PREFACE TO THE FIRST EDITION

This new *Oxford Companion to Classical Civilization* is an up-to-date and authoritative, but handily sized, encyclopaedia about the civilizations of Greece and Rome and their more or less immediate neighbours. The contributors number just over 300 of the world's most distinguished classical scholars. The aim of the *Companion* is to make available to an even wider readership the essential material from the very successful third (1996) edition of the *Oxford Classical Dictionary* (OCD³), but in a cheaper and less weighty format. We have achieved the shorter length by omitting entries which we thought too technical or recondite for the readership we envisage, and by removing the specialist bibliographies attached to particular entries, adding instead a select general bibliography at the back of the book. We have *not*, however, shortened individual entries in any other way (except that we have retained only the general, introductory section of the long OCD³ entry on 'music'; the *Companion* entry thus becomes 'music in Greek and Roman life'). Readers can therefore be assured that all the expert material from OCD³ included in this *Companion* is undiluted and unabridged. Naturally, however, it has been edited so as to achieve internal consistency: the copious cross-references which were such a feature of OCD³ have either been adapted so that they refer to material elsewhere in the *Companion* or replaced by explanations,

where the cross-reference was to a technical term which no longer has its own entry.

A notable feature of the *Companion* is its many illustrations, which we hope succeed in adding a further dimension which will interest and stimulate readers to a fuller understanding of life in the ancient world. Here we are indebted to Professor Brian Sparkes, who made the initial selection of pictures and provided a great deal of further help to the picture researcher. Our policy on illustration has been not just to cover archaeological entries (sites, places, and so on) but as far as possible to reflect all the different scholarly areas represented in the book, underlining the great breadth of the *Companion* text and of its parent volume.

At the Press we pay tribute to the enthusiasm and support of the commissioning editor, Michael Cox. We were enormously fortunate in that Pam Coote, in-house editor for OCD³, performed the same job for this volume with her usual diligence, sympathy, and wisdom. We are also grateful for the expertise of, respectively, Tom Chandler (copy-editor), Sandra Assersohn (picture-research), Kim Richardson (maps and chronology), and Leofranc Holford-Strevens (for assistance with the thematic listing of entries).

SIMON HORNBLOWER
ANTONY SPAWFORTH
1998

PREFACE TO THE SECOND EDITION

The first edition of the *Oxford Companion to Classical Civilization* (*OCCC*) contained a wide-ranging selection of expert entries from the third edition (1996) of the *Oxford Classical Dictionary* (*OCD*³), simplified on principles described in the Preface to the First Edition. This second edition of the Companion (*OCCC*₂) repeats both the general format and the same selection, but these entries are now taken from the fourth edition (2012) of the *Oxford Classical Dictionary* (*OCD*⁴), for which all entries in *OCD*³ were scrutinized and, if necessary, updated, either by their original authors, or by a new reviser chosen by us as editors of *OCD*⁴.

In addition, *OCCC*₂ contains an essential selection from the new and completely replaced entries commis-

sioned by us for *OCD*⁴ (see List of New and Replacement Entries in the Second Edition).

On practicalities, we have retained and expanded the List of Abbreviations (pp. xix–xxvii) and updated the Select Bibliography (p. 866).

We would like to express our thanks to the OUP team, and especially to Leofranc Holford-Strevens for vital help with the editing.

ESTHER EIDINOW
SIMON HORNBLOWER
ANTONY SPAWFORTH

2014

LIST OF NEW AND REPLACEMENT ENTRIES IN THE SECOND EDITION

All existing entries from the first edition of OCCC included in this volume have been checked and where necessary updated by the original author, an area advisor, or one of the editors. In addition this second edition of OCCC includes 50 new or entirely rewritten entries as listed here:

aetiology	heresy
anthologies, Latin	immortality
art, Jewish	Jocasta (Iocasta)
belief	Julii Caesares
books, sacred and cultic	Laius
Carian language	Luwian
catacombs, Jewish	madness
circumcision	masculinity
colour, ancient perceptions of	materiality
court	migration
creolization	nature
dance (reception)	opera
diagrams	personification
emotions	popular culture
encomium/enkōmion	presocratic philosophers
epideictic	prostitution, secular (male)
epigram, Latin	religions, ancient, cognitive anthropology of
epinician poetry	sabbath
ethics	sacred laws
explanation, historical	samaritans
film	senses, ancient conceptions of
gender	Socratic dialogues
ghosts	supplication, Greek
Helena Augusta	theatricality
Hellenistic philosophy	tragedy, Greek, reception in antiquity; modern reception

LIST OF MAPS

Greece and the Aegean World	870–71
The Hellenistic World	872–74
Italy	875
The Roman Empire (Central and Eastern Provinces)	876–77

HOW TO USE THIS BOOK

This book is designed for easy use but the following notes may be helpful to the reader.

Chronological span The period covered is from the middle of the second millennium BC to the 6th century AD, with the main concentration of coverage focused on 800 BC to AD 300. For a brief outline, see the Chronology on pp. 860–865.

Alphabetical arrangement Entries are arranged in letter-by-letter alphabetical order of their headwords, which are shown in bold type.

Names In all cases the forms of names used are those that are the most familiar. Thus, Roman individuals of the Republican and imperial periods (up to about AD 275) are listed under their surname (*cognomen*) rather than the family name (*nomen*). For example, Cicero is listed under C rather than under his family name of Tullius, and the great general Publius Cornelius Scipio Aemilianus Africanus is listed under the familiar form ‘Scipio Africanus’, rather than under his family name of Cornelius. Similarly, Roman emperors, who often had long names, are listed under their usual short form, such as Nero, and the full name follows in parentheses.

In antiquity, the Latin alphabet did not contain the letter J and only in medieval times were many Roman names, such as Iulius, written with a J. In this book, we have retained the ‘I’ spellings except for those names which occur as headwords, which the reader would naturally look for under J.

Note that the Roman forename (*praenomen*) Gaius is conventionally abbreviated C. (not G.) and similarly Gnaeus is abbreviated Cn. not Gn.

Greek names are normally spelt in their more familiar Latinized or Anglicized forms (that is, ‘Pericles’ not ‘Perikles’).

Transliteration of Greek Except where its use was thought essential to the subject-matter or context of the entry, Greek has been transliterated, with long vowels indicated by macrons (ō,ē).

Cross-references An asterisk (*) in front of a word in the text signals a cross-reference to a related entry which may be interesting to look up. Similarly, ‘see’ or ‘see also’ followed by a headword in SMALL CAPITALS is used to cross-refer when the precise form of headword to which the reader is being pointed does not occur naturally in the text.

Thematic listing of entries The list of entries under major topics at the front of the book (see pp. xiv–xviii) offers another means of access to the material, in that it allows the reader to see at a glance all the entries relating to a particular subject—such as women’s studies or Greek mythology—without needing to know the precise entries to look up.

References to classical texts and commentaries are given in abbreviated form in the entries, for the benefit of classics students and others who may wish to follow them up. Details of these sources are given in full in the list of abbreviations at the front of the book (pp. xix–xxvii).

Contributors’ initials are given at the end of each entry, and a key to these initials is provided on pp. xi–xiii.

A

abortion was controversial in antiquity. Doctors taking the Hippocratic Oath (*see* MEDICINE, § 1.5) swore not to administer abortifacients, but other Hippocratic texts suggest that prostitutes (*see* PROSTITUTION, SECULAR) often employed abortion. A *Lysias fragment suggests that abortion was a crime in Athens against the husband, if his wife was pregnant when he died, since his unborn child could have claimed the estate. Greek temple inscriptions show that abortion made a woman impure for 40 days (*see* POLLUTION).

The Stoics (*see* STOICISM) believed that the foetus resembled a plant and only became an animal at birth when it started breathing. This attitude made abortion acceptable. Roman jurisprudence maintained that the foetus was not autonomous from the mother's body. There is no evidence for laws against abortion during the Roman republic. It was common during the early Roman empire (e.g. *Ov. Am.* 2. 14), and was practised for many reasons, e.g. for family limitation, in case of *adultery, or because of a desire to maintain physical beauty. Soranus (*Gynaecology* 1. 59–65, Eng. trans. 1956) distinguished deliberate from spontaneous abortion, and abortion from *contraception. He accepted abortion if the woman's life was in danger. Galen and Dioscorides mention many plant products used, either orally or by vaginal suppository, to provoke abortions. Some plants, e.g. aristolochia and squirting cucumber, can indeed have such effects. Mechanical methods were also used.

The emperors *Septimius Severus and *Caracalla towards AD 211 introduced the first definite ban on abortion in Rome as a crime against the rights of parents, and punished it with temporary exile. The spread of *Christianity changed attitudes. The *Teachings of the Apostles*, the first Christian document to mention abortion, condemned it, as did the *Letter of Barnabas*, Tertullian, and many later writers. Christians regarded abortion, once the foetus was fully formed (40 days after conception), as murder of a living being.

JRS

Academy, public *gymnasium at Athens, sacred to the hero Academus, north-west of the Dipylon gate. It gave its name to the school founded there by *Plato in the early 4th cent. and maintained by an unbroken line of successors until the 1st cent. BC. The school's private property was never there, but, at least during the 4th cent., at Plato's nearby house.

The Early Academy is the phase of doctrinal Platonism under Plato himself (d. 347) and his successors Speusippus, Xenocrates, Polemon, and Crates.

The 'New Academy' is the phase, from c.269 to the early or mid-1st cent. BC (its further subdivision, *Sext. Emp. Pyr.* 1. 220, is a later imposition), in which the school, initially under Arcesilaus, interpreted true Platonism as scepticism. Dialectical criticism of doctrines, usually Stoic, was orchestrated to demonstrate *akatalēpsia*, the impossibility of knowledge, resulting in *epochē*, suspension of judgement. Carneades, its most influential head (mid-2nd cent.), was a systematic critic of all doctrines. His successors disagreed about his true intentions: Clitomachus (scholarch c.128–c.110) regarded his arguments as still promoting *epochē*, but Metrodorus of Stratonicea and Philon of Larissa (possibly the last scholarch, c.110–c.79) considered their intent doctrinal, albeit fallibilist, with the 'convincing' (*pithanon*) an adequate basis for both action and philosophical judgement. *Cicero's main philosophical works reflect his allegiance to the Philonian Academy.

In 87 BC, when the Academics were refugees from Athens, Philon was openly challenged by his disciple Antiochus of Ascalon, whose 'Old Academy' claimed to return to the doctrines of the 'ancients', meaning especially Plato and *Aristotle. Thereafter the Academy as an institution disintegrated (whether Antiochus ever became scholarch is uncertain), although the title 'Academic' lived on (cf. PLUTARCH).

DNS

Achilles, son of Peleus and Thetis; greatest of the Greek heroes in the Trojan War; central character of *Homer's *Iliad*.

His name may be of Mycenaean Greek origin, meaning 'a grief to the army'. If so, the destructive Wrath of Achilles, which forms the subject of the *Iliad*, must have been central to his mythical existence from the first.

In Homer he is king of Phthia, or 'Hellas and Phthia', in southern Thessaly, and his people are the Myrmidons. As described at *Il.* 2. 681–5 the size of his kingdom, and of his contingent in the Trojan expedition (50 ships), is not outstanding. But in terms of martial prowess, which is the measure of excellence for a Homeric hero, Achilles' status as 'best of the Achaeans' is unquestioned. We are reminded of his absolute supremacy throughout the poem, even during those long stretches for which he is absent from the battlefield.

