wooden posts (known as Cahokia's "Woodhenge"), a spacious central plaza, and an 18-meter-wide, 800-meter-long earthwork causeway running arrow-straight between raised embankments.

Enigmatically, but quite deliberately set to an azimuth of 005 degrees—that is, 5 degrees east of true north—it is this causeway, referred to by archaeologists as the "Rattlesnake Causeway," that defines Cahokia's principal axis,[14] giving the site a certain ambiguity and adding to its air of mystery. Every mound and earthwork is set out upon the ground in strict relation to it, with clusters of structures, dominated by Monks Mound itself, running south to north and other clusters running west to east.

It's easy to understand, then, why the first and most powerful impression I get overlooking this massive ancient site from the top of Monks Mound is of its distinct "cardinality." Exactly as is the

case at Giza and Angkor—both of which are aligned within fractions of a single degree to true north—so, too, here at Cahokia. Despite its puzzling 5-degree offset there's no mistaking where to look for the cardinal directions. Something about the place—something intended and carefully thought through by its original designers—immediately connects you to both earth and sky.

Detail of Monks Mound and some of its immediately adjoining structures.

Running through the Grand Plaza and Monks Mound, and extending northward beyond Monks Mound, the Rattlesnake Causeway defines Cahokia's 5 degrees east of north axis.

Monks Mound
Romain

Lidar image reveals how Monks Mound is bounded by plazas and other significant structures on its north, south, east, and west sides. IMAGE BY WILLIAM ROMAIN.

This sense of terrestrial and cosmic connectedness is among several cogently argued reasons why archaeologist William Romain, whose work at Serpent Mound we encountered in part 1, considers Monks Mound to have been conceived by its designers as a true "axis mundi"—intended to serve as a junction point between heaven and earth. He reminds us of the traditional shamanistic spiritual system of the Native American peoples of the Eastern Woodlands—the region of Cahokia. According to this system, the universe is comprised "of an Above World, This World, and Below World. … Connecting these realms is a vertical vector … the axis mundi that enables shamans to move between cosmic realms. … The axis mundi can be symbolically represented by any number of vertical elements such as a pole, tree, column of smoke, mountain, pyramid, or mound."[15]

Monks Mound has the look of a small mountain, Romain observes. It dwarfs everything in the surrounding landscape and utterly dominates Cahokia. This character of "verticality" is enhanced by the local topography of the Mississippi floodplain, which would have ensured that the Grand Plaza was regularly, if shallowly, inundated. Out of the watery, marshy realm thus created, Monks Mound would have seemed to rear up in numinous and mythic power and was perhaps, Romain writes:

> imagined as an earth island. … If the Below World as represented by the wetlands, swamps, lakes, and man-made water features surrounding central Cahokia is a watery world, then it is appropriate that in its verticality, Monks Mound would be the structural axis mundi linking the watery Below World to the Above Sky World.[16]

Interestingly, and again despite the 5-degree offset from true north so firmly declared by Cahokia's principal axis, the largest known building of the Mississippian civilization was erected on the

apex of Monks Mound and in this case was precisely aligned to the cardinal directions.[17] Its long axis, measuring 30.85 meters, was set perfectly east–west; its short axis, measuring 13.85 meters, was set perfectly north–south.[18]

Archaeologists have established that a large structure, perfectly aligned to the cardinal directions, once stood on the summit of Monks Mound. IMAGE BY WILLIAM ROMAIN.

The workings of Cahokia's Woodhenge. PHOTO BY WILLIAM ISEMINGER; ANNOTATIONS BY WILLIAM ROMAIN.

Romain also draws our attention to "the powerful visual hierophany" that would have been witnessed at the spring and fall equinoxes when Cahokia was in its prime, locking the site in to key conjunctions of heaven and earth. It was in the staging of this hierophany that the site's "Woodhenge" played its most crucial role. Re-created with a modern simulacrum for the benefit of the 300,000 tourists who now visit Cahokia each year, and named after the similar prehistoric circle of huge wooden posts that stood on England's Salisbury Plain close to the world-famous site of Stonehenge before the stone circle itself was completed, Cahokia's Woodhenge lies some 850 meters west of Monks Mound. Its existence remained unsuspected until the 1960s when archaeologist Warren Wittry found traces of immense postholes. Subsequent excavations revealed that no fewer than five woodhenges had been built on the same site over a period of a couple of centuries in order

to accommodate increases in the size and shape of the Mound itself, which affected crucial solar sight lines.

Rotraud

PHOTOGRAPHED FROM WOODHENGE BY WILLIAM ROMAIN.

The objective of every realignment and rededication was that an observer at the center of the post circle, looking due east across the "front sight" of a specially placed equinox marker post, should see the sun's disk appear above the slope of the southern terrace of Monks Mound—an arrangement, says Romain, that establishes an east–west solar-oriented line across the entire Cahokia complex:

> The result is that Monks Mound is visually connected to the Above World vis á vis the rising sun and its location on the east–west sightline that intersects the major site axis. In this way, Monks Mound is positioned at a center place.[19]

That assertion and manifestation of centrality is reconfirmed by two other posts at Woodhenge that serve as front sights targeting the horizon azimuths of the summer and winter solstice sunrises.[20]

ENTER THE MOON

THE CIRCLES, RECTANGLES, AND SQUARES of Cahokia, the solstitial and equinoctial alignments, and the perfect cardinality of the large structure that once stood atop Monks Mound are among the hallmarks of the same distinct pattern of geometry and astronomy that we find in the Amazon earthworks.

Unexplained so far, however, is why Cahokia's designers made a deliberate choice **not** to align the main axis of their premier site to the cardinal directions of earth and sky but instead chose to offset it by 5 degrees east of true north?

It's a question to which William Romain offers an intriguing answer. The builders of Cahokia, he argues, were geometricians who made use of a special rectangle, known as a "root-2 rectangle," in planning the layout of the city.

He gives much supporting evidence for this claim, which need not detain us here.[21] Nor do we want to get bogged down in unnecessary technical detail. In brief, however, a root-2 rectangle is constructed by extending the opposite sides of a square to the length of the square's diagonal. If you take such a rectangle, orient it to true north (0 degrees azimuth), and then rotate it eastward by 5 degrees to match the azimuth of Cahokia's principal axis, its diagonals turn out to align closely with important solar and lunar events as viewed from Monks Mound—specifically, **the summer solstice sunrise** at azimuth 59.7 degrees, **the winter solstice sunset** at azimuth 239.3 degrees, **the moon's maximum southern rising position** at azimuth 130.1 degrees, and **the moon's maximum northern setting position** at azimuth 307.1 degrees.

The match, Romain admits, “is not perfect. A couple of the celestial azimuths differ from the diagonals of the root two rectangle by 2 to 3 degrees. But since the rectangle is not intended for observational purposes it is perhaps close enough to symbolically represent the complementary opposite relationships of the sun and moon.”[22]

If Romain is right, then it appears that sophisticated astronomical and mathematical ideas, combined with complex and cleverly thought through symbolism, were already present, fully worked out, and in the hands of competent professionals when Cahokia underwent what archaeologists call its “big bang”—an explosive period of expansion and development—around AD 1050.[23]

Is there evidence that such ideas were deployed elsewhere in North America before Cahokia?

19

MOON

WILLIAM ROMAIN'S CASE THAT NOT only solar but also lunar connections were mediated through geometry in the alignments of Cahokia is strengthened by the fact that other significantly older earthwork sites, most of which were destroyed by "development" in the nineteenth and twentieth centuries, were built in the Mississippi River basin incorporating complex geometries based almost

exclusively on lunar alignments. Two of the most significant such sites to have survived, at least in part, into the twenty-first century are the High Bank Works and Newark Earthworks, both in Ohio. High Bank Works is located near the town of Chillicothe, about 40 miles northeast of Serpent Mound, and Newark Earthworks stands about 60 miles farther to the northeast near the town of Newark.

Both are true geoglyphs in the Amazonian sense, being formed by embankments and ditches set out on such a gigantic scale that their shape is not evident at ground level and can only be discerned clearly from the air.

This 1934 aerial photograph shows the Circle-Octagon combination of the Newark Earthworks. Those parts that still survive are now largely contained within a private country club that includes an eighteen-hole golf course and promotes itself as "unlike any other in the world. It is designed around famous prehistoric Native American Earthworks that come into play on eleven of the holes."

Both are dominated by immense octagon-circle combinations linked by short causeways amid assemblies of other geometrical figures. Both are currently thought to date to between AD 250 and 400.[1] Both are attributed to a culture that archaeologists have named the "Hopewell"—after a certain Captain M. C. Hopewell, who happened to own a farm in the right place when excavations began.[2]

Newark and High Bank were first professionally surveyed in the mid-nineteenth century when numerous mounds—most subsequently leveled for plowing or industrial purposes—were reported to be situated within the geometrical earthworks.[3] It may therefore be relevant to recall at this point that many of the

Amazonian geoglyphs described in chapter 15 also contain mounds—for example, eleven arranged in a circle within an immense enclosure in the Upper Tapajos Basin,[4] the "two high mounds, standing like towers" at the southwestern entrance of the trapezoidal earthwork at Fazenda Colorada,[5] the twenty-five adjoining mounds of Fazenda Iquiri II,[6] and the ten surviving mounds of Coqueiral.[7]

Whereas no archaeoastronomical survey of the Amazonian earthworks has yet been attempted, Cahokia and Serpent Mound have both been subject to intense scrutiny. Meanwhile, at Newark and High Bank a series of studies since the 1980s have revealed a complex symphony of geometry and astronomy encoding not only familiar solar alignments but also, as we are about to see, much more subtle and esoteric conjunctions of heaven and earth concerned with the complex dance along the horizon of the rising and setting moon.

PCBS

NEWARK AND HIGH BANK HAVE an almost technological feel to them, resembling gigantic printed circuit boards or wiring diagrams from the innards of some immense and ineffable instrument. It's interesting, therefore, that Bradley Lepper, currently curator of archaeology with the Ohio History Connection, believes they may originally have been conceived by their designers as the components in "a monumental engine for world renewal … a vast machine, or device, designed and built to unleash primordial forces."[8]

At both sites the principal geoglyph combines a circle with an octagon and in both cases these figures are formed by large earthen embankments as much as 12 meters wide at the base and typically about 1.7 meters high.[9]

NEWARK WORKS
LICKING COUNTY.

Newark Great Circle, also known as the Fairground Circle, with its interior ditch and central three-lobed "Eagle Mound." The diameter of the circle is 365.9 meters (just over 1,200 feet).

A striking similarity of general design connects the octagon/circle theme of Newark and High Bank with the Amazonian geoglyph (see chapter 15) of Santa Isabel. Although the latter is less geometrically exact than the Ohio examples, this is by no means always the rule since both regions exhibit numbers of extremely precise and numbers of more mediocre earthworks.

The strict lines of Ohio's Newark Octagon enclose an area of 50 acres and its eight walls have an average length of 167.7 meters.[10] The adjoining circle, known since the nineteenth century as the "Observatory Circle," encloses an area of 20 acres and has a diameter of 321.3 meters.[11] A resurvey of the site, carried out with modern instruments in 1982, revealed that "the midline of the embankment walls deviates by no more than 1.2 m at any place from a perfect circle of diameter 321.3 m. A perfect circle of this diameter would have a circumference of 1009.4 m, whereas the actual circle has a circumference of 1008.6 m. Thus it is evident that the Observatory Circle very closely approximates a true circle."[12]

Located 2 kilometers southeast of the Observatory Circle is a second, larger but less geometrically perfect circle known as the Great Circle and formerly as the Fairground Circle, since it was used as the site of the Licking County Fairgrounds from 1854 to 1933.[13] It encloses an area of 30 acres[14] and, though much depleted

by misuse and the passage of time, its earthwork walls today, varying between 1.5 meters and 4.3 meters in height and between 11 meters and 17 meters in width,[15] still give a sense of the enormity of the original enterprise. At its center are the remnants of a three-lobed mound, usually referred to as "Eagle Mound" because many visitors have seen in it a resemblance to a bird with outstretched wings.[16] Archaeologists, however, regard it as "a series of conjoined mounds rather than a specific effigy form."[17]

Images from the 1894 Bureau of Ethnology Survey. Badly damaged even then, Newark's Great Square (left), also known as "Wright Square" or "the Wright Earthworks," is almost completely destroyed today, with only a short segment of one of the four walls remaining. The perimeter of the Great Square is equal to the circumference of the Great Circle (center), while its area is equal to the area of the Observatory Circle (right).

The diameter of the Great Circle, at 365.9 meters,[18] is of the same order of magnitude as the Neolithic henges in the British Isles. Stonehenge at 110 meters is smaller[19] but Avebury at approximately 420 meters is larger.[20] Moreover, just like Avebury and many of the Amazonian earthworks reviewed in chapter 16, a striking feature of Newark's Great Circle is the massive ditch—as much as 12.5 meters wide and 4 meters deep[21]—that runs *inside* its embankment walls. Indeed, such a ditch, within rather than outside a circular embankment, is the very definition of a henge.

Alongside its circles, and an integral part of the same enormous complex (to the other major elements of which it was joined by

causeways), Newark in its prime possessed a square enclosure, "nearly geometrically perfect,"[22] with sides averaging 931 feet in length.[23] Almost nothing of it remains today but fortunately enough was intact when it was surveyed in the nineteenth century, first by Squier and Davis and later by Cyrus Thomas of the Bureau of Ethnology, to establish its measures exactly. These and subsequent surveys have revealed not only that "the perimeter of the square earthwork is precisely equal to the circumference of the Great Circle," but also, as Bradley Lepper notes, that "its area is equal to the area of the Observatory Circle." In these clearly deliberate and carefully thought through harmonies, Lepper rightly finds "indications of the remarkable sophistication of the geometry incorporated into the architecture of the Newark Earthworks."[24]

Variations on a theme. LEFT: Ancient Works, Pike County, Ohio, as mapped by Squier and Davis in 1848. RIGHT: Jacó Sá earthwork, the Amazon. PHOTO: RICARDO AZOURY/PULSAR IMAGENS.

William Romain is more specific. In his view the creators of this extraordinary and in some ways rather otherworldly site "were intrigued by the variety of possible relationships between a circle

and a square. … The idea that seems to be expressed is that, for every circular enclosure, a corresponding square … can be related to the circle by geometric means."[25]

"Squaring the circle"—constructing a square with the same area as a given circle—was of course a geometrical exercise of great interest to the master mathematicians of ancient Babylon, Egypt, and Greece.[26]

The dominant reference frame of modern archaeology does **not** encourage us to believe that any Native North Americans 2,000 years ago would have possessed the necessary knowledge and skills to perform such an exercise. Yet clearly they did, for the proof is there at Newark—not scratched on some handy-sized clay tablet or papyrus but set out with high precision on the ground in an assembly of truly gigantic and mysterious earthworks.

Many different variations on the same theme, which there is not space to review here, are to be found at other Hopewell sites in Ohio

—for example, a square/circle combination that formerly existed in Pike County. Fortunately, it was surveyed by Squier and Davis in 1848 and their rendering, in figure 11 of *Ancient Monuments of the Mississippi Valley,* shows it to have been very similar in concept and plan—and indeed in size—to the earthwork at Jacó Sá in the Amazon described in chapter 15. The two figures are not identical, but they appear to demonstrate the identical geometrical principle.

From chapter 15 the reader will also recall the recent discovery of a squared circle complex within the great henge at Avebury in the British Isles.

Are we to resort once again to the archaeological cover-all of "coincidence" to explain the constant repetition and replication of the same astronomical and geometrical constructs in earthworks as far apart in space and time as Avebury, Newark, and Jacó Sá? Or could it be that some guided and intentional process, as yet undetected by archaeology, was under way behind the scenes of prehistory?

THE CONNECTION TO HIGH BANK

WE'VE SEEN HOW THE DIAMETER of the nearly geometrically perfect Observatory Circle at Newark is 321.3 meters (1,054 feet). Astronomer Ray Hively and philosopher Robert Horn of Indiana's Earlham College, whose comprehensive work at Newark and High Bank in the 1980s provided the foundation for all subsequent studies, realized that the same length of 321.3 meters had also been used by the builders to lay out the Octagon:[27]

> The conclusion suggested by the geometry of the Observatory Circle–Octagon combination is that both figures have been carefully and skilfully constructed from the same fundamental length.[28]

This unit of measure, now known by the unfortunate yet strangely appropriate acronym OCD (for Observatory Circle Diameter), was also deployed at High Bank, which, as Hively and Horn remind us,

is “the only other circle-octagon combination known to have been constructed by the Hopewell.”[29] It cannot be a coincidence, then, that High Bank turns out to conform to a geometric pattern based on a fundamental length of 0.998 OCD.[30]

Nor is the connection between these two sites limited to their shared unit of measure.

Perhaps most striking of all is the fact, noted by archaeologist Bradley Lepper, that “the main axis of High Bank Works—that is, a line projected through the center of the Circle and the Octagon—bears a direct relationship to the axis of Newark’s Observatory Circle and Octagon. **Although built more than 60 miles apart**, the axis of High Bank Works is oriented at precisely 90 degrees to that of Newark earthworks. This suggests a deliberate attempt to link these sites through geometry and astronomy.”[31]

In my view it more than merely “suggests!” Given that these are the only two sites in North America with circle-octagon

combination earthworks, given that the circles are 99.8 percent identical in size, and given their precise 90-degree orientation to one another, a quite remarkable feat of surveying across a great span of country, I think we can safely say that the designers **did** intend a deliberate connection here. Lepper himself makes a strong case that this connection might have been more than symbolic when he presents evidence for the former existence of a causewayed road with some stretches of its parallel walls still in place as late as the mid-nineteenth century. He calls it "the Great Hopewell Road" and speculates that it was perhaps a pilgrim route that once ran between Newark and High Bank.[32]

As at Newark, a circle-octagon combination forms the dominant glyph at High Bank, and there are adjacent figures and causewayed avenues. When Squier and Davis surveyed the site in the nineteenth century (there has been massive destruction since) they reported that the walls of the High Bank Octagon were "very bold; and where

they have been least subjected to cultivation are between eleven and twelve feet in height, by about fifty feet base. The wall of the circle is much less, nowhere measuring over four or five feet in altitude."[33] Despite its once "bold" walls, the High Bank Octagon, enclosing 18 acres,[34] is a much smaller figure than the Newark Octagon, which, as we've seen, encloses 50 acres.[35]

Why, since otherwise the circle-octagon motifs of the two sites are so similar, since their circles are of identical size, and since it seems the earthwork-makers did nothing by chance, should there be this marked reduction in scale of the High Bank Octagon?

The answer, as we shall see, has to do with eerily precise, indeed scientific, observations of the moon.

Extreme rise and set points of the moon over its 18.6-year cycle as viewed from Newark, Ohio. When the moon is at a position for maximum extremes, the extreme north and south moonrises and moonsets in a given month are separated by 77 degrees; at the position for minimum extremes, the extreme moonrises and moonsets are separated by 49 degrees.

SKY KNOWLEDGE

LIKE OTHER SACRED SITES SCATTERED around the world, the geometrical mounds and earthworks of North America don't give up their secrets easily. They have ways of grabbing your attention but they're going to force you to do some work before they allow you to understand them. Thus, for example, getting to grips properly with Serpent Mound requires knowledge of what a solstice is and of how the rising and setting points of the sun change according to a predictable cycle throughout the year.

Such knowledge, archaeologists argue, would have had immediate utility in the pre-industrial world, reminding farmers, in the words of Ecclesiastes, that for "every thing there is a season … a time to plant and a time to pluck that which is planted."

As a motive for the memorialization of solstitial and equinoctial alignments, however, the arguments in favor of a practical immediate agricultural payoff don't adequately account for the enormous effort involved in the construction of many of the sites.

After all, the same calendrical functions could have been realized almost as effectively and much less expensively with pairs of aligned poles.

The notion that a reliable agricultural calendar was the primary motive for skywatching also fails to explain why we find the same focus on the rising and setting sun on the solstices and the equinoxes in distinctly **pre**-agricultural sites such as Painel do Pilão in the Amazon, dating back more than 13,000 years.[36]

Likewise, though they can only have been the product of detailed observations of the heavens and would have required meticulous record-keeping over many generations, the lunar alignments manifested in the great earthworks at Newark and High Bank have no obvious practical function in terms of harvests—or, indeed, of any other utilitarian pursuit. Once again, though, what they do require of those who seek deeper knowledge of them is a study of the heavens.

Nothing beats direct observation of the sky over the course of the year—except observing it over the course of many years—but these days excellent free astronomical software can speed up and simplify the learning task by showing us the exact rising points of the sun and the moon at any location and over any interval we choose.

If we make use of such software to observe the behavior of the moon over, say, a period of a century, we will quickly notice that its rising and setting points along the eastern and western horizons are locked to a cycle shifting from farthest north to farthest south and back to farthest north again **every month**. As more time passes, however, we will also observe that these monthly "boundaries" on the moon's rising and setting points aren't fixed from year to year but instead widen and narrow over an 18.6-year cycle. If they are at their widest ("Maximum Extreme") today, then they will be at their narrowest ("Minimum Extreme) in 9.3 years and at their widest again 9.3 years after that.

Eight prominent directions are therefore implicated in these celestial events. Four target the maximum and minimum monthly boundaries north of east and the maximum and minimum monthly boundaries south of east between which the moon can rise during its 18.6-year cycle. The other four do the same for moonset on the western horizon. On each occasion as it reaches one of its extremes the moon's constant motion stops—literally comes to a standstill—before it reverses the direction of its oscillation for the next 9.3 years.

The geometry of the Newark Earthworks—and of High Bank, too—turns out to be very closely fitted to these obscure celestial events, known to astronomers as "lunar standstills," knowledge of which would appear to have no practical contribution to make to the necessities of everyday life.

NEWARK'S LUNAR CODE

IT'S LARGELY THANKS TO RAY Hively and Robert Horn that we know of these lunar connections at all.

When they began work at Newark in 1975 their purpose was to conduct "a field exercise in data collection and analysis for an undergraduate interdisciplinary course."[37] Although cosmology and the astronomical knowledge of prehistoric and ancient cultures were within the scope of the course, they make clear that they "did not expect to find any particular geometrical or astronomical pattern" at Newark.[38] "Indeed, given the difficulty of showing that any such pattern was intentional rather than fortuitous, we doubted any persuasive hypothesis regarding design of the earthworks could be formed."[39]

To their surprise, however, as they admitted in 2016:

> Our continued analysis … has revealed repetitive patterns of earthwork and topographical features oriented or aligned to the extreme rise and set points of both the sun and the moon on the horizon. These alignments, combined with the massive scale, geometrical symmetry and regularity of the earthen enclosures suggest that the Newark Earthworks were built to record, celebrate, and connect with celestial actors or large-scale forces that appear to govern relations among earth, sky and the human mind.[40]

In their initial study, published in the journal *Archaeoastronomy* in 1982,[41] Hively and Horn did not recognize any solar alignments at Newark.[42] What grabbed their attention instead was the intricate cat's cradle of lunar alignments uncovered by their detective work.[43]

Some were obvious, indeed unmissable once the lunar concerns of the site were admitted—for example, the fact that "the avenue axis of the Octagon points to the maximum northern extreme rising point of the moon with an error of 0.2°."[44]

Such an “error,” amounting to less than two-tenths of a single degree, represents remarkable precision for any epoch and far exceeds the level of science generally assumed by archaeologists to have existed in the pre-Columbian Americas. Moreover, “the avenue axis and four sides of the Octagon mark five of the eight extreme lunar rise-set points with a mean accuracy of 0.5º.”[45]

The three remaining alignments, accurate to within 0.4 degrees, 0.7 degrees, and 0.8 degrees, respectively, are also shown in the diagram following.

RIGHT: The eight key stations of the 18.6-year lunar-standstill cycle at Newark. The central axis and four walls target, respectively: (1) maximum northern moonrise; (2) maximum northern moonset; (3) minimum northern moonrise; (4) minimum southern moonset; and (5) maximum southern moonrise. The three remaining alignments identified by Hively and Horn are (6) maximum southern moonset; (7)

minimum northern moonset; and (8) minimum southern moonrise. TOP LEFT: Simulation of maximum northern moonrise at Newark, as viewed along the Observatory Circle–Octagon axis.

Hively and Horn reinforce their case with another observation. The four sides of the Newark Octagon that are **not** aligned to significant lunar events form closely parallel pairs and are highly symmetrical. By contrast the four sides that **do** align to lunar standstills are neither parallel nor symmetrical. The obvious deduction to be made from this is that the geometrical symmetry of the Octagon was deliberately distorted to achieve more accurate lunar alignments.[46] Moreover,

> the requirements of (1) octagonal symmetry and of (2) alignment with lunar extrema uniquely define the Newark Octagon. Of the infinity of possible octagons which could have been constructed at this site, the one we find is precisely the one which matches the lunar extrema most closely. In fact we have been unable to design an equilateral polygon with eight or fewer sides which incorporates the same lunar points more efficiently and accurately than does the Newark Octagon.[47]

In the High Bank Octagon wall 11 → 1 is 16 percent longer than wall 10 → 11, displacing vertex 11 from its ideal position in such a way as to produce a lunar alignment, targeting the minimum southern moonrise between vertices 11 and 5. Likewise, there is no gap at the position of the ideal vertex at position 12. Instead the gap has been moved northward to position 9. A line between points 4 and 9 aligns with the minimum southern moonset. A further alignment, made possible by deviations in linearity, targets the maximum northern moonset at maximum standstill.

SUN AND MOON AT HIGH BANK

THE GREAT CONTRIBUTION OF HIVELY and Horn's 1982 paper in *Archaeoastronomy* was that it demonstrated how precisely, and how cleverly, Newark celebrates and embraces the lunar standstills. In a follow-up paper published in the same journal in 1984, the same investigators go on to prove that the High Bank structures embody equally unequivocal alignments to the extreme north and south rise points of the moon.[48] And just as at Newark, where deliberate asymmetries were introduced into the side lengths and angles of the Octagon to achieve more perfect lunar alignments, so, too, we find that one of the eight walls of High Bank's octagon is 16 percent longer than it "should" be to preserve perfect geometrical symmetry. This "error," however, alters the angle to the neighboring vertex, thus opening up an alignment to the **southern extreme moonrise** at minimum standstill within a margin of just 0.6 degrees.

If the wall had been the "correct" symmetrical length no lunar alignment would have been possible.[49] A second such "error" facilitates an alignment with the **southern extreme moonset**, again at minimum standstill.[50]

Targeting of the northern extreme moonrise and the southern extreme moonset at High Bank—both at maximum standstill. In addition, the summer solstice sunrise is targeted within 0.5 degrees by wall 1 → 2 while the alignment 13 → 2 targets the winter solstice sunrise.

A further alignment, in this case made possible by deviations in linearity, targets the **northern extreme moonset** at maximum standstill.

Clearly, therefore, High Bank and Newark have much in common and in some ways seem almost like twins. Why then, as we asked earlier, does the octagon of one of these "twins" enclose 50 acres while the octagon of the other encloses just 18 acres?

The answer offered by Hively and Horn is that not only does the 50-acre Newark octagon match the lunar extrema more closely than any other possible octagon, but also that it was designed to do so within the specific latitude band—measuring 44.5 kilometers from north to south—in which Newark is located.[51] In other words, the purpose of accurately aligning the earthwork to the lunar standstills would **not** have been served if the Newark octagon, like the circle, had been reproduced with an exact duplicate at High Bank more than 90 kilometers to the south.[52] The 18-acre figure with different

vertex angles that we find at High Bank is perfectly suited to the task at High Bank's latitude.

Among other differences between the two sites, perhaps the most notable is that no alignment to any significant solar event, whether to the equinoxes, or to the solstices, or to the so-called cross-quarter days in between, has yet been satisfactorily identified at Newark in the earthworks themselves.[53]

But there's a context to this.

Recent research by Hively and Horn has raised the intriguing possibility that the very reason Newark's earthworks are where they are is that four prominent "high-elevation overlooks" in the surrounding landscape serve as natural front and back sights targeting sunrise and sunset on the winter and summer solstices.[54] It's unlikely to be an accident that the point of intersection of these natural alignments "lies in the central region of the earthworks and

is equidistant (within 2 percent) from the centers of the Observatory Circle and the Great Circle."[55]

Just as with its latitude, therefore, though the matter cannot be proved, the choice of Newark's natural setting feels designed and deliberate.

Meanwhile, at High Bank, Hively and Horn's 1984 study not only confirmed key lunar alignments to southern extreme moonrise, southern extreme moonset, and northern extreme moonset, as we've seen, but also to the **northern extreme moonrise** and to the **southern extreme moonset**—both at maximum standstill. In addition, the **summer solstice sunrise** is targeted within 0.5 degrees by wall 1 → 2 while the alignment 13 → 2 targets the **winter solstice sunrise**[56]—the same familiar memes of cosmic mystery and geometric magic that manifest in earlier sites such as Serpent Mound and later sites such as Cahokia.

We've seen that these memes can be traced in the Amazon at least as far back as Painel do Pilão some 13,000 years ago.

Before Cahokia, before Newark and High Bank, before Serpent Mound, how far back can we follow their trail in North America?

20

THE POVERTY POINT TIME MACHINE

DEAR READER, I DO NOT propose to take you on a tour of every mound and earthwork site in the United States, nor even of every mound or earthwork site I've visited personally. But if you were to rent a car in New Orleans and drive the 800 or so miles north

through the Mississippi Valley as far as Cincinnati or a little farther, with time on your hands for some significant side trips east and west, you could plan an interesting journey. Despite the wanton destruction during the past 200 years, some outstanding sites have been saved in Louisiana,[1] Mississippi,[2] Alabama,[3] Tennessee,[4] Illinois,[5] and Ohio,[6] and there are also significant sites in Florida,[7] Georgia,[8] Texas,[9] Arkansas,[10] Kentucky,[11] and Indiana.[12] Other states have mounds and earthworks, too. But in antiquity the North American mound-building phenomenon was centered on the Mississippi River, and on its great Ohio and Missouri tributaries, and this is reflected in the distribution of the surviving sites today.

A number of different "mound-building cultures" have been identified by archaeologists, who have assembled them into categories based on period, location, types of pottery, types of tools, arts and crafts, and other criteria. We've already met some of the leading lights in this typology, such as the "Adena" (roughly 1000

BC to 200 BC), presently thought to have been the builders of Serpent Mound, the "Hopewell" (roughly 200 BC to AD 500), who were responsible for Newark and High Bank, and the "Mississippians" (roughly AD 800 to 1600), who built Cahokia.

Archaeologists make routine use of all these labels but also interpolate them with others that filter out of the classroom and into general consciousness, causing confusion all around. Thus, for example, you will not go far in learning about the mound-builders without encountering references to the Woodland Period, which is in turn divided into Early Woodland (1000 BC to 200 BC), Middle Woodland (200 BC to AD 600–800) and Late Woodland (AD 400 to AD 900–1000).[13] Allowing for some oversimplification of a complicated picture, the Adena culture built its mounds and earthworks during the Early Woodland period. The Hopewell culture built its mounds and earthworks during the Middle Woodland period. The Coles Creek culture was prominent during

the Late Woodland period. The Late Woodland period in turn overlaps with the Early Mississippian period.

But these are no more than artificial constructs that help tidy-minded archaeologists preserve a sense of order and control over otherwise dangerously unruly data—and, besides, we must question how much the types of utensils and tools used by a culture actually tell us anything of value. We wouldn't expect to gather crucial information about modern cultures from their knives, forks, hammers, and screwdrivers, so why should we suddenly set different standards when we try to understand the ancient world?

Undoubtedly many different Native American cultures, speaking many different languages, were involved in the construction of the mounds. Undoubtedly their arts and crafts and tools and pottery differed. Undoubtedly they expressed themselves in many different ways. Yet when it came to their earthworks, for some mysterious reason, they all did the **same** things, in the **same** ways, repeatedly

reiterating the **same** memes linking great geometrical complexes on the ground to events in the sky.

It represents a catastrophic loss of memory for our species, something akin to a madman smashing his own brains out, that there was such wholesale destruction of the Native American earthworks during the rapid growth of the United States in the nineteenth and twentieth centuries. To give credit where credit is due, it is entirely because of the excellent, dedicated, meticulous surgery of archaeologists that anything has been salvaged from the wreck at all —and as it turns out, quite a lot has been salvaged.

In consequence, whether we are viewing the handiwork of the Adena, such as Serpent Mound, or of the Hopewell, such as Newark and High Bank, or of the Mississippians, such as Cahokia, no sentient person can doubt the prodigious scale of this Native American achievement. There can be no doubt either that geometers and astronomers were in every case central to the enterprise. Nor is there doubt about when the enterprise came to an end—around AD

1600 in yet another catastrophic consequence of the European conquest of North America.

But when did it begin?

DEFYING EXPECTATIONS

I'M OUT NEAR THE WESTERN edge of Poverty Point, a very mysterious archaeological site in northeast Louisiana, climbing the second biggest earthwork mound in North America. Built around 1430 BC,[14] a century before the pharaoh Tutankhamun took the throne in ancient Egypt, it's often referred to as "Bird Mound," because of a supposed resemblance to a bird with outstretched wings flying east. Slumped and ruined in places, it does have something of that appearance today, particularly when viewed from the air, but an

archaeological reconstruction of how the entire mound would have looked in antiquity does not support the bird interpretation. More prosaically and more usually, therefore, it's known simply as Mound A.

It reaches 72 feet in height.[15] Monks Mound at Cahokia, 500 miles to the north, is taller by 28 feet, and also more massive, but 2,500 years younger and the work of a settled agricultural civilization. Mound A, on the other hand, was made by hunter-gatherers,[16] as was the entire Poverty Point complex, where the oldest element of the site, Mound B, has been dated as early as 1740 BC.[17]

The sides of Mound A at its base measure 710 feet east to west and 660 feet north to south (as compared to 720 feet east to west and 910 feet north to south for Monks Mound). Mound A's volume is estimated at 8.4 million cubic feet, a number hard to visualize, but Diana Greenlee, station archaeologist at Poverty Point, offers a

good analogy. “Take a standard American football field,” she suggests, “and make it 146 feet tall. It’s that much dirt.”[18]

Some archaeologists still give credence to the notion that Mound A is an enormous bird effigy since “birds are important within the iconography of Native Americans past and present of the southeastern United States.”[19] But not so long ago, just as was the case with Monks Mound, the experts felt they didn’t need to invoke Native Americans, or indeed any human agency, to explain Mound A. It and Motley Mound (2 kilometers north of the Poverty Point complex) were judged to be:

> Of natural origin, solitary outliers, the only ones for many miles in any direction, of the geological formations found in the bluffs to the east and the west of the Mississippi river; islands left by the drainage which cut the present river valley. Their appearance would easily deceive someone who was not somewhat familiar with such deposits.[20]

This confident piece of misinformation, put out in 1928 by respected archaeologist Gerard Fowke, was among a number of factors that delayed proper investigation and recognition of Poverty Point. And again, as happened at Monks Mound, when the amazing structure could no longer be shrugged off as natural there were still many who sought to deny Native Americans the credit for it, attributing it instead to some imaginary group of prehistoric Caucasian settlers who in the course of time were overrun by "savage" Native Americans.[21]

All archaeologists now agree that the half dozen mounds and other earthworks at Poverty Point are man-made. All agree likewise that Caucasian settlers (no matter how appealing the idea continues to prove with the general public) were NOT in any way involved, and that Native Americans made them. Such disputes and debates as did occur on the road to reaching these conclusions were more around the level of sophistication of the site, the amount of

manpower thought necessary to build it, and the degree of socioeconomic complexity that would have been required to see it through.

We'll not go into detail here, since we've seen already that the mainstream view for much of the nineteenth and twentieth centuries was that large-scale monumental constructions like Mound A at Poverty Point could only have been made by equally "large-scale, centralised and hierarchical societies" that had "the administrative means to carry out such achievements and to organise the large, settled populations whose labour is required."[22] Hunter-gatherers, the prevailing theory proclaimed, could never have generated sufficient surpluses, nor put the necessary hierarchical organization in place, to make such projects viable. Living from hand to mouth, their concerns were entirely focused on survival. Productive agricultural societies, by contrast, were wealthy enough to lift the burden of the daily struggle to survive from the shoulders of

talented individuals, thus allowing a class of specialists—architects, surveyors, engineers, astronomers, and others—to emerge and to master their skills.

It was realized from the first archaeological surveys in the 1950s that Poverty Point was ancient, but it was not initially assumed to be **very** ancient. Hitherto the oldest mounds in America north of Mexico were thought to be Early Woodland (e.g., Adena) in origin, dating between 1000 BC and 200 BC—although clustered toward the latter end of that period. Two initial C-14 dates, explains Professor Jon L. Gibson of the University of Louisiana, "seemed to indicate that the Poverty Point mounds were not only contemporary with Early Woodland but overlapped the earliest part of the Middle Woodland Hopewellian mound-building period."[23] In consequence, "pushing the mounds back to the time of Poverty Point was not that drastic a conceptual jump."[24]

Indeed, despite being older than any other mounds previously encountered by archaeologists in North America, the evidence from Poverty Point was accepted with relative ease. That it was not the subject of the usual catfights and rival claims, Gibson suggests, was in part because of the general assumption of the profession in the 1950s and 1960s that "mound building, pottery, agriculture, sedentism, and large populations were … an integrated complex. … This all or nothing association … promoted the assumption of an agricultural base for Poverty Point despite the lack of direct evidence."[25]

Nor would direct evidence of agriculture ever be forthcoming, for, as subsequent excavations have proved, Poverty Point was not the work of agriculturalists, but of hunter-gatherers.[26] This was paradigm-busting in its way, but archaeologists do hate a busted paradigm, so some wriggle room was found. "Planned large-scale earthworks," commented *Science* magazine in 1997, "were

previously considered to be beyond the leadership and organisational skills of seasonally mobile hunter-gatherers. Poverty Point was considered the exception, and its extensive trade was cited as evidence for sophisticated socioeconomic organisation."[27]

Schematic of Poverty Point indicating principal mounds and geometric ridges.

The notion that trade rather than agriculture fostered a sufficiently complex and prosperous society to get the mounds built proved satisfactory to most archaeologists. The two younger ("Hopewellian") dates turned up in the initial excavations subsequently proved to be out of context. No one now disputes that the oldest structures at Poverty Point go back to around 1700 BC—fully 1,500 years earlier than the first Hopewell earthworks—that the site flourished for 600 years, and that it was abandoned and left deserted at around 1100 BC.[28]

THE WORLD'S LARGEST PREHISTORIC SOLSTICE MARKER?

THERE ARE SIX MOUNDS AT Poverty Point, labeled A, B, C, D, E, and F. Of these Mound B is the oldest, perhaps as old as 1740 BC, as we've seen. Mound F, where construction began sometime after 1280 BC,[29] is the youngest. And Mound D (also known as "Sarah's Mound") was not the work of the Poverty Point culture at all, but was a much later addition by the Coles Creek culture some time after AD 700.[30]

Thus it is the four mounds, A, B, C, and E, that form the key elevations of old Poverty Point. Mound A looms massively over all of them. Despite its huge presence, however, it is not the definitive feature of the site, and neither are any of the other mounds. That role is reserved for a complex earthwork consisting of a series of six concentric ridges, originally up to 9 feet high, forming together a gigantic geometrical figure resembling a half octagon or the letter C, with a diameter of ¾ of a mile. When the lengths of all the ridges are added together they total almost 7 miles.[31] The ridge crests are

up to 100 feet wide, as are the ditches between the ridges, but they were much damaged by plowing in the nineteenth and twentieth centuries and today vary from a few inches to at the most about 6 feet in height.[32]

When archaeology began at Poverty Point in 1952, the ridges were so insignificant that they went unnoticed for about a year. The late William G. Haag, one of the original excavators, gave a candid account[33] of his reaction when he saw them for the first time in aerial photographs shown to him in 1953 by his colleague James Ford—who didn't initially reveal where the photographs had been taken:

"You know where that site is?" Ford asked.

"Well, it's got to be in the Ohio River Valley," Haag replied. "No place, except that area in the East where you get complex earthworks like that."

Simulation of Poverty Point's geometric ridge system in its prime.

Haag clearly had in mind the geometrical earthworks of Ohio, such as High Bank and Newark, reviewed in the last chapter, but he

was in for a surprise.

"You've walked all over that site," said Ford.

"Not I," insisted Haag. "I've never been to that site."

But then doubt set in, he looked closer and finally exclaimed: "That's Poverty Point!"

Haag may have been a little slow in recognizing the ridges, but he was decades ahead of everyone else when he joined forces with astronomer Kenneth Brecher[34] in 1980 to coauthor a paper in the *Bulletin of the American Astronomical Society* titled "The Poverty Point Octagon: World's Largest Prehistoric Solstice Marker."[35]

Haag and Brecher supposed the ridges had once formed a complete octagon but that the eastern half had been "washed away." However:

> The western half is intact and well-defined. It is intersected in four places by broad avenues, radiating out from a common center. … The west-northwest and west-southwest avenues have astronomical azimuths of approximately 299° and

241° respectively, accurately pointing to the summer and winter solstice sunset directions at the latitude of the site (32°37' N).[36]

Subsequent research proved Haag and Brecher wrong in their assumption that the Poverty Point ridges had originally formed an octagonal shape,[37] a matter that anyway has no bearing on their solstice thesis, which depends exclusively on the angles of the avenues in what survives of the figure today.

If they're right about this, then it would confirm a much deeper lineage for the astronomical and geometrical memes that we've followed back in time through the Mississippian and Hopewell and Adena earthworks.

MASTER PLAN

IN THE JANUARY 1983 ISSUE of *American Antiquity* the alignments along the avenues that Haag and Brecher had proposed were questioned by Robert Purrington, an astronomer at Tulane University. He agreed that in the epoch of Poverty Point, "the sun would have set, at the solstices, at azimuths of 241° and 299°."[38] He disagreed, however, that these were the azimuths of the west-southwest and west-northwest avenues, which he put at 239 degrees and 290 degrees, respectively. He concluded that these avenues "very poorly mark the solstices. … There are no obvious solar alignments."[39]

Haag and Brecher responded in the same issue that the discrepancy between their azimuths and those of Purrington appeared "to arise mainly from the difference in the location of the center of the earthwork. "Purrington," they complained, "has located the viewing center at least 100 m to the east-northeast of the center we have found."[40] They repeated their assertion that "for the

latitude of Poverty Point, the summer and winter solstice sunset azimuths are 241° and 299°, respectively, in good agreement with the orientatons of the southwest and northwest avenues. Such a solstitial alignment, while not surprising, seems hard to doubt in the Poverty Point earthwork."[41]

Purrington continued to *sound* like he doubted it, yet in a confusing and self-contradictory manner. In 1989 he published a paper in *Archaeoastronomy* titled "Poverty Point Revisited: Further Consideration of Astronomical Alignments."[42] In it he recalculated the azimuth of the west-southwest avenue from his previous figure of 239 degrees to a revised figure of 240 degrees that, he now stated, gave "an excellent match to the setting of the sun at the winter solstice (241°)."[43] His azimuth for the west-northwest avenue, however, remained the same as before at 290 degrees, thus missing "the summer solstice setting azimuth by as much as 9°" and therefore "almost certainly not intended to mark this solar standstill.

The symmetry of the site then suggests that *neither* is a solar solstice alignment."[44] As a final equivocation, however, Purrington conceded that "a counter-argument would take into account the special importance attached to the winter solstice standstill by the native American Indians."[45]

There the matter rested until 2006, when archaeologists launched a magnetic gradiometer survey at Poverty Point. Completed in 2011, the survey revealed the traces of no fewer than thirty great circles of wooden posts that had once stood in the plaza east of the geometric ridges, "some built only inches away from the previous ones, as if the posts were erected, removed sometime later, moved a slight distance, then rebuilt."[46]

According to archaeologist Diana Greenlee, who was closely involved in all aspects of the investigation, the postholes located were straight-sided and flat-bottomed, nearly 1 meter wide and 2 meters deep, while the circles they formed varied in diameter from 6

meters to 60 meters.[47] Unfortunately, though, as Greenlee concedes, the project was confined almost exclusively to remote sensing:

> We didn't excavate a complete circle, or even a significant arc of one. So there is a lot we don't know about the circles. We don't know how many different kinds of post circles are represented. We don't know how high the posts were. We don't know if there were walls between the posts. We don't know if they had roofs. We don't know what, if anything, they did inside the circles. We don't know how many post circles were visible in the plaza at any one time. Someday I hope to excavate a larger area of the plaza circles so that we can find answers to these questions.[48]

One possibility, surely worthy of further investigation, is that what the survey found were the archaeological fingerprints of a series of "woodhenges" at Poverty Point. Very much like the Woodhenge at Cahokia—also constantly moved and adjusted, as we saw in chapter 18—they were perhaps used in conjunction with other features to create sight lines that would manifest sky-ground hierophanies at the solstices and equinoxes.

At any rate, even without the circles, the case for significant solar alignments at Poverty Point was greatly strengthened when Ohio archaeologist and archaeoastronomer William Romain, one of the sharpest thinkers in this field, rolled up his sleeves and got involved. His paper on the subject, coauthored with Norman L. Davis and published in *Louisiana Archaeology* in 2011, used newly acquired Lidar data, and refined archaeoastronomical calculations, to conclude that "Brecher and Haag were right in their assessment more than thirty years ago—i.e. Poverty Point does incorporate solstice alignments … [and] may indeed be the world's largest solstice marker."[49]

The alignments, however, turn out not to be those that Brecher and Haag originally proposed. Instead, with the advantage of the new data, Romain and Davis were able to identify two locations "of special importance in the design of Poverty Point." Referring to

these locations as Design Point 1 (DP1) and Design Point 2 (DP2) they note:

- Line DP1 to Mound B is aligned to the summer solstice sunset.
- Line DP1 to Mound E is aligned to the winter solstice sunset.
- Viewed from Mound C, the summer solstice sun will set over Mound B.
- Viewed from Mound C, the winter solstice sun will appear to set not over but rather into the side of Mound A. The placement of Mound C … allowed for a long sight line to Mound A, but also resulted in the location for Mound A in a place that seems not-symmetrical with the overall site plan.
- A line from DP1 through the central plaza of the site marks the azimuth of the equinox sunset along the northern edge of Mound A.[50]

According to Davis, an eyewitness to the latter phenomenon, the sun appears to “roll down the northern edge of Mound A before sinking into the western horizon.”[51]

Romain

Poverty Point is "a center place," Romain and Davis assert, "and also a place of balance in the sense that, in addition to the sunset alignments … conceptually opposite sunrise alignments are also found."[52] These they detail as follows:

- Viewed from DP2, the summer solstice sun will rise over Mound C.
- Viewed from DP2, the winter solstice sun will rise over Mound D. If in fact Mound D was constructed more than 2,000 years after the Poverty Point florescence, then the implication is that the people of the Coles Creek culture understood, incorporated, and further expanded upon the Poverty Point design for their own purposes.
- Viewed from DP2, the equinox sun will rise in alignment with DP1.[53]

The overall achievement—the "seamless integration of site orientation, celestial alignments, bilateral symmetry of design points, internal geometry [and] regularities in mensuration"[54]—leads Romain and Davis to conclude that "Poverty Point was built according to a preconceived master plan … or design template … that integrated astronomical alignments, geometric shapes and local topography."[55]

In their view, the question that begs to be answered is, "Why? Why was Poverty Point designed in such a way that it connects geometric earthen forms to celestial bodies and events at such a massive scale?"[56]

It's an excellent question, but another should be asked first.

If there was a "preconceived master plan," where did it come from?

CONTINUITY

THE SOUTHERNMOST OF THE POVERTY Point mounds is Mound E, also known as "Ballcourt Mound." Just 2.6 kilometers farther south, however, is another mound, once thought to have been part of the Poverty Point complex. Known as Lower Jackson Mound, excavations by archaeologists Joe Saunders and Thurman Allen have established that it is in fact extremely ancient—not from the Poverty Point era around 1700 BC at all, but from fully 3,000 years earlier, specifically between 3955 and 3655 BC.[57]

"That Poverty Point builders were aware of ancient mounds is beyond doubt," comments John Clark, professor of anthropology at Brigham Young University:

> The entire layout of Greater Poverty Point is calibrated to the position of Lower Jackson, a Middle Archaic mound. All principal measuring grids pass through Lower Jackson, and calculated space appears to have commenced from there.[58]

What Jon L. Gibson of the University of Louisiana makes of the same evidence is that there must have been “an enduring traditional, if not direct ancestral, connection between the Old People and later groups.”[59] This connection, he argues, is “demonstrated by the incorporation of the Middle Archaic Lower Jackson Mound into the principal earthwork axis at Poverty Point. Actually, Lower Jackson Mound was not merely incorporated—it furnished the alpha datum, the anchor, a vivid case of material or implicit memory.”[60]

William Romain's Lidar work confirms that Mound E ("Ballcourt Mound"), Mound A, and Mound B are all aligned to true north.

Lower Jackson Mound, 3,000 years older, is on the same azimuth.

The suggestions, made by Clark in 2004 and Gibson in 2006, were followed up in 2011 by William Romain. The results of his Lidar survey greatly strengthen the case that "Poverty Point was intentionally oriented to true north" along "the sightline between Mounds E-A-B and the Lower Jackson Mound."[61]

The implications of a connection between the Lower Jackson mound-builders and their successors at Poverty Point are intriguing for many reasons.

The "intrusive" Mound D, built by the Coles Creek culture at least 1,800 years after Poverty Point was abandoned, and more than 2,000 years after works peaked there, appears to have been deliberately located to create an alignment to the winter solstice sunrise. In William Romain's view, as we've seen, this suggests that the people of the Coles Creek culture "understood, incorporated, and further expanded upon the Poverty Point design."

The suggestion, therefore, is that below the radar of archaeology more than 2 millennia of continuously transmitted knowledge connected the Coles Creek culture to the Poverty Point culture.

Now, going much further back in time, Gibson proposes continuity across the earlier 2,000-year gap between the builders of Lower Jackson Mound and Poverty Point.

These are long periods of time to maintain any kind of connection, but such a feat is by no means impossible. The Judaic faith, for example, carries down a body of traditions and beliefs that are at least 3,000 years old.[62] Hinduism has roots going back to the Indus Valley civilization more than 5,000 years ago.[63] Both religions also create architecture, the design of which is directly influenced by their beliefs and traditions.

There's no reason in principle why the same sort of thing should not have happened in North America. The notion that Lower Jackson Mound and Poverty Point are each manifestations in

different eras of a single system of ideas is the only way, other than coincidence, to account for the obviously deliberate axial relationship between the two sites. If the earlier mound had **not** been significant for the later builders, then they surely would not have used it to "anchor" the great enterprise on which they were about to embark.

But there's a problem. In the cases of Hinduism and Judaism we have unimpeachable evidence of continuity. Through sacred texts, through teachings passed from one generation to the next, and through cherished and vibrant traditions, there are no broken links in the chain of transmission. Neither Hinduism nor Judaism have ever abruptly vanished from the face of the earth, left zero traces of their presence for millennia, and then equally abruptly reappeared in full flower.

As we'll see, however, this appears to be exactly what happened in North America.

21

GLIMPSES BEHIND THE VEIL

THE REMOTE EPOCH BETWEEN 6,000 AND 5,000 years ago out of which Lower Jackson Mound emerges is an important one in the story of civilization. It was toward the end of this same millennium that the civilizations of ancient Mesopotamia and ancient Egypt took their first confident steps on the stage of history. They, too, built mounds —for example, Egypt's predynastic *mastabas* or the *tells* of Uruk-

period Mesopotamia. They, too, deployed geometry and astronomical alignments in the project of sacralizing architectural spaces. And they, too, participated in an extraordinary and seemingly coordinated burst of early construction—for just like the mounds of ancient Egypt and ancient Mesopotamia, Lower Jackson Mound is not an isolated case but part of what may once have been a very numerous and widespread group of monuments.

Just how numerous and widespread we may never hope to know because of the wholesale destruction of thousands of mounds and earthworks across North America in recent centuries. No doubt most of those ancient monuments, sacrificed to the modern gods of agriculture and industry, were from the more recent periods—Mississippian, Hopewell, and so on—but chances are that some, and perhaps many, were from the much earlier episode of mound-building dating back to 5,000 years ago and more.

From what remains we can begin to gauge the extent of the loss and by 2012, despite the destruction of ancient sites, archaeologists

had identified as many as 97 surviving mounds and earthworks in the Lower Mississippi Valley, with several others found as far afield as Florida, thought to be in the range of 5,000 years old.[1] Very few of these sites have yet been subject to radiometric dating, but of the 16 that have, with a combined total of 53 mounds and 13 causeways, all are more than 4,700 years old[2]—and many are much older than that.

As a result, says Joe Saunders, a leading specialist in this field, "the existence of Middle Archaic mound-building is no longer questioned."[3]

Why there should be such a concentration of these archaic sites in the Lower Mississippi Valley is unclear. It could be an accident of history—that is, purely by chance more old sites survived destruction in this area than elsewhere. Or it could be that many more sites were built here in antiquity than elsewhere and this is why more have survived. Who knows? Perhaps future research will

reveal very ancient mounds much farther afield in North America. For the present, however, the Lower Mississippi Valley is where the action is.

It's unnecessary to describe every site. Indeed only one, Watson Brake, need concern us in any detail. For the rest, the map and the minimal listing below, substantiated by references for readers who wish to dig deeper, will serve the purpose.

The **Banana Bayou Mounds** and the so-called **LSU Mounds** (because they are on the grounds of Louisiana State University) date to around 2700 BC,[4] which, in a global context, makes them about 200 years older than the Great Pyramid of Giza.

After that, the mounds of the Lower Mississippi Valley just keep on getting older. We've already spoken of **Lower Jackson Mound** (3955 to 3655 BC). Here are some of the others:

Ancient Mound Sites of the Lower Mississippi Valley.

WATSON BRAKE

One C-14 date suggests that mound-building may have begun as early as 3590 BC; others suggest a range of 3400 to 3300 BC.[5]

CANEY MOUNDS

C-14 dates range from 3600 to 3000 BC.[6]

FRENCHMAN'S BEND

C-14 supports a date of 3570 BC.[7] A significantly older date of 4610 BC—almost 7,000 years ago—was derived from an excavated hearth.[8]

HEDGEPETH MOUNDS

The earliest mound date is 4930 BC—again, very close to 7,000 years ago.[9]

MONTE SANO

A charcoal sample from a cremation platform within one of the mounds yielded a date of 4240 BC.[10] Two other charcoal samples from a small platform mound produced dates of 5030 to 5500 BC[11]—moving past 7,000 years ago and toward 7,500 years ago.

CONLY

Eight radiocarbon dates securely locate the site between 7,500 and 8,000 years ago.[12]

THE SITE THAT CHANGED THE GAME

BOTH IN TERMS OF QUANTITY and of quality, Watson Brake has been the subject of more thorough, sustained, and wide-ranging scientific scrutiny than any of the other sites that are 5,000 years old or older. Moreover, it is only at Watson Brake that the excavations and archaeological research have been accompanied by detailed archaeoastronomical assessments, allowing comparison with the later Adena, Hopewellian, and Missippian sites reviewed in previous chapters.

So it is Watson Brake we'll focus on here.

First, and it is good the reader should harbor no illusions in this regard, not a single item has been excavated at Watson Brake that in any way suggests the presence of an advanced material culture. The people who built the mounds and lived at the site intermittently—or perhaps more permanently—over a period of many hundreds of

years used stone tools and points that are typical of the Middle Archaic period. They were hunter-gatherers, not agriculturalists, and although they did gather plants that would later be domesticated, they did not domesticate these plants themselves. In other words, they lived simply, close to the earth, and were in every way a normal and representative population for this part of North America 5,000 or 6,000 years ago.[13]

In every way, that is, except one.

They built mounds.

Referring to the sites listed above (and a handful of others I didn't list), Joe Saunders writes:

> The earliest … earthworks in the Lower Mississippi Valley appear to have been made by autonomous societies. Practically speaking, it is difficult for 16 Middle Archaic mound sites spanning 1,000 years of prehistory in three subregions of Louisiana … not to look autonomous.
>
> But there must have been some communion among the autonomous societies because there are too many shared traits that cross the vast expanses of the Lower Mississippi Valley, and there is no evidence of other monuments being made

elsewhere. If all Middle Archaic mound sites were spontaneous creations, would they not occur spontaneously elsewhere as well?[14]

Sadly, Saunders passed away on September 4, 2017. Formerly regional archaeologist and professor of geosciences at the University of Louisiana, he was the acknowledged expert on Watson Brake and its lead excavator. It was his paper, "A Mound Complex in Louisiana at 5400–5000 Years Before the Present," published in *Science* on September 19, 1997,[15] that effectively put Watson Brake on the map, preempting arguments that might otherwise have arisen around the dates of the site with a meticulous, comprehensive, and wide-ranging body of evidence.

"There's just no question about it," said Jon Gibson at the time. "Saunders has come at it from too many different angles."[16]

And Vincas Steponaitis of the University of North Carolina commented: "It's rare that archaeologists ever find something that

so totally changes our picture of what happened in the past, as is true for this case."[17]

Certainly Watson Brake did change the picture archaeologists had of the past, delivering the death blow to the tired old prejudice, already mortally wounded by Poverty Point, that hunter-gatherer societies were somehow constitutionally incapable of complex large-scale constructions.

And as it turns out, despite its low-maintenance material culture, the site itself is sophisticated and precociously clever.

SACRED OVAL

LIKE SERPENT MOUND, WATSON BRAKE was built on a natural elevation, in this case a terrace dating back to the depths of the Ice Age

overlooking the 12,000-year-old floodplain of the Ouachita River with its tributary stream the Watson Bayou.[18] And in just the way that Serpent Mound stands above Brush Creek, Watson Brake stands above Watson Bayou,[19] creating the illusion that the mounds are 5 or 10 meters higher than they actually are.[20]

In the case of Serpent Mound, in front of the effigy's gaping jaws, the reader will recall the presence of an earthwork enclosure in the form of a great oval. Although complicated by the integration of mounds into the figure, and on a much larger scale, Watson Brake is also an earthwork enclosure forming a distinct and unmistakable oval, with a long axis of 370 meters and a short axis of 280 meters.[21]

LEFT: Watson Brake site plan. RIGHT: 3D model of Watson Brake.

There is some disagreement as to whether the total number of mounds at Watson Brake should be counted as eleven or twelve because one, designated Mound L, requires further archaeological

verification. It also lies outside the border of the oval formation so firmly demarcated by the other eleven mounds and their interconnecting embankments—these latter being in the range of 20 meters wide and about 1 meter high.[22] The plaza contained within the embankments covers an area of 9 hectares (about 22 acres)[23] and appears to have been artificially leveled.[24] The excavators found it to be almost completely sterile of artifacts or debris, "suggesting its use as ritual space."[25]

"Apparently daily activities did not occur in the enclosure," comments Saunders.[26] By contrast, however, "daily activities," suggestive of resident populations, certainly did occur on the wide embankments surrounding the enclosure, particularly on the northeastern side.[27]

In a major study published in *American Antiquity* in 2005 Saunders reports that the initial occupation of the site took place as early as 4000 BC[28] and that:

> The first occupants came to Watson Brake to fish, hunt deer and gather plants in every season of the year. Prolonged visits probably occurred. … The construction of the first minor earthworks began around 3500 BC, with Mounds K and B (and possibly A) followed by midden accumulations where Mounds D and C, and to the south I and J, and E were subsequently built. This suggests that the shape of the complex was deliberately laid out by 3500 BC. Major building projects then commenced ca. 3350 BC and existing earthworks may have been heightened and extended along the north mound row. Mound J was erected on the south side at around 3000 BC. Site occupation was concentrated along the terrace escarpment before construction began and continued after the earthworks were completed.[29]

The relative "residential stability and autonomy" evidenced at Watson Brake, Saunders concludes, were made possible by "the diversity and abundance of resources" in the local area.[30]

It seems almost superfluous to state, however, that those resources and the stability they promoted could have been exploited efficiently **without** the mounds. Indeed they **were** exploited for the 500 years when humans were present at the site who built no mounds at all between 4000 BC and 3500 BC.

And then, suddenly … mounds.

Why? What could have prompted this colossal architectural enterprise? What was its purpose?

"I know it sounds pretty Zenlike," Saunders speculated when he was asked this question in 1997, "but maybe the answer is that building them was the purpose."[31]

TRIANGULATION

MAYBE. BUT I'M TRYING TO envisage how the community leaders or influencers would have sold that to the population. Somehow, "We want you to build these mounds because building them will be a good thing for you to do" doesn't sound like a winning line to me. And when we remember that in the same period mounds and earthworks were also being built at other scattered sites belonging to

separate, autonomous communities across the Lower Mississipi Valley, it becomes increasingly obvious that a powerful and far-reaching social phenomenon must have been at work.

After years of field research, excavations, and on-site measurements, Kenneth Sassman of the Laboratory of Southeastern Archaeology, and Michael Heckenberger of the University of Florida are convinced that at least three of these sites—Watson Brake, Caney Mounds, and Frenchman's Bend—share the same basic design:[32]

> The plan we infer from the spatial arrangement of Archaic mounds consists of a series of proportional and geometric regularities, including (1) a "terrace" line of three or more earthen mounds oriented along an alluvial terrace escarpment; (2) placement of the largest mound of each complex in the terrace-edge group, typically in a central position; (3) placement of the second-largest mound at a distance roughly 1.4 times that between members of the terrace-edge group; (4) a line connecting the largest and second-largest … mound (herein referred to as the "baseline") set at an angle that deviates roughly 10 degrees from a line orthogonal to [i.e., at right angles to] the terrace line; and (5) an equilateral triangle oriented

> to the baseline that intercepts other mounds of the complex and appears to have formed a basic unit of proportionality.[33]

I won't attempt to describe Frenchman's Bend or the several other sites that Sassman and Heckenberger believe may also fit this pattern.[34] Watson Brake and Caney can stand for them all. Again a long story must be cut short since these two sites tick all the boxes listed above, but perhaps the most striking outcome of Sassman and Heckenberger's study is the clear evidence they've produced for a shared geometrical plan involving the mounds designated A, E, I, and J at Watson Brake and mounds B, F, E, and D at Caney.

In both cases the line that Sassman and Heckenberger call the "baseline" between the largest and second-largest mounds (A and E at Watson Brake; B and F at Caney) forms one side of an equilateral triangle. In both cases the lines that form the other two sides of the triangle extend through a second pair of mounds (I and J at Watson Brake; E and D at Caney) before intersecting. And in both cases a

line emanating from the “baseline” evenly bisects the gap between a second pair of mounds (B and K at Watson Brake; A and C at Caney).[35]

A comparison of the overall layout, design, and orientation of Watson Brake (left) and Caney Mounds (right).

Evidence for a shared geometrical system at Watson Brake (left) and Caney Mounds (right).

All equilateral triangles have internal angles of 60 degrees, but why, asks Norman Davis in a review of Sassman and Heckenberger's findings, "did Middle Archaic Builders use a 60° triangle? Why not a 45°, or a 65 or a 75° triangle?"[36]

The answer to this question, he suggests, has everything to do with the sun:

> It is probably not a coincidence that at Watson Brake the distance along the horizon from where the sun rises (or sets) on the winter solstice to where it rises (or sets) on the summer solstice defines an arc of 59 degrees. … Their triangle was probably derived from [this].[37]

THE DIRECTORS

AS AT SERPENT MOUND, AS at Cahokia, as at Newark, as at High Bank, and as at Poverty Point, the primary concern of the designers of Watson Brake seems to have been to manifest, memorialize, and consummate the marriage of heaven and earth at key moments of the year. This notion of sky/ground communion—summarized in the Old World in the Hermetic dictum "as above so below" but part of a universally distributed package of astronomical and geometrical memes—can involve the moon and the earth, specific stars or constellations and the earth, other planets and the earth, the Milky Way and the earth, and the sun and the earth.

At Watson Brake, it's the sun and the earth that take center stage, as Norman Davis ably demonstrated in 2012 across 18 pages of the journal *Louisiana Archaeology*.[38] The principal assertions concerning solstitial and equinoctial alignments that he makes there have stood the test of time and won the support of leading archaeoastronomers.[39]

In brief, Davis includes the twelve recognized mounds, A through L, in his survey but he also takes note of two natural mounds "possibly modified"[40] that in his view were intentionally left near the center of the oval in antiquity when the rest of the plaza was artificially leveled. These he designates Mounds 1 and 2.

Among his key findings the most immediately striking is that no fewer than five separate alignments running through the site each independently and redundantly target the summer solstice sunset. "Even if the alignments were not to the sun," Davis writes, "the ability to establish five perfectly parallel, nearly equidistant sightlines across several hundred meters would be remarkable. The sightlines had to have preceded construction. Their pattern suggests a master site plan, with construction to the plan taking years, or perhaps centuries, to complete."[41]

Impressively, the alignments target the sun not exactly where it rises and sets today but rather precisely where it would have risen

and where it would have set in the epoch of 3400 BC—which, at the latitude of Watson Brake, was at azimuth 119 degrees for the winter solstice sunrise and at azimuth 299 degrees for the summer solstice sunset.[42] As the reader will recall, solstice alignments are reciprocal. If you are facing the setting sun on the summer solstice, then 6 months later on the winter solstice the sun will rise in the exact opposite direction, 180 degrees around the "dial" of the "azimuth clock."

The "azimuth" of an object is its distance from true north in degrees counting clockwise. North is nominated as 0 degrees, so azimuth 90 degrees is due east, azimuth 180 degrees is due south, and azimuth 270 degrees is due west. An azimuth of 299 degrees will therefore be 29 degrees north of west. An azimuth of 119 degrees is 29 degrees south of east.

There are no alignments to the **summer solstice sunrise** or to the **winter solstice sunset** at Watson Brake. But the clear alignments to the **summer solstice sunset** (azimuth 299 degrees) and the **winter solstice sunrise** (azimuth 119 degrees) identified by Davis are as follows:

- From Mound A to Mound B.
- From Mound J to Mound 2.
- From Mound D to Mound L.
- From Mound I to the southern edge of Mound D.
- From Mound E to the outside edge of the double bulge on

the Mound E platform.[43]

"The Mound J to Mound 2 sightline," Davis adds, "continues on and passes through the center of the gap between Mounds C and D. The Mound D to Mound L sightline passes through the center of the gap between Mounds I and J. The sightlines have azimuths of 119 degrees and 299 degrees."[44]

Could Watson Brake's multiple alignments to the summer solstice sunset and the winter solstice sunrise have come about by chance? It already seems vanishingly unlikely, but what settles the matter is that the site's concerns turn out to be not only with the solstices but also with the spring and autumn equinoxes—those special times of balance around March 21 and September 21 when night and day are of equal length and the sun rises perfectly due east and sets perfectly due west. Davis has identified four equinoctial alignments at Watson Brake, as follows:

- From Mound A to Mound C.
- From Mound 1 to Mound 2.
- From Mound E to Mound F.
- From Mound G to Mound H.[45]

In addition, several of these equinox sight lines, notably Mounds E–F and mounds G–H, extend to other mounds and features of the earthwork in such a way, Davis notes, that their east to west alignment "had to have preceded construction. This suggests that equinox alignments were … used to engineer this site."[46]

And not only the equinox alignments.

The length of the Watson Brake earthworks is defined by the alignment to the summer solstice sunset of the two ends of its principal axis, Mound L in the southeast and Mound D in the northwest. Its breadth is defined on one side by the Mound E to Mound E-platform alignment, and on the other by the Mound A to Mound B alignment, both also solstitial.[47]

All in all, Davis makes a strong case that the entire design of the site is an artifact of its solstitial and equinoctial alignments. They

came first; everything else followed. The question that remains unanswered, however, is … why? Davis sidesteps it, stating that his purpose is only "to demonstrate that solstice and equinox alignments are present at Watson Brake."[48] There's no doubt he has succeeded in this enterprise, as his findings regarding the site's solstice alignments have subsequently been confirmed at a higher level of technical precision in a Lidar survey by archaeoastronomer William Romain.

Joining earth to sky. All equinox and solstice sight lines at Watson Brake.

Lidar confirmation and refinement of the solstitial alignments in the Davis survey by William Romain.

Building on the discoveries made by Davis, Romain's conclusions are striking:

> Watson Brake incorporates sophisticated geometric designs tied to astronomical sightlines in multiple ways. As someone who has worked mostly in the field of Hopewell archaeology, I am still trying to wrap my head around the fact that all this anticipates Adena and Hopewell by thousands of years. Indeed, the significance of these findings is that Watson Brake appears to be the earliest-known celestially-aligned mound complex in North America. That's a big deal.[49]

The fact that it's a big deal only makes the unanswered "why" question more urgent, but Davis admits he's unable to think of any "practical reason why the site should have been designed and engineered around solar sightlines. In fact it must have added to the difficulty of construction."[50]

The logical conclusion, he suggests, is that "using solar azimuths to design and build Watson Brake may have had more to do with cosmology [beliefs about the origin and nature of the universe] than astronomy [the scientific study of the heavens]."[51]

None of the other Middle Archaic sites have yet had the benefit of the sort of thorough archaeoastronomical survey that Davis, and subsequently Romain, have been able to carry out at Watson Break. However, Davis estimates from map analysis, within a margin of error of plus or minus 2 percent, that the Caney Mounds site has "one equinox alignment and two summer and winter solstice alignments. Frenchman's Bend has one equinox alignment and one winter solstice alignment."[52]

The mystery, although the sites so far investigated "show no evidence for the development of astronomical knowledge over time,"[53] is that "the people who directed the construction of Watson Brake … had an advanced knowledge of the solar and probably lunar cycles, and they used this knowledge to design and engineer their sites. Who were these directors, and how did they get others to build the sites one container of earth at a time?"[54]

REINCARNATIONS

OTHER QUESTIONS SHOULD BE ASKED.

How were these “directors” able to manifest geometrical and astronomical knowledge, and advanced combinations of the two, more than 5,000 years ago when no prior evidence of the existence of such abilities has been found in North America at such an early date? Set aside for a moment the issue of the organizational competence necessary to motivate and manage the workforce. The bigger problem is that the scientific skills and the knowledge required to create the earthworks just seem to appear out of nowhere, with no evolution and no buildup.

One minute they’re not there. The next, almost magically, they are. And then, at once, the Middle Archaic mound-building phenomenon bursts into full bloom.

We know it starts earlier, but for convenience let's take the florescence of Watson Brake around 3400 BC as a benchmark.

What follows, there and at the other sites, is roughly 700 years of stability, continuity, and—we must assume given the similarities—communications and connections. As noted earlier, these were all different cultures, but they all shared the same mound-building obsession and continued to express it in the same ways.

Until sometime around 2700 BC.

That was when, for some unexplained reason, the ancient sites were all abandoned and the whole mound-building enterprise came to an abrupt and complete halt. I'll let Joe Saunders, the acknowledged expert on the subject, take up the story of the mysterious end of Middle Archaic mound-building:

> New radiometric data indicate a sudden and widespread cessation of mound building in northeast Louisiana. The clustering of the ten youngest dates from seven mounds at four sites is remarkable. The median probability for seven of the ten samples falls between 2884 BC and 2739 BC. Equally remarkable is that the

> cessation of mound construction may have lasted up to 1,000 years, or until the emergence of the Poverty Point culture. … To date, not one mound site dating to the Late Archaic (2700 BC to 1700 BC) has been identified in the Lower Mississippi Valley.[55]

Saunders declines to speculate in any depth about the reasons for this precipitous end to the precocious early mound-building phenomenon in North America. He's open to the possibility, suggested by some, that climate change might have been involved, but states his own view that "the 'synchronous' event may be better understood as a social phenomenon. The abandonment of an ideology or change in ethos can occur simultaneously within a diverse range of environments. Also the absence of environmental change would be consistent with the documented continuity in economy from Early to Late Archaic periods—before, during, and after mound building."[56]

Whatever the reason, the facts are not in doubt. Mound-building, with all its sophisticated geometry and astronomy, stopped dead in

its tracks around 2700 BC. For the next thousand years not a single mound was built and not a single earthwork was raised. There's not a hint of geometry or of monumental architecture. The only reasonable conclusion is that those skills had been utterly lost.

But then, as suddenly and mysteriously as the "mound-building movement" had vanished, it appeared again, at around 1700 BC, in the spectacular and sophisticated form of Poverty Point.[57] All the old geometrical and astronomical skills were redeployed there—and by practiced hands—as though they'd been in regular use all along.

Poverty Point thrived for the next 600 or so years, only to be abandoned in its turn at around 1100 BC. Then it seems that mound-building was interrupted again until relatively late in the development of the culture archaeologists call the Adena. The label "Adena" is in fact the name of the country estate in Ohio on which the "typesite" was found.[58] We have no idea what that culture called itself. Its origins can be traced back to around 1000 BC.[59] However,

no early Adena mounds exist and those that have been dated, such as the Adena Mound typesite,[60] cluster around 200 BC or, in the case of Serpent Mound, 300 BC,[61] but not significantly earlier.[62]

It looks very much as if there was another hiatus, perhaps not of 1,000 years—let's say 800 years—between the end of Poverty Point and the rebirth of the mound-builder movement late in the Adena period. Thereafter it grew again to full force in its Hopewell and later Mississippian manifestations until finally being brought to an end by the European conquest.

Despite the fact that different cultures were involved at different periods, every resurgence of mound-building was linked to the reiteration and reimagination of the same geometrical and astronomical memes.

This was not "chance" or "coincidence."

Witness, for example, the way that Lower Jackson Mound was used as the base datum from which the entire geometry of Poverty

Point was calculated.

Or, at a more human level, consider the case of the highly polished hematite plummet—a valuable item—that was made at Poverty Point at around 1500 BC but that some pilgrim carefully carried to the by then long-abandoned and deserted site of Watson Brake and deliberately buried half a meter deep near the top of Mound E.[63]

This kind of behavior—the incorporation of ancient sites into younger ones, pilgrimage, an offering—has the feel of a religion about it. Religious institutions have proved themselves throughout history to be extremely efficient vehicles for the preservation and transmission of memes across periods of thousands of years.

It's not unreasonable, therefore, to suppose that some kind of cosmic "sky-ground" religion lay behind the alignments to the solstices and the equinoxes at Watson Brake and at the other early sites—a religion sufficiently robust to ensure the continuous

successful transmission of a system of geometry, astronomy, and architecture over thousands of years.

John Clark is in no doubt. “The evidence,” he says, “suggests very old and widely disseminated knowledge about how to build large sites. The building lore persisted remarkably intact for so long that I think we can, and must, assume that it was part of special knowledge tied to ritual practice.”[64]

Where did this special knowledge come from before it appeared at Watson Brake?

How old is it really?

And why, like the serpent that changes its skin or the phoenix reborn from the ashes, does it possess the extraordinary ability to vanish for millennia and then to reappear, as Clark puts it, “with no apparent distortions, loss of measurement accuracy, or shifts in numeration?”[65]

If it was carried in religious ritual among the ancient civilizations of the Mississippi Valley, then perhaps there will be clues to its origins, and its purpose, in what survives of the spiritual ideas of those long-lost people.

PART VI

EQUIPPED FOR JOURNEYING

The Mystery of Death

22

QUIETUS?

IN MAY 2017, ON A research trip for this book across the American Southwest, I awoke in my hotel room in the small town of Bloomfield, New Mexico. It was deep in the night and very dark. I felt nauseous and assumed I'd picked up a stomach bug somewhere along the way. I didn't imagine it was anything serious. I remember getting out of bed without disturbing Santha, who was sleeping

deeply after a long day of photography in the sun. I found my way to the bathroom, switched on the light, and stood hunched over the toilet, waiting to throw up.

The next thing I knew I was returning to consciousness, deeply confused, wired to a drip and lying in a hospital bed. It was full daylight and Santha was standing over me, looking scared.

"Where am I?" I asked. My voice sounded slurred, my tongue thick in my mouth. I had difficulty forming words. "What the fuck happened?"

"You had a seizure, my love," Santha replied, "but they say you're going to be okay."

The hospital was the San Juan Regional Medical Center in Farmington, New Mexico, about 15 miles west of Bloomfield. I recall nothing of the paramedics coming, or the ambulance journey, or what happened in the emergency room. What I do know, because Santha subsequently told me, is that at around 3:30 am she had awakened, sensed my absence, seen that the light was on in the

bathroom, and called my name. I didn't answer so she called again, and when there was still no reply she hurried from the bed to find me lying on the floor, half in the bathroom and half out of it, writhing uncontrollably with powerful muscular convulsions and blood pouring from my mouth where I'd bitten my tongue.

After turning me on my side to stop me from choking, Santha called 911 and woke our traveling companions, Randall Carlson and Bradley Young, who were staying in neighboring rooms.

I remember none of this. It seems, however, that I'd been stabilized in the ER and then transferred to the bed where I regained consciousness and quite rapidly began to get my wits back. That evening I was discharged and was able to return to our hotel in Bloomfield, where I read my medical notes. It turned out I was suffering from a previously undetected heart condition known as atrial fibrillation and was now to take anticoagulant medication daily to prevent a possible recurrence of what was diagnosed as a transient ischemic attack—in other words, a "mini stroke." I

suffered some loss of memory of events that had taken place in the weeks before the attack but there was no obvious neurological damage visible on the scans. The medical staff at Farmington were absolutely brilliant. I'm deeply grateful for their rapid and effective intervention.

I do indeed have atrial fibrillation, which can and does cause strokes (the blood pools and clots in the heart). I'm still taking anticoagulants. However, the diagnosis I'd been given was very far from complete, as became clear around noon on Monday, August 14, 2017, when I suffered further, far more severe, seizures at my home in Bath, England.

Again I was rushed to the emergency room and then to the ICU. Again the medical staff, now at the Royal United Hospital in Bath, were completely brilliant, caring, and engaged with my case far above and beyond the call of duty. This time the convulsions racking my body were exceptionally violent and continuous and Santha was taken aside by the neurologist who advised her she must

prepare herself for the worst. The medical team was having no success in stopping the seizures and it was possible I would die or end up so badly brain damaged that I would effectively be a vegetable.

As a last resort I was put into an induced coma, intubated on a ventilator. My condition settled over the next 48 hours and eventually the doctors were able to withdraw the tube and start me breathing for myself again. It was the evening of Wednesday, August 16, when I began to return to some form of consciousness, baffled to see that Sean and Shanti, two of my grown-up children, had flown from Los Angeles and New York to be with Santha at my bedside, together with Leila and Gabrielle, two more of our grown-up children, who live in London. For quite some time I couldn't understand what had happened, why I'd been fitted with a catheter, why my brain was so foggy.

Little by little consciousness increased. I was moved to the neurology ward and on Thursday night, August 17, much to my

relief, the catheter was removed. All day Friday the 18th I remained in the neurology ward, very wobbly but able to totter to the toilet with the aid of a stick. By Friday night I was feeling much better. Finally, on Saturday, I was discharged and came home.

Tests carried out established pretty clearly (although there is still some mystery over what exactly is going on) that the epileptic seizures were not caused by blood clots deriving from my atrial fibrillation, but rather by long-term overuse of a migraine medication called sumatriptan, delivered by injection; I was taking up to a dozen of these shots a month and had been doing so for more than 20 years. Turns out having migraines is itself a risk factor for epilepsy, and research has established a link between triptans (especially when overused) and seizures. It's almost certain it was the sumatriptan that had brought me to death's door, and it is now obvious that I must simply suffer the hideous and mind-numbing pain of my migraines or end up comatose or dead. As I write this in 2018 I'm still on massive daily doses of the anticonvulsant

medication levetiracetam. As long as I keep on taking it there's a good chance the condition won't recur.

OUT OF BODY

THE 48 HOURS OF INDUCED coma, though utterly harrowing for Santha, for our children, and for myself, raised interesting questions. Where was "I" during these missing 48 hours? I do remember the ventilator tube being stuffed down my throat and the powerful sense that I was being invaded and asphyxiated. But what happened after that?

A few confused recollections return from time to time to haunt me, but they're so muddled and fragmentary I can't put them into place. I don't think they're memories of near-death experiences because—after all—I wasn't dead. It was simply that my consciousness had been switched by medication to standby mode

and the more I look back on it the more I realize that I was just absent, just gone, during those 48 hours. If I try to visualize that strange interlude what I see and what I feel is … darkness.

Claustrophobic, enclosed, thick darkness.

It wasn't like that the last time I "died," which was in May 1968, pretty much exactly 49 years earlier, following a massive electric shock.

I was seventeen then and still living at home with my parents. I'm an only child. One of my siblings, a boy, was carried to term but born dead a couple of years before I was conceived. My two other siblings, first a girl—Susan—and then a boy—Jimmy—each lived for nearly a year before they died. When my parents went away to their holiday cottage that weekend in May 1968 I was home alone. Naturally, I seized the opportunity to throw a party on Saturday night.

The house was semidetached with a small garden off a quiet, close-packed street, not an ideal location for 300 rowdy teenagers,

loud music, and public drunkenness. It turned into an all-night event. The last stragglers didn't leave until the early afternoon on Sunday and visits from irate neighbors left me in no doubt how fortunate I was that the police had not been called. Certainly my parents would be informed about what had happened when they returned that evening.

In a state of some anxiety I spent the afternoon cleaning up. The house had been trashed so it took me hours to make it presentable, but by nightfall I was left only with the kitchen. I didn't expect my parents back until late. There was still time. So I rolled up my sleeves and started in on the huge pile of dishes, cups, glasses, and empty bottles littered around the sink. A lot of water had been spilled on the floor. I would find a mop and deal with that as soon as the dishes were done.

I was barefoot, hands and arms wet, and standing in the water around the base of the sink, when it occurred to me to check whether the refrigerator was properly plugged in. I'm quite

obsessive and often push the back of a plug to make sure it is securely in its socket. The plug was close, I knew exactly where it was—having done this many times before—and without looking I reached for it.

What I didn't realize was that the back of the plug had been smashed off during the night and the live terminals were exposed. When I touched them with my wet hand while standing in a pool of water there was a tremendous *BANG,* a huge searing jolt lashed through my body, and I was thrown across the kitchen, hitting the wall behind me and slumping down to the floor.

I knew I was slumped on the floor because I saw my body clearly but from a completely new perspective. I was no longer "in" that body! I was up around the light, hovering like a bird, looking down on myself.

"Hmm," I remember thinking, "how interesting." My body lying there below me seemed a heavy, cumbersome thing now. Quite

unnecessary, really. It was no great loss to be rid of it, and I liked the feeling of lightness and freedom.

"What happens next?" I wondered.

But then just as suddenly as I'd left my flesh, with just as little choice in the matter, I was within it again, stirring, groaning, coming back to consciousness on the floor.

I was okay. Just fine, in fact! I'd had a nasty electric shock, that was all.

I was young and strong then, and quite soon I was back on my feet. I finished the dishes, mopped the kitchen floor, and did a final check of the whole house. Finally, around 10 pm, with my parents still not returned, I took Rusty, my Irish terrier, for a walk. The moon was full and huge in the sky, dimming the stars with its cold, clear light and casting eerie shadows on the ground. Although I don't remember the exact date in May 1968 on which I was electrocuted, a quick internet search confirms it could only have been the night of Sunday, May 12, when the moon was indeed full.

My migraines began quite soon after that and have continued ever since. I think there's a pattern where they occur more frequently around the time of the full moon than at other times of the month, but I've never bothered to keep a detailed record that would confirm or refute that theory. I could just as easily be imagining the connection.

One thing my near-death experience in 1968 and my experiences of seizure and induced coma in 2017 have taught me, however—one thing I'm sure of—is that the borderline between life and death is filmy, fragile, and as permeable as a breath of air.

We feel firmly fixed in our lives but any of us may cross over at any time.

Sometimes, very rarely, we come back.

But when we don't? What happens then? Is that the end of us, or is it possible—as every religion in the world asserts—that some part of us, some immaterial essence, survives the grave?

A faction of scientists (Richard Dawkins and Daniel Dennett are notable members), scoff at the very suggestion that there might be anything more to us than our material, mortal parts—and they could be right. It may really be the case that there is no transcendent meaning in the universe, no purpose to the human experience, no such thing as the soul, and therefore no possibility of any kind of "life after death." It's important to be clear, though, that such ideas are **not** proven, evidence-based, scientific "facts" arising from experiments and empirical research. On the contrary, they are unproven assumptions and as such, even if voiced by eminent figures like Dawkins and Dennett, they're of no greater or lesser value than the unproven assumptions that underlie all religions.

Regardless of one's own opinions on such matters, moreover, there is one undeniable fact on which I think everyone can agree, and this is that ancient civilizations, just like our own, had religions and that these religions, just like our own, concerned themselves very deeply with the problem of death.

REALM OF THE DEAD

I WAS RAISED IN A Christian family, and being by nature rebellious I committed myself to atheism at around age fifteen.

After that, I think can safely say that I took no interest in spiritual matters whatsoever until I encountered the *Ancient Egyptian Book of the Dead* in my early forties. I was ready for it then, in a way I wouldn't have been in my twenties or thirties, and I was so intrigued by its contents that over a period of years I also delved extensively, with growing fascination, into the more ancient Pyramid Texts and the less well known Coffin Texts, *Book of Gates, Book of What Is in the Netherworld,* and *Book of the Breaths of Life*.

I'll refer to these texts in what follows sometimes by their specific titles and sometimes, collectively, as the "books of the dead" or as the "funerary texts." They are the surviving treasures of

an ancient and profound inquiry into the mysterious nature of reality. I first began to describe what I drew from them in *Fingerprints of the Gods,* published in 1995, and then had the opportunity to go into greater detail in two subsequent books, *Message of the Sphinx* (titled *Keeper of Genesis* in the United Kingdom), published in 1996, and *Heaven's Mirror,* published in 1998.

An enigma that I explore in all those books, but in the greatest detail in *Heaven's Mirror,* is that traces of the same spiritual concepts and symbolism that enlighten the Egyptian texts are found all around the world among cultures that we can be certain were never in direct contact. Straightforward diffusion from one to the other is therefore not the answer, and "coincidence" doesn't even begin to account for the level of detail in the similarities. The best explanation, in my view, is that we're looking at a legacy, shared worldwide, passed down from a single, remotely ancient source.

There are many aspects to this legacy, but I believe its hallmark, as the reader knows by now, is a system of ideas in which geometry, astronomy, and the fate of the soul are all strangely entangled. The geometrical and astronomical memes by which the system replicates itself across cultures and epochs are plentifully represented in the circles, squares, rectangles, and triangles, and in the solstitial, equinoctial, and lunar alignments, of the great mounds and geoglyphs of the Amazon and the Mississippi River basins.

But what about the fate of the soul?

For the entire span of more than 3,000 years that it endured, this question was the preeminent focus of the astonishing high civilization of ancient Egypt and of the remarkable religion that seems to have been born fully formed with it in the Nile Valley in the late fourth millennium BC. Within that religion, expressed in the books of the dead, certain key symbols and ideas stand out, involving most prominently the constellation of Orion, the Milky Way, and the notion, intimately connected to beliefs about both, that

the soul must make a perilous postmortem journey on which it will face challenges and ordeals and be judged on the choices that it made during life.

The constellation Orion, on the west bank of the Milky Way, was seen in ancient Egypt as the celestial image of the god Osiris, Lord of the Realm of the Dead. A narrow shaft cut though the body of the Great Pyramid targets Zeta Orionis, the lowest of the three stars of Orion's belt. IMAGE: ROBERT BAUVAL.

Seemingly with the intention of preparing its initiates for this afterlife journey, as Robert Bauval and I showed in our coauthored book *Message of the Sphinx,* the funerary texts also called for the construction of large-scale geometrical and astronomically aligned structures that were to "copy" or imitate on the ground a region of the sky known as the *Duat*—the ancient Egyptian name, often translated as "Netherworld," for the realm of the dead.[1]

The ruler of this Duat realm was the god Osiris, Lord of the Dead, whose figure in the sky was the majestic constellation that the ancient Egyptians called *Sahu,* and that we know as Orion.[2] It is therefore not surprising, as a manifestation of this "as above so below" cosmology, that the three great pyramids of Egypt's Giza necropolis are laid out on the ground in the form of the three stars of

the belt of Orion. This correlation was first discovered and put on the public record by my dear friend Robert Bauval in his ground-breaking 1994 book *The Orion Mystery*.[3] As early as the mid-1960s, however, Egyptologist Alexander Badawy and astronomer Virginia Trimble had recognized that a mysterious narrow shaft constructed at an angle of about 45 degrees through the body of the Great Pyramid would have pointed at the belt of Orion at meridian transit some 4,500 years ago.[4] With the use of accurate inclinometer data provided by a robotic exploration in 1992, Robert Bauval was able to refine Badawy and Trimble's work and to confirm that in the Pyramid Age, circa 2450 BC, the shaft had been precisely targeted on Zeta Orionis, the first of the three stars of Orion's belt, counterpart in the sky of the Great Pyramid on the ground.[5]

This, too, makes perfect sense from the perspective of ancient Egyptian beliefs. An invocation often repeated in the Pyramid Texts states of the deceased pharaoh:

> O King, you are this great star, the companion of Orion, who traverses the sky with Orion, who navigates the Netherworld with Osiris. … O King, navigate and arrive.[6]

Since the shaft emanates from the so-called King's Chamber of the Great Pyramid, within meters of an empty granite sarcophagus, it's therefore difficult to disagree with what is now the prevailing scholarly opinion concerning its purpose—namely that it must have been designed to serve as a portal, a "star-shaft," through which the soul of the deceased could ascend to Orion and thence begin its navigation of the Duat.[7]

ANCIENT EGYPT IN ALABAMA?

FOLLOWING MY FIRST BOUT OF seizures in New Mexico in May 2017, Santha and I flew to New Orleans and enjoyed a few days of rest,

recreation, and good Cajun food in one of the most laid-back cities in the world while I recovered my strength. Then we were on the road again, driving north to explore the mound-builder sites of the Lower Mississippi Valley, heading ultimately for Serpent Mound in Ohio on the summer solstice.

We stopped first about 4 hours north of New Orleans at the incredible geometrical and astronomical earthworks of Poverty Point, described in chapter 20.

We then went on to visit Emerald Mound, also in Louisiana, and the Winterville Mounds in Mississippi, and on the fourth day of our journey reached Moundville in Alabama.

Here, in addition to the geometry and astronomy I'd come to expect, I found myself plunged most unexpectedly into an ancient Egyptian déjà vu moment after we'd climbed to the top of Mound B. A good vantage point for Santha's photography, this mound is pyramidal in form, 18 meters high, and dominates the whole rather spectacular site that extends southward from the Black Warrior

River. The expansive grand plaza lay at our feet, edged by more than twenty mounds laid out, somewhat like Watson Brake, in the pattern of a great ellipse. At the center of the plaza, presently the focus of Santha's camera, stood a large rectangular platform mound —Mound A—and while she photographed it I stepped aside to read the official archaeological marker.

Much of what it had to say was standard stuff about the building of the site, most of which apparently had been completed over a period of about 100 years in the twelfth and thirteenth centuries. There was some predictable speculation that religion must have been used to coerce, cajole, or convince the population to do all that work. But then suddenly things got interesting. "At Moundville," I read,

> an excellent example of a powerful religious image was the hand and eye motif. Moundville's "Rattlesnake Disk," pictured on this noticeboard, offers us the best-known version, although numerous variations occur in pottery, copper, stone and shell artifacts.

> Stories passed down among various tribes tell of the dead entering the afterlife through an opening marked by a great warrior's hand in the sky. One account describes that hand as the constellation we know as Orion with Orion's belt as the wrist, its fingers pointing downwards. A faint cluster of stars in the center of the palm is a portal to the path of souls or path to the land of the dead. Researchers speculate that the hand and eye represent this constellation.[8]

I was nonplussed. I try to prepare thoroughly, but it looked like I'd missed something important in my background reading before starting out on this trip. The connection of the constellation of Orion to the land of the dead was a fundamental aspect of the ancient Egyptian religion and it felt weirdly like coming home—that comfortable intimacy of familiar territory—to find it here in a Native North American religion.

Moundville: Rattlesnake Disk with "Hand-and-Eye" symbol. **PHOTO: COURTESY OF THE UNIVERSITY OF ALABAMA MUSEUMS, TUSCALOOSA, ALABAMA.**

But I should have known about this!

The Rattlesnake Disk was in the museum we'd passed through briefly on our way into the site, intending to see the exhibits

properly at the end of our visit.

Now suddenly it was top priority, so 10 minutes later we were standing in front of its display case.

It's a mysterious, complex image on a disk of dark gray sandstone, 32 centimeters (just over 12 inches) in diameter. Seventeen notches, creating a coglike effect, are chiseled at equal distances around the perimeter of the disk. Next, intaglio, come two intertwined rattlesnakes, their long tongues flicking forward, their bodies knotted together. Curiously, these serpents have horns. An oval enclosure formed by their coils frames a human hand with what indeed appears to be an eye engraved at its center.

"The hand and eye," I read in the accompanying description:

> is a prominent Moundville motif and is thought to represent a part of the constellation that we identify as Orion. As a group the knotted serpents and the hand and eye are believed to be a representation of the night sky. The serpents are the ropes that join the earth and sky. In the palm of the hand is the portal or doorway through which the spirits of the dead can ascend the path of souls … a

> road or ribbon of light, the Milky Way, stretching out before the traveling souls. This river of light … deposits the souls, after a series of trials, into the realm of the dead. Families from all over the Moundville chiefdom brought and buried their dead here because they believed that Moundville was the appropriate place for the spirit to start its journey along the path of souls. Thus over time Moundville became, in the minds of its people, not only the symbolic gateway to the realm of the dead but also the materialized image of that sacred domain on earth.[9]

So not only was the constellation of Orion part of the Moundville story, not only was a journey to the realm of the dead part of it, too, but now I knew also that a series of trials would have to be faced on that journey, that the Milky Way was involved and, last but by no means least, that Moundville itself had been thought of as an image, or copy, of the realm of the dead on earth. Every one of these were important symbols, concepts, and narratives in the ancient Egyptian funerary texts that I'd been fascinated by for more than 20 years. It would be striking to find even two of them together in a remote and unconnected culture, but for them all to be present in ancient North

America in the same way that they were present in ancient Egypt, and serving the same ends, was a significant anomaly.

In the museum there were other superb examples of the art and iconography of Moundville. It is all indisputably Native American art, the work of the same Mississippian culture responsible for Cahokia. Every piece on show in the display cases had been produced between about AD 1150 and 1500 when Moundville was abandoned, and the archaeologists had done their work so well that there could be no doubt whatsoever about the dates. This ruled out any possibility of direct influence since ancient Egypt breathed its last under Roman occupation in the fifth century AD, at least 500 years before the Mississippian culture came into existence.

How, then, to explain the fact that some of the fundamental symbols and ideas of the religions practiced at Moundville and in ancient Egypt—ideas and symbols specifically concerning the afterlife journey of the soul—appear to be the same?

23

THE PORTAL AND THE PATH

THE BOARD AT THE TOP of Mound B said there was "one account" linking the constellation that we know as Orion to traditions of "a great warrior's hand in the sky." This turned out not to be the case. There are in fact dozens of such accounts specifically referencing an ancient Native American constellation in which the stars of Orion's belt form the wrist of this hand—sometimes said to belong to a

great warrior chieftain and sometimes to a malevolent celestial being called “Long Arm,” who used it in an attempt to block a portal between earth and sky but lost the hand when it was chopped off by a human hero.[1]

Other than their underestimation of the sheer numbers of such accounts, it took me no more than an hour on Google to confirm that the information about the Mississippian afterlife beliefs displayed at Moundville, though scant, was based on solid research and accurately reflected the views of leading scholars in the field.

The Milky Way, the connection with Orion, the perilous afterlife journey of the soul, and the notion of creating an image or copy of the realm of the dead on the ground were all genuinely present in the Mississippian religion, just as they were in the ancient Egyptian religion. No one familiar with the Pyramid Texts and the Book of the Dead could fail to notice these obvious resemblances. I’m not the first to do so. Andrew Collins and Gregory Little made passing

mention of them in 2014 and there was earlier brief recognition of the same issue by others in 2012.[2] To my knowledge at the time of this writing, however, no in-depth comparative study has ever been undertaken to determine whether there's a real connection between these two otherwise very different cultures, separated not only by geography but also by time.

Is it all just coincidence?

Or can coincidence be ruled out?

The issue, it seemed to me, was important enough to justify a thorough investigation, and I already had a head start since the ancient Egyptian funerary texts, though never "easy," were home turf for me. I'd been through them so often while researching previous books that I had no difficulty in reengaging with them. As a bonus I still had hundreds of pages of detailed notes I'd made on all the key recensions over the years and most of those notes, with

page references to the heavily underlined and tagged print editions in my shelves, were in searchable electronic form.

The ancient Egyptians left us immense numbers of documents in their beautiful hieroglyphic script and we've been able to read them since Champollion deciphered the Rosetta Stone in the nineteenth century. We also have historical accounts of the ancient Egyptians and their religious beliefs written in antiquity by eyewitnesses to their civilization such as Herodotus. So we have a lot to go on.

In the case of North America, on the other hand, there are no eyewitness reports to provide a pre-Columbian historical record, and since Native North Americans possessed no written languages, they left no documents. Even had they done so, if the example of the organized burning of the Mayan codices during the Spanish conquest of Mexico is anything to go by,[3] precious few of them would remain for us to study today. Such wholesale destruction was visited upon the indigenous cultures of North America that it is a

miracle any of their painted and engraved images on pottery, stone, copper, shell, and bone have survived at all.

We can only guess at what has been lost and work with what remains. In this respect, as anthropologist Mark Seeman explains, while sites like Watson Brake, Serpent Mound, and even the Hopewell earthworks are so old that "historical connections are extremely difficult to make," it's quite a different matter with the Mississippian culture, which is "close enough in time to connect it to the religious practises and oral traditions of historical groups such as the Chickasaw, Creek, Caddo and Osage."[4]

Similar connections with the Lakota, Mandan, Hidatsa, Crow, Arapaho, Oglala, and other Siouan speakers, as well as with the Ojibwa and other speakers of Algonquian languages, have added further vital information to the inquiry.[5]

With these resources at hand, and through a sustained exercise of interdisciplinary detective work involving archaeologists,

anthropologists, and ethnologists, the code of Mississippian ideas and iconography has been comprehensively broken. The crucial realization, as anthropologists Kent Reilly and James Garber inform us, is that much of the imagery "has a linkage to ethnographic material that describes the location of the realm of the dead and the journey of dead souls to the underworld."[6]

There is "variation in ethnographic details from one tribal group to another, as might be expected," adds Professor George Lankford, an internationally recognized authority on Native American folklore, anthropology, religious studies, and ethnohistory.[7] Nonetheless:

> There is a unifying metaphor which argues for a common core of belief across the Eastern Woodlands and Plains, and probably far beyond that area. That unifying notion is an understanding of the Milky Way as the path on which the souls of the deceased must walk.[8]

Elsewhere Lankford reiterates that this belief system was by no means confined to the Plains, the Eastern Woodlands, and the Mississippi Valley. It is better understood, he argues, as part of "a widespread religious pattern" found right across North America and "more powerful than the tendency towards cultural diversity."[9] Indeed, what the evidence suggests is the former existence of "an ancient North American international religion[10] … a common ethnoastronomy … and a common mythology. Such a multicultural reality hints provocatively at more common knowledge which lay behind the façade of cultural diversity united by international trade networks. One likely possibility of a conceptual realm in which that common knowledge became focused is mortuary belief [and] … the symbolism surrounding death."[11]

SOULS OF ANCIENT EGYPT

IN BOTH ANCIENT NATIVE NORTH America and ancient Egypt the universe was believed to be "layered"—with This World, the everyday material realm, inhabited by humans, sandwiched between an Underworld below (often with powerful Underwater aspects) and an Upper World, or Sky World, above. In both ancient Native North America and ancient Egypt the afterlife journey was envisaged as unfolding in the Sky World, among the stars. But in both this apparently celestial setting had contradictory Below World characteristics, including bodies of water and other obstacles to cross, architectural spaces to navigate, and monstrous adversaries to face.

Ancient Egyptian notions of the soul can seem extremely complex at first glance. Indeed, according to the great authority on the subject, Sir E. A. Wallis Budge, formerly Keeper of Egyptian Antiquities at the British Museum, it's not just a matter of one soul but of multiple souls—all of them separate from but in some way

connected to the *khat,* or physical body—"that which is liable to decay."[12]

In Budge's summary, these separate, nonphysical "souls"—perhaps "aspects of the soul" would be a better description—include notably:

- The *Ka,* or "double," that stays earthbound after death in the immediate vicinity of the corpse and the tomb.
- The *Ba,* depicted as a bird or human-headed bird that can fly freely "between tomb and underworld."
- The *Khaibit,* or shadow.
- The *Khu,* or "spiritual soul."
- The *Sekhem,* or "power."
- The *Ren,* or "name."
- The *Sahu,* or "spiritual body," which formed the habitation

of the soul.

- The *Ab,* or heart, "regarded as the center of the spiritual and thinking life. … It typifies everything which the word 'conscience' signifies to us." The heart, and what its owner has imprinted upon it by his or her choices during life, is the specific object of judgment in the Netherworld.[13]

The *Ba* soul flying free of the physical remains of the deceased.

It would be possible to write an entire book, perhaps several, on the complexities of ancient Egyptian soul beliefs. In my opinion, however, once the baroque flourishes, dramatic elements, and multiple iterations are dispensed with, the eight “souls” or “soul

aspects" listed above can be boiled down to two, reflecting the ancient Egyptian view of the fundamentally dualistic nature of the human creature as both a spiritual and as a material being.

On the one hand, there is that nonphysical, spiritual aspect of ourselves that is potentially eternal and immortal, aspiring to the "life of millions of years," as the funerary texts put it. Having worn the body like a suit of clothes, it is this "soul" that is liberated from it at death and can ascend to the stars, specifically to the constellation of Orion, to begin the next stage of its journey.

On the other hand, there is the physical body and the animating force believed to have attended to the vital functions of that body during life. Also seen as a kind of "soul," a supernatural entity in its own right, it is the lot of this ghostly, nonphysical presence—combining most notably the characteristics of the *Ka* ("double") and of the *Khaibit* ("shadow")—to remain on earth with the corpse.

Inevitably in such a system of ideas, earth and sky become opposed dualities symbolizing the material realm that is to be left

behind and the spiritual realm to which the potentially immortal, nonphysical aspect of the deceased ascends. Thus we read in the Pyramid Texts:

> Earth is this King's detestation. … This King is bound for the sky.[14]
> The spirit is bound for the sky, the corpse is bound for the earth.[15]
> The King is one of those … beings … who will never fall to the earth from the sky.[16]

In a similar vein, with some complexity regarding the activities of the "shadow," the *Book of What Is in the Duat* has this to say:

> Let thy soul be in heaven … let thy shadow penetrate the hidden place, and let thy body be to the earth.[17]

Many other examples could be cited but the summary is that the ancient Egyptians believed in two souls, or two fundamental aspects of the soul. One of these (let us not quibble about its several different avatars) remained bound to the physical remains and the

tomb. The other, again in its several forms, was free to ascend to the sky and begin the journey to the realm of the dead.

SOULS OF ANCIENT AMERICA

WHAT NOW OF NATIVE NORTH AMERICAN conceptions of the soul?

Here, too, we find at first a bewildering multiplicity.

The Quileute people of the US northwest coast believe that within every living human body there reside several souls that "look exactly like the living being and may be taken off or put on in exactly the manner as a snake sheds its skin."[18]

These souls are an inner soul, called the "main, strong soul," an outer soul, called the "outside shadow," a life-soul, referred to as

“the being whereby one lives,” and the “ghost” of the living person, “the thing whereby one grows.”[19]

Let’s note in passing that the *Ancient Egyptian Book of the Dead* declares in chapter 164:

> I have made for thee a skin, namely a divine soul.[20]

Returning to North America, it was believed among the Yuchi of Oklahoma that the individual “possesses four spirits … one of which, at death, remains on the spot where the disembodiment took place, while two others hover in the vicinity of tribesfolk and relatives. … The fourth starts upon a four-days” journey … to the haven of souls.[21]

In other accounts gathered from among the widely spread Ojibwa people of northeastern North America, the ethnographer Vernon Kinietz was told that humans have seven souls—only one of which, “the real soul,” goes to the realm of the dead.[22] Another Ojibwa

group reported that, according to their traditions, the human being consists of three parts:

> The body (*wiyo*), which decays after death, the soul (*udjitchog*), which at death departs for the realm of the dead in the West, and the shadow (*udjibbom*), which after death becomes a grave-ghost.[23]

Expressing the same idea in a slightly different way, the Menominee of Wisconsin say there are two souls in every human being:

> One, which is called "a shade across," resides in the head and is the intellect; after death it becomes a grave ghost. The other is the real soul, *tcebai,* which has its seat in the heart and at death betakes itself to the realm of the dead.[24]

For the Choctaw, also, humans have two souls—the *shilombish,* "the outside shadow," and the *shilup,* "the inside shadow," or ghost, which at death goes to the land of ghosts. The *shilombish* remains on earth.[25]

And indeed, when the unnecessary details and confusingly ambiguous terminology are stripped away, it becomes clear that the fundamental Native North American belief across a vast geographical area, like the fundamental belief of the ancient Egyptians, was in the existence of two souls, one bound to the body and the earth, the other free to ascend to the sky. "Soul dualism," concludes renowned Swedish anthropologist Ake Hultkrantz in his immense and still widely cited 1953 study, *Conceptions of the Soul Among North American Indians,* "constituted the predominant type of soul belief in North America."[26]

At the heart of this widespread belief system stand twin concepts defined by Hultkrantz as the "free-soul" and the "body-soul." The latter, also sometimes referred to as the "life soul," represents "the forces that keep the body vital and active." The "free-soul," on the other hand, represents "the person himself in his extracorporeal form" but with the added power of limitless movement.[27]

To what end was this freedom of movement used?

Among ancient Native North Americans, as George Lankford explains, it was believed that

> at a crucial point in the dying process the "free-soul," the one that is self-aware and has an identifiable personality in relation to the deceased, separates from the body, leaving behind the life-soul, a mindless force which can be dangerous to the living, trapped in or near the physical remains. The free-soul remains present in the vicinity for a brief time, then … sets off towards the west on its final journey. … If at any time along the route the free-soul gains the power or will to return to earthly life, then it may retrace its steps and re-enter its body. … Mortuary rituals must therefore include at least two different tasks, taking care of two different souls."[28]

Exactly the same care and attention paid to two different "souls," and for the same reasons, also characterized ancient Egyptian mortuary rituals.[29] It seems clear that these separate ancient Egyptian "souls" are essentially identical to, and interchangeable

with, Native American notions of the “body-soul” and the “free-soul.”

THE ROAD TO THE WEST

IN THE ANCIENT EGYPTIAN PYRAMID Texts, line 1109, a soul reaches the realm of the dead only to hear a voice telling him:

> Turn about, O you who have not yet come to the number of your days.[30]

A legend of the Ottawa, a Native American people who lived in Michigan and Ohio before migrating to Oklahoma where most members of the tribe are now found, tells of a person who enters the realm of the dead although he himself still lives. A voice, “as if it were a soft breeze,” whispers in his ear:

Go back to the land from whence you came. Your time has not yet come.[31]

The free-soul can become detached from the body not only in death, but also in dreams, visions, and comatose states. From the Native American perspective, "death" has therefore not definitively occurred until there is certainty that the absent free-soul will not return. It is for this reason, explains Lankford, that "the 'dead' are almost never buried immediately, and most people have a ritually specified time of waiting."[32] The Ojibwa were particularly known for their "habit of keeping the dead four days, in the hope that the soul in the spirit world would return and the person come back to life."[33]

But when the soul does not return, where has it gone and how did it get there?

A legend of the Native American Tachi Yokut people tells of a husband whose deeply cherished wife had died. Grieving, he went to her grave and dug a hole near it:

> There he stayed watching, not eating. … After two nights he saw that she came up, brushed the earth off herself, and started to go to the [land] of the dead.[34]

Similarly, in the ancient Egyptian Pyramid Texts, lines 747–48, we read the following invocation to the deceased:

> Arise, remove your earth, shake off your dust, raise yourself that you may travel in company with the spirits.[35]

In ancient Egypt the first stage of the journey to the realm of the dead was to ensure that the mortuary rites were properly observed. The purpose of these rites, Wallis Budge explains, was to enable the "disembodied spirit … to pass through the tomb out into the region which lies immediately to the west of the mountain chain on the west bank of the Nile, which we may consider as one mountain and call Manu, or the mountain of the sunset."[36]

In the case of the Native American afterlife journey, likewise, as Lankford summarizes:

> The path leads towards the west, the place of the setting sun, the end of the east-west cosmic passage, the point of transition from day to night.[37]

Returning to ancient Egypt, it is clear that the first stage of the afterlife journey unfolds on the earth plane and brings the soul to a special location in the west, described as beyond "the mountain of sunset." At this place, Budge continues,

> are gathered together numbers of spirits, all bent on making their way to the abode of the blessed; these are they who have departed from their bodies during the day.[38]

In Native America, too, a place is reached at the western edge of the "earth-disk" where the dead gather and where they, too, must await the right moment, after nightfall, to make the transition from the earth plane to the Sky World. "There may be a camping-place for the free-soul," Lankford tells us:

> For there may be a wait until conditions are right to continue the journey.[39]

ORION, THE "LEAP," AND THE PORTAL IN ANCIENT AMERICA

IN ANCIENT EGYPT, THE CONSTELLATION of Orion, located prominently on the west bank of the Milky Way, was seen as the celestial figure of the God Osiris, Lord of the Realm of the Dead, and the funerary texts explicitly and repeatedly urge the soul to ascend to the sky and unite itself with Orion. A few examples:

> You shall reach the sky as Orion.[40]
>
> May a stairway to the Netherworld be set up for you in the place where Orion is.[41]
>
> I have gone upon the ladder with my foot on Orion.[42]
>
> The Netherworld has grasped your hand at the place where Orion is.[43]
>
> May Orion give me his hand.[44]

The intention, confirmed in architecture by the star-shaft of the Great Pyramid (see previous chapter) is unmistakable. After completing its westward journey on the earth plane, and gathering with other souls at a staging point, the spiritual form of the deceased must find a way to gain access to the "place where Orion is" from whence the remainder of its journey to the realm of the dead will unfold.

But how to get to Orion?

The means suggested in the utterances quoted above include a stairway, a ladder, and the "hand" of the constellation itself. Another utterance tells us more vaguely, "There is brought to him a way of ascent to the sky"[45] and fifty lines later we read:

> Here comes the ascender, here comes the ascender! Here comes the climber, here comes the climber! Here comes he who flew up, here comes he who flew up.[46]

How was the transition to the Sky World achieved in the Native American afterlife journey when the soul had reached the staging point at the edge of the earth-disk? Lankford draws on his vast store of knowledge of the ethnography surrounding this subject when he tells us that in order to continue its journey to the realm of the dead:

> What the free-soul must do … is to make a terrifying leap. The realm of the dead … can only be reached by walking the Path of Souls, the Milky Way, across the night sky. To get to the path, however, one must leave the earth-disk and enter the celestial realm. The portal that is appointed for the free-soul at death is to be seen on the edge of the Path of Souls. It is a constellation in the shape of a hand, and the portal is in its palm.[47]

As I learned at Moundville, this Native American "Hand" constellation is none other than the constellation we know as Orion, with the three prominent belt stars forming the wrist. Beneath these stars, identified as part of Orion's sword by the Greeks, is a bright sky object known as Messier 42, or the Orion Nebula. In the "hand-and-eye" motif it is this nebula, regarded by modern astronomers as

a “stellar nursery” where new stars are constantly born,[48] that represents the “eye.” Its description as such is, however, a misleading and long outdated label that only remains in use out of habit. The truth, as scholars are now agreed, is that in Mississippian iconography it does not represent an eye at all but “a hole in the sky, a portal,”[49] through which the free-soul must pass in order to reach the realm of the dead.

LEFT: Native American "Hand" constellation in which the three stars of Orion's belt form the wrist. CENTER: Orion's belt and the Orion Nebula. RIGHT: An example of the Moundville "hand-and-eye" motif. The Orion Nebula is represented by the "eye," and was conceived of as a portal through which the soul must leap on its afterlife journey.

George Lankford clarifies the muddle:

> The hole in the sky is indicated as a slit being pulled apart, and the fact that it is celestial is frequently elaborated by the inclusion of a star circle or dot. The resulting double sign thus gives the appearance of being an eye, but … it is a coincidental similarity. The "eye" is but a portal with a star at its center. The hand-and-eye combination thus indicates the beginning of the spirit journey, the entry of the soul into the Milky Way at Orion.[50]

In ancient Egypt the hieroglyphic representation of the Duat Netherworld (likewise accessed via Orion and the Milky Way) made use of exactly the same concepts expressed in locally appropriate symbolism. Whereas in Mississippian art it was customary to depict a star in the form of a circle or dot, the star symbol in ancient Egypt was very much like the five-pointed version we still use today. Likewise, in Mississippian art the sky portal was depicted as an aperture in the form of an open slit while in ancient Egypt it was represented by a circle.

LEFT: ANCIENT EGYPT: The hieroglyph for the Duat Netherworld depicts a hole in the sky with a star at its center. RIGHT: ANCIENT NATIVE AMERICA: "The hole in the sky is indicated as a slit being pulled apart, and the fact that it is celestial is frequently elaborated by the inclusion of a star circle or dot."

ORION, THE "LEAP," AND THE PORTAL IN ANCIENT EGYPT

THE TOP HALF OF "ORION" above the belt stars is important in the ancient Egyptian *Sahu* constellation but isn't part of the "Hand" at all. The stories behind the imagery that were told in the Nile Valley and the Mississippi Valley are also very different. Nonetheless, it's bizarre that the same constellation plays such a key role in both Native American and ancient Egyptian beliefs concerning the afterlife journey.

Moreover, although ladders and stairs are among the "means of ascent" suggested to the soul in the ancient Egyptian funerary texts, they are by no means the only ones. Particularly close to the Native American notion of a "leap" for the portal is Utterance 478 of the Pyramid Texts, line 980, in which the deceased states:

> I leap up to the sky into the presence of the god.[51]

Likewise in Utterance 467, lines 890–91, we read:

> Someone flies up. I fly up from you, O men; I am not for the earth, I am for the sky.[52]

And again, almost technologically, in Utterance 261:

> The King is a flame moving before the wind to the end of the sky.[53]

Such references, and numerous other examples that could be cited, leave little room for misinterpretation. As with the Native Americans, so, too, with the ancient Egyptians—a "leap" by one means or another from the earth-plane to Orion was an essential stage in the afterlife journey.

It might be objected that the constellation *Sahu*/Orion for the ancient Egyptians was the celestial figure of Osiris, Lord of the Realm of the Dead, and therefore in no way a "portal" in the Native American sense. That, however, does no justice to the possibility, in so subtle a system as the ancient Egyptian funerary texts, that symbols might be encoded with multiple levels of meaning. A close study of the texts reveals that the passage of the soul through a

portal in the sky was indeed a fundamental stage of the ancient Egyptian afterlife journey.

The Pyramid Texts again:

> Portal of the Abyss, I have come to you; let this be opened to me.[54]
>
> The doors of the sky are opened for you, the doors of the starry sky are thrown open for you.[55]
>
> The doors of iron which are in the starry sky are thrown open for me, and I go through them.[56]
>
> Open the gates which are in the Abyss.[57]
>
> The aperture of the sky-window is open to you.[58]
>
> The celestial portal to the horizon is open to you.[59]
>
> I am he who opened a door in the sky.[60]
>
> The door of the sky at the horizon opens to you.[61]

"The Orion Nebula," clarifies Susan Brind Morrow in a new study of the Pyramid Texts, "is in the door of the sky."[62]

And in case there is any remaining doubt, the celestial address of this portal through which the deceased must pass in order to enter

the Duat Netherworld is also repeated on multiple occasions in the Pyramid Texts, for example:

> The *Duat* has grasped your hand at the place where Orion is.[63]

And, as we've seen:

> May a stairway to the Netherworld be set up for you in the place where Orion is.[64]

THE TIMING OF THE "LEAP"

FOR THE ANCIENT EGYPTIANS, ARRIVAL at the top of the metaphorical "stairway," the accomplishment of the "leap" to the sky "in the presence of the god," was to be timed to coincide with the moment when:

Orion is swallowed up by the *Duat*.[65]

According to R. O. Faulkner, translator of the Pyramid Texts, this occurs when "the stars vanish at dawn."[66] More broadly the "swallowing" of Orion by the Duat can be linked to the setting of the constellation in the west at whichever time of day or night this happens.

Let's now return to George Lankford's authoritative account of the Mississippian afterlife journey and the soul's leap to the portal in the Orion Nebula in the constellation that Native North Americans called the "Hand." The leap can only be attempted when that constellation makes its closest approach to the edge of the earth-disk, setting low in the west under the Milky Way just before it vanishes beneath the horizon—the precise moment, for both ancient Egyptians and ancient Native Americans, when the door of the sky, "the celestial portal to the horizon," was believed to stand open. As Lankford makes clear:

The portal in the Hand must be entered by a leap at the optimum time, which is a ten-minute window which occurs once each night from November 29, when the Hand vanishes … in the West just at dawn, to April 25, when the Hand sinks at dusk, not to be seen again for six months. During that winter period the portal is on the horizon for a breathless few minutes each night, and the free-souls must enter at that time or be lost. Free-souls who do not make the transition remain in the West and can eventually become unhappy threats to the realm of the living.[67]

Likewise in ancient Egypt, Budge informs us, it is the fate of those who have not prepared adequately for the afterlife journey to remain trapped on the earth plane—where their lot, "having failed

to present themselves in the Judgment Hall of Osiris," is an unhappy one.[68]

And in both ancient Egypt and ancient North America it was also believed that those souls that had successfully ascended to Orion must then continue their long and arduous journey, now transposed from the earth plane to the Sky World. On that journey they would meet monsters and terrors for which it appears that the ancient Egyptian books of the dead and the parallel oral and iconographic traditions of the Mississippian civilization were designed to prepare them.[69]

Before we explore these further similarities between the supposedly entirely unconnected religions of the Mississippi and the Nile, let's reflect in passing on the spiritual system that has evolved in the Amazon rainforest around the use of ayahuasca, the "Vine of the Dead." The reader will recall that it has that name because in the "indigenous context" ayahuasca is "intimately related to death."[70]

The visions received in the ayahuasca trance are considered to resemble death and to give foreknowledge of the death process and thus, at the level of experience rather than of study, the "Vine of the Dead" appears to be performing the same function as a "Book of the Dead."

Ayahuasca shamans in the Amazon speak of "dying" when they drink the brew. It's again suggestive of hidden connections that thereafter, as we saw in chapter 17, they experience "ascent to the Milky Way" in a "single soaring flight" (which sounds very much like a "leap") in order to reach the "Otherworld" that lies "beyond the Milky Way."

Sometimes, as they make these journeys, the shamans encounter trials and adversaries that will test them:

> Terrifying monsters … jaguars and serpents that approach and threaten to devour the person who, terror stricken, will call out in anguish.[71]

TERRORS AND OBSTACLES OF THE ANCIENT EGYPTIAN NETHERWORLD

NO ONE IN THE NORTHERN Hemisphere who pays any attention to the sky can fail to notice the presence of the majestic constellation of Orion during the winter months or the fact that it stands at the western side—indeed one could say on the west bank—of the glowing band of supernal light that is our own disk-shaped galaxy viewed from within. We call that band of light the Milky Way. To the ancient Egyptians it was the "Winding Waterway,"[72] the great celestial river that, as Wallis Budge informs us,

> flowed through the Duat much as the Nile flowed through Egypt. There were inhabitants on each of its banks, just as there were human beings on each side of the Nile.[73]

Moreover, the soul's leap to Orion was not an end in itself, but simply its means of entry to the Sky World. Once there, it was the Winding Waterway that would provide the setting for the next stage of the afterlife journey. "May you take me and raise me to the Winding Waterway," as the Pyramid Texts put it.[74]

It is therefore intriguing that in ancient North America the Milky Way was most widely known as the "Path of Souls,"[75] and it was on this path, after passing through the Orion portal, that the spirits of the deceased found themselves. Lankford takes up the story again:

> When the free-soul has entered the celestial realm, the Path of Souls stretches out before it. By most accounts it is a realm much like the earthly one left behind, but some describe it as a river of light with free-souls camped alongside. The free-soul must journey down the Path to the realm of the dead.[76]

Inevitably, with a great river flowing through it, the Duat "had the shape of a valley."[77] However, unlike the Nile Valley, which it otherwise resembled, this ancient Egyptian realm of the dead was

“shrouded in the gloom and darkness of night … a place of fear and horror.”[78]

It was, moreover, a place filled with obstacles and fearsome challenges including:

> abysses of darkness, murderous knives, streams of boiling water, foul stenches, fiery serpents, hideous animal-headed monsters and creatures, and cruel, death-dealing beings of various shapes.[79]

A few hours with the vignettes and tomb paintings and you begin to get the idea.

The Duat is an utterly eerie parallel universe that is at once a starry “otherworld” and a strange physical domain with narrow passageways and darkened galleries and chambers populated by fiends and terrors. There are entities whose work is “to hack souls in pieces.” There are serpents of enormous size, serpents with legs and feet, serpents with multiple heads, serpents with wings. There are serpents that breathe fire and that are depicted as flooding corridors

with fire. There is in particular the monstrous serpent Apep and a specially dedicated company of nine gods whose work is to slay Apep. There are firepits where souls are roasted, in some cases head down. There are bodies of water to cross and “abysmal depths of darkness.” There are torture blocks. There are gods armed with knives who will kill inadequately prepared souls.[80] And one particularly curious vignette shows “a goddess standing upright with her hands stretched out to the top of the head of a man who is kneeling before her, and is cutting open his head with a hatchet.”[81]

Vignette from the *Book of What Is in the Duat*. E. A. Wallis Budge offers no direct translation of the relevant hieroglyphs, merely describing the scene thus: "[A] goddess standing upright with her hands stretched out to the top of the head of a man who is kneeling before her, and is cutting open his head with a hatchet." LEFT: Detail of the vignette. RIGHT: The vignette in context.

The vignette[82] captured my attention for reasons that I will explain below. Budge expresses no opinion in his description and since I don't read hieroglyphs I couldn't be sure exactly what was going on. One interpretation that occurred to me was that the goddess was trying to **stop** the kneeling man from bashing his own brains out. But the scene had an uncanny, rather ominous, quality that suggested a very different possibility. From the way the outstretched arms and hands of the goddess were portrayed it looked more to me as though she was **encouraging** him to take that hatchet to his own head—or even perhaps exerting some kind of divine will to **force** him to do it.

Since there are repeated references to a menacing female figure, usually called the "brain-smasher" or the "brain-taker" in accounts of the Native American afterlife journey, it occurred to me there was an opportunity here to test the mettle of my evolving theory of a deep structural connection between the spiritual systems of

ancient Egypt and the ancient Mississippi Valley. All I had to do was find an Egyptologist to translate the hieroglyphs in the vignette for me. If the translation showed no relationship whatsoever between the goddess in this vignette and the Native American "brain-smasher," then my theory would be weakened. If, on the other hand, a clear relationship emerged, then my theory would be strengthened.

Egyptologists in general avoid me, but I was fortunate that Louise Ellis-Barrett at the British Museum was prepared to accept the commission. She was curious as to why I wanted a translation at all but I was determined that this should be a proper blind test, in which no preconceptions were inserted into the translator's mind before she began work, so I declined to tell her.

A few weeks later, after investigating the matter thoroughly, Louise came back to me with her translation of the group of hieroglyphs describing the role of the goddess in the scene:

She lives from the blood of the damned
And from what these gods provide her
That Ba-soul who belongs to the damned
The demolishing one, who cuts the damned to pieces.

She lives from the blood of the damned

And from what these gods provide her

That Ba-soul who belongs to the damned

The demolishing one, who cuts the damned to pieces

For clarification Louise added that the *Book of What Is in the Duat* is "divided into Hours—each of which is a unit of text and illustration." The vignette occurs in the Fifth Hour of the journey

through the Duat (often also referred to as the "Fifth Division of the Duat") where, as we shall see, the ancient Egyptian judgment scene was also set. Moreover, although the vignette itself is not a formal part of the judgment, the entire burden of the Fifth Hour, as Louise expressed it in the document she prepared for me, is:

> its indication of the turning point in life. Here, life will either be renewed or annihilated. The last scene of the upper register [where the vignette is located] demonstrates the task of the deities whose responsibility is annihilation, the goddess demonstrating how the damned will be dealt with.

They will be dealt with, in other words, just as in the ancient Native American belief system, by having their brains smashed out.

TERRORS AND OBSTACLES OF THE ANCIENT AMERICAN NETHERWORLD

ANTHROPOLOGIST AKE HULTKRANTZ NOTES TRADITIONS among the Ojibwa and the Huron of northeastern North America concerning:

> the so-called brain-smasher [who] … deprives travellers to the land of the dead of their brains. … There is in general something demoniac about the brain-catching guardian. … In the eschatological conceptions of the Sauk and Fox Indians … the deceased perishes altogether if he is unable to save himself from the "brain-smasher."[83]

George Lankford gives an overview of such myths across North America and confirms the very widespread nature of the "fearsome image of a 'brain-smasher,' usually a woman, whose task is to destroy memory (and humanity?) by removing or smashing the brain."[84]

An interesting variant, documented by the ethnologist Alanson Skinner in the early 1920s, comes from the Sauk people, who speak of an obstacle on the Path of Souls where the celestial river must be crossed:

> A log serves for a bridge, and this is guarded by a being called *Po'kitapawa,* "Knocks-a-hole-in-the-head," or "Brain Taker." Brain taker has a watch-dog who barks the alarm whenever a new soul approaches and the fleeting spirit must be swift indeed to avoid having his brains dashed out. If this happens, he is destroyed or lost forever.[85]

It seems, therefore, that the Native American "brain smasher" and the ancient Egyptian goddess in the vignette from the Fifth Hour of the Duat both serve exactly the same function, namely, the annihilation and permanent destruction of unworthy souls on the afterlife journey. There are differences in the traditions, to be sure, as one would expect if they descended from a remote common ancestor many millennia ago and then evolved separately, but the fundamental similarities of the role are unmissable.

A further point arising from this material has to do with the more general issue of the trials and tribulations faced by the soul on its postmortem journey. That the precise character of these obstacles should vary between ancient Egypt and ancient Native America is

only to be expected. Even so, the striking similarities in the core structure of the "story"—physical death, a journey of the soul on land, a leap to the sky involving Orion followed by a further journey with perils and challenges to be faced, through the valley of the Milky Way—all argue for some as yet unexplained connection.

Monstrous winged serpents of the ancient American Netherworld.

In the case of Native America a bridge, sometimes shaky, sometimes thin as a blade, from which the soul can easily fall and be lost forever in the raging torrent below, is one among several ordeals consistently documented in the ethnographic accounts.[86]

Another regular character (who, along with the bridge, appears in one of the recensions of the brain smasher tradition cited above) is a dog, often monstrous and ferocious, described by the Algonquin as "the dog with the bloody mouth that devours the souls."[87]

In some accounts the bridge has the power to transform into a serpent,[88] thus further challenging spirits on the Path. Indeed the Native American afterlife journey is almost as filled with monster serpents as the ancient Egyptian Duat. Most notable in this respect is the presence of the Great Horned Water Serpent, sometimes described as "Master of the Beneath World" and sometimes as "the Great Serpent with the Red Jewel in its Forehead:"[89]

> If the free soul knows how to deal with the Serpent and is permitted to pass, then it enters the realm of the dead.[90]

In the ancient Egyptian tradition, too, the guardians of various gates and passageways in the Duat, often in serpent form, would

permit the soul to pass so long as it had "knowledge of certain formulae, or words of power, and magical names."[91]

THE UNDERWATER PANTHER AND THE GREAT SPHINX

OTHER NOTABLE CURIOSITIES INCLUDE THE fact, noted earlier, that the serpents of the Duat are very often winged[92] and, in addition, are sometimes depicted with legs and feet.[93] The same goes for the Great Horned Water Serpent, almost always winged,[94] and in addition, in a Sioux account, described as a "water monster which … resembled a rattlesnake, but he had short legs."[95]

Because we have the benefit of copious documentation and painted and engraved images, the descriptions of the Duat that have

come down to us from ancient Egypt are more vivid and detailed than the descriptions of the Path of Souls that have survived from the Native American oral tradition. Nonetheless, enough remains to confirm that as well as serpents, many of the other monsters and fiends of the Duat also have their counterparts in the Native American afterlife journey.[96]

Of particular interest in this respect is the Underwater Panther, a bizarre hybrid figure, described by the Ojibwa as "a curious combination of cougar, rattlesnake, deer and hawk"[97] and understood to be an avatar, or alter ego, of the Great Horned Water Serpent.[98]

Different Native American peoples gave different names and aspects to the Underwater Panther—*Mishebeshu* and *Michibichi* are the most common—but it was also known among the Algonquian-speaking tribes as *Pizha,* meaning "panther."[99] On account of this latter name, and of an ancient image of it that was once visible

painted on a bluff above the Mississippi at Alton, Illinois, the Underwater Panther became known to interested European travelers as the “Piasa” and was described confusingly both as a “tiger” and as an “animal of the dragon species.”[100] In 1839 Arenz and Company of DÜsseldorf published a line drawing of it “taken on the spot by artists from Germany,” which is reproduced above. The original petroglyph no longer exists, as the whole face of the bluff on which it was depicted was quarried away in 1846–47.[101]

Monstrous serpents of the ancient Egyptian Netherworld—winged (right), and with legs (left).

Other imagery of the Underwater Panther, long since lost, was seen by Nicolas Perrot in 1664, who called it the "Great Panther," while the Ojibwa today describe it as a "sea tiger," preserving its watery associations, and as a "huge brown cat."[102] In some accounts it is said that the Piasa has "a human head."[103]

If the variety of descriptions is bewildering we should not be surprised, for we are dealing with the Netherworld and its shape-shifting denizens here. That the Underwater Panther was seen as

having feline characteristics, however, is certain from a number of surviving images of the creature.

Among them is a pottery figure, reproduced in the collage below, that I was able to see for myself in the museum at Moundville. Although the scale is completely different, I suggest that it bears more than a passing resemblance to the Great Sphinx of Giza. The Sphinx, of course, has a human head, not the head of a feline, but let's keep in mind those traditions in which human-headed Piasas are described. Also possibly of relevance here is the evidence that the original prehistoric Sphinx, perhaps more than 12,000 years old, had the head, as well as the body, of a lion. After suffering severe erosion over several millennia the leonine head was recut into human form during the early Dynastic period.[104] Last but not least, Native American traditions of the Underwater Panther speak of a time when "four Piasas existed, each associated with its own cardinal direction."[105] Is it a coincidence that the Great Sphinx of

Giza, with its strong family resemblance to the Underwater Panther, is an equinoctial marker, oriented precisely to one of the four cardinal directions to face the sun as it rises due east on the equinox?

DOGS AND OTHER "COINCIDENCES"

FEROCIOUS DOGS THAT APPEAR AS obstacles and challenges on the Native American afterlife journey have their counterparts among the monsters of the Duat described in the ancient Egyptian books of the dead. "That god who lives by slaughter," for example, in Spell 335 of the Coffin Texts, "whose face is that of a hound."[106]

Nor is that the only curious nexus involving dogs.

As an exception to the general rule among Native American peoples, the Cherokee do not describe the Milky Way as the "Path of Souls" but refer to it, rather, as "Where the Dog Ran."[107] This is

on account of a myth of a giant mill standing on one side of the earth-disk where corn was ground into meal. The store of flour was kept in a great bowl and on several mornings the people who attended the mill found that some of the flour was missing. When the thefts continued they investigated and found the tracks of a dog. The next night:

> They watched, and when the dog came … and began to eat the meal out of the bowl they sprang out and whipped him.[108]

At this, the dog, who lived on the opposite side of the earth-disk, leapt to the sky and fled "howling" across it to his home,

> with the meal dropping from his mouth as he ran, and leaving behind a white trail where now we see the Milky Way, which the Cherokee call to this day *Gi'li-utsun' stanun' yi,* "Where the dog ran."[109]

What's strange is that in ancient Egypt, too, where the Milky Way was the Winding Waterway, there is an exception. It's found

in a curious "spell" from the Coffin Texts in which no dogs are mentioned but where the deceased declares:

> I am made a spirit. … I am he who is in charge of secret matters. … I have come equipped with magic, I have quenched my thirst with it. I live on white emmer, filling the Winding Waterway.[110]

White emmer is, of course, one of the domesticated varieties of wheat, and one, moreover, that was particularly favored in ancient Egypt.[111] As with maize in the Americas, it must be milled to produce usable flour. In this variant ancient Egyptian tradition, as in the variant Cherokee tradition, the path in the sky on which the afterlife journey unfolds is likened to a white trail of milled flour.

There are other curiosities.

Take the case of the hero-deity known as the "Birdman," of whom multiple depictions have survived in the Mississippi Valley. He is unmistakably part falcon, part man, just like the god Horus of the Nile Valley. Just like Horus, the Birdman's celestial associations

include both the Morning Star and the Sun.[112] And just like Horus, the fundamental role of the Birdman is to symbolize the triumph of life over death. "Although everyone must die eventually," explains Professor James Brown of Northwestern University,

> life is the victor through the survival of one's descendants. The avatar of this struggle of life to reassert itself in the face of inevitable death is the falcon, and one of his guises is the Morning Star. In the pre-dawn light the Morning Star beats back the darkness to make way for the life-sustaining sun. The fact that the [Native American myth of the] Birdman has embedded within it the diurnal progress of night and day, the passage of the heavenly bodies and the cardinal directions tells us that they are properties of a particular cosmology. These elements are not loosely connected.[113]

This is not the place to elaborate further on the Birdman myth, or on the extensive traditions surrounding the god Horus, one of the most famous and complex figures in the ancient Egyptian pantheon. Entire books could be, and have been, written about each and there are great differences between the two as well as some rather striking

similarities. What remains to be resolved is whether these similarities are purely coincidental or whether there is some deep, hidden, and previously undetected connection.

Then there's the question of pygmies and dwarfs. They enjoyed special favor in ancient Egypt, where their mummified remains have survived in a number of tombs. They were regarded as possessing more than human powers—there is even a pygmy god named Bes—and they were given positions of importance in the funerary texts.[114] For example, in a vignette to chapter 164 of the Book of the Dead we see a goddess flanked by two dwarfs, each of whom is depicted with two heads, one of a man and one of a falcon.[115] And in the Pyramid Texts, the deceased on his afterlife journey declares:

LEFT: Engraved whelk shell depicting the ancient Mississippian hero-deity referred to by archaeologists as the "Birdman." PHOTO: THE NATIONAL MUSEUM OF THE AMERICAN INDIAN (NMAI), SMITHSONIAN INSTITUTION [18/9121]. RIGHT: Statue of the ancient Egyptian hero-deity Horus. The fundamental role of both was to symbolize the triumph of life over death. PHOTO: RAOUL KIEFFER.

> I am deemed righteous in the sky and on earth. … I am that pygmy of "the dances of god" who diverts the god in front of his great throne.[116]

Likewise, dwarfs and pygmies enjoyed special favor and respect among ancient Native Americans. Hultkrantz reports "a widespread belief in dwarves on the land, at times associated with the concept of a more or less extinct 'prehistoric' race, at times linked to the concept of spirit beings."[117]

As in ancient Egypt, the skeletons of dwarfs have been found in ancient Native American tombs, and as in ancient Egypt, dwarfs were believed to possess superhuman and magical powers. There is even evidence of the existence of dwarf shamans in the Mississippi Valley.[118]

Also worthy of note is the appearance and manifestation of souls, and we have seen already how, in ancient Egypt, the free-flying *Ba* soul was depicted as a bird or as a human-headed bird. "He opens for you the doors of the sky," the Pyramid Texts declare:

> he throws open for you the doors of the firmament, he makes a road for you that you may ascend by means of it into the company of the gods, you being alive in your bird shape.[119]

In the case of ancient Native America, the free-soul was likewise very often pictured and spoken of as a bird. Among the Modoc tribe, for example, a boy training to become a shaman fell into a deathlike trance. In this condition he met a female spirit who took out his heart. The boy then heard the spirit talking to his heart, which she held in her hand:

> After a while she opened her hand and let go of the heart. Then the little boy thought he saw a bird coming from the west. It came to him and lighted on his breast. That moment he jumped up.[120]

Hultkrantz reports that among the White Knife Shoshoni the soul has the appearance of a bird while "the Huichol identify it as a little white bird and the Luiseno know that it is a dove. The Kootenay believe that the free-soul can show itself as a tomtit or a jay."[121] …

The free-soul of the Bella Coola is like a bird enclosed in an egg [the physical body]; if the shell of the egg breaks and the soul flies away its owner must die."[122]

Once again, then, it seems that some of the fundamental ideas and imagery of the death process were held in common in ancient Native America and in ancient Egypt and once again the only question we must decide is whether this is a coincidence or not.

JUDGMENT

BOTH THE ANCIENT EGYPTIAN AND the ancient Native American afterlife journeys involve a strong element of judgment. Indeed, in a sense, the entire ordeal in both cases concerns the judgment of the soul for its choices—for what it has done and not done, for the use

that it made of the gift of life—during its physical incarnation. In both cases the unworthy soul can face annihilation by gods, demons, and monsters at any point on the journey (for example, at the hands of the "brain-smasher" figure) but in both cases also, for those who have progressed thus far through the Netherworld, a specific judgment awaits.

In the ancient Egyptian system the judgment scene occurs in the Fifth Division (or "Hour") of the Duat, in the Judgment Hall of Osiris, also known as the Hall of Maat—a location that can be reached only by those who are sufficiently provided with spiritual protection to make it through the first four divisions.

I have described the scene at length in previous books, and will not repeat all the details here. In summary, however, the deceased is ushered into a great hall or chamber at the head of which, in partially mummified form, sits Osiris, the high god of death and resurrection, identified in the ancient Egyptian sky religion with the constellation Orion. Also present, wearing a feather headdress, is

Maat, the goddess of truth and cosmic justice, and forty-two dispassionate figures, crouched in the manner of scribes poring over papyrus, each wearing the feather of Maat, which symbolizes truth. These are the forty-two Assessors of the Dead, before each of whom the deceased must be able to declare himself innocent of certain acts of moral wrongdoing—notably the act of murder.

Having completed this stage of its examination the soul now finds itself confronted by an immense pair of scales beneath the arms of which are to be seen representations of Anubis, the jackal-headed guide of souls, and Horus, the falcon-headed son of Osiris. One pan of the scales contains an object, shaped like a small urn, symbolizing the heart of the deceased, "considered to be the seat of intelligence and thus the instigator of man's actions and conscience."[123] In the other pan is placed the feather of Maat, symbolizing, once again, Truth.

If the soul is to triumph in the judgment, heart and feather must stand poised in equilibrium and the prize of eternal life in the Osirian kingdom of the dead beckons. But if the heart is heavy with wickedness and willful waste of the gift of life, if it does not balance with the feather of Truth, then eternal annihilation awaits. To remind us of this, beyond the scales in every depiction of the judgment scene we see the agency of the soul's extinction—a

monstrous hybrid, part crocodile, part lion, part hippopotamus, who is known as Amit, the "Devourer," the "Eater of the Dead," in whose slavering jaws the "unjustified" soul is utterly destroyed.[124]

In the ancient Native North American afterlife journey the judgment scene is nowhere so formalized and elaborate as it is the ancient Egyptian version but there is nonetheless—and unmistakably so—a judgment. In the early 1900s, for example, Francis La Flesche, a member of the Omaha tribe of Nebraska and Western Iowa, cooperated with Alice C. Fletcher of Harvard's Peabody Museum to record the traditions of his people. The result, published by the Bureau of American Ethnology in 1911, includes the following account of a crucial moment in the afterlife journey:

> It was said that at the forks of the path of the dead (the Milky Way) there "sat an old man wrapped in a buffalo robe, and when the spirits of the dead passed along he turned the steps of the good and peaceable people toward the short path which led directly to the abode of their relatives, but allowed the contumacious to take the long path, over which they wearily wandered. …" The simple and ancient

> belief seems to have been that the Milky Way is the Path of the Dead. It was said also that the spirit of a murderer "never found his way to his relatives but kept on endlessly searching but never finding rest."[125]

Likewise the late Joseph Epes Brown, founder of the Native American Studies Program at Indiana University, gives this account of the afterlife journey of the Sioux:

> It is held … that the released soul travels southward along the "Spirit Path" (the Milky Way) until it comes to a place where this way divides. Here an old woman, called *Maya owichapaha,* sits; "She who pushes them over the bank," who judges the souls; the worthy ones she allows to travel on the path which goes to the right, but the unworthy she "pushes over the bank," to the left.[126]

In 1967 Ake Hultkrantz joined Fletcher and Brown in linking such traditions to the fact that:

> the path of souls is not always one and undivided. In the northern hemisphere the Milky Way splits into two streaks. Not unexpectedly, the Indians have associated this phenomenon with concepts of different passageways to the other world and of

> dissimilar fates after death. Tradition has it that one road … leads to the blessed land of the dead and the other brings downfall and annihilation.[127]

To this George Lankford adds a crucial insight that Hultkrantz missed, namely that there is "a bright star—Deneb—that is placed right at the fork in the path and thus could serve as a marker for the decision point or a figure who does the deciding."[128]

Again a long story must be cut short here, but what Lankford goes on to demonstrate is that a ferocious bird, a raptor with a hooked beak, is a very distinctive "opponent" or "adversary" on the afterlife journey, as portrayed in Moundville pottery. In his view this "Moundville Raptor" is the Mississippian equivalent of the old woman who pushes souls over the bank or the old man who condemns the souls of murderers to endless wandering without rest. And to reinforce his argument, he draws our attention to the Alabamas and the Seminoles, "two groups who are major candidates for descendants of the prehistoric inhabitants of

Moundville," who indeed place an eagle in the role of an adversary on the Milky Way path of souls.[129]

Deneb is of course Alpha Cygni, the first-magnitude master star of the Cygnus constellation, which the Greeks identified as a bird, and specifically as a swan. "It is a satisfying coincidental possibility," writes Lankford, "that the people of Moundville saw it the same way, but with the identity of an eagle rather than a swan."[130]

Since his specialty is Native American religions, there is no reason why Lankford should have studied the ancient Egyptian Pyramid Texts. Had he done so, however, he would surely have been struck by Utterance 304, in which the soul on its journey through the Duat is confronted by a bird adversary that apparently has the power to block its path. It's difficult to give any other interpretation to this encounter since the soul is made to declare:

The star Deneb in the constellation we know as Cygnus, the Swan, is positioned on the bank of the Milky Way exactly at the fork where a second "path," a dead end, branches off. George Lankford identifies Deneb—and Cygnus as a whole—with the Moundville Raptor figure (inset), an adversary on the journey of the soul.

> Hail to you, Ostrich which is on the bank of the Winding Waterway! Open my way that I may pass.[131]

An ostrich is not a swan and a swan is not an eagle. Nonetheless, it is surely noteworthy that in both the ancient Egyptian and the ancient Mississippian religions we encounter a bird, with the power to block the further progress of the soul, poised on a bank of the Milky Way.

What else but recognition of the same fork in the Milky Way that was regarded as so ominous in Native American myth can be expressed in Utterance 697 of the Pyramid Texts, where we read:

> Do not travel on those western waterways, for those who travel thereon do not return, but travel on the eastern waterways.[132]

ASTRONOMER CHIEFS

IN THE COFFIN TEXTS, IN a passage that addresses the deceased, we read:

> May you recognise your soul in the upper sky while your flesh, your corpse, is in *On*."[133]

The latter location, now a suburb of Cairo 12 miles to the northeast of the immense Old Kingdom burial fields and world-famous pyramids of Giza, was the center of the religious cult that served the Giza necropolis in antiquity. It was the Biblical Hebrews who called this cult center *On*—there are references to it in Genesis, Jeremiah, and Ezekiel.[134] Its original name in the ancient Egyptian language, however, was *Innu*—"the pillar"—and the Greeks would later know it as *Heliopolis,* "the City of the Sun."[135]

The Pyramid Texts, from which the Coffin Texts and all the later funerary texts descended, are often referred to as the "Heliopolitan Recension of the Book of the Dead"[136] because they are thought to

have originated in the archives of the cult center of Heliopolis. The archives have not survived the millennia, but the texts themselves are convincing evidence that something such must have existed since they "contain formulae and paragraphs which, judging from the grammatical forms that occur in them, must have been composed, if not actually written down, in the earliest times of Egyptian civilization."[137]

Let's note in passing that the High Priest of Heliopolis bore the title "Chief of the Astronomers" and is represented in tomb paintings and statuary wearing a mantle adorned with stars.[138] It is therefore of interest, when ethnographers recorded the customs and beliefs of the Skidi Pawnee of Oklahoma in the nineteenth century, that they were reported to have shamans, raised to the rank of chiefs, who specialized in astronomy. In the archives of the Smithsonian Institution there is a photograph of one of these individuals, named His Chiefly Sun, and notably he is shown

wearing a mantle adorned with stars.[139] It was also the custom of the Skidi Pawnee to wrap a newborn baby in a speckled wildcat skin. This, ethnographers were told,

> was equivalent to saying, "I wrap the child with the heavens," for the hide represented the sky and stars.[140]

LEFT: In ancient Egypt priests wearing a leopard-skin mantle, on which the spots represented stars, played a key role in mortuary ceremonies to prepare the deceased for the afterlife journey. IMAGE FROM TUTANKHAMUN'S TOMB. CENTER: The High Priest of Heliopolis, the cult center of the Giza pyramids, was titled the "Chief of the Astronomers" and wore a mantle like this one adorned with stars. PHOTO: FEDERICO TAVERNI AND NICOLA DELL'AQUILA/MUSEO EGIZIO. RIGHT: Skidi, Pawnee Astronomer Chief. PHOTO: THE NATIONAL ANTHROPOLOGICAL ARCHIVES (NAA), SMITHSONIAN INSTITUTION [BAE GN 01285].

In the case of the Heliopolitan "Chief of the Astronomers" we can see clearly from surviving depictions that the mantle he wore, upon which stars were embossed, was in fact a leopard skin. When the leopard skin was left undecorated the spots of the leopard itself were believed to have symbolized stars.[141] A specialized class of priests, the Sem Priests, also wearing leopard-skin mantles, played a key role in mortuary ceremonies for the deceased.[142]

There is no dispute that the great Mississippian religious centers like Cahokia and Moundville were primarily focused on a cult of

the dead, and while not every mound in these sites contains a burial, or multiple burials, the vast majority do. This is also the case at many other mound and earthwork sites in North America. Even some of the very earliest, such as Monte Sano, contain evidence of the postmortem processing of bodies.[143] The Adena mounds are largely burial mounds.[144] And as to the Hopewell earthworks, William Romain writes:

> By far the vast majority of known … remains are interred in mounds located within the geometric enclosures. Necessarily, then, the physical relationship between the remains of the dead and the enclosures tells us that the Hopewell did, indeed, associate the geometric enclosures with the passage of the individual from life to death.[145]

It may even be, Romain adds,

> that the Hopewell considered the geometric enclosures to be actual gateways, or doorways, to the otherworld. Certainly the idea of architectural structures being used to create entrances to the otherworld was known throughout North America. The circular hole in the top of the Ojibway shaking tent, for example, was

specifically meant to allow for "soul-flight travel to the Hole in the Sky and across the barrier to the spirit realm."[146]

Though different in degree in terms of the engineering required, there is no difference in kind between the hole in the Ojibwa tent and the star-shaft in the Great Pyramid—which likewise appears to have been intended to facilitate soul-travel to the sky across the barrier to the spirit realm.

Similarly, although there is again a marked difference of degree, there is no difference in kind between the geometric, astronomically aligned structures of the Giza plateau and the geometric, astronomically aligned structures of the Mississippi Valley. All of them seem bound together by the single purpose of the triumph of the soul over death and by the means deployed to achieve that purpose.

But why were structures required at all? And why these specific kinds of structures?

24

ASTRONOMY AND GEOMETRY IN THE AFTERLIFE

I'M NOT SUGGESTING THAT THE religion of ancient Egypt was brought from there to ancient North America and I'm **not** suggesting that the religion of ancient North America was brought to ancient Egypt. I accept the scientific consensus that the Old World and the New

World have been isolated from one another, with no significant genetic or cultural contacts, for more than 12,000 years. Also, the similarities between the religious systems practiced in ancient Egypt and ancient North America are not such as could be explained by direct "missionary" or "conversion" activities at any time, whether relatively early or relatively late. There are too many stark and obvious differences, too deeply adapted to local conditions and local cultural circumstances, for this to be the case.

What, then, are we to make of the striking package of shared beliefs and symbols reviewed in the previous chapter? In both cases we have a journey of the soul to a staging ground in the west, a "leap" to a portal in the constellation Orion, transition through that portal to the Milky Way, a journey along the Milky Way during which challenges and ordeals are faced, and a judgment at which the soul's destiny is decided.

Just as the differences rule out direct influence so, too, in my view, the similarities are too many and too obvious to be dismissed

as mere “coincidences.” A better explanation needs to be sought and in this respect it’s helpful to remember that analogous situations arise in genetics. Sometimes, for example, two seemingly completely different groups of people, separated by huge distances and formidable geographic barriers and with zero opportunity to trade DNA, nevertheless turn out to share certain distinct clusters of genes. In these cases the answer very often lies in an earlier population, perhaps with no living members today—a “ghost” population—that was the remote common ancestor of both otherwise unrelated populations in which the surprising genetic resemblances have been found.

In the realm of archaeology, E. A. Wallis Budge faced a comparable problem with similarities he had identified between the Mesopotamian deity Sin, a moon god, and the ancient Egyptian deity Thoth, also associated with the moon. The resemblances, in Budge’s view, are “too close to be accidental. It would be wrong to say that the Egyptians borrowed from the Sumerians or the

Sumerians from the Egyptians, but it may be submitted that the literati of both peoples borrowed their theological systems from some common but exceedingly ancient source."[1]

Walter Emery, late Edwards Professor of Egyptology at the University of London, also looked into similarities between ancient Egypt and ancient Mesopotamia. He found it impossible to explain them as the result of the direct influence of one culture upon the other and concluded:

> The impression we get is of an indirect connection, and perhaps the existence of a third party, whose influence spread to both the Euphrates and the Nile. … Modern scholars have tended to ignore the possibility of immigration to both regions from some hypothetical and as yet undiscovered area. [However] a third party whose cultural achievements were passed on independently to Egypt and Mesopotamia would best explain the common features and fundamental differences between the two civilizations.[2]

What I'm suggesting is essentially the same. The hypothesis that best explains the puzzling common features and fundamental

differences between the religions of ancient Egypt and ancient North America is that an even more ancient religion, of as yet unidentified provenance, was ancestral to both. The presence of its "DNA" in Egypt and North America also has chronological implications. In view of the evidence that the Old and New Worlds were isolated for more than 12,000 years, from the end of the Ice Age until the time of Columbus, the remote common ancestor of the religions that would later blossom in the Nile and Mississippi River valleys must therefore be more than 12,000 years old. I suggest that this ancestral religion—perhaps *system* would be a better word—used astronomical and geometrical memes expressed in architectural projects as carriers through which it reproduced itself across cultures and down through the ages, and that it was a characteristic of the system that it could lie dormant for millennia and then mysteriously reappear in full flower.

The ayahuasca-inspired art of the Shipibo, in the Peruvian Amazon, is noted for its complex geometrical imagery. PHOTOS: TOP LEFT AND BOTTOM: LUKE HANCOCK. TOP CENTER: NMAI. SMITHSONIAN INSTITUTION [19/5940]. TOP RIGHT: "DADEROT."

Though it is not my purpose to argue this case here, the possibility that the system still hibernates in some form or another in the twenty-first century cannot be ruled out, nor the possibility that it might at some point be awakened again in a garb suited to its time.

Indeed, might we not already be seeing the first intimations of this with the explosion of interest all around the world in ayahuasca as a teacher plant, and in the parallel growth in public exposure to the initiating geometries of ayahuasca-inspired art?

The notion that human agents were behind the spread of the system is not contradicted by this suggestion. On the contrary, the system may itself have had its origins in visionary experiences, in which case those responsible for its spread would surely have made use of “plant allies” wherever they could find them.

ANSWERS IN UNEXPECTED PLACES?

BECAUSE OF THE BURNING OF the library of Alexandria and the frenzied despoiling of the temples by fanatical Christian mobs in the fifth and sixth centuries, much of the legacy of wisdom that made ancient Egypt the "light of the world" has been lost. Nevertheless, because they carved so much in stone, and wrote so much down on papyrus and other media, and because they were enormously prolific artists and builders for more than 3,000 years, the ancient Egyptians have left us a vast legacy of knowledge about their spiritual ideas.

The immense destruction, genocide, and near-total obliteration of indigenous cultures unleashed in North America during the European conquest was a matter of an entirely different order—a full-blown, fast-moving cultural cataclysm, as a result of which we're left often with no record at all or with huge gaps in the record.

Thus, although we can be sure the great earthworks and mounds of the Mississippi Valley were connected to beliefs about death and the afterlife, no myths or traditions have survived to explain **why** it was essential to these beliefs that geoglyphs and mounds should be built or why these structures should incorporate complex geometry and astronomical alignments.

After all a vast expenditure of energy, effort, ingenuity, manpower, and organizational skills was required to create a Cahokia or a Moundville or a Newark Earthworks or, for that matter, a Watson Brake, so it makes no sense that such projects would have been undertaken without some enormously important motive that inspired all the participants. In the absence of surviving evidence of what that motive was in North America, could it be possible that the ancient Egyptian funerary texts might provide an answer?

SQUARES, RECTANGLES, ELLIPSES, AND CIRCLES

I REMEMBERED FROM MY EARLIER encounters with the texts that they included references to geometry and sought out those references now.

A few examples.

In chapter 108 of the Book of the Dead we read of the "Mountain of Sunrise … in the eastern heaven. It hath dimensions of 30,000 cubits in length and 15,000 cubits in breadth."[3]

That's a perfect 2-by-1 rectangle, no matter what system of measure you convert it into, equivalent roughly to 15,000 meters by 7,500 meters.

Strange "mountain!"

In chapter 81 there's an obscure geometrical reference to "four sides of the domain of Ra and the width of the earth four times."[4]

Ra is the Sun God and it is the business of "geometry"—literally "earth-measuring"—to know the "width of the earth."

Turning to chapter 110 of the Book of the Dead, we read:

> The god Horus maketh himself to be strong like unto the Hawk which is one thousand cubits in length and two thousand cubits in width.[5]

It seems a scribe copying from an older source document mixed up the concepts of length and width but what is defined here is nonetheless a 2-by-1 rectangle with dimensions of approximately 1,000 meters by 500 meters.

In the *Book of What Is in the Duat* another rectangular district is mentioned. Named Sekhet-Hetepet, its long and short dimensions are so close that it is almost, and in the vignettes appears visually to

be, a square. Its shape is defined by an unbroken water-filled moat. The land within it is intersected by canals.[6]

Sekhet-Hetepet (Papyrus of Nebseni, BRITISH MUSEUM).

A second district of the Duat, named “Tchau,” is “440 cubits in length and 440 cubits in width.”[7]

That’s a perfect square, no matter what system of measure you convert it into, equivalent to roughly 220 meters by 220 meters.

Later, in the Seventh Division of the Duat, another square enclosure of identical dimensions is encountered.[8]

In the Land of Sokar, part of the Fifth Division, and the location of the Judgment scene, we meet a “goddess of the apex.”[9] In that same division we also encounter “the god of his angle” whose hieroglyph incorporates a right triangle,[10] fundamental for surveying and trigonometry. The heart of the Land of Sokar, which rests on the backs of two man-headed lion sphinxes set tail to tail, is formed by an elongated ellipse over the top of which looms a pyramid with its apex in the form of the head of a goddess.[11]

Pyramid over elliptical enclosure in the Land of Sokar.

Turning to the Coffin Texts, we find a gigantic ship or "bark" described with the following dimensions:

> A million cubits are half the length of the bark; starboard, bow, stern and larboard are four million cubits.[12]

That's around 500 kilometers for "half the length of the bark" and a combined total of 2,000 kilometers for its other listed parts, a geometrical progression with a ratio of 4.

Among the squares, rectangles, and ellipses of ancient Egypt's starry Netherworld there are also perfect circles everywhere.

Staying with the Coffin Texts, we read of "the circle of the Pillar of Horus which is north of the opening of darkness."[13]

In the Book of the Dead we meet "the gods of the *Querti*"—literally the "Circles"—to whom the soul on its afterlife journey was obliged to sing hymns of praise.[14]

In the *Book of What Is in the Duat,* in the Fifth Division and associated with Ra, the Sun God, we are told of a "Circle" that "unites itself with the roads of the Duat."[15] In the Seventh Division a journey is made "in the path of the Circle of Osiris,"[16] while in the Eighth Division we learn of "the Circles of the hidden gods who are on their sand."[17] In addition, five "Circles of the Duat," each entered through a "door," are described.[18]

And throughout the texts we hear repeatedly of "the hidden Circle of the Duat,"[19] a location of great significance, as we shall see. There are indications that the Duat itself was considered to be circular in form. As Wallis Budge points out, there is a scene in the *Book of Gates* that depicts "the body of Osiris bent round in a circle and the hieroglyphics enclosed within it declare that it is the Duat."[20]

SUN AND MOON

AS WELL AS MULTIPLE REFERENCES to stars and constellations, too numerous and all-pervasive in the funerary texts to require special mention here,[21] the moon is frequently encountered on the journey through the Duat. In the Second Division, for example, a vignette

shows a boat, the purpose of which, as Budge describes it, is "to support the disk of the full moon. … By the disk kneels a god who is 'supporting Maat,' which is symbolized by a feather, and is described by the word MAAT."[22]

Central to the ancient Egyptian judgment scene described in the previous chapter, the concept of Maat enshrines notions of cosmic justice, harmony, and balance. Its association with the moon is appropriate since the moon indeed plays a key "balancing" or "stabilising" role for the earth.[23]

The sun is also often figured as being carried aboard a boat and also features prominently in the Duat, blazing an indomitable path through its terrors each night, a symbol of hope and resurrection in whose company, if they are fortunate, the souls of some of the deceased might be permitted to ride. That much might be expected, but what is interesting are passages in the texts that help us to understand the special attention paid by the ancient Egyptians to the

solstices, with several of the greatest temples of the Nile Valley, notably the Temple of Karnak at Luxor, incorporating spectacular solstitial alignments.

A defining characteristic of the solstices, around June 21 and December 21 when the sun reaches its northernmost and southernmost rising and setting points, is that the pendulum swing of the solar disk along the horizon appears to pause or "stand still," without further northward or southward movement, for an interval of 3 days. In this connection let's recall the peculiarly geometrical "Mountain of Sunrise." The passage concerning it in chapter 108 of the Book of the Dead that I cited earlier continues as follows:

> There is a serpent on the brow of that Mountain, and he measureth 30 cubits in length; the first 8 cubits of its length are covered with flints and with shining metal plates. … Now after Ra hath stood still he inclineth his eyes towards him and a stoppage of the boat of Ra taketh place, and a mighty sleep cometh upon him that is in the boat.[24]

It's difficult to interpret this passage in any other way than a colorful, lyrical, poetic description of a solstice.

Similarly, in the Coffin Texts we read:

> I am here from the lifting up of the horizon that I may show Ra at the gates of the sky. … A path is prepared for Ra when he comes to a halt.[25]

Again, what else but a solstice could possibly bring Ra, the almighty Sun God, to a halt?

EARTHWORKS

THERE ARE CAUSEWAYS IN THE ancient Egyptian Netherworld.

"I will travel on that great causeway," proclaims the deceased in Spell 629 of the Coffin Texts, "on which those whose shapes are

great travel."[26]

In Utterance 676 of the Pyramid Texts, in a passage that calls to mind a pilgrimage with relics, we read:

> Do for him what you did for his brother Osiris on that day of putting the bones in order, of making good the soles, and of traveling the causeway.[27]

And in Utterance 718:

> The Mourning Woman summons you as Isis, the Mooring-post calls to you as Nepthys, you having appeared upon your causeway.[28]

Very frequently when causeways are mentioned it's in specific association with mounds. The above passage continues:

> May you travel around your Horite Mounds [i.e., mounds consecrated to the god Horus], may you travel around your Sethite Mounds [i.e., mounds consecrated to the god Seth]. You have your spirit, O my father the King … make yourself into a spirit.[29]

In Utterance 470 the deceased informs the soul of his mother, the "Lady of the Secret Land:"

> "I am going to the sky that I may see my father."
> "To the High Mounds?" she asks, "or to the Mounds of Seth?"
> "The High Mounds," the deceased replies, "will pass me on to the Mounds of Seth."[30]

It's a very curious, obviously coded language, beyond the reach of straightforward translation, that continues throughout the funerary texts.

As well as Horite Mounds and Sethite Mounds there are the Mounds of Osiris,[31] and also the Southern Mounds and the Northern Mounds that the soul must travel to and traverse on its journey through the Duat.[32] And the structure in the Fifth Division of the Duat that Budge refers to as a pyramid is also sometimes described as a "hollow mound,"[33] and as a "mound of earth."[34]

In the Coffin Texts we hear of "the gods on their mounds,"[35] and later that "mounds will be towns and towns will be mounds."[36]

There are also frequent references to "cities of the gods," as in:

> A divine city hath been built for me; I know it and I know the name thereof. Sekhet-Aaru is its name.[37]

Or:

> I come from the city of the god, the primeval region.[38]

I mention these "city" references because if towns can be mounds and mounds can be towns, then "cities" presumably can also be towns and therefore mounds as well? Moreover, the whole picture immediately becomes much more complicated when we read of a god who "setteth the stars in their places"[39] only for the translator to immediately qualify that the word he's chosen to render as "places" actually means "towns." What this god is doing, therefore—though

it seemed an impossible concept to the translator—is literally setting stars down to earth in “towns.”

And we already know that towns can be mounds and mounds can be towns. That both should also be stars is not at all a contradiction if you just … think like an Egyptian!

HOW TO EQUIP A SPIRIT FOR JOURNEYING

THE ANCIENT EGYPTIANS SAW THEIR lives as their opportunity to prepare for the trials of the journey through the Duat that they would have to confront as souls after death. The stakes were high, with both eternal annihilation and immortality being possible outcomes of that journey. There was undoubtedly an ethical aspect

to the Judgment, as we've seen, but something else was also required, some gnosis, some deep understanding, and very strangely it turns out to be the case that those who truly sought the prize of immortality—"the life of millions of years"—were called upon first to build on the ground perfect copies "of the hidden circle of the Duat in the body of Nut [the sky]."[40]

> Whoever shall make an exact copy of these forms, and shall know it, shall be a spirit well-equipped both in heaven and earth, unfailingly, and regularly and eternally.[41]
>
> Whosoever shall make a copy thereof, and shall know it upon earth, it shall act as a magical protector for him both in heaven and upon earth.[42]
>
> If copies of these things be made according to the ordinances of the hidden house, and after the manner of that which is ordered in the hidden house, they shall act as magical protectors to the man who maketh them.[43]
>
> He who hath no knowledge of the whole or part of the secret representations of the Duat shall be condemned to destruction.[44]
>
> Whosoever shall know these secret images shall be in the condition of a spirit who is equipped for journeying.[45]

Wrapped up in the colorful archaic language is a belief—or perhaps the inculcation of a belief—that the immortal destiny of the soul can be influenced by an architectural project to copy on the ground a "hidden" or "secret" part of the Duat sky region, the coordinates of which are set down in archives in the "hidden house."