His character is complex. In many ways he carries the savage ethical code of the Homeric hero to its ultimate and terrifying conclusion. When *Agamemnon steals his concubine Briseis in *Il.* 1, his anger at the insult to his personal honour is natural and approved by gods and men; but he carries this anger beyond any normal limit when he refuses an offer of immense compensation in *Il.* 9. Again, when he finally re-enters the war (*Il.* 19) after the death of his friend Patroclus, his ruthless massacre of Trojans, culminating in the killing of *Hector (*Il.* 22), expresses a 'heroic' desire for revenge; but this too is taken beyond normal bounds by his contemptuous maltreatment of Hector's dead body (*Il.* 22. 395–404, 24. 14–22).

But what makes Achilles remarkable is the way in which his extreme expression of the 'heroic code' is combined with a unique degree of insight and self-knowledge. Unlike Hector, for instance, Achilles knows well that he is soon to die. In his great speech at *Il.* 9. 308–429 he calls the entire code into question, saying that he would rather live quietly at home than pursue glory in the Trojan War; but it is his 'heroic' rage against Agamemnon that has brought him to this point. In his encounter with Lycaon at *Il.* 21. 34–135, his sense of common mortality (the fact that Patroclus has died and Achilles himself will die) is a reason, not for sparing his suppliant, but for killing him in cold blood. Finally at *Il.* 24, when Priam begs him to release Hector's body, it is human feeling, as well as the gods' command, that makes him yield (507–70); but even then he accepts a ransom, and his anger still threatens to break out afresh (568–70, 584–6).

Later writers seldom treated the subject-matter of the *Iliad* (though *Aeschylus did so, devoting a probable trilogy to the events of *Il.* 16–24 and portraying Achilles and Patroclus as lovers: fr. 134a). But they did provide

many further details of Achilles' career, often derived from other epics such as the *Cypria* and *Aethiopis*. As a boy he was brought up by the wise *Centaur Chiron on Mt. Pelion. Later his mother Thetis, knowing that he would be killed if he joined the expedition to Troy, hid him at the court of King Lycomedes on Scyros, disguised as a girl (this episode is treated in the unfinished *Achilleis* of *Statius). There he fell in love with the king's daughter Deidamia, who bore him a son, Neoptolemus. *Odysseus discovered his identity by trickery (the subject of *Euripides' lost *Scyrians*) and he joined the Greek army at Aulis, where he was involved in the story of Iphigenia (see EURIPIDES' *Iphigenia at Aulis*). On the way to Troy he wounded Telephus. His exploits at Troy included the ambush and killing of Priam's son Troilus. After the events of the *Iliad* he killed two allies of the Trojans: the *Amazon queen Penthesilea and the Ethiopian king Memnon. Finally he was himself killed by Paris and *Apollo (as predicted at *Il.* 22. 358–60). Then, by a tradition dating back to the *Aethiopis*, Thetis translated him to a blessed existence on the White Island (mod. Insula Şerpilor, Ostriv Zmiyinyy) in the Euxine Sea, where some say that he is accompanied by Helen (but Ibycus, fr. 10 Page, curiously has him married in Elysium to Medea). All this contradicts *Od.* 11. 467–540, 24. 15–98, where his shade is in the Underworld.

The fight over his body, and his funeral, are described at *Od.* 24. 36–94. His famous arms (described at *Il.* 18. 478–613) were then given to Odysseus (see SOPHOCLES' *Ajax*). After the fall of Troy his ghost demanded the sacrifice of Polyxena (see Euripides' *Hecuba*).

The 'Achilles heel' is a late addition to the story, at least to judge from our literary sources: allusions at Hyg. *Fab.* 107 and Stat. *Achil.* 1. 134, 269, 480 but no full account until Servius and 'Lactantius Placidus' (though vase paintings showing an arrow directed at Achilles' foot suggest that some version was known much earlier). By this account Thetis sought to make the infant Achilles invulnerable by dipping him in the Styx, but omitted to dip the ankle (rather than the heel) by which she held him, and it was there that he received his death-wound. An alternative story, from the *Aegimius* (Hes. fr. 300 M-W), was that Thetis had earlier children by Peleus and placed them in boiling water to test whether they were immortal, but, as the results proved negative, Peleus prevented her from performing the experiment on Achilles.

Several episodes from his life, including the ambush of Troilus and the killing of Penthesilea, were popular with vase-painters (see POTTERY, GREEK). Also popular, in the

Achilles An Athenian clay water jar (late 6th cent. BC) depicts the vengeful Achilles about to drag Hector's body behind his chariot—an example of the excessive behaviour which distinguishes his portrayal in *Homer. The Antiope Group. Place of Manufacture: Athens. Ceramic, Black Figure. Height (to mouth): 50 cm (19 11/16 in.); diameter (of mouth): 26.1 cm (10 1/4 in.). Museum of Fine Arts, Boston, William Francis Warden Fund 63.473. Photograph © 2014 Museum of Fine Arts, Boston

later 6th cent., but with no known literary precedent, was a game of draughts (*see* GAMES) between Achilles and *Aias: a treatment by Execias (Vatican 16757 = ABV 145 = LIMC Achilleus 397, c.535–530 BC) is justly famous. In the 5th cent. he often appears as a beardless youth, for example on the name-vase of the Achilles-Painter (Vatican 16571 = ARV² 987 = LIMC Achilleus 907, c.450 BC), showing him alone as an ideal of male beauty.

Achilles had a tomb at Sigeum, where *Alexander the Great, among others, paid homage, and received cult honours in many places, in particular at Olbia and other sites on the north shore of the Black Sea (the region of the White Island, where he had a temple). This was more than a hero-cult as (in Roman times at least) he was honoured as a god, with the title Pontarches, Lord of the (Black) Sea (*Alcaeus, fr. 354 L-P, addresses him as Lord of Scythia). The origin of this cult and its connection with the human Achilles of myth and epic are matters of debate.

ALB

Actium (*see* ◀ Map 1, Ab ▶), a flat sandy promontory at the entrance to the Ambracian Gulf, forming part of the territory of Anactorium, as well as the NW extremity of Acarnania. A cult of Apollo was located here as early as the 6th cent. BC to judge from the torsos of two archaic *kouroi* found on the cape in 1867. At this time, or soon thereafter, a temple stood on a low hill near the tip of the promontory where games were celebrated in honour of the god as late as the end of the 3rd cent. BC. In 31 BC the cape was the site of Mark *Antony's camp, and gave its name to the naval battle, fought just outside the gulf, in which he was defeated by Octavian (2 September). A few years later, when Octavian founded *Nicopolis on the opposite (northern) side of the strait, he took care to enlarge Apollo's sanctuary at Actium by rebuilding the old temple and adding a monumental naval trophy (not to be confused with the naval trophy he dedicated at Nicopolis). In ship-sheds constructed in the sacred grove at the base of the hill, he dedicated a set of ten captured warships, one from each of the ten classes that had fought in the battle (Strabo 7. 7. 6). Although the ships and their ship-sheds were gone (destroyed by fire) by the time Strabo composed his account, recent excavations have located the site where the *kouroi* were found in 1867 and have confirmed the location of the temple, obscured for many years. Octavian also revitalized the old Actian Games by transferring them to a new venue outside Nicopolis. The quinquennial games, called Actia, were modelled on the Olympian festival, and were later imitated by several other Greek cities (*see* GAMES). An Actian 'era' was established, whose initial date is variously placed between 30 and 28 BC.

WMM

Acts of the Apostles The second of two volumes which continues the story of the rise and spread of *Christianity begun in the gospel of Luke. Its textual history poses peculiar interpretative problems as it is extant in two versions, the longer in Codex Bezae. Its narrative starts with Jesus' ascension in Jerusalem and ends with Paul preaching in Rome, where he had been taken after his appeal to Caesar (i.e. the emperor). The focus of the material on the earliest Jerusalem church around Peter and, later in the book, on the Christian career of Paul shows the concern of the author to relate the Jewish and Gentile missions and to demonstrate their basic unity. Only occasional glimpses are offered of the conflict in early Christianity which is evident in the Pauline corpus (e.g. Acts 6: 1 and 15). Acts has for a long time been a cause of great controversy between those who maintain the substantial authenticity of its historical account (while allowing for its apologetic interests) and those who see the document as a work of skilful narrative propaganda whose historical value is negligible. Knowledge of contemporary Graeco-Roman institutions should not mask the difficulties in accepting the historicity of Acts, a particular problem being the reconciliation of the accounts of Paul's career in Acts, Galatians 1 & 2, and the Corinthian correspondence. The references to Paul's theology indicate a markedly different set of ideas from what we find in the letters to the Romans and Galatians. For this and other reasons Acts has proved to be disappointing to the historian of Christian origins as a source for early Christian history. The history of the Jerusalem church after the start of the Pauline mission is only touched on in so far as it helps the author explain Paul's career as apostle to the Gentiles. Whereas Luke's gospel portrays Jesus as a Palestinian prophet with a controversial, indeed subversive, message for Jewish society, there is little in Acts (apart from the idealized accounts of the common life of the Jerusalem church) of that radicalism. The antagonism to *Jews and the sympathetic account of Roman officials evident in the gospel of Luke is continued in Acts, and a conciliatory attitude towards Rome has been suggested. Jews in Acts are regarded as responsible for the harassment of nascent Christianity, though there are occasional glimpses of more openness to Judaism elsewhere in the book than the concluding verses would indicate.

Various suggestions have been made with regard to its (and the related gospel of Luke's) purpose. These have included an apologia for Christianity to the Roman state, an explanation for the delay of the Parousia (Second Coming) by stressing the role of the church in the divine purpose, an essay in anti-Jewish polemic, and a defence of Paul when his case was heard in Rome. Like his contemporary *Josephus

the author of Acts seeks to demonstrate that divine providence is at work, though for the latter there is nothing in the emergence of a strange Jewish messianic movement to contradict the Jewish tradition, since it is rather the inevitable continuation of it. CCR

adoption

Greek

Greeks counted on their heirs for support in old *age, and for continuation of their *oikoi* (families) and tending of their tombs after death. But high mortality ensured that many had no surviving children. Adoption was a common recourse, probably encouraged by the great variation in fertility characteristic of populations with unreliable means of *contraception. The fullest accounts can be provided for Gortyn and *Athens in the Classical period.

The law code of Gortyn apparently modifies prior practice. It permits an adult male to adopt anyone he chooses, including someone without full membership in the community, even if he already has legitimate children; however, the inheritance of those adopted in such circumstances is less than it would be if they were themselves natural children. Adoptive fathers are to announce the adoption to a citizen assembly and make a stipulated payment to their *hetaireia* (in this context, a kind of kinship group analogous to the phratry); they may also publicly disavow the adoption, and compensate those adopted with a set sum. Neither women nor minors may adopt.