Egyptologists already accept that the Milky Way and the constellation Orion on its west bank are key markers in the celestial geography of the Duat, and in 1996 Robert Bauval and I made the case in our book *The Message of the Sphinx* that the constellation Leo was very much part of the Duat as well. To cut a long story short, our argument, which we stand by today, is that the ideas expressed in the funerary texts were indeed manifested in architecture in Egypt in the form of the Great Pyramid, the leonine Sphinx, and the underground corridors and chambers beneath these monuments.

The complex was constructed, we believe, as a three-dimensional replica, model, or simulation of the intensely geometrical Fifth Division of the Duat, also known as the "Kingdom of Sokar" and always regarded as an especially hidden and secret place.[46] Moreover, we suggest that what motivated the population to support this gigantic project was precisely the promise of thus obtaining that "magical protection," that power to become "a spirit equipped for journeying," that would ensure a successful afterlife passage through the Duat.

It is not necessary, for the sake of my argument, to enter into any debate about the merits or demerits of such beliefs. It is enough to say that they were clearly held in ancient Egypt over an immensely long span of time and that the proof of this is in the books of the dead and in the Giza architectural complex. Nor is it controversial to add that it was around the belief system expressed in those texts and monuments that the entire extraordinary civilization of the ancient

Nile Valley was organized and mobilized from the very beginning—and since that civilization endured and fed its people and nourished their spirituality for more than 3,000 years, it's also obvious that at some fundamental level something about the system *worked*.

QUESTIONS AND ANSWERS

SO WE RETURN TO THE question of why, over a period of many thousands of years, sometimes punctuated by long, culturally barren intervals, huge numbers of architectural projects were undertaken up and down North America's Mississippi Valley linked to a very distinctive set of beliefs about the afterlife journey of the soul that shared many core elements with the spiritual cosmology of ancient Egypt.

If the resemblances are coincidental, we would not expect the ancient Egyptian funerary texts to provide immediate, sensible answers to some outstanding questions about the monuments of the Mississippi Valley. The fact that they do, in my view, increases the likelihood that we're looking at a real connection.

Why are the Mississippi Valley sites built on such a gigantic scale and why are celestial alignments of such importance within them?

For the same reasons given in the ancient Egyptian funerary texts for the construction of the sky-ground architecture of the Nile Valley—that the sky is gigantic and the purpose of the architecture is to honor, connect with, and above all "resemble the sky."

Why are the Orion constellation and the Milky Way so important in the funerary symbolism of the Mississippian culture? And why is the Milky Way the "Path of Souls"?

For the same reason given in the ancient Egyptian funerary texts—that within the general frame of the starry sky it is specifically Orion that hosts the portal through which the soul must pass to reach the "Winding Waterway" that in turn leads the soul onward on its journey through the Land of the Dead.

Why is geometry, and its particular manifestation in the form of rectangular, square, circular, and elliptical enclosures, such a significant element of the Mississippi Valley sites?

For the same reasons given in the ancient Egyptian funerary texts for the distinct geometrical character of the sky-ground architecture of the Nile Valley—geometry is a foundational characteristic of the Land of the Dead and the rectangular, square, circular, and elliptical enclosures are the typical forms of celestial "districts" through which the soul must pass on its afterlife journey.

Why do the Mississippi Valley sites feature causeways and mounds?

For the same reasons given in the ancient Egyptian funerary texts for the incorporation of causeways and mounds in the sky-ground architecture of the Nile Valley—namely, that causeways and mounds are prominent features of the celestial Land of the Dead that it is the purpose of the architecture to replicate on earth.

Why were the peoples of the Mississippi Valley willing to expend such great quantities of treasure and energy on the creation of spectacular sites such as Moundville, Cahokia, and the Newark Earthworks, and why did they take such care to imbue every one of them with intense geometrical characteristics and to ensure that each in its own way "resembled" and formed intimate connections with the sky?

For the same reason given in the ancient Egyptian funerary texts—the belief that if the sky, or some "hidden" or "secret" aspect of it, were NOT copied on the ground (and in some way explored, navigated, and *known* prior to death), then those souls who had failed to do this necessary work, and thus were not equipped with the knowledge of "the secret representations," would be "condemned to destruction."

SKY AND GROUND

WHEN IT COMES TO MOTIVATIONAL techniques, as the Roman Catholic Church demonstrated throughout the Middle Ages, the prospect of eternal damnation can be very effective. I suggest that in ancient Egypt it was the equivalent prospect of "destruction" or "annihilation" of the soul, and the possibility of avoiding such a fate —as spelled out in the funerary texts—that motivated the construction of the sky-ground temples and pyramids of the Nile

Valley. They were all, in a sense, gigantic books of the dead in stone and some–the Giza complex in particular—were undoubtedly seen as "actual gateways, or doorways, to the otherworld."

That phrase, "actual gateways, or doorways, to the otherworld," is William Romain's, cited at the end of the previous chapter with reference to the Hopewell earthworks. I quote it again here to emphasize the peculiar interchangeability of spiritual beliefs in the Nile Valley and the Mississippi Valley. Although widely separated in time and space, the ancient inhabitants of these two regions seem to have shared a core set of ideas about the afterlife destiny of the soul and seem, moreover, to have been largely in agreement not only that those ideas should be manifested in architecture, but also on many of the specific characteristics of that architecture, and on the purpose that the architecture was intended to serve.

Thus, while one reproduced Orion's belt and the constellation of Leo and the other orchestrated complex architectural dances aligned to lunar and solar standstills, the fundamental objective of both was

to open portals between sky and ground through which the souls of the dead could pass.

I'm not ruling out the possibility that some of the monuments of the Mississippi Valley are "constellation diagrams"—or constituent parts of "constellation diagrams"—much like the Giza monuments. Indeed Ross Hamilton, as we saw in part 1, has long been of the opinion that Serpent Mound is a terrestrial figure of the constellation Draco. George Lankford, on the other hand, makes a strong case that it represents the constellation Scorpius.[47] The point is not whether one is right or wrong, but that both see the possibility that the mounds and earthworks could have been used to represent constellations.

Perhaps we'll never know for sure, since so much of North America's pre-Columbian heritage has been destroyed. Nevertheless, efforts are already being made.

Stepping back in time from the Mississippian civilization, for example, William Romain's detailed studies of the Hopewell lead him to conclude that, in the minds of those who made them:

> the Newark Earthworks were a portal to the Otherworld that allowed for interdimensional movement of the soul during certain solar, lunar and stellar configurations.[48]

He also argues that the "Great Hopewell Road," an ancient causeway that once ran straight for more than 60 miles between Newark and High Bank (see chapter 20), "was the terrestrial equivalent of, or metaphor for the Milky Way Path of Souls providing a directional component for soul travel to the Realm of the Dead."[49]

Further, Romain joins George Lankford in linking Serpent Mound to Scorpius and in concluding that "Serpent Mound was a cognate for the Great Lowerworld Serpent which guarded the Realm of the Dead."[50]

What confronts us with the Hopewell, then, as with ancient Egypt and as with the Mississippian civilization, is a Realm of the Dead in the sky and its representation by architectural structures on the ground. It is part of the brilliance of such structures that they can play multiple roles in the cosmic drama. Thus, while the Great Sphinx may be the terrestrial counterpart of the constellation Leo, its gaze also sacralizes the union of heaven and earth at sunrise on the equinoxes. And while Serpent Mound may indeed be the earthly twin of the constellation Scorpius, its open jaws and the oval earthwork between them also serve to unite ground and sky at sunset on the summer solstice.

In this connection, let's reconsider the reference cited earlier from the Book of the Dead concerning a great serpent on the brow of a mountain that brings the boat of the Sun God Ra to a halt, plunging that deity into a "mighty sleep" with nothing more than a glance.[51] It may, of course, be a coincidence, but this description resonates

curiously with the situation of Serpent Mound. For what do we encounter there on the bluff above Brush Creek if not a massive serpent effigy with its gaze targeted on the sun at its midsummer standstill? That's indeed a time, as we've seen, when the setting point of the solar disk appears to remain fixed at the same place on the horizon for 3 days, an event that might appropriately be expressed, in mythical language, as a "mighty sleep" brought on by the precisely aimed gaze of the Serpent.

Then, too, the great serpent in the Book of the Dead is described as having "the first 8 cubits of its length"—its head and neck, in other words—"covered with flints and with shining metal plates."[52] The resonance here is with George Lankford's study of Native American traditions of the Great Horned Water Serpent (see chapter 23), sometimes described as the "Master of the Beneath World" and sometimes as "the Great Serpent with the Red Jewel in its Forehead"—a notion not so very far away from the ancient

Egyptian representation in which the creature's head and neck glitter "with flints and with shining metal." It is this Great Jeweled Serpent, Lankford concludes, represented as an adversary on the Path of Souls, that is depicted very frequently in Moundville designs where it is directly linked to other imagery associated with the afterlife journey. He also makes a strong case that Serpent Mound is a three-dimensional representation of the same supernatural entity[53] and draws an interesting comparison with myths of the Cherokees describing the Uktena, "a great snake, as large around as a tree-trunk," with:

> a bright blazing crest like a diamond on its forehead, and scales glittering like sparks of fire.[54]

The same myths also tell us that the gaze of this serpent had the power to "daze" people so that they were stopped in their tracks and could not escape from it,[55] and again there is a notable parallel here

with the great serpent of the Book of the Dead whose gaze plunges even the Sun into a "mighty sleep."[56]

Kheti, a serpent of the Duat.

RENEWAL AND REBIRTH

SCHOLARS ARE IN NO DOUBT that the ideas about the afterlife journey of the soul expressed in the ancient Egyptian funerary texts are much older than the surviving inscriptions and extend far back into

the oral traditions of the pre-dynastic, pre-literate period before 5,500 years ago.[57]

Likewise, although we have no hieroglyphs or inscriptions from North America, it's noteworthy that the same geometrical concerns and the very same alignment to the summer solstice sunset that we see at Serpent Mound, supposedly from the "Adena" period around 2,300 years ago, are also present at Watson Brake 5,500 years ago. And indeed we may say that the sudden burst of mound-building and earthwork construction across the Lower Mississippi Valley between 6,000 and 5,000 years ago is mysterious and unexplained. Like the sudden and fully formed appearance of the high civilization of Egypt, it seems just to have come out of nowhere, with no apparent antecedents, yet already in possession of advanced knowledge.

The earliest mound sites we know of in North America may possibly date back as far as 8,000 years.[58] After that the trail goes

cold.

But then why should we be surprised? The trail goes cold for a full 1,000 years between the end of the Watson Brake epoch and the beginning of Poverty Point, and it goes cold again several times thereafter, only to reappear reborn and renewed on the far side of each lacuna. The same stop-start process, however, also means that we can't date the inception of the tradition to its oldest manifestations so far found.

First, the archaeology is very far from complete, and given the destruction of so much of the evidence from prehistory, will never be complete—so our ability to figure out what really happened in the North American past is deeply compromised. It may be that there was no mound-building at all before 8,000 years ago, but it could equally well be that the evidence of an earlier mound-building episode has simply been lost.

Second, because we are dealing with a system of ideas that has a proven ability to appear and disappear and reappear again fully

formed, we must consider the possibility that it is such a "reappearance" that the archaeological record has identified at the supposed "earliest" mound sites—in other words, that the skills manifest in those already very ancient sites were, as my friend the late John Anthony West used to put it about the civilization of ancient Egypt, "a legacy not a development."

But a legacy of what? And when? And how is it that it keeps on turning up all around the world, in different places at different times, but always expressing and manifesting the same core ideas?

Once again, the ancient Egyptian texts offer some suggestive answers.

REBIRTH OF A LOST WORLD

THIS TIME IT'S NOT THE funerary texts I'm referring to, but the Edfu Building Texts, so called because they are inscribed on the walls of the Temple of Horus at Edfu in Upper Egypt.

These texts take us back to a very remote period called the "Early Primeval Age of the Gods"[59]—and these gods, it transpires, were not originally Egyptian,[60] but lived on a sacred island, the "Homeland of the Primeval Ones," in the midst of a great ocean.[61] Then, at some unspecified time in the past, an immense cataclysm shook the earth and a flood poured over this island, where "the earliest mansions of the gods" had been founded,[62] destroying it utterly, submerging all its holy places, and killing most of its divine inhabitants.[63] Some survived, however, and we are told that this remnant set sail in their ships (for the texts leave us in no doubt that these "gods" of the early primeval age were navigators[64]) to "wander" the world.[65] Their purpose in doing so was nothing less

than to re-create and revive the essence of their lost homeland,[66] to bring about, in short:

> The resurrection of the former world of the gods …[67]
> The re-creation of a destroyed world.[68]

For those readers not already familiar with the enigma of the Edfu Building Texts, and who would like to know more, I give a detailed analysis in my book *Magicians of the Gods*. I won't repeat here the case I made there, nor support it with the evidence presented there. The takeaway is that the texts invite us to consider the possibility that the survivors of a lost civilization, thought of as "gods" but manifestly human, set about "wandering" the world in the aftermath of an extinction-level global cataclysm. By happenstance it was primarily hunter-gatherer populations, the peoples of the mountains, jungles, and deserts—"the unlettered and the uncultured," as Plato so eloquently put it in his account of the

end of Atlantis—who had been "spared the scourge of the deluge."[69] Settling among them, the wanderers entertained the desperate hope that their high civilization could be restarted, or that at least something of its knowledge, wisdom, and spiritual ideas could be passed on so that mankind in the post-cataclysmic world would not be compelled to "begin again like children, in complete ignorance of what happened in early times."[70]

In this Edfu account of the wandering civilizers am I wrong to be very strongly reminded of the Tukano origin myth, given in chapter 18? It tells of how "Helmsman" and "Daughter of the Sun" brought the gifts of fire, horticulture, pottery-making, and other skills to the first humans to enter the Amazon while other "supernaturals" traveled over all the rivers, explored the remote hill ranges, identified the best places for settlement, and "prepared the land so that mortal human creatures might live on it."

Before returning whence they had come these so-called supernaturals:

> Left their lasting imprint on many spots so that future generations would have ineffaceable proof of their earthly days and would forever remember them and their teachings.[71]

These same spots, very frequently marked with petroglyphs, are still held sacred by the Tukano today, anthropologist Gerardo Reichel-Dolmatoff confirms, as "proof of the divine origin of the cultural heritage, the foundations of which had been laid down by the spirit beings who, at that time, still dwelled upon earth."[72]

Returning to ancient Egypt and to the Edfu texts, we're told that the survivors of the Island of the Primeval Ones:

> journeyed through the … lands of the primeval age. …[73] In any place in which they settled they founded new sacred domains.[74]

We may deduce, therefore, that part of their mission was to

repromulgate the lost religion of the days before the flood.

Next we learn that architecture, initially in the form of earthen mounds, was also central to their mission. Indeed it was so central that they carried with them a book, *The Specifications of the Mounds of the Early Primeval Age,* that literally "specified" the locations in the Nile Valley upon which every mound was to be situated, the character and appearance of each mound, and the understanding that those first, foundational mounds were to serve as the sites for all the temples and pyramids that would be built in Egypt in the future.[75]

Little wonder then that included among the company of the "gods" of Edfu were the *Shebtiw,* a group of deities charged with a specific responsibility for "creation,"[76] the "Builder Gods" who accomplished "the actual work of building,"[77] and the "Seven Sages" who, in addition to dispensing wisdom, as their name

suggests, were much involved in the setting out of structures and in laying foundations.[78]

My argument has long been that the Edfu Building Texts reflect real events surrounding a real cataclysm that unfolded between 12,800 and 11,600 years ago, a period known to paleoclimatologists as the Younger Dryas and that the Texts call the "Early Primeval Age." I have proposed that the seeds of what was eventually to become dynastic Egypt were planted in the Nile Valley in that remote epoch more than 12,000 years ago by the survivors of a lost civilization and that it was at this time that structures such as the Great Sphinx and its associated megalithic temples and the subterranean chamber beneath the Great Pyramid were created. I have further proposed that something resembling a religious cult or monastery, recruiting new initiates down the generations, deploying the memes of geometry and astronomy, disseminating an "as-above-so-below" system of thought, and teaching that eternal annihilation

awaited those who did not serve and honor the system, would have been the most likely vehicle to carry the ideas of the original founders across the millennia until they could be brought to full flower in the Pyramid Age.

TURTLE ISLAND

IF WE TAKE THE EDFU Building Texts seriously, with their depiction of seafaring missions sent all around the world to attempt to restart a civilization after a global cataclysm, and if ancient Egypt is the distant descendant of one of those missions, then we would expect to find other distant descendants elsewhere in the world.

It is my case in this book that we do indeed find such a descendant civilization in the Mississippi Valley and that, like ancient Egypt, it carries the DNA of a "ghost" civilization of remote

prehistory. At sites such as Cahokia and Moundville, and 1,000 years earlier at Newark and High Bank, and 1,000 years before that at Poverty Point, and again 2,000 years before that at Watson Brake, we see the same sky-ground geometrical and astronomical system at work, with origins that keep on receding deeper and deeper into the past until the trail fades from view around 8,000 years ago. In the case of the older sites in this continuum—despite early evidence of a special place granted to the constellation Orion across North America[79]—there is insufficient information for us to be sure of the afterlife beliefs of the people who made them and whether they were linked to the "Path of Souls" complex that we find so amply demonstrated in the later sites. But the fact that such beliefs are confirmed at Cahokia and Moundville, and other relatively recent Mississippian sites where the archaeological evidence can be enriched with ethnographic data, and the fact that they are also strongly implicated in Hopewell and Adena sites such as Newark,

High Bank, and Serpent Mound, suggest strongly that the same "cultural package" of sky-ground geometry and astronomy, linked to the same set of beliefs about the afterlife journey of the soul, is likely to have been at work from the beginning to the end of the mound-building enterprise in North America.

Then there's the matter of the Amazon, where earthworks incorporating geometrical and astronomical memes identical to those manifested in the ancient Nile and Mississippi River Valleys are now emerging from the jungle hand in hand with traditions of "geometrical gods" and evidence of an ancient quest using vision-inducing plants to gain knowledge of the realm of the dead.

At the same time, the whole story of the peopling of the Americas is up for grabs. We know that the New World has been separated from the Old—a gigantic island—since the epoch of sea-level rise at the end of the Ice Age between 12,800 and 11,600 years ago. We know that there were subsequently no significant transfers of culture or genes between the two regions until about 500 years ago, when

the European conquest of the Americas began. We may safely conclude, therefore, that anything held in common culturally or genetically between the Old World and the New that is not the result of mixing in the past 500 years is either a coincidence or has to date back at least 11,600 years—and could, of course, be far older than that.

The extraordinary similarities we've considered between ancient Egypt and ancient North America are far beyond the power of coincidence to explain and yet the differences, and the physical and temporal separation of the Nile and Mississippi Valley civilizations, mean direct influence also must be ruled out.

What's left is a remote third party—a lost civilization, perhaps even the "island" that the Edfu texts call the Homeland of the Primeval Ones destroyed in the global cataclysm of 12,800 years ago.

North America—"Turtle Island" in Native American tradition—is always, almost automatically, assumed to be a place to which

culture was brought from elsewhere, but let's shift the reference frame. What if North America itself was the Homeland of the Primeval Ones? What if the distinctive system of ideas involving the afterlife journey of the soul and the building of very specific types of structures thought to facilitate that journey weren't **brought** to North America but originated there?

Now that the "Clovis First" nonsense has finally been laid to rest we know for sure that humans have been in the Americas for at least 25,000 years, with compelling evidence for an even earlier presence 50,000 years ago or more. Indeed if, Tom Deméré and his team have correctly read the clues at the Cerutti Mastodon Site, the real First Americans may have inhabited the New World—as far south as San Diego—as much as 130,000 years ago.

Even if the continent wasn't inhabited until 25,000 years ago, however, we're still left with an immense span of time before the earliest evidence of mound-building in North America around 8,000 years ago. That's an interval quite long enough for great innovations

in human culture to have occurred, yet if they did occur, why do we find no trace of them?

We've already seen, and I think there's no dispute about it, that a vast heritage of truth about Native American cultures, and what they really knew and believed, was utterly obliterated by the European conquest in the past 500 years. That's one reason why the record is so patchy, with great chunks simply missing.

The second reason, as Tom Deméré explained (see part 2), is that archaeologists have, until recently, been unwilling to investigate older deposits because of a preexisting conviction that nothing would be found in them.

But there's a third factor that may prove to be of far greater significance than the other two, and this has to do with the extinction-level cataclysm that the earth experienced 12,800 years ago. Although the entire globe was affected, all the evidence indicates that the epicenter was in North America. It's giant ice cap, 2 kilometers deep and extending in that epoch as far south as

Minnesota, was massively destabilized, and the destruction that followed was near total across an immense area where the archaeological record was effectively swept clean.

What happened in North America?

PART VII

APOCALYPSE THEN

The Mystery of the Cataclysm

25

ELOISE

IT'S EARLY OCTOBER 2017, A roasting-hot midmorning, and we've just left Tucson, Arizona, for the 80-mile drive to Murray Springs, a very rich and complex Clovis site about 14 miles southwest of the town of Tombstone and 20 miles north of the Mexican border. Our route takes us via I-10 and AZ-90 through increasingly sere scrub and semidesert under a merciless sky, but when we arrive at Murray

Springs itself, park, say hello to the rangers at the gate, and walk the couple of miles of the trail around the archaeological site we find ourselves in a sort of oasis with abundant mesquite growing tall enough along the edges of a sinuous arroyo—a flood channel—to offer some welcome shade. Although flash floods still rip through here from time to time it's rumored that the present lush environment owes more to treated sewage being dumped in the area.

Santha and I are accompanied by geophysicist Allen West and his wife, Nancy. Working with Jim Kennett, an earth scientist and oceanographer at the University of California, and Richard Firestone, a nuclear analytical chemist at Lawrence Berkeley National Laboratory, West is one of the principal investigators in a loose alliance of more than sixty scientists from many different fields who have joined forces since 2007 to try to solve a profound mystery. It concerns the Younger Dryas, the interlude of cataclysmic global climate change coinciding with the Late

Pleistocene Extinction Event in which thirty-five genera of North American megafauna (with each genus consisting of several species) were wiped out around 12,800 years ago. Sharing their fate were the Clovis people and their distinctive culture with its characteristic “fluted-point” weaponry.

We climb down to the floor of the arroyo, which is about 2 meters deep and 12 meters wide at this point, and begin to walk along it. After a few moments Allen stops. “It’s around here that they excavated Eloise,” he says. He’s referring to one of the mammoths ambushed and butchered at Murray Springs by the Clovis people some 12,800 years ago. He describes how Eloise’s skeleton was found intact except for the hind legs, which had been chopped off right after she was killed. One was moved up and placed alongside her head. Archaeologists found the other a few hundred meters away, close to the residue of an ancient campfire. Part of a broken Clovis point was also found by the campfire, while the rest of it was “in Eloise.”

The archaeologist who excavated the mammoth in the 1960s, and who would bring Allen West and Richard Firestone to the site many years later, was Vance Haynes, Regents Professor Emeritus at the University of Arizona and a senior member of the National Academy of Sciences. The reader will recall that his adamant defense of "Clovis First" was a significant factor in extending the life of that now thoroughly discredited theory and in inhibiting other research indicating a much earlier peopling of the Americas.

As the discoverer and principal excavator of Murray Springs, however, Haynes deserves credit for drawing attention to a very curious aspect of the site—a distinct dark layer of soil draped "like shrink-wrap," as Allen West puts it, over the top of the Clovis remains and of the extinct megafauna—including Eloise.

Haynes has identified this "black mat" (his term) not only at Murray Springs but at dozens of other sites across North America,[1] and was the first to acknowledge its clear and obvious association

with the Late Pleistocene Extinction Event. He speaks of the "remarkable circumstances" surrounding the event, the abrupt die-off on a continental scale of all large mammals "immediately before deposition of the … black mat," and the total absence thereafter of "mammoth, mastodon, horse, camel, dire wolf, American lion, tapir and other [megafauna], as well as Clovis people."[2]

Haynes notes also that "The basal black mat contact marks a major climate change from the warm dry climate of the terminal Allerød to the glacially cold Younger Dryas."[3]

From roughly 18,000 years ago, and for several thousand years thereafter, global temperatures had been slowly but steadily rising and the ice sheets melting. Our ancestors would have had reason to hope that earth's long winter was at last coming to an end and that a new era of congenial climate beckoned. This process of warming became particularly pronounced after about 14,500 years ago. Then suddenly, around 12,800 years ago, the direction of climate change

reversed and the world turned dramatically, instantly cold—as cold as it had been at the peak of the Ice Age many thousands of years earlier. This deep freeze—the mysterious epoch now known as the Younger Dryas—lasted for approximately 1,200 years until 11,600 years ago, at which point the climate flipped again, global temperatures shot up rapidly, the remnant ice sheets melted and collapsed into the oceans, and the world became as warm as it is today.[4]

In addition to Murray Springs, Vance Haynes reports finding:

> At least 40 other localities in the United States with Younger Dryas age black mat deposits. … [5] This layer or mat covers the Clovis-age landscape or surface on which the last remnants of the terminal Pleistocene megafauna are recorded. Stratigraphically and chronologically the extinction appears to have been catastrophic, seemingly too sudden and extensive for either human predation or climate change to have been the primary cause. This sudden … termination … appears to have coincided with the sudden climatic switch from Allerød warming to Younger Dryas cooling. Recent evidence for extraterrestrial impact, although

> not yet compelling, needs further testing because a remarkable perturbation occurred … that needs to be explained.[6]

Haynes published these thoughts in the *Proceedings of the National Academy of Sciences* in May 2008. The "extraterrestrial" impact that he mentions (and finds "not yet compelling") has nothing to do with "aliens" but refers to a serious scientific theory, the "Younger Dryas Impact Hypothesis," that had received its first formal airing—also in *PNAS*—in October 2007.[7] The paper was coauthored by Allen West, Richard Firestone, James Kennett, and more than twenty other scientists and presents evidence that multiple fragments of a giant comet—a swarm of fragments—struck the earth with disastrous consequences around 12,800 years ago. The effects were global but the epicenter of the cataclysm was over the North American ice cap, which the impacts destabilized, triggering the Younger Dryas deep freeze and the megafaunal extinctions.[8]

Haynes was right to say, in 2008, that this radical hypothesis needed further testing. It would receive it in the years ahead and become the focus of a furious debate that has divided scientists and continues to this day. On one side, many highly qualified and experienced specialists from many different fields are convinced that a comet swarm was indeed encountered around 12,800 years ago and that the result was a global catastrophe, with its most extreme effects felt in North America. On the other side is a smaller but more vocal and highly influential group of skeptics who reject the theory. I reported the debate between the two factions in some detail in my book *Magicians of the Gods* so won't repeat myself here. As I write these words in 2018, and despite a decade of unrelenting criticism and focused attempts at refutation, the upshot is that the Younger Dryas Impact Hypothesis [YDIH] has stood the test of time, gained increasingly wide acceptance among scientists, and remains by far the best single, coherent explanation for the

cataclysmic events and extinctions—the "remarkable perturbation"—that did indeed occur around 12,800 ago.

Allen West is at the cutting edge of the research into this colossal mystery and the coauthor of more than forty scientific papers looking into it in depth.

I'm privileged to have him join me at Murray Springs.

BLACK MAT

ALLEN LEADS US OVER TO the side wall of the arroyo, explaining, as we walk, that the area would have had a very different appearance 12,800 years ago. In particular it would have been "much wetter," with "a string of lakes" serving as watering holes for the megafauna that the Clovis hunters came here to kill. The arroyo itself is a relatively recent feature but a useful one because it slices vertically

through a couple of meters of sediment laid down before and after the onset of the Younger Dryas and thus functions something like an archaeological trench, revealing the layers—and what's in them—stacked one on top of the other.

A distinct black stratum, running horizontally like a layer in a cake, is visible on both walls of the arroyo about a meter below present ground level. It obviously lies across the whole landscape and has been exposed here by the flash floods that cut the arroyo—as though, to extend the analogy, a "slice" of the cake has been removed, allowing us a glimpse of its interior.

The stratum is about a hand's-breadth thick.

"That's the black mat," Allen confirms.

It doesn't look like a cataclysm, but appearances can be deceptive.

The first and most obvious sign of an impact by an asteroid or comet is a crater—or multiple craters in the case of a swarm. However, the earth's surface is dynamic and craters can be

obliterated by erosion or other geological processes, or covered over by later sediments or submerged by rising sea levels. In the case of impacts on the 2-kilometer-deep North American ice cap, as envisaged in the YDIH, the craters would have been excavated in ice that would have subsequently melted away, leaving little or no evidence on the ground beneath.

Scientists have therefore developed other measures, more subtle than looking for craters, to detect cosmic impacts in the geological record. Nanodiamonds, for example, are microscopic diamonds that form under rare conditions of great shock, pressure, and heat, and are recognized as being among the characteristic fingerprints —"proxies" in scientific language—of powerful impacts by comets or asteroids.[9] Other proxies include meltglass (resembling trinitite), tiny carbon spherules that form when molten droplets cool rapidly in air, magnetic microspherules, charcoal, soot, platinum, carbon

molecules containing the rare isotope helium-3, and magnetic grains with iridium.[10]

Certain of the glassy and metallic proxies require temperatures in excess of 2,200 degrees C to form and there is nothing in nature other than the heat and shock of a cosmic impact that can instantly generate such temperatures.[11] Alternative explanations might be offered for some of the other proxies but when they occur together, and in abundance, a cosmic impact again fits the evidence better than anything else.[12]

Moreover, to this day, scientists know of only two layers of sediment "broadly distributed across several continents that exhibit coeval abundance peaks in a comprehensive assemblage of cosmic impact markers, including nanodiamonds, high-temperature quenched spherules, high-temperature melt-glass, carbon spherules, iridium and aciniform carbon."[13]

These layers are found at the Cretaceous-Paleogene Boundary 65 million years ago, when it has long been agreed that a gigantic cosmic impact in the Gulf of Mexico caused the mass extinction of the dinosaurs, and at the Younger Dryas Boundary 12,800 years ago.[14]

I have a question for Allen. “Since the black mat was found draped directly on top of Eloise—like ‘shrink-wrap,’ you said—then presumably it must have begun to form very shortly after she was killed and butchered with most of her remains left lying on the spot?”

“What we see is that at the bottom of that black-mat layer, literally the first thing touching those bones, are spherules, iridium, platinum, and small pieces of melt-glass from the event. So it doesn’t mean the animal was alive when the event happened, but she had to have been alive very, very shortly, at most a few weeks, before it.”

I ask Allen to explain the black mat to me. “I understand that the lowest part of it is full of impact proxies laid down at the time the mat began to form but clearly they’re not the mat itself …”

“The black mat formed on top of the layer of proxies,” Allen replies. “Down here it has a lot of charcoal in it. But it also has algal remains so it’s not just fire. The Younger Dryas changed the climate and made the area much wetter. Algae began to grow along the edges of the lakes.” He puts a hand on the black stripe along the arroyo wall: “So the remains of about 1,000 years of dead algae, charcoal, and a lot of other stuff are all embedded in here, and at the bottom of it, where the impact happened, we find iridium, platinum, and a layer of melted spherules where the temperatures must have been so high that they would have melted a modern car into a pool of metal.”

“So are you saying that there was an impact right here? At Murray Springs?”

Allen replies that it's not as simple as that. "The bigger impacts were farther north. Down here it's more likely to have been an airburst—a fragment of the comet that literally blew up in the sky before hitting the ground …"

"And the effect of that would have been … what?"

"If you'd been standing here it would have seemed like the whole sky caught on fire with the center of it brighter than the sun. And the thing is it would have been totally silent. They would have heard nothing at first. Because the speed of sound is a lot slower than the speed of light."

My imagination has gone into overdrive. "Could it have happened," I ask, "while the Clovis hunters were actually butchering Eloise?"

Allen shakes his head. "We know it didn't happen instantaneously," he reminds me, "because they chopped her legs off and hauled one of them away and cooked it. But it could have happened later the same day and like I say it certainly happened

within a couple of weeks. That's based on modern data from elephant kills in Africa. The scavengers come in quickly and disarticulate the skeleton, and that didn't happen with Eloise."

This kill site sounds like unfinished business to me.

"That other haunch left up by Eloise's head," I reflect, "and the rest of her intact. Doesn't that suggest that the hunters were still in the vicinity and meant to come back to finish butchering her, but for some reason never did?"

Allen joins in with the spirit of the thought. "Okay," he says. "It's pure speculation, obviously, because we'll never know for sure the exact sequence of events here 12,800 years ago, but based on the evidence it's not unreasonable to envisage the hunters sitting around, cooking mammoth haunch over their campfire when all of a sudden the sky explodes …"

"And that's why they never go back for the rest of Eloise? Because they're all dead?"

“Could be,” Alan agrees. He jabs a finger into the base of the black mat and continues.

“But what we can be certain of was that this moment marked the end of their story, and the end of an epoch, really. There’s not a single Clovis point found anywhere in North America that’s above that black mat. They’re all in it or below it. And there’s not a single mammoth skeleton anywhere in North America that’s above it. A huge part of the die-off could have been as a direct result of the impacts themselves, but impacts and airbursts south of the ice cap, particularly as far south as New Mexico, would also have set off wildfires. There’s overwhelming evidence that gigantic wildfires raged at the onset of the Younger Dryas—in fact, more soot has been found at the Younger Dryas Boundary than at the Cretaceous-Paleogene Boundary. We did the calculations and it looks like as much as 25 percent of the edible biomass and around 9 percent of the total biomass of the planet was on fire and destroyed within days or weeks of the YDB. So in many areas if the animals weren’t killed

outright they wouldn't have been able to forage enough food afterwards to survive. The grass would have burned up, leaves on trees were gone. … And you know, the other thing is that when comet fragments come in they're traveling incredibly fast and they literally punch a hole in the atmosphere. They actually push the air aside and they bring in that super cold from space, and when they explode in the air that cold plume continues to the ground and you literally have things frozen in place if they were close enough to where the plume came down. It's possible they were fried and then frozen all within a matter of seconds."

MULTIPLE INJECTIONS OF PLATINUM

I ASK ALLEN HOW LONG, in his opinion, the multiple impacts that kicked off the Younger Dryas were sustained for. Was it an

overnight affair? Was it a matter of days? Was it weeks?

He replies that there are levels of uncertainty, variables that will probably never be properly resolved, but that within those limits what the evidence points to is not days or weeks but a **21-year** period of utter devastation, horror, and cataclysm unfolding between 12,836 years ago and 12,815 years ago, with a peak around 12,822 years ago.

This ability to zoom in at very high resolution on a time window just 21 years wide and almost 13,000 years in the past comes to us courtesy of an amazing scientific resource consisting of ice cores from Greenland. Extracted with tubular drills that can reach depths of more than 3 kilometers, these cores preserve an unbroken 100,000-year record of any environmental and climatic events anywhere around the globe that affected the Greenland ice cap. What they show, and what Allen is referring to, is a mysterious spike in the metallic element platinum—"a 21-year interval with elevated platinum," as he puts it now—"so we know that was the

length of the impact event because there's very little way, once platinum falls on the ice sheet, that it can move around. It's pretty well locked in place."

The backup to what Allen's saying is in a paper I'm already familiar with by Michail Petaev of Harvard University's Department of Earth and Planetary Sciences and his colleagues Shichun Huang, Stein Jacobsen, and Alan Zindler. Published in the *Proceedings of the National Academy of Sciences* in August 2013, the self-explanatory title of the paper is "Large Pt Anomaly in the Greenland Ice Core Points to a Cataclysm at the Onset of Younger Dryas."

Platinum is, of course, an element found on earth, but analysis of the platinum in the ice core by Petaev and his colleagues reveals a composition quite unlike terrestrial platinum and leads the scientists to conclude that "an extraterrestrial source," perhaps "a metal impactor with an unusual composition," is the most likely

explanation.[15] They note also that during the 21-year interval—between 12,836 and 12,815 years ago, as indicated by Allen:

> The Pt concentrations gradually rise by at least 100-fold over ~14 y and drop back during the subsequent ~7 y. … The observed gradual ingrowth of the Pt concentration in ice over ~14 y may suggest multiple injections of Pt-rich dust into the stratosphere.[16]

Allen's reading of what Petaev's findings point to, shared widely by his colleagues, is that the "impactor" was in fact multiple impactors, all of them fragments of a comet that had wandered in from the outer solar system and taken up a potentially deadly earth-crossing orbit.

Though bound together by ice, comets have rocky cores that are often volatile, and it is in the nature of these cores to undergo fragmentation. Take Comet Shoemaker-Levy 9, for example. It broke apart into twenty-one fragments, all of which smashed into the planet Jupiter over a period of 6 days in July 1994 with

spectacular effect, creating huge, fiery explosions and dark scars, in some cases larger than the earth, that persisted on the surface of the gas giant for many months.

Something of the same sort is involved in Allen's vision, again widely shared by his colleagues, of what happened to the earth at the Younger Dryas Boundary. Drawing also on the work of William Napier, professor of astrobiology at the University of Cardiff, what the Younger Dryas Impact Hypothesis proposes, in brief, is a large parent comet in the range of 100 kilometers in diameter. Plunging in from the outer solar system, it enters an earth-crossing orbit around 30,000 years ago and remains intact for the next 10,000 years. About 20,000 years ago, due to gravitational forces in the inner solar system it undergoes a massive "fragmentation event" that transforms it from a single deadly and potentially world-killing object into multiple objects varying in diameter from the extremely dangerous kilometer-plus range down to a few tens of meters, down to chunks the size of cars, down to boulder-sized pieces, down to

fist-sized rubble, and down beyond that to countless billions of smaller fragments and an immense penumbra of dust. As thousands of years pass, the whole turbulent mass of big and little pieces of the comet orbiting at tens of thousands of kilometers per hour begins to separate into multiple filaments each filled with debris, eventually expanding to form a giant tubular "meteor stream" some 30 million kilometers in diameter and extending more than 300 million kilometers across the entire orbit of the earth—which it cuts in two places so that we must pass through the stream twice a year. Traveling 2.5 million kilometers along its orbital path every day, the earth takes 12 days to complete each passage through the stream.[17]

The Taurid Meteor Stream. Remnant of a giant comet 100+ kilometers in diameter, before undergoing fragmentation. The stream includes three known comets or comet-like objects, namely: Enke, Oljiato, and Rudnicki, and nineteen of the brightest near-earth objects.

Because the meteor stream produces showers of “shooting stars” that look to observers on the ground as though they originate in the region of the sky occupied by the constellation Taurus, it’s called the Taurid meteor stream. Our planet still passes through it twice a year, negotiating its dangerous inner filaments in late June and early July (when shooting stars are not visible because they are encountered in daylight) and again from late October into November, when a spectacular “Halloween fireworks” display is put on.[18]

On most of these biannual encounters with the Taurids we just get the pretty fireworks, but occasionally we get more. On June 30, 1908, for example, an object thought to have fallen out of the Taurid meteor stream,[19] and estimated to be somewhere between 60 and 190 meters in diameter, penetrated earth’s atmosphere. It exploded in the air—fortunately above an uninhabited region of Siberia—flattening 80 million trees across an area of 2,000 square kilometers.

To put this in context, Greater London has an area of 1,582 square kilometers and a population of more than 7 million people. “If transferred to London,” Professor Napier calculates, the Tunguska airburst:

> would have been heard throughout the UK, north to Denmark and across Europe as far as Switzerland. Topsoil would have been stripped from fields in the north of England, people in Oxford would have been thrown through the air and severely burned, an incandescent column of matter would have been thrown 20 km in the air over London, and the city itself would have been destroyed about as far out as the present-day ring road. Impact energy estimates range from 3 to 12.5 Mt (megatons TNT equivalent).[20]

The consequences if an object of similar size were to explode over a major city today would, in other words, be utterly catastrophic, but because the Tunguska event took place in a remote region before the era of modern mass communications, very few people are aware of how deadly even relatively small chunks of space rock can be.

Professor Napier and his colleague Victor Clube, formerly dean of the Astrophysics Department at Oxford University, go so far as to describe the "unique complex of debris" within the Taurid stream as "the greatest collision hazard facing the earth at the present time."[21] Coordination of their findings with those of Allen West, Jim Kennett, and Richard Firestone, has led both teams—the geophysicists and the astronomers—to conclude that it was very likely objects from the then much younger Taurid meteor stream that hit the earth around 12,800 years ago and caused the onset of the Younger Dryas. These objects, orders of magnitude larger than the one that exploded over Tunguska, contained extraterrestrial platinum, and what the evidence from the Greenland ice cores seems to indicate is an epoch of 21 years in which the earth was hit *every year,* with the bombardments increasing annually in intensity until the fourteenth year, when they peaked and then began to decline before ceasing in the twenty-first year.

Tunguska—an airburst at an altitude of 5–6 kilometers. The object was estimated to have had a diameter of between 60 and 190 meters. It flattened 80 million trees across an area of more than 2,000 square kilometers. This is an area larger than London.

Had the event occurred over a major city, rather than over an uninhabited area, the loss of life would have been horrendous. PHOTOS: LEONID KULIK.

"It's as though after dodging the bullet for thousands of years," I say to Allen as we walk back along the baking floor of the arroyo, "the earth finally intersects a particularly lumpy and rocky filament of debris and we get hit really hard, over and over again, year after year, until we've passed through it."

"Petaev himself says 'multiple injections of platinum,'" Allen reminds me. "I think those were pretty much his exact words in the paper, so that's an independent assessment of the idea. There's something else, too, from new research we've been working on. In the ice core, at the exact same moment we see this big onset of platinum at the beginning of the 21 years, we also see a sudden rise in dust."

The Younger Dryas Boundary strewn field. The area enclosed by the dotted line defines the current known limits of the YDB field of cosmic impact proxies spanning more than 50 million square kilometers.

"Which tells you what?"

"Which tells us that along with everything else that was going on at the time there were also **very** high winds blowing. There are certain proxies of that windiness that end up in the ice sheet. When it's windier the winds will pick up continental dust, and, number

one, it's colder so there's less plant cover, so when it gets windier and there are less plants to hold the sediment down, you get huge dust storms. We can see that buildup in the Greenland ice sheet. We see magnesium and calcium, a huge increase in them, and those are indicative of terrigenous dust, continental dust, and we see an increase in sodium and chlorine which are from sea salt—so the winds are so strong they pick up more sea salt and deposit it in Greenland. The levels of these windiness proxies continue to climb for nearly 100 years. At the same time we see one of the biggest peaks in the entire ice core in all the biomass-burning proxies, and those occur within less than a 10-year window of the start of that 21-year interval—so you look at that and the best explanation is the impact occurred, that it triggered immense biomass burning, and that it changed the climate radically, resulting in high winds and immense dust storms."

"So it was a combination of really horrible things?"

“A cascade of bad things. It must have felt like the end of the world for those who lived through it.”

“And particularly bad here in North America—the epicenter of the disaster?”

“Much worse here than anywhere else! A true calamity. But it wasn’t only North America. We’ve traced evidence of further impacts from the same swarm in the exact same period in Europe and as far east as Syria and even into South America. The strewn field extends across more than 50 million square kilometers of the earth’s surface.”

NEW EVIDENCE

I HAVE WRITTEN EXTENSIVELY ABOUT the Younger Dryas Impact Hypothesis in *Magicians of the Gods*. There I present evidence that

the impacts changed the world completely and wiped from the record almost all traces not only of the Clovis people but also of an advanced civilization of the Ice Age.

The fact that North America was the epicenter of the cataclysm, though acknowledged, has profound implications for our understanding of the human past that archaeologists have never thought through—in part because the **scale** of the cataclysm is only now beginning to be fully mapped out.

After completing *Magicians,* therefore, I made sure I stayed up to date with the steady stream of new evidence released by Allen and his group in the scientific journals. There was a visible quickening in the pace of the research, and in 2017 and 2018 two major studies revealed how truly devastating the cataclysm at the onset of the Younger Dryas really was.

If there was ever a time when a significant chapter in the story of human civilization could have been lost, this, surely, was it.

26

FIRE AND ICE

ALLEN WEST AND THE TEAM of scientists working on the Younger Dryas Impact Hypothesis established themselves as a formal research organization, the Comet Research Group, in 2015.[1] The group (hereafter CRG) presently numbers sixty-three leading scientists from fifty-five universities in sixteen countries.[2] Many

other scientists are also directly and indirectly associated as coauthors of papers written by CRG members.

This is the case with a paper, published in *Nature*'s sister journal *Scientific Reports* on March 9, 2017, titled "Widespread Platinum Anomaly Documented at the Younger Dryas Onset in North American Sedimentary Sequences."[3]

The lead author is geoarchaeologist and CRG member Dr. Christopher Moore of the University of South Carolina. His coauthors and fellow CRG members are geophysicist Allen West, whom we met in the last chapter, anthropologist Randolph Daniel of East Carolina University, archaeologist Albert Goodyear, whom we met in chapter 6, earth scientist James P. Kennett of the University of California, geologist Kenneth B. Tankersley of the University of Cincinnati, and geologist Ted Bunch of Northern Arizona University. The non-CRG coauthors are planetary and atmospheric scientist Malcolm LeCompte of the University of South Carolina,

geomorphologist Mark J. Brooks, also of the University of South Carolina, environmental scientist Terry A. Ferguson of Wofford College, South Carolina, geoscientist Andrew H. Ivester of the University of West Georgia, luminescence-dating expert James K. Feathers of the University of Washington, and physicist Victor Adedji of Elizabeth City State University.[4]

All in all, therefore, a very distinguished assembly of scientists—and the task that they set themselves was also in the finest tradition of good science, namely, to test an important prediction made by other scientists. From the previous chapter, the reader will recall the research by Michail Petaev and his colleagues showing elevated levels of platinum in the Greenland ice cores over a 21-year period between 12,836 and 12,815 years ago. Petaev reports what appear to have been "multiple injections" of platinum-rich dust into the stratosphere over this period and predicts that if the source of the dust was cometary, asteroidal, or meteoroidal, then the fallout

should have extended far beyond Greenland and would be "expected to result in a global Pt anomaly."[5]

The coauthors of the 2017 platinum paper chose North America, the suspected epicenter of the Younger Dryas cataclysm—and also their home turf—to test this prediction by establishing "whether or not a Pt anomaly exists in terrestrial sediments of YD age that is similar to that reported from the GISP2 ice core."[6]

It sounds low-key, but much was at stake. If soil samples showed platinum to be at normal background levels in the YDB layer across North America, then Petaev's prediction would be false and the Younger Dryas Impact Hypothesis would suffer serious collateral damage. On the other hand, if elevated levels of platinum were found, it would vindicate Petaev and give further strong support to the hypothesis that cosmic impacts caused the Younger Dryas cataclysm.

Eleven archaeological sites—see map below—all with good stratification and well-established YD-age sediments were selected as the focus of the study: 1. Arlington Canyon, Santa Rosa Island, California; 2. Murray Springs, Arizona; 3. Blackwater Draw, New Mexico; 4. Sheriden Cave, Ohio; 5. Squires Ridge, North Carolina; 6. Barber Creek, North Carolina; 7. Kolb, South Carolina; 8. Flamingo Bay, South Carolina; 9. Pen Point, South Carolina; 10 Topper, South Carolina; and 11. Johns Bay, South Carolina.

The project began by testing soil samples from Arlington Canyon, Murray Springs, Blackwater Draw, and Sheriden Cave, four sites with particularly "well-defined and well-dated YDB age

sediments containing peaks in YDB impact-related proxies."[7] What the tests revealed was:

> a large above-background Pt anomaly at each site in the identical sample previously identified as the YD boundary layer containing abundance peaks in YDB proxies, including micro-spherules, meltglass, and nanodiamonds.[8]

The team then extended the Pt analysis to soil samples from the seven other sites. In summary, across all eleven sites, they conclude that their results

> provide strong evidence for above-background enrichment in Pt within sediments that date to the onset of YD climate change at ~12,800 Cal B.P. Pt abundances from our study sites averaged 6.0 parts per billion (ppb) … compared to background abundances above and below the YDB layer averaging 0.3 ppb. Average background Pt concentrations are all lower than crustal abundance of 0.5 ppb, whereas average YDB concentrations are 12× higher. These concentrations are also higher than the peak Pt concentration (~80 parts per trillion [ppt] or 0.1 ppb) reported at high chronological resolution from the GISP2 ice-core in Greenland by Petaev et al. All study sites contain significant Pt peaks that are ~3 to 66× higher than in Greenland.[9]

The technical language and abbreviations make it difficult to stay focused on the grave implications of all this. In a layer in the earth that already contains abundant evidence of a cataclysmic cosmic impact around 12,800 years ago, a mass of new corroborative evidence has now been discovered. In parallel, the much greater strength of the Pt signal in the United States than in Greenland joins multiple other indicators pointing to North America as the most severely affected locus of the cataclysm. If this were a homicide investigation in which the prosecution were hesitating to charge the suspect, new evidence of this quality would be decisive, and a winnable case could be brought to court. Moore and his colleagues are cautious and modest, however, claiming only that:

> the consistent presence of anomalous Pt concentrations within sediments from multiple archaeological sites across North America that date to the onset of the YD Chronozone is compelling. … This study finds no evidence to contradict the conclusions of Petaev *et al.* that the Greenland Pt enrichment most likely resulted

> from an extraterrestrial source. … In addition, our findings show no contradiction with the Younger Dryas impact hypothesis.[10]

After completing their own investigation, Moore et al. combed the scientific literature for indications of how far beyond North America and Greenland the YDB platinum anomaly extends. Though not central to any investigation prior to Petaev's, they found that platinum group elements had been discovered and mentioned in passing in other earlier studies of the Younger Dryas Boundary at locations as far afield as Belgium, the central Pacific, Venezuela, the southwest of England, and the Netherlands—"important information," hinting at a truly global picture, that they hope "may encourage further research."[11]

In the Supplementary Information to their main paper, Moore and his colleagues also provide detailed evidence ruling out either volcanic activity or processes in the mantle of the earth as the sources for the enriched platinum at the YDB.[12] By contrast, after

compiling geochemical data for 167 meteorites, including chondrites, achondrites, irons, and ureilites, they found very high average Pt abundances, "making all four classes of meteorites possible sources of YDB Pt enrichment."[13]

They also note, "If a Pt-rich meteorite or comet impacted Earth, the target rocks would have become a melted mix of meteoritic and terrestrial material, and so should be Pt-enriched."[14]

The coauthors therefore compiled geochemical data from eighty-six examples of such "impactites" from three major impact layers spread out over a period of more than two billion years. In every one of them they found elevated Pt abundances in a range including all the values in the Pt-rich YDB layers from around 12,800 years ago.[15]

FOLLOWING THE TRAIL OF CLUES

THE CORROBORATING EVIDENCE KEEPS COMING in.

When we met at Murray Springs in October 2017, Allen West told me about new CRG research that had identified an extended episode of extreme windiness, dustiness, and large-scale "biomass burning" at the onset of the Younger Dryas. He mentioned that "around 9 percent of the total biomass of the planet was on fire and destroyed within days or weeks of the YDB"—an astonishing statement—but I'd been so focused on other aspects of what he was saying that I hadn't really considered the implications.

In February 2018 the *Journal of Geology* published the massive two-part study on which Allen's off-the-cuff remarks were based. The title speaks for itself: "Extraordinary Biomass-Burning Episode and Impact Winter Triggered by the Younger Dryas Cosmic Impact ~12,800 Years Ago."[16] CRG member Wendy Wolbach, professor of inorganic chemistry, geochemistry, and analytical chemistry at

Chicago's De Paul University, led the study, in which she was joined by Allen West and twenty-five other top researchers.[17]

Confirmation of the figure of 9 percent of terrestrial biomass comes on the first page, with the calculation that this would have meant that plant matter covering an area of no less than 10 million square kilometers would have been consumed by the inferno.[18]

To imagine a world in which 10 million square kilometers of vegetation is in flames is to imagine a world in which an area roughly twice the size of the Amazon rainforest is burning. That would be about the same as the entire area of China or the entire area of Europe or the entire area of North America in flames.

No matter how many separate wildfires there were, or how spread around the planet, a conflagration on this scale, hand in hand with the cascade of other disasters that marked the onset of the Younger Dryas, can only be described as hell on earth.

Once again, although records from lake sediments also provide vital clues, it is the Greenland ice cores, together with ice cores from other Arctic regions, that contain decisive evidence of the large-scale wildfires that raged across the world 12,800 years ago. This is not least because the upper (i.e., most recent) levels of these extremely long cores contain the traces of biomass wildfires that occurred and were recorded in the historic period, thus allowing identification and calibration of specific combustion aerosols, notably oxalate, ammonium, nitrate, acetate, formate, and levoglucosan, that serve as distinct signals—or proxies—of biomass-burning.[19] Wherever an abundance of these combustion aerosols shows up in the ice cores we can be certain that they mark the atmospheric fallout from extensive wildfires, we can date those wildfires, and it is often possible to identify where on the planet they occurred.

Here are some important pieces of the Younger Dryas puzzle winnowed from the dense pages of the 2018 paper:

- GISP2 Ice Core: Ammonium (NH_4), a biomass-burning proxy, displays one of the highest peaks in the 120,000-year record in an interval dating to 12,830–12,828 years ago. This overlaps the platinum-rich interval dating to 12,836–12,815 years ago and coincides with the onset of the Younger Dryas.[20]
- NGRIP Ice Core: A single high NH_4 peak, traced to biomass burning across North America, begins at the YD onset. It is the largest biomass-burning episode from North American sources in the entire record.[21]
- The GRIP concentrations of combustion aerosols began to increase sharply around 12,816 years ago, correlating with the GISP2 Pt anomaly (12,836–12,815 years ago). At the

onset of the Younger Dryas, concentrations of oxalate and formate reached their highest known concentrations in the ~386,000-year core, with acetate abundances ranking among the highest in the entire core.[22]

- These GRIP data reveal that massive wildfires occurred at the onset of the Younger Dryas, representing the most anomalous episode of biomass burning in at least 120,000 years and possibly in the past ~386,000 years.[23]
- The Taylor Dome (Antarctica) ice-core record exhibits a small but distinct peak in NO_3 that closely correlates with the Younger Dryas onset. The base of the Belukha, Siberia, ice core exhibits a major peak in NO_3 [nitrate], indicating that a major episode of biomass burning occurred at the Younger Dryas onset.[24]
- Several ice-core sequences (GISP2, NGRIP, GRIP, Taylor Dome and Belukha) confirm that the onset of the Younger

Dryas was intimately associated with one of the highest and most pervasive late Quaternary peaks in each of NH_4, NO_3, formate, oxalate, and acetate. These peaks occurred synchronously with the abrupt cooling and other climatic effects marking the onset of the Younger Dryas episode.[25]

- Investigation of "black mats" at nineteen sites in North America, Central America, Europe, and the Middle East: Peak abundances of black carbon (BC)/soot and other biomass-burning proxies were found in the Younger Dryas Boundary layers. … Concentrations of levoglucosan from within the black-mat layer in Ohio were around 125 times higher than those in the layer below it, signalling a significant peak in biomass burning.[26]

- Analysis of charcoal in lake sediments from nine countries in South and Central America: One of the highest peaks in the record occurs at the Younger Dryas onset around 12,850

years ago.[27]

- Analysis of charcoal in lake sediments from seven countries across Asia: There is a conspicuous peak in mean charcoal abundances at around 12,950 years ago (plus or minus 225 years) … followed by a sharp decline in biomass burning and then a peak at 12,400 years ago.[28]

- A 24,000-year sequence recorded in a marine core from the Santa Barbara Basin, off the coast of California, exhibits the highest peak in biomass burning precisely at the onset of the Younger Dryas. … This anomalously high peak correlates with intense biomass burning documented from the nearby Channel Islands. … The peak also coincides with the extinction of pygmy mammoths on the islands and with the beginning of an apparent 600–800-year gap in the archaeological record, suggesting a sudden collapse in island human populations.[29]

- A marine core from the western Pacific, 1,500 kilometers north of Papua New Guinea, provides a biomass-burning record spanning a period of 368,000 years. This core is unusual in providing a record not only of charcoal but also of black carbon, which includes AC/soot. The core exhibits a high black-carbon peak spanning the period between 13,291 and 12,515 years ago and overlapping the Younger Dryas onset at around 12,800 years ago. In addition, the YDB peak in black carbon coincides with an above-average charcoal peak at around 12,750 years ago.[30]

- Evidence from widely separated ice records and sediment records demonstrates that a major, widespread peak in biomass burning occurred on at least four continents at the warm-to-cold transition marking the YD onset. This peak is synchronous with the cosmic-impact layer at the Younger Dryas Boundary as recorded by multiple impact-related proxies, including peak abundances of platinum, high-

temperature microspherules, and meltglass.[31]

In summary, the earth and all life upon it endured and was devastated by what can only be described as a globally distributed firestorm at the onset of the Younger Dryas around 12,800 years ago. In this planetary debacle, 10 million square kilometers of trees and other plant matter burned.

To put that in perspective, the United Kingdom was in a state of traumatic shock in late June and early July 2018 after 4,942 acres of Lancashire moorland were consumed by wildfires. That's an area of just 20 square kilometers, but firefighters and emergency services from seven counties were utterly overwhelmed by the blaze and the military had to be brought in to assist.[32]

Meanwhile, a report in the *Sacramento Bee* dated July 2, 2018, opined that California's wildfire season had started early, with two "major fires" already fought at huge expense and requiring evacuation of local residents. These two fires were estimated to

have consumed 85,000 acres,[33] which sounds an awful lot but in fact converts to just 344 square kilometers.

The previous year, 2017, was California's most destructive wildfire season then on record, with a total of 1.25 million acres burned.[34] The cost of dealing with the disaster, including fire suppression, insurance, and recovery expenditures, was estimated at US$180 billion.[35] Yet 1.38 million acres converts to just 5,585 square kilometers—an insignificant fraction (around 0.05 percent—that is, a twentieth of 1 percent) of the 10 million square kilometers destroyed in the Younger Dryas wildfires.

It seems, therefore, that the United States and Britain, two of the world's wealthiest, most technologically advanced, and most powerful countries, face great difficulties in confronting what are, in the grand scheme of things, relatively minor wildfires. Imagine, then, the consequences for all living things of the great inferno that consumed 9 percent of the earth's biomass around 12,800 years ago

and that left an indelible record of its climatic and atmospheric impact in lake sediments and Arctic ice.

IMPACT WINTER

NEWS FOOTAGE OF THE US AND UK summer wildfires shows smoke everywhere. Close up it seems foggy or misty. In the longer view there's an obvious gloom, a darkening of the skies, where the pall obscures incoming sunlight. It's a local effect, of course. Fifty miles away the air is clear and the skies are blue.

The 2018 *Journal of Geology* study reports that matters would have been very different at the onset of the Younger Dryas, when the smoke from 10 million square kilometers of burning biomass

would have enshrouded the entire earth, creating what Wendy Wolbach and her coauthors describe as an "impact winter."[36]

This is a concept derived directly from research in the early 1980s revealing previously unexpected consequences of a nuclear war in the form of a "nuclear winter." The findings of that research were first put before the public in October 1983 in an article by esteemed astrophysicist Carl Sagan under the headline "**In a Nuclear Exchange, More Than a Billion People Would Instantly Be Killed, But the Long-Term Consequences Could Be Much Worse.**"

Appearing in a mass-circulation magazine, Sagan's article showed that the immense quantities of dust and smoke arising from multiple nuclear explosions, and from the wildfires they sparked off, would significantly reduce the amount of sunlight reaching the surface of the earth, causing a steep and sustained fall in global temperatures, widespread failure of crops, and devastating famines.

Nor would a full-scale war between superpowers be required to bring on the terrible, and potentially terminal, consequences of a nuclear winter. Even a regional nuclear conflict could do it.[37] "We have placed our civilization and our species in jeopardy," Sagan concluded.[38]

In the case of the Younger Dryas, the jeopardy that humanity faced was not from nuclear missiles but from the incoming fragments of a disintegrating giant comet, traveling at tens of kilometers per second, with the larger fragments as deadly as hundreds of nuclear warheads. Indeed, it is estimated that the total explosive power of the comet fragments that struck the earth in repeated episodes over a period of 21 years some 12,800 years ago would have been of the order of 10 million megatons[39]—1,000 times greater than all the nuclear devices stockpiled in the world today.[40]

The Younger Dryas is already recognized as an epoch of extreme, anomalous cold that lasted for approximately 1,200 years, setting in fast and suddenly around 12,800 years ago and ending, equally suddenly, around 11,600 years ago. The *Journal of Geology* study greatly enriches this picture with compelling new evidence that the onset of this 1,200-year "deep-freeze" was marked by a brief period of extremely intense and large-scale wildfires triggered by "the radiant and thermal energy from multiple explosions" as fragments from the comet swarm pelted the earth:

> This widespread biomass-burning generated large amounts of long-lived, persistent AC/soot that blocked nearly all sunlight, rapidly triggering an impact winter that transitioned into the YD cool episode.[41] …
>
> The negative effects of AC/soot might have persisted for 6 wk or more at the YD onset, blocking all sunlight and causing rapid cooling. Reduced insolation is also expected from the injection of comet dust to the upper atmosphere. If so, the lack of sunlight would have had widespread and catastrophic biotic effects, including insufficient light for plant photosynthesis and growth. At the same time,

> North Atlantic deep-water formation ceased, thus throttling the so-called ocean conveyor and triggering a sustained decrease in near-global temperatures.[42]

THE MAMMOTH IN THE ROOM

IT HAS LONG BEEN UNDERSTOOD that an interruption of the warm Atlantic current known as the Gulf Stream correlates with YD cooling, and it is generally agreed that

> a great gush of cold freshwater derived from the melting Laurentide ice sheet … swept across the surface of the North Atlantic. It prevented warm, salty water from the southern ocean flowing deep below the surface (the Gulf Stream) from rising to the surface. The normal overturning of the ocean water stopped. As a consequence the atmosphere over the ocean, which would normally have been warmed, remained cold and so, in consequence, did the air over Europe and North America.[43]

It's revealing, looking back through the scientific literature, to see how long explanations of this sort were simply taken for granted. That there had been a cold-water flood was not in doubt, so the detective work that at first interested scientists most was **WHERE** all the water had come from.

The reader will recall that the North American ice cap had two distinct segments consisting of two separate ice sheets, the Cordilleran in the west and the Laurentide in the east, which were often joined, but which in the later stages of the Ice Age were separated by the famous "ice-free corridor" that for a long while was erroneously believed to have been the sole route for human migration into the Americas. Along the southern margins of these ice sheets, enormous glacial lakes formed and were prone to flooding—most famously glacial lake Missoula in the west and glacial lake Agassiz in the east. Floodwaters out of Lake Missoula would have had no access to the Atlantic Ocean (they would have been routed into the Pacific). Lake Agassiz was therefore thought to

be the most likely source, and a study published in *Geology* in January 2018 confirms that its floodwaters "could have been routed eastward to the North Atlantic at the Younger Dryas onset and caused the canonical abrupt climate shift."[44]

After *Geology*, "Opening of Glacial Lake Agassiz's Eastern Outlets by the Start of the Younger Dryas Cold Period," January 4, 2018.

So we know that a cold-water flood poured into the Atlantic ocean around 12,800 years ago on a scale sufficient to stop the Gulf Stream in its tracks; we know that glacial lake Agassiz has been implicated in it; and we know that this "great gush of cold freshwater" has been connected to the plunge in global temperature—the "deep freeze"—that defines the Younger Dryas cold event.

The issue that most of the scientists are skirting, however—the mammoth in the room—is **why** such a flood would have occurred at the onset of the Younger Dryas "deep freeze" around 12,800 years ago rather than, say, 800 or 1,000 years earlier at the height of the warm phase—known as the Bølling—Allerød interstadial—that immediately preceded the Younger Dryas.[45] Intuitively one feels the meltwater floods should have been at their peak during the warming phase. Why, therefore, **in this case only**, do we see them at the

onset of an extremely cold phase? I raised this problem in *Magicians of the Gods* in 2015,[46] and it is raised again by Wolbach et al. in their 2018 paper, where they present evidence that deepens the mystery. "Unlike for typical warm-to-cold climate transitions," they report, "global sea levels **rose** up to 2–4 m within a few decades or less at the YD onset, as recorded in coral reefs in the Atlantic and Pacific Oceans."[47]

The point is understated, but this is a very big deal. Two to 4 meters of global sea-level rise within "a few decades or less" of the onset of the Younger Dryas is an IMMENSE amount of water, a cataclysmic world flood by any standard.

What makes it all the more remarkable, however—and all the more puzzling—is the evidence from Wolbach's study that in the exact same period the planet suffered a spectacular episode of biomass burning and an associated "impact winter" that "caused

warm interglacial temperatures to abruptly fall to cold, near-glacial levels within less than a year, possibly in as little as 3 months."[48]

Meanwhile, in the process of absorbing that sudden massive flood of icy water into the North Atlantic, the world ocean had reacted by shutting off the Gulf Stream, thus sustaining freezing temperatures in Europe and North America and setting in process the entire Younger Dryas cold episode.

Ice Sheet Meltwater Discharge Routes

What we are looking for, therefore, is an agent capable—simultaneously and almost instantaneously—of bringing about all of the following:

- a global flood
- wildfires across an area of 10 million km^2
- 6 months of icy darkness followed by more than 1,000 years of glacially cold weather
- a stratum of soil across more than 50 million km^2 dated to the Younger Dryas Boundary (YDB) and infused with a cocktail of nanodiamonds, high-temperature iron-rich spherules, glassy silica-rich spherules, meltglass, platinum, iridium, osmium, and other exotic materials
- a mass extinction of megafauna

Wolbach and her coauthors are forthright in their conclusion:

> Multiple lines of ice-core evidence appear synchronous, and this synchroneity of multiple events makes the YD interval one of the most unusual climate episodes in the entire Quaternary record. … A cosmic impact is the only known event capable of simultaneously producing the collective evidence.[49]

A VIOLENT HURRICANE OF BOLIDES

WHAT KIND OF COSMIC IMPACT?

From quite early in the research, since the first strong impact-proxy evidence was analyzed, it's been the consensus view of CRG members that the agent responsible for the Younger Dryas cataclysm was a comet. Wolbach's study strengthens that position, noting:

> Comets are a compositionally variable mix of volatile ices, meteoritic material, and presolar dust. … Wide ranges of elemental ratios confirm that cometary material is heterogeneous, similar to the YDB samples. Although the type of YDB impactor remains unclear, the current evidence does not support any specific meteoritic type as source. Instead, the broad extent of biomass burning at the YD onset is more consistent with Earth's collision with a fragmented comet[50] … [resulting in a] violent hurricane of bolides[51] … [that] detonated above and/or collided with land, ice sheets, and oceans across at least four continents in the Northern and Southern Hemispheres.[52]

This scenario, the study argues, explains all the anomalous and synchronous evidence:

> Vaporization of cometary materials, and platinum-group-element–rich target rocks, injected Pt, Ir, Os, and other heavy metals into the stratosphere, accompanied by impact-related nanodiamonds, meltglass, and microspherules.[53]
>
> Airburst fireballs and the ejection of molten rocks … triggered many individual wildfires over wide areas, producing one of the largest concentrations of combustion aerosols deposited in the Greenland ice sheet during the past 120,000–368,000 years. In the higher midlatitudes, atmospheric and oceanic temperatures abruptly decreased from warm interglacial to near-glacial conditions within a few months to a year. Atmospheric and cometary dust, along with AC/soot, triggered

> the rapid onset of an impact winter. This blocking of sunlight led to a die-off of vegetation. Damage to the ozone layer likely led to an increase in ultraviolet-B radiation reaching Earth's surface, damaging flora and fauna. Increases in nitrogen compounds, sulfates, dust, soot, and other toxic chemicals from the impact and widespread wildfires likely led to an increase in acid rain. Increased production of organic matter and burn products from environmental degradation and biomass burning contributed to algal blooms and the subsequent formation of widespread black mats.[54]

In my view, however, by far the most significant finding of the study, fitting perfectly with the scenario of a disintegrating comet, is:

> The impact event destabilized the ice-sheet margins, causing extensive iceberg calving into the Arctic and North Atlantic Oceans. The airburst/impacts collapsed multiple ice dams of proglacial lakes along the ice-sheet margins, producing extensive meltwater flooding into the Arctic and North Atlantic Oceans. Destabilization of the ice sheet also may have triggered extensive subglacial ice-sheet flooding, leaving widespread, flood-related landforms across large parts of Canada. The massive outflow of proglacial lake waters, ice-sheet meltwater, and icebergs into the Arctic and North Atlantic Oceans caused rerouting of oceanic

> thermohaline circulation. Through climatic feedbacks, this, in turn, led to the YD cool episode.[55]

In other words, the long-established and widely accepted evidence linking the onset of the Younger Dryas cold interval to a freshwater flood off the North American ice cap and consequent changes in oceanic circulation is fully accepted by Wolbach. What she and her coauthors add, however, is:

> an additional key element … suggesting that **these climate-changing mechanisms did not occur randomly but rather were triggered by the YDB impact event**. After shutdown of the ocean conveyor, the YD episode persisted … not because of continued airburst/impacts but because, once circulation stopped, feedback loops and inertia within the ocean system maintained the changed state of circulation until it reverted to its previous state.[56]

Indeed so. No one is suggesting that impacts and airbursts continued throughout the entire 1,200 years of the Younger Dryas cold interval. Wolbach and her colleagues leave us in no doubt that

their study is focused on the **beginning** of that interval and specifically on the sudden and mysterious climatic reversal from warm to cold around 12,800 years ago that they attribute to an "impact event." They remind us at several points in their *Journal of Geology* paper, however, that when they speak of an "event" they do not mean to imply a one-off "hurricane of bolides" striking the earth over a single day or two in a single year. What the evidence points to, instead, is a series of such brief but deadly encounters recurring biannually over the full period of 21 years of platinum enrichment identified in the Greenland ice cores.[57]

Many of the individual impactors would have been Tunguska-meteor-size or smaller, but they would have come in vast swarms capable of doing enormous damage, and there is evidence that at least once during these 21 years the biannual "hurricane of bolides" may have contained comet fragments with diameters of a kilometer or more.

This is what was specifically proposed in the very first scientific paper to outline the Younger Dryas Impact Hypothesis. Coauthored by Wendy Wolbach, Richard Firestone, Allen West, and more than twenty others, and published in *Proceedings of the National Academy of Sciences* in October 2007, it raised the possibility that "multiple 2km objects struck the 2km thick Laurentide Ice Sheet."[58]

Subsequently, in September 2013, Yingzhe Wu, Mukul Sharma et al. drew attention to the Gulf of St. Lawrence, Canada, where a submerged impact crater with a diameter of 4 kilometers—the Corossol Crater—has been dated to the Younger Dryas Boundary. Looking at a range of other evidence they concluded there had been multiple impacts in this region "that were closely associated in time."[59]

Separately, Richard Firestone and Allen West reported evidence of an airburst at the Younger Dryas Boundary "near the Great Lakes of an object unusually enriched in titanium and other incompatible

elements. Terrestrial-like ejecta fell close to an impact site near Gainey while projectile-rich ejecta fell farther away. High water content in the ejecta favors an airburst over the Laurentide Ice Sheet north of Gainey."[60]

Now perhaps we are getting closer to an explanation of how a single cause could account both for plunging the earth into a 1,000-year "deep freeze" and for melting sufficient quantities of glacial ice to raise global sea level by up to 4 meters. The immense meltwater pulse that entered the North Atlantic and Arctic Oceans was of course **not** the result of anomalous global warming in an epoch of global cooling but a direct consequence of the "destabilization" of the ice sheet by impacts and airbursts of multiple comet fragments —indeed of a swarm of comets. The thermal energy and blast wave radiated out southward beyond the ice margin all across North America, accompanied by additional local airbursts and impacts that set immense areas of the continent's primeval conifer forests

ablaze,[61] followed by "aerial detonations or ground impacts by numerous relatively small cometary fragments, widely dispersed across several continents."[62]

Wolbach et al. looked into a series of seven episodes of meltwater release that occurred during the Ice Age, of which the Younger Dryas was the last. Named "Heinrich Events" (after Hartmut Heinrich, the marine geologist who first identified them), such episodes are distinguished by massive armadas of icebergs calving off the continental glaciers. These icebergs carry rocks, rubble, and other debris that as the bergs melt are deposited on the ocean floor where geologists can identify them, measure them, and derive estimates of scale and chronology.

It's therefore notable that,

> even though the YD is considered a Heinrich event (designated H0), the anomalously high peak in wildfire activity at the YD onset is completely opposite to that of six previous Heinrich events, which showed low levels of biomass burning. … This is a crucial observation: the presence of high peaks in biomass

> burning at the YD onset is completely contrary to very low levels of biomass burning observed at previous similar climatic transitions, making the YD climate episode highly anomalous and unexplainable by the natural processes that created previous warm-to-cold transitions.[63]

Again, the hypothesis of repeated encounters with the fragments of a disintegrating comet over the 21 years from 12,836 to 12,815 years ago provides a straightforward explanation for this apparently anomalous state of affairs. The Younger Dryas Heinrich Event was not triggered by normal climatic changes but by the impacts of comet fragments on the North American ice cap.

We cannot say exactly when within that 21-year period the impact-related destabilization of the ice cap occurred. It might have been right at the beginning, or right at the end, or somewhere in the middle, and it might have happened more than once. What the data from the Greenland ice cores definitely do indicate, however, as we saw in the previous chapter, is that the ferocity and intensity of the bombardment, with its accompanying rain of platinum, increased

year-on-year for the first 14 years, reached a peak around 12,822 years ago, and then declined over the next 7 years until ceasing as abruptly as it had begun.

It's a good guess, therefore—nothing more scientific than that—that the peak of the comet's interaction with the North American ice cap, and most likely the time when the really big fragments came in, would be around 12,822 years ago.

Allen West and fellow CRG scientist Richard Firestone think as many as eight such kilometer-scale fragments[64] may have struck the ice cap, excavating their craters in the 2-kilometer-deep ice that subsequently melted away, leaving little or no permanent trace on the ground beneath, or leaving craters that are hard to find, for example, four suspiciously deep holes in lakes Superior, Michigan, Huron, and Ontario.[65]

Encounters with *any* fragments of this size, let alone multiple fragments, would already constitute a planetary disaster on an

almost unimaginable scale, wherever they occurred. What we must keep in mind, however, although North America was the epicenter, is that the terrible impacts experienced there were only part of a much wider event that left a trail of devastation across at least three other continents.

WHAT WAS LOST

EXTINCTIONS OF ANIMAL SPECIES TOOK place all around the world at the onset of the Younger Dryas but were particularly fast, savage, and severe in North America, where thirty-five genera of large mammals were wiped out.[66]

Offering evidence from seventy-three sites across twenty-three US states, Wolbach et al. document the synchroneity of these

megafaunal extinctions with the Younger Dryas impact.[67] Three examples—one of which, Murray Springs, was the subject of the last chapter—can stand for the rest:

- BLACKWATER DRAW, NEW MEXICO: At this site, a distinctive black-mat layer, dating to the onset of YD climate change, is in direct contact with peaks in magnetic spherules, Pt, Ir, and biomass-burning proxies, including charcoal, glass-like carbon, fullerenes, and PAHs [polycyclic aromatic hydrocarbons]. These proxies are draped conformably over the last known bones of mammoths killed by Clovis hunters, who then abandoned the site for hundreds of years. The evidence from Blackwater Draw suggests that the YDB impact event is coeval with the megafaunal extinctions and a human population decline, along with a peak in biomass burning and with YD climate change.
- MURRAY SPRINGS, ARIZONA: Peaks in magnetic spherules,

meltglass, nanodiamonds, Pt, and Ir [are located] immediately beneath a distinctive black mat that dates to the YD onset. Peaks in YDB biomass-burning proxies include charcoal, carbon spherules, glass-like carbon, AC/soot, fullerenes, and PAHs. At this site, several mammoths were killed by Clovis hunters, after which the black mat formed atop the bones and humans abandoned the site for ~1000 y. Thus, the evidence supports the synchroneity of the YDB impact event, increased biomass burning, YD climate change, megafaunal extinctions, and a major human population decline.

- SHERIDEN CAVE, OHIO: There are YDB peaks in magnetic spherules, meltglass, nanodiamonds, Pt, and Ir. A charcoal-rich black mat dates to the YD onset and contains peak abundances of charcoal, AC/soot, carbon spherules, and nanodiamonds that are closely associated with the last known Clovis artifacts in the cave. The black-mat layer is in

> direct contact with the wildfire-charred bones of two mega-mammals, the flat-headed peccary (*Platygonus compressus*) and the giant beaver (*Castoroidies ohioensis*), that are the last known examples anywhere in the world of those extinct species.[68]

Horses, camels, mammoths, mastodons, giant ground sloths, saber-tooth tigers, short-faced bears, and dire wolves are among the other iconic creatures of the Ice Age that disappear from the record at this time. "This represents a major extinction," James Kennett and Allen West remind us in a paper published in 2018 by the Florida Museum of Natural History:

> Not only because so many large and well-known animals were lost, but also because many of the extinct taxa had resided for millions of years in North America. Horse evolution had continued without a break in North America since the Eocene (~55 million years ago) with the only known absence beginning at around ~12,800 years ago until their return from Europe ~500 years ago. Clearly such extinctions are highly anomalous.[69]

All in all, Kennett and West conclude:

> Sufficient geologic and chronologic data now exists to support the hypothesis that megafaunal extinctions were caused by continental-scale ecosystem disruption, resulting from the cosmic impact at the onset of the YD. … The megafaunal extinction would not have occurred at or close to the YD onset without the YDB cosmic impact at ~12,800 years ago. Instead many of the now extinct animals would have survived much longer, even to modern times.[70]

The archaeological evidence is scarce, perhaps precisely because so much was swept away and covered over by the Younger Dryas earth changes. Nonetheless, it's clear that along with the disruption of animal life in North America, the cataclysm also had severe consequences for human beings.

Top of the list, of course, is the abrupt, mysterious disappearance of the entire successful, technically accomplished, and geographically widespread Clovis culture right around 12,800 years ago.[71] Then, in the centuries following, if we take the case of the southeast as an example, we see a sudden anomalous 50 percent

drop in the numbers of projectile points being made.[72] A similar trend is seen in many other parts of North America at the same time,[73] and in California there is evidence of a cessation of human activity between roughly 12,800 years ago and 12,200 years ago.[74]

A study of almost 700 cultural carbon-14 dates from across North America by David Anderson, Albert Goodyear, and others shows "a rapid decline" in human activities "at the beginning of the YD that reached its lowest level early in the YD … a 200-year-long 80 percent decline in the number of cultural carbon-14 dates, implying a major decrease in population … followed by a gradual rebound for ~900 years."[75]

We do not possess a time machine. We cannot place ourselves physically in North America 12,800 years ago. But all the evidence suggests the continent passed through a tremendous, earthshaking cataclysm, and we know that at least one ancestral North American

culture—Clovis—became every bit as extinct 12,800 years ago as the mammoths and the dire wolves.

What else went the way of Clovis in that time of burning darkness and icy floods?

27

CAPE FEAR

IMAGINE A WORLD WHERE GOOD, honest, hardworking, inquisitive scientists live in fear of ruining their careers, perhaps even of losing their jobs and incomes, if they investigate certain subjects that have been judged by a dominant elite to be "taboo."

Is such a climate of fear-based conformity likely to result in *good* science that breaks new ground? Or is it likely to keep science stuck

in a rut, endlessly refining and reconfirming established models while rejecting any evidence that suggests those models might be wrong or in need of fundamental revision?

These are not rhetorical questions, because it turns out that this "imaginary" world is the very world we live in today. Science in the twenty-first century does NOT encourage scientists to take risks in their pursuit of "the facts"—particularly when those facts call into question long-established notions about the human past.

The controversy surrounding the Younger Dryas Impact Hypothesis is an example. Since it was first proposed formally in 2007 the scientists behind it have endured an unrelenting barrage of deeply unpleasant and self-serving attacks from a small but influential group of other scientists whose work and opinions are challenged by the notion of a comet-induced global cataclysm 12,800 years ago.

In my 2015 book, *Magicians of the Gods,* I give a detailed account of the major studies supporting the YDIH coupled with an

equally detailed evaluation of the attacks made on the hypothesis up to that point.[1] I will not repeat the same information here since it is on record and can easily be consulted. My conclusion at the time was that the attacks were generally unjustified, misleading, and propagandistic, and that the YDIH constitutes the best possible explanation for the earthshaking events of 12,800 years ago. Now, as I write these words in 2018, my desk is covered with papers published during the past 3 years presenting a great mass of new evidence that very strongly reinforces, extends, and develops the original Younger Dryas Impact Hypothesis. The biomass-burning and platinum studies mentioned in chapter 26 are the jewels in the crown, which is why I focused on them in the limited space available here. The other studies are referenced in the notes.[2]

I'm more confident than ever that the Comet Research Group scientists are on the right track, and I hold them in the highest regard for speaking truth to power and being willing to stick their

necks out. I was therefore excited when George Howard, not a scientist but an environmental restoration specialist and a supporter of CRG who edits the online magazine *Cosmic Tusk,* contacted me to suggest a meet-up with some of the leading members of the group during my fall 2017 research trip across the United States. On the same trip I met Al Goodyear and Allen West, and now here was an opportunity to exchange views with some of their other colleagues.

The meet-up was scheduled for Wilmington, North Carolina, on November 13 and 14, 2017. Chris Moore and Malcolm LeCompte, coauthors of both the platinum and the biomass-burning papers, would join us from the University of South Carolina, together with their colleague Mark Demitroff of Stockton University in New Jersey, coauthor of several earlier papers providing solid support for the YDIH.[3]

I invited my friend and colleague Randall Carlson to drive in from Atlanta to be part of the discussions. His work connecting

impacts on the North American ice cap 12,800 years ago to the immense flood damage in the Channeled Scablands of eastern Washington State is discussed extensively in *Magicians of the Gods*.[4]

PHOTO: FAIRCHILD AERIAL SURVEYS, 1930.

And I was pleased to learn that George Howard had also asked Antonio Zamora to be there. An independent researcher, a chemist, and a computer scientist,[5] Zamora is not a member of CRG and has nothing whatsoever to do with the group, but I had recently read an intriguing paper he had published earlier in 2017 in the peer-reviewed journal *Geomorphology* tracing the origins of the Carolina Bays to the Younger Dryas impacts.[6]

Around 500,000 peculiar elliptical ponds, depressions, and lakes with raised rims pock much of the US Atlantic seaboard from Delaware to Florida. Since it was in the Carolinas that scientists first noticed them in the late nineteenth century, they became known as Carolina Bays and from quite early on there were theories that they had been created by an immense swarm of meteorites striking the earth.[7] Several CRG members have explored the possibility that the Younger Dryas impacts might be connected to the mystery,[8] but the

majority of the group have since distanced themselves from such notions. Dating studies indicate that the Bays were not all created simultaneously, as the YDIH would require, but are of widely varying ages separated by tens of thousands of years.[9]

Antonio Zamora's 2017 paper in *Geomorphology* put the cat among the pigeons by raising an interesting scenario whereby the bays could, after all, have resulted from YD impacts. I had naively assumed that Malcolm LeCompte and Mark Demitroff (who were then both CRG members but have since resigned) would welcome this new research.

I couldn't have been more wrong.

GLACIER ICE IMPACT HYPOTHESIS

LET'S START BY TAKING A proper look at the controversial proposals behind the "Glacier Ice Impact Hypothesis" that Antonio Zamora puts on the table in his *Geomorphology* paper.[10]

He begins by recognizing earlier evidence that discounts the Carolina Bays as impact features but then draws our attention to an intriguing mystery—the so-called Nebraska Rainwater Basins. Other than being oriented from northeast to southwest instead of from northwest to southeast (an important piece of evidence in itself), these curious elliptical geological formations more than 2,000 kilometers west of the Carolinas greatly resemble the bays:

> The Nebraska Rainwater Basins are not as well known as the Carolina Bays but their elliptical shape is so similar that it is necessary to consider that they formed contemporaneously with the Carolina Bays by the same mechanisms. … The objective of the Glacier Ice Impact Hypothesis is to examine the characteristics of the Carolina Bays and Nebraska Rainwater Basins to determine whether these geomorphological features could have been created by secondary impacts from terrestrial material, such as glacier ice, ejected by an extraterrestrial impact.[11]

Zamora is the first to acknowledge that his "Glacier Ice Impact Hypothesis" depends heavily on prior work done by two other investigators, Michael E. Davias[12] and Thomas H. S. Harris,[13] the former a specialist in "geospatial big data, data mining, computer graphics and algorithms" and the latter a dynamics and flight science expert at Lockheed Martin Corporation.

Michael Davias accompanied Zamora to Wilmington and shared with us there the evidence that he and Harris had first presented in

May 2015 at the 49th Annual Meeting of the Geological Society of America.[14]

Published as a conference paper, their proposal is that a cosmic impact during the Ice Age in Michigan's Saginaw Bay (which was then solid land covered by deep glacial ice) would have produced ejecta and secondary impacts in a "butterfly-wing" pattern precisely over the Nebraska Rainwater Basins, where they would be oriented northeast to southwest, and the Carolina Bays, where they would be oriented northwest to southeast.[15]

IMAGE: MICHAEL DAVIAS, CINTOS.ORG.

While he has no quarrel with Allen West, Richard Firestone, and other CRG scientists who suspect that there may have been a total of eight impacts on the North American ice cap,[16] Zamora focuses

his investigation on the Michigan event proposed by Davias and Harris to have been specifically responsible for the simultaneous creation both of the Carolina Bays and of the Nebraska Rainwater Basins.

Saginaw Bay, the suggested impact site, is "commonly attributed to erosion by the Saginaw glacial lobe penetrating through the Mississippian and Pennsylvanian Cuestas," Davias and Harris concede, but propose instead that it is "the footprint of an oblique impact arriving at an azimuth of 222°. … Given 1 kilometer of ice over this footprint, 45,000 cubic kilometres of water would have been instantly ionized or vaporized."[17]

Meanwhile, the shock effects of the impact, although somewhat mitigated by the ice cover, would have bulldozed into the ancient promontory of bedrock then beneath the ice at the center of the Michigan Basin, plowed out the gap in the "mitten" that we now call Saginaw Bay, and sent up a mass of ejecta consisting of

pulverized Michigan sandstone (from the bedrock) and water (from the vaporized ice).[18] Blasted into suborbital space, this ejecta would then have reentered the atmosphere and fallen back to earth—with the end result being a sort of slurry that splattered down across much of the continental United States south of the ice sheet but that only left impressions, such as the Carolina Bays and the Nebraska Rainwater Basins, on suitably soft and "unconsolidated" ground.[19]

LEFT: Saginaw Bay is an enigmatic, now water-filled, depression in Michigan's distinctive "Mitten," separating the "hand" of the mitten, to the left, from its "thumb," to the right. RIGHT: Instead of erosion by glacial ice, Davias and Harris

propose that Saginaw Bay is the footprint of a massive impact of a cosmic object that struck ancient Michigan at an oblique angle. IMAGE: MICHAEL DAVIAS, CINTOS.ORG.

When Davias and Harris gave their paper at the Geological Society of America in 2015 they tentatively suggested an age of 786,000 years for the formation of Saginaw Bay.[20] While drawing on their excellent ballistics and triangulation work, Zamora's presentation of his own Glacial Ice Impact Hypothesis in his 2017 paper in *Geomorphology* rejects so great an age and offers a compelling case that Saginaw Bay was scooped out just 12,800 years ago by one of the fragments of the Younger Dryas comet.[21] On technical grounds to do with "the thermodynamics of water in a liquid state" he also rejects Davias and Harris's notion that the ejecta would have consisted of a "foam of sand and water."[22] According to Zamora's calculations, massive quantities of solid glacial ice would instead have been blasted aloft:

> Experiments of high-speed impacts on ice sheets using NASA's Ames Vertical Gun demonstrate that ice shatters when a projectile hits it. Pieces of ice are ejected, radiating from the impact site in ballistic trajectories.[23]

"The Laurentide Ice Sheet," writes Zamora,

> covered the convergence point determined by Davias and Harris in Saginaw Bay with a thickness of approximately 1500 to 2000 m of ice during the Pleistocene. … Ballistic equations, scaling laws relating crater size to impact energy, geometrical analysis and statistical analysis provide a mathematical foundation for explaining the shape of the bays and their origin from secondary impacts of glacier ice ejected from the Laurentide Ice Sheet that covered Michigan.[24]

It's important to be clear on this.

Just as Zamora does not support Davias and Harris's idea that the ejecta consisted of pulverized sandstone and water, so, too, he adamantly does NOT suggest that hundreds of thousands of fragments of the original Younger Dryas comet bombarded North America's Atlantic seaboard, creating the phenomenon of the Carolina Bays. Neither is he suggesting that the Nebraska Rainwater

Basins were the result of direct hits by comet fragments. Instead he accepts the CRG's long-established position that the epicenter of the impacts was the North American ice cap.

Ballistic trajectories of glacier ice ejecta after a cosmic impact on the North American ice cap. IMAGE: ANTONIO ZAMORA.

In his view all the damage in the Carolinas and Nebraska was done by the stupendous mass of icy ejecta, varying in size from basketballs to “ice boulders” tens or even hundreds of meters across, that fell back to earth following the Saginaw Bay impact.

AN APOCALYPTIC VISION

I REFER THE READER TO Zamora’s paper itself for the detailed evidence behind his findings. In summary, however, having first reviewed and rejected all other explanations for the formation of the bays and basins, and having given special consideration to the longer-term evolution of impact craters on viscous surfaces, Zamora concludes as follows:

> The radial orientation of the Carolina Bays and Nebraska Rainwater Basins toward a convergence point in Michigan, and the elliptical shapes of the bays with specific width-to-length ratios can be better explained by impact mechanisms than by terrestrial wind and water processes.
>
> The Glacier Ice Impact Hypothesis … has been supplemented with an experimental model demonstrating that oblique impacts on viscous surfaces can reproducibly create inclined conical cavities that are remodeled into shallow elliptical depressions by viscous relaxation. This makes it possible to model the Carolina Bays and Nebraska Rainwater Basins as conic sections whose width-to-length ratio can be explained by the angle of impact.[25]

Zamora addresses the issue of the great diversity of dates for the Carolina Bays obtained by Optically Stimulated Luminescence (OSL), noting that this has hitherto been the most significant barrier to acceptance of any form of impact hypothesis with reference to the bays. As he rightly points out, however, the fundamental assumption behind the use of OSL has been that the subsurface of the Carolina Bays was exposed to light at the time of bay formation. His experimental model refutes this by demonstrating that impacts

on viscous surfaces are plastic deformations that do not expose the subsurface to light:

The width-to-length ratios of the Carolina Bays (right) average 0.58 and are very consistent for bays of different sizes. The bays in Nebraska (left) are indistinguishable from the bays on the East Coast based on their width-to-length ratios. IMAGE: ANTONIO ZAMORA; LIDAR FROM CINTOS.ORG.

Therefore, OSL can only determine the date of the terrain, but not the date of formation of the bays. If all the Carolina Bays and Nebraska Rainwater Basins formed contemporaneously, it will be necessary to find a different way of dating them.

The Glacier Ice Impact Hypothesis explains all the features of the Carolina Bays and Nebraska Rainwater Basins, including their elliptical shape, radial orientation, raised rims, undisturbed stratigraphy, absence of shock metamorphism, overlapping bays, and the occurrence of bays only in unconsolidated ground.[26]

Finally, and chillingly, Zamora's paper in *Geomorphology* notes:

The great surface density of the bays indicates that they were created by a catastrophic saturation bombing with impacts of 13 KT to 3 MT that would have caused a mass extinction in an area with a radius of 1500 km from the extraterrestrial impact in Michigan. This paper has considered mainly the ice boulders ejected by an extraterrestrial impact on the Laurentide Ice Sheet during the Pleistocene, but the impact would also have ejected water and produced steam. Taking into consideration the thermodynamic properties of water, any liquid water ejected above the atmosphere would have transformed into a fog of ice crystals that would have blocked the light of the sun. Thus, the time of formation of the Carolina Bays and Nebraska Rainwater Basins must coincide with an extinction event in the eastern half of the United States and the onset of a period of global

cooling. This combination of conditions is best met by the disappearance of the North American megafauna, the end of the Clovis culture and the onset of the Younger Dryas cooling event at 12,800 cal. BP. The report of a platinum anomaly typical of extraterrestrial impacts at the Younger Dryas Boundary supports this scenario.[27]

IMAGE: ANTONIO ZAMORA.

In his book *Killer Comet,* Zamora elaborates on the extent and true horror of the Younger Dryas cataclysm. He considers how the effects of the primary impact over Michigan would have been massively compounded across North America by the secondary impacts of glacier ice boulders. It's instructive to spend a few moments with the disturbing picture he paints:

> All living things within 100 kilometers of the [Michigan] impact died instantly. They were either burned by the heat blast or killed by the shock wave. On the East Coast, 1000 kilometers from the impact zone, the blinding flash on the horizon was followed by a sky that darkened ominously as it filled with the giant ice boulders ejected by the impact. Three minutes after the flash, the dark sky advanced relentlessly, and the ground shook as the first seismic waves from the extraterrestrial impact site arrived traveling at 5 km/sec.
>
> By this time, all animals and humans were aware that something terrible was happening. The sky continued to darken, and then filled with bright streaks as the ice boulders in suborbital flights re-entered the atmosphere at speeds of 3 to 4 km/sec. … [As] the giant ice boulders started falling … the thumping of the impacts sent shock waves through the ground that traveled at 5 to 8 km/sec. … The shaking ground started to liquefy, trapping everyone. The ground had turned to quicksand, making it impossible to walk or run …

At the peak of intensity, a hail of glacier ice chunks, many as big as a baseball stadium, left steam trails in the sky as they re-entered the atmosphere at supersonic speeds and crashed into the liquefied ground accompanied by the thunder of sonic booms.

The impacts created oblique, muddy, conical craters … with diameters of one to two kilometres … that swallowed whole villages and buried all the vegetation. The vibration of the ground quickly reduced the depth of the conical craters and turned them into [the] shallow depressions [that we know today as the Carolina Bays]. … The comet itself had not killed the megafauna. The saturation bombardment by the ice boulders that were ejected when the comet struck the Laurentide ice sheet caused the extinction event. … The landscape of the Eastern Seaboard had been transformed into a barren wasteland full of huge, shallow mud holes. …

The Carolina Bays have remained as evidence of the glacier ice impacts on the soft, sandy soil of the East Coast.

No such evidence remains of the ice chunks that must have fallen on harder ground, but the ice impacts in the central and Midwestern states were equally merciless. When the colossal chunks of glacier ice hit the hard terrain, they shattered and sent out ice fragments at high speed. Any creature or vegetation in the path of the fast-moving ice shards was destroyed.

When the ice finally came to rest, the ejecta blanket had covered one-half of the contiguous United States with a thick layer of crushed ice … that increased the albedo of the Earth and reflected a significant portion of the dimmer light from the

> Sun back into space. The combined effect of the increased ice cover and the orbiting ice crystals would make the land cold and inhospitable for many years. …
>
> The buried vegetation would freeze or remain dormant under the ice. Grazing animals that had survived the glacier ice bombardment had no access to their normal food sources and would soon starve. Predators that were still alive would also soon die without their herbivorous prey. …
>
> Eventually, North America would be repopulated by new land animals and new humans, but the megafauna, and the ingenious Clovis people that had crafted such fine stone projectiles were gone forever.[28]

It's an apocalyptic vision to be sure, and we must remind ourselves that it deals with the widespread consequences of just **one** of the major impacts on the North American ice cap.

ATTACK AND DESTROY

AS WE'VE SEEN, ALLEN WEST and Richard Firestone propose that there may have been as many as **eight** significant impacts on the North American ice cap during the 21 years of the peak Younger Dryas bombardments.[29] Together with the other scientists from the Comet Research Group, they have focused, with great success, on gathering the evidence for these bombardments in the form of impact proxies scattered across 50 million square kilometers of the earth's surface.

What none of the group has yet done, however, is investigate the full implications **for North America itself** of the hypothesized impacts on the ice cap.

Why Antonio Zamora matters, and why his work deserves serious evaluation, is that he is the first to undertake such an exercise—albeit focused on only one out of the possible eight impacts. In addition, he offers testable hypotheses and opens up new vistas for inquiry and discussion. I was therefore expecting to spend 2

constructive and thought-provoking days at Wilmington, sharing ideas with big thinkers and giving proper consideration for the first time to the implications of the icy fallout across North America that Zamora rightly calculates would have been the outcome of impacts on the ice cap.

The opposite happened. It was clear from the outset that the only reason Malcolm LeCompte and Mark Demitroff were with us at Wilmington at all was to attack and destroy the Glacier Ice Impact Hypothesis at birth. There was no interest whatsoever in a discussion of the wider implications of Zamora's thinking. Their entire focus was to demonstrate that he was completely wrong to link the Carolina Bays to any kind of cosmic impacts, and to the Younger Dryas impacts in particular.

At one level this was all good. For science to progress it is important that all ideas be tested in the fire of peer review. And while Zamora's hypothesis had already been through that fire once

in order to have appeared in *Geomorphology* at all, here were other scientists who disagreed.

Excellent! Bring it on, guys!

I was at Wilmington to learn, and such constructive disagreements would surely only help me gain a better understanding of what no scientist today can yet claim to understand fully—namely, the cause and true extent of the cataclysmic events that shook the earth at the onset of the Younger Dryas 12,800 years ago.

Because I'd gone into the meeting with the mind-set that we were all colleagues here trying to figure out a solution to one of the greatest mysteries of the past, I didn't initially expect the level of antagonism, hostility, scorn, and downright unpleasantness with which Zamora's impact hypothesis was received by LeCompte and Demitroff—who are themselves proponents of an impact hypothesis at the receiving end of a great deal of antagonism, hostility, scorn, and unpleasantness.

But that was naivete on my part. Over the following months I was to get a much clearer understanding of what was really going on.

“EXTREMELY REGRETTABLE …”

AFTER THE WILMINGTON MEETING, SANTHA and I flew to Little Rock, Arkansas, where I had a presentation to give at a conference before we returned to the United Kingdom. During my talk, which was filmed, I showed a photograph of myself with Chris Moore on a field trip to a Carolina Bay—Johns Bay—where platinum had been found. I outlined the platinum research and other YDIH research in my presentation and then moved on to a discussion of Antonio Zamora’s Glacier Ice Hypothesis. I did not connect his work to the work of the Comet Research Group and I did not suggest he was a member of the Comet Research Group or had anything to do with it.

The video was released on YouTube on January 26, 2018.[30] A little over a month later I found myself embroiled in heated email correspondence with Malcolm LeCompte and Mark Demitroff.

The first salvo was fired on March 9, 2018, with an email from LeCompte to Zamora, cc'd to me, titled "Paper by Antonio Zamora: *Geomorphology* 282 (2017) 209–216."

That email accused me of providing "extraordinary coverage" of Zamora's "speculative theory" in my Little Rock presentation and of giving it exposure "in juxtaposition" with my "discussion of the YDB Impact Hypothesis." Describing my alleged "association" of Zamora's work with the work of the Comet Research Group as "extremely regrettable," LeCompte added a postscript specifically addressed to me:

> Graham, I find Antonio's work to be unsupportable, not because impact proxies aren't found in the bay rims, as you apparently have been told and are now saying, but for the variety of reasons listed in the attached letter, first and foremost of

which: because there was no ice in Saginaw Bay or anywhere within 200 km of where Antonio believes his impact occurred.

My bad about the impact proxies!

I had indeed incorrectly stated in that hastily-put-together segment of my presentation that none were found in the Carolina Bay rims and that this was part of the long-established dismissal of any impact connection to the bays. I got that wrong. Platinum is an impact proxy, as I knew very well, and Chris Moore had found it in the Carolina Bays. Multiple other proxies, including "magnetic grains and microspherules, carbon spherules and glass-like carbon," have also been found, as a 2010 study reports, "throughout the rims of 16 Carolina Bays."[31]

What I don't see, however, is how this helps LeCompte's claim that impacts did not make the bays. On the contrary, it seems to me that the presence of the proxies there only strengthens the case that

the bays are impact-related. I shall certainly speak of this in future presentations.

Much more significant is the second statement in the postscript, to the effect that 12,800 years ago there was no ice in Saginaw Bay or anywhere within 200 kilometers of the proposed impact site. LeCompte elaborates on this point in the longer letter attached to his mail, formally addressed to the Editor of *Geomorphology,* where he refers to "a large body of literature" providing evidence that Zamora's proposed point of impact had been deglaciated for more than 1,000 years before the onset of the Younger Dryas and that not only Saginaw Bay but all of Lake Huron had been ice-free when the Younger Dryas began.

This seemed to be a fatal criticism of the Glacier Ice Impact Theory—but Zamora gave an immediate response to LeCompte:

> In your note to the editor of *Geomorphology* you say "Dyke (2004), and Larson and Schaetzl (2001), provide graphical depictions of the retreat of the Laurentide Ice Sheet with sufficiently high spatial and temporal resolution to make clear that

not only Saginaw Bay, but all of Lake Huron was ice-free at the time of the Younger Dryas onset."

Let us say that no evidence can be found for glaciers at the point where the axial projections of the bays converge. Geologists usually determine the extent of glacier coverage by examining glacial striations on the terrain and by identifying deposits of erratic boulders. Would you expect the site of an extraterrestrial impact to retain these markers? Wouldn't the impact of a 3 km asteroid obliterate striations and erratic boulders? The subsequent melting of the glaciers would then flood the impact point and wash away the last traces of the crater. The Carolina Bays do exist, and because they are conic sections, it is very likely that they originated as conical impact cavities. … The Nebraska Rainwater Basins are now intimately related to the Carolina Bays through their geometry. Any modern publication about the Carolina Bays that ignores the Nebraska basins is incomplete and inadequate. … In my paper, I mentioned that an ET impact on hard ground would have sent rocky ejecta only one third as far as an impact on ice. Moreover, an impact on land, rather than on ice, would have left a typical ET crater. My bet is that there was an ice sheet wherever the meteorite hit, otherwise someone would already have found the crater.

Frankly, I thought that Zamora had returned Malcolm's hardball quite well, and soon afterward he followed through by sending me a paper I hadn't come across before, published in *Quaternary Science*

Reviews in 1986, titled "Correlation of Glacial Deposits of the Huron, Lake Michigan and Green Bay Lobes in Michigan and Wisconsin."[32] The paper, by Donald Eschman and David Mickelson, concludes that following an earlier retreat there was a re-advance of the ice sheet during the so-called Port Huron stade around 13,000 years ago and that at this time both Saginaw Bay and Lake Huron were indeed covered with ice.[33]

Once again, therefore, as so often in science, statements touted as facts turn out to be opinions contradicted by other opinions that are also touted as facts. The truth of the matter is that there remains great uncertainty and confusion around exactly what happened in North America—and across the whole world—at the onset of the Younger Dryas. While that uncertainty persists, alleged "certainties" of almost any kind are inappropriate and it is wise to keep an open mind to all possibilities.

Beyond the issue of the absence (or presence?) of an ice sheet at the proposed point of impact, LeCompte's dismissal of the Glacier Ice Impact Theory is of course supported by other evidence and reasoning, but my purpose here is not to get into these minutiae. I concede the possibility that LeCompte may be right while remaining open to the possibility that he may be wrong. Either way, the real importance of Zamora's contribution has been to raise new questions around the matter of the Younger Dryas impacts. Only time and further research will tell whether his theory really solves the mystery of the Carolina Bays and the Nebraska Rainwater Basins, but he has undoubtedly done scholarship a service by exploring the ballistics and dynamics of explosive cosmic impacts on the North American ice cap, and by looking into the potentially disastrous consequences in terms of the subsequent storm of icy ejecta.

“YOU WERE REPEATEDLY WARNED …”

THE STORM OF EJECTA FROM the Wilmington meeting was far from over. My exchange of emails with Malcolm LeCompte continued, Mark Demitroff joined the conversation as well, and both of them were clearly very annoyed with me! Chris Moore was cc’d but did not comment. What became clear from all this was that LeCompte’s objection to the video was not that I had misrepresented the Comet Research Group in any way, or that I had misrepresented Chris Moore’s recent research, but simply that right after what I had to say about the Comet Research Group, ending up with the visit I’d just made with Chris Moore to Johns Bay, I had gone on to talk about Zamora’s Glacier Ice Impact Theory.

On March 21, 2018, therefore, because I sensed there was something going on here that was worthy of reporting, and wanted no one involved to be in any doubt that I intended to report it, I

began a new thread of emails under the subject line FOR THE RECORD:

> I speak about the work of many scientists [in the video]. The fact that what I have to say about the work of one scientist follows what I have to say about the work of another scientist does not mean I am connecting the two—unless I specifically do so, which I don't do here. I am therefore really perplexed as to why this video has caused offence.

I have no hesitation in sharing the bulk of LeCompte's reply because of the light it sheds on a growing problem within science in general—the problem of enforced conformity.

The passages that I have placed in bold type were not in bold in the original but I choose to emphasize them in the extracts below because of the insights they provide into the ways this problem can manifest and the states of mind it engenders.

> MALCOLM LECOMPTE TO GRAHAM HANCOCK, MARCH 23, 2018:
>
> You were … repeatedly warned that any association of Carolina Bay genesis linked to a discussion of the YDB impact event would likely be harmful to the

progress of the YDIH research and to the reputations of its investigators.

You may not be aware of the time and energy spent to largely neutralize the distracting effects and hostility created by the early Carolina Bay related assertions made in the non-peer reviewed book: *Cycle of Cosmic Catastrophes.* [This is a book coauthored by Richard Firestone and Allen West, the original formulators of the YDIH, and published in 2006, a year before the first formal paper appeared in *PNAS.*] The association of bay impact genesis with the YDIH created an early perception in some scientific communities that the YDB impact research was both unprofessional and bordering on pseudoscientific. Those original, naive Bay genesis claims still haunt the research and contribute to hobbling its acceptance as a legitimate research activity for a new generation of scientists. **We have few, relatively younger and seasoned tigers like Chris Moore willing to disregard the real and perceived risks to their careers and reputations, and even fewer younger, newly-trained scientists following in his footsteps to adopt what is still considered a somewhat controversial line of research. His participation in this research is noticed and monitored by his many colleagues.**

Nevertheless, only a week after our meeting, where Mark [Demitroff], with Chris' endorsement, had presented an evidence-based alternative to Zamora's proposed Bay impact genesis, you gave a video presentation that juxtaposed YDIH research with Zamora's very controversial claim of Bay impact genesis. …

Less than a month [later] … Chris Moore, probably the most important current and hopefully future investigator of the YDB event, received a call from a colleague who had seen your You Tube video and posted it on his anti-

> **pseudoscience website that is apparently visited by some of Chris' peers.** Your presentation juxtaposing YDIH research with Zamora's claims certainly endowed them with some unwarranted credibility but also contaminated the YDIH by the association. **Chris achieved some unwanted negative-celebrity among his colleagues. He was challenged about the wisdom of hosting you and suffered the indignity of wondering about the effect the … video might have on his career and reputation.**
>
> **It is obvious to me that distribution of your video presentation has put Chris's reputation, career and participation in the YDIH research in potential jeopardy …** the resulting harm … has yet to be completely comprehended. Fortunately Chris made the brave decision to continue the YDIH research, despite that video's presence on you tube for the foreseeable future.

Wow! All this stress, drama, and defensiveness over a video of a presentation I gave at a conference! I have to confess, I was taken aback by the vehemence of LeCompte's reply and the suggestion that I might have harmed the career of that very likable and diligent scientist Chris Moore.

But at a deeper level what this whole exchange revealed to me was something disturbing about the way science works. I hadn't

quite grasped the role of **fear** before. But I could see it in action everywhere here: fear of being "noticed and monitored by colleagues," fear of unwanted negative celebrity, fear of indignity, fear of loss of reputation, fear of loss of career—and not for committing some terrible crime but simply for exploring unorthodox possibilities and undertaking "somewhat controversial research" into what everyone agrees were extraordinary events 12,800 years ago.

Worse still, this pervasive state of fear has somehow ingrained itself so deeply into the fabric of science that those who have embraced unorthodox possibilities themselves are often among the least willing to consider unorthodox possibilities embraced by others—lest by doing so they "contaminate" their own preferred unorthdoxy.

How will it ever be possible to discover the truth about the past when so much fear gets in the way?

PART VIII

SURVIVE!

The Mystery of the Invisible Man

28

HUNTER-GATHERERS AND THE LOST CIVILIZATION

UTTERLY HORRIFIC, TROUBLING, AND CONFUSING events took place at the onset of the Younger Dryas, and more than a decade under the scientific spotlight has repeatedly confirmed that the best explanation of all the evidence is that the earth underwent a series of

interactions with the remnants of the disintegrating giant comet that spawned the Taurid meteor stream. These encounters are thought to have reached a peak 12,822 years ago but were sustained over a span of 21 years beginning 12,836 years ago and ending 12,815 years ago. There were other episodes of bombardment around the time of the Younger Dryas onset, but this was the worst.

Perhaps it was not a comet after all. Perhaps in the next decade some other even more compelling theory with even more evidence to back it up will be advanced—or perhaps some decisive new discovery will be made that vindicates one of the existing nonimpact theories. Until that time, however, the Younger Dryas Impact Hypothesis continues to make complete sense to me and to a great many scientists, and its 21-year window of maximum devastation, peaking around 12,822 years ago, deserves special attention.

Archaeological evidence from this period is scarce in North America, but what there is suggests that widely scattered

populations of Native American hunter-gatherers were badly mauled at the Younger Dryas onset. Amid indications of sudden population collapses, many previously inhabited areas were abandoned entirely, as we saw in chapter 26, with no return for hundreds of years. Clovis ceased to exist—an entire vibrant, widely distributed culture obliterated—but other humans survived and bounced back, something our species has a talent for. I'd stayed in touch with Al Goodyear since Topper and he confirmed that in his view, while there was evidence for a "possible demographic crash/depression," there had been no "extermination post Clovis."[1]

We shouldn't be surprised.

Hunter-gatherers are hard to exterminate!

They roll with the punches and they bounce back.

In the technology-dominated twenty-first century, the majority of humans live in cities fed by intensive agriculture, but in the world today there still exists a tiny minority of hunter-gatherers. Many of

the urbanites enjoy great wealth and abundance while the hunter-gatherers possess very little. If a cataclysm on the scale of the Younger Dryas impacts were to strike in our lifetimes, however, I predict it would be these few remaining groups of hunter-gatherers —in the Kalahari desert, for example, or in the Amazon rainforest— who would have the best chance of surviving the devastating consequences, and it would be their descendants, not ours, who would carry the human story forward. Unlike most city dwellers who have no idea how to live off the land, hunter-gatherers are masters of survival, they know how to deal with environmental setbacks, and no matter how tough things get they can usually improvise a workaround. By contrast the masses in the cities, suddenly discovering that technology can't fix everything, would be psychologically traumatized and largely helpless.

Almost the opposite of our twenty-first-century world, the world as I imagine it 12,800 years ago is one in which the vast majority of humans are hunter-gatherers while a minority have taken another,

more complex, path. The hunter-gatherers form populations recognized by modern archaeologists, and their stone tools, weapons, and ornaments speak of an effective but fairly rudimentary technology. The minority who have taken a different path are not recognized and I contend that this is primarily because the destruction of their civilization was near-total, and because the few, faint, tantalizing clues to their technology that have reached us across the ages hint at a level of science far in advance of anything believed by scholars to have been possible at such a remote period of prehistory.

It is for this reason that ancient maps incorporating scientifically accurate latitudes and longitudes and depicting the world as it looked during the lowered sea levels of the last Ice Age have been dismissed by the mainstream as mere curiosities with no bearing on our understanding of the origins of civilization.

I looked into the mystery of these maps in *Fingerprints of the Gods* (1995) and again in *Underworld* in 2002, and refer the reader

to appendix 2 for details. Contrary to the mainstream, my broad conclusion is that an advanced global seafaring civilization existed during the Ice Age, that it mapped the earth as it looked then with stunning accuracy, and that it had solved the problem of longitude, which our own civilization failed to do until the invention of Harrison's marine chronometer in the late eighteenth century. As masters of celestial navigation, as explorers, as geographers, and as cartographers, therefore, this lost civilization of 12,800 years ago was not outstripped by Western science until less than 300 years ago at the peak of the Age of Discovery.

Suppose there was an earlier "Age of Discovery" in the centuries before the onset of the Younger Dryas, when the fleets of the lost civilization set out to open interaction with tribes of hunter-gatherers all around the world and either passed themselves off as, or were mistaken for, "gods." I'm just offering food for thought here, a pure speculation, but I submit this might have followed a period of severely restricted involvement with other peoples—such

as the Ming dynasty imposed on China in the late fourteenth century—and I suggest that the renewed outreach may have been motivated by foreknowledge of the impending Younger Dryas cataclysm. This lost civilization, after all, appears to have evolved a sophisticated religion deploying powerful symbolism that emphasized the connection between heaven and earth and that envisaged an afterlife journey through specific well-charted regions of the celestial vault. Its astronomer-priests are therefore most unlikely to have missed the signs in the sky as our planet began its long journey toward intersection with a particularly lumpy and debris-filled filament of the Taurid meteor stream where the menacing serpentlike tails of the outgassing larger fragments might have served as visible omens of the terrors to come.

The astronomers and mathematicians of our hypothetical lost civilization would surely have set to work calculating trajectories and orbits and would have learned in due course that collisions with fragments of the disintegrating comet, though not an immediate

threat, were unfortunately inevitable during the centuries ahead. It was not yet certain how large and how sustained the bombardments would be, or where and when the first fragments would strike. Multiple outcomes were possible, from escaping relatively unscathed, at one end of the scale, to a worst-case scenario in which civilization itself would be snuffed out. And although the worst would probably never happen, a contingency plan would certainly have been prepared on the off chance that it did.

My bet is the planners would have seen from the outset that the superior survival skills of hunter-gatherer populations might potentially make them the inheritors of the earth in the event of a true planetary cataclysm. An important strand of any contingency plan, therefore, would have been to establish connections with hunter-gatherers, to teach them, to learn from them, and in so doing to ensure that these populations were willing and able—if called upon—to offer refuge to the "gods" of the lost civilization.

It would not be until weeks or even days before the bombardments began that the areas likely to be worst hit could be pinpointed with any certainty. There must have been hope that by some miracle the impacts might be avoided altogether, but until the centuries of danger passed it was best to regard the whole world as a target and therefore to prepare safe havens on many different continents so that if some were destroyed others would survive. I speculated in chapter 10 that this process of preparation might even have involved the experimental resettlement of groups of hunter-gatherers far from their home regions with the intention that they should create places of refuge for the "gods" in their new surroundings. Such a project might account for that strange Australasian DNA signal stranded in the genes of certain Amazonian tribes.

In this scenario, therefore, hunter-gatherer populations all around the world were deliberately recruited by people from a different, more scientifically advanced culture to prepare for a coming

cataclysm, to offer refuge to the "gods" should they require it, and perhaps even to serve as duplicate archives—either in oral tradition or in the safekeeping of physical records—for some of the scientific knowledge of the "gods."

In North America the evidence is that hunter-gatherers bounced back quite successfully within less than a millennium of the onset of the Younger Dryas, and thereafter there is a thin but fairly continuous archaeological record. What is mysterious is not so much the early appearance of mound-building in this new age—perhaps as early as 8,000 years ago, as we've seen—or the sophistication of sites such as Watson Brake 5,500 years ago, nor even their obvious astronomical and geometrical connections to later vast earthworks such as Moundville and Cahokia, but that in this early monumental architecture of the New World memes of geometry, astronomy, and solar alignments consistently appear that are also found in the early monumental architecture of the Old World at iconic sites such as Stonehenge and the Great Pyramid of

Giza. A tremendous leap forward in agricultural know-how, coupled with the sudden uptake of eerily distinctive spiritual ideas concerning the afterlife journey of the soul, also often accompanies the architectural memes. It's therefore hard to avoid the impression that some kind of "package" is involved here.

Something designed.

Something deliberately and carefully contrived to engage future generations in specific courses of action, regarded as religious duties, that would also educate them deeply in the cycles of the heavens and in the measurement and nurturing of the earth.

It's almost as though a guiding hand has been at work behind the scenes of prehistory. If so, whether through secret groups of insider initiates or by some other means of cultural transmission, this hidden influence appears to have been active in the Americas since before the onset of the Younger Dryas, to have undergone long periods of inactivity, and to have reemerged again and again at crucial junctures to shape the direction of civilization.

CLOVIS GIVEN A HELPING HAND?

KNOWLEDGE OF THE TRUE GLOBAL extent of the Younger Dryas impacts continues to grow. We've focused on the evidence from North America, but recent research published in *Studia Quaternaria* in 2018 presents evidence of a cometary airburst over Mount Viso in Europe's Western Alps around 12,800 years ago that raised temperatures instantly, in a brief pulse, to above 2,200 degrees C—almost 1,000 degrees hotter than the melting point of steel.[2] Another 2018 study, published in the *Journal of Geology,* reports evidence from Antarctica's New Mountain, near the Taylor Glacier, that an "impact/airburst of the same time line as the Younger Dryas Boundary may have reached across South America and the Pacific Ocean to the Dry Valley Mountains of Antarctica."[3]

As of late 2014, the Younger Dryas Boundary strewn field of impact proxies had been traced across 50 million square kilometers of the earth's surface (above). Since then YDB impact proxies have been found much more widely distributed than previously reported in South America, and a 2018 study reports their discovery in Antarctica's

Taylor Valley (inset) linked to evidence of an impact or airburst around 12,800 years ago.

As more evidence of this quality continues to pour in, two significant observations thrust themselves to the fore.

First, this cataclysm, which we know to have been drawn out over 21 years between 12,836 and 12,815 years ago, was truly global, affecting regions as far apart as Greenland, the Pacific, the Americas, Europe, and Antarctica.

And second, it was just the luck of the draw that North America, rather than some other region, found itself at the epicenter of the peak bombardment. However, this had profound implications for the world because so much of the continent was then still covered by ice that was radically destabilized, releasing the meltwater flood that shut down the Gulf Stream and ushered in the Younger Dryas. The fact that Greenland and Europe were also severely hit and also ice covered compounded the problem by adding to the deluge of icy meltwater pouring into the Atlantic Ocean. There is no doubt,

however, that it was the continental landmass of North America that suffered the worst effects of the impacts, airbursts, shock waves, and wildfires and finally, perhaps early in that 21-year episode of bombardment, of Antonio Zamora's proposed storm of icy ejecta. The latter, we might speculate, could even have played a role in extinguishing the wildfires, thus accounting for the fact that a single massive episode of biomass burning, the largest in the entire NGRIP Ice Core, is documented for North America right at the onset of the Younger Dryas, and then rapidly dies down, never to recur on such a scale.[4]

Once all this is taken into account, the severity of the extinctions in North America seems less surprising and we can begin to understand how it was that the Clovis people passed from abundance to nonexistence virtually overnight.

Moreover, the Clovis phenomenon is, itself, an intriguing mystery. We've already seen that no archaeological background has

ever been found to the beautiful and sophisticated fluted points used by these remarkably successful hunter-gatherers to spear mammoths like Eloise at Murray Springs. From the moment we meet them around 13,400 years ago to the moment of their disappearance from the record about 12,800 years ago, they're equipped with their extremely effective signature "toolkit" of which the points are part. These Clovis tools and weapons appear suddenly and fully formed in archaeological deposits across huge expanses of North America with no evidence, **anywhere**, of experiments, developments, prototypes, or, indeed, of any intermediate stages in their evolution.[5]

My guess is there's a connection between Clovis and the lost civilization, not least because studies of ancient DNA show the Clovis genome to be much more closely related to Native South Americans than to Native North Americans (see part 3). Indeed, there's a parallel between the rather sudden and inexplicable way that Australasian genes turn up in the Amazon basin and the equally

sudden and inexplicable way that Clovis fluted-point technology turns up in North America.

Could both have the same cause?

Could the same hidden hand that transported a population of Australasian setters across the Pacific Ocean from New Guinea to the Amazon also have given technical assistance to one group among the many that we now know inhabited North America before the onset of the Younger Dryas? And since the whole Clovis First nonsense has finally been relegated to the dustbin of history, perhaps it's time to consider another possibility—let's call it "Clovis Most Favored" or "Clovis Given a Helping Hand."

Though in no way "high-tech" in twenty-first-century terms, the Clovis toolkit is far superior to anything else Native Americans are thought to have been capable of 13,400 years ago when the first fluted points begin to appear south of the ice cap. I'm not proposing that these stone tools were part of the technology of the lost civilization itself—any more than jet aircraft were part of it. I've

argued already that a more realistic parallel for the level of science and technology attained would be with Europe and the newly formed United States in the late eighteenth and early nineteenth centuries.

Other than that, the civilization I envisage was very different from our own, founded upon entirely different principles. Much of its science may remain opaque to us not because it is absent but because we are unable to recognize it for what it is. Nor is there any reason to suppose it would have shared its own “high-tech” with other peoples; quite possibly there were even specific stipulations against doing so. But there might have been less hesitation around the idea of devising better, more efficient stone tools to put into the hands of favored groups of hunter-gatherers, thus conferring a competitive advantage upon them.

Suppose Clovis was such a group, already present alongside many other groups that we now know to have inhabited the Americas before the Younger Dryas onset. The connection to the

southern lineage of Native Americans is interesting. Perhaps it might even have been in those 5 million square kilometers of Amazon rainforest where archaeologists have not yet ventured that fluted-point technology was initially taught to Clovis ancestors who then migrated north, bringing "their" expertise with them.

In so doing they burst in upon—and in a brief few centuries radically changed—a cultural landscape that archaeologists are now beginning to realize had previously been stable and continuous for thousands of years. Just as Al Goodyear discovered at Topper when he took the decision to dig down below the lowest Clovis occupation level (see chapter 6), recent excavations at the extremely prolific Clovis site of Gault, Texas, have likewise revealed deeper, pre-Clovis levels. Reported in the journal *Science Advances* in July 2018, these levels contain an assortment of stone tools—"the Gault Assemblage"—so far confirmed to be at least 2,000 years older than Clovis. Significantly, what archaeologists have identified in the

assembly is "a previously unknown, early projectile point technology unrelated to Clovis."[6]

Of note also is that:

> There is a ~10-cm-thick zone of decreased cultural material between the Clovis and Gault components. This suggests a reduction in site activity or possible occupational breaks between … cultural depositions.[7] … The distinct technological differences between Clovis and Gault Assemblage, together with the stratigraphic separation between the cultural depositions, indicate a lack of continuity between the two complexes.[8]

In other words, Clovis just rather inexplicably appears and replaces preexisting native North American cultures, and pretty soon its occupation levels are imposed over other, earlier occupation levels all across the continental United States until suddenly, and mysteriously, in the big bang of the Younger Dryas onset, Clovis itself is gone—dead and buried beneath the black mat.

Yet in the brief few hundred years of its florescence, Clovis sparkled and shone as the most successful and widespread hunter-gatherer culture thus far seen in the Americas. Archaeologists and flint knappers who have studied the matter are in no doubt that the distinctive points, and the way that fluting was deployed in their manufacture, would have given the Clovis people a significant technological edge over other hunter-gatherers.[9] The question, therefore, has to be why they were wiped out while other less prominent and capable cultures were able to emerge from the shadows of archaeological invisibility and survive.

Perhaps they grew too close to the "gods" of the lost civilization and shared their fate?

This is a serious proposition, not a frivolous question, and we may anticipate the skeptical response. If Clovis benefited from contact with a more advanced civilization, then we should find the skeletal remains of those more advanced people intermingled with

the Clovis remains, and we do not—therefore, there was no advanced civilization. Similarly, if Clovis benefited from contact with the people of a more advanced civilization, then we should find at least some traces of their higher tech among the Clovis assemblages, and we do not—therefore, there was no advanced civilization.

I've already responded to the second argument. There might have been very good reasons why people from a more technologically advanced civilization would have decided **not** to share their high-tech with hunter-gatherers, while at the same time choosing to favor a particular group with the know-how to work existing raw materials like stone, antler, and bone into more efficient hunting weapons and tools than they'd ever made before.

As to the first argument, although Clovis were not the "first Americans," their culture has been the subject of intensive archaeological study for more than 80 years and we've seen that

Clovis artifacts have been discovered in great quantities at sites scattered far and wide across North America.

But how many Clovis bones have been found alongside the artifacts? How many skeletons, crania, tibia, phalanges, or teeth? I had imagined there must be quite a collection for such a famous and well-understood culture. I was therefore surprised to learn during the research for this book that **apart from the incomplete skeleton of a single individual**—the Anzick-1 child excavated in Montana and discussed in chapter 9—**there are no human remains at all from the Clovis period**.[10] Even in the case of Anzick-1, as we've seen, the Clovis provenance was questioned by some until sophisticated dating techniques in 2018 resolved an apparent discrepancy between the age of the infant's bones and the age of the Clovis tools found with him, placing both firmly at the onset of the Younger Dryas around 12,800 years ago and confirming the Clovis identity of the buried child.[11]

Here then is the conundrum. At locations scattered all across North America from Alaska to New Mexico and from Florida to the state of Washington, more than 1,500 Clovis sites have been found. These sites have yielded more than 10,000 Clovis points[12] and tens of thousands of other artifacts from the Clovis toolkit (40,000 at Topper alone, as we saw in chapter 6). Yet among all these archaeological riches, it bears repeating that the sum total of Clovis human remains found in 85 years of excavations is limited to the Anzick-1 partial skeleton.[13]

In short, if the homeland of our hypothetical advanced civilization were in America, and if it became a lost civilization during the tumultuous earth changes of 12,800 years ago, then the Clovis case suggests that a dearth of skeletal remains is a normal state of affairs by which we should not be surprised. Certainly it does not constitute disproof of the lost civilization hypothesis.

By contrast, the sudden appearance of Clovis fluted-point technology with no evidence of prior trial and error, buildup of skills, experimentation, or prototypes[14] cries out for an explanation. So, too, does the Australasian DNA signal in the heart of the Amazon rainforest. So, too, the shared geometry and astronomy, and the shared earthwork designs across the Old World and the New. So, too, the incredible overlaps of symbolism, spiritual inquiry, and beliefs.

The only viable explanation is a remote common source behind them all—a lost civilization, in my view. And although that civilization had established self-perpetuating memes that would keep the flame of its influence burning for thousands of years, it is clear that it did not survive the Younger Dryas cataclysm itself.

Let's look at North America, therefore, with the possibility in mind that it might be the "crime scene" from which a great

civilization of prehistoric antiquity—the stuff of myth and legend all around the world—vanished without a trace.

29

UNKNOWN UNKNOWNS

A LOST ADVANCED CIVILIZATION OF the Ice Age with global navigational and mapmaking skills equivalent to our own in the late eighteenth and early nineteenth centuries would have had the capacity to establish outposts on every continent but must also have had a homeland.

Since that homeland has not been found after 200 years of diligent archaeology, most diligent archaeologists conclude—quite reasonably on the face of things—that it did not exist.

But there are other options.

It might be underwater now—the immense Sunda Shelf around Indonesia, for example, submerged by sea-level rise at the end of the Ice Age.

It might be under ice, perhaps in Antarctica, if we're willing to accept that some rather extraordinary geophysical events occurred in the past 100,000 years.

IMAGE: EARTH 18K BCE BY DONALD L. EDWARDS.

It might await rediscovery in the unexplored heart of the Amazon rainforest.

It might lie beneath the sands of the Sahara desert.

Or perhaps its homeland has all along remained hidden in plain view in the very last place that anyone has thought to look—North America?

There are surprisingly few "known knowns" in American prehistoric archaeology and good reasons why there are so many "known unknowns"—reasons that in turn suggest that the third Rumsfeldian category,[1] of "unknown unknowns," the "things we don't know we don't know," may ultimately prove to be far larger and more significant than either of the other two.

First and foremost, the Younger Dryas impacts, and subsequent sustained cataclysm, changed the face of the earth completely and wrought particularly significant havoc across North America. We have considered the question of huge volumes of meltwater released into the Arctic and Atlantic Oceans from the destabilized ice sheet and looked at the effects on global climate. But keep in mind that those enormous floods also devastated the rich North American

mainland to the **south**, perhaps the best and most bounteous real estate then available anywhere.

This immense and extraordinary deluge, "possibly the largest flood in the history of the world,"[2] swept away and utterly demolished everything that lay in its path. Jostling with icebergs, choked by whole forests ripped up by their roots, turbulent with mud and boulders swirling in the depths of the current, what the deluge left behind can still be seen in something of its raw form in the Channeled Scablands of the state of Washington today—a devastated blank slate (described at length in *Magicians of the Gods*) littered with 10,000-ton "glacial erratics," immense fossilized waterfalls, and "current ripples" hundreds of feet long and dozens of feet high.[3]

If there were cities there, before the deluge, they would be gone.

If there was any evidence of anything that we would recognize as technology there, before the deluge, it would be gone.

And if an advanced antediluvian civilization had flourished anywhere within 500 kilometers of the southern edge of the ice cap, not only in the Channeled Scablands but all the way along the ice margin, the flood alone might have been sufficient to ensure that not a trace of it would be left for archaeologists to misrepresent 12,800 years later.

Washington displays flood-ravaged scablands, but so, too, does New Jersey much farther to the east. Washington is notable for its fields and hillsides strewn with huge ice-rafted erratics, but so, too, is the state of New York. Interestingly also, just as Washington has its coulees, New York State has its Finger Lakes. These latter were long thought to have been carved by glaciers, but their geomorphology closely parallels that of the coulees of the channeled scablands, and some researchers now believe they were cut by glacial meltwater at extreme pressures—a process linked by sediment evidence to "the collapse of continental ice sheets."[4]

Likewise in Minnesota, on the Saint Croix River, there is a spectacular array of more than eighty giant glacial potholes. One is 10 feet wide and 60 feet deep, making it the deepest explored

pothole in the world. Others, as yet unexcavated, are even wider, and probably deeper as well. And all of them, without exception, were formed by turbulent floods at the end of the Ice Age.

We are looking then at vast expanses of North America that were literally *scoured*.

And this is before we get to the other effects of the Younger Dryas impacts explored in previous chapters—including direct hits on populated areas, searing heat and shock waves from airbursts, continent-wide wildfires, an impact winter, icy ejecta, and so on and so forth.

All in all, if North America is where a lost civilization of prehistoric antiquity vanished, then by far the most significant problem we face in investigating it is the way that the "crime scene" was systematically "wiped down" by the cataclysmic events at the onset of the Younger Dryas.

WIPING DOWN THE CRIME SCENE: CONQUEST

THE EUROPEAN INVASION OF THE American mainland began 500 years ago with the Spanish conquest of Mexico. In 1519, when Hernán Cortés first set foot on the shores of the Yucatán, more than 30 million people lived in Mexico. A century later, after the brutal genocide of the conquest itself and immense loss of life to smallpox epidemics, the population had fallen to just 3 million.[5]

The entire pre-Columbian literature of Mexico, a vast library of tens of thousands of codices, was carefully and systematically destroyed by the priests and friars who followed in the wake of the conquistadors. In November 1530, for example, Bishop Juan de Zumarraga, who had shortly before been appointed "Protector of the Indians" by the Spanish crown, proceeded to "protect" his flock by

burning at the stake a Mexican aristocrat, the lord of the city of Texcoco, whom he accused of having worshipped the rain god. In the city's marketplace Zumarraga "had a pyramid formed of the documents of Aztec history, knowledge and literature, their paintings, manuscripts, and hieroglyphic writings, all of which he committed to the flames while the natives cried and prayed."[6]

More than 30 years later, the holocaust of documents was still under way. In July 1562, in the main square of Mani (just south of modern Merida in the Yucatan), Bishop Diego de Landa burned thousands of Maya codices, story paintings, and hieroglyphs inscribed on rolled-up deer skins. He boasted of destroying countless "idols" and "altars," all of which he described as "works of the devil, designed by the evil one to delude the Indians and to prevent them from accepting Christianity."[7] Noting that the Maya "used certain characters or letters, which they wrote in their books about the antiquities and their sciences" he informs us:

> We found a great number of books in these letters, and since they contained nothing but superstitions and falsehoods of the devil we burned them all, which they took most grievously and which gave them great pain.[8]

Any of us today interested in the truth about the past share the pain of those horrified Native Americans—for what, we cannot help but wonder, was written in their lost books concerning "the antiquities and sciences" of the ancients? What exactly went up in smoke there?

I have explored the mysteries of the Maya, and of their predecessors the Olmec, in my earlier work, so I have not retold their extraordinary story here. I will mention in passing, however, that in 1998, long before I knew of the Mississippi Valley civilization and its afterlife beliefs concerning the constellation Orion and the Milky Way, I drew attention in *Heaven's Mirror* to a discovery by archaeologists Jose Fernandez and Robert Cormack establishing that the settlement core of the Maya city of Utatlan was

designed "according to a celestial scheme reflected by the shape of the constellation of Orion."[9]

Fernandez was also able to prove that all of Utatlan's major temples "were oriented to the heliacal setting points of stars in Orion,"[10] and noted that the Milky Way, alongside which Orion stands, "was thought of as a celestial path connecting the firmament's navel with the centre of the underworld."[11]

This should be familiar territory to the reader by now and hopefully you can guess what comes next. "Very much like the ancient Egyptians," I reported in *Heaven's Mirror,* the Maya regarded the Milky Way as a particularly important feature of the heavens:

> They conceived of it as the road that led to their netherworld, *Xibalba* which, in common with other Central American peoples, they located in the sky.[12]

I also commented on Mexican traditions of the postmortem journey of the soul in which the deceased, just as in the ancient Egyptian Duat, would face a series of ordeals and "a final judgment in the terrifying presence of the death god."[13] Noting numerous other striking similarities in beliefs and symbolism around the mysteries of death and the afterlife, I concluded:

> In Egypt, as amongst the Maya, the stellar context involves Orion and the Milky Way. In Egypt as in Mexico a journey through the netherworld must be undertaken by the deceased. In Egypt as in Mexico religious teachings assert that life is our opportunity to prepare for this journey—an opportunity that should under no circumstances be wasted.[14]

Such correspondences led me to speculate that both ancient Egypt and ancient Mexico had shared in the legacy of an even more ancient cosmological religion, "wrapped up in sophisticated astronomical observations" and specifically focused on the afterlife journey of the soul. Neither Egypt nor Mexico had originated this

religion, nor had they transmitted it directly to one another. Rather each of them had inherited it from a third, as yet unidentified, civilization.[15]

It was a hypothesis. What would help to strengthen it, and perhaps even confirm it, would be evidence of other civilizations with no direct relationship in which the same legacy could be identified.

This evidence, I submit, now exists in the astonishing proximity of the religious beliefs, iconography, and symbolism of the Mississippi Valley to the religious beliefs, iconography, and symbolism of ancient Egypt outlined in part 6. These deep structural connections are, in my view, unexplainable by any means other than a shared legacy from a very ancient source—a source predating the separation of peoples when the Americas became isolated from the "Old World" by the rising oceans at the end of the Ice Age.

Let's take a brief look at the most ancient Native American book still in existence—the Dresden Codex, so called because it's kept in a museum in the German city of Dresden.[16]

It is a thought-provoking document for many reasons, not least the scientific character of the mathematics and astronomy incorporated in it. For example, the eminent Mayanist Sylvanus Griswold Morley noticed that on pages 51–58 of the codex, "405 revolutions of the moon are set down; and so accurate are the calculations involved that although they cover a period of nearly 33 years, the total number of days recorded (11,959) is only 89/100th of a day less than the true time computed by the best modern method."[17]

Also of great interest is the way that numbers set out in the Dresden Codex keep on getting longer and longer in the final pages:

> Until, in the so-called "serpent numbers," a grand total of nearly twelve and a half million days (thirty-four thousand years) is recorded again and again …

Finally, on the last page of the manuscript, is depicted the Destruction of the World, for which these highest numbers have paved the way.

Here we see the rain serpent, stretching across the sky, belching forth torrents of water. Great streams of water gush from the sun and the moon. The old goddess, she of the tiger claws and forbidding aspect, the malevolent patroness of floods and cloudbursts, overturns the bowl of the heavenly waters. The crossbones, dread emblem of death, decorate her skirt, and a writhing snake crowns her head.

Below, with downward-pointing spears symbolic of the universal destruction, the black god stalks abroad, a screeching bird raging on his fearsome head. Here, indeed, is portrayed with graphic touch the final all-engulfing cataclysm.[18]

Dresden Codex—the final page of the manuscript depicting the Destruction of the World. PHOTO OF PUBLIC DOMAIN ARTWORK: THE SAXON STATE LIBRARY [MSCR.DRESD.R.310].

It's curious—this mixture of science, cataclysm, and time. "Calculations far into the past or lesser probings of the future occur in many a Maya hieroglyphic text," notes archaeologist J. Eric S. Thompson:

> On [a] stela at Quiriga a date … over 90 million years ago is computed; on another a date over 300 million years before that is given. … These are actual computations, stating correctly day and month positions, and are comparable to calculations in our calendar giving the month positions on which Easter would have fallen at equivalent distances in the past. The brain reels at such astronomical figures, yet these reckonings were of sufficient frequency and importance to require special hieroglyphs for their transcription.[19]

All that can be said for sure is that embedded in the Mayan material, together with core religious beliefs very similar to those of

the ancient Egyptians—and now we know very similar to those of the ancient Mississippians also—is evidence of an interest in complex scientific calculations and immense expanses of time. I'm reminded of the passage from the *Ancient Egyptian Book of the Dead,* quoted in chapter 3, in which the Sun God Ra is praised for his travels through the "untold spaces" of the cosmic void "requiring millions and hundreds of thousands of years to pass over"—a chronology on a similar order to the Mayan scheme of things but, one would have thought, irrelevant to the concerns of agricultural societies. And the same goes for the immense geometrical mounds and enclosures of the ancient Egyptian Duat that are matched by the immense geometrical mounds and enclosures of the Hopewell of Ohio and the immense geometrical mounds and enclosures now emerging from the Amazon rainforest.

What the evidence suggests to me is that something extraordinary, something that the theories of mainstream archaeology cannot account for, was going on behind the scenes of

prehistory. All the indications are that Mexico, with its ancient tradition of literacy, was once a vast archive of the "antiquities and sciences" of former times and that the records the Spaniards destroyed in their zealous stupidity may have been as integral to the memory of humanity as the library of Alexandria. I think it is very possible, had the Mayan documents survived in sufficient quantities, that they would have shed light on the mystery of the lost common source of inspiration that appears to have kick-started civilizations in both the Old World and the New.

In the event, however, out of the tens of thousands of Mayan codices in existence in 1519 just **four** are still with us in the twenty-first century.[20]

After the Spanish conquest of Mexico, the conquest of Peru soon followed, again accompanied by the destruction of a high civilization—in this case the Inca—in the lineage of the First Americans. Though they had their *quipus* (a means of

communication and calculation using knotted string), the Inca were not a literate people like the Maya and thus possessed no documents for the Spaniards to destroy. As in Mexico, however, a sustained and determined effort was made to stamp out local religions and traditions and replace them with Roman Catholicism. Once again, this effort, officially sanctioned as "the extirpation of idolatry," called for cultural destruction on a grand scale, calculated to erase the memory banks of the population within a generation or two and replace their deep connection to their own past with the new dispensation.[21]

The Spaniards did venture into North America, of course—most eccentrically and unproductively in the form of an expedition led by Hernando de Soto, who landed in Florida in 1539 with more than 600 men.[22] After losing half his force along the way, de Soto spent the next 3 years until his own death in Louisiana in 1542 wandering all over the southeast and deep south of what is now the United

States, passing many of the great mound sites, and engaging in ruinous pitched battles with the locals. The most disastrous by-product of his visit, however, may have been smallpox, which his expeditionaries appear to have brought with them and which afterward devastated the indigenous population of the region.[23]

We may say, therefore, that from its earliest days the European conquest of the Americas was an agent of chaos, genocide, and cultural extinction for Native Americans and that this, too, was very much part of the process that wiped down the "crime scene," leaving us scratching our heads trying to make sense of the few clues left behind.

WIPING DOWN THE CRIME SCENE: WITNESS AMNESIA

THE EXTIRPATION OF VITAL EVIDENCE concerning the past of our species across huge swaths of the Americas was by no means limited to the effects of the Younger Dryas cataclysm, or to the subsequent much later cataclysms of militant Christianity and smallpox. Once the calamitous century of the initial encounters was over, a more insidious but equally deadly process of erosion began to grind down the little of the past that the previous millennia had spared. During the sixteenth century, apart from a few failed raids like de Soto's, North America was not much affected, but from the early seventeenth century onward, following the first European settlements in Virginia and Massachusetts, everything changed.

Thereafter, with monotonous, depressing regularity, either for their agricultural potential or for the prospect of gold, lands held sacred in the possession of Native American tribes for eons were snatched from them and their inhabitants driven off or slaughtered. These murderous land grabs only accelerated and became crueler as

the seventeenth century was followed by the eighteenth and as the eighteenth century rolled on into the nineteenth:

> From the time Europeans arrived on American shores, the frontier—the edge territory between white man's civilization and the untamed natural world—became a shared space of vast, clashing differences that led the U.S. government to authorize over 1,500 wars, attacks and raids on Indians, the most of any country in the world against its indigenous people. By the close of the Indian Wars in the late 19th century, fewer than 238,000 indigenous people remained, a sharp decline from the estimated 5 million to 15 million living in North America when Columbus arrived in 1492.[24]

In his important book *American Holocaust,* which documents the genocide, David Stannard, professor of American studies at the University of Hawaii, reminds us that scholarly estimates of the size of the pre-Columbian population of the Americas have changed radically in recent decades:

> In the 1940s and 1950s conventional wisdom held that the population of the entire hemisphere in 1492 was little more than 8 million—with fewer than 1 million

people living in the region north of present-day Mexico. Today few serious students of the subject would put the hemispheric figure at less than 75 million to 100 million (with approximately 8 million to 12 million north of Mexico), while one of the most well-regarded specialists in the field recently has suggested that a more accurate estimate would be around 145 million for the hemisphere as a whole and about 18 million for the area north of Mexico.[25]

Gone forever—and good riddance—is the long-held myth of North America as a pristine wilderness inhabited by a handful of "savages" when the first settlers from Europe arrived.

Nothing could be further from the truth.

The new picture, derived from a combination of archaeology, ethnography, genetics, and the reports of early travelers, is of a busy and boisterous continent with a growing population, widespread trade networks, and abundant resources.

Like the Inca, though lacking their centralized, structured state, the Native North Americans were people of the spoken word who carried their wisdom and their records not in documents but in oral traditions carefully nurtured, memorized, and passed on from

generation to generation. Today we grope in the dark when we try to discover what they knew, what they taught, and what they had preserved from primeval times because the genocide inflicted upon them radically disrupted and in many cases completely destroyed the normal intergenerational processes of transmission.

The accounts of the genocide are repulsive; reading the details today leaves one stunned, nauseated, and horrified. Professor Stannard holds nothing back in *American Holocaust,* a comprehensive record of European wickedness in the Americas, but it's not my purpose here to zoom in on the many massacres and betrayals he describes, or to dwell on the horrific symptoms of the imported infectious diseases that killed indigenous people by the millions.

The point I wish to make is simply that **this happened**, that it was both physical and cultural genocide, and that its long-term effect on the descendants of those who survived was to sever their

connections to the traditions, wisdom, memories, and even the languages of their ancestors.

Lest there be any doubt that cultural annihilation was always the purpose, hand in hand with the continent-wide theft of land, we need only consider the shameful history of the so-called Indian boarding schools. The National Native American Boarding School Healing Coalition sets out the bare facts:

> Between 1869 and the 1960s, hundreds of thousands of Native American children were removed from their homes and families and placed in boarding schools operated by the federal government and the churches. Though we don't know how many children were taken in total, by 1926, the Indian Office estimated that nearly 83% of Indian children were attending boarding schools. The U.S. Native children that were voluntarily or forcibly removed from their homes, families, and communities during this time were taken to schools far away where they were punished for speaking their native language, banned from acting in any way that might be seen to represent traditional or cultural practices, stripped of traditional clothing, hair and personal belongings and behaviors reflective of their native culture.[26]

A founder and advocate of the boarding schools movement, US army captain Richard Henry Pratt, summarized the spirit of the whole enterprise in a speech in 1892:

> A great general has said that the only good Indian is a dead one. In a sense, I agree with the sentiment, but only in this: that all the Indian there is in the race should be dead. Kill the Indian in him and save the man.[27]

This, then, was an ethnically targeted brainwashing exercise on a gigantic scale—an exercise deliberately designed to make Native Americans forget their ancient heritage. For the purposes of our inquiry here, if it were indeed from North America that a lost civilization vanished, then not only has the crime scene been thoroughly wiped down but also—to extend the analogy—the principal witnesses have been badly beaten about the head and are suffering from amnesia.

WIPING DOWN THE CRIME SCENE: LAND GRABS

EVEN AS THE GENOCIDE AND imposed "unremembering" gathered pace during the nineteenth and twentieth centuries, a parallel force was also active removing many prominent physical traces—notably the great mounds and earthworks—that Native Americans of former ages had left. This parallel force was primarily greed for land, where the fate of the monuments was either to be plowed down for agriculture or demolished to make way for industry, housing, or commerce. Among the unknown unknowns of North American prehistory, therefore, is how many of the mounds and earthworks were *already* gone—plowed under, demolished, ransacked—before responsible and thorough surveyors began to investigate them from about the mid-nineteenth century onward.

Renowned among these early surveyors were Ephraim Squier and Edwin Davis, whose classic *Ancient Monuments of the Mississippi Valley,* the first-ever publication of the Smithsonian Institution, appeared in print in 1848. In their preface they note of the mounds and earthworks that:

> The importance of a complete and speedy examination of the whole field cannot be over-estimated. The operations of the elements, the shifting channels of the streams, the levelling hand of public improvement, and most efficient of all the slow but constant encroachments of agriculture, are fast destroying these monuments of ancient labor, breaking in upon their symmetry and obliterating their outlines. Thousands have already disappeared, or retain but slight and doubtful traces of their former proportions."[28]

One of the reasons that *Ancient Monuments* is still useful today is that it provides the locations of many important mounds and earthworks that no longer exist. In 2011, in a paper published in *American Antiquity,* Jarrod Burks and Robert Cooke looked into the specific case of Ohio, where Squier and Davis had reported

“approximately 88 earthwork sites” in 1848. Perhaps because of the fame brought to them by *Ancient Monuments,* 16 of these sites—18 percent of the total—are “now preserved whole or in part within parks.” Another 18 sites (20 percent) “are mostly or completely destroyed, with urban development and gravel mining being the primary destructive processes.” The remaining 54 sites (62 percent) are “now invisible at the surface.”[29]

So, to summarize, out of 88 Ohio sites put on record in 1848 by Squier and Davis, 54 are now “invisible,” 18 more are “destroyed,” and only 16 (just 18 percent of the total) are still in place–implying an effective loss of 82 percent or, in plain English, 82 out of every 100 sites.

What, then, are we to make of David J. Meltzer’s presumably authoritative introduction to the 150th anniversary reissue of *Ancient Monuments,* which informs us that Ohio’s Ross County

alone was estimated by Squier and Davis in 1848 to contain "one hundred enclosures and five hundred mounds"?[30]

If that's the correct figure, then all the other numbers change. Sixteen sites remaining out of 600 is quite a different matter from 16 out of 88 and amounts to a 97 percent loss.

On July 23, 2018, wanting to get to the bottom of this, I emailed Jarrod Burks, coauthor of the 2011 *Antiquity* paper.

His first point was to remind me that the focus in his paper was not on earthworks in Ohio in general but only on those "depicted in Squier and Davis—88 sites. There are many hundreds of earthwork sites (those with enclosures) in Ohio … and we keep finding more."

As to the specific issue of the discrepancy between Meltzer's figures and his own, Burks explained:

> I was counting actually sites with enclosures depicted in maps in Squier and Davis. This comes from individual maps of sites, like the map of High Bank Works, and from unique sites depicted on their composite maps of select areas—

like the area around Chillicothe. For example, they show the Steel Group site on that map but they do not have a separate, more detailed map of Steel.

So, when I say "enclosure site" I am referring to places with one through X enclosures. Hopewell Mound Group is one site though it has several enclosures. Cedar Bank is one site that has only one enclosure. Following this approach, Squier and Davis depict 88 sites with enclosures in their maps. There is no way there are 100 enclosure sites in Ross County, but there may be 100 enclosures. So far I have only found solid evidence for 37–38 enclosure sites in Ross County, and this includes some previously undocumented ones we have found in aerial photos and subsequently surveyed with geophysics. In fact, most of the 37–38 have been surveyed. … Still working on getting access to a few of them.

The Archaeological Atlas of Ohio (William C. Mills 1914) reports 586 enclosure sites in Ohio. Many of these are unconfirmed and/or lost since 1914, but we are working to find many of them. We have also found more not recorded in 1914. So, the total number of enclosure sites once in Ohio conservatively is 500–1000. It could be double or more.

I had also asked Burks if he knew where I might find estimates of the sort that he had made in Ohio for the Mississippi Valley as a whole—that is, how many mounds and earthworks remain and how many have been destroyed since the mid-nineteenth century.

“Getting numbers for all of the Mississippi Valley is a daunting task,” he replied, “especially if you include mounds. There are/were many tens of thousands of mounds in the eastern US. You might start by contacting the state historic preservation office in each state.”

I was surprised that no archaeologist had yet done this basic legwork and that there was no authoritative volume or paper I could immediately be referred to—since presumably at least some measure of what has been lost must be fundamental to the correct assessment of what remains. I therefore asked for confirmation that I would be representing the facts correctly if I were to “tell my readers that reliable figures simply don’t exist for the whole Mississippi Valley and that no archaeologist or other researcher has ever attempted to estimate what has been lost across the whole region as a result of agricultural, industrial and other encroachments since the mid-19th century.”

Burks replied immediately:

> That's a pretty broad statement. I don't know that "no archaeologist or other researcher" has done that. George Milner produced a book on mounds 10–15 years ago. Perhaps he makes a statement like that? But I doubt it given how nearly impossible it is to track that. For example, in Ohio we say there once were 10,000+ mounds (a 19th century estimate). The state has only about 2000 that have been recorded in the modern list. Many have been destroyed but we are constantly recording new ones, many of which likely were known in the 19th century. So, hard to put numbers to it, but it's true that many, many mounds have been destroyed.[31]

George R. Milner's book *The Moundbuilders* arrived on my desk the following morning, but contains no information that adds significantly to what we already know about the loss of mound sites since the nineteenth century. Nor was David Meltzer able to come up with a figure, observing in reply to my query that "200+ years ago there was no systematic count of these earthworks, so we have no idea what the denominator should be for the equation of sites still extant / sites once present."[32]

The good news is that sites are still being discovered (or probably more often rediscovered). The bad news is that it may be "nearly impossible" to track the "many, many" that have been destroyed.

All estimates are guesswork, but I suspect that Gregory Little's diligent and thoroughly researched *Illustrated Encyclopedia of Native American Mounds and Earthworks,* though not a mainstream source, is close to the truth when it calculates that 90 percent of all the Mississippi Valley sites have been destroyed and that only 10 percent remain.[33]

And lest such a ballpark figure sound too extreme let us remember, despite the conservationist rhetoric of our supposedly more enlightened age, that mounds and earthworks are **still** being destroyed in the twenty-first century.

Walmart seems to have a penchant for this. In 2001, for example, the Fenton Mounds, a pair of Native American burial mounds in Fenton, Missouri, dated between AD 600 and 1400, were leveled to

make way for a Walmart Supercenter.[34] A few years later, in August 2009, city leaders in Oxford, Alabama, approved the destruction of a 1,500-year-old Native American ceremonial mound because, once again, Walmart wanted the location.[35] The developers began work, removing a substantial section of the mound, but a month later, following a public outcry, the media reported a change of heart:

> A re-consecration ceremony was held this past weekend at a damaged Indian mound in Oxford, Alabama. … The 1,500-year-old sacred and archaeologically significant site was partially demolished during a taxpayer-funded economic development project, with the excavated dirt to be used as fill for construction of a Sam's Club, a retail warehouse store owned by Walmart.[36]

What's indicated here is a state of mind across a segment of the American population that sees no inherent cultural value in antiquities and believes firmly that the past has nothing to teach us that outweighs our need for yet another large store. I don't mean to

pick on Americans. Exactly the same state of mind exists in Britain, France, China, and virtually every other country in the world.

By encouraging disdain for the past, however, the cost of such an outlook in fast-growing America since the nineteenth century has been the mass destruction of ancient sites, notably including the loss of many thousands of the mounds and earthworks of the Mississippi Valley. Exactly how **many** thousands will probably remain a "known unknown" forever. But whatever the true number, it represents yet another level at which the "crime scene" of ancient America has been wiped down.

WIPING DOWN THE CRIME SCENE: BAD ARCHAEOLOGY

THOSE OF US WHO EXPLORE alternative approaches to prehistory are frequently accused by archaeologists and their friends in the media of being "pseudoscientists." What, however, could provide a better example of truly damaging and misleading pseudoscience than the "Clovis First" paradigm that ruled American archaeology for more than 40 years with a wholly false doctrine taught to generations of students as fact? We saw in part 2 how this pseudoscientific theory of the peopling of the Americas, based on wildly irresponsible extrapolations from tiny data sets yet promoted by a powerful lobby of leading archaeologists, was, for a very long while, held to be so **right**, so **correct,** and so self-evidently **true** that any researchers who questioned it faced ridicule, ostracism by their colleagues, withdrawal of research grants, and ruined careers.

This kind of behavior in scholarship not only fails to serve the truth but actively undermines the search for it and, as such, has also played a significant part in wiping down the ancient American

"crime scene." How much was missed, and has since been built over or plowed under during those 40-plus years when it was considered heresy to investigate deposits older than Clovis for signs of a human presence? And how much wide-ranging and open-minded investigation into the true age and origins of the First Americans was postponed or entirely nipped in the bud at the same time? How many unexplored avenues do we owe to the absurd Clovis First dogma? How many doors did it close on how many promising initiatives? And how much public interest and curiosity in other possibilities did the pat answer "Clovis First" snuff out?

It's been the same problem with another archaeological theory—the so-called Pleistocene Overkill theory whereby all the megafauna were supposedly slaughtered by those same ruthlessly efficient Clovis hunters (who nevertheless proved insufficiently ruthless and efficient to survive the Younger Dryas onset). I've not gone into the details here—just too much academic bickering to impose upon the reader—but this theory, also, though not yet quite as dead as

"Clovis First" (since it still has some advocates), has been "conclusively rejected" by increasing numbers of scholars in recent years.[37]

Although he lists archaeology and North American prehistory among his fields of study, Terry Jones, professor and department chair of social sciences at California Polytechnic State University, brings the benefit of an outsider's perspective when he observes:

> The Paleoindian Period (often defined as anything pre-dating 10,000 cal BP [i.e., 10,000 years ago]) is basically the domain of a small number of specialists who interpret it for everyone else. For the last 40 years these researchers have focused their interpretations on two closely related and intricately inter-connected theories: Clovis First and Pleistocene Overkill. During this time, Paleoindian research has also deteriorated into an intense if not hostile debate over these two competing but not mutually exclusive ideas. Much of the energy in this protracted dialog has been devoted to debunking or nullifying alternative hypotheses associated with these two theories. While this is standard practice in science, **the degree to which the Paleoindian debate has been focused on deconstruction of opposing ideas rather than development of empirically solid, new ones has been extreme.**[38]

This, too, is part of the wiping down of the North American "crime-scene." Some limited but perhaps case-breaking clues to what really happened here around 12,800 years ago may remain. To the extent that the "detectives" involved in this paleo-CSI are more interested in ego contests than the truth, however, the truth may take a very long time to emerge.

Besides, there's another aspect to the problem in the visceral resistance shown by a number of influential scholars to **any** suggestion that a cataclysm of **any** kind ushered in the onset of the Younger Dryas. These scholars themselves apparently believe, and so far as possible would like us to believe, that nothing really bad happened at the Younger Dryas Boundary—that, yes, there were extinctions, and yes, Clovis abruptly disappeared, but there is no mystery here, just a fairly routine and predictable combination of overkill and climate change. Terry Jones, a member of the Comet Research Group, refutes such reasoning at length in a paper in the

Journal of Cosmology[39] and strongly advocates the Younger Dryas Impact Hypothesis, which, he points out:

> has been introduced into North American archaeology at a time when the failings of the overkill model have been acknowledged by the majority of researchers. … Alternatives to overkill have long been focused on climate change associated with the Pleistocene-Holocene transition, but this idea has always been problematic because large animal populations had lived through previous interglacials without massive die offs. Something different seems to have happened in North America at the end of the Pleistocene, and that something was not a blitzkrieg by human hunters.
>
> An extraterrestrial impact event seems to provide an exceptionally parsimonious explanation for a variety of patterns in the archaeological and paleontological records that are not accommodated by overkill.[40]

IN THE CROSSHAIRS

ANOTHER "PATTERN" FOR WHICH THE YDIH provides a parsimonious explanation is formed by the deep structural connections demonstrated in part 6 between the spiritual beliefs and "astro-geometry" of the ancient Egyptians and the spiritual beliefs and "astro-geometry" of the ancient Mississippians. The case I've sought to make throughout this book is that these two river valley civilizations were among several in the ancient world that inherited a shared legacy of knowledge and ideas from an earlier, "lost" civilization. Regardless of when that legacy was activated, or how its integrity was preserved over the many generations before it first manifests in the archaeological record, I've argued that its origins go back to the last Ice Age and predate the physical separation of the Old World from the New. The additional element of parsimony that the YDIH brings to this case, therefore, comes in the form of the impact-related earth changes documented at the Younger Dryas Boundary. These involved not only radical climate change and sea-

level rise, not only global wildfires and a subsequent "impact winter," not only mass extinctions of large animal species and the abrupt disappearance of Clovis but also, in the combination of all these ills, a **realistic mechanism** deadly, substantial, drastic, and sustained enough to devastate and destroy even a technologically advanced civilization.

If a disaster on such a scale were to recur today, our civilization would not survive it and all our works would crumble into ruin within a few millennia. I therefore see no reason in principle why the global cataclysm indicated in the Greenland ice cores that we know unfolded at the onset of the Younger Dryas between 12,836 and 12,815 years ago should not have brought an end to that previous high civilization of the "Early Primeval Age of the Gods"—the civilization of the "Ancient Ones," the civilization of the "First Time"—that is recalled with awe in myths and traditions from all around the world.

Although there were significant impacts in Greenland, the Pacific, South America, Antarctica, Europe, and the Near East, the evidence points conclusively toward North America as the epicenter of the Younger Dryas cataclysm and to the North American ice cap specifically as the target for the largest swarm of comet fragments.

Almost by default, therefore, although the crime scene has been brutally compromised, and although the lead investigators have a priori ruled the possibility out, North America is the most likely location on earth where a civilization could have thrived during the Ice Age and been destroyed at the onset of the Younger Dryas.

Not only that. If the Edfu Texts contain a record of these events, as I have proposed, then we should take seriously the message they transmit, that there were survivors of the cataclysm who made it their mission to bring about:

> The resurrection of the former world of the gods. … The re-creation of a destroyed world. [41]

These survivors are said to have wandered the earth, setting out and building sacred mounds wherever they went, and teaching the fundamentals of civilization, including religion, agriculture, and architecture. In *Heaven's Mirror* (1998) I speculate that it is perhaps as a result of their efforts that we find the basic doctrines of the same sky-ground religion, essentially the same beliefs about the afterlife journey of the soul, and the same architectural and geometrical principles as far afield as South America, Easter Island, Micronesia, Japan, Cambodia, India, Mesopotamia, Egypt, Malta, Spain, and Britain.

Turtle Island.

Because the earth is a sphere it is technically true that any point could be selected as central to the radiation of these ideas. As I've been researching this book, however, my perspective has changed and what I see now when I look at the globe are two great oceans, the Atlantic on one side and the Pacific on the other, with the longitudinal sprawl of the Americas running between them and forming, literally, the center of the world.

North America, we now know, was scoured, burned, frozen, and flooded by the Younger Dryas cataclysm and has since been systematically ransacked by Western greed and poorly served by Western scholars. Although less severely affected by the impacts of the Younger Dryas, South America also suffered all these assaults. And just as in North America, where millions of square kilometers have been rendered opaque to archaeologists because the "crime scene" has been so successfully wiped down, so, too, in South America we have 5 million square kilometers of the Amazon

rainforest that remain almost as unfamiliar to archaeology as the dark side of the moon.

The two great continents of the Americas are not separate and have never been separate, either before or after the Ice Age. North America is in itself a **huge** landmass, with vast regions where little or no archaeology has ever been done. If a lost civilization was here in the Ice Age we cannot rule out the possibility that its physical artifacts and remains might yet be found. Given that many Native American cultures share myths of the destruction of a former world, a subterranean interval in the womb of the earth, and then an emergence into our present world,[42] the most fruitful direction in which to look might be for places of shelter and refuge deep underground.

The other region with immense scope for further inquiry is the Amazon. When North America passed through that cataclysmic episode between 12,836 and 12,815 years ago, South America

would have seemed like the obvious place for survivors of the lost civilization to take refuge. This would have been all the more likely if, as I speculate, South American hunter-gatherers had already been "adopted" and gifted with useful know-how in much the same way that Clovis appears to have been.

Even if the human story is badly broken in North America, with big pieces obviously missing, it's possible that a more complete account awaits us in the Amazon.

I can hear the mainstream protests already: "The whole idea of a lost civilization is nonsense!" "Pseudoscience!" "A waste of research funds!"

But the mainstream, which has wasted research funds for decades fruitlessly pursuing nonsensical fantasies like "Clovis First," should have learned by now to keep an open mind.

30

THE KEY TO EARTH'S LOST CIVILIZATION

SINCE I BEGAN WORK ON *Fingerprints of the Gods* in the early 1990s I've been an advocate for the unorthodox notion that an advanced civilization flourished during the Ice Age and was destroyed in the cataclysms that brought the Ice Age to an end. I've written my

books to make the case and provide supporting evidence for this possibility. I've suggested a number of locations that I feel would be worth looking into—including, most controversially, Antarctica—and I invested nearly 10 years of my life in arduous and sometimes highly risky scuba-diving adventures searching for man-made structures submerged by rising sea levels at the end of the Ice Age.

So I've walked the walk, but it's been a bit like tracking the Invisible Man. There are signs of his presence everywhere—he has touched this, he has reshaped that, this was how he did mathematics, these were his beliefs—but the Man himself remains concealed. There's not even the option to guess the appearance and character of the lost civilization by wrapping its face in bandages like the hero of the H. G. Wells novel. It's much more elusive. Physical traces that might point to its homeland have either been so completely demolished or so thoroughly hidden from view that they are extremely difficult to find, especially so by an archaeological

community already preconvinced of their nonexistence and therefore unwilling to look for them.

What's tantalizing, however, is that the influence of the lost civilization declares itself repeatedly in the commonalities shared by supposedly unconnected cultures all around the ancient world. The deeper you dig, the more obvious it becomes that they did not get these shared features from one another but from a remote common ancestor of them all. We see only the effects and modes of expression of that inheritance, not its source, and all searches for the key to the mystery have thus far been in vain.