At Athens, we hear of three forms of adoption, differing chiefly in the manner in which those adopted entered into their inheritance. These involved living parties (*inter vivos*), a will (testamentary adoption, said to have been introduced by *Solon), or the provision of an heir for a man already deceased. (Such posthumous adoptions did not require the prior agreement of the adoptive father.) As at Gortyn, only adult male citizens could adopt. However, Athenians' freedom of action was more limited: they could adopt only in the absence of legitimate sons, and then no one other than (male) citizens. Magistrates could not adopt or be adopted until their accounts had been rendered; those who were *atimoi* (subject to civic disability) could not be adopted. In addition, adopted sons could not themselves adopt in some or all cases. But fathers with daughters only could adopt; they might also marry their daughters to their adopted sons. In practice, adopters tended to choose adults, as these were more likely to survive and (according to the orators) had already given good evidence of their character, and sons were preferred to daughters. Those

adopted would often have inherited anyway by the laws governing intestacy; adoptions of others were likely to be challenged by closer kin. Their claims might be furthered by the belief, apparent in other contexts as well, that adoption did not generally forge links of loyalty and intimacy equal to those of blood (e.g. Pl. *Leg.* 9. 878 a; Dem. *Epit.* 4). Adoptions by will could also be attacked on the legal grounds that the adopter had acted when mad or senile, under the influence of drugs, illness, or a woman, or under coercion. Adopted children severed their connections with their natural fathers, though not their mothers. They could return to their *oikos* of birth if they left a natural son as heir to their adoptive *oikos*.

Adoption at Athens has often been viewed in the context of the community's concern for the survival of individual *oikoi*, a concern thought to be reflected in the responsibilities of the eponymous archon (a magistrate). Other Greek *poleis* (see POLIS) provide parallels: the role of the kings in adoptions at *Sparta (Hdt. 6. 57), the tradition that Philolaus, the lawgiver of Thebes, used adoption to maintain the number of *klēroi*, 'inheritable estates' (Arist. *Pol.* 2. 1274^b5). However, recent scholarship tends toward contrary conclusions: the *polis* was not concerned to maintain separate *oikoi* through adoption, though individuals certainly were; adoption was essentially a private matter, regulated by the phratries and demes (subgroups of the citizen body) into which adopted children were introduced, in which the archon took no initiative; heirs had no legal obligation to continue an *oikos* through posthumous adoption. Furthermore, arguments (based on the disappearance of testamentary adoption) that continuation of the *oikos* ceased to be a goal of adoption after the 4th cent. probably read too much into the silence of our literary sources.

Almost all our evidence from adoption in the Hellenistic and Roman periods comes from numerous inscriptions from throughout the Greek world, especially Rhodes. These reveal a bewildering inconsistency in terminology, even within the same community, perhaps attesting to differences in formal procedures and consequences now unclear. They also indicate that Greeks might change their names on adoption. MG

Roman

Adoptio is a legal act by which a Roman citizen enters another family and comes under the *patria potestas* (paternal authority) of its chief. Since only a *paterfamilias* (usually father or grandfather) could adopt, women could not (except in later law by imperial grant). When the adopted person, male or female, was previously in the paternal power of another, the act was *adoptio*; when a male who was not in paternal power but himself the head

of a family, it was *adrogatio*. Women could not be adrogated. Both acts involved a *deminutio capitis minima*, a reduction of legal status.

Adrogatio fused two families, for with the adoptee (*adrogatus*) all under his power (*potestas, manus*) and his property pass into the family of the adopter (*adrogator*). In early times *adrogatio* was publicly validated by a vote of the curiate assembly, preceded (since it extinguished a family and its cult) by an investigation by the pontiffs; by the time of Cicero, 30 lictors represented the *curiae*. Since the assembly met only in Rome, *adrogatio* could take place only there, until (by Diocletian's time at latest) imperial rescript replaced the vote.

Adoptio of a person in power (of any age) was a more private act performed before a praetor or governor. Its form was the same as that of emancipation (*emancipatio*, the release of a child from power), except that after the third sale the buyer did not free the child but collusively claimed that he/she was in his power. Under Justinian, these formalities were replaced by a declaration before a magistrate.

The effect of both *adoptio* and *adrogatio* was to place the adopted person for all legal purposes in the same position as if he/she had been a natural child in the power of the adopter. The adoptee took the adopter's name and rank and acquired rights of succession in his new family, losing those held in the old family. 'Adoption imitates nature' (*Inst. Iust.* 1. 11. 4), so an adoptive relationship barred marriage and the adopter had to be older than the adoptee (a rule allegedly flouted by the adoption of Publius *Clodius Pulcher). Bachelors and men physically incapable of reproduction (except if they had been castrated) could adopt. Adoption could be reversed by emancipation.

Adoption (of both kinds), since it created paternal power and continued the agnatic family, was originally the prerogative of men only. Adoption by women, 'to console them for the loss of children', was allowed by later emperors, as was adrogation of women: this shows a new conception. Safeguards grew up, especially for young children and their property.

Since adoption destroyed the adoptee's succession rights in the old family and a subsequent emancipation would destroy rights in the new family, Justinian drastically changed *adoptio* to allow the adoptee to retain rights in the old family, except where the adopter was a close relative, e.g. maternal grandfather.

The testamentary adoptions recorded in non-legal sources in the late republic and Principate apparently created only an obligation (from which the praetor could give dispensation) to take the testator's name. So Titus Pomponius *Atticus inherited from his mother's brother

Caecilius and became formally Q. Caecilius Q. f. Pomponianus Atticus (Cic. Att. 3. 20); the future emperor Ser. Sulpicius Galba for some time bore a name taken from the family of his stepmother, Livia Ocellina: L. Livius Ocella (Suet. Galba. 3–4). Caesar's adoption of his great-nephew C. Octavius (see AUGUSTUS) was ratified by a posthumous *adrogatio*.

Adoption of adult men was a convenient recourse for childless aristocrats and for emperors in need of successors.

adultery

Greek

At Athens, a law (attributed to Draco or *Solon) allowed a man who killed another he found in the sexual act with his wife, mother, sister, daughter, or concubine held for the purpose of bearing free children, to plead justifiable homicide; such adulterers might also be held for ransom. It is probable that there was also a *graphē* (legal suit) against adulterers, possible that those caught in the act were delivered to the 'Eleven' for summary execution or trial. Adulterous wives had to be divorced, and were excluded from public sacrifices. As for unmarried women, Solon supposedly permitted a *kurios* ('controller', male representative at law) to sell a daughter or sister into slavery if he discovered she was not a virgin. No instances are known, however, and indeed some husbands too probably preferred to respond (or not) to adultery without recourse to the law, so avoiding public dishonour. Many states are said to have allowed adulterers to be killed with impunity (Xen. *Hiero* 3. 3). But the law code of Gortyn envisages adulterers paying ransoms, varying with the status of the parties and the setting of the acts, and pecuniary penalties are stipulated in some marriage contracts from Hellenistic Egypt. Punishments in other (mostly later) communities stress public humiliation. Laws at both Athens and Gortyn provided protection against entrapment and false accusations. There was allegedly no Lycurgan (see LYCURGUS) law against adultery at Sparta, a tradition informed by the custom by which Spartans could share their wives with fellow citizens for procreative purposes (see MARRIAGE LAW (Greek)).

MG

Roman

Roman tradition ascribed to fathers and husbands great severity in punishing illicit sexual behaviour by daughters or wives. Such misconduct was *stuprum* in married or unmarried women, an offence against chastity (*pudicitia*); *adulterium* described sexual intercourse between a married woman and a man other than her husband. Until the legislation of Augustus, regulation was chiefly in the

hands of the family: adultery probably always justified divorce; a family council might advise the *paterfamilias* (husband or father in whose power the woman was) on this and other sanctions, possibly including execution. The immediate killing of adulterers/adulteresses taken in the act was defensible (morally and in court) but probably not legally prescribed. Other physical violence against the adulterer is a literary commonplace. Adultery in the late republic, like the seduction or rape of an unmarried woman, entitled the father or husband to sue the man for damages (for *iniuria*, insult) and not only to divorce the wife but to retain part of her dowry. Magistrates occasionally proceeded against adulterers/adulteresses.

*Augustus, in the Julian law on repression of adulteries (*lex Iulia de adulteriis coercendis vel sim*, Dig. 48. 5), passed apparently shortly after the marriage law of 18 BC, made illicit sexual intercourse (extramarital intercourse by and with a respectable free woman) a crime, to be tried by a special court under a praetor (in practice, often the senate). The law detailed restricted circumstances in which homicide by father or husband was justifiable. The normal judicial penalty for adulterers was *relegatio* (banishment) to different islands, and partial confiscation of property and dowry (one half). The husband with clear evidence had to divorce or be liable to a charge of procuring (*lenocinium*; penalties similar). On divorce, husband or father might bring an accusation within 60 days, or anyone within the next four months. A woman might not be accused while married.

Penalties were increased by Christian emperors. *Constantine I introduced the death penalty (which Justinian confirmed (see JUSTINIAN'S CODIFICATION)), but allowed only the husband or the wife's relatives to prosecute.

Adultery by the husband was not *adulterium* (unless his partner was a married woman), but his intercourse with a respectable unmarried woman (or male) constituted *stuprum* and in the 5th cent. AD (*Cod. Iust.* 5. 17. 8) his adultery in the matrimonial home or with a married woman entitled his wife to divorce him without incurring the penalties then imposed for unjustified divorce (see MARRIAGE LAW (Roman)).

AB/BN/SMT

Aegae (Vergina) in northern Pieria (see ◀ Map 1, Ba ▶), overlooking the coastal plain of Macedonia. Founded by the first of the Temenid kings and thereafter the site of their tombs, it has been made famous by Manolis Andronikos, who excavated a pre-Temenid cemetery of tumuli and then, in 1977, three royal tombs of the 4th cent. BC. Two were intact. The frescos, the offerings in gold, silver, ivory, and bronze, and the weapons were of the highest artistic quality. Tomb II was almost certainly that of *Philip II (for an alternative view, that Philip

Arrhidæus was buried here, see E. Borza, *In the Shadow of Olympus* (1990), 256 ff.). Earlier and later burials have also been found. Theatre, palace, and acropolis stand above the cemetery area. Excavations continue. NGLH

Aeneas, character in literature and mythology, son of Anchises and the goddess Aphrodite. In the *Iliad* he is a prominent Trojan leader, belonging to the younger branch of the royal house (13. 460–1, 20. 179–83, 230–41), and has important duels with Diomedes (5. 239 ff.) and *Achilles (20. 153 ff.), from both of which he is rescued by divine intervention. His piety towards the gods is stressed (20. 298–9, 347–8), and *Poseidon prophesies that he and his children will rule over the Trojans (20. 307–8).

This future beyond the *Iliad* is reflected in the version in the lost epic *Iliu Persis* ('Fall of Troy') that Aeneas and his family left Troy before its fall to retreat to Mt. Ida, which led later to accusations of his treachery (e.g. *Origo gentis Romanae* 9. 2–3). The departure of Aeneas from Troy is widely recorded, and the image of Aeneas' pious carrying of his father Anchises on his shoulders in the retreat is common in Greek vases of the 6th cent. BC found in Etruria, and occurs in 5th- and 4th-cent. Attic literature (Soph. fr. 373 Radt, Xen. *Cyn.* 1. 15). The further story of Aeneas' voyage to Italy may have existed as early as the 6th or 5th cent. BC (Stesichorus fr. 205 Davies; Hellanicus, *FGrH* 4 F 84), but seems well established by the 3rd cent. (Timaeus, *FGrH* 566 F 59). Following recent excavations at Lavinium, claims have been made for hero-cult of Aeneas there as early as the 4th cent. BC, but these must remain unproven; it is not easy to link this with other attestations of cult for Aeneas as Jupiter Indiges (e.g. Dion. Hal. *Ant. Rom.* 1. 64. 5; Livy 1. 2. 6).

The list of Aeneas' westward wanderings towards Italy is already long and contradictory by the 1st cent. BC (cf. Dion. Hal. 1. 44–64), including cities and cults supposedly named after him in Thrace, Chalcidice, Epirus, and Sicily, and visits to Delos and Crete. A visit to Carthage, possibly involving a meeting with Dido, is certainly part of the itinerary by the time of *Naevius' *Bellum Punicum* (3rd cent. BC), where it is seen as an ancestral cause of the enmity between Rome and *Carthage. As Rome confronted a Greek-speaking Mediterranean world in the 3rd cent. BC, it found it politically and culturally useful to claim as its founder Aeneas, famous through his appearance in Homer but also an enemy of the Greeks; a particular stimulus was the invasion of Italy by Pyrrhus of Epirus (280 BC), who claimed descent from Achilles and saw Rome as a second Troy (Paus. 1. 12. 2). In consequence, Roman poets (e.g. Ennius), historians

(e.g. Cato (Censorius)), and antiquarians (e.g. Varro) stressed the Trojan origins of Rome; considerations of chronology eventually led to the view that Aeneas founded not Rome but a preceding city, Lavinium, and that Rome's eponymous founder Romulus was his distant descendant.

*Virgil's version of the Aeneas-legend in the *Aeneid* aims at literary coherence rather than antiquarian accuracy. Aeneas' wanderings, apart from the stay at Carthage, are compressed into a single book (*Aeneid* 3); his war in Latium is the subject of the second half of the poem, and he appears there and at other times to have some a typological link with *Augustus (cf. *Aen.* 8. 680 and 10. 261), who claimed him as ancestor (1. 286–8). The Virgilian Aeneas' central traits of pietas and martial courage continue his Homeric character, but he is also a projection of the ideal patriotic Roman, subordinating personal goals to national interest. And yet he never renounces his human vulnerability; he is in despair in his first appearance in the poem (1. 92 ff.), he is deeply affected by love for Dido (4. 395, 6. 455), and the poem ends not with his triumphant apotheosis, anticipated earlier (1. 259–60, 12. 794–5), but with his emotional killing of Turnus in a moment of passion.

The success of the *Aeneid* meant that few innovations were made in the Aeneas-legend by later writers; subsequent Aeneas-narratives are clearly crafted from existing materials, principally Virgil (e.g. *Ov. Met.* 13. 623–14. 608, *Origo gentis Romanae* 9. 2–15. 4). SJHA

Aeneas Tacticus, probably the Stymphalian general of the Arcadian League in 367 BC (*Xen. Hell.* 7. 3. 1); anyway the earliest(-surviving) and most historically interesting of the ancient military writers (*tactici*). Of several treatises only his *Siegecraft* (*Polioretica*) is extant, internally datable to the mid-4th cent. via the clustering of contemporary illustrations of its precepts (and linguistically important for its embryo form of the *koinē*, i.e. standard Greek). Concerned more with defence against than prosecution of siege-warfare, it offers unique insights into the stresses of life in small communities with warfare and revolution constantly threatening. DW

Aeschines (c.397–c.322 BC), Athenian orator whose exchanges with *Demosthenes in the courts in 343 and 330 provide a large part of the evidence for the relations of Athens and Macedon in the 340s and the 330s. His origins were sufficiently obscure to allow Demosthenes' invention full play. He probably did not receive the usual formal training in rhetoric, but after hoplite service of some distinction in the 360s and early 350s, and a period as an actor, he embarked on a public career as a supporter first briefly of Aristophon and then of Eubulus, during

whose supervision of the city's finances Aeschines' brother, Aphobetus, was a theoretic commissioner (responsible for distribution of grants for attendance at festivals). In 347/6 both Aeschines and Demosthenes were members of the Council of 500 and their disagreements led to sixteen years of enmity. Early in 346 (though many have dated the affair to 348/7) when alarming news reached Athens of the extension of Macedonian influence to Arcadia, Eubulus supported by Aeschines took the lead in urging Athens to protest to Arcadia and to seek to organize a Common Peace, which would provide for common action against aggressors and so make it unnecessary for any state to seek Macedonian help. Aeschines was sent on an embassy to Megalopolis where he sought to dissuade the assembly of the Arcadians from dealings with *Philip II. Whether through the indifference of the Greek states or through the new threat to Greece caused by the refusal of the Phocian tyrant, Phalaecus, to permit access to Thermopylae, the key-point for the defence of Greece, the initiative of Eubulus and Aeschines proved abortive. An embassy of ten, including Aeschines and Demosthenes, was hastily sent to negotiate peace terms with Philip. Their return to the city was closely followed by a Macedonian embassy, and on the 18th and 19th of the month Elaphebolion, when the peace was debated and voted, Aeschines played a notable if ineffectual part. Demosthenes, realizing that peace was essential and that the only form of peace which Philip would accept was a plain alliance with Athens and her allies of the Second Athenian Confederacy, made himself responsible for getting the decree of Philocrates passed: Aeschines strove without success for a Common Peace open to all the Greeks. The ten ambassadors then set off again to secure Philip's oath to the treaty which he did not render until his forces were in position to attack Phocis. When the ambassadors returned with this alarming news, it was decided in the Council to recommend an expedition to save Phocis, but by the 16th of the month Skirophorion, when the people met, it was known that Philip had occupied Thermopylae; Demosthenes' proposal was not even read out and he was himself shouted down. Aeschines then made a speech, which Demosthenes chose to regard as proof that Aeschines had been won over by Macedonian bribery. The truth was probably far different; since Phocis could not be saved, Aeschines sought to reconcile the Athenians to the fact by reporting vague suggestions of Macedonian proposals for central Greece which were very much what Athens was seeking.

From that day Demosthenes was implacably opposed to Aeschines as well as determined to destroy the Peace, while Aeschines was gradually won over to support it and seek its extension into a Common Peace. In 346/5

Demosthenes with the support of Timarchus began a prosecution of Aeschines for his part in the peace negotiations; Aeschines replied by charging Timarchus with breach of the law forbidding those whose misconduct was notorious from addressing the assembly; the *Against Timarchus* was successful and Demosthenes was forced to recognize that the time was not ripe to attack Aeschines. By mid-343 the mood of Athens had clearly begun to change; early in the year Philocrates had been successfully prosecuted by *Hyperides and in the *De falsa legatione* Demosthenes attacked Aeschines, the advocate of merely amending a discredited peace, as if he had been the orator really responsible in 346 for Athens' accepting the Peace. Aeschines replied in a speech of the same title and, supported by Eubulus and Phocion, was narrowly acquitted. Aeschines continued to have some influence in the assembly, and in 340/39 was sent as one of Athens' representatives to the Amphictionic Council (*see DELPHI*), on which occasion he appears to have displayed a serious lack of judgement in relation to the affairs of central Greece: at a time when the war against Philip had recommenced and there was a clear need to avoid exacerbating the divisions of Greece, Aeschines replied to Locrian charges against Athens with such a vigorous attack on the conduct of the Amphissians that hostilities began and Philip was the more easily able to intervene.

Aeschines was a member of the embassy sent to negotiate with Philip after the battle of Chaeronea, but from then on he withdrew from politics only to re-emerge on two occasions when circumstances seemed favourable for an attack on Demosthenes. The first was in early 336 when Ctesiphon proposed that Demosthenes should be crowned in the theatre at the Dionysia for the excellence of his services to the city: earlier Demosthenes had been similarly honoured without protest but, at a time when Demosthenes' gloomy predictions after Chaeronea seemed mocked by the opening of the Macedonian invasion of Persia, Aeschines indicted the decree under the *graphē paranomōn* (law against unconstitutional proposals). However, the murder of Philip made the future too uncertain for Aeschines to be confident of success, and he decided not to proceed with the indictment for the moment. In 330 after the defeat of Persia at Gaugamela and the failure of Agis III's revolt, which Demosthenes had chosen not to support, Athens was in almost complete isolation with no prospect of liberation from Macedon, and Aeschines thought the moment suitable for him to proceed with his prosecution of Ctesiphon. In the *Against Ctesiphon*, after adducing minor, if perhaps valid, legalistic considerations concerning the details of the original decree, he reviewed the career of Demosthenes, somewhat selectively, and sought to show that

Demosthenes was unworthy of the crown. In the *De corona* Demosthenes replied with all the devastating effect that his great rhetorical gifts could command, and Aeschines failed to secure the necessary fifth of the jury's votes to save him from a fine and the limitation of the right to prosecute. He chose to retire from Athens to Rhodes, where he taught rhetoric.

The supremacy of Demosthenes as an orator has to a large extent beguiled posterity into the opinion that he alone fully appreciated the menace of Macedon and correctly diagnosed the causes of Philip's success, and Aeschines has been represented as an opportunist with little judgement and less principle. In fact, there was no obvious way of saving Athens and Greece, and it is probable that Aeschines no less than Demosthenes sought to maintain his city's power and independence.

Speeches

The only genuine speeches of Aeschines known to the critics of the Roman period were the three that we have: a fourth, concerning Delos, was rejected by Caecilius. Aeschines was a man of dignified presence and fine voice, who deprecated the use of extravagant gestures by an orator, preferring a statuesque pose. Proud of his education, he displays it by frequent quotation of poetry. In the use of historical argument he cannot compare with Demosthenes, but in a battle of wits he more than holds his own. His vocabulary is simple but effective, though occasional obscurities may be found in his sentences. Ancient critics ranked him lower than he deserves; the fact is that he was not aiming at literary perfection; his object was to produce a powerful effect on his audiences, and he was justified by the result. GLC

Aeschylus (*see following page*)

aetiology in religion and mythology refers to an explanation, normally in narrative form (hence 'aetiological myth'), of a practice, epithet, monument, or similar. Typically such explanations elucidate something known in the contemporary world by reference to an event in the mythical past; they are thus related to the traditions of first inventors and are quite often found in connection with etymologies. Comparative evidence suggests that many aetiologies in the ancient world will have been of popular origin, while others could derive from the priestly traditions of individual cults, but it is very likely also that some literary aetiologies represent authorial inventions rather than pre-existing accounts. Aetiological accounts are frequent in classical literature. Implicit in a few Homeric passages (e.g. the tombs of Sarpedon [*Il.* 16.666–83] and Phrontis [*Od.* 3.278–85]), they are seen in more developed form in *Hesiod,

[*continued on p. 13*]

AESCHYLUS

Aeschylus, Athenian tragic dramatist.