My proposal, simply, is that America offers us that key, and that it does so because of the unique circumstances of its prehistory. Unlike the interconnected landmasses of Africa and Eurasia, and unlike Australia, which was relatively accessible by sea from the extreme southeast of Asia, we've seen that the Americas were isolated during much of the Ice Age—a geological epoch that lasted, let us not forget, from around 2.6 million years ago until

around 12,000 years ago.[1] In this long geological epoch, however, there were several periods of temporary climate warming when the macro-continent of North, Central, and South America would have become accessible. Two of these periods of enhanced accessibility occurred within the known time frame of past human migrations and it is the most recent (the so-called Bølling-Allerød interstadial, dated from around 14,700 years ago to around 12,800 years ago[2]) that archaeologists focused their attention on for far too long in their attempts to reconstruct the true story of the peopling of the Americas. I think paleontologist Tom Deméré is on to something HUGE with this plea that he makes to the scientific community, discussed in chapter 5:

> what we're saying to everyone, really, is open your mind to the possibility that instead of the peopling of the Americas being associated with the last deglaciation event [the Bølling-Allerød interstadial] … what we should actually be looking at is the deglaciation event *before that*—between 140,000 and 120,000 years ago.[3] You get the same sort of scenario with a landbridge and ice sheets retreating and

you get that same sweet spot between really low sea levels and a blockage by ice sheets, and ice sheets gone and the flooding of the landbridge.

Deméré's suggestion still remains unpalatable to some archaeologists, yet it satisfactorily explains the growing mass of evidence that the Americas were peopled many tens of millennia **before** the Bølling-Allerød interstadial (see chapters 4, 5, and 6). More than that, this hitherto unimagined possibility of a very old (rather than very young) human presence in the New World helps make sense of the complex genetic heritage of Native Americans—explored in chapters 7, 8, 9, and 10. Embedded in this evidence is the mind-dilating mystery of the strong Australasian DNA signal present among certain isolated tribes of the Amazon rainforest. It's a recent discovery and highly significant because it raises the possibility, as discussed in chapter 10, that transoceanic voyages were being undertaken more than 12,000 years ago—a notion hitherto considered impossible by archaeologists. If the technology and geodetic know-how to make such voyages were indeed present

in the world during the Ice Age (see appendix 2), then we are, by definition, dealing with a lost civilization.

And this of course brings us to the mystery of the Amazon itself. Was it in some way "touched" by a civilization advanced enough to have explored all the world's oceans during the Ice Age? And if so, has any evidence of that influence remained? In chapters 11 through 17 I address these questions and present evidence that human settlement in the Amazon is extremely ancient, that great cities and large populations once flourished there, that ancient scientific knowledge of the properties of plants persists among Amazonian peoples to this day, that there was very early domestication of useful agricultural species, that the rainforest itself is an anthropocentric, cultivated, ordered "garden," and that a "miraculous" man-made soil—*terra preta*—was developed in the Amazon in deep antiquity, bringing fertility to otherwise agriculturally unproductive lands and imbued with astonishing powers of self-renewal that modern scientists marvel at and do not yet fully understand.

In parallel, and again a recent discovery, is the presence of gigantic geometrical earthworks and astronomically aligned stone circles in the Amazon. I show in chapters 15 and 16 that these remarkable structures share significant scientific “memes” with the henges and stone circles of the British Isles and with other works of ancient, sacred architecture all around the world. I suggest this is not coincidental, nor due to the direct influence of one region upon the other, but that it bears witness instead to a shared legacy, a shared package of sacred geometrical and astronomical blueprints, inherited in both these widely separated regions from an earlier civilization lost to history.

Chapter 17 returns to the theme of plant gnosis in the Amazon, looks into the mysteries of the vision-inducing brew ayahuasca, and hears the words of ayahuasca shamans, who see geometric patterns as portals to other realms of existence—specifically to the afterlife realm or land of the dead.

Indeed, the very name ayahuasca means “Vine of the Dead” or “Vine of Souls.”

In chapters 18 through 21 I explore the deep structural similarities between the Amazonian geoglyphs and the great mounds and geometric earthworks of the Mississippi Valley. It’s not simply a matter of appearances. Mississippian religious ideas, like those of the ancient Amazon, were focused on the mystery of death and on certain very specific notions concerning the afterlife journey—and destination—of the soul.

I show that these notions are extremely ancient in North America and trace them back into remote prehistory through a succession of sites such as Poverty Point, Lower Jackson Mound, Watson Brake, and Conly, where the same astronomical and geometric “memes” consistently reappear.

Chapter 22 recounts my own close encounter, as a teenager, with the mystery of death and how my interest in this mystery was reawakened when I first studied the *Ancient Egyptian Book of the*

Dead many years later. I describe the Duat, the afterlife realm as depicted by the ancient Egyptians, and the soul's ascent to the constellation Orion and thence through a portal, or "doorway in the sky," to a journey along the Milky Way. And I describe my astonishment, on a visit to Moundville in Alabama, to learn that what appeared to be exactly the same system of ideas involving Orion, the Milky Way, and a journey to the realm of the dead was also a predominant motif of the Mississippian civilization.

In chapters 23 and 24 I offer a detailed investigation of Mississippian and ancient Egyptian ideas concerning the afterlife journey—and destiny—of the soul. The parallels, in my view, are too remarkable, too many, and too detailed to be explained by coincidence. Nor do they point to a direct influence of ancient Egypt on the Mississippian civilization or vice versa—chronologically impossible because they existed at completely different times. As with the geoglyphs, what is indicated here is a legacy of ideas

inherited in both these widely separated areas from a remote common source as yet unidentified by archaeologists.

Could that common source, that lost civilization, have had its Ice Age homeland in North America?

I set out to answer that question in chapters 25 through 27, where I present detailed evidence of the immense cataclysm that shook the earth around 12,800 years ago—a cataclysm that was global in its consequences but that had its epicenter in North America.

For more than two decades, while eliciting patronizing sneers and sometimes extreme hostility from the scholarly establishment, I've consistently maintained that "my" proposed lost civilization was erased from history in a global cataclysm somewhere around 12,500 years ago. At first, the very suggestion that there had been a cataclysm at all, and that it might be of immense relevance to the past of our species, was singled out for particular ridicule, but then came a mass of new evidence that shifted the balance of the argument decisively. Within the resolution limits of radiocarbon

calibration (where at such a remove margins of error of two or three centuries are the norm), the date for the cataclysm of around 12,500 years ago that I first put into print in 1995 is extremely close to the date of around 12,800 years ago that scientists have much more recently established for the impacts of multiple fragments of the giant disintegrating comet that precipitated the catastrophic onset of the Younger Dryas.

It seems, then, that there **was** a global cataclysm—and at more or less the very time I had proposed.

But so what? Just because I got lucky on the timing of the cataclysm doesn't mean I was right that it wiped out an advanced prehistoric civilization. Show us its homeland, the skeptics therefore quite reasonably demanded.

This book is, in part, my response to that challenge.

MORE THAN ENOUGH TIME FOR A CIVILIZATION TO DEVELOP

HITHERTO ICE AGE NORTH AMERICA has been seen as an uninhabited archaeological vacuum, awaiting the arrival of culture with the first human migrations across the Bering land bridge. Because of the entrenched belief that these migrations came relatively late, at a time when our ancestors had been "out of Africa" and already established in Europe, Asia, and Australia for tens of millennia, there was no reason to seek the origins of civilization in such an unlikely place. In the light of the new evidence on the very ancient peopling of the Americas that we have explored, however, and of the Younger Dryas Impact Hypothesis, I suggest that the balance of the argument has once again shifted decisively. Whereas before it was reasonable to ask why the homeland of the lost civilization **should** have been in North America, the more pertinent question

today is why should it **not** have been in North America—the continent that suffered more severe disruption than any other and that had so much of its rich prehistory pounded, pulverized, and swept away by the devastating events of 12,800 years ago.

Not for the first time in this investigation I'm reminded of what Tom Deméré told me when he showed me the finds from the Cerutti Mastodon Site at The Nat in San Diego:

> If you go to a place and you absolutely rule out in advance that humans were there 130,000 years ago, then you're clearly not going to find evidence that they were. But if you go with an open mind and dig deep enough in the right places, then who knows what you might turn up.

Tom was talking about the conclusion that he and his team had reached concerning the mastodon remains now on show in his museum, namely, as we saw in chapter 5, that they had been scavenged by human beings 130,000 years ago. His point was that an ingrained perception that no humans could have reached the

Americas by such an early date had for too long inhibited investigation of alternative scenarios—and that perhaps much more evidence of a very early presence would be found if a more targeted and determined search were made.

Using rocks intelligently to smash mastodon femurs so that the marrow can be extracted is certainly not the work of a lost civilization of any kind. It is the work of ancestral humans, perhaps anatomically modern, perhaps not. But the real importance of the Cerutti Mastodon Site is that it provides the first solid evidence—solid enough to make it into the pages of *Nature*—of a truly **ancient** human occupation of the New World. If humans were in North America 130,000 years ago (more than twice as long as the span of the known human presence in Europe), that gives them **117,000 years** to have evolved a high civilization before the Younger Dryas cataclysm struck.

And why should they **not** have done so? What is particularly special or inviolable about the so-called march toward civilization

that **seems** to begin with the onset of the Neolithic at the end of the Younger Dryas? Why did it happen then and not before? Why shouldn't there have been an earlier "march towards civilization" that began with an earlier peopling of the Americas—not with the last deglaciation event but, as Tom Deméré suggested, with "the deglaciation event *before that,* between 140,000 and 120,000 years ago?"

Thereafter, until the next episode of deglaciation (the Bølling-Allerød interstadial) in the 2,000 years immediately preceding the Younger Dryas, all scholars agree that the vast landmass of the Americas, straddling half the globe, was cut off from the rest of the world by the Atlantic and Pacific Oceans and by mountains of ice. Migrants from Asia, even when Beringia was accessible, could not get in. But for those humans who were already south of the ice cap 120,000 years ago, the Americas must have been a paradise, safe from incursions by any other peoples and blessed with an astonishing abundance and variety of natural resources. The New

World offered conditions utterly different from those available on any other continent, so I see no reason why the very first of the First Americans should not also have followed a radically different path from other humans—a path that more rapidly veered away from hunting and gathering and that led ultimately to the emergence of a precociously early civilization.

MYSTERIOUS POWERS

IF THE YOUNGER DRYAS EARTH changes wiped a prehistoric civilization from the record, then can anything useful ever be said about the character of that civilization?

Thus far (extrapolating from the belief systems of its descendants) I've suggested that its spirituality must have involved profound explorations of the mystery of death. I've suggested that

accurate ancient maps depicting the earth as it looked during the Ice Age imply that it had developed a level of maritime technology at least as advanced as that possessed by European seafarers in the late eighteenth century. I've suggested that it had mastered sophisticated geometry and astronomy. I've also suggested that such a "lost" civilization, maturing in isolation for tens of thousands of years in North America, might have taken a very different path from our own and might have developed technologies that archaeologists would be unable to recognize because they operated on principles or manipulated forces unknown to modern science.

In his 1920 study *The Interpretation of Radium,* Nobel Prize winner Frederick Soddy, one of the pioneers of nuclear physics, speculated as to the former existence of "a wholly unknown and unsuspected ancient civilization of which all other relic has disappeared."[4] He drew attention to the seemingly limitless stores of nuclear energy that were in his time understood to be possessed by

certain elements such as radium and compared these to the fabulous "philosopher's stone" credited in ancient traditions with mysterious powers of transmutation and regeneration. The similarity, he felt, was no coincidence but "an echo from one of many previous epochs in the unrecorded history of the world"[5]:

> Can we not read into [such traditions] … justification for the belief that some former forgotten race of men attained not only to the knowledge we have so recently won, but also to the power that is not yet ours? Science has reconstructed the story of the past as one of a continuous Ascent of Man to the present-day level of his powers. In face of the circumstantial evidence existing of this steady upward progress of the race, the traditional view of the Fall of Man from a higher former state has come to be more and more difficult to understand. From our new standpoint the two points of view are by no means so irreconcilable as they appeared. A race which could transmute matter would have little need to earn its bread by the sweat of its brow. If we can judge from what our engineers accomplish with their comparatively restricted supplies of energy, such a race could transform a desert continent, thaw the frozen poles and make the whole world one smiling Garden of Eden. Possibly they could even explore the outer realms of space. … The legend of the Fall of Man … may be all that has survived of such a time before, for some unknown reason, the whole world was plunged

> back again under the undisputed sway of Nature, to begin once more its upward toilsome journey through the ages.[6]

In the 2020s (as would not have been the case in the 1920s) there's a good chance archaeologists would recognize an ancient technology designed to exploit nuclear power—and if they didn't, they would certainly be able to call in someone who did. This is because our own science has now advanced to a level where nuclear power is familiar to us. By contrast, Soddy's imagining of a lost high civilization of prehistoric antiquity that had fully penetrated the mysteries of the atom was written in the infancy of our risky dance with nukes—25 years before Hiroshima and Nagasaki and 35 years before the first nuclear power stations came online. A man of his time, therefore, when the almost magical potential of the new technology was becoming apparent but when its downsides were largely unknown, Soddy was all idealism. He could not have anticipated that the immense power of the atom, once fully

harnessed, would **never** be used to transform deserts, thaw the poles, or "make the whole world one smiling Garden of Eden," but would instead be deployed primarily for destructive purposes in the form of bombs and missiles, or for generating electricity at the long-term cost of poisoning the earth.

It is not necessarily the case that an earlier advanced civilization would have chosen the nuclear path so enthusiastically envisaged for it by Soddy. Nor must it inevitably have taken the path of leverage and mechanical advantage that historical civilizations have so doggedly trudged down for the past few thousand years on their way to the "machine age." I return again to my point. Since we are considering the possibility of "a wholly unknown and unsuspected civilization," we must also consider the possibility that it might have developed wholly unknown and unsuspected ways of manipulating matter and energy—which we might therefore be unable to recognize even if the evidence was right before our eyes.

Perhaps this is why modern archaeologists, trained to analyze ancient construction techniques through the reference frame of leverage and mechanical advantage, are unable to provide convincing explanations for a number of significant architectural problems of the ancient world.

Take the case of the massive beams, quarried from solid granite and weighing in the range of 70 tons each, incorporated into the core of Egypt's Great Pyramid in the series of "relieving chambers" stacked on top of the "King's Chamber" more than 50 meters (164 feet) above ground level. None of the wishful scholarly claims of megaliths somehow being slid "easily" into place on wooden rollers or on lubricated sand will work at this elevation. The fact of the matter is that the hulking beams forming the floors and ceilings of the relieving chambers are where they are—and that in order to get there they had to be lifted more than 50 meters into the air.

Or consider the Trilithon at Baalbek in Lebanon. Here, 20 feet above the ground, three immense ashlars weighing more than 800

tons each have been placed end to end within a wall of smaller blocks and so tightly fitted that the joints can barely be seen. It wouldn't be an easy feat even with twenty-first-century technology, so how could it possibly have been accomplished thousands of years ago?

Let us also not forget the marvel of Sacsayhuamán, perched on a ridge above the city of Cuzco in the Peruvian Andes at an altitude of 3,700 meters (12,140 feet). I have made the case in previous books that this supposed Inca site was already enormously ancient at the time of the Incas and has been wrongly attributed to them. Of particular relevance here are its colossal megalithic walls arranged in a series of zigzags and consisting of intricately formed polygonal blocks. No two blocks among the thousands at Sacsayhuamán are the same shape, some weigh more than 300 tons, and all are so tightly interlocked in all dimensions that the edge of a piece of paper cannot be slipped between the joints. Efforts by archaeologists to reconstruct how the work at Sacsayhuamán was

done have proved as ludicrous as a failed attempt in 1978 to build a midget-size scale model of the Great Pyramid—and once again this is because the only reference frame deemed acceptable, involving leverage and mechanical advantage, is unable to account for many of the more complex anomalies.

There is an answer, but it involves looking outside the box.

At the Great Pyramid, at Baalbek, and at Sacsayhuamán, as well as at numerous other mysterious sites (such as the almost unbelievable Kailasa Temple, hewn out of solid basalt at Ellora in the Indian state of Maharashtra), intriguing ancient traditions persist. These traditions speak of meditating sages, the use of certain plants, the focused attention of initiates, miraculously speedy workmanship, and special kinds of chanting or tones played on musical instruments in connection with the lifting, placing, softening, and moulding of megaliths. My guess, confronted by the global distribution of such narratives and by the stark reality of the sites themselves, is that we're dealing with the reverberations of an

ancient technology we don't understand, operating on principles that are utterly unknown to us.

Soddy, imagining a lost civilization that had developed machines powered by nuclear energy, speaks of exploring the outer realms of space and manipulating the global climate, but I beg to differ. I don't think nuclear power was involved and I don't think *machines* were involved, either. As I near the end of my life's work, and of this book, I suppose the time has come to say in print what I have already said many times in public Q&A sessions at my lectures, that in my view the science of the lost civilization was primarily focused upon what we now call *psi* capacities that deployed the enhanced and focused power of human consciousness to channel energies and to manipulate matter.

Although *psi* research is still undertaken at a small number of universities and institutes in Britain, the United States, and Russia, it is generally ridiculed and sidelined by modern mainstream scientists. This categorically does not mean that "there's nothing to

psi" but instead speaks volumes about the nature of science today, which is heavily dominated by materialist thinkers whose reference frame has little room for "spooky action at a distance." The phrase (which was Einstein's) refers specifically to the paradoxes of quantum entanglement but applies equally well to other alleged "non-local" phenomena such as:

1. telepathy ("communication from one person to another of thoughts, feelings, desires, etc, involving mechanisms that cannot be understood in terms of known scientific laws");
2. remote viewing ("the practice of seeking impressions about a distant or unseen target, purportedly using extrasensory perception");
3. telekinesis ("the movement of a body caused by thought or willpower without the application of physical force");
4. healing powers (whereby patients are successfully cured of

their ailments by nonphysical and nonmedical means)

My speculation, which I will not attempt to prove here or to support with evidence but merely present for consideration, is that the advanced civilization I see evolving in North America during the Ice Age had transcended leverage and mechanical advantage and learned to manipulate matter and energy by deploying powers of consciousness that we have not yet begun to tap. In action such powers would look something like magic even today and must have seemed supernatural and godlike to the hunter-gatherers who shared the Ice Age world with these mysterious adepts.

Keep in mind that we are talking about a Native American civilization growing to maturity at some point during the long interval between the scavenging of the Cerutti mastodon 130,000 years ago and the cataclysmic onset of the Younger Dryas 12,800 years ago. Though we may never know what set it on its own brilliant, idiosyncratic path, there is every reason to suppose that its

people would have been closely related genetically, linguistically—and at first culturally—to other early Native American populations who remained at the hunter-gatherer stage. It follows, therefore, if this hypothetical civilization had sciences, that they should be rooted and grounded in a recognizably Native American reference frame, and therefore would likely have developed under the guidance of shamans and using the methods of shamanism.

Telepathy, telekinesis, remote viewing, and healing powers are, of course, all capacities believed to be within the repertoire of master shamans. Indeed ayahuasca, which lies at the heart of Amazonian shamanism, first entered mainstream Western consciousness under the name *Telepathine*. In 1952, for example, on a quest in Ecuador for the visionary brew, William Burroughs wrote [his spellings; emphasis mine] that he had failed to "score for Yage, Bannisteria caapi, **Telepathine**, ayahuasca—all names for the same drug."[7]

He was determined to find it, however, because of its "tremendous implications" and the "mystery" surrounding it, adding, "I'm the man who can dig it."[8]

The reason behind the choice of the name *Telepathine,* which began to be applied to ayahuasca as early as 1905,[9] was that Amazonian tribes making regular use of the brew repeatedly stated that it facilitated telepathic communication. The mechanistic Western mind of the twenty-first century scoffs at such claims, but leading ayahuasca researcher Benny Shanon, professor of psychology at the Hebrew University in Jerusalem, concedes that "reports of paranormal experiences with Ayahuasca abound:"

> Practically everyone who has had more than a rudimentary exposure to the brew reports having had telepathic experiences. Many such reports also appear in the anthropological literature. … Similarly many of my informants said that without overt verbal articulation they could pass messages to other people present in the Ayahuasca session. … Likewise, many indicated that they received such messages from other persons or beings. Usually, in visions in which drinkers feel that they are receiving messages or instructions from beings and creatures, the

communication in question is said to be achieved without words—directly from thought to thought.[10]

In the modern world we are so fixated on our machines and devices that it's almost impossible to imagine life without them. But if telepathy is real—a debate we won't be able to get into here—and if its use and projection could be refined and made reliable, then who would need cell phones or Facebook or any of the other means of communication that are so ubiquitous today? Once again we would own our own conversations rather than having to depend on some intermediary or "platform" to relay them!

Might it not be the case that *psi* powers have always been part of the human heritage? Part of our "Golden Age"? Perhaps these powers atrophied after the Younger Dryas cataclysm broke our connection to our roots? And perhaps, in the aftermath of the cataclysm, the resourcefulness of our species was refocused on techniques of leverage and mechanical advantage and a negative

feedback loop developed that ushered in the march of the machines and saw *psi* banished to the margins of human experience?

REVERSE ENGINEERING THE SYSTEM

I'LL NOT SPECULATE FURTHER HERE about the lost technology of a destroyed civilization. There are tantalizing hints and clues but unfortunately even the first archaeological steps that might make solid progress possible have never been taken. There's more to work with, however, when we come to religious and spiritual beliefs that, according to the Edfu Building Texts, it was the duty of the survivors of the lost civilization to preserve and to replicate wherever in the world they could find receptive ground.

In the twenty-first century, Christianity and Islam—upstart religions of the past 2,000 years—exercise effective monopolies

over the spiritual lives of more than half the world's population. Their simple formula of one creator god (male, of course), and of a heavenly paradise for His faithful paired with a hellish place of punishment for disbelievers and evildoers, brilliantly removes the need for serious thought. All that's required to join the elect is to tick the right boxes and maintain a state of rigid, abiding, unquestioning BELIEF in the authority of the sacred texts and the utterances of the priests and the mullahs self-appointed to interpret them.

Perhaps it's the easiest option, requiring the smallest quantum of uncomfortable reflection, but it's certainly not the only one, and neither is atheism—which also rests on unproven beliefs—in any way its opposite. The full range of human spiritual potential cannot be brutally reduced to believing that a god exists or to believing that a god does not exist. Agnosticism is often proposed as the only alternative, but there are far more subtle and even "scientific" ways forward, explored confidently by our ancestors many millennia ago,

that deserve serious attention. Important elements survive in some of the more esoteric aspects of Hinduism and Tibetan Buddhism—notably in *The Tibetan Book of the Dead,* which bears striking similarities to the *Ancient Egyptian Book of the Dead* and descends, I suggest, from the same common source. There is much among the Maya (reported in *Fingerprints of the Gods* and in *Heaven's Mirror*) that adds to the picture. Meanwhile, Amazonian shamanism and the strangely interlinked religions of the Nile and Mississippi Valleys open further vistas of understanding.

In particular, whether we speak of the visionary "leap" to the Milky Way and to the Underworld that lies beyond it made by Tukano shamans under the influence of ayahuasca, or of Mississippian ideas concerning the "Path of Souls," or of the ancient Egyptian afterlife journey through the Duat, I think the only reasonable conclusion to be drawn from the material presented in previous chapters is that we are dealing with a complex and sophisticated system of shared ideas inherited from a remote

common ancestor. And just as our DNA can be "reverse engineered" by geneticists to reveal much about our forebears, so, too, the shared segments of cultural DNA in the religions of the Mississippi Valley and ancient Egypt give us insights into the character of the vastly more ancient predecessor religion that spawned them both. That ancient religion—the religion of the lost civilization—was itself, I would contend, a highly specialized offshoot of Native American shamanism and its primary focus, as is the focus of all shamanism, was the mystery of death.

WHAT HAPPENS TO US WHEN WE DIE?

OUR SOCIETY PREFERS TO IGNORE and marginalize the problem of death. It is an ever-present reality for all of us—much less when we are young, much more as we grow old—and yet we do all we can to

avoid it. We know in an abstract sense that it awaits us, but meanwhile we prefer to dwell as little as possible on its implications and to live our lives as though they will never end.

The reference frame out of which such thinking emerges cannot be pinned on any of the Abrahamic religions but belongs to the scientism of the modern age, which holds that we are entirely material creatures, random accidents of chemistry and biology, that there is no transcendent meaning or purpose to our existence, that there is no such thing as the soul, that death is final, and that there is no "afterlife." If those are your beliefs, which are only a subset of wider beliefs that strip the universe of spirit and conceive of it as some sort of gigantic, unconscious automaton, then of course it makes sense to abjure all thoughts of death and to postpone death for as long as possible, even though many ancient traditions, despised by the scientific mind-set, warn that unwillingness to die produces unfavorable results. "As here in America," comments W. Y. Evans-Wentz, the translator of *The Tibetan Book of the Dead,*

> every effort is apt to be made by a materialistically inclined medical science to postpone, and thereby to interfere with, the death-process. Very often the dying is not permitted to die in his or her own home or in a normal, unperturbed mental condition when the hospital has been reached. To die in hospital, probably while under the mind-benumbing influence of some opiate, or else under the stimulation of some drug injected into the body to enable the dying to cling to life as long as possible, cannot but be productive of a very undesirable death, as undesirable as that of a shell-shocked soldier on a battlefield. Even as the normal result of the birth-process may be aborted by malpractices, so, similarly, may the normal result of the death-process be aborted.[11]

Matters would have been handled very differently, I propose, in an advanced Native American civilization that had **not** severed its roots with shamanism—as we have done—but had instead evolved forms of science and technology that emerged directly from shamanistic preoccupations and shamanistic experiences. Rather than turning its back on death, I expect that such a civilization would have confronted and investigated every aspect of the mystery, and would certainly have deployed trance techniques with scientific objectivity and discipline to explore and test the reality

status of the “Otherworlds” and “Underworlds” encountered in vision.

It is further evidence of a remote common source behind some widespread religious motifs that one of the most famous myths of the ancient Greeks—the tale of Orpheus and Eurydice—was also present, long before European contact, in the ancient pre-Columbian cultures of North America.[12] Some details vary, as of course do the names of the central characters and the general setting, but the underlying structure remains the same[13]—(1) a wife or sweetheart (Eurydice) dies prematurely; (2) her husband or lover (Orpheus) follows her soul to the Underworld and persuades its ruler to let her return with him to the land of the living; (3) Eurydice’s release is agreed on condition that she walk behind Orpheus as they make the return journey from the Underworld and that under no circumstances should he set eyes on her until they reach the land of the living; (4) at the last moment, overcome with love, Orpheus

cannot resist glancing over his shoulder at his wife and in that instant she is cast back into the Underworld that she can henceforth never leave.

So compellingly similar are the Native American and Greek versions that leading scholar of religions Ake Hultkrantz dedicated an immense monograph to the mystery, published in Stockholm in 1957, titled *The North American Indian Orpheus Tradition.*[14] Meanwhile his contemporary, Canadian ethnographer Charles Marius Barbeau, proposed that the Greek and Native American stories must both be offshoots of some much older core narrative and concluded, "The worldwide diffusion from an unknown source of a tale so typically classical as Orpheus and Eurydice must have required millenniums."[15]

Of course I agree that the wide distribution of localized versions of the Orpheus and Eurydice myth suggests the great antiquity of the common source from which they all descend. But what I find

equally interesting is that the foundations of the narrative clearly lie in the concepts of the afterlife journey of the soul and the duality of spirit and matter so central to the religious beliefs of ancient Egypt and the ancient Mississippi Valley. Could it be that what we have in these superficially separate but deeply interconnected systems are the surviving threads from a once immense tapestry of thought about the human condition, our place in the cosmos, and the meaning of life and death?

And just as our own sciences today are capable of highly sophisticated interventions and manipulations in the realm of matter, might it not be that the sciences of the lost civilization were capable of equally effective interventions and manipulations in the realm of spirit—and possibly, therefore, had accumulated veridical information concerning dimensions of reality about which we ourselves are presently entirely ignorant?

For those who believe that all notions of "spirit" are fantasy, that consciousness expires with the physical body, and that any form of

life after death is therefore impossible, the notion of investing time, resources, and ingenuity in developing a "science of death"—perhaps better termed a "science of the afterlife" or even a "science of immortality"—sounds like the worst kind of wishful thinking. The consequence, described so eloquently by W. Y. Evans-Wentz, is that from the materialistic perspective the only valid application of science to the problem of death is in the outfitting of hospitals and the preparation of medicines to "ease" the passing and—if the deceased is otherwise in good physical condition—to recycle his or her organs.

But what if our materialist science, which has a pedigree of only a few hundred years since the dawn of the so-called Age of Reason in the late seventeenth century, is fundamentally **incomplete** in its analysis of the nature of reality and of the phenomenon of death? And what if the far older tradition of the afterlife journey of the soul manifested in ancient Egypt and in the ancient Mississippi Valley, and by Amazonian shamans to this day, conceals deep truths?

If that were the case, then Western scientific materialism might have led us down a very dark and dangerous path indeed—one with repercussions across eternity.

In Tibetan Buddhism the afterlife realm is known as the Bardo—literally "the Between." Just like the *Ancient Egyptian Book of the Dead* and the Mississippian oral and iconographic traditions, the purpose of the Tibetan Book of the Dead is to serve as a guidebook and instruction manual for the soul on its postmortem journey through this strange parallel dimension.

"The Between," explains prominent American Buddhist scholar Robert A. F. Thurman, is "a time of crisis after death when the soul (the very subtle mind-body) is in its most highly fluid state."[16] It is a time of extraordinary danger but also of extraordinary opportunity:

> If the good person, who has a strong momentum of good evolutionary action, is unprepared for the Between, he or she can lose an enormous amount of evolutionary progress in the twinkling of an eye by becoming frightened and

> hiding in darkness. Similarly, a bad person, who has a great weight of negative evolution, if well prepared for the Between, can overcome immense eons of wretched lives by bravely shooting for the light. After all, a tiny achievement on the subtle plane can have a powerful impact on the gross. The soul in the Between can directly modify, just with creative imagination, what the Buddhists call "the spiritual genes" it carries with it. The Between voyager has temporarily an immensely heightened intelligence, extraordinary powers of concentration, special abilities of clairvoyance and teleportation, flexibility to become whatever can be imagined and the openness to be radically transformed by a thought or a vision or an instruction. This is indeed why the Between traveler can become instantly liberated just by understanding where he or she is in the Between, what the reality is, where the allies are, and where the dangers.[17]

Western science possesses unprecedented knowledge of the material realm over which it has achieved extensive mastery. We should not assume, however, that this means it is also automatically in possession of superior knowledge that refutes the Tibetan "Science of Death" (the phrase that Robert Thurman uses to describe the teachings in *The Tibetan Book of the Dead*[18]). On the contrary, since Western science has shunned investigation of the

afterlife because of the unevidenced preconception that there is no such thing, we should rather accept that Tibetan Buddhism, which has devoted long centuries of intelligent study to the matter, may be far ahead of us. Moreover, as I've argued, *The Tibetan Book of the Dead* descends from the same vastly older progenitor that also gave rise to the ancient Egyptian and Mississippian systems and therefore might potentially be harnessed, like them, to the task of reconstructing that progenitor.

My sense is that the lost civilization, as might be expected with its proposed shamanic origins, was not much interested in material things. Like many other Native American cultures, its primary goals were not to do with the acquisition of status or wealth but instead were focused, through vision quests and right living, on the perfection of the soul. From the complexity and deep wisdom that still shines through in its offspring religions, I suggest that it took these inquiries very far into regions of mystery that in our culture even quantum physicists and scientists engaged with virtual reality

have barely begun to contemplate. In order to prepare its initiates thoroughly so that they might be "well equipped" for the ultimate journey of death—surely a matter of far greater significance than any material concerns—the direct exploration of parallel dimensions would, as noted earlier, almost certainly have been undertaken. Had this investigation been allowed to proceed uninterrupted it might by now have transcended space, time, and matter entirely, but 12,800 years ago a deadly mass of matter in the form of the Younger Dryas comet was flung at it and brought a pause to the great prehistoric quest.

A pause but not a halt—for if I'm right there were survivors who attempted, with varying degrees of success, to repromulgate the lost teachings, planting "sleeper cells" far and wide in hunter-gatherer cultures in the form of institutions and memes that could store and transmit knowledge and, when the time was right, activate a program of public works, rapid agricultural development, and enhanced spiritual inquiry.

As to the fate of the lost civilization itself, I can only guess that its North American homeland, in which it may have evolved in comparative isolation for more than 100,000 years, was located in one or several of the immense areas south of the ice cap, from the Channeled Scablands of Washington State in the west, through Nebraska, Wyoming, and the Dakotas, through the Great Lakes where one of most devastating impacts may have occurred, and east to the Finger Lakes of upstate New York. I've suggested that this was a seafaring civilization, able to map the Ice Age world and spread its influence to remote shores, but if it had harbors on the Atlantic and Pacific coasts of North America 13,000 years ago, they would have been submerged by the rapid rise in sea levels at the onset of the Younger Dryas 12,800 years ago and by the even more massive rise that marked the end of the Younger Dryas 11,600 years ago when the remnant ice caps of North America and Europe simultaneously collapsed into the oceans.

PAST IMPERFECT, FUTURE UNCERTAIN

THERE ARE LITERALLY THOUSANDS OF myths from every inhabited continent that speak of the existence of an advanced civilization in remote prehistory, of the lost golden age in which it flourished, and of the cataclysm that brought it to an end. A feature shared by many of them—the story of Atlantis, for example, or of Noah's flood—is the notion that human beings, by their own arrogance, cruelty, and disrespect for the earth, had somehow brought the disaster down upon their own heads and accordingly were obliged by the gods to go back to basics and learn humility again.

Where does this sense of ancestral guilt come from with its peculiar intimations of a mistaken direction taken by humanity in some remote period and purged by a global catastrophe? These are not the kinds of thoughts one would expect hunter-gatherers to devote much time to. A technologically advanced people, on the

other hand, particularly if they had mastered the transmutation of matter, would have had vastly more potential for hubris and overreach. In the event of the cataclysmic downfall of their civilization, those who survived might well have reflected on their history and blamed themselves for what happened.

Who knows? Perhaps some hubristic excesses had occurred that would have justified such speculations?

A drift toward self-indulgent materialism?

The introduction of human sacrifice?

The appearance of a new and vigorously proselytizing cult denying the existence of the soul?

The enslavement and exploitation of hunter-gatherer tribes?

The arming of one group of hunter-gatherers—such as Clovis—to give it a competitive advantage over others?

There could be 1,000 reasons why the humbled survivors of a once powerful but now utterly destroyed civilization seeking refuge among hunter-gatherers might have arrived with a sense of guilt.

An Ojibwa tradition seems relevant. It speaks of a comet that "burned up the earth" in the remote past and that is destined to return:

> The star with the long, wide tail is going to destroy the world some day when it comes low again. That's the comet called Long-Tailed Heavenly Climbing Star. It came down here once, thousands of years ago. Just like the sun. It had radiation and burning heat in its tail …
>
> Indian people were here before that happened, living on the earth. But things were wrong with nature on the earth, a lot of people had abandoned the spiritual path. The Holy Spirit warned them a long time before the comet came. Medicine men told everyone to prepare. … The comet burnt everything to the ground. There wasn't a thing left …
>
> There is a prophecy that the comet will destroy the earth again. But it's a restoration. The greatest blessing this island [Turtle Island] will ever have. People don't listen to their spiritual guidance today. There will be signs in the sun, moon and stars when that comet comes down again.[19]

Our science and technology in the twenty-first century are close to the point where, should we choose to do so and be willing to divert the necessary resources from—say—military expenditures, it

would be within our capacity to sweep our cosmic environment clean of asteroids and cometary debris and thus spare future generations the existential threat of further impacts. What is **not** within our scientific and technological competence, however, is to restore the earth and its environment **after** a major impact has occurred. Astronomer William Napier, professor of astrobiology at the University of Cardiff and a world expert on comets and asteroids, reminds us that the consequences of a global celestial catastrophe would far outstrip our capacity to respond:

> A modest impact has the potential to end civilisation, a giant one might put our species into an irreversible decline, like other primate species past and present. It took over three billion years of evolution to produce the sole terrestrial species capable of understanding the universe, and we do not know whether, if we are removed, intelligence is likely to evolve again. Nor do we know whether there are other intelligent species in our Galaxy. In the event that we are alone, and are removed by some catastrophe, then our Galaxy will return to its former dumb state and may never again leave it. In that sense, the survival of this particular species of ape is a cosmic imperative.[20]

We have already received fair warning from the universe in the form of the cataclysmic earth changes at the onset of the Younger Dryas. No serious researcher disputes that those earth changes occurred and, since 2007, the Younger Dryas Impact Hypothesis has established itself as the most widely accepted explanation for everything that happened. But at first the earth scientists behind the hypothesis could only say that the evidence pointed to a cosmic impactor of some kind, most likely a swarm of fragments from a disintegrating comet.

In 2010, however, in a paper published in the *Monthly Notices of the Royal Astronomical Society,* William Napier added his weight and specific details to the conclusion that a comet had indeed been involved—a giant comet, perhaps 100 kilometers in diameter, according to his calculations, that entered the inner solar system on an earth-crossing orbit somewhere between 30,000 and 20,000 years ago and thereafter underwent the series of fragmentations that

spawned the Taurid meteor stream.[21] This is a normal process for comets[22] and it's Professor Napier's case that intersection with the fragmenting debris of this exceptionally large comet around 12,800 years ago "provides a satisfactory explanation" for the postulated celestial origin of the Younger Dryas cataclysm.[23]

It's my case that the hit humanity took then erased a remarkable civilization from the record and that we have remained mired in amnesia ever since. In the process what is being neglected, despite the increasingly urgent warnings of a handful of astronomers, is that **most of the rubble from the ongoing fragmentation of the original comet remains in orbit in the Taurid meteor stream**, including some pieces of enormous size capable of ending civilization again. Indeed, as we saw in chapter 25, it's Napier's conclusion that this "unique complex of debris" represents "the greatest collision hazard facing the earth at the present time."[24]

In September 2017, drawing on imagery captured by the European Fireball Network, important new research on the Taurids, published in the journal *Astronomy and Astrophysics,* gave strong support to Napier's warning. The title of the paper speaks for itself: "Discovery of a New Branch of the Taurid Meteoroid Stream as a Real Source of Potentially Hazardous Bodies."[25]

The newly discovered branch is part of the Southern Taurids, encountered by the earth in late October and the first half of November, and it is just one of many indications that humanity's relationship with the Younger Dryas comet is not over. On the contrary, all the evidence from the close observation and investigation of the Taurids now being undertaken by astronomers is that we may be about to enter—or indeed may already have entered—an episode of enhanced danger. Ahead of us, perhaps still some decades away, lie particularly dense and turbulent filaments of the stream believed to contain "dark" fragments of the original

comet, in one case with a possible world-killing diameter of 30 kilometers.[26]

A TIME FOR CHANGE?

THIS BOOK HAS ROOTS IN much of my earlier work, particularly on ancient Mexico, the ancient Andean civilizations of South America, and ancient Egypt. However, it was not until early December 2016, during a visit I made to North Dakota and to the protest camp named Oceti Sakowin situated just beyond the present northern boundary of the Standing Rock Sioux Reservation, that *America Before* crystallized in my mind as a definite concept, coupled with firm intent.

Readers may recall how, from July 2016 onward, a rainbow coalition of Sioux, other Native American tribes, and non–Native American people gathered at Oceti Sakowin in an attempt to stop the laying of an oil pipeline under Lake Oahe on the Missouri River half a mile north of Standing Rock in a location where it not only transgressed traditionally sacred lands, but also threatened the reservation's water supply in the event of a spill.

Although extremely active and impassioned in the face of a clampdown by militarized security police, the protests of those who had become known as the "water protectors" failed to achieve their immediate objective, which was to have construction of the Dakota Access Pipeline (DAPL) halted completely. Quite to the contrary, on February 7, 2017, the official easement was granted,[27] work to complete the DAPL went ahead, and the first oil began to flow on June 1, 2017.[28] There were legal challenges from the Sioux and further protests and controversy following oil spills.[29] In December

2017 some interim restrictions were imposed on the pipeline operator to prevent further spills,[30] but as I write these words in July 2018, oil is still flowing through the pipeline and it seems that commercial interests have once again effectively trumped the interests and concerns of Native Americans.[31]

Central to the entire protest at Standing Rock was the notion that we live at a time when there is an urgent need to change our ways, to adopt a more humble and no longer rapacious approach to the earth, and to receive a spiritual message passed down from the ancients and held in safekeeping by the First Americans.

It's a message that resonates profoundly for me with so much that I've learned while researching this book.

"This is about everyone," Cody Two Bears of the Standing Rock Sioux told me as he explained the larger purpose of the Oceti Sakowin protests:

It's such an important time today—why people need to know this history. Because, for one, the history books would never tell you the correct story … the reason why. I talk to a lot of elders and a lot of spiritual leaders. We had to keep our ceremonies secret. We had to keep our stories a secret for so many years to preserve that. Because the government was fearful of what we had and who we are as a people. The laws will tell you that. There's even a current standing law today in Montana, I don't think they've taken it out of their law book, that if you see three Native Americans all together then you are able to shoot and kill them. Still legal in Montana! Those are the types of laws they created because they don't want to see Native Americans gather because for some reason they were fearful of us.

But little do they know, our ceremonies and our ways of life protected us and *Unci Maka* [Mother Earth]. We prayed even for those people who were afraid of us, to help them … to pray for them to make sure they were okay.

That's what our ceremonies are based around. It's not witchcraft … it's not casting spells on anybody, but that's what they thought for many, many years. … For example, the Ghost Dances we used to have in Lakota and Dakota country. When we did that, the *Washi'chu* [white people—literally "those who always take the largest portion"] were so fearful. They thought we were casting spells, when all in all we were trying to keep the balance with the Earth and the Stars. We need to keep that in balance, because if we don't start doing that today, we're not going to have anywhere to live in the next hundred years."

Some 12,800 years ago the balance between the Earth and the Stars was lost and a key chapter of the human story was lost with it. If it happens again, if our brief chapter, too, is lost, will all that remains of us at some vast remove in the future be an unhappy myth that tells of how, through our own greed and conceit, through our own recklessness and disregard for the planet in our care, and through our own excess of hate and dearth of love, we conspired in our own downfall?

APPENDIX 1

MELAZONIA, AKA AMANESIA

Although they are "a world apart and separated by forty thousand years or more of human history," certain "striking resemblances" and "remarkable similarities between societies in Amazonia and Melanesia" have kept scholars puzzled for more than a century.[1]

One of these puzzles concerns the skull shapes of indigenous Amazonians and Melanesians and an always unorthodox theory known as the "Paleoamerican hypothesis"[2] that proposes, "on the basis of cranial morphology" (just a fancy name for skull shapes):

> that two temporally and source-distinct populations colonized the Americas. The earlier population reportedly originated in Asia in the Late Pleistocene and gave rise to both Paleoamericans and present-day Australo-Melanesians, whose shared cranial morphological attributes are presumed to indicate their common ancestry. The Paleoamericans were, in turn, thought to have been largely replaced by ancestors of present-day Amerindians, whose crania resemble modern East Asians and who are argued to be descendants of later arriving Mongoloid populations. The presence of Paleoamericans is inferred primarily from ancient archaeological specimens in North and South America and a few relict populations of more recent age, which include the extinct Pericúes and Fuego-Patagonians.
>
> The Paleoamerican hypothesis predicts that these groups should be genetically closer to Australo-Melanesians than other Amerindians.[3]

Maanasa Raghavan and Eske Willerslev, both of the Centre for Geo-Genetics at the University of Copenhagen, put the hypothesis to the test at the genetic level as part of their study (discussed in part 3) and found that the ancient and more recent Native American skulls previously identified as having Australo-Melanesian morphology in fact cluster at the genetic level "with other Native American groups" and show no affinity to Australo-Melanesians.[4]

Their data joined a mass of preexisting genetic evidence pointing to the same conclusion.

For example, another study found that even the most ancient skulls displaying "traits attributable to Paleoamerican crania" turned out, after genetic sequencing, to "present the same mtDNA haplogroups as later populations with Amerindian morphology."[5]

A third comparative study of morphometric and molecular mtDNA haplogroup data from ancient and more recent Native American skeletal remains likewise concluded that "human populations inhabiting the Americas during archaic times cannot be considered as belonging to two different groups on the basis of analyzed data."[6]

In other words, although their skulls indeed might *appear* different, and much more like Australo-Melanesian skulls than more recent Amerindian skulls, "Paleoamericans" turn out to be genetically indistinct from more recent Amerindian populations.

Since genotype trumps phenotype every time as evidence for relatedness, the "Paleoamerican hypothesis" has therefore been regarded for some years as disproved.

Following their own study, however, discussed in chapter 9, Pontus Skoglund and David Reich (both of the Department of Genetics, Harvard Medical School) seem open to reconsidering the whole question when they describe their hypothetical "Population Y" that "likely contributed to the DNA of Native Americans from Amazonia and the Central Brazilian Plateau" as "a lineage more closely related to present-day Australasians than to present-day East Asians and Siberians."[7] They go on to add:

> This discovery is striking in light of interpretations of the morphology of some early Native American skeletons, which some authors have suggested have affinities to Australasian groups. The largest number of skeletons that have been described as having this craniofacial morphology and that date to younger than 10,000 years old have been found in Brazil, the home of the Surui, Karitiana and Xavante groups who show the strongest affinity to Australasians in genetic data.[8]

What has never been substantially in dispute is that the craniometric similarities between ancient populations from the Brazilian Amazon and Australo-Melanesian populations are real and quantifiable.[9] Moreover, while equally real and quantifiable, the genetic data suggesting that these similarities are not evidence of relatedness but must be coincidental, or perhaps the result of some sort of bizarre parallel evolutionary process, seems to me—and clearly to Skoglund and Reich as well—to be directly contradicted by that Australo-Melanesian signal sending out its rather compelling message of relatedness from Brazil.

In view of this I'd say, at the very least, that the earlier craniometric data needs to be revisited, particularly a study by Walter A. Neves and Mark Hubbe published in December 2005 in the *Proceedings of the National Academy of Sciences* in which "the largest sample of early American skulls ever studied"—eighty-one skulls from Brazil's Lagoa Santa region—is compared "with

worldwide datasets representing global morphological variation in humans, through three different multivariate analyses."[10]

In their paper Neves and Hubbe point out:

> Whereas late prehistoric, recent, and present Native Americans tend to exhibit a cranial morphology similar to late and modern Northern Asians … the earliest South Americans tend to be more similar to present Australians, Melanesians, and Sub-Saharan Africans.[11]

After conducting detailed measurements and analyses of their collection of eighty-one ancient Brazilian skulls and running their global comparisons, Neves and Hubbe are confident that "the results obtained from all multivariate analyses confirm a close morphological affinity between South-American Paleoindians and extant Australo-Melanesian groups."[12]

They then go on to offer two different hypotheses to explain "the morphological differences observed between early and late Native South Americans:"

> One is a local microevolutionary process that transformed, *in situ,* the Paleoamerican morphology into that prevailing today among Native Americans. The other is that the Americas were successively occupied by two morphologically differentiated human stocks, with the Paleoamerican morphology entering first.
>
> We believe the second hypothesis is more plausible for three reasons: first, it would be very unlikely that the same evolutionary event … happened in the Americas and in East Asia in parallel at approximately the same time; second, because in South America, at least, the transition between the two morphological patterns was, as far as we know, abrupt; and third, cranial morphology has recently been shown to respond adaptively only to extreme environmental conditions, being therefore much less plastic than originally thought.[13]

In short, as Neves and Hubbe summarize elsewhere in their paper, their results support the hypothesis "that two distinct biological populations could have colonized the New World in the Pleistocene-Holocene transition."[14]

This, of course, is a conclusion arrived at from the craniometric data, but it is also precisely the conclusion arrived at by Skoglund and Reich from their reading of the genetic data; namely, as the title

of their 2015 *Nature* paper indicates, that there is "genetic evidence for two founding populations of the Americas."[15]

On the other hand, as we've seen, Raghavan and Willerslev disagree. In their *Science* paper they favor, instead, a single founding population.[16]

Clearly in a state of affairs like this where the experts come to radically different conclusions based on nuances within essentially the same data, it would be unwise to go with one side or the other. Whether in the form of skulls or genes, though, it seems to me that the clues so far point in the direction of—to say the least!—some sort of forgotten connection.

There's more.

TWO TOWERS OF BABEL

Several researchers have noted that Australo-Melanesia and the Americas both manifest extraordinary "linguistic diversity" featuring much greater numbers of languages than in all other parts of the world. An implication of this, argues anthropologist German Dziebel, is that:

> measured by the number of independent linguistic stocks, linguistic divergence in the Americas must have taken at least 35,000 years. Of course, this figure cannot be taken literally but there's a marked contrast between language diversity in the Americas (and in places like Papua New Guinea, with human archaeological record of some 40,000 years) and language diversity in Africa.[17]

Austin Whittall, an author and regular blogger on ancient South American genetics and anthropological issues, also comments on the surprising phenomenon of high levels of linguistic diversity in Australo-Melanesia and the Americas:

> Why do Native American people speak so many languages? They supposedly reached the New World recently … yet evolved over 40% of the global

> languages! A figure higher than that found in Africa, the "Cradle of Mankind."
>
> Africans have had the time … and the advantage of not going through bottlenecks. … so they should have evolved more languages than any other group of humans. But they have not.[18]

New Guinea, Whittall points out next, has "the highest language diversity in the whole world."[19] Indeed, authority on world languages *Ethnologue* confirms that there are 841 living languages in Papua New Guinea, which make up 11.85 percent of living languages in the world.[20]

Whittal finds this quite reasonable:

> the island is a jungle, with many mountain ranges that isolate populations and keep them from mixing. New Guinea has been considered as one of the first places reached by mankind during our epic trek out of Africa.
>
> But America is different. … The Papuans had 50 ky to develop their languages, the Amerindians had less than 15 ky. So how do we explain this?[21]

The linguistic diversity of the Americas **is** an anomaly—Whittall is absolutely right about this—and its parallels with the linguistic

diversity of New Guinea and Australasia in general are intriguing. The following table,[22] reproduced in Whittall's blog, makes the anomaly clear:

Total numbers of separate language families by macrocontinent

AFRICA & EURASIA	87	(25%)
AUSTRALASIA	110	(32%)
AMERICAS	144	(42%)

Source: The Autotyp database (Bickel and Nichols 2002ff; Nichols et al. 2013)

"I do believe," Whittall concludes, "that we should look into language diversity as an indicator of an older origin for mankind as a whole and for an earlier date for the peopling of America."[23]

It's an excellent point but, for me, the more immediate takeaway is the two clusters of **especially abundant** linguistic diversity that the table highlights, one in Australasia and the other in the

Americas. Moreover, we've already seen that within Australasia it's Melanesian New Guinea that has by far the highest level of linguistic diversity—indeed higher than anywhere else in the world. Likewise, within the Americas, South America has more than double the linguistic diversity of North America,[24] with the greatest abundance of all found in lowland Amazonia where no fewer than 350 of South America's total of 448 languages are spoken.[25]

	Number of language families	**Number of languages**	**Average number of languages per family**
NORTH AMERICA	13	220	16.9
CENTRAL AMERICA	6	273	45.4
SOUTH AMERICA	37	448	12.1

Once again, therefore, Melanesian New Guinea and Amazonia seem to parallel one another. Each has the highest level of linguistic diversity within its own macrocontinent and together they occupy first and second place among the world's most linguistically diverse regions.[26]

NOW SOME WEIRD STUFF …

Melanesia and Amazonia are divided by the full width of the Pacific Ocean, so ethnographers of the late nineteenth and early twentieth centuries were perplexed when they found that certain distinctive customs and patterns of behavior occurred in almost exactly the same forms in both places.

For example, the practice of organizing society around so-called men's houses, where:

> the men conducted secret rituals of initiation and procreation, excluded the women, and punished those who would violate the cult with gang rape or death. In both regions, the men told similar myths that explained the origin of the cults and gender separation. The resemblances were such as to convince anthropologists of the day, including Robert Lowie, Heinrich Shurtz, and Hutton Webster, that they could only have come about through diffusion. Lowie flatly declared that men's cults are "an ethnographic feature originating in a single center, and thence transmitted to other regions."
>
> The parallels included not only men's cults but also similar systems of ecological adjustment; egalitarian social organization; flexibility in local- and descent-group composition and recruitment; endemic warfare; similar religious, mythological and cosmological systems; and similar beliefs relating to the body, procreation and the self. [27]

The scholarly puzzlement at these sorts of similarities has continued into the twenty-first century, for example, in a detailed study, "Gender in Amazonia and Melanesia," published by the University of California Press in 2001,[28] which followed an international symposium organized by the Wenner-Gren Foundation. The symposium was "inspired by the suggestion often

made by anthropologists that the cultures of Amazonia and Melanesia seem to display startling resemblances even though they are historically, linguistically, and geographically unrelated."[29]

I do not wish to overload the reader with detail from this important in-depth study, but a few examples will give the general flavor of the results.

The Mundurukú of the Brazilian Amazon and the Avatik of the Sepik River in northern Papua New Guinea both, traditionally, visited "random, indiscriminate violence" on outsiders "as an internal requirement of the village's male cult." In both cases raids were seen as a special kind of hunting. In both cases cult members sought prestige in the eyes of fellow villagers by taking trophy heads during their raids. In both cases the heads were not brought back to the village until the men had undergone a ritual period of seclusion and sexual abstinence. And in both cases the heads were believed to enhance and renew fertility.[30]

Among the Sambia of eastern Papua New Guinea, as among the Arawete, Jivaro, and Mehinaku of the Amazon, a war leader would traditionally exhibit his erect penis as a sign of his aggression.[31]

Among the Alambak, the Sawos, and the Sepik Wape of Papua New Guinea, as among the Cashinahua of the Amazon, domestic conflict prior to a hunt or raid was believed to bring "bad luck" to the endeavor.[32]

In both Melanesia and Amazonia blood is seen as the main agent of growth and vitality. In both regions it is blood—especially menstrual blood—that is seen as the mother's contribution to conception or gestation. In both regions semen is considered closely related to blood or interactive with blood, and many believe, more specifically, that a fetus "is formed from the combination of female blood and male semen."[33]

In both Melanesia and Amazonia "the central symbols of the men's cults" are bullroarers, flutes, and trumpets, and in both

regions the myths recall a time when "women discovered, invented, or possessed" these powerful cult objects. In both regions the myths say that the former control of these objects by women allowed them to dominate men. In both regions the myths also say that the men joined forces and compelled or deceived the women into handing the cult objects over to them, resulting in a reordering of society and the dominance of men. Moreover, in both regions "the men share a strategic secret: the sounds of the trumpets, flutes and other instruments associated with the cult are not the voices of spirits but are produced by the men themselves."[34]

Anthropologist Pascale Bonnemère draws attention to certain "striking similarities" in initiation rituals as performed among the Angans of New Guinea and by tribes in the Vaupés region of the Colombian Amazon. These "involve the playing of musical instruments that are hidden from women and that were owned by them in mythic times; they imply the consumption of substances

that are symbolically associated with reproduction; they are interpreted in a similar way, as a rebirth of the young boys into the world of men; and myths offer keys for understanding the ritual."[35]

In both Amazonia and Melanesia there are dire consequences for women, including subjection to gang rape and murder, if they see the cult instruments.[36] There is also disruption to society as a whole. Among the Gimi of Papua New Guinea, for example, as among the Barasana of the Amazon, there is a belief that chaos and social disintegration will follow if the men's sacred bamboo flutes are seen by women.[37] Nonetheless, in both Amazonia and Melanesia, the men do not hesitate to "parade and play" the instruments "in public areas such as gardens and plazas that are normally open to women. As such, the men must be extraordinarily vigilant in sequestering the women during rituals"—which in practice, in both regions, means forcing them to remain indoors.[38]

In summary, as Thomas A. Gregor and Donald Tuzin, editors of *Gender in Amazonia and Melanesia,* conclude, "The similarities of men's institutions in Amazonia and Melanesia is one of the great riddles of culture that has not received the attention that it deserves."[39] In their view it is quite noteworthy enough that the "men's house complex"[40] obtains in both regions, but "what is even more striking is that the details of the cult also bear close comparison."[41]

They're right about the magnitude of the riddle but, in my view, the solution they offer is singularly disappointing. Just like the quacks who each year conjure a new mental illness from thin air to add to the already morbidly obese *Diagnostic and Statistical Manual of Mental Disorders,* so, too, Gregor and Tuzin are convinced that the whole weird complex of behavior around men's cults in Melanesia and Amazonia is best understood using the tools of psychoanalysis:

> We need the insights of psychology and especially that of personality dynamics to explain the emotional content and the remarkable regularities in men's conduct in such different cultures.[42]

Though writing in 2001, they particularly recommend the approach taken in a 1959 paper by Robert Murphy on the Mundurukú men's cult:

> Murphy pointed out that the psychological roots of the cult draw on the universal emotional conflicts associated with the Oedipus complex. The simultaneous fear of women and antagonism toward them and the associated myths of matriarchy are reflections of the dark side of the family romance. Since the Oedipus complex is universal, Murphy wondered, "why are we not all swinging bullroarers?" His answer is that men's cults appear to flourish in social environments where the unity of groups of men and groups of women is not blurred by competing modes of role allocation such as derive from political hierarchy or kinship. The small horticultural societies of Amazonia and Melanesia fit this description.[43]

Do you see what's being sold to us here? Wrapped up in the same package of ideas that portrays the cults as the outcome of deep-rooted psychological complexes, we're also being asked to accept

that these complexes manifest in the same distinctive ways in Melanesia and Amazonia **because** of the state of economic development of these societies.

Both propositions are profoundly reductionist. The first seeks to reduce the remarkably similar details of male behavior in both regions to underlying psychiatric issues. The second seeks to reduce the cultural expression of such issues to the specific socioeconomic circumstances of small horticultural societies—as though flutes, trumpets, bullroarers, initiation ceremonies, ritual prohibitions, and gang rape and murder for those who break them can be expected to appear, almost automatically, in such societies.

There are other options, and the most obvious that immediately springs to mind is diffusion. Throughout human history, ideas, religions, cults, and rituals have always traveled far. Why, therefore, should they not have done so in prehistory as well? As we've seen, Gregor and Tuzin do admit that at one time leading anthropologists were convinced that diffusion of ideas "from a single center" was

the best explanation for the strange cultural similarities between Melanesia and Amazonia. Other than adding that subsequently "the diffusionist school of anthropology waned,"[44] however, Gregor and Tuzin barely give the notion a second thought. Their whole focus remains throughout on psychological and sociological explanations.

Who knows? They could be right. They have certainly done a wonderful job of assembling the comparative cultural data, and if I were assessing that data in isolation, if it were just the bizarre and idiosyncratic similarities that keep on cropping up, *if that were all there were to it,* then I might be impressed by their proposed sociological psychodrama.

But that's by no means all there is to it.

First and foremost, there's that totally unexpected Australo-Melanesian genetic signal among Amazonian peoples, discovered in 2015, which Gregor and Tuzin could not have been aware of in

2001. The very fact that it's there at all means that diffusion of some kind can no longer be ruled out.

Second, there's more than a hint of a connection from cranial morphology.

Third, Australo-Melanesia and Amazonia constitute the world's largest surviving reservoirs of linguistic diversity, suggesting that their languages have extremely ancient roots.

And now, fourth, we find complex and multilayered similarities in cultural institutions and beliefs in both these widely separated regions.

It stretches credulity to put the simultaneous occurrence of all these factors down to coincidence.

A more "parsimonious explanation," I believe, is that something else must have been going on, some other process must have been under way behind the scenes, *some other hand must have been at work,* that hasn't yet been accounted for.

APPENDIX 2

ANCIENT MAPS OF THE ICE AGE

The Waldseemüller World Map of 1507 (**next page**) is notable for the apparent extreme inaccuracy with which sixteenth-century Southeast Asia and Australia are represented.

By contrast the map offers a much closer match to the region as it appeared in the depths of the Ice Age around 21,300 years ago, when Sahul and Sunda (modern Southeast Asia and Australia) formed an almost continuous landmass.

Waldseemüller's and other similar maps of the sixteenth century were produced by copying from older source maps while attempting to incorporate into them information from the voyages of discovery of Columbus and other later mariners.

Deriving from the discarded and lost older source maps, the portrayal of geographical features last present during the Ice Age hints at the existence of a lost civilization that was capable of exploring and mapping the earth in remotest prehistory.

ANTEDILUVIAN CARTOGRAPHY?

It is the—at first surprising—hypothesis of Professor Robert Fuson of the University of South Florida that the island named "Satanaze" on the 1424 Pizzagano Chart, though incorrectly located in the Atlantic Ocean, is, arguably, the earliest-surviving representation of Japan in European cartography. Professor Fuson's 1995 book *Legendary Islands of the Ocean Sea,*[1] in which he makes this case with a mass of corroborative evidence, came to my attention while I was researching my own book *Underworld,* published in 2002.

The 1424 Pizzagano Chart incorrectly locates the islands of Japan and Taiwan (respectively nominated as Satanaze and Antilia) in the Atlantic Ocean. Santanaze is the northernmost of the two dark landmasses shown at mid-left on the Chart.

I'm convinced by Professor Fuson's argument, but what I suggest is equally significant about it is a matter that Fuson himself does not comment on, leaving open the opportunity for me to explore it at some length in *Underworld*—namely that "Satanaze"/Japan is **not** depicted as the principal Japanese islands would have looked in 1424, when details from older source maps were copied onto the Pizzagano Chart, but rather as Japan would have appeared during the lowered sea levels of the last Ice Age, in a very specific interlude, between 13,500 and 12,400 years ago, spanning the cataclysmic onset of the Younger Dryas.[2]

During that interlude the three principal Japanese islands, Honshu, Kyushu, and Shikoku, (**above right**) were all conjoined to form a single large island, as depicted in the sea-level-rise map (**above left**), based on modern geological studies.[3] The depiction of "Satanaze" on the Pizzagano Chart (**above center**), also shows Honshu, Kyushu, and Shikoku as one island and accurately depicts the inlets that existed between 13,500 and 12,400 years ago

southwest and northeast of what would later become the island of Shikoku.

A similar state of affairs presents itself on the other side of the world in a representation of Ireland and its surrounding waters in the *Ptolemaeus Argentinae* map of 1513 (**below left**). **Below right** is a bathymetric map of Ireland and the surrounding seas with a resolution of 2 minutes. Depth can be gauged through the shading as well as by the contour line, which is placed at 55 meters beneath today's sea level. The bathymetry reveals that around 13,000 years ago, during the lowered sea levels of the Ice Age, a significant island, with an area of perhaps 100 square kilometers, occupied the exact location where the supposedly "legendary" island named "Brazil" appears on the *Ptolemaeus Argentinae* map of 1513.[4]

The implication, again, is that some unknown civilization explored the earth during the Ice Age and that copies of copies of scraps of the maps made by its seafarers and navigators survived to be used as sources of reference by cartographers in the late Middle Ages.

A clear line of transmission through the library of Alexandria via

Constantinople and thence into Europe during the era of the Crusades is traced in *Fingerprints of the Gods* for those who wish to follow the matter further.[5]

THE HOLE AT THE BOTTOM OF THE WORLD

Antarctica remained undiscovered by the seafarers and navigators of our civilization until the year 1819, and accordingly does not feature on early-nineteenth-century maps, such as the Pinkerton map of 1818 (**below left**). **To the right of it**, for comparison, is a modern map of Antarctica.

SOUTHERN HEMISPHERE.

NOVA, ET INTEGRA VNIVERSI ORBIS DESCRIPTIO

Curiously, although supposedly undiscovered at that time, Antarctica does appear on several maps from the sixteenth century, such as the Oronteus Finnaeus world map (**top**), and **below it** the Mercator world map, which in turn were copied from older source maps now lost.[6]

ISLAND OF MEGALITHS

The Piri Reis map of 1513 features the western shores of Africa and the eastern shores of North and South America and is also controversially claimed to depict Ice Age Antarctica—as an extension of the southern tip of South America. I report this claim in *Fingerprints of the Gods*.[7]

The same map (**above left and top right**) depicts a large island lying east of the southeast coast of what is now the United States. Also clearly depicted running along the spine of this island is a "road" of huge megaliths. In this exact spot during the lowered sea levels of the Ice Age a large island was indeed located until approximately 12,400 years ago. A remnant survives today in the

form of the islands of Andros and Bimini. Underwater off Bimini (**above, lower right and below**) I have scuba-dived on a road of great megaliths exactly like those depicted **above water** on the Piri Reis map.

Again, the implication, regardless of the separate controversy of whether the so-called Bimini Road is a man-made or natural feature, is that the region must have been explored and mapped before the great floods at the end of the Ice Age caused the sea level to rise and submerged the megaliths.

APPENDIX 3

FIRST THERE WAS A FOREST, THEN THERE WAS NO FOREST, THEN THERE WAS …

What sort of place was the Amazon during the Ice Age? What was its climate? And what about the environment, vegetation, and trees?

Given the enormous importance of the world's largest surviving rainforest in global ecology today, I had assumed the subject would have been well studied and that the experts would long ago have

reached a consensus. In the case of the former I was correct but in the case of the latter I was not—for there is an ever-shifting consensus that, when you get right down to it, is pretty much the same thing as no consensus at all.

Here's a brief timeline of the debate as I see it:

1. Prior to and into the 1990s, the scientific consensus supported the view that the Amazon had been largely arid during the Ice Age, with isolated rainforest "refugia" broken up by extensive areas of savanna and open vegetation.
2. From the mid-1990s onward, into the early years of the twenty-first century, this entire view came under attack and, out of the dispute, a new consensus emerged in which the Amazon had "always" (anyway for millions of years) been a rainforest, much as it is now.
3. Finally, in the past decade or so the consensus appears to

> have shifted again and we are told that actually, yes, much of the Amazon was savanna during the Ice Age, and that the tropical rainforest we see today has been present for at most 7,000 or 8,000 years—and barely 2,000 years in some areas.

It's instructive to spend a few moments sampling the flavor and character of this shifting consensus. Let's start with a paper by P. A. Colinvaux, P. E. De Oliveira, and M. B. Bush, published in January 2000 in *Quaternary Science Reviews,* that confirms the overthrow of the earlier, pre-1990s paradigm of an arid savanna interspersed with rainforest refugia:

> Our conclusion that the Amazon lowlands were forested in glacial times specifically refutes the hypothesis of Amazonian glacial aridity.[1]

A few months later, Katherine Willis and Robert Whittaker of Oxford University published similar conclusions in *Science*:

> The evidence clearly indicates that the lowland tropical forests were not extensively replaced by savanna vegetation during the glacial periods, but rather that the forests dominated throughout.[2]

In the following year, 2001, a study published in *Palaeogeography, Palaeoclimatology, Palaeoecology* concluded:

> In the later Pleistocene the whole of the Amazon lowlands were under closed-canopy forest throughout all stages of a glacial cycle, contrary to the biogeographical consensus of the last thirty years.[3]

A 2003 study published in the journal *Geology* reinforced this view:

> The current tropical rainforest vegetation has been a permanent and dominant feature of the Amazon River watershed over the past 70 k.y. Specifically, we found no evidence for the development of large savannas that had been previously postulated as indicators of increased glacial aridity in Amazonia.[4]

A further study, published in November 2004 in *Palaeogeography, Palaeoclimatology, Palaeoecology,* investigated the Hill of Six Lakes in the Northwest Brazilian Amazon and concluded:

> The data indicate the continuous presence of mesic forest throughout the last ice age. … Even during lowstand episodes, pollen is well preserved and provides a clear signal of uninterrupted forest cover.[5]

But now let's jump forward to 2013, when a follow-up study of the Hill of Six Lakes, published in *Quaternary Sciences Reviews,* lamented the great length of time that "Six Lakes was erroneously used as an emblematic locality to illustrate the permanence of the rainforest in the Amazon basin"[6] because:

> all of the proxies seem to indicate that the present-day vegetation dates back to the middle-late Holocene, around 6 cal ka BP.[7]

And a year later, in July 2014, a study in the *Proceedings of the National Academy of Sciences* reduced the inception of the present-day forest cover of some parts of the Amazon to just 2,000 years ago or less. Focusing on southern Amazonia, the study concluded that:

> the inhabitants exploited a naturally open savanna landscape that they maintained around their settlement despite the climatically driven rainforest expansion that began ~2,000 years ago across the region.[8]

Last, in *Quaternary Science Reviews* of October 1, 2017, Professor Diana Fontes and Professor Renato Cordeiro published a study titled "Paleoenvironmental Dynamics in South Amazonia, Brazil, during the Last 35,000 Years Inferred from Pollen and Geochemical Records of Lago do Saci." Their conclusion, although they state that "the rainforest always existed in this region," is that it underwent "expansion and regression" over time.[9]

There are many other papers I could cite reflecting the shifting consensus, but I'm sure the reader has got my point by now. When leading scientific authorities are in such a state of disagreement that prevailing paradigms abruptly change every decade or two, we cannot be at all sure of the solidity and merits of the current paradigm—according to which the Amazon rainforest in its present form is less than 8,000 years old, and in some areas less than 2,000 years old.

Reviewing the literature, I felt that the conclusion of Fontes and Cordeiro, that there was always rainforest in the area they studied but that it was subject to periodic expansions and contractions, might help to explain why consensus on this subject has been so elusive. The Amazon basin is, after all, a vast and diverse region encompassing more than 7 million square kilometers, of which approximately 5.5 million square kilometers are presently covered by rainforest.[10] The figures only become meaningful by

comparison. The whole of India, with a total area of 2.97 million km^2, is less than half the size of the Amazon basin, but Australia, at 7.68 million km^2 is bigger, as are China (9.38 million km^2), Canada (9.09 million km^2), the United States (9.15 million km^2), and Europe (10.18 million km^2).[11] All in all, then, it's fair to say that what the Amazon confronts us with is a truly gigantic landmass, on a scale similar to many of the world's largest countries and regions, extending for thousands of kilometers from north to south and thousands of kilometers from east to west. It's unrealistic to suppose that, across such enormous distances over great expanses of time, the climate and environment in all areas would always remain the same. Of course there would be significant variations among the different regions and from epoch to epoch, and thus a danger of overenthusiastic extrapolation from particular instances to general conclusions.

On March 12, 2018, therefore, I contacted Renato Cordeiro about the whole issue of the shifting consensus and what conclusions I might legitimately draw from it. “I must confess,” I told him, “that expert opinion on the Ice Age Amazon is very confusing and contradictory! I want to try to sort out the facts for my readers, as those facts are understood now, if they are indeed subject to any kind of consensus today.”[12]

Professor Cordeiro teaches geoeconomics at Brazil’s Universidad Federal Fluminense. His rather technical reply, set out in full in the note, essentially restated the conclusions of his 2017 paper, that the Amazon basin has always contained rainforests, that the gallery forests along the rivers remained “relatively well preserved” even in drier periods, but that in other areas tree cover has undergone considerable fluctuation over time.[13]

It was as close as I was able to get to some kind of answer to what I had thought would be a simple question, namely, what sort of

climate, environment, vegetation, and trees characterized the Amazon during the Ice Age? The scholars did not agree among themselves and many different pictures had been painted, but perhaps this was largely because of the immensity of the region and the complex, constantly changing, and often contradictory nature of the data.

Indeed, there is only one thing I have been able to find that all the involved scientists appear to be in complete agreement on, and this is that the region was significantly cooler during the Ice Age—5 or 6 degrees C cooler—than it is now.[14] The year-round average temperature of the Amazon rainforest today is 80 degrees F (26.6 degrees C) so, if anything, a reduction of 5 degrees to 21.6 degrees C/75 degrees F would have been a bonus for prospective settlers.

So … forests? Savanna? A mixture of both? Like so much else about the ancient Amazon, it seems there is no certain answer.

PART I

1: AN ENCHANTED REALM

1. "Around 12,000 years ago" is, of course, an approximation, a ballpark figure that I will use throughout to allow for margins of error in the data that are constantly being adjusted in the light of ongoing research. From the point of view of my argument, 1,000 years in either direction makes no difference—that is, the point is that the Americas have been isolated from the rest of the world for a VERY long time and my position does not alter whether that time is 13,000 years, 12,000 years, or 11,000 years. Recent work suggests that the Bering land bridge may not have been fully inundated until around 11,000 years ago. See M. Jakobsson et al., "Post-Glacial Flooding of the Bering Land Bridge Dated to 11 cal ka BP Based on New Geophysical and Sediment Records," *Climate of the Past* 13, no. 8 (2017), 991. 29. Mann, "The Clovis Point and the Discovery of America's First Culture:" "Most researchers believe that the rapid dissemination of Clovis points is evidence that a single way of life—the Clovis culture—swept across the continent in a flash. No other culture has dominated so much of the Americas."

30. See, for example, Kirk Bryan, *Geological Antiquity of the Lindenmeier Site in Colorado,* Smithsonian Miscellaneous Collections 99, no. 2 (Washington, DC, 1940), "It is believed by the writers that the age be much nearer 25,000 years than 10,000." The reference is to the Folsom culture, already established by that time to be younger than the Clovis culture.

31. C. Vance Haynes Jr., "Fluted Projectile Points: Their Age and Dispersion," *Science* 145 (September 25, 1964), 1408–1413. **Important note:** Haynes published his paper in 1964, before improvements in radiocarbon dating, notably "calibration," which takes account of different amounts of C-14 formed in the earth's atmosphere at different periods of the past and derives calendar years from radiocarbon years according to a sliding scale. Going back as far as the last Ice Age, dates in calendar years turn out to be increasingly older than dates given in radiocarbon years so that, for example, a radiocarbon age reading of 12,000 years ago corresponds, after calibration, with a calendar date of 13,800 years ago (see J. Tyler Faith and Todd A. Surovell,

"Synchronous Extinction of North America's Pleistocene Mammals," *Proceedings of the National Academy of Sciences* 106, no. 49 (December 8, 2009), 20641). I have therefore taken the liberty in my text of replacing the dates given by Haynes in his 1964 paper with the dates most recently agreed and accepted by archaeologists.

32. Haynes, "Fluted Projectile Points," 1412.

42. Tom Dillehay et al., "New Archaeological Evidence for an Early Human Presence at Monte Verde, Chile," *PLoS One* (November 18, 2015).
43. Mann, *1491,* 186, reports that fifty studies were dismissed. It is important to add, however, that Haynes's dismissals were often entirely justified. For example, in 1951 a crucial piece of evidence that Hrdlička had suppressed during his tenure at the

Smithsonian was—commendably—brought to light by his successor T. Dale Stewart. The disclosure was low-profile, appearing only in the "Comments and Communications" section of the journal *Science* (April 6, 1951, 391), and it did not outright accuse Hrdlička of any malfeasance. The fact remained, nonetheless, that in Hrdlička's own files Stewart had found a paper published in the *American Naturalist* in 1895, that Hrdlička had "failed to mention" when he published his *Skeletal Remains Suggesting or Attributed to Early Man in North America* (Bureau of American Ethnology, Bulletin 33, 1907). "This might be expected, Stewart wrote: "Because Wilson's conclusions are contrary to those of Hrdlička. The latter concluded on morphological grounds that the Natchez pelvic bone was that of a recent Indian, whereas Wilson concluded from the fluorine content that this bone was as ancient as an associated Mylodon bone."

Fossil bones absorb fluorine from soil and water, so fossils that have been in the same soil for the same length of time should have roughly the same amount of fluorine. The reason the paper caught Stewart's eye in 1951 was that two years previously, a fluorine test carried out on the remains of so-called Piltdown Man had proved them to be hundreds of thousands of years younger than they were supposed to be and set in motion the investigation that would lead in 1953 to the exposure of this embarrassing archaeological fraud. For the latest research on the Piltdown Man hoax see Isabelle De Groote et al., "New Genetic and Morphological Evidence Suggests a Single Hoaxer Created Piltdown Man," *Royal Society Open Science* 3, no. 8 (August 1, 2016).

For Hrdlička to have ignored the compelling implications of the fluorine test results on the Natchez human pelvic bone, cutting-edge science in his day, was, to say the least,

distinctly odd. He was vindicated, however, in April 1990 when C. Vance Haynes was sent a sample of the Natchez bone for radiocarbon dating and reported a relatively recent age of around just 5,000 years (see John L. Cotter, "Update on Natchez Man," *American Antiquity* 56, no. 1 (1991), 38). This turned out to be about 12,000 years younger than the associated mylodon fossil (now redesignated as *Glossotherium harlani,* a giant extinct ground sloth), which was radiocarbon dated to more than 17,000 years before the present (pp. 38–39).

How had the two deposits of entirely different age become so muddled up that the younger one actually lay beneath the older one?

The answer, and perhaps Hrdlička had noticed it, giving him what he would probably have regarded as sufficient justification to ignore the 1895 fluorine paper, was that the Natchez bone, together with the associated fossils of extinct megafauna, had been excavated in a ravine from a deposit of clay, "the talus of a neighboring cliff on of which were some old Indian graves." When the famed British geologist Sir Charles Lyell visited the site, he expressed the opinion that "although the human bone may have been contemporaneous with those of the extinct animals with which it had been found, he thought it more probable it had fallen from one of the Indian graves and had become mingled with the older fossils which were dislodged from the deeper part of the cliff. … In the wear of the cliff the upper portion, with the Indian graves and human bones, would be likely to fall first and the deeper portion with the older fossils subsequently on the latter" (Leidy cited in Cotter, "Update on Natchez Man," 37).

13. "Story of the Discovery."
14. Cited in Thomas Curwen, "Archaeology as Blood Sport," *Los Angeles Times,* December 22, 2017, http://www.latimes.com/local/california/la-me-cerutti-mastodon-20171222-htmlstory.html.
15. Ibid.
16. Ibid.
17. Ibid.
18. Although the decisive shift came in 2014, Tom Deméré states that the tide really began to turn in 2008 when archaeologists Steve Holen and Kathleen Holen made their initial research visit to The Nat to examine the Cerutti Mastodon materials. A full timeline is available here: https://www.sdnhm.org/consulting-services/paleo-services/projects/cerutti-mastodon/cerutti-mastodon-discovery-timeline/.
19. "Story of the Discovery." Complete details are given in Steven R. Holen et al., "A 130,000-Year-Old Archaeological Site in Southern California," *Nature* (April 27, 2017).
20. Other members of the team were George Jefferson, Paleontologist Emeritus with the Colorado Desert District Stout Research Center; Kathleen Maule Holen, M.S., M.A., Administrative Director at the Center for American Paleolithic Research; Jared Beeton, Professor of Earth Science at Adams State University; Adam Rountree of the University of Michigan's Museum of Paleontology, and Lawrence Vescera, Paleontologist at

California State Parks Colorado Desert District Stout Research Center in Borrego Springs. For further details, see https://www.sdnhm.org/consulting-services/paleo-services/projects/cerutti-mastodon/cerutti-mastodon-discovery-timeline/.

21. The range of 140,000 to 120,000 years ago is approximate, and Deméré himself (personal correspondence) prefers 130,000 years ago down to about 115,000 years ago. There are nuances, as usual. For full details of recent discussions around the dating of the Eemian, see "Eemian Interglacial Reconstructed from a Greenland Folded Ice Core," *Nature* 493 (January 24, 2013), 489–494.

22. Like our understanding of the origins of civilization, our understanding of human origins is undergoing somewhat of a paradigm shift. Around the time of the publication of Holen et al.'s Cerutti Mastodon paper in April 2017, multiple studies have pushed the timing of the initial migration of *Homo sapiens* out of Africa back so far that the "Out of Africa" paradigm—which has been firmly in place since 1924 when the first *Australopithecus* fossils were found in South Africa—has been questioned and alternative theories explored. In the same month as the Cerutti paper was published, the Dali skull from China was dated to 260,000 years ago, thus reviving the question of whether *Homo sapiens* originated in isolation in Africa. [Xuefeng Sun et al., "TT-OSL and Post-IR IRSL Dating of the Dali Man Site in Central China," *Quaternary International* 434 A (April 1, 2017), 99–106.] June 2017 saw the results of Hublin et al.'s study on the 315,000–360,000-year-old modern human skeleton in Jebel Ihroud, Morocco, thus making East Africa's status as the "cradle of mankind" redundant. [Jean-Jaques Hublin et al., "New Fossils from Jebel Ihroud, Morocco and the pan-African

origin of *Homo sapiens,*" *Nature* 546 (08 June 2017), 289–292.] July 2017 saw Clarkson et al.'s publication on the occupation of northern Australia by 65,000 years ago, which altered the minimum date of 60,000–50,000 years ago for the dispersal of anatomically modern humans out of Africa [Chris Stringer and Peter Andrews, "Genetic and Fossil Evidence for the Origin of Modern Humans," *Science* vol. 239, no. 4845 (March 11, 1988), 1263–1268.] or made more likely the possibility that humans migrated from Australia to Africa at that time. [Bruce R. Fenton, *The Forgotten Exodus: The Into Africa Theory of Human Evolution* (Independently Published, April 7, 2017).] In August 2017, the Dali skull was confirmed as being a hybrid *Homo sapiens* and *Homo erectus* hominin that has contributed significantly to the evolution of Chinese *Homo sapiens*, thus further complicating the story and entrenching East Asia as a focal point of human origins. [Sheela Athreya and Xinzhi Wu, "A Multivariate Assessment of the Dali Hominin Cranium from China: Morphological Affinities and Implications for Pleistocene Evolution in East Asia" *American Journal of Physical Anthropology* vol. 164 no. 4 (December 2017), 679–701.] In September 2017, Schlebusch et al.'s study of ancient southern African genomes deepened the divergence of modern humans from archaic humans to 350,000–260,000 years ago, thus supporting a much earlier initial migration event through Asia to southern China. [Carina M. Schlebusch and Helena Malmström et al., "Southern African Ancient Genomes Estimate Modern Human Divergence to 350,000 to 260,000 years ago," *Science* 10.1126/science.aao6266 (September 28, 2017).] In light of all this, on December 8, 2017, Bae, Douka, and

Petraglia wrote a review in *Science* calling for the official revision of anatomically modern human migrations to account for the Eurasian findings:

> The identification of Neanderthals and Denisovans in Siberia … along with growing fossil and archaeological evidence for the presence of early modern humans in East and Southeast Asia, much earlier than originally thought, places the spotlight on the evolutionary history of our species in Asia over the last 125,000 years. Exciting and unanticipated new discoveries call for a need to critically reexamine the Asian record.

[Christopher J. Bae, Katerina Douka, Michael D. Petraglia, "On the Origin of Modern Humans: Asian Perspectives," *Science* vol. 358 no. 6368 (December 8, 2017).] Shortly after, on January 18, 2018, a team led by evolutionary geneticist Deigan Yuang published a landmark paper suggesting that the Y chromosome and mitochondrial DNA originated in East Asia, thus calling for a serious reconsideration of the multiregional model of human origins. [Dejian Yuang et al., "Modern Human Origins: Multiregional Evolution of Autosomes and East Asia Origin of Y and mtDNA," *bioRxiv* (May 1, 2018).] Since then, archaeological findings revealing characteristics of early middle Paleolithic culture in India around 385–172 ka has made certain that the traditional "Out of Africa" model must at least be reframed. [Kumar Akhilesh et al., "Early Middle Palaeolithic Culture in India Around 385–172ka reframes Out of Africa Models," *Nature* 554 (February 1, 2018), 97–101.] The current consensus among those interpreting human origins from within the "Out of Africa" framework is marked by the publication of a paper written by twenty-five scholars from institutions around the world entitled, "Did Our Species Evolve in Subdivided Populations Across Africa, and Why Does It Matter?" The abstract reads:

> We challenge the view that our species, *Homo sapiens,* evolved within a single population and/or region of Africa. The chronology and physical diversity of Pleistocene human fossils suggest that morphologically varied populations pertaining to the *H. sapiens* clade lived throughout Africa. Similarly, the African archaeological record demonstrates the polycentric origin and persistence of regionally distinct Pleistocene material culture in a variety of paleoecological settings. Genetic studies also indicate that present-day population structure within Africa extends to deep times, paralleling a paleoenvironmental record of shifting and fractured habitable zones. We argue that these fields support an emerging view of a highly structured African prehistory that should be considered in human evolutionary inferences, prompting new interpretations, questions, and interdisciplinary research directions.

[Eleanor Scerri et al., "Did Our Species Evolve in Subdivided Populations Across Africa, and Why Does it Matter?" *Trends In Ecology & Evolution* vol. 33, no. 8 (August 2018), 582–594.] Also see the somewhat convincing, albeit controversial, interpretation of anthropologist German Dziebel, "The End of Out-of-Africa: A Copernican Reassessment of the Patterns of Genetic Variation in the Old World" (November 13, 2013), http://anthropogenesis.kinshipstudies.org/blog/2013/11/11/the-end-of-out-of-africa-a-copernican-reassessment-of-the-patterns-of-genetic-variation-in-the-old-world/.

23. Tom Deméré adds (personal communication): "The site was excavated over a 5 month period and eventually unearthed 50m**2** of the bone-and-stone-bearing bed. The resulting bone and stone distribution map presented a pattern of 2 work stations with concentrations of objects."

24. Tom Deméré adds (personal communication): “The ‘work station’ hypothesis is based on the pattern of bone and stone distribution revealed after 5 months of hard excavation of the bone bed.”

25. Tom Deméré adds (personal communication): “Actually, we suggest that there are ‘tools’ at the CMS—the hammerstones and anvils are expedient tools not manufactured tools. Such ‘tools’ were probably the ‘first’ tools used by hominins.”

26. Tom Deméré adds (personal communication): “We also suggest that the bones were broken to provide raw materials for the making of bone tools.”

27. See Gary Haynes, “The Cerutti Mastodon,” *PaleoAmerica* 3.3 (2017), 196–199 and Donald Grayson quoted in D. Vergano, “Don’t Believe the Big Story About Humans Roaming America 130,000 Years Ago” (Buzzfeed, April 26, 2017). Also see Joseph V. Ferraro and Katie M. Binetti., “Contesting Early Archaeology in California,” *Nature* 554 (February 8, 2018).

28. See David Meltzer quoted in “Don’t Believe the Big Story About Humans Roaming America 130,000 Years Ago” (Buzzfeed, April 26, 2017).

29. G. Haynes, “The Cerutti Mastodon.”

30. S. R. Holen et al., “Supplementary Information” for “A 150-Year-Old Archaeological Site in Southern California,” *Nature* (April 27, 2017), 13–25.

31. Ibid., 4. Also see pp. 14–15, “Weathering”: “Evidence indicating weathering of bone at the CM site is variable. The majority of limb bones do not exhibit extensive weathering cracks (i.e., weathering stage 0 or 110), while ribs and vertebrae exhibit some cracks that represent wetting and drying processes and/or diagenetic processes related to formation

of pedogenic carbonate (caliche). All weathering-like features appear to post-date the disarticulation and burial of CM bones. In addition, some limb element fragments (e.g., CM-288) with unweathered surfaces are spirally-fractured, with smooth curvilinear fracture planes indicating that the bone was broken while it was still fresh."

For visual 3D evidence of the limb element fragments on CM-288 go to the University of Michigan, "Online Repository of Fossils," Museum of Paleontology, "The Cerutti Mastodon Site," "Bone Fragments," "Specimen: SDSNH 49926, Taxon: *Mammut americanum,* Element: CM 288; bone fragment: https://umorf.ummp.lsa.umich.edu/wp/wp-content/3d/viewer.html?name=1244&extension=ctm.

See also "Supplementary Information," pp. 15–16, "Geologic Processes of Proboscidean Limb Bone Modification:" "Post-depositional dry-bone fracturing, as evidenced by longitudinal and perpendicular fracture planes with rough surfaces is distinguished from the spiral fracture patterns produced by dynamic fracturing of fresh bone noted on the majority of CM limb bone fragments. There is no evidence at the CM site that geological processes caused breakage of fresh mastodon limb bones" and, "Two biologic processes, carnivoran gnawing and trampling by large mammals, are known to fracture bone. However, fresh cortical proboscidean limb bone is rarely broken by either agent."

See also p. 18: "Fracturing of proboscidean limb bones while still fresh is rare in modern single-elephant death sites, and no sites have been documented like the CM site, where fresh elephant limb bone is broken into numerous small spirally fractured fragments with evidence of multiple impacts. … The femoral diaphyses found at the CM

site are broken into small spirally-fractured pieces, whereas more fragile bones like ribs and vertebrae are complete, or more complete than the heavier and denser limb bones. This pattern of differential breakage is exactly the opposite of what is found where proboscidean bones have been extensively trampled. Under trampling, the lightest bones (e.g., ribs and vertebrae) are broken first and into much smaller pieces than the limb bones that have thicker cortical walls resistant to breakage."

Also see "Extended Data," Figure 4a–e: Diagnostic anvil wear on CM bone, https://www.nature.com/articles/nature22065/figures/8, as well as Supplementary Video 3 and Extended Data Figure 8: Experimental hammerstone percussion of elephant bone: https://www.nature.com/articles/nature22065/figures/12.

32. Ibid., 13–25.

33. Tom Deméré adds (personal communication): "Again, marrow extraction is only one possible reason for breaking up the long bones—another possible/probably reason is to produce bone 'blanks' from which to fashion bone tools."

6: MILLENNIA UNACCOUNTED FOR

1. See, for example, Michael Collins quoted in E. A. Powell, "Early Dates, Real Tools?" Archaeological Institute of America (November 17, 2004),

https://archive.archaeology.org/online/news/topper.html: "I don't believe those are artifacts. … They're geofacts—not manmade."

2. M. Rose, "The Topper Site: Pre-Clovis Surprise," Archaeological Institute of America (July/August 1999), https://archive.archaeology.org/9907/newsbriefs/clovis.html.
3. See discussion in J. M. Adovasio and David Pedler, *Strangers in a New Land* (Firefly Books, 2016), 276.
4. The Southeast-American Early Archaic period is conventionally dated to 10,000 to 8,000 BP. The beginning of the period, at 10,000 BP, was marked in accordance with conventional geological dating of the Pleistocene/Holocene boundary, while the end of the period, 8,000 BP, is usually equated with the Hypsithermsal warming episode. See M. F. Johnson et al., *The Paleoindian and Early Archaic Southeast* (University of Alabama Press, 1999), 15.
5. Adovasio and Pedler, *Strangers in a New Land,* 275. Also see the Paleoindian Database of the Americas (PIDBA), "Total Number of Reported Clovis Projectile Points." The lack of Clovis points found at coastal regions of the southeast (North Carolina, South Carolina, Georgia, and Florida) is clearly illustrated in these two maps: http://web.utk.edu/~dander19/clovis_continent_647kb.jpg and http://web.utk.edu/~dander19/clovis_southeast_569kb.jpg.
6. Adovasio and Pedler, *Strangers in a New Land,* 275: "The renown of its massive Clovis deposit is very well deserved."
7. Some skeptics resorted to arguing that bend-breaks can be made by natural forces or accidental breakage. See for example Stuart. J. Stewart, "Is That All There Is? The

Weak Case for Pre-Clovis Occupation of Eastern North America," *In the Eastern Fluted Point Tradition*, (eds.) J. A. M. Gingerich (University of Utah Press, 2013), 333–354. Skip to note 11 of this chapter for a list of studies that have since rendered this argument in association with the Topper Palaeolithic terrace untenable.

8. It was in November 2004 that the radiocarbon results of carbonized plant remains where artifacts excavated in May from along the Savannah River in Allendale County first came back. See "New Evidence Puts Man in North America 50,000 Years Ago," *Science Daily* (November 18, 2004), https://www.sciencedaily.com/releases/2004/11/041118104010.htm.

   The Pleistocene antiquity of the site and artifacts found within it were then reaffirmed in 2009 by a team led by Michael R. Waters, in a paper titled "Geoarchaeological Investigations at the Topper and Big Pine Tree Sites, Allendale County, South Carolina," in the *Journal of Archaeological Science*. See, for example, p. 1305: "Six samples of wood, nutshell, and humic acids were dated from unit 1a (Figs. 4 and 5). These dates represent minimum ages for unit 1a and indicate that this unit dates in excess of 50,000 14C yr B.P. A date of >54,700 14C yr B.P. (CAMS-79022) was obtained on a Hickory (Carya) nutshell and a date of >55,500 14C yr B.P. (CAMS-19023) on a piece of fir wood (Abies) from an organic horizon within unit 1a underlying the reported oldest cultural horizon at the Topper site." It was from unit 1a of the Pleistocene terrace that distinctive bend-break tools were recovered.

9. Albert C. Goodyear, "Evidence of Pre-Clovis Sites in the Eastern United States," *Paleoamerican Origins Beyond Clovis* (2005), 103–112.

10. A. C. Goodyear and D. A. Slain, "The Pre-Clovis Occupation of the Topper Site, Allendale County, South Carolina," in A. C. Goodyear and C. R. Moore, *Early Human Life on the Southeastern Coastal Plain* (University Press of Florida, 2018), S30.

11. The natural vs. human creation of the materials excavated from a Pleistocene terrace at Topper was evaluated by Douglas Slain and presented at the 81st Annual Meeting of the Society for American Archaeology (SAA) in Orlando, Florida, on April 8, 2016. The content of this presentation is documented in D. Slain, "Pre-Clovis at Topper (38AL23): Evaluating the Role of Human Versus Natural Agency in the Formation of Lithic Deposits from a Pleistocene Terrace in the American Southeast," *The Selected Works of Douglas Slain* (April 8, 2016). In this paper, Slain concludes, "The weathering simulations produced lithic detachments that fit the morphological description of bend breaks. However, as these detachments did not have technological attributes consisting of either compression rings, bulbs of force, or impact markers, these items should not be mistaken for the byproducts of intentional biface, or bipolar technologies. In other words, detachments resulting from natural weathering processes often exhibit morphological similarity to cultural debitage, but lack the technological attributes of a chipped stone reductive technology" (p. 7). Consequently, "Evidence from this study supports King's (2012) findings and demonstrates a human origin for the pre-Clovis flake assemblage at the site" (p. 8). The M. King study, "MA Thesis Title: The Distribution of Paleoindian Debitage from the Pleistocene Terrace at the Topper Site: An Evaluation of a Possible Pre-Clovis Occupation (38Al23)" (University of Tennessee,

2012) is indeed consistent with Slain in concluding that "the data supports the notion that the pre-Clovis debitage was manmade" (p. 137).

12. Adovasio and Pedler, *Strangers in a New Land,* 284; see also J. M. Adovasio and Jake Page, *The First Americans: In Pursuit of Archaeology's Greatest Mystery* (Modern Library, 2003), 272.

17. Adovasio and Page, *The First Americans,* 272.

18. This list, from Wikipedia, gives some idea of the number of claimed sites, but, as its failure to include the Cerutti Mastodon Site indicates, it is by no means complete: https://en.wikipedia.org/wiki/Category:Pre-Clovis_archaeological_sites_in_the_Americas. Probably the most useful source is Adovasio and Pedler, *Strangers in a New Land,* which devotes many chapters to the more credible pre-Clovis sites. But see also http://scienceviews.com/indian/pre_clovis_sites.html and https://www.thoughtco.com/pre-clovis-sites-americas-173079.

19. For a fascinating and extensive discussion of Hueyatlaco, a site that we will consider further, see Christopher Hardaker, *The First American: The Suppressed Story of the People Who Discovered the New World* (New Page Books, 2007).

20. Adovasio and Pedler, *Strangers in a New Land*.

21. Ibid. For Pedra Furada, see also N. Guidon and G. Delibrias, "Carbon-14 Dates Point to Man in the Americas 32,000 Years Ago," *Nature* 321 (June 19, 1986), 769, and Marvin W. Rowe and Karen L. Steelman, "Comment on 'Some Evidence of a Date of First Humans to Arrive in Brazil,' *Journal of Archaeological Science* 30 (2003), 1349.

22. Adovasio and Pedler, *Strangers in a New Land*. Compare, for example, the Topper Assemblage going back 50,000 years or more (p. 279ff.), with the relative sophistication of the Miller Lanceolate projectile point and bone tools found at Meadowcroft (dated between about 17,000 years ago and 13,000 years ago) (pp. 211–212), or with the chert "El Jobo" projectile points from Monte Verde (dated to around 14,500 years ago) (p. 225), or with the Cactus Hill points, dated roughly 18,000 years ago (p. 235).

23. In 2011, there were over 100 uncontacted tribes worldwide. See, for example, Joanna Eede, "Uncontacted Tribes: The Last Free People on Earth," National Geographic Blog: Changing Planet (April 1, 2011), https://blog.nationalgeographic.org/2011/04/01/uncontacted-tribes-the-last-free-people-on-earth/.

24. For example, Stuart J. Fiedel, "The Anzick Genome Proves Clovis Is First, After All," *Quaternary International* 44 (2017), 4–9.

25. As King reminds us with regard to Topper, "Prior to 1998, no units were taken deeper than the Clovis age level since the project director thought it was the oldest possible occupation. However, the 1997 reporting on the discoveries at Monte Verde in South America and discoveries at Cactus Hill, Virginia, in 1998 prompted Goodyear and his

research team to excavate below what was known to be Clovis-age sediments." ("MA Thesis Title: The Distribution of Paleoindian Debitage from the Pleistocene Terrace at the Topper Site: An Evaluation of a Possible Pre-Clovis Occupation (38Al23)," 15.) If you don't look, you won't find!

3. A. Briney, "Geography of Siberia," ThoughtCo. (last updated March 17, 2017), https://www.thoughtco.com/geography-of-siberia-1435483.
4. Reconstructions of global sea level over the past 470 ka suggest it was possible to walk from Asia to Alaska via the Bering land bridge from **approximately** 370 to 337 ka, 283 to 240 ka, 189 to 130 ka, and 75 to 11 ka. See for example Mark Siddall et al., "Sea Level Fluctuations During the Last Glacial Cycle," *Nature* 423 (June 19, 2003), 855, Figure 2.
5. Qiaomei Fu et al., "Genome Sequence of a 45,000-Year-Old Modern Human from Western Siberia," *Nature* 514 (October 23, 2014), 445ff; and Vladimir V. Pitulko et al.,

"Early Human Presence in the Arctic: Evidence from 45,000-Year-Old Mammoth Remains," *Science* 351, no. 6270 (January 15, 2016), 260ff.

6. M. Raghavan et al., "Upper Paleolithic Siberian Genome Reveals Dual Ancestry of Native Americans," *Nature* 505 (January 2, 2014), "The Y chromosome of MA-1 [an ancient 24kya Siberian individual] is … near the root of most Native American lineages. Similarly, we find autosomal evidence that MA-1 is … genetically closely related to modern-day Native Americans" (p. 87). See also M. Rasmussen et al., "The Genome of a Late Pleistocene Human from a Clovis Burial Site in Western Montana," *Nature* 506 (February 13, 2014), "Gene flow from the Siberian Upper Paleolithic Mal'ta population into Native American ancestors is also shared by the Anzick-1 [ancient American/Montanan] individual and thus happened before 12,600 years BP. … Our data are compatible with the hypothesis that Anzick-1 belonged to a population directly ancestral to many contemporary Native Americans" (p. 225).

7. There have been a few theories, generally regarded by the academic establishment as "zany," "lunatic," or worse, that have attempted to argue that prehistoric settlement also occurred from Europe by boat across the Atlantic Ocean. Among these, the most credible is the so-called Solutrean theory of Clovis origins put forward by Dennis J. Stanford, curator of archaeology and director of the Paleoindian Program at the Smithsonian's National Museum of Natural History, and his fellow researcher and coauthor Bruce A. Bradley, associate professor in archaeology and director of the Experimental Archaeology program at the University of Exeter. See Dennis J. Stanford

and Bruce A. Bradley, *Across Atlantic Ice: The Origin of America's Clovis Culture* (University of California Press, 2012).

To cut a very long story very short indeed, Stanford and Bradley strongly resist what they call "the preconceived notion of geneticists and archaeologists that the Americas must have been settled by Asians" (p. 246). Their argument, instead, is that "Clovis predecessors were immigrants from southwestern Europe" and that this wave of immigration took place during the last glacial maximum (p. 247), in other words, somewhere around 22,000 years ago. Their claim is based on the—admittedly stunningly close—morphological resemblances between bifacial projectile points made by the "Solutrean" culture of Upper Paleolithic western Europe between roughly 22,000 and 17,000 years ago, and almost identical bifacial projectile points made with an almost identical technique by North America's "Clovis" culture over a period of less than 1,000 years beginning roughly 13,400 years ago.

The gap of several thousand years between the end of the Solutreans and the beginning of Clovis is one among many reasons why the majority of archaeologists reject Stanford and Bradley's unusually daring theory, while more recent genetic research claims to have refuted it completely. See Morten Rasmussen et al., "The Genome of a Late Pleistocene Human from a Clovis Burial Site in Western Montana," 228. See also Jennifer A. Raff and Deborah Bolnick, "Genetic Roots of the First Americans," *Nature* 506 (February 13, 2014), 162. Indeed Raff and Bolnick of the University of Texas have such confidence in this new research that they conclude: "Unless proponents offer evidence of direct European ancestry in other securely dated ancient American genomes, the Solutrean hypothesis can no longer be treated as a

credible alternative for Clovis (or Native American) origins. It is time to move on to more interesting questions."

8. See part 2 of *America Before.*

9. A major multidisciplinary study published in 2016 in *Nature* pointed out that the supposed "ice-free" corridor would have been completely uninhabitable until 12,600 years ago (Mikkel W. Pedersen et al., "Postglacial Viability and Colonization in North America's Ice-Free Corridor," *Nature* 537 no. 7618 (2016), 45). The authors demonstrate this by means of ancient DNA from the bottom of glacial lakes. This suggests that the "first" Americans did not arrive by land, but by sea. This is supported by a study undertaken by a team from the University of California, who reconstructed family trees for bison that lived in the "ice free" corridor and demonstrated that it wasn't habitable until 13,000 years ago (Peter. D. Heintzman et al., "Bison Phylogeography Constrains Dispersal and Viability of the Ice Free Corridor in Western Canada," *Proceedings of the National Academy of Sciences* 113, no. 29 (2016), 8057–8063). Though these studies do not rule out the possibility that the "first" Americans reached the Americas via the Bering land bridge and ice-free corridor as Clovis proponents contend, they do enhance the likelihood that early Americans favored sea over land crossings.

10. Kris Hirst, "The Beringian Standstill Hypothesis: An Overview," August 14, 2017, https://www.thoughtco.com/beringian-standstill-hypothesis-first-americans-172859.

11. S. L. Bonatto and F. M. Salzano, "A Single and Early Migration for the Peopling of the Americas Supported by Mitochondrial DNA Sequence Data," *Proceedings of the*

National Academy of Sciences 94, no. 5 (1997), 1866–1871. The authors suggest, on the basis of mitochondrial DNA results, that the collapse of the ice-free corridor between ~14,000 and ~20,000 years ago isolated the people south of the ice sheets, who gave rise to the Amerind, from those still in Beringia; the latter originated the Na-Dene, Eskimo, and probably the Siberian Chukchi.

20. Confirmed by emails between my research assistant Holly Lasko and Maxim Kozlikin, May 4–7, 2018. **Excerpt from email of May 4—HL to MK:**

To what extent can we say that we've gained a good archaeological understanding of the Altai during the Palaeolithic? Or, in other words, approximately how much of the Altai region remains to be excavated? From what I can see, our understanding is limited to approximately 15 **main** sites out of a possible very many more.

Thank you so much for your time.

May 5: Dear Holly, To be brief, then indeed, the key multi-layered well-studied sites are about 20. In total, more than 100 objects are known.

Yours sincerely, Maxim.

May 7: Thanks so much Maxim! By "objects" do you mean Palaeolithic artifacts?

May 7: Dear Holly, I meant the number of Paleolithic sites.

5. N. Zwyns, “Altai: Paleolithic” in *Encyclopedia of Global Archaeology*: “Based on the Eurasian system of division, three main periods can be recognized during the Paleolithic of the Altai: the Lower, Middle, and Upper Paleolithic. The Lower Paleolithic corresponds to the first human occupation of the Altai that would start c. 800 ka. The Middle Paleolithic would start sometime at the end of the Middle Pleistocene and last until c. 50 ka. The Upper Paleolithic covers a time range from c. 50 ka to the end of the Pleistocene” (p. 150). Note that while this is the commonly discerned time frame among Altai archaeologists, the time frame for the Paleolithic era varies by region and academic discipline.
6. Turner et al., *Animal Teeth and Human Tools,* 79.
7. A. Gibbons, “Who Were the Denisovans?” *Science* 333 (August 26, 2011). Svante Pääbo comments, “The one place where we are sure all three human forms have lived at one time or another is here in Denisova Cave.” In 2010, a Neanderthal toe bone was discovered in Denisova Cave. The results of its morphological analysis are documented in M. B. Mednikova, “A Proximal Pedal Phalanx of a Paleolithic Hominin from Denisova Cave, Altai,” *Archaeology, Ethnology and Anthropology of Eurasia* 39, no. 1 (2011). Radiocarbon dating of the organic material found above the toe revealed that the Neanderthal roamed the cave at least 50,000 years ago. In S. Brown et al., “Identification of a New Hominin Bone from Denisova Cave, Siberia, Using Collagen Fingerprinting and Mitochondrial DNA Analysis,” *Scientific Reports* 6, no. 25339 (March 29, 2016), a sample taken from layer 12 from the East Gallery of the cave was found through mtDNA analysis to be from a >50,000-year-old Neanderthal. Then, in

2017, researchers successfully sequenced soil samples from the Cave for DNA; Neanderthal DNA was detected in layer 15 from the Main Gallery, and layer 14 from the East Gallery at a depth deeper than any fossilized remains or artifacts have been found (V. Slon et al., "Neanderthal and Denisovan DNA from Pleistocene Sediments," *Science* 356, no. 6338 [May 12, 2017]: 605–608). Frequent occupations of Denisova Cave by Neanderthals are supported by the Mousterian artifacts, generally associated with Neanderthals, that have been excavated there. The editors of *Encyclopaedia Britannica,* in "Denisova Cave," https://www.britannica.com/place/Denisova-Cave (last updated February 8, 2018), state that there is "evidence of 13 separate occupations occurring between 125,000 and 30,000 years ago … supported by the presence of artifacts from the Acheulean, Mousterian, and Levalloisian stone-flaking industries," all of which are associated with Neanderthals.

8. The first conclusive evidence that anatomically modern humans interbred with Neanderthals was established in 2010 by R. E. Green et al., "A Draft Sequence of the Neanderthal Genome," *Science* 328, no. 5979 (May 7, 2010), 710–722. The investigators conclude, on the basis of remains from Croatia, that "between 1 and 4% of the genomes of people in Eurasia are derived from Neandertals" (p. 721). Then, an investigation by K. Prüfer et al., "The Complete Genome Sequence of a Neanderthal from the Altai Mountains," *Nature* 505 (January 2, 2014), concluded that "the proportion of Neanderthal-derived DNA in people outside Africa is 1.5–2.1%" (p. 45). All these results are consistent with Q. Fu et al.'s findings in "An Early Modern Human from Romania with a Recent Neanderthal Ancestor," *Nature* 524 (August 13, 2015),

216–219, in which the 37,000–42,000-year-old was confirmed as having 6–9 percent of its genome derived from Neanderthals (p. 216). The most recent and accurate investigation on modern human and Neanderthal interbreeding was, however, led by K. Prüfer, "A High-Coverage Neanderthal Genome from Vindija Cave in Croatia," *Science* 358 (November 3, 2017), 655–658. In this study, non-African populations outside Oceania are found to carry between 1.8 and 2.6 percent Neanderthal DNA, East Asians are found to carry 2.3–2.6 percent Neanderthal DNA, and Western Eurasians carry 1.8–2.4 percent. The amount of Neanderthal DNA carried by current modern humans can therefore be estimated as being in the realm of 0–4 percent.

19. Ibid.

20. The historical explanation for this is unsurprisingly rooted in early-twentieth-century interpretations of human origins. See, for example, Smithsonian National Museum of Natural History, "La Chapelle-aux-Saints," http://humanorigins.si.edu/evidence/human-fossils/fossils/la-chapelle-aux-saints (accessed March 12, 2018), "The original reconstruction of the 'Old Man of La Chapelle' by scientist Pierre Marcellin Boule led to the reason why popular culture stereotyped Neanderthals as dim-witted brutes for so many years. In 1911, Boule reconstructed this skeleton with a severely curved spine indicative of a stooped, slouching stance with bent knees, forward flexed hips, and the head jutted forward. He thought the low vaulted cranium and the large brow ridge, somewhat reminiscent of that seen in large apes such as gorillas, indicated a generally primitive early human and a lack of intelligence."

The Neanderthal discovery took place within the Victorian epoch in which the Western white man sought to excuse his domination and colonization of the world by means of cultural and racial hegemony, namely "scientific racism" (also termed "eugenics"). It is unsurprising that Neanderthals, a species considered more primitive than the most "primitive" early-twentieth-century humans, were instantly assumed to be

intellectually and creatively incapable and totally unable to enjoy abilities reserved for "civilised" white modern humans.

21. Archaeologist Ralph Solecki's 1971 book, *Shanidar: The First Flower People,* was seminal in the consensus change on Neanderthal intelligence. Solecki's article based on the book is available in *Science* 190 as "Shanidar IV, a Neanderthal Flower Burial in Northern Iraq" (880–881). The abstract reads: "The discovery of pollen clusters of different kinds of flowers in the grave of one of the Neanderthals, No. IV, at Shanidar Cave, Iraq, furthers our acceptance of the Neanderthals in our line of evolution. It suggests that, although the body was archaic, the spirit was modern."

Since then, a stream of studies supporting this hypothesis have been published, establishing Neanderthals as not only socially intelligent, compassionate, and sensitive humans, but also as culturally and technologically advanced and artistic. For evidence of Neanderthal social intelligence, compassion, and sensitivity, see Penny A. Spikins, Holly E. Rutherford, and Andy P. Needham, "From Homininity to Humanity: Compassion From the Earliest Archaics to Modern Humans," *Time and Mind* 3.3 (2010), 303–325; William Rendu et al., "Evidence supporting an intentional Neandertal burial at La Chapelle-aux-Saints," *Proceedings of the National Academy of Sciences* 111.1 (2014), 81–86; Penny Spikins et al., "The cradle of thought: growth, learning, play and attachment in Neanderthal children," *Oxford Journal of Archaeology* 33.2 (2014), 111–134; Erik Trinkaus and Sébastien Villotte, "External auditory exostoses and hearing loss in the Shanidar 1 Neandertal," *PloS one* 12.10 (2017), e0186684; Penny Spikins et al., "Calculated or caring? Neanderthal healthcare in social context," *World Archaeology*

(2018), 1–20; A. Gómez-Olivencia et al, "La Ferrassie 1: New Perspectives on a 'classic' Neandertal," *Journal of Human Evolution* 117 (2018), 13–32.

For Neanderthal cultural and technological advancement, art, and symbolism see Karen Hardy et al. "Neanderthal medics? Evidence for food, cooking, and medicinal plants entrapped in dental calculus," *Naturwissenschaften* 99.8 (2012), 617–626; Ruggero D'Anastasio et al., "Micro-biomechanics of the Kebara 2 hyoid and its implications for speech in Neanderthals," *PLoS One* 8.12 (2013), e82261; Jacques Jaubert et al., "Early Neanderthal constructions deep in Bruniquel Cave in southwestern France," *Nature* 534.7605 (2016), 111; A. Sorensen et al., "Neandertal fire-making technology inferred from microwear analysis," *Scientific reports* 8.1 (2018), 10065; Ana Majkić et al., "A decorated raven bone from the Zaskalnaya VI (Kolosovskaya) Neanderthal site, Crimea," *PloS one* 12.3 (2017), e0173435; Biancamaria Aranguren et al., "Wooden tools and fire technology in the early Neanderthal site of Poggetti Vecchi (Italy)," *Proceedings of the National Academy of Sciences* (2018), 201716068; Dirk L. Hoffmann et al., "U-Th dating of carbonate crusts reveals Neandertal origin of Iberian cave art," *Science* 359.6378 (2018), 912–915; Dirk L. Hoffmann et al., "Symbolic use of marine shells and mineral pigments by Iberian Neandertals 115,000 years ago," *Science advances* 4.2 (2018), eaar5255.

The recent and pivotal turning point in our understanding of Neanderthals as intelligent beings is marked by A. Lawler, "Neanderthals, Stone Age People May Have Voyaged the Mediterranean," *Science* (April 24, 2018), "The recent evidence from the Mediterranean suggests purposeful navigation," the article reads. "The orthodoxy until pretty recently was that you don't have seafarers until the early Bronze Age," adds

archaeologist John Cherry of Brown University, an initial skeptic. “Now we are talking about seafaring Neandertals. It’s a pretty stunning change.”

The genetic data confirm that Denisovans were present in the area at least twice and possibly over a long period of time. Thus, we have adequate data to evaluate the hypothesis of continuous cultural and physical development of Denisovans over time. The similar morphology of two upper hominin molars from Denisova Cave, separated by a thick deposit and tens of thousands of years, also supports this idea.”

53. Ibid.

54. Ibid.

55. Which Middle Pleistocene species of human the Sima de los Huesos (SH) hominins of Spain belonged to—either the Denisovans of southern Siberia or the Neanderthals of western Eurasia—adds an interesting nuance to the archaeological evasiveness of the Denisovans, however. While the SH hominins share morphological features and nuclear DNA with Neanderthals, the mtDNA of one SH individual is more closely related to the mtDNA of Denisovans than to that of Neanderthals. Whether or not the Denisovans can

be termed a separate species to the Neanderthals and SH hominins has therefore been put to doubt.

For studies concluding upon the morphological affinity of the SH hominins to Neanderthals, see I. Martínez and J. L. Arsuaga, "The Temporal Bones from Sima de los Huesos Middle Pleistocene Site (Sierra de Atapuerca, Spain): A Phylogenetic Approach," *Journal of Human Evolution* 33 (1993), 283–318; M. Martinón-Torres et al., "Morphological Description and Comparison of the Dental Remains from Atapuerca-Sima de los Huesos Site (Spain)," *Journal of Human Evolution* 62 (2012), 7–58; J. L. Arsuaga et al., "Neanderthal Roots: Cranial and Chronological Evidence from Sima de los Huesos," in *Science* 44, no. 6190 (2014); R. Quam et al., "The Bony Labyrinth of the Middle Pleistocene Sima de los Huesos Hominins (Sierra de Atapuerca, Spain)," *Journal of Human Evolution* 90 (2016), 1–15.

For sequencing results that link the nDNA of the SH hominins to Neanderthals, see M. Meyer et al., "Nuclear DNA Sequences from the Middle Pleistocene Sima de los Huesos Hominins," *Nature* 531 (March 24, 2016).

For results that link the mtDNA of SH hominins with Denisovans, see M. Meyer et al., "A Mitochondrial Genome Sequence of a Hominin from Sima de los Huesos," *Nature* 505 (January 16, 2014). There has also been speculation surrounding the mysterious 105–125 ky skulls excavated in Xuchang, China, which from the perspective of Martinón-Torres "definitely" fit what one expects from Denisovans: "something with an Asian flavor but closely related to Neandertals." But because the investigators have not extracted DNA from the skulls, "the possibility remains a speculation" (Martinón-

Torres quoted in A. Gibbons, "Ancient Skulls May Belong to Elusive Humans Called Denisovans," *Science* News [March 2, 2017]).

56. See Anne Gibbons, "Siberian Cave Was Home to Generations of Ancient Humans," *Science* (September 15, 2015), http://www.sciencemag.org/news/2015/09/siberian-cave-was-home-generations-mysterious-ancient-humans.

14. Peregrine and Ember, *Encyclopedia of Prehistory: Volume 2: Arctic and Subarctic,* 194.

15. Specifically between "24,423–23,891 calendar years before present;" see Raghavan et al., "Upper Palaeolithic Siberian Genome," 87.

16. Ibid.

17. Morten Rasmussen et al., "The Genome of a Late Pleistocene Human from a Clovis Burial Site in Western Montana," *Nature* 506 (February 13, 2014), 225ff; Stuart J. Fiedel, "The Anzick Genome Proves Clovis Is First After All," *Quaternary International* (June 20, 2017), 4ff.

18. As of July 2018, it has been known that a species of *Homo* reached central China by 2.12 million years ago (Z. Zhu et al., "Hominin Occupation of the Chinese Loess Plateau

Since About 2.1 Million Years Ago," *Nature* [July 11, 2018]). Whether this species of *Homo* migrated there from Africa or originated somewhere in East Asia, perhaps even China, is up for debate. What is for certain, is that evidence for the advanced exploratory abilities of the most ancient hominins like *Homo erectus* is mounting and becoming harder to deny. For the most comprehensive documentation of *Homo erectus* and other early hominin technological—most notably maritime—abilities, see R. Bednarik, "The Maritime Dispersal of Pleistocene Humans," *Migration and Diffusion* 3, no. 10 (2002), 6–33; R. G. Bednarik, "The Beginnings of Maritime Travel," *Advances in Anthropology* 4, no. 4) (2014), 209; and R. G. Bednarik, "An Experiment in Pleistocene Seafaring," *International Journal of Nautical Archaeology* 27, no. 2 (1998), 139–149.

For the viability of early hominin maritime dispersal, consult work by Sue O'Connor, for example, S. O'Connor et al., "Hominin Dispersal and Settlement East of Huxley's Line: The Role of Sea Level Changes, Island Size, and Subsistence Behavior," *Current Anthropology* 58, no. S17 (2017), S567–S582; S. Kealy, J. Louys, and S. O'Connor, Reconstructing Palaeogeography and Inter‐Island Visibility in the Wallacean Archipelago During the Likely Period of Sahul Colonization, 65–45,000 Years Ago," *Archaeological Prospection* 24, no. 3 (2017), 259–272.

Finally, for conclusive evidence of ancient hominin marine capability, see T. F. Strasser et al., "Dating Palaeolithic Sites in Southwestern Crete, Greece," *Journal of Quaternary Science* 26, no. 5 (2011), 553–560. Crete has been separated from mainland Greece since the Miocene 6 million to 5 million years ago, so the presence of Pleistocene-age arteiacts there proves conclusively that early hominins were able to—

and indeed did—make substantial sea crossings and explore more of the world than we hitherto gave them credit for.

Also see T. Ingicco et al., "Earliest Known Hominin Activity in the Philippines by 709 Thousand Years Ago," *Nature* 557, no. 7704 (2018), 233. This paper "pushes back the proven period of colonisation of the Philippines by hundreds of thousands of years, and furthermore suggests that early overseas dispersal in Island South East Asia by premodern hominins took place several times during the Early and Middle Pleistocene stages."

5. Raghavan et al., “Genomic Evidence for the Pleistocene and Recent Population History of Native Americans,” aab3884-8.
6. Ibid., aab3884-7.
7. The challenge posed to scholars of the “deliberate voyaging” school is the unconvincing argument that ancient hominins were “accidentally” transported across the sea by natural events like storms and tsunamis. See, for instance, comment from archaeologist Matthew Sprigs in R. Bednarik, “The Maritime Dispersals of Pleistocene Humans,” p. 55: “Given Bednarik’s ongoing search to find out how sea barriers cannot be crossed,

one wonders on what basis he can be so certain that colonization cannot have been accidental, by being caught up in strong currents."

Among a mass of evidence is a paper by T. F. Strasser et al., "Dating Palaeolithic Sites in Southwestern Crete, Greece," *Journal of Quaternary Science* 26, no. 5 (2011), 553–560. Crete has been separated from mainland Greece since the Miocene 6–5 million years ago, so the presence of Pleistocene-age artifacts there proves conclusively that early hominins made sea crossings (unless one is willing to argue that ancient hominins were "accidentally" transported the approximate 500 miles there from mainland Greece or 600 miles there from mainland Turkey via islands).

The recent analysis of rock art in Asphendou Cave, Crete, fashioning a species of deer, *Candiacervus,* that has been extinct on the island for at least 11,000 years, indicates that hominins conclusively reached Crete at least 11,000 years ago: if they could create art then why could they not create boats? See T. F. Strasser et al., (2018). "Palaeolithic Cave Art from Crete, Greece," *Journal of Archaeological Science: Reports* 18 (2018), 100–108, esp. p. 103, "if *Candiacervus,* then they date earlier than the end of the Palaeolithic at least 11 thousand years ago," and p. 107, "The last occurrence of the Cretan dwarf deer Candiacervus sometime after 21,500 years ago provides a terminus ante quem for the earliest layer of the Asphendou Cave rock carvings and confirms them as the oldest figural art found in Greece."

Also see T. Ingicco et al., "Earliest Known Hominin Activity in the Philippines by 709 Thousand Years Ago," *Nature* 557, no. 7704 (2018), 233. This paper "pushes back the proven period of colonisation of the Philippines by hundreds of thousands of years, and furthermore suggests that early overseas dispersal in Island South East Asia by

premodern hominins took place several times during the Early and Middle Pleistocene stages."

8. For evidence of Denisovan contribution to the genes of present-day Oceanians, see D. Reich et al., "Genetic History of an Archaic Hominin Group from Denisova Cave in Siberia," *Nature* 468 (2010), 1053–1060, and D. Reich et al., "Denisova Admixture and the First Modern Human Dispersals into Southeast Asia and Oceania," *American Journal of Human Genetics* 89 (2011), 516–528.

For a reasonable explanation of this genetic signal see Alan Cooper and Chris Stringer, "Did the Denisovans Cross Wallace's Line?" *Science* 342 (2013), 321, esp. p. 332: "The source of the Denisovan gene flow appears to have been east of Wallace's Line, with a lack of Denisovan DNA in mainland populations explained by Wallace's Line limiting the reverse dispersal of introgressed populations."

For evidence of lesser Denisovan contribution to the genes of present-day East Asians, see K. Prüfer et al., "The Complete Genome Sequence of a Neanderthal from the Altai Mountains," *Nature* 505 (2014), 43–49; P. Skoglund and M. Jakobsson, "Archaic Human Ancestry in East Asia," *Proceedings of the National Academy of Sciences* 108 (2011), 18301–18306; S. R. Browning et al., "Analysis of Human Sequence Data Reveals Two Pulses of Archaic Denisovan Admixture," *Cell* 173, no. 1 (2018), 53–61.

Also see Robert G. Bednarik, "The Beginnings of Maritime Travel," *Advances in Anthropology* (January 2014), 209: "The maritime history of humanity commenced not a few thousand years ago, as traditional nautical archaeology has tended to assume, but more than a hundred times as long ago … Archaeological data from Wallacea (Indonesia) have shown that the history of seafaring began in the late part of the Early

Pleistocene, at least 900 ka (900,000 years) ago. To understand better the technological magnitude of these very early maritime accomplishments, expeditions are currently engaged in a series of replicative experiments."

9. Bednarik, "The Beginnings of Maritime Travel," 210–211. Also see results of the experiment made in R. G. Bednarik, "An Experiment in Pleistocene Seafaring," *International Journal of Nautical Archaeology* 27, no. 2 (1998), 148: "The [800km] voyage from Timor or Roti to Australia was made by a marine people whose accumulated knowledge derived from a history of seafaring spanning at least 700,000, and quite probably a million, years."

For *Homo erectus*' colonization of Flores, also see Paul Y. Sondaar, "Middle Pleistocene Faunal Turnover and Colonization of Flores (Indonesia) by Homo erectus," *Comptes Rendus de l'Academie des Sciences* 319 (1994), 1255: "Several stone artefacts have been found in a uvial sandstone layer belonging to the Ola Bula Formation, near Mata Menge in the Ngada District, West Central Flores, Indonesia … indicating an age of slightly less than 0.73 Ma BP. is relatively old age suggests that the artefacts are the work of *Homo erectus*." Also see Ingicco et al., "Earliest Known Hominin Activity in the Philippines by 709 thousand Years Ago," 233.

10. The two papers that established the consensus of 3,500 years ago for the Polynesian expansion are I. D. Goodwin, S. A. Browning, and A. J. Anderson, "Climate Windows for Polynesian Voyaging to New Zealand and Easter Island," *Proceedings of the National Academy of Sciences* 111, no. 41 (2014), 14716–14721, and D. A. Johns, G. J. Irwin, and Y. K. Sung, "An Early Sophisticated East Polynesian Voyaging Canoe

Discovered on New Zealand's Coast," *Proceedings of the National Academy of Sciences* 111, no. 41 (2014), 14728–4733.

11. Having said that, mainstream academia has begun to change its tune. Quoted in a *Science* news article from April 24, 2018, is "initial skeptic" of prehistoric human seafaring abilities John Cherry of Brown University: "The orthodoxy until pretty recently was that you don't have seafarers until the early Bronze Age. … Now we are talking about seafaring Neandertals. It's a pretty stunning change." Quoted in the same article is Curtis Runnels of Boston University, co-leader of the 2008 and 2009 Crete excavations: "We severely miscalculated. … The seas were more permeable than we thought" (A. Lawler, "Neanderthals, Stone Age People May Have Voyaged the Mediterranean," *Science* [April 24, 2018], doi:10.1126/science.aat9795).

18. Ibid.
19. Ibid.
20. But for an opposing interpretation, see Skoglund et al., "Genetic Evidence for Two Founding Populations of the Americas," 104: "The coefficients for which non-American

populations contribute the most to the signals **separate Native Americans into a cline with two Amazonian groups (Surui and Karitiana) on one extreme and Mesoamericans on the other**. … Among the outgroups, the most similar coefficients to Amazonian groups are found in Australasian populations: the Onge from the Andaman Islands in the Bay of Bengal (a so-called 'Negrito' group), New Guineans, Papuans and indigenous Australians." (Emphasis added.)

21. Ibid.

22. The Denisovan signal across Native American populations is presently estimated to be between 0.13 and 0.17 percent, not so much on the basis of genomic surveys but of more estimations: "As it was previously estimated that the Denisovan-related ancestry in … [Native American] populations is 3.8 percent to 4.8 percent of that in Oceania … combining this information with our new estimate of approximately 3.5 percent Denisovan ancestry in New Guinea and Australia leads to estimates of Denisovan ancestry in … [Native American] populations of 0.13 percent–0.17 percent." See Pengfei Qin and Mark Stoneking, "Denisovan Ancestry in East Eurasian and Native American Populations," *Molecular Biology and Evolution* 32, no. 10 (2015), 2671.

PART IV

11: GHOST CITIES OF THE AMAZON

1. H. C. Heaton (ed.), *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents* (American Geographical Society, 1934), 169.
2. Ibid., 172.
3. Ibid., 198: "There was one settlement that stretched for five leagues without any intervening space from house to house, which was a marvellous thing to behold." Commenting on this observation, Professor David Wilkinson of UCLA notes that the exact length of a "league" was "not a fully agreed-upon or stabilized physical distance, but was probably not less than 2.5 English statute miles nor more than 4." See David Wilkinson, "Amazonian Civilization?" *Comparative Civilizations Review* 74, no. 74 (Spring 2016), 96. At the minimum measure, therefore, 5 leagues equals 12.5 miles (20.1 kilometers), while at the maximum measure, 5 leagues equals 20 miles (32.2 kilometers). It seems safe, therefore, to summarize the extent of this settlement as "more than 20 kilometers."

4. Ibid, 198, where the "territory of the great overlord Machiparo," all inhabited, with "a wealth of natural resources," is said to extend for 80 leagues. See also p. 188 for a second cultivated area of similar extent. And see p. 217: "This land is as good, as fertile, and as normal in appearance as our Spain. … Already the Indians were beginning to burn over their fields. It is a temperate land, where much wheat may be harvested and all kinds of fruit trees may be grown; besides this, it is suitable for the breeding of all sorts of livestock." See note above on the length of a league.
5. For example, see ibid., 190: "This Machiparo has his headquarters near the river upon a small hill and holds sway over many settlements and very large ones which together contribute for fighting purposes fifty thousand men of the age of from thirty years up to seventy." See also pp. 194–195, 197–199, 204, 213, and 218–219.
6. See note 3 above on the length of a "league."
7. Heaton, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents,* 198.
8. Ibid., 200.
9. Including: "meats, partridges, turkeys, and fish of many sorts;" "turtles and parrots in abundance;" "turtles … manatees and other fish, and roasted partridges and cats and monkeys;" "turtles in pens and pools of water, and a great deal of meat and fish and biscuit … in such great abundance that there was enough to feed an expeditionary force of one thousand men for one year;" "pineapples and [avocados] and plums and custard apples and many other kinds of fruit;" "a very great quantity of very good biscuit which the Indians make out of maize and yucca, and much fruit of all kinds," and fish drying

"to be transported into the interior to be sold;" "turtles … turkeys and parrots … bread and … very good wine resembling beer;" a tapir; "snails and crabs; yams and maize." Ibid., 175, 180, 182, 192, 200, 203, 207, 210, 211, 230, 231, 232.

10. Ibid., 201.

11. Ibid.

12. Ibid., 202.

13. Ibid.

14. J. T. Medina, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents,* vol. 17 (American Geographical Society, 1934), 8.

15. Ibid., 9.

16. See, for example, Spanish historian Francisco Lòpez de Gomara, quoted in Medina, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents,* 25–26, who in 1552 described Carvajal's journal as being "full of lies." However, Carvajal actually visited the Amazon, whereas Gomara did not. Furthermore, Gomara was evidently more criticized by his sixteenth-century contemporaries for distorting historical truth than Carvajal was; on November 17, 1553, Prince Phillip of Spain imposed a penalty of 200,000 maravedis on anyone who would reprint Gomara's historically inaccurate work.

17. Heaton, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents,* 214: "Our Lord was pleased to give strength and courage to our companions, who killed seven or eight (for these we actually saw) of the

Amazons, whereupon the Indians lost heart." Carvajal clearly distinguishes between the "women warriors" or "the Amazons" and "the Indians" here.

18. Ibid., 214.

19. Ibid., 212–214, 220–221.

20. Ibid., 221.

21. By 1541 the fierce Amazonian women warriors had made an especially significant appearance in literary culture and were becoming embedded in the European imagination. For example, they featured heavily in "Las sergas de Esplandan," a sequel to the Amadis of Gaul cycle, which was first published in 1510 and widely circulated. For a good documentation of European imagination of the Amazons, see E. Pink, "The Amazons of the Americas: Between Myth and Reality," available here via Newcastle University: https://www.societies.ncl.ac.uk/pgfnewcastle/files/2015/03/Pink-The-Amazons-of-the-Americans.pdf.

22. Heaton, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents*. Most agree that the Amazon got its name from the women of the Tupya tribe against whom Orellana battled, as they reminded him of the female Amazon warriors of Greek legend. This is evident in Carvajal's account, for he explains, "In the years which followed Orellana's expedition the name Marañón … was abandoned, and the river began to more generally be known as the River of the Amazons." At times, also, it was referred to under the name of its discoverer. An instance of this may be seen in the articles of agreement drawn up by order of the king, under the date of August 11, 1552, empowering Gerónimo de Aguayo "to go to the

provinces of the Aruacas **and of the Amazons,**" who are located, as this document reads, "[in a region stretching away] from the mouth of the Orellana River, called by another name The Amazons" (162–163). (Emphasis added.) Supporting this are words of the fiercest critic of Carvajal, López de Gómara, who is quoted by Medina in his introduction to Carvajal's account as saying, "Among the extravagant statements which he made was his claim that there were Amazons along this river with whom he and his companions had fought. … Because of this imposture, already many write and say 'River of the Amazons,' and there have gathered together so many parties to go there" (26).

23. Heaton, *The Discovery of the Amazon According to the Account of Friar Gaspar de Carvajal and Other Documents,* 217.

24. See, for example, A. C. Roosevelt et al., "Paleoindian Cave Dwellers in the Amazon: The Peopling of the Americas," *Science* 272, no. 5260 (1996), 373–384, esp. 373: "The tropical rainforest was thought to have been an ecological barrier to Paleoindians because it provided only scarce resources for human subsistence, and anthropologists have theorised that people could not survive there before the development of slash and burn cultivation."

25. M. W. Palace et al., "Ancient Amazonian Populations Left Lasting Impacts on Forest Structure," *Ecosphere* 8, no. 12 (December 2017), 2.

33. Wilkinson, "Amazonian Civilization?" 83.
34. See for example the population estimates of Jan De Vries in *European Urbanisation, 1500–1800* (Methuen, 1984), 28: "Of the perhaps 3000–4000 settlements in Europe that were vested with city rights of one form or another, or were otherwise acknowledged to be urban places around 1500, only 154 were inhabited by 10,000 or more people, and only 4 contained as many as 100,000. …" Also of note is that the whole of Scandinavia is estimated as having had a total urban population of 13,000 in 1500, which is just over half the size of Wilkinson's largest estimated Amazonian settlement (30).
35. Admittedly, the population of London is estimated as having fallen by a third following the bubonic plague. Even so, its estimated population of 60,000 in 1500 is revealing in the context of contemporaneous Amazonian urbanity. 58. Wilkinson, “Amazonian Civilization?” 89.

59. The smallpox epidemic, to which the Aztecs had no immunity, was probably the single key factor that ensured Spanish victory in the conquest. By the time Cortes and his conquistadors finally captured Tenochtitlan, the Aztec capital, most of its inhabitants were already dead—from smallpox. It is thought likely that the Inca emperor Huayna

Capac died of smallpox in 1528, four years before the arrival of Pizarro's forces in Peru, indicating strongly that the virus had traveled on trade networks from Mexico. If those networks were exclusively coastal, then smallpox might not have reached the Amazon until 1542. If they had been inland, then it is possible it could have done so a decade or so earlier. See, for example, D. R. Hopkins, *The Greatest Killer: Smallpox in History* (University of Chicago Press, 2002), 208–211: "The rumours of the Inca Empire that lured Balboa south were also evidence of communication, by land and by sea, between the Indians of Peru and those living in Central America." The author goes on to say that when smallpox struck the land of the Incas sometime around 1524–1527, it was almost certainly smallpox imported from Central America.

22. "Thomas R. Miles has designed, developed, installed and tested agricultural and industrial systems for fuel handling, air quality, and biomass energy since 1975. An expert in combustion and gasification of biomass, he has designed and developed many systems to make biochar. He has sponsored and hosted internet discussions on biomass energy since 1994 including biochar@yahoogroups.com listservs and www.biochar.bioenergylists.org since 2006." See http://2012.biochar.us.com/profile/116/thomas-r-miles.

23. Tom Miles, "Amazon's Mysterious Black Earth: Soil Found Along Region Riverbanks; Rich in Nutrients, Stores More Carbon," BioEnergy Lists: Biochar Mailing Lists, January 20, 2007, http://terrapreta.bioenergylists.org/forestsorg.

24. The fertility of terra preta is discussed at length in Scheub et al., *Terra Preta,* 6.

25. WinklerPrins, "Terra Preta: The Mysterious Soils of the Amazon," 236. The quoted passage continues: "In the generally high humidity and high rainfall environments such as found in the Amazon basin, most nutrients in the soil mineralize and are leached out

of the system quickly, and because of this, the vegetation of the region typically absorbs nutrients quickly from the soil once these have been released in the soil through decomposition or other processes."

26. Ibid.

27. Ibid. "The carbon found in ADE's is aromatic carbon (also known as black or pyrogenic carbon) that is likely a consequence of the incorporation of charcoal into the soil. … Soils with this type of carbon are able to retain, even attract nutrients, resulting in more plant-available phosphorus, calcium, and nitrogen, as the aromatic carbon acts as a carrying agent for nutrients. Aromatic carbon is also known to be highly resistant to degradation."

28. Morris, "Putting the Carbon Back," 625. The cited passage continues: "They become homes for populations of microorganisms that turn the soil into that spongy, fragrant, dark material that gardeners everywhere love to plunge their hands into. The char is not the only good stuff in *terra preta*—additions such as excrement and bone probably play a role too—but it is the most important factor. Leaving aside the subtleties of how char particles improve fertility, the sheer amount of carbon they can stash away is phenomenal."

29. William Balée, "Amazonian Dark Earths," *Tipiti: Journal of the Society for the Anthropology of Lowland South America* 8, no. 1 (2010), 5. Emphasis in the original. The cited passage goes on to state: "Biochar is believed to be the principal source of the color of the Amazon Dark Earths as well as the reason for retention of nutrients. Microbial activity leads to increased carbon sequestration. That is what makes ADEs of

interest in research on climate change. The higher and more diverse the microbial activity, the better the soil, and ADE is richer and more diverse in microbes than surrounding soils, even though millions of these species remain to be identified precisely and literally *a million separate taxa can be contained in only 10 grams of soil*. A significant proportion of the microbes in ADE are different from the microbes in the surrounding primeval soils."

30. Glaser and Woods, *Amazonian Dark Earths,* 4. The cited passage continues: "The consequent increase in microbiological activity adds colloidally sized organic decomposition products to the soil matrix."

41. And see Watling et al., “Direct Archaeological Evidence for Southwestern Amazonia as an Early Plant Domestication and Food Production Centre,” 21–22: “The pervading view is that the early Holocene inhabitants of the upper Madeira were simple hunter-gatherers from a ‘pre’-landscape domestication age. However, this scenario seems unlikely if we think about the following: we know manioc was domesticated—and therefore cultivated—by societies in the same region during the Girau phase, and

probably, we have argued, by the Girau-period inhabitants themselves. **In domesticating manioc, people not only improved various aspects such as the size and production of its tubers, photosynthetic rates and seed functionality, but they did this by repeated cycles of recombination and selection which involved clonal propagation as a viable reproductive mechanism (wild manioc cannot reproduce from stem cuttings). This process, which was completed by 8,000 years ago, required highly sophisticated knowledge of the natural world.**"

50. Ibid., 136.
51. Ibid.
52. Ibid.
53. According to Mann, "Ancient Earthmovers of the Amazon," p. 1148, at a time when more than 150 geoglyphs had been found Pärssinen estimated this number to represent "less than 10%" of the total.
54. John Francis Carson et al., "Environmental Impact of Geometric Earthwork Construction in the Pre-Columbian Amazon," *Proceedings of the National Academy of Sciences* 111, no. 29 (July 22, 2014), 10497.
55. Schaan et al., "New Radiometric Dates for Precolumbian (2000–700 BP) Earthworks in Western Amazonia, Brazil": A date of 2577 BC was retrieved from excavation unit 3 (p. 136, Table I); it measures 230 meters along each side; and its full perimeter, defined

by an enclosure ditch 12 meters wide, measures 920 meters—more than 3,000 feet (p. 135). The Great Pyramid has almost the same footprint; see Cole, *Determination of the Exact Size and Orientation of the Great Pyramid of Giza,* 6. For the accuracy of the Great Pyramid's cardinal alignments, which are the same as those given by Severino Calazans, see Edwards, *The Pyramids of Egypt,* 99–100.

16. Ibid., 57.
17. Ibid., 45.
18. Though the names *ayahuasca* and *yagé* both refer to essentially the same potion made from similar plants, the approach varies greatly between ayahuasca and *yagé*. For example, *yagé* bark is usually pounded off, leaving only the woody core of the vine to be boiled; these brews contain less tannins and cause less vomiting than ayahuasca brews, which are usually prepared with the bark left on the vine. Ayahuasca bark is usually only slightly rasped and pounded before being boiled, leaving more tannins in the brew, causing a more powerful purgative effect in the recipient. The DMT element of *yagé* is not derived from *Psychotria viridis* (chacruna) but is derived from another vine, *Diplopterys cabrerana,* which contains both N,N-DMT and 5-MeO-DMT. Further information available in J. M. Weisberger, *Rainforest Medicine: Preserving Indigenous Science and Biodiversity in the Upper Amazon* (North Atlantic Books, 2013). And for more differences in the preparation and ceremonial practicing of *yagé* and ayahuasca, see this easily accessible article, "The Difference Between Ayahuasca and Yagé," Rainforest Medicine Gatherings: Preserving Indigenous Science and Biodiversity in the Upper Amazon, accessed July 30, 2018, https://rainforestmedicine.net/the-difference-between-ayahuasca-and-yage/.

38. Reichel-Dolmatoff, *The Shaman and the Jaguar,* 85.
39. See the work of cognitive psychologist Benny Shanon, most notably, "Ayahuasca Visualization: A Structural Typology," in *Journal of Consciousness Studies* 9, no. 2 (February 2002), 24. Shanon creates a typology of the structural types or forms in which ayahuasca visions occur. He reports eighteen typological structures, in the order in which they arise during a session, the seventh of which is experience of "patterned geometric designs."

40. See Shanon, *The Antipodes of the Mind,* 386: "As I have made abundantly clear, this is a psychological book, not a philosophical one. … As described at the outset of this book, what impressed me greatly when I first partook of the brew were the similarities between the experiences I had with it and ones described in the anthropological literature. Some of the images that appeared in my visions were similar, at times identical, to ones reported by indigenous persons and by the first European explorers who encountered Ayahuasca. The extensive empirical research I have subsequently conducted corroborated these first impressions and led me to conclude that there are striking cross-personal commonalities in the contents of Ayahuasca visions, in their themes, and in the ideations that are associated with them."
41. This is the central theme of my 2005 book *Supernatural*.

52. Hively and Horn, “A Statistical Study of Lunar Alignments at the Newark Earthworks.”

53. Hively and Horn’s original observation to this effect in their paper “Geometry and Astronomy in Prehistoric Ohio,” S11, has subsequently been confirmed by Christopher S. Turner in his “Ohio Hopewell Archaeoastronomy: A Meeting of Earth, Mind and Sky,” *Time and Mind: The Journal of Archaeology, Consciousness and Culture* 4, no. 3 (November 2011), 308. Note, however that Hively and Horn did subsequently go on to identify solstice alignments at Newark, not in the earthworks themselves but between topographical features in surrounding hills in the midst of which the earthworks appear to have been deliberately situated. See Ray Hively and Robert Horn, “A New and Extended Case for Lunar (and Solar) Astronomy at the Newark Earthworks,” *Midcontinental Journal of Archaeology* 38 (Spring 2013), in particular pp. 101–104.

13. See, for example, A. P. Wright, and E. R. Henry, *Early and Middle Woodland Landscapes of the Southeast* (University Press of Florida, 2013), 1: "The Early and Middle Woodland periods, respectively, to circa 1000–200 BC and 200 BC–AD 600–800." Note, however, that the dates vary from subregion to subregion and the authors' end date for the Middle Woodland period is fairly late compared to most cultural frameworks, the reasons for which are not of concern here. This is clear upon reflection of Late Woodland periodization by authors of the comprehensive compendium M. S. Nassaney and C. R. Cobb, *Stability, Transformation, and Variation: The Late Woodland Southeast* (1991), who ascribe a window of AD 600–900 to the Late Woodland Period.

57. Ellerbe and Greenlee, *Poverty Point: Revealing the Forgotten City,* 28.
58. Ohio History Connection, "Adena Culture," http://www.ohiohistorycentral.org/w/Adena_Culture.
59. See, for example, p. 1 of D. W. Dragoo, "Adena and the Eastern Burial Cult" in *Archaeology of Eastern North America* 4 (Winter 1976), 1–9: "Extensive research throughout the East in recent years has clearly shown Adena to be one of only several regional cultures present between 1000 BC and AD 200." This view has been maintained in the twenty-first century—see, for example, p. 453 of S. M. Rafferty,

"Evidence of Early Tobacco in Northeastern North America?" *Journal of Archaeological Science* 33, no. 4 (2006), 453–458, which dates the Boucher Mound, Vermont: "The site has an extensive radiocarbon chronology, with dates ranging from 885 +-35 BC to as late as 49 BC uncalibrated, with a calibrated range indicating continuous use of the site through the majority of the first millennium BC, from as early as 1036 BC to as late as 49 BC. … The site features a rich and diverse assemblage of burial offerings, including numerous Adena-related artifacts."

60. Correspondence by my research assistant Holly Lasko with Bob Maslowski of the Council for West Virginia Archaeology on May 25, 2018, "Most Adena mounds I'm familiar with date between 400 and 200 BC." See B. Lepper, "How Old Is the Adena Mound?" Ohio History Connection Archaeology Blog (January 12, 2014), https://www.ohiohistory.org/learn/collections/archaeology/archaeology-blog/2014/january-2014/how-old-is-the-adena-mound. This article is based on a paper published in the *Midcontinental Journal of Archaeology,* whose abstract states that Adena Mound (typesite) dating of 200 BC places it near the midpoint of radiocarbon-dated Adena culture sites. The reference for the paper is Bradley T. Lepper et al., "Radiocarbon Dates on Textile and Bark Samples from the Central Grave of the Adena Mound (33RO1), Chillicothe, Ohio," *Midcontinental Journal of Archaeology* (2014).

61. Edward W. Herrmann et al., "A New Multistage Construction Chronology for the Great Serpent Mound, USA," *Journal of Archaeological Science* 50 (October 2014), 121.

62. The oldest reliable Adena Mound date is arguably (by no means definitively) c. 400 BC and based on recent AMS dates from Cresap Mound. See William H. Tippins, Richard W. Lang, and Mark A. McConaghy, "New AMS Dates on the CRESAP Mound (46MR7)," *Pennsylvania Archaeologist* 86, no. 2 (2016), 2–20, Table 4, p. 17.

29. F. Dunand and R. Lichtenberg, *Mummies and Death in Egypt* (Cornell University Press, 2006), x: "During the funeral, magical formulas were recited, and these and others were copied onto a Book of the Dead that lay in the tomb along with the deceased. A selection of figurines and ritual implements, along with a panoply of amulets and utilitarian objects from this life, accompanied the body. Once placed in the tomb, the individual would simultaneously move about in the realm where the dead were and also share in the course of the sun as it set and was reborn daily. The mobile 'soul,' the *ba,* soared up toward the daylight and then returned to animate its home base, the embalmed corpse in its coffin. The *ka,* the other 'soul' and the immaterial double of the material body, consumed the food and drink the survivors brought to the funerary chapel, at the same time perpetuating, by speaking it out loud, the name of the person, which they

could read on a stela. This whole system—which implies a far more complex anthropological representation of a living, thinking being than our own—was believed to confer the potential capacities of a god on the deceased. The classical form of a sarcophagus—a mummy with the mask and the heavy wig that were proper to images of deities—served as the hieroglyphic symbol for the idea of superior dignity (the Egyptian word was *sah*)."

111. See, for example, F. F. Leek, "Further Studies Concerning Ancient Egyptian Bread," *Journal of Egyptian Archaeology* 59, no. 1 (1973), 199–204, esp. 199: "The two most common cereals to be found in all sites in Upper and in Lower Egypt were wheat and barley … *Triticum dicoccum*—emmer—was the most important variety of wheat grown." See also 201: "Two samples taken from the abdominal remains of mummified Thebes showed that emmer was the sole ingredient of bread eaten, and in another

sample that it was mixed with another cereal. Since the remains came from Thebes, it suggests that emmer was commonly used in Upper Egypt."

112. Christopher Knight and Robert Lomas, *The Hiram Key: Pharaohs, Freemasons and the Discovery of the Secret Scrolls of Christ* (Arrow Books, 1997), 152: Knight and Lomas suggest that the ancient Egyptians considered Horus to be the "Morning Star" when Osiris says in 1000–1 of the Pyramid Texts:

> *The reed-floats of the sky are set in place for me, that I may cross by means of them to Re at the horizon … I will stand among them, for the moon is my brother, the Morning Star is my offspring.*

The authors go on to suggest that Pyramid Texts 357, 929, 935, and 1707 refer to the dead king's offspring—Horus—as being the morning star. On 153 they state, "In Egypt the new king, the Horus, is the morning star, arising (like the raised Freemason) from a temporary and figurative death." 134. E. K. Holt et al. (eds.), *Concerning the Nations: Essays on the Oracles Against the Nations in Isaiah, Jeremiah and Ezekiel* (vol. 612) (Bloomsbury, 2015), 35. On the basis of Dead Sea Scrolls translations of Isaiah, Jeremiah, Judges, and Job, respectively, the authors understand the Hebrew phrases "City of the Sun" and "house of the sun" to be references to Heliopolis, or the Egyptian name *Iwnw,* "pillar town," which in Genesis 41:45 and Ezekiel 30:17 is referred to as *'ôn/'āwen*. Examples from the New American Standard of the bible here:

He will also shatter the obelisks of Heliopolis, which is in the land of Egypt; and the temples of the gods of Egypt he will burn with fire. (Jeremiah 43:13)

And Pharaoh called Joseph's name Zaphenath-paneah. And he gave him in marriage Asenath, the daughter of Potiphera priest of On. So Joseph went out over the land of Egypt. (Genesis 41:45)

The young men of On and Pi-beseth
Will fall by the sword,
And the women will go into captivity (Ezekiel 30:17)

141. P. Lacovara, *The World of Ancient Egypt: A Daily Life Encyclopedia* (2 volumes) (ABC-CLIO, 2016), 183. Anke Napp, "Priests of Ancient Egypt," http://www.ancient-egypt-priests.com/AE-Life-english.htm: "The high-ranking priests wore sashes, probably with gold ornaments similar to the ones the Pharaoh used, and a leopard skin. The leopard was considered a sacred animal, personification of the ancient sky-Goddess Mafdet. Perhaps the spots on the skin reminded the Ancient Egyptians of stars. Artificial leopard cloth had star-shaped items on it for the spots. A leopard skin was also seen as connected to the beliefs of regeneration and rebirth in the afterlife, and with Sun God Ra. This can be traced back to the pyramid texts of the Fifth Dynasty. So in particular the Sem-priests, who had to perform the rituals of inspiriting the mummy before the funeral, wore this special garment, but also the deceased person! It can be seen as some sort of christening robe. Apart of the sash, they do not wear any jewellery." 61. Wolbach et al., "Extraordinary Biomass-Burning Episode and Impact Winter Triggered by the Younger Dryas Cosmic Impact ~12,800 Years Ago," 195: "Peros et al.'s (2008) comprehensive analysis of North American pollen records indeed demonstrated that an abrupt, temporary decline in conifer forests (mostly Picea sp.) occurred widely across North America during the first 150 y of the YD climate episode. This loss was accompanied by a sudden expansion of Populus species (poplar, cottonwood, aspen) and sometimes Alnus (birch), which are opportunistic pioneers that often flourish following major forest disruptions such as wildfires. In turn, Populus species were replaced by conifers during the remainder of the YD. Thus, a large, pervasive, temporary change in continental vegetation, as reflected in the North American pollen record, is consistent with a major biotic perturbation that would have resulted from widespread biomass burning at the YDB."

LeCompte et al., "An Independent Evaluation of Conflicting Microspherules Results from Different Investigations of the Younger Dryas Impact Hypothesis," *Proceedings of the National Academy of Sciences* 109, no. 44 (2018), e2960–e2969, doi:10.1073/pnas.1208603109; and Y. Wu et al., "Origin and Provenance of Spherules and Magnetic Grains at the Younger Dryas Boundary," *Proceedings of the National Academy of Sciences* 110, no. 38 (2013), e3557–e3566, doi:10.1073/pnas.1304059110.
4. See G. Hancock, *Magicians of the Gods,* chapters 4 and 5, 69–85.
5. Antonio Zamora has a multidisciplinary background in chemistry, computer science, and computational linguistics. Mr. Zamora was born in Mexico and came to the United States at an early age. He studied chemistry at the University of Texas (BS 1962), and computer and information science at Ohio State University (MS 1969). During his service in the U.S. Army from 1962 to 1965, Mr. Zamora studied medical technology at the Medical Field Service School (MFSS) in Fort Sam Houston and worked in

hematology at Brooke Army Medical Center. Mr. Zamora worked for many years as an editor and researcher at Chemical Abstracts Service developing chemical information applications. He also worked as a senior programmer at IBM on spelling checkers and novel multilingual information retrieval tools. He holds thirteen patents. After his retirement from IBM, Mr. Zamora established Zamora Consulting, LLC, and worked as a consultant for the American Chemical Society, the National Library of Medicine, and the Department of Energy to support semantic enhancements for search engines. Mr. Zamora has been interested in astronomy since childhood when his father helped him build a refracting telescope. Since his retirement in 2011, Mr. Zamora completed massive open online courses in astronomy, geology, and paleobiology. He regularly attends the seminars of the Department of Terrestrial Magnetism at the Carnegie Institution of Washington.

6. Zamora, "A Model for the Geomorphology of the Carolina Bays," 209–216.
7. The Carolina Bays were first postulated to be of cosmic origin in 1933 when the Roosevelt administration took the first aerial photographs of the seemingly crater-dotted landscape to assist farmers during the Great Depression. For an example, consult G. Howard, "The Carolina Bays" (1997) on George Howard.net, http://www.georgehoward.net/cbays.htm, accessed August 21, 2018. See also William S. Powell, "The Carolina Bays" (Encyclopedia of North Carolina, 2006). Available here: https://www.ncpedia.org/carolina-bays.
8. For example, Richard Firestone, Allen West, and Simon Warwick-Smith, *The Cycle of Cosmic Catastrophes* (Bear, 2006).

9. See, for example, M. J. Brooks, B. E. Taylor, and A. H. Ivester, "Carolina Bays: Time Capsules of Culture and Climate Change," *Southeastern Archaeology* 29, no. 1 (2010), 146–163, esp. 148: "Based on 45 OSL dates, active shorelines and associated eolian deposition occurred during marine isotope stage (MIS) 2 to late MIS 3 (~12 to 50 ka), MIS 4 to very late MIS 5 (60–80 ka), and late MIS 6 (120–140 ka). … In addition to these age ranges, some OSL dates indicate that bays also were active during the Holocene and Sangamon Interglacials."

4. Wendy Wolbach et al., "Extraordinary Biomass-Burning Episode and Impact Winter Triggered by the Younger Dryas Cosmic Impact ~12,800 Years Ago," *Journal of Geology* 126, no. 2 (March 2018), 170.
5. Marc Barton, "Smallpox and the Conquest of Mexico" (Past Medical History, February 28, 2018), https://www.pastmedicalhistory.co.uk/smallpox-and-the-conquest-of-mexico/.
6. Thomas J. Williams et al., "Evidence of an Early Projectile Point Technology in North America at the Gault Site, Texas, USA," *Science Advances* (July 14, 2018), 1, http://advances.sciencemag.org/content/4/7/eaar5954.
7. Ibid., 2.
8. Ibid., 5.
9. Thomas et al., "Explaining the Origin of Fluting in North American Pleistocene Weaponry," 23, 24, 28. And see B. A. Storey et al., "Why Are Clovis Fluted Points

More Resilient Than Non-Fluted Lanceolate Points? A Quantitative Assessment of Breakage Patterns Between Experimental Models," *Archaeometry* (July 2, 2018).

10. Personal correspondence with Al Goodyear, July 25, 2018. And see Lorena Becerra-Valdivia et al., "Reassessing the Chronology of the Archaeological Site of Anzick," *Proceedings of the National Academy of Sciences* (June 18, 2018), and Morten Rasmussen et al., "The Genome of a Late Pleistocene Human from a Clovis Burial Site in Western Montana," *Nature* 506 (February 13, 2014), 225.

11. Becerra-Valdivia et al., "Reassessing the Chronology of the Archaeological Site of Anzick," 3: "There is strong agreement between the Anzick-1 … date (12,905–12,695 cal B.P.) and all those obtained for the antler rods (12,990–12,840 cal B.P.). The results therefore suggest that Anzick-1 is temporally coeval with the antler rods, associated with the Clovis assemblage, and dates within the Clovis period."

12. Numbers on Clovis sites and points from Charles C. Mann, "The Clovis Point and the Discovery of America's First Culture," *Smithsonian Magazine,* November 2013, https://www.smithsonianmag.com/history/the-clovis-point-and-the-discovery-of-americas-first-culture-3825828/.

13. Becerra-Valdivia et al., "Reassessing the Chronology of the Archaeological Site of Anzick," 1. See also Rasmussen et al., "The Genome of a Late Pleistocene Human from a Clovis Burial Site in Western Montana," 225. The very fact that no other Clovis burials have ever been found means there's nothing to compare Anzick-1 with. To give an extreme example of the kinds of problems this raises, although we can make informed guesses, we cannot know for sure whether *every* deceased Clovis infant was

buried in the same elaborate way with equally copious offerings of grave goods or whether Anzick-1 was an exceptional burial of an exceptional individual, perhaps from some exceptional lineage. Intuitively we feel it's more likely to be the latter than the former, but we can't prove it.

14. Personal correspondence with Al Goodyear, July 26, 2018. And see Thomas et al., "Explaining the Origin of Fluting in North American Pleistocene Weaponry," 23–24.

29: UNKNOWN UNKNOWNS

1. The reference is to this famously circuitous 2002 statement by former secretary of state Donald Rumsfeld concerning lack of evidence linking the government of Iraq with weapons of mass destruction: "Reports that say that something hasn't happened are always interesting to me, because as we know, there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns—the ones we don't know we don't know. And if one looks throughout the history of our country and other free countries, it is the latter category that tend to be the difficult ones." Online here: http://archive.defense.gov/Transcripts/Transcript.aspx?TranscriptID=2636.

31. I put a similar question to David J. Meltzer (email exchange July 23 and 24, 2018), **GH:** I'm inclined to say in the relevant chapter of the book I'm just completing on ancient America that reliable figures simply don't exist for the whole Mississippi Valley

and that no archaeologist or other researcher has ever attempted to estimate what has been lost across the whole region as a result of agricultural, industrial and other encroachments since the mid-19th century. Would that, in your opinion, be a true reflection of the state of knowledge on this issue, or would it be misleading? **DJM:** I think that is an accurate statement, though again not having expertise in the area I cannot be certain. I also think it important to add that one of the reasons why such an estimate might be impossible is that 200+ years ago there was no systematic count of these earthworks, so we have no idea what the denominator should be for the equation of "sites still extant / sites once present." Add to that the fact that the (un)systematic ballpark estimates of a Squier would not only have failed to capture all the small mounds and hamlets, many of those sites were probably plowed down without anyone (except the mule team doing the work) even noticing or recording.

Lago do Saci," *Quaternary Science Reviews* 173 (October 1, 2017), 177.

10. M. Goulding, R. B. Barthem, and R. Duenas, *The Smithsonian Atlas of the Amazon* (Smithsonian Books, 2003), 19. "Approximately 85 per cent of the South American rainforest … is found in the Amazon Basin."

11. All figures are taken from the World Bank, "Land Area (sq. km.)," https://data.worldbank.org/indicator/ag.lnd.totl.k2?name_desc=false, apart from Europe, taken from S. Adams, A. Ganeri, and A. Kay, *Geography of the World: The Essential Family Guide to Geography and Culture* (DK, 2006), 78.

12. Email from Graham Hancock to Professor Renato Cordeiro dated March 12, 2018.

13. Professor Cordeiro's kind reply (email of March 14, 2018) contained some technical terms that I feel I need to translate here before getting to the meat of what he said:

- **Quaternary**—the reference is to our current era, roughly from 2.5 million years ago until the present.
- **Edaphic characteristics**—the reference is to the role of factors such as water content, acidity, aeration, and the availability of nutrients, that is, factors inherent in the soil itself rather than consequent upon climate.
- **Campinaranas**—these are neotropical ecoregions in the Brazilian Amazon.
- **Caatingas**—another kind of ecoregion of the Brazilian Amazon, in this case characterized by desert vegetation.
- **Pollinic**—the reference is to all matters relating to, containing, or derived from pollen.

"In order to understand the vegetation fluctuations during the quaternary," Professor Cordeiro told me, "one must try to understand some of the current distribution of

vegetation. Basically in the Amazon we have evergreen forests, deciduous forests, tree savanna, shrub savanna, open savanna and fields. In some regions vegetation is influenced by edaphic characteristics such as the *campinaranas* and *caatingas* of the Rio Negro where vast areas covered by quartz sands, with low nutrients and low water retention, limit the occurrence of vegetation with large biomass. Along the rivers are the gallery forests which, probably have been relatively well preserved during drier climatic periods. *Varzea* forests (floodplain forest) are still distributed along flood areas and inundated forests (regionally called *igapó*) that occur inside the river bed until 6 meters depth. This vegetation type mosaic produces variable amounts of pollens and therefore different responses in the sedimentary records as a function of the depositional environment (lakes near the Rios channel, e.g., Lago Saci, Lago La Gaiba; lakes far from the dynamics of rivers e.g. Carajás Lakes, Lagoa da Pata; marine deposits). As an example of this complexity of interpretations it is possible to mention that marine records have a pollinic signal very influenced by galleries forests and floodplain forests that would have been preserved during drier climatic periods. The Saci lake, because it is relatively close to the São Benedito II River, probably had a vegetation with higher biomass in relation to sites outside of the river influence. Therefore, due to this complexity between the generation of the different types of pollens of different vegetation types in relation to the depositional environment, many interpretations do not accurately depict the regional vegetation physiognomy."

14. For example, see M. B. Bush et al., "Paleotemperature Estimates for the Lowland Americas between 30 Degrees South and 30 Degrees North at the Last Glacial Maximum," chapter 17 in *Interhemispheric Climate Linkages,* ed. Vera Markgraf

(Academic Press, 2001), 303. See also Bush et al., “Amazonian Paleoecological Histories,” 360.

ABOVE: Only from the sky does the entire form of the great Manitou of Serpent Mound become visible. BELOW: The Serpent's head appears to seek out the setting sun, but only on the summer solstice. PHOTOS: SANTHA FAIIA.

A marriage of earth and sky: progress of the summer solstice sunset over Serpent Mound. PHOTOS: SANTHA FAIIA.

Winter solstice sunrise as viewed through the kilometer-long axis of the Temple of Karnak, Upper Egypt. PHOTO: SANTHA FAIIA.

The Great Sphinx of Egypt is an equinoctial marker. At the summer solstice the sun rises far to the north of east and at the winter solstice far to the south of east, but on the equinox the sun rises due east in direct alignment with the gaze of the Sphinx. PHOTO: SANTHA FAIIA.

The temple of Angkor Wat, Cambodia, is perfectly aligned to the cardinal directions so that the rising sun on the equinox sits momentarily at the pinnacle of the central tower, lighting up the whole enchanted structure like a fairy-tale kingdom. PHOTO: SANTHA FAIIA.

ABOVE: Entrance to Denisova Cave, Siberia, where the prehistory of our species is being rewritten. BELOW: View out of the main entrance of Denisova Cave, downslope to the Anui River. PHOTOS: SANTHA FAIIA.

ABOVE: Excavation trench, central gallery, Denisova Cave. BELOW: Although it seems to have served as a workshop where very special objects were made, the arches and the natural clerestory window of Denisova Cave give it a cathedral-like feel. PHOTOS: SANTHA FAIIA.

These fragments of a chloritolite bracelet, and the way that it seems designed to catch and transform light, suggest a far higher degree of artistic sophistication among the "anatomically primitive" Denisovans than among anatomically modern humans of the same period. The drill marks—indicated by superimposed arrows—bear witness to a level of technology in the depths of the Ice Age that was thousands of years ahead of its time. PHOTOS: INSTITUTE OF ARCHAEOLOGY AND ETHNOGRAPHY, SIBERIAN BRANCH, RUSSIAN ACADEMY OF SCIENCES.

Graham Hancock with Tom Deméré (left), chief palaeontologist at the San Diego Natural History Museum. The evidence that Deméré and his colleagues have excavated from the Cerutti Mastodon Site, including a single tusk set purposefully upright in the ground as a marker (right), indicates that humans were present in North America 130,000 years ago—ten times as long as had previously been supposed. PHOTOS: SANTHA FAIIA.

In the archives of the San Diego Natural History Museum examining the evidence for a human presence in the Americas 130,000 years ago. PHOTO: SANTHA FAIIA.

At Topper, South Carolina, with archaeologist Al Goodyear (left) who kept on digging below the Clovis level and found evidence of pre-Clovis humans going back 50,000 years. PHOTO: SANTHA FAIIA.

Together with the monkey and spider figures (see chapter 15), the hummingbird is another of the geoglyphs of the Nazca plateau that represents Amazonian species. PHOTO: SANTHA FAIIA.

The geometric theme of Nazca is expressed not only in pure geometrical figures (lower left and right) but also in effigies such as the "Condor" (top). PHOTOS: SANTHA FAIIA.

The English megalithic sites of Stonehenge (above) and Avebury (below) combining sacred geometry, earthworks, and stone circles. PHOTOS: SANTHA FAIIA.