Life (?525/4–456/5 BC)

Aeschylus was probably born at *Eleusis in 525/4 BC (*Marm. Par.*). He fought at the battle of Marathon (*Marm. Par.*; *Vita* 4, 11) and probably at Salamis (Ion of Chios, *FGrH* 392 F 7). His first tragic production was in 499 (*Suda* α 357 with π 2230), his first victory in 484 (*Marm. Par.*); thereafter he may have been almost invariably victorious, especially after the death of Phrynichus c.473 (he gained thirteen victories altogether, *Vita* 13). Of his surviving plays, *Persians* was produced in 472 (his *chorēgos* being the young *Pericles) and *Seven against Thebes* in 467. *Suppliants*, part of a production which won first prize over *Sophocles (*POxy.* 2256. 3), is probably later than *Seven* (despite the predominant role of the chorus and other features once thought to prove it very early); its exact date is uncertain. The *Oresteia* (comprising *Agamemnon*, *Choephoroi* ('Women Bearing Drink-offerings'), and *Eumenides*, with the lost satyr-play *Proteus*) was Aeschylus' last production in Athens, in 458. He had already visited Sicily once, possibly twice, at the invitation of Hieron of Syracuse, composing *Women of Aetna* in honour of Hieron's newly founded city of Aetna (*Vita* 9) and producing *Persians* at Syracuse (ibid. 18; Eratosth. in schol. Ar. *Frogs* 1028); after the production of the *Oresteia* he went there again, dying at Gela in 456/5. *Prometheus Bound*, if by Aeschylus (see below), may have been composed in Sicily and produced posthumously. His epitaph (*Vita* 11) makes no reference to his art, only to his prowess displayed at Marathon; this estimate of what was most important in Aeschylus' life—to have been a loyal and courageous citizen of a free Athens—can hardly be that of the Geloans and will reflect his own death-bed wishes (cf. Paus. 1. 14. 5) or those of his family.

Two sons of Aeschylus themselves became dramatists, Euphorion (who also restaged many of his father's plays) and Euaeon. A nephew, Philocles, was the founder of a dynasty of tragedians that lasted over a century.

Works

(°denotes a known satyr-play). Aeschylus' total output is variously stated at between 70 and 90 plays. Seven plays have survived via medieval manuscripts, of which *Prometheus Bound* is of disputed authenticity (it was possibly composed by Euphorion and produced by him as Aeschylus' work). In addition there survive substantial papyrus fragments of °*Netfishers* (*Diktyoukoi*) and °*Spectators at the Isthmian Games* (*Theōroi* or *Isthmiastai*).

Many of Aeschylus' productions were connected 'tetralogies', comprising three tragedies presenting successive episodes of a single story (a 'trilogy') followed by a satyr-play based on part of the same or a related myth. This seems to have been common practice in his day, though the production of 472 (*Phineus*, *Persians*, *Glaucus of Potniae* and °*Prometheus the Fire-kindler*) is an exception. Four tetralogies are securely attested: (1) the *Oresteia* (see above); (2) *Laius*, *Oedipus*, *Seven against Thebes*, °*Sphinx*; (3) *Suppliants*, *Egyptians*, *Danaids*, °*Amymone*; (4) a *Lycurgeia* comprising *Edonians*, *Bassarids*, *Young Men* (*Neaniskoi*) and °*Lycurgus*. At least six other tetralogies can be reconstructed with a fair degree of probability: (5) *Myrmidons*, *Nereids*, *Phrygians*, and perhaps *Chamber-makers* (*Thalamopoioi*), based on *Iliad* 16–24; (6) *Ghost-Raisers* (*Psychagōgoi*), *Penelope*, *Bone-Gatherers* (*Ostologoi*), °*Circe*, based on the *Odyssey* but apparently with an innovative ending; (7) *The Award of the Arms* (*Hoplōn Krisis*), *Thracian Women*, *Women of Salamis* (satyr-play unknown), centring on the death of Ajax; (8) *Semele*, *Wool-Carders* (*Xantriai*), *Pentheus*, and perhaps °*The Nurses of Dionysus*, on the birth of Dionysus and his conflict with Pentheus (cf. Euripides' *Bacchae*); (9) *Eleusinians*, *Women* (?) of *Argos*, *Epigoni*, and perhaps °*Nemea*, on the recovery of the bodies of the Seven against Thebes and their sons' war of revenge; (10) *Lemnian Women*, *Hypsipyle*, *Cabeiri*, *Argo*, on the story of Hypsipyle and Jason. In some cases two tragedies seem to be connected but no third related one can be confidently identified: (11) *Memnon* and *The Weighing of Souls* (*Psychostasia*), based on the cyclic *Aethiopis*; (12) *Prometheus Bound* and *Prometheus Unbound* (if, as is likely, the title *Prometheus the Fire-bearer* (*Pyrphoros*) is no more than a (superior) alternative name for *Prometheus the Fire-kindler* (*Pyrkaeus*)); (13) *Phorcides* and *Polydectes* (with °*Netfishers*), with Perseus as hero; (14) *Mysians* and *Telephus*.

Aeschylean plays not mentioned above include *Archer-Nymphs* (*Toxotides*), on the death of Actaeon; *Athamas*; *Atalanta*; *Callisto*; *Carians* or *Europa*; °*Cercyon*; *Children of Heracles*; *Cretan Women* (on the story of Polyidus); *Daughters of the Sun* (*Heliades*); *The Escort* (*Propompoi*); *Glaucus the Sea-god*; °*Heralds* (*Kērykes*); *Iphigenia*; *Ixion*; °*The Lion*; *Niobe*; °*Oreithyia*; *Palamedes*; *Perrhaebian Women* (whose central character was Ixion); *Philoctetes* (see Dio Chrys. Or. 52); *Priestesses* (*Hiereiai*); °*Sisyphus the Runaway*; and *Sisyphus the Stone-roller*.

Technique

Aeschylus was the most innovative and imaginative of Greek dramatists. His extant plays, though covering a period of only fifteen years, show a great and evolving variety in structure and presentation.

The three earlier plays (*Persians*, *Seven*, and *Suppliants*) are designed for a theatre without a *skēnē* (a tent or hut forming a background for plays: see THEATRES (GREEK AND ROMAN), STRUCTURE) but containing a mound or elevation (tomb of Darius, Theban acropolis, Argive sanctuary, the two latter with cult-images on them). There are two actors only; the main interactions are less between character and character than between character and chorus (often expressed in 'epirrhematic' form, i.e. dialogue between singing chorus and speaking actor), and in two cases the chorus open the play in marching anapaests. There is a wide variety of structural patterns, some of them (like *Sept.* 375–676, with its seven pairs of speeches punctuated by short choral stanzas) probably unique experiments, but all built round the basic framework of a series of episodes framed by entries and exits and separated by choral songs. The pace of the action is usually rather slow.

By 458 the dramatist had available to him a *skēnē* and probably an *ekkyklēma* (wheeled platform) and *mēchanē* (crane) also, as well as a third actor. Aeschylus makes imaginative, and once again very varied, use of the new opportunities. After composing the first half of *Agamemnon* entirely in his old style (with no actor–actor dialogue whatever), he centres the play on a verbal trial of strength between *Agamemnon and Clytemnestra, meanwhile keeping Cassandra long silent and then making her narrate Agamemnon's death prophetically before it happens. The house and its entrance are firmly controlled throughout by the 'watchdog' Clytemnestra. In the second half of *Choephoroi* the action increasingly accelerates as the climax approaches, and then abruptly slows as Clytemnestra for a time staves off her doom with brilliant verbal fencing. In *Eumenides* a series of short scenes, full of surprises and changes of location, and including a trial-scene with some virtuoso four-sided dialogue, leads to a conclusion mainly in the old epirrhematic mode for one actor and chorus (with a second chorus at the very end).

Aeschylus' plots tend to be characterized, not by abrupt changes of direction (*peripeteiai*), but by a build-up of tension and expectation towards a climax anticipated by the audience if not by the dramatis personae. He was quite capable of contriving *peripeteiai* when he wished, as witness *Seven against Thebes* where the whole action pivots on Eteocles' discovery that he has unwittingly brought about a combat between himself and his brother and thus fulfilled his father's curse; the trilogy form, however, encourages sharp changes of direction and mood between plays rather than within them.

In general the central interest in Aeschylean drama is in situation and event rather than in character. Even quite major figures in a play (like Pelasgus or Orestes) can be almost without distinctive character traits: if their situation gives them effectively no choice how to act, their personal qualities are irrelevant and are ignored. On the other hand, characters who make (or have previously made) decisions vitally affecting the action, when alternative choices were possible, are portrayed as far as is necessary for illuminating these decisions: Eteocles is usually calm and rational but can be carried away by strong emotions, Agamemnon is one who values prestige above all other considerations. The character most fully drawn is Clytemnestra, because the plot requires her to be a unique individual, 'a woman with a man's mind'. In the *Oresteia* several minor characters are drawn with marked vividness, less perhaps for their own sake than to focus special attention on what they have to say.

For similar reasons, Aeschylean choruses nearly always have a strong and distinctive personality. Their words are often of the utmost importance in drawing attention to the deeper principles underlying events (even when they do not themselves fully understand these principles or their implications) and, together with their music and dance, in establishing the mood and theme of a whole play. The women of *Seven*, dominated almost throughout by fear, contrast sharply with the Danaids, utterly determined in their rejection of marriage and coercing Pelasgus by a cool threat of suicide; the Argive elders of *Agamemnon*, enunciators of profound moral principles, yet unable to understand how these principles doom Agamemnon to death, share a trilogy with the Erinyes, hellish bloodsuckers, yet also divine embodiments of these same principles. Aeschylus' choruses often have a substantial influence on the action; the Danaids and the Erinyes are virtually the protagonists of their plays, the women's panic in *Seven* causes Eteocles' promise to fight in person, while in *Choephoroi* it is the chorus who ensure that Aegisthus is delivered unguarded into Orestes' hands. Sometimes a chorus will surprise the audience near the end of a play (as when the Argive elders defy Aegisthus); it is a distinctly Aeschylean touch in *Prometheus Bound* when the hitherto submissive Oceanids resolve to stay with Prometheus despite Hermes' warning of apocalyptic destruction impending.

Aeschylus' lyric style is smooth and flexible, and generally easier of immediate comprehension than that of *Pindar or Sophocles, provided the listener was attuned to a vocabulary that tended towards the archaic and the Homeric. In iambic dialogue, where he had fewer models to follow, he sometimes seems stiff compared with Sophocles or Euripides, though he can also create an impression of everyday speech through informal grammar and phraseology.

He excels at devising patterns of language and imagery, elaborating them down to minute detail, and sustaining them all through a play or a trilogy.

Patterns of metre (and presumably of music) are likewise designed on a trilogic scale; in the *Oresteia*, ode after ode ponders the workings of justice in syncopated iambics and lekythia, with variations and deviations to suit particular contexts (epic-like dactyls for the departure of the expedition to Troy, ionics for Helen's voyage and her welcome by the Trojans). Aeschylus' lyrics are mostly simple and perspicuous in structure, here too resembling *Alcman or *Stesichorus more than Pindar or Sophocles. He makes extensive use of marching anapaests as preludes to (and occasionally substitutes for) choral odes, and also in quasi-epirrhematic alternation with lyrics. The regular speech-verse is the iambic trimeter, but the trochaic tetrameter (characteristic of early tragedy according to Arist. *Poet.* 1449a22) appears in *Persians* and *Agamemnon*.

Aeschylus is consistently bold and imaginative in exploiting the visual aspects of drama. The contrast between the sumptuous dress of Atossa at her first, carriage-borne entry and the return of Xerxes alone and in rags; the chaotic entry of the chorus in *Seven*; the African-looking, exotically dressed Danaids and their confrontation with brutal Egyptian soldiers; the purple cloth over which Agamemnon walks to his death, and the display of his corpse in the bath with Cassandra beside him and Clytemnestra 'standing where I struck' (a scene virtually repeated in *Choephoroi* with a different killer and different victims); the Erinyes presented anthropomorphically on stage (probably for the first time), yet tracking Orestes like hounds by the scent of blood; the procession that ends the *Oresteia*, modelled on that at the Great Panathenaea—these are far from exhausting the memorable visual images in only six or seven plays, quite apart from numerous careful touches of detail (e.g. at the end of *Agamemnon* where Aegisthus, that 'woman' of a man, alone of those on stage has neither weapon nor staff in his right hand).

Thought

Aeschylus, like all truly tragic writers, is well aware of, and vividly presents, the terrible suffering, often hard to justify in human terms, of which life is full; nevertheless he also believes strongly in the ultimate justice of the gods. In his surviving work (leaving aside *Prometheus*), all human suffering is clearly traceable, directly or indirectly, to an origin in some evil or foolish action—Xerxes' ill-advised decision to attempt the conquest of Greece; Laius' defiance of an oracular warning to remain childless; the attempt by the sons of Aegyptus to force the Danaids to be their wives; the adultery of Thyestes with Atreus' wife; the abduction of Helen by Paris. The consequences of these actions, however, while always bringing disaster to the actors, never end with them, but spread to involve their descendants and ultimately a whole community; some of these indirect victims have incurred more or less guilt on their own account, but many are completely innocent. In some of Aeschylus' dramas, like *Persians* or the Theban trilogy, the action descends steadily towards a nadir of misery at the end. In the *Oresteia*, however, presumably also in the Odyssean trilogy, and not improbably in the Danaid trilogy, it proves to be possible to draw a line under the record of suffering and reach a settlement that promises a better future; each time a key element in the final stages is the substitution of persuasion for violence, as when in the *Oresteia* a chain of retaliatory murders is ended by the judicial trial of Orestes, and the spirits of violent revenge, the Erinyes, are persuaded to accept an honoured dwelling in Athens.

In dramas of the darker type described above, the gods are stern and implacable, and mortals often find themselves helpless prisoners of their own or others' past decisions; though they may still have considerable freedom to choose how to face their fate (compare the clear-sighted courage of Pelasgus or Cassandra with Xerxes or Agamemnon). Elsewhere, especially perhaps in Aeschylus' latest work, a different concept of divinity may appear. In the *Oresteia* ethical advance on earth, as the virtuous Electra and an Orestes with no base motive succeed the myopic Agamemnon and the monstrous Clytemnestra, is presently answered by ethical advance on Olympus as the amoral gods of *Agamemnon* and *Choephoroi* turn in *Eumenides* into responsible and even loving (*Eum.* 911, 999) protectors of deserving mortals. Something similar may well have happened in the Prometheus plays.

Aeschylus is intensely interested in the community life of the *polis*, and all his surviving genuine works have strong political aspects. He seems to be a strong supporter of democracy (a word whose elements first appear together in the phrase *dēmou kratousa cheir* 'the sovereign hand of the people', *Supp.* 604) and of Athens' wars of the early 450s, while recognizing the overriding importance of avoiding civil conflict by conciliating rival interests (*Eum.* 858–66, 976–87). To later generations, who from time to time continued to see his plays (cf. Ar. *Ach.* 10), Aeschylus, who may have come of age in the year of *Cleisthenes' reforms and whose death coincided with the peak of Athenian power, was (as in Aristophanes' *Frogs*) the poet of Athens' greatness, of the generation of Marathon where he had lived what to him was the supreme day of his life. See also TRAGEDY, GREEK.

notably in the story of Prometheus' attempt to deceive *Zeus, explaining the unequal division of sacrificial meat between gods and humans. *Tragedy, with its interest in the relationship between past and present, is fond of aetiology, and many of *Euripides' final scenes include an aetiology in the form of a command or prophecy. But it is *Callimachus whose *Aitia* ('Causes'), though surviving only in fragments, is perhaps the most famous literary exemplification. In consequence of Callimachus' influence, few Roman poets avoid aetiologies, but they are especially prominent in *Propertius 4 and *Ovid's *Fasti*. See MYTHOLOGY. EAT/AJSS

Africa (Libya), exploration Africa was distinguished from Asia as the third continent by c.500 BC, with the Nile, later usually the Red Sea, as divider; but its interior and, even at the most extended period of knowledge, its coasts south of Cape Delgado on the east and Cape Yubi on the west, remained substantially unknown, locations of marvels and geographical features uncertainly identifiable (Ptol. *Geog.* 4). Some believed it circumnavigable (Hdt. 4. 42) and triangular in shape (Strabo 17. 3. 1), but no circumnavigation is satisfactorily attested, and there are modern scholars who think it impracticable for ancient ships; pure theorizing could account for the traditions. An inconsistent belief in a land bridge from Africa to Asia in fact prevailed (Ptol. 7. 3. 6).

In Egypt, and to some extent in Cyrenaica, Greeks could supplement autopsy with local information; cf. Herodotus on the Nile valley (2. 29–31), the inland route therefrom, via oases, possibly to the Atlas (4. 181–3), and a Libyan foray perhaps reaching the Niger, more probably Chad (not the Nile as he supposed; 2. 32–3). Extended knowledge of the Red Sea and NE coasts came from *Alexander the Great's Indian expedition, more under Ptolemaic rule in Egypt, and still more in Roman times as a result of increasing trade with India (see especially, *Peripl. M. Rubr.*; Ptol. *Geog.* 4). Penetration up the Nile valley was furthered under Augustus by the campaign of Gaius Petronius against the Ethiopians (Strabo 17. 1. 54) and an investigative mission which probably reached southern Nubia in Nero's reign (Sen. *QNat.* 5. 8. 3–5); but it was checked by swamps; the geographer Ptolemy, however, recorded lakes sighted by a sailor driven off course near Zanzibar, which he took to be the source of the Nile (*Geog.* 1. 9; presumably Victoria and Albert Nyanza) and had also heard of the Mountain of the Moon whose snows fed them (*Geog.* 4. 8. 2; perhaps Mt. Kilimanjaro).

In the north-west, local knowledge, both of the coastal hinterland and of the west coast, may have been less readily available before the fall of Carthage. What became

known then was soon supplemented by Roman exploration, often undertaken for military purposes. Already in 146 BC Scipio Aemilianus had despatched *Polybius with a fleet down the west coast (Plin. *HN* 5. 9, 10). Later landmarks were the Jugurthine War (but Sallust's account is disappointing); campaigns by Lucius Cornelius Balbus under Augustus and Valerius Festus under Vespasian against the Garamantes in the Fezzan (Plin. *HN* 5. 36–8), and by Suetonius Paulinus under Claudius in the Atlas mountains (ibid. 5. 14–15); investigative missions, probably under Domitian, attributed to Iulius Maternus and Septimius Flaccus (perhaps identical events), from Tripolitania via the Garamantes, possibly to Chad (Ptol. *Geog.* 1. 8. 4).

Archaeological evidence, constantly accruing, is not always easy to interpret since artefacts might penetrate further than travellers in the packs of native traders and raiders; but a scatter of recently reported inscriptions may suggest Mediterranean contacts further south than expected, e.g. in the Fezzan, the Hoggar mountains of Algeria, the Canaries, while the announcement of Roman pottery found on Zanzibar accords with the literary record. See GEOGRAPHY; MAPS. JMR

Africa, Roman (see ◀Map 4, Ad▶) The Punic Wars made Rome heir to the Carthaginian empire. In 146 BC she left most territory in the hands of Masinissa's descendants, but formed a new province (Africa) in the most fertile part. This covered about 13,000 sq. km. (5,000 sq. mi.) of north and central Tunisia, north-east of a boundary line (the *fossa regia*, 'the royal ditch') from Thabraca to Hadrumetum; it was governed by a praetor from Utica. Except for Utica and six other towns of Phoenician origin which had supported Rome rather than Carthage in the Punic Wars, most of the land became *ager publicus* (see AGRARIAN LAWS AND POLICY). Although the attempt by Gaius *Gracchus to found a Roman colony at Carthage failed, Roman and Italian traders and farmers settled in the province in large numbers, and many of Gaius *Marius' veterans settled west of the *fossa regia*. After the battle of Thapsus in 46 BC *Caesar added to the existing province (thenceforth called Africa Vetus, 'Old Africa') the Numidian territory of Juba I (Africa Nova, 'New Africa'). Caesar's colonial foundations in Africa included Clupea, Curubis, and Neapolis, and his intention to colonize Carthage afresh was carried out by Octavian. A substantial territory in Numidia based on Cirta was given to Caesar's supporter Publius Sittius.

Under Augustus, after various boundary changes, the united province, now called Africa Proconsularis, extended from Arae Philaenorum, on the western edge of Cyrenaica, to the river Ampsagas (Rhummel) in eastern

Algeria. At least eleven colonies were founded in Proconsularis, in addition to the thirteen colonies settled on the coast of Mauretania (the rest of which was ruled by the client king Juba II). Africa Proconsularis was governed from Carthage by a proconsul, who (unusually for the governor of a province not controlled by the emperor) also commanded the Legio III Augusta, then stationed at Ammaedara. Under Gaius command of the legion was handed over to an imperial legate who became responsible for the government of Numidia and the frontier districts. The provincialization of North Africa was completed by Claudius with the creation of two provinces in Mauretania. Resistance to Roman rule on the fringes of the Sahara and in the mountainous regions such as the Kabylie and Aurès was no more than sporadic, and for over three centuries the whole area from Cyrenaica to the Atlantic was protected by only a single legion and auxiliaries. The southern frontier ran approximately from Arae Philaenorum through Cydamus (Gadhamès), Nefta, Vescera (Biskra), and Auzia (Aumale) to the Atlantic south of Volubilis.

Urban life in North Africa was of pre-Roman origin, both Punic and (under Punic influence) Numidian. In spite of the destruction of Carthage, a number of towns of Phoenician or Carthaginian origin survived on the coast, such as Hadrumetum and Lepcis Magna; further west, Icosium (Algiers), Iol (Caesarea), Tingis, and Lixus appear to have been pre-Roman settlements of some size. In a few places Carthaginian language and institutions survived into the 2nd cent. AD, as inscriptions demonstrate; spoken Punic lasted much longer and was still being used, at least in rural areas, in *Augustine's day (*Ep.* 66. 108. 14, 209. 3). Over large areas of the interior the influence of Carthaginian civilization on the indigenous tribes was profound, especially in central Tunisia and in the region of Cirta where Numidian kings had encouraged it. Under Roman control, however, urbanization occurred on a vastly increased scale, and refounded Carthage became the largest city in the western empire after Rome (see URBANISM (Roman)). Over 600 communities ranked as separate *civitates* (citizen communities), of which a large number in due course obtained the rank of *municipium* or *colonia*. The area of densest urbanization was around Carthage and the Bagradas valley, where some of the towns were only a dozen miles apart. Some, like Ammaedara and Theveste, were established on the sites of early legionary fortresses; Lambaesis grew out of the settlement outside the final fortress chosen for Legio III Augusta; others, like Timgad and Diana Veteranorum, were settled as colonies for retired legionaries. Roman **equites* of African origin are known from the mid-1st cent. AD, soon followed by senators. During the

2nd cent. African senators (the best known being the orator Cornelius Fronto) formed the largest western provincial group. The influence of Africans reached its height under *Septimius Severus, who was born at Lepcis Magna.