ABOVE: The Great Pyramid of Egypt with the Pyramid of Khafra to its left, both perfectly oriented to the cardinal directions. PHOTO: SANTHA FAIIA.
BELOW: The Amazonian earthwork site of Fazenda Parana with its principal square also perfectly oriented to the cardinal directions. PHOTO: MARTTI PÄRSSINEN.

ABOVE: Fazenda Atlantica. The principal geoglyph forms a square measuring 250 meters along each side and is oriented northwest to southeast—an alignment that makes it a candidate for alignment to the setting sun on the June solstice and the rising sun on the December solstice. As yet no archaeoastronomical survey has been carried out on the Amazonian geoglyphs. BELOW: The Amazonian geoglyphs frequently combine two or more geometrical forms. Here, at Fazenda Cipoal, a square inscribed within an octagon with rounded corners. PHOTOS: MARTTI PÄRSSINEN.

ABOVE: The colossal Amazonian geoglyph of Tequinho once extended over an area of 15 hectares (37 acres). What remains today are its two principal squares, the larger measuring 210-by-210 meters (with two further squares inter-nested within it) and the smaller, which has suffered extensive damage, measuring 130-by-130 meters and enclosing one further square. Defining the ruling northwest axis of the site, the main entrance to the larger square is 40 meters wide and opens onto a causeway 1.5 kilometers long. BELOW: The principal geoglyph of Jacó Sá earthwork complex, here seen in context, intriguingly "squares the circle," as discussed in chapter 15. PHOTOS: MARTTI PÄRSSINEN.

ABOVE: As well as its spectacular geometrical earthworks, the Amazon is home to an unknown number of megalithic sites, such as the great stone circle of Rego Grande, shown here and discussed in chapter 16. PHOTO: MARIANA CABRAL. BELOW: Paired circle geoglyph at Ramal do Capatará, western Amazon. PHOTO: RICARDO AZOURY/PULSAR IMAGENS.

The complex arrangement of geoglyphs at Fazenda Colorada includes a large open square that may have been connected to ancient Amazonian beliefs about the mystery of death and the afterlife journey of the soul. See discussion in chapter 17.
PHOTO: MARTTI PÄRSSINEN.

ABOVE: Woodhenge, Cahokia. Alignment of the center post and equinox-marker post to the equinox sunrise over the southern face of Monks Mound. PHOTO: WILLIAM ISEMINGER. BELOW: Woodhenge overview. A modern reconstruction of an ancient astronomical device. PHOTO: SANTHA FAIIA.

ABOVE: Monks Mound, Cahokia, from the air. PHOTO: WILLIAM ISEMINGER.
BELOW: Monks Mound, that "stupendous pile of earth," the third largest pyramid in the Americas after the Pyramid of Quetzalcoatl at Cholula and the Pyramid of the Sun at Teotihuacan. PHOTO: SANTHA FAIIA.

ABOVE: Artist's impression, by William Iseminger, of Cahokia in its prime. BELOW: "Bird Mound," also known as "Mound A," Poverty Point—the second largest earthwork mound in North America after Monks Mound. PHOTO: SANTHA FAIIA.

Moundville, Alabama: Mound A viewed from Mound B, with three of the mounds of the outer ellipse also visible. PHOTO: SANTHA FAHA.

The hand-and-eye symbol is everywhere at Moundville—here on pottery. PHOTO: SANTHA FAHA.

Moundville's "Rattlesnake Disk," a powerful representation of the hand-and-eye symbol. The hand is the Mississippian depiction of the constellation of Orion, and the "eye" represents a portal in the sky, identified with the Orion Nebula, through which it was believed that the souls of the dead must travel on their afterlife journey. See discussion in chapters 22 and 23. PHOTO: COURTESY OF THE UNIVERSITY OF ALABAMA MUSEUMS, TUSCALOOSA, ALABAMA.

Utterances from the ancient Egyptian Pyramid Texts in the tomb chamber of the Pyramid of Unas (5th Dynasty) at Saqqara in Upper Egypt. The progenitor of the more famous Book of the Dead, the Pyramid Texts seek to prepare the deceased for an afterlife journey that is eerily similar to the afterlife journey envisaged by the ancient Mississippians. PHOTO: SANTHA FAIIA

The god Osiris, seated. In the ancient Egyptian system of religion Osiris was identified with the constellation of Orion. As in the case of the hand-and-eye symbol of the Mississippians, the constellation of Orion was seen as a portal to the afterlife journey.
PHOTO: SANTHA FAIIA.

In the ancient Egyptian system, Amit, the "Eater of the Dead," with his slavering jaws, served as the agency of permanent annihilation for those souls not justified in the judgment.
PHOTO: SANTHA FAIIA.

In the Mississippian system the Underwater Panther, with his slavering jaws, served an identical purpose.
PHOTO: SANTHA FAIIA.

FACING PAGE: The weighing of the soul against the feather of Truth in the ancient Egyptian judgment scene. Both the ancient Egyptians and the ancient Mississippians believed that the soul must face judgment after death.
PHOTO: SANTHA FAIIA.

The Temple of Horus at Edfu preserves ancient archives, the "Edfu Building Texts," that tell the story of a great and godlike civilization, destroyed in a global cataclysm in remote prehistory. Though Egyptologists are unwilling to make the connection, the destroyed "Island of the Gods," the "Homeland of the Primeval Ones" spoken of in the Edfu Building Texts, shares many common elements with Plato's story of Atlantis—which was said to be derived from an ancient Egyptian source. PHOTO: SANTHA FAIIA.

The Edfu Building Texts report that there were survivors of the cataclysm that destroyed the "Homeland of the Primeval" ones. We are told that these survivors set about "wandering" the world in the desperate hope that their high civilization could be restarted, or that at least something of its knowledge, wisdom, and spiritual ideas could be passed on so that mankind in the post-cataclysmic world would not be compelled (Plato's words concerning the aftermath to the fall of Atlantis) to "begin again like children, in complete ignorance of what happened in early times." PHOTOS: SANTHA FAIIA.

ABOVE: Graham Hancock with geophysicist Allen West of the Comet Research Group examining the black-mat deposit at Murray Springs, Arizona. Packed with impact proxies such as melt glass, carbon spherules, and nanodiamonds, the black mat is the global signature of the giant series of impacts by the fragments of a disintegrating comet that sparked a global cataclysm 12,800 years ago. The scale of the event was so immense that it interrupted human history and wiped from the record almost all traces of an advanced civilization of the Ice Age. However, some hints and clues as to the nature of that civilization remain. BELOW: Take the case of the massive beams, quarried from solid granite and weighing in the range of 70 tons each, incorporated into the core of Egypt's Great Pyramid in the series of "relieving chambers" stacked on top of the "King's Chamber" more than 50 meters (164 feet) above ground level. None of the wishful scholarly claims of megaliths somehow being slid "easily" into place on wooden rollers or on lubricated sand will work at this elevation. The fact of the matter is that the hulking beams forming the floors and ceilings of the relieving chambers are where they are—and that in order to get there they had to be lifted more than 50 meters into the air. Leverage, mechanical advantage, and the simple technologies attributed to the ancient Egyptians by archaeologists are incapable of achieving such a feat. Are we confronted by the achievements of a lost science? PHOTOS: SANTHA FAIIA.

ABOVE: The Trilithon at Baalbek. The uppermost section of the wall, with the gap, is a relatively recent reconstruction. But under it sit the three ancient blocks of the Trilithon, with the contact between first and second blocks directly under the gap while the contact between the second and third blocks, farther to the left, is too tight to be visible. Each of these three blocks weighs around 900 tons—about the weight of 450 large SUVs. Again, simple technologies of leverage and mechanical advantage seem inadequate to account for the achievement of raising such immense blocks and fitting them perfectly into place. BELOW: Sacsayhuaman, Peru. These colossal megalithic walls are arranged in a series of zigzags and consist of intricately formed polygonal blocks. No two blocks among the thousands at Sacsayhuaman are the same shape and all are so tightly interlocked in all dimensions that the edge of a piece of paper cannot be slipped between the joints. Efforts by archaeologists to reconstruct how the work at Sacsayhuaman was done have proved ludicrous because the only reference frame deemed acceptable, involving leverage and mechanical advantage, is unable to account for many of the more complex anomalies. PHOTOS: SANTHA FAIIA.

The estimated weight of this enormous polygonal block is 360 tons. Archaeologists attribute the construction of Sacsayhuaman to the Incas but there are no records of the Incas moving such immense weights successfully and according to one account disaster followed when they attempted to do so. PHOTO: SANTHA FAIIA.

ABOVE: Sacsayhuaman: detail of block jointing, with indications that the stone had been softened like putty before being put into place. Traditions speak of meditating sages, the use of certain plants, the focused attention of initiates, miraculously speedy workmanship, and special kinds of chanting or tones played on musical instruments in connection with the lifting, placing, softening, and moulding of megaliths all around the world. Confronted by the global distribution of such narratives, and by the stark reality of the sites themselves, we're obliged to ask if we're dealing with the reverberations of an ancient technology we don't understand, operating on principles that are utterly unknown to us. BELOW: The almost unbelievable Kailasa Temple, hewn in a single piece out of solid basalt at Ellora in the Indian state of Maharashtra. Traditions speak of magic used in its construction but, as has been said, "any sufficiently advanced technology is indistinguishable from magic." PHOTOS: SANTHA FAIIA.

ABOVE: With its stone walls, enclosures, and crumbling earthen pyramid, the ancient megalithic site of Tiahuanaco in the high Andes echoes the austere geometries of the earthworks now emerging from the Amazon jungle. BELOW: Teotihuacan, Mexico, "the place where men became gods." With its principal pyramids of the Moon (foreground) and the Sun (mid left) arranged along the immense axis of the "Way of the Dead," the site is rich in geometry and cosmic alignments. PHOTOS: SANTHA FAIIA.

Uncelebrated, and frequently defaced by modern graffiti, large numbers of anomalous megalithic structures await proper study in the forests of New England. Without good evidence archaeologists seek to attribute all of them to the colonial period of the last few centuries, and to deny that Native Americans were involved in their construction. PHOTOS: SANTHA FAIIA.

The megalithic character of the New England structures (above and overleaf) and the fact that their entrances are frequently oriented to solstitial sunrise points (below) argues for their great antiquity and refutes the "colonial root cellar" fantasy of archaeologists. PHOTOS: SANTHA FAIIA.

TEIL I: DIE LEGENDE

Kapitel 1

Die ersten Weihen

Als der Mönch erschien, begann es dunkel zu werden, und die kühle Luft des äthiopischen Hochlandes ließ mich frösteln. Vornübergebeugt auf einen Gebetsstab schlurfte er mir aus der Kapelle des Heiligtums entgegen und hörte aufmerksam zu, als ich ihm vorgestellt wurde. In Tigre, der Sprache dieser Region, forderte er durch meinen Übersetzer Aufklärung über meine Herkunft und meine Absichten: aus welchem Land ich kam, was ich vorhatte, ob ich Christ war, was ich von ihm wollte.

Jede dieser Fragen beantwortete ich genau und versuchte dabei, in der Dämmerung die Gesichtszüge meines Inquisitors auszumachen. Seine Augen waren von milchigen Schleiern getrübt, tiefe Furchen durchzogen seine dunkle Haut. Er war bärtig, wahrscheinlich zahnlos - und obgleich seine Stimme tief und wohltönend war, so klang sie gleichzeitig merkwürdig undeutlich. Sicher war ich mir nur, daß er ein alter Mann war, wahrscheinlich so alt wie das Jahrhundert, daß er bei Verstand war und mir nicht aus müßiger Neugier Fragen stellte. Erst als er genug erfahren hatte, kam er die Stufen herunter, um mir die Hand zu schütteln. Sein Händedruck war trocken und rauh wie Papyrus, und seiner dicken Kutte entströmte schwach, aber unverkennbar der heilige Duft von Weihrauch.

Nach diesen Formalitäten kam ich auf mein Anliegen zu sprechen. Ich deutete in Richtung des Gebäudes, dessen Umrisse sich undeutlich hinter uns abzeichneten, und sagte: »Ich habe von einer äthiopischen Überlieferung gehört, nach der die Bundeslade hier aufbewahrt wird, hier in dieser Kapelle. Man hat mir auch gesagt, daß Sie der Wächter der Lade sind. Ist das wahr?«

»Das ist wahr.«

»Aber in anderen Ländern glaubt niemand an diese Dinge.

Überhaupt kennen nur wenige die Legenden, und die Menschen, die davon wissen, sagen, sie seien falsch.«

»Die Menschen mögen glauben, was sie wollen. Sie mögen sagen, was sie wollen. Und dennoch, wir sind im Besitz des Heiligen Schreins, welcher die Bundeslade ist, und ich bin der Wächter...«

»Das möchte ich gerne genauer wissen«, hakte ich ein, »beziehen Sie sich auf die ursprüngliche Bundeslade, auf die aus Holz und Gold gefertigte Kassette, in der der Prophet Moses die Zehn Gebote aufbewahrte?«

»Ja. Gott selbst schrieb die zehn Worte des Heiligen Gesetzes auf die zwei Steintafeln. Moses legte diese Tafeln in die Bundeslade, die die Israeliten auf ihrer Wanderung durch die Wildnis bis in das Gelobte Land mit sich führten. Sie brachte ihnen den Sieg, wohin auch immer sie kamen, und machte sie zu einem mächtigen Volk. Als die Bundeslade ihre große Aufgabe erfüllt hatte, wurde sie von König Salomo in den Tempel gebracht, den er in Jerusalem hatte erbauen lassen. Wenig später verschwand sie aus dem Allerheiligsten und wurde nach Äthiopien gebracht ...«

»Erzählen Sie mir, wie das geschah«, bat ich, »ich weiß nur, daß man die Königin von Saba für eine äthiopische Monarchin hält. Die Legenden, die ich studiert habe, berichten von der Reise der Königin nach Jerusalem, wo sie von König Salomo ein Kind empfing und ihm einen Sohn gebar, einen königlichen Prinzen, der viele Jahre später die Bundeslade stahl ...«

Der Mönch seufzte. »Der Name des Prinzen, von dem Sie sprechen, war Menelik - und in unserer Sprache bedeutet das >der Sohn des weisen Mannes<. Obgleich in Jerusalem gezeugt, geboren wurde er in Äthiopien, wohin die Königin von Saba zurückgekehrt war, als sie König Salomos Kind unter dem Herzen trug. In seinem zwanzigsten Lebensjahr reiste Menelik von Äthiopien nach Israel und kam an den Hof seines Vaters. Man erkannte ihn dort sogleich an und zollte ihm große Ehre. Doch als ein Jahr vergangen war, regte sich bei den Ältesten des Landes Mißgunst. Sie beklagten, daß Salomo ihm zuviel Gunst erweise, und bestanden darauf, daß er nach Äthiopien zurück-

gehen müsse. Dies akzeptierte der König - unter der Bedingung, daß alle erstgeborenen Söhne der Ältesten ihn begleiten sollten. Dazu zählte Azarius, Sohn des Hohenpriesters von Israel - und nicht Menelik war es, sondern jener Azarius, der die Bundeslade von ihrem Platz im Allerheiligsten des Tempels stahl. Erst als sie weit von Jerusalem entfernt waren, offenbarten die jungen Männer Menelik die Tat. Als sie ihm alles erzählt hatten, erkannte der junge König sogleich, daß ein solch kühnes Wagnis ohne Gottes Duldung nie hätte Erfolg haben können. Und so entschied er, daß die Lade bei ihnen bleiben sollte. So geschah es, daß sie nach Äthiopien gebracht wurde, in diese heilige Stadt ..., und hier wird sie seither aufbewahrt.«

»Und Sie sagen, daß diese Legende der Wahrheit entspricht?«

»Es ist keine Legende. Es ist Geschichte.«

»Wie können Sie so sicher sein?«

»Weil ich der Wächter bin. Ich kenne das Wesen des Gegenstandes, den man in meine Obhut gegeben hat.«

Für einige Augenblicke verharrten wir in Schweigen, und ich versuchte, hinter die kühlen und überlegten Worte zu dringen, mit denen der Mönch diese phantastischen und unglaublichen Dinge ausgesprochen hatte. Dann fragte ich, wie und warum man ihn an diesen Ort berufen hatte. »Es ist eine große Ehre, für diese Aufgabe ausgewählt zu werden«, erzählte er. »Mit den letzten Worten meines Vorgängers wurde ich in das heilige Amt eingesetzt. Und einst, wenn ich selbst auf dem Totenbett liege, werde ich meinen Nachfolger bestimmen.«

»Welche Eigenschaften werden Sie bei diesem Mann suchen?«

»Die Liebe zu Gott, die Reinheit im Herzen, die Stärke des Körpers und des Geistes.«

»Ist es irgend jemandem außer Ihnen gestattet«, fuhr ich fort, »die Lade zu sehen?«

»Nein. Ich allein darf sie sehen.«

»Bedeutet das, sie wird nie aus dem Heiligtum herausgebracht?«

Der Wächter hielt lange inne, bevor er meine Frage beantwortete. Schließlich erzählte er mir, daß die Reliquie vor langer Zeit an allen großen Kirchenfeiertagen umhergetragen worden sei. Nun aber werde sie nur noch einmal im Jahr für religiöse Prozessionen eingesetzt, zu einer Gelegenheit, die als »Timkat« bekannt sei und im Januar stattfinde.

»Wenn ich also im nächsten Januar wiederkomme, werde ich dann Gelegenheit haben, die Bundeslade zu sehen?«

Der Mönch sah mich merkwürdig beunruhigt an und sagte dann: »Sie müssen wissen, daß in diesem Land Unruhe und Bürgerkrieg herrschen ... Unsere Regierung ist schlecht, die Menschen wehren sich, und die Kämpfe rücken jeden Tag näher. Unter diesen Umständen ist es unwahrscheinlich, daß die echte Lade bei den Zeremonien eingesetzt wird. Wir können nicht riskieren, daß einem so kostbaren Gegenstand Unheil geschieht. Aber selbst in Friedenszeiten würden Sie die Lade nicht sehen können. Es ist meine Aufgabe, sie ganz in dicke Tücher einzuschlagen, bevor sie in der Prozession getragen wird.«

»Warum verbergen Sie die Lade?«

»Um die Menschen vor ihr zu schützen.«

Ich bat meinen Übersetzer, mir diese rätselhafte Bemerkung noch einmal zu erklären: hatte der Mönch wirklich gesagt: »um die Menschen vor ihr zu schützen«? Oder hatte er gemeint, man müsse sie »vor den Menschen schützen«?

Es verging einige Zeit, bis ich die Antwort bekam: »Um die Menschen vor ihr zu schützen ... Die Lade ist mächtig.«

Geheimnisse der Bibel

In alttestamentarischen Zeiten wurde die Bundeslade von den Israeliten als Verkörperung Gottes verehrt, als Symbol und Bekräftigung seiner Anwesenheit auf Erden, als Feste seiner Macht und Instrument seines unaussprechlichen Willens.[1] Die Lade, in der die Steintafeln mit den Zehn Geboten aufbewahrt wur-

den, war eine hölzerne Truhe, innen und außen mit purem Gold beschlagen, die 114 Zentimeter in der Länge und 69 Zentimeter in der Breite und in der Höhe maß.[2] Die Figuren zweier geflügelter Cherubim überragten, die Angesichter einander zugewandt, den schweren Deckel der Kassette.[3]

Biblische und andere alte Quellen sprechen davon, daß von der Lade flammendes Licht ausging, das Krebsgeschwülste und schwere Verbrennungen hervorrief, Berge dem Erdboden gleichmachte, den Lauf von Flüssen anhielt, ganze Armeen zerstörte und Städte in Schutt und Asche legte. Dieselben Quellen lassen keinen Zweifel daran, daß die Bundeslade für lange Zeit den Eckpfeiler des jüdischen Glaubens darstellte, und in der Tat: als König Salomo den ersten Tempel erbauen ließ, bestand sein einziges Motiv darin, eine »Heimstätte für die Bundeslade des Herrn« zu schaffen.[4]

Doch zwischen dem zehnten und dem sechsten Jahrhundert vor Christus verschwand dieser unvergleichlich wertvolle und mächtige Gegenstand von seinem Platz im Allerheiligsten des Tempels: sang- und klanglos, ohne Widerhall in den Schriften - fast so, als hätte die Lade niemals existiert. Das vorhandene Quellenmaterial legt nahe, daß die Kassette längst nicht mehr in Jerusalem war, als die Stadt im Jahre 587 vor Christus von den Truppen Nebukadnezars II. niedergebrannt wurde. Mit Sicherheit aber befand sie sich nicht im zweiten Tempel, der auf den Grundmauern des ersten errichtet wurde, nachdem das jüdische Volk 538 vor Christus aus dem babylonischen Exil zurückgekehrt war. Ebensowenig glaubhaft scheint es schließlich, daß die Lade den Babyloniern als Kriegsbeute in die Hände fiel.

Richard Elliott Friedman, Professor für Hebräisch und Vergleichende Religionswissenschaften an der University of California, fand die Zustimmung vieler Gelehrter, als er 1987 schrieb, das Verschwinden des heiligen Schreins sei »eines der unergründlichen Geheimnisse der Bibel«:

»Es wird nicht davon berichtet, daß die Lade weggebracht, zerstört oder versteckt worden sei. Es gibt nicht einmal einen Kommentar wie >Und dann verschwand die Lade und wir wis-

sen nicht, was mit ihr geschah< oder >Und bis heute weiß keiner, wo sie sich befindet<. Der aus biblischer Sicht wichtigste Gegenstand der Welt hört einfach auf zu existieren.«[5]

Und tatsächlich offenbart eine intensive Lektüre des Alten Testamentes mehr als zweihundert verschiedene Verweise auf die Bundeslade - bis zur Zeit König Salomos (970-931 vor Christus] ; nach der Herrschaft dieses weisen und großartigen Königs wird sie nie wieder erwähnt.[6] Und das ist sicherlich das zentrale Problem, ein wirkliches historisches Rätsel: natürlich war es vorstellbar, daß ein unermeßlich wertvoller goldener Kasten »verloren« gehen konnte (bezieht man einmal die Schwäche der menschlichen Natur mit ein). Nein, es ist vielmehr die unglaubliche - sozusagen ohrenbetäubende - Ruhe, in der dieser Gegenstand von höchster religiöser Bedeutung verschwand. In den späteren Büchern des Alten Testamentes besteht die Existenz der Lade nur noch darin, daß sie eben nicht mehr existiert - vergleichbar vielleicht mit einem der »schwarzen Löcher« im All. Kurz, sie fällt allein durch ihr Nicht-Vorhandensein auf.

Es wurde also etwas vertuscht - so muß man annehmen -, vertuscht von Priestern und Schreibern, die sicherstellen wollten, daß der Aufenthaltsort der Reliquie für immer ein Geheimnis bleiben würde. Und wenn dies der Fall ist, dann haben viele versucht, das Rätsel zu lüften. Zu allen Zeiten haben sich Abenteurer in seinen Bann schlagen lassen und Expeditionen unternommen - die allesamt erfolglos blieben. Erst jüngst war die Bundeslade Inspiration für einen der erfolgreichsten Hollywood-Filme, für Die Jäger des verlorenen Schatzes, der 1981 mit Harrison Ford als »Indiana Jones« in der Hauptrolle gedreht wurde.

Zu dieser Zeit lebte ich in Kenia und konnte den Film erst 1983 sehen, als ich nach Nairobi kam. Mir gefiel die Kombination von Abenteuer, Action und Archäologie, und ich erinnere mich genau, daß ich überlegte, was für eine Sensation es sein müsse, wenn jemand tatsächlich die Lade finden würde. Nur wenige Monate später unternahm ich eine ausgedehnte Reise in den Nordwesten Äthiopiens, in die vom Bürgerkrieg geschüt-

telte Provinz Tigre. Hier, in Aksum - der sogenannten »heiligen Stadt der Äthiopier« -, fand die Begegnung mit dem Wächter der Bundeslade statt.

1983: Ein Land im Krieg

Am 28.Mai 1991, nach vielen Jahren heftigster Kämpfe, wurde das Regime in Addis Abeba von einer starken Koalition aus Rebellentruppen gestürzt, in der die Tigrianische Volksbefreiungsfront TPLF eine führende Rolle spielte. Als ich 1983 nach Aksum kam, war die TPLF eine relativ kleine Guerilla-Gruppe, und die heilige Stadt - wenngleich bereits belagert - noch in den Händen der Regierung. Vor mir war zuletzt ein britisches Archäologenteam hier, das aber schon 1974 von den Wirren der Revolution vertrieben wurde, die Kaiser Haile Selassie gestürzt und einen der blutigsten Diktatoren Afrikas als Staatsoberhaupt eingesetzt hatte: Oberstleutnant Mengistu Haile Mariam.

Bedauerlicherweise war der freie Zugang zu Aksum, den man mir gewährt hatte, nicht auf meine eigene Initiative zurückzuführen, sondern auf die Tatsache, daß ich für Mengistu arbeitete. 1983 erklärte ich mich bereit, ein Coffee-table-Buch über Äthiopien zu schreiben - eine geschäftliche Beziehung, die ich später bitter bereute. Das Mengistu-Regime hatte dieses Buch in Auftrag gegeben, um die - erzwungene - Einheit der im Grunde sehr vielschichtigen Kultur des Landes zu propagieren und um die Gültigkeit der alten Grenzen zu unterstreichen, deren Revision von den Rebellen so heftig gefordert wurde. Bevor ich mit der Arbeit begann, war vereinbart worden, daß die Absichten der Regierung so wenig offenkundig wie möglich in den Vordergrund treten sollten, und in meinem Vertrag stand, daß keine Einzelpersonen (einschließlich Mengistu] besonders hervorgehoben oder kritisiert werden dürften. Trotzdem gab ich mich keinen Illusionen hin, wie das Vorhaben von Seiten des Regimes eingeschätzt wurde: Kein Mensch hätte mir meine Rechnungen abgezeichnet oder mir die Erlaubnis erteilt, die historisch inter-

essanten Stellen aufzusuchen, wenn man nicht sicher gewesen wäre, daß meine Arbeit der Regierung von Nutzen sein würde.

Trotzdem erwies es sich als schwierig, nach Aksum zu kommen. Entlang der Hauptstraßen und um die heilige Stadt selbst gab es starke Aktivitäten der Rebellentruppen, was bedeutete, daß der Landweg überhaupt nicht in Frage kam. Die Stadt war nur aus der Luft zu erreichen. Zu diesem Zweck reiste ich - zusammen mit meiner Frau und Assistentin Carol und meinem Fotografen Duncan Willetts - zunächst nach Asmara, der Hauptstadt der Provinz Eritrea. Wir hofften, von dort aus mit einem Militärflugzeug über die Kampflinie nach Aksum zu gelangen.

Auf einem fruchtbaren Hochplateau über der unwirtlichen Küstenregion gelegen, ist Asmara ein sehr angenehmer Ort von ausgesprochen romanischem Charakter. Verwunderlich ist das nicht, denn die Stadt wurde 1889 von italienischen Truppen besetzt und blieb deren Militärstützpunkt bis zur Unabhängigkeit Eritreas im Jahre 1952. Wo man hinsah, die flammenden Farben der Bougainvileen, Flamboyants und Jacaranda, während die warme, sonnenerfüllte Luft den unverkennbaren Duft des Mittelmeeres mit sich brachte. Kaum zu übersehen war allerdings auch die Anwesenheit vieler sowjetischer und kubanischer »Militärberater« in Tarnanzügen, die laut schwadronierend mit ihren Kalaschnikow-Gewehren über die Boulevards zogen.

Die Ausbildung, die diese Männer den äthiopischen Soldaten zuteil werden ließen, konnte jedoch nicht besonders effektiv sein. Die Krankenhäuser von Asmara platzten vor Verwundeten aus allen Nähten, und die Regierungsbeamten, die wir trafen, konnten Pessimismus und Anspannung kaum verbergen.

Unsere Beunruhigung wuchs, als wir einige Abende später in der Bar des noblen Ambasoira-Hotels zwei sambische Piloten trafen, die zeitweilig für die äthiopische Luftlinie flogen. Eigentlich hatten sie gedacht, ein halbes Jahr lang praktische Erfahrungen im kommerziellen Luftfrachtverkehr sammeln zu können. Nun aber flogen sie verwundete Soldaten von den Fronten in Tigre und Eritrea nach Asmara. Die beiden Männer hatten zwar

versucht, von diesen Aufgaben entbunden zu werden, als sie jedoch das Kleingedruckte ihrer Verträge genauer gelesen hatten, wurde ihnen klar, zu was sie sich da verpflichtet hatten.

Nach mehreren Wochen fast ununterbrochener Einsätze mit alten, zu Truppentransportern umgebauten DC3-Maschinen, waren die Piloten verbittert, nervlich sehr angegriffen und körperlich geschwächt. Sie erzählten uns, daß sie mittlerweile beide zur Flasche greifen würden, um ihre Angst zu ertränken: »Bevor ich nicht völlig betrunken bin, ist an Schlaf gar nicht zu denken«, vertraute mir einer der Männer an, »ich werde die Bilder von den Dingen, die ich gesehen habe, nicht los.« Er erzählte von einem sechzehnjährigen Jungen, der an diesem Morgen an Bord gebracht worden war - den rechten Fuß von einer Miene weggerissen - und von einem anderen Soldaten, dessen Schädel eine Granate halb zertrümmert hatte. »Oft haben wir über vierzig Verletzte an Bord, mehr als die DC3 eigentlich verkraftet, aber wir gehen das Risiko ein, wir können die Leute ja nicht da sterben lassen.«

Drei, manchmal vier Flüge am Tag würden von ihnen verlangt, fügte der andere Pilot hinzu. In der vergangenen Woche war er zweimal in Aksum gewesen, und beide Male wurde sein Flugzeug von Maschinengewehren beschossen. »Das ist ein sehr schwieriger Flughafen - es gibt da nur eine sandige Landepiste. Auf den Hügeln ringsherum sitzt die TPLF und hat uns jedesmal genau im Visier. Die lassen sich von dem Zeichen der >Ethiopian Airways< auf dem Leitwerk nicht täuschen, die wissen, daß wir militärische Aufgaben erfüllen ...«

Die Sambier waren überglücklich, daß sie jemanden getroffen hatten, der sympathisch, weder Russe noch Kubaner war, und dem sie ihr Unglück schildern konnten. Nun fragten sie, was wir in Äthiopien wollten und schienen höchst amüsiert, als wir erwiderten, daß wir für die Regierung an einem Bildband arbeiteten. Dann erklärten wir ihnen, daß wir nach Aksum müßten.

»Warum das?« fragten sie völlig verblüfft.

»Nun, weil das alte Aksum von großer archäologischer Bedeutung ist. Dort begann das äthiopische Christentum und es

war über viele Jahrhunderte hinweg die Hauptstadt des Landes. Unser Buch sähe ohne Aksum ein bißchen dünn aus.«

»Wir könnten Sie schon mitnehmen«, schlug einer der Piloten vor.

»Sie meinen, wenn Sie das nächste Mal Verwundete abholen?«

»Nein. Das würde man kaum erlauben. Aber eine Delegation hochrangiger Offiziere wird übermorgen nach Aksum geschickt, um die Garnison dort zu inspizieren. Vielleicht können Sie da mitfliegen. Es käme auf die Fäden an, die Sie in Addis ziehen können. Versuchen Sie's doch.«

Nach Aksum

Den nächsten Tag verbrachten wir am Telefon und sprachen mit dem für unser Projekt zuständigen Minister. Die Angelegenheit stand auf des Messers Schneide, aber schließlich verschaffte er uns Plätze in dem Flugzeug, von dem unsere sambischen Freunde berichtet hatten.

Die einstündige Verspätung und den fünfunddreißig Minuten dauernden turbulenten Flug am nächsten Morgen nutzte ich lesend, um mein Hintergrundwissen zu vervollständigen - und dabei wurde mir immer klarer, wie lohnend dieser Besuch in Aksum sein würde.

Frühe historische Quellen zeichnen von Aksum das Bild eines kosmopolitischen und urbanen Zentrums. Der anonyme Autor einer griechischen Abhandlung über den Handel zum Beispiel, die nur als *Periplus des Eritreischen Meeres* bekannt ist, charakterisierte im Jahre 64 nach Christus den Herrscher von Aksum als »einen erhabenen Prinzen, der auch im Griechischen unterrichtet worden sei«[7]. Einige Jahrhunderte später beschrieb Julian, Botschafter des römischen Kaisers Justinian, Aksum in den leuchtendsten Farben als »die bedeutendste Stadt ganz Äthiopiens«. Der König, so fügte er hinzu, ging fast nackend umher und trug nur ein mit Goldstickereien verziertes leinernes

Lendentuch, das von einem mit Perlen besetzten Gürtel zusammengehalten wurde. Goldene Reife und Ketten schmückten ihn an Armen und Brust, und sein Haupt wurde von einem goldgewirkten Turban gekrönt, von dem kostbare Bänder herabhingen. Als der römische Botschafter empfangen wurde, um seine Empfehlungsschreiben vorzulegen, stand der Monarch auf einem mächtigen, mit goldenen Platten beschlagenen Triumphwagen, der von vier Elefanten gezogen wurde.[8]

Im sechsten Jahrhundert nach Christus ergänzte der vielgereiste Mönch Kosmas Indikopleustes die Beschreibungen Julians. Nach seinem Aufenthalt in der Stadt berichtete er, daß »der viertürmige Palast des Königs von Äthiopien mit ebensovielen ehernen Figuren von Einhörnern« geschmückt sei. Er erzählte von einem ausgestopften Rhinozeros und von Giraffen, die man auf Befehl des Königs gefangen und gezähmt hatte, damit sie ihm zur Unterhaltung dienten.[9]

Diese Bilder von barbarischer Pracht und Herrlichkeit paßten gut zu einer Stadt, die sich mit der Zeit zur größten Macht zwischen dem Römischen Reich und Persien entwickelt hatte - zu einer Macht, die ihre Handelsschiffe bis nach Ägypten, Indien, Ceylon und China schickte, die bereits im vierten Jahrhundert nach Christus das Christentum als Staatsreligion angenommen hatte.

Rufinus, dessen Schriften als wichtige historische Quellen gelten, überliefert die Geschichte der Christianisierung Äthiopiens. Meropius, ein christlicher Kaufmann, der von Rufinus »Philosoph von Tyrus« genannt wird, unternahm eine Reise nach Indien, auf die er zwei syrische Knaben mitnahm, die er in der Tradition des christlichen Abendlandes unterrichtete. Der ältere der beiden hieß Frumentius, der jüngere Aedesius. Auf der Rückreise durch das Rote Meer wurde ihr Schiff vor der Küste von Äthiopien in einer Vergeltungsaktion gekapert, weil die Römer ein Abkommen mit dem Volk in dieser Region gebrochen hatten.

Meropius fiel im Kampf. Die jungen Männer aber überlebten und wurden nach Aksum zu König Ella Amida gebracht. Aede-

sius wurde sein Mundschenk und Frumentius, der klügere und besonnenere von beiden, sein Sekretär und Schatzmeister. Der König behandelte die Jünglinge mit Ehrerbietung und Zuneigung. Er starb jedoch bald und ließ eine Witwe und seinen Erben, einen kleinen Sohn mit Namen Ezana, zurück. Ella Amida hatte den Syrern vor seinem Tod die Freiheit geschenkt, die Königin aber bat die jungen Männer unter Tränen, bei ihr zu bleiben, bis ihr Sohn alt genug sein würde, um die Thronfolge anzutreten. Vor allem Frumentius sollte ihr beistehen, denn Aedesius war, obgleich loyal und von gutem Herzen, einfachen Geistes.

In den folgenden Jahren wuchs der Einfluß Frumentius' im Königreich von Aksum. Er ließ im Land nach christlichen Händlern suchen und bat sie eindringlich, sie sollten »an verschiedenen Orten Andachtsstätten gründen, die sie zum Gebet aufsuchen könnten«. Er versah sie »mit allem, was sie benötigten, stellte ihnen Bauplätze für die Gebäude zur Verfügung und förderte das Christentum wo er nur konnte«.

Kurz nachdem Ezana schließlich den Thron bestiegen hatte, kehrte Aedesius nach Tyrus zurück. Frumentius aber reiste in die ägyptische Stadt Alexandria, zu dieser Zeit ein Zentrum des Christentums, wo er dem Patriarchen Athanasius von seinem Werk berichtete. Der junge Mann bat den Kirchenführer, »einen würdigen Mann als Bischof für die vielen dort schon versammelten Christen« nach Äthiopien zu schicken. Athanasius, der die Worte Frumentius' sorgfältig bedacht hatte, erklärte vor der Versammlung seiner Priester: »Können wir denn einen anderen Mann finden, dessen Geist von Gott erfüllt ist, als denjenigen, der schon so viel vollbracht hat?« Daraufhin »weihte er ihn und bat ihn im Namen Gottes dorthin zurückzukehren, von wo er gekommen war«[10].

Frumentius reiste als erster äthiopischer Bischof nach Aksum zurück. Dort setzte er seine missionarischen Anstrengungen fort, die im Jahre 331 nach Christus mit der Bekehrung des Königs selbst belohnt wurden. Münzen aus der Zeit von Ezanas Herrschaft zeigen den langsamen Übergang zum Christentum:

die älteren tragen Abbildungen des zunehmenden und des vollen Mondes, auf späteren Exemplaren ist eindeutig das Kreuz zu erkennen. Es sind dies die frühesten Münzen überhaupt, die das Symbol des Christentums tragen.

Aksum, die Hauptstadt des äthiopischen Reiches vom ersten bis fast zum zehnten Jahrhundert nach Christus, gilt also als Geburtsstätte des äthiopischen Christentums - was unser Projekt anbelangte, ergaben sich jedoch noch viel interessantere Sachverhalte. So las ich zum Beispiel, daß wir auf eine Vielzahl imposanter vorchristlicher Ruinen von großer archäologischer Bedeutung stoßen würden, auf die Überreste einiger großer Paläste und Monumente: zum Beispiel die über zweitausend Jahre alten Obelisken. Aksum mußte zu dieser Zeit in künstlerischer und architektonischer Hinsicht ein hohes Niveau entwikkelt haben, das andere Zivilisationen südlich der Sahara-Region erst sehr viel später erreichten. Und die Obelisken in ihrer technischen und künstlerischen Besonderheit waren nicht einmal die einzigen Beispiele für die besondere Rolle, die Aksum einnahm. Zu meinem Erstaunen berichteten die Handbücher, die ich bei mir hatte, von äthiopischen Legenden, denenzufolge die Bundeslade in der Kapelle einer besonders geheiligten Kirche aufbewahrt werde. Diese Legenden standen in engem Zusammenhang mit dem Anspruch Äthiopiens, das Reich der biblischen Königin von Saba gewesen zu sein.

Nun hatte ich gerade den ersten Indiana-Jones-Film *Die Jäger* des *verlorenen Schatzes* gesehen und war gefesselt von der (sicherlich nicht gerade naheliegenden] Möglichkeit, das kostbarste und geheimnisvollste Zeugnis des Alten Testaments, die beinahe drei Jahrtausende verloren geglaubte Bundeslade, könne sich in der Stadt befinden, die ich nun besuchen wollte. Ich faßte den Entschluß, nicht aus Aksum abzureisen, bevor ich nicht mehr von dieser merkwürdigen Geschichte erfahren hatte. Mit neuerwachtem Interesse sah ich aus dem Kabinenfenster, als der Pilot ankündigte, daß Aksum direkt unter uns liege.

Die Landung der DC3 war höchst ungewöhnlich - und einigermaßen furchteinflößend. Anstelle eines gewöhnlichen, nied-

rigen und langgestreckten Anfluges brachte der Pilot das Flugzeug direkt über der Stadt aus einer beachtlichen Höhe in engen Kreisen herunter. Ein Offizier erklärte uns, daß so die Zeit verringert werden könne, in der die Maschine Ziel der Scharfschützen auf den umliegenden Hügeln sein würde. Es war ein höchst ungemütliches Gefühl, in dieser langen Metallröhre mehrere hundert Meter über dem Erdboden, auf einem wackeligen Sitz angeschnallt, darauf zu warten, daß die Kabine jeden Augenblick von Geschossen durchschlagen werden würde.

Glücklicherweise geschah an diesem Morgen nichts dergleichen, und wir landeten sicher. Bis zu den Zähnen bewaffnete Soldaten in Tarnanzügen beobachteten uns, als wir zu unserem Haltepunkt rollten. Zu beiden Seiten der Landebahn konnte man Schützengräben und unter Tarnnetzen verborgene Bunker ausmachen, aus denen die Rohre schwerer Artilleriekanonen ragten. In der Nähe des Kontrollturmes waren mehrere bewaffnete Mannschaftswagen und vielleicht ein halbes Dutzend sowjetischer Panzer postiert. Auf dem Vorfeld standen zwei Hubschrauber vom Typ Mi-24, die Raktenabschußhalterungen unter den stummelartigen Heckstabilisatoren gut sichtbar. Nicht für einen Augenblick während unseres gesamten Aufenthaltes entspannte sich die unruhige und angespannte Atmosphäre dieser belagerten Stadt auch nur etwas.

Paläste, Katakomben, Obelisken

Wir konnten sofort mit der Arbeit beginnen. Als wir aus dem Flugzeug stiegen, wurden wir bereits von einem älteren Abessinier erwartet. In altertümlichem, aber hervorragendem Englisch stellte er sich als Berhane Meskel Zelelew vor und erklärte, daß er über Funk aus Addis Abeba zu unserem Führer und Dolmetscher bestimmt worden war. Als Angestellter des Ministeriums für Kultur sollte er, wie er sagte, »ein Auge auf die Altertümer von Aksum haben«. In dieser Eigenschaft hatte er schon die Archäologen des Britischen Ostafrika-Instituts begleitet, deren

Ausgrabungen durch die Revolution von 1974 unterbrochen worden waren.[11] »Ich freue mich außerordentlich, nach einer so langen Zeit wieder einmal Engländer zu sehen«, rief er, als wir uns vorstellten.

Wir stiegen in einen ziemlich alten, hellgrün gestrichenen Geländewagen mit zwei hübschen Einschußlöchern in der Windschutzscheibe.

»Glücklicherweise wurde niemand getötet«, versicherte Zelelew. Ich brachte nur ein nervöses Lachen zustande. Als wir das Flugfeld verließen, erklärte ich ihm, warum wir nach Aksum gekommen waren und zählte die historischen Orte auf, die wir besuchen wollten. Ich erklärte ihm auch, daß mich die geheimnisvolle Geschichte der Bundeslade besonders interessiere.

»Glauben Sie denn, daß die Lade hier ist?« fragte ich ihn.

»Ja, ganz sicher.«

»Und wo ist sie genau?«

»Sie befindet sich in einer Kapelle in der Nähe des Stadtzentrums.«

»Ist diese Kapelle sehr alt?«

»Ihre Erbauung wurde von unserem letzten Kaiser angeordnet - ich glaube, das war 1965. Davor wurde der Schrein über viele Jahrhunderte hinweg im Allerheiligsten der benachbarten Kirche der >Heiligen Maria auf Zion< aufbewahrt.« Zelelew hielt inne und fügte dann hinzu: »Haile Selassie hatte übrigens ein besonderes Interesse an dieser Geschichte. Er war der zweihundertfünfundzwanzigste Nachkomme in direkter Linie von Menelik, dem Sohn der Königin von Saba und König Salomos. Und es war Menelik, der die Bundeslade in unser Land brachte ...«

Ich wollte die Kapelle sofort besichtigen, doch Zelelew überzeugte mich, daß es wenig sinnvoll sei, die Sache zu überstürzen: »Man wird Ihnen nicht erlauben, sich der Lade zu nähern. Wo sie aufbewahrt wird, ist heiliger Boden. Die Mönche und die Bewohner von Aksum beschützen sie und würden nicht davor zurückschrecken, jeden zu töten, der dort eindringt. Nur einer darf diesen Ort betreten, und das ist der Mönch, der die Lade bewacht. Wir werden versuchen, ihn später am Tag zu treffen.

Lassen Sie uns zuerst den Palast der Königin von Saba ansehen.«

Diesem verlockenden Vorschlag stimmten wir zu. Die holperige Straße voller Schlaglöcher führte nach Südwesten. Kaum zwei Kilometer von Aksum entfernt hielten wir in der Nähe eines stark bewaffneten Militärpostens an, der, wie Zelelew erklärte, die Grenze des von den Regierungstruppen kontrollierten Gebietes markierte. Aufgeregt deutete er auf die naheliegenden Hügel: »Alles TPLF, da können wir nicht hin, das ist sehr schade. Es gibt dort eine Menge interessanter Dinge zu sehen. Dort hinten, gleich nach der Biegung der Straße, liegen die Steinbrüche, in denen die Granitsäulen geschnitten wurden. Eine ragt noch heute aus dem Felsen, nur halb herausgehauen. Dort gibt es auch eine wunderschöne geschnitzte Löwin, die sehr alt ist; sie muß schon vor Beginn des Christentums entstanden sein. Aber leider können wir da nicht hin.«

»Wie weit ist es genau?« fragte ich gequält.

»Ganz nah, weniger als drei Kilometer. Aber der Militärposten wird uns nicht passieren lassen, und wenn, dann würden wir mit Sicherheit von der Guerilla erwischt werden. Deshalb sollten wir hier auch nicht zu lange herumstehen. Die Scharfschützen der TPLF würden Sie als Ausländer erkennen, Sie vielleicht für Russen halten und auf Sie schießen ...« Er lachte: »Das wäre nicht gerade wünschenswert, also folgen Sie mir.«

Er schlug einen Weg durch die Felder nach Norden ein, und schnell stolperten wir über die ersten Überbleibsel dessen, was einst ein imposantes Bauwerk gewesen sein mußte. »Das war der Palast der Königin von Saba«, verkündete Zelelew stolz. »Nach unseren Überlieferungen war ihr Name Makeda, und Aksum war ihre Hauptstadt. Ich weiß, daß Fremde meist nicht glauben wollen, daß sie Äthiopierin war. Aber es gibt auch kein Land, das seinen Anspruch glaubhafter formulieren könnte als das unsere.«

Ich fragte, ob Archäologen schon einmal versucht hätten, bei Grabungen der Legende auf die Spur zu kommen.

»Ja, Ende der sechziger Jahre hat das Äthiopische Archäolo-

gische Institut hier Ausgrabungen durchgeführt. Ich selbst war damals dabei.«

»Und was hat man herausgefunden?«

Zelelew machte ein betrübtes Gesicht. »Man war der Meinung, der Palast sei nicht alt genug, um als Residenz der Königin von Saba gelten zu können.«

Was die Archäologen freigelegt hatten und was wir nun kurz untersuchten, waren die Grundmauern eines einstmals großen Gebäudes mit festgefügten Steinwänden, starken Fundamenten und einem eindrucksvollen Abwassersystem. Wir sahen einen unzerstörten, mit Fliesen ausgelegten Gang, den Zelelew für den Thronsaal hielt, und eine Anzahl von Treppenschächten, die eindeutig darauf hinwiesen, daß es mindestens ein weiteres Stockwerk gegeben haben mußte. Man konnte noch die raffinierten Ziermuster der Baderäume ausmachen und die von zwei großen Steinöfen dominierte Küche.

Auf der anderen Straßenseite, gegenüber dem Palast, untersuchten wir einige rohbehauene Granitstelen, von denen manche über vier Meter hoch in den Himmel ragten. Andere lagen zerbrochen am Boden. Die meisten waren nicht verziert, aber in die größte waren vier Querfriese eingemeißelt, jeder von einer Reihe reliefartig herausgehobener Kreise gekrönt - wie die herausragenden Stützbalken eines Gebäudes aus Holz und Stein. Die Stadtbewohner, so erzählte uns Zelelew, glaubten, daß dieser unfertige Obelisk das Grab der Königin von Saba markiere. Man hatte hier allerdings nie Ausgrabungsarbeiten unternommen, und das Feld war mittlerweile den Bauern zur Bewirtschaftung übergeben worden.

Nachdem wir genug Fotos und Notizen angefertigt hatten, durchquerten wir Aksum bis an den Stadtrand im Nordosten. Hier erreichten wir einen weiteren, auf einem Hügel gelegenen Palastkomplex, von dem aus sich ein weiter Blick über die Gegend bot. Der Grundriß des Bauwerkes mußte fast eintausend Quadratmeter umfassen. Die Wände waren schon vor langer Zeit zusammengefallen, aber man konnte an den vier Ecken noch die Aufmauerungen von Türmen erkennen - möglicher-

weise genau die Türme, die nach der Beschreibung des Mönches Kosmas mit den ehernen Einhörnern verziert waren.

Zelelew führte uns nun über eine steile Steintreppe hinunter in eine Flucht von unterirdischen Gängen und Kammern. Die Wände und Decken bestanden aus massiven Granitquadern, die man so exakt behauen hatte, daß sie ohne Mörtel in den Fugen ganz genau aneinanderpaßten. Die Leute in der Gegend, erzählte Zelelew, hielten dieses kühle und dunkle Labyrinth für die Schatzkammer des Kaisers Kaleb (514-542 nach Christus) und dessen Sohn Gebre Maskal. Trotz der Dunkelheit konnten wir die leeren Steinkammern erkennen, von denen man glaubte, daß sie einstmals unermeßliche Reichtümer an Gold und Perlen und die einbalsamierten Körper der toten Könige beherbergt hatten. Es gab eine Reihe weiterer, noch nicht freigelegter Räume, die sich weit in den Hügel hinein erstreckten. Dicke Granitwände versperrten den Weg dorthin.

Schließlich verließen wir die Hügelfestung und fuhren zurück nach Aksum. Auf dem Weg dorthin hielten wir an, um ein großes offenes Wasserreservoir zu fotografieren, das in den roten Granit der Hügel hineingehauen worden war. Über rohgemeißelte Stufen stiegen wir zu dem Becken hinunter. Wir kannten es unter dem Namen »Mai Shum« und es schien uns sehr alt - ein Eindruck, den Zelelew bestätigte, als er bemerkte, daß dies ursprünglich das Vergnügungsbad der Königin von Saba gewesen sei: »Das glaubt zumindest mein Volk. Mit dem Beginn des Christentums wurde es für Taufzeremonien benutzt und um das Dreikönigsfest zu feiern, das bei uns >Timkat< genannt wird. Und natürlich kommen die Bauern jeden Tag hierher, um ihr Wasser zu schöpfen.«

Niemand von uns hatte bemerkt, wie schnell die Stunden vergangen waren, und nun war es schon spät am Nachmittag. Zelelew hielt uns zur Eile an, betonte, daß wir im Morgengrauen des nächsten Tages nach Asmara zurückfliegen müßten und daß es bis dahin noch viel zu sehen gäbe.

Unser nächstes Ziel, der sogenannte »Park der Säulen«, mit Sicherheit der archäologisch interessanteste Ort in Aksum, lag

ganz in der Nähe. Wir untersuchten und fotografierten eine bemerkenswerte Menge riesiger Obelisken, die aus großen Granitblöcken herausgehauen worden waren. Die mächtigste dieser Säulen war, so glaubte man, schon vor über tausend Jahren umgestürzt und in viele Stücke zerbrochen. Aber zu ihrer Glanzzeit mußte sie mit ihren über dreißig Metern Höhe alles um sich herum bestimmt haben. Ihr Gewicht, hatte ich gelesen, wurde auf über fünfhundert Tonnen geschätzt. Man vermutete, daß dies der größte aus einem Stück gehauene und aufgerichtete Stein des Altertums war.

In diese Stele hatte man die sorgfältige Nachbildung eines hohen und schmalen Gebäudes mit dreizehn Stockwerken hineingehauen - jedes Geschoß mit kunstvoll gearbeiteten Fenstern und anderen Details, vom nächsten abgehoben durch eine Reihe angedeuteter Querbalken. Am Fuß der Säule konnte man eine in den Stein gemeißelte blinde Tür erkennen, detailgetreu mit Klopfer und Griff.

Zelelew erzählte von einem anderen, viel kleineren, aber nicht zerborstenen Obelisken, der während der italienischen Besatzung von 1935 bis 1941 gestohlen, unter enormen Schwierigkeiten nach Rom transportiert und dort in der Nähe des Konstantinbogens wieder aufgestellt worden war. Seitdem bemühte sich die äthiopische Regierung um die Rückgabe, denn auch diese Stele war sorgsam verziert worden und somit von großem künstlerischen Wert.

Mit einer schwungvollen Gebärde wies unser Begleiter auf einen dritten, ebenso kunstvoll bearbeiteten Monolith, der glücklicherweise an seinem Platz im »Park der Obelisken« verblieben war. Die hochaufragende Steinnadel maß über zwanzig Meter und war an der Spitze mit einem herausgehauenen Halbmond versehen. Wir schlenderten hinüber, um sie genau zu untersuchen, und entdeckten, daß auch ihre Schnitzereien ein mehrstöckiges Gebäude darstellten - in diesem Fall ein neungeschossiges Haus in der Art eines Turmes. Und wieder war die Hauptfront mit Fensterformen und genau nachgebildeten Stützstempeln versehen, wie man sie zwischen Fensterrahmen und

Mauerwerk findet. Auch die Abstände zwischen den Stockwerken waren mit nachgebildeten Holzbalken markiert. Die gebäudeartige Erscheinung des Obelisken wurde schließlich durch eine vorgetäuschte Tür betont.

Um dieses hochentwickelte Monument herum war eine Reihe weiterer Säulen angeordnet, allesamt das Ergebnis einer zweifelsohne weitentwickelten, vielseitigen und prosperierenden Kultur. An keinem anderen Ort südlich der Sahara war etwas annähernd Ähnliches je entstanden - aber genau darin bestand das Geheimnis von Aksum: Die Vorgeschichte war unbekannt, die Quellen seiner Vorbilder verschüttet.

Das Sanktuarium

Dem Obeliskenfeld gegenüber stand ein von Mauern umgebener Gebäudekomplex mit zwei Kirchen, von denen die eine sehr alt war, die andere aber offensichtlich aus jüngster Zeit stammte. Beide waren der »Heiligen Maria auf Zion« geweiht, erklärte uns Zelelew. Die jüngere der beiden, von Haile Selassie in den sechziger Jahren erbaut, hatte ein kuppeiförmiges Dach und einen obeliskenartigen, hochaufragenden Glockenturm. Die andere ging auf die Mitte des siebzehnten Jahrhunderts zurück und war das Werk des Kaisers Fasilidas, der, wie viele Herrscher vor und nach ihm, in Aksum gekrönt worden war. Ungeachtet der Tatsache, daß er einen anderen Regierungssitz gewählt hatte, war er voller Verehrung für die heilige Stadt.

Haile Selassies ambitiös-moderne »Kathedrale« erschien uns gleichermaßen unschön wie uninteressant. Unsere Aufmerksamkeit zog vielmehr der Bau Fasilidas' auf sich, der uns mit seinen Türmchen und zinnenbestückten Brustwehren halb wie das Haus Gottes, halb wie eine Burg erschien. Doch dies paßte nur zu gut zu einer sehr alten äthiopischen Gepflogenheit, derzufolge die Grenzen zwischen Kriegswesen und Geistlichkeit von jeher fließend waren.

Im Halbdunkel des Inneren konnte ich mehrere eindrucks-

volle Wandgemälde erkennen, von denen eines das Leben der Jungfrau Maria, ein anderes die Kreuzigung und Auferstehung Christi und ein drittes die Legende vom heiligen Yared darstellte. Yared war vermutlich der Erfinder der etwas furchteinflößenden äthiopischen Kirchenmusik. Das mit der Zeit stark verblaßte Gemälde stellte Yared dar, wie er vor König Gebre Maskai spielte. Der Monarch hatte den Fuß des Heiligen mit einem Speer durchbohrt, aber beide Männer waren von den Klängen des Sistrum (jenes alten ägyptischen Saiteninstrumentes) und der Trommel derartig ergriffen, daß sie dessen nicht gewahr wurden.

Nicht weit entfernt von der alten Kirche stießen wir auf die Ruinen eines Gebäudes, das einstmals große Ausmaße gehabt haben mußte, nun aber nur noch aus seinen tief eingelassenen Fundamenten bestand. Zelelew erklärte uns, daß dies die Überreste der eigentlichen Marienkirche seien, die im vierten Jahrhundert nach Christus erbaut worden war, zu der Zeit, als das aksumitische Königreich zum Christentum konvertierte. Über ein Jahrtausend später, 1535, wurde es von einem fanatischen muslimischen Eroberer namens Ahmed Gragn dem Erdboden gleichgemacht.

Kurz vor ihrer Zerstörung besuchte ein umherziehender portugiesischer Mönch mit Namen Francisco Alvarez die »erste St. Maria«, wie Zelelew sich ausdrückte. Später las ich Alvarez' Beschreibung der Kirche: »Sie ist sehr groß«, schrieb er, »und hat fünf gewölbte Schiffe von erheblicher Breite und Länge; die Decke und die Seitenwände sind bemalt, und sie hat auch einen Chorraum nach unserer Art ... Diese prächtige Kirche ist auf einem weiten Platz erbaut, der ganz mit Steinplatten so groß wie Grabsteine gepflastert und von einer langen Einfriedung umgeben ist, die wiederum von einer hohen Mauer umschlossen wird, wie der Wall einer großen Stadt.. .«[12]

Den Beginn der Bauarbeiten datierte Zelelew ganz richtig auf das Jahr 372 vor Christus[13] - was bedeutete, daß es sich überhaupt um die erste christliche Kirche der südlichen Sahara-Region handelte. Mit ihrer Konsekration wurde sie zum heilig-

sten Ort Äthiopiens, und das mit gutem Grund, denn sie war erbaut worden, um die Bundeslade zu beherbergen. Wenn die Legenden ein Körnchen Wahrheit enthielten, dann mußte der Schrein lange vor Christi Geburt ins Land gebracht worden sein. Und zu einem bestimmten Zeitpunkt nach der Christianisierung des aksumitischen Königreiches wurde die Reliquie von der Priesterschaft für die neue Religion reklamiert.

Der portugiesische Mönch war übrigens der erste Europäer, der die äthiopische Legende von der Königin von Saba und der Geburt ihres einzigen Sohnes Menelik dokumentierte.[14] Als er St. Maria um 1520 besuchte, war die Lade noch an ihrem Platz im Allerheiligsten der alten Kirche. Sie verblieb jedoch nicht mehr lange dort, denn als die Truppen Ahmed Gragns immer näher rückten, wurde der Schrein in Sicherheit gebracht. So entging der Schatz dem Sturm der Zerstörung und Plünderung, den die Muslime 1535 über Aksum entfesselten.

Als der Frieden nach einhundert Jahren wiederhergestellt war, brachte man die Bundeslade im Triumph zurück nach Aksum in die von Fasilidas erbaute neue Marienkirche. Erst Haile Selassie ließ die Lade 1965 von dort entfernen und in die sicherere Kapelle bringen, die zur gleichen Zeit wie seine grandiose Kathedrale errichtet worden war. Wenigstens bei der Kapelle hatte man sich bemüht, den Stil des siebzehnten Jahrhunderts zu treffen.

Hier war es, wo mir der alte Mönch die erstaunliche Geschichte der Bundeslade erzählt und mich vor ihrer Macht gewarnt hatte.

»Wie mächtig ist sie?« fragte ich.

»Was meinen Sie damit?« Die Haltung des Wächters versteifte sich und er schien plötzlich vor etwas auf der Hut zu sein. Für einige Momente schwieg er. Dann lachte er leise in sich hinein und stellte mir eine Frage: »Haben Sie die Säulen gesehen?«

»Ja«, gab ich zurück, »ich habe sie gesehen.«

»Was glauben Sie, wie wurden sie aufgestellt?«

Ich gab zu, es nicht zu wissen.

»Man nahm die Bundeslade«, flüsterte der Mönch geheimnisvoll, »die Lade und das göttliche Feuer. Menschen allein hätten so etwas nie vollbringen können.«

Nachdem wir Aksum verlassen hatten, nutzte ich die Bibliotheken in Addis Abeba und führte einige Nachforschungen bezüglich der historischen Glaubwürdigkeit der Legenden durch, von denen mir der Mönch berichtet hatte. Ich war nicht im geringsten von dem überzeugt, was er gesagt hatte. Sollte jedoch irgend etwas dafür sprechen, daß die Königin von Saba eine äthiopische Monarchin war, so wollte ich das herausfinden. Aber hätte sie zu Zeiten König Salomos wirklich nach Israel reisen können? War es möglich, daß sie von dem jüdischen König ein Kind empfangen hatte? Daß sie einen Sohn namens Menelik zur Welt brachte? Und vor allem: war der junge Mann nach dem Besuch am Hofe seines Vaters nach Äthiopien zurückgekehrt - mit der Bundeslade?

Kapitel 2

Ernüchterung

Die Fragen, die ich nun stellen mußte, waren im Addis Abeba des Jahres 1983 nicht gerade willkommen. Neun Jahre nach Haile Selassies Sturz schwebten noch immer die Reste von revolutionärem Chauvinismus in der Luft. Allenthalben traf man auf Argwohn, Haß und Mißgunst, und die Leute hatten noch bittere Erinnerungen an die späten siebziger Jahre, als Mengistus Streitkräfte den »Roten Terror« gegen all jene entfesselten, die für die Wiedereinführung der Monarchie kämpften. Von der Regierung unterstützte Todesschwadronen durchstreiften die Straßen, zerrten Verdächtige aus ihren Häusern und exekutierten sie auf der Stelle. In dieser leicht erregbaren Atmosphäre hatte ich meine ersten Nachforschungen in einer Sache anzustellen, die ganz offensichtlich mit dem letzten Kaiser Äthiopiens und der salomonischen Dynastie zusammenhing, aus der er stammte.

Wie eng diese Verbindungen tatsächlich waren, wurde mir klar, als ich von einem Freund die Kopie eines unter der Hand kursierenden Dokumentes erhielt, das auf dem Höhepunkt der Macht und Popularität Haile Selassies ausgearbeitet worden war - die revidierte Verfassung von 1955. Erfüllt von der Absicht, das moderne Äthiopien darin zu bestärken, »in allen Bereichen der Staatsverwaltung mitzuarbeiten« und »an der großen Aufgabe teilzuhaben, die in der Vergangenheit von den äthiopischen Herrschern alleine erfüllt worden war«, enthielt dieses bemerkenswerte Stück Gesetzgebung noch immer die unmißverständliche Bekräftigung des seit Menschengedenken bestehenden göttlichen Rechts auf Herrschaft:

»Die kaiserliche Würde soll immerdar mit dem Geschlecht Haile Selassies I. verbunden sein, das sich ohne Unterbrechung von der Dynastie Meneliks I., Sohn der Königin von Äthiopien,

der Königin von Saba, und des Königs Salomo von Jerusalem, herleitet ... Kraft seines königlichen Blutes und kraft der empfangenen Weihen ist die Person des Kaisers heilig, seine Würde unverletzlich und seine Macht unangreifbar .. .«[1]

Ich stellte schnell fest, daß Zelelew, unser Dolmetscher in Aksum, zumindest in einer Sache recht hatte: Der Kaiser hatte tatsächlich den Anspruch erhoben, der zweihundertfünfundzwanzigste direkte Nachkomme von Menelik I. zu sein. Und die göttliche Abkunft der salomonischen Dynastie bezweifelten nur die wenigsten der Äthiopier, mit denen ich in Addis Abeba sprach - selbst die revolutionärsten nicht. Man munkelte sogar, daß Präsident Mengistu selbst den Ring Salomos von der Hand des toten Kaisers abgezogen habe, und ihn nun an seinem Mittelfinger trage - als ob er sich so etwas vom Charisma und den angeblich magischen Kräften seines Vorgängers aneignen wollte.

Nun waren derartige Gerüchte sicherlich interessant; sie befriedigten mein Verlangen nach konkreten Informationen über die Bundeslade und ihre geheimnisvollen Verbindungen mit der entthronten Dynastie Haile Selassies jedoch nicht. Das Problem bestand darin, daß die meisten meiner äthiopischen Gesprächspartner einfach Angst hatten - sie verschlossen sich wie eine Auster, wenn das Gespräch auf die Lade, auf den Kaiser oder auf irgend etwas kam, das mit der Zeit vor der Revolution zu tun hatte. Niemand wollte den Verdacht erwecken, aufrührerische Informationen weiterzugeben. Fortschritte konnte ich erst erzielen, als ein Kollege aus England eintraf. Ich hatte Professor Richard Pankhurst, der sich in der Materie gut auskannte, gebeten, mir bei dem Buch, das ich für die äthiopische Regierung schrieb, als Co-Autor zur Seite zu stehen.

Richard war der Enkel der berühmten englischen Frauenrechtlerin Emmeline Pankhurst und der Sohn von Sylvia Pankhurst, die während der italienischen Besatzung in den dreißiger Jahren heldenmütig auf der Seite des abessinischen Widerstandes gekämpft hatte. Er war und ist der maßgebende Historiker in Äthiopien. Zur Zeit Haile Selassies hatte er an der Univer-

sität von Addis Abeba das angesehene Institut für Äthiopische Studien gegründet. Kurz nach der Revolution von 1974 mußte er das Land verlassen, nun aber lag ihm daran, neue Kontakte zu knüpfen. Unser Buchprojekt paßte also gut zu seinen Plänen, und so hatte Richard, der an der Royal Asiatic Society in London arbeitete, sich ein paar Tage freigenommen, um mit mir einige Dinge zu besprechen. Er besaß eine umfassende Kenntnis äthiopischer Geschichte, und so war die Bundeslade eine der ersten Angelegenheiten, auf die ich ihn ansprach. Ich wollte wissen, ob es eine wissenschaftliche Grundlage für den scheinbar allzu weit hergeholten Anspruch gebe, die Lade werde in Aksum aufbewahrt.

Er erwiderte, daß die Legende von Salomo und der Königin von Saba in Äthiopien eine lange Geschichte habe und daß mehrere mündlich und schriftlich überlieferte Versionen existierten.

»Das älteste erhaltene schriftliche Zeugnis befindet sich in einer Handschrift aus dem dreizehnten Jahrhundert, die Kebra Nagast genannt wird. Dieses Manuskript wird in Äthiopien sehr verehrt, man sagt, es enthalte >die Wahrheit, die ganze Wahrheit und nichts als die Wahrheit<. Als Historiker kann ich das kaum akzeptieren, zumal man herausgefunden hat, daß die Königin von Saba aus Arabien kam und nicht aus Äthiopien. Trotzdem möchte ich nicht ausschließen, daß die Legende ein Fünkchen Wahrheit enthält. Denn es gab im Altertum tatsächlich Kontakte zwischen Äthiopien und Jerusalem, die übrigens gut dokumentiert sind. Aber sie reichen nicht bis in die Zeit Salomos zurück. Es besteht natürlich auch kein Zweifel, daß die äthiopische Kultur zu einem guten Teil vom Judentum bestimmt ist. In Äthiopien gibt es eine Gruppe einheimischer Juden, die das beweisen. Es sind die Falaschen, die in den Simienbergen südlich von Aksum und am Tanasee leben. Zudem existieren einige weitverbreitete Bräuche - von denen man manche nicht nur bei den Falaschen, sondern auch bei abessinischen Christen antrifft -, die als Indizien für frühe Verbindungen mit der jüdischen Zivilisation gelten können. Dazu zählen der Beschneidungsritus, das

Befolgen bestimmter Ernährungsgebote, die sehr denjenigen ähneln, die im dritten Buch Mose aufgestellt werden, und in einigen von der Umwelt isolierten ländlichen Gemeinden wird der wöchentliche Feiertag noch immer am Samstag - so wie der Sabbat also - und nicht am Sonntag praktiziert.«

Von der Existenz der Falaschen hatte ich schon gehört und um offizielle Genehmigung ersucht, bei unserer nächsten Exkursion zumindest eines ihrer Dörfer aufsuchen und fotografieren zu dürfen. Diese Reise sollte uns zum Tanasee, von dort aus nordwärts nach Gondar und hoffentlich bis in die Simienberge führen. Ich wußte so gut wie nichts von den sogenannten »schwarzen Juden« Äthiopiens, und bat Richard, mir darüber etwas zu sagen.

»Äußerlich unterscheiden sie sich nicht von den abessinischen Hochlandbewohnern«, begann er. »Ihre Muttersprache ist ein einheimischer Dialekt des Agaw, das in den nördlichen Provinzen sehr verbreitet war. Mittlerweile ist es vom Amharischen, der nationalen >lingua franca<, fast vollständig ersetzt worden. Nun, die einzige Besonderheit der Falaschen besteht in ihrer Religion, und das ist zweifelsohne die jüdische, allerdings in einer eigenen und archaischen Ausprägung. Ihr Festhalten an alten Bräuchen, die anderswo längst nicht mehr praktiziert werden, hat eine Menge romantisch veranlagter und aufgeregter Fremder dazu gebracht, sie zum >verlorenen Stamm Israels< zu erklären. Diese Vorstellung hat vor wenigen Jahren auch den Segen des aschkenasischen und des sephardischen Oberrabbinats in Jerusalem erhalten, das die Falaschen eindeutig als Juden anerkannt hat. Nach den Bestimmungen des >Law of Return< sind sie damit automatisch Bürger Israels.«

»Aber woher kamen die Falaschen ursprünglich?« fragte ich. »Und wieso ließen sie sich mitten in Äthiopien nieder - zweitausend Meilen von Israel entfernt?«

Richard gab zu, diese Frage sei nicht ohne weiteres zu beantworten. Die Lehrmeinung war, daß eine Gruppe von Juden im ersten und zweiten Jahrhundert nach Christus von Südwest-Arabien aus in das abessinische Hochland gewandert sei und

offensichtlich Teile der Bevölkerung zu ihrem Glauben bekehrt habe. Man müsse die Falaschen also als Abkömmlinge dieser Konvertiten ansehen. »Es gilt als gesichert«, fügte er hinzu, »daß sich im Jemen eine einflußreiche jüdische Gemeinde gebildet hat, die vor der Verfolgung durch die römischen Besatzer in Palästina im ersten Jahrhundert vor Christus geflüchtet war. Theoretisch ist es also durchaus möglich, daß Missionare und Händler die Straße von Bab-el-Mandeb überquerten und nach Äthiopien gelangten.« Aber auch Richard hatte keinen historischen Beweis dafür, daß sich alles so zugetragen hatte.

»Und was sagen die Falaschen selbst?«

Richard lächelte: »Daß sie von König Salomo abstammen natürlich ... Ihre Geschichte entspricht in den Grundzügen derjenigen der Christen, vielleicht ist sie etwas ausgeschmückter. Wenn ich mich richtig erinnere, behaupten sie, daß Salomo nicht nur die Königin von Saba schwängerte, sondern auch ihre Dienstmagd - und somit nicht nur Menelik zeugte, sondern auch einen Halbbruder, der eine Dynastie von Falaschen-Königen begründete. Alle anderen äthiopischen Juden sind vermutlich die Nachfahren der erstgeborenen Söhne der Ältesten Israels, die Menelik und die Bundeslade begleiteten.«

»Besteht denn deiner Meinung nach die Möglichkeit, daß das wahr ist - ich meine, daß die Bundeslade wirklich aus dem Tempel Salomos gestohlen und nach Aksum gebracht worden sein könnte?«

Richard schnitt eine Grimasse: »Ehrlich gesagt, nein. Ausgeschlossen. Tatsache ist, daß Aksum zu dieser Zeit nicht einmal existierte. Aksum gab es nicht. Nun, ich weiß nicht genau, wann Salomo starb, es muß um 940 oder 930 vor Christus gewesen sein. Wenn Menelik sein Sohn war, dann muß er die Lade etwa zehn oder fünfzehn Jahre vorher nach Aksum gebracht haben. Aber das wäre gar nicht möglich gewesen, denn Aksum wurde frühestens im dritten, wahrscheinlich nicht vor dem zweiten Jahrhundert vor Christus gegründet - mit anderen Worten: sieben oder acht Jahrhunderte nach dem vermutlichen Diebstahl der Lade ...«

»Nun«, sagte ich, »das macht der ganzen Sache wohl ein Ende, nicht wahr?«

»Ja, obgleich ich es für möglich halte, daß die Lade an einen anderen Ort in Äthiopien gebracht wurde, dessen Geschichte sich später mit derjenigen von Aksum vermischte. Trotzdem, es gibt so viele unklare Punkte, Anachronismen und Ungenauigkeiten in dieser Legende. Daher kommt es, daß bisher kein Historiker oder Archäologe, der etwas auf sich hält, bereit war, in dieser Sache Nachforschungen anzustellen ... Dennoch, nicht alles, was die Falaschen über sich erzählen, sind komplette Phantasiegebilde, und einige Aspekte ihrer Herkunft würden weitere Untersuchungen schon rechtfertigen.«

»Zum Beispiel?«

»Ich erwähnte ihre Behauptung, es habe einst eine Dynastie jüdischer Könige in Äthiopien gegeben. Wenn wir einmal, sagen wir ins fünfzehnte oder sechzehnte Jahrhundert zurückgehen, würden wir einige Anzeichen finden, die das unterstützen - und es ist glaubhaft, daß es eine Monarchie auch vor diesem Zeitpunkt gab. Alles in allem: Die Juden waren eine ernstzunehmende Macht in diesem Land. Manchmal haben sie sogar erfolgreich Krieg gegen die christlichen Herrscher geführt, um ihre Unabhängigkeit zu bewahren. Doch mit der Zeit wurden sie schwächer und verschwanden nach und nach. Wir wissen, daß ihr Volk zwischen dem fünfzehnten und achtzehnten Jahrhundert ziemlich dezimiert wurde. Und unglücklicherweise hält diese Entwicklung noch immer an. Es sind wahrscheinlich nicht mehr als zwanzigtausend übriggeblieben - und die meisten wollen nach Israel.«

Während der nächsten drei Tage arbeitete ich mit Richard an unserem Buchprojekt, und in dieser Zeit profitierte ich enorm von seinen genauen Analysen der äthiopischen Geschichte und Kultur. Dann kehrte er nach London zurück, und Carol, Duncan und ich brachen zu der Exkursion auf, die uns zum Tanasee, nach Gondar und in die Simienberge führen würde.

Tabots: Repliken der Bundeslade

Wir verließen Addis Abeba in einem arg mitgenommenen Toyota-Jeep, der uns für unsere Arbeit von der Regierung zur Verfügung gestellt worden war. Über die Höhen des Mount Entoto fuhren wir in nordwestlicher Richtung Meile um Meile durch rauhes und trostloses Heidehochland. Schließlich erreichten wir Dahar Bar, eine kleine Stadt am südlichen Zipfel des Tanasees. Das gewaltige Binnenmeer ist bekannt für seine unzähligen Inseln, auf denen sich über zwanzig Klöster befinden. Dank einer großen Dieselbarkasse, die uns von den Marinebehörden überlassen worden war, konnten wir einige der Klosterinseln besuchen und dort wundervolle Sammlungen alter Handschriften, sakrale Bilder und Wandmalereien fotografieren.

In unruhigen Zeiten wurden Kunstschätze und wertvolle Sakralgegenstände aus dem ganzen Land an diese Orte in Sicherheit gebracht. Das Hauptanliegen der Einsiedler war es jedoch, ihr Leben in Frieden und Abgeschiedenheit ihrem Schöpfer zu widmen. Ein Mönch erzählte uns, daß er seine kleine bewaldete Insel seit fünfundzwanzig Jahren nicht verlassen habe. »Indem ich mich so vor der Welt verschließe«, sagte er, »erfahre ich die wirkliche Glückseligkeit. Mein ganzes Leben lang war ich Gott treu und das wird bis an das Ende meiner Tage so bleiben. Ich habe mich vom Leben in der Welt abgewandt. Und ich bin frei von ihren Versuchungen.«

Jede Bruderschaft hatte ihre eigene Kirche, die oftmals sehr alt waren. Im Grundriß eher rund als rechteckig, besitzen sie in der Regel einen außen umlaufenden Wandelgang, der von dem überhängenden Reet des Daches bedeckt wird. Der erste innere Bereich, das »kane mahlet«, ist mit Gemälden reich verziert, der zweite innere Bereich, das »keddest«, das für Abendmahlsgottesdienste benutzt wird, umschließt das von einer Mauer geschützte Zentrum der Kirche, das »magdas«, das Allerheiligste.

Ich hatte zuvor viele äthiopische Kirchen besichtigt, aber hier begann ich zum erstenmal die Bedeutung des Allerheiligsten zu verstehen. Ich fand heraus, daß jeder dieser abgeschirmten

Bereiche, der übrigens nur vom ältesten Mönch betreten werden durfte, einen heiligen Gegenstand enthielt. Ich bat Kebran Gabriel, unseren Dolmetscher, nachzufragen, was dies für ein Objekt sei.

»Das ist das >Tabot<«, antwortete mein Gesprächspartner, der neunzigjährige Abba Haile Mariam.

Dieser Begriff schien mir bekannt, und nach einem Augenblick des Nachdenkens erinnerte ich mich, daß ich davon in Aksum gehört hatte, als ich mit dem Wächter der Kapelle gesprochen hatte: Es war die äthiopische Bezeichnung für die Bundeslade.

»Was meint er mit >Tabot<?« fragte ich meinen Begleiter. »Meint er die Bundeslade? Vor einigen Wochen erst waren wir in Aksum, wo man uns sagte, die Lade sei dort ...« Ich hielt verwirrt inne, und schloß dann ziemlich lahm: »Ich verstehe nicht, wie sie gleichzeitig hier sein kann.«

Ein langer Wortwechsel folgte, in den sich auch die anderen Mönche einschalteten. Nach vielen Fragen und Antworten ergab sich so langsam ein klares Bild. Es schien, als habe jede orthodoxe Kirche in Äthiopien ein Allerheiligstes, und in jedem dieser innersten Bereiche gibt es ein »Tabot«. Niemand behauptete, daß einer dieser heiligen Gegenstände die echte Bundeslade sei. Es gab nur eine Bundeslade, Meneliks »Tabota Zion«, die nun im Allerheiligsten der Kapelle von Aksum stand. Alle anderen »Tabots« im Land waren lediglich Repliken des heiligen und unantastbaren Originals.

Doch auch diese Kopien waren wichtig. Um genauer zu sein, sie waren von großer Bedeutung. Ihre symbolische Kraft lag in der absoluten Verkörperung des unfaßbaren Begriffes von Heiligkeit. Mittels unseres Übersetzers ließ Abba Haile Mariam mir genau erklären: »Die >Tabots< sind geheiligt, nicht die Kirchen, in denen sie stehen; ohne ein >Tabot< in ihrem Herzen, im Allerheiligsten, ist eine Kirche nur eine leere Hülle, ein totes Bauwerk, das keine größere oder geringere Bedeutung als andere Gebäude besitzt.«

Die schwarzen Juden Äthiopiens

Als wir unsere Arbeiten auf den Klosterinseln beendet hatten fuhren wir von Bahar Dar aus am Ostufer des Tanasees entlang nordwärts, bis wir Gondar erreichten. Während der Reise konnte ich die Informationen überdenken, die ich gerade über die Geschichte der »Tabots« erhalten hatte. Es war zumindest sehr merkwürdig und verblüffend, daß die äthiopischen Christen die Bundeslade für so bedeutsam hielten, daß sie in jeder ihre: Kirchen Repliken der Lade aufbewahrten. Schließlich war die Lade eine vorchristliche Reliquie und hatte absolut nichts mit den Lehren Jesu Christi zu tun. Was ging hier also vor?

Wieder dachte ich an die alte aksumitische Legendensammlung, das Kebra *Nagast.* Möglicherweise gab es hier einen wahren Kern. Die Existenz einheimischer Juden im Land, derer Herkunft so sehr im Unklaren lag, war ebenso interessant - und konnte durchaus ein Bindeglied darstellen. Erwartungsvoll sah-ich deshalb den Falaschen-Siedlungen entgegen, auf die wir in zunehmender Zahl auf der nächsten Etappe unserer Exkursion stoßen würden.

Bevor wir allerdings Gondar verließen, wurden wir zu meiner Enttäuschung von einem höheren Beamten gewarnt, wir sollten unter keinen Umständen versuchen, äthiopische Juden zu fotografieren oder mit ihnen zu sprechen. Das waren nur gerade die Dinge, die mir am wichtigsten waren. Noch enttäuschter - und verärgert! - fühlte ich mich, als unser Dolmetscher und offizieller Begleiter die Gründe für dieses Verbot nannte. Ohne das Gesicht zu verziehen, erzählte er mir: »In diesem Jahr vertritt die Regierung eine Position, nach der die Falaschen nicht existieren. Und wenn sie nicht existieren, dann kann man natürlich auch nicht mit ihnen sprechen oder sie fotografieren ... Das wäre doch widersprüchlich, oder?«

Nur wenige Kilometer außerhalb der Stadt passierten wir ein kleines Dorf, und auf dem Dach einer Hütte machte ich einen Davidstern aus. »Also, Balcha«, sagte ich zu dem Dolmetscher »das ist doch ein Falaschen-Haus ...?«

Balcha war ein intelligenter, sensibler und hochgebildeter Mann, der einige Jahre in den Vereinigten Staaten verbracht hatte. Für den Job, den er hier im Auftrag der Regierung übernommen hatte, war er hoffnungslos überqualifiziert. Es war augenscheinlich, daß er für die idiotischen Verordnungen der Bürokraten in Addis Abeba wenig übrig hatte - und für die offizielle Geheimnistuerei schon gar nichts. Obwohl wir das Falaschen-Dorf schon hinter uns gelassen hatten, unternahm ich also noch einen entschlossenen Versuch, ihn zur Umkehr zu bewegen.

Er warf mir einen vernichtenden Blick aus den Augenwinkeln zu: »Das ist wirklich eine heikle Sache. Wir wissen nie, wie die Stimmung in Addis Abeba gerade ist. Ende letzten Jahres habe ich ein kanadisches Filmteam genau zu diesem Dorf gebracht. Sie interessierten sich für die Juden und hatten die offiziellen Genehmigungen und alles. Also, sie stöberten überall herum, stellten eine Menge kritischer Fragen über religiöse Freiheit, politische Verfolgung und so weiter - die ich allesamt übersetzen mußte. Als wir zurückkamen, wurde ich von der Sicherheitspolizei verhaftet und ein paar Wochen eingesperrt. Ich wurde wegen Verbreitung staatsfeindlicher Propaganda angeklagt. Wollen Sie wirklich, daß mir das noch einmal zustößt?«

»Nein, natürlich nicht. Aber in unserem Fall wird es sicher keine Probleme geben. Ich meine, wir sind doch hier, um für die Regierung zu arbeiten, um dieses Buch über die Menschen und Kulturen dieses Landes zu machen. Das ist doch ein Unterschied, nicht?«

»Nicht unbedingt. Letztes Jahr, als ich mit dem Filmteam hierher kam, existierten die Falaschen offiziell. Sie wurden also von der Regierung nicht totgeschwiegen - und trotzdem landete ich im Gefängnis. In diesem Jahr gibt es keine Juden in Äthiopien; wenn ich Sie also in eines ihrer Dörfer lasse, dann gerate ich in ernsthafte Schwierigkeiten.«

Ich hatte Balchas Argumenten nichts entgegenzusetzen. Auf unserer Fahrt durch das bergige Gelände fragte ich ihn, ob er mir die Haltung der Regierung erklären könne.

Nach seiner Darstellung bestand das Problem zum Teil darin, daß die meisten »Bonzen« in Addis Abeba zu der sehr dominanten ethnischen Gruppe der Amhara gehörten. Die Falaschen wiederum lebten zum größten Teil in den Provinzen von Gondar und Gojjam, beide von jeher amharische Gegenden. In der Vergangenheit hatte es gelegentlich regelrechte Massaker gegeben, und wirtschaftliche Schikanen waren an der Tagesordnung. Noch heute verachteten die Amhara ihre jüdischen Nachbarn, auch wenn man nach der Revolution einige Versuche unternommen hatte, die Situation zu verbessern. Aber offensichtlich litten die Mitglieder der herrschenden Elite noch immer an einer Art kollektiven Schuldbewußtseins, denn man wollte nicht, daß irgendwelche Fremden ihre Nasen in die Angelegenheit steckten. Mit Beginn der achtziger Jahre verstärkte sich diese Paranoia, ausgelöst durch die kritische Haltung englischer und amerikanischer Juden, die bei Besuchen in Äthiopien lautstark ihre Sorge um das Wohlergehen der Falaschen geäußert hatten. »Das wurde als Einmischung in unsere inneren Angelegenheiten aufgefaßt«, erklärte Balcha.

Ich erfuhr jedoch, daß es für das Verhalten der Regierung auch andere Gründe gab. Obwohl unser Fahrer kein Englisch sprach, senkte Balcha instinktiv die Stimme. Er machte deutlich, daß Addis Abeba Sitz der Organisation für Afrikanische Einheit war und daß Äthiopien nach dem letzten arabisch-israelischen Krieg zusammen mit anderen afrikanischen Staaten die diplomatischen Beziehungen zu Jerusalem abgebrochen hatte. Trotzdem bestanden noch immer geheime Verbindungen zwischen den beiden Ländern: Die Israelis stellten Äthiopien Militärhilfe in einem bestimmten Umfang zur Verfügung, als Gegenleistung sah man in Addis Abeba stillschweigend über die Ausreise von einigen hundert Falaschen pro Jahr nach Israel hinweg. Das Problem war jedoch, daß Tausende mehr illegal die Grenzen zum Sudan passierten und dort, in Flüchtlingslagern untergebracht, darauf hofften, ins Gelobte Land ausgeflogen zu werden.

Die Angelegenheit hatte sich also insgesamt zu einem heiklen Thema entwickelt. Auf der einen Seite fürchtete die Regie-

rung, daß der geheime Waffen-für-Menschen-Handel auffliegen könnte, was natürlich zu ernsten Verwicklungen innerhalb der OAE führen würde. Auf der anderen Seite bestand großer Unmut über die Tatsache, daß äthiopische Bürger in die Flüchtlingslager eines benachbarten Landes emigrierten, mit dem man nicht einmal auf besonders gutem Fuß stand. Es sah also so aus, als hätten die »hohen Tiere in Addis«, wie Balcha sich ausdrückte, nicht mehr alles unter Kontrolle - was den Tatsachen entsprach, aber verständlicherweise nicht gerade an die große Glocke gehängt wurde.

Unterdessen waren wir mitten in den Simienbergen angekommen, so daß ich in den nächsten drei Tagen kaum dazu kam, weiter über die Falaschen nachzudenken. Die Hochplateaus dieser afro-alpinen Wildnis lagen auf Höhen von über eintausendachthundert Metern, viele Berge waren über zweitausendsiebenhundert Meter hoch.

Auf dreitausend Metern Höhe hatten wir das Basislager für unsere Forschungsexkursionen eingerichtet. Hier sank die Temperatur bis auf null Grad, so daß man in den Nächten ein großes Feuer unterhalten mußte. Am Morgen aber, wenn die Frühnebel sich verflüchtigt hatten, wurde die Luft langsam von der Sonne erwärmt, und es boten sich faszinierende Aussichten über eine fast surreale Bergwelt, die von den seismischen Aktivitäten mehrerer Jahrtausende in eine zerklüftete, aufgeworfene und zerrissene Landschaft verwandelt worden war.

Unsere Wanderungen führten häufig auf entlegene und unbewohnte Höhen von dreitausendsechshundert Metern. Weiter unten trafen wir jedoch oft auf Anzeichen menschlicher Zivilisation: Bergwiesen, die das Futter für Schafe, Ziegen und Rinder lieferten, oder terrassenartig angelegte Abhänge mit Ackerparzellen, auf denen Getreide angebaut wurde. Natürlich trafen wir auch auf einige Falaschengemeinden, die wir - auf Balchas Beharren hin - jedoch strikt mieden. Die Mehrheit der Bevölkerung in dieser Gegend bestand aus Amhara, die nicht in Dörfern, sondern in kleinen Weilern von höchstens sechs Häusern lebten, die meist von den Zweigen einer Großfamilie bewohnt

wurden. Ihre Hütten waren in der Regel kreisrund und hatten meist Wände aus lehmverputzem Flechtwerk, nur selten aus Stein. Die spitz zulaufenden, strohgedeckten Dächer wurden in der Mitte von hölzernen Pfosten gestützt.

Die Bauern, die wir sahen und mit denen wir sprachen, waren arm - manchmal sogar sehr arm -, und ihr Leben wurde von den eisernen Regeln der Jahreszeiten und des Ackerbaus bestimmt. Trotzdem besaßen sie einen Stolz, denn sie wußten, daß sie zu einer »Herrenrasse« gehörten. Tatsächlich waren über den erstaunlichen Zeitraum von über siebenhundert Jahren, von 1270 nach Christus bis zum Sturz Haile Selassies 1974, bis auf einen alle äthiopischen Herrscher Amhara. Zudem war es ihre eigene Muttersprache, das Amharische, die man als offizielle Landessprache übernommen hatte. Es war klar, daß die Amhara-Kultur einen enormen Einfluß hatte. In den vergangenen Jahrhunderten gab es regelrechte »Amharisierungen« ganzer Volksteile und Stämme, und dieser Prozeß hielt in manchen Teilen des Landes noch an. Unter solchen Bedingungen grenze es an ein Wunder, schloß Balcha, daß eine Bevölkerungsgruppe wie die Falaschen überlebt und sich ihre ausgeprägte Identität bewahrt habe.

Auf unserer Rückreise nach Gondar überraschte uns Balcha (im Innersten ein Individualist, der übrigens einige Jahre später in die USA floh), als er dem Fahrer befahl, bei dem Falaschen-Dorf anzuhalten, das wir schon auf der Hinfahrt gesehen hatten. »Also los«, sagte er, »ich gebe Ihnen zehn Minuten.« Dann verschränkte er die Arme über der Brust und gab vor einzuschlafen.

Beim Verlassen des Jeeps wurden wir von Frauen und Kindern umringt, die ohne Unterlaß »Shalom, Shalom« riefen. Es war, wie sich schnell erwies, so ziemlich das einzige hebräische Wort, das sie kannten. Ohne Balcha, der sich unerschütterlich weigerte, für uns zu übersetzen, hatten wir zunächst einige Kommunikationsschwierigkeiten. Wir fanden aber schnell einen jungen Mann, der ein wenig Englisch sprach, und für etwas Geld war er bereit, uns herumzuführen. Es gab nicht viel zu sehen.

Das Dorf mit Namen Weleka lag hingeduckt in einer Senke an der Straße. Es war schmutzig und wimmelte von Fliegen. Die Leute, die uns umringten, schienen zu glauben, wir seien auch Juden und gekommen, um sie nach Israel zu bringen. Andere liefen uns mit Souvenirs beladen entgegen - meist Davidsterne aus gebranntem Ton oder Darstellungen der angeblichen Bettszene zwischen der Königin von Saba und Salomo. Der traurige Ernst, in dem diese Dinge angeboten wurden, berührte mich sehr. Ich fragte den jungen Falaschen, wann die letzten Fremden hier gewesen seien, um etwas zu kaufen. »Seit einem Jahr nicht mehr«, gab er zur Antwort.

In der kurzen Zeit, die wir zur Verfügung hatten, fotografierten wir soviel wir konnten. Hier einen primitiven Webstuhl, dort Eisenteile um ein Feuer verstreut, in dessen Flammen der Schmied eine Axt hämmerte; in einer Hütte wurde Ton gebrannt, in einer anderen sahen wir eine Frau, die mit Töpferarbeiten beschäftigt war. Die Amhara verachteten derartig niedriges Handwerk, erzählte Balcha uns später, und so bedeutet »tabib«, das Wort für Handwerk, gleichzeitig »der mit dem bösen Blick«.

Als wir Weleka verließen, war ich völlig erschöpft. Zum Teil voreingenommen durch das, was mir Richard Pankhurst über die mittelalterliche Hochblüte der Falaschen erzählt hatte, zum Teil, weil ich mich selbst von der Idee hatte fesseln lassen, es gäbe eine Verbindung zwischen den Falaschen und der Geschichte der Bundeslade, hatten sich in mir ziemlich unrealistische und übertriebene Erwartungen angesammelt. Im Herzen war ich Romantiker, so daß ich den Traum, einer alten und mächtigen jüdischen Kultur auf die Spur zu kommen, ein bißchen zu sehr gepflegt hatte. Die Wirklichkeit schien jedoch ganz anders: ich hatte eine niedere und verarmte bäuerliche Lebensform gesehen, und Menschen, die überbegierig waren, irgendwie das Interesse von Fremden zu erwecken. Sogar die Kultstätten, die von den Falaschen »mesgid« genannt werden, präsentierten sich als verlotterte Kammern, in denen sich billige Geschenke aus Israel stapelten: Schachteln mit Matzen lagen

umher, und niemand konnte die Thora lesen, weil sie aus Tel Aviv kam und in Hebräisch gedruckt war.

Kurz bevor wir wegfuhren, kaufte ich eine der kleinen Skulpturen von Salomo und der Königin von Saba. Ich habe sie immer noch. Mittlerweile glaube ich, daß dieses billige Stück Arbeit und die sentimentale Vorstellung, die darin steckt, genau die Schwächen der Legende selbst symbolisieren. Enttäuscht und ernüchtert starrte ich aus dem Fenster, als wir zurück nach Gondar fuhren.

Gnadenstoß

Ende 1983 hatte sich mein Interesse an der Bundeslade ziemlich gelegt. Den »Gnadenstoß« dazu hatte mir jedoch nicht der Anblick des armseligen Falaschen-Dorfes versetzt. Es war vielmehr eine Frage, die ich nach meiner Rückkehr nach England verfolgte - die Frage der »Tabots« nämlich, der Repliken der Bundeslade, die sich in jeder christlichen Kirche in Äthiopien befinden. Dieser Brauch hatte mich sehr beeindruckt, und da ich glaubte, er könne von Wichtigkeit sein, wollte ich mehr darüber herausfinden.

Ich brachte die Sache im Spätherbst 1983 zur Sprache, als ich Richard Pankhurst in seiner Londoner Wohnung besuchte. Der Historiker bestätigte, daß man die »Tabots« tatsächlich für Repliken der Bundeslade halte, und fügte hinzu: »Das ist ein merkwürdiger Brauch. Mir ist kein Beispiel bekannt, daß so etwas auch in einer anderen Ausprägung des Christentums vorkommt.«

»Wie lange gibt es diese >Tabots< schon in Äthiopien?«

»Ehrlich gesagt, ich habe keine Ahnung. Die erste schriftliche Erwähnung stammt wahrscheinlich von Francisco Alvarez, der im sechzehnten Jahrhundert den Norden des Landes bereiste. Nur bestätigt er natürlich eine Tradition, die zu dieser Zeit schon sehr alt war.«

Richard zog ein dünnes Bändchen mit dem Titel Die äthio-

pisch-orthodoxe Kirche aus einem Regal. »Das ist eine offizielle Publikation aus dem Jahre 1970«, sagte er, »mal sehen, ob wir hier mehr erfahren.«

Der Band hatte kein Register, so daß wir die Kapitel einzeln durchgehen mußten. In dem Abschnitt »Die Konsekration einer Kirche« stießen wir auf folgende Passage:

»Die Konsekration einer Kirche ist eine feierliche und eindrucksvolle Zeremonie mit symbolischer Darstellung der heiligen Gebräuche, für die das Gebäude bestimmt wird. Die einzelnen Bestandteile des Gottesdienstes stammen aus sehr alter Zeit ... Das zuvor vom Patriarchen geweihte >Tabot<, auch Lade genannt, wird in einer weihevollen Handlung aufgestellt und bedeutet den wichtigsten Bestandteil der Zeremonie ...«[2]

Und in einem Kapitel über Kirchenbauten lasen wir:

»Es ist das >Tabot<, welches der Kirche, in der es sich befindet, die Weihe verleiht ...«[3]

Das Glossar verzeichnete das Stichwort »Tabot« und definierte es als »Bundeslade«[4].

Nun fragte ich Richard, ob er wisse, wie ein »Tabot« aussehe: »Die Bibel sagt, daß die Bundeslade ein Behältnis von Holz und Gold ist - das in etwa die Maße einer großen Truhe besitzt. Passen die >Tabots< zu dieser Beschreibung?«

»Nein, ich fürchte nicht. Natürlich dürfen Laien sie gar nicht sehen, und selbst in den Prozessionen werden sie immer mit großen Tüchern verhängt. Mit Sicherheit sind sie kleiner als in der biblischen Beschreibung. Aber wir müssen darüber nicht spekulieren: im British Museum kannst du einige >Tabots< sehen, die im neunzehnten Jahrhundert während der Napier-Expedition nach Magdala in Äthiopien erbeutet wurden. Ich glaube nicht, daß sie noch ausgestellt werden, aber sie werden wohl im Magazin der Ethnographischen Abteilung in Hackney aufbewahrt.«

Am nächsten Morgen fuhr ich in den Norden Londons, wo sich das Magazin befand. Es war ein modernes und reizloses Gebäude mit hohen Sicherheitsvorkehrungen. »Die Leute wollen hier manchmal einbrechen und unser Zeug klauen«, sagte

der Hausverwalter lakonisch, als ich mich in die Besucherliste eintrug.

Wir fuhren mit dem Aufzug in eines der höhergelegenen Stockwerke und betraten einen großen Lagerraum, der ganz mit Reihen von Metallregalen ausgefüllt war. Die Regale reichten vom Boden bis zur Decke und ließen das Licht der Neonröhren kaum bis hinunter in die schmalen Gänge dringen. Der Verwalter konsultierte eine umfangreiche Kartei, murmelte unverständlich vor sich hin und sagte schließlich: »Ich glaube, es geht da lang. Kommen Sie mit.«

Als wir an den Regalen vorbeigingen, wurde ich unwillkürlich an die Schlußszene von *Die* Jäger des verlorenen Schatzes erinnert - an die Sequenz, in der der heilige Schrein in eine Kiste eingenagelt und unter tausenden anderer Behälter unbekannter Herkunft in einem Lagerraum gestapelt wird. Dieser Eindruck verstärkte sich, nachdem wir uns im Labyrinth der Regale mehrmals verlaufen hatten. Endlich blieb der Lagerist vor einem der Gestelle stehen und zog einen großen Kasten hervor.

Ich spürte einen Schauer der Erregung, als er die Metallbox öffnete. Was ich dann sah, hatte jedoch nicht die entfernteste Ähnlichkeit mit meiner Vorstellung von der Bundeslade. Keine der in Lagen von Packpapier eingewickelten hölzernen Platten war länger oder breiter als fünfundvierzig Zentimeter und dicker als acht Zentimeter. Die meisten dieser quadratischen oder rechteckigen Tafeln waren schmucklos, alle jedoch trugen Ge'ez-Schriftzeichen. Bei einigen bemerkte ich eingeritzte Kreuze und andere Muster.

Ich bat den Lagermeister, noch einmal seine Liste zu überprüfen, vielleicht standen wir vor dem falschen Regal. Er warf einen Blick auf das Verzeichnis und erwiderte: »Nein. Kein Fehler. Das sind Ihre >Tabots<. Aus der Sammlung Holmes. Britische Expedition nach Abessinien 1867/68. Das steht hier.«

Ich dankte ihm für seine Mühe und ging - überzeugt, daß sich die ganze Angelegenheit nun endgültig erledigt hatte. Diese kläglichen Holzbretter waren also das Pendant zu dem Heilig-

tum, das in der Kapelle von Aksum aufbewahrt wurde. Was immer dies nun war, eines schien mir absolut klar: Es war nicht die Bundeslade.

»Das war's also«, dachte ich, als ich auf die Orsman Road hinaustrat und zu meinem Auto lief.

Ich sollte mich sehr getäuscht haben.

TEIL II: DER GRAL ALS SCHLÜSSEL

Kapitel 3

Die Königin von Saba in Chartres

Den größten Teil des Winters 1988/89 verbrachte ich damit, den Begleittext zu einem Bildband über die nördlichen Regionen Äthiopiens zu verfassen, der sich mit der Geschichte und den religiösen Bräuchen der Einwohner dieser Provinzen auseinandersetzte. Um zu detaillierten Hintergrundinformationen zu gelangen, hatte ich mich mit verschiedenen ethnischen Gruppen zu befassen, darunter den Falaschen, den eingeborenen schwarzen Juden der Hochebenen, denen ich schon 1983 begegnet war. Zur gleichen Zeit schien es mir notwendig, die alte Legendensammlung, auf die mich Professor Richard Pankhurst aufmerksam gemacht hatte, aufgrund ihrer zentralen Stellung in der abessinischen Religionskultur zu lesen. Dieser Text, genannt Kebra Nagast (Ruhm der Könige), war im Original in Ge'ez geschrieben. Er enthielt die älteste überlieferte Fassung der Geschichte von der Königin von Saba, König Salomo, der Geburt ihres Sohnes Menelik und dem Raub der Bundeslade. Sir E. A. Wallis Budge, einstmals Verwalter der archäologischen Funde im British Museum, hatte 1920 eine englische Übersetzung des Textes angefertigt.[1] Obwohl die Ausgabe vergriffen war, konnte ich mir eine Fotokopie besorgen, die ich sorgfältig studierte. Die Sammlung alter Legenden erwies sich als hilfreiches Nachschlagewerk.

Erst Ende März 1989 konnte ich die Arbeit an meinem Manuskript abschließen. Im April reiste ich mit meiner Familie nach Frankreich, wo wir einige Urlaubswochen verbringen wollten. Eine unserer ersten Stationen war Chartres, das für seine gotische Kathedrale bekannt ist. Die Stadt war für die Christen schon seit dem sechsten Jahrhundert von großer Bedeutung und spätestens seit dem neunten Jahrhundert ein Ort der Marienverehrung. Im elften Jahrhundert brannte die Kirche ab, und ein

neues, größeres Gotteshaus wurde auf ihren Grundfesten erbaut. Im zwölften und dreizehnten Jahrhundert vergrößerte man den erhaltenen Kern und modifizierte ihn nach Art des neuen, emporsteigenden und schwebenden Baustils, der Gotik. Heute gilt der Nordturm der Kathedrale, die im Jahre 1260 geweiht wurde, als eines der frühesten Beispiele gotischer Architektur.

Als ich Chartres im April 1989 besuchte, war ich anfänglich viel weniger an der Geschichte der Kathedrale interessiert als an ihrer aufsehenerregenden und prächtigen Schönheit. Die große Anlage war so reich an sakralen Kunstwerken und architektonischer Schönheit, daß man ein Leben damit hätte zubringen können, alles genau zu betrachten.

Den größten Teil meiner Zeit verbrachte ich damit, langsam um die Kathedrale zu wandern und ihre mächtige und numinose Wirkung immer tiefer in mich aufzusaugen: die kunstvollen Bleiglasfenster, die biblische Geschichten erzählten und das düstere Innere mit seltsamen Lichtmustern durchzogen, das rätselhafte Labyrinth, das die Fliesen im Zentrum des Mittelschiffs darstellten, die Strebepfeiler und Spitzbögen, die die hochaufragenden Wände stützten - und schließlich der überwältigende Eindruck von Harmonie und Proportion, vermittelt durch Anmut und Geschlossenheit der Architektur.

Die Beschreibungen und Führer, die ich mir gekauft hatte, betonten, daß hier nichts dem Zufall überlassen worden war. Das gesamte Gebäude war sorgfältig und bedacht als Schlüssel zu den großen religiösen Mysterien entworfen worden. So hatten sich zum Beispiel die Architekten und Baumeister der Gematria[2] bedient, einer althebräischen Form der Codierung, bei der die Buchstaben des Alphabets durch ihren jeweiligen Zahlenwert ersetzt werden, um so geheime liturgische Stellen in die vielen Dimensionen des großen Gebäudes zu »übersetzen«[3]. Auf ähnliche Weise verbargen Bildhauer und Glaser - die für gewöhnlich nach den Angaben des höheren Klerus arbeiteten - sorgsam die vielschichtigen Botschaften über die Natur des Menschen oder die prophetische Bedeutung der Schriften in den tausend verschiedenen Gegenständen und Formen, die sie

entwarfen. Die Skulpturen und Fenster waren schon in sich Kunstwerke, die in ihrer Schönheit selbst bei oberflächlicher Betrachtung Zufriedenheit und inneres Gleichgewicht, ja selbst Unterhaltung vermitteln konnten. Die Herausforderung lag jedoch darin, tiefer einzudringen und die Informationen zu entschlüsseln, die sich hinter dieser oder jener Skulpturengruppe, diesem oder jenem Bleiglasarrangement verbargen.[4]

Anfänglich konnte mich ein solches Ansinnen kaum begeistern, da mir nicht einleuchten wollte, daß in diesem Gebäude mehr als seine äußere Erscheinung stecken sollte. Als ich jedoch weiterforschte und mich auf einem Rundgang einigen Spezialisten anschloß, begriff ich langsam, daß diese weitgespannte Struktur tatsächlich eine Art »steinernes Buch« war - ein ausgeklügeltes, die Phantasie ansprechendes Werk, dem man sich aus den unterschiedlichsten Richtungen nähern und das man auf verschiedenen Ebenen verstehen konnte.

Schon bald fand ich Gefallen an diesem Spiel und vergnügte mich des öfteren damit, die tiefere Bedeutung von Skulpturen zu suchen, die mir zufällig ins Auge gefallen waren. Sobald ich der Meinung war, die richtige Erklärung für ein bestimmtes Arrangement oder Bild gefunden zu haben, sah ich in einem der Führer nach, um zu überprüfen, ob ich recht hatte.

Dann geschah etwas Unerwartetes. Auf der Suche nach einer Erfrischung betrat ich ein dem Südportal der Kathedrale gegenüberliegendes Cafe mit dem Namen »La Reine de Saba«. Da mir die Lektüre des *Kebra Nagast,* das die äthiopische Legende der Königin von Saba enthielt, noch frisch im Gedächtnis war, fragte ich einen der Kellner, warum man diesen Namen gewählt hatte.

»Weil es dort drüben im Portal eine Skulptur der Königin von Saba gibt«, erklärte er.

Meine Neugier war geweckt. Ich überquerte die Straße und stieg die Stufen zu dem reichverzierten Portal empor. Jeder Quadratzentimeter seines Mauerwerkes war mit aberhunderten von kleinen und vielen lebensgroßen Statuen bedeckt. Es gelang mir jedoch nicht, die Darstellung der Königin von Saba auszuma-

chen. Also sah ich in meinen Reiseführern nach und stieß auf einen Hinweis, wo ich zu suchen hatte.

»Die innere Archivolte des äußeren Bogens zeigt achtundzwanzig Figuren von Königinnen und Königen des Alten Testaments. Man erkennt David mit der Harfe, Salomo mit einem Zepter und die Königin von Saba mit einer Blume in der linken Hand. An der Spitze sieht man vier >große< Propheten (mit Bart) im Gespräch mit vier >kleinen< Propheten (bartlos).«[5]

Hier las ich auch, daß das Südportal im ersten Viertel des dreizehnten Jahrhunderts erbaut worden war - im gleichen Jahrhundert, in dem das Kebra Nagast in Äthiopien zusammengestellt wurde, um die Geschichte der Bundeslade zu erzählen.

Dies erschien mir mehr als nur ein amüsantes Zusammentreffen zu sein, so daß ich die Skulptur der Königin mit gesteigertem Interesse betrachtete. Mir wollte jedoch nichts auffallen, das die Figur in irgendeiner Weise hervorgehoben hätte - abgesehen von der Tatsache, daß sie, umgeben von einer so großen Anzahl ehrenwerter jüdischer Herrscher und Propheten, etwas fehl am Platze wirkte. Zwar gibt das Kebra Nagast an, die Königin sei zum Judentum konvertiert[6], die relativ kurze Stelle in der Bibel, die von ihrem Besuch in Jerusalem spricht, erwähnt jedoch nichts dergleichen. Im ersten Buch der Könige und im zweiten Buch der Chronik - den einzigen Stellen, wo sie in den Schriften ausdrücklich erwähnt wird - erreicht sie den Hof König Salomos als Heidin und verläßt ihn allem Anschein nach auch als solche.[7] Es war folglich ihr Heidentum, das sie eigentlich aus der Reihe dieser Skulpturen fallen ließ - es sei denn, die Baumeister der Kathedrale wären mit der äthiopischen Überlieferung ihrer Bekehrung zum Judentum vertraut gewesen. Das hielt ich jedoch für wenig wahrscheinlich. Im Alten Testament gibt es keinerlei Hinweis darauf, daß sie überhaupt aus Äthiopien kam, und die Mehrheit der Fachgelehrten hält sie für eine südarabische Herrscherin, die mit einiger Sicherheit aus Saba oder Sabaea, das im heutigen Jemen liegt, stammte.[8]

Ich hätte die Sache als kleine Anomalität auf sich beruhen lassen, wäre ich nicht bei weiterer Lektüre in meinem Führer

darauf gestoßen, daß es eine zweite Figur der Königin von Saba im Nordportal gab. Auch dieses Portal war in den Jahren zwischen 1200 und 1225 erbaut worden und der ausführlichen Darstellung alttestamentarischer Themen gewidmet.

Steinerne Inschriften

Es waren wohl über zwei Stunden, die ich bei meiner ersten Betrachtung des Nordportals mit dem Versuch verbrachte, die ineinanderverschlungenen Geschichten, die die Figuren erzählten, zu entschlüsseln.

Der linke Bogen enthielt mehrere Darstellungen der Jungfrau Maria und des Jesuskindes zusammen mit Propheten des Alten Testaments wie Jesaja und Daniel. Daneben gab es allegorische Darstellungen des Sieges der Tugend über das Laster oder der Seligpreisung von Körper und Seele, wie sie der große Kirchengelehrte des zwölften Jahrhunderts, Bernhard von Clairvaux, formuliert hat. Der mittlere Bogen wurde von einer Gruppe alttestamentarischer Propheten und Patriarchen dominiert, darunter Melchisedek, jener geheimnisvolle und angeblich unsterbliche Priesterkönig von Salem, der im ersten Buch Mose und in den Psalmen beschrieben wird.[9] Abraham, Moses, Samuel und David waren dort ebenso versammelt wie Elias und Petrus. Andere Szenen beschrieben den Garten Eden mit seinen vier Flüssen und die Jungfrau Maria, gekrönt auf dem himmlischen Thron neben Jesus.

Im rechten Bogen entdeckte ich die Königin von Saba. Hier handelte es sich nicht um eine kleine Figur in einer Archivolte, wie im Südportal, sondern um eine fast lebensgroße Statue. Man hatte sie neben Salomo gestellt, was, dem biblischen Kontext zufolge, durchaus sinnvoll war. Was mir jedoch sofort ins Auge fiel, war die Darstellung eines zu ihren Füßen kauernden Afrikaners, der in einem meiner Reiseführer als »negroider Diener«[10], in einem anderen als »ihr äthiopischer Sklave«[11] beschrieben wurde.

Den Erläuterungen waren keine weiteren Details zu entnehmen. Aber ich hatte genug gesehen, um mit Zufriedenheit festzustellen, daß die Bildhauer, die im dreizehnten Jahrhundert am Nordportal von Chartres gearbeitet hatten, die Königin unmißverständlich in einer afrikanischen Umgebung darstellten. Dies wiederum bedeutete, daß ich die Möglichkeit nicht mehr ohne weiteres ausschließen konnte, daß die Bildhauer mit der äthiopischen Überlieferung des Kebra Nagast vertraut gewesen waren. Das würde auch erklären, warum einer offensichtlich heidnischen Figur in der Ikonologie einer christlichen Kathedrale eine solche Wichtigkeit zukam. Damit stellte sich jedoch eine andere schwierige Frage: Wie war es möglich, daß die äthiopische Legende zu einem solch frühen Zeitpunkt nach Nordfrankreich gelangt war?

Noch ganz in Gedanken, entdeckte ich auf einer Säule zwischen dem mittleren und dem rechten Bogen eine Figur, die einen noch stärkeren Eindruck bei mir hinterlassen sollte. In Miniaturform - nicht mehr als ein paar Zentimeter hoch und breit - war hier eine Kiste oder Truhe dargestellt, die auf einem Ochsenkarren transportiert wurde. Darunter hatte man in Versalbuchstaben zwei Worte eingraviert:

ARCHA CEDERIS.

Als ich um die Säule herumging, fiel mir eine andere, stark beschädigte und verwitterte Szene auf, die einen Mann darstellte, der sich über dieselbe Kiste oder Truhe zu beugen schien. Auch hier gab es eine Inschrift, die jedoch kaum zu entziffern war:

HIC AMICITUR ARCHA CEDERIS oder möglicherweise HIC AMITTITUR ARCHA CEDERIS oder HIC AMITITUR ARCHA CEDERIS oder auch HIC AMIGITUR ARCHA CEDERIS.

Ich konnte erkennen, daß die einzelnen Majuskeln unterschiedlichen Schriftenfamilien entstammten, die in unregelmäßiger Anordnung aufeinanderfolgten. Zumindest war klar, daß es sich bei allen Buchstaben um lateinische Lettern handelte. Aufgrund meiner sprachlichen Unfähigkeit hatten mich meine Lehrer dazu gebracht, Latein schon mit dreizehn Jahren aufzu-

geben, so daß ich erst gar keine komplette Übersetzung versuchte. Es schien mir jedoch, daß ARCHA Arche, also Schrein oder Lade bedeuten mußte. Und es war klar erkennbar, daß diese Kiste oder Truhe im Vergleich zu den anderen Figuren die richtigen Proportionen besaß, um die Bundeslade darzustellen - so wie sie im zweiten Buch Mose beschrieben wird.

Wenn diese Annahme zutraf, dann würde die Darstellung der Bundeslade ganz in der Nähe der Königin von Saba meine Vermutung bestärken, daß die Erbauer von Chartres direkt von den äthiopischen Überlieferungen des Kebra *Nagast* beeinflußt worden waren - obgleich ich mir nicht erklären konnte, wie diese Verbindung hätte Zustandekommen können. Gerade die Tatsache, daß die Bildhauer die Königin so eindeutig in einem afrikanischen Umfeld plaziert hatten, ließ meine These immer plausibler erscheinen. Es mußte sich also lohnen, herauszufinden, ob es sich hier tatsächlich um eine Darstellung der Bundeslade handelte. Aber zunächst mußte ich wohl die Bedeutung der lateinischen Inschrift entziffern. Ich setzte mich auf die Stufen des Nordportals und durchforstete meine Führer. Nur zwei von ihnen erwähnten die Skulpturen, auf die es mir ankam. Der erste bot keine Übersetzung der Inschriften an, versicherte aber, daß sich die dargestellten Szenen auf die Bundeslade bezogen.[12] Der zweite lieferte eine Übersetzung, die mir zwar sehr interessant, aber ebenso fragwürdig erschien:

ARCHA CEDERIS: »Durch die Bundeslade wirst du wirken« und HIC AMITITUR ARCHA CEDERIS: »Hier läßt man gehen, durch die Bundeslade wirst du wirken.«[13]

Selbst mein Schülerlatein reichte aus, um zu vermuten, daß diese Interpretationen möglicherweise falsch waren. Ich entschloß mich also, die Angelegenheit einem Experten anzuvertrauen, und erinnerte mich an Dr. Peter Lasko, Kunsthistoriker und ehemaliger Direktor des Courtauld-Institutes der Universität London, der jetzt in Südfrankreich lebte. Lasko hatte sein Leben damit verbracht, die Kirchenkunst und Architektur des Mittelalters zu studieren. Ich war mir sicher, daß er mir weiterhelfen konnte.

Also schrieb ich die Inschriften sorgfältig ab und fertigte zudem eine Skizze des gesamten Nordportals an. Dabei fiel mir noch etwas auf: Obgleich die Abbildung der Lade auf den Stützpfeilern optisch etwas im Vordergrund stand, lag sie genau in der Mitte zwischen Melchisedek, dessen Figur den mittleren Bogen beherrschte, und der Statue der Königin von Saba im Zentrum des rechten Bogens. So ergab sich ein regelrechtes Dreieck, das alle drei Figuren miteinander verband.

Doch das war noch nicht alles. Als ich den Aufbau der Bilder in den beiden Bögen untersuchte, stellte ich fest, daß sich aus der Position der Lade und des kleinen Karrens, auf dem sie sich befand, eine Bewegung ablesen ließ, die fort von Melchisedek und hin zur Königin von Saba führte - und das auf einer Linie des imaginären Dreiecks, das ich gezeichnet hatte. Noch einmal rief ich mir ins Gedächtnis, daß man die allermeisten Skulpturengruppen mit Bedacht so kombiniert hatte, daß sie Geschichten erzählten oder verschlüsselte Informationen transportierten. Gerade dieses Arrangement mußte alles andere als ein Zufall sein. Ganz im Gegenteil, es schien als weiteres Beweisstück für meine These gelten zu können, nach der die Baumeister der Kathedrale auf irgendeine Art mit der äthiopischen Legende in Berührung gekommen sein mußten. Noch hatte ich zuwenig in den Händen, um eine Schlußfolgerung ziehen zu können, aber es schien immer wahrscheinlicher, daß das seltsame Bildwerk des Nordportals Elemente jener Überlieferung enthielt, nach der die Bundeslade dem alten Israel weggenommen und nach Äthiopien gebracht worden war.

Bevor ich also das Nordportal verließ, widmete ich meine besondere Aufmerksamkeit der Figur des Melchisedek. Er war mir gleich zu Beginn aufgefallen, doch während ich ihn zeichnete, nahm ich immer mehr Einzelheiten wahr. Unterhalb seiner rechten Hand baumelte zum Beispiel ein Weihrauchfaß, das sehr denjenigen ähnelte, die ich oft bei äthiopischen Meßfeiern gesehen hatte. In der Linken hielt er einen langstieligen Kelch oder Becher, der keine Flüssigkeit, sondern eher einen festen, zylindrischen Gegenstand zu enthalten schien.

Wieder konsultierte ich meine Führer, konnte jedoch keine Erwähnung des Weihrauchfasses und nur widersprüchliche Erklärungen für den Becher finden. Eine Quelle gab an, daß Melchisedek hier als Vorläufer Christi anzusehen sei und daß der Kelch sowie der darin enthaltene Gegenstand »Brot und Wein, die Sinnbilder der Eucharistie« darstellten.[14] An anderer Stelle war unter einer Fotografie der Statue zu lesen: »Melchisedek im Besitz des Grals, aus dem der Stein hervortritt«. Noch weniger konnte ich mit der folgenden Bemerkung anfangen: »Dieser Legende kann man die Dichtung des Wolfram von Eschenbach an die Seite stellen ... - von dem man behauptet hat, er sei Templer gewesen, was aber unbewiesen ist.«[15]

Um keinen Deut klüger verließ ich schließlich das Nordportal, um meine Familie in den Gärten hinter der großen Kathedrale zu treffen. Am nächsten Tag verließen wir Chartres und fuhren in Richtung Bordeaux und Biarritz. Wenig später erreichten wir mit Hilfe einer guten Karte die Ortschaft Montaigu de Quercy und das Haus des Kunsthistorikers Dr. Peter Lasko, den ich von Chartres aus angerufen hatte. Lasko wollte gerne mit mir über die Figuren des Nordportals sprechen, obgleich er, wie er bescheiden hinzufügte, nicht den Anspruch erheben wollte, als Experte auf diesem Gebiet zu gelten.

Eine Verbindung nach Äthiopien?

Mit Peter Lasko verbrachte ich einen ganzen Nachmittag. Er wußte, daß ich mich als Autor auf Äthiopien und Ostafrika spezialisiert hatte, so daß er mich als erstes fragte, weshalb ich mich mit einem Mal für französische Kathedralen des Mittelalters interessierte.

Ich beantwortete die Frage, indem ich ihm meine Theorie erläuterte, nach der die Figuren am Nordportal von Chartres auf irgendeine Art vom Kebra *Nagast* beeinflußt worden sein könnten. »Melchisedek mit dem Becher in der Hand stellt das alttestamentarische Israel dar«, fuhr ich fort. »Immerhin war er

Priesterkönig von Salem, das viele Wissenschaftler als Jerusalem identifiziert haben.[16] Dann könnte die Königin von Saba mit ihrem Diener Äthiopien darstellen. Die Skulpturengruppe gibt also genau das wieder, was im Kebra Nagast steht: daß die Lade von Jerusalem nach Äthiopien gelangte. Wie klingt das Ihrer Meinung nach?«

»Um ganz offen zu sein, Graham, es klingt absurd.«

»Warum?«

»Nun ..., es mag vielleicht noch angehen, daß eine äthiopische Legendensammlung schon im dreizehnten Jahrhundert nach Europa gedrungen ist. Wo wir gerade davon sprechen, fällt mir ein, daß es da mindestens einen Aufsatz gibt, der dieser Theorie eine Möglichkeit einräumt. Ich bezweifle das eher. Nun gut, selbst wenn die Geschichten des Kebra Nagast in Chartres zu dieser Zeit bekannt waren, so sehe ich dennoch keinen Grund dafür, warum irgend jemand auf die Idee gekommen sein sollte, diese Legenden in die Bildersprache der Kathedrale zu übersetzen. Das wäre ein absonderliches Vorhaben gewesen, insbesondere am Nordportal, das vor allem die alttestamentarischen Vorläufer Christi behandelt. Das ist, nebenbei bemerkt, auch der Grund, warum Melchisedek sich dort befindet. Im Hebräerbrief wird er ausdrücklich mit Christus gleichgesetzt.«[17]

»In Chartres hält er einen Becher in der Hand. Außerdem befindet sich eine Art zylindrischer Gegenstand in diesem Becher ...«

»... der möglicherweise Brot und Wein darstellt: Brot und Wein der Eucharistie.«

»So steht es auch in einem meiner Führer. In einem anderen jedoch wird der Becher mit dem Gral verglichen und behauptet, der zylindrische Gegenstand sei ein Stein.«

Peter Lasko runzelte fragend die Stirn: »Das ist das erste Mal, daß ich so etwas höre. Es erscheint mir noch weiter hergeholt als Ihre Theorie von einer Verbindung nach Äthiopien ...« Aber dann fügte er hinzu: »Allerdings gibt es da doch etwas. Diese Abhandlung, von der ich gesprochen habe, beschäftigt sich eben-

falls mit äthiopischen Einflüssen, die ihren Weg in das mittelalterliche Europa gefunden haben ...«

»Ja?«

»Es ist schon seltsam, aber dieser Aufsatz befaßt sich mit dem Gral. Wenn ich mich recht erinnere, wird dort behauptet, daß Wolfram von Eschenbachs Darstellung des Grals, der im übrigen ein Stein und kein Becher war, von einer Art christlich-äthiopischer Überlieferung beeinflußt wurde.«

Ich rückte auf meinem Stuhl nach vorn: »Das ist interessant ... Wolfram von Eschenbach wurde in meinem Führer auch erwähnt. Wer war das eigentlich?«

»Einer der ersten mittelalterlichen Dichter, die sich mit dem Gral beschäftigten. Er schrieb ein umfassendes Werk über dieses Thema: Parzival.«

»Ist das nicht der Name einer Oper?«

»Ja, *Parsifal* von Wagner. Er ist von Wolfram beeinflußt worden.«

»Und dieser Wolfram, wann genau war er tätig?«

»Ende des zwölften oder Anfang des dreizehnten Jahrhunderts.«

»Mit anderen Worten, genau zu der Zeit, als das Nordportal der Kathedrale entstand?«

»Ja, das ist wohl richtig.«

Wir schwiegen einen Augenblick, dann fragte ich: »Erinnern Sie sich zufällig an den Titel der Abhandlung?«

»Hm ..., nein, ich fürchte nein. Es ist mindestens zwanzig Jahre her, daß ich das gelesen habe. Ich glaube, es war von einem gewissen Adolf. Zumindest bringe ich diesen Namen damit in Verbindung. Am besten wenden Sie sich vielleicht an einen Fachmann für mittelhochdeutsche Literatur.«

Ich nahm mir vor, diesen Rat zu befolgen. Nun fragte ich Peter, ob er mir bei der Übersetzung der rätselhaften Inschriften weiterhelfen könnte, und erzählte ihm von den Interpretationen meines Reiseführers.

Damit war Peter jedoch überhaupt nicht einverstanden. ARCHA bedeutete sicherlich »Lade«, begann er, während CEDERIS

wahrscheinlich eine Entstellung von FOEDERIS, »Bündnis«, war. So gesehen bedeutete ARCHA CEDERIS ganz einfach »Bundeslade«. Eine zweite Möglichkeit bestand darin, das Wort CEDERIS mit einer Form des Verbs CEDERE zu erklären, was soviel wie »hergeben« oder »aufgeben« oder »weggehen« bedeutete. Die Tempusform war zwar unorthodox, doch könnte die Übersetzung von ARCHA CEDERIS in diesem Fall lauten: »Die Lade, die du hergeben (oder >aufgeben< oder >wegschicken<) wirst.«

Bei der längeren Inschrift lag die Schwierigkeit bei dem vierten Buchstaben des zweiten Wortes. In meinem Führer hatte man ihn für ein einfaches »T« gehalten. Es schien sich jedoch eher um die Abkürzung für ein doppeltes »T« zu handeln, denn es gibt kein lateinisches Wort AMITITUR mit einem »T«. Also müßte man den Satz als HIC AMITTITUR ARCHA CEDERIS lesen, was soviel wie »Hier wird sie losgelassen, die Lade, die du hinweggibst« bedeutete, oder vielleicht »Hier wird sie losgelassen, o Lade, du bist hinweggegeben«, oder als weitere Variante - wenn man CEDERIS als Korrumpierung von FOEDERIS betrachtete - »Hier wird sie losgelassen, die Bundeslade«.

Es war jedoch auch denkbar, daß der Buchstabe ein »C« war (wonach er auch am ehesten aussah). Wenn dem so war, dann lautete der in Frage kommende Satz HIC AMICITUR ARCHA CEDERIS, was man entweder mit »Hier ist die Bundeslade versteckt« oder mit »Hier ist die Lade versteckt, die du hergeben wirst« übersetzen kann.

»Aber selbst das Wort >versteckt< ist nicht eindeutig«, fuhr Peter fort, während er sein Wörterbuch zuschlug. »In diesem Zusammenhang könnte man AMICITUR genausogut mit >bedeckt< wiedergeben, wobei beide Begriffe sicherlich auf eine gemeinsame Grundbedeutung zurückzuführen sind. Ich weiß nicht, das ganze erscheint mir wie eine Art absichtsvolles Verwirrspiel.«

Dem konnte ich nur zustimmen. Mehr noch: Meine Neugier war geweckt, ich fühlte mich herausgefordert, angezogen, verführt von diesem Rätsel - und ich wollte es um jeden Preis lösen.

Während meiner restlichen Urlaubstage in Frankreich kehrte

ich in Gedanken immer wieder zum Nordportal von Chartres zurück. Ich konnte einfach nicht vergessen, wie sich die Reliquie auf dem Ochsenkarren in die Richtung der Königin von Saba zu bewegen schien. Und ebensowenig kam ich davon los, daß diese Bewegung nach Äthiopien deutete.

Ich wußte nur zu gut, daß ich mich wilden Spekulationen hingab, die ich unter wissenschaftlichen Gesichtspunkten kaum rechtfertigen konnte; und Peter Laskos Einwand, daß die Bildhauer von Chartres es sich nie gestattet hätten, bei ihrer Themenwahl eine äthiopische Legende zu berücksichtigen, nahm ich widerspruchslos an. Doch es war gerade dieser Einwand, der mich über eine noch aufregendere Möglichkeit nachdenken ließ: Vielleicht hatten die Verantwortlichen für das Nordportal der Kathedrale (das auch »Tor der Eingeweihten« genannt wurde[18]) einen verschlüsselten Hinweis für nachfolgende Generationen entworfen - eine Art Landkarte, die auf den Aufenthaltsort des heiligsten und wertvollsten Schatzes hinwies, den die Welt je gesehen hatte. Vielleicht hatte man herausgefunden, daß die Bundeslade tatsächlich losgelassen, hergegeben oder weggeschickt worden war, nämlich vom alttestamentarischen Israel, und daß sie nachfolgend versteckt oder bedeckt wurde, nämlich in Äthiopien. Vielleicht war dies die wahre Bedeutung der kleinen Figuren und verwirrenden Inschriften. Und wenn es sich so verhielt, dann mußten sich daraus atemberaubende Schlußfolgerungen ergeben. Mir war klar, daß die aksumitische Überlieferung, über die ich im Jahre 1983 so leichtfertig hinweggegangen war, eine erneute und eingehende Betrachtung verdiente.

Maria, der Gral und die Bundeslade

Als ich Ende April 1989 aus Frankreich zurückkehrte, wußte ich noch immer nicht, wo und wann der Aufsatz, den Peter Lasko erwähnt hatte, erschienen war. Also wies ich meinen Assistenten an, sich mit verschiedenen Universitäten in Verbindung zu

setzen, um herauszufinden, ob es einen Fachmann für deutsche Literatur des Mittelalters gab, der in der Lage war, uns weiterzuhelfen.

Während ich auf eine Antwort wartete, besorgte ich mir die verschiedenen Gralsromane. Darunter war Chrétien de Troyes' Perceval, den der Autor um 1182 unvollendet zurückgelassen hatte, Sir Thomas Malorys Der Tod Arthurs, ein viel später entstandenes Epos, das aus der Mitte des fünfzehnten Jahrhunderts stammte, und natürlich der Parzival, von dem man annahm, daß Wolfram von Eschenbach ihn zwischen 1200 und 1210 geschrieben hat - ein Datum, das fast genau mit den Hauptarbeiten am Nordportal der Kathedrale von Chartres zusammenfällt.

Ich begann mit der Lektüre dieser Bücher. Malorys Werk war mir zunächst am leichtesten zugänglich, da es die Grundlage für eine Reihe von Geschichten und Filmen über die Suche nach dem Gral war, die ich als Kind mit Begeisterung gelesen und gesehen hatte.

Ich stellte jedoch schnell fest, daß Malory eine idealisierte, gereinigte und vor allem christianisierte Fassung der »einzig wahren Suche« lieferte. Im Gegensatz dazu besaß Wolframs Geschichte einen eher weltlichen Charakter und beschrieb die Vielfalt menschlichen Verhaltens viel genauer. Zudem - und das war das wichtigste - vermied er, was den Gral betraf, jegliche neutestamentarische Symbolik.

Bei Malory wurde die Reliquie als »goldenes Gefäß« beschrieben, das von einer »Jungfrau ganz in Weiß gekleidet« getragen wurde und »ein Teil des heiligen Blutes unseres Herrn Jesus Christus« enthielt.[19] Mir fiel auf, daß dies genau das Bild war, das sich ganz allgemein in der Kunst und Kultur festgesetzt hatte - gewöhnlich handelte es sich dabei um die Schale, in der Joseph von Arimathia einige Tropfen des Blutes Christi auffing, als der Erlöser am Kreuze litt.

Auch ich war von dieser Vorstellung so beeinflußt, daß ich mit dem Gral schwerlich etwas anderes hätte verbinden können. Als ich mich bei meiner Lektüre jedoch Wolframs Parzival zuwandte, wurde bestätigt, was ich in Frankreich erfahren hatte:

Die Reliquie wird, wenngleich sie wie bei Malory von einer Jungfrau getragen wird, als Stein dargestellt.

»Erblickt ein todkranker Mensch diesen Stein, dann kann ihm in der folgenden Woche der Tod nichts anhaben. Er altert auch nicht, sondern sein Leib bleibt wie zu der Zeit, da er den Stein erblickt. Ob Jungfrau oder Mann: wenn sie, in der Blüte ihres Lebens stehend, den Stein zweihundert Jahre lang anschauen, ergraut lediglich ihr Haar. Der Stein verleiht den Menschen solche Lebenskraft, daß der Körper seine Jugendfrische bewahrt. Diesen Stein nennt man auch den Gral.«[20]

Diese seltsame und gleichzeitig einnehmende Bildsprache berührte mich tief und führte in mir zu einer bohrenden Frage: Warum konnte der Gral in *Der* Tod Arthurs als Gefäß dargestellt werden, wenn der weit ältere Parzival ihn eindeutig als Stein bezeichnet? Was war hier geschehen?

Ich setzte meine Nachforschungen fort und erfuhr von einem Spezialisten auf dem Gebiet der Gralsliteratur, daß Malory »lediglich ein Sujet ausschmückte, dessen Bedeutung er nicht verstand«, obgleich schon Wolfram und Chrétien de Troyes das Thema so genau behandelt hatten.[21]

Von diesem Hinweis ermutigt, wandte ich mich Chrétiens unvollendetem Roman zu und las dort die folgende Beschreibung des Grals - übrigens die erste in der Literatur und somit auch in der Geschichte. Wie bei Wolfram und Malory wurde der kostbare Gegenstand von einer Jungfrau getragen:

»Als sie mit dem Grale, den sie trug, eingetreten war, da kam damit so ein großer Glanz herein, daß die Kerzen ihre Helligkeit ebenso verloren wie die Sterne, wenn die Sonne oder der Mond aufgeht.«[22]

Ich stellte fest, daß in Chrétiens Text an keiner Stelle ausdrücklich davon gesprochen wird, daß der Gral ein Becher oder eine Schale ist. Aus dem Kontext war jedoch zu entnehmen, daß er den Gral als genau das ansah. Mehrfach erwähnt Chrétien den »Fischerkönig«, der »mit dem Gral bewirtet« wird.[23] Und viel später erfährt Perceval, daß es sich dabei um den Gralskönig handelt:

»... der Heilige Mann stärkt und erhält sein Leben mit einer einzigen Hostie, die man ihm in diesem Grale bringt. So heilig ist der Gral und der König so geistig, daß seinem Leben nur noch die Hostie nottut, die in dem Grale kommt.«[24]

Bei weiteren Untersuchungen ergab sich, daß das Wort Gral aus dem altfranzösischen »gradale« (lateinisch: »gradalis«) stammte, was soviel bedeutet wie »ein großes und in gewisser Weise ausgehöhltes Gefäß, in dem wohlschmeckende Speisen dargebracht werden«. Zu Chrétiens Zeiten veränderte sich »gradale« in der Umgangssprache oft zu »greal«. Und selbst in jüngerer Zeit wurden Wörter wie »grazal«, »grazau« und »grial« in Teilen Südfrankreichs dazu benutzt, um verschiedene Arten von Behältern zu bezeichnen.[25]

Hier also lag der Ursprung von Malorys Vorstellung des heiligen Gegenstandes als Gefäß. Außer der Erwähnung einer geweihten »Hostie« enthält Chrétiens Bearbeitung ansonsten jedoch keine eindeutigen Verweise auf das neutestamentarische Christentum (selbst in der Bezeichnung des Grals als »heiliger Gegenstand« nicht - eine Formulierung, die ebensogut aus dem Alten wie aus dem Neuen Testament stammen konnte). Wie Wolfram erwähnt auch der französische Dichter an keiner Stelle das Blut Christi oder gibt an, daß die Reliquie ein Gefäß dafür sei.

Das Bild des »heiligen Blutes«, das im allgemeinen mit dem Gral assoziiert wird, war eine Auslegung späterer Verfasser, die das ursprüngliche Thema erweitert, aber auch verändert haben. Im Verlauf meiner Recherche konnte ich feststellen, daß dieser Prozeß der »Christianisierung« von den Zisterziensern unterstützt worden war.[26] Dieser Orden wiederum wurde im wesentlichen von einem Mann beeinflußt und geformt, der der Bruderschaft im Jahre 1112 beigetreten war und von vielen Wissenschaftlern als die bedeutendste religiöse Gestalt seiner Zeit angesehen wird: Bernhard von Clairvaux.[27]

Und es war Bernhard, der eine führende Rolle in der Entwicklung und Verbreitung des gotischen Architekturkonzeptes gespielt hatte. 1134, als der emporstrebende Nordturm von Char-

tres gebaut wurde, befand sich Bernhard im Zenit seiner Macht, die er einsetzte, um mit Nachdruck auf die Prinzipien der heiligen Geometrie hinzuweisen, so wie sie in diesem wunderbaren Bauwerk umgesetzt worden waren.[28] Noch weit über seinen Tod im Jahre 1153 hinaus gehörten seine Predigten und Ideen zu den Quellen, aus denen man Anregungen für die Weiterentwicklung der gotischen Architektur und Skulptur schöpfte.[29]

Eine der wichtigsten Verbindung zwischen Chrétiens Version der Geschichte vom Heiligen Gral und der neutestamentarisch stilisierten Prosasammlung Malorys bildete die sogenannte Queste deJ Saint *Graal,* die zu Beginn des dreizehnten Jahrhunderts von Zisterziensermönchen zusammengestellt wurde.[30] Obgleich der Kirchenmann schon tot war, als mit der Arbeit an diesem umfangreichen Roman begonnen wurde, schien mir, als sei dem Werk die starke Hand des heiligen Bernhard anzumerken - gewissermaßen aus dem Grab heraus. Ich kam zu dieser Schlußfolgerung, weil der ungeheuer einflußreiche Geistliche in seinen umfangreichen Schriften eine mystische Sichtweise des Blutes Christi vertreten hatte, die von den Verfassern der Queste für ihr neues Konzept des Grals rezipiert wurde.[31] So war Wolframs Stein völlig in Vergessenheit geraten, während Chrétiens Gefäß zwar erhalten blieb, fortan jedoch mit dem Blut Christi angefüllt wurde.

Besonders interessant war die Tatsache, daß die Kirche die neue Gralsvorstellung sofort weiterinterpretierte. Ich fand heraus, daß der Gral nach und nach in ganz Europa in Hymnen, Predigten und Episteln mit der Heiligen Jungfrau Maria gleichgesetzt wurde - und ihr, so erinnerte ich mich, war ja auch die Kathedrale von Chartres geweiht. Der Gedanke hinter dieser frommen Allegorie war folgender: Der Queste und allen späteren Bearbeitungen zufolge enthielt der Gral das heilige Blut Christi; bevor sie ihn zur Welt brachte, hatte Maria den Sohn Gottes in ihrem Leib getragen; folglich war der Gral schon seit jeher ein Symbol für Maria.[32]

Gemäß dieser Logik war »Maria Theotokos«, die »Gottesträgerin«, das heilige Gefäß, das den fleischgewordenen Geist ent-

hielt. So wurde sie im Bittgesang von Loreto aus dem sechzehnten Jahrhundert[33] als »vas spirituale« (Gefäß des Geistes), »vas honorabile« (Gefäß der Verehrung) und »vas insigne devotionis« (einzigartiges Gefäß der Verehrung) angebetet.[34]

Warum diese Symbole meine Aufmerksamkeit auf sich zogen? Ganz einfach: der Bittgesang von Loreto bezeichnete die Heilige Jungfrau auch als »arca foederis«[35] - und inzwischen wußte ich, daß es sich dabei um die lateinische Bezeichnung für »Bundeslade« handelte. Ich untersuchte diese Übereinstimmung eingehender und fand heraus, daß der Bittgesang nicht der einzige Ort war, an dem der Schrein auftauchte. Der mächtige Bernhard von Clairvaux hat Maria ebenfalls ausdrücklich mit der Bundeslade verglichen, und das gleich in einer ganzen Reihe von Schriften.[36] Und schon im vierten Jahrhundert predigte der heilige Ambrosius, Bischof von Mailand, daß es sich bei der Bundeslade um eine prophetische Allegorie für Maria handele: So wie der Schrein das alte Gesetz in Form der Zehn Gebote enthielt, so barg die Jungfrau das neue Gesetz, den Körper Jesu Christi.[37]

Ähnliche Auffassungen haben sich - im modernen christlichen Glauben verwoben - bis in das zwanzigste Jahrhundert hinein gehalten. Während einer Reise durch Israel stieß ich zum Beispiel auf eine kleine Dominikanerkirche, die 1924 erbaut und »A La Vierge Marie Arche d'Alliance« geweiht worden war - mit anderen Worten der »Heiligen Jungfrau Maria von der Bundeslade«. Die Kirche stand auf einer Anhöhe bei Kiriath-Jearim über der Straße zwischen Tel Aviv und Jerusalem. Ihr sieben Meter hoher Kirchturm war an der Spitze mit einer Darstellung der Bundeslade verziert und auch im Inneren der Kirche fand ich mehrere Wandmalereien, die die heilige Reliquie abbildeten. Während der Besichtigung gab mir Schwester Raphael Mikhail, ein Mitglied des Kirchenvorstandes, folgende Erklärung für diese Form der Marienverehrung: »Wir betrachten Maria als lebendige Lade. Maria war die Mutter Jesu, Herr des Gesetzes und des Bündnisses. Die Steintafeln mit den Zehn Geboten des Gesetzes wurden von Moses in die Lade gelegt, genauso legte

Gott Jesus in den Leib Mariae. Und so ist sie die lebendige Lade ...«

Es schien mir im höchsten Maße bedeutsam, daß sowohl Bundeslade als auch Gral, zwei zunächst so unterschiedliche Gegenstände, dennoch wiederholt mit derselben Gestalt in der Bibel verglichen worden waren, und dies genau auf dieselbe Art und Weise. Wenn Maria sowohl »lebendige Bundeslade« als auch »lebendiger Gral« war, so konnte dies bedeuten, daß die beiden heiligen Gegenstände in Wirklichkeit gar nicht so verschieden voneinander waren - unter Umständen handelte es sich um ein und denselben Gegenstand.

Ich war wie elektrisiert von dieser Möglichkeit. Schien sie auf den ersten Blick auch weit hergeholt, so warf sie doch ein interessantes Licht auf die Auswahl und Stellung der Figuren im Nordportal von Chartres. Sollte ich recht behalten, so konnte Melchisedeks »Gral-Becher«, der den »Stein« enthielt, auf einer Ebene Maria darstellen, auf einer anderen jedoch als verschlüsseltes Symbol für die Bundeslade und ihren kostbaren Inhalt gelten.

Ich war der Meinung, daß eine solche Interpretation meiner These, daß die Skulpturengruppe im Nordportal die Überführung der heiligen Reliquie nach Äthiopien darstellte, mehr Gewicht verlieh. Gleichzeitig war mir jedoch klar, daß ich noch keinen festen Boden unter den Füßen hatte, um eine so gewichtige Schlußfolgerung zu ziehen. Was ich besaß, waren zufällige Übereinstimmungen, Vermutungen und die starke Ahnung, etwas Wichtigem auf der Spur zu sein.

Schon immer war ich meinen Ahnungen gefolgt, um zu sehen, wohin sie mich führten. Dennoch erschien es mir notwendig, etwas Zuverlässigeres als ein paar glückliche Zufälle und Vorahnungen an der Hand zu haben, um mich auf eine so kostspielige und zeitaufwendige Untersuchung einzulassen.

Ich mußte nicht lange warten. Im Juni 1989 gelang es meinem Assistenten endlich, die lange gesuchte Abhandlung ausfindig zu machen. Der Antrieb, den mir dieser Aufsatz gab, ließ mich eine Suche antreten, die die nächsten zwei Jahre meines Lebens beherrschen sollte.

Literarischer Einfluß - oder mehr?

Die Abhandlung mit dem Titel *Neues Licht auf orientalische Quellen* in Wolframs >*Parzival*< war 1947 in einer angesehenen wissenschaftlichen Zeitschrift erschienen. Bei der Autorin handelte es sich um Helen Adolf, eine qualifizierte Mediävistin, die sich insbesondere mit dem Stammbaum des Grals befaßte. Nach ihrer These mußte Wolfram - obgleich stark von Chrétien de Troyes beeinflußt - auch von einer weiteren Gralsgeschichte orientalischer Provenienz Kenntnis gehabt haben.[38]

Schon vor der Lektüre des Aufsatzes wußte ich, daß Chrétien de Troyes den Gral im Jahre 1182 gewissermaßen »erfunden« hatte. Die meisten Fachleute auf diesem Gebiet stimmten darin überein, daß es zwar früherere Legenden gab, die sich zum Beispiel mit magischen Kesseln oder den heldenhaften Fahrten und ritterlichen Taten der Artusrunde beschäftigten, auf die die Hofdichter zurückgriffen, um ihren Gralsgeschichten Fülle zu verleihen.[39] Diese alten Epen, die mündlich von einer Generation an die folgende weitergegeben wurden, waren jedoch zu bekannt, zu »abgenutzt« und zu vertraut, als daß von ihnen jener kreative Impuls für die Reihe großer Romane hätte ausgehen können, die Chrétien Ende des zwölften Jahrhunderts einleitete.

Der große französische Dichter hat seine Gralserzählung unvollendet zurückgelassen. Wenige Jahre später profitierte Wolfram von diesem gelungenen Anfang, indem er die Geschichte seines Vorgängers erweiterte und zu einem Ende brachte. Gleichzeitig beschuldigte er Chrétien mit groben Worten der »Unwahrheit«, nicht ohne hinzuzufügen, daß es sich allein bei seinem eigenen Werk um die »authentische Erzählung« handele.[40] Was diese Anschuldigungen so merkwürdig erscheinen läßt, ist die Tatsache, daß Wolfram ganz offensichtlich viele Einzelheiten bei dem Franzosen entlehnt hatte und im großen und ganzen sogar der Handlung und ihren Akteuren treugeblieben war.[41] Ich stieß auf mehrere eindeutige Überschneidungen, zum Beispiel bei der Beschreibung der Gralsprozessionen oder dem Verschwinden des Heiligtums nach Parzivals Versagen. Tatsäch-

lich gab es nur einen, aber sehr bedeutsamen Unterschied: die merkwürdige Neuerung, die aus dem Gral einen Stein machte. Der Grund für diese Veränderung blieb für viele Forscher ein Rätsel. Ich konnte mir kaum vorstellen, daß Wolfram einfach einen Fehler begangen hatte. Er war ein zu kluger und genauer Erzähler, als daß ihm ein so markanter Irrtum hätte unterlaufen können. Für die bewußte Entscheidung Wolframs mußte es andere, wichtige Gründe gegeben haben.

Genau auf diese Frage ging Helen Adolf in ihrer kurzen Abhandlung ein - und ihre Antwort faszinierte mich sehr. Die Autorin gab an, daß Wolfram auf irgendeine Art und Weise mit dem Kebra Nagast in Berührung gekommen sein mußte. Begeistert von der Legende, nach der die Bundeslade von Jerusalem nach Aksum gelangte, hatte er beschloßen, Teile davon in seinen eigenen *Parzival* einzuarbeiten. Die Verfasserin vermutete einen nur »indirekten« Einfluß; und dennoch bestand die annehmbarste Erklärung für das seltsame Aussehen von Wolframs Gral im Vergleich mit einem äthiopischen Kultgegenstand, den man in jeder abessinischen Kirche antrifft, den »... sogenannten Tabot, eine Tafel aus Holz oder Stein .. .«[42]

Helen Adolf erläuterte, daß die Verwendung der »Tabots« ihre Ursprünge in den religiösen Überlieferungen des Kebra Nagast hatte - eine Feststellung, die ich bestätigen konnte. Schon 1983 hatte ich in Aksum erfahren, daß »Tabot« die regionale Bezeichnung für den heiligen Schrein war, der nun in Äthiopien aufbewahrt werden sollte. Darüber hinaus hatte ich herausgefunden, daß jede äthiopisch-orthodoxe Kirche ohne Ausnahme einen eigenen hölzernen oder steinernen »Tabot« besaß.

Auf der Basis einiger Vergleiche behauptete die Mediävistin, daß Wolfram von dem Kultgegenstand gewußt und seinen Gral-Stein dem äthiopischen »Tabot« nachgebildet hatte. An anderer Stelle verwies die Autorin darauf, daß nicht alle Charaktere des Parzival von Chrétien entliehen waren. Es gab einige zusätzliche Figuren, deren Ursprung zunächst im Dunklen lag, die aber sehr gut aus dem Kebra Nagast stammen konnten. Auf die Frage, wie die Berührung des deutschen Erzählers mit der äthiopischen

Legendensammlung hatte Zustandekommen können, bot Helen Adolf nur einen Erklärungsversuch an. Es bestand die Möglichkeit, daß jüdische Nomaden die Geschichte nach Europa gebracht hatten. Im Mittelalter, so erläuterte sie, »... galten die Juden als Vermittler zwischen Arabern und Christen. Besonders wichtig war ihre Stellung jedoch in Äthiopien, wo sie einen bedeutenden Teil der Bevölkerung stellten und noch immer stellen.«[43]

Ich hielt die Argumentation für überzeugend, wenngleich ein wenig eingeschränkt in ihrem Blickwinkel. Die Autorin hatte sich auf das engumgrenzte Gebiet der Literaturwissenschaft konzentriert, so daß ihr Anliegen rein literarischer Natur bleiben mußte. Das Umfeld war nur soweit untersucht worden, wie es für das gesteckte Ziel notwendig erschien.

Und dennoch schuldete ich der Wissenschaftlerin großen Dank, denn sie hatte mir die Augen für etwas noch Aufregenderes geöffnet - etwas von unendlich größerer Bedeutung.

Auf Grund der bereits erwähnten Vergleiche zwischen der Bundeslade, dem Gral und der Jungfrau Maria fragte ich mich, ob Bundeslade und Gral tatsächlich so verschieden waren, wie zunächst angenommen. Wenn Wolframs Darstellung des Grals tatsächlich von den äthiopischen Überlieferungen beeinflußt worden war, dann mußte mehr an der Sache sein, als Helen Adolf angenommen hatte. Um es deutlich zu formulieren: Ich fragte mich, ob der deutsche Dichter seinen scheinbar fiktiven Gral nicht ganz bewußt als eine Art Code für die historische Bundeslade betrachtet hatte. Wenn das zutraf, so war das zentrale Thema des *Parzival,* die Suche nach dem Gral, ebenfalls als Chiffre zu begreifen, die in Form einer verschlüsselten Schatzkarte auf den letzten Aufenthaltsort der Bundeslade verwies.

Ich hatte mich schon davon überzeugt, daß eine ähnliche, in Stein gehauene und geheime Botschaft im Nordportal von Chartres darauf hinzudeuten schien, daß der Schrein nach Äthiopien gebracht worden war. Mit neuentflammter Begeisterung drängte es mich, den *Parzival* zu decodieren.

Himmlische Inschriften, Gesetze und Orakel

Zuerst wollte ich herausfinden, ob Wolfram seinen Gral tatsächlich als eine Art Kryptogramm für die Bundeslade entworfen hatte. Ich beschloß deshalb, weitere Nachforschungen im Hinblick auf eine Verbindung nach Äthiopien, wie Helen Adolf sie angedeutet hatte, zunächst zurückzustellen. Statt dessen wollte ich nach direkten Parallelen zwischen den Eigenschaften des Grals und der Bundeslade (wie sie im Alten Testament und anderen altjüdischen Quellen beschrieben wird] suchen. Nur wenn sich hier überzeugende Resultate ergeben würden, hatte es Sinn, mit den Untersuchungen fortzufahren.

Das erste, was meine Aufmerksamkeit erregte, war die Art, wie Wolfram den Gral Chrétiens vom Gefäß in einen Stein verwandelte. Mir fiel auf, daß der französische Dichter den Gral so vage und gewissermaßen mystifiziert beschrieben hatte, daß Wolfram ihm eine Identität geradezu aufzwingen konnte. Er hatte nun die Möglichkeit, das eher ungenaue Bild, das sein Vorgänger entworfen hatte, so umzusetzen, daß es seinen eigenen Vorstellungen entsprach. Also definierte er das Behältnis durch seinen Inhalt, ohne je direkt von ihm selbst zu sprechen.

Auch die Bundeslade war ja ein Behältnis, das einen Stein enthielt - oder besser zwei Steintafeln mit der göttlichen Inschrift. Auffälligerweise erschienen auf Wolframs Gral von Zeit zu Zeit ebenfalls himmlische Schriftzeichen, die bestimmte Gesetze verkündeten.[44] Und es gab noch weitere vergleichbare Übereinstimmungen. So übernimmt der Gral die Funktion eines Orakels für die Gemeinschaft, die sich auf ihn verschworen hat:

»Schließlich warfen wir uns betend vor dem Gral auf die Knie. Da zeigte sich auf seinem Rand eine Inschrift: ein Ritter würde kommen. Sollte er mitleidig nach dem Geschick des Königs fragen, dann hätte alles Elend ein Ende. Doch dürfe ihn niemand auf die Wichtigkeit der Frage hinweisen, sonst würde sie nicht helfen. Die Wunde bliebe dann unverändert, ja sie bereite noch größere Schmerzen als vorher. Und weiter hieß es in der Schrift: <Habt ihr auch alles gut verstanden? Jeder heim-

liche Hinweis schadet nur! Und fragt er nicht gleich in der ersten Nacht, dann ist die Gelegenheit verpaßt; späteres Fragen wirkt nicht mehr. Fragt er jedoch zur rechten Stunde, dann soll er die Herrschaft über das Königreich übernehmen .. .<«[45]

Auch die Bundeslade diente oftmals als Orakel, das den Israeliten lebenswichtige Hinweise gab. Im Buch Richter beispielsweise, das die Bundeslade immer wieder und eindeutig mit Gott selbst identifiziert, fand ich diesen Absatz:

»Und die Kinder Israel fragten den Herrn (es war aber daselbst die Lade des Bundes Gottes zu der Zeit, und Pinhas, der Sohn Eleasars, Aarons Sohn, stand vor ihm zu der Zeit) und sprachen: Sollen wir weiter ausziehen, zu streiten mit den Kindern Benjamin, unseren Brüdern, oder sollen wir ablassen? Der Herr sprach: Ziehet hinauf; morgen will ich sie in eure Hände geben.«[46]

Eine Bibelstelle aus späterer Zeit gibt an, daß die Lade nur noch selten sprechen würde und »wenig Weissagung war«. Als aber der Prophet Samuel sich »im Tempel des Herrn, da die Lade Gottes war, niederlegte, vernahm er die warnende Stimme des Herrn: Siehe, ich tue ein Ding in Israel, daß, wer das hören wird, dem werden seine beiden Ohren gellen.«[47] Nicht nur mit Stimmen und Visionen gab die Lade ihre Weissagungen kund. Wie der Gral offenbarte auch sie sich von Zeit zu Zeit im geschriebenen Wort - zum Beispiel als sie König David die Anweisungen für den Tempel verkündete, den sein Sohn Salomo bauen würde.[48]

Die Last der Sünde

Im Verlauf meiner Nachforschungen konnte ich noch andere Charakteristika feststellen, die den Gral mit der Lade und insbesondere mit den Steintafeln verbanden. Eine Besonderheit lag darin, daß das Gewicht des Grals symbolische Bedeutung besaß. Bei Wolfram heißt es:

»Er ist so schwer, daß ihn selbst die ganze sündige Menschheit nicht von der Stelle bewegen könnte.«[49]

Ich verglich diese Passage mit einer alten jüdischen Legende, die den Augenblick schildert, in dem der Prophet Moses mit den Steintafeln vom Berg Sinai herabsteigt. Als er das Lager erreichte, überraschte er sein Volk bei der Anbetung des Goldenen Kalbs, bei einer so unaussprechlichen Sünde, daß »... er mit einem Mal die Schrift von den Tafeln verschwinden sah, während er im gleichen Augenblick deren gewaltiges Gewicht spürte. Denn als die göttliche Schrift auf ihnen war, trugen sie ihr eigenes Gewicht und lasteten nicht auf Moses.«[50]

In Wolframs verschlüsselter Prosa taucht selbst das Goldene Kalb auf - und zwar an einer zentralen Stelle. Ich war mir sicher, daß der Autor das Kalb ganz bewußt eingesetzt hatte, um eine Botschaft zu vermitteln, die den Gral noch deutlicher mit der Bundeslade gleichsetzen sollte. Im neunten Buch des Parzival las ich:

»Einst lebte ein Heide mit Namen Flegetanis, der für seine Gelehrsamkeit hoch berühmt war. Dieser Naturforscher stammte von Salomo ab und war aus altem israelischen Geschlecht ... Dieser Mann zeichnete die Geschichte des Grals auf. Väterlicherseits war Flegetanis ein Heide und erwies einem Kalb göttliche Ehre ... Der Heide Flegetanis besaß Kenntnisse über die Bahnen der Sterne und ihre Umlaufzeit. Mit dem Kreislauf der Sterne ist aber das Geschick der Menschen eng verbunden. So entdeckte der Heide Flegetanis in der Konstellation der Gestirne verborgene Geheimnisse, von denen er selbst nur mit Scheu erzählte. Er erklärte, es gäbe ein Ding, das >der Gral< hieße; diesen Namen las er klar und unzweideutig in den Sternen. >Eine Schar von Engeln ließ ihn auf der Erde zurück, bevor sie hoch über die Sterne emporschwebte und vielleicht, von ihrer Schuld befreit, wieder in den Himmel gelangte .. .<«[51]

Was mir an diesem Abschnitt so wichtig erschien, war die Art und Weise, wie durch Flegetanis und seinen faszinierenden salomonischen und jüdisch-heidnischen Hintergrund auf den astralen Ursprung des Grals verwiesen wurde. Welche Aussagekraft diese Parallele hatte, wurde mir klar, als ich bei einem maßgeblichen Bibelforscher nachlas, der die Meinung vertrat,

die Steintafeln in der Bundeslade seien in Wirklichkeit zwei Teile eines Meteoriten gewesen.[52] Und dabei handelte es sich nicht einmal um eine neuzeitliche Interpretation, von der Moses und die levitischen Priester nichts gewußt haben konnten. Im Gegenteil, es ist bekannt, daß semitische Stämme wie die Israeliten schon seit alters her »vom Himmel gefallene Steine« verehrten.[53]

Ein gutes Beispiel für diesen Brauch, der sich bis in unsere Zeit erhalten hat, ist die besondere Verehrung, die dem Schwarzen Stein, der in die Südost-Ecke der Kaaba in Mekka eingelassen ist, von Muslimen entgegengebracht wird. Der Prophet Mohammed hatte erklärt, daß dieser Stein, der von jedem Pilger bei seinem »Hadsch« zu den heiligen Stätten des Islam geküßt wird, vom Himmel gefallen sei. Zunächst hatte Adam ihn erhalten, damit der Stein dessen Sünden nach der Vertreibung aus dem Paradies aufnehme. Später übergab ihn der Erzengel Gabriel dem hebräischen Stammesvater Abraham. Und schließlich war er zum Eckstein der Kaaba geworden, dem »schlagenden Herzen« der islamischen Welt.[54]

Ich erfuhr, daß Geologen den Schwarzen Stein ohne zu zögern als Teil eines Meteoriten identifiziert hatten.[55] Auch das Paar heiliger Steine, bekannt als »Bätyloi«, das von Araberstämmen in präislamischer Zeit auf ihren Wanderungen durch die Wüste mitgenommen wurde, bestand wohl aus meteoritischem Gestein. Schließlich erkannte man, daß die »Bätyloi« (die oft in tragbaren Schreinen aufbewahrt wurden) in einer direkten Linie kultureller Übertragung mit dem Schwarzen Stein der Kaaba und den steinernen Gesetzestafeln der Bundeslade verbunden waren.[56]

Dann fand ich heraus, daß der »Bätylos« im mittelalterlichen Europa als »lapis betilis« bekannt war, als »... ein aus dem Semitischen stammender und, wenn auch erst spät, zu den Griechen und Römern übergegangener Name für heilige Steine, in denen man göttliches Leben voraussetzte ..., die, an heiligen Orten aufgestellt, durch Salbung und Bekränzung verehrt ... wurden. Es waren vom Himmel gefallene Meteorsteine.«[57]

Angesichts dieser Zusammenhänge erschien es mir unwahrscheinlich, daß Wolfram sich lediglich in Phantastereien ergangen hatte, als er seinem Gral meteorischen Ursprung zuschrieb. Es war nicht allein die Figur Flegetanis', die auf diese Entscheidung verwies, einige Seiten später bietet Wolfram einen seltsamen anderen Namen für den Gral an: »Lapsit exillis«[58]. Unter den vielen Interpretationen, die sich mit der Bedeutung des pseudo-lateinischen Attributes »exillis« auseinandersetzten[59], erschien mir diejenige am plausibelsten, die den Begriff von »lapis ex caelis« (»Stein vom Himmel«], »lapsit ex caelis« (»er fiel vom Himmel«) oder »lapis, lapsus ex caelis« (»Stein, vom Himmel gefallen«) ableitete.[80] Zudem überlegte ich, daß die verfälschten Wörter »Lapsit exillis« dem Begriff »lapis betilis« ähnlich genug waren, um den Verdacht aufkommen zu lassen, daß der deutsche Dichter es auch hier auf ein wohlüberlegtes und natürlich verschlüsseltes Wortspiel angelegt hatte.

Segnungen und übernatürliches Licht

Andere Vergleichsmöglichkeiten ergaben sich aus Wolframs wiederholter Beschreibung des Grals als ergiebige Quelle von Segnungen und Wohltaten für diejenigen reinen Herzens, die mit ihm in Berührung kamen. Als ein Beispiel unter vielen kann die folgende Passage aus dem fünften Buch des *Parzival* gelten:

»Vor dem Gral stand alles bereit, wonach man nur verlangte. Man fand dort warme und kalte Speisen, bekannte und unbekannte Gerichte ... Der Gral war wirklich ein Hort des Glücks, ein Füllhorn irdischer Köstlichkeiten .. .«[61]

Es war durchaus denkbar, daß in diesen Zeilen ein alter Talmud-Kommentar widerklang, in dem es heißt:

»Als Salomo die Lade in den Tempel brachte, da füllten sich alle goldenen Bäume des Tempels mit Säften und ließen reichlich Früchte sprießen, daß die Priester ihr Wohlgefallen daran hatten .. ,«[62]

Eine noch stärkere Übereinstimmung zwischen Lade und

Gral entdeckte ich in der überirdischen Luminiszenz, die beiden Heiligtümern zugeschrieben wurde. Der innerste Bezirk in Salomos Tempel, wo sich die Lade befand, bevor sie auf seltsame Weise verschwand, war der Bibel zufolge ein Ort »im Dunkel«[63]. Andere Quellen, die auf den Talmud zurückgehen, vermerken jedoch: »Der Hohepriester Israels betrat und verließ das Haus des Herrn im Licht, das die Bundeslade umgab«, ein Zustand, der sich änderte, als die Reliquie verschwand. Danach mußte der Priester »seinen Weg im Dunklen ertasten«[64].

Die Lade war demnach die Quelle eines übernatürlichen Funkeins; auch zahlreiche Bibelstellen belegen, daß sie von einem blendenden Schein umhüllt wurde.[65] Ähnlich verhielt es sich mit Chretiens Gral, der ein Licht ausstrahlte, das »die Kerzen ihre Helligkeit« verlieren ließ.[66] Ich nahm an, daß Wolfram diesen Aspekt des Grals nur allzugern aufgenommen hatte, lieferte Chretiens Gral doch einen deutlichen Verweis auf die Bundeslade. Wolfram mußte nun seine Darstellung nur noch mit dem Stein komplettieren.

Chrétiens Gral bestand aus »reinem Golde«[67] - so wie die »mit feinem Golde inwendig und auswendig« überzogene Bundeslade[68], die von einem schweren Deckel, dem »Gnadenstuhl«, bedeckt wurde, der ebenfalls aus »feinem Golde« bestand.[69] Und dennoch war es nicht das wertvolle Material, das Lade und Gral jenen überirdischen Glanz verlieh; der Grund lag vielmehr darin, daß beide eine brennende und himmlische Energie besaßen. Dieselbe Kraft ging von den Steintafeln und den göttlichen Geboten aus und ließ auf dem Gesicht Mose ein unheimliches und übernatürliches Leuchten erscheinen, als er von seinem Zwiegespräch mit dem Herrn zurückkehrte:

»Da nun Mose vom Berg Sinai ging, hatte er die zwei Tafeln des Zeugnisses in der Hand und wußte nicht, daß die Haut seines Angesichts glänzte davon, daß er mit ihm geredet hatte. Und da Aaron und alle Kinder Israel sahen, daß die Haut seines Angesichts glänzte, fürchteten sie sich, zu ihm zu nahen.«[70]

Es konnte sich nicht um eine zufällige Übereinstimmung handeln, wenn Wolframs Gral bei seinem ersten Erscheinen im

Parzival von einer Jungfrau getragen wurde, deren Antlitz »so hell strahlte, daß alle meinten, der neue Tag sei angebrochen«[71].