The wealth of Africa was proverbial throughout the Roman period, and consisted largely of agricultural products. Of these corn was certainly the most important and with Egypt Africa replaced Sicily as Italy's major supplier during the empire (see FOOD SUPPLY (Roman)). The Bagradas valley and the region around Cirta and Sitifis were productive corn-growing districts, but polyculture throughout North Africa was common. Especially from the 2nd cent. *olive-growing and the production of oil for export became an increasingly important part of the African economy, especially in the drier regions of Proconsularis, around Cillium and Sufetula in central Tunisia, and near Thysdrus and Sullethum in eastern Tunisia, as well as further west in Numidia and Mauretania. *Wine was also exported from Tripolitania, Proconsularis, and Mauretania, although on a much smaller scale. The maintenance of irrigation systems, some clearly of pre-Roman origin, and the efficient collection and conservation of what little rainwater there was, were essential to successful cultivation. Africa was famed as a place where large estates in the hands of a few men were commonplace, the largest landowner being the emperor, but there were plenty of medium-sized estates as well, the majority of them owned not by Italians but by prosperous members of the Romano-African urban élite, whose wealth was so conspicuously displayed in the showy public monuments they paid for in their home towns. Our knowledge of the administration of imperial estates, and the relationship between tenants (*coloni*) and lessees (*conductores*), is best known from a series of 2nd- and early 3rd-century inscriptions from the Bagradas valley. Other exports from Africa included fish-pickle (*garum*), especially from Proconsularis (see FISHING); marble, especially the prized yellow *marmor Numidicum* from Simithus; wood, especially the citrus-wood for furniture making from Mauretania (see TIMBER); dyes, for which the island of Mogador off western Morocco was famous; an orange-red pottery ('African red slip-ware'), which despite its simplicity gained a Mediterranean-wide export market at the zenith of its production in the 4th and 5th cents. (See POTTERY, ROMAN); and wild animals destined for *amphitheatres in Italy and elsewhere, including lions, leopards, and elephants, the capture of which is featured on a number of African mosaics (e. g. from Hippo Regius and Carthage). The arts flourished, with several vigorous local schools of sculptors working in both limestone and marble, while *mosaic workshops (*officinae*),

in response to the demand for elaborate polychrome figured mosaics in both private houses and public buildings such as baths, adopted from the second quarter of the 2nd cent. onwards an original and creative approach to mosaic design which by the 4th cent. had left its influence on mosaic floors in Italy and several other provinces as well.

During the 3rd cent. the African provinces continued to prosper, and suffered less from imperial usurpations than most provinces of the Roman west; the failure of Gordian I had, however, serious repercussions. Christianity established itself more firmly than in any other western province, first in the cities, but making rapid strides in Numidia after c.200. The works of Tertullian and Cyprian were of considerable importance in the development of Latin Christianity.

In *Diocletian's administrative changes, the provinces of Tripolitania, Byzacena, Numidia, Mauretania Sitifensis, and Mauretania Caesariensis formed the diocese of Africa, Africa Proconsularis being strictly outside the diocesan system, and Mauretania Tingitana forming part of the diocese of Spain. The military forces of the area were put under a count of Africa (*comes Africae*), and the frontier was divided into districts each under a *praepositus limitis* (frontier commander), a system unique in the empire (see LIMES).

Throughout the 4th and early 5th cent., North Africa was affected by serious divisions among Christians; the Donatists, condemned as schismatics by imperial legislation from Constantine onwards, were particularly strong in rural areas of Numidia and Mauretania, where social discontent was growing and where central government's authority was increasingly in decline. Nevertheless the area remained prosperous in comparison with the devastated provinces of northern Europe, and the collapse of Africa to the Vandals (Carthage was captured in 439) was a grievous blow, not least for the corn supply. The invaders found Africa easy prey, since the defensive system was designed for policing work and the suppression of sporadic tribal revolts rather than full-scale invasion. WNW/BHW/RJAW

after-life See ART, FUNERARY, GREEK; ART, FUNERARY, ROMAN; DEAD, DISPOSAL OF; DEATH, ATTITUDES TO; HADES.

Agamemnon, in mythology son of Atreus (or, occasionally, of Atreus' son Pleisthenes), brother of Menelaus, and husband of Clytemnestra; king of Mycenae, or Argos, and, in Homer, commander-in-chief of the Greek expedition against Troy, taking with him 100 ships, the largest single contingent (*Il.* 2. 569–80). He had a son, Orestes, and three daughters, Chrysothemis, Laodice,

Iphianassa (*Il.* 9.145); Iphigenia, whom Homer does not mention, seems to be a later substitution for Iphianassa, as does *Electra for Laodice (Xanthus, fr. 700 PMG).

Homer depicts Agamemnon as a man of personal valour, but lacking resolution and easily discouraged. His quarrel with *Achilles, who withdrew in anger and hurt pride from battle when Agamemnon took away his concubine Briseis, supplies the mainspring of the *Iliad's* action, with Achilles' refusal to fight leading to tragedy. The *Odyssey* (1. 35 ff., 4. 512 ff., 11. 405 ff., 24. 96 f.) tells how, on Agamemnon's return home, Aegisthus, Clytemnestra's lover, treacherously set on him and his men at a banquet and killed them all, Clytemnestra also killing his Trojan captive Cassandra, daughter of Priam. Eight years later Orestes came from Athens and avenged his father's murder (1. 304 ff.). This whole story became a favourite one among later authors, who retold it with various elaborations and changes. Aeschylus, for instance, makes Clytemnestra a powerful and awe-inspiring female who, quite alone, kills Agamemnon after she has pinioned him in a robe while he is unarmed in his bath (*Ag.* 1379–98).

The epic *Cypria* is the earliest evidence of the sacrifice of Agamemnon's daughter Iphigenia. Agamemnon caught a stag, then boasted that he was a better huntsman than *Artemis, whereupon the offended goddess held the Greek fleet wind-bound at Aulis. Calchas told them to appease her by sacrificing Iphigenia, whom they sent for on the pretext of marriage to Achilles. Here the guilt for the killing seems to be laid on the Greeks in general; moreover Iphigenia was snatched away and made immortal by Artemis, who left a deer on the altar in her place (as in Euripides' *Iphigenia in Tauris*). But again matters are very different in Aeschylus, where Iphigenia is simply a child, dead, and Agamemnon himself her killer, for which Clytemnestra never forgave him.

In historic times Agamemnon had a cult at Laconia, Tarentum, Clazomenae, and Chaeronea: see Farnell, *Hero-Cults* 321 and n. 55; also Mycenae. Agamemnon appears occasionally in art from the 7th cent. BC in a variety of scenes, mostly relating to the war at Troy: see O. Touchefeu and I. Krauskopf, *LIMC* 1/1. 256–77; also A. J. N. W. Prag, *The Oresteia: Iconographic and Narrative Tradition* (1985). Agamemnon in Homer: O. Taplin in C. Pelling (ed.), *Characterization and Individuality in Greek Literature* (1990). HJR/JRM

age The division of life into age-groups was prominently adhered to in antiquity, though there was considerable disagreement as to their precise identification. The Pythagorean philosophers (see PYTHAGORAS) identified four (*Diod. Sic.* 10. 9. 5), whereas Hippocratic writers (see MEDICINE § 4) acknowledged seven ages of man, each

seven years in length (Poll. 2. 4). Since adult society was primarily organized on a two-generational principle, a threefold division probably served most practical purposes, namely *pais*, *neos*, and *gerōn* in Greek, *puer*, *iuuenis*, and *senex* in Latin. Mental ability was judged to be strictly a function of ageing, as indicated by the fact that there were minimum age qualifications for administrative and executive posts. So an Athenian councillor had to be 30 years old, as, probably, did a Spartan ephor (see also AGE CLASSES). Similarly the Roman *cursus honorum* or ladder of office prescribed minimum ages for all magistracies. Belief in the magical power inherent in certain numbers, notably seven and three, meant that certain ages were believed fraught with danger. *Augustus is said to have expressed considerable relief 'at having survived my climacteric, the sixty-third year' (Gell. NA 15. 7. 3). Censorinus' *De die natali* (*On Birthdays*) provides an invaluable compilation of information about age terminology, etc.

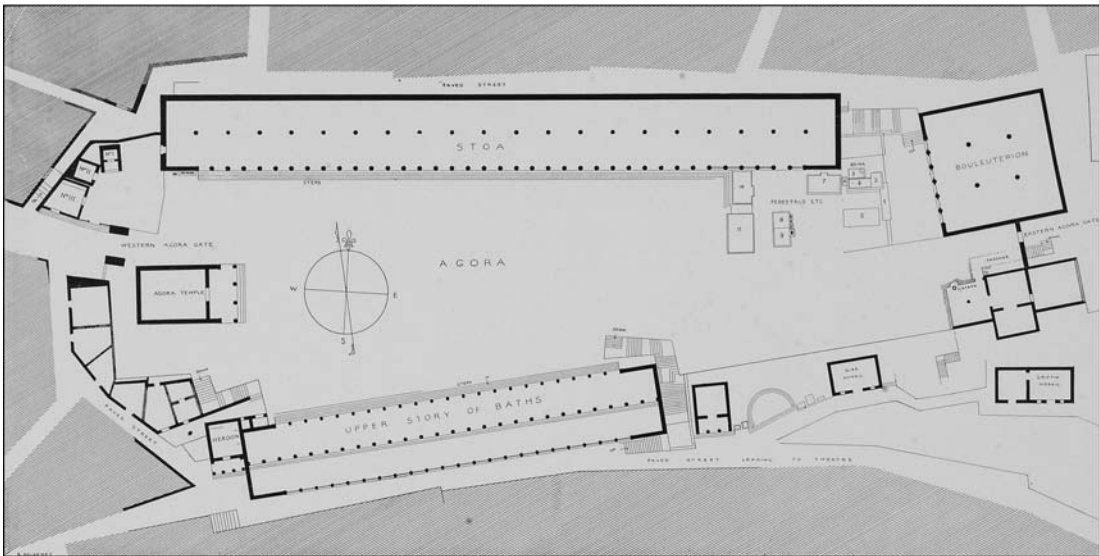

There is little evidence with which to estimate the age structure of the population of ancient Rome, and even less that of ancient Greece because Greek funerary monuments, unlike Roman ones, rarely record age at death except in the case of extreme youth and extreme longevity. What follows must therefore be treated with extreme caution, as must any such model. There were relatively few elderly people in the sense in which we understand the word 'elderly', and a much larger proportion of adolescents and young. It is estimated that in Rome 'more than a quarter of all live-born Roman babies died within their first year of life' (K. Hopkins, *Population Studies* (1966), 246–64). About one-third of the children who survived infancy were dead by the age of 10. Upper-class females in their early teens tended to marry males who were at least ten years older. In Rome, however, the legal age for marriage was 12 and 14 for females and males respectively (see MARRIAGE LAW). Sepulchral inscriptions, no doubt biased in favour of the upper classes, suggest that in the Roman world the median age of death was 34 years for wives and 46.5 for husbands. The study of skeletal remains from Classical Athens has produced comparable results, viz. 35 for women and 44 for men. Life expectancy was appreciably lower for *women at all social levels, largely because of the debilitating and often lethal effects of *childbirth. Probably less than one per cent of the population attained the age of 80 and anyone who did so was judged remarkable, as [*Lucian's] catalogue of octogenarians in *Macrobii* suggests. Notwithstanding the brevity of human life, threescore years and ten still constituted the proper quota of years (cf. Solon 27. 17 f. West, *IE*²). Maximum life-span, i.e. about 100 years, appears to have been the same in antiquity as it is today. Old age is commonly described as hateful and de-