Der vom Himmel auserkorene Held

Repanse de Schoye war eine »unberührte und makellose Edelfrau«[72]. Ihre hervorstechendste Eigenschaft war jedoch, daß der Gral sie auserwählt hatte: »Von ihr allein ließ der Gral sich herbeitragen«, erklärt Wolfram und greift diese Besonderheit an anderer Stelle noch einmal auf. »Schließlich folgte ihnen mit Repanse de Schoye die strahlendste und schönste Jungfrau. Wie ich hörte, ließ sich der Gral einzig und allein von ihr tragen.«[73]

Sätze wie diese schienen anzudeuten, daß die Reliquie auf die Menschen in ihrer Umgebung reagierte. Nur unter bestimmten Bedingungen war es möglich, sich auf die Suche nach dem Gral zu begeben: »Den Gral kann allein erringen«, schrieb Wolfram, »wer im Himmel bekannt genug ist, zum Gral berufen zu werden.«[74] Und später wiederholt der Dichter noch einmal: »Niemals kann ein Mensch den Gral erkämpfen, der nicht von Gott dazu berufen ist.«[75]

Die Macht der göttlichen Vorsehung war für Wolframs Gesamtkonzept von großer Bedeutung. Ich nahm an, daß sich entsprechende Beispiele auch in den biblischen Verweisen auf die Bundeslade finden lassen würden. So bestimmt das Heiligtum im vierten Buch Mose den Weg der Israeliten durch die Wüste und legt fest, wo die Zelte zur Nacht aufgestellt werden sollen. Und das erste Buch der Chronik bestätigt, daß nur bestimmte Personen für den Dienst an der Lade auserkoren waren:

»Die Lade Gottes soll niemand tragen außer den Leviten; denn diese hat der Herr erwählt, daß sie die Lade Gottes tragen und ihm dienen ewiglich.«[76]

Die deutlichsten Entsprechungen zwischen der Bundeslade und Wolframs Gral fand ich jedoch nicht in der Bibel, sondern im Kebra *Nagast,* das die Geschichte von der Entführung der

Lade nach Äthiopien erzählt. Hier stieß ich auf ein Textstelle, in der die übermenschliche Eigenmacht der Reliquie beschrieben wird:

»In betreff dessen aber, was du davon erwähnt hast, daß die Bundeslade nach der Gegend des Landes Äthiopien gezogen ist, so wisse: wenn Gott gewollt hatte und wenn sie selbst gewollt hatte, so konnte auch nicht ein einziger sie zurückhalten. Denn sie geht nach ihrem eignen Willen und kehrt nach ihrem eignen Willen zurück, wenn Gott es billigt.«[77]

Immer öfter fielen mir Textstellen auf, die auf die eigenständige Macht der Lade verwiesen und deutlich machten, daß die Hüter des Schreins allein von der göttlichen Vorsehung auserwählt worden waren.[78]

So berichtet das sechzehnte Kapitel der alten Überlieferung von der tiefen Trauer Salomos, als er erfuhr, daß die Bundeslade von seinem Sohn Menelik entführt worden war. Im Augenblick seines größten Schmerzes erscheint ein Engel und fragt ihn:

»>Warum bist du so traurig? Dieses ist ja mit dem Willen Gottes geschehen. Die Bundeslade ist nicht einem anderen gegeben worden, sondern deinem erstgeborenen Sohn.< ... Darum tröstete sich der König und sprach: >Der Wille Gottes geschehe und nicht der Wille des Menschen!<«[79]

Hier mußte es sich um genau das handeln, was Wolfram im Sinn hatte, als er schrieb: »Niemand vermag den Gral mit Gewalt zu erringen, außer dem, der von Gott dazu erkoren ist.« Mit anderen Worten, wenn es sich bei dem Gral tatsächlich um ein Kryptogramm für die Bundeslade handelte, war es dann nicht denkbar, daß es sich bei dem Vorbild für den »vom Himmel auserkorenen« Helden des deutschen Dichters um Menelik handelte?

Um diese Frage zu beantworten, las ich erneut im Parzival. Dabei kam es mir jedoch weniger auf literarische Einflüsse an, sondern vielmehr auf solche Textstellen, die eindeutig auf Äthiopien verwiesen. Ich wollte herausfinden, ob Äthiopien tatsächlich Wolframs geheimnisvolle »Terre Salväsche« war - das Land des Grals und damit das Land der Bundeslade.

Kapitel 4

Ebenholz und Elfenbein

Ich sollte bald fündig werden. Schon der Prolog des Epos berichtet von dem weitentfernten Land »Zazamac«, wo die Menschen »dunkel wie die Nacht« sind.[1] In dieses Land reist ein europäischer Fürst, Gachmuret von Anjou, der sich in keine geringere als die Königin, die wunderschöne und kluge Belakane verliebt.[2]

Aus »Belakane« glaubte ich das Echo von »Makeda« zu vernehmen, dem äthiopischen Namen für die Königin von Saba. Auch wußte ich, daß dieselbe Königin in alten muslimischen Texten »Bilquis« genannt wurde.[3] Da ich mittlerweile mit Wolframs Vorliebe für Wortschöpfungen vertraut war und seine Angewohnheit kannte, Namen zu bilden, indem er zwei alte zu einem neuen verband, schien es mir übereilt, die Möglichkeit, daß »Belakane« aus »Makeda« und »Bilquis« zusammengesetzt war, ganz und gar von der Hand zu weisen - zumal der Dichter selbst berichtet, die Hautfarbe der Königin sei »tiefschwarz«[4].

Als ich die Romanze zwischen Belakane und Gachmuret näher untersuchte, fand ich weitere Anklänge an das Kebra *Nagast.* Es war auffällig, daß Wolfram immer wieder darauf hinwies, daß Gachmuret (wie Salomo) weiß und Belakane (wie Makeda) schwarz war.

So stellt Belakane nach der Ankunft des »hellhäutigen« Ritters von Anjou in Zazamac gegenüber ihrem Hofmarschall fest: »Seine Hautfarbe ist allerdings anders als die unsere. Ach, hoffentlich nimmt er keinen Anstoß daran!«[5]

Die Befürchtungen der Königin sollten bald zerstreut werden, denn in den folgenden Wochen erblüht die Liebe Gachmurets zu Belakane, eines führt zum anderen, und das Paar zieht sich schließlich in ein Schlafgemach des Palastes zurück:

»Die Königin nahm ihm mit dunkler Hand selbst die Rüstung

ab. Dann wurde er zu einer prächtigen Bettstatt geleitet, über der eine Zobeldecke lag... Die Jungfrauen verließen nun den Raum und schlossen die Tür; nur die Königin blieb zurück. War auch ihrer beider Haut von unterschiedlicher Farbe: sie und ihr herzliebster Gachmuret gaben sich unbeschwert dem Genuß berauschender und lauterer Liebe hin.«[6]

Die Liebenden heiraten. Da aber Belakane Heidin ist und Gachmuret Christ, dem noch viele Heldentaten bevorstehen sollten, verläßt er Zazamac, als seine Gattin »ein drei Monate altes Kind unterm Herzen« trägt.[7] Zurück bleibt nur dieser Brief:

»Heimlich wie ein Dieb habe ich die Fahrt angetreten, da ich uns den Schmerz des Abschiednehmens ersparen möchte. O Gebieterin, ich kann es nicht verschweigen: Hättest du den gleichen Glauben wie ich, so würde ich mich in Sehnsucht nach dir verzehren, wird mir der Abschied auch schon so schwer. Solltest du einen Sohn gebären, so wird er gewiß Löwenstärke zeigen .. .«[8]

Noch lange nach seiner Abreise bereut er, sie verlassen zu haben, da »er seine dunkle Gattin mehr als das eigene Leben« liebte.[9] Später verkündet er:

»Manch unwissender Tor freilich meint, ihre dunkle Hautfarbe hätte mich fortgetrieben. O nein, sie war für mich wie die Sonne! Weil sie solch unvergleichliche Frau ist, fühle ich jetzt tiefes Herzeleid. An edler Würde überragte sie alle anderen Frauen.«[10]

Soviel zu Belakane und Gachmuret. Doch was war mit ihrem Kind?

»Als ihre Zeit gekommen war, gebar die Herrscherin einen zweifarbenen Sohn, an dem Gott ein Wunder getan hatte: seine Haut war nämlich schwarz und weiß gescheckt. Die Königin bedeckte seine weißen Haustellen mit Küssen. Feirefiz von Anjou nannte die Mutter das Kind... Haar und Haut waren bei ihm weiß und schwarz gefleckt wie das Gefieder einer Elster.«[11]

Wolfram hätte kaum bildlicher darstellen können, daß es sich bei Feirefiz um das Kind einer schwarzen Frau und eines weißen Mannes handelte. Im Verlauf des Parzival würde Feirefiz

noch eine entscheidende Rolle spielen. Sein Vater, der hingebungsvolle Gachmuret, kehrt nach Europa zurück, nachdem er Belakane verlassen hat, und heiratet dort die Königin Herzeloyde. Auch sie empfängt ein Kind von Gachmuret und wird verlassen; der Ritter selbst besteht weitere Abenteuer, erringt großen Ruhm in vielen Schlachten und wird schließlich getötet. »Vierzehn Tage darauf«, erzählt Wolfram, »brachte die Herrscherin ein Kindlein zur Welt; es war ein Sohn und so kräftig gebaut, daß seine Geburt sie fast das Leben kostete.«[12] So kommt Parzival zur Welt, der Wolframs großem Epos seinen Namen gab, und Feirefiz hat hinfort einen Halbbruder.

Im Kebra *Nagast* und anderen wichtigen äthiopischen Legenden gab es, wie ich herausfand, zahlreiche Parallelen zu dem Beziehungsgeflecht Gachmuret - Belkane - Feirefiz - Parzival. Wolfram hat seine äthiopischen Quellen natürlich nur in Andeutungen verarbeitet. Aber gerade bei ihm war ich auf Stolpersteine und Fallgruben gefaßt, zwischen denen er gleichwohl eine Fährte ausgelegt hatte, die mich schließlich nach Äthiopien führen würde.

Die beständigen Hinweise auf die kontrastierende schwarze und weiße Hautfarbe von Belakane und Gachmuret waren unübersehbare Bestandteile der Anfangskapitel des Parzival. Im Kebra *Nagast* sind die Liebenden König Salomo und die Königin von Saba. Wie Gachmuret und Belakane verbringen sie eine gemeinsame Nacht.[13] Wie Gachmuret Belakane verläßt, so verläßt Makeda den König, um eine weite Reise anzutreten.[14] Auch die Frucht ihrer Vereinigung ist ein Mischlingssohn, in diesem Fall Menelik.[15] Und schließlich betont auch das *Kebra Nagast* wiederholt die unterschiedliche Hautfarbe der Liebenden. Mit deutlichen Worten und Vorwürfen wird der jüdische Monarch auf diesen Sachverhalt aufmerksam gemacht:

»Deine Herrin hat ja dein Sohn fortgenommen, den du erzeugt hast, der aus einem fremden Volke stammt, von dem Gott auch verboten hat, ein Weib zu heiraten, das nicht von deiner Farbe ist.. .«[16]

In der Folge stieß ich auf Parallelen zwischen Menelik und

Feirefiz, die über ihr gemeinsames Dasein als Mischling hinausgingen. Ein Beispiel war der seltsame Name »Feirefiz«. Aus welcher Sprache stammte er, und was bedeutete er? Die meisten Literaturwissenschaftler deuteten den seltsam klingenden Namen als typische Wortschöpfung Wolframs, die - ausgehend vom altfranzösischen »vair fils« - »bunter Sohn« bedeutete.[17] Ebenso plausibel erschien mir jedoch die Ableitung »wahrer Sohn« von »vrai fils«[18].

Das Kebra Nagast selbst bietet keine direkten Bezugsmöglichkeiten auf eine der beiden Etymologien - obwohl Salomo im sechsunddreißigsten Kapitel, als er Menelik zum erstenmal begegnet, ausruft: »Sehet, dies ist mein Sohn.«[19] In einer anderen, jedoch aus der gleichen Zeit stammenden Legende wird die Begegnung zwischen Salomo und Menelik ebenfalls beschrieben. Hier fand ich folgende Stelle:

»Menelik ging sogleich auf ihn zu und nahm seine Hand, um ihn zu begrüßen. Da sprach Salomo: >Du bist mein wahrer Sohn.<«[20]

Mit anderen Worten: »vrai fils«!

Irrwege und Sackgassen

Übereinstimmungen wie diese machten es mir immer schwerer, dem Gedanken zu widerstehen, daß Wolfram Feirefiz tatsächlich mit Menelik in Verbindung gebracht hatte.

Doch warum sollte er das getan haben?

Ich glaubte, daß die Verwendung von Elementen des Kebra Nagast auf literarischer Ebene für Wolfram nur ein probates Mittel war, um zu verbergen, daß er genau wußte, daß die Bundeslade in Äthiopien verborgen wurde. Wolfram wollte sein Wissen in der Geschichte des *Parzival* verbergen, aber gleichzeitig eine literarische »Schatzkarte« erstellen, die den Gral als Kryptogramm für die Bundeslade benutzte.

Wolfram war ein Anhänger raffinierter Tricks und verbaler Taschenspielereien, die ebenso verblüffend wie unterhalt-

sam waren. Dennoch begann ich langsam, seine Trugbilder zu durchschauen, und ich erkannte nach und nach die Lockvögel, die er so oft aufstellte, um den Leser von dem Geheimnis abzulenken, das im Herzen der Geschichte verborgen lag. Ich ließ mich deshalb nicht von der Tatsache irritieren, daß es nicht Feirefiz selbst war, dem die Ehre zukam, den kostbaren Gral zu finden. Diese Art von Entwicklung wäre viel zu direkt gewesen und hätte zu offensichtlich in eine bestimmte Richtung gewiesen. Vor allem konnte Wolfram es sich einfach nicht erlauben, den heidnischen Mischlingssohn einer schwarzen Königin zum Helden eines Epos zu machen, das dem Amüsement eines höfischen und christlich-europäischen Publikums dienen sollte.

Es zeugte von Wolframs Geschick, daß der Großteil seiner Leserschaft die Suche des weißhäutigen Parzival nach dem verschwundenen Gral verfolgte, während nur einige wenige in Feirefiz den »wahren Sohn« erkannten, der den richtigen Weg zur Lade wies.

Doch so vielsagend und faszinierend die Reihe der Entsprechungen war, die ich bisher hatte aufstellen können, so sehr fehlte mir noch immer eine solide Basis für meine Schlußfolgerungen. Ich machte mich also an die aufwendige Arbeit, den Parzival ein weiteres Mal zu durchforsten - und dabei gelang mir eine aufregende Entdeckung.

Gegen Ende des Epos heiratet Feirefiz die reine und makellose Trägerin des Grals, Repanse de Schoye, die im Verlauf der Geschichte, umgeben von einer Aura der Macht und Herrlichkeit, immer wieder aufgetaucht und verschwunden war. Nun stieß ich auf ein kleines, aber höchst bedeutsames Detail: Repanse de Schoye bringt ein Kind zur Welt - und dieser Sohn wird »Priester Johannes« genannt.[21]

Mir war sofort klar, daß es sich hier um einen wichtigen Hinweis handeln konnte. Ich wußte nämlich, daß die ersten Europäer, die nach Äthiopien kamen, die dortigen Herrscher »Priester Johannes« nannten.[22] Und der legendäre Gründer dieser salomonischen Dynastie war niemand anderes als Menelik I., der angebliche Sohn von Salomo und der Königin

von Saba. Ich konnte also meine Erregung kaum unterdrücken, als ich las, daß Repanse de Schoye Feirefiz einen Sohn »mit Namen Johannes« schenkte, »und den man den Priester Johannes nannte. Seither tragen dort alle Könige diesen Namen.«[23]

Es wäre nur zu schön gewesen, wenn ich in diesem Augenblick hätte beweisen können, daß das Land des Grals - »Terre Salväsche« - dasselbe Land war, das von einem Priester Johannes regiert wurde. Eine so direkte Verbindung hätte meiner »Schatzkartentheorie« das notwendige Fundament gegeben. Unglücklicherweise fand sich im Parzival nicht die Spur eines Beweises, der diese Vermutung erhärten konnte: Die »Terre Salväsche« wurde immer nur mit träumerischen und unbestimmten Worten beschrieben; keine Stelle gab Anlaß zu der Annahme, daß es sich bei dem König dieses Landes um Priester Johannes handelte.

Schon glaubte ich, in einer Sackgasse angelangt zu sein, als ich herausfand, daß es ein anderes deutsches Epos gab, in dem der Priester Johannes zum Hüter des Grals wird. Der Jüngere Titurel, so lautete der Name des Werkes, war dem Parzival stilistisch so ähnlich, daß es lange Zeit Wolfram selbst zugeschrieben wurde.[24] Seit einigen Jahren aber ordnet man das Werk einem anderen Autor zu, Albrecht von Scharfenberg, der den Jüngeren Titurel um 1270 verfaßt haben soll[25] - rund fünfzig Jahre nach Wolframs Tod also. Albrechts Epos scheint auf Fragmenten aus Wolframs Dichtung zu beruhen und knüpft unmittelbar an den Parzival an.[26] Tatsächlich identifizierte sich Albrecht so sehr mit seinem »Meister«, daß er seine wahre Identität erst in Vers 5883 preisgibt.[27]

Die Literatur des Mittelalters war sehr stark von Erweiterungen oder Vollendungen bereits bestehender Werke geprägt. Auch Wolframs Parzival basierte ja auf Chrétien de Troyes' Originalgeschichte vom Heiligen Gral. Nun sah es so aus, daß der Stoff an einen dritten Dichter weitergegeben worden war, an Albrecht, der den Weg des Grals bis zu seinem letzten Ruheort verfolgen sollte.

Der *Jüngere Titurel* erklärt klar und unmißverständlich, daß

sich der Gral im Land des Priester Johannes befand. Ich hielt es für außerordentlich bedeutsam, daß eine solche Aussage in der Gralsliteratur existierte, und daß sie darüber hinaus von einem Anhänger Wolframs formuliert worden war, der allem Anschein nach Zugang zu den Skizzen und Notizen des Meisters hatte. Zum wiederholten Male faszinierte mich die Geschicklichkeit, mit der Wolfram sich hütete, sein Geheimnis im Parzival zu offenbaren, während er gleichzeitig dafür sorgte, daß die verschlüsselten Informationen an zukünftige Generationen weitergegeben wurden.

Meine Ergebnisse bestärkten mich darin, Wolframs kurze Erwähnung des Priester Johannes ernstzunehmen und die aufwendige und anstrengende Untersuchung weiterzuführen, die mich längst in ihren Bann geschlagen hatte. Nun wollte ich die Antwort auf eine zentrale Frage finden: Hatte Wolfram, als er vom Priester Johannes sprach, einen äthiopischen Herrscher im Sinn?

Auf den ersten Blick schien das nicht der Fall zu sein, denn der Dichter gibt an, daß die Geburt des Priester Johannes in »Indien«[28] stattgefunden habe, einem Land also, dessen König allem Anschein nach Feirefiz war. Dorthin waren er und Repanse de Schoye heimgekehrt, nachdem sie die im Parzival beschriebenen Abenteuer überstanden hatten.

Um das Bild zu vervollständigen, wird im selben Abschnitt erwähnt, daß »Indien« auch als »Tribalibot« bekannt war.[29] Ich blätterte zurück und entdeckte eine Stelle, wo Feirefiz als »Heide aus Tribalibot« bezeichnet wird[30] - was völlig folgerichtig war, da ich wußte, daß sein Sohn, der Priester Johannes, ihm schließlich als Herrscher von Tribalibot/Indien auf den Thron folgt. Dennoch durfte ich nicht übersehen, daß Feirefiz selbst der Sohn der Königin Belakane von Zazamac war. Es überraschte mich deshalb keineswegs, daß Wolfram von seiner Figur Feirefiz auch als »König von Zazamac« erzählt.[31]

Die einzig annehmbare Schlußfolgerung, die man aus diesem Wirrwarr exotischer Titel und Namen ziehen konnte, war, daß Zazamac, Tribalibot und Indien in Wirklichkeit alle denselben

Ort bezeichneten. Aber konnte es sich bei diesem Ort wirklich um Äthiopien handeln? Lag es nicht viel näher, daß Wolfram tatsächlich an den indischen Subkontinent gedacht hatte? Ich entschloß mich, den wirklichen, den historischen Stammbaum des Priester Johannes zu untersuchen und so etwas Licht in die Angelegenheit zu bringen.

Ein wirklicher König

Ich fand heraus, daß der Name »Priester Johannes« bis zum zwölften Jahrhundert völlig unbekannt war.

In diesem Jahrhundert gelang es den europäischen Kreuzfahrern, die heilige Stadt Jerusalem über achtzig Jahre hinweg ohne Unterbrechung zu halten - bis sie im Jahre 1187 von Saladins Truppen vertrieben wurden. Historiker stimmen darin überein, daß die erste Erwähnung des Priester Johannes ungefähr in die Mitte dieses Zeitraumes fällt, nämlich in das Jahr 1145. Eine Chronik verzeichnet den Bericht des Bischofs Otto von Freising, der sich auf einen gewissen »Johannes, König und Priester« bezieht, einen Christen, der im »allerfernsten Osten« lebt, wo er riesige Armeen dirigiert, die er, wie es scheint, der Verteidigung Jerusalems zur Verfügung stellen möchte. Dieser »Priester Johannes, denn so ward er gemeinhin genannt«, war so reich, daß er ein Zepter aus reinem Smaragd sein eigen genannt haben soll.[32]

Um 1165 kursierte ein Brief in Europa, der sich, angeblich von Priester Johannes selbst verfaßt, an »alle christlichen Herrscher, insbesondere an Kaiser Manuel I. von Konstantinopel und den römischen Kaiser Friedrich I.« wandte.[33] Neben einer Unmenge von sagenhaften und unglaublichen Behauptungen erklärte diese ausführliche Epistel unter anderem, daß das Reich des Priesters in vier Teile aufgeteilt war, »denn ebensoviele indische Reiche gibt es«[34].

Die Spur führte weiter in das Jahr 1177, in dem Papst Alexander III. einen Brief an seinen »treuen Sohn in Christo, Johannes,

erhabener und herrlicher König der Inder« richtete.[35] Obwohl der Papst zweifelsohne daran glaubte, daß er dem Verfasser des Schreibens von 1165 antwortete, ließ er durchscheinen, daß er sein Wissen über »den Priester« auch aus anderen Quellen hatte. So erwähnte der Kirchenfürst seinen Leibarzt, »den Medicus Philip«, der in Jerusalem offensichtlich von Abgesandten des Priesters angesprochen worden war. Interessanterweise trugen diese Botschafter ein ganz konkretes Anliegen vor (von dem in dem Brief von 1165 noch nicht die Rede war): Ihr König wollte einen Altar in der Grabeskirche von Jerusalem.[36] In der Antwort auf dieses Ansinnen schrieb der Papst:

»Je erhabener und großmütiger sein Verhalten sein wird, je weniger er sich seiner Macht und seines Reichtums zu rühmen gedenkt, desto williger werden wir seinem Wunsch, einen Altar in der Grabeskirche zu Jerusalem zu erhalten, Beachtung schenken .. ,«[37]

Die Dokumente aus dem zwölften Jahrhundert ließen viele Fragen offen; eines jedoch war völlig klar - daß der Priester Johannes in diesen Jahrzehnten ausdrücklich mit »Indien« in Verbindung gebracht wurde. Als ich mich näher damit beschäftigte, bestätigte sich mein Eindruck: Immer wieder wird die Heimat des Priesters »Indien« genannt, oder - etwas allgemeiner - mit »indische Reiche« bezeichnet.

Keiner der fraglichen mittelalterlichen Verfasser konnte jedoch behaupten, eine exakte Vorstellung davon zu besitzen, wo dieses Indien oder die indischen Reiche genau zu finden waren. Ebenso offensichtlich war es, daß sie an den Stellen, an denen sie von »Indien« sprachen, nur in den seltensten Fällen den Subkontinent meinten. Die meisten Hinweise bezogen sich recht deutlich auf eine andere Gegend - vielleicht in Afrika, vielleicht an einem anderen Ort, aber das schien niemand so genau zu wissen.

Als ich diesen Punkt eingehender betrachtete, begann ich zu verstehen, was die Ursache dieser Unsicherheit gewesen sein mochte: Schon tausend Jahre vor der ersten Erwähnung des Priester Johannes gab es einen irreführenden terminologischen

Wirrwarr, in dem Indien regelmäßig mit Äthiopien verwechselt wurde. Vom ersten Jahrhundert vor Christus, als Vergil den Ursprung des Nils nach »Indien« verlegte, bis zu Marco Polo, der alle Länder, die an den Indischen" Ozean grenzten, mit »indische Reiche« bezeichnete[38], schien man »Äthiopien« und »Indien« als völlig austauschbare Synonyme benutzt zu haben.

Ein klassisches Beispiel fand ich in den Werken des Rufinus, des byzantinischen Theologen aus dem vierten Jahrhundert, der einen maßgeblichen Bericht über die Bekehrung Äthiopiens zum Christentum zusammengestellt hatte. Die Einzelheiten dieses wichtigen Werkes bestätigten ohne Zweifel, daß es sich bei dem Land, von dem Rufinus berichtete, tatsächlich um Äthiopien handelte, denn es erwähnt Ortsnamen wie Aksum oder historische Persönlichkeiten wie Frumentius oder König Ezana. Und dennoch spricht Rufinus konsequent von »Indien«![39]

Ein Historiker erklärte die Namensgebung damit, daß »die frühen Geographen generell Äthiopien als den westlichen Teil des großen Indischen Reiches ansahen«[40]. Diese geographischen Fehleinschätzungen mußten - zusammen mit dem merkwürdigen Brief, der im zwölften Jahrhundert kursierte - die Vorstellung gefestigt haben, daß es sich bei dem Priester Johannes um einen Asiaten, genauer einen indischen König handelte. Dieser Eindruck sollte so prägend sein, daß er sich noch lange hielt - selbst nachdem der Priester aufgehört hatte, eine mythologische Figur zu sein, und selbst nachdem sein Reich eindeutig in Nordafrika lokalisiert werden konnte.

Im vierzehnten Jahrhundert zum Beispiel nannte der florentinische Reisende Simone Sigoli den »Presto Giovanni« noch immer einen indischen Herrscher; dieses »Indien« jedoch war ein Reich, das an die Länder des ägyptischen Sultans stieß und dessen König als »Herr des Nils« Erwähnung fand, da er in der Lage gewesen sein soll, den Zustrom des Flusses nach Ägypten kontrollieren zu können.[41] Und auch im sechzehnten Jahrhundert noch, als die erste offizielle portugiesische Gesandtschaft nach Äthiopien reiste, war man der Meinung, nun den »Priester Johannes der indischen Reiche« zu treffen.[42]

Der autorisierte Bericht dieser Reise wurde von Vater Francisco Alvarez verfaßt, der im April 1520 im Hafen von Massawa am Roten Meer an Land ging und die nächsten sechs Jahre damit verbrachte, Äthiopien zu erforschen. Trotz dieser anstrengenden Reise, die ihn zweifellos durch Teile des afrikanischen Festlandes führte, klingt im Titel seines Werkes noch immer die alte terminologische Verwirrung an: *Wahrhaftiger Bericht* über die Länder des Priester Johannes, Herrscher der indischen Reiche.[43] In seinem lehrreichen und informativen Buch bezeichnet Alvarez den Herrscher durchgängig als »den Priester« oder als »Priester Johannes«[44].

Aber schon viel früher, so stellte ich fest, im Jahre 1352 nämlich, berichtete der päpstliche Legat in Asien, der Franziskaner Giovanni de Marignolli, in seiner Chronik von »Äthiopien, wo die Neger sind und das das >Land des Priester Johannes< genannt wird«. Und ein Mönch mit Namen Jordanus Catalani hatte 1328 den Herrscher Äthiopiens als »quem vos vocatis Prestre Johan« vorgestellt. Später, im Jahre 1459, verzeichnete Fra Mauros vielbeachtete Karte der damals bekannten Welt eine große Stadt in den Grenzen des heutigen Äthiopien unter der Überschrift »Qui il Preste Janni fa residentia principal«[45].

Noch immer verwirrte mich die Uneindeutigkeit der Zuordnungen. Es war kaum möglich, das Geflecht von »Priester Johannes«, »Äthiopien« und »Indien« aufzulösen. Und doch war ich mir sicher, daß der Auslöser dieser ganzen Mystifikation, der wahre Priester Johannes, schon immer Herrscher Äthiopiens war, dem einzigen nicht-europäischen christlichen Königreich, das es im Mittelalter überhaupt irgendwo auf der Welt gab. Er war somit das einzige Vorbild, auf das Wolfram sich hatte beziehen können, als er erzählte, daß »Indien« vom »Priester Johannes«, dem christlichen Sohn von Feirefiz und Repanse de Schoye, regiert wurde.

Auf der Suche nach einer abschließenden und hoffentlich endgültigen Information, wandte ich mich der *Encyclopaedia Britannica* zu, die feststellte:

»Es ist durchaus möglich, daß der Titel >Priester Johannes<

schon seit frühester Zeit dem abessinischen König zukam, obwohl diese Zuordnung lange Zeit von der asiatischen Legende überlagert wurde. Den Anfang dieser zweifachen Zuordnung macht zweifellos die Verwechslung von Äthiopien mit Indien, die so alt ist wie Vergil, oder vielleicht sogar noch älter.«[46]

Bedeutsam für meine Zwecke schloß die Encyclopaedia ihren Eintrag mit einem Verweis auf jenen Briefwechsel zwischen dem Papst und Priester Johannes, den ich schon erwähnt habe:

»Wie vage die Vorstellungen des Papstes Alexander III. bezüglich des geographischen Aufenthaltsortes des Potentaten ... auch gewesen sein mögen, die einzige existierende Person, an die der Brief sich hätte wenden können, war der König von Abessinien. Es ist festzuhalten, daß es sich bei den >ehrenwerten Vertretern des königlichen Reiches< auf die der Arzt Philip im Osten getroffen war, um Repräsentanten einer tatsächlichen und keiner eingebildeten Macht gehandelt haben mußte. Auch mußte es sich um einen wirklichen König handeln, der seinem Wunsch Ausdruck verlieh..., einen Altar in Jerusalem zugewiesen zu bekommen. Darüber hinaus ist bekannt, daß die äthiopische Kirche lange Zeit sowohl eine Kapelle als auch einen Altar in der Grabeskirche von Jerusalem besaß .. .«[47]

Ich überprüfte diese letzte Angabe und fand heraus, daß dem fernen Königreich tatsächlich ein Altar zugestanden worden war, und zwar im Jahr 1189 - allerdings nicht vom Papst, der zu dieser Zeit schon nicht mehr in der Position war, solche Vergünstigungen zu erweisen, sondern vom muslimischen General Saladin, der Jerusalem im Jahre 1187 den Händen der Kreuzritter entrissen hatte. Interessant war die Tatsache, daß der äthiopisch-orthodoxen Kirche dieses besondere Recht zuteil wurde, nachdem niemand geringeres als der König von Äthiopien selbst sich an Saladin gewandt hatte.[48]

Nicht einmal zehn Jahre später sollten unbekannte Steinmetze in Nordfrankreich die rätselhaften Abbildungen des Heiligen Grals, der Bundeslade und der Königin von Saba im Nordportal der Kathedrale von Chartres hinterlassen - und Wolfram von Eschenbach war es, der in diesen Jahren mit der Arbeit an

seinem Parzival begann. Hier mußte es um mehr gehen als nur zufällige Übereinstimmungen. Im Gegenteil, ich hatte mittlerweile das Gefühl, daß meine Indizienkette immer deutlicher darauf verwies, daß sowohl die Figuren in Chartres als auch Wolframs bemerkenswertes Epos in bewußter Absicht geschaffen worden waren. Obgleich diese exotische Schatzkarte kein »x« verzeichnete, das den Fundort markierte, gab es für mich keinen Zweifel mehr, daß es sich bei dem Versteck nur um Äthiopien handeln konnte - das Land des Priester Johannes, das Land, das dem fiktiven Heiligen Gral seine letzte Ruhestätte gegeben hatte. Und wenn meine Schlußfolgerungen zutrafen, dann war dasselbe Äthiopien das Land, in dem die Bundeslade - der existente Gegenstand, den der Gral nur symbolisierte - zu finden war.

Noch immer aber waren einige wichtige Fragen zu beantworten:

- Wie konnte die Nachricht, daß sich die Lade in Äthiopien befand, Ende des zwölften Jahrhunderts einen deutschen Dichter und die französischen Bildhauer erreicht haben?

- Was verband Wolfram mit den Erbauern der Kathedrale? Es war klar, daß es eine Verbindung geben mußte, arbeiteten doch alle an der Verschlüsselung derselben Information.

- Und schließlich: Warum war man so darauf bedacht, den wahren Sachverhalt zu verschleiern? Besonders Wolframs »Code« war außerordentlich schwer zu brechen, so daß selbst ich - mit allen wissenschaftlichen Möglichkeiten des zwanzigsten Jahrhunderts und meinen Informationen über Aksum - nur bis zu einem bestimmten Punkt gekommen war!

- Wer also war im Mittelalter überhaupt in der Lage, das komplizierte Kryptogramm zu entschlüsseln? Ich war mir sicher, daß es diese Personen gab. Nur, wer waren sie?

Schnell fand ich heraus, daß nur ein kleiner Kreis von Männern in Frage kam. Als Kreuzfahrer hatten sie sich eine sichere Position im Jerusalem des zwölften Jahrhunderts aufbauen können: Sie waren dort, als im Jahre 1145 die Legenden um den Priester Johannes zum erstenmal kursierten, und sie waren noch

dort, als im Jahre 1177 die Botschafter des Königs von Äthiopien die Heilige Stadt besuchten. Direkte Kontakte zwischen Äthiopiern und Mitgliedern dieser europäischen Gruppierung waren somit durchaus denkbar.

Zwei weitere Punkte kamen hinzu. Zum einen betrieben jene Männer eine intensive Politik der Geheimhaltung in allen ihren Angelegenheiten, zum anderen aber waren sie eindeutig mit der Entwicklung und Verbreitung der gotischen Architektur in Europa (insbesondere mit der Bauweise und Bildgestaltung der Kathedrale von Chartres) in Verbindung zu bringen. Schließlich und endlich handelte es sich um eine Gruppe, die Wolfram von Eschenbach mehrere Male namentlich erwähnte.

Bei den einflußreichen, mächtigen und weitgereisten Männern handelte es sich um den »Orden der Armen Ritterschaft Christi vom Salomonischen Tempel« oder - einfacher - um die Tempelritter. Es war im Grunde ein religiöser Orden, der sich 1118 gegründet hatte, eine Bruderschaft kriegerischer Mönche, die fast während des gesamten zwölften Jahrhunderts ihren Hauptsitz in Jerusalem hatte - und zwar ganz in der Nähe des Tempels Salomos, desselben Ortes also, von dem die Bundeslade in alttestamentarischer Zeit auf unerklärliche Weise verschwunden war.

Kapitel 5

Weiße Ritter, schwarzer Kontinent

Emma Jung zufolge, Frau des bekannten Psychiaters Carl Gustav Jung und selbst Analytikerin, tauchte die Gattung der Gralserzählungen Ende des zwölften Jahrhunderts so überraschend wie plötzlich auf. In einer fundierten Studie über die Gralslegende kam sie zu dem Ergebnis, daß hinter dieser plötzlichen und dramatischen Materialisation etwas von großer Bedeutung liegen mußte. Denn die beiden ersten Werke dieses Genres - Chrétien de Troyes' Conte du *Graal* und Wolfram von Eschenbachs Parzival - machten den Eindruck, »als ob eine unterirdische Wasserader angebohrt worden wäre .. .«[1]

Was für ein immenser Impuls mochte das gewesen sein? Ich vermutete, daß die Antwort in dem historischen Zeitabschnitt zu suchen war, in dem die Gralsromane in Umlauf kamen. Es war das Zeitalter der Kreuzzüge, das die Europäer zum erstenmal mit der arabischen und jüdischen Kultur in Berührung brachte. Um 1180, etwa im achtzigsten Jahr der Besetzung Jerusalems, schrieb Chrétien de Troyes seine Version der Gralslegende nieder. Und kurz nach dem Fall der Heiligen Stadt begann Wolfram von Eschenbach mit der Arbeit am Parzival.

Diese frühen Gralsromane, so überlegte ich, mußten auf etwas basieren, das sich zugetragen hatte (oder entdeckt worden war), als die europäischen Ritter und Soldaten die heilige Stadt kontrollierten. Erneut und eingehend studierte ich also den Parzival, um nach Belegen zu suchen, die diese Verbindung unterstützten. Wolfram erwähnt an mehreren Stellen eine mysteriöse Quelle namens »Kyot« und beschreibt ihn als einen Mann, von dem er einen Großteil seiner Informationen bezogen habe, und der glücklicherweise »... getauft war, sonst wäre die Erzählung bis heute unbekannt geblieben. Keine heidnische Wissenschaft

reicht nämlich aus, um das Wesen des Grals zu entschlüsseln und in seine Geheimnisse einzudringen.«[2]

Dabei handelte es sich keineswegs um den einzigen Fingerzeig darauf, daß es mit dem Gral mehr auf sich hatte, als zunächst vermutet. Ich war mittlerweile davon überzeugt, daß dieses »mehr« die Bundeslade sein konnte, und als ich die weitverstreuten Verweise auf Kyot untersuchte, kam ich auf den Gedanken, daß es sich bei dieser schemenhaften Figur, dessen wahre Identität der Dichter an keiner Stelle offenlegt, um denjenigen handeln könnte, der Wolfram mit dem Geheimnis um den Aufenthaltsort der Lade vertraut gemacht hatte. Da er an einer Stelle als »Kyot, der uns die Geschichte in der richtigen Fassung überlieferte«[3], vorgestellt wird, mußte es sich zweifellos um eine überaus wichtige Person handeln. Doch um wen ging es da tatsächlich?

Einige, wenngleich wenig greifbare Hinweise liefert das große Epos selbst. Einmal wird Kyot als »gelehrter Meister« bezeichnet[4], dann wieder gibt der Dichter an, daß er Provenzale sei.[5] Konkretere Hinweise fehlen. Ich fand jedoch heraus, daß Literaturwissenschaftler Kyot mit einem ganz bestimmten Dichter des zwölften Jahrhunderts identifiziert haben, mit einem Franzosen namens Guyot von Provins, der, kurz bevor die Stadt von den Sarazenen zurückerobert wurde, eine Pilgerreise nach Jerusalem unternommen und sich dort eine Weile am Hof des römischen Kaisers Friedrich I. aufgehalten hatte.[6]

Diese letzte Information erregte meine Aufmerksamkeit besonders. Denn Friedrich I. war (wie Wolfram) von Geburt Deutscher - und es war Friedrich, der zu den erklärten Adressaten des Briefes vom »Priester Johannes« von 1165 gehörte.

Aber noch etwas erwies sich als überaus bedeutsam: Emma Jung zufolge stand Kyot (oder Guyot!) in enger Verbindung mit den Tempelrittern, die »als Hüter des Tempels Salomo galten«[7]. Meine Begeisterung war entsprechend groß, als ich herausfand, daß Wolfram die Hüter des Grals in seinem Epos »Tempelherren« nennt[8] und sie nur mit den schmeichelhaftesten Worten beschreibt:

»... eine auserlesene Bruderschaft, die mit der Kraft ihrer kampferprobten Arme bisher jeden Zudringling fernhielt. So blieben die Geheimnisse des Grals gewahrt; nur die wissen von ihnen, die nach Munsalväsche in die Gralsgemeinschaft berufen wurden.«[9]

Ob es sich bei Wolframs Tempelherren wohl um die Mitglieder jenes streitbaren Ordens handelte - die Tempelritter?

Das mittelhochdeutsche Wort für die Tempelherren lautet »templeise«[10]. Lange Zeit haben die Literaturwissenschaftler über die Bedeutung dieses Begriffes debattiert. Man hat sich schließlich darauf geeinigt, »templeise« als Variante des französischen »Templier« und des lateinischen »templarius« anzusehen und mit »Templer« zu übersetzen. Wolframs dem Gral verpflichteter Ritterorden wies so viele Parallelen mit der historischen »Bruderschaft vom Tempel Salomos« auf, daß man ihn mit den Tempelrittern identifizierte.[11]

Schon bei meiner Besichtigung der Kathedrale von Chartres hatte ich in einem meiner Führer gelesen, daß Wolfram von Eschenbach möglicherweise Templer war.[12] Bei weiteren Nachforschungen stieß ich immer wieder auf solcherlei Gerüchte.[13] Zudem erfuhr ich, daß einige anerkannte Wissenschaftler die Vermutung geäußert hatten, der deutsche Dichter habe das Heilige Land selbst besucht, während er am Parzival schrieb.[14]

Schatzgräber in Jerusalem

Zunächst war mir unklar, warum man die Templer zu Wolframs Zeiten als »Hüter des Tempels Salomo« angesehen hatte. Als ich mich jedoch näher mit der Geschichte des Ordens auseinandersetzte, fand ich heraus, daß er seinen offiziellen Titel »Bruderschaft der armen Glaubensgenossen Christi und des Salomo Tempels« daraus ableitete, daß der Hauptsitz in Jerusalem auf dem Gipfel des Berges Morija lag - dort, wo sich der Tempel des großen jüdischen Königs bis zu seiner Zerstörung im Jahre 587 vor Christus befunden hatte. Nun, ein Orden, der sich so

unmißverständlich mit Salomos Tempel identifiziert hatte, mußte auch an die Bundeslade gedacht haben - erschien mir doch die Gleichsetzung von Tempel und Lade als unauflöslich.

Der Templerorden wurde im Jahre 1118/19 von neun französischen Adligen gegründet. Alle diese Ritter hatten zuvor Reisen ins Heilige Land unternommen. Ein Historiker des zwölften Jahrhunderts, der Erzbischof Wilhelm von Tyrus, schrieb, daß zu den »vornehmsten und ausgezeichnetsten« unter diesen neun Männern der »ehrenwerte Hugo von Payens und der ehrenwerte Godfrey von St.Omer« gehörten.[15]

Bei meinen weiteren Nachforschungen stieß ich auf etwas äußerst Interessantes: Hugo von Payens, der erste Großmeister des Ordens[16], wurde in dem Dorf Payens geboren, das dreizehn Kilometer nördlich von Troyes in der Provinz Champagne liegt.[17] Es hatte sogar den Anschein, als stammten alle neun Gründer der Bruderschaft aus derselben Gegend.[18] In dieser Region konzentrierte sich jedoch noch mehr:

- Chartres mit seiner großen Kathedrale gehörte sowohl im zwölften als auch im dreizehnten Jahrhundert zum Herrschaftsgebiet der Familie von Champagne.[19]
- Einer der neun Ritter, Andre von Montbard (der später zum fünften Großmeister ernannt wurde], war ein Onkel des heiligen Bernhard von Clairvaux[20], der selbst aus der Champagne stammte.
- Bernhard wiederum hatte sich mit besonderem Interesse der gotischen Architektur gewidmet.
- Aus der Stadt Troyes stammte auch Chrétien de Troyes, der »Erfinder« der Gralsromane.
- Hugo von Payens war der Cousin eines der Grafen der Champagne[21] - und dieser Graf trat im Jahre 1125 den Templern bei.[22]
- Als Chrétien de Troyes gegen Ende des zwölften Jahrhunderts Bekanntheit erlangte, gehörten die Grafen der Champagne zu seinen Gönnern.

Nachdem ich diese ineinander verschränkten biographischen Informationen mit großem Interesse zur Kenntnis genom-

men hatte, versuchte ich, mehr über die Gründungsphase der Templer zu erfahren.

Zu den vielen Merkwürdigkeiten zählte die Art und Weise, wie die neun Ritter im Jahre 1119 von König Balduin II. in Jerusalem empfangen worden waren. Kaum in der Heiligen Stadt angekommen, teilten sie dem König schon mit, daß sie ihren Hauptsitz auf dem Tempelberg einrichten würden.[23] Erst kürzlich hatte der Herrscher die El-Aksa-Moschee zu seinem Palast umfunktioniert - und doch ging er erstaunlicherweise sofort auf die Bitte der Ritter ein und überließ ihnen einen Teil der ehemaligen Moschee und deren Nebengebäude zur alleinigen Nutzung. Die Moschee befand sich direkt neben dem berühmten Felsendom, der die Stelle markierte, an der einst der Tempel Salomos stand.[24]

Fast wie Archäologen unserer Tage bei einer bedeutenden Ausgrabung, so lebten, aßen, schliefen und arbeiteten die Tempelritter allein an diesem Ort: Tatsächlich verließen sie ihn in den folgenden sieben Jahren kaum und verwehrten jedem Fremden hartnäckig den Zutritt. Die Templer hatten öffentlich bekannt gemacht, daß ihre Mission im Heiligen Land darin bestand, die Straße von der Küste nach Jerusalem von Banditen freizuhalten.[25] Nichts jedoch wies darauf hin, daß sie in diesen sieben Jahren irgendwelche Aktivitäten in dieser Hinsicht gezeigt hätten. Im Gegenteil: Der neue Orden, so formulierte es ein Spezialist, tat allem Anschein nach außerordentlich wenig.[26] Es war auch kaum anzunehmen, daß neun Männer eine fast achtzig Kilometer lange Straße hätten sichern können. Und sie blieben neun, bis der damalige Graf der Champagne dem Orden im Jahre 1125 beitrat. Zudem existierte zu dieser Zeit bereits ein älterer und militärisch bei weitem besser organisierter Orden, die Johanniter, die sich ebenfalls die Aufgabe gestellt hatten, die wichtige Route zur Küste zu bewachen.

Daraus war nur zu schließen, daß Hugo von Payens und seine Mitstreiter aus einem anderen, geheimgehaltenen Grund nach Jerusalem gekommen waren. Und da sie sich in den ersten sieben Jahren ihres Aufenthaltes fast ausschließlich im Tempel-

bezirk aufhielten, mußte ihr wirklicher Auftrag mit diesem engumgrenzten Gebiet zusammenhängen.

Von Anfang an übten sich die Ritter in strikter Geheimhaltung, so daß die Schriften und Dokumente aus dieser Zeit keinerlei konkrete Hinweise darüber enthalten, was dort oben geschah. Es lag jedoch zumindest im Bereich des Möglichen, daß sie nach etwas suchten; und dieser Verdacht erhärtete sich, als ich erfuhr, daß sie in den Jahren auf dem Tempelberg umfangreiche Ausgrabungen durchgeführt hatten. Noch heute beherbergt der Tempelberg zwei der vier heiligsten Stätten des Islam - den Felsendom und die El-Aksa-Moschee -, so daß es Archäologen nicht erlaubt wurde, dort Nachforschungen anzustellen. In jüngster Zeit haben israelische Forschungsteams jedoch direkt an der Südseite des Berges gearbeitet. Sie entdeckten dort den Ausgang eines Tunnels, den sie auf das zwölfte Jahrhundert datierten.[27] In ihrem offiziellen Bericht schreiben die Archäologen:

»Der von der Südwand ausgehende Tunnel führt etwa dreißig Meter weit ins Innere, bevor er von Steinen und Geröll versperrt wird. Wir wußten, daß er weiterführen mußte, respektierten aber die Übereinkunft, nach der wir nicht im Bereich des Tempelberges graben durften, ohne zuvor die Zustimmung der zuständigen muslimischen Behörden einzuholen. In diesem Fall erlaubte man uns lediglich, den freigelegten Teil des Tunnels zu vermessen und zu fotografieren. Weitere Ausgrabungen durften nicht durchgeführt werden. Wir beendeten unsere Arbeit, indem wir den Tunnel mit Steinen verschlossen.«[28]

Das war auch schon alles, was man über den Tunnel der Templer wußte. Ich konnte mir jedoch sehr gut vorstellen, daß der von der Südwand ausgehende unterirdische Gang mitten ins Herz der heiligen Stätten führte - möglicherweise direkt unter dem Felsendom hindurch bis zum Nordende der El-Aksa-Moschee.

Ein riesiger Stein im Innern des Felsendoms hatte dem Bauwerk seinen Namen gegeben. Die Juden nannten diesen Stein »Shetiyyah«, was soviel wie »Grundstein« bedeutet. Der »She-

tiyyah« bildete den Boden des Allerheiligsten im Tempel Salomos, und auf diesem Felsboden stand die Bundeslade.[29] Eine der vielen Legenden, die verbreitet wurden, nachdem der Tempel im Jahr 587 vor Christus von den Babyloniern zerstört worden war, erklärte, daß die heilige Reliquie nur Sekunden, bevor die Plünderer in das Allerheiligste eindrangen, in einer geheimen und versiegelten Kammer direkt unter dem »Shetiyyah« versteckt worden war.[30]

Diese Legende fand ihren Niederschlag sogar in einer Reihe von Talmud- und Mischnatexten sowie einer weitverbreiteten apokalyptischen Schrift mit dem Titel Vision des Baruch[31]. Solche Überlieferungen waren im Jerusalem des zwölften Jahrhunderts weit verbreitet. Es lag nahe, daß die Templer Einzelheiten dieser faszinierenden Legende erfahren haben konnten.

Mehr noch: Schon einige Jahre vor ihrer Ankunft in Jerusalem hatten sie möglicherweise Kenntnis davon gehabt. Hugo von Payens und der Graf der Champagne unternahmen bereits 1104 eine Pilgerfahrt ins Heilige Land.[32] Anschließend kehrten die beiden Männer nach Frankreich zurück, wo sie bis in das Jahr 1113 immer wieder gemeinsam auftraten.[33] Drei Jahre später reiste Hugo, diesmal allein[34], erneut ins Heilige Land und kam nur noch einmal nach Frankreich zurück, um acht weitere Ritter um sich zu scharen. 1119 brachen die Männer, die hinfort den Kern der Templer bildeten, nach Jerusalem auf.

Je genauer ich mir die Abfolge der Ereignisse betrachtete, desto plausibler erschien es, daß Hugo und der Graf der Champagne während ihrer Pilgerreise im Jahr 1104 vernommen hatten, daß die Bundeslade irgendwo im Tempelberg verborgen lag. Und war es dann nicht gleichermaßen plausibel, daß sie einen Plan entwickelt hatten, um die heilige Reliquie wiederzufinden? Würde dies nicht auch das entschlossene Auftreten erklären, mit dem sich die neun Ritter im Jahre 1119 des Tempelberges bemächtigt hatten? Auch andere Merkwürdigkeiten in ihrem Verhalten in den ersten Jahren nach der Ordensgründung wären so erklärlich gewesen.

Unterstützung für diese Annahme kam von Emma Jung. In

einem Exkurs legt die Psychoanalytikerin dar, daß die europäische Besetzung Jerusalems im zwölften Jahrhundert zumindest teilweise auf den Glauben zurückzuführen sei, daß im Inneren der Stadt eine mächtige, heilige und unermeßlich wertvolle Reliquie verborgen sei. »Gewiß hat diese tief wurzelnde Vorstellung vom verborgenen Schatz dazu beigetragen, daß der Aufruf zur Befreiung des Heiligen Grabes ein so starkes Echo fand.« Und es war die Gralslegende, so gibt die Autorin an, »welche der Bewegung der Kreuzzüge, wenn sie diese nicht überhaupt auslöste, das zündende Motiv verlieh«[35].

Für die Menschen des zwölften Jahrhunderts, die sich in höchstem Maße von Reliquien faszinieren ließen, konnte es keinen wertvolleren und heiligeren Schatz geben als die verlorene Bundeslade.[36] Es erschien mir deshalb nicht nur möglich, sondern sehr wahrscheinlich, daß Hugo von Payens und seine Männer sich die Aufgabe gestellt hatten, die Lade zu finden.

Offensichtlich haben die Templer ihr Ziel nicht erreicht. Wir wissen nichts von einem Triumphzug, in dem der Orden den heiligen Schrein nach Europa gebracht hätte, und wir wissen nichts von einem enormen Zuwachs an Macht und Prestige, den die Lade den Templern verschafft hätte.

Und doch hielten sich hartnäckige Gerüchte, daß sie während der sieben Jahre andauernden, intensiven Grabungen auf dem Tempelberg irgend etwas gefunden hatten. Keines dieser Gerüchte war auch nur von geringster akademischer Beweiskraft - dafür aber um so faszinierender:

»Die tatsächliche Aufgabe der neun Tempelritter bestand darin, in dieser Gegend Nachforschungen anzustellen, die sie in den Besitz gewisser Reliquien und Manuskripte bringen sollten, in denen der Kern jüdischer und altägyptischer Geheimlehren verborgen lag, und von denen einige höchstwahrscheinlich aus den Tagen Moses stammten … Es besteht kein Zweifel, daß sie diese Mission erfüllten und das dadurch gewonnene Wissen innerhalb des Ordens von einer Generation an die nächste weitergaben.«[37]

Obgleich diese einnehmende Behauptung durch keinerlei

Beweise untermauert wurde, war es für mich doch von Interesse, in demselben Werk auf einen Namen zu stoßen, der mir schon einige Male zuvor aufgefallen war: Bernhard von Clairvaux, von dem hier (wiederum ohne jeglichen wissenschaftlichen Nachweis) behauptet wurde, er selbst habe die neun Ritter nach Jerusalem entsandt.[38]

Zu diesem Zeitpunkt wußte ich bereits, daß Bernhard der Neffe einer der neun Gründungsritter war. Und als die ersten Templer 1119 in Jerusalem ankamen, hatte Bernhard innerhalb des französischen Klerus schon eine Stellung von beachtlichem Rang erreicht.[39] Die Möglichkeit, daß Bernhard an der Mission der Ritter in irgendeiner Form beteiligt war, war nicht ohne weiteres von der Hand zu weisen.

Dieser Verdacht erhärtete sich beträchtlich, als ich mich mit der Geschichte der Templer nach jenen sieben ersten und merkwürdigen Jahren befaßte.

Ein Tauschgeschäft?

Ende 1126 verließ Hugo von Payens plötzlich Jerusalem und kehrte mit Andre von Montbard, dem Onkel des heiligen Bernhard, nach Europa zurück.[40] Die Ritter erreichten Frankreich ein Jahr darauf und nahmen im Januar 1128 an einem der bedeutendsten Ereignisse in der Frühgeschichte der Templer teil.

Es handelte sich um die Synode von Troyes, die mit dem erklärten Ziel einberufen worden war, dem Tempelorden die offizielle Anerkennung der Kirche zu verschaffen.[41]

An diesem Treffen interessierten mich insbesondere drei Dinge. Erstens traf man sich in der Heimatstadt des Dichters, der wenige Jahre später die Gralsromane ins Leben rufen würde, zum zweiten wurde die Zusammenkunft von Bernhard in seiner Eigenschaft als Sekretär des Ordens geleitet[42], und drittens entwarf Bernhard im Verlauf der Synode selbst die Satzung der Tempelritter, die fortan die Entwicklung und Verbreitung des Ordens bestimmte.[43]

Für mich stellte sich die Sachlage nun so dar: Allem Anschein nach waren die neun Gründungsritter zunächst mit den Ausgrabungen auf dem Tempelberg beschäftigt. Was immer auch sie dort gefunden haben mochten, spätestens 1126 wurde ihnen klar, daß sie das eigentliche Objekt ihrer Suche, die Bundeslade, nicht mehr finden würden. Diese Erkenntnis zog die Notwendigkeit nach sich, über die Zukunft nachzudenken: sollte man jetzt, da man seine »raison d'être« verloren hatte, den Orden auflösen, oder sollte man weitermachen?

Die Geschichte zeigt, daß sich die Templer im Jahre 1126 tatsächlich in einer Identitätskrise befanden. Gleichwohl, das Tief wurde überwunden, und der Orden beschloß, seine Machtposition auszubauen. Bernhard von Clairvaux ließ den Rittern dabei tatkräftige Unterstützung zukommen. Nach der Anerkennung durch die Kirche warb er in einer Reihe von Predigten und glühenden Lobeshymnen (wie De laude novae militiae[44]) eifrig für den noch jungen Orden und trat mit seinem Einfluß und dem Ansehen, das er genoß, für die Ritter ein.

Die Resultate waren spektakulär. Neue Rekruten strömten aus ganz Frankreich und später auch aus vielen Teilen Europas zusammen, Land- und Geldschenkungen von wohlhabenden Förderern folgten, so daß der Orden gegen Ende des zwölften Jahrhunderts außerordentlich reich war. Man verwaltete ein ausgeklügeltes internationales Bankensystem[45] und verfügte in der gesamten damals bekannten Welt über riesige Besitztümer. Sehr schnell hatte sich die Bruderschaft zu einer politischen Macht entwickelt. Aber war der Grund für Bernhards umfassende Unterstützung allein in seiner Selbstlosigkeit zu suchen? Oder hatte der hochgestellte Geistliche auch Gegenleistungen gefordert?

Noch einmal rief ich mir ins Gedächtnis, daß Bernhard zu den Vorkämpfern und Initiatoren der europäischen Gotik gehörte. Dem gegenüber standen die Gerüchte, nach denen die Tempelritter in Jerusalem auf eine alte und geheime Wissensquelle gestoßen waren. Ich kam also nicht umhin, mich zu fragen, ob es sich bei alledem nicht um ein Tauschgeschäft gehan-

delt hatte. Natürlich: Den Rittern war es nicht gelungen, die Bundeslade zu finden, doch vielleicht waren sie bei ihren Ausgrabungen auf Schriftrollen, Manuskripte, Lehrsätze oder Pläne gestoßen, die mit dem Tempel Salomos zusammenhingen. Vielleicht hatten diese Funde die verloren geglaubten architektonischen Geheimlehren von Geometrie, Proportion, Ausgewogenheit und Harmonie wieder ans Tageslicht gebracht, die schon von den Erbauern der Pyramiden eingesetzt worden waren. Und vielleicht hatten die Templer diese Geheimlehren dem heiligen Bernhard als Gegenleistung für die engagierte Unterstützung des Ordens anvertraut.

Diese Spekulationen waren nicht völlig aus der Luft gegriffen. Im Gegenteil, gerade die Templer taten sich als große Architekten hervor. Im Jahre 1139 gewährte Papst Innozenz II. [dessen Kandidatur der heilige Bernhard bemerkenswerterweise ebenso entschieden unterstützt hatte[46]) in seiner Bulle *Omne Datum* Optimum dem Orden ein einzigartiges Privileg: das Recht, seine eigenen Kirchen zu bauen.[47] Die Templer nutzten diese Möglichkeit in der Folge weidlich aus: Wunderbare Gotteshäuser entstanden, deren Grundriß oftmals rund war (wie beispielsweise die Templerkirche in London), und wurden zum Markenzeichen templerischer Unternehmungskraft.

Auch bei militärischen Bauwerken zeichneten sich die Ritter aus. Ihren Burgen in Palästina lagen so außerordentlich durchdachte Pläne zugrunde, daß sie praktisch uneinnehmbar waren. Die eindrucksvollste unter diesen Wehren war das Kastell von Atlith, auch Château Pèlerin oder Pilgerburg genannt, das im Jahre 1218 vom vierzehnten Großmeister der Templer, Wilhelm von Chartres, erbaut worden war.[48]

Atlith, auf einer Landzunge südlich von Haifa gelegen, war an drei Seiten vom Meer umgeben. Es konnte sich selbst mit Frischwasser, Obst und Gemüse versorgen und besaß einen eigenen Hafen sowie eine Schiffswerft. Die Burg wurde mehrfach von den Sarazenen belagert, aber nie eingenommen. Die massiven, fünf Meter dicken und fast dreißig Meter hohen Mauern[49], die auf ungewöhnlich tiefen Fundamenten standen, konnten bis zu

viertausend Menschen beherbergen und waren so gut gebaut, daß große Teile davon noch immer intakt sind. 1932 wurde diese Stätte unter der Leitung des Archäologen C. N. Johns sorgsam freigelegt. Er stellte fest, daß die Fähigkeiten der Architekten und Baumeister des Ordens im Vergleich zu mittelalterlichen Standards unglaublich fortgeschritten, im Vergleich zu modernen Standards noch immer »außerordentlich« waren.[50]

Auch in Jerusalem errichteten die Templer viele Bauten, bis die Heilige Stadt von Saladin zurückerobert wurde. Ich erfuhr, daß ein deutscher Mönch namens Theoderich im Jahre 1174 nach Jerusalem gepilgert war, wo er alle Gebäude im Bezirk des Felsendoms noch immer »im Besitz der Templer« vorfand.[51] Er fügte hinzu:

»In diesem und anderen Gebäuden, die ihnen alle gehören, sind die Templer einquartiert... Darunter befinden sich Ställe aus der Zeit König Salomos mit vielerlei Gewölben, Bögen und Dächern ... Nach unserer Schätzung dürften sie zehntausend Pferde und ebenso viele Stallburschen haben .. .«[52]

Tatsächlich stammten die Ställe nicht aus der Zeit Salomos, sondern aus der Regentschaft Herodes des Großen um die Zeit von Christi Geburt. Die Gewölbe, Bögen und Dächer jedoch hatten die Templer gebaut und dabei die unterirdischen Gänge stark erweitert. Theoderichs Augenzeugenbericht fährt fort mit den Worten:

»Auf der anderen Seite des Palastes [d.h. der El-Aksa-Moschee] haben die Templer ein neues Gebäude errichtet, das in seiner Höhe, Länge und Breite, seinen Kellern, Speisesälen, Treppen und Dächern das landesübliche weit übersteigt. Tatsächlich ist das Dach so hoch, daß, erwähnte ich seine Höhe, niemand meiner Zuhörer mir Glauben schenken würde.«[53]

Unglücklicherweise wurde dieser großartige Palast in den fünfziger Jahren unseres Jahrhunderts zerstört, als die muslimischen Behörden einige wenig geschichtsbewußte bauliche Veränderungen auf dem Tempelberg durchführten. Die Aussagen des deutschen Mönches sprachen jedoch für sich. Gerade sein Erstaunen machte deutlich, daß er die architektonischen Fähig-

keiten der Templer als fast übernatürlich ansah. Es war kein Zufall, daß die von ihm erwähnten hochaufragenden Dächer und Bögen auf die Merkmale gotischer Architektur zu verweisen schienen - so wie sie zum Beispiel in Chartres zum Ausdruck kamen.

Der Bogen zurück zu Bernhard von Clairvaux war geschlossen. Als ich noch einmal seine Lebensdaten und zentralen Ideen überprüfte, verstärkte sich der Eindruck, daß sein Einfluß auf die Bildersprache der gotischen Kathedralen zwar massiv, jedoch indirekt war. Bei vielen Skulpturen, Figurengruppen oder Bleiglasfenstern wurden Themen aus seinen Predigten und Schriften aufgegriffen - oft aber erst nach seinem Tod.[54] Zu Lebzeiten hatte sich Bernhard meist gegen eine unnötige Hervorhebung von Bildwerken ausgesprochen: »Allein um die Proportionen geht es, nicht um die Dekoration.«[55]

Die Betonung von Proportion, Harmonie und Gleichmaß waren der Schlüssel zu der eigenartigen Ausstrahlung, die von der gotischen Architektur ausgeht. Mittlerweile war ich vertrauter mit Bernhards Gedanken und verstand, daß sein Einfluß auf die Gestaltung von Chartres und anderen Kathedralen sehr weitreichend war. Die Einführung einer Reihe beachtlicher technischer Neuerungen, wie dem Kreuzrippengewölbe, den Spitzbögen und Strebebögen, hatte den Baumeistern dieser Gebäude die Möglichkeit gegeben, ihren komplexen religiösen Vorstellungen durch geometrische Perfektion Ausdruck zu verleihen. So konnten Architektur und Glaube in der Gotik des zwölften Jahrhunderts eine ganz neuartige - und fast greifbare - Synthese bilden. Dieses Zusammenwachsen beschrieb der heilige Bernhard, als er die Frage stellte »Was ist Gott?« und sie dann selbst mit den erstaunlichen Worten beantwortete: »Er ist Länge, Weite, Tiefe und Höhe.«[56]

Nicht ohne Grund war es gerade die Kathedrale von Chartres, in deren Bau man das hochentwickelte Wissen der gotischen Architektur investiert hatte. In den Jahren vor Baubeginn nämlich hatte Bernhard eine enge Freundschaft zu Geoffrey, dem Bischof von Chartres, entwickelt[57] und ihn mit »über-

schwenglicher Begeisterung«[58] für den gotischen Stil geworben. Zudem hielt er »fast täglich Unterredungen mit den Bauleuten«[59].

Interessant war diese Information jedoch vor allem deshalb, weil diese Zeit genau in die Jahre nach der Synode von Troyes fällt. Historiker haben bislang keine angemessene Erklärung für das plötzliche und konzentrierte Auftauchen gotischer Architektur im Frankreich der dreißiger Jahre des zwölften Jahrhunderts geben können. Meine Vermutung, daß die Templer damit etwas zu tun gehabt haben könnten, erwies sich als immer plausibler. Noch einmal verglich ich alle von mir zusammengetragenen Indizien und war mir sicher, daß man auf dem Tempelberg tatsächlich auf die alten Geheimnisse der Baukunst gestoßen war - und daß man sie an den heiligen Bernhard weitergegeben hatte.

Nach und nach ergaben sich auch die Verbindungen zwischen jenen kryptischen »Schatzkarten«: dem Nordportal von Chartres und Wolframs Parzival. Jedes dieser Werke verwies auf Äthiopien als letzte Ruhestätte der Bundeslade. Doch wie waren die Tempelritter darauf gekommen, daß die heilige Reliquie nach Äthiopien gebracht worden war? Und welche Verbindung bestand zwischen dem Ritterorden und Wolfram von Eschenbach?

Eine Antwort mußte in Jerusalem selbst zu finden sein - dort, wo ein äthiopischer Prinz über ein Vierteljahrhundert im Exil lebte, bevor er im Jahre 1185 in seine Heimat zurückkehrte, um Anspruch auf sein Königreich zu erheben.[60] Nur fünfzehn Jahre später schrieb Wolfram die ersten Verse des Parzival, und nur zehn Jahre später begann man mit der Arbeit am Nordportal der Kathedrale von Chartres.

Ein äthiopischer Prinz in Jerusalem

Der Name des Prinzen war Lalibela. Aber nicht Lalibela ersuchte den Papst um einen Altar in der Grabeskirche, sondern

König Harbay von Äthiopien, der um 1177 noch regierte. Das Vorrecht, das der Herrscher gefordert hatte, sollte jedoch erst seinem Nachfolger zugute kommen: Prinz Lalibela.

Weder Harbay noch Lalibela stammten aus dem Geschlecht, das Menelikl. begründet hatte. Vielmehr gehörten beide Könige dem Stamm der Zagwe an, die das Land von etwa 1130 bis 1270 regierten, bevor die salomonische Dynastie den Thron wieder einnahm.[61]

Über die Zeit der Zagwe ist nur wenig bekannt. Fest steht, daß die salomonische Linie um das Jahr 980 unterbrochen wurde, als die jüdische Königin Gudit in einem Staatsstreich die Macht übernahm und alles daransetzte, die christliche Religion auszulöschen. Sie griff Aksum an, machte einen großen Teil der Stadt dem Erdboden gleich und tötete viele der salomonischen Prinzen. Allein Prinz Delna'ad konnte sein Leben retten und in die Provinz Shoa fliehen, wo er das Überleben der alten Dynastie sicherte.[82]

Gudit war die Anführerin der Agaw-Stämme, zu denen auch die Falaschen gehörten.[63] Fünfzig Jahre nach dem Tod der Usurpatorin befand sich der Großteil Nordäthiopiens unter der Herrschaft der Zagwe, die ebenfalls von den Agaw abstammten. Wahrscheinlich gehörte auch die Dynastie - wie Gudit - der jüdischen Religion an.[84] Die Mitglieder des Herrscherhauses mußten jedoch schon vor der Geburt des Prinzen Lalibela, also vor 1140, zum Christentum konvertiert sein.

Lalibela, der jüngere Halbbruder von König Harbay, schien von Anfang an zu Höherem bestimmt. Legenden berichten, daß seine Mutter beobachtete, wie das Kind in seiner Wiege von Bienen umringt wurde. »Lalibela«, rief die Mutter da aus, was soviel bedeutet wie »Die Bienen anerkennen seine Herrschaft«, und so kam der Prinz zu seinem Namen.[85]

Harbay allerdings sorgte sich nach dieser Prophezeiung um seinen Thron, so daß er beschloß, den Säugling zu töten. Nach mehreren fehlgeschlagenen Versuchen gelang es ihm schließlich, dem jungen Prinzen ein Gift zu verabreichen, das ihn in einen todesähnlichen Schlaf versetzte. Den Überlieferungen zu-

folge hielt die Lähmung drei Tage und drei Nächte an. Lalibela wurde während dieser Zeit von Engeln in den ersten, zweiten und dritten Himmel gebracht. Dort sprach der Allmächtige zu ihm, er solle sich nicht fürchten. Er sei auserwählt, und Gott werde sein Leben lenken. Sobald er aus seinem Schlaf erwacht sei, solle er aus Äthiopien fliehen und in Jerusalem Zuflucht suchen. Dennoch könne er sicher sein, daß er einst als König in seine Geburtsstadt Roha zurückkehren würde. Dort sollte er wunderbare Kirchen errichten, wie sie die Welt noch nie gesehen habe. Gott übergab Lalibela detaillierte Anweisungen, welche die Bauweise, das Aussehen jeder einzelnen Kirche, ihren Standort und selbst die innere und äußere Gestaltung betrafen.[66]

Hier kreuzen sich Legende und Geschichte. Tatsächlich floh der Prinz nach Jerusalem und lebte dort von 1160 bis 1185. Dann kehrte Lalibela im Triumph in seine Heimat zurück und eroberte den Thron.[67]

Von diesem Zeitpunkt an gibt es verläßliche Chroniken seiner Regentschaft, die bis in das Jahr 1211 andauerte.[68] Er machte seine Geburtsstadt Roha (die später zu seinen Ehren in Lalibela umbenannt wurde) zum Regierungssitz[69] und begann sogleich mit dem Bau jener aufsehenerregenden Monolithkirchen. Daß Lalibela sein Exil im Heiligen Land nicht vergessen hatte, schlug sich in der Aufteilung der neuen Königsstadt nieder: Der Fluß, der die Stadt durchlief, wurde in »Jordan« umbenannt; eine der elf Kirchen, Beta Golgatha, wurde der Grabeskirche in Jerusalem nachgebildet; und ein in der Nähe befindlicher Hügel hieß fortan Debra Zeit, »Ölberg«, nach dem Ort, an dem Jesus von den Häschern ergriffen wurde.[70]

Darüber hinaus hielt der König während seiner gesamten Regierungszeit enge Verbindungen nach Jerusalem. Dies war, wie ich herausfand, nichts Ungewöhnliches. Seit dem Ende des vierten Jahrhunderts nach Christus hielten sich ständig Gesandte der äthiopisch-orthodoxen Kirche in der Heiligen Stadt auf.[71] Schon König Harbay wollte diese Kontakte festigen, was schließlich zu dem Vorstoß führte, den Papst um eine Kultstätte zu bitten. Wir wissen, daß Harbay keinen Erfolg hatte, denn

wenig später waren zwei entscheidende Entwicklungen eingetreten: Im Jahr 1185 übernahm Lalibela die Herrschaft, und nach 1187 befand sich die Heilige Stadt nicht mehr in den Händen der Christen.[72]

Die königlichen Chroniken zeigen, daß Lalibela von den Veränderungen in Jerusalem sehr beunruhigt war. 1189 gelang es einem seiner Botschafter, Saladin dazu zu bewegen, der nach Zypern geflüchteten äthiopischen Gemeinde den Zugang zum Tempelbezirk wieder zu gestatten. Darüber hinaus erhielt sie sogar eine eigene Kultstätte in der Grabeskirche.[73] In neuerer Zeit sind den Äthiopiern diese Privilegien wieder abhanden gekommen. Heute müssen abessinische Pilger ihre Verehrung auf dem Dach einer Klosterkapelle bekunden.[74] Immerhin unterhält die äthiopische Kirche noch immer zwei Gotteshäuser und einen Bischofssitz in Jerusalem.

Betrachtet man einmal die Außen- und Innenpolitik, die architektonischen Ausdrucksformen oder die geistige Entwicklung dieser Jahre, so erkennt man, daß Lalibelas Regierungszeit den Höhepunkt der Zagwe-Dynastie darstellt. Nach seinem Tod setzte ein jäher Verfall ein, bis Naakuto Laab im Jahre 1270 zugunsten Yekuno Amlaks auf den Thron verzichtete.[75] Fortan gehörten, mit einer einzigen Ausnahme, alle äthiopischen Herrscher der von Menelik I. begründeten salomonischen Dynastie an, und das bis ins Jahr 1974, als Kaiser Haile Selassie durch die kommunistische Revolution seines Amtes enthoben wurde.

Greifbare Ergebnisse

Als ich mir noch einmal vergegenwärtigte, was ich über Lalibelas glanzvolle Regierungszeit erfahren hatte, erkannte ich, daß meine Ergebnisse genau in das verlockende Muster von Übereinstimmungen paßten, das sich aus den Kreuzzügen, den Templern und den Ereignissen im zwölften Jahrhundert ergab:
- Im Jahre 1099 wird Jerusalem von den Kreuzfahrern eingenommen.

- Im Jahre 1119 treffen die neun Gründungsritter des Templerordens in Jerusalem ein und besetzen die Stelle, an der einst der Tempel Salomos stand.
- Im Jahre 1128 erreicht Bernhard von Clairvaux auf der Synode von Troyes die offizielle Anerkennung des Ordens durch die Kirche.
- Im Jahre 1134 beginnt man mit der Errichtung des Nordturmes der Kathedrale von Chartres.
- Im Jahre 1145 taucht der Name »Priester Johannes« zum erstenmal in Europa auf.
- Im Jahre 1160 wählt Prinz Lalibela auf der Flucht vor seinem Halbbruder Harbay Jerusalem als politisches Exil.
- Im Jahre 1165 kursiert jener Brief in Europa, der angeblich vom Priester Johannes verfaßt wurde.
- Im Jahre 1177 veröffentlicht Papst Alexander III. eine Antwort auf dieses Dokument. Offensichtlich bestehen in Jerusalem direkte Kontakte zwischen Abgesandten des Priester Johannes und dem Leibarzt des Papstes.
- Bei diesem Priester Johannes kann es sich nur um Lalibelas Halbbruder Harbay handeln.
- Im Jahre 1182 beschreibt der Dichter Chrétien de Troyes zum allerersten Mal den Heiligen Gral.
- Im Jahre 1185 verläßt Lalibela Jerusalem und kehrt nach Äthiopien zurück, wo er die Macht übernimmt. Unmittelbar danach beginnt er mit dem Bau der Felsenkirchen.
- Im Jahre 1187 fällt Jerusalem an die muslimischen Streitkräfte unter Saladin.
- Im Jahre 1189 schickt Lalibela Abgesandte zu Saladin und erreicht einige Vorrechte für die äthiopischen Christen in Jerusalem.
- Um das Jahr 1200 beginnt Wolfram von Eschenbach mit der Arbeit am Parzival, setzt die Erzählung Chrétiens fort und verwandelt den Gral in einen Stein. Wolfram läßt viele äthiopische Elemente in seine Geschichte einfließen und erwähnt dabei nicht nur den Priester Johannes, sondern auch die Templer.
- Zu genau derselben Zeit wird das Nordportal der Kathe-

drale von Chartres mit seinen Skulpturen der Königin von Saba, dem Gral und der Bundeslade errichtet.

Es hat den Anschein, daß alle diese Ereignisse auf eine verworrene Art und Weise durch eine Gemeinsamkeit miteinander verbunden waren, die der Geschichte bislang verborgen geblieben war - vielleicht, weil man sie mit Absicht geheimhalten wollte. Hätte ich den Beweis antreten können, daß die Templer zunächst in Jerusalem und später in Äthiopien nach der verlorenen Bundeslade forschten, dann wäre dies das fehlende Glied in der komplexen Kette ineinander verzahnter Ereignisse, Ideen und Personen gewesen. Aber mir war klar, daß ich im Moment alle Mittel ausgeschöpft hatte, was die Aktivitäten der Ritter in Jerusalem betraf. Doch was war mit Äthiopien? Gab es denn tatsächlich nicht den geringsten Anhaltspunkt, daß die Templer auch dort nach der Lade gesucht und anschließend dafür gesorgt hatten, daß die Ergebnisse ihrer Nachforschungen in Wolframs großem Epos verschlüsselt wurden?

»Diese verräterischen Templer ...«

Der erste Durchbruch gelang mir, als ich eine vollständige Übersetzung des Briefes einsehen konnte, den der Priester Johannes im Jahre 1165 geschrieben haben sollte. Anders als das Schreiben Alexanders III. an Priester Johannes von 1177 wurde der Brief von 1165 von der Wissenschaft mit großer Skepsis betrachtet. Auch wenn die Lehrmeinung die Datierung des Briefes nicht anzweifelte, so war es nur schwer vorstellbar, daß die Epistel tatsächlich von einem Priester Johannes stammte, so daß man das Schreiben als geschickte Fälschung ansah.[76]

Als ich den Brief las, verstand ich den Grund für diese Einschätzung. Schließlich gab der Verfasser vor, sein Reich beherberge unter anderem »Wildhasen, so groß wie Schafe«, »Vögel, die man Greif nennt, und die mit Leichtigkeit einen Ochsen oder ein Pferd in ihr Nest tragen können«, »gehörnte Männer, die nur ein Auge vorn, jedoch drei oder vier hinten haben«, »andere

Männer mit Hufen an den Beinen, wie Pferde«, »Bogenschützen, die von der Hüfte aufwärts Menschen, abwärts jedoch Pferde sind«, den Jungbrunnen, einen »Sandsee«, aus dem sich »jedes Stück Geröll in einen kostbaren Stein verwandelt«, den »Baum des Lebens«, »siebenköpfige Drachen« und so weiter und so fort.[77]

Es hatte den Anschein, als könne man im Land des Priester Johannes so ziemlich jedes Fabeltier und jede Traumgestalt finden. Wo sich dieses Land jedoch genau befand, wurde an keiner Stelle des Briefes erwähnt, sieht man einmal von dem etwas dürftigen Verweis auf die »vielen indischen Reiche« ab. Allerdings fanden sich hier und da zwischen den Fabelwesen auch andere Tiere, deren Existenz man nicht so schnell abstreiten konnte: »Elefanten« und »Dromedare« zum Beispiel, auch das »Einhorn« mit »einem einzigen Horn auf der Stirn«, das sich sehr nach einem Rhinozeros anhörte, zumal es dafür bekannt war, manchmal »Löwen zu töten«.[78]

Gerade diese Einzelheiten ließen mich aufhorchen. Möglicherweise handelte es sich bei dem Verfasser des fraglichen Briefes eben nicht um einen Fälscher, sondern vielmehr um einen Kenner dieser Region - wo es natürlich Kamele, Elefanten, Löwen und Rhinozerosse gab. Mein Verdacht erhärtete sich, als ich bemerkte, daß auch »König Alexander von Mazedonien« erwähnt und mit »Gog und Magog« in Verbindung gebracht wurde.[79] Mir fiel diese Stelle vor allem deshalb auf, weil ich mich daran erinnerte, daß eine solche Verknüpfung auch in einem sehr alten äthiopischen Manuskript hergestellt wurde, dem *Lefafa Sedek,* dem Buch der *Rechtschaffenheit*[80], das bis zum neunzehnten Jahrhundert außerhalb Äthiopiens völlig unbekannt war.

Schließlich behauptete der Priester Johannes, daß in seinem Reich viele Juden lebten, die scheinbar einen halbautonomen Status besaßen und des öfteren bekriegt wurden. Auch das ähnelte ja den tatsächlichen Verhältnissen in Äthiopien: Nach der Erhebung der jüdischen Königin Gudit im zehnten Jahrhundert war tatsächlich ein Konflikt zwischen äthiopischen Juden

und Christen entstanden, der über die Jahrhunderte hinweg weiterschwelte.

Trotz seiner vielen zweifellos phantastischen und nicht belegbaren Stellen glaubte ich nun nicht mehr, daß es sich bei dem Brief um eine Fälschung handelte. Vielmehr war ich der Meinung, daß der Brief in der Absicht entstanden war, seine Adressaten zu beeindrucken und vor allem zu ängstigen. Auffällig waren insbesondere die häufigen Verweise auf die Größe der »priesterlichen Streitkräfte«:

»Wir besitzen zweiundvierzig Burgen, welche zu den sichersten und prächtigsten der Welt zählen, dazu viele Männer zu ihrer Verteidigung: zehntausend Ritter, sechstausend Armbrustschützen, fünfzehntausend Bogenschützen und vierzigtausend Mann Kavallerie ...« Und eine vergleichbare Passage lautet: »So wisse, daß wenn wir zu Krieg ziehen, vierzigtausend Kirchenmänner und eine ebenso große Anzahl Ritter vor uns her marschieren. Sodann folgen zweihunderttausend Mann Fußvolk, ungeachtet der Wagen mit Verpflegung, der Elefanten und Kamele, welche Waffen und Munition tragen .. .«[81]

Hier handelte es sich einwandfrei um Machtdemonstration. Erstaunlicherweise legte der Verfasser dabei Wert darauf, seine ablehnende, ja feindliche Haltung gegenüber den Tempelrittern zu betonen. In einem Abschnitt des Briefes, der sich allem Anschein nach an den »König von Frankreich« richtete, heißt es:

»Zu Eurem Gefolge und zu Eurer Familie gehören aber Franzosen, die es mit den Sarazenen halten. Ihr habt Vertrauen in sie und setzt darauf, daß sie Euch helfen werden, wo sie doch falsch sind und verräterisch ... Mögt Ihr tapfer sein und von großem Mut und, so wolle Gott, diesen verräterischen Templern ein Ende machen .. .«[82]

Wer also kam im Jahre 1165 als Kandidat für die Rolle des Priester Johannes in Frage? Und wer hatte ein Interesse daran, die europäischen Königshäuser mit seiner überwältigenden militärischen Macht zu konfrontieren? Und wem schließlich lag so ausdrücklich daran, die Tempelritter in Mißkredit zu bringen und sogar ihre Vernichtung zu fordern?

Meine Antwort auf diese Frage lautete Harbay. Einer der Gründe, warum ich allein Harbay als den tatsächlichen Verfasser dieses Briefes ansah, war begrifflicher Natur. Im Laufe meiner Untersuchungen hatte ich herausgefunden, daß alle Herrscher der Zagwe in ihren Titeln den äthiopischen Terminus »Jan« bevorzugten.[83] »Jan« kommt von dem Wort »Jano«, das eine purpurrote Toga bezeichnet, die nur von den Herrschern des Landes getragen wird, und bedeutet soviel wie »König« oder »Majestät«. Da »Jan« leicht mit »John« zu verwechseln war, konnte sich möglicherweise hier der Ursprung des Namens »Priester Johannes« verbergen, zumal einige der Zagwe-Herrscher zugleich Priester waren.

Allerdings hatte ich noch einen anderen Grund, auf Harbay zu beharren, dessen politische Probleme genau um 1165 einsetzten. Sein Widersacher und Halbbruder Lalibela befand sich zu dieser Zeit bereits fünf Jahre im Jerusalemer Exil, lange genug also, um die Templer kennenzulernen und sich mit ihnen anzufreunden. Vielleicht hatte er die Ritter sogar gebeten, ihn bei seinem Anspruch auf den Thron zu unterstützen, und vielleicht hatte Harbay Wind von der Sache bekommen.

Für meine Begriffe war ein solches Szenario durchaus vorstellbar. Sein Engagement bezüglich einer Kultstätte in der Grabeskirche ließ darauf schließen, daß Harbay regelmäßig Abgesandte nach Jerusalem schickte und daß diese Abgesandten leicht von dem sich anbahnenden Komplott zwischen Lalibela und den Templern erfahren haben konnten. Nun ergab auch der merkwürdige Vorschlag einen Sinn, daß der König von Frankreich die »verräterischen Templer« exekutieren lassen sollte. Der »Brief des Priester Johannes« wäre somit als durchdachte Strategie zu begreifen, die eine Verschwörung gegen den äthiopischen König Harbay verhindern sollte.

Nun, mir war klar, daß meine Überlegungen in höchstem Maße spekulativ waren, und ich hätte sie nicht weiter verfolgt, wenn nicht Wolframs Parzival Hinweise geliefert hätte, die eine Verbindung zwischen den Templern und Lalibela nahelegten.

»In das ferne Afrika ...«

Wolframs Epos, das einige Jahre nach Harbays Vertreibung vom Thron entstand, berichtet mehrfach von geheimen Missionen der Templer nach Übersee, bei denen es offensichtlich um den Gewinn politischer Macht ging. Eine Passage zum Beispiel lautet:

»Beruft die Allmacht Gottes einen Tempelherrn zum Herrscher eines fremden Volkes, dann ... muß er aber jede Frage nach seinem Namen und seinem Geschlecht verbieten. Wird er dennoch gefragt, dann kann er nicht länger im Lande bleiben.«[84]

Und eine andere Textstelle gibt an:

»Erlischt aber andererseits in der Welt ein Herrscherhaus und wünscht das Volk des verwaisten Landes in Ehrfurcht vor Gott einen Herrscher aus der Gralsgemeinschaft, dann wird dieser Wunsch erfüllt... Die Männer sendet Gott im geheimen aus .. .«[85]

Und nur wenig später formuliert ein Mitglied der Gralsgemeinschaft einen konkreten Sachverhalt: Seine Ritterfahrten führten ihn bis in »das ferne Afrika ... vor die Rohas«[86]. Literaturwissenschaftler haben versucht, »die Rohas« mit dem Rohitscher Berg an der Grenze von Slowenien zur Steiermark zu identifizieren. Ich hielt diese Ableitung jedoch für völlig irrig, da sie ganz und gar nicht in den afrikanischen Kontext paßte. Zudem verfügte ich über eine Information, die mir einen Vorsprung vor den Wolfram-Experten deutscher und englischer Universitäten verschaffte: Roha war der alte Name einer Stadt in den entlegensten Hochebenen Äthiopiens - Lalibela. Und König Lalibela war es, der über ein Vierteljahrhundert hinweg in der Nähe der Tempelritter lebte. Es stellte sich also noch immer die berechtigte Frage, ob Lalibela, als er 1185 nach Äthiopien zurückkehrte, von einem Kontingent Templer begleitet wurde.

Ich glaubte nicht, daß diese Frage leicht zu beantworten war. Glücklicherweise hatte ich Lalibela bereits 1983 besucht. Als ich die Notizen dieser Reise noch einmal genau durchging, stieß ich auf einen interessanten Punkt.

An der Decke der Felsenkirche Beta Mariam, die ebenfalls der heiligen Maria Mutter Jesu gewidmet ist, hatte ich »verblaßte rote Kreuze« entdeckt und vermerkt: »Sehen nicht aus wie normale äthiopische Kreuze - in Addis nach Herkunft forschen.« Ich fand sogar eine grobe Skizze wieder, die ich später mit dem Fachausdruck für diese Kreuzform ergänzt hatte: Croix pattée.

1983 wußte ich jedoch noch nicht, daß es sich bei dem Emblem der Templer um ein rotes Croix pattée handelte[87] - und ich wußte nicht, daß die Templer als Baumeister herrlicher Kirchen bekannt waren.

Bei den elf Felsenkirchen von Lalibela handelt es sich mit Abstand um die architektonisch ausgereiftesten Gebäude Äthiopiens (die UNESCO geht sogar soweit, sie unter die Weltwunder einzuordnen[88]).

Was die Gesamtkonzeption, die handwerkliche Ausführung und den ästhetischen Ausdruck der Kirchen anging, so waren sie tatsächlich einzigartige Werke. Bislang gelang es keinem Experten festzustellen, wie sie gebaut wurden, und noch immer hält sich das Gerücht, daß Fremde an der Errichtung beteiligt waren. Einige Forscher nahmen an, daß König Lalibela Inder oder ägyptische Kopten als Bauleute angeworben habe.[89] Und während die äthiopischen Legenden von einem Werk der Engel sprachen, fragte ich mich, ob es sich bei den wahren Erbauern von Lalibela nicht um die Templer handelte.

Meine Notizen aus dem Jahr 1983 entwarfen ein Bild dieser beeindruckenden Bauwerke: »Ähnlich wie in den mittelalterlichen Mysterien hat man einige Anstrengungen unternommen, ihr wahres Wesen zu verbergen: Einige liegen fast völlig abgeschlossen in tiefen Gräben, andere sind in den klaffenden Mäulern riesiger Steinbrüche versteckt. Verbunden sind sie alle durch ein komplexes und labyrinthisches System von Tunneln und schmalen Gängen, von denen Krypten, Grotten und Emporen abgehen - eine kühle, von Flechten eingewachsene unterirdische Welt, schattig, klamm und schweigend, bis auf den verklingenden Hall ferner Schritte, der vom zeitlosen Tun der Priester und Diakone erzählt.

Vier der Kirchen stehen ganz frei und sind mit dem sie umgebenden Fels nur an der Basis verbunden. Sie stehen völlig isoliert in den tief ausgegrabenen Höfen, am eindrucksvollsten Beta Giorghis, die Kirche des heiligen Georg. Sie thront in majestätischer Größe in einiger Entfernung von den anderen. Mehr als zwölf Meter hoch, befindet sie sich in der Mitte einer tiefen, brunnenähnlichen Grube; ihr Grundriß und ihr gesamtes Erscheinungsbild ähnelt einem Kreuz.«

Schon damals hatte sich mir die Frage nach den wahren Baumeistern gestellt - und vor allem nach den ausgeklügelten und weitentwickelten Techniken, die ein solches Wunderwerk erst ermöglichen konnten. Nun wurde mir mit einigem Unbehagen bewußt, wie wenig sich diese Dunkelheit erhellt hatte - und wieviel es für mich noch herauszufinden gab. Intuitiv glaubte ich fest daran, daß die Templer mit der Errichtung der Kirchenanlage zu tun hatten. Tatsache war aber nun einmal, daß ich meinen Verdacht bislang auf die roten »Kreuzfahrerkreuze« an der Decke von Beta Mariam stützen konnte. Dabei besaß das Mysterium von Lalibela noch weitere Dimensionen, die sich meiner Beurteilung erst recht entzogen.

In Beta Mariam zum Beispiel hatte mich ein Priester vor den Eingang zum Allerheiligsten geführt, wo er mich auf eine große Säule aufmerksam machte. In meinen Aufzeichnungen las ich: »Sie hat den Durchmesser eines gut gewachsenen Baumes. Die Säule erhebt sich aus dem Steinboden und verschwindet weit über uns im Düsteren. Sie wird völlig von einem fadenscheinigen Tuch verhüllt, das die eingravierten Worte - so erklärt der Priester - König Lalibelas verbirgt. Möglicherweise handelt es sich um eine Schilderung der geheimnisvollen Entstehung der Felsenkirchen; aber der Priester gerät in großes Entsetzen, als ich ihn bitte, das Tuch zur Seite zu ziehen. >Das wäre ein Sakrilege sagt er, >die Hülle wird niemals entfernte«

Ärgerlicherweise hatte ich diesen Punkt nicht weiter verfolgt, so daß ich ein Gefühl nachträglicher Wut über meinen damaligen Mangel an Neugier nicht unterdrücken konnte. Enttäuscht wandte ich mich dem großen Stapel von Quellentexten

und Sekundärliteratur zu, den ich damals zusammengetragen hatte. Das meiste bestand aus Fotokopien wissenschaftlicher Abhandlungen, von denen allerdings die wenigsten für meine Zwecke von Bedeutung waren. Ein Buch machte jedoch einen vielversprechenden Eindruck. Es handelte sich um den Bericht des portugiesischen Botschafters in Äthiopien von 1520 bis 1526 mit dem Titel: Der Priester Johannes der indischen Reiche. Das von Vater Francisco Alvarez verfaßte, fünfhundert Seiten starke Werk war erstmals im Jahre 1540 in Lissabon erschienen und seit 1881 auch in einer englischen Übersetzung zugänglich.

Der portugiesische Mönch, so erfuhr ich in der Einleitung, genießt unter Historikern den Ruf der Glaubwürdigkeit, und seine Aufzeichnungen gelten als authentische und wichtige Quelle für die Erforschung der äthiopischen Geschichte.[90] Im ersten Band des Werkes beschreibt Alvarez unter anderem seinen Besuch in Lalibela. Ich bewunderte die einfache und sachliche Sprache, in der er seine außerordentlich detaillierte Beschreibung der Kirchen formulierte. Selbst die verhüllte Säule in Beta Mariam fiel dem Mönch auf: »Dann findet sich dort noch am Scheitelpunkt des Querschiffes eine hohe Säule, die mit -einer Verkleidung umspannt ist, deren Flechtwerk einem in Wachs geprägten Muster gleicht.«[91]

Alvarez mußte geahnt haben, daß seine Beschreibungen nur ungläubiges Erstaunen hervorrufen würden, und so endet sein Bericht über Lalibela mit den Worten: »Ich schwöre hiermit bei Gott, in dessen Gewalt ich bin, daß alles, was ich geschrieben habe, der Wahrheit entspricht, daß ich nichts hinzugefügt habe und daß es noch viel mehr zu berichten gibt und ich es allein darum wegließ, daß man mich nicht der Lüge beschuldige .. .«[92]

Bei Alvarez handelt es sich zweifellos um einen gewissenhaften Forscher und Chronisten, denn er sprach sogar mit einigen der älteren Priester. So wollte er wissen, wie lange das Aushöhlen und Bearbeiten der Steinblöcke gedauert und wer die Arbeit vollbracht habe. Die Antwort, die man ihm gab, war noch frei von den später hinzukommenden legendarischen Ausgestaltungen - und sie ließ meinen Puls höher schlagen:

»Man teilte mir mit, daß alle Arbeit an den Kirchen in vierundzwanzig Jahren vollbracht wurde, so wie es geschrieben steht, und daß es weiße Männer waren, die dies taten. Auch sagte man, daß König Lalibela dies alles angeordnet habe .. .«[93]

Lange war es mir nicht gelungen, den Berührungspunkt der Tempelritter mit Äthiopien auszumachen. Nun aber hatte ich das Gefühl, auf einen ernstzunehmenden Beweis gestoßen zu sein, der die Präsenz weißer Männer in Äthiopien mehr als nur nahelegte. Dabei mußte es sich um Personen handeln, die internationalen Einfluß besaßen, weiße Männer, die (mit Wolframs Worten) manchmal zu einem »fremden Volk« geschickt wurden, um »im Lande für Recht und Gerechtigkeit zu sorgen«[94].

Der Bericht des Portugiesen und die Worte des alten Priesters über die »weißen Männer« festigten meine Überzeugung, daß Wolfram nicht nur einer Laune folgte, als er die Templer im Parzival mit seiner kryptischen Gralsdarstellung und Äthiopien in Verbindung brachte. Ich war mir immer sicherer, daß dieser kluge und gewitzte Dichter zu jenem inneren Zirkel gehörte, der das Geheimnis um den letzten Aufenthaltsort der Bundeslade kannte. Vielleicht war er durch Vermittlung seiner »Quelle«, des Gelehrten Kyot (alias Guyot von Provins), vielleicht aber auch auf direkterem Wege vom Orden beauftragt worden, dieses Geheimnis in einer mitreißenden Geschichte zu verschlüsseln. Doch welches Interesse konnten die Templer an einer solchen Übereinkunft gehabt haben? Mir fiel zumindest eine mögliche Antwort ein. Hätte man die geheimen Informationen an einem unzugänglichen Ort verborgen, dann bestand keine Garantie, daß das Wissen um den Aufenthaltsort der Lade auch wirklich an weitere Generationen weitergegeben werden konnte. Geschickt in einem populären Gewand wie dem Parzival verschlüsselt, hatte das Geheimnis eine reelle Chance, unbegrenzt im Bereich der Kultur weiterzubestehen.

Kurz, was über Jahrhunderte hinweg von den meisten als packende Geschichte betrachtet wurde, bedeutete für einige wenige Eingeweihte und Entschlossene die Schatzkarte, die nach Äthiopien und zur Bundeslade führte.

Kapitel 6

Dreiste Lügen?

Alle Reliquien haben ein gemeinsames Merkmal: Abergläubische und leicht zu beeindruckende Menschen lassen sich schnell von ihnen faszinieren. Aber bei genauerer Untersuchung halten diese Objekte der Verehrung oftmals nicht das, was sie versprechen. Warum sollte es im Falle von Aksum nicht auch so sein? Ich mußte also herausfinden, ob es tatsächlich handfeste Beweise für die Vermutung gab, daß sich die Bundeslade dort befand.

Mitte des neunzehnten Jahrhunderts war ein Abgesandter des armenischen Patriarchen in die heilige Stadt gereist, um zu beweisen, daß man es bei der Legende um die Bundeslade mit nichts anderem als einer »dreisten Lüge« zu tun habe.[1] Nachdem der Legat Dimotheus etwas Druck auf die aksumitischen Priester ausgeübt hatte, zeigte man ihm eine »aus rot gefärbtem Marmor gearbeitete, vierundzwanzig Zentimeter lange, zweiundzwanzig Zentimeter breite und nur drei Zentimeter dicke« Tafel[2], von der die Priester behaupteten, daß es sich um eine der beiden Steintafeln aus der Bundeslade handelte. Offenbar hofften sie, daß der Gesandte sich mit einem Blick auf diese Tafel, die sie »Tabot des Mose« nannten[3], zufriedengeben würde. Und Dimotheus war sehr zufrieden. Mit dem sichtlichen Vergnügen eines Mannes, der gerade einen großen Mythos entzaubert hat, berichtet er:

»Der Stein war völlig intakt und zeigte keine Merkmale der Alterung. Er stammt frühestens aus dem dreizehnten oder vierzehnten Jahrhundert unserer Zeit... Ein dummes Volk wie die Abessinier, das diesen Stein blindlings als echt ansieht, schwelgt ganz ohne Grund im Stolz der Besitzer, denn es handelt sich keinesfalls um das Original. All diejenigen, die von der Heiligen Schrift Kenntnis haben, benötigen keine weiteren Be-

weise: Es ist eine Tatsache, daß die Tafeln mit den göttlichen Gesetzen in die Bundeslade gelegt wurden und auf immer verloren sind.«[4]

Was sollte ich damit anfangen? Wenn es sich bei jener Steintafel um einen Teil der so verehrten aksumitischen Reliquie handelte, dann sprach er mit Recht davon, daß sie keinen Grund zur Freude hatten. Mit anderen Worten: Wenn der Inhalt falsch war, so konnte daraus nur folgen, daß auch der Behälter falsch war. Was wiederum bedeutete, daß es sich bei der aksumitischen Überlieferung wirklich um nichts als eine »dreiste Lüge« handelte.

Und doch enthielt Dimotheus' Urteil eine entscheidende Schwachstelle: Hatte man ihm wirklich den Gegenstand gezeigt, den die Priester als echten »Tabot Mose« verehrten, oder hatte man ihm vielleicht etwas ganz anderes vorgeführt? Diese Frage drängte sich besonders deshalb auf, weil der armenische Legat offensichtlich beleidigt und geradezu erbost darüber war, daß ein so »dummes Volk« wie die Äthiopier ein so wertvolles Objekt wie die Bundeslade besitzen sollte - und so war ihm sehr daran gelegen, den Gegenbeweis anzutreten. Ich merkte schnell, daß sein Drang, um jeden Preis sein Vorurteil zu bestätigen, über jeglichen unvoreingenommenen Forschergeist gesiegt hatte. So war ihm der feinsinnige und hintergründige Charakter der Äthiopier völlig entgangen.

Als Dimotheus um 1860 nach Aksum kam, wurde die Lade noch in der Marienkirche aufbewahrt, aber es war dem Legaten nicht gestattet worden, das Allerheiligste zu betreten. Statt dessen führte man ihn zu einem wackeligen Holzbau, der sich »mit einigen anderen Räumen zusammen außerhalb der Kirche auf der linken Seite« befand, und enthüllte in seiner Gegenwart den marmornen Stein.

Nun, der armenische Legat war von den Priestern höchstwahrscheinlich an der Nase herumgeführt worden. Ich wußte, daß die äthiopisch-orthodoxe Kirche die Lade als einzigartiges Heiligtum betrachtete. Ich bezweifelte aus diesem Grund, daß man Bestandteile der Lade auch nur zeitweise aus dem Allerhei-

ligsten entfernt hatte, zumal es keinen wirklich triftigen Grund dafür gab. Das sicherlich entschieden vorgetragene Interesse irgendeines Fremden reichte dafür gewiß nicht aus. Gleichzeitig handelte es sich bei diesem Mann jedoch um einen Gesandten des armenischen Patriarchen in Jerusalem, und es wäre unklug gewesen, ihn nicht mit einem gewissen Respekt zu behandeln. Was sollte man also tun? Die Antwort, so vermutete ich, bestand darin, daß die Priester ihm einen der vielen »Tabots« zeigten, die es in Aksum gab, und erklärten, daß es sich um eine Steintafel aus dem heiligen Schrein handelte.

Um mich in dieser Hinsicht zu vergewissern, rief ich Professor Richard Pankhurst in Addis Abeba an und befragte ihn über den Besuch von Dimotheus. Glaubte er, daß es sich bei dem »Tabot«, das dem Legaten gezeigt wurde, wirklich um eine der alten Gesetzestafeln gehandelt hatte?

»Höchst unwahrscheinlich«, antwortete Richard. »Sie würden einen so heiligen Gegenstand keinem Fremden zeigen. Außerdem habe ich das Buch von Dimotheus gelesen, es wimmelt darin nur so von Fehlern und Mißverständnissen. Er war ein aufgeblasener Mensch, ohne Skrupel, was seinen Umgang mit der äthiopisch-orthodoxen Kirche anging, und nicht ganz ehrlich. Ich kann mir gut vorstellen, daß der Klerus von Aksum ihn sehr schnell durchschaut und mit irgendeinem >Tabot<, das ihnen nichts weiter bedeutete, abgespeist hat.«

Richard gab mir Namen und Telefonnummern zweier äthiopischer Forscher, von denen er glaubte, daß sie mir behilflich sein könnten: Dr.Belai Gedai, der eine ausführliche Studie über die Frühgeschichte seines Landes erstellt und sich dabei besonders auf seltene amharische und Ge'ez-Dokumente gestützt hatte, sowie Dr. Sergew Hable-Selassie vom Institut für äthiopische Studien, Autor eines anderen Standardwerkes zum gleichen Thema.

Am meisten beschäftigte mich noch immer die Frage, was Dimotheus in Aksum gesehen hatte, und so beschloß ich, Dr. Hable-Selassie um Hilfe zu bitten. Ich rief ihn an, stellte mich vor und fragte ihn nach seiner Meinung zu diesem Thema.

Er lachte: »Natürlich hat dieser Kerl nicht den wirklichen >Tabot des Mose< gesehen. Um seinem Wunsch nachzukommen, zeigten ihm die Priester ein anderes Stück. Hier in Äthiopien besitzt jede Kirche mehr als ein >Tabot<. Es gibt sogar Gemeinden, die zehn oder zwölf davon haben, die sie für verschiedene Zeremonien benutzen. Also hat man ihm einen davon gezeigt. Da gibt es gar keinen Zweifel...«
Die Sicherheit, mit der mir der Historiker diese Antwort gab, kräftigte mein Mißtrauen gegenüber der Aussage des armenischen Legaten. Die rote Marmortafel, die er gesehen hatte, besaß keinerlei Beweiskraft für oder gegen Äthiopiens Anspruch, die Bundeslade zu besitzen. Und doch hatte sein Bericht über Aksum einen komplizierten Vorbehalt in mir ausgelöst, der mit dem gesamten Thema der »Tabots« als heilige Gegenstände zusammenhing.

Zwanzigtausend Tabots

Einerseits galten »Tabots« als Repliken der Bundeslade, des truhenartigen Schreins als ganzem also. Andererseits aber bezeichneten die Priester auch jene Dimotheus präsentierte schmale Steintafel als »Tabot« und erklärten, sie stamme *aus* der Bundeslade. Drittens wußte ich, daß jede äthiopische Kirche mindestens einen eigenen »Tabot« besaß. Und die »Tabots«, die ich während meiner Reisen in Äthiopien gesehen hatte, waren tatsächlich Tafeln aus Holz oder Stein - und konnten somit zunächst einmal nicht als Kopie der Bundeslade gelten. Das brachte den gesamten aksumitischen Anspruch, den Schrein zu besitzen, ziemlich ins Wanken. Mich hatte dieses Problem schon einmal sehr irritiert, als mir der Lagerverwalter des British Museum jene unscheinbaren Holztafeln zeigte, die in der Inventarliste als »Tabots« verzeichnet waren.

Ein für allemal mußte ich also herausfinden, was es mit den »Tabots« wirklich auf sich hatte. Ich rief Dr.Belai Gedai an und kam nach einer kurzen Vorstellung gleich zur Sache: »Sind Sie

der Meinung«, fragte ich, »daß sich die Bundeslade in Äthiopien befindet?«

»Ja«, antwortete er mit Nachdruck. »Und nicht nur ich, alle Äthiopier glauben, daß die Bundeslade in Äthiopien ist und in der Marienkirche von Aksum aufbewahrt wird. König Menelik I. brachte sie nach seinem Besuch bei seinem Vater aus Jerusalem mit.«

»Und was hat es mit dem äthiopischen Wort >Tabot< auf sich? Bedeutet es >Lade<? Stellen die >Tabots< Repliken der Lade in Aksum dar?«

»Der Plural von >Tabot< lautet in unserer Sprache >Tabotat<. Ja, es sind Repliken. Da es nur eine einzige echte Lade gibt, das Volk jedoch etwas Greifbares braucht, an das es seinen Glauben heften kann, bedienen sich alle anderen Kirchen dieser Kopien. Es gibt mittlerweile mehr als zwanzigtausend Kirchen und Klöster in Äthiopien und jede von ihnen besitzt zumindest ein >Tabot<.«

»Das genau dachte ich auch, aber gleichzeitig verwirrt es mich.«

»Warum?«

»Weil keiner der >Tabotat<, die ich gesehen habe, Ähnlichkeit mit der in der Bibel beschriebenen Lade hatte. Immer waren es Stein- oder Holztafeln, nie länger oder breiter als dreißig Zentimeter, nie dicker als fünf oder sieben Zentimeter. Wenn diese Gegenstände als Repliken der echten Reliquie gelten sollen, dann lautet die einzig logische Schlußfolgerung, daß es sich bei dieser Reliquie nicht um die Bundeslade handeln kann ...«

»Warum nicht?«

»Wegen der Beschreibung in der Bibel. Im zweiten Buch Mose wird die Lade ganz klar als mittelgroße, rechteckige Truhe beschrieben. Warten Sie bitte einen Moment, ich schaue schnell nach, wie es genau heißt...«

Ich nahm die Bibel zur Hand, suchte die entsprechende Stelle und las laut vor, wie die Lade nach den göttlichen Angaben gefertigt wurde: »Und Bezaleel machte die Lade von Akazien-

holz, dritthalb Ellen lang, anderthalb Ellen breit und hoch, und überzog sie mit feinem Golde .. .«[5]

»Wie lang ist eine Elle genau?« fragte Gedai.

»Ungefähr so lang wie ein Unterarm vom Ellbogen bis zur Spitze des Mittelfingers - mit anderen Worten ungefähr fünfundvierzig Zentimeter. Danach wäre die Lade ungefähr einhundertzwölf Zentimeter lang und achtundsechzig Zentimeter breit und tief. Die >Tabotat< passen nicht zu diesen Abmessungen. Sie sind viel zu klein.«

»Da haben Sie recht«, räumte Gedai ein. »Dennoch besitzen wir die Bundeslade. Das steht fest. Es gibt dafür sogar einen Augenzeugenbericht.«

»Sie meinen den des armenischen Legaten Dimotheus?«

»Nein, nein. Bestimmt nicht. Er hat gar nichts gesehen. Ich spreche von jemandem, der viel früher da war, einem Geographen namens Abu Salih, der übrigens auch Armenier war. Er lebte zu Beginn des dreizehnten Jahrhunderts und bereiste christliche Kirchen und Klöster in Ägypten. Dabei kam er aber auch in benachbarte Länder. Und so findet sich in seinem Buch die Beschreibung der Bundeslade. Wenn ich mich recht erinnere, stimmt sie ziemlich genau mit dem überein, was Sie gerade vorgelesen haben.«

»Ist das Buch von Abu Salih übersetzt worden?«

»O ja. Es gibt eine sehr gute Übersetzung aus dem neunzehnten Jahrhundert, die eigentlich noch zu finden sein müßte. Der Herausgeber war ein gewisser Evetts ...«

Wenige Tage später hielt ich B. T. Evetts Übersetzung von Abu Salihs Monumentalwerk Kirchen und Klöster Ägyptens und einiger Nachbarländer in der Hand. Unter der Überschrift »Abessinien« stieß ich auf acht Seiten eng gedruckter Beobachtungen und Kommentare. Darunter war diese Stelle:

»Die Abessinier besitzen die Bundeslade, in welcher sich zwei Steintafeln befinden, auf denen die Gebote Gottes ... geschrieben stehen. Die Bundeslade wird auf den Altar gestellt, ist jedoch nicht so breit wie dieser; sie ist hoch wie das Knie eines Mannes und von Gold überzogen .. .«[6]

Sogleich maß ich mein eigenes Bein von der Fußsohle bis zum Knie: achtundfünfzig Zentimeter. Für mein Gefühl kam das nahe genug an die im Buch Exodus erwähnten achtundsechzig Zentimeter heran, um von Bedeutung zu sein. Mir war klar, daß ein so grobes Maß nicht die allerletzte Beweiskraft haben konnte, auf der anderen Seite aber schloß es keinesfalls die Möglichkeit aus, daß der armenische Geograph die Bundeslade wirklich gesehen hatte. In jedem Fall, und das machte seinen Bericht so wertvoll, hatte er eine existierende, mit Gold überzogene Kiste oder Truhe beschrieben - und nicht eine der nur wenige Zentimeter dicken Holz- oder Steintafeln.

Ebenso interessant waren einige Einzelheiten über die Verwendung des Gegenstandes während religiöser Riten:

»Viermal im Jahr wird im Palast des Königs ein Gottesdienst mit der Lade gefeiert; und ein Baldachin wird über sie gespannt, wenn sie von ihrer Kirche zu der Kirche im königlichen Palast gebracht wird: nämlich zum Fest der Geburt Christi, zum Fest der Taufe, zum Fest der Wiederauferstehung und zum Fest der Kreuzerhöhung.«[7]

Dieser frühe und sehr sachliche Augenzeugenbericht brachte mich ein gutes Stück voran. Abmessungen und Erscheinungsform trafen im großen und ganzen zu; auch stimmte Abu Salihs Erwähnung des Baldachins mit den in der Bibel niedergelegten Vorschriften überein: »Wenn das Heer aufbricht, so sollen Aaron und seine Söhne hineingehen und den Vorhang abnehmen und die Lade des Zeugnisses darein winden ... und obendrauf eine ganz blaue Decke breiten und ihre Stangen daran legen.«[8]

Bisher hatte sich der armenische Geograph als sehr hilfreich erwiesen, doch auch er gab keine Antwort auf die verzwickte Frage nach den vielen »Tabotat«. Ich konnte dieses Problem nicht einfach ignorieren, und so beschloß ich, mich mit der Etymologie dieses äthiopischen Wortes zu beschäftigen: Bedeutete »Tabot« in seiner Grundform nun »Lade« oder »Steintafel«? Oder bedeutete es vielleicht etwas ganz anderes?

Nun mußte ich mich auf ein Gebiet begeben, das ich noch nie zuvor betreten hatte (und ich würde es vorziehen, es auch nie-

mals wieder zu betreten): die Linguistik. Nachdem ich mich durch einen großen Stapel langwieriger und langweiliger Arbeiten gekämpft hatte, wußte ich schließlich, daß sowohl das alte Ge'ez als auch das moderne und heute weitverbreitete Amharisch aus einer semitischen Sprachenfamilie stammen, zu der auch das Hebräische gehört.[9]

Das biblische Hebräisch verwendete meist das Wort »'aron«, um die Bundeslade zu bezeichnen. Aber von hier aus war kaum eine Verbindung zu »Tabot« herzustellen.[10] Aus einem anderen hebräischen Wort - und darin stimmt die Forschung überein - läßt sich »Tabot« sehr wohl ableiten: aus »Tebah«[11]. Der Begriff taucht im Alten Testament nur zweimal auf. Bezeichnenderweise steht er in beiden Fällen für einen schiffartigen Behälter: für die Arche Noah und den Binsenkorb, in dem Moses auf dem Nil ausgesetzt wurde, um ihn vor dem Zorn des Pharao zu bewahren.

Auch im Kebra Nagast entdeckte ich eine Stelle, an der die Bundeslade als »Bauch eines Schiffes« beschrieben wird. »Zwei und eine halbe Elle soll die Länge sein und ein und eine halbe Elle die Breite, und du sollst sie mit lauterem Gold überziehen.« In diesen Schiffsbauch sollte dann »das Wort des Bundesgesetzes ..., die beiden Tafeln des Bundes«, gelegt werden.[12] Die Überschneidungen verwiesen eindeutig auf den Gebrauch des Wortes »Tabot« als Bezeichnung für die biblische Bundeslade in ihrer ursprünglichen Form als goldüberzogener Behälter - eine Form, für die der »Bauch eines Schiffes« die passende Metapher war, denn so wurde die Bundeslade auch inhaltlich mit früheren »Schiffen« verbunden: mit der Arche Noah und dem Binsenkorb, die ja ebenfalls heilige und wertvolle Dinge enthielten.

Mir war nun klar, daß sich das Wort »Tabot« in seiner korrekten Etymologie nicht auf flache Stein- oder Holzfliesen bezog. Professor Edward Ullendorff, der erste und mittlerweile emeritierte Lehrstuhlinhaber für äthiopische Studien an der Universität London, beantwortete mir schließlich die Frage, warum »Tabot« trotzdem immer wieder auch für die einzelnen Tafeln verwendet wurde:

»Die echte Bundeslade soll sich in Aksum befinden, wonach alle anderen Kirchen nur Repliken besitzen können. In den meisten Fällen handelt es sich jedoch nur um Nachbildungen ihres angeblichen Inhalts, den Gesetzestafeln. Mit anderen Worten: Indem man die Stein- oder Holztafeln als >Tabotat< bezeichnet, bezieht man sich - pars pro toto - auf den wichtigsten Teil der Lade: auf die Tafeln des Bundes .. .«[13]

Fliegen in Bernstein

Ullendorffs Erklärung löste den offensichtlichsten Widerspruch des »Tabot«-Problems auf. Andere Unklarheiten blieben jedoch bestehen, und es war Ullendorff, der sie sogar noch verdichtete. In einer Abhandlung wies er mit Nachdruck darauf hin, daß man das Kebra *Nagast* keinesfalls ernsthaft als historische Quelle begreifen dürfe, die Funktion des Textes bestehe einzig darin, Äthiopien und seine Könige zu verherrlichen. Nur aus diesem Grund habe die Bundeslade überhaupt Eingang in die Legendensammlung gefunden.[14]

Ullendorff war nicht einmal der einzige, der diese Meinung vertrat. Sir E. A. Wallis Budge zum Beispiel wies in der Einführung zu seiner Übersetzung des Kebra Nagast darauf hin, daß es sich bei der Königin von Saba höchstwahrscheinlich überhaupt nicht um eine Äthiopierin handelte: »Viel wahrscheinlicher ist es«, schreibt er, »daß sie aus Sheba oder Saba im Südwesten Arabiens stammte.«[15]

Die meisten Fachgelehrten haben sich dabei auf die Tatsache berufen, daß es zu Salomos Zeiten keine eigenständige Kultur in Äthiopien gab, so daß es höchst unglaubwürdig erschien, dort eine fortschrittliche, städtische Gesellschaft vorzufinden, die in der Lage gewesen wäre, eine so schillernde Persönlichkeit wie die Königin von Saba hervorzubringen. Es bestand weitgehend Konsens darüber, daß es bis zum sechsten Jahrhundert vor Christus keine namhafte kulturelle Entwicklung in den abessinischen Hochländern gab und daß es noch einmal vierhundert

Jahre dauerte, bis man von einer gewissen Verfeinerung sprechen konnte. Diese Veränderung war nicht einmal als äthiopisches Verdienst zu betrachten, da ein Zustrom arabischer Nomaden mit »entwickelteren Qualitäten« als Katalysator für die Entwicklung der trägen Kultur der Ureinwohner galt.

Diese semitischen Emigranten, die vorwiegend aus dem Jemen kamen, »... ließen sich vor allem im Norden Äthiopiens nieder und bewirkten durch ihre Assimilation mit der ortsansässigen Bevölkerung eine kulturelle Transformation. Was sie mit sich brachten, waren Geschenke von unschätzbarem Wert: Religion, höher entwickelte soziale Strukturen, Architektur und Kunst, sowie eine eigene Schrift.«[16]

Kurz gesagt, die äthiopische Zivilisation war nicht nur viel jünger als die aksumitischen Legenden Glauben machen wollten, sie basierte auch noch auf dem Einfluß eines anderen Volkes. Natürlich war den meisten Äthiopiern diese Tatsache im Innersten ihres Herzens bewußt, und so konnten sie ihrem kulturellen Erbe gegenüber nur eine zutiefst verunsicherte Position einnehmen. Ein geschichtliches Standardwerk behauptete sogar, daß das Kebra Nagast nur deshalb so populär war, weil es ein tiefes psychisches Bedürfnis der Abessinier stillte, nämlich »ihre alte Abstammung zu beweisen ..., darin sind sich Emporkömmlinge gleich, ob es sich um Einzelpersonen oder ganze Völker handelt, sie sehnen sich nach Vorfahren, und beide haben sie keinerlei Skrupel, wenn es darum geht, den Stammbaum zu fälschen«[17].

Der zentrale Punkt bei dieser Argumentation lag sicherlich in der Feststellung, daß die Kultur relativ jung war und aus Südarabien stammte. Ich war jedoch nicht im geringsten davon überzeugt, daß dies den Anspruch der Äthiopier auf die Bundeslade ausschloß. Zuerst differenzierte ich meine Nachforschungen insofern, als ich nach verschiedenen ethnischen Gruppen suchte, die in der äthiopischen Geschichte eine Rolle gespielt hatten. Dabei stieß ich erneut auf die Falaschen.

Im Kebra *Nagast* wird mit einiger Deutlichkeit festgestellt, daß der jüdische Glaube im Jahre 950 vor Christus nach Äthio-

pien kam, als Menelik aus Jerusalem in sein Land zurückkehrte. Oberflächlich betrachtet, schien die Existenz der eingeborenen schwarzen Juden Äthiopiens Beweis genug zu sein, um das Vorhandensein der Lade zu bestätigen. Sah man jedoch genauer hin, so war dies ganz und gar nicht der Fall - zumindest nach Meinung der Wissenschaftler. Schon Richard Pankhurst hatte mir berichtet, welche Auffassung die Lehrmeinung vertrat: nämlich daß der jüdische Glaube kaum vor dem zweiten vorchristlichen Jahrhundert nach Äthiopien gelangt sein konnte, zu diesem Zeitpunkt aber über das Rote Meer aus dem Jemen kam, wo sich um 70 nach Christus eine große jüdische Gemeinde gebildet hatte, die vor der römischen Verfolgung aus Palästina geflohen war.[18] Bis weit in das sechste Jahrhundert hinein haben diese Emigranten die Vorfahren der Falaschen zum jüdischen Glauben bekehrt.[19]

Ich entschloß mich, diesen Punkt sehr eingehend zu untersuchen. Wenn der jüdische Glaube der Falaschen tatsächlich weit weniger als zweitausend Jahre alt war und zudem aus Arabien stammte, dann war eine ganze Reihe meiner zunächst überzeugenden Beweise für einen direkten Kontakt zwischen Äthiopien und Jerusalem in alttestamentarischer Zeit mit einem Schlag hinfällig geworden. Aber auch die Geschichten um Aksum und die Bundeslade hätten viel, wenn nicht sogar alles von ihrer Glaubwürdigkeit eingebüßt.

Kaum daß ich begonnen hatte, mich mit diesem Problem auseinanderzusetzen, wurde mir schon klar, daß der wissenschaftliche Konsens über die »Jemen-Theorie« vor allem deshalb entstanden war, weil schlicht und einfach ein Mangel an Beweisen für andere Theorien herrschte. Man hatte sich auf Südarabien als Ausgangspunkt konzentriert, weil von dort auch andere Emigrationsbewegungen nach Äthiopien ausgegangen waren.[20] Ich erkannte darin nichts weiter als ein erbärmliches Versagen der Logik. Denn hier wurde das Nicht-Vorhandensein von Beweisen kurzerhand gleichgesetzt mit dem Beweis für das Nicht-Vorhandensein einer bestimmten Entwicklung - ein trügerischer Umkehrschluß! Um es noch einmal zu wiederholen: Das

Problem lag im Mangel an Hinweisen, daß das Judentum viel früher und auf einem anderen Weg nach Äthiopien gelangt war. Aber gleichzeitig konnte niemand mit Sicherheit behaupten, daß dies *nicht* der Fall war.

Für mich war also alles noch offen, so daß ich mich entschloß, die Überlieferungen, den Glauben und das Verhalten der Falaschen zu studieren und daraus meine eigenen Schlüsse über ihre Abstammung zu ziehen. Dabei bedachte ich, daß ihre religiösen Bräuche im zwanzigsten Jahrhundert durch den großen Einfluß westlicher, vor allem auch jüdischer Besucher zweifellos verändert worden waren, so daß ich mich zunächst älteren Berichten zuwandte, die ihren Lebensstil beschrieben, bevor sie mit den modernen Kulturen in Berührung gekommen waren.

Ironischerweise waren einige dieser Berichte von Fremden verfaßt worden, die mit der erklärten Absicht nach Äthiopien gereist waren, dort eine kulturelle Veränderung herbeizuführen. Besonders zu erwähnen sind dabei die christlichen Missionare des neunzehnten Jahrhunderts, die von der Existenz der abessinischen Juden gehört hatten und sich sofort dorthin begaben, um sie zum wahren Glauben zu bekehren.[21]

Einer dieser Evangelisten war Martin Flad, der 1855 nach Äthiopien kam, um im Auftrag der »Londoner Gesellschaft zur Verbreitung des Christentums« missionarische Arbeit zu leisten. Sein Buch Die Falaschen Abessiniens wurde im Jahre 1869 veröffentlicht. Ich fand eine abgenutzte und zerlesene Ausgabe in der British Library und war sogleich von einigen Stellen fasziniert, in denen der Autor darauf beharrte, daß es mindestens seit der Zeit des Propheten Jeremia um 627 vor Christus, möglicherweise jedoch schon seit der Regierungszeit Salomos, Juden in Äthiopien gegeben habe. Flad stützte seine Behauptungen unter anderem auf folgenden Sachverhalt:

»Die Falaschen kennen weder den babylonischen noch den jerusalemischen Talmud, deren beider Wurzeln aus der Zeit der Gefangenschaft stammen. Sie feiern weder Purim noch das Fest der Tempelweihe, die von den Juden unserer Tage noch immer feierlich begangen werden .. .«[22]

Das Fest der Tempelweihe ist besser bekannt als Chanukka, was wörtlich »Weihe« bedeutet. Seine Entstehung läßt sich auf das Jahr 165 vor Christus datieren.[23] Es hätte also mit einiger Sicherheit zum religiösen Brauchtum einer jüdischen Gemeinde, die siebzig Jahre nach Christus entstand, gehören müssen. Die Nichtbeachtung von Chanukka ließ nur eine logische Schlußfolgerung zu: Die Falaschen mußten den jüdischen Glauben bereits vor 165 vor Christus angenommen haben - und damit folglich nicht aus dem Jemen, sondern aufgrund eines anderen Einflusses.

Als nächstes beschäftigte ich mich mit dem Purim-Fest, von dem die äthiopischen Juden, wie Flad feststellte, ebenfalls nichts wußten. Auch dieses Fest reicht auf das zweite Jahrhundert vor Christus zurück. Es war sogar denkbar, daß seine Ursprünge noch weiter zurücklagen: Die Ereignisse, an die der Feiertag erinnert, fanden Mitte des fünften Jahrhunderts vor Christus statt[24], so daß einige der von mir konsultierten Standardwerke annahmen, daß das Fest um das Jahr 425 vor Christus schon weit verbreitet gewesen sein dürfte. Allem Anschein nach waren die Falaschen also lange vor diesem Zeitpunkt von den Entwicklungen des Judentums abgeschnitten, vielleicht schon seit dem sechsten Jahrhundert vor Christus.

Ich fühlte, wie sich die Lücke zwischen der abessinischen Legende und den historischen Tatsachen schloß: Es sah immer mehr danach aus, daß der jüdische Glaube Äthiopien schon zu alttestamentarischen Zeiten erreicht hatte, so wie es das Kebra Nagast und die Falaschen behaupteten. Daher mußte auch die Geschichte vom Raub der Bundeslade durch Menelik mit mehr Ernst betrachtet werden, als es die Wissenschaft bisher getan hatte.

Weitere Beweise lieferte ein anderer Missionar des neunzehnten Jahrhunderts, Henry Aaron Stern. Er hatte mit Flad zusammengearbeitet, war mit ihm durch Äthiopien gereist und hatte seine Wanderungen *mit* den *Falaschen* in Äthiopien im Jahre 1862 veröffentlicht. Während meiner Lektüre dieses dreihundert Seiten starken Bandes entwickelte ich eine starke

Abneigung gegen den Verfasser, der sich mir als arroganter, brutaler und skrupelloser Bekehrer darstellte und nicht den geringsten Respekt für die Kultur und Traditionen des Volkes besaß, das er erforschte. Überhaupt schienen mir seine Beobachtungen dürftig und wenig genau. So war ich nach der Lektüre der ersten Hälfte des Buches ziemlich ungehalten.

Dann aber stieß ich auf etwas Interessantes. Stern beschreibt, wie genau die äthiopischen Juden den Gesetzen Mose folgten, »welche die Vorlage sind, nach denen sie ihren Glauben geformt haben ...«, und fügt hinzu:

»Es mag seltsam klingen, von einem jüdischen Altar und Sühneopfern in der Mitte Afrikas zu hören ... Und doch befindet sich auf der Rückseite jeder Kultstätte eine kleine Einfriedung mit einem großen Stein in der Mitte; auf diesem urtümlichen Altar wird das Opfer geschlachtet und der dazugehörige Ritus ausgeführt.«[25]

Was das Judentum betraf, so verfügte ich damals nur über ein relativ begrenztes Wissen, aber ich wußte genau, daß moderne Juden an keinem Ort der Erde mehr Tiere opferten. In seiner Beschreibung des Opferplatzes schrieb der deutsche Missionar weiter:

»Dieses Heiligtum wird streng vor unrechtmäßigem Betreten geschützt ... Ich selbst hätte diese unverzeihliche Tat eines Tages fast begangen. Es war ein sehr schwüler Nachmittag, als wir nach mehreren Stunden ermüdenden Marsches ein Falaschen-Dorf erreichten. Nichts anderes im Sinn, als mich kurz zu erholen..., erblickte ich zufällig in der Mitte eines abgelegenen Grasstücks einen glatten Stein, der dazu einlud, dem Müden Abgeschiedenheit und Ruhe zu spenden. Die dornige Einfriedung gab dem Eisen meiner Lanze sofort nach, und gerade wollte ich es mir bequem machen, als mich ein Chor wütender Stimmen auf meinen Irrtum aufmerksam machte und mich zum schnellen Rückzug zwang.«[28]

Insgeheim wünschte ich mir, Stern hätte seine gerechte Strafe für die Zerstörung des heiligen Ortes erhalten. Gleichzeitig jedoch mußte ich ihm dankbar sein, daß er meine Aufmerksam-

keit auf die Opferbräuche der Falaschen gelenkt hatte. Mit Sicherheit würde es sich lohnen, diesem Hinweis zu folgen, um so den Zeitpunkt genau zu bestimmen, an dem die äthiopischen Juden von ihren Glaubensgenossen und deren Weiterentwicklung getrennt worden waren.

Das Zustandekommen der jüdischen Opferriten war nicht einfach zu verfolgen. Ihren Anfang nahmen sie wohl in einfachen Gottesopfern, die von jedermann, gleich ob Priester oder Laie, und an jedem Ort, an dem sich ein Heiligtum befand, vollbracht werden konnten. Dies änderte sich nach dem Auszug aus Ägypten. Während der Wanderschaft der Israeliten durch die Wüste von Sinai wurde die Bundeslade gebaut und in einem tragbaren Zelt oder Tabernakel aufbewahrt. Fortan mußten alle Opfer an der Schwelle zum Tabernakel dargebracht werden, und wer dieses Gesetz mißachtete, dem drohten Vertreibung und Tod:

»Welcher Mensch aus dem Hause Israel ... ein Opfer oder Brandopfer tut und bringt's nicht vor der Tür der Hütte des Stifts, daß er's dem Herrn tue, der soll ausgerottet werden von seinem Volk.«[27]

Diese Vorschrift sollte bewirken, daß ein Ritus von so großer Bedeutung allein an einem religiösen Zentrum durchgeführt wurde, wenn ein solcher Ort vorhanden war. In der Wildnis war die Stiftshütte ein solches Zentrum. Später, um 1200 vor Christus, entstand das erste Nationalheiligtum der Israeliten in Silo. Erst als Silo um 1050 vor Christus zerstört wurde und das Volk die Stadt verlassen mußte, war es wieder erlaubt, an den Kultstätten der jeweiligen Gemeinden Opfer darzubringen.[28] Mit der Errichtung des ersten Tempels existierte wieder ein religiöses Zentrum. Es hat jedoch den Anschein, als habe man Opferungen außerhalb des Tempels - vor allem bei jüdischen Gemeinden, die weit von der Hauptstadt entfernt lebten - nicht so streng verfolgt, wie es das Gesetz vorschrieb. Aber mit der Regentschaft König Josias (639-609 vor Christus) wurden wieder drastische Strafen verhängt.[29] Mit den Jahrhunderten hat sich dieses Verbot so tief im jüdischen Glauben verwurzelt, daß

sie selbst in den Jahren nach 587 vor Christus, nach der Zerstörung des Tempels durch Nebukadnezar, an keinem anderen Ort mehr Opferungen darbrachten. Der Brauch aus früheren Zeiten, sich den einzelnen lokalen Kultstätten zuzuwenden, wenn eine nationale Stätte fehlte, schien unwiderruflich vergessen zu sein. Offenbar hat das Fehlen eines Tempels schlicht zum Aussetzen der Opferriten geführt.[30]

Nach der Rückkehr aus dem babylonischen Exil wurde der zweite Tempel in Jerusalem errichtet und der alte Brauch des Blutopfers erneuert. Noch einmal gab es eine lange Periode, in der Opferungen ausschließlich vor dem Allerheiligsten des Tempels dargebracht werden durften - von 520 vor Christus bis 70 nach Christus, als der römische Kaiser Titus den Tempel zerstören ließ.[31]

An den Bau eines dritten Tempels haben die Juden offensichtlich nie gedacht, und mit dem Fehlen eines zentralen Heiligtums endete zugleich der alte Brauch der Opferungen. Die einzige Ausnahme bildeten die Falaschen.[32] Ich fand sogar heraus, daß dieser Ritus bei den Falaschen so tief verwurzelt war, daß die meisten von ihnen selbst heute noch, wo sie verstärkt mit dem modernen Judentum in Berührung kommen, daran festhalten.[33]

Dafür konnte es eine Reihe von Erklärungen geben. Die naheliegendste und interessanteste war zugleich die einfachste und schien mir der Wahrheit am nächsten zu kommen. In meinem Notizbuch entwarf ich die Abfolge der Ereignisse:

AUSGANGSPUNKT: Die Vorfahren der heutigen Falaschen mußten zu einer Zeit zum Judentum konvertiert sein, als es für die nicht in der Nähe Jerusalems lebenden Israeliten noch möglich war, an örtlichen Kultstätten zu opfern. Ihre Bekehrung mußte also vor dem strengen Verdikt König Josias stattgefunden haben, d.h. nicht später als 639 vor Christus, wahrscheinlich sogar sehr viel früher.

ANNAHME: Zu irgendeinem Zeitpunkt zwischen der Errichtung des ersten Tempels und der Regentschaft Josias emigrierte eine Gruppe von Juden aus Israel, um sich in Äthiopien nieder-

zulassen. Dort errichteten sie Kultstätten, brachten ihrem Gott Opfer dar und bekehrten die Eingeborenen zu ihrem Glauben. Vielleicht unterhielten sie anfänglich noch Kontakte zu ihrer Heimat. Man kann jedoch davon ausgehen, daß die Verbindung aufgrund der großen Entfernung schließlich völlig abbrach. Es gab also keine Berührungspunkte mehr mit den Umwälzungen, denen das jüdisch-theologische Gedankengut in den folgenden Jahrhunderten ausgesetzt war. Das würde erklären, warum die Falaschen die einzigen Juden sind, die noch Opfer darbringen. Eingeschlossen wie Fliegen in Bernstein, gefangen in einer anderen Zeit, sind sie die letzten Überlebenden, die das ursprüngliche Judentum des ersten Tempels praktizieren. Aber:

FRAGE: Warum sollten Juden in ein so weit entferntes Land wie Äthiopien emigrieren. Es mußte einen triftigen Grund dafür gegeben haben.

ANTWORT: Das Kebra *Nagast* beantwortet die Frage nach den Motiven. Es sagt, daß es sich bei den Emigranten um die erstgeborenen Söhne der Ältesten Israels handelte, die im Gefolge Meneliks die Bundeslade begleiteten, die sie aus dem Tempel geraubt hatten.

Niedergang einer Religion

Wenn die Darstellung des Kebra *Nagast* der Wahrheit entsprach, so mußte es auch in anderen historischen Dokumenten Beweise dafür geben, daß der jüdische Glaube damals sehr viel stärker verbreitet war als im heutigen Äthiopien. Das war durchaus vorstellbar, da die Geschichte des abessinischen Judentums mit einer so schillernden Persönlichkeit wie Menelik I. in Verbindung gebracht worden war. Zudem erinnerte ich mich, daß mir Richard Pankhurst erzählt hatte, wie mächtig und reich das Volk der Falaschen und seine Könige einst gewesen sein mußten. Ich führte deshalb ein weiteres Telefongespräch mit Richard, um ihn nach Quellen zu fragen, die etwas mehr Licht auf den Aufstieg und Niedergang dieses Volkes werfen würden.

Er verwies mich auf ein Buch, von dem ich schon einmal gehört hatte: *Reisen zur Entdeckung der Quellen des Nils in den Jahren 1768 bis 1773* von einem schottischen Abenteurer namens James Bruce of Kinnaird. Dazu empfahl er mir die Königlichen Chroniken, die seit dem Mittelalter im Auftrag der äthiopischen Herrscher erstellt worden waren: »Hier werden die Kriege zwischen den Christen und Juden dokumentiert, vielleicht interessiert dich das. Darüber hinaus fällt mir leider nichts weiter ein. Das Problem ist«, schloß er, »daß vor Bruce nichts Bedeutendes über die Falaschen geschrieben wurde ...«

James Bruce of Kinnaird war eine rätselhafte Gestalt. Er stammte aus einer strenggläubigen Presbyterianerfamilie aus Stirlingshire, gehörte dem niederen Adel an und hatte genug geerbt, um seiner lebenslangen Neigung für Reisen nachgehen zu können. Zunächst hatte ich den Eindruck, als habe ihn lediglich dieser Wandertrieb in das abessinische Hochland geführt. Als ich aber seine Beobachtungen über die Falaschen las, wurde mir klar, daß sein Interesse an diesem Volk zu intensiv und nachhaltig war, als daß man es allein mit der Neugier eines gebildeten Reisenden hätte erklären können. Über einen Zeitraum von sieben Jahren hinweg führte er minutiöse Nachforschungen über den Glauben, die Bräuche und geschichtlichen Ursprünge der schwarzen Juden Abessiniens durch. Dabei gelang es ihm, im Gespräch mit Stammesältesten und Priestern viele alte Überlieferungen aufzuzeichnen, die ansonsten wahrscheinlich unwiderruflich verlorengegangen wären.

Eine dieser Legenden schilderte, wie König Ezana von Aksum gerade dabei war, die Psalme Davids zu lesen, als ihm zum erstenmal Frumentius gegenübertrat, der junge Syrer, der ihn später zum Christentum bekehren sollte.[34] Bruce zweifelte nicht daran, daß die Kenntnis des Herrschers von diesem alttestamentarischen Buch aus der weitverbreiteten Vorherrschaft des Judentums zu jener Zeit resultierte[35] - also zu Beginn des vierten Jahrhunderts nach Christus.

Gerade die Tatsache, daß diese Religion sich bereits zu einem so frühen Zeitpunkt etabliert hatte, unterstützte meine Auffas-

sung, daß in Äthiopien eine archaische, den Brauch des Blutopfers bewahrende Form des jüdischen Glaubens schon seit vielen Jahrhunderten bestanden haben mußte.

Weitere Bestätigung fand ich in einem alten und seltenen äthiopischen Manuskript, das sich in der tigreischen Festung Magdala befunden hatte (die im neunzehnten Jahrhundert von britischen Streitkräften unter General Napier erstürmt und verwüstet wurde). In diesem Werk mit dem Titel *Geschichte* und *Genealogie* der alten Könige las ich folgende Passage:

»Das Christentum wurde im Jahre 331 nach Christi Geburt von Abuna Salama, der zuvor unter dem Namen Frumentius oder Frumentos bekannt war, in Abessinien eingeführt. Bevor die christliche Religion in Äthiopien bekannt wurde, war die Hälfte der Einwohner Juden, die sich streng an die Gesetze hielten; die andere Hälfte verehrte Sando, den Drachen .. .«[38]

Der Verweis auf den »Drachen« - vermutlich ein Überbegriff für alle Arten primitiver Gottheiten - war interessant. Er unterstellte, daß das Judentum zu keiner Zeit die einzige oder Staatsreligion Äthiopiens war, und daß die Falaschen - wie andere Juden auch - in vorchristlicher Zeit die Koexistenz anderer Kulte akzeptierten. Ich konnte mir jedoch gut vorstellen, daß sie wachsam wurden und gezwungen waren, ihre traditionelle Toleranz aufzugeben, als militante, monotheistische Predigersekten wie die Christen auftauchten, die man mit Recht als Gefahr für die starke Verbreitung des jüdischen Glaubens ansehen mußte. Gerade in einem solchen Zusammenhang nahm sich die Bekehrung des aksumitischen Königs besonders bedrohlich aus; und tatsächlich war dies der Zeitpunkt, wo die erbitterten Auseinandersetzungen zwischen Juden und Christen begannen.

Der schottische Abenteurer behauptete zum Beispiel, daß die Falaschen »zum Zeitpunkt ihrer Bekehrung zum Christentum, oder wie sie sagen >ihrer Apostasie<, sehr mächtig waren. Damals ernannten sie einen Prinzen aus dem Stamme Juda, aus dem Geschlecht des Salomo und des Menelik, zu ihrem König. ... Dieser Prinz weigerte sich, den Glauben seiner Väter aufzu-

geben .. .«[37] Eine solche Situation, fügte Bruce hinzu, mußte unweigerlich zu einem machtpolitischen Konflikt führen, da die Christen behaupteten, ebenfalls von einem König aus dem Geschlecht Salomos regiert zu werden: »Obgleich es keinerlei Blutvergießen wegen der unterschiedlichen Religionen gab, wurden, da jede Seite einen König mit den gleichen Ansprüchen besaß, viele Kriege aus Gründen des Machthungers und des rivalisierenden Anspruchs auf die Herrschaft ausgefochten.«[38]

Bruce ging auf die »vielen Kriege« leider nicht weiter ein, und auch die Geschichtsbücher schwiegen sich zu diesem Thema aus. Erwähnt wird lediglich, daß Kaleb, der christliche König von Aksum, im sechsten Jahrhundert nach Christus eine große Armee um sich sammelte und über das Rote Meer zog, um im Jemen gegen einen jüdischen Herrscher zu kämpfen.[39]

Beweise für die Eskalation der Kämpfe zwischen Juden und Christen fanden sich wiederum im Kebra Nagast. Ein von antisemitischen Vorurteilen fast überschäumendes Kapitel gegen Ende des Epos erzählt von König Kaleb: Ohne ersichtlichen Grund werden hier die Juden mit einem Mal als »Feinde Gottes« bezeichnet, die man »bekämpfen und vernichten« und deren Land man »verwüsten« müsse.[40] Sodann berichtet die Legende von den zwei Söhnen Kalebs: Israel der eine, der andere Gebre Maskal, was soviel bedeutet wie »Diener des Kreuzes«. Die Anspielung auf die jüdisch-christliche Spaltung war kaum zu übersehen, wobei die Christen natürlich durch Gebre Maskal, und die Juden durch Israel symbolisiert wurden. Nun erinnerte ich mich auch daran, daß sich die Falaschen selbst nie als Falaschen, sondern immer als »Beta Israel«, als »Haus Israel«, bezeichneten.[41]

Die Grundaussage dieser Passagen war mir also klar, doch dann verkomplizierten schwerverständliche und undurchschaubare Bilder das Verständnis des Kapitels. Zum Beispiel tauchten mehrmals die Begriffe »Triumphwagen« und »Zion« auf. Ich wußte mittlerweile genau, daß es sich bei »Zion« um eines der vielen Synonyme handelte, die das Kebra Nagast für die Bun-

deslade einsetzt. Mit dem ersten Begriff konnte ich jedoch so gut wie nichts anfangen.

Ich verstand mehr, als ich las, daß es Israel und Gebre Maskal bestimmt war, gegeneinander zu kämpfen. Nach der Schlacht spricht Gott zu Gebre Maskal: »... >wähle dir zwischen dem Wagen und Zion!< und er wird seinen Wunsch dahin lenken, daß er Zion nimmt und öffentlich König sein wird auf dem Thron seines Vaters. Israels Wunsch aber wird er dahin lenken, daß er den Wagen wählt und heimlich König sein wird, und daß er unsichtbar werde .. .«[42]

In diesem Tenor schließt das Kebra Nagast:

»Dann wird die Herrschaft der Juden vorüber sein, und das Reich Christi wird bestehen bis zur Ankunft des Antichrists ... So hat Gott dem König von Äthiopien Herrlichkeit und Gnade zuteil werden lassen, und er ist größer als alle anderen Könige der Erde, um der Größe Zions willen, der Gesetzeslade Gottes, der himmlischen Zion.«[43]

Mir war klar, daß die Anhänger der neuen Religion triumphierten, während die Verfechter des alten Glaubens besiegt wurden. Ebenso klar war es, daß die Bundeslade im Mittelpunkt dieses Machtkampfes stand, und daß es den Christen offenbar gelungen war, sie den Juden zu entwenden, die sich fortan mit dem »Triumphwagen«, dem zweitbesten, zufriedengeben mußten.

Doch die Geschichte zeigt, daß sich die Falaschen mit ihrem Machtverlust nicht abfinden wollten. Im Gegenteil, vieles ließ darauf schließen, daß sie mit großer Willenskraft und über einen langen Zeitraum hinweg zurückgeschlagen hatten.

Den ersten Hinweis über einen fortgesetzten Krieg zwischen Christen und Juden fand ich in einem Reisebericht aus dem neunten Jahrhundert, verfaßt von einem gewissen Eldad Hadani, den man auch Eldad »den Daniden« nannte, da er behauptete, ein Nachfahre des verlorenen israelischen Stammes Dan zu sein. Wer genau er war und woher er stammte, war nicht festzustellen. In einem weitverbreiteten Brief aus dem Jahre 833 nach Christus gab er an, daß die Daniden und drei weitere

»verlorene« jüdische Stämme in Äthiopien lebten, wo sie sich in ständiger Zwietracht mit den christlichen Herrschern des Landes befanden.[44]

Historiker waren sich uneins, was die Bewertung Eldads als zuverlässige Quelle betraf. Die einen lehnten den Brief als unglaubwürdige Fälschung ab, andere waren der Meinung, daß sich die meisten seiner Aussagen auf Tatsachen gründeten.[45] Ich zögerte nicht, mich letzteren anzuschließen - allein deshalb, weil Eldads Aussagen sich mit anderen Berichten zu sehr überschnitten, um reine Erfindung zu sein. Er bestand zum Beispiel darauf, daß sein Stamm zur Zeit des ersten Tempels, kurz nach der Trennung der Königreiche Juda und Israel im Jahr 926 vor Christus aus dem Heiligen Land nach Äthiopien emigriert war. Folglich feierten sie keine Feste, die nach diesem Zeitpunkt entstanden - wie Purim und Chanukka. Zudem hatten sie keine Rabbiner (da das Rabbinertum sich erst in der Zeit des zweiten Tempels entwickelte[46]): Ihre Religionsführer wurden noch »kahen« genannt, ein Wort, das aus dem hebräischen »kohen« abgeleitet wird, soviel wie »Priester« bedeutet und in die Zeit des ersten Tempels zurückreicht.[47]

Alles in allem konnte man den starken Eindruck gewinnen, daß Eldad tatsächlich in Äthiopien gewesen war und eine relativ genaue Beschreibung über den Zustand des Judentums in der Mitte des neunten vorchristlichen Jahrhunderts gegeben hat. Auch sein Bericht über die Kämpfe zwischen den abessinischen Juden und ihren Nachbarn erschien glaubhaft:

»Und ihr Banner ist weiß, und darauf steht in schwarz zu lesen, >Höre Oh Israel, der Herr unser Gott ist ein Gott< ... Sie sind so zahlreich wie der Sand am Meeresstrand und kennen kein anderes Geschäft als das des Krieges, auch sagen sie, wenn immer sie kämpfen, daß es für starke Männer nicht gut sei zu fliehen; mögen ihre Herzen gestärkt werden in Gott.. ,«[48]

Eldad erwähnte weiter, daß die jüdischen Stämme in ihren kriegerischen Bemühungen erfolgreich waren und »ihre Hände im Nacken der Feinde« hatten.[49] Auch das schien mir eine durchaus zutreffende Beurteilung der wahren Machtverhält-

nisse zu sein. Schließlich ging es genau um den Zeitraum, in dem die christlich-salomonische Dynastie von Aksum gestürzt wurde. Dieser »coup d'état« war das Werk einer jüdischen Königin, der großen Königin Gudit.

Gudits kurzer und blutiger Regentschaft folgte die Zagwe-Dynastie (die zu einem nicht genau bestimmbaren Zeitpunkt zum Christentum übergetreten war) und schließlich König Lalibela. Etwa fünfzig Jahre nach Lalibelas Tod dankte der letzte Zagwe zugunsten der salomonischen Linie ab. Welches Verdienst der Übergangsregierung der Zagwe auch immer zugekommen war, dem ständigen Konflikt zwischen Juden und Christen vermochten sie keinen Einhalt zu gebieten. Benjamin von Tudela, ein weitgereister spanischer Händler aus dem zwölften Jahrhundert, berichtete von der Existenz äthiopischer Juden, die »sich nicht unter dem Joch der Nichtjuden befanden« und »Städte und Burgen auf den Spitzen der Berge« besaßen. Er sprach von Kriegen gegen die Christen, aus denen die Falaschen meist siegreich hervorgingen und nach Belieben »plünderten und Beute nahmen«, da keiner »gegen sie ankam«[50].

Im fünfzehnten Jahrhundert berichtete der jüdische Reisende Elias von Ferrara, wie ihm ein junger Falasche in Jerusalem erzählte, daß seine Glaubensgenossen »in einer bergigen Gegend ihre Unabhängigkeit bewahrt hatten, und daß sie von dort beständig kriegerische Angriffe gegen die christlichen Herrscher Äthiopiens führten«[51].

Hundert Jahre später behauptete der Bischof von Oviedo, ein spanischer Jesuit, daß die Falaschen sich in »hohen, unzugänglichen Bergen« versteckten, und daß sie »den Christen große Landstücke geraubt hatten und die Könige von Äthiopien sie nicht unterwerfen konnten, da sie nur eine kleine Streitmacht besaßen und es sehr schwierig war, in ihre unwegsamen Berge einzudringen«[52].

Der Bischof irrte. Seine Aussage stammte aus dem Jahre 1557, als die Falaschen, weit davon entfernt, irgend jemandem Land zu rauben, sich bereits den ständigen Angriffen der christlichen Streitmächte gegenübersahen, die es allem Anschein

nach auf einen Völkermord abgesehen hatten. Der salomonische Herrscher Sarsa Dengel, der von 1563 bis 1597 regierte, führte einen siebzehn Jahre dauernden Feldzug gegen sie - einen Feldzug, der von einem namhaften Historiker als »wahrhafter Kreuzzug, gelenkt von religiösem Fanatismus« bezeichnet wurde.[53]

Die Verteidiger hielten sich mit großer Würde, obgleich sie in ihren Festungen im Simiengebirge brutalen Angriffen ausgesetzt waren. Selbst Sarsa Dengeis speichelleckender Chronist konnte sich der Bewunderung für einige jüdische Frauen nicht erwehren, die sich mit dem Aufschrei »Gott steh mir bei« von einem Felsen stürzten, bevor die Männer des Königs sie ergreifen und schänden konnten.[54]

Radai, der König der Falaschen, wurde schließlich gefangengenommen. Man war bereit, ihm das Leben zu schenken, wenn er die Jungfrau Maria um Gnade anflehte. Aber Radai soll gesagt haben: »Ist es nicht verboten, den Namen Mariae zu nennen? So macht zu! Es ist besser für mich, die Welt der Lügen zu verlassen, um in die Welt des Rechts einzugehen, von der Dunkelheit zum Licht. Tötet mich, schnell!« Yonael, der General des christlichen Königs, entgegnete darauf: »Wenn du den Tod vorziehst, so senke deinen Kopf und stirb mit Würde.« Radai tat wie ihm befohlen und Yonael holte mit seinem langen Schwert aus: Mit einem einzigen Schlag enthauptete er den Herrscher der Falaschen, und die Klinge versank erst im Boden, nachdem sie auch noch seine Knie durchtrennt hatte. Die Zeugen dieser grausamen Begebenheit bewunderten »den Mut des Juden, der in seiner Todesstunde erklärte, daß die Dinge der Erde schlecht und die des Himmels gut seien«[55].

Gegen Ende des Feldzuges wurden auch die letzten Bastionen der Falaschen angegriffen und erobert. In beiden Fällen zogen die jüdischen Anführer und ihre Männer den Selbstmord der Gefangenschaft vor. Dies setzte den Verfolgungen jedoch kein Ende. Im Gegenteil, als König Susneyos im Jahre 1607 den Thron bestieg, wurden noch schrecklichere Greueltaten begangen. Der Monarch führte ein Pogrom gegen die Falaschen durch,

die noch in dem weiten Hochland lebten, das sich zwischen Simiengebirge und Tanasee erstreckt. Es folgten zwanzig Jahre »unbeschreiblichen Gemetzels«, Tausende wurden getötet und ihre Kinder als Sklaven verkauft. Dem detaillierten Bericht James Bruce' zufolge wurde den wenigen Überlebenden »unter Androhung der Todesstrafe befohlen, ihrem Glauben abzuschwören und sich taufen zu lassen. Da sie keinen Ausweg wußten, gaben sie nach .... so daß viele in der Folge getauft wurden und am Sabbat pflügen und eggen mußten.«[56]

Diese unablässige und rachsüchtige Unterdrückung beraubte die äthiopischen Juden schließlich für immer ihrer kulturellen Autonomie - und ließ ihre glanzvolle Geschichte unaufhaltsam in Vergessenheit geraten. Die Dokumente und wissenschaftlichen Studien, die ich zur Verfügung hatte, erlaubten es mir sogar, das graduelle Zurückweichen und Verschwinden der Falaschen in Zahlen auszudrücken. Zu Beginn des siebzehnten Jahrhunderts sollen die Falaschen über ungefähr »einhunderttausend kampffähige Männer« verfügt haben.[57] Wenn man auf einen kampffähigen Mann eine fünfköpfige Familie rechnet, so ergibt sich für diesen Zeitraum eine Gesamtbevölkerung von etwa fünfhunderttausend Menschen. Fast dreihundert Jahre später, im ausgehenden neunzehnten Jahrhundert, gab der jüdische Gelehrte Josef Halévy die Gesamtzahl der Falaschen mit einhundertfünfzigtausend an.[58] Der auf genauen Informationen basierenden Schätzung von Jacques Faitlovich zufolge war diese Zahl in den zwanziger Jahren unseres Jahrhunderts auf fünfzigtausend gesunken.[59] Und sechzig Jahre später, während der Hungersnot von 1984, gab es nur noch achtundzwanzigtausend Falaschen in Äthiopien.[60]

Die Unterdrückung und Verarmung der Falaschen, wie sie sich der Geschichte seit einigen Jahrhunderten präsentiert, widerlegte den Anspruch der Legenden keineswegs, die von Menelik I. ein strahlendes Bild zeichnen und den Glanz und die Macht der Falaschen-Könige hervorheben. Das einzig plausible Motiv für die gnadenlosen Pogrome und Kriege gegen die Falaschen lag gerade darin, daß die Christen ein Wiedererstar-

ken des Judentums fürchteten. Nun war ich mir sicher: Die äthiopischen Juden mußten über viele Jahrhunderte hinweg einen außerordentlich großen und prägenden Einfluß auf die Geschichte ihres Landes ausgeübt haben, denn nur so war die unstillbare Verfolgungswut der christlichen Herrscher zu verstehen.

Mit einer Zusammenfassung verdeutlichte ich mir den Stand meiner Untersuchungen:

- Die religiösen Praktiken der Falaschen (darunter vor allem der alte Brauch des Blutopfers) erwecken bei mir einige Zweifel an der akademischen Lehrmeinung, derzufolge das Judentum erst spät und über Südarabien nach Äthiopien gelangte. Vielmehr läßt die Beweislage darauf schließen, daß der jüdische Glaube Abessinien zur Zeit des ersten Tempels erreicht hat und dort isoliert wurde. Noch immer scheint mir das Kebra *Nagast* die besten Hinweise auf diese Entwicklung zu liefern. Demzufolge muß der äthiopische Anspruch auf die Bundeslade ernstgenommen werden.

- Es gibt stichhaltige Beweise, daß der jüdische Glaube, lange bevor Äthiopien zum Christentum übertrat, eine starke Kraft im Lande bedeutete. Nur aus diesem Grunde konnte ein so langwieriger und tödlicher Kampf zwischen Juden und Christen entbrennen. Die Sieger dieser Auseinandersetzung, die Christen, erbeuteten die Bundeslade und bezogen sie nach und nach in ihre Religion mit ein. Nur so ist es zu verstehen, daß das eigentlich alttestamentarisch-jüdische Heiligtum noch immer eine entscheidende Rolle im äthiopischen Christentum spielt.

- Die Repliken der Bundeslade stellen eher ihren Inhalt als die Lade selbst dar. Im Allerheiligsten einer jeden Kirche befindet sich ein »Tabot«. Nur ein mächtiger und mysteriöser Gegenstand wie die Bundeslade kann für die tiefe Verehrung verantwortlich sein, die die Menschen den »Tabotat« entgegenbringen. Ich halte es also für mehr als nur wahrscheinlich, daß die Äthiopier im Besitz des heiligen Schreins sind.

Natürlich gab es noch eine Reihe ungeklärter Fragen. Bisher war es mir nicht gelungen, die Abstammung der Königin von

Saba definitiv zu klären. Und noch immer mußte ich herausfinden, ob Äthiopien zur Zeit Salomos bereits eine so weitentwickelte Zivilisation besessen hatte, um einen direkten kulturellen Austausch mit Israel pflegen zu können. Das größte Problem aber bedeutete Aksum: Richard Pankhurst zufolge konnte die Stadt im zehnten Jahrhundert vor Christus überhaupt noch nicht existiert haben, und so hätte man auch die Bundeslade nicht dorthin bringen können. Allerdings bestand durchaus die Möglichkeit, daß der Schrein erst später nach Aksum gebracht und zuvor an einem anderen Ort aufbewahrt worden war. Bisher war ich jedoch noch nicht auf entsprechende Hinweise gestoßen.

Vielleicht hing es mit dem okkulten und mysteriösen Charakter der Bundeslade selbst zusammen, daß sie immer wieder Fragen aufwarf, Verwirrung stiftete, Zweideutigkeiten und Ahnungen heraufbeschwörte. Es lag nur nahe, daß ein so geheimnisvoller und von der Kraft Gottes durchdrungener Gegenstand sich selbst gegen seine Entdeckung und Enthüllung sperrte.

Und doch glaubte ich, genug Beweise an der Hand zu haben, um meine Nachforschungen fortzusetzen.

Kapitel 7

Eine Suche ohne Ende

Zwischen dem ersten und dem sechsten Jahrhundert nach Christus konnte sich das aksumitische Königreich mit den mächtigsten und blühendsten Kulturen der damals bekannten Welt messen. Ebenbürtig mit Persien und dem Römischen Reich, sandte es seine Schiffe bis nach Ägypten, Indien, Ceylon und China. Seine Errungenschaften auf den Gebieten der Kunst und Architektur waren beeindruckend. Im siebten Jahrhundert begann Aksums Licht zu verlöschen; nur vereinzelt wurden noch Botschafter in fremde Länder gesandt, und die einstmals große Militärmacht ging ihrem Ende entgegen. Diese auffällige Veränderung, die schließlich fast zu völliger Isolation führte, hing mit dem immer stärkeren Auftreten der kriegerischen islamischen Kräfte zusammen, die seit der Zeit des Propheten Mohammed (570-632 nach Christus) für die Zerstörung des abessinischen Christentums kämpften. »Eingeschlossen von den Feinden ihrer Religion«, schrieb Edward Gibbon in seinem Buch über das Römische Reich, »fielen die Äthiopier in einen fast tausendjährigen Schlaf, vergessen von der übrigen Welt.«[1]

Das Jahrtausend, auf das sich der Historiker bezieht, erstreckt sich vom siebten bis zum sechzehnten Jahrhundert - und guten Gewissens kann man sagen, daß Äthiopien in dieser Zeit von der Bildfläche verschwunden war. Das einstmals bekannte und relativ vielbereiste Land entwickelte sich langsam zu einem geheimnisvollen Reich der Mythen und Zauberei, in dem, so glaubte man, Drachen und andere Ungeheuer lebten - eine »terra incognita«, der sich niemand zu nähern wagte.

Man könnte annehmen, daß die Abessinier in diesem großen schwarzen Loch ihrer Geschichte der Barbarei verfallen wären, oder daß ihre Entwicklung zumindest deutlich stagnierte. Meine Nachforschungen hatten jedoch ergeben, daß

das Gegenteil der Fall war. So beweisen zum Beispiel die außergewöhnlichen Felsenkirchen von Lalibela, daß über die Jahrhunderte hinweg eine ausgeprägte und vielschichtige Kultur bewahrt werden konnte. Und mehr noch: Obgleich das aksumitische Königreich sich ängstlich und argwöhnisch anderen Kulturen gegenüber verschloß, hatte es sehr wohl Kontakte mit der Außenwelt unterhalten. Das fünfundzwanzig fahre andauernde Exil Prinz Lalibelas ist ein Beispiel dafür, denn die Verbindungen, die er in Jerusalem geknüpft hat, haben aller Wahrscheinlichkeit nach dazu geführt, daß der äthiopische Thronanwärter von Tempelrittern begleitet wurde, als er 1185 in sein Heimatland aufbrach. Noch immer war mir nicht ganz klar, welche Pläne die Templer in Äthiopien verfolgt hatten, und so beschloß ich, mich näher mit der Geschichte des Ordens zu beschäftigen.

Ein dunkles Kapitel der Geschichte

Nach ihrer Gründung im Jahre 1119 entwickelten sich die Templer schnell zu einer internationalen Macht, die über immense Reichtümer verfügte und großes Ansehen genoß. Und dennoch ging der Orden schon nach zwei Jahrhunderten seinem Untergang entgegen. Die Geschichte der Tempelritter und ihres katastrophalen Niedergangs ist so umfassend und gründlich untersucht worden, daß ich an dieser Stelle nicht mehr ausführlich darauf eingehen muß.[2] Es genügt, noch einmal auf die ausgezeichnet vorbereitete Operation am 13. Oktober 1307, einem Freitag, hinzuweisen, die zur Verhaftung aller in Frankreich lebenden Templer führte. Zur gleichen Stunde überfielen die Häscher und Soldaten des französischen Königs Philipp IV. überall im Land die Häuser und Landgüter des Ordens. Bis zum Abend lagen fünfzehntausend Männer in Ketten, und »Freitag, der 13.«, hatte seinem Namen alle Ehre gemacht.

Die Beschuldigungen, die man zur Rechtfertigung der dramatischen Verhaftungsaktion gegen die Tempelritter erhob, waren so schwerwiegend wie falsch. Man warf ihnen vor, sie hätten

Jesus Christus verleugnet und sein Bild bespuckt, man bezichtigte sie unzüchtiger Küsse auf Anus, Nabel und Mund, »die, den gottlosen Riten des Ordens zufolge, die menschliche Würde in den Schmutz ziehen sollten«, und behauptete, sie unterhielten homosexuelle Kontakte untereinander, zu denen die Mitglieder »gezwungen« würden. Nicht zuletzt wurden sie des Götzendienstes angeklagt.[3]

Zu dieser Zeit (und noch bis 1377) war Avignon de facto der Sitz des Papstes. Mit dem Heiligen Stuhl auf französischem Territorium konnte Philipp IV. zweifelsohne großen Einfluß auf Papst Clemens V. ausüben, der 1305 in Gegenwart des Königs in Lyon gekrönt worden war. Dieser Einfluß wurde gegen die Templer geltend gemacht, deren Zerschlagung Philipp nicht nur in Frankreich, sondern auch in allen anderen Ländern sicherstellen wollte. Aus diesem Grund übte der Monarch großen Druck auf Clemens V. aus und bewegte ihn schließlich zur päpstlichen Bulle *Pastoraiis praeeminentiae* vom 22. November 1307, die die Verhaftung der Templer in allen Ländern der Christenheit befahl.[4]

In England, Spanien, Deutschland, Italien und Zypern erfolgten entsprechend der Anordnung Gerichtsverhandlungen, und im Jahr 1312 ordnete eine weitere Bulle des Marionettenpapstes die offizielle Auflösung des Ordens an. Unterdessen hatten sich Tausende den grauenhaftesten Verhören und Folterungen unterziehen müssen - und die meisten waren anschließend auf die Scheiterhaufen gezerrt und verbrannt worden, darunter der Großmeister Jacques von Molay und der Großpräzeptor der Normandie, Geoffroi von Charnay.[5]

Für meine Nachforschungen war dieses dunkle Kapitel in der Geschichte des Ordens insofern von Bedeutung, als es mit Äthiopien und der Suche der Templer nach der Bundeslade zusammenhängen mußte. Es war freilich eine kurze Geschichte: Kaum hundertdreißig Jahre nach Lalibelas Thronbesteigung wurden die Templer verhaftet, gefoltert und verbrannt. Ihr Besitz wurde unter den Königshäusern Europas aufgeteilt, der Orden hatte aufgehört zu existieren, und sein guter Name war

vom Verdacht der Unzucht, Blasphemie und des Götzendienstes besudelt.

Die Dokumente aus dem letzten Jahrhundert seines Bestehens liefern nicht den Schatten eines Hinweises, der die Vermutung eines länger andauernden Engagements der Templer in Äthiopien unterstützen würde. Mit Beginn des dreizehnten Jahrhunderts verlieren sich alle Spuren im Nichts, und bis zu den Verhaftungen im Jahr 1307 scheint der Orden mit den Feldzügen im Nahen Osten und der Festigung seiner mächtigen Position beschäftigt zu sein.

Wo also konnte ich die Informationen finden, nach denen ich suchte? Es hat nur wenige Versuche gegeben, die Entwicklung Äthiopiens in diesen Jahren chronologisch zu erfassen. James Bruce tat während seines ausgedehnten Aufenthaltes in Äthiopien sein möglichstes, um die alten Überlieferungen zu sammeln und aufzuzeichnen. Ich kehrte also noch einmal zu seinen Reisen zurück - und legte sie so bald nicht mehr aus der Hand.

Am Ende des ersten Bandes stieß ich erwartungsgemäß auf einige Textstellen, die sich auf die Regierungszeit Lalibelas bezogen. Nicht alles, was der schottische Abenteurer geschrieben hatte, war für mich von Bedeutung, aber ein Detail zog meine Aufmerksamkeit auf sich. Bruce berichtete, daß Lalibela einen Plan entwickelt habe, wie man die Zuflüsse zum Nil reduzieren könne, »um Ägypten auszuhungern«[6]. Nach »genauer Vermessung und Berechnung« hatte dieser illustre Monarch aus der Zagwe-Dynastie offensichtlich herausgefunden, daß »man die Flüsse, die von den hochgelegenen Teilen des Landes herunterfließen, durch Gräben aufhalten und ihre Ströme in die Ebenen im Süden ableiten könnte, damit sie den nach Norden fließenden Nil nicht erreichten. So sollte das Anschwellen des Flusses verhindert werden, auf daß er nicht mehr genug Wasser für die Bestellung der Böden in Ägypten mit sich führe.«[7]

Ich konnte mich des Gedankens nicht erwehren, daß ein solcher Plan den Vorhaben der Templer nur entgegenkommen konnte, die gegen Ende der Regierungszeit Lalibelas die Eroberung Ägyptens ins Auge gefaßt hatten. An den Ufern des Nils gab

es mehrere heftige Schlachten, und die Templer belagerten über mehr als ein Jahr hinweg die arabische Festung von Damietta im Deltagebiet des großen Flusses.[8] Ohne Zweifel, ein vom Hunger geschwächtes Ägypten konnte die Ziele der Templer nur unterstützen. Es ist aber nie zu der Umleitung der Flüsse gekommen. »Der Tod, schlimmster Feind aller großartigen Unternehmungen, warf sich dazwischen und beendete Lalibelas kühnes Vorhaben.«[9]

Zu den zwei letzten Königen der Zagwe-Dynastie bemerkt Bruce:

»Lalibela folgte Imrahana Christos, der nur dadurch auffiel, daß er der Sohn eines Vaters wie Lalibela war, und selbst Vater eines Sohnes wie Naakuto Laab: Denn beide vollbrachten außergewöhnliche, wenn auch sehr verschiedenartige Taten. Auf diejenigen des ersteren, des Vaters, haben wir schon verwiesen, sie bestanden in großen technischen Vorhaben. Der zweite übte sich in geistigen Taten noch viel schwierigerer Natur, indem er einen Sieg über den eigenen Ehrgeiz erfocht und freiwillig auf die Krone verzichtete .. ,«[10]

Ich war schon vertraut mit den geschichtlichen Details, die nun folgten. Naakuto Laab, der letzte der Zagwe, wurde 1270 dazu überredet, zugunsten von Yekuno Amlak abzudanken - einem Monarchen, der sich zur salomonischen Linie zählte.[11] Über die Nachfolger Naakuto Laabs, Yekuno Amlak (12 70-1285) und Yagba Zion (1285-1294) bis hin zu Wedem Ara'ad (der von 1299 bis 1314 regierte), wußte Bruce wenig zu berichten. Es scheint, als sei es dem anspruchsvollen Forscher nicht gelungen, handfeste Informationen über das Jahrhundert zusammenzutragen, das auf den Tod Lalibelas im Jahre 1211 folgte: »Der gesamte Zeitraum liegt im Dunklen«, bedauerte Bruce. »Wir können wohl Vermutungen anstellen, mehr aber nicht, und selbst diese werden uns nicht weit bringen.«[12]

Eine solche Dunkelheit verhüllt auch die Jahre vor Lalibelas Thronbesteigung. Ich sah mich also einer Unzahl unbeantworteter Fragen gegenüber. Die wichtigste davon betraf die Bundeslade: Ich mußte herausfinden, was mit ihr in den annähernd

drei Jahrhunderten geschehen war, in denen die salomonische Herrscherdynastie unterbrochen war. Und ich wollte wissen, ob es den Templern gelungen war, direkten Zugang zu dem heiligen Schrein zu erlangen, als sie sich - was ich für sehr wahrscheinlich hielt - zur Zeit Lalibelas eine feste Position im aksumitischen Königreich errungen hatten.

Wieder einmal rief ich den Historiker Belai Gedai in Addis Abeba an und hoffte, er würde mir mit seiner Kenntnis der alten Überlieferungen weiterhelfen können.

»Wir Äthiopier«, erklärte er, »behaupten, daß die Lade im zehnten Jahrhundert von den Priestern aus Aksum entfernt und vor den Verwüstungen der Königin Gudit auf eine Insel im Zwaisee in Sicherheit gebracht wurde ...«

»Sie meinen, in das Rift Valley südlich von Addis Abeba?«

»Ja.«

»Das war ein verdammt langer Weg ...«

»Ja, aber nur ein so weit entfernt liegender Ort konnte Sicherheit bieten. Wissen sie, Gudit war Jüdin. Sie wollte ihre Religion dem ganzen Land aufzwingen und das Christentum zerstören. Sie plünderte die Kirchen von Aksum und brannte sie nieder. Also mußten die Priester verhindern, daß die Lade in die Hände der Königin geriet.«

»Wissen sie, wie lange die Lade auf der Insel blieb?«

»Unsere Überlieferungen sagen, daß sie dort siebzig Jahre aufbewahrt und dann nach Aksum zurückgebracht wurde.«

Ich dankte Gedai für seine Hilfe und legte auf. Was er mir gesagt hatte, stimmte mehr oder weniger mit dem Bild äthiopisch-mittelalterlicher Geschichte überein, das ich bis dahin rekonstruiert hatte. Ich wußte, daß Gudit nach dem Sturz der salomonischen Dynastie für einige Jahre regierte, aber bald vom ersten König der Zagwe-Dynastie - auch er wahrscheinlich Jude - abgelöst wurde. Schon lange vor Lalibelas Zeit waren die Zagwe jedoch zum Christentum übergetreten. Es war also denkbar, daß sie die sichere Rückkehr des Schreins an seinen angestammten Platz in Aksum ermöglicht hatten - wo er sich befand, als Lalibela an die Macht kam.

Im Zusammenhang mit der Bundeslade ist das bereits erwähnte zeitgenössische Zeugnis des armenischen Geographen Abu Salih von offensichtlicher Bedeutung. Aus dem Textzusammenhang ergibt sich, daß der Bericht »in den ersten Jahren des dreizehnten Jahrhunderts« entstand - mit anderen Worten während der Regierungszeit Lalibelas. An keiner Stelle erwähnte Abu Salih, in welcher äthiopischen Stadt er den Schrein gesehen hatte, aber es gab keinen Grund, nicht anzunehmen, daß es sich um Aksum handelte. Und als ich die betreffenden Passagen immer wieder las, fielen mir einige Worte ins Auge, die ich zuvor übersehen hatte. Salih beschrieb bestimmte Zeremonien, bei denen die Lade mitgeführt wurde, und erwähnte, der Schrein sei von Männern »bewacht und getragen« worden, die »von weißer und roter Hautfarbe« waren und »rote Haare« hatten.[13]

Ich geriet in helle Aufregung, als mir klar wurde, daß ich hier ein zweites frühes Zeugnis dafür vor mir hatte, das die Anwesenheit weißer Männer in Äthiopien zur Zeit Lalibelas nahelegte, zumal eine andere zuverlässige Übersetzung dieselbe Passage mit »blonde Haare« wiedergab.[14] Schon Alvarez hatte mich auf eine Überlieferung verwiesen, nach der die Felsenkirchen von Europäern erbaut worden waren - eine Information, die genau zu dem paßte, was ich über die weitentwickelten architektonischen Kenntnisse der Templer in Erfahrung gebracht hatte.

Es war mehr als nur verlockend anzunehmen, daß es sich bei den Baumeistern um Tempelritter gehandelt hatte; aber noch immer konnte ich mit meinen Nachforschungen nicht weiter als bis in das frühe dreizehnte Jahrhundert vordringen, und noch immer war eine Schlüsselfrage unbeantwortet: Wenn die von Abu Salih beschriebenen Nordeuropäer tatsächlich dem Tempelorden angehörten, hatten sie sich dann nur mit dem Umhertragen der Lade in den Prozessionen begnügt, oder hatten sie versucht, den Schrein aus Äthiopien heraus zurück nach Europa zu bringen?

Ich mußte zugeben, daß ich bei all diesen Punkten einfach nicht weiterkam: Das Fehlen zuverlässiger historischer Quellen

blockierte mich. Bei der von den Templern fast obsessiv betriebenen Geheimhaltung war es freilich kaum überraschend, daß ihre Dokumente so wenig hergaben. Die Schweigepflicht gehörte zu den strengsten Regeln des Ordens, und einem Verräter drohten drakonische Strafen.[15] Aber auch von äthiopischen Chroniken war keine Hilfe zu erwarten: Nachdem ich eine Reihe unterschiedlichster Quellen konsultiert hatte, mußte ich mich damit abfinden, daß das Jahrhundert nach Lalibelas Tod tatsächlich »im Dunklen lag«. Es war einfach nicht zu rekonstruieren, was in diesen Jahren geschah. Trotzdem rief ich Richard Pankhurst in Addis Abeba an und fragte ihn nach Dokumenten, die auf einen Kontakt zwischen Äthiopiern und Europäern im fraglichen Zeitraum hinwiesen.

»Keine vor 1300, soweit ich weiß«, antwortete er.

»Und nach 1300? Ich nehme an, der erste Bericht stammt von der portugiesischen Gesandtschaft, die 1520 nach Äthiopien gelangte?«

»Nicht ganz. Schon zuvor gab es einige diplomatische Missionen, die in die andere Richtung reisten - von Äthiopien nach Europa also. Tatsächlich wurde die erste Mission schon in den Jahren nach Lalibelas Tod ausgeschickt: und damit sind wir wohl genau in dem Zeitraum, der dich interessiert.«

Ich saß kerzengerade auf meinem Stuhl: »Weißt du das genaue Datum?«

»Ja«, gab Richard zurück, »es war 1306, und es handelte sich um eine große Gesandtschaft. Sie wurde von König Wedem Ara'ad beauftragt und umfaßte sicherlich dreißig Männer.«

»Und kannst du mir sagen, welche Aufgabe die Mission zu erfüllen hatte?«

»Das weiß ich nicht genau. Du müßtest die Quellen selbst einmal überprüfen. Aber ich bin mir sicher, das Reiseziel war Avignon im Süden Frankreichs ...«

Eine entscheidende Information

Richard hatte, ohne es zu merken, eine kleine Bombe platzen lassen. Avignon war der Sitz Papst Clemens'V. Und niemand anderes als Clemens hatte 1307 die Gefangennahme aller Templer angeordnet. Und nun erfuhr ich, daß eine hochrangige äthiopische Delegation (überhaupt die erste, die je nach Europa geschickt wurde) im Jahr 1306 Avignon besucht hatte - nur ein Jahr vor der Verhaftungswelle. War es ein Zufall, daß diese Ereignisse so dicht aufeinanderfolgten? Oder sollte es hier ein Wechselspiel von Ursache und Wirkung gegeben haben? Ich mußte herausfinden, ob die abessinischen Abgesandten tatsächlich mit dem Papst zusammengetroffen waren und was sich bei dieser Gelegenheit abspielte.

Der Bericht über die Mission von 1306 stammte von Giovanni da Carmignano, einem genuesischen Kartographen, der in den Jahrzehnten von 1291 bis 1329 tätig war.[16] Derselbe Carmignano sorgte in Europa für ein neues Bild von Äthiopien: Nach Jahrhunderten der Unklarheit war er der erste, der eindeutig bekräftigte, daß der berühmte »Priester Johannes« in Afrika und nicht, wie bisher angenommen, in Indien herrschte.[17]

Carmignano hatte die äthiopischen Botschafter in Genua kennengelernt, als sie die Stadt auf dem Rückweg von Avignon passierten. Die Männer wurden von widrigen Winden »viele Tage« in dem italienischen Hafen festgehalten. Bei dieser Gelegenheit befragte sie der Kartograph über ihre »Riten, Gebräuche und ihr Land«[18]. Beklagenswerterweise sind Carmignanos Aufzeichnungen in späteren Jahren verlorengegangen. Bis heute hat sich nur eine kurze Zusammenfassung erhalten, für die ein gewisser Jacopo Filippo Foresti in einer bergamaskischen Chronik des späten fünfzehnten Jahrhunderts verantwortlich zeichnete.[19] Nicht ohne Schwierigkeiten gelang es mir, eine englische Übersetzung des Textes zu bekommen. Er besteht aus nur einem Absatz, in dem sich Foresti lobend zu Carmignanos Bericht äußert und diesen zusammenfaßt:

»Unter vielen Dingen, die dort über das Land der Äthiopier

geschrieben stehen ..., wird gesagt, daß ihr Herrscher ein guter Christ sei, dem vierundsiebzig Könige und unzählige Prinzen Gehorsam leisten ... Es ist bekannt, daß dieser Kaiser im Jahre des Herrn 1306 dreißig Gesandte schickte, die ehrerbietig vor dem Papst Clemens V. in Avignon erschienen .. .«[20]

Abgesehen von einigen nebensächlichen Kleinigkeiten und dem bereits erwähnten Verweis auf den »Priester Johannes«, gab die Chronik jedoch keine weiteren Aufschlüsse. Und dennoch, so knapp die Information auch war, sie besaß eine Aussagekraft, die meine Vermutungen nur bestätigte: Die Gesandten waren auf französischem Boden mit Clemens V. zusammengetroffen, und das nur ein Jahr bevor der Papst die Massenverhaftungen der Templer befohlen hatte.

Es gab keinen Hinweis auf den Gegenstand dieser Gespräche, und an keiner Stelle wurde auch nur die leiseste Vermutung geäußert, warum dem äthiopischen Herrscher zu dieser Zeit so an einem Kontakt mit dem Papst gelegen war. Zweifelsohne aber mußte Wedem Ara'ad einen starken Beweggrund gehabt haben, daß er so viele Männer auf den langen und gefahrvollen Weg nach Europa geschickt hatte. Ich nahm mir die Freiheit und stellte einige Mutmaßungen über diese Gründe an. In meinem Notizbuch entwarf ich folgende Überlegungen und Thesen:

- Nehmen wir einmal an, die Templer begleiteten im Jahre 1185 Prinz Lalibela von Jerusalem nach Äthiopien und unterstützten ihn bei seinen Ansprüchen auf den Thron. Nehmen wir weiterhin an, daß die besagten »weißen Männer«, die die Felsenkirchen erbaut haben sollen, tatsächlich Tempelritter waren und daß es sich bei den Männern, die zu Beginn des dreizehnten Jahrhunderts die Bundeslade trugen, um eben jene Templer gehandelt hat.

- Daraus folgt, daß der Orden sich eine starke und einflußreiche Position gegenüber Lalibela und der Zagwe-Dynastie erkämpft hatte. Es ist also anzunehmen, daß die zwei letzten Könige der Dynastie - Imrahana Christos und Naakuto Laab - ebenfalls gute Beziehungen zu den Templern unterhalten und

1 *(oben)* Gemälde in einer äthiopischen Kirche, das König Salomo und die Königin von Saba darstellt. Den äthiopischen Legenden zufolge raubte beider Sohn Menelik die Bundeslade aus dem Tempel von Jerusalem und brachte sie nach Äthiopien.

2 (unten) Anbetung der Bundeslade in alttestamentarischen Zeiten. Die Lade symbolisierte die Allgegenwart Gottes auf Erden und galt als heiligster Gegenstand des alten jüdischen Glaubens.

3 *(oben)* Der »Park der Säulen« in Aksum.

4 *(unten)* Teil einer umgestürzten Säule. Die etwa 500 Tonnen schwere und über 30 Meter hohe Säule war vermutlich der größte in der Alten Welt je errichtete Monolith.

5 Diese einem Turm nachgebildete Stele ragt 21 Meter in die Höhe und wiegt etwa 300 Tonnen. Die aksumitischen Überlieferungen berichten, daß die Säule mit Hilfe der Bundeslade aufgerichtet wurde.

7 *(unten)* Agitation der Rebellen gegen das Regime. Die 6 *(links)* Äthiopisches Gemälde, das den 1974 gestürzten Kaiser Haile Selassie zeigt.

Wandmalerei verdeutlicht, mit welcher Brutalität Präsident Mengistu das Land beherrschte.

8 *(links)* Falaschen-Marktfrau

9 *(oben)* Kunsthandwerk der Falaschen, das die legendäre Bettszene zwischen Salomo und der Königin von Saba darstellt.

10 Ein Priester bewacht den Eingang zum
Allerheiligsten eines Klosters auf dem Tanasee.

11 *(rechts)* Die Kathedrale von Chartres. Das Sakralbauwerk zählt zu den frühesten und zugleich weitentwickeltsten Beispielen gotischer Architektur, die sich im 12. Jahrhundert plötzlich und auf geheimnisvolle Weise entwickelte.

12 *(unten)* Skulptur des altisraelischen Priesterkönigs Melchisedek. Nordportal der Kathedrale von Chartres. Wissenschaftlern zufolge stellt der Becher in seiner Hand den Heiligen Gral dar, der einen Stein enthält.

13 *(rechte Seite)* Die Königin von Saba *(Mitte)* mit einem äthiopischen Sklaven zu Füßen. Nordportal der Kathedrale von Chartres.

14 *(oben)* Säule im Nordportal der Kathedrale von Chartres. Auf einem Ochsenkarren wird die Bundeslade an einen unbekannten Ort gebracht.

15 *(unten)* Teil der geheimnisvollen Inschrift unter der Darstellung der Bundeslade.

16 *(oben links)* Auf einer Kirchturmspitze steht Maria über der Bundeslade. Im Mittelalter wurde die Jungfrau Maria oftmals sowohl mit dem Gral als auch mit der Bundeslade verglichen.

17 und 18 Zu den vielen gemeinsamen Charakteristika, die den Heiligen Gral *(oben rechts)* und die Bundeslade *(unten)* verbinden, zählt ein übernatürlicher, strahlender Glanz.

19 *(rechts)* Miniatur in einer Handschrift aus dem 14. Jahrhundert. Das Bild zeigt Wolfram von Eschenbach (2. v. 1.) mit anderen Minnedichtern. In seinem Werk *Parzival* stellt Wolfram den Heiligen Gral nicht als Becher oder Behältnis dar, sondern als Stein.

20 *(unten)* Der heilige Bernhard von Clairvaux ruft den Zweiten Kreuzzug aus. Bernhard war die treibende Kraft bei der Gründung des Tempelordens im 12. Jahrhundert.

21 *(oben)* Tempelritter mit dem für den Orden charakteristischen »croix pattée« oder »Tatzenkreuz«.

22 *(rechts)* Decke einer Felsenkirche in Lalibela. Auffällig und ungewöhnlich ist das in einen Davidstern eingelegte Kreuz der Tempelritter.

23 *(oben)* Der Felsendom, eine große muslimische Moschee, wurde im 7. Jahrhundert n. Chr. erbaut und befindet sich genau an der Stelle des Tempelberges, wo einstmals König Salomos Tempel stand.

24 *(unten)* Innenansicht des Felsendoms mit dem »shetiyyah«, dem »Grundstein der Welt«, der schon den Boden des Allerheiligsten von Salomos Tempel bildete. An diesen Ort brachte Salomo vor 3000 Jahren die Bundeslade, und von diesem Ort verschwand sie zu einem unbekannten Zeitpunkt.

25 und 26 Portal der Al-Aksa-Moschee auf dem Tempelberg *(oben)*. Das gotische Portal wurde im 12. Jahrhundert von den Tempelrittern errichtet, nachdem sie die Moschee zu ihrem Hauptquartier gemacht hatten. Zum Vergleich das gotische Nordportal der Kathedrale von Chartres *(unten)*.

27 *(oben links)* Innenansicht der Templerkirche in London. Im Vordergrund Steinskulpturen auf Grababdeckungen, unter denen die Gebeine von Tempelrittern ruhen. Auch diese vom Templerorden erbaute Kirche gilt als frühes Beispiel gotischer Architektur.

28 *(oben rechts)* Frontispiz des Reiseberichtes von Francisco Alvarez über die erste offizielle portugiesische Gesandtschaft an den Hof des Priesters Johannes um 1520.

29 *(unten)* Die aus dem Fels herausgehauene Marienkirche von Lalibela entstand im späten 12. Jahrhundert. Überlieferungen zufolge, die Alvarez in seinem Reisebericht festhielt, wurde die Kirche von »weißen Männern« erbaut. Möglicherweise handelte es sich dabei um Tempelritter.

30 *(oben)* Papst Clemens V.

31 *(oben links)* Der schottische König Robert Bruce, der den flüchtenden Tempelrittern Schutz gewährte.

32 *(oben rechts)* Prinz Heinrich der Seefahrer (1394 - 1460), Großmeister der Christusritter, übernahm das Erbe der Templer und zeigte außergewöhnlich großes Interesse an Äthiopien.

33 *(oben)* Vasco da Gama, Ritter des Christusordens. Sein Sohn, Don Christopher da Gama, starb 1542 in Äthiopien.

34 *(oben)* James Bruce von Kinnaird, Nachkomme des schottischen Königs Robert Bruce. Seine ausgedehnten Reisen durch Äthiopien beweisen die fortgesetzte Suche nach der Bundeslade. Bruce war Freimaurer, was er sein Leben lang geheimhielt, und Erbe der schottischen Templertradition.

35 *(oben)* Ein Großmeister der Templer wird auf dem Scheiterhaufen verbrannt. Die Vernichtung des Ordens begann 1307 und wurde von Papst Clemens V. und König Philipp IV. von Frankreich betrieben.

36 *(unten)* Georgskirche von Lalibela. Das Doppelkreuz auf dem Dach ist eine Variante des Templerkreuzes und wurde später von den Nachfolgern der Tempelritter, den portugiesischen Christusrittern, übernommen.

ihnen weiterhin besondere Rechte bezüglich des heiligen Schreins eingeräumt hatten.

- In den sechs Jahrzehnten nach Lalibelas Tod hatten die Ritter also Zugang zur Bundeslade, aber man erlaubte ihnen nicht, die Lade aus dem Land zu bringen. Wahrscheinlich war gerade das die Absicht der Templer, und sie warteten in all diesen Jahren auf eine günstige Gelegenheit. Es hat natürlich auch unter den Rittern ein Generationswechsel stattgefunden: Andere, jüngere Templer wurden aus dem Heiligen Land nach Äthiopien geschickt, um die älteren abzulösen. Es hat den Anschein, als bestand nicht einmal besondere Eile bei der Umsetzung der Pläne, vielleicht waren die Ritter ganz zufrieden, im Dienst der Bundeslade in Äthiopien zu leben.

- Die Situation muß sich drastisch geändert haben, als man Naakuto Laab im Jahre 1270 dazu brachte, auf den Thron zu verzichten. Er wurde von Yekuno Amlak, einem Nachkommen Salomos, gefolgt. Anders als die Zagwe war die salomonische Dynastie untrennbar mit der Bundeslade und ihrer Geschichte verbunden. In diesem Zusammenhang lohnt es sich, darauf zu verweisen, daß die erste schriftliche Aufzeichnung des Kebra Nagast auf Anordnung Yekuno Amlaks geschah.[21] Mit anderen Worten: Obwohl die Legenden schon seit vielen Jahrhunderten mündlich tradiert worden waren[22], wollte der König eine schriftliche Fixierung der Überlieferungen. Warum? Weil die Legenden nun in noch stärkerem Maße den Anspruch der salomonischen Dynastie auf den Königsthron rechtfertigten.

- Die Präsenz von gut bewaffneten und technologisch weit fortgeschrittenen Fremden im eigenen Land mußte Yekuno Amlak also sehr beunruhigen. Dazu kam, daß die Templer jederzeit Verstärkung aus dem Nahen Osten hätten anfordern können, wo sich mehrere Tausend ihrer Ordensbrüder aufhielten. Schließlich war bekannt, daß die Fremden ein ausgeprägtes Interesse an der Bundeslade hatten und nur allzu wahrscheinlich die Entführung des Schreins planten.

- Es ist anzunehmen, daß Yekuno Amlak zunächst darauf achtete, daß die Templer sich in Sicherheit wähnten. Denn er

hatte gerade erst den Thron bestiegen und seine Position noch nicht gefestigt. Er vermittelte also den Eindruck, daß auch er weiterhin bereit war, die privilegierte Position der Ritter anzuerkennen. Das wäre strategisch plausibel gewesen, zumal bekannt war, daß der König nur über eine kleine Armee verfügte.[23] Schließlich könnte das auch die Erklärung dafür sein, warum während seiner Regierungszeit keine spektakulären Veränderungen zu verzeichnen sind. Es oblag also seinem Nachfolger, sich von den Tempelrittern zu befreien und den Anspruch auf die Bundeslade zu bekräftigen.

- Yekuno Amlaks Sohn Yagba Zion (König von 1285 bis 1294) war in militärischer Hinsicht wahrscheinlich noch wehrloser als sein Vater. In der Thronfolge kam jedoch bald ein starker Mann an die Macht: Wedem Ara'ad, der von 1299 bis 1314 regierte und im Jahr 1306 die Unterhändler zu Papst Clemens V. nach Avignon schickte.

- Mit einiger Wahrscheinlichkeit schürte die Mission den Unwillen gegen die Templer und verschaffte Clemens V. und Philipp IV. mit einem Mal die Möglichkeit, gegen den Orden vorzugehen. Denn es war vorstellbar, daß die Tempelritter den Schrein nach Frankreich bringen würden. Und angesichts des tiefen Aberglaubens, der die Vorstellungskraft des Volkes zu dieser Zeit prägte, hätten die Templer - im Besitz eines so heiligen und mächtigen Gegenstandes - binnen kürzester Zeit eine Position erreicht, die es ihnen ermöglicht hätte, die weltliche und geistliche Macht in Frage zu stellen. Es war nur konsequent, wenn Staat und Kirche zu einem Präventivschlag ausholten.

- Vor dem Hintergrund der Verhaftungen in ganz Europa gewinnt diese Theorie sehr an Attraktivität. Die Verfolgungen setzten 1307 ein, das heißt nur ein Jahr nachdem die äthiopische Mission Avignon verlassen hatte. Und das paßt genau zu dem, was wir von König Philipp wissen: Es gibt Beweise dafür, daß er mit den Vorbereitungen für seine Operation schon ein Jahr zuvor begonnen hatte, also 1306.[24] Ebenso genau läßt sich belegen, daß Philipp und Clemens im Laufe dieses Jahres mehrmals

zusammengekommen waren, um wichtige Dinge zu besprechen.[25]

- Natürlich wäre es töricht anzunehmen, die Zerschlagung der Templer sei allein durch die Einflußnahme der äthiopischen Botschafter ausgelöst worden. Philipp IV. hegte schon lange Groll und Neid gegen die mächtige Bruderschaft. Denn zum einen war er von dem Orden mehrfach schlicht abgekanzelt worden; zum anderen hatte er ohne Frage ein Auge auf das große Vermögen geworfen, das über sein ganzes Königreich verstreut in den Schatzkammern der Templer ruhte.

- Aber es wäre ebenso töricht, die Rolle der äthiopischen Gesandtschaft unterzubewerten und einen Zusammenhang mit den Ereignissen von 1307 zu verneinen. Im Gegenteil: Es mußte ein verbindendes Glied geben, und ich war überzeugt, dieses Bindeglied war die Bundeslade.

Phönix aus der Asche

Trotz aller Anstrengungen war es nicht leicht, eine so reiche und mächtige Organisation zu zerschlagen. In Frankreich konnte die Auflösung des Ordens mit großer Effektivität betrieben werden, aber selbst dort entzogen sich einige Ritter ihrer Verhaftung.[26] Und erstaunlicherweise lief die gesamte Flotte der Templer am Morgen des 13. Oktober 1307 aus dem Hafen von La Rochelle aus und ward nie wieder gesehen.[27]

In anderen Ländern wurden die Verhöre und Gerichtsverhandlungen bei weitem nicht mit dem Nachdruck betrieben wie in Frankreich. Trotzdem: Einkerkerung, Folter und Hinrichtungen führten - wenngleich mit einiger Verzögerung - auch in England, Spanien, Italien, Deutschland und Zypern zur Auflösung des Ordens. Nur in Portugal und Schottland wurden die Templer kaum oder gar nicht verfolgt. Die Umstände in diesen Ländern erwiesen sich als so günstig, daß dem Orden das Überleben gelang.[28]

Als Clemens V. im November 1307 die Verhaftung aller Or-

densbrüder anordnete, befand sich Schottland im Krieg mit England, gegen das es seine nationale Unabhängigkeit durchsetzen mußte. Der führende Kopf dieser Bestrebungen war der schottische König Robert Bruce, der in der Schlacht von Bannockburn im Jahre 1314 den Engländern eine derartig vernichtende Niederlage zufügte, daß die Freiheit seines Landes für mehrere Jahrhunderte gesichert war. Bruce mußte seine ganze Kraft auf diese Auseinandersetzungen konzentrieren, so daß er nicht das geringste Interesse hatte, die päpstlichen Anordnungen zu unterstützen. Zum Schein verhaftete man zwei Ritter[29] und ermahnte den Orden zur Zurückhaltung.

Alles weist darauf hin, daß Robert Bruce nicht nur schottischen Templern Sicherheit garantierte, sondern auch den Rittern, die aus anderen Ländern geflohen waren.[30] Natürlich geschah das nicht aus purer Nächstenliebe, vielmehr legte der König diese generöse Haltung an den Tag, um die Ordensbrüder für seine Armeen zu gewinnen.[31] Wiederholt und nicht ohne Grund hat man triftige Argumente dafür angeführt, daß tatsächlich Templertruppen auf der Seite von Bruce in der Schlacht von Bannockburn gekämpft haben[32] - und diese Vermutung gewinnt um so mehr an Gewicht, als die siegreichen Schotten einen kleinen Reliquienschrein mit sich führten, als sie in die berühmte Schlacht marschierten.[33]

Das wohlwollende Verhalten des Königs gegenüber den Templern und die Tatsache, daß viele Ritter noch vor ihrer Verhaftung aus England fliehen konnten, ermöglichte es dem Orden, sich auf den schottischen Inseln zu verstecken und im Verborgenen zu überleben. Schon früh hat man vermutet, daß sich die Existenz der Templer im Untergrund zur Freimaurerei entwickelt hat, zumal die ältesten Dokumente des Geheimbundes etwa bis auf das Jahr 1250 zurückreichen.[34] Nach einer Überlieferung war es König Robert selbst, der nach der Schlacht von Bannockborn die erste und älteste Loge Schottlands (die Loge von Kilwinning) »für die Aufnahme der aus Frankreich geflohenen Tempelritter«[35] gründete. Im achtzehnten Jahrhundert untermauerte Andrew Ramsay, ein prominenter schotti-

scher Historiker und Freimaurer, den Wahrheitsgehalt dieser Angaben mit seinem umfassenden Gesamtwerk über die Verbindungen zwischen der Freimaurerei und dem Tempelorden.[36] Etwa um die gleiche Zeit erklärte Baron Carl von Hund, ein führender deutscher Freimaurer, daß »die Freimaurerei aus dem Tempelrittertum entstand und infolgedessen jeder Freimaurer ein Tempelritter« sei.[37]

Daß solche unmißverständlichen Verlautbarungen erst im achtzehnten Jahrhundert an die Öffentlichkeit gegeben wurden, kann kaum überraschen: Erst 1717 erklärten die Freimaurer offiziell ihre Existenz. Und erst diese Öffnung nach außen ermöglichte weitere Nachforschungen, in deren Verlauf deutlich wurde, daß das Tempelrittertum immer eine treibende Kraft innerhalb der Freimaurerei war und auch bleiben würde.[38] Diese Untersuchungen wurden kürzlich - zusammen mit bislang unveröffentlichtem Material - in einer detaillierten und umfassenden Studie vereinigt, die sich mit der Entstehung der Logen und ihrer starken Beeinflussung durch die geflohenen Tempelritter auseinandersetzt.[39]

Ich beabsichtigte also keineswegs, mich an den hitzigen und verwickelten Debatten zu beteiligen, die von den Experten noch immer geführt werden. Es lag mir nur an der Feststellung, daß der Freimaurerei zweifelsohne die zentralen Merkmale des Tempelrittertums in die Wiege gelegt wurden und daß die geflüchteten Ordensritter in den Jahren 1307 bis 1314 dieses Erbe aufgrund der günstigen Bedingungen in Schottland an ihre Nachfolger weitergeben konnten, wo es bis auf den heutigen Tag überlebt hat.

Wie bereits erwähnt, war Schottland nicht das einzige Land, in dem die Templer den Verfolgungen entkamen. In Portugal wurden sie von den Vorwürfen freigesprochen und somit weder verhaftet noch gefoltert.[40] Als guter Katholik hatte es sich der portugiesische König Dennis I. natürlich nicht leisten können, die päpstlichen Anordnungen völlig zu ignorieren: Folglich reagierte er auf die Befehle mit einem Lippenbekenntnis und erklärte im Jahr 1312 den Orden für aufgelöst. Nur sechs Jahre

später erwuchs aus dem alten Tempelorden eine neue Bruderschaft: die Soldaten Jesu Christi, auch als Ritter Christi oder einfach als Christusorden bekannt.[41]

Durch diese Umbildung entkamen die portugiesischen Tempelritter nicht nur den Scheiterhaufen der Inquisition, sondern konnten sich nach 1318 sogar stärker denn zuvor ihren Unternehmungen widmen. Das gesamte Vermögen der alten Bruderschaft wurde auf den neuen Orden übertragen, und selbst die Soldaten der Templer marschierten hinfort unter dem Banner der Ritter Christi.[42] Nach dem Tod Clemens V. ließ Papst Johannes XXII. dem neugegründeten Gebilde sogar die offizielle Anerkennung der Kirche zuteil werden.[43]

Der portugiesische Christusorden sowie die englische - und insbesondere schottische - Freimaurerei können also als die Werkzeuge angesehen werden, mit denen die Templertraditionen bewahrt und weitergegeben wurden - wahrscheinlich bis in unser Jahrhundert hinein. Im Verlauf meiner Nachforschungen war mir immer klarer geworden, daß es sich bei einer dieser Traditionen um die Suche nach der Bundeslade handeln mußte.

Die Soldaten unter dem roten Doppelkreuz

Doch selbst wenn meine Theorie über die Templer und ihr Engagement in Äthiopien zutreffen sollte, so war es mir noch immer unmöglich herauszufinden, was nach 1307 mit ihnen geschehen war. Es sind praktisch keine Dokumente aus der Regierungszeit Wedem Ara'ads erhalten. Ich vermutete jedoch, daß er die Entwicklungen in Europa nach 1306 genau beobachtete und von der Zerschlagung der Bruderschaft wußte. Er konnte sich also sicher sein, daß ihn keine weiteren Ordenstruppen bedrängen würden. Das gab ihm freie Hand, gegen die Templer in Äthiopien vorzugehen, sie zu vertreiben oder - was anzunehmen ist - zu vernichten.

So zumindest lautete mein vorläufiges Ergebnis, und wahrscheinlich hätte ich über diesen Aspekt meiner Nachforschungen

nicht weiter nachgedacht, wäre ich nicht auf den Christusorden gestoßen. Soweit bekannt ist, handelte es sich bei den allermeisten frühen Äthiopien-Reisenden um Portugiesen. Kaum ein Jahrhundert nach der Zerschlagung der Templer wurde das portugiesische Interesse am Königreich des »Priester Johannes« offenkundig, und von Anbeginn an erwies sich der Christusorden als die treibende Kraft.

Die erste und zugleich außerordentlich tatkräftige Persönlichkeit in diesem Zusammenhang war Heinrich der Seefahrer, Großmeister des Christusordens und ein Mann, von dem sein Biograph berichtet, daß er über »reiches Wissen, Autorität und ein gutes Gedächtnis« verfügt habe.[44]

Um 1415 hatte sich Heinrich - gerade zwanzigjährig - bereits ganz und gar der Seefahrt verschrieben.[45] Wie er selbst zugab, war es sein erklärtes Ziel, »Kunde über das Reich des Priester Johannes zu erhalten«[46]. Sowohl die zeitgenössischen Chroniken als auch Historiker unseres Jahrhunderts stimmen darin überein, daß er den größten Teil seiner bemerkenswerten Laufbahn allein diesem Ziel widmete.[47] Und trotzdem verschleiert eine Aura von geheimen Machenschaften und Intrigen seine Unternehmungen. Edgar Prestage, der Emeritus des Camões-Lehrstuhls für portugiesische Sprache, Literatur und Geschichte an der Universität London, bemerkte hierzu:

»Leider ist unser Wissen über die von Heinrich angeregten Fahrten ziemlich unvollständig, und zwar wegen der Geheimhaltungspolitik Portugals, das alle für Konkurrenten wertvollen Daten unterdrückte ... Als Heinrich starb, wurden seine Karten, Instrumente und Papiere sofort nach Lissabon geschafft, und bezeichnenderweise sind sie in der genauen Liste seiner persönlichen Habe mit keinem Wort erwähnt.«[48]

Die Verschwiegenheitspflicht zu Heinrichs Zeiten wurde in der Tat so ernst genommen, daß die Weitergabe von Informationen, die die Ergebnisse seiner vielen Forschungsreisen betrafen, mit dem Tode bestraft wurde.[49] Doch Heinrich konnte kaum verbergen, wie besessen er von dem Plan war, direkte Beziehungen zu Äthiopien zu knüpfen. Er hoffte, dieses Ziel zu erreichen,

indem er den afrikanischen Kontinent umsegelte: Die weitaus kürzere Route über das Mittelmeer, Ägypten und das Rote Meer versperrten die feindlichen muslimischen Mächte.[50] Aber schon lange bevor man das Kap der Guten Hoffnung erreicht hatte, wurden Expeditionskorps an der Westküste Afrikas ausgesetzt, um nach dem Reiche des Priester Johannes zu forschen und zu überprüfen, ob man dieses Königreich nicht noch schneller auf dem Landwege erreichen konnte.[51]

Über die wahren Motive des portugiesischen Prinzen lassen sich letztlich nur Mutmaßungen anstellen. Allgemein wird angenommen, daß er - als »guter Kreuzritter« - eine anti-islamische Allianz mit dem christlichen Herrscher Äthiopiens bilden wollte.[52] Das ist nicht einmal auszuschließen. Aber schon mehr als ein Jahrhundert vor Heinrichs Geburt hatte man im Grunde alle ernsthaften Pläne aufgegeben, das Heilige Land für die Christenheit wiederzugewinnen. Ich konnte mich also der Vorstellung nicht erwehren, daß es andere Gründe für den Portugiesen gegeben haben mußte, die sein erklärtes Interesse am Reich des Priester Johannes einerseits und seine obsessive Geheimhaltung andererseits rechtfertigten.

Als ich mich mehr mit dem Leben des Seefahrers beschäftigte, schien es mir immer wahrscheinlicher, daß die Motive mit seiner Stellung als Großmeister des Christusordens zusammenhingen. In dieser hohen Position mußte er von den geheimen Überlieferungen des Tempelordens gewußt haben. Bemerkenswerterweise hat Heinrich ausführliche Studien der Mathematik und Geographie, der Himmelserscheinungen und Astrologie betrieben und war immer von Gelehrten und Astronomen umgeben[53] - Männer, die sehr an Wolfram von Eschenbachs Figur Flegetanis erinnern, der »in der Konstellation der Gestirne verborgene Geheimnisse entdeckte« und »erklärte, es gäbe ein Ding, das >der Gral< hieße; diesen Namen las er klar und unzweideutig in den Sternen«[54].

Zudem unterwarf sich der portugiesische Prinz den strengen Prinzipien des Zölibats - ein weiterer Umstand, der nahelegte, daß Heinrich von den Regeln der Templer beeinflußt wurde.[55]

Und es konnte sich kaum um einen Zufall handeln, daß der illustre Seefahrer sein Testament genau am 13.Oktober 1460 niederschrieb[56] - am einhundertdreiundfünfzigsten Jahrestag der Verhaftungen in Frankreich.

Heinrich starb noch im selben Jahr. Aber erst zu Beginn des zwanzigsten Jahrhunderts sollten die Dokumente und Aufzeichnungen aus den letzten Jahren seines Lebens ans Tageslicht kommen. Unter diesen Schriften, die Dr. Jaime Cortezão 1924 in Auszügen in der Zeitschrift Lusitania veröffentlichte, fand man eine Notiz, die von einem Botschafter des Priester Johannes berichtet, der acht Jahre vor Heinrichs Tod Lissabon besuchte.[57] Es ist nicht bekannt, welchen Zweck diese Mission verfolgte oder welche Angelegenheiten der Prinz und der äthiopische Gesandte besprachen. Nur zwei Jahre nach diesen Verhandlungen aber - und auch hier liegt es nahe, ein Zusammenspiel von Ursache und Wirkung zu vermuten - übertrug der portugiesische König Alfons V. dem Christusorden die geistliche Gerichtsbarkeit über Äthiopien. »Hinsichtlich der Motive für diese königliche Verleihung«, gibt Professor Prestage zu, »wissen wir aber noch nichts.«[58]

Als Heinrich 1460 starb, erblickte in Sines, einer Hafenstadt im Süden Portugals, ein würdiger Nachfolger das Licht der Welt: Vasco da Gama, der 1497 mit der Umsegelung des Kaps der Guten Hoffnung den Seeweg nach Indien entdecken sollte. Es ist kaum mehr erstaunlich, daß auch Vasco da Gama zu den Rittern des Christusordens zählte.[59]

Bezeichnenderweise führte da Gama zwei Dinge mit sich, als er zu seiner berühmten Reise aufbrach: das weiße Seidenbanner mit dem roten Doppelkreuz der Ritter Christi und ein Beglaubigungsschreiben, das an den Priester Johannes gerichtet war.[60] Wenngleich das eigentliche Ziel seiner Reise Indien war, so verbrachte der portugiesische Admiral doch einen beträchtlichen Teil der Expedition mit der Erforschung des afrikanischen Kontinents. Man berichtete, der Entdecker sei in Freudentränen ausgebrochen, als die Schiffe vor Mosambik lagen und man ihm berichtete, der sagenumwobene Priester Johannes lebe

tatsächlich weit im Norden des Landes.[61] Dieselben Informanten gaben an, daß der äthiopische Herrscher »auch längs der Küste viele Städte besitze«[62]. Das sollte sich später als unwahr herausstellen, aber die häufigen Zwischenstationen in Mombasa, Malindi und Brava waren zum Teil sicherlich von seinen Bestrebungen motiviert, einen Kontakt mit dem Priester Johannes herzustellen.[63]

Schon 1487, ein Jahrzehnt also, bevor da Gama zu seiner Reise aufbrach, hatte der Christusorden einen Expeditionstrupp zusammengestellt, der die gleiche Aufgabe hatte: Man wollte nach Äthiopien gelangen. König Johannes II. von Portugal, der zu dieser Zeit zugleich Großmeister des Ordens war, hatte einen Vertrauten, seinen Adjutanten Pero de Covilhan, auf die gefährliche Reise an den Hof des äthiopischen Königs geschickt. Der Weg führte die als Kaufleute getarnten Männer über Alexandria und Kairo nach Suakin am Roten Meer. Von dort segelten sie in einer kleinen arabischen Barke bis nach Aden. Im Südjemen geriet de Covilhan offensichtlich in Schwierigkeiten, denn erst 1493 gelang es ihm, nach Abessinien überzusetzen.[64] Auf dem schnellsten Wege reiste er an den Hof des Herrschers, wo man ihn zunächst freundlich empfing, dann jedoch unter strengsten Hausarrest stellte. Über die Gründe hierfür kann man nur mutmaßen, es steht jedoch fest, daß de Covilhan im Ruf stand, ein guter Spion zu sein (zuvor war er als geheimer Agent nach Spanien geschickt worden[65]). Es lag also nahe, daß der Portugiese vom Christusorden beauftragt worden war, sich Klarheit über den Aufenthaltsort der Bundeslade zu verschaffen. Bei seinen Nachforschungen hat er vielleicht das Mißtrauen der Äthiopier geweckt, vielleicht auch nicht; fest steht, daß er für den Rest seines Lebens in Äthiopien festgehalten wurde.[88]

De Covilhan war noch am Leben, als die erste offizielle portugiesische Gesandtschaft im Jahr 1520 den am Roten Meer gelegenen Hafen von Massawa erreichte und sich auf den Weg zu Lebna Dengel machte, dem seit 1508 regierenden König. Ein Angehöriger dieser Mission war Vater Francisco Alvarez. Ich beschäftigte mich noch einmal mit der englischen Übersetzung

seines umfangreichen Reiseberichtes. Immer wieder las ich das Kapitel über die Felsenkirchen und konzentrierte schließlich meine Aufmerksamkeit auf die Beschreibung der Georgskirche. Auf dem flachen Dach dieses großen, in den Felsboden hineingehauenen Gebäudes, so schrieb er, sei »ein Doppelkreuz, also eines im anderen, in der Art des Kreuzes der Christusritter« eingemeißelt.[67]

Natürlich waren die Felsenkirchen zur Zeit des Tempelordens entstanden, also lange bevor der Christusorden dessen Nachfolge angetreten hatte. Aber gleichzeitig war es nur folgerichtig, daß die Ritter Christi auch das Wahrzeichen des alten Ordens übernommen hatten, und so kam es, daß der portugiesische Kleriker vom »Kreuz der Christusritter« sprach. In jedem Fall war es hochinteressant, daß der alten Kirche - zweifelsohne die schönste und beeindruckendste des gesamten Komplexes - dieses Zeichen an so exponierter Stelle aufgeprägt worden war. Ich versuchte, mir die Bauwerke zu vergegenwärtigen, die ich 1983 selbst besucht hatte, aber ich konnte mich nicht an das Doppelkreuz erinnern. Die Sache interessierte mich jedoch so sehr, daß ich die Fotos, die wir auf der Exkursion aufgenommen hatten, noch einmal durchsah. Alvarez' Beschreibung von St. Georg entsprach der Wahrheit: Das Kreuz war da.

Um 1525 befand sich die portugiesische Delegation noch immer am Hofe Lebna Dengeis. Schon zu dieser Zeit war gewiß, daß Äthiopien über kurz oder lang von muslimischen Truppen angegriffen werden würde, die sich in dem im Osten des afrikanischen Horns gelegenen Emirat von Harare sammelten. Die Kämpfer wurden von einem furchterregenden und charismatischen Kriegsherrn angeführt - Ahmed Ibn Ibrahim el Ghazi, genannt Gragn, »der Linkshändige«.

Im Jahr 1527, nach umfassenden Vorbereitungen, erklärte Gragn schließlich seinen Heiligen Krieg und führte ganze Horden von wilden Somali-Soldaten, die von arabischen Söldnern und türkischen Musketieren unterstützt wurden, auf einen blutigen Feldzug in das Land seiner christlichen Feinde.[68] Über viele Jahre hinweg und ohne Unterlaß wurden landauf, landab

äthiopische Städte und Dörfer niedergebrannt, Kirchen zerstört, unermeßliche Schätze geraubt und Tausende niedergemetzelt.[89]

Den Portugiesen gegenüber hatte sich Lebna Dengel lange Zeit kühl verhalten: In den sechs Jahren ihres Aufenthaltes in seinem Lande (von 1520 bis 1526) betonte er immer wieder seine Unabhängigkeit und verwies, ungeachtet der drohenden Gefahr durch die Muslime, die 1526 nicht mehr zu übersehen war, darauf, daß er keinen Grund für ein übereiltes Bündnis mit einer fremden Macht sehe.[70] Ich glaubte, daß diese unverständliche Zurückhaltung nur mit dem Mißtrauen gegenüber den Europäern und ihren geheimen Absichten zu erklären war: der Suche nach der Bundeslade.

Welche Befürchtungen der Herrscher auch immer gehegt haben mochte, nach und nach wurde ihm unmißverständlich vor Augen geführt, daß Ahmed Gragn die weit größere Gefahr nicht nur für die Bundeslade, sondern für das gesamte äthiopische Christentum bedeutete. 1535 stürmten die Muslime die heilige Stadt Aksum und machten die Kirche der Heiligen Maria auf Zion dem Erdboden gleich[71] - aus der man allerdings, wie ich noch genau berichten werde, die Bundeslade in Sicherheit gebracht hatte. Es war höchste Zeit, als Lebna Dengel im selben Jahr seine Vorbehalte gegen ein Bündnis mit fremden Mächten überwand und Emissäre mit der dringenden Bitte um militärische Hilfe zum König von Portugal schickte.[72]

Unterdessen war allerdings die Verbindung zwischen Äthiopien und Europa immer schwieriger geworden, denn die Türken kontrollierten einen Großteil der Küsten des afrikanischen Horns sowie die meisten Häfen am Roten Meer. Es verging viel Zeit, bis der Hilferuf des Königs sein Ziel erreichte, und erst 1541 traf ein Kontingent von vierhundert portugiesischen Musketieren in Massawa ein. Sie sollten die abessinischen Truppen verstärken, die zu diesem Zeitpunkt bereits sehr geschwächt und demoralisiert waren. Lebna Dengel, seit Jahren auf der Flucht, war vor Erschöpfung gestorben, und sein Sohn Claudius, kaum zwanzig Jahre alt, hatte das Blatt nicht zugunsten seines Landes wenden können.[73]

Man setzte große Hoffnungen in die Intervention der portugiesischen Truppen, die mit Feuerwaffen und einigen schweren Kanonen ausgerüstet waren. Die äthiopische Königschronik für das Jahr 1541 berichtet von der siegessicheren Haltung, mit der die Soldaten in das Hochland marschierten, und rühmt sie als »kühne und mutige Männer, die nach der Schlacht dürsteten wie Wölfe und nach dem Gemetzel wie Löwen«[74].

Offensichtlich handelte es sich dabei nicht einmal um eine übertriebene Beschreibung: Die kleine Kampftruppe focht mit begeistertem Heldenmut und erzielte eine Reihe entscheidender Siege. Der englische Historiker Edward Gibbon brachte diese großartige Leistung später mit wenigen Worten auf den Punkt: »Äthiopien wurde von vierhundert Portugiesen gerettet.«[75]

Der Kommandeur der Entsatztruppen war, und ich hielt das für eine wichtige Information, niemand anderes als Don Christopher da Gama, Sohn des berühmten Vasco da Gama und, wie sein Vater, Ritter des Christusordens.[76] James Bruce schien einigermaßen fasziniert vom Charakter des jungen Abenteurers und beschrieb ihn mit den folgenden Worten:

»Er war außerordentlich tapfer, tollkühn und ungestüm, begierig nach militärischen Ehren und kaum von seinen eigensinnigen Entscheidungen abzubringen ... Unter den vielen Tugenden, die er besaß, fehlte die der Geduld ganz und gar, obgleich sie so wichtig ist für die Befehlshaber von Armeen.«[77]

Als Ritter Christi, dachte ich, war Don Christopher mit Sicherheit aus zwei Gründen nach Äthiopien gekommen: Zuerst mußte er die Muslime besiegen. Dann aber würde er die Bundeslade suchen und finden. Seine Unbesonnenheit und sein Mangel an Geduld kosteten ihn jedoch das Leben, bevor er auch nur das erste Ziel erreicht hatte.

Trotz überwältigender Widerstände suchte Don Christopher unablässig den Kampf mit den Truppen Ahmed Gragns: Einmal, so wird berichtet, sahen sich die Portugiesen (von den abessinischen Soldaten längst im Stich gelassen) zehntausend wilden Speerkämpfern gegenüber - und schlugen sie. Solche Meister-

stücke großer Verwegenheit waren aber mit Risiken verbunden, und 1542 geriet Don Christopher in Gefangenschaft. Ein Augenzeuge berichtete, daß der Heerführer kurz vor seiner Überwältigung »in das rechte Knie geschossen worden war und nun mit dem Schwert in der linken Hand tapfer weiterkämpfte, da der rechte Arm von einer anderen Kugel zerschmettert war .. .«[78] James Bruce' Darstellung zufolge wurde Don Christopher auf die grauenhafteste Weise gefoltert »und dann vor den General der Mohren geschleift, der ihn mit bösen Anschuldigungen überhäufte; auf diese gab der Portugiese derartige Schmähungen zurück, daß der Mohr, vor Zorn in Raserei geraten, sein Schwert zückte und den Mann eigenhändig enthauptete«[79].

Kaum ein Jahr darauf fiel auch der muslimische Befehlshaber. In einer Schlacht am Ufer des Tanasees am 21. Februar 1543 wurde er von einem gewissen Peter Leon im Kampf niedergeschossen, »einem Mann von kleiner Statur, doch tatkräftig und mutig, der vormals Kammerdiener des Don Christopher war. ... Kaum daß die Soldaten der Mohren den Verlust ihres Generals bemerkt hatten, hielten sie die Schlacht für verloren, gerieten in Verwirrung und wurden von den Portugiesen und Abessiniern bis in die Nacht hinein verfolgt und niedergemetzelt .. .«[80]

Nach fünfzehn Jahren beispielloser Zerstörung konnte dem muslimischen Einfall in Äthiopien ein Ende bereitet werden. Doch die Verluste der portugiesischen Truppen waren hoch: Neben dem furchtlosen Don Christopher fiel mehr als die Hälfte der vierhundert Musketiere. Noch viel größer war die Zahl der äthiopischen Kriegstoten, die in die Zehntausende ging; und der kulturelle Schaden - der Verlust von Handschriften, Ikonen und Gemälden - warf noch in den nächsten Jahrhunderten seinen Schatten über die Zivilisation des Hochlandes.

Und doch war der größte aller Schätze in Sicherheit: Nur wenige Tage bevor Aksum von den muslimischen Horden überrannt worden war, hatten die Priester die Bundeslade auf eine der vielen Klosterinseln im Tanasee gebracht. An diesem sicheren Ort blieb sie noch lange nach Ahmed Gragns Tod. Erst Mitte

des siebzehnten Jahrhunderts ließ Kaiser Fasilidas die Kirche der Heiligen Maria auf Zion wiedererrichten, und dort nahm der Schrein mit Pracht und Herrlichkeit seinen angestammten Platz wieder ein.[81]

Aber Fasilidas vollbrachte noch etwas. Trotz des Dankes, den sein Land den Portugiesen schuldete, setzte er alles daran, die Fremden aus dem Land zu vertreiben. Nach dem Sieg über Ahmed Gragn hatte man ihnen zunächst freien Zugang gewährt, aber es scheint, als habe der Kaiser bald dunkle Absichten bei den Europäern vermutet. So traf er schließlich ein Abkommen mit den Türken in Massawa: Jeder portugiesische Reisende, der von diesem Hafen aus nach Äthiopien vordringen wollte, wurde festgenommen und enthauptet. Und für jeden Kopf sollten die Türken eine ansehnliche Summe Goldes erhalten.[82]

Was verheimlicht James Bruce?

Nach dem Tod Don Christophers schien der Christusorden seine Vorstöße nach Äthiopien beendet zu haben. Bei den drastischen Abschreckungsmaßnahmen, die Fasilidas gegen die Fremden verhängt hatte, war es undenkbar, daß ein Portugiese den Boden des Königreiches betrat.

Nicht nur die Ritter Christi setzten jedoch die geheimnisvollen Unternehmungen der Templer fort, auch die schottischen Freimaurer hatten das Erbe des Ordens übernommen, in dem die Bundeslade eine so zentrale Rolle spielte. In diesem Zusammenhang war ich schon vor einiger Zeit auf einen Mann gestoßen, der mir nicht nur aufgrund seiner schottischen Abstammung einer genaueren Untersuchung wert zu sein schien. Er erhob nämlich zudem den Anspruch, ein Nachfahre des Königs zu sein, der im vierzehnten Jahrhundert den flüchtenden Tempelrittern Zuflucht gewährt hatte.[83] Und schließlich zählte er zu jenen tapferen und unbeirrbaren Männern, die es nach Äthiopien gezogen hatte: James Bruce of Kinnaird.

Mit seinen über ein Meter neunzig und einem dazu passen-

den Leibesumfang war Bruce ein wahrer Koloß von Mann - »der größte Mensch, den man gratis sehen kann«, wie ein Zeitgenosse ihn einmal scherzhaft beschrieb. Er war wohlhabend und hatte eine gute Erziehung genossen. Im Jahre 1730 auf dem Landsitz der Familie in Kinnaird im schottischen Tiefland geboren, wurde er mit zwölf Jahren nach Harrow geschickt, wo er exzellente Leistungen in den klassischen Sprachen erbrachte. An der Universität von Edinburgh vervollständigte er seine Studien.

Nach längerer Krankheit und familiären Schicksalsschlägen reiste er niedergeschlagen und ruhelos umher und lernte ohne Schwierigkeiten die Sprachen der jeweiligen Länder. Als man in London seine Sprachbegabung erkannte, wurde James Bruce zum britischen Konsul ernannt und nach Algier geschickt. Von dort aus unternahm er ausgedehnte Exkursionen entlang der nordafrikanischen Küste, die ihn bis ins Heilige Land führten. In dieser Zeit eignete sich Bruce sogar die Fertigkeiten eines Astronomen an und beschaffte sich zwei moderne Teleskope, die er fortan immer mit sich führte. Zudem übte er sich im Navigieren und absolvierte eine Art Überlebenstraining - Fähigkeiten, die ihm auf seinen Reisen nach Abessinien von unschätzbarem Wert sein sollten.

Man kann nicht genau rekonstruieren, wann Bruce den Plan zu seinem großen Abenteuer gefaßt hat, aber er scheint die Reise lange im voraus geplant zu haben; wir wissen zum Beispiel, daß er schon 1759 damit begann, das altäthiopische Ge'ez zu erlernen.[84] Als Bruce 1768 in Kairo eintraf, um von dort nach Abessinien aufzubrechen, war er in jeder Hinsicht gut vorbereitet. Neben den praktischen Kenntnissen verfügte er auch über ein fundiertes Hintergrundwissen, das auf den Reiseberichten seiner Vorgänger basierte. Aber was hatte Bruce dazu gebracht, nach Äthiopien zu reisen?

Der Forscher selbst macht hierzu nur ausweichende Angaben: Er habe sich den »unzähligen Gefahren und Entbehrungen, die mich ohne die Güte und den Schutz der göttlichen Vorsehung verschlungen hätten«, ausgesetzt, um die Quellen des Nils

zu entdecken.[85] Um auch den letzten Zweifel auszuräumen, betonte er das offizielle Ziel seiner Reise an exponierter Stelle. Denn der Titel seines umfangreichen Reiseberichtes lautet: *Reisen zur Entdeckung der Quellen des Nils in den Jahren 1768,1769, 1770, 1771, 1772 und 1773.*

Bruce' scheinbar so unmißverständlich formuliertes Expeditionsziel hat bei einigen Historikern zu Irritationen geführt, obgleich man bislang keine Erklärung für die kleine Unstimmigkeit gefunden hat[86], um die es hier geht: Schon lange bevor er zu seiner Reise nach Äthiopien aufbrach, mußte James Bruce gewußt haben, daß das Quellgebiet des Blauen Nils längst von zwei anderen Europäern entdeckt und genau erkundet worden war. Es gibt entsprechende Berichte von Pedro Paez und Jeronimo Lobo, zwei portugiesischen Priestern, die in Äthiopien lebten, bis Fasilidas um 1650 seine drastischen Maßnahmen gegen die Fremden ergriff.

Die so sorgsam verschleierten tatsächlichen Absichten von Bruce erregten meine Aufmerksamkeit immer mehr. Die fünf gewichtigen Bände seiner Reisen erwiesen sich schnell als unverzichtbares Nachschlagewerk, das ein einzigartiges Bild der äthiopischen Kultur zeichnete - und das zu einer Zeit, als diese Kultur noch gar nicht so weit von ihren eigenen archaischen Wurzeln entfernt war. Aus den Aufzeichnungen ging hervor, daß der Schotte ein sehr gelehrter Mann war, und von Anfang an beeindruckte mich die scharfsinnige Beurteilung von historischen Entwicklungen und die Genauigkeit seiner Beobachtungen. Im übrigen war ich durchaus der Ansicht, daß sein Bericht der Wahrheit entsprach, und hatte den Eindruck, daß er nicht übermäßig zu Übertreibungen oder verfälschender Darstellung neigte. Wie aber war es dazu gekommen, daß Bruce den Portugiesen Paez und Lobo offensichtlich keinen Glauben schenkte, obgleich er, wie aus seinen Schriften hervorgeht, ihre Berichte genau studiert hatte?[87] Im Grunde stimmte ich der Bewertung zu, die seine Werke später erfahren haben, vor allem der Tatsache, daß »Bruce, ganz und gar kein Romantiker, ein glaubwürdiger Informant«[88] war. Um so mehr verwirrte mich seine augen-

scheinliche Ungenauigkeit in diesem zentralen Punkt - oder, um es deutlich zu sagen: die Unehrlichkeit, die durch seine unverblümte Behauptung, daß »keiner der Portugiesen je die Quellen des Nils zu Augen bekommen habe«, noch verstärkt wurde.[89]

Ich fand schnell heraus, daß Bruce nicht nur in diesem Punkt die Unwahrheit gesagt hatte. Noch ausweichender reagierte er, wenn es um die Bundeslade ging. Bei der Beschreibung seines Besuches in der heiligen Stadt Aksum kommentiert er zunächst die Zerstörung der Marienkirche durch Ahmed Gragn und fügt sodann ganz richtig hinzu, daß an diesem Ort eine neue Kirche errichtet worden sei:

»Man sagt, daß in ihr die Bundeslade aufbewahrt werde, die Menelik, will man den ins Reich der Fabeln gehörenden Legenden Glauben schenken, vor seiner Rückkehr nach Äthiopien gestohlen haben soll. Ich glaube, daß in der Kirche eine Abschrift des Alten Testaments gehütet wurde, aber selbst diese hat Gragn zerstört. Fälschlicherweise nimmt man an, sie sei noch an ihrem Platz. All das hat mir der König selbst berichtet.«[90]

James Bruce zufolge, um es auf den Punkt zu bringen, wurde der Schrein nie nach Aksum gebracht. Ohne seine letzte Bemerkung hätte ich mich wahrscheinlich mit der Konstruktion zufriedengegeben, daß Bruce einfach nie herausgefunden hatte, daß der Schrein vor den Muslimen gerettet werden konnte und nach achtzig Jahren zurück nach Aksum gebracht wurde. Bruce' Verweis auf seinen königlichen Informanten entsprach jedoch schlicht der Unwahrheit: Nur wenige Jahrzehnte vor seiner Reise nach Äthiopien - und lange nach dem blutigen Krieg - hatte König Iyasu der Große die Lade mit eigenen Augen gesehen, da er zugleich das Amt des Hohenpriesters bekleidete.[91] Es war kaum vorstellbar, daß der Herrscher zu Bruce' Zeiten nichts mehr von diesem so einzigartigen Vorfall wußte. Ich konnte daraus nur schließen, daß der schottische Reisende wieder einmal »sehr sparsam mit der Wahrheit«[92] umgegangen war, zumal ich auf eine Textstelle stieß, die ein ganz anderes Bild vermittelte. Denn Bruce hatte die äthiopische Überlieferung von Me-

nelik, Salomo und der Königin von Saba keineswegs als Märchen abgetan. Im Gegenteil, er behandelte die Legende mit größtem Respekt. Im ersten Band seiner Reisen, einige tausend Seiten vor dem Bericht über Aksum, räumt er den kulturellen und Handelsbeziehungen zu alttestamentarischen Zeiten viel Platz ein.[93] Hier äußert sich der Autor ganz eindeutig zur Königin von Saba und betont, daß es sich bei ihr um eine historische - und keineswegs legendarische! - Figur gehandelt haben mußte.[94] Dann beschreibt er den langen Weg nach Jerusalem an den Hof König Salomos und kommt zu dem Ergebnis: »über diese Reise besteht kein Zweifel«[95]. Vor allem aber hebt er hervor, daß die Königin aus Äthiopien und nicht aus einem anderen Land stammte: »Andere glauben, die Königin war Araberin, aber es gibt viele Gründe, die mich davon überzeugen, daß sie Äthiopierin war.«[96] Im gleichen Tonfall faßt er die Geschichte von Meneliks Geburt und seiner Reise nach Jerusalem zusammen. Menelik sei sodann nach Äthiopien zurückgekehrt und habe im Gefolge »viele Juden, unter ihnen auch zahlreiche Gelehrte der jüdischen Gesetze«[97], gehabt. Diese Entwicklung, schließt Bruce, führte »zur Gründung einer äthiopischen Monarchie und zur Vererbung des königlichen Zepters innerhalb des Stammes Juda bis auf den heutigen Tag .. .«[98]

Was hier vorlag, war nicht mehr und nicht weniger als die genaue Wiedergabe des Kebra Nagast in einem Kontext, der den alten Überlieferungen ein hohes Maß an historischer Authentizität und Gewicht verschaffte. Merkwürdig war nur, daß Bruce einerseits jedes noch so kleine Detail ausführlich beschrieb, die Bundeslade aber mit keinem Wort erwähnte. Dabei konnte es sich nur um ein absichtliches Versäumnis handeln, bedenkt man einmal die zentrale Rolle, die der Schrein in dem äthiopischen Nationalepos spielt.

Auch in diesem Fall mußte ich also zu dem Schluß kommen, daß der schottische Reisende seine Leser absichtlich in die Irre führen wollte. Aber was verbarg sich hinter dieser Taktik? Sorgfältig und immer gespannter verfolgte ich noch einmal die Beschreibungen von Aksum und stieß auf ein wichtiges Detail, das

mir bisher völlig entgangen war. Sein Besuch in der heiligen Stadt fand am 18. und 19. Januar 1770 statt."

Schlagartig wurde mir klar, wie wichtig dieses Datum war: Denn genau an diesen Tagen mußte er »Timkat« miterlebt haben, das wichtigste Fest der äthiopisch-orthodoxen Kirche. Nur zu dieser Gelegenheit - und an keinem anderen Tag im Jahr! - wurde der Schrein nach althergebrachter Weise in kostbare Brokattücher eingeschlagen und in einer Prozession umhergetragen. Sorgsam hatte Bruce darauf geachtet, zu diesem Zeitpunkt in Aksum zu sein, denn nur dann bestand eine ernstzunehmende Möglichkeit, sich als Fremder und Laie dem heiligen Schrein zu nähern.

Der Verdacht, daß es die Bundeslade war, die den Schotten nach Aksum gelockt hatte, verdichtete sich immer mehr. Und sein Vorwand, auf der Suche nach den Nil-Quellen zu sein, hielt einem prüfenden Blick nicht länger stand. Bruce hatte sich eine »Titelgeschichte« ausgedacht, die den wahren Gegenstand seiner Suche verbergen sollte. Sein ausweichendes Verhalten war außerordentlich ungewöhnlich und ergab nur dann einen Sinn, wenn der Forscher daneben eine andere Absicht verfolgt hatte: etwas, was er unter allen Umständen geheimhalten wollte.

Aber mittlerweile waren noch mehr Indizien aufgetaucht, die Bruce überführten. So fand ich heraus, daß Bruce das Hebräische, Aramäische und Altsyrische[100] hervorragend beherrschte, tote Sprachen also, die man gewöhnlich nur dann erlernt, wenn man intensive Studien der frühen Bibeltexte betreiben möchte. Es bestand kein Zweifel, daß Bruce solche Studien betrieben hatte; seine Kenntnis des Alten Testaments, die auf fast jeder Seite der Reisen deutlich zutage tritt, war außergewöhnlich.

Es gab noch andere Beispiele für Bruce' ungewöhnliche Gelehrsamkeit.[101] Mir war bekannt, daß er eigene, peinlich genaue Untersuchungen zur Kultur und den Traditionen der schwarzen Juden Afrikas durchgeführt hatte. »Ich habe«, so schreibt er selbst, »keine Mühen gescheut, die Geschichte dieses sonderba-

ren Volkes zu erforschen, und pflegte die Freundschaft kundiger Männer, von denen ich lernte.«[102] Mit diesen Anstrengungen war es ihm gelungen, einen dauerhaften Beitrag zur Erforschung der Falaschen zu leisten - ein Unterfangen, das ebenfalls im Einklang mit der Suche nach der verlorenen Lade zu stehen schien.

Noch einmal führte ich ein Telefongespräch mit Dr. Belai Gedai in Addis Abeba und fragte ihn, ob er über Erkenntnisse bezüglich Bruce' wahren Motiven verfüge. Die Antwort des Historikers war deutlich:

»In Äthiopien ist man sich einig darüber, daß Mr. Bruce nicht in unser Land kam, um die Nil-Quellen zu entdecken. Wir glauben, daß das ein Vorwand war. Er verfolgte ein ganz anderes Ziel.«

»Fahren Sie fort«, hakte ich nach. »Was war es, wenn nicht der Nil?«

»Nun, er kam, um unsere Kunstschätze zu stehlen.« Dr. Gedai konnte seinen Ärger nicht verbergen. »Er hat einige kostbare Handschriften mit nach England genommen, zum Beispiel das Buch Henoch. Und aus der kaiserlichen Bibliothek in Gondar entwendete er eine alte Abschrift des Kebra Nagast.«

Das war eine aufregende Neuigkeit - wenn sie zutraf. Ich stellte einige Nachforschungen in dieser Richtung an und konnte Gedais Aussage nur bestätigen. Als Bruce Äthiopien verließ, führte er tatsächlich ein Exemplar des Kebra *Nagast* mit sich. Seine ausgezeichneten Kenntnisse des Ge'ez hatten es ihm sogar erlaubt, noch vor Ort eine Übertragung der alten Königslegenden in seine Sprache anzufertigen.[103] Später hat er beide Manuskripte der Bodleian Library in Oxford vermacht; dort werden sie noch heute unter den Signaturen »Bruce 93« und »Bruce 97« aufbewahrt.[104]

Das war noch nicht alles. Bis zum achtzehnten Jahrhundert hatten die Gelehrten geglaubt, das Buch Henoch sei unwiederbringlich verloren: Schon im zweiten Jahrhundert vor Christi Geburt entstanden[105], wurde die Schrift als wichtiger Bestandteil der jüdisch-mystischen Literatur angesehen. Ihre Existenz

war nur aus wenigen Fragmenten und Verweisen in anderen Texten zu rekonstruieren. James Bruce änderte die Situation, als er sich in Äthiopien gleich mehrere Exemplare des verschollen geglaubten Werkes beschaffte und nach England brachte. Man muß sich das vorstellen: Zum erstenmal gelangte der vollständige Text des Henoch-Buches nach Europa![106]

Die Tatsache, daß Bruce zudem auch das Kebra Nagast nach England brachte, und sich dazu noch der Mühe unterzog, das umfangreiche Werk vollständig zu transkribieren, ließ es noch unerklärlicher erscheinen, daß Bruce nie auf die Bundeslade eingegangen war, und bestärkte meine Vermutungen, daß mehr dahinter stecken mußte.

Für die Freimaurer hatte das Buch Henoch schon immer eine wichtige Bedeutung: So wurde in bestimmten Ritualen des Geheimbundes, die schon lange vor Bruce' Zeit entstanden, Henoch mit Thoth, dem ägyptischen Gott der Weisheit, identifiziert.[107] Und in der *Royal Masonic Cyclopaedia* stieß ich auf einen Eintrag, nach dem Henoch in den Augen des Ordens als Erfinder der Schrift galt und »die Menschen die Baukunst lehrte«. Vor der großen Flut »fürchtete er, daß die Geheimnisse aller Geheimnisse verloren gehen würden, und so verbarg er das auf weiße Porphyr-Platten eingemeißelte >Große Geheimnis< im Innern der Erde...« Der Artikel in der Enzyklopädie schließt mit den Worten: »Man wußte, daß das Buch Henoch seit Urzeiten existierte. Die Kirchenväter haben immer darauf verwiesen. Bruce brachte drei Abschriften des Buches aus Abessinien mit.. .«[108]

Die beiläufig und geradezu vertraut wirkende Nennung seines Namens und die Tatsache, daß Bruce die Anstrengungen der langen Reise unternommen hatte, um nicht nur eines, sondern sogar drei Exemplare des Buches zu erobern, ließ mich vermuten, daß der Schotte selbst Freimaurer gewesen sein mußte. Damit würden sich auf einen Schlag eine Vielzahl von Mosaiksteinchen zu einem glaubhaften Bild zusammenfügen und sein ausweichendes Verhalten in vielen Punkten erklären lassen. Es bestand für mich längst kein Zweifel mehr, daß er ein

besonderes Interesse an der Bundeslade hatte, das er mit allen Mitteln zu verbergen suchte. Nun erkannte ich, wo dieses Interesse herrührte und warum er so sehr auf Geheimhaltung bedacht war. Als Freimaurer - und obendrein als schottischer Freimaurer - mußte er auf die Unternehmungen der Templer und ihre Suche nach dem Schrein gestoßen sein.

Aber gehörte Bruce wirklich zu den Freimaurern? Es erwies sich als schwierig, eine Antwort auf diese Frage zu erhalten. Auf den über dreitausend Seiten seiner Reisen fand ich keinen einzigen Hinweis, der meinen Vermutungen hätte Gestalt verleihen können. Auch die umfangreichen und detaillierten Biographien, die 1836[109] und 1968[110] über Bruce verfaßt wurden, versagten in diesem Punkt. Erst im August 1990 ergab sich die Gelegenheit, nach Schottland zu reisen, um den Familiensitz der Bruce of Kinnaird aufzusuchen. Hier würde ich hoffentlich Antworten auf meine Fragen erhalten.

Kinnaird House befindet sich in der Nähe von Falkirk am Rande der Ortschaft Larbert. Das Gutsgebäude, das abseits der Landstraße inmitten eines großen Grundstückes liegt, ist ein imposantes Gebäude aus grauem Stein. Nach einigem Zögern willigte der heutige Besitzer, Mr. John Findlay Russell, ein, mir das Haus zu zeigen. Schnell bemerkte ich, daß es nicht aus der Zeit von James Bruce stammen konnte.

»Ganz richtig«, bestätigte Findlay Russell, »Kinnaird House ging 1895 in andere Hände über. Das alte Gebäude wurde von seinem neuen Besitzer, einem gewissen Dr. Robert Orr, abgerissen. Er hat dieses Anwesen 1897 errichten lassen.«

Wir standen in der riesigen, getäfelten Eingangshalle, direkt vor dem breiten Treppenaufgang. Findlay Russell deutete auf die Stufen und erzählte stolz: »Das ist das einzige, was von dem alten Haus übriggeblieben ist. Dr. Orr hat die Treppe so belassen und sein Haus darum gebaut. Sie ist von einiger Bedeutung, müssen Sie wissen.«

»Wirklich? Warum?«

»Weil James Bruce auf diesen Stufen starb. Es war im Jahr 1794. Er hatte in einem der höhergelegenen Räume ein Abend-

essen gegeben und begleitete einen Gast die Treppe hinunter. Dabei stolperte er und stürzte schwer. Er war sofort tot. Ein großes Unglück ...«

Bevor ich aufbrach, fragte ich Findlay Russell noch, ob er etwas über Bruce' Verbindung zu den Freimaurern wisse.

»Nein«, antwortete er, »nicht das Geringste. Natürlich habe ich mich viel mit ihm beschäftigt, aber ich würde nicht behaupten, ein Experte zu sein.«

Enttäuscht nickte ich. Als wir das Haus verließen, fiel mir noch etwas ein: »Wissen Sie vielleicht, wo er begraben liegt?«

»Bei der alten Kirche von Larbert. Es wird aber nicht einfach sein, das Grab zu finden. Es gab einmal einen großen, eisernen Obelisken, der über der Grabstelle aufragte, aber der war völlig verrostet. Vor ein paar Jahren hat man ihn entfernt, weil er zusammenzustürzen drohte ...«

Zehn Minuten später hatte ich die Kirche gefunden. Die Suche nach der letzten Ruhestätte des berühmten schottischen Forschers nahm allerdings sehr viel mehr Zeit in Anspruch.

Es war ein scheußlicher, regnerischer Nachmittag, und als ich die Reihen der Gräber absuchte, wurde ich immer mißmutiger. Ich konnte mich nicht damit abfinden, daß Bruce unter irgendeinem unscheinbaren Fleckchen Erde in Vergessenheit geraten sein konnte. Während ich den Hauptteil des Friedhofs immer wieder gründlich absuchte, stieß ich mehr zufällig auf eine dichtbewachsene und überwucherte Parzelle, die von einer niedrigen Steinmauer umschlossen wurde. Ich öffnete ein kleines Tor, stieg ein paar Stufen hinunter und fand - eine Art Müllkippe. Lumpen und löchrige Schuhe lagen neben Blechdosen und zerbrochenen Möbeln, überwuchert von Nesseln und Dornengestrüpp. Der dichte Baumbestand bildete ein Blätterdach, durch das kaum Tageslicht drang. Schwärme von Mücken und Wespen empfingen mich, als ich versuchte, das kniehohe Gestrüpp niederzutrampeln. Nun hatte ich schon alles abgesucht, da konnte ich hier auch noch nachsehen. Ich wollte die Hoffnung schon aufgeben, als ich inmitten dieses schottischen

Dschungels massive Steinplatten entdeckte, die schon halb im Boden versunken und völlig mit Moos und Flechten bedeckt waren. Ich schwankte zwischen Verärgerung und Spannung, als ich die Steine so gut es ging freilegte. Nichts wies darauf hin, daß sie Bruce' sterbliche Überreste verbargen, aber ich hatte das dunkle Gefühl, daß es so war.

Für eine Weile stand ich in Gedanken versunken vor den Steinen. Dann verließ ich die verwilderte Anlage - allerdings nicht auf dem normalen Weg durch das kleine Tor, sondern über das rückwärtige Mäuerchen. Nur Augenblicke später machte ich eine interessante Entdeckung: An der Mauer, nur wenige Meter von mir entfernt, lag ein großer Obelisk aus Metall. Als ich mich näherte, konnte ich den eingravierten Namen des Forschers und folgenden Epitaph erkennen:

»In seinem Leben vollbrachte er große und nützliche Taten / Er erforschte viele fremde Länder / Er entdeckte die Quellen des Nils / Er war ein liebevoller Ehemann und ein gütiger Vater / Mit Inbrunst liebte er sein Vaterland / Einmütig wird die Menschheit seinen Namen zu denjenigen zählen, die Genie, Mut und Tugend bewiesen haben.«

Es war jedoch nicht die Inschrift, die mich irritierte. Es war der Obelisk an sich. Er war weder verrostet noch zerfallen, im Gegenteil, er war gerade erst mit einer roten Grundierungsfarbe gestrichen worden. Wer aber konnte ein Interesse an der Grabstelle des Forschers haben, daß er das Monument restaurieren ließ, aber offensichtlich noch keine Zeit gefunden hatte, es wieder über dem Grab zu errichten?

Noch am selben Nachmittag stellte sich heraus, wer der geheimnisvolle Wohltäter war. Im Pfarramt der Kirchengemeinde erzählte man mir, daß der Obelisk vor einigen Jahren zu Reparaturarbeiten von seinem Standort entfernt und erst vor wenigen Tagen wiedergebracht worden war. Die Restaurierung hatte niemand geringeres als das Oberhaupt der Familie Bruce in Schottland angeordnet: der Graf von Elgin und Kincardine, selbst Meister des Freimaurerordens.[111] Das war ein vielversprechender Anhaltspunkt, dem ich bis nach Bromhall folgte, wo Graf

Elgin lebte. Ich meldete mich telefonisch an und sollte am Morgen des 4. August empfangen werden.

»Ich habe aber nur eine Viertelstunde Zeit für Sie«, hatte mich der Graf gewarnt.

»Fünfzehn Minuten werden genügen«, war meine Antwort.

Elgin, ein kleiner, untersetzter älterer Herr, führte mich ohne große Umstände in einen prächtigen Salon, der von einer Unzahl von Familienporträts beherrscht wurde, und bat mich, mein Anliegen vorzutragen. Bis zu diesem Moment war sein Verhalten fast schroff gewesen. Als wir aber über Bruce sprachen, taute er merklich auf. Elgin verfügte über ein großes und detailliertes Wissen, was bewies, daß er das Leben seines Vorfahren sorgfältig studiert hatte. Nach einiger Zeit führte er mich in einen anderen Raum und verwies auf einige Regale, die mit alten Büchern aus den unterschiedlichsten Sprachen und Sachgebieten angefüllt waren. »Das ist ein Teil seiner persönlichen Bibliothek«, erklärte er. »Bruce besaß ein weitgespanntes Interesse. Ich habe auch seine Teleskope, seinen Quadranten und den Kompaß. Wenn Sie möchten, zeige ich Ihnen die Instrumente schnell ...«

Die angekündigte Viertelstunde war längst verstrichen. Doch von Elgins enthusiastischen Erklärungen mitgerissen, war es mir nach anderthalb Stunden noch immer nicht gelungen, die wichtigste Frage loszuwerden. Nun sah er plötzlich auf die Uhr und rief: »Donnerwetter, wie die Zeit vergeht. Ich fürchte, ich muß mich von Ihnen verabschieden. Geschäfte ... Ich muß heute noch ins Hochland. Vielleicht kommen Sie ein andermal wieder?«

»Oh ... ja, das würde ich sehr gerne ...«

Freundlich lächelnd erhob sich der Graf. Auch ich stand auf und schüttelte ihm die Hand. Für einen Moment kam ich mir überrumpelt vor, aber ich konnte nicht abreisen, ohne meine Neugier befriedigt zu haben.

»Erlauben Sie bitte«, sagte ich, »daß ich Sie noch etwas frage, was mich besonders interessiert. Schon lange denke ich über die wahren Gründe nach, die Bruce dazu bewogen haben, die

Reise nach Äthiopien zu unternehmen. Wissen Sie vielleicht, ob ... nun, ich meine, besteht die Möglichkeit, daß er Freimaurer war?«

Elgin schien für einen Moment verblüfft. »Aber junger Mann«, gab er zurück, »natürlich war er Freimaurer. Das war ein wichtiger, sehr wichtiger Bestandteil seines Lebens.«

TEIL III: LABYRINTH

Kapitel 8

Nach Äthiopien

Lord Elgin bestätigte meine Vermutungen: Als Mitglied der Canongate Kilwinning Loge Nummer zwei in Edinburgh hatte James Bruce tatsächlich zu den Freimaurern gehört. Elgin hatte mir auch erzählt, daß Bruce der »spekulativen« Seite der Freimaurerei sehr verbunden war, was bedeutete, daß er ein großes Interesse an den esoterischen und okkulten Traditionen der Bruderschaft hatte: Traditionen, zu denen das Tempelrittertum gehörte. Die modernen Freimaurer unterscheiden sich in ihren eher »weltlichen« Auffassungen des Kultes damit erheblich von Bruce; von den Templern und ihrer Geschichte wissen die meisten nichts und kümmern sich auch nicht darum.

Ich war übrigens nie der Überzeugung, daß alle Freimaurer Zugang zum Vermächtnis der Tempelritter hatten; im Gegenteil, man muß annehmen, daß dieses Geheimnis zu allen Zeiten nur einigen wenigen Männern bekannt war. Bruce sah jedenfalls nach dem idealen Kandidaten für diesen inneren Zirkel aus. Er verfügte über eine profunde Bibelkenntnis und ließ sich von der Faszination der mystischen Schriften packen. Nach meinem Treffen mit Lord Elgin fühlte ich mich also sicherer denn je, daß es von. Anbeginn an der Schrein gewesen war, der den schottischen Abenteurer im Jahre 1768 nach Äthiopien gelockt hatte - und nicht etwa der Nil...

Alle Beweise, die ich im Verlauf meiner Untersuchungen ans Licht gebracht hatte, schienen in die Richtung einer fortgesetzten Suche nach der Bundeslade zu deuten - ein geheimes Unternehmen, das in allen Jahrhunderten Reisende und Abenteurer aus den unterschiedlichsten Ländern angelockt hatte -, und alle verfolgten das gleiche erhabene und immerwährende Ziel. War es also nicht möglich, daß die Faszination auch in unserem Jahrhundert noch andauerte? Gab es noch andere, die wie ich

die Bundeslade suchten? Ich hatte mich bemüht, in dieser Frage immer unvoreingenommen zu bleiben, und doch begann ich, Männer wie James Bruce oder Christopher da Gama zu meinesgleichen zu zählen. Und so war es für mich höchste Zeit, nach Äthiopien zurückzukehren, um das, was bisher mehr oder weniger eine intellektuelle Übung war, um genaue Untersuchungen vor Ort zu ergänzen.

Schwierige Zeiten

Ich traf diese Entscheidung schon im Juni 1989, aber es verstrichen mehrere Monate, bevor ich meinen Plan in die Tat umsetzen konnte. Der Grund dafür war der 19. Mai desselben Jahres, an dem in Addis Abeba ein Putschversuch stattfand, der das Land in große Unruhe stürzte.

Die Regierung von Präsident Mengistu Haile Mariam konnte sich nur unter schweren Opfern halten. Nachdem der Staub sich gelegt hatte, waren einhundertsechsundzwanzig Offiziere verhaftet worden, darunter nicht weniger als vierundzwanzig Generäle. Der Oberbefehlshaber der Luftwaffe und der Stabschef entzogen sich der Verhaftung durch Selbstmord. Elf weitere Generäle wurden während der Kämpfe getötet, der Verteidigungsminister von den Putschisten erschossen.

Das fast vollständig zerschlagene Offizierskorps ließ die militärische Aktionsfähigkeit des Regimes auf Null sinken, ein Zustand, der sich an den Fronten sehr schnell bemerkbar machte. In den Monaten nach dem Putschversuch mußte die äthiopische Armee eine Reihe vernichtender Niederlagen hinnehmen, was bis zum vollständigen Rückzug aus der Provinz von Tigre führte, die von der TPLF zur »befreiten Zone« erklärt wurde. Auch weite Teile Eritreas waren nicht mehr unter Kontrolle der Armee, und die Eritreische Volksbefreiungsfront EPLF schuf bereits die Grundlagen für einen unabhängigen Staat. Auch in anderen Gebieten breiteten sich die Kämpfe mit einer alarmierenden Geschwindigkeit aus.

Der größte Rückschlag aber - zumindest aus meiner eigennützigen Perspektive - war, daß die Regierung Aksum aufgeben mußte. Die heilige Stadt war Ende 1988 von der TPLF eingenommen worden - bereits einige Monate vor dem Staatsstreich in Addis Abeba. Ich hatte zunächst gehofft, daß dies nur ein vorübergehender Zustand sein würde. Nach den Geschehnissen im Mai 1989 mußte ich mich allerdings mit der Möglichkeit abfinden, daß die Guerilla Aksum auf unbestimmte Zeit würde halten können.

Natürlich gab es immer noch die Alternative, in London Kontakt mit der TPLF zu knüpfen und sie um Zusammenarbeit zu bitten. Ich sah mich allerdings kaum in der Lage, diesen Versuch zu unternehmen. Meine seit langem bestehenden Verbindungen mit der äthiopischen Regierung würden bei der Befreiungsfront mit Sicherheit zu Mißtrauen führen. Wahrscheinlich würde man meine Bitte, nach Aksum zu reisen, rundweg ablehnen. Zudem war ich auch um meine eigene Sicherheit besorgt. Denn selbst wenn man mir die Erlaubnis erteilen würde, bestand noch immer die Möglichkeit, daß irgendein örtlicher Guerillakommandeur mich als bekannten Sympathisanten und Spion des Mengistu-Regimes verhaften und kurzerhand erschießen lassen würde.

In der unsicheren Atmosphäre nach dem Putschversuch war es kaum möglich, Pläne zu machen, so daß ich mich den Sommer über auf andere Aspekte meiner Nachforschungen konzentrierte.

Ein geheimes Versteck?

Im Spätherbst 1989 erhielt ich eine Information, die mich meine Bemühungen um die Einreise nach Äthiopien verstärken ließ. Sie kam von Hochwürden Liqa Berhanat Solomon Gabre Selassie. Dem Mann mit dem langen Namen - und dem ebensolangen grauen und vollen Bart - begegnete ich zum erstenmal am 12. Juni 1989. Als Erzpriester der äthiopisch-orthodoxen Kirche

in Großbritannien war er genaugenommen ein Missionar. Das Patriarchat in Addis Abeba hatte ihn vor einigen Jahren nach England geschickt, um die orthodoxe Botschaft zu verbreiten. Erzpriester Solomon war für mich das genaue Abbild eines alttestamentarischen Patriarchen. Die ehrwürdige Erscheinung, die absolute Überzeugung in den Dingen seines Glaubens, die scharfsinnigen Reaktionen und der verschmitzte Blick ergaben eine charismatische Persönlichkeit, die zudem eine natürliche Bescheidenheit ausstrahlte.

Im Verlauf unserer Unterhaltung wurde mir schnell klar, daß Solomon fest davon überzeugt war, daß der heilige Schrein in Äthiopien war. Dieser intelligente und offensichtlich hochgebildete Mensch, dessen sichere Bibelkenntnis ein langes Studium verriet, drückte seine Meinung mit ruhiger Bestimmtheit aus, die keinen Irrtum zuzulassen schien.

Ich machte mir sorgfältig Notizen, als er noch einmal eindringlich auf diesen Punkt hinwies: »Die echte Bundeslade, die am Fuße des Berges Sinai gebaut wurde, um die Steintafeln mit den Zehn Geboten aufzubewahren, eben dieser einzigartige Gegenstand befindet sich nun in Aksum. Und auch heute besitzt der Schrein Dank Gottes Gnaden noch seine große Macht. Das Volk von Tigre beschützt ihn, er ist in den sicheren Händen der Kirche und der gläubigen Menschen, die ihn ohne Unterlaß bewachen.«

Bevor wir uns trennten, übergab ich dem Erzpriester eine Liste mit fünfzehn Fragen, um deren Beantwortung ich ihn bat Als sein Brief Mitte Juli eintraf, befand ich mich allerdings in Ägypten, und nach meiner Rückkehr überflog ich die halb mit der Hand, halb mit der Schreibmaschine beschriebenen Blätter nur flüchtig. Ich war so beschäftigt, daß ich mir nicht einmal die Mühe machte, mich kurz zu bedanken. In einem müßigen Moment Anfang November lenkte ich meine Aufmerksamkeit endlich auf den Fragebogen. Ich entdeckte, daß er alle fünfzehn Punkte sorgfältig beantwortet hatte, und einige seiner Erläuterungen waren außerordentlich interessant.

Ich wollte zum Beispiel wissen, ob die angeblich »übernatürlichen« Kräfte der Lade je von den Herrschern Äthiopiens eingesetzt worden waren, um den Sieg in einer Schlacht zu erringen. Die Bibel verweist sehr deutlich auf derartige Situationen im alten Israel. Wenn die Bundeslade also wirklich in Äthiopien war, mußte man dann nicht annehmen können, daß diese Tradition fortgesetzt wurde?

»Den Lehren unserer Kirche zufolge«, antwortete Solomon, »ist Gott die einzige Macht im Universum. Er ist der Schöpfer allen Lebens, des sichtbaren und des unsichtbaren. Er selbst ist

das unvorstellbare ewige Leben, das uns Licht und Kraft und Gnade spendet. Es gibt jedoch eine faßbare Dimension, in der wir die Beziehung zwischen Gott und der Bundeslade verstehen können, enthält doch der Schrein die Zehn Heiligen Worte des Gesetzes, deren Macht unvermindert anhält. Bis zum heutigen Tag liegt der Segen des Herrn auf der Bundeslade, und im Namen Gottes ist sie heilig und von großer spiritueller Bedeutung.«

»Die Herrscher Äthiopiens«, las ich weiter, »wußten das. Der Schrein sollte das orthodoxe Christentum schützen und verteidigen. In den vielen Kriegen, die in den Jahrhunderten geführt wurden, versicherten sie sich der Hilfe der Lade als Quelle geistiger Stärke gegen die Angreifer. Die Könige versammelten das Volk zur Schlacht um sich, und die Priester erhoben sich wie an dem Tag, an dem Josua die Lade um die Stadtmauern von Jericho trug. So führten auch unsere Priester den Schrein mit sich, sangen zum Ruhme Gottes und gingen in die Schlacht.«

Das Heiligtum als Kriegswaffe - als sehr effektive dazu - war offenbar nicht nur in der fernen Vergangenheit benutzt worden. Im Gegenteil: »Erst 1896, als der König der Könige, Menelik II., in der Schlacht von Adua gegen die italienischen Aggressoren kämpfte, trugen die Priester den Schrein ins Feld und stellten sich den Eindringlingen entgegen. Menelik ging siegreich aus dem Kampf hervor und kehrte in großen Ehren nach Addis Abeba zurück.«

Ich las diese Stelle mit einigem Interesse, denn ich wußte, daß Menelik II. im Jahre 1896 tatsächlich sehr siegreich war. In diesem Jahr waren siebzehntausend italienische Soldaten unter dem Kommando General Baratieris in das abessinische Hochland vorgerückt. Die Truppen waren mit den modernsten Waffen und schwerer Artillerie ausgerüstet und hatten den Auftrag, das gesamte Land zu kolonialisieren. Meneliks Männer, die schlecht vorbereitet und weit weniger gut bewaffnet waren, trafen am Morgen des 1.März auf die Italiener - und gewannen in weniger als sechs Stunden eine Schlacht, die ein Historiker später als »den bemerkenswertesten Sieg einer afrikanischen

über eine europäische Armee seit Hannibal« bezeichnete.[1] Im gleichen Tenor kommentierte die Londoner Zeitung *Spectator* vom 7.März 1896 das Ereignis: »Die Italiener haben eine große Niederlage erlitten ... So etwas ist den Weißen in Afrika noch nie zugestoßen.«

Der Hinweis, daß die Lade in der Schlacht von Adua eingesetzt worden war, beschäftigte mich sehr: War es nicht möglich, daß der Schrein auch heute noch benutzt wurde, vielleicht von der TPLF, die nun die Kontrolle über Aksum hatte, und die in den vergangenen Monaten sehr erfolgreich war? Solomon äußerte keine derartigen Vermutungen. Statt dessen entwarf er auf meine Frage, die die Sicherheit des Schreins in den Wirren dieser Monate betraf, ein vollständig anderes Szenario.

Als ich im Juni mit ihm gesprochen hatte, schien er noch davon überzeugt, daß die Lade sich an ihrem Platz in Aksum befinde und vom Volk beschützt werde. Dessen war er sich nicht mehr sicher. »In Zeiten großer Unruhe und Gewalt gab es einige sehr seltene Fälle«, erklärte er, »in denen der Wächter den Schrein unter Tüchern verbarg und ihn aus Aksum heraus in Sicherheit brachte. Wir wissen, daß dies im sechzehnten Jahrhundert geschah, als Aksum von den muslimischen Horden Ahmed Gragns besetzt und zum großen Teil zerstört wurde. Der Mönch brachte die Lade zum Kloster Daga Stephanos auf einer Insel im Tanasee. Dort wurde sie an einem geheimen Ort versteckt.«

Es war die letzte Bemerkung des Erzpriesters, die mich schlagartig aufmerksam werden ließ: Unter den gegenwärtigen Umständen von Krieg und Chaos in Tigre, schrieb er, sei es möglich, daß der Wächter das Heiligtum aus Aksum entfernt habe ...

Zwei Seen, zwei Inseln

Am 14. November 1989 flog ich nach Addis Abeba. Wenn die Schlußfolgerungen des Erzpriesters zutrafen, war es dann nicht naheliegend, daß das Heiligtum von Aksum nun auf der Kloster-

insel von Daga Stephanos versteckt wurde, an jenem »geheimen Platz«, an den es schon einmal gebracht worden war?

Es gab jedoch einen weiteren Ort, der in Frage kam. Ich erinnerte mich sehr gut an einen Satz von Dr. Belai Gedai, der mir bei einem unserer vielen Telefongespräche von einer früheren Überlieferung berichtet hatte, nach der die Lade schon einmal, während des Aufstandes der Königin Gudit im zehnten Jahrhundert, in Sicherheit gebracht worden war, und zwar auf eine der Inseln im Zwaisee. Ich wollte also beide Seen überprüfen: Der Tanasee lag im Norden des Landes in einer Region, die noch von den Regierungstruppen kontrolliert wurde; der Zwaisee im Süden von Addis Abeba, also auf ungefährlichem Gebiet.

Ich hatte England kaum eine Woche nach der Lektüre des Briefes von Solomon verlassen, und der Grund, warum ich mich nun so in Eile befand, war höchst einfach: Obgleich das Gebiet um den Zwaisee zumindest im Moment nicht vom Krieg bedroht war, so gab es absolut keine Garantie dafür, daß der Norden des Landes noch lange in der Hand der Regierung bleiben würde. Die Streitkräfte der Rebellen hatten bereits die Stadt Gondar eingeschlossen, die nur fünfzig Kilometer nördlich des Tanasees lag. Unterdessen hatte es auch schon sporadische Artillerieangriffe auf den Hafen von Bahar Dar am Südufer des Sees gegeben. Bahar Dar war der einzige Weg, auf dem ich Daga Stephanos erreichen konnte. Ich wußte also, daß ich keine Zeit verlieren durfte.

Es kam natürlich nicht in Frage, den normalen bürokratischen Weg zu beschreiten, um eine Reiseerlaubnis für das Inland zu bekommen. Begleitet von meinem alten Freund Richard Pankhurst, machte ich mich zu einem Treffen mit einem hochrangigen Beamten auf. Shimelis Mazengia war der Chefideologe des Regimes und eines der führenden Mitglieder des Politbüros der Äthiopischen Arbeiterpartei.

Der hochgewachsene, schlanke und fließend Englisch sprechende Shimelis mußte in den Vierzigern sein. Er war überzeugter Marxist, aber gleichzeitig einer der intelligentesten und kultiviertesten Männer der Regierung. Sein Einfluß innerhalb des

Regimes war beträchtlich, und ich wußte, daß er ein echtes Interesse für die Geschichte seines Landes besaß. Es war also gut möglich, daß er seinen Einfluß einsetzen würde, um unsere Arbeit zu unterstützen. Und tatsächlich sollte ich nicht enttäuscht werden. Nachdem ich mein Projekt umrissen hatte, stimmte er unserer Exkursion zu den Seen bereitwillig zu. Die einzige Bedingung bestand darin, daß unser Aufenthalt in der Tana-Region so kurz wie möglich sein sollte. »Haben Sie einen Zeitplan ausgearbeitet?« fragte er.

Ich zog mein Notizbuch hervor und schlug nach kurzer Überlegung den 20. November als Abreisetag vor: »Ich fliege nach Bahar Dar, miete bei den Marinebehörden ein Boot, besuche Daga Stephanos und komme am... sagen wir Mittwoch, den 22. zurück nach Addis. Das sollte hinkommen. Wenn Sie damit einverstanden sind, würde ich dann am 23. runter zum Zwaisee fahren.«

Shimelis wandte sich an Richard: »Und Sie werden mitreisen, Professor?«

»Wenn das möglich ist, gerne.«

»Selbstverständlich ist das möglich.«

Shimelis telefonierte sofort mit dem Hauptquartier der Sicherheitspolizei in Addis Abeba und sprach mit einem hochgestellten Beamten. Nachdem er aufgelegt hatte, teilte er uns mit, daß wir die Reisegenehmigungen am Nachmittag abholen könnten.

»Und kommen Sie nächsten Freitag zu mir«, sagte er, »wenn Sie von Ihrer Reise zurück sind. Sie können mit meiner Sekretärin einen Termin ausmachen.«

Wir verließen das Parteigebäude in bester Laune. »Ich hätte nie gedacht, daß es so einfach sein würde«, sagte ich zu Richard.

Kapitel 9

Der heilige See

Nach einem neunzigminütigen Flug erreichten wir Bahar Dar am Südende des Tanasees. Trotz der Kämpfe in diesem Gebiet konnten wir keine besonderen Vorkehrungen beim Landeanflug beobachten; das Flugzeug beschrieb einen langsamen und weitgestreckten Bogen über den malerischen Nil-Fällen, bevor es auf der holprigen Sandbahn aufsetzte.

In einem großen Hotel am Ufer des Sees bezogen wir zwei der hundert leerstehenden Zimmer und fuhren dann zum Pier der Marinebehörden, wo die Barkasse vertäut lag, die wir hoffentlich würden mieten können. Nach langwierigen Verhandlungen mit den zuständigen Beamten erhielten wir schließlich die Genehmigung, das Boot zu chartern - allerdings erst für den nächsten Tag, den 21. November, und auch nur unter der Voraussetzung, daß wir bereit waren, die räuberische Summe von fünfzig US-Dollar pro Stunde zu zahlen. Verärgert ging ich auf diese erpresserische Forderung ein und verlangte, daß das Boot am frühen Morgen um fünf Uhr zum Auslaufen bereit liegen müsse.

Um die Zeit am Nachmittag totzuschlagen, verließen wir Bahar Dar in Richtung des nahegelegenen Dörfchens Tisisat. Von dort aus unternahmen wir einen Fußmarsch durch die gelbbraun gefärbte Landschaft, bis wir eine Steinbrücke erreichten, die sich über eine tiefe Felsschlucht spannte. Sie war im frühen siebzehnten Jahrhundert von Portugiesen erbaut worden und machte nicht gerade einen vertrauenerweckenden Eindruck; Richard versicherte mir jedoch, daß sie noch begehbar sei. Wir überquerten die Brücke, erklommen einen Hügel - und sahen uns plötzlich zwei Milizsoldaten gegenüber, die aus einem Gebüsch hervortraten. Sie durchsuchten uns, überprüften unsere Pässe - zumindest gaben sie vor, das zu tun, denn meinen hielten sie auf dem Kopf- und ließen uns schließlich passieren.

Nach etwa fünfzehn Minuten auf einem von dichtem tropischen Bewuchs gesäumten, schmalen Ziegenpfad spürten wir unter den Füßen ein tiefes und donnerndes Vibrieren. Im Weitergehen bemerkten wir die zunehmende Luftfeuchtigkeit, und nach einer kurzen Weile konnten wir den ersten Blick auf das Ziel unseres Ausflugs werfen: den eindrucksvollen Basaltfelsen, über den sich der Blaue Nil mit gewaltiger Kraft hinunterstürzt, bevor er seine weite Reise durch das abessinische Hochland bis nach Ägypten antritt.

Der volkstümliche Name für den Blauen Nil - und für das Dorf, durch das wir gekommen waren - ist »Tisisat«, was soviel bedeutet wie »Wasser, das dampft«. Als ich hingerissen die Regenbögen bestaunte, die in den feinen Gischtschleiern des kochenden Kataraktes hingen, wurde mir klar, woher dieser Name kam.

Der Anblick erinnerte mich an die Beschreibungen des schottischen Entdeckers James Bruce, nichts schien sich seitdem geändert zu haben, und ich war erstaunt von der Genauigkeit seiner Beobachtungen:

»Der Fluß fällt in einer einzigen Wasserwand und ohne Unterlaß auf einer Breite von etwa einer halben englischen Meile mit einer Kraft und Lautstärke, die wahrlich furchteinflößend ist, und die mich überwältigte und für einen Augenblick völlig benommen werden ließ. Dichte Schwaden verhüllen den Wasserfall, hängen sowohl oben als auch unten über dem Fluß und bezeichnen so seinen Lauf, obgleich man das Wasser nicht sehen kann. Es war ein großartiger Anblick, der sich meinem Geist für alle Ewigkeiten einprägen wird; er traf mich mit einer Art Erstarrung und ließ mich alles Irdische und den Ort, an dem ich war, vergessen .. .<[1]

Wenig später begannen wir unseren Rückmarsch in Richtung Tisisat, umringt von Kindern, die plötzlich aufgetaucht waren, um Geld, Süßigkeiten oder Kugelschreiber zu erbetteln. Bisher hatte dieser Nachmittag etwas sehr Idyllisches, Friedliches und Ländliches gehabt. Sogar die Milizsoldaten, die uns durchsucht hatten, waren so träge und gut gelaunt, daß sie das

Bild nicht störten. Als wir jedoch in der ersten Abenddämmerung die Brücke der Portugiesen überquerten, sahen wir uns unversehens einem Schauspiel gegenüber, das so gar nicht zu dieser Stimmung passen wollte. Aus der Gegenrichtung näherten sich mindestens dreihundert schwerbewaffnete Soldaten in Kampfanzügen.

Es war nicht auszumachen, ob es Regierungstruppen oder Rebellen waren. Die Soldaten trugen keine Regimentsabzeichen oder sonstige identifizierbare Ausrüstungsgegenstände. Um die Disziplin der Truppe schien es nicht gut bestellt zu sein, und es war zweifelhaft, ob sie unter dem Kommando eines Offiziers standen. Ohne erkennbare Marschordnung kamen uns die Soldaten mit finsteren Blicken entgegen. Sie trugen ihre Waffen äußerst nachlässig: Einer benutzte sein Gewehr als Spazierstock, ein anderer trug sein AK 47 mit dem Lauf nach vorn über der Schulter, und ein dritter fuchtelte unachtsam mit einem geladenen Raketenwerfer herum, der ein größeres Gebäude leicht zerstören konnte - oder, um genauer zu sein, die Brücke, auf der wir uns befanden.

Richard, der recht gut Amharisch spricht, grüßte einige Männer aus diesem rauhen Haufen in leutseligem Ton, schüttelte vielleicht einem Dutzend anderen herzlich die Hand und machte übertriebene Gesten der Freundschaft in Richtung der übrigen. »Die glauben, daß alle Fremden leicht verrückt sind«, erklärte er mir, ohne seine Verständigungsbemühungen zu unterbrechen, »und ich passe haargenau in dieses Bild. Glaub mir, das ist das Beste, was man tun kann.«

Ägyptische Schilfboote

Am nächsten Morgen waren wir um fünf Uhr an der Anlegebrücke der Marinebehörden. Kein Mensch war zu sehen und Richard, der sich gegen die Kälte in eine Decke eingewickelt hatte, grummelte etwas vom »Vetake-Syndrom«.
»Was ist denn das?« wollte ich wissen.

»Verabredungen treffen, aber keine einhalten«, brummte der Historiker zurück.

Eine halbe Stunde später erschien der Kapitän der MS Dahlak und mit ihm ein glattrasierter junger Mann in einem gutsitzenden Anzug, der sich in bescheidenen Worten als zweiter stellvertretender Assistent der Regionalverwaltung vorstellte. Sein Name war Wondemu. »Gestern nachmittag hat mein Chef einen Anruf vom Genossen Shimelis Mazengia aus Addis Abeba erhalten. Wir sollen uns um Sie kümmern. Ich bin sofort zu Ihrem Hotel gegangen, aber Sie waren nicht da. Ich erfuhr aber von den Nachforschungen, die Sie heute betreiben wollen. Also«, schloß er mit einem breiten Lächeln, »hier bin ich.«

Um Viertel vor sechs legten wir ab und machten wenig später gute Fahrt voraus in Richtung Daga Stephanos, das etwa dreißig Kilometer nordwärts lag. Über den Bergen, die das südliche Ende des Sees umschlossen, begann die Sonne aufzugehen.

Richard und Wondemu verschwanden bald in der Kabine, um Tee zu trinken und zu plaudern. Hingerissen von dem Blick auf den See und der Romantik des Augenblicks, blieb ich an der Reling stehen und genoß die frische Brise. Allerdings dachte ich auch daran, was diese kleine Vergnügungsfahrt mich kosten würde. Wir brauchten sicherlich zweieinhalb Stunden bis Daga. Ebensolange würden wir uns auf der Insel aufhalten, und dann kam noch die Rückfahrt. Ich würde wohl fast vierhundert Dollar hinlegen müssen.

Ein eindrucksvolles Schauspiel riß mich aus dieser deprimierenden Übung in Kopfrechnen: Zwei einheimische Langboote mit hohen, gebogenen Bugschnäbeln legten vom gegenüberliegenden Ufer ab. Im orangefarbenen Licht der aufgehenden Sonne konnte ich die Silhouetten von fünf oder sechs Männern ausmachen, die in gebückter Haltung und ganz im Gleichklang die Paddel ins Wasser tauchten.

Solche Boote, »Tankwas« genannt, sind ein vertrauter Anblick auf dem Tanasee, und die zwei, die ich nun beobachtete, waren zwar sehr viel größer als diejenigen, die ich kannte, aber

eindeutig in der gleichen Bauart, nämlich aus zusammengeknüpften Schilfbündeln.

Einen erheblichen Teil der vergangenen Monate hatte ich mit der Untersuchung der archäologischen Stätten Ägyptens verbracht, so daß ich nun mit eigenen Augen das sehen konnte, was schon andere Historiker vor mir beobachtet hatten: nämlich daß die äthiopischen »Tankwas« eine starke Ähnlichkeit mit den Schilfbooten besaßen, die schon von den alten Ägyptern als Transportmittel und zum Jagen und Fischen auf dem Nil benutzt worden waren.[2]

In den Grabstätten im Tal der Könige gab es Fresken, die genau solche Wasserfahrzeuge mit hochgezogenen Bugschnäbeln darstellten, und an den Tempelmauern von Karnak und Luxor hatte ich Reliefs mit ähnlichen Bildern entdeckt.

Nicht zum erstenmal überlegte ich, daß die alten Ägypter zum Tanasee gereist sein mußten. Es war nicht nur die Ähnlichkeit in der Konstruktionsweise der Boote, die mich über diese Verbindung nachdenken ließ, sondern auch die Bedeutung des Sees als größtes Reservoir für den Blauen Nil.

Der Tanasee selbst ist nicht der eigentliche Ursprung des großen Flusses. Aus zwei Quellen im Süden des Sees entspringt der »Kleine Abai«, fließt in den Tana und verläßt ihn wieder als der »Große Abai« - der volkstümliche Name für den Blauen Nil. Es ist also der Tanasee, aus dem der Blaue Nil hervorgeht[3], denn der große See wird neben dem »Kleinen Abai« von einer Vielzahl von kleinen Flüssen gespeist. Und so liefert dieses riesige Binnengewässer mit seiner Oberfläche von 3630 Quadratkilometern fast sechs Siebtel der gesamten Wassermenge von Blauem Nil und Weißem Nil.[4] Von lebenswichtiger Bedeutung ist die lange Regenzeit in Äthiopien: Sie führt zu großen Fluten, die sich aus dem Tanasee in den Blauen Nil ergießen, und ist verantwortlich für die jährlichen Überschwemmungen, die seit unvordenklichen Zeiten fruchtbaren Schlamm in das ägyptische Delta tragen. Der viel längere Weiße Nil steuert dazu kaum etwas bei, denn mehr als die Hälfte seiner Wassermenge versickert in den Sumpfgebieten im Süd-Sudan.[5]

Beim Betrachten dieser schilfgeflochtenen »Tankwas« schien es mir fast unvorstellbar, daß die Priester von Karnak und Luxor (die den Nil als lebenspendende Kraft und heiligen Gott verehrten) nicht zu irgendeinem Zeitpunkt ihrer langen Geschichte den Weg nach Äthiopien gefunden hatten. Es gab keine Dokumente, die so etwas bewiesen, und trotzdem war ich mir sicher, daß die alten Ägypter bis zum Tanasee gekommen waren.

Mit Sicherheit wußte der griechische Geograph Strabo (der zur Zeit Christi lebte und in den ägyptischen Wissenschaften sehr bewandert war), daß der Nil einem riesigen See in Äthiopien entsprang, einem See, den er »Pseboe« nannte.[8] In zweiten Jahrhundert nach Christus formulierte der ägyptische Geograph Claudius Ptolemäus eine ähnliche Meinung, auch wenn der Name, den er dem See gab, »Coloe« war.[7] Ich war schließlich der Ansicht, daß der griechische Dramatiker Aischylos im fünften Jahrhundert vor Christus nicht allein von einer poetischen Laune inspiriert worden war, als er den See mit den unvergeßlichen Worten beschrieb: »... dort wo die alles sehende Sonne / stets dem unsterblichen Leibe und den ermatteten Rossen / im warmen Geriesel sanftfließenden Wassers / Erholung vergönnt«[8].

Das waren nicht die einzigen Hinweise, in denen eine Verbindung zwischen den rätselhaften Gewässern des Tana und den alten Kulturen Ägyptens, Griechenlands und des Nahen Ostens hergestellt wurde. Ich wußte, daß die Abessinier selbst der festen Überzeugung waren, daß der Blaue Nil nichts anderes war als der Fluß Gihon in Genesis 2,13 - der »zweite Strom, welcher das ganze Land Äthiopien umfließt«. Und da es sich hier um eine sehr alte, mit einiger Sicherheit vorchristliche Überlieferung handelte, schien meine Vermutung, daß der See mit seinen Zuflüssen und Inseln eine Verbindung zur Bundeslade haben könnte, nicht aus der Luft gegriffen.

Mit einem Anflug von Optimismus sah ich also den grünen Abhängen der Insel Daga entgegen, die sich in einiger Entfernung wie die Spitze eines versunkenen Berges über dem glitzernden Wasser erhoben.

Daga Stephanos

An der hölzernen Anlegestelle wurden wir von einer Gruppe von Mönchen empfangen, die erstaunlich schmutzige Gewänder trugen. Sie hatten unsere Ankunft offensichtlich seit einiger Zeit beobachtet, schienen aber über unseren Besuch nicht im geringsten erfreut zu sein. Wondemu wechselte einige Worte mit ihnen. Schließlich führten sie uns - mit kaum verhohlenem Unwillen - durch eine kleine Bananenplantage und dann über einen steilen, gewundenen Pfad auf die Anhöhe.

Etwa hundert Meter über dem Seespiegel begegneten wir den ersten niedrigen, rohrgedeckten Rundbauten, den Behausungen der Mönche. Durch den Torbogen einer hohen Steinmauer betraten wir einen grasbewachsenen Platz, in dessen Mittelpunkt die Kirche des heiligen Stephanus stand. Im Grundriß hatte sie eine längliche, rechteckige Form mit abgerundeten Ecken und war von einem überdachten Rundgang umgeben.

»Das sieht nicht gerade sehr alt aus«, sagte ich zu Richard.

»Das ist es auch nicht«, gab er zurück. »Die alte Kirche wurde vor etwa hundert Jahren bei einem Brand zerstört.«

»Dann war das die Kirche, in die man im sechzehnten Jahrhundert die Lade gebracht hat?«

»Ja. Übrigens gibt es an dieser Stelle seit mindestens tausend Jahren eine Kirche. Wahrscheinlich schon länger. Daga zählt zu den heiligsten Stätten des Sees. Aus diesem Grund werden hier die mumifizierten Körper von fünf früheren äthiopischen Kaisern aufbewahrt.«

Wondemu sprach unterdessen leise mit den Mönchen. Nun zog er einen der Männer, dessen Kleider in einem etwas besseren Zustand als die seiner Mitbrüder waren, aus der Gruppe heraus und führte ihn zu uns. »Das«, verkündete er stolz, »ist Erzpriester Kifle-Mariam Mengist. Er wird Ihre Fragen beantworten.«

Der Erzpriester schien jedoch in dieser Beziehung eigene Vorstellungen zu haben. Seine runzligen Gesichtszüge drückten eine beunruhigende Mischung von Feindseligkeit, Unmut und

Habgier aus. Wortlos musterte er Richard und mich, dann wandte er sich an Wondemu und flüsterte ihm etwas auf Amharisch zu.

»Aha ...«, seufzte unser Begleiter, »ich fürchte, er will Geld. Sie wollen Kerzen, Weihrauch und... äh... andere notwendige Dinge für die Kirche kaufen.«

»Wieviel?« fragte ich.

»Was Sie für angemessen halten.«

Ich schlug zehn äthiopische Birr vor, etwa fünf US-Dollar, aber Kifle-Mariam bedeutete uns, daß dies nicht ausreichen würde. Er erklärte sogar, die angebotene Summe sei so wenig befriedigend, daß er sich kaum in der Lage sehe, die Banknote aus meinen Händen entgegenzunehmen.

»Ich glaube, Sie sollten mehr zahlen.« Wondemu brachte die Sache auf den Punkt.

»Sehr gerne«, gab ich zurück, »aber ich möchte wissen, was ich dafür bekomme.«

»Er wird mit Ihnen sprechen. Sonst wird er sagen, er hätte zu viel zu tun.«

Nach einigen Verhandlungen einigten wir uns auf dreißig Birr. Die Scheine verschwanden blitzschnell in einer der Taschen seines wenig ansehnlichen Priestergewandes. Wir gingen langsam zu dem Arkadengang hinüber, der die Kirche umgab, und ließen uns im Schatten des überhängenden Daches nieder. Einige der anderen Mönche folgten uns, hielten sich in kontemplativer Haltung in unserer Nähe auf und gaben vor, uns nicht zu belauschen.

Kifle-Mariam Mengist erzählte uns, daß er seit achtzehn Jahren auf der Insel lebe und Experte in allen Dingen sei, die das Kloster beträfen. Als ob er dies unter Beweis stellen wollte, verfiel er in eine Art kurzgefaßter Geschichte Äthiopiens - und redete und redete und redete.

»Gut«, unterbrach ich ihn, nachdem Wondemu mir den Sinn dieser langweiligen Litanei klargemacht hatte. »Natürlich möchte ich gerne einen Überblick bekommen. Aber ich möchte dem Erzpriester zunächst eine konkrete Frage stellen: Man sagte mir, die Bundeslade sei im sechzehnten Jahrhundert hierher

gebracht worden, als Aksum von den Truppen Ahmed Gragns angegriffen wurde. Kennt er diese Geschichte? Ist sie wahr?«

Fünfzehn oder zwanzig Minuten unverständlicher Debatte vergingen, bevor Wondemu mir verkündete, der Priester wisse bestimmt nichts von dieser Geschichte. Aus diesem Grunde sei er auch nicht in der Lage, uns zu sagen, ob sie wahr oder falsch sei.

Ich versuchte es in eine andere Richtung. »Haben sie ein eigenes >Tabot<? Hier? In dieser Kirche?« Ich gestikulierte in Richtung des Eingangs zum Allerheiligsten, der im Dämmerlicht der Kirche kaum sichtbar war.

Nach einem weiteren Frage-und-Antwort-Spiel auf Amharisch sagte Wondemu: »Ja. Natürlich gibt es hier ein >Tabot<.«

»Fein. Ich bin froh, daß wir wenigstens das herausbekommen haben. Fragen Sie ihn, ob sie ihr >Tabot< als Kopie, als Replik des echten >Tabot< in Aksum verstehen.«

»Vielleicht«, war die rätselhafte Antwort.

»Ich verstehe. Na gut. Dann fragen Sie ihn doch bitte, ob er etwas von der Bundeslade weiß. Wie kam sie nach Aksum? Wer brachte sie dorthin? Er soll die Geschichte mit seinen eigenen Worten erzählen.«

Es kam eine prompte und nichtssagende Antwort. »Er sagt, er wisse nichts davon«, übersetzte Wondemu mit düsterer Miene. »Er sagt, er kenne sich in diesen Dingen nicht aus.«

»Gibt es irgend jemanden, der sich damit auskennt?« fragte ich verärgert.

»Nein. Kifle-Mariam Mengist ist der höchste Priester auf dieser Insel. Wenn er nichts weiß, ist es unmöglich, daß ein anderer etwas weiß.«

Ich sah zu Richard hinüber: »Was ist hier los? Ich habe noch nie, niemals, einen Äthiopier getroffen, der nichts von der Geschichte des Kebra Nagast über die Bundeslade wußte.«

Der Historiker zuckte die Achseln. »Ich auch nicht. Das ist tatsächlich sehr merkwürdig. Vielleicht solltest du ihm ... nun, einen weiteren Anreiz geben.«

Ich seufzte. Es lief immer auf Geld hinaus. Aber wenn ein

paar Birr mehr diesen schweigsamen Bastard zum Reden bringen würden, war es sicherlich am besten, schnell zu zahlen. Schließlich war ich den ganzen Weg von London hierhergekommen, um Daga Stephanos zu untersuchen; und am Anlegesteg lag die MS Dahlak, deren Zähler jede Minute einen weiteren Dollar anzeigte. In grimmiger Resignation ließ ich weitere zerknitterte Scheine auf die andere Seite wandern.

Diese großzügige Aktion war jedoch nicht zu meinem Vorteil. Der Priester hatte nichts Wichtiges mehr zu sagen. Als mir das endlich klar war, lehnte ich mich an einen der Dachpfeiler zurück, inspizierte meine Fingernägel und versuchte, zu einer Entscheidung zu kommen.

Es konnte nur zwei Erklärungen für die offensichtliche Unwissenheit Kifle-Mariams geben. Die weniger wahrscheinliche war, daß der Mann einfach dumm war. Die näherliegende war: Er log.

Aber warum sollte er lügen? Auch dafür konnte es zwei Gründe geben: Er hatte etwas Wichtiges zu verbergen, oder - und das war am glaubhaftesten - er wollte mein immer dünner werdendes Bündel äthiopischer Geldscheine noch um einige Banknoten erleichtern.

Ich stand auf und sagte zu Wondemu: »Fragen Sie ihn noch einmal. Fragen Sie ihn, ob die Bundeslade im sechzehnten Jahrhundert hierher gebracht wurde ... Und fragen Sie ihn, ob sie hier ist. Sagen Sie ihm, ich würde seine Mühe lohnen, wenn er sie mir zeigt.«

Unser Dolmetscher zog spöttisch eine Augenbraue in die Höhe. Was ich ihm vorgeschlagen hatte, war nicht gerade taktvoll. »Los«, drängte ich, »fragen Sie ihn.«

Noch mehr Amharisch, dann Wondemus Antwort: »Er sagt nichts anderes. Er weiß nichts von der Bundeslade. Aber er sagt auch, daß für eine lange Zeit nichts von außerhalb nach Daga gebracht wurde.«

Die Mönche, die im Halbkreis um uns herum dem Gespräch gefolgt waren, zerstreuten sich langsam. Einer jedoch, barfuß, zahnlos und in derartig armselige Lumpen gehüllt, daß man ihn

gut für irgendeinen Bettler in Addis Abeba hätte halten können, begleitete uns auf dem Rückweg zur Anlegestelle. Bevor wir an Bord gingen, zog er Wondemu beiseite und flüsterte ihm etwas ins Ohr.

»Was war das?« fragte ich heftig und erwartete eine weitere Geldforderung.

Diesmal ging es jedoch nicht um Geld. Wondemu runzelte die Stirn: »Er sagt, wir sollen nach Tana Kirkos fahren. Scheinbar sollen wir dort etwas über die Lade herausfinden ..., etwas Wichtiges.«

»Was ist Tana Kirkos?«

»Das ist eine andere Insel, östlich von hier. Ziemlich weit weg.«

»Bitten Sie ihn, uns mehr zu erzählen. Was meint er mit >etwas Wichtiges<?«

Wondemu fragte nach und übersetzte die Antwort: »Er sagt, daß die Bundeslade sich auf Tana Kirkos befindet. Das ist alles, was er weiß.«

Auf diese überraschende Nachricht schickte ich einen verzweifelten Blick zum Himmel, fuhr mir erregt durchs Haar und versetzte der Reling des Motorbootes einen Tritt. Unterdessen humpelte der Mönch davon und verschwand in den Bananenpflanzungen.

Ich sah auf die Uhr. Es war fast Mittag, wir waren also seit sechs Stunden - oder für dreihundert Dollar - unterwegs.

»Liegt Tana Kirkos auf unserem Rückweg?« fragte ich Wondemu.

»Nein«, gab er zurück. »Ich war noch nie dort. Da fährt niemand hin. Aber ich weiß, daß es im Osten liegt. Bahar Dar liegt im Süden.«

»Ich verstehe. Haben Sie eine Vorstellung, wie lange wir dorthin brauchen?«

»Nein. Ich frage den Kapitän.«

Es würde etwa anderthalb Stunden dauern.

»Und dann? Zurück nach Bahar Dar?«

»Noch einmal drei Stunden.«

In Sekundenschnelle überschlug ich die Rechnung. Sagen wir zwei Stunden nach Tana Kirkos, anderthalb Stunden Aufenthalt, dann drei Stunden nach Bahar Dar, das macht zusammen etwa sieben, dazu die sechs Stunden bis zu diesem Zeitpunkt. Das sind, einen Moment, dreizehn Stunden. Dreizehn verdammte Stunden. Und fünfzig Scheine pro Stunde. Mindestens sechshundertfünfzig Dollar insgesamt. O Gott.

In mir rumorte es noch eine Weile. Schließlich entschied ich mich mit schwerem Herzen und leichter Brieftasche. Wir machten uns auf den Weg.

Natürlich würde die Lade nicht auf Tana Kirkos sein, das war mir klar. Im Gegenteil, ich hatte das Szenario schon vor Augen: Man würde uns hinhalten, wie auf Daga Stephanos, mir das Geld stückchenweise aus der Tasche ziehen, bis meine Geduld erschöpft war. Dann ein kleiner verlockender Hinweis auf eine weitere Insel, wo wir noch einer Bruderschaft bedürftiger Einsiedler Spenden zukommen lassen würden.

Auch James Bruce hatte den Tanasee besucht, und ich erinnerte mich an seine Worte: »Es gibt fünfundvierzig bewohnte Inseln auf dem See, wenn man den Abessiniern glauben will, die in allen Dingen sehr große Lügner sind .. .«[9]

Tana Kirkos

Als wir Tana Kirkos erreichten, war ich nicht gerade in guter Gemütsverfassung. Trotzdem, ich mußte zugeben, daß es ein ungewöhnlich schöner Ort war. Ganz bedeckt mit grünem Gebüsch, hochaufragenden Kakteen und blühenden Blumen, erhob sich die Insel über dem Wasser. Auf einer Anhöhe konnte ich die Dächer von Rundbauten erkennen. Eisvögel und hellblaue Stare schossen durch die Luft. Am Strand der sandigen Bucht stand eine Gruppe von Mönchen auf einem behelfsmäßigen Steg. Sie lächelten.

Wir gingen vor Anker und kletterten aus dem Boot. Wondemu machte die übliche Vorstellungsrunde und erklärte, war-

um wir gekommen waren. Hände wurden geschüttelt und langwierige Begrüßungen ausgetauscht. Dann führte man uns auf einem schmalen, überwachsenen Pfad, der aus dem Fels herausgehauen worden war, bis zu einem Torweg. Schließlich erreichten wir einen Platz mit drei oder vier verfallenen Gebäuden und einem Dutzend zerlumpter Mönche.

Das Licht drang nur gedämpft durch den dichten Baumbewuchs, und der Ort lag dunkel, still und abgeschlossen hinter einer Steinmauer. Trotz der schlechten Erfahrungen bisher hatte ich plötzlich das Gefühl, daß sich die Reise hierher gelohnt haben könnte. Ich hatte keine Erklärung dafür, aber Tana Kirkos schien irgendwie »richtig« - ganz im Gegensatz zu Daga Stephanos.

Der Erzpriester des Klosters erschien und stellte sich als Memhir Fisseha vor. Er war von magerer Gestalt und roch nach Weihrauch. Und er erkundigte sich nicht etwa nach Geld, sondern nach unserer Reisegenehmigung. Diese Frage verblüffte mich, kam sie doch von einer so altehrwürdigen Erscheinung in Priestergewändern.

»Natürlich haben wir eine Genehmigung«, sagte ich, zog das Dokument hervor und gab es Wondemu, der es an Memhir Fisseha weiterreichte. Der alte Mann studierte das Papier zerstreut, schien zufrieden und gab es zurück.

Wondemu erklärte nun, daß wir etwas über Tana Kirkos und die Bundeslade erfahren wollten. Ob das möglich sei?

»Ja«, antwortete der Priester - ein wenig schwermütig, wie mir schien. Er führte uns zu einem Eingang, hinter dem, den rußgeschwärzten Töpfen und Pfannen nach zu urteilen, die Küche lag. Er ließ sich auf einem kleinen Hocker nieder und bedeutete uns, daß wir ihm folgen sollten.

»Glauben Sie«, begann ich, »daß Kaiser Menelik I. die Bundeslade von Jerusalem nach Äthiopien gebracht hat?«

»Ja«, übersetzte Wondemu.

Ich stieß einen Seufzer der Erleichterung aus. Das war schon viel besser als auf Daga Stephanos.

»Man hat mir erzählt«, fuhr ich fort, »daß die Bundeslade hier ist, auf der Insel Tana Kirkos. Ist das wahr?«

Ein schmerzlicher Ausdruck überflog die ledrigen Gesichtszüge Memhir Fissehas, als er antwortete: »Das war einmal so.«

War? Was im Himmel sollte das bedeuten? Ich war einigermaßen aufgeregt. »Das soll er genauer sagen«, fuhr ich Wondemu an. »Was heißt >das war einmal so<?«

Die Antwort des Priesters erregte mich noch mehr: »Es war einmal so. Aber die Bundeslade ist nicht mehr hier. Man hat sie nach Aksum gebracht.«

»Zurück nach Aksum?« rief ich aus. »Wann? Wann hat man sie zurückgebracht?«

Eine ausgedehnte Diskussion auf Amharisch folgte, deren Hauptpunkt offensichtlich wiederholt besprochen wurde. Endlich übersetzte Wondemu: »Die Lade wurde vor eintausendsechshundert Jahren nach Aksum gebracht, zur Zeit des Königs Ezana. Sie wurde nicht zurückgebracht. Sie wurde einfach nach Aksum gebracht und befindet sich seitdem an diesem Ort.«

Ich war verwirrt und enttäuscht: »Das muß ich genau wissen«, sagte ich. »Er sagt nicht, daß die Lade kürzlich hier war und nun nach Aksum zurückgebracht wurde, oder? Er meint, daß sie vor langer Zeit einmal hier war.«

»Genau. Vor eintausendsechshundert Jahren. Das sagt er.«

»Gut, dann fragen Sie ihn folgendes: Wie kam die Lade zum erstenmal hierher? Kam sie von Aksum und wurde dann wieder dorthin gebracht? Oder war sie hier, bevor sie nach Aksum kam? So scheint es ja zu sein, aber ich möchte ganz sicher gehen.«

Nach und nach kam die Geschichte zum Vorschein, und das war so mühsam, als wollte man einen Baumstumpf aus dem Boden ausgraben. Der Priester hielt mehrere Male Rücksprache mit seinen Mönchen, und schließlich zog man einen großen ledergebundenen Band in Ge'ez zu Rate und verlas eine Passage daraus.

Was Memhir Fisseha uns sagte, war kurzgefaßt dies: Die Bundeslade wurde von Menelik und seinen Begleitern aus Salomos Tempel gestohlen. Sie wurde aus Israel nach Ägypten gebracht. Von dort aus folgten die Männer dem Lauf des Nils

und dann seinem Nebenfluß Takazze, bis sie Äthiopien erreichten.

Soweit entsprach die Geschichte der Legende, wie sie das Kebra *Nagast* berichtet. Was dann folgte, war jedoch völlig neu.

Auf der Suche nach einem sicheren und angemessenen Platz für die kostbare Reliquie, so fuhr der alte Priester fort, erreichten die Männer den Tanasee, der schon zu dieser Zeit ein heiliger Ort war. Es war Gottes See. So waren sie zum Tanasee gekommen und hatten diese Insel auserwählt.

»Wie lange blieb die Lade hier?« fragte ich.

»Achthundert Jahre lang«, kam die Antwort, »segnete sie uns mit ihrer Gegenwart.«

»Gab es ein Gebäude auf der Insel? Hat man einen Tempel für die Lade gebaut?«

»Es gab keinen Tempel. Die heilige Lade wurde in einem Zelt aufbewahrt. In diesem Zelt, hier auf Tana Kirkos, blieb sie achthundert Jahre. Zu dieser Zeit waren wir Juden. Als wir Christen wurden, brachte König Ezana die Lade nach Aksum und stellte sie in der großen Kirche dieser Stadt auf.«

»Und Sie sagen, die Bundeslade sei vor eintausendsechshundert Jahren nach Aksum gebracht worden?«

»Ja.«

»Wenn sie also achthundert Jahre auf Tana Kirkos war, dann muß sie hier vor ..., nun, vor zweitausendvierhundert Jahren eingetroffen sein. Stimmt das? Vierhundert Jahre vor Christi Geburt?«

»Ja.«

»Aber zu diesem Zeitpunkt war Salomo bereits seit rund fünfhundert Jahren tot. Wie kann man das erklären?«

»Das weiß ich nicht. Ich habe Ihnen die Überlieferung erzählt, wie sie in den heiligen Büchern und in unserer Erinnerung verzeichnet ist.«

Eine Bemerkung, die der Priester schon einige Augenblicke vorher von sich gegeben hatte, interessierte mich besonders, und ich kam darauf zurück: »Sie sagten, daß Sie zu dieser Zeit Juden waren? Welcher Religion gehörten Sie an?«

»Wir waren Juden«, wiederholte der Mönch, »wir verrichteten Opferdienst..., das Opferlamm. Und wir setzten diesen Brauch fort, bis die Lade nach Aksum gebracht wurde. Dann kam Abba Salama und lehrte uns den christlichen Glauben, und wir erbauten hier eine Kirche.«

Abba Salama war der äthiopische Name für Frumentius, der um 330 nach Christus König Ezana und das aksumitische Königreich zum Christentum bekehrt hatte. Das bedeutete, daß die Zeitabschnitte, die Memhir Fisseha genannt hatte, einen Sinn ergaben. Zumindest widersprachen sie sich nicht. Das einzige Problem war das große Loch, das zwischen Salomo im neunten Jahrhundert vor Christus und dem mutmaßlichen Eintreffen der Lade auf Tana Kirkos um 470 vor Christus klaffte.

Ich drängte weiter: »Und es gab keine Kirche hier, bevor Abba Salama Sie zum Christentum führte?«

»Nein, keine Kirche. Ich sagte es Ihnen schon. Wir waren Juden. Wir brachten Opfer dar.« Er hielt inne, dann fügte er hinzu: »Das Blut des Lamms wurde in einer Schale aufgefangen ..., in einem >gomer<. Dann versprengte man es über einige Steine, kleine Steine. Sie sind hier, es gibt sie noch, bis zum heutigen Tag.«

»Entschuldigung, bitte noch einmal. Was gibt es noch?«

»Die Steine, die wir für das Opfer benutzten, als wir Juden waren. Diese Steine sind hier. Hier auf der Insel.«

»Können wir sie sehen?« fragte ich mit einem kleinen Schauer der Erregung. Wenn das, was Memhir Fisseha gerade gesagt hatte, zutraf, dann sprach er von Beweisstücken, von existierendem Beweismaterial, das diese merkwürdige, aber eigenartigerweise überzeugende Geschichte erhärten würde.

»Sie können sie sehen«, gab er zurück. Er erhob sich langsam. »Folgen Sie mir. Ich werde sie Ihnen zeigen.«

Das *Blutopfer*

Der Priester führte uns zu einem hochgelegenen Punkt auf dem Kliff, von dem aus man den See überblicken konnte. Hier, auf einem erhöhten Felssockel, zeigte er uns drei kurze Steinsäulen, die nahe beieinander standen. Die größte Säule war vielleicht anderthalb Meter hoch, hatte einen quadratischen Durchmesser und besaß oben eine halbrunde, herausgemeißelte Vertiefung. Die beiden anderen Säulen waren rund, etwa einen Meter hoch und an der Spitze ebenfalls bis zu einer Tiefe von etwa zehn Zentimetern ausgehöhlt.

Bei allen dreien handelte es sich, das war trotz des dichten Flechtenbewuchses zu erkennen, um freistehende Monolithe aus dem gleichen grauen Granit. Sie sahen alt aus, und ich fragte Richard nach seiner Meinung.

»Ich bin kein Archäologe«, gab er zurück, »aber nach der Art, wie sie behauen sind, nach ihrem Stil würde ich sagen, daß sie aus der aksumitischen Periode stammen, wenn nicht früher - besonders die quadratische.«

Ich fragte Memhir Fisseha nach den halbrunden Vertiefungen.

»Sie enthielten das Blut«, antwortete er. »Nach dem Opfer wurde etwas von dem Blut über den Steinen verspritzt und etwas auf das Zelt, in dem die Lade stand. Den Rest gab man in diese Mulden.«

»Können sie mir zeigen, wie das geschah?«

Der alte Priester winkte einen der anderen Mönche herbei und erteilte ihm mit leiser Stimme einige Instruktionen. Der Mann schritt davon und kam bald mit einer großen, flachen Schale zurück. Das Gefäß war mit der Zeit so verrostet und angelaufen, daß man nicht einmal raten konnte, aus welchem Metall es gefertigt war.

Das, so erfuhren wir, war der »gomer«, in dem das Opferblut zunächst aufgefangen wurde.

»Was genau bedeutet >gomer<?« fragte ich Wondemu.

Der zuckte die Achseln: »Das ist kein Wort aus dem Amhari-

schen, und auch kein Tigre. Mir scheint, es gehört zu keiner äthiopischen Sprache.«

Ich sah hilfesuchend zu Richard, aber auch er gestand, das Wort nicht zu kennen.

Memhir Fisseha sagte einfach, daß man die Schale »gomer« nenne, daß man sie immer »gomer« genannt habe, und das sei alles, was er wisse. Dann stellte er sich mit der Schale in der Hand zu den Steinen, tauchte seinen rechten Zeigefinger hinein, erhob die rechte Hand auf Kopfhöhe und vollführte mit ihr eine Kreisbewegung. »Auf diese Weise wurde das Blut verspritzt«, sagte er, »über die Steine und das Zelt mit der Lade. Danach gab man das, was übrig war, in die Mulden.« Er neigte die Schale über der halbrunden Vertiefung.

Ich fragte den Priester, ob er wisse, wo genau das Zelt mit der Lade gestanden habe. Aber alles, was er sagen konnte, war »hier in der Nähe ..., irgendwo hier in der Nähe«.

Ich hatte noch einen Punkt unserer Diskussion zu klären. »Sie sagten, daß die Lade vor eintausendsechshundert Jahren von Tana Kirkos nach Aksum gelangte. Ist das richtig?«

Wondemu übersetzte und Memhir Fisseha nickte zustimmend.

»Gut«, fuhr ich fort. »Wurde die Lade je nach Tana Kirkos zurückgebracht? Zu irgendeiner Zeit, aus irgendeinem Grund?«

»Nein. Sie wurde nach Aksum gebracht und blieb in Aksum.«

»Und soweit Sie wissen, ist sie dort bis auf den heutigen Tag.«

»Ja.«

Mehr war wohl nicht herauszubekommen, aber ich war zufrieden mit dem, was ich hatte, schon deshalb, weil ich die Dinge nicht im Tausch gegen Geld erfahren hatte. Dankbar übergab ich dem Priester eine Hundert-Birr-Note als freiwillige Spende für das Kloster. Dann fotografierte ich mit Memhir Fissehas Erlaubnis die Opfersteine aus verschiedenen Winkeln.

Wir erreichten Bahar Dar kurz vor acht Uhr. Nach unserer vierzehnstündigen Exkursion betrug die Rechnung für das Motorboot siebenhundertfünfzig US-Dollar.

Es war ein unvergleichlich teurer Tag geworden. Ich bedauer-

te die Ausgabe aber nicht mehr, denn die Zweifel, die mich auf Daga Stephanos befallen hatten, waren auf Tana Kirkos aus dem Weg geräumt worden. Ich wußte, daß ich meine Suche nun wieder mit Optimismus und Engagement vorantreiben konnte.

In Addis Abeba erhielt meine gute Laune weiteren Auftrieb. Bevor wir von dort zum Zwaisee aufbrachen, nutzte ich die Gelegenheit, in der Universitätsbibliothek einige Textstellen zu überprüfen, die sich auf den Gebrauch von Opfersteinen im alttestamentarischen Judentum bezogen.

Sowohl auf der Sinai-Halbinsel als auch in Palästina ließen sich Säulen, wie ich sie auf Tana Kirkos gesehen hatte, mit den frühesten Phasen der jüdischen Religion in Verbindung bringen. Man nannte sie »masseboth«, errichtete sie an hochgelegenen Orten als Altäre und nutzte sie für Opferzwecke.[10]

In der Bibel suchte ich nach Hinweisen, die sich auf Opferrituale bezogen. Ich wurde fündig, und als ich die betreffenden Passagen immer wieder las, wurde mir klar, daß das, was Memhir Fisseha mir auf der Insel demonstriert hatte, eine absolut authentische, uralte Zeremonie war. Zweifellos war bei der Überlieferung der Traditionen von Generation zu Generation manches durcheinandergebracht oder verändert worden. Wenn der Priester aber über das Verspritzen des Blutes gesprochen hatte, war er erstaunlich nahe an der Wahrheit geblieben.

Im dritten Buch Mose stieß ich zum Beispiel auf folgenden Vers: »Und der Priester soll seinen Finger in das Blut tauchen und damit siebenmal sprengen vor dem Herrn, vor dem Vorhang im Heiligen.«[11] Und im fünften Kapitel las ich: »... und sprenge mit dem Blut des Sündopfers an die Seite des Altars, und lasse das übrige Blut ausbluten an des Altars Boden.«[12]

Erst als ich in der Mischna nachlas, dem Grundstock des jüdischen Talmud, erkannte ich, wie genau Memhir Fissehas Darstellung tatsächlich war. Im Traktat Joma fand ich detaillierte Beschreibungen der Opferrituale, wie sie von den Hohenpriestern im Tempel des Salomo vor dem Vorhang, der die Bundeslade vor den Blicken der Laien schützte, ausgeführt wurden.

Ich las, daß das Blut des Opfertieres in einem Bassin aufge-

fangen und einem Gehilfen anvertraut wurde, der »es umrühren soll, damit es nicht gerinne«. Dann trat ein Priester aus dem Heiligtum hervor, »nahm das Blut von dem, der es umgerührt hatte, und ging hinein, dorthin wohin er vorher hineingegangen war, und sprengt davon 1mal oben hin und 7mal unten hin.. .«[13] Und wo genau versprengte der Priester das Blut? Der Mischna zufolge »etwas an den Vorhang, der der Lade gegenüber war, von der Außenseite her, 1mal nach oben und 7mal nach unten ... Und die Überreste des Blutes goß er aus auf den Boden an der Südseite des Altars .. .«[14]

Es schien mir wenig wahrscheinlich, daß Memhir Fisseha je in der Mischna gelesen hatte. Als Christ gab es keine Veranlassung dazu, ganz zu schweigen davon, daß er auf seiner Insel überhaupt Zugang zu einem solchen Buch haben konnte. Schließlich kannte er auch keine der Sprachen, in die es übersetzt worden war. Aber seine Handbewegungen waren genau die eines Mannes gewesen, der eine Peitsche schwang. Und mit Überzeugung hatte er davon gesprochen, daß das Blut nicht nur über den Altar gegossen wurde, sondern auch auf das Zelt der Lade.

Diese Übereinstimmungen waren zu genau, als daß man sie hätte ignorieren können, und ich war mir sicher, daß in weiter Vergangenheit ein Gegenstand von großer religiöser Bedeutung nach Tana Kirkos gebracht worden war. Und abgesehen von bestimmten Unsicherheiten bei der Datierung seiner Ankunft sprach alles dafür, das anzunehmen, woran Memhir Fisseha fest glaubte: daß es sich bei diesem Gegenstand um die Bundeslade gehandelt hatte.

Kapitel 10

Wie ein Phantom im Labyrinth

Erst die Erzählungen des alten Priesters auf Tana Kirkos hatten meine Aufmerksamkeit in einem bestimmten Punkt erregt. Bei all meinen Untersuchungen in den vergangenen Monaten war ich nie darauf gekommen, mich ernsthaft mit der Frage nach Meneliks Reiseroute auseinanderzusetzen. In der Bibliothek des Instituts für Äthiopische Studien las ich also nach, was das Kebra *Nagast* in dieser Sache berichtete. Ich wollte herausfinden, ob die alte Schrift die Behauptung des Priesters, die Lade sei über achthundert Jahre auf der Insel aufbewahrt worden, bestätigte.

Zu meiner Überraschung wurde Aksum überhaupt nicht erwähnt. Klar und eindeutig gibt das umfangreiche Werk an, Menelik und seine Reisegefährten hätten die Bundeslade an einen Ort namens »Debra Makeda« gebracht.[1] Damit klärte sich mit einem Schlag ein ernstzunehmender Widerspruch bei den Daten, der mich schon seit langem gequält hatte, nämlich daß Aksum erst rund achthundert Jahre nach Meneliks legendärer Reise gegründet worden war.[2] Einige meiner bisherigen Informanten hatten mir versichert, daß Aksum das Ziel dieser Reise war und daß sich die Lade von Anfang an dort befand.[3] Aber das war mit den historischen Gegebenheiten natürlich nicht vereinbar. Das Kebra Nagast erhob diesen Anspruch keineswegs. Ich wußte, daß das Wort »Debra« soviel wie »Berg« bedeutete und »Makeda« der äthiopische Name für die Königin von Saba war. Debra Makeda war also der »Berg der Königin von Saba«.

Ich stieß in der kurzen Beschreibung der Reise jedoch auf nichts, das eine Gleichsetzung von Debra Makeda und Tana Kirkos hätte rechtfertigen können - obgleich diese Möglichkeit keineswegs auszuschließen war. Auf der Suche nach weiteren Anhaltspunkten zog ich eine amtliche Publikation von 1930 über

das Tanagebiet zu Rate und fand heraus, daß unsere Insel den Namen Kirkos erst verhältnismäßig spät und zu Ehren eines christlichen Heiligen erhalten hatte. »Vor der Bekehrung Äthiopiens zum Christentum«, fügte der Bericht hinzu, »wurde Tana Kirkos >Debra Sehel< genannt.«[4]

Was konnte »Sehel« bedeuten?

Ich befragte einige der Wissenschaftler, die in der Bibliothek arbeiteten. Sie erklärten mir, daß es sich um eine Ableitung von dem Ge'ez-Verb »verzeihen« handele.

»Täusche ich mich«, fragte ich, »wenn ich annehme, daß die Übertragung von >Debra Sehel< ungefähr >Berg der Vergebung< lauten müßte?«

»Ja, das ist richtig.«

Das war interessant. Ich erinnerte mich gut an Wolframs *Parzival,* der die Gralsburg und den Gralstempel an einen Ort namens »Munsalväsche« verlegt hatte. Es gab einige Diskussionen um die Interpretation dieses Begriffes, und mehr als nur ein Parzival-Experte hatte vermutet, daß sich »der biblische Mons Salvationis, der Berg des Seelenheils« dahinter verberge.[5]

Es bestand kein Zweifel, daß die Begriffe »Vergebung« und »Seelenheil« zusammenhingen, zumal vor der Erlösung im biblischen Sinne die Vergebung erfolgen muß. Und mehr noch. Auch der Psalm 130 vermerkt: »So du willst, Herr, Sünden zurechnen, Herr, wer wird bestehen? Denn bei dir ist die Vergebung ... Israel, hoffe auf den Herrn! Denn bei dem Herrn ist die Gnade und viel Erlösung bei ihm ...« Natürlich ist »Erlösung« ein Synonym für »Seelenheil«[6]. Aus diesem Grund ahnte ich, daß man Wolframs »Berg des Seelenheils« mit dem äthiopischen »Berg der Vergebung«, mit Tana Kirkos also, würde verbinden können.

Ich war mir im klaren darüber, daß man mit solchen Vermutungen sehr vorsichtig umgehen mußte, und daß der Sprung von »Debra Sehel« zu »Munsalväsche« tatsächlich sehr gewagt war. Und doch: Bei meiner aufmerksamen Parzival-Lektüre war mir aufgefallen, daß der geheimnisvolle Grals-Tempel am Ufer eines Sees stand - und höchstwahrscheinlich sogar auf einer Insel in

diesem See. Und es schien mir keinesfalls unwichtig, daß sowohl die christlichen Kirchen in Äthiopien als auch die Kultstätten der Falaschen traditionell Rundbauten waren[7] - so wie die Mehrzahl der Templerkirchen. Es mußte also in diesem Gefüge bestimmte Verbindungen geben, die man auf keinen Fall übersehen durfte (auch wenn es sicherlich ebenso unklug war, sie überzubewerten).

Unterdessen galt es, einen anderen und weit weniger spekulativen Zusammenhang zu berücksichtigen, der zwischen Debra Sehel und Debra Makeda bestand. Der alte Name von Tana Kirkos verdeutlichte, daß äthiopische Inseln mit dem Präfix »Debra«, also »Berg«, bezeichnet wurden. Nun bewies das noch lange nicht, daß das Kebra Nagast sich auf Debra Sehel bezog, wenn es davon sprach, die Lade sei auf den »Berg der Königin von Saba« gebracht worden. Zweifelsohne kam Tana Kirkos jedoch zumindest als Kandidatin für diese Ehre in Betracht.

Was aber war mit der Route, auf der Menelik und seine Männer nach Äthiopien gekommen waren? Bisher hatte ich angenommen, daß sie vom Hafen Ezion-Geber aus (dem heutigen Elat am Golf von Akaba)[8] per Schiff über das Rote Meer bis zur äthiopischen Küste gelangt waren. Über die Ausgabe des Kebra *Nagast* gebeugt, die mir der Bibliothekar beschafft hatte, mußte ich jedoch eingestehen, daß meine Vermutungen falsch waren. Menelik und sein Gefolge bildeten eine regelrechte Karawane, die durchweg über Land reiste.[9] Die Beschreibung des Trecks ähnelte einer wundersamen, fast surrealen Erzählung, in der identifizierbare Ortsnamen und geographische Anhaltspunkte fast völlig fehlten. Trotzdem gab es einige präzise Details von Wichtigkeit. Von Jerusalem aus waren die Reisenden nach Gaza aufgebrochen, an die Mittelmeerküste Israels also, wo eine Stadt mit diesem Namen noch immer existiert. Dann folgten sie wahrscheinlich der gut ausgebauten Handelsstraße über die nördliche Sinai-Halbinsel[10], setzten nach Ägypten über und erreichten bald einen großen Fluß:

»Lasset uns die Wagen niederstellen«, sprachen sie an dieser Stelle, »wir sind ja an die Wasser Äthiopiens angekommen,

denn dies ist der Fluß, der von Äthiopien herabfließt und den Nil bewässert.«[11]

Aus dem Kontext ergab sich, daß sich Menelik und seine Begleiter zu diesem Zeitpunkt noch »in den Ebenen Ägyptens« befanden - wahrscheinlich im Süden der heutigen Stadt Kairo. Der Fluß, an dem sie ihre Karren zurückließen, konnte also nur der Nil sein. Erstaunlich war jedoch, daß sie ihn sogleich als Takazze identifizierten, jenen großen, aus Äthiopien kommenden Zufluß, den schon der Priester auf Tana Kirkos erwähnt hatte.

Vom Bibliothekar lieh ich mir einen Atlas und folgte dem Verlauf des Takazze mit der Fingerspitze. Er entspringt im zentralabessinischen Hochland, nicht weit von der alten Stadt Lalibela entfernt, zieht seine gewundene Bahn in nordwestlicher Richtung durch die Simienberge, vereinigt sich im Sudan mit dem Atbara und erreicht ganz richtig den Nil einige hundert Kilometer nördlich des heutigen Khartum.

Als ich die Karte betrachtete, waren zwei Dinge sofort ersichtlich: Erstens konnte der Nil - aus der Perspektive der Äthiopier - gut als Fortsetzung des Takazze angesehen werden (und Quellen aus dem vierten Jahrhundert nach Christus bürgen für diese Annahme[12]). Zweitens aber konnte es sich für die Karawane nur als richtig erweisen, wenn sie dem Nil und dem Takazze folgte, um die Heimat zu erreichen. Es hätte auch kaum eine andere Möglichkeit gegeben: Es war wenig sinnvoll, dem Nil durch die lebensfeindliche Wildnis der sudanesischen Wüste bis weit in den Süden zu folgen, um dann entlang des Blauen Nils in das äthiopische Hochland vorzudringen. Denn der Strom beschreibt einen weiten Umweg über den Süden, bevor er sich nach Norden zum Tanasee wendet, was die Reise unnötig verlängert hätte. Die Takazze-Route war um mehr als eintausendfünfhundert Kilometer kürzer.

Die Landkarte verdeutlichte noch etwas: Die Reisenden, die dem Takazze bis zu seinem Oberlauf folgten, hatten am Ende ihres Weges einen Punkt erreicht, der weniger als einhundert Kilometer vom Ostufer des Tanasees und vor allem von Tana

Kirkos entfernt lag! War es da noch pure Spekulation, wenn man die Insel als erste Station der Bundeslade identifizierte? Zweifelsohne: Auf der Suche nach einem sicheren und abgeschiedenen Ort für den heiligen Schrein hätten Menelik und seine Männer kaum eine bessere Wahl treffen können.

Drei Männer im Boot

Als Richard und ich am nächsten Morgen zum Zwaisee aufbrachen, begleitete uns ein alter Freund, Yohannes Berhanu, der Generalmanager des Nationalen Reisebüros NTO. Wir trafen uns kurz vor sechs am Büro des NTO, wohin Yohannes vorsorglicherweise einen Geländewagen mit Fahrer beordert hatte. Zwanzig Minuten später hatten wir die Wolkenkratzer und Slums von Addis Abeba hinter uns gelassen und fuhren dem Zentrum des Great Rift Valley entgegen.

Abgesehen vom künstlich angelegten Koka-Stausee ist der Zwaisee der nördlichste in der Seenkette des Great Rift Valley. Mit seinen sumpfigen Ufern und den unzähligen Inseln bietet er den idealen Lebensraum für Störche, Pelikane, wilde Enten, Gänse und Fischadler - und für viele Nilpferde.

Das Ziel unserer zweistündigen Fahrt war eine Anlegestelle im Süden des Sees. Man hatte uns gesagt, das Fischereiministerium unterhalte eine Anzahl von Booten, von denen wir sicherlich eines zu einem geringen Preis würden mieten können. Aber eigentlich hätten wir uns denken können, daß alle größeren Fahrzeuge zum Fischen ausgefahren waren. Verfügbar war nur ein kleines Boot, und für seinen Außenbordmotor gab es kein Benzin.

Umständlich erklärten uns die Beamten, daß das Boot zu klein sei, um Richard, Yohannes und mich sowie einen Bootsführer aufzunehmen. Nach Debra Zion benötigte man mindestens drei Stunden - drei Stunden in diesem erbärmlichen Kahn, zu viert, und wir würden mit Sicherheit schwer von der Sonne heimgesucht werden! Ob wir nicht morgen wiederkom-

men könnten, damit man uns bis dahin ein geeigneteres Transportmittel beschaffen könnte?

Yohannes lehnte diesen Vorschlag rigoros ab. Professor Pankhurst und Mister Hancock hätten am morgigen Tag wichtige Verabredungen in Addis Abeba, die unter allen Umständen einzuhalten seien. Wir müßten aus diesem Grunde unbedingt heute nach Debra Zion.

Weitere Diskussionen folgten, bis wir schließlich auf den Steg marschierten und uns probehalber in das Boot setzten. Wir verteilten uns entlang der Bordwand und arrangierten uns mehr oder weniger, auch wenn unser Gewicht das Boot gefährlich tief ins Wasser drückte.

Was tun? Die Beamten hegten offensichtliche Zweifel, stimmten unserer Fahrt am Ende aber zu. Nachdem auch das Benzinproblem gelöst war, tuckerten wir endlich sehr, sehr langsam über das leicht gekräuselte Wasser und passierten eine dicht bewaldete Insel nach der anderen. Das schilfgesäumte Seeufer war längst verschwunden, aber Debra Zion kam und kam nicht in Sicht. Die Sonne stand mittlerweile hoch am Himmel, und das Boot leckte leicht, aber unübersehbar. Wie zufällig erinnerte uns Yohannes daran, daß es hier viele Nilpferde gäbe, die er als sehr aggressive und wenig vertrauenerweckende Tiere beschrieb. Er trug übrigens eine Rettungsweste, die er sich noch kurz vor unserer Abfahrt besorgt haben mußte... Richards Nase hatte unterdessen eine interessante krebsrote Farbe angenommen, und ich, nun, ich knirschte mit den Zähnen und versuchte, den immer stärker werdenden Druck meiner Blase zu ignorieren. Wo war diese verdammte Insel? Und wann würden wir dort ankommen? Immer wieder sah ich ungeduldig auf die Uhr. Langsam wurde mir die Lächerlichkeit dieser Situation bewußt - Die Jäger des verlorenen Schatzes und Indiana Jones waren eine Sache, aber das hier sah, ehrlich gesagt, mehr nach »Drei Männer in einem Boot« aus ...

Die Fahrt dauerte schließlich sogar weniger als zwei Stunden, aber das war schon lange genug. So schnell wie möglich sprang ich an Land, stürzte an der Abordnung von Mönchen vorbei, die

zu unserer Begrüßung erschienen war, und verschwand hinter dem nächsten Busch. Einige Minuten später kam ich wieder zum Vorschein und fühlte mich schon sehr viel besser.

Die anderen waren mit dem Empfangskomitee in ein Gespräch vertieft. Als ich mich dazugesellte, bemerkte ich einige am Strand aufgereihte Schilfboote, die in jeder Hinsicht denjenigen ähnelten, die ich bereits am Tanasee gesehen hatte. Gerade wollte ich nach den Booten fragen, da unterbrach Yohannes meine Überlegungen: »Graham, das ist sehr merkwürdig. Es sieht so aus, als sei die Muttersprache dieser Leute Tigre.«

Das war tatsächlich überraschend. Wir befanden uns hier im Süden der Provinz Shoa und damit auf amharischsprachigem Gebiet. Tigre hingegen wird in der gleichnamigen Provinz und in Aksum gesprochen - mehrere hundert Kilometer im Norden. Ich wußte, daß in Äthiopien regionale Besonderheiten und gerade sprachliche Eigenheiten so von Bedeutung waren, daß sie sogar zum Bürgerkrieg geführt hatten. Es war also außerordentlich erstaunlich, daß Amharisch nicht die Umgangssprache dieser Mönche war. Und das galt nicht nur für die Mönche. Auch die anderen Einwohner der Insel, Bauern und Fischer, unterhielten sich gewöhnlich in einem Dialekt des Tigre und benutzten Amharisch (das die meisten nicht einmal besonders gut beherrschten) nur bei den wenigen Gelegenheiten, zu denen offizieller Besuch auf die Insel kam.

Auf dem Weg zu der Anhöhe, auf der die Kirche von Debra Zion lag, fragte ich einen der Mönche: »Wie kommt es, daß Sie alle Tigre sprechen?«

»Weil unsere Vorväter aus Tigre kamen«, lautete die Antwort.

»Und wann kamen sie hierher?«

»Das war vor etwa eintausenddreißig Jahren.«

Schnell überschlug ich die Daten im Kopf: zehntes Jahrhundert, dachte ich sofort. Das Jahrhundert, in dem Königin Gudit die Dynastie Salomos gestürzt hatte und in dem die Lade mit einiger Wahrscheinlichkeit nach Debra Zion in Sicherheit gebracht worden war.

»Wie kamen sie hierher?« fragte ich. »Wie und warum?«

Yohannes übersetzte die Antwort. »Nun, ihre Urahnen kamen mit dem >Tabot< hierher. Es war zur Zeit der Königin Gudit. Sie bekämpfte die Christen in Tigre. Es bestand große Gefahr und so flüchteten sie. Und kamen mit dem >Tabot< auf diese Insel.«

»Welchem >Tabot<?«

»Sie sagen, daß es das >Tabot< aus der Kirche in Aksum war ...«

»Meinen Sie das alte >Tabot<, das Menelik von Jerusalem nach Äthiopien brachte? Mit anderen Worten: die Bundeslade? Oder war es irgendein anderes >Tabot<? Ich möchte in diesem Punkt ganz sicher gehen.«

Yohannes stürzte sich beherzt in dieses Wirrwarr von Interpretationen. Die Angelegenheit wurde ausführlich erörtert, bevor er schließlich berichtete:

»Ich glaube, das wissen sie selbst nicht genau. Aber sie sagen, es sei aufgeschrieben worden ..., in einem alten Buch, das hier in der Kirche aufbewahrt wird. Wir sollen die Sache mit ihrem Oberpriester besprechen.«

Ein verschwundenes Manuskript

Wenig später erreichten wir die schmucklose und weißgetünchte Kirche, die, was mich kaum erstaunte, der »Heiligen Maria auf Zion« gewidmet war. Der Oberpriester stellte sich als Abba Gebra Christos vor. Er war ein kleiner, drahtiger Mann mit einem grauen Bart, vielleicht Ende sechzig, der einen Anzug trug. Um die Schultern hatte er ein weißes Baumwolltuch geschlungen, wie es traditionellerweise auch im Hochland verwendet wurde. Seine Art war angenehm und herzlich, und doch vermittelte sie etwas Listiges und Berechnendes, das mir bestimmte finanzielle Transaktionen anzukündigen schien. Nervös tastete ich nach dem Bündel von Birr-Noten, das ich vor unserer Abreise aus Addis in meine Tasche gestopft hatte. Im stillen beschloß ich, diesmal nur für wirklich gute Informationen zu zahlen.

Dann schaltete ich so unauffällig wie möglich mein Bandgerät an und stellte die erste Frage: Ob er die Geschichte von Menelik und der Entführung der Bundeslade aus dem Tempel Salomos kenne?

Ja, übersetzte Yohannes, natürlich kenne er die.

Und ob er wisse, was dann geschah?

Menelik, gab der Priester zurück, habe die Lade nach Äthiopien gebracht, und da befinde sie sich bis auf den heutigen Tag.

»Ist er sich sicher«, fragte ich, »daß es sich dabei um die echte Bundeslade handelt, in der die Steintafeln mit den Zehn Geboten Gottes aufbewahrt werden?«

Yohannes gab die Frage weiter, und Abba Gebra Christos antwortete feierlich: »Ja. Ich bin sicher.«

»Nun gut. Dann sagen Sie mir bitte, wurde diese Lade einmal nach Debra Zion gebracht?«

»Ja«, sagte der Priester, »zur Zeit Gudits brachte man die Lade von Aksum hierher.«

»Aber warum?« wollte ich wissen. »Warum gerade hierher? Aksum ist weit entfernt. Es muß doch auch in Tigre Hunderte von sicheren Orten gegeben haben, wo man den Schrein hätte verbergen können.«

»Hören Sie, diese Gudit ..., sie war ein Teufel. Sie brannte viele Kirchen in Tigre nieder. Und auch in anderen Teilen des Landes. Es war eine Zeit großer Kämpfe, großer Gefahren. Unsere Vorväter waren sehr beunruhigt, daß sie die Lade an sich reißen könnte. So brachten sie sie weg aus Aksum und kamen zum Zwaisee, wo sie den Schrein in Sicherheit wußten. Sie reisten nur bei Nacht, versteckten sich tagsüber in Wäldern und Höhlen. Sie hatten große Angst, glauben Sie mir! Sie entgingen jedoch den Soldaten und brachten die Lade zum Zwaisee und dann auf diese Insel.«

»Wissen Sie, wie lange sie hier blieb?«

Ohne einen Moment zu zögern gab Abba Gebra Christos zurück: »Nach zweiundsiebzig Jahren wurde die Lade zurück nach Aksum gebracht.«

Nun war der Augenblick für die große Preisfrage gekommen:

»Hat jemals«, begann ich zaghaft, »die Notwendigkeit bestanden, den Schrein noch einmal hierher zu bringen? Vielleicht kürzlich?«

Ruhig antwortete der Mönch: »Niemals.«

»Soweit Sie wissen, ist sie also noch in Aksum.«

»Ja.«

»Selbst jetzt, trotz der Kämpfe in Tigre?«

Er zuckte die Achseln: »Ich denke schon. Aber das ist nur meine eigene Meinung. Um die Wahrheit herauszufinden, müssen Sie nach Aksum gehen.«

Nun fiel mir etwas ein: »Auf dem Weg hierher haben uns die Mönche erzählt, daß es auf der Insel ein altes Buch gibt, in dem geschrieben steht, wie die Bundeslade zu Gudits Zeiten nach Debra Zion kam. Stimmt das?«

Als Yohannes diese Frage übersetzte, konnte man auf dem faltigen Gesicht des Mönchs für einen Augenblick die Überraschung ablesen, mit der ihn diese Worte trafen. Doch er beherrschte sich und sagte: »Ja, es gibt hier ein solches Buch.« Dann zögerte er kurz: »Ja ..., aber der Teil, der die Lade betrifft, ist nicht mehr hier.«

»Entschuldigung, ich kann Ihnen nicht folgen. Was meinen Sie genau?«

»Vor etwa zwanzig Jahren kam ein Mann, schnitt einige Seiten aus dem Buch und verschwand damit. Es waren die Seiten, auf denen die Geschichte der Lade erzählt wird.«

»War dieser Mann ein Fremder? Oder ein Äthiopier?«

»Nun, er war Äthiopier. Aber wir haben ihn nie ausfindig machen können.«

Ich seufzte und sagte Abba Gebra Christos, daß ich jenes Buch trotz der fehlenden Seiten gerne sehen wollte. Ob er uns erlauben würde, einige Aufnahmen davon zu machen?

Mein Vorschlag löste eine Flut aufgeregter Einwände aus. Nein, sagte der alte Priester, das sei unmöglich. Aufnahmen kämen nicht in Frage, bevor nicht der Patriarch der Orthodoxen Kirche Äthiopiens in Addis Abeba entsprechende Genehmigungen erteilt hätte. Ob wir zufällig eine solche Erlaubnis hätten?

Nein, die hatten wir natürlich nicht.

Dann könnten wir, bedauerlicherweise, das Buch keinesfalls fotografieren. Wir könnten es jedoch ansehen, wenn wir wollten.

Ich deutete an, daß wir für jedes kleine Zugeständnis dankbar seien. Abba Gebra Christos neigte weise den Kopf, führte uns in seine Kirche und ging zu einem Schränkchen im Hintergrund des armseligen Gebäudes. Der Priester bot uns ein furchterregendes Pantomimespiel, als er in allen Taschen nach dem passenden Schlüssel suchte, den er jedoch, wie er kurz darauf zugab, nicht finden konnte.

Ein junger Diakon wurde herbeigerufen und irgendwohin geschickt. Nach zehn Minuten kehrte er nach Luft schnappend zurück und umklammerte ein Bund mit mindestens zwanzig Schlüsseln. Einer nach dem anderen wurde ausprobiert, und schließlich geschah, was ich kaum noch für möglich gehalten hatte: Das Schränkchen konnte geöffnet werden. Es war jedoch fast leer, und das einzige Buch, das es enthielt, war ein Werk aus unserem Jahrhundert, das Prinzessin Zaudito, die Tochter Meneliks II., der Kirche gestiftet hatte.

In diesem Augenblick erinnerte sich Abba Gebra Christos plötzlich daran, daß das fragliche Manuskript gar nicht in der Kirche war. Vor einigen Wochen habe er selbst das Buch in das Repositorium gebracht; das Gebäude liege etwas abseits, aber wenn wir wollten, sollten wir ihn dorthin begleiten.

Ich sah auf die Uhr, überlegte, daß wir noch ausreichend Zeit hätten, und gab meine Zustimmung zu diesem Plan. Nach einem längeren Fußmarsch erreichten wir ein baufälliges, zweigeschossiges Steinhaus. Mit einer würdevollen Geste geleitete uns der Priester in einen dumpfen und verstaubten Hinterraum, an dessen Wände Dutzende hölzerner Kisten und grellackierter Blechtruhen aufgereiht waren. Nach kurzem Zögern ging er auf eine der Kisten zu und öffnete den Deckel. Darin befand sich ein Stoß Bücher, von denen er das oberste herausnahm und mir übergab.

Richard und Yohannes blickten mir über die Schulter, als ich

den gewichtigen Band aufschlug. Ohne zu zögern, bestätigten sie, daß es sich bei den Schriftzeichen um Ge'ez handelte. Es bestand auch kein Zweifel, daß die Handschrift sehr alt war: »Dem Einband und dem Stil der Illuminationen nach zu urteilen, würde ich sagen, daß sie aus dem dreizehnten Jahrhundert stammt«, vermutete Richard. »Mit Sicherheit nicht später als vierzehntes Jahrhundert. Kein Zweifel, das ist ein sehr altes Werk. Und wahrscheinlich sehr wertvoll.«

Ungeduldig blätterten wir die Pergamentseiten um. Es gab jedoch keine Anzeichen dafür, daß etwas aus dem Band herausgeschnitten worden war. Soweit wir sehen konnten, war das Manuskript vollständig. Wir machten Abba Gebra Christos, der uns wortlos beobachtet hatte, darauf aufmerksam und fragten ihn, ob er sich ganz sicher sei, daß es sich um das Buch handelte, über das wir gesprochen hatten.

Wie sich erwies, war es das nicht. Entschuldigungen murmelnd stöberte der Priester in mehreren Kisten herum und gab uns ein altes Manuskript nach dem anderen.

»Das ist unglaublich«, sagte Richard irgendwann. »So viele alte Bücher. Ein wirklicher Schatz. Und sie liegen hier einfach so herum. Sie könnten feucht werden, gestohlen werden. Alles mögliche könnte passieren. Wenn ich nur ein paar davon mit ins Institut nehmen könnte ...«

Der letzte Band, den wir in die Hand nahmen, war eine in Holzdeckel gebundene und wunderschön illustrierte Ausgabe des äthiopischen Buches der Heiligen. Es befand sich ebenfalls in gutem Zustand. Als wir es betrachteten, stieß Richard mich leicht an: »Ich glaube nicht, daß wir hier noch etwas herausbekommen.«

Ich nickte: »Ich denke, du hast recht. Es ist spät geworden. Wir brechen wohl besser auf, sonst müssen wir den See in der Dunkelheit überqueren.«

Vorher aber bat ich Yohannes, einen letzten Versuch zu unternehmen, dem Priester etwas zu entlocken. War das Buch, das wir suchten, nun hier oder nicht?

Selbstverständlich sei es hier; der Priester bestand darauf.

Das einzige Problem war, daß er sich nicht mehr sicher sei, in welcher Kiste er es aufbewahrte. Wenn wir nur etwas länger warten könnten, würde er es bestimmt finden.

Ich war mir sicher, daß ich dieses Angebot ablehnen konnte. Mir schien, daß der alte Mann uns absichtlich auswich, und wenn das der Fall war, konnte es nur bedeuten, daß er etwas zu verbergen hatte. Aber was? Nicht die Lade selbst. Vielleicht nicht einmal das gesuchte Buch. Aber irgend etwas auf jeden Fall.

Verwirrt und ein wenig verärgert ging ich zum Motorboot zurück, wo wir uns verabschiedeten. Im letzten Licht der untergehenden Sonne steuerten wir auf den stillen See hinaus.

In meinem Notizbuch vermerkte ich:

- Es hat sicherlich keinen Sinn, weitere Zeit mit der Überprüfung von Debra Zion zu verbringen. Nach den Gesprächen mit den Mönchen und dem Oberpriester bin ich mir ziemlich sicher, daß die Bedeutung der Insel allein in der Anziehungskraft liegt, die von den alten Legenden ausgeht. In den wesentlichen Punkten bestätigen die Überlieferungen das, was Belai Gedai mir am Telefon erzählt hat - vor allem, daß die Bundeslade im zehnten Jahrhundert nach Debra Zion gelangte, wo man sie vor der Königin Gudit schützen konnte, daß sie ungefähr siebzig Jahre hier war und dann nach Aksum zurückgebracht wurde.

- Die Tatsache, daß die Muttersprache der Inselbewohner Tigre und nicht Amharisch ist, muß als Beweis für die Überlieferungen angesehen werden. Denn die einzige logische Erklärung für eine solche ethnographische Besonderheit liegt in der Wanderbewegung von Aksum nach Debra Zion vor langer Zeit. Nur etwas so Wichtiges wie die Notwendigkeit, die Lade in Sicherheit zu bringen, kann als Erklärung für eine derartige Abwanderung gelten. Mehr noch, wenn der Schrein erst nach mehr als siebzig Jahren nach Aksum zurückgebracht worden war, dann ist es nur verständlich, wenn die Nachfahren der ursprünglichen Emigranten auf der Insel bleiben wollten. Denn dies war die einzige Heimat, die sie kannten. Es ist ebenfalls anzunehmen, daß sie die mündliche Überlieferung der glorreichen Taten ihrer Vorväter gepflegt haben.

- Im Verlauf des Tages sind einige beeindruckende Dinge ans Licht gekommen. Zu keinem Zeitpunkt hatte ich jedoch das Gefühl, daß sich der Schrein wirklich auf der Insel befindet.

- Und weil das gleiche für den Tanasee gilt, ist Aksum noch immer der Ort, an dem man den Schrein vermuten kann. Mit anderen Worten, ich muß nach Aksum, ob ich will oder nicht. Der beste Zeitpunkt dafür wird »Timkat« im Januar sein, denn dort wird sich die einzige Gelegenheit bieten, nahe genug an die Lade heranzukommen, ohne daß ich mir Zugang zum Allerheiligsten verschaffen muß.

Ich schloß mein Notizbuch und sah Richard und Yohannes an: »Glaubt ihr an die Möglichkeit, daß die Regierungstruppen bis zum Januar Aksum zurückerobert haben? Ich würde allzugerne dorthin reisen, um das nächste >Timkat< zu erleben.«

Yohannes sagte gar nichts. Richard schnitt eine Grimasse: »Gute Idee. Aber ebensogut könntest du zum Mond fliegen.«

»Na gut«, räumte ich ein, »es war ja nur ein Gedanke.«

Es war bereits dunkel, als wir das Motorboot am Anlegesteg der Fischereibehörde festmachten, und erst gegen zehn Uhr erreichten wir die Vororte von Addis Abeba. Der Fahrer sollte uns zu Yohannes' Büro bringen, wo wir unsere Wagen am Morgen geparkt hatten. Bis zur Ausgangssperre blieben noch zwei Stunden, die wir für ein schnelles Abendessen in einem nahe gelegenen Restaurant nutzen wollten. Als wir jedoch aus dem Wagen stiegen, hörten wir das länger anhaltende Feuer eines automatischen Gewehres, das offenbar aus einem Wohnblock auf der anderen Straßenseite kam. Sekunden später antwortete eine andere Waffe. Dann lag die Straße in tiefer Stille.

»Was im Himmel war das?« fragte ich.

»Sicher nichts Ernsthaftes«, vermutete Richard, »seit dem Putsch gab es einige wenige Vorfälle dieser Art ..., ein paar Schüsse hier und dort, das ist alles.«

»Trotzdem«, sagte Yohannes ernst, »ich glaube, es ist klüger, wenn wir auf unser Abendessen verzichten. Laßt uns nach Hause gehen.«

Eine Art Fingerabdruck

Am nächsten Morgen rief ich das Büro von Shimelis Mazengia an. Seine Sekretärin hatte meinen Anruf erwartet und gab uns einen Termin für den selben Nachmittag. Trotz Richards Pessimismus war ich entschlossen, die Frage des »Timkat« und Aksum aufzuwerfen. In guter Stimmung verließ ich das Hotel und fuhr zum Institut für Äthiopische Studien.

Meine Nachforschungen zwei Tage zuvor hatten die Wahrscheinlichkeit der Nil/Takazze-Route untermauert, zumal feststand, daß die Strecke schon seit dem vierten Jahrhundert nach Christus von Händlern und Pilgern bereist wurde.[13] Heute wollte ich eine Theorie überprüfen, von der ich in Gedanken nach und nach bereits grobe Umrisse erarbeitet hatte. Wenn Menelik und die erstgeborenen Söhne der Ältesten Israels die Bundeslade tatsächlich nach Tana Kirkos gebracht hatten und wenn sie dabei der Takazze-Route gefolgt waren, mußte das auch Auswirkungen auf die Verbreitung des jüdischen Glaubens in Äthiopien gehabt haben. Wenn die Legende recht hatte, überlegte ich, konnte das Siedlungszentrum der Falaschen nur zwischen dem Takazze und dem Tanasee liegen - denn das wäre genau das Gebiet, in dem Menelik mutmaßlich mit der Bekehrung der Bevölkerung zum Judentum begonnen hatte. Sollten sich die Überlieferungen aber als falsch erweisen, dann war es nur wahrscheinlich, daß die Falaschen weiter verstreut lebten - möglicherweise weiter im Norden und näher am Roten Meer, denn der Lehrmeinung zufolge waren die Urahnen der Falaschen jüdische Immigranten aus dem Jemen.

Ich begann bei James Bruce und seinen ausführlichen Abhandlungen über die Falaschen. Im dritten Band seiner Reisen hatte der schottische Autor ein Kapitel dem gewidmet, was man vielleicht als die »Sozialgeographie« Äthiopiens im achtzehnten Jahrhundert bezeichnen könnte. Bruce' Überblick begann mit dem Norden Äthiopiens, mit dem am Roten Meer gelegenen Hafen Massawa. Aber weder in Eritrea noch in Tigre schien er auf Falaschen gestoßen zu sein. Erst nach der Überquerung des

Takazze schrieb er, das Land, das sich südwestlich bis hin zum Tanasee erstrecke, sei »zum großen Teil von Juden bewohnt, und der König und die Königin dieses Volkes aus dem Hause Juda beziehen die Wurzeln ihrer Souveränität und ihrer Religion aus sehr alten Zeiten«[14].

Im neunzehnten Jahrhundert, rund achtzig Jahre nach James Bruce, stellte der deutsche Missionar Martin Flad eine ähnliche Verteilung der Bevölkerung fest und ging auf vierzehn, allesamt »westlich des Takazze« liegende Provinzen ein, in denen die Falaschen lebten.[15]

Auch die neueren Quellen, die ich als nächstes durchging, vermittelten einen solchen Eindruck. Die große Mehrheit der äthiopischen Juden bewohnte das Gebiet westlich und südlich des Takazze: Das war ihr eigentliches Kerngebiet, dessen Besiedlung bereits zu unvordenklichen Zeiten begonnen haben mußte.[16] Eine besonders genaue amtliche Studie enthielt eine Karte, die das Siedlungsgebiet der Falaschen mit einer Schraffur markierte: ein langer, aber relativ schmaler Streifen, der sich vom Takazze aus südwestlich über die Simienberge und Gondar erstreckte und dann das gesamte Tanagebiet umschloß.[17]

Es konnte kaum schlagkräftigere Argumente für meine These geben, daß diese Fläche gleichzeitig das Gebiet beschrieb, in dem einst die Bekehrung der eingeborenen Abessinier zum alttestamentarischen Judentum stattfand. Mittlerweile hatte ich immer mehr stichhaltige Gründe gegen die Lehrmeinung zusammengetragen, derzufolge das Judentum erst um das Jahr 70 nach Christus und über den Jemen nach Äthiopien gelangt war. Nein, die Schraffur auf der Landkarte war ein verräterischer Beweis dafür, daß die Religion Salomos und das Machtinstrument Gottes, die Bundeslade, Äthiopien nur vom Westen aus hatten erreichen können - über Ägypten und den Sudan, auf den vielbefahrenen Handelsrouten des Nil und des Takazze.[18]

Geduld ist eine Tugend

Punkt fünfzehn Uhr trafen Richard und ich bei Shimelis Mazengia ein. Das Politbüromitglied wollte zunächst wissen, wie unsere Reise verlaufen war. Ob wir irgend etwas herausgefunden hätten?

»Ich bin mir jetzt sicher, daß Tana Kirkos der erste Aufenthaltsort der Bundeslade war«, erklärte ich.

»Dann glauben Sie also wirklich, daß wir die Lade haben?« fragte Shimelis mit einem Lächeln.

»Ich bin davon überzeugt. Es spricht immer mehr dafür ...« Ich zögerte, dann gab ich die Frage zurück: »Was glauben Sie?«

»Ich denke, im Allerheiligsten von Aksum befindet sich etwas ganz Besonderes. Nicht unbedingt der Schrein, wohlgemerkt, aber es muß etwas ganz Wichtiges sein. Immerhin handelt es sich um eine uralte Überlieferung, die man nicht ohne weiteres ignorieren kann.«

Ich wollte wissen, ob seine Regierung jemals den Versuch unternommen habe herauszufinden, ob die heilige - und sicher unglaublich wertvolle - Lade in Aksum aufbewahrt werde. Schließlich bestand die äthiopische Arbeiterpartei aus Marxisten und wurde sicherlich nicht von abergläubischen Vorurteilen behindert.

»Wir haben das nie auch nur für einen Moment in Betracht gezogen«, erwiderte Shimelis, »niemals ... Hätten wir etwas Derartiges versucht, dann hätten wir« - er lächelte ironisch - »eine regelrechte Revolution am Hals gehabt. Unser Volk ist sehr traditionell gesinnt, wie Sie wissen, und es gäbe mit Sicherheit eine Explosion, wenn sich die Regierung in eine solche Angelegenheit einmischen würde.«

»Glauben Sie, daß die TPLF in dieser Beziehung eine ähnliche Haltung einnimmt?« fragte ich. »Jetzt, wo sie Aksum erobert hat, meine ich.«

Shimelis zuckte die Achseln. »Da fragen Sie den Falschen. Aber die TPLF ist nicht gerade für ihre Sensibilität in religiösen Angelegenheiten bekannt...«

Ich war etwas unschlüssig, ob ich meine nächste Frage stellen sollte. »Entschuldigen Sie, wenn das unverschämt klingt«, sagte ich, »aber ich muß Sie das fragen. Besteht irgendeine Chance, daß Ihre Regierung Aksum in naher Zukunft zurückgewinnt?«

»Warum fragen Sie?«

»Weil ich zu dem Ergebnis gekommen bin, daß ich dorthin muß. Ich möchte die nächsten >Timkat<-Feiern sehen.«

»Sie meinen, im kommenden Januar?«

Ich nickte.

»Ausgeschlossen«, sagte Shimelis entschieden. »Aber warum solche Eile? Wenn Sie recht haben, dann ist die Lade seit drei Jahrtausenden in unserem Land. Übernächstes Jahr, vielleicht in zwei Jahren, werden wir die Stadt wieder unter Kontrolle haben. Dann werden Sie der erste Fremde sein, der Aksum besuchen darf. Das verspreche ich Ihnen. Also haben Sie Geduld, Sie bekommen Ihre Chance ...«

Ich mußte zugeben, das klang vernünftig. In einem Land wie Äthiopien war Geduld von jeher eine Tugend. Und doch: Ich konnte keine zwei Jahre warten. So beschloß ich für mich, daß ich, wenn schon nicht im Januar 1990, so doch im darauffolgenden Jahr nach Aksum reisen würde. Die überzeugte Haltung, die Shimelis an den Tag gelegt hatte, beeindruckte mich, und ich hoffte, daß die Stadt bald wieder in den Händen der Regierungstruppen sein würde. Unterdessen - nur als Vorsichtsmaßnahme - mußte ich mit der TPLF in London Kontakt aufnehmen. Bis zu diesem Zeitpunkt hatte ich das vermieden, aber nun schien ich um derartige Annäherungsversuche nicht mehr herumzukommen.

Über den Tisch sah ich Shimelis an. »Sie haben natürlich recht«, sagte ich, »aber darf ich Sie trotzdem um einen anderen Gefallen bitten?«

Mit einer Geste forderte mich das Politbüromitglied zum Weiterreden auf.

»Ich möchte trotzdem eine >Timkat<-Zeremonie erleben«, fuhr ich fort, »und weil Aksum nicht in Frage kommt, könnte ich im kommenden Januar vielleicht nach Gondar reisen.«

Richard, der neben mir saß, zog tief die Luft ein. Die Stadt, die ich gerade erwähnt hatte, war angeblich von den Rebellen umzingelt und konnte jeden Tag fallen.

»Warum Gondar?« fragte Shimelis.

»Weil Gondar im Tanagebiet liegt, das wiederum eng mit der Frühgeschichte der Lade in Äthiopien zusammenhängt. Und weil ich weiß, daß in der Region von Gondar noch immer viele Falaschen leben. Ich erinnere mich, daß wir 1983 auf dem Rückweg in die Stadt eine jüdische Siedlung passiert haben, aber zu dieser Zeit ergab sich keine Möglichkeit, dort ein Gespräch zu führen. Wenn Sie erlauben, will ich also zwei Fliegen mit einer Klappe schlagen. Ich möchte >Timkat< in Gondar sehen. Und ich möchte einige Untersuchungen bei den Falaschen durchführen.«

»Das wäre schon möglich«, erwiderte Shimelis. »Es hängt natürlich von der militärischen Lage ab, aber es ist möglich. Ich werde die Angelegenheit prüfen lassen und gebe Ihnen Bescheid ...«

Kapitel 11

»Und David tanzte vor dem Herrn«

Erst am 8.Januar 1990 erhielt ich ein Telex von Shimelis Mazengia, in dem er mir bestätigte, daß die notwendigen Genehmigungen von den Militärbehörden erteilt worden seien. Gondar sollte also für mich die entscheidende Vorübung sein: Wie Aksum einstmals die Hauptstadt Äthiopiens, ist es heute eine wichtige historische Stätte und überdies Zentrum religiöser Gelehrsamkeit. Ich würde ein Ritual erleben, das als höchster Feiertag des äthiopischen Kirchenkalenders angesehen wurde und das mit Sicherheit den Feiern in Aksum genau glich. In dieser Umgebung hoffte ich, mich geistig auf die vor mir liegende Feuerprobe einstimmen zu können. Denn bis zum nächsten Jahr wollte ich mich mit jenen geheimnisvollen Ritualen vertraut machen, die James Bruce schon 1770 miterlebt haben mußte, wollte so viel Informationen wie möglich ansammeln und meine Nachforschungen mit doppeltem Engagement vorantreiben. Aber gleichzeitig wußte ich, daß ich auch kritisch an die Sache herangehen mußte. Wenn ich in Gondar irgend etwas entdecken sollte, das ernsthafte Zweifel am Anspruch Äthiopiens aufwarf, die Bundeslade zu besitzen, dann blieb mir nur der ehrenvolle Rückzug - und der Verzicht auf die Reise nach Aksum.

Noch mehr Rätsel

»Timkat« ist das Fest der Epiphanie - der Erscheinung des Herrn.[1] Epiphanias hat jedoch unter den Christen der östlichen Kirchen eine ganz andere Bedeutung und erinnert an die Taufe Christi.[2] Ich hatte herausgefunden, daß die Äthiopische Kirche in diesem Punkt mit den anderen orthodoxen Kirchen überein-

stimmte, daß jedoch deutliche Abweichungen festzustellen waren, wenn es um die besonderen Rituale an diesem Tag ging.[3] So gibt es für den Gebrauch des »Tabots« in anderen Kulturen keine Entsprechung, und das Koptische Patriarchat in Alexandria, das bis zur Autokephalie im Jahre 1959 alle äthiopischen Bischöfe eingesetzt hat[4], lehnt ihn sogar ab[5], was mit der Beeinflussung, ja Beherrschung des äthiopischen Christentums durch einen vorchristlichen Gegenstand zusammenhängt: der Bundeslade.

In Gondar wollte ich zudem die Gelegenheit nutzen, um mit den Falaschen in der Umgebung der Stadt zu sprechen. Gegenüber Shimelis hatte ich diese Absicht erwähnt, und er hatte keinen Einspruch erhoben. Dafür gab es einen einfachen Grund, denn seit meiner Reise von 1983 hatte sich einiges geändert. Auch damals war ich von Gondar aus in die Simienberge gefahren, konnte jedoch keine Nachforschungen anstellen, da die Falaschen-Siedlungen von der Regierung zum Sperrgebiet erklärt worden waren.

Im November 1989, als Addis Abeba und Jerusalem nach sechzehn Jahren wieder diplomatische Beziehungen aufnahmen, war eine neue Entwicklung eingetreten. Das Kernstück der Vereinbarungen war die Zustimmung Äthiopiens zur Ausreise aller Falaschen nach Israel. Zu diesem Zeitpunkt gab es nicht mehr viele schwarze Juden in Äthiopien, schätzungsweise weniger als fünfzehntausend. Viele waren während der Hungerkatastrophen Mitte der achtziger Jahre umgekommen, andere in die Flüchtlingscamps im Sudan geflohen. Von dort aus wurden im Zuge der »Operation Moses« allein 1984 und 1985 über zwölftausend Menschen nach Israel ausgeflogen.

Bis zum Januar 1990 hatte die Zahl der äthiopischen Juden rapide abgenommen. In den drei Monaten seit Wiederherstellung der diplomatischen Beziehungen waren mehr als dreitausend Menschen emigriert. Unaufhaltsam nahm dieser moderne Exodus seinen Lauf, und es war abzusehen, daß man bald keine Falaschen mehr in Äthiopien antreffen würde. Dieses Jahr stellte also mit Sicherheit die letzte Gelegenheit dar, Eindrücke vom

archaischen Leben der Falaschen in ihrer ursprünglichen Umgebung zu gewinnen. Ich war fest entschlossen, diese Chance nicht zu verpassen, war doch das Geheimnis der Bundeslade auf das engste mit der Geschichte jenes schwarzen, jüdischen Volkes im Herzen Äthiopiens verbunden. Würde ich das Rätsel der Herkunft dieser Menschen lösen können, dann mußte auch das Geheimnis des Schreins zu lüften sein.

Doch es ging mir nicht nur um die Falaschen. In der Woche vor meiner Abreise aus England hatte ich einige Nachforschungen angestellt und dabei eine überraschende Verbindung zu einem anderen Volk herstellen können - den Qemant, die in einer Abhandlung als »Hebräo-Heiden« bezeichnet wurden. Frederick Gamst, der Verfasser dieser wenig beachteten Monographie aus dem Jahre 1969, hatte folgendes beobachtet:

»Der Hebraismus, den man bei den Qemant antrifft, ist eine sehr alte Glaubensform, die von den Entwicklungen der jüdischen Religion in den vergangenen zwei Jahrtausenden unberührt geblieben ist. Dieser Hebraismus besitzt auch eine Dominanz in der Religion der Falaschen, der Nachbarn der Qemant ..., die man manchmal >die schwarzen Juden Äthiopiens< genannt hat.«[6]

Bis zu diesem Zeitpunkt hatte ich von den Qemant nichts gewußt. Um so mehr beeindruckte mich die Annahme Gamsts, daß auch ihre Religion althebräische Elemente enthielt. Diese Angelegenheit verdiente zweifellos weitere Nachforschungen. Es mußte doch möglich sein, Licht in die Zeit zu bringen, in der die Verbreitung des jüdischen Glaubens in Äthiopien ihren Anfang genommen hatte.

Der heilige Hain

In seiner Studie erwähnte Gamst, daß sich bei seiner Exkursion in den sechziger Jahren ein alter Priester seiner angenommen und ihm sehr geholfen hatte. Der Name dieses Würdenträgers war Muluna Marsha, und er führte den Titel »Wambar«, was in

Qemant soviel bedeutete wie »Hohepriester«. Ich wollte diesen Mann, den Gamst als »unerschöpflichen Informationsquell« bezeichnet hatte, ausfindig machen und ihn selbst befragen. Natürlich wußte ich nicht, ob er nach so vielen Jahren noch am Leben war oder ob ich überhaupt einen Qemant finden würde, der den alten hebräisch-heidnischen Glauben noch praktizierte. Schon zu Gamsts Zeiten hatte es weniger als fünfhundert davon gegeben.[7]

Nach meiner Ankunft in Gondar trug ich dieses Problem den Regierungsbeamten vor, die mich am Flughafen abgeholt hatten. Ich erfuhr, daß es tatsächlich nur noch sehr wenige, hauptsächlich alte Menschen gab, die dieser Religion angehörten. Man stellte einige Nachforschungen an, übermittelte Funksprüche an Parteimitglieder in weiter entfernt liegenden Dörfern, und am 18. Januar erhielt ich die gute Nachricht, daß der Wambar noch am Leben sei. Sein Heimatort lag zwar abseits aller befahrbaren Straßen, aber man hielt es für möglich, daß er sich auf einen gemeinsamen Treffpunkt einlassen würde - einen Ort namens Aykel, der etwa zwei Fahrstunden entfernt im Westen von Gondar lag. Wir würden darüber hinaus gefahrlos reisen können, da man die Rebellen aus diesem Gebiet vertrieben hatte und die westlichen Landesteile bei Tageslicht als sicher galten.

Das »Timkat«-Fest, das ich im Verlauf dieses Kapitels noch genau beschreiben werde, nahm zunächst meine ganze Aufmerksamkeit in Beschlag. Erst am Nachmittag des 20. Januar konnte ich in einem Geländewagen aufbrechen, den die Partei mir zur Verfügung gestellt hatte. Neben einem Fahrer wurde ich von Legesse Desta begleitet, einem jungen und engagierten Beamten, der als mein Dolmetscher fungierte - und von zwei grimmig dreinblickenden Soldaten, die mit Kalaschnikow-Sturmgewehren bewaffnet waren.

Während der holprigen Fahrt studierte ich aufmerksam eine Karte dieser Region. Mir wurde klar, daß unser Ziel nicht weit entfernt vom Quellgebiet des Atbara lag, der etwa fünfzig Meilen nördlich des Tanasees entspringt und von dort aus in den Sudan

fließt. Noch immer war ich davon überzeugt, daß Menelik und die Bundeslade über den Takazze nach Äthiopien gelangt waren, wird doch der Fluß, der so nahe an den Tanasee heranreicht, ausdrücklich im Kebra *Nagast* erwähnt. Mir wurde aber beim Betrachten der Karte klar, daß auch der Atbara in Frage kam, denn er hätte die Reisenden ebenfalls direkt in das Tanagebiet geführt.

In Aykel empfing uns eine Delegation örtlicher Parteimitglieder. Der Wambar Muluna Marsha, so berichteten sie, sei gerade eingetroffen und erwarte uns. Man begleitete uns zu einer runden, geräumigen Hütte und führte uns in das kühle Halbdunkel unter dem bienenkorbförmigen Dach. Sonnenstrahlen drangen durch die Ritzen der Wände und zogen ihre Bahnen durch die feinen Staubteilchen, die in der Luft schwebten. Vom saubergekehrten Lehmboden stieg ein erdiger Geruch auf und vermischte sich mit dem leichten Duft von Sandelholz.

Der Wambar war erwartungsgemäß ein alter Mann. Ganz augenscheinlich hatte er sich für diesen Tag herausgeputzt, denn er trug einen weißen Turban, weiße Feiertagsgewänder und einen schwarzen Umhang aus gutem Tuch. Als wir hereinkamen, erhob er sich würdevoll, und nach den üblichen Vorstellungen schüttelte er herzlich meine Hand.

Durch meinen Dolmetscher ließ er sogleich fragen: »Arbeiten Sie mit Herrn Gamst zusammen?«

Ich räumte ein, daß dies nicht der Fall sei. »Aber«, fügte ich hinzu, »ich habe das Buch gelesen, das er über Ihr Volk geschrieben hat. Und das ist auch der Grund, warum ich hier bin. Ich möchte mehr über ihre Religion erfahren.«

Der Wambar lächelte schmerzlich. Dabei entblößte er einen irritierend langen Zahn, der aus seinem linken Oberkiefer wie ein Fangzahn über die Unterlippe ragte. »Unsere Religion«, sprach er, »gehört der Vergangenheit an. Nur wenige praktizieren sie noch. Die Qemant sind nun Christen.«

»Aber Sie selbst sind kein Christ?«

»Nein. Ich bin der Wambar. Ich befolge die alten Regeln.«

»Und gibt es noch andere, die das tun?«

»Nur wenige sind übriggeblieben.« Noch einmal das traurige Lächeln. Dann fügte er schlau und etwas zweideutig hinzu: »Aber auch diejenigen, die sagen, sie seien Christen, haben dem alten Glauben nicht ganz abgesprochen. Sie suchen noch immer die heiligen Haine auf ..., sie bringen immer noch Opfer dar.« Es folgte eine Pause. Der alte Mann schüttelte langsam sein greises Haupt, seufzte und fuhr fort: »Aber die Dinge ändern sich ..., alles ändert sich ...«

»Sie erwähnten >heilige Haine<. Was bedeutet das?«

»Unser Gottesdienst, wenn er den Regeln entsprechend ausgeführt wird, findet unter freiem Himmel statt. Zu diesem Zweck wurden besondere Haine angelegt, die man >degegna< nennt.«

Ich hakte nach und fand heraus, daß genaugenommen zwei Arten heiliger Haine existierten. Die einen, »degegna«, wurden für besondere, alljährlich stattfindende Zeremonien genutzt und waren in weiter Vergangenheit angepflanzt worden, als dem Gründer der Qemant-Religion im Traum die richtigen Orte dafür bestimmt worden waren. Daneben gab es kleinere heilige Stätten, die sogenannten »gole«, die meist nur aus einem einzigen Baum bestanden, in dessen Krone ein mächtiger Geist residierte. Gewöhnlich befanden sich diese »gole« an höhergelegenen Orten. Es ergab sich, daß eine solche Kultstätte am Rande von Aykel lag, die wir uns ansehen konnten.

Ich fragte den Wambar, ob auch die Falaschen heilige Haine verehrten.

»Nein«, entgegnete er, »das ist nicht der Fall.«

»Gibt es denn irgendwelche Ähnlichkeiten zwischen den Religionen der Qemant und der Falaschen?«

Ein weises Nicken: »Ja, in vieler Hinsicht. Wir haben einiges gemeinsam. Der Gründer unserer Religion hieß Anayer. Er kam vor Urzeiten nach Äthiopien. Er kam aus einem Land, in dem sieben Jahre lang Hunger herrschte. Dieses Land war weit weg. Auf der Reise hierher traf er den Begründer der Falaschen-Religion, der ebenfalls mit Frau und Kindern unterwegs war. Sie sprachen über ein Heiratsbündnis zwischen den Familien, aber es kam nicht zustande ...«

»Kamen Anayer und der Gründer der Falaschen-Religion aus demselben Land?«

»Ja. Aber es waren zwei Stämme. Es gab keine Heiratsverbindungen.«

»Aber ihr Geburtsland war ein und dasselbe?«

»Ja.«

»Wissen Sie, welches Land das war?«

»Es war weit weg ... Es lag im Nahen Osten.«

»Kennen Sie den Namen des Landes?«

»Es war das Land Kanaan. Anayer war der Enkel von Kanaan, Sohn des Ham, und der war der Sohn Noahs.«

Diese Genealogie und die mündliche Überlieferung einer lang zurückliegenden Wanderbewegung aus dem Nahen Osten - die mit dem Tod des Wambar unwiderruflich verloren sein würde - fesselte mich ungemein. Besonders wichtig war der Hinweis, daß die Religion der Qemant und der Falaschen aus demselben Ursprungsland stammen mußten. Der Wambar konnte mir leider nicht bestätigen, daß es sich bei seinem Kanaan tatsächlich um das Gelobte Land der Bibel handelte. Trotz seiner Vertrautheit mit Namen wie Ham und Noah gab er an, nie die Bibel gelesen zu haben. Ich glaubte ihm, zweifelte aber gleichzeitig nicht daran, daß es irgendeine literarische Grundlage für das geben mußte, was er mir erzählt hatte. Der Bericht des Wambars enthielt zum Beispiel Anklänge an die große Reise des Patriarchen Abraham und seiner Frau Sarah, die Kanaan verließen und »weiter nach Süden« zogen, weil »eine Hungersnot in das Land« gekommen war.[8] Auch Anayers Heimat wurde sieben Jahre lang vom Hunger bedroht - wie das Ägypten im ersten Buch Mose.[9]

»Erzählen Sie mir mehr von Ihrer Religion«, bat ich den Wambar. »Vorhin haben Sie die Geister in den Bäumen erwähnt. Aber wie verhält es sich mit Gott? Glauben Sie an einen Gott oder an viele Götter?«

»Wir glauben an einen Gott. Es gibt nur einen Gott. Aber ihm zur Seite stehen die Engel.«

Der Wambar zählte die Namen der Engel auf: Jakaranti, Ki-

berwa, Aderaiki, Kiddisti, Mezgani, Anzatatera. Offensichtlich hatte jeder Engel seinen genau festgelegten Stammplatz in der Natur. »Als unsere Religion noch stark war, gingen die Qemant zu diesen Orten und beteten zu den Engeln, um mit Gott in Verbindung zu treten. Jakaranti war der mächtigste Engel, dann folgten Mezgani und Anzatatera.«

»Und Gott?« fragte ich. »Der Gott der Qemant? Hat er einen Namen?«

»Natürlich. Sein Name ist Yeadara.«

»Wo ist er?«

»Er ist überall.«

Ein einziger und allgegenwärtiger Gott. Langsam verstand ich, warum Gamst dieses Volk als hebräisch-heidnisch beschrieben hatte. Fast alles, was der Wambar mir erzählt hatte, paßte in dieses Bild. Nach meiner Rückkehr nach Addis Abeba verglich ich seine Aussagen Punkt für Punkt mit der Heiligen Schrift, und dabei wurde mir schnell klar, wie alt die jüdischen Bestandteile der Qemant-Religion tatsächlich waren.

So hatte mir der Wambar erklärt, daß es den Qemant verboten sei, Fleisch zu essen, das nicht von paarhufigen und wiederkäuenden Tieren stamme. Kamele und Schweine galten als unrein und waren ebenfalls streng verboten. Diese Vorschriften stimmten genau mit denjenigen überein, die im dritten Buch Mose über die Juden verhängt werden.[10] Aber selbst reine Tiere durften nicht verzehrt werden, wenn sie nicht ordnungsgemäß geschlachtet worden waren. »Ihr Hals muß durchschnitten werden, bis alles Blut herausgelaufen ist«, hatte der Wambar erläutert und hinzugefügt, daß es aus diesem Grunde verboten sei, Tiere zu essen, die eines natürlichen Todes gestorben waren. Beide Gebote entsprachen genau den jüdischen Gesetzen.[11]

Die Qemant-Religion gestattete den Verzehr von Fleisch und Milchprodukten auf dem gleichen Tisch. Es wurde jedoch mit Abscheu betrachtet, wenn man in Milch gekochtes Fleisch aß. Ich wußte, daß es orthodoxen Juden verboten war, Fleisch und Milchprodukte in ein und derselben Mahlzeit zu verwenden. Als ich den Hintergrund dieses besonders strengen Gebotes

recherchierte, entdeckte ich, daß es bis auf die fünf Bücher Mose zurückging, in denen mehrfach betont wird: »Und du sollst das Böcklein nicht kochen in seiner Mutter Milch.«[12]

Andere Übereinstimmungen betrafen den Sabbat, den die Qemant genau wie die Juden am Samstag befolgten. »An diesem Tag darf nicht gearbeitet werden«, erklärte der Wambar. »Es ist verboten, am Samstag ein Feuer anzuzünden. Und wenn ein Feld am Samstag abbrennen sollte, dann darf dieses Feld nie wieder bestellt werden .. .«[13]

Diese und ähnliche Verbote befanden sich im Einklang mit den biblischen Gesetzen und verdeutlichten, wie stark verwurzelt dieses uralte jüdische Substrat in der Qemant-Religion war. Selbst ein Brauch, der sich zunächst überhaupt nicht mit jüdischen Riten verbinden ließ, nämlich die Verehrung der heiligen Haine, stellte sich schließlich als weitere Verbindung zum alten Israel heraus.

Ich hatte mir die vom Wambar erwähnte Kultstätte in der Nähe von Aykel natürlich angesehen. Der heilige Baum erwies sich als eine mächtige, hohe und ausladende Akazie, die auf einer Anhöhe westlich der Ortschaft stand. Sie war so alt, daß man sich leicht vorstellen konnte, daß sie seit Hunderten, wenn nicht seit Tausenden von Jahren an diesem Ort stand. Innerhalb der gemauerten Umfriedung fand ich, am Boden ausgelegt, viele Opfergaben: einen Krug Öl, eine Schüssel Hirse, ein Häufchen gerösteter Kaffeebohnen oder ein an den Beinen gefesseltes Huhn, das seine Opferung erwartete. Es waren nicht zuletzt diese Gaben, die zum eigentümlichen Charakter des Ortes beitrugen. Obgleich keine Bedrohung von ihm ausging, war er doch in höchstem Maße unheimlich und entzog sich allen normalen Kategorien.

Was die Jenseitsstimmung noch verstärkte und worin diese »gole« der Qemant sich so von Kultstätten anderer Religionen unterschied, war die Tatsache, daß etwa bis auf Kopfhöhe jeder Ast des Baumes mit ineinander verwobenen bunten Stoffstreifen geschmückt war. Die wehenden Bänder und Fähnchen raschelten im Wind und schienen zu wispern und zu murmeln, als

hätten sie eine Botschaft zu überbringen. Wenn ich diese Nachrichten nur verstehen könnte, dachte ich in diesem Moment, dann würden sich viele geheime Dinge erklären lassen. In einer Anwandlung von Aberglauben berührte ich diesen so lebendigen Baum und glaubte, sein biblisches Alter zu verspüren. Dann kehrte ich zu meinen Begleitern zurück, die mich am Fuße des Hügels erwarteten.

In Addis Abeba verglich ich die Eigenheiten der Qemant-Religion mit dem alttestamentarischen Judentum und durchforstete die Heilige Schrift und die wissenschaftlichen Werke über biblische Archäologie noch einmal auf Hinweise zu diesen kultischen Bäumen. Ich versprach mir nicht viel davon, so daß meine Überraschung um so größer war, als ich entdeckte, daß schon in den frühesten Entwicklungsphasen des jüdischen Glaubens die Rede von bestimmten, besonders angelegten Wäldchen war, denen eine heilige Funktion zugesprochen wurde. Und diese Stätten wurden in der Tat für Gottesdienste benutzt. Im Buch Genesis verweist eine Textstelle auf folgenden Sachverhalt: »Abraham aber pflanzte Bäume zu Ber-Seba und predigte daselbst von dem Namen des Herrn, des ewigen Gottes.«[14]

Ich dehnte meine Suche aus und stieß auf drei weitere Punkte: Zum einen hatten die Juden den Gebrauch heiliger Haine von den Kanaanitern übernommen, den ursprünglichen Bewohnern des Gelobten Landes, zum zweiten lagen diese Wäldchen für gewöhnlich an höhergelegenen Orten, die man »bamoth« nannte, und schließlich gab es dort oftmals auch steinerne Opfersäulen in der Art, wie ich sie auf Tana Kirkos gesehen hatte und von denen ich bereits wußte, daß sie »masseboth« hießen.[15]

Verläßliche Angaben über die Anlage der Haine, die Art der ausgeführten Rituale oder dargebotenen Opfer fehlten jedoch völlig. Der Grund für diese offensichtlichen Lücken konnte nur bei der mächtigen Priesterschaft liegen, die in späteren Zeiten streng gegen derartige Bräuche vorgegangen war. Die heiligen Bäume wurden gefällt und verbrannt, die »masseboth« umgestürzt.[16] Es waren dies dieselben Priester, die für die Zusammenstellung und Bearbeitung der Heiligen Schrift verantwort-

lich waren, und so überraschte es mich kaum, daß die Bibel keine genauen Angaben zu Funktion und Erscheinungsbild der Opferhaine überliefert. Der einzige Verweis, der eine verschwommene Vorstellung von diesen Dingen vermittelt, löst bei den Bibelgelehrten noch heute Unstimmigkeiten aus. In dem Bibelvers aus dem zweiten Buch der Könige ist die Rede von einem Ort, »wo die Weiber wirkten Tuch für die Haine«[17]. Beim Lesen dieser Worte erinnerte ich mich sofort an die gewebten Stoffstreifen, die von jedem Ast des heiligen Baumes bei Aykel herabhingen. Für mich barg die Textstelle im Buch der Könige kein Geheimnis mehr. Um so mehr galt es jedoch über die Qemant herauszufinden, die im Herzen Afrikas eine religiöse Kultur am Leben erhalten hatten, die so alt war wie der jüdische Glaube selbst. Und der gesamte Sachverhalt mußte auf das engste mit der Geschichte der Falaschen zusammenhängen.

Assuan und Meroë

Trotz der unverkennbar jüdischen Glaubenselemente hat man die Qemant nie als Juden betrachtet, denn ihre Kulte sind zugleich sehr von heidnischen Bräuchen und vom Naturglauben bestimmt. Ganz anders verhält es sich mit den Falaschen. Schon mit dem frühen neunzehnten Jahrhundert setzte die weitgehende Anerkennung dieses Volkes als Juden ein. Die formale Bestätigung aus Jerusalem durch den Oberrabbiner der Sephardim erfolgte allerdings erst 1973. Zwei Jahre später stimmte auch das Oberrabbinat der Aschkenasim zu, so daß das israelische Innenministerium schließlich in der Lage war, den Falaschen die automatische Staatsbürgerschaft nach den Bestimmungen des »Law of Return« zuzuerkennen.[18]

Ironischerweise lag der Grund für die lange Zurückhaltung der Oberrabbinate gerade im ausgesprochen alttestamentarischen Charakter der Falaschen-Religion - der in keiner Weise mit dem Talmud übereinstimmte, der maßgeblichen Grundlage jüdischer Gesetze und Lehren also, die erst um 500 nach Chri-

stus vollständig abgeschlossen wurde.[19] Die Falaschen mußten somit den modernen Juden als sehr fremd erscheinen, und erst spät akzeptierte man, daß die Unkenntnis der talmudischen Gebote nur aus der Tatsache resultieren konnte, daß der äthiopische Zweig des jüdischen Glaubens zu einem außerordentlich frühen Zeitpunkt von der Entwicklung der übrigen jüdischen Welt abgeschnitten worden war. Es war diese Isolation, die erklärte, warum die Falaschen noch immer Bräuchen nachgingen, die die Rabbis schon seit langem verboten hatten.

Der zentrale Punkt aber, der die offizielle Anerkennung schließlich ermöglichte, war die allgemeine soziale und religiöse Struktur der Falaschen, die sich eindeutig mit den Lehren der Thora vereinbaren ließ. Besonders dem Pentateuch, den fünf Büchern also, die nach orthodoxem Glauben von Moses selbst verfaßt wurden[20], erwiesen die Falaschen den größten Respekt. Dieser »Fundamentalismus« wurde durch die strikte Befolgung der Nahrungsgebote verkörpert oder durch die Weigerung, Fleisch zu essen, das von Nichtjuden geschlachtet worden war. Man anerkannte zudem die peinliche Genauigkeit, mit der die mosaischen Gebote von Sauberkeit und Reinheit beachtet wurden.[21]

Die Beschneidungsrituale der Falaschen, »gezrat« genannt, entsprachen genau der jüdischen Tradition und wurden am achten Tag nach der Geburt eines männlichen Kindes durchgeführt, so wie es die fünf Bücher Mose vorschreiben.[22] Insbesondere die Sabbat-Prozeduren folgten streng den orthodoxen Regeln: Am Vorabend wurden alle Feuer gelöscht und am Sabbat keine Arbeit ausgeführt, kein Wasser geschöpft und kein Kaffee gekocht. Allein der Verzehr von kalten Speisen und Getränken war zulässig.

Mit diesem Wissen war ich im Januar 1990 nach Gondar gekommen. Während meines Aufenthaltes besuchte ich einige Falaschen-Siedlungen und hoffte, dort auch die religiösen Oberhäupter der Gemeinden kennenzulernen. Angesichts der Massenemigration äthiopischer Juden erwies sich das als schwierig: Die meisten Häuser waren völlig verlassen, Hab und Gut ge-

plündert, die Türen unverschlossen und die Bewohner fort. Etwa zwanzig Meilen von Gondar entfernt stieß ich jedoch auf ein Dorf, in dem noch Menschen lebten. Anbober wurde fast nur noch von Frauen und Kindern bevölkert, die Mehrheit der Männer hatte das Land verlassen.

Falaschen haben weder Synagogen noch Rabbiner. Ihre Kultstätten nennen sie »mesgid« und ihre religiösen Oberhäupter »kahenat« - in der Einzahl »kahen«, was soviel wie »Priester« bedeutet. Mit meinem Dolmetscher Legesse Desta ging ich durch den Ort, verfolgt von einer schnell anwachsenden Schar ausgelassener Kinder. Wir näherten uns dem »mesgid«, das durch den Davidstern auf dem Dach erkennbar war. Ich hoffte, daß ich dort den »kahen« antreffen würde.

Ich sollte nicht enttäuscht werden. Im Innern der ärmlichen Hütte saß ein alter Mann an einem rohgezimmerten Holztisch und las in der Thora, einem wunderschönen Pergamentexemplar in Ge'ez. Legesse erläuterte den Grund unseres Kommens und fragte den Priester, ob er bereit sei, einige Fragen zu beantworten. Nach längerem Wortwechsel gab er seine Zustimmung und stellte sich als Solomon Alemu vor. Er war achtzig fahre alt und seit fast dreißig Jahren der »kahen« von Anbober.

Die nächsten Stunden sprachen wir über die unterschiedlichsten Aspekte des Falaschen-Glaubens und seiner Rituale. Solomons Antworten bestätigten durchweg den genuin alttestamentarischen Charakter dieser Religion und damit einmal mehr meine bisherigen Forschungsergebnisse. Mit besonderem Nachdruck befragte ich ihn über die Blutopfer und versuchte herauszufinden, warum sein Volk diesen Brauch noch immer verfolgte, obgleich die jüdische Religion schon vor zweitausend Jahren davon gelassen hatte. Mit großer Überzeugung antwortete er: »Wir glauben, daß Gott im Himmel diese Zeremonien mit Wohlgefallen betrachtet.«

Vielleicht wußte es der alte Priester, vielleicht nicht: In jedem Fall entsprach diese einfache Erklärung einem Vers im dritten Buch Mose, der das »Brandopfer« als »Feuer zum süßen Geruch des Herrn« beschrieb.[23]

Solomon war ein kluger und belesener Mann. Als ich ihm jedoch ein Kompliment über seine Gelehrsamkeit machte, entgegnete er ohne falsche Bescheidenheit, daß er so viel weniger von den jüdischen Traditionen der Falaschen wisse als sein Vater. Und schon der habe weniger gewußt als sein Großvater, der zu seiner Zeit ebenfalls »kahen« von Anbober war. »Wir vergessen unsere eigene Vergangenheit«, sagte er traurig. »Tag für Tag verlieren wir ein Stück unserer Geschichte.«

Ich griff dieses Stichwort auf und fragte Solomon, ob er wisse, seit wie vielen Jahrhunderten Juden in Äthiopien lebten.

»Vor langer Zeit«, entgegnete er, »kamen wir in dieses Land, lange vor den Christen. Die Christenheit ist noch jung, verglichen mit uns.«

Beiläufig fragte ich: »Haben Sie eine Vorstellung, auf welcher Route Menelik und seine Begleiter nach Äthiopien kamen?«

Vor einiger Zeit hätte mich die Antwort noch überrascht, aber jetzt konnte ich seine Worte nur noch mit Zufriedenheit registrieren: »Unseren Überlieferungen zufolge reisten sie von Jerusalem aus durch Ägypten und den Sudan.«

Fast gelangweilt ergänzte ich: »Und wahrscheinlich sind sie über weite Strecken hinweg dem Nil gefolgt?«

Der »kahen« nickte: »Ja, so heißt es.« Dann aber fügte er zwei Details hinzu, die mich aufhorchen ließen: »Aber sie unterbrachen ihre Reise in Assuan und Meroë.«

Assuan liegt in Oberägypten. Seine Steinbrüche waren einstmals der wichtigste Lieferant für die Granitblöcke, die man zum Bau der Pyramiden verwendete. Meroë, die alte Hauptstadt Nubiens, liegt viel weiter im Süden, in der heutigen Republik Sudan. Mit erwachtem Interesse bat ich Solomon um mehr Informationen über diese Orte. Er beteuerte jedoch, daß dies alles sei, was er wisse. »Ich habe diese Namen gehört«, seufzte er, »in den Geschichten, die mir mein Großvater erzählt hat. Er war ein weiser Mann ..., aber er ist tot... Bald lebt keiner mehr von uns.«

Die Falaschen waren Juden, daran bestand kein Zweifel, und auch die Qemant wiesen überzeugende Anzeichen auf, die auf

einen tiefverwurzelten jüdischen Einfluß zurückzuführen waren. Dieser Einfluß ließ sich nicht einmal auf die Falaschen und Qemant beschränken. Im Gegenteil, fast in ganz Äthiopien hatten die angeblich »orthodoxen« Christen Riten und religiöse Anschauungen entwickelt, die unverkennbar jüdischen Ursprungs waren. Wie die Falaschen beschnitten sie ihre Söhne am achten Tag nach der Geburt, zu einem Zeitpunkt also, der unter allen Völkern der Welt nur noch bei den Juden und den Falaschen von Bedeutung ist.[24] Vor allem aber (und das ist ein bemerkenswerter Fall von Synkretismus) wird der jüdische Sabbat selbst im zwanzigsten Jahrhundert noch von Millionen abessinischer Christen respektiert, und zwar nicht anstelle des sonntäglichen Feiertages, sondern zu diesem dazu.[25]

Auch andere, auf den ersten Blick christliche Feiertage besitzen jüdische Ursprünge. Das äthiopische Neujahrsfest (»enkutatsh«) ähnelt sehr dem jüdischen Neujahrstag (»Rosch ha-Schana«). Beide werden im September gefeiert, beiden folgt wenige Wochen später ein zweiter Festtag (»maskal« in Äthiopien und »Jom Kippur« in Israel), und in beiden Kulturen liegt zwischen den genannten Feiertagen eine Periode der Buße und Einkehr.[26]

Viele Gesetze des Pentateuch werden von äthiopischen Christen streng befolgt, so etwa das Gebot der Sauberkeit und Reinheit.[27] Ähnlich konsequent beachten sie die alttestamentarischen Nahrungsmittelgebote und vermeiden peinlich genau den Verzehr unreinen Fleisches - vor allem von Schweinefleisch oder »Muskelfleisch«, von dem Mose spricht.[28] Im Ge'ez, der alten liturgischen Sprache der orthodoxen Kirche, ist vom »verbotenen Muskel« die Rede.[29]

Auch die Kirchengewänder weisen Ähnlichkeiten auf.[30] So entspricht die »kenat« (eine Bauchschärpe] dem Gürtel des Hohenpriesters[31], das »koba« (Käppchen) ähnelt der Mitra[32] und der »askema« (Überwurf) mit seinen zwölf, in vier Reihen zu je drei angeordneten Kreuzen gleicht dem Amtsschild des Priesters. Das zweite Buch Mose beschreibt dieses Schild genau und erläutert die Anordnung der zwölf Edelsteine in vier Reihen.[33]

Alles in allem konnte ich Erzbischof David Matthew zustimmen, der in einer Publikation aus dem Jahr 1947 den Sachverhalt so formuliert hatte: »Die gesamte Spannbreite religiöser Erscheinungen in Äthiopien ist archaisch, rituell und von jüdischen Bräuchen unterlegt.«[34] Erst mit dem »Timkat«-Fest im Januar 1990 wurde mir jedoch vollends klar, wie stark und bestimmend diese Einflüsse waren.

Die Prozession

Die Vorbereitungen für die Zeremonien waren weit vorangeschritten, als ich mich am Nachmittag des 18. Januar durch eine aufgeregte Menge schlängelte und den breiten Treppenaufgang zum Vorplatz des Gotteshauses erklomm. Die Kirche Medhane Alem, was soviel bedeutet wie »Erlöser der Welt«, ist ein großer und nach den traditionellen Vorgaben errichteter Rundbau. Der Grundriß mutet mit seinen konzentrisch um das Allerheiligste angeordneten Wandelgängen und Vorräumen wie eine Schießscheibe an.

Diese spezifisch äthiopische Anordnung wird, nur geringfügig modifiziert, auch bei rechteckigen oder oktogonalen Kirchenbauten verfolgt und von Wissenschaftlern mit der »dreifachen Unterteilung des hebräischen Tempels« erklärt.[35] Zunächst verstand ich nicht, warum die Abessinier ihren christlichen Gotteshäusern gerade ein vorchristliches Baumodell zugrunde legten. Als ich den äußeren Säulengang der Kirche von Medhane Alem betrat, schien mir die Antwort jedoch auf der Hand zu liegen: Der syrische Missionar Frumentius, der erste Erzbischof von Äthiopien, hatte wohlüberlegt und einfühlsam gehandelt, als er im vierten Jahrhundert nach Christus den neuen Glauben und seine Institutionen mit den im Land bereits existierenden jüdischen Traditionen verband.[36]

Es gilt als Sakrileg, eine äthiopische Kirche in Schuhen zu betreten, und so ging ich auf Strümpfen durch den äußeren Bezirk, das »kene mahlet«. Ich betrachtete die verblaßten Wand-

-Seite fehlt-

Höhepunkt. Derartige Chorgesänge waren, wie ich zuvor herausgefunden hatte, bereits fester Bestandteil der alttestamentarisch-jüdischen Liturgie.[37]

Als ich diese Szene beobachtete, drang der Duft von Weihrauch aus der geöffneten Tür zum »keddest«. Langsam bewegte ich mich der Tür zum zweiten Innenbezirk entgegen, bis ich eine umherwirbelnde, in grüne, goldbestickte Gewänder gehüllte Figur sah, die einem Traum entsprungen zu sein schien - halb Hexenmeister, halb Priester, tanzte der Mann abwesenden Blickes wie ein Derwisch durch den Raum.

Um ihn herum hatten sich weitere, ähnlich gekleidete Priester versammelt, jeder mit einem Weihrauchfaß in den Händen, das von feinen silbernen Ketten gehalten wurde. Ich mußte meine Augen anstrengen, um hinter diesen Gestalten und durch die dicken Schwaden hindurch das im Halbdunkel liegende eigentliche Zentrum des »keddest« auszumachen: den verhängten Eingang zum Allerheiligsten. Hinter diesem Vorhang verborgen, verehrt, geheimnisvoll und behütet vom uralten Glauben, lag der »Tabot« - das Symbol für die Bundeslade. Ich erinnerte mich, daß die Priester schon im alten Israel große Mengen von Weihrauch verbrennen mußten, damit die Lade von den Schwaden eingehüllt wurde.[38] Nur so konnte der Priester sein Leben schützen und sichergehen, »daß er nicht sterbe«[39]. Nun überschritt ich die Schwelle zum »keddest«, um einen genaueren Eindruck von den Vorgängen zu bekommen.

Ich hatte mich zu weit vorgewagt. Sofort verstummte der Gesang der Diakone, die Trommel schwieg, und für einen Moment senkte sich absolute Stille über den Ort. In der Luft lag die Spannung drohender Gefahr, gleich einer Gewitterwolke, aus der jeden Moment ein gewaltiger Blitz hervorbrechen will. Dann geriet alles in Bewegung, die Männer stoben in alle Richtungen auseinander. Ich merkte, wie ein Priester mich vorsichtig, aber unmißverständlich am Arm nahm und bis zum Hauptportal führte. Sekunden später blinzelte ich verwirrt ins gleißende Sonnenlicht des Nachmittages, völlig verblüfft von der plötzlichen Wendung der Dinge.

Unterdessen hatte sich eine unüberschaubare Menge von Köpfen und Körpern angesammelt, die den Kirchplatz bis zum Bersten ausfüllte und sich bis weit in die Straßen und Gassen hinein erstreckte. Männer und Frauen, kleine Kinder, Alte und Gebrechliche, sogar Kranke, lachende und glückliche Menschen - halb Äthiopien schien sich hier versammelt zu haben. Viele trugen Musikinstrumente mit sich, Zimbeln und Trommeln, Flöten, Fiedeln und altertümliche Zupfinstrumente.

Nur wenige Momente, nachdem ich die Kirche verlassen hatte, trat eine Gruppe von Priestern aus dem Portal. Es waren dieselben Männer, die ich gerade noch inmitten der Weihrauchschwaden vor dem zugezogenen Vorhang zum Allerheiligsten gesehen hatte. Nun aber trug einer von ihnen, ein hochgewachsener, bärtiger Mann mit vornehmen Gesichtszügen, den von kostbaren rotgoldenen Brokattüchern verborgenen »Tabot« auf dem Kopf.

In diesem Augenblick brach die Menge in frenetische Schreie aus und begann mit den Füßen zu trampeln. Die Frauen ließen ein schrilles Geheul ertönen - bebende, anschwellende Schwingungen, die Professor Ullendorff zufolge ihre Parallelen »in bestimmten melodischen Ausrufen im althebräischen Gottesdienst haben. Das hebräische >hallel< entspricht dem äthiopischen >ellel<, und der Jubelruf wird durch die fortwährende Wiederholung des Lautes >ellel< ausgeführt, so daß ein unablässiges >ellellellellellell .. .< erklingt. Die eigentliche Bedeutung von >Halleluja!< lautet vermutlich: singt >hallel< oder >ellel< Jehova zu Ehren! .. .«[40]

Für einige Minuten blieben die Priester unter dem Hauptportal stehen. Dann setzte sich der Zug in Bewegung und umschritt einmal die Kirche, bevor er sich der Menge näherte. Wie von Zauberhand geteilt, bildeten die Gläubigen einen schmalen Pfad, durch den die Prozession vorankommen konnte. Das Geheul und die Schreie vermischten sich mit dem Schmettern der Trompeten, dem Pfeifen der Flöten, dem Klimpern der Leiern und dem Geklingel der Tambourine zu einem ohrenbetäubenden Lärm, der die Menschen völlig in Trance geraten ließ.

Es war nicht ungefährlich, wie ich mich im aufgewühlten Kielwasser des Zuges so dicht wie möglich hinter den Priestern hielt. Und obgleich die Menge, sei es vom Hirsebier, sei es vom Tumult, im Rausch tobte, und obwohl ich mehr als einmal fast von den Füßen gerissen wurde, ich fühlte mich nicht einen Moment beunruhigt oder bedroht.

Oft mußten wir uns durch die engen Gassen der alten Stadt drängen, dann bewegte sich der Zug wieder über große, offene Flächen, manchmal langsam, manchmal schnell, immer begleitet von der wie Flammen hochschlagenden, explodierenden Musik. Ich zwang mich, fortwährend Blickkontakt mit dem unter den rotgoldenen Tüchern verborgenen »Tabot« zu halten. Schließlich war ich jedoch so weit zurückgedrängt worden, daß ich es aus den Augen verlor. Ich stellte mich auf die Zehenspitzen, reckte meinen Kopf über die Menge, bis ich es wieder sah. Schnell erkletterte ich die Straßenböschung, überholte rennend vielleicht zwei- oder dreihundert Menschen, und sprang auf die Straße zurück, als ich auch die Priester passiert hatte.

Hier offenbarte sich der Grund für das nur stockende Vorankommen der Prozession. Vor dem Zug formierten sich immer wieder neue Tanzgruppen, manche in ihren Alltagskleidern, manche in feierlichen Gewändern. Jede dieser Gruppen bewegte sich um einen Trommler, der sein »kebero« um den Hals trug, in wilden Drehungen herumwirbelte und dabei jenen uralten und wilden Rhythmus schlug. Die Tänzer um ihn herum explodierten vor Energie, schnellten in die Höhe, klatschten in die Hände, schlugen ihre Tambourine und Zimbeln und drehten taumelnd ihre Kreise bis zur völligen Erschöpfung.

In diesem Fall war es ein junger Mann in volkstümlichen Gewändern aus weißer Baumwolle, der - vorangetrieben vom fordernden Schmettern der Trompete, den Klängen der zehnsaitigen »begegna«[41] und den anfeuernden Rufen - vor dem hoch über den Köpfen getragenen »Tabot« und der erregten Menge einen furiosen Solotanz darbot. Die geschmeidige Kraft und wilde Energie des Mannes schien ganz und gar aus der Trance zu erwachsen, in der er sich offensichtlich befand. Ohne

Unterlaß umkreiste er den »kebero«-Trommler, drehte seine Figuren, bewegte ruckartig die Schultern und pries - völlig verloren in seinem eigenen, inneren Rhythmus - den Herrn mit jedem Teil seines Seins. So mußte es sich vor dreitausend Jahren schon einmal zugetragen haben, als vor den Toren Jerusalems »David und das ganze Haus Israel vor dem Herrn herspielte mit allerlei Saitenspiel von Tannenholz, mit Harfen und Psaltern und Pauken und Schellen und Zimbeln ... Und David tanzte mit aller Macht vor dem Herrn her und war begürtet mit einem leinenen Leibrock. Und David samt dem ganzen Israel führten die Lade des Herrn herauf mit Jauchzen und Trompeten.«[42]

Von einem Moment auf den anderen sank der Tänzer in sich zusammen und blieb wie tot liegen. Einige der Zuschauer hoben ihn auf und trugen ihn an den Straßenrand, wo sie ihn vorsichtig auf ein weiches Grasfleckchen legten. Dann drängte die Menge noch stärker voran, begleitet von immer neuen Tänzern, die sofort den Platz des Erschöpften eingenommen hatten.

Bald darauf ergab sich eine Veränderung. Durch eine letzte schmale Gasse ergossen sich die Menschen auf einen weiträumigen, offenen Platz. Zugleich näherten sich aus drei verschiedenen Richtungen weitere Prozessionen mit Priestern, die ein »Tabot« auf dem Kopf trugen und von einer unüberschaubaren Menschenmasse gefolgt wurden. Wie vier große Flüsse strömten die Prozessionen aufeinander zu und vereinigten sich. Die Priester der Kirche von Medhane Alem reihten sich unter die anderen Priester ein. Dahinter versammelten sich nun die Menschen und bildeten eine mächtige Heerschar, die mindestens zehntausend Seelen stark sein mußte.

Sobald die Prozession sich neu geordnet hatte, verließen wir den Platz und wälzten uns eine breite, abschüssige Landstraße hinunter. Manchmal gerieten kleine Kinder in meine Nähe, nahmen mich schüchtern bei der Hand und führten mich ein Stück des Wegs voran. Dann ließen sie mich los und verschwanden in der Menge. Eine alte Frau gesellte sich an meine Seite, rief mir etwas auf Amharisch zu, lächelte zahnlos. Zwei junge Mäd-

chen, kichernd und aufgeregt, berührten fasziniert mein blondes Haar und stoben wieder davon.

Ganz eingenommen von der Macht des Augenblickes und ganz ohne jegliches Zeitgefühl ließ ich mich einfach mittreiben.

Nach einer Wegbiegung tat sich unerwartet ein Bild auf, das aus einem Märchen hätte stammen können: Wir näherten uns einem großen, von einer Mauer umgebenen Gelände, auf dem ich die hohen Türme eines gut befestigten Kastells ausmachen konnte. Nicht zum erstenmal wurde ich in Äthiopien an das wundersame Gralsheiligtum erinnert, wie es Wolfram von Eschenbach beschreibt: als »vortrefflich befestigte Burg«, mit »vielen Türmen und Palästen«, am Ufer jenes geheimnisvollen Sees im Reich Munsalväsche.[43]

In der Mitte des gemauerten Walls befand sich ein schmaler Torbogen, durch den die Menschen nun strömten - und von dem auch ich unwiderstehlich angezogen wurde. Mit einer unglaublichen Macht drängte die Masse dem Nadelöhr entgegen, als ob sie unaufhaltsam von einem Strudel verschluckt würde. Geschoben und gedrängt von der Masse ungeduldiger Körper, erreichte ich schließlich den Torbogen, und wurde eng an die rauhe Steinmauer gestoßen. Dabei verlor ich meine Armbanduhr, doch im selben Augenblick gelang es jemandem hinter mir, die Uhr aus dem Gewühl der Beine herauszufischen und sie mir in die Hand zu drücken. Bevor ich mich jedoch bedanken oder meinen Wohltäter auch nur ausmachen konnte, wurde ich durch den Flaschenhals gedrückt und erreichte die weiten und offenen Rasenflächen innerhalb der Mauern. Sofort fiel der immense Druck der Beengtheit von mir ab, und ich verspürte ein wunderbares Gefühl von Freiheit.

Das rechteckige Gelände mußte im Grundriß etwa die Größe von vier Häuserblocks haben. In der Mitte des großen Feldes sah ich eine zweite gemauerte Umfassung, die etwa ein Drittel der Fläche einnahm. Hinter diesen Mauern erhob sich die große, zinnenbewehrte Burg, die mir schon von weitem aufgefallen war. Das Gebäude war von drei Seiten von einem künstlichen, halb gefüllten See umgeben. Die Burg selbst, im sieb-

zehnten Jahrhundert von Kaiser Fasilidas errichtet, schien nur über eine schmale Brücke zugänglich, die sich über einen tiefen Graben spannte. Sie führte direkt auf das massive Holztor in der Vorderfront des Gebäudes zu.

Die Menschen strömten noch immer durch den schmalen Torbogen, liefen ein wenig ziellos auf der großen Rasenfläche umher und grüßten einander mit ausgelassener und lebhafter Gutmütigkeit. Weiter entfernt, zu meiner Rechten, versammelte sich eine Gruppe von Priestern und Diakonen vor der Burg. Ich erkannte, daß sie mittlerweile sieben »Tabots« mit sich führten. Im Verlauf des Nachmittags waren also noch weitere Prozessionszüge zu uns gestoßen. Schulter an Schulter standen die Priester mit den verhüllten Schreinen in einer Reihe. Hinter ihnen hielten andere Priester hell gefärbte und mit Fransen geschmückte Prozessionsschirme, die mit einem Muster von Kreuzen, Sternen, Sonnen und Halbmonden verziert waren. Wenige Meter links davon standen sich zwei Reihen von Priestern gegenüber, die ihre langen Gebetsstäbe und Sistren in den Händen hielten. Dazwischen saß ein Trommler, der sich tief über sein »kebero« beugte.

Als ich mich näherte, um besser sehen zu können, begann diese Formation, einen langsamen, schwingenden Tanz vor den »Tabots« auszuführen - im gleichen hypnotisierenden Rhythmus und mit denselben dialogartigen Gesängen, wie ich sie am Vormittag schon in der Kirche von Medhane Alem beobachtet hatte. So plötzlich wie er begonnen hatte, brach der Tanz ab, und die Priester mit den »Tabots« schritten majestätisch über die Brücke zum Eingang der Burg. Dort hielten sie einen Augenblick inne, eingefangen vom Licht der untergehenden Sonne. Die Frauen in der Menge ließen ihren Gefühlen freien Lauf und brachen in wildes Geheul aus. Dann öffnete sich das schwere Holztor, gewährte mir einen kurzen Blick ins Halbdunkel des Inneren, und die »Tabots« verschwanden hinter den schweren Mauern.

Allmählich beruhigten sich die Zuschauer und ließen sich auf dem Boden nieder. Manche hatten Decken mitgebracht, andere »shemmas«, Umhängetücher aus Baumwolle, oder dik-

kere, wollene »gebbis«. Alle erweckten den Anschein, daß sie für die Dauer des »Timkat« im Frieden mit sich selbst waren - erschöpft von den Anstrengungen und Erregungen der Prozession, bereit für die vor ihnen liegende Nachtwache.

Mit Einbruch der Dunkelheit wurden immer mehr Lagerfeuer angezündet. Um die flackernden Flammen herum saßen die in ihre Decken eingehüllten Menschen. Sie murmelten leise vor sich hin, und die geheimnisvollen Worte in der alten, semitischen Sprache Äthiopiens schienen noch lange in den Atemwolken vor den Gesichtern zu schweben.

Erfrischt von der kühlen Nachtluft legte ich mich auf den Grasboden zurück, verschränkte die Hände unter dem Kopf und starrte in den dunklen, von Sternen übersähten Nachthimmel. Lange ließ ich meinen Gedanken freien Lauf, bis mich ein lauter werdender rhythmischer Gesang und das Schlagen einer Trommel wieder in die Gegenwart zurückholten - ein geisterhafter, beunruhigender Widerhall, der so schwach und gedämpft aus der alten Burg zu mir herüberdrang, daß ich ihn zunächst kaum lokalisieren konnte.

Ich stand auf und näherte mich der Brücke. Ich hatte nicht einmal die Absicht, sie zu überqueren, denn ich glaubte nicht, daß das erlaubt war, sondern suchte nur eine günstigere Position, die es mir erlauben würde, die Musik deutlicher zu hören. Unerklärlicherweise wurde ich jedoch von vielen Händen vorwärts gestoßen - sanft, aber bestimmt -, und ehe ich mich versah, stand ich auf der Brücke. Dort führte mich ein Kind bis an das gewaltige Portal, öffnete das Tor und bedeutete mir mit einem Lächeln, daß ich eintreten sollte.

Einigermaßen unsicher und vorsichtig trat ich über die Schwelle in einen großen, hohen Raum, der nach Weihrauch duftete. In unzähligen Nischen brannten Dutzende von Kerzen. Ein kalter Luftstrom fuhr unter der Türe hindurch, die sich hinter mir geschlossen hatte, und der Wind, der durch die Ritzen und Spalten des Mauerwerkes drang, ließ die Wachslichter flackern und tropfen.

-Seite fehlt-

beln, Psaltern und Harfen und bei ihnen hundertzwanzig Priester, die mit Trompeten bliesen ... Und da die Stimme sich erhob von den Trompeten, Zimbeln und Saitenspielen und von dem Loben des Herrn, daß er gütig ist und seine Barmherzigkeit ewig währet, da ward das Haus des Herrn erfüllt mit einer Wolke .. .«[45]

Genauso trug es sich in diesem Augenblick zu, als die Priester Äthiopiens den Namen des Herrn priesen. Und es war die gleiche Inbrunst und Überzeugung, in der sie Ihm für Seine Gnade dankten und Seinen erhabenen Namen lobten, indem sie sangen:

»So mache dich nun auf, Herr, Gott, zu deiner Ruhe, du und die Lade deiner Macht. Laß deine Priester, Herr, Gott, mit Heil angetan werden und deine Heiligen sich freuen über dem Guten.«[46]

In dieser Nacht vermischten sich Realität und Traum. Es gab Augenblicke, in denen ich glaubte, die Lade selbst müsse sich irgendwo in dieser Burg befinden. Ich wußte jedoch, daß ich noch lange nicht an das Ende meiner Suche gelangt war, daß die Lade nicht in Gondar war und daß ich noch viele Wege würde gehen müssen, bevor ich auch nur hoffen konnte, mich ihr zu nähern. Im Moment mußte ich mich mit den »Tabots« zufriedengeben, die hier behütet wurden, mit den sieben Schreinen, die durch die Zauberkraft des blinden Glaubens innerhalb weniger Stunden mühelos zu mächtigen Symbolen verwandelt worden waren.

Vor Morgengrauen führten mich die Priester aus der Burg heraus und über die schmale Steinbrücke. Als das erste Tageslicht den Himmel erhellte, verbrachte ich eine gute Stunde damit, das Gelände genau zu erforschen. Viele Menschen hatten den großen Rasenplatz im Verlauf der Nacht verlassen, andere gingen zu zweit umher und sprachen miteinander, standen in dichten Gruppen zusammengedrängt oder wärmten sich an den matten Flammen der verlöschenden Feuer. Aber schon wieder war den Gesichtern der Ausdruck von Erwartung, von gespannter und unruhiger Vorahnung abzulesen, der die Menschen

schon beherrscht hatte, als das »Tabot« am Vortag aus der Kirche von Medhane Alem herausgetragen worden war.

Ich machte einen Rundgang um die innere Mauer, umkreiste einmal die Burg und den See. Als ich die Rückseite des Gebäudes erreichte, bot sich mir ein bizarres und zugleich wundervolles Bild. Der gesamte See wurde von einem etwa anderthalb Meter breiten Erddamm umgeben, und auf dieser Böschung warteten die Menschen dichtgedrängt und aufmerksam auf irgend etwas. Im Licht der aufgehenden Sonne spiegelte die bewegungslose Wasseroberfläche die gespannten Gesichtszüge der Menge wider.

Ich blickte direkt auf den Balkon an der rückwärtigen Fassade der Burg, auf den nun, in einer Wolke von Weihrauch, eine Gruppe von Priestern in kostbaren rotgrünen Roben trat. Aus der Menge erscholl lautes Geheul, und eine kurze Zeremonie folgte. Wie ich später erfuhr, diente sie dazu, das Wasser zu segnen und zu weihen. Nur Bruchteile später - und ungeachtet der morgendlichen Kälte - stürzten sich die Menschen in den See, einige völlig bekleidet, andere ganz nackt. Hier tauchte eine junge Frau ihr nacktes Baby unter Wasser, da watete ein alter, gebrechlicher Mann mit abgezirkelten Bewegungen vorsichtig durch den See, und dort bespritzte eine Matrone ihren bis zur Hüfte entkleideten Körper mit einem Zweig. Kinder tollten im Wasser herum, und von der Vorderseite der Burg drang aufgeregter Lärm herüber, als die Menschen sich auch dort in die Fluten stürzten, um ihr ausgelassenes Bad zu nehmen.

Ich verließ meinen Beobachtungspunkt auf der Mauer und eilte um das Gebäude herum zum Haupteingang. Ich wollte den Tumult nutzen, um noch einmal in das Innere der Burg vorzudringen. Die »Tabots« hatten sich nicht in dem Raum befunden, in dem ich in der Nacht an der Zeremonie teilgenommen hatte. Wo waren sie also?

Von der hysterischen Menge unbemerkt, überquerte ich die Brücke, stieß das Portal auf und betrat den Raum. Noch immer war der Boden mit Gras bestreut, und die Wände waren vom Qualm der Kerzen rußgeschwärzt. Es mußte nun etwa sieben

Uhr sein, und die ersten Sonnenstrahlen fielen auf die jungen Diakone, die sich in dem großen Saal aufhielten. Auf der anderen Seite bemerkte ich einen zugezogenen Vorhang, der mir in der Nacht entgangen war. Aus dem dahinterliegenden Raum trat nun ein Priester, der mich zunächst mißtrauisch betrachtete. Dann aber lächelte er und schien mich willkommen zu heißen.

Ich ging zu ihm hinüber und gab zu erkennen, daß ich hinter den Vorhang wollte. Doch er schüttelte vehement den Kopf. »Nein«, flüsterte er auf Englisch. »Nein. Unmöglich. Hier >Tabot<.« Dann verschwand er wieder hinter dem Vorhang, hinter dem ich einige Geschäftigkeit und Schritte ausmachen konnte.

Ich rief nach dem Priester und hoffte die Aufmerksamkeit der Männer zu erwecken, aber es kam keine Antwort. Dann legte ich - unvorsichtigerweise - meine Hand an den Vorhang und schickte mich an, ihn zu öffnen. Sofort stürzten sich drei Diakone auf mich, packten mich bei den Armen und brachten mich zu Boden, wo ich einige schwere Schläge einstecken mußte.

Ich versuchte mich zu wehren, fluchte und konnte für einige Momente keinen klaren Gedanken fassen. Ich fühlte nur, daß ich verwirrt und schockiert war. Vor wenigen Stunden noch war ich davon überzeugt, dazuzugehören, nun wurde ich verprügelt. Mühsam schüttelte ich meine Angreifer ab und kam auf die Füße. Mein Rückzugsgefecht wurde jedoch als erneuter Ausfall Richtung Vorhang mißverstanden, so daß ich noch mehr Hiebe empfing und grob herumgestoßen wurde. Immer mehr Diakone stellten sich mir in den Weg. »Hineingehen verboten«, drohte mir einer in gebrochenem Englisch, »nur Priester dürfen!« Er schüttelte wütend die Faust gegen mich und fügte hinzu: »Du sehr böser Mann!«

Ohne viele Umstände zerrte man mich zur Pforte. Gleich darauf fand ich mich auf der Brücke wieder - beobachtet von einigen tausenden mißtrauisch blickender Augenpaare. Schlagartig wurde mir klar: Wenn ich solche Schwierigkeiten bekommen hatte, nur weil ich zu nahe an die »Tabots« herangekommen war, was um alles in der Welt würde mir zustoßen, wenn ich in Aksum versuchen würde, die Bundeslade zu sehen?

Ich überquerte die Brücke, taumelte zitternd vor Aufregung durch die Menge, bis ich ein freies Fleckchen fand. Nachdem ich wieder zu mir gekommen war, sah ich, daß noch immer viele Menschen im Wasser waren, und ich konnte ihr fröhliches Rufen und Schreien hören. Die meisten aber hatten sich schon wieder vor der Burg versammelt; gespannt und merkwürdig still reckten sie erwartungsvoll die Hälse.

Die sieben Priester in vollem Ornat erschienen nun am Burgtor und trugen wieder die verhüllten »Tabots« auf den Köpfen. Langsam und bedächtig passierten sie die Brücke, gefolgt von anderen Priestern mit den Prozessionsschirmen. In diesem Moment stieß die Menge fast unisono einen Seufzer aus - einen innigen, leidenschaftlichen Laut von Ehrfurcht und Hingabe, der fast unmittelbar vom üblichen ohrenbetäubenden Geheul der Frauen gefolgt wurde. Ein heftiges Gedränge entstand, als die Menschen seitwärts zurückwichen, um einen Pfad für die sich nähernden »Tabots« freizumachen.

Den Vormittag über verfolgte ich die Prozession auf ihrem Weg zurück nach Gondar. Als wir den großen Platz inmitten der alten Stadt erreichten, an dem sich Tags zuvor die verschiedenen Züge getroffen hatten, wurde noch einmal Davids Tanz vor der Lade zelebriert und von schmetternden Trompeten und der Musik der Sistren und Streichinstrumente begleitet. Dann endlich teilte sich die Menge wieder in ihre Ströme auf - sieben verschiedene Züge, die den Platz in sieben verschiedene Richtungen verließen.

Keuchend und schwitzend blieb ich dicht hinter dem »Tabot« von Medhane Alem und folgte ihm bis zu der alten runden Kirche. Unter ausgelassenen Tänzen und Liedern wurde der Schrein einmal um das Gebäude getragen, dann noch einmal - und schließlich, mit einem gewaltigen Schrei der Freude und des Beifalls, verschwand er im Dunkel der Kirche, im Allerheiligsten, im geheimsten aller geheimen Orte.

Ein Jahr Aufschub ...

Als ich Gondar im Januar 1990 verließ, wußte ich, daß die Bundeslade nur in Äthiopien zu finden war. Unter dem dünnen Firnis christlicher Rhetorik wies alles auf eine dunkle und weiter, viel weiter zurückliegende Vergangenheit hin: die archaischen Tänze der Priester, die ekstatische Verehrung, die von der Menge ausging, die Musik der Tamburine und Sistren, der Trompeten und Zimbeln. Noch heute bin ich mir sicher, daß diese komplizierten Rituale nie mit einer solchen Inbrunst und Überzeugung praktiziert worden wären - und das über Jahrhunderte hinweg, durch Zeiten von Gefahr und Kriegen hindurch -, wenn es sich in Aksum nur um irgendein »Tabot« gehandelt hätte.

Nein. Die Äthiopier besaßen die Bundeslade. Im ersten Jahrtausend vor Christus waren sie in den Besitz des Schreins gekommen; vielleicht so, wie das Kebra *Nagast* es beschreibt, vielleicht auf einem anderen Weg, das würde ich noch herausfinden. Und heute, am Ende des zweiten Jahrtausends nach Christus, hatten sie die Lade noch immer, verborgen und geschützt vor allzu neugierigen Blicken. Aber wo?

Ich war mir sicher, daß ich mich bei meinen Nachforschungen nicht hatte täuschen lassen. Das Heiligtum war weder auf einer der Inseln des Zwaisees noch des Tanasees. Alle Hinweise deuteten darauf, daß es sich an seinem angestammten Platz im Allerheiligsten der Kapelle von Aksum befand. Noch hatte ich keinen sicheren Beweis dafür, aber tief in meinem Inneren war ich mir dessen sicher. Bis zum »Timkat« 1991 waren es noch zwölf Monate, dann würde ich nach Aksum gehen und die Lade suchen - und hoffentlich mit eigenen Augen sehen.

Bis dahin beschloß ich, alles über diesen unheilvollen Gegenstand herauszufinden, der eine so unwiderstehliche Anziehungskraft auf mich ausübte. Ich würde die Lade des Herrn erforschen, würde herausfinden, ob es eine rationale Erklärung für die Wunder, aber auch für die Schrecken geben konnte, die die Lade zu alttestamentarischen Zeiten bewirkt haben soll.

Ich würde dieses Jahr gut nutzen.

TEIL IV: DIE MACHT DES SCHREINS

Kapitel 12

Magie oder Methode?

Zwischen 1989 und 1990 vertiefte ich mich immer mehr in die Rätsel der Bundeslade und begann, mich nicht nur dafür zu interessieren, *wo* sie war, sondern auch dafür, was sie eigentlich war. Natürlich wandte ich mich zunächst an die Bibel, wo die Bundeslade zum erstenmal zu Beginn der Wanderschaft durch die Wüste erwähnt wird. Das Buch Exodus berichtet, daß Gott selbst Moses auf dem Berg Sinai verkündete, wie die genauen Maße sein und welche Materialien zu ihrem Bau verwendet werden sollten.[1]

Dieser »göttliche Konstruktionsplan« ist sicher eine der merkwürdigsten Stellen in der Bibel. Nachdem er ihn empfangen hatte, gab Moses ihn wörtlich an einen Handwerker namens Bezaleel weiter, und dieser baute die Bundeslade genau wie vorgeschrieben. Als sie fertig war, legte Moses die beiden steinernen Gesetzestafeln mit den Zehn Geboten hinein. Der heilige Gegenstand, nun gleichsam schwanger mit seinem kostbaren Inhalt, wurde dann in der Stiftshütte aufgestellt, jenem tragbaren Zelt, das den Israeliten während ihrer Wanderschaft als Ort der Anbetung diente.

Die Schrecken und die Wunder

Bald traten furchtbare Ereignisse ein. Das erste betraf Nadab und Abihu, zwei der vier Söhne des Hohenpriesters Aaron, Moses' Bruder. Als Mitglieder der priesterlichen Familie hatten sie Zugang zum Allerheiligsten, in das sie eines Tages mit Räucherpfannen in den Händen eintraten. Dort brachten sie ein »fremdes Feuer vor den Herrn, das er ihnen nicht geboten hatte«[2]. Die verheerende Folge war, daß eine Flamme aus der

Lade fuhr - »und verzehrte sie, daß sie starben vor dem Herrn«[3].

»Und der Herr redete mit Mose, nachdem die zwei Söhne Aarons gestorben waren, da sie vor dem Herrn opferten, und sprach: Sage deinem Bruder Aaron, daß er nicht zu aller Zeit in das inwendige Heiligtum gehe hinter den Vorhang vor dem Gnadenthron, der auf der Lade ist, damit er nicht sterbe; denn ich will in einer Wolke erscheinen auf dem Gnadenthron.«[4]

Der Gnadenthron war die goldene Platte, die als Deckel der Lade diente. An beiden Enden befanden sich, die Gesichter einander zugewandt, zwei goldene Cherubsfiguren. Die »Wolke auf dem Gnadenthron« muß demnach zwischen den Cherubim zu sehen gewesen sein. Sie war nicht immer da, aber wenn, dann »herrschten die Geister«[5], wie die Israeliten glaubten, und nicht einmal Moses wagte sich dann zu nähern.[6]

Auch andere, angeblich übernatürliche Phänomene ereigneten sich »zwischen den Cherubim«. So betrat Moses nur wenige Tage nach dem unglückseligen Tod der Söhne Aarons die Stiftshütte, die damals noch am Fuße des Berges Sinai aufgeschlagen war. Da »hörte er die Stimme mit ihm reden von dem Gnadenthron, der auf der Lade des Zeugnisses war, zwischen den zwei Cherubim .. .«[7] In einigen sehr alten jüdischen Legenden heißt es, die Stimme sei in »Form einer Feuersäule« vom Himmel gekommen.[8] Und Feuer scheint oft mit den Cherubim in Verbindung gebracht worden zu sein. Nach einer dieser volkstümlichen Überlieferungen beispielsweise »sprangen zwei Funken aus den Cherubim, die die Lade beschirmten«, Funken, die zuweilen zu einem Feuer wurden und Gegenstände in ihrer Nähe zerstörten.[9]

Schließlich kam die Zeit, daß die Israeliten ihr Lager am Fuße des Berges Sinai verlassen mußten:

»So zogen sie von dem Berge des Herrn drei Tagesreisen weit, und die Lade des Bundes des Herrn zog vor ihnen her die drei Tagesreisen, ihnen zu weisen, wo sie ruhen sollten ... Und wenn die Lade aufbrach, so sprach Mose: Herr, steh auf! Laß deine Feinde zerstreut und alle, die dich hassen, flüchtig werden

vor dir! Und wenn sie sich niederließ, so sprach er: Komm wieder, Herr, zu der Menge der Tausend Israels!«[10]

An der Spitze der Heerschar wurden »die heiligen Geräte« auf den Schultern der Kehatiter getragen, einer Sippe des Stammes Levi, zu dem auch Moses und Aaron gehörten. Mehreren Legenden und rabbinischen Kommentaren zum Alten Testament zufolge wurden diese Träger von Zeit zu Zeit vom Boden gehoben, denn »die Lade war imstande, ihre Träger ebenso zu tragen wie sich selbst«[11].

Das ist keineswegs die einzige jüdische Überlieferung, die andeutet, daß die Lade geheimnisvolle, der Schwerkraft entgegenwirkende Fähigkeiten gehabt haben soll. Auch einige andere gelehrte Midrasch-Auslegungen bezeugen, daß sie ihre Träger manchmal vom Erdboden hob und sie so zeitweilig von einer ansonsten beachtlichen Last erleichterte.[12] Und eine besonders beeindruckende jüdische Legende berichtet im selben Tenor, wie die Priester, die die Bundeslade zu tragen versuchten, »wieder und wieder von einer unsichtbaren Macht in die Luft geschleudert und zu Boden geworfen wurden«[13]. Eine andere Überlieferung wiederum beschreibt einen Vorfall, bei dem »die Lade von selbst in die Luft sprang«[14].

Es ist kein Wunder, daß die Lade von den Israeliten auch als Waffe benutzt wurde - als Waffe von so gewaltiger Macht, daß sie den Sieg bringen konnte, selbst wenn die Lage aussichtslos erschien.[15] In einem Bericht über eine solche Schlacht heißt es, die Lade habe zuerst »ein Ächzen« von sich gegeben, sich dann vom Boden erhoben und auf die Feinde gestürzt.[16] Alle Mann wurden auf der Stelle erschlagen. Ein andermal indessen, wie um die Regel zu bestätigen, wurden die Israeliten selbst besiegt. Das geschah, wie es in der Bibel heißt, weil sie die Lade bei jener Gelegenheit nicht mit sich führten. Moses hatte sie seinem Volk nicht gegeben, nachdem er zuvor davon abgeraten hatte, in diesem Gebiet anzugreifen:

»Aber sie waren störrig, hinaufzuziehen auf die Höhe des Gebirges; aber die Lade des Bundes des Herrn und Mose kamen nicht aus dem Lager. Da kamen die Amalekiter und Kanaaniter,

die auf dem Gebirge wohnten, herab und schlugen und zersprengten sie bis gen Horma.«[17]

Der Bibel zufolge dauerte die Wanderschaft durch die Wüste vierzig Jahre. In dieser Zeit lernten die Israeliten, daß es in ihrem eigenen Interesse lag, wenn sie Moses' Ratschläge sehr genau befolgten. Unter seiner Führung und mit Hilfe der Lade unterwarfen sie die wilden Stämme der Sinai-Halbinsel, eroberten Transjordanien, töteten die Midianiter und vernichteten alle, die sich ihnen widersetzten. Gegen Ende ihrer Wanderschaft schließlich »lagerten sie jenseits des Jordan gegenüber Jericho«[18].

Auf der anderen Seite war endlich das Gelobte Land in Sicht. Zu dieser Zeit war Moses' Bruder Aaron bereits tot, und sein Nachfolger im Amt des Hohenpriesters war Eleasar.[19] Jahwe selbst hatte Moses in der Zwischenzeit geweissagt, daß es ihm nicht beschieden sei, nach Kanaan zu kommen, und so hatte er »Josua, den Sohn Nuns«, an seine Stelle berufen.[20] Moses starb, nachdem Josua in die Geheimnisse der Bundeslade eingeweiht worden war[21], so daß der neue Führer die furchtbare Waffe gegen den Widerstand der schwer befestigten Stadt Jericho einsetzen konnte.

Josua wußte, daß die Lade, wenn sie nicht richtig gehandhabt wurde, den Israeliten genauso viel Schaden zufügen konnte wie ihren Feinden. Als er den Marsch auf Jericho plante, schickte er seine »Amtleute« durch das Lager, um das Volk zu warnen:

»Wenn ihr sehen werdet die Lade des Bundes des Herrn, eures Gottes, und die Priester aus den Leviten sie tragen, so ziehet auf von eurem Ort und folgt ihr nach; doch daß zwischen euch und ihr ein Raum sei bei zweitausend Ellen! Ihr sollt nicht zu ihr nahen!«[22]

Und als alles vorbereitet war, sprach Josua zu den Priestern:

»Traget die Lade des Bundes und geht vor dem Volk her ... Da nun das Volk auszog aus seinen Hütten, daß sie über den Jordan gingen, und die Priester die Lade des Bundes vor dem Volk her trugen, und an den Jordan kamen und ihre Füße vorn ins Wasser tauchten (der Jordan aber war voll an allen seinen

Ufern die ganze Zeit der Ernte), da stand das Wasser, das von oben herniederkam, aufgerichtet auf einem Haufen ..., aber das Wasser, das zum Meer hinunterlief, zum Salzmeer, das nahm ab und verfloß. Also ging das Volk hinüber. Und die Priester, die die Lade des Bundes des Herrn trugen, standen still im Trockenen mitten im Jordan. Und ganz Israel ging trocken durch, bis das ganze Volk über den Jordan kam.«[23]

Kaum jemand kennt die Geschichte von der Eroberung Jerichos nicht. Während das Volk den obligatorischen Abstand von zweitausend Ellen wahrte [fast einen ganzen Kilometer), zogen die höchsten Priester um die Stadtmauern, »bliesen die Posaunen, und die Lade des Bundes des Herrn folgte ihnen nach«. Sechs Tage lang zogen sie täglich einmal um die Stadt, »am siebten Tage aber, als die Morgenröte aufging, machten sie sich früh auf und gingen nach derselben Weise siebenmal um die Stadt... Und beim siebentenmal, da die Priester die Posaunen bliesen, sprach Josua zum Volk: Macht ein Feldgeschrei; denn der Herr hat euch die Stadt gegeben ... Da erhob das Volk ein Feldgeschrei, und man blies Posaunen ... Und die Mauern fielen um, und das Volk erstieg die Stadt.. .«[24]

Zu Beginn ihrer Geschichte war die Lade offenbar nahezu unbesiegbar, und auch lange nach dem Fall Jerichos scheint sie noch eine bedeutende militärische Rolle gespielt zu haben. Doch in den einhundertfünfzig Jahren nach Josuas Tod trat eine Veränderung ein: Eine genaue Untersuchung der wichtigen Bücher des Alten Testaments zeigt, daß die Lade nicht mehr immer in den Kampf mitgenommen wurde. In Silo, dem ersten Nationalheiligrum der Juden, hatte sie ihren festen Platz gefunden.

Der Grund für diese Veränderung lag in der wachsenden Macht und im zunehmenden Selbstvertrauen der Israeliten, die bis zum elften Jahrhundert vor Christus den größten Teil des Gelobten Landes erobert und besiedelt hatten und offensichtlich nicht mehr glaubten, ihre Geheimwaffe einsetzen zu müssen.[25]

Doch die Israeliten hatten sich verschätzt: In der Schlacht von Eben-Ezer wurden sie von den Philistern besiegt und verloren

viertausend Mann.[26] Nach dieser Katastrophe sprachen die Ältesten Israels: »Warum hat uns der Herr schlagen lassen von den Philistern? Laßt uns zu uns nehmen die Lade des Bundes des Herrn von Silo und laßt sie unter uns kommen, damit sie uns helfe von der Hand unserer Feinde.«[27] Der Vorschlag wurde sofort befolgt. »Und das Volk sandte gen Silo und ließ da holen die Lade des Bundes des Herrn Zebaoth, der über den Cherubim sitzt... Und da die Lade ins Lager kam, jauchzte das ganze Israel mit einem großen Jauchzen, so daß die Erde erschallte.«[28]

Obgleich die Philister sich nun sehr fürchteten[29], wurde der Kampf wieder aufgenommen. Aber zum größten Erstaunen aller Beteiligten wurde Israel geschlagen.[30] Das war wirklich eine Katastrophe. Niemals zuvor hatten die Israeliten eine Niederlage erlitten, wenn sie die Lade mit in den Kampf genommen hatten, und niemals zuvor war die Bundeslade selbst erbeutet worden. So etwas war undenkbar, unvorstellbar gewesen, und doch war es geschehen.

Als die Philister triumphierend ihre Beute davontrugen, wurde ein Läufer mit der schlimmen Botschaft zum Hohenpriester Eli nach Silo geschickt. Eli starb vor Entsetzen und Schrecken, als er die Nachricht vernahm. Und als seine schwangere Schwiegertochter erfuhr, daß ihr Mann im Kampf gefallen war, daß die Lade Gottes geraubt und nun auch Eli tot war, da überfielen sie die Geburtswehen, und sie gebar einen Sohn.[31] Das neugeborene Kind wurde Ikabod genannt, was soviel bedeutet wie »Die Herrlichkeit ist hinweg aus Israel!«[32] Denn die Mutter hatte bei den schlimmen Neuigkeiten einen Schmerzensschrei ausgestoßen und gerufen: »Die Herrlichkeit ist dahin von Israel; denn die Lade Gottes ist genommen.«[33]

Die Bundeslade brachte den siegreichen Philistern jedoch kein Glück. Überall brachen Seuchen und schwere Krankheiten aus, das Land drohte in große Unruhen zu stürzen, und die Menschen wurden von Furcht gepackt.[34] Gestraft von diesen Heimsuchungen, beschlossen die Philister nach sieben Monaten, die Lade an die Juden zurückzugeben. Also luden sie den

Schrein auf einen Wagen und schickten ihn auf den Weg nach Beth-Schemesch, dem nächsten Ort auf jüdischem Territorium.

Die Bücher des Alten Testaments berichten von den vielen Segnungen, die dem Volk Gottes in den nächsten Jahrzehnten zuteil wurden, aber auch von den harten Strafen, die diejenigen ereilten, die den Gesetzen des Herrn zuwiderhandelten. Selbst König David, der Eroberer Jerusalems, lebte in großer Angst und Ehrfurcht vor der mächtigen Lade Gottes.[35] Doch schließlich überführte David den heiligen Schrein in einer fröhlichen Prozession »mit Jauchzen und Posaunen«[36] nach Jerusalem. Er hatte gehofft, in Jerusalem einen Tempel für die Bundeslade bauen zu können, doch auf Gottes Geheiß mußte er sich damit begnügen, die Lade weiterhin in einem einfachen Zelt unterzubringen, wie es die Juden während ihrer langen Wanderschaft getan hatten.[37] So blieb die Ehre, den Tempel zu errichten, einem anderen Manne vorbehalten. David selbst sprach vor seinem Tod:

»Ich hatte mir vorgenommen, ein Haus zu bauen, da ruhen sollte die Lade des Bundes des Herrn. Aber Gott ließ mir sagen: Du sollst meinem Namen nicht ein Haus bauen ... Dein Sohn Salomo soll mein Haus und meine Vorhöfe bauen .. .«[38]

So geschah es. Auf Salomos Befehl hin begann man um 962 vor Christus mit dem Bau des Tempels, der vermutlich um 955 vor Christus abgeschlossen wurde. Erst zu diesem Zeitpunkt bereitete man nämlich das Allerheiligste vor, um den kostbaren Gegenstand aufzunehmen:

»Da versammelte der König Salomo zu sich die Ältesten Israels ..., um die Lade des Bundes des Herrn heraufzubringen aus der Stadt Davids, das ist Zion ... Und da alle Ältesten Israels kamen, hoben die Priester die Lade des Herrn auf und brachten sie hinauf. Und der König Salomo und die ganze Gemeinde Israel, die zu ihm sich versammelt hatte, gingen mit ihm vor der Lade her und opferten Schafe und Rinder, so viel, daß man sie nicht zählen noch berechnen konnte. Also brachten die Priester die Lade des Bundes des Herrn an ihren Ort, in den Chor des Hauses, in das Allerheiligste, unter die Flügel der Cherubim.«[39]

Und hier blieb der heilige Gegenstand, bis er auf geheimnisvolle Weise und zu einem unbekannten Zeitpunkt zwischen dem zehnten und sechsten Jahrhundert vor Christus verschwand. Es gibt keinerlei Erklärung für dieses Verschwinden, das von Wissenschaftlern noch immer als eines der größten und ungelösten Geheimnisse der Bibel betrachtet wird.

Deus ex machina

Im Verlauf meiner Untersuchungen war ich immer wieder auf die Schilderungen der schrecklichen Kräfte der Bundeslade gestoßen. Nun mußte ich mich fragen, was es damit auf sich hatte. Es schien mir drei mögliche Antworten auf diese Fragen zu geben:

- Das Alte Testament hatte recht. Von der Lade gingen tatsächlich göttliche Energien aus und bewirkten die Wunder, Strafen oder militärischen Erfolge.
- Das Alte Testament hatte unrecht. Die Lade war nur ein verziertes Kästchen und Gottes Volk das Opfer einer kollektiven, mehrere Jahrhunderte andauernden Massenhalluzination.
- Das Alte Testament hatte gleichzeitig recht und unrecht. Die Lade besaß tatsächlich Kräfte, aber diese Kräfte waren weder übernatürlich noch göttlich. Sie waren ganz einfach menschlichen Ursprungs.

Ich überprüfte alle drei Möglichkeiten und kam zu dem Schluß, daß ich die erste nicht akzeptieren konnte. Es sei denn, ich wollte hinnehmen, daß der Gott der Israeliten ein psychopatischer Mörder war oder ein bösartiger, in einem Kasten lebender Geist. Auch die zweite Möglichkeit war inakzeptabel, vor allem deswegen, weil das Alte Testament im Zusammenhang mit der Bundeslade bemerkenswert einheitlich reagiert, obgleich es doch eine Kompilation zu sehr verschiedenen Zeiten kodifizierter Bücher ist. In der gesamten Heiligen Schrift ist die Lade der einzige Gegenstand, dem ausdrücklich und eindeutig übernatürliche Kräfte zugeschrieben werden. Alle anderen,

von menschlicher Hand hergestellten Gerätschaften behandelt die Bibel sehr nüchtern. Selbst außergewöhnliche heilige Dinge, wie der siebenarmige goldene Leuchter, der sogenannte »Schaubrotetisch« oder der Opferaltar, werden als wichtige Bestandteile des rituellen Mobiliars verstanden - und nicht mehr.

Die Lade war folglich einzigartig; und doch weisen ihre vermeintlichen Kräfte kaum Spuren einer phantasievollen literarischen Ausschmückung auf. Im Gegenteil: Von ihrem Bau am Fuße des Berges Sinai bis zu ihrem plötzlichen und unerklärlichen Verschwinden viele hundert Jahre später führte sie ständig dasselbe spektakuläre, aber doch begrenzte Repertoire an »Wundern« aus. So hob sie immer wieder sich selbst und ihre Träger vom Boden, strahlte intensives Licht aus und wurde wiederholt mit jener seltsamen »Wolke« in Verbindung gebracht, die zwischen den Cherubim zu sehen war. Sie konnte Krankheiten wie Aussatz oder Geschwüre hervorrufen und tötete diejenigen, die sie zufällig berührten oder gar öffnen wollten. Bezeichnenderweise besaß sie jedoch keine wunderbaren oder märchenhaften Eigenschaften, die man bei einem übergroßen Maß an fiktionaler Ausstattung hätte erwarten können: Sie machte keinen Regen, verwandelte Wasser nicht in Wein, erweckte keine Toten und gewann keineswegs alle Schlachten, in die sie mitgeführt wurde.

Mit anderen Worten: Die Bundeslade stellte sich konsequent wie eine gewaltige Maschine dar, die für ganz bestimmte Aufgaben konstruiert worden war und natürlich innerhalb ihrer konzeptionellen Grenzen funktionieren konnte. Wie alle Maschinen war sie fehlbar, aufgrund von Konstruktionsfehlern vielleicht, von menschlichem Versagen oder natürlicher Abnutzung.

Ich konnte mir das Erscheinungsbild der Bundeslade nur so erklären: Die Lade besaß tatsächlich außergewöhnliche Kräfte, aber diese Kräfte waren weder übernatürlich noch göttlich; sie mußten vielmehr das Ergebnis menschlicher Geschicklichkeit und menschlichen Einfallsreichtums gewesen sein. Aber das war nur eine Theorie, eine Vorgabe, die meine weiteren For-

schungen leiten sollte. Zugleich tauchte eine Menge berechtigter Zweifel auf. Denn wie sollte es für die Menschen vor mehr als dreitausend Jahren möglich gewesen sein, ein so mächtiges Gerät herzustellen - zu einer Zeit, in der sowohl Zivilisation als auch Technologie angeblich nur rudimentär entwickelt waren? Um diese Frage zu beantworten, mußte ich einen bestimmten kulturellen Faktor berücksichtigen, der die Israeliten betraf: Ägypten. Schließlich war die Lade nur wenige Monate nach der Flucht aus diesem Ägypten gebaut worden, nach einer mehr als vierhundert Jahre währenden Gefangenschaft in diesem Land. In Ägypten würden somit am ehesten Aufschlüsse über die wahre Natur der Bundeslade zu finden sein.

Tutanchamuns Vermächtnis

Nach einem Besuch im Ägyptischen Museum von Kairo war ich endgültig davon überzeugt, daß ich recht hatte. Das Museum präsentierte unter anderem eine ständige Ausstellung von Gegenständen aus dem Grab Tutanchamuns[40], des jugendlichen Königs, der von 1347 bis 1237 vor Christus über Ägypten herrschte, das heißt ungefähr ein Jahrhundert vor Moses. Ich war überwältigt von der Ausstellung und ging mehrere Stunden zwischen den Schaukästen umher, fasziniert von der Schönheit und Vielfalt der ausgestellten Stücke. Was mich an den Schätzen jedoch am meisten interessierte, waren die vielen Truhen oder Kästen - manche mit, andere ohne Tragestangen, aber alle ähnelten sie der Bundeslade ungemein. Besonders auffällig waren vier große Schreine, die dazu dienten, den Sarkophag Tutanchamuns aufzunehmen. Diese Schreine hatten die Form großer rechteckiger Kästen, bestanden aus Holz und waren innen und außen mit Gold überzogen. So lag die Schlußfolgerung auf der Hand, daß der Geist, der die Bundeslade erdacht hatte, auch mit Gegenständen wie diesen vertraut war.

Zwei mythische Figuren an der Tür und an der Rückwand eines jeden Schreines bestärkten diesen Eindruck: große,

schreckliche, geflügelte Frauen, wild und gebieterisch von Wuchs und Antlitz, wie finstere Racheengel. Diese gewaltigen und beherrschenden Geschöpfe, die dem kostbaren Inhalt des Grabes rituellen Schutz gewähren sollten, waren vermutlich Darstellungen der Göttinnen Isis und Nephthys.[41] Zwar hatte diese Identifizierung selbst keine besondere Bedeutung für mich, aber ich konnte nicht umhin zu bemerken, daß die Gottheiten »ihre Flügel nach oben hin ausbreiteten«, gerade so wie die in der Bibel erwähnten Cherubim über der Bundeslade. Auch die Gesichter waren einander zugewandt. Und obwohl sie als Hochrelief aus den Türflächen heraustraten (also eigentlich keine freistehenden Statuen waren), waren auch sie aus Gold gefertigt und ähnelten den in der Bibel beschriebenen Cherubim.[42]

Man hat nie genau feststellen können, wie die Cherubim ausgesehen haben. Übereinstimmung herrschte nur darüber, daß sie in keinem Fall den pausbäckigen Putten der abendländischen Kunst geähnelt haben konnten, die bestenfalls eine verharmloste und christianisierte Interpretation einer wirklich alten und heidnischen Idee darstellten.[43] Als ich so gedankenverloren im Ägyptischen Museum stand, schien es mir jedenfalls, daß die gewaltigen, geflügelten Wächterinnen auf Tutanchamuns Schreinen viel eher den Cherubim der Bundeslade entsprachen. Denn auch die Cherubim galten als Wächter eines kostbaren Behältnisses und zudem als Kanäle seiner gewaltigen und tödlichen Macht.

Die Tabots von Opet

Ich sollte bald herausfinden, daß die ägyptischen Wurzeln der Bundeslade noch viel tiefer reichten. Tutanchamun hatte noch ein anderes Erbe hinterlassen, das mir die volle Bedeutung jenes Hintergrundes zu verstehen half. Im Jahre 1990 besuchte ich den großen Tempel von Luxor in Oberägypten. Als ich durch den eleganten Säulengang schritt, der sich vom Vorhof Ramses' II. ostwärts erstreckt, stieß ich auf eine in Stein gehaue-

ne Geschichte, auf eine unvergängliche und reich illustrierte Darstellung des Opet-Festes, die im vierzehnten Jahrhundert vor Christus auf unmittelbaren Befehl Tutanchamuns hier eingemeißelt worden war.[44]

Obgleich von den Jahrtausenden stark mitgenommen, waren die Reliefs auf der West- und Ostwand des Säulenganges noch so gut erkennbar, daß ich die wesentlichen Charakteristika des Festes erfassen konnte, das zu Tutanchamuns Zeiten den Höhepunkt der jährlichen Nil-Überschwemmungen bezeichnete, von denen fast die gesamte ägyptische Landwirtschaft abhing.[45] Die Überschwemmungen waren zum größten Teil die Folge der langen Regenzeit im äthiopischen Hochland - eine Flut, die jedes Jahr vom Tanasee den Nil hinunterströmte und auf den Feldern des großen Nil-Deltas Hunderttausende Tonnen fruchtbaren Schlammes ablagerte.[46] Ich hatte das Gefühl, daß die Opet-Zeremonien in irgendeiner Weise für meine Untersuchungen bedeutsam sein konnten: Bei diesem Fest ging es schließlich um ein alljährlich wiederkehrendes Naturereignis im weit entfernten Äthiopien, das für Ägypten von immenser Bedeutung war.

Es stellte sich heraus, daß ich auf einen wichtigen Punkt gestoßen war.

Zunächst untersuchte ich die Westwand des Säulenganges. Dabei fiel mein Blick auf etwas, das wie eine Lade aussah und von Priestern auf Tragestangen in Schulterhöhe transportiert wurde. Die Szene erinnerte mich sofort an das erste Buch der Chronik, wo es heißt: »Und die Kinder Levi trugen die Lade Gottes auf ihren Achseln mit den Stangen daran, wie Mose geboten hatte nach dem Wort des Herrn.«[47] Mein einziger Vorbehalt bestand darin, daß der transportierte Gegenstand eher die Form eines Bootes und weniger die eines Kastens hatte.

Als ich einen Schritt zurücktrat, um einen Gesamteindruck zu erhalten, bemerkte ich, daß die gesamte Westwand des Säulenganges mit ähnlichen Abbildungen bedeckt war: In einer großen und fröhlichen Prozession waren die Umrisse mehrerer Behältnisse auszumachen, die von verschiedenen Priestergruppen auf

den Schultern getragen wurden. Den Zug begleiteten Musikanten mit Sistren und vielen anderen Instrumenten, aber auch Akrobaten, die ihre Kunststücke vorführten, und Menschen, die sangen, tanzten und in die Hände klatschten.

Mein Puls beschleunigte sich. Im Schatten einer Säule setzte ich mich nieder und spürte die Wucht des Déjà-vu-Erlebnisses, das mich gerade überfallen hatte. Es war kaum drei Monate her, daß ich in Gondar am »Timkat«-Fest teilgenommen hatte. Die Einzelheiten der Feierlichkeiten, die Musikanten und Tänzer ähnelten sehr der ekstatischen Prozession auf dem Tempelrelief, und mir wurde klar, daß sich beide Ereignisse auf eine Art »Laden-Anbetung« konzentrierten. Natürlich sahen die flachen Platten der äthiopischen »Tabots« anders aus als die schreinähnlichen Boote, die die Priester auf den Schultern trugen. Bei meinen früheren Nachforschungen hatte sich jedoch einwandfrei herausgestellt, daß »Tabot« ursprünglich »schiffartiger Behälter« bedeutete: Das althebräische Wort »tebah« (von dem sich der äthiopische Begriff ableiten läßt) wird in der Bibel verwendet, um ganz besondere, schiffähnliche Behältnisse zu bezeichnen - etwa die Arche Noah oder Moses' Binsenkörbchen. Selbst das Kebra Nagast beschreibt die Bundeslade einmal als Schiffsbauch, der die beiden von Gottes eigener Hand beschriebenen Tafeln enthielt.[48]

Ich holte tief Luft, stand auf und trat aus meinem Fleckchen Schatten in die gnadenlose Mittagssonne hinaus, um die Untersuchung des verwitterten Reliefs fortzusetzen. Die Westwand zeigt, wie die Laden von Karnak in das etwa fünf Kilometer entfernte Luxor gebracht wurden; auf der Ostwand wird die Rückkehr der Prozession am Nil entlang nach Karnak dargestellt, wo die heiligen Gefäße mit den entsprechenden Feierlichkeiten wieder an ihre ursprünglichen Standorte gebracht wurden. Jede Einzelheit dieser wundervoll gearbeiteten Szenen erinnerte mich an »Timkat« in Gondar, und ich erkannte nun, daß auch die bizarren Zeremonien, die ich am frühen Morgen des 19. Januar am geweihten Wasser des Sees beobachten konnte, eine Entsprechung im Opet-Fest hatten. Naturgemäß waren es gerade die

lebenspendenen Gewässer, denen im Verlauf beider Feste eine besondere Ehre erwiesen wurde.

Beweise

Nach meiner Ägypten-Reise im April 1990 unterzog ich die Indizien, über die ich dort geradezu gestolpert war, einer genaueren Überprüfung. Ich stellte fest, daß die Experten keine Schwierigkeiten mit meinen Vermutungen hatten. Kenneth Kitchen, Professor für Ägyptologie an der Universität von Liverpool, bestätigte beispielsweise, daß die Kästen aus Tutanchamuns Grab durchaus Vorbilder für die Bundeslade gewesen sein konnten: »Zumindest beweisen sie«, sagte er, »daß vergoldete Holzkästen zur normalen religiösen Ausstattung der Zeit gehörten und daß Moses folglich sowohl über die Techniken als auch über die Geschicklichkeit zur Herstellung der Bundeslade verfügt haben dürfte. Die von ihm verwendeten Konstruktionsmethoden und der Gebrauch derartiger Behältnisse zu religiösen Zwecken in Ägypten sind durch Funde, durch Bilder und durch Schriftstücke ausreichend bezeugt.«[49]

Auch für die Verbindung zwischen dem Opet-Fest und den frühen jüdischen Zeremonien um die Bundeslade fand ich wissenschaftliche Bestätigung. Als ich mich in der British Library durch Berge von Quellenmaterial arbeitete, stieß ich auf ein 1884 in London veröffentlichtes Buch mit dem Titel Neues *Licht auf alte Monumente.* Ich hätte dieses dünne und unauffällige Bändchen womöglich übergangen, wäre mir nicht der Name des Autors aufgefallen. Ich erinnerte mich, daß E.A. Wallis Budge, einer der wirklichen Experten für ägyptische Religion, A.H. Sayce sehr geschätzt hatte. Also schlug ich das Buch auf und las im Kapitel über die Flucht aus Ägypten, daß die Gesetze und Riten der Israeliten aus vielerlei Quellen stammten, unter denen auch bestimmte »Feste und Fastenbräuche« zu finden seien. Über deren Verlauf heißt es bei Sayce: »Die Götter wurden in >Schiffen< in der Prozession mitgeführt, die, wie wir von den

Skulpturen erfahren, der hebräischen Bundeslade ähnelten und mit Hilfe von Stäben auf den Schultern getragen wurden.«[50]

Ermutigt sah ich die vor mir liegenden Unterlagen weiter durch und fand heraus, daß die schiffsähnlichen Behältnisse des Opet-Festes tatsächlich Statuetten verschiedener Gottheiten aus dem ägyptischen Pantheon enthalten hatten.[51] Diese Figuren bestanden aus Stein, und so schien mir die Vermutung nicht mehr sehr weit hergeholt, daß sie einiges mit den steinernen Gesetzestafeln zu tun hatten, die die Israeliten als Verkörperung ihres Gottes verehrten. Ein jüdischer Gelehrter formulierte den Sachverhalt folgendermaßen: »Führt man sich einmal die Tradition vor Augen, derzufolge in der Bundeslade die beiden heiligen Steintafeln aufbewahrt wurden, so könnte man zu dem Schluß gelangen, daß der ursprüngliche Inhalt der Lade ein heiliger Stein war, der entweder als die Gottheit selbst begriffen wurde, oder aber als der Gegenstand, in dem diese Gottheit sich ständig aufhielt.«[52]

Und auch etwas anderes war mir aufgefallen: Noch im fünften Jahrhundert vor Christus war die Region von Luxor und Karnak als »Thebai« bekannt. Erst die Europäer haben den Namen in das bekanntere »Theben« umgewandelt[53] und dabei eine äußerst verblüffende Etymologie verschleiert: Das Wort »Thebai« stammte nämlich von »Tapet«, dem Namen, unter dem der gesamte Tempelkomplex von Karnak und Luxor zur Zeit von Moses und Tutanchamun bekannt war.[54] »Tapet« wiederum war nichts anderes als die weibliche Form von »Opet«. Mit anderen Worten, man hatte die heiligen Plätze ursprünglich nach dem großen Fest benannt, für das sie berühmt waren.[55] Was mich daran natürlich ganz besonders interessierte, war die lautliche Ähnlichkeit der Wörter »Tapet« und »Tabot« - eine ganz und gar nicht zufällige Ähnlichkeit. Denn ich erfuhr aus einer wissenschaftlichen Abhandlung, daß die »Tapet«-Schreine sich im Verlauf der Jahrhunderte von der Form eines Schiffes fortentwickelt und mehr die Ausmaße eines Kastens angenommen hatten.[56]

Wenn das äthiopische »Tabot« vom althebräischen »Tebah«

abstammte, so lag es nur nahe, daß von »Tebah« auch eine Verbindung zum altägyptischen »Tapet« zu ziehen war. Gerade die Parallelen zwischen den Festlichkeiten um die Bundeslade und dem Opet-Fest schienen auf eine solche Etymologie zu verweisen.[57] Ich war davon überzeugt, daß die Geschichte der Bundeslade nur in ihrem ägyptischen Kontext richtig zu verstehen war. Nun war der heilige Schrein mehr als nur ein vergoldeter Holzkasten. Es mußte auch für seine unheilvollen und zerstörerischen Kräfte eine Erklärung geben, deren Wurzeln möglicherweise in Ägypten lagen. In diesem Zusammenhang faszinierte mich die Persönlichkeit Moses' immer mehr. Je genauer ich seinen außergewöhnlichen und heroischen Charakter betrachtete, desto sicherer war ich mir, daß sich hinter seiner Biographie einige bedeutsame Informationen verstecken mußten.

Ein Zauberer von Gottes Gnaden

Vermutlich hat fast jeder Mensch eine vage Vorstellung vom Propheten Moses, und ich stellte sicherlich keine Ausnahme dieser Regel dar, als ich begann, ernsthaft über ihn und seine Rolle im Rätsel um die Bundeslade nachzudenken. Mein Problem bestand darin, daß ich mir das Bild, das ich im Religionsunterricht kennengelernt hatte, nicht in Fleisch und Blut vorstellen konnte. Nun aber war es notwendig, jenen Mann wirklich zu verstehen, von dem die Wissenschaftler übereinstimmend behaupten, er sei die »herausragende Gestalt während der Entstehung und Entwicklung der jüdischen Religion« gewesen.[58]

Von unschätzbarer Hilfe waren für mich die Schriften des Josephus Flavius, einem jüdischen Historiker, der um Christi Geburt im römisch besetzten Palästina lebte. In seiner Sammlung Jüdische Altertümer hat dieser fleißige Gelehrte heute längst nicht mehr existierende Überlieferungen und Quellenmaterial zusammengestellt und so die vier Jahrhunderte hebräischer Sklaverei in Ägypten nachgezeichnet. Das wichtigste Ereignis jener Zeit war die Geburt Mose:

»Einer von ihren [der Ägypter] Schriftkundigen ... weissagte dem König, es werde um jene Zeit aus hebräischem Blute ein Knabe geboren werden, der, wenn er erwachsen sei, die Herrschaft der Ägyptier [sic!] vernichten, die Israeliten hingegen mächtig machen werde ... Durch diesen Spruch wurde der König erschreckt, und er befahl, alle israelitischen Kinder gleich nach der Geburt in den Fluß zu werfen und zu töten.«[59]

Amaram, Moses' zukünftiger Vater, ängstigte sich sehr, als er von den Anordnungen hörte, denn seine Frau war gerade schwanger. Gott erschien ihm jedoch im Traum und tröstete ihn mit den Worten:

»Jetzt aber, das merke dir, bin ich für euer Wohlergehen und für deinen Ruhm besorgt. Denn jener Knabe, dessen Geburt die Ägyptier so sehr fürchten, daß sie die israelitischen Kinder alle töten wollen, wird dir geboren werden. Er wird denen verborgen bleiben, die ihm nachstellen, auf wunderbare Weise wird er erzogen werden und das Volk der Hebräer aus ägyptischer Knechtschaft befreien.«[60]

Die zwei Textstellen waren für mich insofern hilfreich, als sie die biblische Erzählung von Moses' Geburt erheblich ergänzten. Ich bemerkte mit Interesse, daß die große Macht des zukünftigen jüdischen Stammesführers sogar von den Ägyptern erkannt wurde. Auffällig war die besondere Betonung des »Schriftkundigen« und seiner Prophezeiung, bei dem es sich in Anbetracht seiner wahrsagerischen Fähigkeiten nur um einen Astrologen am Hofe des Pharao handeln konnte. Es hat den Anschein, als spielte Josephus darauf an, daß von Anfang an etwas Außergewöhnliches um Moses war, haben wir es hier doch mit einem Magier zu tun, der die Ankunft eines anderen Magiers vorhersagte.

Das Schicksal Moses' ist bekannt: Er überlebte das Verdikt, wurde am königlichen Hof erzogen, wo man ihn, wie die Bibel es formuliert, »in aller Weisheit der Ägypter« unterrichtete.[81] Josephus fügt dem wenig hinzu, aber ein anderer angesehener jüdischer Philosoph, Philo von Alexandria, der ebenfalls zur Zeit Christi lebte, gab eine ziemlich genaue Beschreibung dessen,

was Moses lernte: »Rechnen und Geometrie, sowie Rhythmik, Harmonik und Metrik und die gesamte Musik ..., ferner noch die in Symbole gekleidete Philosophie ..., die chaldäische Wissenschaft von den Himmelskörpern und mathematische Studien.«[62]

Als Adoptivsohn der königlichen Familie galt Moses lange Zeit als Thronfolger. Dieser besondere Status brachte es mit sich, daß er schon in seiner Jugend in die verborgensten priesterlichen Geheimnisse sowie in die Mysterien der ägyptischen Magie eingeweiht wurde[63] - und das dürfte nicht nur die Sternenkunde eingeschlossen haben, wie Philo angibt, sondern auch die Nekromantie, das Wahrsagen und andere Elemente der okkulten Lehren. Die Bibel selbst deutet diesen Sachverhalt an, wenn sie Moses als »gelehrt in aller Weisheit der Ägypter und mächtig in Werken und Worten« beschreibt.[64] E.A. Wallis Budge zufolge enthält dieser - gewiß nicht zufällig auch auf Jesus[65] angewandte - Ausdruck den verschlüsselten Hinweis darauf, daß der hebräische Prophet eine Sprachgewalt besaß, die weniger mit rhetorischen Fähigkeiten als mit formelhaften Anordnungen zusammenhing, »die er richtig aussprach, ohne zu stocken, und er gab den Befehl und sagte das Wort in vollendeter Weise«[66]. Das heißt, er wäre wie Isis, die für ihre magischen Kräfte berühmt war, imstande gewesen, die gewaltigsten Zauber auszusprechen. Die Menschen in seiner Umgebung müssen ihn mit größtem Respekt behandelt haben, denn sie werden nicht im entferntesten an seiner Fähigkeit gezweifelt haben, sich die Wirklichkeit zu unterwerfen und die Gesetze der Physik umzustoßen. Natürlich werden Moses' außergewöhliche Attribute an keiner Stelle der Bibel mit der Allmacht Gottes gleichgesetzt. Im Gegenteil: Es steht fest, daß Moses seine magischen Kräfte einzig und allein auf den Befehl Jahwes einsetzte.

Es ist verständlich, daß spätere Bearbeiter der Heiligen Schrift das Verhältnis zwischen allmächtigem Gott und dienendem Menschen genau so darstellen wollten. Sie konnten aber nicht die Beweise dafür vernichten, daß jener Mann tatsächlich ein Magier war; und sie konnten auch die überzeugendsten

Demonstrationen seiner Zauberkraft nicht einfach übergehen, die Plagen und Seuchen, die er bald über die Ägypter verhängte, um den Pharao zu zwingen, die Kinder Israels aus der Gefangenschaft zu entlassen.

Diese schrecklichen Wunder vollbrachte Moses mit Hilfe seines älteren Halbbruders Aaron, der oft als sein Bevollmächtigter auftrat. Alle beide besaßen Stäbe, mit denen sie ungewöhnliche Dinge vollbrachten. Der des Mose wird zuweilen »Stab Gottes« genannt[67] und zum erstenmal erwähnt, als der Prophet sich bei Jahwe darüber beklagt, daß ihm weder der Pharao noch die Israeliten glauben würden, daß er von Gott selbst eingesetzt sei - er müsse sicher einen Beweis erbringen können. Da sprach Gott zu ihm: »Was ist's, was du da in deiner Hand hast?« Und Moses antwortete: »Einen Stab.«[68] Darauf befahl ihm Gott, den Stab auf die Erde zu werfen:

»Und er warf ihn von sich; da ward er zur Schlange, und Moses floh vor ihr. Aber der Herr sprach zu ihm: Strecke deine Hand aus und erhasche sie bei dem Schwanz. Da streckte er seine Hand aus und hielt sie, und sie ward zum Stab in seiner Hand.«[69]

Die Betonung von Gottes Überlegenheit ist verständlich. Aber auch hier waren die Verbindungen zur okkulten Praxis der Ägypter nicht zu übersehen. Die Verwandlung eines leblosen Stockes in eine Schlange und umgekehrt war eines der beliebtesten Kunststücke der ägyptischen Magier; und von Anbeginn hatten die ägyptischen Priester für sich die Fähigkeit reklamiert, giftige Reptilien beherrschen zu können. Schließlich besaßen alle ägyptischen Magier elfenbeinerne Zauberstäbe.[70]

Und so überraschte es mich kaum, daß das erste Kräftemessen zwischen Moses und Aaron auf der einen und den Priestern des Pharao auf der anderen Seite ziemlich gleich ausging. Um den ägyptischen Tyrannen zu beeindrucken, warf Aaron seinen Stab auf die Erde, der sich erwartungsgemäß in eine Schlange verwandelte. Der unerschrockene Pharao ließ seine eigenen Weisen und Magier rufen, »und die ägyptischen Zauberer taten auch also mit ihrem Beschwören. Ein jeglicher warf seinen Stab

von sich, da wurden Schlangen daraus.« Da aber verschlang Aarons Schlange, die Jahwes unermeßliche Kraft besaß, die Schlangen der ägyptischen Zauberer.[71]

Nun verwandelten Moses und Aaron das Wasser des Nils in Blut. Trotz der außerordentlich drastischen Folgen war der Pharao noch immer nicht beeindruckt, denn »die ägyptischen Zauberer taten auch also mit ihrem Beschwören«[72]. Auch bei der darauffolgenden Froschplage konnten die Zauberer mithalten.[73] Erst bei der Stechmückenplage erkannten sie die Übermacht Jahwes: »Die Zauberer taten auch also mit ihrem Beschwören, daß sie Mücken herausbrächten; aber sie konnten nicht. Und die Mücken waren sowohl an Menschen als an Vieh. Da sprachen die Zauberer zu Pharao: Das ist Gottes Finger.«[74]

Doch der König ließ die Israeliten nicht ziehen. Der Katalog der Plagen, die Moses gegen die Ägypter heraufbeschwor, ist bekannt: die Stechmückenplage, die Viehpest, die Blattern, Finsternis, Donner und Hagel. Sogar die erstgeborenen Söhne Ägyptens mußten sterben.[75] Und endlich: »Die Ägypter drängten das Volk, daß sie es eilend aus dem Lande trieben, denn sie sprachen: Wir sind alle des Todes.«[76]

So begann der Auszug aus Ägypten - und damit eine lange, gefahrvolle Zeit. Zunächst mußte das Rote Meer überquert werden, so daß Moses einen weiteren dramatischen Beweis seiner okkulten Fähigkeiten geben konnte:

»Da nun Mose seine Hand reckte über das Meer, ließ es der Herr zurückweichen durch einen starken Ostwind die ganze Nacht und machte das Meer trocken, und die Wasser teilten sich voneinander. Und die Kinder Israel gingen hinein mitten ins Meer auf dem Trockenen, und das Wasser war ihnen eine Mauer zur Rechten und zur Linken.«[77]

Wer jemals den Religionsunterricht besucht hat, wird sich erinnern, daß die Ägypter ihnen folgten »und zogen hinein ihnen nach, alle Rosse Pharaos, und Wagen und Reiter, mitten ins Meer«. Aber nun geschah folgendes: »Da reckte Mose seine Hand aus über das Meer, und das Meer kam... wieder in seinen Strom, und die Ägypter flohen ihm entgegen. Also stürzte sie der

Herr mitten ins Meer und bedeckte Wagen und Reiter, und alle Macht des Pharao, die ihnen nachgefolgt waren ins Meer, daß nicht einer aus ihnen übrigblieb.«[78]

Erwartungsgemäß betont die Bibel auch hier wieder die Macht Gottes. Zwar streckte Moses seine Hand aus, aber es war der Herr, der das Wasser zurückweichen und wiederkommen ließ. Nachdem ich erfahren hatte, daß auch die Beherrschung der Gewässer nachweisbarer Bestandteil der ägyptischen Magie war, fiel es mir allerdings schwer, diese »offizielle« Version der Bibel zu akzeptieren. Der sogenannte »Westcar-Papyrus« beispielsweise berichtet von den Taten eines gewissen Tchatcha-em-ankh, Hohepriester am Hof des Pharao Seneferu zur Zeit der IV. Dynastie - etwa tausendfünfhundert Jahre vor Moses' Zeit. Eines Tages sei der Pharao in angenehmer Gesellschaft von »zwanzig Jungfrauen mit wunderschönem Haar und anmutiger Gestalt und wohlgeformten Gliedern« Boot gefahren.

Eine der Damen war tieftraurig, weil ihr Lieblingsschmuckstück in den See gefallen war. Der Pharao aber ließ Tchatcha-em-ankh rufen, und dieser »sprach einige Worte der Macht und ließ dadurch einen Teil des Wassers sich auf einen anderen wälzen. Da fand er das Schmuckstück auf einer Tonscherbe liegen, und er nahm es und gab es der Jungfrau. Nun war das Wasser zwölf Ellen tief, aber als Tchatcha-em-ankh den einen Teil des Wassers auf den anderen gewälzt hatte, war dieser Teil vierundzwanzig Ellen tief. Da sprach der Zauberer erneut einige Worte der Macht, und das Wasser des Sees wurde wieder so, wie es gewesen war, bevor er den einen Teil des Wassers sich auf den anderen hatte türmen lassen.«[79]

Zwar bezog sich die alte Handschrift auf einen weitaus trivialeren Anlaß als die Bibel. Trotzdem ähnelte die Geschichte in vielen Punkten geradezu verblüffend der Teilung des Roten Meeres. Meines Erachtens konnte zumindest kein Zweifel daran bestehen, daß Moses' virtuose Vorführung seine Zugehörigkeit zu einer sehr alten ägyptischen okkulten Tradition bewies. Der Ägyptologe E.A. Wallis Budge bemerkte dazu folgendes:

»Moses führte die magischen Rituale sehr geschickt aus; er

kannte die begleitenden Zauberformeln sehr genau. Darüber hinaus legen die von ihm vollbrachten Wunder nahe, daß er nicht nur Priester war, sondern auch Zauberer ersten Ranges und vielleicht sogar ein >Kher Heb<, ein ägyptischer Hoherpriester.«[80]

Geheime Wissenschaften?

Als »Kher Heb« des ägyptischen Tempels wäre Moses zweifellos mit all den magisch-religiösen Wissenschaften in Berührung gekommen, die die Priester vor den Laien verborgenhielten. Ich wußte, daß unter modernen Ägyptologen Übereinstimmung hinsichtlich der Existenz derartiger Fähigkeiten herrschte.[81] Ich wußte aber auch, daß man kaum eine Vorstellung davon hatte, worin diese tatsächlich bestanden haben könnten: Von Tempelbeamten verfaßte Grabinschriften vermitteln zwar einige dunkle Andeutungen, aber nichts wirklich Konkretes. Vermutlich war dieses Wissen nur mündlich und nur an Eingeweihte weitergegeben worden.[82] Vieles aber wurde - vielleicht absichtlich - zerstört: Unglaubliche Wissensschätze sind beim Brand der Bibliothek von Alexandria verlorengegangen, die im zweiten Jahrhundert vor Christus über zweihunderttausend Schriftrollen besessen haben soll.[83]

Eines jedoch war klar: Wie Herodot im fünften Jahrhundert vor Christus schrieb, enthielt Ägypten »mehr wunderbare Dinge und erstaunliche Werke ... als andere Länder. Darum müssen wir es genauer beschreiben.« Der weitgereiste griechische Historiker schrieb den Ägyptern zu Recht die Einführung des Jahres und dessen Einteilung in zwölf Monate zu. Herodot behauptete auch, in einige der ägyptischen Geheimnisse eingeweiht worden zu sein, aber dann fügt er einigermaßen spöttisch hinzu, daß er nicht Willens sei, sie mitzuteilen - oder es nicht könne .. .[84]

Die Vorstellung, daß diese alte Kultur ursprünglich durch die Anwendung eines fortgeschrittenen, aber inzwischen verlorengegangenen Geheimwissens zu ihrer Größe kam, ist eine der

dauerhaftesten und beherrschendsten der menschlichen Geschichte. Auf exzentrische Sonderlinge und nüchterne Wissenschaftler übte sie denselben Reiz aus und war Gegenstand einer Vielzahl von Auseinandersetzungen, wilden Spekulationen und ernsthaften Untersuchungen.

Zugleich eröffnete diese Vorstellung eine faszinierende Möglichkeit: Hatte Moses, der ägyptische Priester-Wissenschaftler, nicht vielleicht über weit mehr Kenntnisse und technische Möglichkeiten verfügt, als die Archäologen gemeinhin annahmen? Und war es nicht denkbar, daß er diese Kenntnisse und Fähigkeiten beim Bau der Bundeslade eingesetzt hatte?

Ich war auf einen schwierigen Punkt gestoßen, weil das, was man über die technischen Errungenschaften der Ägypter wußte, mindestens ebenso viele Fragen aufwarf wie beantwortete.

Es besteht kein Zweifel, daß diese Leute geschickte Metallarbeiter waren. Insbesondere ihr Goldschmuck war exquisit und bewies einen hohen Grad an Kunstfertigkeit. Bemerkenswerterweise waren die Schneiden ihrer kupfernen Werkzeuge schon sehr früh erstaunlich scharf und stabil, so stabil, daß sie Schiefer und härtesten Kalkstein schneiden konnten. Ich erfuhr, daß kein moderner Schmied derartige Resultate mit Kupfer zu erzielen vermochte, so daß man es für wahrscheinlich hielt, daß die »verlorene Kunst« weniger mit den Werkzeugen selbst zusammenhing als mit ihrer virtuosen Handhabung durch die Steinmetzen.

Nach dem Studium vieler Papyri und Hieroglyphen hatte ich keinen Zweifel mehr daran, daß die alten Ägypter keine schlechten Mathematiker waren. Sie kannten komplexere Formen der Bruchrechnung und hatten anscheinend ein Spezialverfahren der Infinitesimalrechnung entwickelt, das es ihnen erlaubte, das Volumen unterschiedlichster Körper zu berechnen.[85] Ferner war es sehr wahrscheinlich, daß sie zweitausend Jahre vor den Griechen die Zahl Pi verwendeten, um den Umfang eines Kreises aus seinem Durchmesser zu berechnen.[86]

Auch auf dem Gebiet der Astronomie waren die Ägypter anscheinend schon sehr früh erfolgreich. Livio Stecchini, ein

amerikanischer Professor für Wissenschaftsgeschichte und Fachmann für alte Maße, gibt an, daß die ägyptischen Priester bereits um 2200 vor Christus in der Lage waren, Längen- und Breitengrade auf wenige hundert Meter genau zu berechnen. Andere Kulturen waren dazu erst ungefähr viertausend Jahre später imstande.[87]

Zudem galten die Ägypter als hervorragende Mediziner. Wir wissen von einer Vielzahl kompliziertester und erfolgreich durchgeführter Behandlungen[88]; ihre Kenntnis des menschlichen Nervensystems war weitentwickelt, und ihre Arzneibücher verzeichneten mehrere noch heute bekannte Medikamente.[89]

Ich entdeckte viele weitere Hinweise auf das hochentwikkelte Wissen in Ägypten zu einer Zeit, als die Europäer noch tief in der Barbarei steckten. Dennoch ließ keine dieser Informationen meines Erachtens auf die Existenz einer technischen Errungenschaft schließen, die für die gewaltigen Energien, die von der Bundeslade ausgingen, verantwortlich sein konnte. Und doch bestand der Verdacht, die Ägypter seien die Hüter einer großen und geheimen Weisheit gewesen - ein Verdacht, der gleichsam immun gegen jedes Gegenargument war.

Natürlich wußte ich sehr gut, daß derartige Überzeugungen oft mehr aus dem unbewußten Wunsch herrührten, die Vergangenheit der Spezies Mensch zu verherrlichen, als aus einem rationalen Abwägen verfügbarer Fakten. So zumindest argumentierte das Establishment der Archäologen, das die Theorie einer »großen Geheimweisheit« für unsinniges Geschwätz hielt und behauptete, in über einem Jahrhundert mühevollen Grabens und Siebens sei nichts Außergewöhnliches in Ägypten gefunden worden. Ich persönlich bin von Natur aus skeptisch und pragmatisch. Trotzdem muß ich gestehen, daß mich die konkreten Beweise, die ich während meiner Forschungsreisen in diesem schönen und uralten Land überall um mich herum sah, davon überzeugten, daß die Akademiker nicht für alles Antworten gefunden hatten, daß nach wie vor viele Fragen offen waren, und zwar einfach deshalb, weil viele Problem-

bereiche außerhalb des wissenschaftlichen Erkenntnisinteresses lagen.

Drei Orte hatten eine besondere Wirkung auf mich: der Tempelkomplex von Karnak, die Stufenpyramide des Djoser bei Sakkara und die Cheopspyramide von Gise. Die besondere Mischung von delikater Anmut, beeindruckender Größe, von Macht, Geheimnis und Unsterblichkeit, die diese Gebäude besitzen, schien mir der Ausdruck eines verfeinerten und hochentwickelten Sinnes für Harmonie und Proportion zu sein, der sich zu einer regelrechten Wissenschaft ausgewachsen hatte. Diese bemerkenswerte Wissenschaft kombinierte Ingenieurswesen, Architektur und Gestaltung im weitesten Sinne. In einzigartiger und unübertroffener Weise flößen diese Bauwerke religiösen Schauder ein, und in Europa kommen ihnen nur die großen gotischen Kathedralen des Mittelalters gleich, so etwa Chartres.

Konnte dies Zufall sein? Die ägyptischen Monumente und die gotischen Kathedralen übten zweifellos die gleiche Wirkung auf die menschlichen Sinne aus. Gab es da vielleicht eine Verbindung?

Schon lange hatte ich vermutet, daß ein derartiger Zusammenhang existierte und daß das Bindeglied in der Überlieferung jenes geheimen architektonischen Wissens bestand, auf das die Tempelritter in Jerusalem gestoßen sein konnten. Als ich in Karnak langsam an den aufragenden Pylonen entlang in den Großen Hof und durch den gigantischen Säulenwald des Hypstyls ging, erinnerte ich mich an den heiligen Bernhard von Clairvaux, den Schutzpatron der Tempelritter, der - wie erstaunlich für einen Christen! - Gott als »Länge, Weite, Höhe und Tiefe« definiert hatte. Und mir war keineswegs entfallen, daß die Templer selbst außergewöhnliche Werke als Baumeister und Architekten zustandegebracht hatten.

Die ersten großen Architekten und Meister in der Wissenschaft des Bauens waren jedoch die Ägypter - und das Jahrhunderte und Zivilisationen vor Beginn der europäischen Kulturen. Die Monumente, die sie der Nachwelt hinterlassen hatten, ließen jede Beschreibung unmöglich erscheinen und waren eine

Herausforderung an die Zeit selbst. Typisch in dieser Hinsicht waren die beiden großen Obelisken, die die Anlage von Karnak dominieren und von denen ich mich ganz besonders angezogen fühlte. Wie ich feststellte, war der eine von Pharao Thutmosis I. (etwa 1506 bis 1492 vor Christus) errichtet worden, und der andere von Königin Hatschepsut (1490 bis 1468 vor Christus). Beide waren vollkommene, aus einem Stück rosafarbenen Granit herausgehauene Monolithe. Der erste war einundzwanzig Meter hoch und wog ungefähr hundertdreiundvierzig Tonnen, der andere ragte fast dreißig Meter in die Höhe und hatte ein Gewicht von schätzungsweise dreihundertzwanzig Tonnen.[90] Nur ein paar Fußminuten weiter südlich fand ich einen dritten Obelisken, der zwar umgestürzt und zerbrochen, dessen von einer Pyramide gekrönte Spitze jedoch fast unbeschädigt war. Ich folgte dem Rat meines Reiseführers und legte mein Ohr an den Winkel der Pyramide. Dann schlug ich mit der Handfläche fest auf den Granit und hörte völlig gebannt, wie der ganze Monolith von einem tiefen, dunklen Ton widerhallte, der fast aus einem seltsamen und wunderbaren Musikinstrument zu klingen schien.

Hinter der Errichtung dieser eleganten und makellosen Stelen mußte mehr stecken als bloße ästhetische Erwägungen. Ich erfuhr, daß sie nicht etwa an Ort und Stelle geschlagen, sondern von den über zweihundert Kilometer südlich liegenden Granitsteinbrüchen über den Fluß hierher transportiert worden waren.

Der Nil war eine breite und tiefe Straße. Also lag die Vermutung nahe, daß der Transport flußabwärts keine Schwierigkeiten mit sich brachte, wenn die Obelisken erst einmal auf Kähne verladen waren. Völlig unklar war mir dagegen, wie die Ägypter diese massiven Steinnadeln überhaupt auf die Kähne wuchten konnten - und dann wieder herunter, nachdem sie angekommen waren. Ein Monolith war, noch mit dem Fels verbunden, im Steinbruch geblieben, weil er zerbrach, noch bevor er völlig ausgegraben worden war. Es hatte eigentlich ein über vierzig Meter hoher und an seiner Basis fast vier Meter starker Obelisk

entstehen sollen, und ganz offensichtlich mußte man zu Beginn der Arbeiten damit gerechnet haben, daß dieser monströse, weit über eintausend Tonnen schwere Stein[91] fortbewegt und irgendwo aufgerichtet werden würde. Und doch war es kaum zu erklären, wie ein Volk, das (nach Aussagen der Archäologen) noch nicht einmal die einfachsten Kurbeln und Hebevorrichtungen besaß, das fertiggebracht haben sollte.[92]

Nicht weniger unerklärlich war, wie die Monolithe in Karnak mit derart fehlerloser Genauigkeit und völlig gerade aufgestellt worden waren. Ein Relief in einem der Tempel stellte einen Pharao dar, der ohne jede Hilfe und nur mit einem einzigen Seil einen Obelisken aufrichtet.[93] Es war sicher nicht ungewöhnlich, daß Herrscher in heroischen Posen dargestellt wurden, und vielleicht sollte dieses Relief nur einen Vorgang symbolisieren, an dem in Wahrheit Hunderte von Arbeitern an vielen Seilen zogen wie ein Mann.

Trotzdem wurde ich den Verdacht nicht los, daß mehr dahintersteckte. Dem erfahrenen Ägyptologen John Anthony West zufolge beherrschten die Pharaonen und Priester ein als »Ma'at« bekanntes Verfahren, das oft mit »Gleichgewicht« oder »Balance« übersetzt wird. Er vermutet, daß dieses Prinzip auch auf praktische Bereiche angewendet wurde, daß »die Ägypter Techniken des mechanischen Gleichgewichts kannten und benutzten, die uns unbekannt sind« und daß solche Techniken sie befähigt hätten, »leicht und geschickt gewaltige Steinmassen zu bewegen ... Was für uns wie Zauberei aussieht, war für sie Methode.«[94] Und tatsächlich wirkten die Obelisken zuweilen wie Produkte einer geradezu übermenschlichen Geschicklichkeit.

Ich mußte aber zugeben, daß die Pyramiden sie noch bei weitem übertrafen. Jean Francois Champollion, der Vater der modernen Ägyptologie, bemerkte einst: »... die alten Ägypter dachten wie Menschen, die dreißig Meter groß sind. Wir Europäer sind im Vergleich dazu bloß Liliputaner.«[95] Auch ich kam mir wie ein Liliputaner vor, als ich zum erstenmal die Cheopspyramide von Gise besuchte, zwergenhaft und ein bißchen ein-

geschüchtert - nicht nur von der bloßen Masse und der Größe dieses Steingebirges, sondern auch, weil das Gewicht der angesammelten Jahrhunderte geradezu körperlich spürbar war. Bei früheren Besuchen hatte ich die Pyramide nur von außen gesehen, weil ich nicht die geringste Lust verspürt hatte, mich den hineinströmenden Touristenmassen anzuschließen. Aber am frühen Morgen des 2 7. April 1990 konnte ich dank eines kleinen Trinkgeldes völlig allein in die große Pyramide gehen. Im trüben Licht einiger Glühbirnen stieg ich hinauf zur sogenannten Königskammer. Die Decke dieses etwa vierundfünfzig Quadratmeter großen Raumes im Herzen der Pyramide ist fast sechs Meter hoch und besteht aus neun monolithischen Blöcken, deren jeder ungefähr fünfzig Tonnen wiegt.[96]

Ich weiß nicht mehr, wie lange ich in der Kammer blieb. Die warme Luft war muffig und erinnerte an die Ausdünstungen eines riesigen Tieres. Die Stille um mich herum war wie eine dichte Hülle. Irgendwann ging ich aus einem unerklärlichen Grund in die Mitte des Raumes und erzeugte einen tiefen Ton, der wie das Lied des gefallenen Obelisken von Karnak klang. Die Wände und die Decke schienen diesen Ton aufzunehmen, zu sammeln und zu verstärken, um ihn dann zu mir zurückzuwerfen, so daß ich die Vibrationen durch meine Füße, meinen Kopf und meine Haut spüren konnte. Ich war wie elektrisiert, energiegeladen, erregt und gleichzeitig ruhig, als ob ich an der Schwelle einer ungeheuerlichen und vollkommen unvermeidlichen Offenbarung stünde.

Ich war so von der großen Pyramide beeindruckt, daß ich etliche Wochen mit dem Studium ihrer Geschichte verbrachte. Die Archäologen vertreten für gewöhnlich die Meinung, daß das Bauwerk ausschließlich als Grab diente: Niemals allerdings war die Mumie eines Pharao dort gefunden worden, und die Königskammer hatte nur einen schmucklosen und überdies leeren Sarkophag enthalten. Die Auseinandersetzung um den wirklichen Zweck der großen Pyramide wurde von den orthodoxen Wissenschaftlern auf der einen und den, sagen wir, »Pyramidologen« auf der anderen Seite geführt. Es waren die letzteren, die

in praktisch jedem Element des Bauwerkes allerlei Prophezeiungen und Zeichen erkannten und aus diesem Grunde nicht gerade ernstgenommen wurden.

Trotzdem sah ich, daß die Pyramidologen konsequent auf einige überraschende Besonderheiten aufmerksam machten, die wahrscheinlich kein Zufall waren. Die Cheopspyramide befindet sich genau auf der Schnittstelle des dreißigsten Grades nördlicher Breite und dem einunddreißigsten Grad östlicher Länge. Diese Breiten- und Längengrade verlaufen über mehr trockenes Land als andere, so daß der Standort der Pyramide als Zentrum und als Symbol für die bewohnbare Welt schlechthin gelten konnte.[97] Besonders interessant war die Tatsache, daß alle Pyramiden von Gise genau nach den vier Kardinalpunkten ausgerichtet waren: Norden, Süden, Osten und Westen.[98] Wie dieses Landvermessungskunststück lange vor der Erfindung des Kompasses vollbracht worden war, ist kaum zu erklären.

Was mich an der Cheopspyramide aber am meisten faszinierte, waren ihre Ausmaße. Man muß sich das einmal vorstellen: Das kolossale Gebäude besteht aus 2,3 Millionen Kalksteinblöcken, von denen jeder ungefähr zweieinhalb Tonnen wiegt.[99] Herodot, dessen Gewährsmann ein ägyptischer Priester war, behauptete, daß Trupps von hunderttausend Arbeitern das Bauwerk in zwanzig Jahren errichtet hätten, wobei sie nur während der drei Monate arbeiteten, in denen keine Landwirtschaft betrieben werden konnte, und daß man zur Fortbewegung der massiven Steinblöcke Holzgerüste und Hebevorrichtungen verwendete.[100] Unter Einbeziehung dieser Daten hat der dänische Ingenieur P. Garde-Hansen eine interessante Berechnung angestellt, derzufolge jeden Tag viertausend Blöcke hätten aufgemauert werden müssen, das heißt 6,67 pro Minute, und das inklusive aller vorbereitenden Arbeiten wie Steine schlagen, Gelände bereinigen und ebnen, und so fort. Er schließt: »Es würde, glaube ich, das kombinierte Genie eines Cyrus, Alexander des Großen und Julius Caesar erfordern - nehmen wir Napoleon und Wellington ruhig noch dazu -, um allein die

Armeen aufzustellen, die nötig wären, um die Arbeiten in der angegebenen Weise auszuführen.«[101]

Zufällig erfuhr ich, daß eine Gruppe japanischer Ingenieure kürzlich versucht hatte, eine nur zehn Meter hohe Nachbildung der Cheopspyramide zu bauen. Das Team beschränkte sich strikt auf die Techniken, die nachweislich zur Zeit der IV. Dynastie verwendet worden waren. Unter diesen Bedingungen erwies sich das Vorhaben allerdings als undurchführbar, und innerhalb kürzester Zeit erschienen moderne Bagger, Kräne und Steinbearbeitungsmaschinen auf der Baustelle. Und doch konnte man keine ernstzunehmenden Fortschritte machen, so daß das Projekt schließlich mit einiger Verlegenheit aufgegeben werden mußte.[102]

Alles in allem legte die Cheopspyramide mit ihren Rätseln und Geheimnissen die Vermutung nahe, daß die alten Ägypter mehr als nur die »technisch begabten Primitiven« waren, als die sie oft beschrieben wurden, und daß sie über ein ganz besonderes Wissen verfügt haben müssen. Wenn das zutraf, dann war es durchaus möglich, daß die unheilvolle Macht der Bundeslade von dieser Wissenschaft herrührte - einer Wissenschaft, mit der Moses von fugend an vertraut war.

Kapitel 13

Weltenschöpfer

Aber woher hätte ein solches geheimes Wissen stammen können? Es ist das alte Ägypten selbst, das eine einfache, wenngleich wenig rationale Antwort auf diese Frage gibt. Alle wichtigen überlieferten Dokumente behaupten eindeutig, daß es der Menschheit vom Mondgott Thoth gegeben worden sei, dem Berechner und Einteiler der Zeit, dem göttlichen Chronisten und Aufseher über die menschlichen Schicksale, dem Erfinder der Schrift und aller Weisheit, dem Schutzgott der Zauberer.[1] Einmal mit dem Mond selbst identisch, ein anderes Mal dessen Wächter, war Thoth damit betraut, seinen Lauf über den nächtlichen Himmel zu sichern - sein Zunehmen und Abnehmen, sein Verschwinden und Wiedererscheinen. In dieser Funktion, als göttliches Regulativ aller himmlischen Bewegungen, maß Thoth die Zeit und teilte sie in Monate ein.[2] Seine Macht soll sich aber weit über die bloße Einteilung der Jahreszeiten hinaus erstreckt haben. Den Lehren der Priester von Hermopolis zufolge, jener heiligen Stadt in Oberägypten, war Thoth der Demiurg, der die Welt durch den Ton seiner Stimme, durch ein einziges Zauberwort erschuf.[3] Die Ägypter verehrten Thoth als Gott, der die Rätsel »von allem, was unter dem Himmelsgewölbe verborgen ist«, verstand und außerdem die Macht besaß, auserwählten Menschen Weisheit zu verleihen. Es hieß, er habe die Grundlagen seines Geheimwissens auf 36 535 Schriftrollen geschrieben und diese dann auf der ganzen Welt versteckt, damit künftige Generationen sie zwar suchen, aber nur die »Würdigen« sie auch finden und ihre Entdeckung zum Besten der Menschheit verwenden sollten.[4]

Kein Wissenschaftler vermag genau zu bestimmen, wie alt dieser Mondgott wirklich war oder wo und wann sein Kult begonnen hatte. Als die Zivilisation in Ägypten langsam herauf-

dämmerte, war Thoth bereits da und wurde für seine Verdienste um das menschliche Wohlergehen verehrt. Er war der absolute Zauberer, der nicht weniger als das absolute Wissen und die absolute Weisheit besaß. Thoth gab den Menschen die Architektur, die Astronomie und die Medizin. Er war der Schöpfer jenes schrecklichen Zauberbuches, aus dem die Priester von Hermopolis ihr gesamtes Wissen vom Okkulten bezogen. Thoth war der »Geheimnisvolle«, der »Unbekannte«[5].

Die alten Ägypter lebten in der Überzeugung, daß ihre ersten Herrscher Götter waren. Natürlich zählte auch Thoth zu diesen göttlichen Königen; es hieß, seine irdische Herrschaft habe 3226 Jahre gedauert.[6] Vor ihm regierte ein anderer Gott, Osiris, der ebenfalls eng mit dem Mond verbunden war.[7] Obwohl Thoth und Osiris oftmals in sehr unterschiedlichen Erscheinungsformen auftreten, konnte ich nachweisen, daß sie in anderen Zusammenhängen auch gleich oder zumindest verwandt waren.[8] Vor allem in der himmlischen Richterhalle, wo die Seelen der Toten auf den großen Waagen gewogen wurden, traten sie gemeinsam auf. Osiris schien als Richter oftmals der wichtigere der beiden Götter gewesen zu sein, während Thoth als Schreiber nur das Urteil festhielt; aber es finden sich ebenso Darstellungen, die dieses Verhältnis umkehren.[9] Thoth und Osiris waren also nicht nur Mondgötter, Totengötter (und vielleicht Brüder); beide waren zudem Gesetzgeber und Richter.

Natürlich vermerkte ich solche Ähnlichkeiten mit großem Interesse, kam aber zunächst nicht auf ihre Bedeutung für meine eigene Suche. Dann fiel mir ein, daß es eine unveränderliche Beziehung zwischen den beiden Göttern gab, die sie auch vom Konzept her mit Moses und dessen Werk verband; Wie er waren sie vor allem heroische Vorkämpfer für die Zivilisation und brachten ihren Gefolgsleuten die Wohltaten der Religion, der Gesetze und einer sozialen Ordnung.

Thoth verbesserte das Los des ägyptischen Volkes. Aber auch Osiris spielte eine zentrale Rolle in der Entstehung und Entwicklung der Gesellschaft. Als er seine göttliche Herrschaft auf Erden antrat, war das Land barbarisch, roh und unzivilisiert,

die Ägypter selbst waren Kannibalen. Als er jedoch in den Himmel zurückkehrte, hinterließ er eine fortgeschrittene und hochentwickelte Nation, die gelernt hatte, den Boden zu bebauen, die Götter anzubeten und deren Gesetze zu befolgen.

Derartige Geschichten konnten natürlich Erfindungen sein. Und doch fragte ich mich, ob letztlich nicht mehr als reine Phantasie hinter der Überlieferung steckte, daß die Ägypter erst mit den Gaben von Thoth und Osiris zu einer großen Nation geworden waren. War es nicht möglich, daß der Weise, allwissende Mondgott eine mythische Figur für die Wahrheit war, eine Metapher für eine Gruppe von wirklich existierenden Individuen, die in fernster Vergangenheit einem primitiven Lande die Wohltaten von Kultur und Wissenschaft brachten?

Die Männer von Atlantis

Ich hätte diesen Gedanken sicherlich von der Hand gewiesen, wäre ich nicht kurz darauf auf die Existenz eines großen Rätsels gestoßen, für das nie eine endgültige Lösung vorgeschlagen worden war. Anstelle einer langsamen und mühevollen Entwicklung schien die ägyptische Zivilisation schlagartig und sofort voll ausgebildet dagewesen zu sein! In der Tat: Allen verfügbaren Berichten zufolge war die Periode des Übergangs von einer primitiven zu einer hochentwickelten Gesellschaft so kurz, daß aus historischer Perspektive keine sinnvolle Erklärung dafür zu finden war. Technologisches Wissen, dessen Entwicklung sich normalerweise über Hunderte, ja sogar Tausende von Jahren hätte erstrecken müssen, schien buchstäblich fast über Nacht verfügbar zu sein.

So hat man in der vordynastischen Periode, die auf etwa 3600 vor Christus datiert wird, offenbar keine Schriften gekannt. Dann - plötzlich und unerklärlich - tauchte das Hieroglyphensystem auf, und zwar in vollständigem und vollkommenem Zustand. Weit davon entfernt, Gegenstände oder Handlungen nur bildlich darzustellen, handelte es sich bei dieser geschriebenen

Schrift vielmehr um ein komplexes und strukturiertes Zeichen- und Zahlensystem. Schon die allerfrühesten Hieroglyphen waren stilisiert und konventionalisiert; und es besteht kein Zweifel, daß die Schriftsprache bereits zu Beginn der I.Dynastie schon nicht mehr »in den Kinderschuhen steckte«.[10]

Besonders beeindruckte mich, daß es absolut keine Spuren einer Veränderung von einfachen zu höher entwickelten Stilen gab. Dasselbe galt für die Mathematik, die Astronomie, die Medizin und die Architektur und selbst für die erstaunlich vielfältige und lebhafte religiöse Ordnung. Sogar derart verfeinerte literarische Werke wie das *Ägyptische Totenbuch* existierten gleich zu Beginn der dynastischen Periode.[11] Als Zusammenfassung für diese Phänomene kann die Meinung von Professor Walter Emery gelten, dem ehemaligen Inhaber des Lehrstuhls für Ägyptologie an der Universität London:

»Etwa 3400 Jahre vor Christi Geburt ergaben sich in Ägypten grundlegende Veränderungen. Sehr rasch ließ das Land das Stadium fortgeschrittener Steinzeitkultur mit verwickelter Stammesstruktur hinter sich, und es bildeten sich zwei festgefügte Monarchien ... Gleichzeitig trat die Kunst der Schrift ans Licht, eine Monumentalarchitektur, Künste und Handwerk entwickelten sich in erstaunlichem Ausmaß, und alles weist auf die Existenz einer durchorgansierten und sogar üppigen Zivilisation hin. Dies vollzog sich in einem verhältnismäßig kurzen Zeitraum. Die grundlegende Entwicklung der Schrift und Architektur scheint kaum irgendeinen geschichtlichen Hintergrund zu haben.«[12]

Plötzlich kam mir ein Gedanke: Ägypten konnte seinen plötzlichen und ungeheuren kulturellen Aufschwung von einer anderen bekannten Zivilisation der Welt erhalten haben - und der wahrscheinlichste Bewerber für diese Rolle war Sumer am unteren Euphrat in Mesopotamien. Darüber hinaus konnte ich nachweisen, daß trotz vieler grundsätzlicher Unterschiede eine Anzahl von gemeinsamen Bau- und Architekturstilen durchaus eine Verbindung zwischen diesen beiden Gegenden vermuten ließ.[13] Keine dieser Ähnlichkeiten war indessen stark genug,

um mir den Schluß zu erlauben, daß es sich hier um eine kausale Verbindung handelte, daß heißt, daß eine Gesellschaft die andere direkt beeinflußt hätte. Das Gegenteil traf zu:

»Eine neue Kunst kam nach Ägypten, und obwohl viele Autoritäten sie als eine geradlinige Weiterentwicklung der prähistorischen Kunst betrachten ..., sind meiner Meinung nach überzeugende Beweise dafür vorhanden, daß in dieser Periode etwas völlig Neues ins Nil-Tal eingedrungen ist ... Die Existenz eines dritten Volksstammes, dessen kulturelle Errungenschaften selbständig nach Ägypten und nach Mesopotamien gelangten, würden am ehesten die gemeinsamen Züge und die grundlegenden Unterschiede in den beiden Zivilisationen erklären.«[14]

Diese Theorie warf ein bezeichnendes Licht auf die sonst unerklärliche Tatsache, daß die Ägypter und die Sumerer praktisch identische Mondgötter anbeteten, die im jeweiligen Pantheon zu den ältesten Göttern überhaupt gehörten. Genau wie Thoth war der sumerische Mondgott Sin mit dem Messen der vergehenden Zeit betraut. Am Ende eines jeden Monats kamen die anderen Götter des sumerischen Pantheons zu ihm, fragten ihn um Rat und erwarteten die Entscheidung des Mondgottes.[15] E.A. Wallis Budge zufolge »ist die Ähnlichkeit zwischen den beiden Göttern zu groß, als daß sie bloßer Zufall sein könnte. Es wäre gewiß falsch zu sagen, die Ägypter hätten von den Sumerern geborgt oder die Sumerer von den Ägyptern, aber man könnte vielleicht annehmen, daß die Gebildeten beider Völker ihr theologisches System aus einer gemeinsamen, aber außerordentlich alten Quelle geschöpft haben mögen.«[16]

Mit Enttäuschung bemerkte ich, daß weder Budge noch Emery bereit waren, weiter zu spekulieren, obwohl sie sich doch schon so weit hervorgewagt hatten. Was war das für eine »gemeinsame, aber außerordentliche alte Quelle«? Emery gab zumindest einen Hinweis darauf, wo seiner Meinung nach die Wiege der ägyptischen Zivilisation gestanden haben könnte: »... riesige Landstriche im Nahen Osten, am Roten Meer und an den ostafrikanischen Küsten«, so beobachtet er einiger-

maßen zurückhaltend, »sind archäologisch noch nicht erforscht.«[17]

Wenn Ägypten die Gaben der Zivilisation und Wissenschaft tatsächlich von anderswoher empfangen hatte, so mußten doch auch Zeugnisse dieser folgenschweren Transaktion überliefert sein. Die Vergöttlichung der beiden großen »Kulturschöpfer« Thoth und Osiris war ein Indiz: Die Legenden von diesen beiden Göttern wurden zwar als Theologie ausgegeben, aber in meinen Ohren klangen sie eher wie das Echo lange vergessener, aber tatsächlich stattgefundener Ereignisse. Nun, mir war klar, daß ich etwas Konkreteres brauchte, etwas, was eindeutig und unbestreitbar die fruchtbaren Kontakte zu einer fortgeschrittenen Gesellschaft bezeugte und außerdem erklärte, wie es möglich war, daß diese Kultur spurlos verschwand.

Ich fand einen weiterführenden Bericht. Es handelte sich um die vertraute Geschichte des versunkenen Kontinents Atlantis, eine Geschichte, die in den letzten Jahren durch die merkwürdigsten Spekulationen so in Mißkredit geraten war, daß es einem beruflichen Selbstmord gleichkam, wenn ein Forscher sich auch nur in ihre Nähe begab. Nachdem ich den ganzen New-Age-Unsinn beiseite geräumt hatte, stieß ich jedoch auf eine bezeichnende Tatsache, die mich nicht mehr losließ: Das früheste überlieferte Dokument über Atlantis stammt von dem griechischen Philosophen Piaton, einem der Gründerväter des rationalen abendländischen Denkens, der darauf bestand, daß das, was er in dieser Angelegenheit gesagt hatte, keine Fiktion, sondern reine Geschichte sei. Außerdem fügte Piaton, der zu Beginn des vierten Jahrhunderts vor Christus lebte, hinzu, die Quelle seines Berichtes sei ein ägyptischer Priester gewesen, der ihm von der sich beständig wiederholenden Zerstörung von Kulturen durch Fluten erzählte und über die Griechen sagte:

»Ihr Hellenen bleibt doch immer Kinder, zum Greise aber bringt es kein Hellene. Jung in den Seelen, denn ihr hegt in ihnen keine alte, auf altertümliche Erzählungen gegründete Meinung noch ein durch die Zeit ergrautes Wissen. Was sich aber, sei es bei euch oder hier oder in andern Gegenden, von

denen uns Kunde ward, Schönes und Großes oder in einer andern Beziehung Merkwürdiges begab, das alles ist von alten Zeiten her hier in den Tempeln aufgezeichnet und aufbewahrt. Bei euch und andern Völkern dagegen war man jedesmal eben erst mit der Schrift und allem andern, dessen die Staaten bedürfen, versehen, und dann brach, nach Ablauf der gewöhnlichen Frist, wie eine Krankheit eine Flut vom Himmel über sie herein und ließ von euch nur die der Schrift Unkundigen und Ungebildeten zurück, so daß ihr vom Anbeginn wiederum gewissermaßen zum Jugendalter zurückkehrt, ohne von dem etwas zu wissen, was so hier wie bei euch zu alten Zeiten sich begab.«[18]

Nun berichtet der Priester von einem solchen, vor Tausenden von Jahren untergegangenen Land:

»Damals war nämlich dieses Meer schiffbar; denn vor dem Eingange, der, wie ihr sagt, die Säulen des Herakles heißt, befand sich eine Insel, größer als Asien und Libyen zusammengenommen, von welcher den damals Reisenden der Zugang zu den übrigen Inseln, von diesen aber zu dem ganzen gegenüberliegenden, an jenem wahren Meere gelegenen Festland offenstand. Auf dieser Insel Atlantis vereinte sich auch eine große, wundervolle Macht von Königen ..., [die sich] eine solche Fülle des Reichtums erworben hatten, wie weder vorher bei irgendeinem Herrschergeschlecht in den Besitz von Königen gelangt war noch in Zukunft so leicht gelangen dürfte, und da bei ihnen für alles gesorgt war, wofür in bezug auf Stadt und Land zu sorgen not tut. Denn vermöge ihrer Herrschaft floß von außen her ihnen vieles zu, das meiste für den Lebensbedarf aber lieferte ihnen die Insel selbst. Zuerst, was da an Starrem und Schmelzbarem durch den Bergbau gewonnen wird ... Ferner brachte die Insel auch alles in reicher Fülle hervor, was der Wald für die Werke der Bauverständigen liefert, und an Tieren eine ausreichende Menge wilder und zahmer ... Was ferner jetzt irgendwo die Erde an Wohlgerüchen erzeugt, an Wurzeln, Gräsern, Holzarten und Blumen oder Früchten entquellenden Säften, das erzeugte auch sie und ließ es wohl gedeihen, sowie desgleichen die durch Pflege gewonnenen Früchte; die Feld-

früchte ..., was Sträucher und Bäume an Speisen, Getränken und Salben uns bieten ... Dies alles brachte die heilige, damals noch von der Sonne beschienene Insel schön und wunderbar und in unbegrenztem Maße hervor.«[19]

Indessen war es diesem Paradies nicht beschieden, länger »unter der Sonne« zu bleiben, denn bald sollten die schlechten Taten der Bewohner und ihr unmäßiges Leben bestraft werden:

»Indem aber in späterer Zeit gewaltige Erdbeben und Überschwemmungen eintraten, versank, indem nur ein schlimmer Tag und eine schlimme Nacht hereinbrach, eure Heeresmacht insgesamt und mit einem Male unter die Erde, und in gleicher Weise wurde auch die Insel Atlantis durch Versinken in das Meer den Augen entzogen.«[20]

Mein Interesse an dieser Geschichte rührte weniger von dem, was sie über Atlantis selbst aussagte. Auch war ich nicht von der Lokalisierung der Insel »gegenüber den Säulen des Herakles« überzeugt. Ich war der Ansicht, was von geophysikalischen Indizien unterstützt wurde[21], daß es im Atlantik niemals eine solche Landmasse gegeben haben konnte und daß diejenigen, die immer noch danach suchten, den falschesten aller falschen Fährten auf den Leim gingen.

Trotzdem hatte ich den Eindruck (und die Autoritäten stimmten diesem Punkt - wenngleich widerwillig - zu[22]), daß Piatons Bericht auch aufgrund von Tatsachen entstanden sein mußte. Zweifellos verzerrte und übertrieb er viel. Dennoch bezog er sich auf etwas, das wirklich irgendwo auf der Welt und vor sehr langer Zeit passiert war. Ferner machte er klar, und das erschien mir von größter Bedeutung, daß die Erinnerung an dieses Ereignis von ägyptischen Priestern bewahrt und in den alten Schriften niedergeschrieben worden war.

Ich überlegte mir, daß die Möglichkeit eines zufälligen Zusammentreffens gering war, wenn in Mesopotamien ähnliche Erinnerungen bewahrt worden waren. Ein und dieselbe Flutkatastrophe, wo auch immer sie stattgefunden hatte, mußte die Überlieferungen in beiden Regionen geprägt haben. Folglich sah ich mir noch einmal die Legenden an, in denen mir die Ähnlich-

keit zwischen Thoth und dem sumerischen Mondgott Sin aufgefallen war. Was ich erfuhr, überraschte mich nicht: Wie ihre ägyptischen Zeitgenossen haben auch die Sumerer die Erinnerung an eine alles zerstörende Flut bewahrt, die eine große, reiche und mächtige Gesellschaft zerstört hatte.[23]

Im Verlauf meiner Nachforschungen begann Atlantis für mich jenes hypothetische und bis jetzt unentdeckte Gebiet zu symbolisieren, von dem die wundervollen Kulturen Ägyptens und Sumers stammten. Wie gesagt, ich glaubte nicht, daß die große Insel im Atlantik zu suchen war. Statt dessen stimmte ich Professor Emery zu, daß sie wahrscheinlich an einem Punkt lokalisiert werden konnte, der mehr oder weniger gleich weit vom Nil-Delta und vom unteren Euphrat entfernt lag, an den unerforschten Küsten des Horns von Afrika oder in einer von Überflutungen heimgesuchten Region auf dem indischen Subkontinent wie Bangladesch. Gerade solche tropischen Zonen kamen durchaus in Frage, denn mir fiel ein, daß Piaton auch die Existenz von Elefanten in seinem »Atlantis« erwähnt hatte - Geschöpfe, die über viele Jahrtausende hinweg nur in Afrika, Indien und Südostasien lebten.

Es war an der Zeit, mir einen Überblick über die vielen neuen Vermutungen zu verschaffen. In meinem Notizbuch vermerkte ich:

- Nehmen wir an, daß irgendwo im Indischen Ozean im ersten oder zweiten Drittel des vierten Jahrtausends vor Christus eine technologisch fortgeschrittene Gesellschaft von einer Flut zerstört wurde. Nehmen wir weiterhin an, daß es Überlebende gab, von denen einige mit ihren Schiffen nach Ägypten und Mesopotamien segelten, dort landeten und begannen, die primitiven Ureinwohner zu zivilisieren und das Land zu besiedeln.

- Vielleicht schufen die Emigranten neue Priesterstrukturen, die hinfort dazu dienten, die heilige Wissenschaft an die nachfolgenden Generationen weiterzugeben. In Ägypten waren diese Traditionen von Anfang an mit der Verehrung des Mondgottes Thoth verbunden, in Mesopotamien mit der Anbetung

Sins. Womöglich lag das daran, daß die neuen Siedler selbst den Mond verehrten. In jedem Fall ermutigten sie die Einwohner, den vertrauten, aber doch erschreckenden und geisterartigen Himmelskörper zu vergöttlichen. Ihr Ziel wäre letztlich gewesen, den einfachen und unkultivierten Geist des Volkes zu formen und zu dirigieren und einen Kultus zu schaffen, der die Jahrtausende überdauern und als Überlebensgarantie ihres gesamten Wissens dienen würde.

- Daraus kann die Vermutung resultieren, daß ein sich verselbständigender Prozeß eingesetzt hat, sobald der Thoth-Kult im frühen Ägypten erst einmal etabliert war und die Priester die von den zugewanderten Fremden mitgebrachten wissenschaftlichen und technologischen Verfahrensweisen kannten und verinnerlicht hatten. Das neue und wertvolle Wissen wurde mit einer geheimnisvollen Aura umgeben und vor den Nichteingeweihten durch alle möglichen rituellen Strafmaßnahmen geschützt. Dieses Wissen - in einem elitären Procedere von einer Generation an die nächste weitergegeben - gab seinen Besitzern eine bislang ungeahnte Macht über die physikalischen Gesetze.

- Die Elite scheute sich nicht, ihre Macht dem Volk auch vor Augen zu führen, nicht zuletzt durch die Errichtung überwältigender und ehrfurchteinflößender Gebäude. Es ist daher leicht zu verstehen, daß der Glaube, der Mondgott habe sowohl die Wissenschaften als auch die Zauberei erfunden, in der breiten Masse verankert werden konnte, und außerdem, daß die Priester dieses Gottes als Zaubermeister angesehen wurden.

Dem *Wasser* entrissen

Vieles sprach dafür, daß das geheime Wissen vor langer Zeit von Fremden ins Land gebracht worden war, die eine Sintflut überlebt hatten. Außerordentlich bedeutsam war in dieser Hinsicht ein Motiv, das seine Spuren fast in der gesamten religiösen Literatur hinterlassen hat und das wiederholt Weisheit und

andere auszeichnende Eigenschaften mit Individuen in Verbindung brachte, die aus dem Wasser errettet worden waren.

Zunächst entdeckte ich, daß Thoth eine Flut zugeschrieben wurde, die er ausgelöst habe, um die Menschen für ihre Bösartigkeit zu strafen.[24] Die Parallelen zum ersten Buch Mose und der Beschreibung der großen Sintflut lagen auf der Hand! In dieser Episode, von der im CLXXV. Kapitel des Ägyptischen Totenbuches berichtet wird, handelte er gemeinsam mit Osiris.[25] Und nachdem die menschliche Rasse wieder aufgeblüht war, herrschten die Götter in Menschengestalt. Als ich die Geschichte des Osiris näher betrachtete, bemerkte ich mit einiger Aufregung, daß er »aus dem Wasser gerettet« worden war.

Den ausführlichsten Bericht über die ursprünglich ägyptische Legende gibt Plutarch[28], der feststellt, daß Osiris Ägypten verließ und durch die Welt reiste, um die Wohltaten der Zivilisation auch anderen Nationen zu bringen. Während seiner Abwesenheit schlossen sich aber zweiundsiebzig Höflinge unter der Führung seines Schwagers Seth gegen ihn zusammen. Bei seiner Rückkehr luden ihn die Verschwörer zu einem Festessen ein, in dessen Verlauf demjenigen Gast, der genau hineinpassen würde, eine prachtvolle Kiste aus Holz und Gold als Preis versprochen wurde. Osiris wußte natürlich nicht, daß die Kiste genau nach seinen Körpermaßen gebaut worden war. Folglich gelang es keinem der anderen Gäste, sich in die Kiste zu legen. Als die Reihe am Gott-König war, legte er sich bequem in ihr nieder, und sofort stürzten die Verräter los, nagelten den Deckel fest und versiegelten sogar die Ritzen mit geschmolzenem Blei, so daß keine Luft zum Atmen mehr eindringen konnte. Dann wurde die Kiste auf dem Nil ausgesetzt und schließlich in den Sümpfen des östlichen Deltas angeschwemmt.[27]

Da aber griff Isis, Osiris' Gattin, ein. Unter Zuhilfenahme ihrer gesamten Zaubermacht und mit Unterstützung Thoths suchte und fand sie die Kiste und versteckte sie an einem geheimen Ort. Doch Seth entdeckte das Behältnis, öffnete den Deckel und zerstückelte in wilder Raserei den Leichnam in vierzehn Teile, die er im ganzen Land verstreute.

Noch einmal machte sich Isis auf, um ihren Mann zu »retten«. Sie baute ein kleines Boot aus Papyrusrohr, dichtete es mit Pech und Teer ab und fuhr mit ihm auf den Nil hinaus, um nach den Überresten des Körpers zu suchen. Nun bat sie abermals um den Beistand Thoths, der ihr half, die Teile mit einigen besonders mächtigen Zauberformeln wieder zusammenzusetzen. Osiris durchlief einen Auferstehungsprozeß und wurde zum Gott der Toten und König der Unterwelt, von wo er, wie die Legende berichtet, gelegentlich in menschlicher Gestalt auf die Erde zurückkehrte.[28]

Drei Einzelheiten dieser Geschichte fielen mir besonders auf: erstens die Tatsache, daß Osiris während seiner Erdenherrschaft Zivilisationen geschaffen und ihnen Gesetze gegeben hatte; zweitens, daß er in eine hölzerne Kiste gelegt und in den Nil geworfen wurde; und drittens, daß Isis sich in einem mit Pech und Teer abgedichteten Papyrusboot aufmachte, den Leichnam zu retten. Die Parallelen zum Leben Moses' konnten nicht auffälliger sein. Auch er sollte ein großes Volk begründen und die Gesetze des Judentums formulieren, auch er schwamm in einem Körbchen aus Papyrus, das mit Teer und Pech abgedichtet war, und auch er wurde von einer ägyptischen Prinzessin gerettet. Tatsächlich bedeutet ja der Name »Moses«, so zeichnete es der Historiker Josephus Flavius schon auf, »aus dem Wasser gerettet«[29], und Philo, der andere große klassische Kommentator, stimmte mit dieser Etymologie überein.[30]

Ich fragte mich, ob es in Ägypten - und vielleicht auch in Mesopotamien - weitere Beispiele zivilisationsschaffender Helden, die aus dem Wasser gerettet wurden, gegeben haben mochte. Meine Suche in alten Annalen und Legenden ergab, daß es sich tatsächlich so verhielt.

Horus beispielsweise, der Sohn von Isis und Osiris, wurde von Titanen ermordet und in den Nil geworfen. Isis wiederbelebte ihn mittels ihrer Zauberkraft und lehrte ihn die »Künste der Heilkunde und der Prophezeiung, die er hinfort zum Wohle der Menschheit anwendete«[31].

Auch Sargon der Große von Mesopotamien, dessen Herr-

schaft Sumer und den Nachbarländern im dritten vorchristlichen Jahrtausend unvergleichlichen Reichtum und Stabilität brachte[32], behauptete, aus dem Wasser errettet worden zu sein:

»Meine Mutter war Priesterin. Meinen Vater kannte ich nicht. Die Priesterin, meine Mutter, empfing und gebar mich im Verborgenen. Sie legte mich in ein aus Rohr gefertigtes Körbchen und verschloß den Deckel mit Pech. Sie setzte das Körbchen in den Fluß. Der trug mich davon und brachte mich zu Akki, einem Mann der für Trankopfer zuständig war. Akki blickte mit Freundlichkeit auf mich und barg mich aus dem Fluß.«[33]

Das Thema der Errettung aus dem Wasser zog sich auch sehr deutlich durch das Alte Testament. Der Prophet Jona zum Beispiel wurde während eines tobenden Unwetters in den See geworfen, bei lebendigem Leibe von einem riesigen Fisch verschluckt und nach drei Tagen an Land gespien, so daß er den Leuten von Ninive das Wort Gottes predigen und sie von ihrem frevelhaften Leben abbringen konnte.[34]

Und jedem vertraut ist die viel ältere Geschichte von Noah, der zusammen mit seiner Familie und den Tieren die Sintflut in einem bemerkenswerten Rettungsschiff überstand, das wir als die Arche kennen. Auch Noah begründete nach dieser Katastrophe eine neue Zivilisation.

Und war es nicht denkbar, daß die Taufe Jesu Christi im Jordan, wie sie im Markus-Evangelium beschrieben wird, nichts anderes war als die Initiation des Messias in das erleuchtete Wissen eines Geheimkultes, dessen Begründer Tausende von Jahren zuvor buchstäblich »aus dem Wasser gerettet« worden waren? Bezeichnenderweise hat Jesus erst nach diesem Ritus begonnen, seine Wunder zu wirken, von denen die meisten von den altägyptischen Hohenpriestern sofort als »magische Fähigkeiten« erkannt worden wären, weil sie sie selbst beherrschten.

Nach reiflicher Abwägung der vor mir liegenden Tatsachen trug ich folgendes in mein Notizbuch ein:

- Das Motiv eines Zivilisationsschöpfers, eines großen Propheten oder Messias', der auf die eine oder andere Weise aus

dem Wasser errettet worden ist, kommt in der Heiligen Schrift vor, in den Mythologien Ägyptens und des Nahen Ostens - und zwar so häufig und mit so vielen Übereinstimmungen, daß man nicht von Zufällen sprechen kann. Ich glaube also, daß die wirkliche Bedeutung dieses häufig vorkommenden Bildes in der Einweihung der betroffenen Individuen in eine geheime Weisheit liegt, die von den Überlebenden einer Flut sehr viel früher und mit der Absicht gegründet wurde, lebenswichtiges Wissen zu bewahren, das anderenfalls möglicherweise verloren gegangen wäre.

Bei meiner Argumentation hatte ich mich jedoch nicht nur auf Mythen und Legenden verlassen; ich war auch auf andere, geradezu greifbare Beweise gestoßen, die meine Interpretation des »Wasser-Motivs« unterstützten. Neben fast allen bedeutenderen Gräbern von Pharaonen und Würdenträgern und in der Nähe aller Pyramiden waren vollständige und seetüchtige Boote versteckt worden, ein Sachverhalt, der von den Archäologen bisher gemäß dem altehrwürdigen Spruch behandelt wurde: Wenn man einen Brauch nicht versteht, ist es am sichersten, ihn der Religion zuzuschreiben. Langsam dämmerte mir jedoch, daß die Praxis des Begrabens von Booten durchaus auch andere Gründe haben konnte, als den einfachen Wunsch, in der Nähe des Grabes ein »existentes Gegenbild des symbolischen Gefährtes, das die Seele des toten Königs zu seiner letzten himmlischen Bestimmung bringen würde«, zu installieren.[35]

Die alten Ägypter waren ungemein geschickt in der Herstellung von maßstabgetreuen Modellen und Darstellungen aller möglichen Gegenstände, die sie für verschiedene religiöse Zwecke verwendeten.[36] So kam es mir äußerst unwahrscheinlich vor, daß sie sich die Mühe gemacht haben sollten, ein so durchdachtes und erwiesenermaßen seetüchtiges Boot zu bauen und dann zu begraben, wenn sein einziger Zweck ein symbolischer war. Diese Funktion hätte genauso wirkungsvoll mit einem kleineren Boot erfüllt werden können. Hinzu kam, daß die ersten Begräbnisboote, die man in Ägypten entdeckt hatte, gerade aus der geheimnisumwitterten Periode vor der

I. Dynastie stammten, als Zivilisation und Technologie im Nil-Tal eine plötzliche und unerklärliche Veränderung erfuhren.[37] Ich konnte daher der Schlußfolgerung kaum widerstehen, daß das eigentümliche Verfahren eher mit der zu diesem Zeitpunkt bereits etablierten Tradition der »Rettung aus dem Wasser« zu tun hatte als mit irgendeinem rein religiösen Symbolismus. Robuste und seetüchtige Schiffe, so überlegte ich, mußten für eine Gruppe von Fremden, die eine Flut überlebt und sich nach ihrer Flucht vom Ort der Katastrophe in Ägypten niedergelassen hatten, von außerordentlicher Bedeutung gewesen sein. Vielleicht glaubten sie oder ihre Nachfahren, daß die begrabenen Boote eines Tages benötigt werden würden - nicht etwa um wiedergeborenen Seelen die Auffahrt zum Himmel zu ermöglichen, sondern vielmehr um für lebende Individuen erneut die Voraussetzung zu schaffen, einer schrecklichen Flutkatastrophe zu entkommen.

Verborgene Reichtümer

Die wirklich großen Werke Altägyptens wurden früh vollbracht. Die Zeit zwischen der III. und der V. Dynastie - grob geschätzt von 2900 bis 2300 vor Christus - stellt einen absoluten Höhepunkt dar; danach setzte ein stetiger Abwärtstrend ein.[38] Dieses allgemein akzeptierte Szenario stimmte meines Erachtens völlig mit der Theorie überein, daß die Zivilisation während des vierten vorchristlichen Jahrtausends ins Nil-Tal gekommen war. Nachdem die Ureinwohner ihr Wissensdefizit aufgeholt und die neuen Techniken erlernt hatten, gelangen ihnen immer durchdachtere Baudenkmäler.[39] Das Streben nach immer größerer Schönheit und Vollkommenheit fand - nach Ansicht mancher moderner Forscher - seinen höchsten Ausdruck in dem bemerkenswerten Begräbniskomplex König Djosers, des ersten Pharao der III. Dynastie. Ich stellte fest, daß Planung und Ausführung des gesamten Bauwerkes das Werk eines einzigen schöpferischen Genies war, des Baumeisters Imhotep, der in den alten

Überlieferungen auch Weiser, Zauberer, Architekt, Hoherpriester, Astronom und Arzt genannt wird.[40] Ich begann mich für diese legendäre Gestalt zu interessieren, weil spätere Generationen seine wissenschaftlichen und magischen Fähigkeiten so sehr betonten, daß er schließlich zum Gott erhoben wurde. Imhotep sah für mich ganz offensichtlich nach einem Kandidaten für den Thoth-Kult aus: Die Baudenkmäler in Sakkara legten, wie mir schien, beredtes Zeugnis dafür ab, daß er das dem Kult eigene technologische Wissen angenommen und hervorragend in die Praxis umgesetzt hatte.

Mit Befriedigung nahm ich zur Kenntnis, daß Imhotep in Inschriften oft als Ebenbild Thoths charakterisiert wird[41], aber auch als Nachfolger Thoths, nachdem der Gott in den Himmel aufgefahren war.[42] Dann erfuhr ich noch etwas Wichtigeres: Auch Moses wurde in der Antike mit Gott verglichen. Im zweiten Jahrhundert vor Christus füllte der jüdisch-griechische Philosoph Artapanus ein ganzes Werk mit solchen Vergleichen und schrieb dem Propheten übrigens eine Reihe bemerkenswerter und eindeutig »wissenschaftlicher« Erfindungen zu.[43]

Daß zwei zeitlich so weit voneinander entfernte Gestalten wie Moses und Imhotep ausdrücklich durch den Kult des Mondgottes verbunden waren, war für mich ein eindeutiger Indizienbeweis nicht nur für die Existenz einer geheimen Tradition von Weisheit, sondern auch für die lange Lebensdauer dieser Tradition. Also fragte ich mich, ob es andere Zauberer und Weise wie Imhotep gegeben hatte, denen der Bau besonders komplexer und hochentwickelter Bauwerke zugeschrieben wird.

Leider ist kein Bericht über den Architekten der Cheopspyramide erhalten, die eine glanzvolle Krönung der IV. Dynastie und zugleich den Zenit der ägyptischen Zivilisation darstellte. Nur die XIX. Dynastie (1580 bis 1200 vor Christus) sollte noch einmal einen bemerkenswerten Aufschwung erleben. Die Krönung dieser Ära, die mich mit Ehrfurcht erfüllte, war der wunderschöne Obelisk der Königin Hatschepsut in Karnak. Und ganz in der Nähe, am Westufer des Nils, hatte dieselbe Monarchin einen massiven Totentempel in Auftrag gegeben, der in

späteren Zeiten zu den großen architektonischen Meisterwerken der Welt zählen sollte.

Der für beide Bauwerke verantwortliche Architekt hieß Senmut. Interessanterweise ließ eine von ihm selbst verfaßte Inschrift auf der Wand seines Grabes keinen Zweifel daran, daß er seine besonderen Kenntnisse und Fähigkeiten erst erworben hatte, nachdem er zu den Mysterien einer alten und geheimen Überlieferung zugelassen worden war. »Nachdem ich die Schriften der göttlichen Propheten durchdrungen hatte«, prahlte er, »war mir nichts mehr verborgen, was seit Anbeginn der Zeiten geschehen ist.«[44]

Man könnte mutmaßen, schrieb ich in mein Notizbuch, daß Moses, der kaum zweihundert Jahre nach Senmut lebte, ein Eingeweihter derselben Geheimüberlieferung war, die sich über Imhotep zu den Gott-Königen Thoth und Osiris bis weit in die Vergangenheit zurückerstreckte und in der Zukunft selbst große Wissenschaftler und Zivilisationsschöpfer wie Jesus Christus einschloß. Wenn auch nur etwas an dieser Hypothese ist, konnten dann nicht auch außergewöhnliche Denker unserer Jahrtausende zu den Erben dieses okkulten Wissens gehören, eines Wissens, das die Erbauer der Pyramiden und Obelisken inspirierte und es Moses ermöglichte, seine Wunder zu vollbringen?

Noch einmal kehrte ich zu den Tempelrittern zurück, die nach ihren Grabungen in Jerusalem in der Lage waren, Kirchen und Burgen zu errichten, die in architektonischer Hinsicht anderen Gebäuden des zwölften und dreizehnten Jahrhunderts weit überlegen waren. War es nicht möglich, daß die Templer dieselbe Tradition weiterführten, mit der schon Moses, Senmut und Imhotep in Berührung gekommen waren? Und war es dann nicht auch möglich, daß die Suche der Templer nach der Bundeslade in Verbindung mit dieser Tradition stand? Mehr als eine alte jüdische Überlieferung versicherte, die Lade habe »die Wurzel allen Wissens« enthalten.[45] Es lag also nur nahe, daß die Suche nach der Bundeslade zugleich die Suche nach der absoluten Weisheit bedeutet haben mußte, zumal die Templer im Verlauf der Gerichtsverfahren, denen sie sich im frühen vier-

zehnten Jahrhundert hatten unterziehen müssen, angaben, sie hätten eine geheimnisvolle Figur namens »Baphomet« angebetet. Ein Wissenschaftler zeigte auf, daß dieses Wort dem griechischen »sophia« entspricht[46], was wiederum nicht mehr und nicht weniger bedeutet als »Weisheit«[47].

Dieser Analyse zufolge verehrten die Templer also das Prinzip der Weisheit. Und genau das war es natürlich, was die Ägypter taten, wenn sie Thoth als »Verkörperung des Geistes Gottes« anbeteten[48], als den »Schöpfer aller Zweige des Wissens, des menschlichen wie auch des göttlichen«[49].

Auch die Freimaurer hielten Thoth in besonderen Ehren. Eine sehr alte Freimaurer-Überlieferung gibt an, Thoth »habe eine Hauptrolle in der Bewahrung des freimaurerischen Handwerks und seiner Weitergabe an die Menschheit nach der Flut« gespielt.[50] Derselbe Verfasser behauptete in seiner gut dokumentierten akademischen Studie sogar, die Freimaurer hätten in ihren frühen Tagen Thoth als Schutzherrn betrachtet.[51] Daß es enge Verbindungen zwischen den Templern und den Freimaurern gab, wußte ich. Die letzteren stammten mit großer Sicherheit von den ersteren ab. Jetzt erkannte ich, daß der Thoth-Kult das verbindende Element einer alten, über Jahrtausende andauernden Wissenstradition darstellte, die bis in die Zeit der Pharaonen zurückreichte. Als nächstes wollte ich herausfinden, ob es neben den Templern und den Freimaurern auch andere Gruppen oder Einzelpersonen gegeben hatte, deren Werke und Ideen zu ihrer Zeit so ungewöhnlich und fortschrittlich waren, daß sie als Eingeweihte derselben Weisheitstradition gelten konnten.

Es gab sie. Kopernikus beispielsweise, der große Renaissance-Gelehrte, dessen Theorie eines heliozentrischen Universums die erdbezogene Selbstzufriedenheit des finsteren Mittelalters über den Haufen geworfen hatte, sprach ziemlich offen davon, daß er zu seinen revolutionären Einsichten nur durch das Studium der geheimen Schriften der Ägypter und der Werke des Thoth selbst gekommen sei.[52] Auch Kepler, der berühmte Mathematiker des siebzehnten Jahrhunderts, gab zu, daß er nur

das »wertvolle Rüstzeug der Ägypter stahl«, als er seine Gesetze über den Lauf der Planten formulierte.[53]

Im gleichen Tenor verkündete Sir Isaac Newton, daß »die Ägypter Geheimnisse, die jenseits des Fassungsvermögens der gemeinen Masse lagen, hinter dem Schleier religiöser Rituale und hieroglyphischer Symbole verbargen«[54]. Unter diesen Geheimnissen befand sich auch, so glaubte er, das Wissen, daß die Erde um die Sonne kreiste, und nicht umgekehrt.[55]

Zu den großen Leistungen des englischen Gelehrten gehörte die Aufstellung des Gravitationsgesetzes, das die menschliche Vorstellung vom Kosmos für immer veränderte. Wenige jedoch wußten, daß sich Newton einen bedeutenden Teil seines Lebens auch in esoterische und alchimistische Literatur vertieft hatte. Über ein Zehntel seiner Privatbibliothek bestand aus alchimistischen Abhandlungen.[56] Ferner war er buchstäblich besessen von der Vorstellung, daß in den Seiten der Heiligen Schrift eine Geheimweisheit verborgen liege. Ganz besonders zogen ihn das alttestamentarische Buch Daniel und das Johannes-Evangelium an: Denn »die Sprache der prophetischen Schriften bestand aus Symbolen und Hieroglyphen, und ihr Verständnis erforderte eine radikal neue Methode der Auslegung«[57].

Als ich mich näher mit Newton beschäftigte, begann ich zu verstehen, warum er so sehr bestrebt war, neue exegetische Wege zu finden. Er hatte sich auf eine anstrengende Untersuchung von ungefähr zwanzig verschiedenen Versionen des Buches der Offenbarung eingelassen und dafür sogar Hebräisch gelernt.[58] Dieselbe Übung exerzierte er mit dem Buch Ezechiel durch[59] und konnte aufgrund seiner Ergebnisse eine exakte Rekonstruktion des Grundrisses des Tempels Salomos herstellen. Warum? Weil er davon überzeugt war, daß das große Gebäude, das in seinem Herzen die Bundeslade barg, eine Art Kryptogramm des Universums war; und wenn er dieses Kryptogramm dechiffrieren konnte, dann, so glaubte er, würde er den Geist Gottes kennen.[60]

Newtons umfangreiche »theologische« Entdeckungen kamen

erst Mitte unseres Jahrhunderts ans Licht der Öffentlichkeit und wurden auf einer Auktion von John Maynard Keynes ersteigert: »Newton war nicht der erste Aufklärer«, teilte der sichtlich erschütterte Besitzer später der Royal Society mit, »er war der letzte Magier, der letzte Babylonier und Sumerer, der letzte große Geist, der mit denselben Augen die Welt betrachtete wie die, die vor nicht weniger als zehntausend Jahren unser intellektuelles Erbe zu errichten begannen.«

Keynes untersuchte die Manuskripte außerordentlich genau und kam zu dem - meines Erachtens bezeichnenden - Schluß, daß Newton »das ganze Universum als ein einziges Rätsel begriff, als Geheimnis, das gelesen werden konnte, wenn man reines Denken auf bestimmte Zeichen anwandte, auf besondere geheime Schlüssel, die Gott in der Welt verborgen hatte, um der Bruderschaft der Esoteriker eine Art philosophischer Schatzsuche zu ermöglichen. Er glaubte, daß diese Schlüssel teilweise im Zeugnis der Himmel und in der Zusammensetzung der Elemente zu finden wären, aber auch in gewissen Aufzeichnungen und Überlieferungen, die seit der ursprünglichen Enthüllung des Mysteriums von den Eingeweihten in einer ununterbrochenen Kette weitergegeben worden waren .. .«[61]

Ich wußte, daß ich möglicherweise nie würde beweisen können, daß die fragliche Bruderschaft direkt mit den okkulten Traditionen des Mondgottes Thoth verbunden war - und mit jenen »aus dem Wasser erretteten« Wissenschaftlern und Zivilisationsschöpfern. Und doch hatte ich den Eindruck, daß es zumindest für eine interessante Tatsache genug Beweise gab. Hinsichtlich seiner großen Entdeckungen hatte Newton mehrfach darauf hingewiesen, daß er nicht nur aus seinem eigenen Genie, sondern auch aus einer sehr alten und geheimen Sammlung von Weisheit schöpfen konnte. Newton zufolge war das in den *Principia* entwickelte Gesetz der Schwerkraft keineswegs neu. Schon in früheren Zeiten habe man es gekannt und verstanden; er selbst habe es durch die Dechiffrierung der Geheimliteratur der Vergangenheit wiedergefunden.[62] Zudem schloß Newton sich dem deutschen Physiker und Alchimisten Michael

Mayer (1568-1622] an, der behauptet hatte, alle wahren Anhänger der Wissenschaften im Verlauf der Geschichte hätten ihr Wissen vom ägyptischen Mondgott abgeleitet.[63]

In der Biographie des englischen Gelehrten stieß ich auf viele Merkwürdigkeiten. Newton hatte sich von dem Gedanken faszinieren lassen, daß es eine »allgemein verbreitete Tradition von Flutkatastrophen bei den alten Völkern« gegeben habe[64], und sich ungemein für die biblische Ansicht interessiert, Noah sei der Urahne der gesamten Menschheit.[65] Am allermeisten jedoch beeindruckte mich, daß die zentrale Gestalt in Newtons Theologie und in seiner Vorstellung von der frühen Wissenschaft niemand anderes als Moses war, von dem er annahm, er sei ein Meister der Alchimie gewesen und Zeuge der doppelten Offenbarung Gottes, die sich in Worten und Taten ausdrückt.[66]

Newton glaubte, daß Moses viele Jahrhunderte vor unserer eigenen aufgeklärten Zeit verstanden habe, daß die Materie aus Atomen bestand. So deutete er die Moses zugeschriebene biblische Schöpfungsgeschichte als allegorische Beschreibung eines alchimistischen Prozesses.[67] Es überraschte mich also kaum, daß Newtons Lieblingsstelle in der Bibel[68] auf die Existenz einer Form verborgenen Wissens hinwies, das nur Eingeweihten zugänglich war: »... und ich will dir geben die heimlichen Schätze und die verborgenen Kleinode, auf daß du erkennest, daß ich, der Herr, der Gott Israels, dich bei deinem Namen genannt habe.«[69]

Nun, es war ein wirklich gewagtes Unterfangen, die Umrisse jener verschwiegenen Sekte darzustellen, die für die Überlieferung des alten Wissens garantierte. Weitaus gewagter war aber die Aufgabe, die wirkliche Natur der Wissenschaft und Technologie zu erraten, die von einer so langlebigen und geheimnisbewahrenden Institution wie dem Thoth-Kult beschützt und tradiert wurde. Mir war klar, daß die Erfindungen und Maschinen unseres Jahrhunderts keine Orientierungshilfe darstellten. Im Gegenteil: Eine vor vielen Jahrtausenden existierende hochentwickelte Gesellschaft verfügte höchstwahrscheinlich über ganz andere Wissensformen, und man muß annehmen, daß ihre Ma-

schinen in einer Weise funktioniert haben, die uns heute unbekannt ist.

Ein gewaltiges Instrument

Von solchen Gedanken bewegt, wandte ich mich erneut den Büchern Mose zu, in denen der Prophet seine Begegnung mit Gott auf dem Berg Sinai beschreibt. Mit Donner und Feuer, elektrischen Stürmen und Rauchwolken enthüllte Jahwe dem hebräischen Zauberer angeblich den Bauplan für die Bundeslade und übergab ihm die steinernen Tafeln mit den Zehn Geboten. Dann wurde die Lade vom Handwerker Bezaleel gebaut, der sklavisch genau die göttlichen Anweisungen befolgte, als ob er gewußt habe, daß er da ein gewaltiges Instrument schmiedete.

Und in der Tat, genau das, vermutete ich, war die Bundeslade auch: ein gewaltiges Instrument, das unkontrolliert und mit katastrophalen Folgen furchtbare Energien freisetzen konnte, wenn es in irgendeiner Weise falsch benutzt oder mißbraucht wurde, ein Instrument, das nicht vom Geist Gottes ersonnen worden war, wie die Bibel lehrt, sondern von Moses selbst.

Alles in allem war es durchaus möglich, daß Moses zu einer Zeit, in der Zauberei und Wissenschaft kaum zu unterscheiden waren, das technische Wissen - und folglich die Fähigkeit - gehabt hat, ein Gerät dieser Art zu entwerfen. Natürlich gibt es dafür keine Beweise. Aber man darf nicht vergessen, daß die alten Weisheitstraditionen Ägyptens durchaus besondere Fertigkeiten oder technologische Verfahrensweisen ermöglicht haben konnten, auf die der Prophet zurückgriff, um der Bundeslade die fürchterlichen Kräfte zu verleihen.

Wenn Moses eine solche Maschine also bauen konnte, fragte sich nur noch, welchen Grund er dafür hatte und ob sich die *Möglichkeit* ergab, diesen Plan auch in die Tat umzusetzen.

Gute Gründe gab es genug. Manches weist daraufhin, daß er weniger den jüdischen Glauben begründen wollte (obgleich er das sicherlich tat), als die Israeliten zu zivilisieren, die vor dem

Auszug aus Ägypten wenig mehr waren als ein loser Stammesverbund von unterdrückten Arbeitern.

Nehmen wir einmal an, daß Moses den Entschluß faßte, diese primitive und kaum regierbare Gruppe von Beduinen zu begeistern (und damit in Bewegung zu bringen), indem er sie davon überzeugte, daß er sie in das Gelobte Land bringen würde, das er verführerisch als »ein gutes und weites Land« geschildert hatte, »darin Milch und Honig fließt«[70]. Moses war zudem ein viel zu schlauer Führer und scharfsinniger Richter menschlicher Schwächen, als daß er den unorganisierten Pöbelhaufen direkt dorthin geführt hätte. Er wußte genau, daß sie im Gelobten Land auch auf Widerstand stoßen würde, so daß er sie erst einmal formen und bilden, sie seinem Willen beugen und ihnen einige Disziplin aufzwingen mußte, bevor sie diese Feinde besiegen könnten.

Nur so war im übrigen etwas ansonsten einigermaßen Unsinniges zu erklären, nämlich die Tatsache, daß die Israeliten angeblich vierzig Jahre durch die lebensfeindlichen Wüsten der Sinai-Halbinsel wanderten. Zu dieser Zeit gab es nämlich mindestens zwei wohlbekannte und vielgenutzte Handelsstraßen, die es Reisenden normalerweise ermöglichten, die Wüste zwischen Ägypten und Kanaan in wenigen Tagen zu durchqueren.[71] Moses' Entscheidung, diese Routen zu meiden und seinem Volk eine lange und gefahrvolle Zeit aufzuerlegen, konnte nur eine wohlüberlegte Strategie gewesen sein, die aus der Überzeugung resultierte, daß dies die beste Möglichkeit war, die Israeliten in Form zu bringen, bevor sie das Gelobte Land eroberten.[72]

Aber natürlich muß eine solche Strategie auch ihre Kehrseite gehabt haben. Sie bestand vor allem in der Schwierigkeit, die Leute des Stammes davon zu überzeugen, daß sie zusammenhalten und alle Schwierigkeiten und Entbehrungen auf sich nehmen sollten. Sehr schnell konnte Unzufriedenheit entstehen, und manchmal kam es sogar zu offener Rebellion.[73]

Es lag nur nahe, daß der Prophet die Notwendigkeit erkannt hatte, sich mit einer Art tragbaren »Wundermaschine« auszurü-

sten, um sicherzustellen, daß sein Volk ihm gehorchte, ganz gleich, wie schwierig die Umstände waren. Es ist nicht schwer, in der Bibel Beispiele für genau diese Verwendung des heiligen Gegenstandes zu finden. Nach dem Bau der Lade hat anscheinend eine dramatische Veränderung in Moses' Verhalten stattgefunden. Vorher reagierte er auf die unaufhörlichen Forderungen und Klagen der Israeliten mit vergleichsweise unbedeutenden Taschenspielertricks: In der Wüste schlug er mit seinem Stab an den Fels und ließ frisches Wasser aus ihm sprudeln[74], er füllte einen ausgetrockneten Teich mit Trinkwasser[75] oder ließ Brot vom Himmel regnen.[76] Später aber richtete der Prophet einfach die Lade gegen das Volk, wenn es murrte oder ihm die Führung streitig machen wollte.

So wurde seine Schwester Mirjam, die seine Autorität in Frage gestellt hatte, mit einem entstellenden Hautausschlag gestraft - mit Wunden, die auftraten, nachdem sie der geheimnisvollen Wolke ausgesetzt war, die gelegentlich zwischen den Cherubim erschien.[77] Bereits hier fragte ich mich, ob die Verletzungen nicht viel eher von einem chemischen oder anderen hochwirksamen Stoff ausgelöst worden waren, den die Lade absonderte.

Abtrünnige, die nicht zur Priesterfamilie gehörten, wurden in der Regel sehr viel härter bestraft. Nach einer Meuterei, in der die Macht von Moses und Aaron offen in Frage gestellt wurde, ereignete sich eine Reihe besonders aufschlußreicher Vorfälle:

»Und Korah samt Dathan und Abiram empörten sich wider Mose samt etlichen Männern unter den Kindern Israel, zweihundertundfünfzig Leute ... Und sie versammelten sich wider Mose und Aaron und sprachen zu ihnen: Ihr macht's zuviel. Denn die ganze Gemeinde ist überall heilig, und der Herr ist unter ihnen; warum erhebt ihr euch über die Gemeinde des Herrn?«[78]

Moses schlug auf diese Anschuldigungen hin folgenden »Test« vor: Um herauszufinden, ob die zweihundertfünfzig Rebellen wirklich so »heilig« waren wie er selbst, sollten alle Räucherwerk in eine bronzene Pfanne tun und es dann vor der

Bundeslade verbrennen. »Welchen der Herr erwählt, der sei heilig.«[79]

Die Herausforderung wurde angenommen. »Und jeglicher nahm seine Pfanne und legte Feuer darein und tat Räucherwerk darauf; und sie traten vor die Tür der Hütte des Stifts, und Mose und Aaron auch.«[80] Kaum hatte sich die Versammlung zusammengefunden, »da erschien die Herrlichkeit des Herrn«[81]. Offenbar warnte Jahwe seine Auserwählten in letzter Minute vor dem, was nun folgte:

»Und der Herr redete mit Mose und Aaron und sprach: Scheidet euch von dieser Gemeinde, daß ich sie plötzlich vertilge ... Dazu fuhr das Feuer aus von dem Herrn und fraß die zweihundertfünfzig Männer, die das Räucherwerk opferten.«[82]

Das Volk hatte eine heilsame Lektion lernen müssen. Nachdem die Macht der Lade es besiegt hatte, zettelte es keine Rebellion mehr an. Im Gegenteil, nun schwenkten die Israeliten ganz auf Moses' Linie ein und taten hinfort genau das, was er von ihnen verlangte.

Soviel zur Frage des Motivs, warum Moses ein Machtinstrument benötigte. Aber noch immer galt es, einen anderen wichtigen Punkt zu untersuchen: War er überhaupt in der Lage, einen Bauplan für die Lade auszuarbeiten und dieses »Kraftpaket« auch herzustellen?

Die Antwort lautete ja: Moses war geradezu prädestiniert dafür. Noch einmal rief ich mir die Hauptereignisse aus Moses' Leben in chronologischer Reihenfolge in Erinnerung:

- Er wurde in Ägypten geboren.
- Er wurde in einem mit Pech und Teer abgedichteten Korb auf dem Nil ausgesetzt.
- Er wurde von der Tochter des Pharao »aus dem Wasser errettet«.
- Er wurde im königlichen Haushalt großgezogen, wo er »alle Weisheit der Ägypter« lernte - und so ein Zauberer sowie höchstwahrscheinlich auch ein Hohepriester wurde.
- Der Bibel zufolge erfuhr er mit vierzig Jahren, daß sein eigenes Volk, die Israeliten, von den Ägyptern unterdrückt wurde.

Er fand heraus, daß sie Tag und Nacht harte Fronarbeit leisten mußten. Er entbrannte in Zorn über diese grausame Behandlung und den Hochmut der Ägypter, verlor die Beherrschung, brachte einen Aufseher um und floh ins Exil.[83]

- Mit achtzig Jahren[84] - das heißt vierzig Jahre später! - kehrte er aus dem Exil zurück, um die Israeliten aus der Gefangenschaft zu führen.

Was geschah während dieser vierzig Jahre? Die Bibel ist ungewöhnlich wortkarg in dieser Frage, sie widmet dem gesamten Zeitabschnitt gerade elf Verse.[85] Eines jedoch macht sie unmißverständlich klar: Das Schlüsselerlebnis dieser langen Zeit war die Begegnung Moses' mit Jahwe im brennenden Dornbusch, eine Begegnung, die am Fuße des Berges Sinai stattfand, genau da, wo später die Bundeslade gebaut werden sollte.

Ist es nicht möglich, daß Moses sich mit der gefahrvollen Wildnis der Sinai-Halbinsel vollkommen vertraut machen wollte, bevor er die Israeliten dazu überredete, ihm durch das Rote Meer zu folgen? Der Ort, an dem das Erlebnis mit dem brennenden Dornbusch stattfand, läßt kaum einen Zweifel daran, daß er wenigstens einen Teil seines vierzigjährigen Exils in diesen entlegenen und gebirgigen Wüsten zubrachte. Ja, es ist sogar möglich, daß er die meiste oder die ganze Zeit dort verbrachte - eine Vorstellung, für die es eine gewisse akademische Unterstützung gibt. Einem gelehrten Ägyptologen zufolge hätte Moses durchaus ein Vierteljahrhundert im Sinai zubringen können. Er hätte dann in einer Siedlung auf einem Berg namens Serabit-el-Khadem gelebt, der kaum achtzig Kilometer vom Berg Sinai entfernt liegt.[86]

Im Juni 1989 besuchte ich den Serabit-el-Khadem im Südwesten der Sinai-Halbinsel. Auf dem abgeflachten Gipfel des Berges, der inmitten eines kargen und wüsten Hochlandes liegt, befinden sich noch heute die Überreste der Siedlung, in der Moses gelebt haben könnte. Die Ruinen werden beherrscht von Obelisken, Altären und anmutigen Säulen, und man vermutet, daß hier einmal ein großer ägyptischer Tempel gestanden haben muß. Ich überlegte, daß sich Moses als Hohepriester der

altägyptischen Religion hier wohlgefühlt haben mußte. Und wenn er wirklich vor dem Zorn des Pharao geflohen war (wie die Bibel behauptet], dann konnte er sich an diesem abgelegenen und unbekannten Ort auch relativ sicher gefühlt haben.

Ich beschloß, mehr über Serabit-el-Khadem herauszufinden. Im Verlauf dieser Arbeit kamen zwei bezeichnende Tatsachen heraus. Zunächst erfuhr ich, daß die Tempelanlage 1904 und 1905 von dem britischen Archäologen Sir William Flinders Petrie untersucht worden war und daß er Fragmente verschiedener Steintafeln ausgegraben hatte.[87] Diese Tafeln trugen Inschriften in einer unbekannten Bilderschrift, die man erst viel später einer semitisch-keltischen Sprache zuordnen konnte, die wiederum mit dem Althebräischen verwandt war.[88]

Zweitens fand ich heraus, daß die Siedlung ungefähr zwischen 1990 und 1190 vor Christus ein bedeutendes Zentrum der Förderung und Verarbeitung von Kupfer und Türkis war.[89] Moses konnte sich im dreizehnten vorchristlichen Jahrhundert also durchaus hier aufgehalten haben - unmittelbar vor dem Exodus. Und als weitere Untermauerung dieser Vorstellung mußte gelten, daß hier zur selben Zeit ein dem Hebräischen verwandtes Alphabet verwendet wurde. Wirklich interessant aber war, daß Serabit sozusagen ein Standort für metallverarbeitende Industrie war und daß in der Gegend mehrere Bergwerke lagen. Mir schien es ziemlich wahrscheinlich, daß Moses, wenn er wirklich längere Zeit hier gelebt hatte, sich gut mit den Mineralien und Erzen des südlichen Sinai ausgekannt hatte.

Nach meinem Besuch auf dem Serabit fuhr ich mit einem Jeep die fünfundsiebzig Kilometer durch die Wüste zum Berg Sinai. Nur gelegentlich stieß ich auf grüne Flecke in den Tälern - und eine solche Oase mit vielen Dattelpalmen gibt es am Fuße des Berges Sinai. Ich war mir sehr wohl bewußt, daß nicht zweifelsfrei erwiesen werden konnte, welcher der drei nahe beieinanderliegenden Berge als der in der Bibel erwähnte »Berg Sinai« gelten konnte. Tatsache ist aber, daß die mindestens bis ins vierte Jahrhundert zurückreichenden mönchischen Traditionen (denn seit dieser Zeit gibt es hier eine Kapelle, die im

fünften Jahrhundert sogar zu einem befestigten Kloster erweitert wurde[90]) einen bestimmten Gipfel mit dem »Berg Gottes« gleichgesetzt hatten, was mit einiger Sicherheit auf der Basis verläßlicher, aber inzwischen verlorener Informationsquellen geschehen war.[91] Darüber hinaus wußte ich von entsprechenden Stammestraditionen der Beduinen, deren Name für den Berg Sinai einfach »Dschebel Musa«, »Berg des Moses« lautete.[92]

Auch wissenschaftliche Studien haben den biblischen Berg Sinai mit dem Gipfel gleichen Namens identifiziert, und die wenigen abweichenden Stimmen bevorzugten nicht etwa eine andere Gegend, sondern eher nahegelegene Gipfel derselben Bergkette, zum Beispiel den »Dschebel Serbal«[93].

Ich muß zugeben, daß ich nach meiner Besteigung des Sinai im Juni 1989 nicht mehr daran zweifelte, daß dies wirklich der Berg war, zu dem Moses die Israeliten nach dem Auszug aus Ägypten gebracht hatte. An diesem rauhen und unwirtlichen Ort überlegte ich mir, daß Moses sich kaum eine dramatischere - und somit geeignetere - Stelle hätte aussuchen können, um die Zehn Gebote aus der Hand Gottes zu empfangen.

Aber war das wirklich der Grund, warum der hebräische Zauberer zum Berg Sinai gekommen war? Ich konnte mir nämlich auch ein anderes Szenario vorstellen. War es nicht möglich, daß seine eigentliche Absicht darin bestand, die Bundeslade zu bauen und in diese eine gewaltige Energiequelle hineinzulegen, deren Rohstoff er, wie er wußte, auf diesem Berggipfel finden würde?

Das ist natürlich eine außerordentlich gewagte These, aber es ist ja ohnehin Spekulation, die wir hier betreiben, und wir sollten uns den Raum für ein wenig »künstlerische Freiheit« gönnen.

Also, wenn Moses von der Existenz einer derart energetischen Substanz auf dem Gipfel des Berges Sinai wußte, was für eine Substanz könnte das gewesen sein? Für mich bestand ein Vorschlag darin, daß die steinernen Gesetzestafeln in Wirklichkeit Stücke eines Meteoriten waren. Diese interessante Möglichkeit wird von einigen Bibelforschern sehr ernst genommen.

Sie weisen auf die Anbetung von Meteoritensplittern in alten semitischen Kulturen hin[94] und fügen hinzu, daß »es einigermaßen merkwürdig scheint, daß Gesetzestafeln in einem geschlossenen Behälter verborgen werden mußten. In Stein geschnittene Gesetzesworte sollten doch eher öffentlich ausgestellt werden. Man kann daher vermuten, daß die Lade nicht zwei Gesetzestafeln enthielt, sondern einen Fetisch-Stein, einen Meteoriten vom Berg Sinai.. .«[95]

Träfe diese Einschätzung zu, so wären den Mutmaßungen, woraus genau der »Meteorit vom Berg Sinai« bestanden haben mag, Tür und Tor geöffnet. Auf alle Fälle war der Gedanke nicht abwegig, daß er radioaktive Strahlungen oder chemische Eigenschaften besessen haben konnte, die Moses mit Sicherheit genutzt hätte, um seine Bundeslade mit einer machtvollen und dauerhaften Energiequelle auszurüsten.

Die Vorstellung, daß er irgend etwas auf dem Gipfel des Berges hergestellt haben könnte, wird von der Bibel keineswegs ausgeschlossen. Im Gegenteil, viele Stellen in Buch Exodus sind eigentümlich und verwirrend genug, um eine solche Interpretation zu ermöglichen.

Die Erscheinung Gottes vor seinem Diener begann, unmittelbar nachdem sich die Israeliten »gegenüber dem Berge« gelagert hatten. »Und Mose stieg hinauf zu Gott. Und der Herr rief ihn vom Berge.«[96] Zu diesem frühen Zeitpunkt erwähnt die Bibel noch keinen Rauch, kein Feuer oder irgendeine der anderen Erscheinungen, die später ins Spiel kamen. Statt dessen bestieg der Prophet einfach den Berg und hielt eine Unterredung mit Jahwe ab, eine Unterhaltung, für die es keine Zeugen gab. Bezeichnenderweise lautete einer der ersten Befehle Gottes:

»Und mache dem Volk ein Gehege umher und sprich zu ihnen: Hütet euch, daß ihr nicht auf den Berg steiget noch sein Ende anrühret; denn wer den Berg anrührt, soll des Todes sterben.«[97]

Es bedarf keiner Erwähnung, daß es für Moses gute Gründe für die Errichtung einer so strengen Sperrzone gab, wenn er wirklich an die Herstellung oder Verarbeitung einer gefähr-

lichen Substanz auf dem Berg Sinai gedacht hatte; niemand würde es wagen nachzusehen, was er dort eigentlich trieb. Zudem konnte Moses die Illusion aufrechterhalten, er treffe sich mit Gott. Jedenfalls begann das Drama erst wirklich, nachdem er drei Tage auf dem Berg zugebracht hatte:

»Als nun der dritte Tag kam und es Morgen war, da erhob sich ein Donnern und Blitzen und eine dicke Wolke auf dem Berge und ein Ton einer sehr starken Posaune; das ganze Volk aber, das im Lager war, erschrak. Der ganze Berg Sinai aber rauchte, darum daß der Herr auf den Berg herab fuhr mit Feuer; und sein Rauch ging auf wie ein Rauch vom Ofen .. .«[98]

Moses scheint ursprünglich nur einen Teil seiner Zeit allein auf dem Gipfel verbracht zu haben und oft im Lager gewesen zu sein. Bald aber teilte ihm Gott folgendes mit: »Komm herauf zu mir auf den Berg und bleibe daselbst, daß ich dir gebe steinerne Tafeln und Gesetze und Gebote, die ich geschrieben habe ...«[99] Der Aufstieg des Propheten wurde von weiteren Erscheinungen begleitet:

»Da nun Mose auf den Berg kam, bedeckte eine Wolke den Berg, und die Herrlichkeit des Herrn wohnte auf dem Berge Sinai und deckte ihn mit der Wolke sechs Tage, und er rief Mose am siebten Tage aus der Wolke. Und das Ansehen der Herrlichkeit des Herrn war wie ein verzehrendes Feuer auf der Spitze des Berges vor den Kindern Israel. Und Moses ging mitten in die Wolke und stieg auf den Berg und blieb auf dem Berge vierzig Tage und vierzig Nächte.«[100]

Hätte ein allmächtiger Gott vierzig Tage und vierzig Nächte benötigt, um seinem Propheten zwei Steintafeln zu übergeben? Wenn aber Moses überhaupt keine Gesetzestafeln erhalten hatte, wenn er statt dessen eine kompakte, steinartige Energiequelle, die in der Lade installiert werden sollte, hergestellt oder veredelt hatte, dann konnte er sehr wohl so viel Zeit gebraucht haben, um seine Arbeit zu vollenden.

So gesehen, wäre das »verzehrende Feuer« auf dem Berggipfel, das die Israeliten als »Herrlichkeit des Herrn« interpretierten, in Wirklichkeit die höllische Glut gewesen, die von den

Geräten und chemischen Prozessen ausging, die der Prophet einsetzte, um sein Ziel zu erreichen. Und obgleich diese Hypothese weithergeholt klingt, entspricht sie doch in vieler Hinsicht den merkwürdigen Informationen über die Steintafeln im Alten Testament, in Mischna, Midrasch und Talmud sowie den meisten alten jüdischen Legenden.

Steintafeln?

Die deutlichsten Beschreibungen der Tafeln finden sich im Midrasch und im Talmud, die folgende Informationen geben: 1. Sie bestanden aus einem »saphirartigen Stein«; 2. sie waren »nicht mehr als sechs Hände lang und ebenso breit«, aber dennoch außerordentlich schwer; 3. obwohl fest, waren sie zugleich biegsam; 4. sie waren durchsichtig.[101]

Man sollte vermuten, daß Moses sehr auf diese einzigartigen Gegenstände aufpaßte. Er tat jedoch nichts dergleichen. Statt dessen zerbrach er die reinen und vollkommenen Geschenke in einem Wutanfall. Warum tat er so etwas Unbegreifliches? Die Erklärung im zweiten Buch Mose dafür ist, daß die treulosen Israeliten die Hoffnung verloren hatten, daß er nach vierzig Tagen auf dem Berg jemals wiederkommen würde, so daß sie ein Goldenes Kalb fabrizierten und anbeteten. Beim Anblick dieser grotesken Abtrünnigkeit »ergrimmte er mit Zorn und warf die Tafeln aus seiner Hand und zerbrach sie unten am Berge«[102]. Daraufhin zerstörte er das Goldene Kalb, ließ ungefähr dreitausend der schlimmsten Götzenanbeter hinrichten und stellte die Ordnung wieder her.[103]

Soviel also zur offiziellen Erklärung, warum und wie die ursprünglichen Steintafeln zerbrochen wurden. Offenbar waren diese Gegenstände aber von lebenswichtiger Bedeutung und mußten folglich ersetzt werden. Also befahl Gott Moses, wieder auf den Berggipfel zu kommen, um zwei neue Tafeln entgegenzunehmen. Der Prophet tat, wie ihm geheißen: »Und er war allda bei dem Herrn vierzig Tage und vierzig Nächte und aß kein Brot

und trank kein Wasser. Und er schrieb auf die Tafeln die Worte des Bundes, die Zehn Worte.«[104]

Wie zuvor stieg Moses mit den Tafeln in seiner Hand den Berg hinab. Die aufmerksame Lektüre der entscheidenden biblischen Stellen enthüllt einen einzigen, aber substantiellen und signifikanten Unterschied zwischen den beiden Abstiegen: Beim zweiten Mal glänzte »die Haut seines Angesichts davon«[105]. Beim erstenmal wurde dieses seltsame Phänomen mit keinem Wort erwähnt.

Was konnte die Ursache für dieses Glänzen sein? Der biblische Verfasser nimmt natürlich an, daß es die Nähe zu Gott war, und erklärt: »Die Haut seines Angesichts glänzte davon, daß er mit ihm geredet hatte.«[106] Aber schon zuvor war Moses bei etlichen Gelegenheiten - angefangen bei dem Vorfall mit dem brennenden Dornbusch - seinem Gott sehr nahegekommen, ohne daß sich eine solche Wirkung gezeigt hätte. Und noch unmittelbar vor seinem zweiten Aufbruch auf den Sinai sprach Moses mit Gott: »Der Herr aber redete mit Mose von Angesicht zu Angesicht, wie ein Mann mit seinem Freunde redet«[107], und doch gibt es keinerlei Hinweise darauf, daß die Haut des Propheten anschließend geglänzt habe.

Was also konnte diese Wirkung hervorgebracht haben? Liegt die Vermutung nicht nahe, es könnten die Steintafeln selbst gewesen sein? Eine indirekte Bestätigung genau dieses Vorschlages fand ich in den Quellen von Talmud und Midrasch, die darauf bestehen, daß die Tafeln mit »göttlichem Glanz« getränkt waren. Als Gott sie Moses übergab, »hielt er sie am oberen Drittel fest, Moses am unteren, aber ein Drittel blieb frei, und so strahlte der göttliche Glanz auf Moses' Angesicht«[108].

Warum aber war diese Situtation bei den ersten, später zerstörten Tafeln nicht eingetreten? Konnte die Antwort womöglich lauten, daß Moses herausbekommen hatte, daß das erste Paar Tafeln als Energiequelle technisch unvollkommen war, und zwar genau darum, weil es sein Gesicht nicht verbrannte? Das würde auch erklären, warum er sie zerbrach. Vom zweiten Paar aber trug er Verbrennungen davon. Vielleicht war das der Be-

weis dafür, daß er mit seinem Herstellungsverfahren schließlich Erfolg gehabt hatte, so daß er darauf vertrauen konnte, daß sie nach ihrer Installierung in der Bundeslade auch richtig funktionieren würden.

Natürlich ist die Idee, daß der Glanz oder das Leuchten auf Moses' Gesicht von Verbrennungen herrühren konnte, rein spekulativ. Aber die fraglichen Bibelverse machen deutlich, daß seine Erscheinung bei der Ankunft im Lager so schauerlich war, daß die Israeliten sich fürchteten, »zu ihm zu nahen«. Um ihre Gefühle zu schonen, »legte er eine Decke auf sein Angesicht«, und von da an trug er diese Decke immer, außer wenn er in seinem Zelt allein war.[109]

Das klang nicht nach einem Mann, der von Gottes Glanz berührt worden war, sondern viel eher nach schlimmen Verbrennungen, die vermutlich von einer intensiven Energiequelle hervorgerufen worden waren.

Das Vermächtnis verlorener Wahrheiten

Man könnte endlos über die wahre Natur der Bundeslade und ihres Inhaltes spekulieren. Ich bin diesen Weg so weit gegangen, wie es mir sinnvoll schien. Wer über diesen Punkt hinausgehen möchte, der trifft auf eine Vielzahl interessanter Punkte, die eine Untersuchung wert wären. Was hatte es beispielsweise mit dem außerordentlich dicken Deckel der Lade auf sich, der aus reinem Gold gefertigt war? Gold ist nicht nur schön und edel, sondern auch außergewöhnlich dicht, und es reagiert chemisch nicht. Und wie verhielt es sich mit den besonderen Kleidungsstücken, die die Hohenpriester des alten Israel trugen, wenn sie sich der Lade näherten?[110] Man glaubte, ihr Leben sei in Gefahr, wenn sie diese Kleidungsstücke nicht trugen.[111] War das nur Aberglaube oder Ritus? Oder war Schutzkleidung aus irgendeinem Grunde, der vielleicht mit der Natur der Bundeslade zusammenhing, geradezu notwendig? Auch die eigenartigen, aus zwei Lagen Stoff und einer Lage Leder bestehenden Hüllen,

in die die Lade gewickelt werden mußte, bevor man sie transportieren konnte[112], sind vielleicht in diesem Zusammenhang zu begreifen. Sollten die Hüllen, die sämtlich aus nichtleitenden Materialien bestanden, vielleicht zur Isolierung dienen?

Eine genaue Untersuchung der Ereignisse, die sich in den Jahrhunderten bis zum Bau des ersten Tempels zutrugen, könnte viele Rätsel lösen. Alles in allem glaubte ich, daß es eine Erklärung für die Wunder und Schreckenstaten gab, und zwar eine rationale Erklärung, die damit zu tun hat, daß die Lade ein von Menschenhand hergestellter Gegenstand war, eine Waffe, ein mächtiges Instrument, deren vorgeblich göttliche Herkunft nur dazu dienen sollte, noch mehr Angst und Ehrfurcht hervorzurufen. Meine Nachforschungen haben mich in der Tat zu dem Schluß geführt, daß der heilige Schrein nur dann wirklich verstanden werden kann, wenn man ihn in diesem Licht betrachtet. Für mich verringerte das keinesfalls die Aura von Magie und Geheimnis um die Bundeslade. Sie ist das Geschenk einer sehr alten und geheimen Wissenschaft, und für mich ist sie der Schlüssel zur versiegelten und vergessenen Geschichte der Menschheit, ein Zeichen unserer vergangenen Größe und ein Vermächtnis verlorener Wahrheiten über uns.

Was ist die Suche nach der Bundeslade oder nach dem Gral schließlich anderes als eine Suche nach Wissen, nach Weisheit, nach Aufklärung?

TEIL V: DIE VERLORENE HERRLICHKEIT

Kapitel 14

Der Grundstein der Welt

Am Spätnachmittag des 4. Oktober 1990 betrat ich Jerusalem durch das Jaffa-Tor. Es war der Felsendom, den ich sehen wollte, allerdings nicht wegen seiner Bedeutung für die moslemische Welt, sondern weil er an der Stelle erbaut worden war, wo ursprünglich der Tempel Salomos gestanden hatte. Ich wußte, daß ich in seinem Innern einen großen Stein finden würde, den orthodoxe Juden den »Shetiyyah« nennen, den Grundstein der Welt. Auf diesen Stein inmitten der dichten Dunkelheit des Allerheiligsten hatte Salomo selbst im zehnten Jahrhundert vor Christus die Bundeslade gestellt.[1]

Das war indessen nicht mein einziges Ziel an jenem Oktobernachmittag. Nur wenige Meter weiter südlich befand sich ein anderes Gebäude von zentraler Bedeutung für meine Suche, die El-Aksa-Moschee, die die Tempelritter im zwölften Jahrhundert nach Christus als Hauptquartier benutzt hatten.

Ich ging zuerst zur El-Aksa-Moschee, streifte meine Schuhe ab und betrat die kühle und geräumige rechteckige Halle, die bei den Moslems als großes Heiligtum gilt, denn angeblich wurde Mohammed selbst auf einer nächtlichen Reise von Engeln an diesen Ort getragen. Doch die zu Lebzeiten des Propheten möglicherweise existierende Gebetsstelle gab es schon lange nicht mehr, und ich sah mich einer Mischung verschiedenster Baustile gegenüber, deren ältester auf etwa 1035 nach Christus zu datieren war, die dann aber bis in die Zeit zwischen 1938 und 1942 reichten, als der italienische Diktator Mussolini einen regelrechten Wald von Marmorsäulen gestiftet und der ägyptische König Faruk die Restaurierung der Deckenbemalung finanziert hatte.[2]

Auch die Templer haben ihre Spuren in der großen Moschee hinterlassen. Sie waren unter anderem verantwortlich für die

42 und 43 Christliche Priester in Gondar bei den Timkat-Feiern. Auf den Köpfen tragen sie die »Tabots«.

44 *(rechte Seite)* Ein Falaschen-Priester zeigt eine Abschrift der Thora in »Ge'ez«, der altäthiopischen liturgischen Schriftsprache. Die Miniatur zeigt den Propheten Moses, der die Zehn Gebote in der Hand hält.

45 »Timkat« in Gondar: Priester führen den Tanz Davids vor der Lade aus.

46 Einer der Tänzer, die die Prozession begleiten. Auf dem Kopf trägt er einen traditionellen Kriegsschmuck.

47 *(oben)* Mittelalterliches Kastell und großes Taufbecken. Hier spielen sich die Höhepunkte der Timkat-Zeremonien in Gondar ab.

48 *(unten)* Äthiopische Priester mit Sistren. Derartige Musikinstrumente wurden schon bei religiösen Zeremonien im alttestamentarischen Israel verwendet.

49 *(oben)* Am Fuße des Berges Sinai wird die Bundeslade gezimmert.

50 *(unten)* Die Israeliten tragen die Bundeslade durch die Wüste. Um die Träger vor den übermächtigen Kräften des Schreins zu schützen, muß er in dicke Tücher eingehüllt werden.

51 *(oben)* Die Bundeslade bewirkt die Zerstörung der Stadt Jericho.

52 *(oben rechts)* König Usia wird mit Aussatz gestraft, weil er sich unerlaubterweise der Lade nähern wollte.

53 *(rechts)* Abihu und Nadab, zwei Söhne Aarons, fallen tot um, als sie sich der Lade nähern.

54 Als Moses die Steintafeln erhielt, wurde sein Gesicht von Verbrennungen so stark entstellt, daß er es hinfort unter einem Tuch verbergen mußte.

55 *(oben)* Die Tempel von Karnak in Ägypten.

56 *(unten)* Archäologen bei Ausgrabungen auf der Insel Elephantine in Oberägypten. Hier befand sich einst ein jüdischer Tempel.

57 *(oben)* Der Autor untersucht eine der umgestürzten Säulen in Aksum. Die merkwürdige Steinschnitzerei ähnelt sowohl der ägyptischen Grabbeigabe (siehe unten) als auch den frühesten aksumitischen Darstellungen der Bundeslade.

58 *(unten)* Dieser schreinförmige Kasten, der mit zwei Tragestangen versehen ist, wurde im Grab des Tutanchamun gefunden.

60 *(oben)* Timkat-Prozession in Aksum.

61 *(unten)* Das für die Bundeslade errichtete Sanktuarium in Aksum.

62 Gebra Mikail, der Wächter der Lade.

drei großartigen Bögen des Portals. Vieles von dem, was die Ritter dem Gebäude außerdem noch hinzugefügt hatten, war später wieder zerstört worden. Ihr Refektorium aber hatte die Zeit überstanden (heute ist es Teil der nahegelegenen Frauenmoschee), und das riesige unterirdische Areal, das sie zu Pferdeställen umfunktioniert hatten (die sogenannten »Ställe Salomos«), war ebenfalls gut erhalten.

Nach der Zerstörung des zweiten Tempels im Jahre 70 nach Christus lag das alte Areal brach, bis die muslimischen Armeen im Jahre 638 nach Christus kamen und der Felsendom gebaut wurde.[3] Während all dieser Veränderungen war allein der »Shetiyyah«, der »Grundstein der Welt«, an seinem Platz geblieben. Der geheiligte Boden, auf dem die Lade einst gestanden hatte, war also der einzige beständige Faktor, der allen Stürmen der Geschichte trotzen konnte, der Juden und Babylonier, Römer, Christen und Moslems hatte kommen und gehen sehen.

Ich verließ die El-Aksa-Moschee, schlüpfte wieder in meine Schuhe und ging nun durch den baumbestandenen Tempelbezirk zum Felsendom, dessen Name bereits seine Funktion als Wächter des »Shetiyyah« andeutet. Es ist ein großes und elegantes achteckiges Gebäude, über und über mit blauen Kacheln verkleidet. Sein hervorstechendes Merkmal ist die massive goldene Kuppel. Für mich hatte dieses große und vollkommene Bauwerk jedoch nichts Erdrückendes. Vielmehr vermittelt es Leichtigkeit und Anmut, die sich mit einer zurückhaltenden, aber vertrauenerweckenden Kraft paart.

Das Innere des Gebäudes, das mir buchstäblich den Atem nahm, unterstützte und vervollkommnete meinen ersten Eindruck. Die schwebende Decke, die Säulen und Bögen, die das innere Achteck tragen, die unzähligen Nischen und Wandvertiefungen, die Mosaiken und Inschriften, all diese Elemente flossen in einer sublimen Harmonie von Proportion und Schönheit zusammen, die der tiefverwurzelten Sehnsucht des Menschen nach dem Göttlichen beredten Ausdruck verlieh.

Zunächst hatte ich den Blick nach oben gewandt, in die Kuppel, deren entfernteste Stellen sich in der kühlen Dunkelheit

verloren. Jetzt aber fühlte ich, wie meine Aufmerksamkeit wie von einer magnetischen Kraft nach unten gezogen wurde, zum eigentlichen Zentrum der Moschee. Unmittelbar unter der Kuppel lag ein riesiger lohfarbener Felsbrocken, der einen Durchmesser von etwa neun Metern hatte. Das war der »Shetiyyah«. Als ich mich ihm näherte, merkte ich, wie mein Herz schneller zu schlagen begann und ich mühsam atmete. Es war nicht schwer zu verstehen, warum die Alten diesen Findling für den Grundstein der Welt hielten, oder warum Salomo ihn zum Herzstück seines Tempels gemacht hatte. Mächtig und unangreifbar ragte er aus dem Berg Morija hervor - so stark und unerschütterlich wie die Erde selbst.

Ein geschnitztes Holzgeländer umgab das gesamte Zentrum, nur an einer Stelle von einem kleinen Durchlaß unterbrochen, durch den man die Hand strecken durfte, um den »Shetiyyah« zu berühren. Seine von den Zärtlichkeiten unzähliger Pilgergenerationen abgegriffene Oberfläche war glatt, fast glasartig, und in Gedanken versunken saugte ich durch die Poren meiner Finger das ungeheure Alter dieses seltsamen und wundervollen Steines ein. Es bedeutete mir sehr viel, hier zu sein und diesen Augenblick gesammelten Nachdenkens an der Quelle eines großen Rätsels auszukosten.

Schließlich zog ich meine Hand zurück, um den Rundgang um den »Shetiyyah« fortzusetzen. An der Seite führte eine Treppe zu einer höhlenartigen Vertiefung unter dem Stein, die von Moslems »Bir el-Arweh« genannt wird, »Brunnen der Seelen«. Den Gläubigen zufolge kann man hier zuweilen die Stimmen der Toten hören, die sich mit dem Rauschen der Flüsse des Paradieses vermischen.

Ich wußte, daß viele jüdische und islamische Legenden von einem versiegelten und geheimen Weg unter dem »Brunnen der Seelen« sprachen, der in das Herz der Erde führe, wo die Lade zur Zeit der Zerstörung des ersten Tempels angeblich verborgen worden war - und viele glauben, daß sie sich dort noch immer befindet, bewacht von Geistern und Dämonen.[4] Schon seit einiger Zeit war ich der Meinung, daß die Tempelritter auch

aufgrund dieser Legenden dazu veranlaßt worden waren, hier nach der Lade zu suchen.

Sie werden sie kaum gefunden haben. Die sogenannte »Apokalypse des Baruch« mag ihnen zwar als authentisches Dokument aus dem sechsten Jahrhundert vor Christus erschienen sein, tatsächlich aber hat die Wissenschaft erst kürzlich herausgefunden, daß sie im späten ersten Jahrhundert nach Christus entstand[5] und folglich unmöglich ein Augenzeugenbericht über das Verbergen des heiligen Schreines sein konnte. Sie war im Gegenteil ein von Anfang bis Ende fiktionales Werk, das trotz seines unheimlichen und suggestiven Tons nicht von historischem Interesse war.

Ich war mir also sicher, daß die Templer ihre Ausgrabungen erfolglos abbrechen mußten. Aber ich vermutete zugleich, daß sie später vom Anspruch Äthiopiens erfahren hatten, die letzte Ruhestätte der Lade zu sein, und glaubte, daß eine Gruppe von Rittern schließlich dorthin gezogen war, um diese Behauptung zu untersuchen. Auch ich folgte dieser Spur, und ich hatte das Gefühl, daß sie geradezu zwingend in die heilige Stadt Aksum führte. Vorher aber wollte ich absolut sichergehen, daß die Lade in keinem anderen Land und an keinem anderen Ort sein konnte. Meinen Aufenthalt in Jerusalem wollte ich also zu Gesprächen mit Vertretern von Theologie und Wissenschaft nutzen und alle Umstände, die das geheimnisvolle Verschwinden der Lade betrafen, einer genauen Überprüfung unterziehen. Sollte ich danach immer noch von der Möglichkeit überzeugt sein, daß sich der Schrein in Aksum befand, würde ich das Abenteuer wagen und nach Äthiopien reisen. Bis zum nächsten »Timkat«, bis zum Januar 1991, blieben kaum noch vier Monate. Meine Zeit lief aus.

Das Haus des Herrn

Im Buch der Könige wird die feierliche Aufstellung der Lade im Tempel Salomos beschrieben, die, wie ich bereits herausgefun-

den hatte, um 955 vor Christus stattgefunden haben muß. Der Heiligen Schrift zufolge neigte Salomo aber später »sein Herz fremden Göttern nach«, und er »wandelte Astoreth, der Göttin derer von Sidon nach und Milkom, dem Greuel der Ammoniter«[6]. So fand ich es kaum glaubhaft, daß der Herrscher, dessen legendäre Weisheit größer war als »aller Ägypter Weisheit«[7], Jahwe jemals besonders hoch geschätzt haben sollte. In diesem Zusammenhang fiel mir ein Bibelvers auf, in dem es heißt: »Denn sollte in Wahrheit Gott auf Erden wohnen? Siehe, der Himmel und aller Himmel Himmel können dich nicht fassen; wie sollte es dann dies Haus tun, das ich gebaut habe?«[8]

Ich hatte nicht den Eindruck, als wollte der König hier in einem Loblied die übermächtige Kraft eines Gottes preisen, vor dem alle irdischen Dinge - und damit auch der Tempel - unvollkommen waren. Es schien mir vielmehr, daß seine Vorbehalte ganz praktischer Natur waren: Konnte die heilige Lade nicht immer noch ihre fürchterliche Wirkung zeigen, selbst da sie nun im »Grundstein der Welt« verankert war? Konnten die in ihr eingesperrten und unberechenbaren Energien nicht immer noch stark genug sein, um durch die dichte Dunkelheit des Allerheiligsten hindurchzudringen und das große Haus zu zerstören, das um sie herum errichtet worden war?

In gewisser Weise schien mir der Tempel eher ein Gefängnis für die Bundeslade zu sein denn ein irdischer Palast für eine geliebte Gottheit. Salomo hatte im Allerheiligsten und über den beiden Cherubim auf dem goldenen Deckel des Schreins zwei weitere, riesengroße Cherubim aufstellen lassen - grimmige, vergoldete Wächter mit einer Flügelspannweite von fast fünf Metern.[9] Das Allerheiligste selbst besaß die Form eines Würfels, der einen sehr gedrungenen und ungeheuer starken Eindruck vermittelt haben muß. Er maß an jeder Seite neun Meter.[10] Sein Boden, seine Wände und die Decke waren mit Platten von reinem Gold, die schätzungsweise vierzigtausend Pfund wogen, verkleidet und mit goldenen Nägeln vernietet worden.[11]

Diese goldene Zelle war keineswegs das einzige Element des Tempels, das meine Aufmerksamkeit erregte. Mindestens

ebenso interessant war die Herkunft des Handwerkers - eines Ausländers -, der damit betraut worden war, die übrigen von Salomo verlangten Metallarbeiten auszuführen:

»Und der König Salomo sandte hin und hieß holen Hiram von Tyrus, einer Witwe Sohn aus dem Stamme Naphtali, der war ein Meister im Erz, voll Weisheit, Verstand und Kunst, zu arbeiten allerlei Erzwerk.«[12]

Sofort hatte ich das Gefühl, auf eine weitere bizarre Koinzidenz gestoßen zu sein, denn jener Hiram von Tyrus war für die Freimaurer eine Gestalt von ungeheurer Bedeutung; sie kannten ihn unter dem Namen Hiram Abiff und spielten in allen wichtigen Ritualen auf ihn an.[13]

In der freimaurerischen Tradition wurde Hiram von dreien seiner Assistenten kurz nach Vollendung der Metallarbeiten für den Tempel umgebracht. Und aus irgendeinem Grund wurde dieser Vorfall für so bedeutsam gehalten, daß er während der Initiationsriten für den Grad eines Meisters in Erinnerung gerufen wurde. Jeder neue Meister mußte die Rolle des Mordopfers spielen. In einer maßgeblichen Studie fand ich die Beschreibung jenes wichtigen Teils der Zeremonie, die noch heute regelmäßig abgehalten wird:

»Der zu Initiierende liegt mit verbundenen Augen auf dem Boden und hört, wie die drei Mörder beschließen, ihn bis Mitternacht in einem Schutthaufen zu begraben und den Leichnam sodann vom Tempel fortzuschaffen. Der Kandidat wird in eine Decke gewickelt und an die Seite des Raumes gebracht, womit das Begräbnis des Hiram Abiff symbolisiert wird. Bald hört er die Glocke zwölf schlagen und wird zu dem am Abhang eines Hügels westlich des Berges Morija geschaufelten Grab gebracht. Er hört, wie die Mörder den Entschluß fassen, sein Grab mit einem Akazienzweig zu kennzeichnen, und wie sie dann nach Äthiopien aufbrechen .. .«[14]

Also auch hier eine Übereinstimmung, eine kleinere, nämlich der Akazienzweig (aus Akazienholz wurde die Bundeslade gebaut), und eine größere, nämlich die freimaurerische Überzeugung, Hirams Mörder seien nach Äthiopien geflohen. Ich

hatte keine Ahnung, wieviel Gewicht ich solchen Einzelheiten zumessen durfte, aber ich konnte mich des Gefühls nicht erwehren, daß sie irgendwie für meine Suche von Bedeutung waren.

Dieser Verdacht vertiefte sich, als ich mich erneut an die Bibel wandte und folgendes über einen der angeblich von Hiram hergestellten Bronzegegenstände herausfand:

»Und er machte ein Meer, gegossen, von einem Rand zum andern zehn Ellen weit, rundumher, und fünf Ellen hoch, und eine Schnur dreißig Ellen lang war das Maß ringsum ... Seine Dicke aber war eine Hand breit, und sein Rand war wie eines Bechers Rand, wie eine aufgegangene Lilie, und gingen darein zweitausend Bath.«[15]

Ich erfuhr, daß es sich bei diesem »Meer« um ein riesiges Bronzebecken handelte, das im Tempelhof stand. Es war über zwei Meter hoch, maß etwa fünf Meter im Durchmesser und war in der Regel mit schätzungsweise fünfundvierzigtausend Litern Wasser gefüllt.[18] Die meisten Fachleute gestanden offen ein, daß sie nicht wußten, wozu das Becken diente - einige vermuteten, es habe die im Buch Genesis erwähnten »Ur-Wasser« symbolisiert[17], während andere glaubten, es sei von den Priestern zu Reinigungsritualen verwendet worden.[18] Keine dieser Hypothesen leuchtete mir ein, am wenigsten die zweite, denn die Bibel sagt ganz deutlich, daß Hiram genau zu diesem Zweck zehn kleinere Bronzebecken hergestellt hatte.[19]

War es nicht möglich, daß das bronzene »Meer« eine anachronistische Erinnerung an die altägyptischen Rituale war, auf deren Basis sich offensichtlich auch die Zeremonien um die Bundeslade entwickelt hatten? Beim Opet-Fest zu Luxor enthielten die Laden Bildnisse der Götter und wurden immer ans Wasser getragen. Genau das geschieht noch heute in Äthiopien: Beim »Timkat« in Gondar werden die »Tabots« zum Ufer des heiligen Sees hinter dem Kastell gebracht. So stellte vielleicht auch das bronzene Meer eine Art heiligen See dar.

Zu den Dingen, die Hiram außerdem für den Tempel anfertigte, gehörten »Töpfe, Schaufeln und Becken«[20], ferner »zwei eherne Säulen, eine jegliche achtzehn Ellen hoch, und ein Fa-

den von zwei Ellen war das Maß um jegliche Säule her... Und er richtete die Säulen auf vor der Halle des Tempels. Und die er zur rechten Hand setzte, hieß er Jachin, und die er zur linken Hand setzte, hieß er Boas.«[21]

Ich stellte fest, daß Jachin und Boas auch in der Freimaurer-Tradition vorkamen.[22] Dem »alten Ritual« zufolge waren die beiden großen Säulen hohl. In ihnen wurden die »alten Aufzeichnungen« und die »kostbaren Schriften« aufbewahrt, die zur Vergangenheit des jüdischen Volkes gehörten.[23] Die Freimaurer behaupteten, daß sich unter diesen Aufzeichnungen »das Geheimnis des >magischen Shamir< und die Geschichte seiner Fähigkeiten« befunden habe.[24] Der »magische Shamir« erregte meine Neugier. Um was handelte es sich da? War es einfach ein Element der freimaurerischen Arkana, oder wurde es vielleicht auch in der Bibel erwähnt?

Meine Recherchen ergaben, daß das Wort »Shamir« im Alten und Neuen Testament nur viermal erwähnt wird[25]: dreimal als Name für einen Ort und einmal als Name für eine Person. Keiner davon konnte der »magische« Shamir sein, dessen Geheimnisse in den bronzenen Säulen verborgen wurden. Trotzdem fand ich die Information, nach der ich suchte, aber nicht in der Heiligen Schrift, sondern im Talmud und im Midrasch. Schon Moses hatte den Israeliten verboten, eisernes Werkzeug zum Bau von Kultstätten zu verwenden[26], so daß auch Salomo befahl, daß keine Hämmer, Äxte oder Meißel benutzt werden dürften, um die massiven Steinblöcke zu bearbeiten. Statt dessen stellte er den Handwerkern ein altes Gerät zur Verfügung, das in die Zeit Moses selbst zurückzudatieren ist.[27] Dieses Gerät wurde »Shamir« genannt und konnte selbst die härtesten Materialien schneiden, ohne Reibung oder Hitze zu entwickeln.[28] Es war auch bekannt als der »Stein, der Felsen zerschnitt«[29]:

»Der Shamir darf zur Aufbewahrung weder in ein eisernes noch in irgendein anderes Metallgefäß getan werden, denn es würde ein solches Behältnis zerbersten lassen. Er wird, in ein wollenes Tuch gewickelt, aufbewahrt, und dieses wiederum wird in einem mit Gerstenkleie gefüllten bleiernen Korb ge-

legt... Bei der Zerstörung des Tempels verschwand der Shamir.«[30]

Diese merkwürdigen und alten Überlieferungen faszinierten mich sehr. Alles in allem klang das - genau wie bei der Bundeslade - eher nach technologischen als magischen Eigenheiten. Es schien mir bezeichnend, daß jenes spezielle Gerät - wiederum wie die Bundeslade - in unmittelbarem Zusammenhang mit Moses stand, und ich hielt es für wichtig, daß selbst die Freimaurer Erinnerungen an die in den Säulen versteckten geheimen Aufzeichnungen Hirams bewahrt hatten.

Mir war klar, daß ich meine Untersuchungen kaum weiterführen konnte, ohne jene lange verlorenen Geheimnisse zu kennen. Ich wußte genau, daß die Geschichte des »Shamir« das Rätsel nur vertieft hatte, das die wirkliche Natur der großen, für die Lade erbauten Festung auf dem Gipfel des Berges Morija umgab. Salomos Tempel war zweifelsohne ein ganz besonderer Ort gewesen: Brennpunkt von Aberglaube und Schrecken, Zentrum jüdischer Religion und kulturellen Lebens. Wie aber hatte die Lade von dort verschwinden können?

Sisak, Joas und Nebukadnezar

Es war natürlich denkbar, daß der Schrein nach einer der vielen militärischen Niederlagen, die Israel nach dem Tod Salomos hinnehmen mußte, mit Gewalt aus dem Tempel entfernt worden war, eine Vorstellung, die Äthiopiens Anspruch, im Besitz der Lade zu sein, schnell entkräften könnte.

Die erste dieser Katastrophen geschah im Jahre 926 vor Christus während der wenig erfolgreichen Herrschaft von Salomos Sohn Rehabeam. Damals führte ein ägyptischer Pharao namens Sheshonq (oder Sisak) eine regelrechte Invasion durch:

»Aber im fünften Jahr des Königs Rehabeam zog Sisak, der König in Ägypten, herauf wider Jerusalem, und er nahm die Schätze aus dem Hause des Herrn und aus dem Hause des Königs, und alles, was zu nehmen war.«[31]

Nichts in diesem bedauerlicherweise sehr kurzen Bericht läßt darauf schließen, daß Sisak die Bundeslade nicht erbeutet hätte. Und doch gab es nur zwei Möglichkeiten: Entweder war die Lade bereits vor dem Einmarsch der ägyptischen Soldaten heimlich weggebracht worden (vielleicht sogar während der Regierungszeit Salomos selbst, wie die äthiopische Überlieferung behauptet), oder sie war während der Invasion im Allerheiligsten geblieben und dort versteckt worden.

Sisak selbst hat ein Indiz für die zweite Annahme geliefert: sein riesiges Triumphrelief in Karnak. Ich hatte es genau untersucht und war mir sicher, daß es keinerlei Hinweise auf die Bundeslade oder auch nur auf die Belagerung oder Plünderung Jerusalems enthielt.[32] Ich überprüfte das noch einmal und konnte bestätigen, daß es sich wirklich so verhielt. In einer maßgeblichen Studie wurde eindeutig festgestellt, daß die Mehrzahl der von Sisak angeblich geplünderten Städte und Ortschaften sich im nördlichen Teil Israels befanden:

»Jerusalem, der Bibel zufolge das Ziel von Sisaks militärischer Aktion, wird nicht erwähnt. Obwohl die Inschrift schwer beschädigt ist, kann als sicher gelten, daß Jerusalem nicht zu den Städten zählte, denn die Liste ist nach geographischen Abschnitten gegliedert, die keinen Raum für den Namen Jerusalem lassen.«[33]

Was also war in der heiligen Stadt passiert, daß die Bibel beteuern mußte, Sisak habe den Tempel und den Königspalast ausgeraubt? In der akademischen Welt herrscht Übereinstimmung darüber, daß der Pharao Jerusalem belagert, es aber nie betreten hat. Offenbar konnte sich die Stadt mit den Schätzen aus Salomos Tempel freikaufen.[34] Die Bundeslade aber war sicherlich nicht unter diesen Schätzen, selbst wenn sie sich 926 vor Christus noch immer dort befunden haben sollte. Es handelte sich um weit weniger kostbare Gegenstände, vor allem Jahwe gewidmete Gaben des Volkes und des Königs. Diese natürlich auch wertvollen und aus Gold und Silber gefertigten Gegenstände wurden auch nicht im Allerheiligsten aufbewahrt, sondern in besonderen Schatzkammern in den Außenbezirken des Tempels.

»Gelegentlich«, so schreibt ein Bibelgelehrter, »wurden diese Schatzkammern entweder von fremden Eindringlingen oder vom König selbst geleert, wenn er Geld brauchte. So schwankten die Schatzkammern beständig zwischen Überfluß und Mangel ... Sisaks Invasion hatte also nichts mit den Tempelheiligtümern zu tun, und es wäre völlig falsch, sie mit dem Verschwinden der Bundeslade in Verbindung zu bringen.«[35]

Dasselbe galt, wie ich herausfand, für die nächste Plünderung des Tempels. Dies geschah zu einer Zeit, als der von David und Salomo geschaffene vereinte Staat bereits wieder in zwei gegeneinander kriegführende Königreiche gespalten war: Juda im Süden (mit Jerusalem] und Israel im Norden. Um 788 vor Christus kämpfte Joas, der König Israels, bei Beth-Schemesch gegen den judäischen König Amazja:

»Aber Juda ward geschlagen vor Israel, und ein jeglicher floh in seine Hütte. Und Joas, der König Israels kam gen Jerusalem und riß ein die Mauer Jerusalems, und nahm alles Gold und Silber und Gerät, das gefunden ward im Hause des Herrn und im Schatz des Königshauses.«[36]

Wieder einmal spielte das Allerheiligste oder die Bundeslade keine Rolle bei der Plünderung des Tempels. Ein Spezialist für die Epoche erklärt: »Joas betrat nicht einmal das äußere Heiligtum des Tempels, ganz zu schweigen vom inneren. Der im Zusammenhang mit Joas verwendete Ausdruck >das Haus des Herrn< ist einfach eine Abkürzung von >die Schätze im Haus des Herrn<. Das kann man aus der Tatsache ersehen, daß auch die >Schätze aus des Königs Haus<, die immer im Zusammenhang mit den >Schätzen im Haus des Herrn< Erwähnung finden, genannt werden.«[37]

Soviel also zu Sisak und Joas. Es war mir nun klar, warum keiner von beiden behauptet hatte, die Lade genommen zu haben, und warum auch die Bibel nichts dergleichen berichtet: Sie waren nicht einmal in die Nähe des Schreins gekommen und hatten nur geringere Schätze aus Gold und Silber erbeutet.

Von Jerusalems nächstem und gefährlichstem Angreifer, König Nebukadnezar von Babylon, konnte man das allerdings nicht

behaupten. Er griff die Heilige Stadt nicht nur einmal, sondern gleich zweimal an und besetzte sie auch. Bereits beim ersten Mal, im Jahre 597 vor Christus, war er offensichtlich bis tief in die inneren Bezirke des Tempels vorgedrungen. Die Bibel beschreibt diese Katastrophe wie folgt:

»Zu der Zeit zogen herauf die Knechte Nebukadnezars, des Königs zu Babel, und kamen an die Stadt mit Bollwerk. Und Nebukadnezar kam zur Stadt, da seine Knechte sie belagerten. Aber Jojachin, der König Judas, ging heraus zum König von Babel mit seiner Mutter, mit seinen Knechten, mit seinen Obersten und seinen Kämmerern; und der König von Babel nahm ihn gefangen im achten Jahr seines Königreichs. Und nahm von dannen heraus alle Schätze im Hause des Herrn und zerschlug alle goldenen Gefäße, die Salomo, der König Israels, gemacht hatte im Tempel des Herrn.«[38]

Woraus hatte die Beute Nebukadnezars bestanden? Auch er konnte eigentlich nur auf entbehrliche Gegenstände in den königlichen und priesterlichen Schatzkammern gestoßen sein. Bedeutsamer hingegen war die Behauptung, der König habe die goldenen Gefäße im Tempel zerschlagen. Ich fand heraus, daß das hebräische Wort »hekal«, das in den meisten Bibelübersetzungen recht ungenau mit »Tempel« wiedergegeben wird, vielmehr »äußeres Heiligtum« meint.[39] Um mir dessen Lage vorstellen zu können, rief ich mir die Anordnung äthiopischer Kirchen in Erinnerung, die die dreiteilige Ordnung des salomonischen Tempels genau widerspiegelt. Aber auch die wissenschaftliche Literatur zu diesem Thema stellte zweifelsfrei fest, daß der »hekal« dem »keddest« äthiopischer Kirchen entsprach.[40] Das aber bedeutete, daß der »Tempel des Herrn«, den Nebukadnezar zerstört hatte, nicht das Allerheiligste gewesen sein konnte, in dem sich die Bundeslade befand, sondern eher der Vorraum zu diesem heiligen Ort. Das Allerheiligste selbst wurde mit dem althebräischen »debir« bezeichnet.

Wenn die Bundeslade sich zur Zeit von Nebukadnezars erstem Angriff noch im Tempel befand, und das war ein dreifach unterstrichenes »wenn«, dann hat der babylonische König sie

mit Gewißheit nicht in seine Gewalt gebracht. Er begnügte sich damit, die goldenen Gefäße zu zerschlagen oder zu rauben:

»... fünf Leuchter zur rechten Hand und fünf Leuchter zur linken vor dem Chor, von lauterem Gold, mit goldenen Blumen, Lampen und Schneuzen; dazu Schalen, Messer, Becken, Löffel und Pfannen von lauterem Gold. Auch waren die Angeln an der Tür am Hause inwendig, im Allerheiligsten, und an der Tür des Hauses des Tempels golden.«[41]

Die Begriffe »inwendig«, »debir« und »Allerheiligstes« sind austauschbar und bezeichnen alle denselben heiligen Ort, das heißt den Aufbewahrungsort der Bundeslade. Als ich mich davon erst einmal überzeugt hatte, ging mir plötzlich ein Licht auf: Nebukadnezar hatte zwar das Allerheiligste selbst nicht geplündert, aber nichtsdestoweniger seine Türangeln entfernt! Von da war es nur noch ein Schritt zu der Annahme, daß die Türen aus den Angeln gehoben worden waren und daß der babylonische Herrscher - oder die seine Befehle ausführenden Soldaten - folglich durchaus imstande waren, in den »debir« hineinzusehen. Mir war sofort klar, daß dies ein wichtiger, ja entscheidender Fund war. Als sie in das Innere des Heiligtums blickten, hätten die Babylonier sofort die zwei riesigen vergoldeten Cherubim sehen müssen, die von Salomo als Wächter über die Lade dorthin gestellt worden waren. Und sie hätten auch die Lade selbst sehen müssen. Es hatte ihnen nichts ausgemacht, das Gold von den Gefäßen im »hekal« abzukratzen. Da fragt es sich doch, warum sie nicht sofort in den »debir« stürzten, um die viel größeren Goldmengen von seinen Wänden und von den Cherubim herunterzunehmen und die Bundeslade zu rauben?

Die Babylonier verachteten die Juden und ihre Religion.[42] Es gab daher keinen Grund zu der Annahme, sie hätten aus moralischen Gründen von der Plünderung des Allerheiligsten abgesehen. Im Gegenteil, alles wies darauf hin, daß Nebukadnezar und seine Männer sich ohne Zögern einer so reichen Beute wie der Lade bemächtigt hätten, wenn sie sie gefunden hätten.

Dafür spricht auch die übliche Praxis der Babylonier, die wichtigsten Götterbilder und Kultgegenstände der von ihnen

besiegten Völker nach Babylon zu bringen, um sie dort in ihrem eigenen Tempel und vor der Statue ihres Gottes Marduk aufzustellen. Aber weder die Bundeslade noch die goldenen Cherubim wurden auch nur erwähnt. Aber was geschah bei der zweiten Plünderung der Stadt?

Nach seiner erfolgreichen Aktion im Jahre 597 vor Christus hatte Nebukadnezar einen Strohmann auf den Thron gesetzt, König Zedekia.[43] Es stellte sich jedoch heraus, daß Zedekia ganz eigene Vorstellungen hatte, und 589 vor Christus rebellierte er gegen den babylonischen Eroberer.[44] Die Reaktion erfolgte sofort. Nebukadnezar marschierte nach Jerusalem, belagerte die Stadt erneut und eroberte sie um die Mitte des Jahres 587 vor Christus.[45] Kurz darauf »kam Nebusaradan, der Hauptmann der Trabanten, und verbrannte das Haus des Herrn und das Haus des Königs und alle Häuser zu Jerusalem ... Aber die ehernen Säulen am Hause des Herrn und die Gestühle und das eherne Meer, das am Hause des Herrn war, zerbrachen die Chaldäer und führten das Erz gen Babel. Und die Töpfe, Schaufeln, Messer, Löffel und alle ehernen Gefäße, womit man diente, nahmen sie weg. Dazu nahm der Hauptmann die Pfannen und Becken, was golden und silbern war, die zwei Säulen, das Meer und die Gestühle. Es war nicht zu wägen das Erz all dieser Gefäße.«[46]

Das also war die ausführliche Liste aller Gegenstände und Schätze, die nach Nebukadnezars zweitem Angriff zerstört oder weggebracht wurden. Bezeichnenderweise und ganz eindeutig fand die Bundeslade wiederum keine Erwähnung. Es war klar, daß die Hauptmasse der Beute von 587 vor Christus aus dem »Erz« der Säulen und des großen Beckens bestand, das Hiram vier Jahrhunderte zuvor hergestellt hatte. Für die Richtigkeit dieser Liste sprach die Tatsache, daß Nebukadnezar bei der zweiten Plünderung des Tempels nur noch auf einige wenige goldene oder silberne Gefäße stieß. Er konnte ja auch gar nichts Wertvolleres gefunden haben, denn das Beste war bereits zehn Jahre zuvor nach Babylon gebracht worden.

Ich war also davon überzeugt, daß der Schrein nicht zur Beute der Angriffe gehörte, und auch der große, von Nebukad-

nezar gelegte Brand[47] konnte kaum als Erklärung für den Verlust der Lade gelten. Nein, ich glaubte fest daran, daß die Bundeslade vor 598 vor Christus aus dem Tempel verschwunden war und somit ihrer Zerstörung entkam.

Aber konnte ich denn mit Sicherheit behaupten, daß man die Lade nach Äthiopien gebracht hatte? Gewiß nicht. Im Gegenteil, ich mußte zugeben, daß die jüdischen Überlieferungen mehrere alternative Erklärungen für die Ereignisse anboten, von denen jede zunächst einmal gut genug war, die Äthiopien-Idee zu Fall zu bringen.

Im Herzen der Erde

Zunächst fiel mir auf, daß das jüdische Volk den Verlust der Lade erst bemerkte, als es den zweiten Tempel baute.

Schon im Jahre 597 vor Christus hatte Nebukadnezar einen großen Teil der Einwohner Jerusalems ins babylonische Exil geschickt.[48] Und nach der Zerstörung des Tempels im Jahre 587 vor Christus heißt es: »Das andere Volk aber, das übrig war in der Stadt, und die zum König von Babel fielen, und den anderen Haufen führte Nebusaradan, der Hauptmann, weg... Also ward Juda weggeführt aus seinem Lande.«[49]

Das Trauma der Verbannung, die Demütigung der Gefangenschaft und der feste Wille, Jerusalem niemals zu vergessen, wurden bald in den beeindruckendsten und suggestivsten lyrischen Passagen des gesamten Alten Testaments verewigt:

»An den Wassern zu Babel saßen wir und weinten, wenn wir an Zion gedachten. Unsere Harfen hingen wir an die Weiden, die daselbst sind. Denn dort hießen uns singen, die uns gefangenhielten, und in unserm Heulen fröhlich sein: >Singet uns ein Lied von Zion!< Wie sollten wir des Herrn Lied singen in fremden Landen? Vergesse ich dein, Jerusalem, so werde meiner Rechten vergessen. Meine Zunge soll am Gaumen kleben, wo ich dein nicht gedenke, wo ich nicht lasse Jerusalem meine höchste Freude sein.«[50]

Das Exil eines ganzen Volkes sollte nicht sehr lange dauern. Nebukadnezar hatte im Jahre 597 vor Christus mit den Deportationen begonnen und sie 587 vor Christus abgeschlossen. Kaum ein halbes Jahrhundert später aber wurde das ganze Reich, das sich unter seiner Herrschaft so dramatisch vergrößert hatte, von dem persischen König Cyrus völlig zerstört, und im Jahre 539 vor Christus nahmen seine siegreichen Truppen Babylon ein.

Cyrus, der als »einer der erstaunlichsten Staatengründer« beschrieben worden ist[51], vertrat gegenüber den von ihm unterworfenen Völkern eine aufgeklärte Position. Es gab außer den Juden noch andere, die in Babylon gefangengehalten wurden; er ließ alle frei und erlaubte ihnen darüber hinaus, die konfiszierten Götterbilder und Kultgegenstände wieder in ihre Heimat zurückzubringen.[52] Das Alte Testament enthält einen ausführlichen Bericht über die feierliche Übergabe:

»Und der König Kores tat heraus die Gefäße des Hauses des Herrn, die Nebukadnezar aus Jerusalem genommen und in seines Gottes Haus getan hatte. Aber Kores, der König in Persien, tat sie heraus durch Mithredath, den Schatzmeister; der zählte sie dar Sesbazar, dem Fürsten Judas. Und dies ist ihre Zahl: dreißig goldene Becken und tausend silberne Becken, neunundzwanzig Messer, dreißig goldene Becher und der anderen, silbernen Becher vierhundertzehn und andere Gefäße tausend, daß aller Gefäße, golden und silbern, waren fünftausendvierhundert. Alle brachte sie Sesbazar herauf mit denen, die aus der Gefangenschaft von Babel heraufzogen gen Jerusalem.«[53]

Das geschah im Jahre 538 vor Christus. Im Frühjahr 537 vor Christus begann man, den zweiten Tempel auf den Fundamenten des ersten zu erbauen. Im Jahre 517 vor Christus war das Werk vollendet. Und obgleich dies ein Grund zu großer Freude war, gab es auch genügend Anlaß zu Trauer. Die Entfernung der Bundeslade aus dem ersten Tempel, wann auch immer das geschehen war, war offenbar vor dem Volk geheimgehalten worden, was nicht besonders schwierig war, denn außer dem Hohenpriester durfte niemand das Allerheiligste betreten. Nun aber war es unmöglich, länger zu verschweigen, daß die Reli-

quie verschwunden war und das innerste Heiligtum somit keine Funktion mehr zu erfüllen hatte. Diese große Veränderung wird im Talmud ausdrücklich zugegeben. In fünferlei Dingen unterscheide sich das erste Heiligtum vom zweiten: in der Bundeslade, der Bedeckung der Bundeslade, den Cherubim, dem Feuer sowie Urim und Thummim.[54] Urim und Thummim waren geheimnisvolle Gegenstände, die möglicherweise als Orakel dienten und zu Moses' Zeiten in die Brustplatte des hohepriesterlichen Gewandes eingelassen waren. Sie befanden sich nicht im zweiten Tempel, ebensowenig wie das himmlische Feuer, das immer mit der Bundeslade in Verbindung gebracht worden war. Und natürlich fehlte die Bundeslade selbst nebst ihrem mächtigen vergoldeten Deckel und den goldenen Cherubim.[55]

Das Geheimnis war also heraus: Die kostbarste Reliquie des jüdischen Glaubens war verschwunden, und niemand wußte, wo sie war. Fast sofort entstanden natürlich Gerüchte, und einige dieser Mutmaßungen nahmen rasch den Charakter von Wahrheiten an. Die Mehrheit vermutete, daß Nebukadnezars Soldaten die Lade nicht gefunden hatten, weil sie vor deren Ankunft im Berg Morija versteckt worden war.

Einer Legende aus der Zeit nach dem Exil zufolge hatte Salomo die Zerstörung des Tempels schon beim Bau vorhergesehen und sogleich tiefe unterirdische Gänge als Versteck für die Bundeslade angelegt.[56]

Auch der Talmud bestärkt die Vorstellung, daß die Höhle direkt unter dem Allerheiligsten lag, und vertritt die Ansicht, daß die Lade »an ihrem eigenen Platz begraben« sei.[57] Und dieses Grab schien das Werk des Königs Josia zu sein, der von 639 bis 609 vor Christus in Jerusalem regierte und gerade ein Jahrzehnt vor der Eroberung der Stadt durch die Babylonier starb. Gegen Ende seiner langen Herrschaft, so heißt es, sah er die bevorstehende Zerstörung des Tempels voraus: »Josia verbarg die Bundeslade und alles, was dazu gehörte, um sie vor der Entweihung durch die Feinde zu bewahren.«[58]

Ich fand das ziemlich glaubhaft. Aber nicht alle Quellen stimmten darin überein, daß das Versteck sich in der unmittel-

baren Nachbarschaft des Allerheiligsten befunden hatte. Eine andere Überlieferung vermutete, die Reliquie sei unter dem Pflaster eines bestimmten Gebäudes im Tempelbereich vergraben worden, dessen genauer Standort seit der Rückkehr aus dem Exil jedoch nicht mehr bekannt war, so daß er für alle Zeiten ein Geheimnis blieb.[59]

Eine völlig andere Darstellung liefert das zweite Buch der Makkabäer, das interessanterweise bei den Katholiken zum Kanon der Bibel zählt, bei den Protestanten hingegen zu den apokryphen Schriften.[60] Es muß vor 70 nach Christus von einem griechisch schreibenden Juden zusammengestellt worden sein[61] und berichtet folgendes über das Schicksal der Bundeslade:

»... der Prophet befahl auf erhaltene göttliche Offenbarung hin, das Zelt und die Lade mit ihm zu führen, bis er an den Berg kam, auf welchen Moses gestiegen war und das Erbe Gottes geschaut hatte. Als Jeremias daselbst gekommen war, fand er die Stätte einer Höhle; dorthin brachte er das Zelt, die Lade und den Räucheraltar, und verwahrte den Eingang.«[62]

Nach Ansicht der Herausgeber des *Oxford Dictionary of the Christian Church* besitzt die Quelle keinen historischen Wert.[83] Und da sie ungefähr fünfhundert Jahre nach Jeremias' Tod entstand, kann man noch nicht einmal behaupten, sie stelle eine besonders alte Überlieferung dar[64], obgleich der Verfasser es so darzustellen versucht, indem er behauptet, er habe sich auf die »Schriften des Propheten Jeremias« gestützt.[65]

Es steht aber fest, daß der Prophet Jeremias die Zerstörung des salomonischen Tempels miterlebt hat, was bedeutete, daß er durchaus eine Rolle beim Verbergen der Lade gespielt haben könnte. Darüber hinaus liegt der Berg Nebo, von dessen Gipfel aus Moses zum erstenmal das Gelobte Land gesehen hatte[68], kaum achtzig Kilometer östlich von Jerusalem entfernt. Da er von kultureller Bedeutung für das Judentum war, machte er auch hinsichtlich seiner geographischen Lage den Eindruck eines geeigneten Verstecks. Spätere Generationen haben daher die Makkabäer-Geschichte nicht völlig zurückgewiesen. Im Gegenteil, in den Überlieferungen hat man sie erweitert und ausge-

schmückt, obwohl sie nie in den jüdischen Schriftenkanon aufgenommen wurden.

Nachdem ich alle jüdischen Überlieferungen hinsichtlich des letzten Ruheplatzes der Bundeslade noch einmal hatte Revue passieren lassen, trug ich folgende Zusammenfassung in mein Notizbuch ein:

- Außerhalb des Talmud, der Mischna, der Baruch-Apokalypse, des zweiten Buches der Makkabäer und einigen Legenden berichten die jüdischen Überlieferungen nichts Wesentliches über den Verbleib der Bundeslade.
- Es scheint nunmehr festzustehen, daß sie nicht von Sisak, Joas oder Nebukadnezar erbeutet worden ist.
- Alles das läßt die Spur, die nach Aksum weist, immer glaubwürdiger erscheinen. Dennoch können die jüdischen »Alternativen« noch nicht definitiv von der Hand gewiesen werden.
- Ich muß also herausfinden, ob es archäologische Grabungen am Berg Nebo gegeben hat oder im beziehungsweise um den Tempelberg herum, den beiden einzigen Orten im Heiligen Land, die als letzte Ruhestätte der Lade in Frage kommen.

Verbotene Grabungen

Im Februar 1968, so erfuhr ich, hatte man auf dem Tempelberg mit umfangreichen Ausgrabungen begonnen. Und obwohl die archäologischen Arbeiten in sicherer Entfernung vom Tempelbezirk durchgeführt wurden, standen sie von Anfang an im Mittelpunkt von Auseinandersetzungen. Meir Ben-Dov zufolge, dem Leiter der Grabungen vor Ort, gab es schon bald Widerstand von Mitgliedern des Hohen Moslemischen Rates, die eine Verletzung ihrer Interessen vermuteten. »Die Ausgrabungen sind in Wahrheit kein wissenschaftliches Unternehmen«, beschwerten sie sich, »ihre zionistische Absicht ist es vielmehr, die Südmauer des Tempelberges, die zugleich die Südmauer der El-Aksa-Moschee ist, zu untergraben, um die Moschee zu zerstören.«[67]

Zu Ben-Dovs Überraschung waren die Christen zunächst ebensowenig hilfsbereit. »Sie vermuteten«, erklärte er, »der Zweck der Ausgrabung bestehe darin, den Grundstein für den dritten Tempel zu legen, und daß das ganze archäologische Projekt nur eine bösartige Verschwörung verdecken sollte. Ich kann nur sagen, daß derartige Gerüchte wie das Produkt einer teuflischen Phantasie klingen, solange man sie nicht mit eigenen Ohren hört. Aber es ist mehr als einmal vorgekommen, daß Leute, deren außergewöhnliche Fähigkeiten als Historiker oder Archäologen außer Frage stehen, mich ohne Umschweife, sei es im Scherz oder im Ernst, gefragt haben: >Haben Sie vor, den Tempel wiederaufzubauen?<«[68]

Der heftigste Widerstand aber kam von den religiösen Autoritäten der Juden selbst, von deren Zustimmung die Ausgrabungsarbeiten abhingen. Professor Mazar vom Archäologischen Institut der Hebräischen Universität führte die Verhandlungen mit den Oberrabbinern der Sephardim und Aschkenasim, die ihm beide eine glatte Abfuhr erteilten, als er sie 1967 erstmals darauf ansprach:

»Der sephardische Rabbi, Rabbi Nissim, erklärte seine Ablehnung damit, das Gebiet, auf dem die Grabungen stattfinden sollten, sei ein heiliger Ort. Aufgefordert, seine Antwort zu erläutern, gab er zu verstehen, wir könnten ja unter Umständen den Beweis dafür erbringen, daß die Klagemauer in Wahrheit nicht die Westmauer des Tempelberges sei... Auf der anderen Seite quälte sich der aschkenasische Rabbi, Rabbi Unterman, mit Fragen der jüdischen Gesetzgebung. >Was geschieht, so überlegte er laut, >wenn Sie im Verlauf der Grabungen die Bundeslade finden?< - >Das wäre großartig!< erwiderte Professor Mazar in aller Unschuld. Der ehrwürdige Rabbi gab dem gelehrten Professor jedoch zu verstehen, daß er genau das befürchte. Da die Kinder Israels vom Standpunkt der jüdischen Gesetzgebung nicht rein sind, dürfen sie die Bundeslade nicht berühren. Von daher ist es undenkbar, Ausgrabungen überhaupt in Betracht zu ziehen, bevor der Messias kommt.«[69]

Die Besorgnis des Rabbi bezüglich der Bundeslade war Aus-

druck einer durch und durch orthodoxen Haltung. Seit der Zerstörung des zweiten Tempels gelten in der Tat alle Juden als unrein, ein Zustand, der erst mit dem Kommen des wahren Messias enden wird.[70] Derartige Dogmen stellten also ein großes Hindernis für die Archäologen dar. Aber es gelang ihnen schließlich, die Rabbis auf ihre Seite zu bringen und die Widerstände der Moslems und Christen zu überwinden. Die Arbeiten konnten beginnen. Und trotz der Lage des Ausgrabungsortes außerhalb des Tempelbereiches wurden einige wenige Gegenstände aus der Zeit des ersten Tempels geborgen. Wie zu erwarten, fand man keine Spur von der Bundeslade, und der größte Teil der Funde stammte aus den späteren Perioden des zweiten Tempels sowie der Moslems und Kreuzfahrer.[71]

Kurz, ich sah, daß Ben-Dovs Ausgrabungen die jüdischen Überlieferungen, die das Versteck der Bundeslade betrafen, nicht gerade erhärteten, aber auch nicht endgültig widerlegten! Das konnte im Grunde nur durch Grabungen auf dem Tempelberg selbst geschehen.

Ich war der Überzeugung, daß schon die Tempelritter derartige Untersuchungen erfolglos durchgeführt hatten. Nun mußte ich herausfinden, ob auch in der Neuzeit Grabungen unternommen worden waren, und wenn ja, mit welchem Ergebnis. Diese Fragen stellte ich Dr. Gabby Barkai, einem Archäologen an der Jerusalemer Hebräischen Universität und Spezialisten für die Periode des ersten Tempels.

»Seit der Entstehung der modernen Archäologie hat es keinerlei Grabungen innerhalb des Tempelbezirks gegeben«, erklärte er mir kurz und bündig.

»Warum nicht?« fragte ich.

»Weil es sich um einen heiligen Ort handelt. Die moslemischen Behörden wehren sich strikt gegen jede wissenschaftliche Untersuchung dort. Von ihrem Standpunkt aus wäre das ein furchtbares Sakrileg. So bleibt der Tempelberg für die Archäologie ein ungelöstes Rätsel. Das, was wir darüber wissen, ist rein theoretischer und interpretativer Natur. Wir besitzen nur die Funde von Charles Warren. Und natürlich die von Parker.

Der hat tatsächlich im Felsendom gegraben - 1910, wenn ich mich recht entsinne. Aber er war kein Archäologe. Das war ein Verrückter. Er hat nach der Bundeslade gesucht.«

Mir war nicht ganz klar, ob Barkai Parker als Verrückten bezeichnet hatte, weil er nach der Lade gesucht hatte; oder ob er nach der Lade suchte, weil er ein Verrückter war. In jedem Fall hatte sich eine ausgezeichnete Gelegenheit ergeben, auf den Hinweis zu verzichten, daß auch ich nach der Bundeslade suchte. Ich beschränkte mich also auf die Frage, wo ich mehr über Parker und Charles Warren erfahren könnte.

Nach einigen Recherchen in Archiven fand ich heraus, das Warren ein junger Leutnant der »Britisch-Königlichen Ingenieure« war, den die in London ansässige »Gesellschaft zur Erforschung Palästinas« im Jahre 1867 mit Grabungen am Tempelberg beauftragt hatte. Seine Arbeit beschränkte sich allerdings mehr oder weniger auf dasselbe Gebiet, das ein Jahrhundert später von Meir Ben-Dov und seinen Kollegen gründlicher untersucht wurde, nämlich außerhalb und südlich der heiligen Bezirke.[72]

Der Unterschied war nur, daß Warren ausdrücklich um die Erlaubnis nachgesucht hatte, auch innerhalb der Mauern graben zu dürfen. Die osmanischen Türken, die damals Jerusalem verwalteten, erteilten ihm jedoch eine Abfuhr. Ein einziges Mal war es Warren gelungen, einen nach Norden führenden Tunnel voranzutreiben und so unterhalb der Außenmauern zu graben. Doch der Lärm der Vorschlaghämmer und anderer Werkzeuge erregte die Aufmerksamkeit der Gläubigen in der El-Aksa-Moschee direkt über den Arbeitern. Das Ergebnis war ein Steinhagel, Aufruhr und die Anordnung des Gouverneurs der Stadt, Izzet Pascha, die Grabungen sofort einzustellen.[73]

Doch Warren ließ sich nicht entmutigen und überredete die Türken, ihn mit der Arbeit fortfahren zu lassen. In der Folge unternahm er etliche andere heimliche Versuche, Tunnels unter dem Tempelberg zu graben.[74] Er gelangte jedoch nur bis zu den Grundfesten der Außenmauern.[75] Natürlich fand er die Bundeslade nicht. Es gab ja ohnehin keinen Hinweis darauf, daß es je

seine Absicht gewesen wäre, danach zu suchen. Sein Hauptinteresse galt der Zeit des zweiten Tempels, und diesbezüglich gelangen ihm viele Entdeckungen von bleibendem wissenschaftlichem Wert.[76]

Das konnte man von Montague Brownslow Parker, einem Sohn des Grafen von Morley, nicht behaupten. Er war 1909 mit der erklärten Absicht nach Jerusalem gegangen, die Bundeslade zu finden. Für die Wissenschaft hat er dabei jedoch keine Beiträge geleistet.

Parkers Expedition, die später von der britischen Archäologin Kathleen Kenyon höflich als »außergewöhnlich« umschrieben wurde[77], war die Kopfgeburt eines finnischen Mystikers namens Valter H.Juvelius, der 1906 an einer schwedischen Universität einen Vortrag über die Zerstörung des salomonischen Tempels durch die Babylonier gehalten hatte. Juvelius behauptete, er habe aus zuverlässiger Quelle Informationen über das - innerhalb des Tempelbezirks gelegene - Versteck der Bundeslade erhalten, und gab an, daß das intensive Studium der relevanten biblischen Stellen ihm die Existenz eines unterirdischen Ganges enthüllt habe, der aus der Stadt in den Tempelberg führe. Er hatte über den Berichten von Charles Warren gebrütet und sich davon überzeugt, daß diese geheime Passage südlich der El-Aksa-Moschee zu finden sein müsse. So legte Juvelius einen Köder von zweihundert Millionen US-Dollar aus, die, wie er glaubte, die Lade wert sei, wenn man sie finden würde, und suchte damit Sponsoren zur Finanzierung einer Expedition anzulocken, die den Schatz aufspüren sollte.[78]

Seine Bemühungen waren erst von Erfolg gekrönt, als er in London den damals dreißigjährigen Montague Brownslow Parker traf und seine Unterstützung für das Unternehmen gewann. Parker gelang es rasch, die Summe von hundertfünfundzwanzigtausend US-Dollar zusammenzubringen, indem er seine Kontakte zur britischen Aristokratie und im Ausland anzapfte. So konnte die Expedition beginnen, und im August 1909 hatte man das Hauptquartier auf dem nicht weit vom Tempelberg entfernten Ölberg aufgeschlagen.

Sofort wurde auf dem Areal gegraben, das zuvor schon Warren in mühevoller Arbeit erforscht hatte. Parker und Juvelius ließen sich keineswegs von der Tatsache abschrecken, daß ihr Vorgänger nichts von großer Bedeutung gefunden hatte. Sie waren im Gegenteil äußerst optimistisch, schließlich hatten sie inzwischen einen irischen Wahrsager angestellt, der ihnen bei der Suche nach dem angeblichen geheimen Tunnel helfen sollte.

Die Zeit verging, und die zu erwartenden Proteste seitens der Gläubigen aller Religionen traten ein. Im Winter verschlechterte sich das Wetter, und die Ausgrabungsstelle wurde von Schlammlawinen überflutet. Parker stellte die Grabungen bis zum Sommer 1910 ein. Dann folgten einige Monate hektischer Betriebsamkeit. Den geheimen Tunnel jedoch fand man weiterhin nicht, und in der Zwischenzeit war entschiedener Widerstand gegen das Projekt erwachsen. Bis zum Frühjahr 1911 hatte es Baron Edmond de Rothschild, überzeugter Zionist und Mitglied der berühmten Bankiersfamilie, zu seinem persönlichen Anliegen gemacht, die Entweihung jenes heiligsten Ortes des Judentums zu verhindern. Zu diesem Zweck hatte er ein direkt an die Ausgrabungsstätte stoßendes Stück Land gekauft, von dem aus er Parker unmittelbar drohen konnte.

Der junge britische Adlige wurde durch diese Entwicklung aus dem Konzept gebracht. Daher gab er im April 1911 die Suche nach dem Tunnel auf und ergriff andere Maßnahmen. Damals stand Jerusalem noch immer unter der Kontrolle der osmanischen Türken, und der Gouverneur der Stadt, Amzey Bey Pascha, war nicht gerade für seine Ehrlichkeit bekannt. Ein Bestechungsgeld von fünfundzwanzigtausend Dollar sicherte seine Mitwirkung. Eine weitere, wenngleich kleinere Summe half Sheik Khalil, dem Kustos des Felsendoms, Parker und seinem Team den Zugang zu den inneren Bezirken zu gewähren.

Aus verständlichen Gründen wurde die Arbeit nur in tiefster Nacht durchgeführt. Als Araber verkleidet, verbrachten die Schatzsucher eine Woche mit Grabungen im südlichen Teil des Tempelberges in der Nähe der El-Aksa-Moschee, wo - was

sowohl Juvelius als auch der irische Wahrsager glaubten - die Lade verborgen sein mußte. Alle Anstrengungen waren jedoch völlig vergeblich, und in den frühen Morgenstunden des 18. April 1911 richtete Parker seine Aufmerksamkeit auf den Felsendom - und auf die legendären Höhlen, die angeblich tief unter dem »Shetiyyah« liegen sollten.

In jenen Tagen gab es die Treppe noch nicht, die heute zum »Brunnen der Seelen« hinunterführt, und so mußten sich Parker und sein Team mitsamt ihrer Ausrüstung an Seilen, die am »Grundstein der Welt« selbst befestigt wurden, hinablassen. Dann zündeten sie Sturmlaternen an und begannen, den Boden der Grotte aufzuhacken, in der Hoffnung, so Zugang zur Ruhestätte der Lade zu finden.

Das Unheil folgte auf dem Fuße. Zwar war Sheik Khalil gekauft worden, aber plötzlich und unerwartet tauchte irgendein Besucher der Moschee auf (es wird erzählt, er habe beschlossen, auf dem Tempelberg zu nächtigen, da sein eigenes Haus voller Gäste war). Er hörte die Grabungsgeräusche, die aus dem Felsendom drangen, platzte herein und erblickte zu seinem Entsetzen eine Horde wildäugiger Fremder, die den geheiligten Boden mit Hacken und Schaufeln attackierten.

Die Reaktion war auf beiden Seiten dramatisch. Der schokkierte Moslem stieß ein durchdringendes Geheul aus und stürzte in die Nacht hinaus, um die Gläubigen zusammenzutrommeln. Die Engländer, denen klar war, daß sie das Spiel verloren hatten, bliesen eiligst zum Rückzug. Sie versuchten nicht einmal mehr, zum Lager zurückzukehren, sondern verließen Jerusalem sofort in Richtung Jaffa, wo eine von ihnen gemietete Motoryacht vor Anker lag. So gelang es ihnen, den hysterischen Massen zu entkommen, die nur Augenblicke nach ihrer Flucht auf dem Tempelberg eintrafen und dem unglückseligen Sheik Khalil ein unaussprechliches Ende bereiteten.

Noch vor Anbruch des Morgens war Jerusalem in einen wilden Aufruhr versetzt worden, und Gouverneur Amzey Bey Pascha wurde angegriffen und beleidigt. Seine Antwort war die Sperrung des gesamten Tempelbezirkes und der Befehl, die

Schatzjäger in Jaffa festzunehmen. Zweifellos ergriff er letztere Maßnahme, um sein Gewissen zu beruhigen. Außerdem verbreitete sich aber das Gerücht, daß Parker die Lade gefunden und entführt habe. Moslemische und jüdische Führer forderten daraufhin lautstark, daß die heilige Reliquie das Land auf keinen Fall verlassen dürfe.

Die Polizei sowie die Zollbehörden von Jaffa wurden telegrafisch verständigt und nahmen die Flüchtlinge bei ihrer Ankunft sogleich fest. Das Gepäck der Engländer wurde beschlagnahmt und peinlich genau durchsucht. Man fand jedoch nichts, und einigermaßen verblüfft erlaubte man den Männern, zu ihrer Yacht zu rudern, wo die Befragungen fortgesetzt werden sollten. Kaum war Parker mit seinen Kollegen sicher an Bord, befahl er natürlich, die Anker zu lichten.

Einige Wochen später war er wieder in England. Er hatte die verlorene Bundeslade nicht gefunden, und es war ihm geglückt, die gesamten hundertfünfundzwanzigtausend Dollar, die ihm die amerikanischen und englischen Investoren anvertraut hatten, buchstäblich in den Sand zu setzen.[79] »Diese Episode«, folgerte Kathleen Kenyon Jahre später, »gereichte der britischen Archäologie nicht gerade zum Ruhm.«[80]

In den nächsten Versuch, die Lade zu finden, waren keine britischen Archäologen verwickelt. Er fand in den zwanziger Jahren statt und konzentrierte sich auf den Berg Nebo, wo (dem Buch der Makkabäer zufolge) der Prophet Jeremias die heilige Reliquie unmittelbar vor der Zerstörung des salomonischen Tempels versteckt haben sollte.

Die treibende Kraft in diesem Fall war ein exzentrischer amerikanischer Forschungsreisender, der sich mit Vorliebe in fließende arabische Gewänder kleidete und, obgleich er männlichen Geschlechts war, den eigentümlichen Namen Antonia Frederick Futterer führte. Nachdem er den Berg Nebo sowie den benachbarten Berg Pisga einer gründlichen Untersuchung unterzogen hatte, verkündete er, daß er einen Geheimgang gefunden habe. Wie originell! Der Gang wurde jedoch von einer Mauer blockiert, und Futterer versuchte nicht, sie niederzurei-

ßen. Als er sie jedoch beim Schein einer Taschenlampe inspizierte, fand er eine alte Inschrift, die er getreulich abschrieb und nach Jerusalem brachte. Dort kontaktierte er einen »Wissenschaftler«, der nur allzu hilfsbereit die Hieroglyphen für ihn entzifferte. Die Botschaft lautete:

HIERIN LIEGT DIE GOLDENE BUNDESLADE.

Leider wollte Futterer weder den Namen des Wissenschaftlers preisgeben, noch beanspruchte irgend jemand in der darauffolgenden Aufregung diese Ehre für sich. Und plötzlich war Futterer auch nicht mehr in der Lage, seine Abschrift der Inschrift vorzuweisen. Merkwürdigerweise kehrte er niemals zum Berg Nebo zurück, um die Lade aus dem angeblichen Geheimgang zu bergen.[81]

Aber ein halbes Jahrhundert später nahm ein anderer »Spezialist« die Staffel da auf, wo Futterer sie hatte fallenlassen. Es handelte sich um einen amerikanischen Forscher namens Tom Crotser, zu dessen früheren »Entdeckungen« der Turm zu Babel, die Arche Noah und die Stadt Adams gehörten. Auf einigermaßen umständliche Weise erwarb dieser Herr im Jahre 1981 einige der von Futterer hinterlassenen Papiere, die anscheinend einen Lageplan des vermauerten Geheimganges auf dem Berg Nebo enthielten.[82]

Der Nebo liegt nordöstlich des Toten Meeres im heutigen Jordanien, und in dieses Land eilte Crotser nun mit einigen Kollegen des ominösen »Internationalen Instituts zur Wiederauffindung von Geschichte«.[83] Ihre Mission war es natürlich, die Bundeslade zu bergen. Unnötig zu sagen, daß Crotser die Lade nicht fand. Nachdem sie jedoch die Untersuchungen auf dem Nebo abgeschlossen hatten, begab sich das Forschungsteam auf den benachbarten Pisga, den Futterer auch besucht hatte. Auf diesem Gipfel stolperten sie über einen Wassergraben, der, wie sie zuversichtlich meinten, den Eingang zu jenem in Futterers Skizze eingezeichneten Geheimgang darstellte.

Die Tatsache, daß sie an einer Stelle des Grabens eine Blechverkleidung entdeckten, erhöhte ihre Aufregung. In der Nacht vom 31. Oktober 1981 entfernten sie das dünne Hindernis mü-

helos. Und wie konnte es anders sein: vor ihnen erstreckte sich ein Gang, der etwa zweihundert Meter in die Erde hineinführte. Dort stießen sie auf die von Futterer beschriebene Mauer und rissen sie ohne weitere Umstände ein.

Dahinter verbarg sich eine in den Fels gehauene Krypta, ungefähr zwei mal zwei Meter groß, die laut Crotser einen vergoldeten, hundertfünfzig Zentimeter langen und zweiundneunzig Zentimeter breiten und hohen Kasten sowie Tragestäbe enthielt, die genau auf die biblische Beschreibung der Tragestangen der Bundeslade paßten. Und an der Seite lagen in Stoff gehüllte Pakete, von denen Crotser annahm, daß sie die Cherubim enthielten.

Die Amerikaner waren sicher, den heiligen Schrein gefunden zu haben. Sie entfernten, berührten oder öffneten ihn jedoch nicht, sondern fertigten mit Hilfe von Blitzlicht nur einige Farbaufnahmen an. Dann verließen sie Jordanien und kehrten in die USA zurück, wo sie sofort die Presseagentur UPI von ihrer Entdeckung in Kenntnis setzten. Die Folge war eine international vermarktete Nachrichtengeschichte von ungeheuren Ausmaßen.[84]

War die Lade tatsächlich gefunden worden? Die in der Krypta aufgenommenen Fotos waren natürlich ein wichtiger Beweis, der die sensationelle Behauptung der Amerikaner erhärten konnte - hätte man den Experten für biblische Archäologie nur die Möglichkeit gegeben, sie zu untersuchen. Daher war es schwer verständlich, daß Crotser sich standhaft weigerte, diese Bilder irgend jemandem zu übergeben. Die allerwenigsten ließen sich von seiner Begründung überzeugen, Gott habe ihm befohlen, sie allein dem Londoner Bankier David Rothschild zu geben, der, wie Crotser sagte, als direkter Nachkomme von Jesus Christus vom Herrn auserwählt sei, den dritten Tempel zu bauen. In diesem würde die aus ihrem Versteck gerettete Bundeslade ihren Platz wieder einnehmen.[85]

Die Rothschilds, die sich schon Parkers Ausgrabungen von 1910 widersetzt hatten, weigerten sich entschieden, die Fotos entgegenzunehmen. Und so bewahrt Crotser sie noch immer in

seinem Haus in Winfield, Kansas, auf und zeigt sie nur ausgewählten Besuchern.

Ein solcher Besucher war der geachtete Archäologe Siegfried H. Horn, Spezialist für die Gegend um den Berg Nebo und Autor von über einem Dutzend wissenschaftlicher Abhandlungen.[86] Im Jahre 1982 verbrachte er einige Zeit mit dem genauen Studium der Fotografien, die anscheinend ziemlich schlecht entwickelt worden waren:

»Außer auf zweien war absolut nichts auf ihnen zu sehen. Von den beiden brauchbaren ist eines verschwommen, aber es zeigt einen Raum mit einem gelben Kasten in der Mitte. Das andere ist recht gut und bietet eine deutliche Ansicht vom vorderen Teil des Kastens.«[87]

Unmittelbar nach seinem Besuch bei Crotser fertigte Horn eine Skizze des Kastens an, wie er ihn auf dem Dia gesehen hatte. Teile des gelben Metallüberzugs schienen aus Messing, nicht aus Gold zu bestehen, und er war darüber hinaus mit einem diamantenen Muster eingelegt, das maschinell gefertigt wirkte. Weit vernichtender aber war, daß man einen Nagel mit einem ganz gewöhnlichen, modernen Kopf aus der oberen rechten Ecke herausragen sah.[88]

»Ich weiß nicht, um was es sich bei dem Gegenstand handelt, aber die Bilder haben mich davon überzeugt, daß es hier in keinem Fall um ein altes Stück geht, sondern um ein modernes Produkt mit maschinell gefertigtem Dekor auf einer Metalloberfläche.«[89]

Das war alles, was die Unterlagen zu den archäologischen Untersuchungen in Jerusalem hergaben. Das war's, wenn man meine eigenen Aktivitäten nicht in Betracht zieht. Und ich? Nun, ich suchte ebenfalls nach der Bundeslade. Ein riskantes Unterfangen, bei dem mich, wie ich gestehen muß, die Tatsache, daß meine Vorgänger durch die Bank messianische Visionäre und seltsame Käuze waren, nicht gerade ermutigte. Es beruhigte mich zumindest, daß ich nicht das geringste Interesse am Bau des dritten Tempels hatte und nicht glaubte, daß die Lade unter dem Felsendom oder auf den Bergen Nebo oder Pisga vergraben

lag. Mir war klar, daß es praktisch unmöglich sein würde, zu beweisen, daß diese Orte keine weiteren Geheimnisse bargen. Aber meine Untersuchungen hatten mich davon überzeugt, daß die verlorene Reliquie sich an keinem der fraglichen Orte befand, daß sie nie in den Besitz der Babylonier oder Ägypter gelangt und auch nicht zerstört worden war.

Um so mehr bedeutete ihr Verschwinden eines der größten Rätsel der Bibel. Alle Ergebnisse, die ich in den Jahren 1989 und 1990 gesammelt hatte, verwiesen darauf, daß die Lösung des Rätsels in Äthiopien zu finden war. Und doch: Ein Problem, mit dem ich mich bisher noch gar nicht auseinandergesetzt hatte, bestand darin, daß der äthiopische Anspruch, die Lade zu besitzen, auf nicht minder schwankendem Boden gegründet zu sein schien als die Vorstellungen, die das Buch der Makkabäer oder die Baruch-Apokalypse geben.

Um es ganz klar zu sagen: Ich hatte zunehmend das Gefühl, daß die kühnen Beteuerungen des *Kebra Nagast* nicht ausreichten, um eine Reise zur heiligen Stadt Aksum zu rechtfertigen. Gewiß, ich hatte viele Indizien - auch überzeugende Indizien - in Äthiopien gefunden, die die Vermutung unterstützten, daß der Schrein wirklich in der Kapelle von Aksum lag. Aber das war weniger auf die Beweiskraft des *Kebra Nagast* zurückzuführen als auf die Schwäche alternativer Darstellungen. Ich mußte also überzeugendere Erklärungen als die des *Kebra Nagast* finden, damit ich mich wirklich nach Aksum aufmachen würde.

Als ich Jerusalem Mitte Oktober 1990 verließ, hatte ich diese Erklärung gefunden.

Kapitel 15

Ein gottloser König

Niemand, der die Geschichte der Bundeslade kennt, würde ernsthaft bestreiten, daß sie ein Gegenstand von ungeheurer Bedeutung für das jüdische Volk war. Und doch ist es unleugbar, daß die Heilige Schrift, so sehr sie sich mit dem Schrein bis zur Zeit des ersten Tempels beschäftigt, sie danach anscheinend völlig vergessen hat. Warum war das so? Welchen Grund konnten die Autoren des Alten Testaments dafür gehabt haben, die Bundeslade aus den heiligen Texten verschwinden zu lassen?

Das Kebra *Nagast* schien eine klare Antwort auf diese Frage anzubieten. Im 62.Kapitel beschreibt es Salomos Trauer, als er entdeckt, daß sein Sohn Menelik die Lade aus dem Tempel entführt und nach Äthiopien gebracht hat. Doch dann faßt er sich und spricht zu den Ältesten Israels, die den Verlust ebenfalls laut beklagen, und fordert sie auf, davon abzulassen:

>»Höret nun auf, damit sich nicht die unbeschnittenen Völker vor uns brüsten und zu uns sagen: Ihr Ruhm ist vernichtet worden, und der Herr hat sie verlassen. Entdecket hiervon nie mehr etwas den anderen Völkern!<... Darauf antworteten ihm die Ältesten Israels und sprachen zu ihm: >Es geschehe dein Wunsch und der Wunsch des Herrn, unseres Gottes; wir wollen dein Gebot nicht übertreten und den anderen Völkern nicht kundtun, daß Zion von uns genommen ist.< Dieses Bündnis schlossen im Tempel des Herrn die Ältesten Israels mit ihrem König Salomo - bis jetzt.«[1]

Wenn man also dem Kebra *Nagast* Glauben schenken durfte, hatte es ein regelrechtes Versteckspiel gegeben. Die Lade war bereits zu Salomos Lebzeiten nach Äthiopien gebracht worden; aber jede Information über diesen tragischen Verlust wurde unterdrückt. Und das war der Grund dafür, daß die Lade in der Heiligen Schrift nicht erwähnt wird. Es gab meines Erachtens

viel, was für diese Entwicklung sprach. Es war mehr als nur möglich, daß der jüdische König wirklich versucht hatte, den Verlust der Lade vor der breiten Masse geheimzuhalten.

Gleichzeitig aber tauchten massive Schwierigkeiten mit anderen Aspekten des Kebra *Nagast* auf, vor allem was die Glaubwürdigkeit der Königin von Saba betraf, ihre Liebesbeziehung zu Salomo und die Geburt ihres Sohnes Menelik. Denn die historische Forschung bestätigt keineswegs, daß sie aus dem abessinischen Hochland kam und nach Israel gereist war. Und war die Beweislage hinsichtlich der Verbindung der Königin mit Äthiopien schon schlecht, so war sie, was die bloße Existenz ihres Sohnes Menelik anging, geradezu katastrophal. Ich wußte seit einiger Zeit, daß Historiker den angeblichen Begründer der »salomonischen Dynastie« Äthiopiens für eine rein legendäre Gestalt hielten. Und bisher hatte ich dem nichts entgegenzusetzen.

Dazu war es kaum vorstellbar, daß sich in den abessinischen Bergen schon im zehnten Jahrhundert vor Christus eine so hochentwickelte Kultur und zentralistische Monarchie hätte entwikkeln können, wie sie das Kebra *Nagast* beschreibt. »Zur Zeit der Herrschaft Salomos«, schrieb E.A. Wallis Budge, »waren die Ureinwohner des heutigen Abessiniens Wilde.«[2] Das war die orthodoxe Sicht der Dinge, und meine Nachforschungen hatten nichts ergeben, was sie widerlegen konnte.

Schließlich berichtete Memhir Fisseha, der Priester, mit dem ich auf Tana Kirkos gesprochen hatte, daß die Reliquie achthundert Jahre auf seiner Insel aufbewahrt worden war, bevor sie zur Zeit der Konversion Äthiopiens zum Christentum nach Aksum gelangte. Diese Bekehrung fand aber erst um 330 nach Christus statt. Das größte Problem bei dieser Zeitrechnung bestand darin, daß die Bundeslade erst um 470 vor Christus nach Äthiopien gekommen sein konnte - mit anderen Worten ungefähr fünfhundert Jahre nach Salomo, Menelik und der Königin von Saba.

Alles in allem hatten sich ernste Schwierigkeiten ergeben, was die wörtliche Auslegung des Kebra *Nagast* betraf. Zudem

beschäftigte mich die praktische Frage, wie Menelik und seine Gefährten es überhaupt fertiggebracht haben sollten, einen so wertvollen und schweren Gegenstand wie die Bundeslade aus dem Tempel zu entfernen, ohne die Aufmerksamkeit der Priester zu erregen, die das Allerheiligste bewachten.

Und ich hatte noch eine Reihe anderer Vorbehalte, die mich zwangen, den akademischen Spezialisten zuzustimmen, die das Kebra Nagast zwar als bemerkenswertes Dokument schätzten, aber Zweifel bezüglich seiner historischen Glaubwürdigkeit äußerten. Ich nahm also widerstrebend Abschied von der Vorstellung einer romantischen Beziehung zwischen Salomo und der Königin von Saba. Und doch mußte das keineswegs bedeuten, daß die Lade nicht vielleicht auf andere Weise nach Äthiopien gelangt sein konnte, die das Kebra *Nagast* später auf seine eigene, originelle und farbige Weise darstellte. Ich war nach wie vor der Ansicht, daß kulturelle und geschichtliche Hinweise in Äthiopien selbst nachdrücklich den Anspruch des Landes bestätigten, die letzte Ruhestätte des Schreins zu sein. Aber wer, wenn nicht Menelik, hatte die Lade nach Äthiopien gebracht, und wann, und unter welchen Umständen?

»Die Dame, dünkt mich, verspricht zuviel«

Mein Ausgangspunkt war zunächst die Vorstellung, daß die Entfernung der Bundeslade aus dem Allerheiligsten totgeschwiegen wurde. Welcher König aber war der Initiator jenes großen Schweigens wenn nicht Salomo?

In der Natur des »Totschweigens« liegt es natürlich, daß es selbst schwer zu entdecken ist. Deshalb erwartete ich auch nicht, daß Beweise der Art, wie ich sie suchte, im Alten Testament leicht zu finden sein würden. Ich fing damit an, jede einzelne Erwähnung der Bundeslade in der Bibel abzutippen. Es war harte Arbeit, sie alle aufzuspüren, und als ich fertig war, lag vor mir ein über fünfzig Seiten dickes Konvolut. Bezeichnenderweise enthielt nur das letzte Blatt Hinweise auf die Zeit nach

Salomos Tod; alle anderen bezogen sich auf die lange Zeit der Wanderschaft, die Eroberung des Gelobten Landes bis hin zur Herrschaft Salomos.

Mir war wohl bewußt, daß die Bibel aus einer Kombination von Texten besteht, die im Verlaufe der Jahrhunderte von unterschiedlichen Schulen und Autoren zusammengetragen wurden. Viele der Hinweise auf die Lade waren wirklich sehr alt, andere hingegen relativ neuen Datums. Das erste Buch der Könige zum Beispiel stammt erst aus der Regierungszeit König Josias (639 bis 609 vor Christus).[3] Das bedeutete, daß der Bericht von der Aufstellung der Lade in Salomos Tempel im ersten Buch der Könige Vers acht zwar zweifellos auf alten mündlichen und schriftlichen Überlieferungen beruhte, daß er aber letztlich das Werk von Priestern war, die lange nach dem Ereignis lebten. Genau die gleiche Beobachtung traf auf die wichtigen Passagen im fünften Buch Mose zu. Denn auch hier handelte es sich um ein verhältnismäßig spätes Dokument aus der Zeit König Josias.[4] Wenn die Lade also vor der Zerstörung des Tempels im Jahre 587 vor Christus heimlich aus dem Allerheiligsten entfernt worden war, dann mußten sich die Spuren einer Vertuschungsaktion am ehesten im Buch der Könige und im fünften Buch Mose finden lassen, falls sie überhaupt irgendwo zu finden waren. Denn natürlich hätten die Autoren beim Zusammenstellen dieser Bücher jede Gelegenheit nutzen können, um die Tatsachen zu verschleiern oder zu verfälschen.

Bei der genauen Untersuchung der Texte stieß ich auf eine Passage, die aus dem Rahmen fiel, weil sie in sehr eigentümlicher Weise überhaupt nicht zum Rest der Beschreibung jener Zeremonie paßte, mit der die Lade ins Allerheiligste gebracht wurde:

»Also brachten die Priester die Lade des Bundes des Herrn an ihren Ort, in den Chor des Hauses, in das Allerheiligste, unter die Flügel der Cherubim. Denn die Cherubim breiteten die Flügel aus an dem Ort, da die Lade stand, und bedeckten die Lade und ihre Stangen von obenher. Und die Stangen waren so lang, daß ihre Knäufe gesehen wurden in dem Heiligtum vor

dem Chor, aber von außen wurden sie nicht gesehen, und waren daselbst bis auf den heutigen Tag.«[5]

Warum, so fragte ich mich, hatte es der für diese Stelle verantwortliche Autor für nötig gehalten zu betonen, daß noch zu seiner Zeit die Tragestangen der Lade deutlich sichtbar aus dem inneren Bezirk herausragten? Eine solche Information war kaum sinnvoll, es sei denn, die Reliquie war damals (etwa 610 vor Christus[6]) eben nicht mehr an ihrem Platz. Der merkwürdig verteidigende Ton klang für mich wie jene nachdrücklichen Unschuldsbeteuerungen, die Schuldige zuweilen von sich geben, um die Wahrheit zu verschleiern. Kurz, wie die berühmte Dame in Shakespeares *Hamlet* hatte der Autor des ersten Buchs der Könige Vers acht mein Mißtrauen gerade dadurch erregt, daß er zuviel versprach.[7]

Mit diesem Verdacht stand ich nicht allein da. Im Jahre 1928 waren auch dem Bibelgelehrten Julian Morgenstern die seltsamen Worte aufgefallen. Seine Schlußfolgerung legte er in einem Aufsatz dar und gab an, der Verfasser der fraglichen Bibelverse müsse die Absicht gehabt haben, »seine Leser davon zu überzeugen, daß die Stäbe der Lade, und damit natürlich die ganze Lade selbst, im Innersten des Tempels war, auch wenn sie nicht vom Volk oder überhaupt von irgend jemandem außer dem Hohenpriester gesehen werden konnte ... Daß der Schreiber sich genötigt fühlte, so sehr zu betonen, daß sich die Lade noch zu seiner Zeit im Tempel befand, läßt darauf schließen, daß er einen vorherrschenden und beharrlichen Zweifel an eben jener Tatsache entkräften mußte, einen Zweifel, der aller Wahrscheinlichkeit nach auf Tatsachen beruhte.«[8]

Das war noch nicht alles. Im fünften Buch Mose stieß ich auf eine ähnliche Formulierung im Zusammenhang mit den zwei Gesetzestafeln, die einst von Moses in die Lade gelegt wurden. In dem Vers heißt es, »daß sie daselbst wären«[9]. Morgenstern vermutete, daß diese Worte aus ganz bestimmten Gründen hinzugefügt worden waren. Unter Verweis auf den hebräischen Originaltext folgerte er, daß es hierbei nur um »die unmittelbare und positive Versicherung des Verfassers dieser Verse gehen

konnte, daß sich die Zehn Gebote noch immer in der Bundeslade befanden. Es scheint, als müsse er einem Zweifel oder einer Frage entgegentreten.«[10]

Das fünfte Buch Mose und das erste Buch der Könige beschäftigen sich natürlich mit sehr unterschiedlichen Perioden der israelitischen Geschichte. Von zentraler Bedeutung jedoch ist, daß beide zur gleichen Zeit zusammengestellt wurden, zur Regierungszeit König Josias, das heißt zwischen 639 und 609 vor Christus!

Meine Neugier war geweckt. Ich wandte mich wieder meinem Manuskript zu, in das ich alle biblischen Erwähnungen der Lade eingetragen hatte, und untersuchte die wenigen Passagen, die sich auf die Zeit nach Salomos Tod beziehen. Es waren eigentlich nur zwei, von denen eine aus der Regierungszeit Josias datierte und die andere sogar Josias eigene Worte wiedergab.

Josia und Jeremias

Auf König Josia war ich schon früher gestoßen. Im Zusammenhang mit den religiösen Gewohnheiten der schwarzen Juden Afrikas hatte ich herausgefunden, daß während seiner Herrschaft die Institution der Opferung verboten worden war. Da aber die Falaschen in Äthiopien den Opferritus noch immer praktizierten, lag die Vermutung nahe, daß ihre Vorfahren zu einer Zeit zum Judentum konvertiert sein mußten, als es noch möglich war, Opferungen auch außerhalb des Nationalheiligtums in Jerusalem vorzunehmen, das heißt vor dem Verdikt Josias und nicht später als im siebten Jahrhundert vor Christus.

Nun konnte ich meine Aufzeichnungen um einige besonders interessante Punkte ergänzen:

- Im ersten Buch der Könige und im fünften Buch Mose sind Anzeichen einer Bemühung festzustellen, die Leser davon zu überzeugen, daß die Lade sich noch immer an ihrem Platz im Tempel befand; es sieht sehr nach einem Versuch aus, die Wahrheit zu verschleiern.

- Die betreffenden Texte entstanden zur Zeit König Josias.
- Daraus schließe ich, daß die Lade möglicherweise zu dieser Zeit aus dem Tempel entfernt wurde. Noch viel wahrscheinlicher aber ist, daß sie bereits verschwunden war und daß damals ihr Verlust entdeckt wurde. Warum? Weil ich mir kaum vorstellen kann, daß ein Staatsmann wie Josia es zugelassen hätte, daß das wichtigste Symbol des Judentums, Zeichen und Siegel von Jahwes Gegenwart auf Erden, aus dem Allerheiligsten entfernt worden wäre. Die Konsequenz ist, daß die Lade weggebracht wurde, bevor er an die Macht kam, daß heißt vor 639 vor Christus.
- Welche Verbindung besteht also zwischen den folgenden Tatsachen: Die Bundeslade wurde vor 639 vor Christus aus dem Tempel entfernt, und: Die Vorfahren der Falaschen wanderten vor 639 vor Christus nach Äthiopien aus? Lag die Vermutung nicht nahe, daß es diese Vorfahren waren, die die Lade mitgenommen haben?

Meine These erschien mir ziemlich plausibel. Sie legte jedoch noch nicht fest, wann genau die vermutliche Auswanderung stattgefunden hatte. Auch schloß sie die Möglichkeit noch nicht endgültig aus, daß die Lade vielleicht doch während Josias Regierungszeit verschwand. Denn noch immer standen die Behauptungen einiger jüdischer Legenden im Raum, denenzufolge der König die Zerstörung des Tempels durch die Babylonier vorhergesehen und die Bundeslade versteckt habe, um sie vor der Entweihung durch die Hand der Feinde zu bewahren.[11] War das möglich? Hatte Josia das Schicksal des Tempels wirklich voraussehen und Maßnahmen zur Rettung der Lade ergreifen können?

Ich sah mir dieses Szenario genauer an und kam zu dem Schluß, daß es schlichtweg unmöglich war, die Ereignisse von 597 bis 587 vor Christus vorherzusagen, es sei denn, er hätte über die wirklich bemerkenswerte Gabe der Hellseherei verfügt. Josia starb 609 vor Christus, fünf Jahre bevor Nebukadnezar den babylonischen Thron bestieg.[12] Zudem hatte Nebukadnezars Vorgänger Nabupolassar wenig oder gar kein militärisches

Interesse an Israel gezeigt und sich statt dessen auf Kriege mit Assyrien und Ägypten konzentriert.[13]

Der historische Hintergrund von Josias Regierungszeit unterstützte also die Theorie, er könne die Bundeslade versteckt haben, in keiner Weise. Noch viel abträglicher aber war dieser Vorstellung die letzte Erwähnung der Bundeslade im Alten Testament, Verse, in denen Josias Kampagne zur Wiedereinsetzung traditioneller Riten im Tempel beschrieben wird:

»Und Josia tat weg alle Greuel aus allen Landen der Kinder Israel ... Und er bestellte die Priester zu ihrem Dienst und stärkte sie zu ihrem Amt im Hause des Herrn und sprach zu den Leviten, die ganz Israel lehrten und dem Herrn geheiligt waren: Tut die heilige Lade ins Haus, das Salomo, der Sohn Davids, der König Israels, gebaut hat. Ihr sollt sie nicht auf den Schultern tragen.«[14]

Mir war sofort klar, daß diese kurze Passage von zentraler Bedeutung für meine Suche war. Warum? Josia hätte die Leviten nicht auffordern müssen, die Lade in den Tempel zu bringen, wenn er sich sicher gewesen wäre, daß sich die Lade an ihrem Platz befand. Aber offensichtlich war das nicht der Fall! Daraus ergaben sich zwei zwingende Schlußfolgerungen:

- Der König war für die Entfernung der Lade nicht selbst verantwortlich, denn er glaubte, sie sei von ihren traditionellen Bewachern mitgenommen worden - den Leviten.
- Die Lade mußte unmittelbar vor der kurzen Rede des Josias aus dem Tempel verschwunden sein.

Glücklicherweise gibt das zweite Buch der Chronik eine sehr genaue Antwort auf die Frage nach dem Zeitpunkt dieser Mahnung an die Leviten: »Im achtzehnten Jahr des Königreichs Josias«[15] - mit anderen Worten: 621 vor Christus. Unklarheit besteht in der Chronik jedoch darüber, ob die Leviten der Anordnung des Königs Folge leisteten. Man sollte erwarten, daß eine Wiedereinsetzung der Lade im Tempel von einer farbenfrohen Zeremonie begleitet worden wäre; aber Josias Befehl scheint keine Konsequenzen nach sich gezogen zu haben. Es war offensichtlich: Die Priester wollten ihm nicht gehorchen, oder sie konnten ihm nicht mehr gehorchen.

Wie gesagt, Josias Rede stellte, chronologisch gesehen, die letzte Erwähnung der Bundeslade im gesamten Alten Testament dar. Nun untersuchte ich die vorletzte Erwähnung. Im Buch Jeremia, in einem um 626 vor Christus verfaßten Kapitel[16], findet sich eine an das Volk von Jerusalem gerichtete Prophezeiung:

»Und es soll geschehen, wenn ihr gewachsen seid und euer viel geworden seid im Lande, so soll man, spricht der Herr, zur selben Zeit nicht mehr sagen von der Bundeslade des Herrn, auch ihrer nicht mehr gedenken noch davon predigen noch nach ihr fragen, und sie wird nicht wieder gemacht werden; sondern zur selben Zeit wird man Jerusalem heißen >Des Herrn Thron<, und werden sich dahin sammeln alle Heiden um den Namen des Herrn willen zu Jerusalem und werden nicht mehr wandeln nach den Gedanken ihres bösen Herzens.«[17]

Jeremias' Worte untermauerten den von Josias Rede hervorgerufenen Eindruck, daß die Lade im Jahre 621 vor Christus nicht mehr im Tempel war; und sie datierten den mutmaßlichen Termin ihres Verlustes bis mindestens auf 626 vor Christus zurück. Ich sage »mindestens«, denn Jeremias' Prophezeiung stellte mit einiger Sicherheit die Reaktion auf einen vorherrschenden und vermutlich seit langem schwelenden Ärger über den Verlust der Lade dar. Nein, ich war mir sicher, für die Bemerkungen Jeremias' bestand ganz offensichtlich eine Notwendigkeit.

In dieser Hinsicht wurde ich von einem der führenden Bibelforscher unterstützt. Professor Menahem Haran von der Hebräischen Universität Jerusalems hatte die fragliche Stelle in seiner maßgeblichen Abhandlung über Tempel und Tempeldienst im alten Israel analysiert und war zu folgendem Ergebnis gekommen:

»Dieser Vers folgt unmittelbar auf Trostworte und enthält selbst eine deutlich versöhnliche Botschaft. Was der Prophet hier verspricht, ist, daß in den bevorstehenden guten Tagen kein Bedarf mehr für die Bundeslade bestehen werde und daß folglich ihr Fehlen kein Anlaß mehr zu Trauer sein müsse. Natürlich

wären diese Worte völlig sinnlos, wenn sich die Lade zu dieser Zeit noch im Tempel befunden hätte.«[18]

Wenn ich das genaue Datum des Verschwindens der Lade bestimmen wollte, mußte ich also die Zeit vor 626 vor Christus einer genaueren Untersuchung unterziehen. Ich hielt es dabei nicht für sehr vielversprechend, den frühen Jahren von König Josias Regierungszeit, das heißt von 626 bis 639 vor Christus, viel Zeit zu widmen. Mir war ja bereits bekannt, daß der Monarch im Jahre 621 vor Christus erfolglos versucht hatte, den Schrein wieder in den Tempel zu bringen; daher schien es mir einigermaßen unwahrscheinlich, daß er für ihr Fehlen verantwortlich war. Der Schuldige mußte einer seiner Vorgänger sein, einer der fünfzehn Könige also, die in Jerusalem nach Salomo regiert hatten.

Mit dem Computer auf der Suche

Ich hatte es mit einem Zeitabschnitt von dreihundertsechzehn Jahren zu tun: von 955 bis zu Josias Thronbesteigung im Jahre 639 vor Christus. In diesen Jahrhunderten waren Jerusalem und der Tempel Mittelpunkt vieler Ereignisse, die in verschiedenen Büchern der Bibel ausführlich beschrieben werden. Die Bundeslade wird allerdings kein einziges Mal erwähnt.

Ich griff zu einem modernen Forschungswerkzeug, um herauszufinden, wie dicht dieses Schweigen wirklich war. Aus England hatte ich eine Computerversion der King-James-Bibel mitgebracht.[19] Es war kaum sinnvoll, ein Suchprogramm nach den Begriffen »Lade« oder »Bundeslade« durchlaufen zu lassen: Sie kamen in dem fraglichen Zeitabschnitt einfach nicht vor. Es gab aber noch eine andere Möglichkeit, nach Wendungen zu suchen, die früher in der Heiligen Schrift regelmäßig in Verbindung mit der Lade auftauchten.

So wählte ich zum Beispiel das Wort »aussätzig«; Moses hatte seine Schwester Mirjam bestraft, indem er die Mächte der Lade in Anspruch nahm, um sie »aussätzig« zu machen.[20] Und ich

versuchte es natürlich mit »zwischen den Cherubim«, weil diese Formulierung vor der Regierungszeit Salomos stets in Verbindung mit der Lade verwendet wurde - niemals in einem anderen Zusammenhang.

Ich ließ zuerst das Wort »aussätzig« laufen. Natürlich fand meine elektronische Bibel es im vierten Buch Mose Vers zwölf, worin beschrieben wird, was Mirjam zustieß. Danach kommt es in der gesamten Heiligen Schrift nur noch zweimal vor: im zweiten Buch der Könige, wo sich eine völlig unwichtige Bemerkung über »vier aussätzige Männer an der Tür vor dem Tor« der Stadt Samaria findet[21], und in einem schon sehr viel interessanteren Zusammenhang im zweiten Buch der Chronik. Der Vers bezieht sich auf König Usija, der von 787 bis 736 vor Christus in Jerusalem regierte: »Und da er mächtig geworden war, erhob sich sein Herz zu seinem Verderben; denn er vergriff sich an dem Herrn, seinem Gott, und ging in den Tempel des Herrn, zu räuchern auf dem Räucheraltar.«[22] Sofort eilte der Hohepriester dem König nach, um ihn von diesem Sakrileg abzuhalten: »Aber Usija ward zornig und hatte ein Räucherfaß in der Hand. Und da er mit den Priestern zürnte, fuhr der Aussatz aus an seiner Stirn vor den Priestern im Hause des Herrn, vor dem Räucheraltar.«[23]

Es sieht so aus, als hätte Usija das Allerheiligste gar nicht betreten (obwohl der Text in diesem Punkt nicht eindeutig ist), sondern sei ihm sehr nahe gekommen. Der plausibelste Schluß war also, daß der Aussatz auf Usijas Stirn dadurch verursacht worden war, daß er sich der Lade ausgesetzt hatte. Und das wiederum konnte nur bedeuten, daß sie sich 736 vor Christus noch immer im Allerheiligsten befand. Im gleichen Jahr und infolge dieser Ereignisse starb Usija.[24] Das engte das Feld schon gewaltig ein, denn es implizierte, daß die Reliquie nur in dem Jahrhundert bis zur Regierung Josias entfernt worden sein konnte, also irgendwann zwischen 736 und 639 vor Christus.

Natürlich war mir klar, daß der Zwischenfall mit Usija nur bedingt von historischem Wert war: Es war ein verführerischer Hinweis, ein Schlüssel, wenn man so will, aber genaugenommen war es unzulässig, daraus endgültig zu folgern, daß die

Lade im Jahre 739 vor Christus noch immer im Tempel war. Es bedurfte eines stärkeren Beweises. Den fand ich, als ich die Wendung »zwischen den Cherubim« durch das Suchprogramm schickte, die, wie bereits erwähnt, ausschließlich im Zusammenhang mit der Lade verwendet wurde. Folglich mußte jedes Vorkommen des Begriffes nach der Aufstellung der Lade im Tempel, also nach 955 vor Christus, ein deutliches Indiz dafür sein, daß sie sich noch immer im Allerheiligsten befand.

Ich fand schnell heraus, daß er in der gesamten nachsalomonischen Zeit nur siebenmal auftauchte. Zwei dieser Erwähnungen bezogen sich eindeutig auf die Cherubim der Bundeslade, Psalm achtzig, Vers eins, und Psalm neunundneunzig, Vers eins. Leider waren sie nicht genau zu datieren. Es bestand eine geringe Möglichkeit, daß sie aus der vorsalomonischen Zeit stammten. Allgemein herrscht jedoch Konsens darüber, daß die Verse wahrscheinlich in den frühen Jahren der Monarchie - und damit zu Salomos Lebzeiten - verfaßt wurden, oder aber innerhalb eines Jahrhunderts nach seinem Tod.[25]

Die Worte tauchten weiterhin dreimal im Buch Hesekiel auf[26], bei dem es sich um ein spätes, nach 597 vor Christus entstandenes Werk handelt.[27] Aber auch in diesem Zusammenhang war der Gebrauch der Wendung nicht von Bedeutung für mich, da es sich hier offensichtlich um lebendige Wesen von gewaltiger Größe, um Engel handelte, die Hesekiel in einer Vision erschienen waren.[28]