testable in classical literature (though cf. Cic. *De senectute*) and many lives would have been characterized by increasing incapacitation and loss of mobility from the beginning of the third decade onwards. (The study of skeletal remains at the Romano-British cemetery at Cirencester indicates that 80 per cent of the population suffered from osteoarthritis). Particularly disadvantaged and scorned were spinsters and widows. Certain races had a reputation for extreme longevity, notably the long-lived Ethiopians, whose life-span was put at 120 years. Many Greeks and Romans would only have had an approximate notion of their exact age in years, as the expression *P(lus) M(inus)* 'more or less', which is frequently found on Roman tombstones, indicates. See POPULATION, ROMAN. RJSJG

age classes A method of social and political organization in *Sparta and *Crete in the Classical period. Traces of analogous institutions in other Greek states permit the hypothesis that age-class systems played an important role in the development of the *polis throughout the Greek world in earlier periods. In the Spartan *agōgē* (educational system) boys were removed from their parents at the age of 7 and allocated in annual age classes (*bouai*, 'herds') to tutors who were responsible for their upbringing. At 12 the boys entered pederastic relationships with young adults (e.g. King Agesilaus II and *Lysander, the future general). The *krypteia*, a head-hunting ritual with a police function, occurred at initiation into adulthood, after which all members of each age class married simultaneously. Age-class control of marriage, along with segregation of the sexes until the age of 30, probably had important demographic consequences linked to Sparta's manpower problems. Completion of the various stages of the system, which also provided the basis for military organization, conferred political rights and duties. In old age some individuals obtained considerable political power through membership of the *gerousia* (council of elders). JRS

agōnes See GAMES.

agora Greek term for an area where people gather together, most particularly for the political functions of the *polis, normally sited centrally in cities (as at Priene), or at least central to the street lines where the actual centre may be occupied by other features (such as the Acropolis at Athens); the area was sacred, and could be treated like a *temenos* or sacred precinct. In unplanned cities its shape depends on the nature of the available site, irregular at Athens, on low-lying ground bordered by rising land to west (the Kolonos Agoraios) and south (the slopes of the Acropolis). In planned cities the required number of blocks in the regular grid plan are allocated, giving a

agora Restored view and plan of the agora (2nd cent. BC) at Assos, a Greek city in NW *Asia Minor. The combination of religious and political buildings with a market and public amenities was typical of the Greek agora. Both views The Bodleian Libraries, The University of Oxford (1705 c.21)

strictly rectangular shape. (See URBANISM (Greek and Hellenistic).)

Architecturally, the agora need be no more than the space defined by marker stones rather than buildings, as, originally, at Athens. When spectacular buildings develop for the various functions of the agora, they are placed along the boundary, which they help to define, rather than in the agora space. These include lawcourts, offices, and meeting-places for officials (and the formal feasting which was part of their office). These may be integrated with extended porticoes—stoas—and it is these that come to dominate the architecture of the agora, often with long lines of rooms behind them, though not infrequently as colonnades pure and simple. Such colonnades, extended along the boundaries, define the agora more obviously than marker stones and are normal in the developed (and particularly the planned) agoras of the 4th cent. BC and the Hellenistic period.

In unplanned agoras, streets normally run through the open area; thus the 'Panathenaic Way' enters the Athenian agora at its north-west corner, and leaves at the south-east. As the buildings on the borders develop, the agora tends more and more to be closed off, streets being diverted to pass outside the surrounding stoas, with perhaps one main street being allowed through (though by Roman times this may have to pass through formal, and closable, gateways).

The central area of the agora was the locality for special monuments and dedications, statue groups such as the Tyrannicides (the killers of Hipparchus, the son of *Pisistratus) at Athens, the line of exedrae at Priene. So long as the space was needed for crowds (all those voting in an *ostracism at Athens, as an extreme example) it had to remain open; it was only with the restricted political life of Greek cities in the Roman period that it might include large buildings such as the odeum of Agrippa at Athens. See ATHENS (TOPOGRAPHY). RAT

agrarian laws and policy Allocation of land by the community is attested in the Greek world at the times of new city foundations (colonies; see COLONIZATION, GREEK), and when land was annexed (cleruchies). There is also some evidence for legislation restricting the disposal of allotments by sale or inheritance, in order to maintain the original land-units which sustained the households. On the other hand, there developed strong resistance to the notion of redividing the city's territory so as to change the proportions of private landholdings: a promise not to propose anything of the kind was included in the oath of the Athenian jurymen. See also SPARTA.

At Rome agrarian legislation played a large part in the history of the republic and the struggles between the

aristocracy and the *plebs. It is hard to know how far we should trust the evidence about the early republic, since often the details of the narratives in *Livy and *Dionysius of Halicarnassus seem to have been elaborated in the light of late-republican experience. However, we can be confident that there were laws about land and it is highly probable that they were connected, as Roman tradition maintained, with plebeian discontent. Legislation arose originally from annexation of land after Roman military expansion. It thus concerned land which was the public territory of the Roman people (*ager publicus*), not land belonging to private individuals (private land remained free from interference by the community except where it could be shown that a public right existed over it, such as access to a water supply). One type of law established new cities (colonies) with their associated land, a second assigned new allotments in a wide tract of territory, such as those in the Sabina and the *ager Gallicus* in Picenum, a third (*de modo agrorum*) did not positively assign land to anyone but restricted the exploitation at will of unassigned public land by reference to area occupied or number of beasts grazed. The first known law of the last type, the *lex Licinia* of 367 BC, was probably a response to the opportunities created by the acquisition of all the land of Veii. During the middle republic, when Italy and *Cisalpine Gaul were gradually subjected to Roman power, land demands were satisfied by new allocations. However, in the late 2nd cent. BC, with a rising number of landless and a shortage of new land available for distribution in the peninsula, the Gracchi (see GRACCHUS, GAIUS; GRACCHUS, TIBERTUS) passed laws which sought to recover what was still technically public land from wealthy men who were exploiting it illegally to excess, and to redistribute it to the poor. This was regarded by wealthy landholders as a radical and subversive move. Nevertheless the Gracchan programme was largely completed and such redistribution seems to have remained part of agrarian policy until the death of Marcus Livius Drusus (*tribune of the plebs 91 BC), though settlements were also made in territory acquired by conquest abroad (we know of land-assignment in Africa, the Balearics, Corsica, Greece, and Gaul, both Cisalpine and Transalpine). The Social and Civil Wars followed by *Sulla's proscriptions led *de facto* to great changes in landholding in Italy, which favoured the greater landholders against the peasants (see SOCIAL WARS). Some attempt was made to return to Gracchan policies in the late republic (Publius Servilius Rullus' bill, *Caesar's legislation of 59 BC), but the chief means of public acquisition of land in Italy now had to be purchase from private individuals. The proscriptions by the triumvirs (see AUGUSTUS) after Caesar's murder made land available for distribution to their

soldiers, but Augustus returned to purchase in order to secure land for his veterans after Actium. AWL

agricultural implements

Greek

The *technology of Greek *agriculture was simple, and apparently underwent little development. Breaking up the ground, which was fundamental to sowing, weed-control, and preservation of moisture, was achieved by simple symmetrical ploughs, which did not turn the soil, or by mattock and hoe. Ploughs and mattocks occasionally appear on vases and the (all wood) plough is described at length in Hesiod (*Op.* 427 ff.). Cereals were reaped with a curved sickle, and vines and olives pruned with an implement which is scarcely distinguishable.

The processing of crops required more sophisticated equipment. Threshing cereals required a stone floor on which the grain was threshed by animal hoofs or perhaps animal-drawn sledges, the runners of which may have been toughened by the addition of obsidian flakes; winnowing was by basket and shovel. Pressing grapes could be done by human feet in a basket, vat, or stone press-bed,

but olives had to be crushed (*see* OLIVE). The earliest (archaeological) evidence for an olive mill is late 5th cent. BC; it is not clear how olives were crushed before that time. An Archaic Attic vase shows an olive press which exploits leverage and counterweights, and vessels specially constructed to facilitate the separation of oil and water survive from the late bronze age. Screw presses seem to be a Hellenistic innovation. RGO

Roman

Roman agricultural implements comprised slaves (*see* SLAVERY), animals, and tools (Varro, *Rust.* 1. 17. 1). Only the third category is reviewed here. The essential similarity between the inventories in *Cato the Elder (*Agr.* 10, 11) and Palladius (1. 42) some 600 years later indicates technological stability or stagnation, depending on one's point of view. (This very stability has enabled researchers working in Mediterranean areas little affected by mechanized agriculture to interpret with some security the growing archaeological evidence, the ancient representations in art, and the Roman agricultural writers.) Yet while innovations such as the Gallic reaping machine (Pliny, *HN* 18. 296; Palladius, 7. 2. 2–4) were rare, improvements

agricultural implements Iron tools (sickles, pruning knife, hoe, spade-sheath, and plough coulter) from Roman Britain. The widespread availability of such tools to ordinary farmers was one of the achievements of Roman *trade and *technology. © The Trustees of the British Museum

in design were common. Examples include: in arable cultivation, the plough (e.g. Pliny, *HN* 18. 171–2) and threshing sledge (Varro, *Rust.* 1. 52. 2); and, in arboriculture, the vine-dresser's knife, trench-measuring devices (Columella, *Rust.* 4. 2. 5, 3. 13. 11), and wine- and oil-presses (Pliny, *HN* 18. 317). Different varieties of basic tools existed (e.g. twelve types of *falx*) due to regional custom (cf. Varro, *Rust.* 1. 50. 1–3), agricultural conservatism despite the introduction of new designs, and the needs of diverse soils and crops. While a *villa estate might keep different varieties of each basic implement for specialized uses (e.g. Varro, *Rust.* 1. 22. 5), the subsistence cultivator would fully exploit one multi-purpose implement. Such was the *rastrum*, thought to characterize peasant agriculture (Virgil *Aen.* 9. 607–8), which was used for clearing rough land, for turnip cultivation, and for breaking up clods of earth left after ploughing (Columella, *Rust.* 3. 11. 3, 2. 10. 23; Pliny, *HN* 18. 180). While some improved designs resulted from the desire for elevated production, implements like the reaping machine, the long-handled scythe, and, perhaps, the harrow, developed as a result of labour shortage (Pliny *HN* 18. 296, 261, 180). Wooden equipment might be home-made, but metal and stone implements were purchased, thus stimulating the local economy (Cato, *Agr.* 22. 3–4, 135; Varro, *Rust.* 1. 22). See AGRICULTURE, ROMAN; TECHNOLOGY. MSSP

agricultural writers Agricultural manuals, written by practising landowners, flourished at Rome from *Cato the Elder (c.160 BC) to Palladius (c.mid 5th cent. AD), enjoying higher status than other technical literature. Greece had produced notable works (*Varro knew more than 50, *Rust.* 1. 1. 8–11), but written mostly from a philosophical or scientific viewpoint; and an influential (non-extant) Punic work by Mago had been translated into both Greek and Latin (Varro *ibid.*; Columella *Rust.* 1. 1. 13). Agriculture, as gradually defined and systematized (earlier Greek, Punic, and Roman writers had wandered off the topic: Varro *Rust.* 1. 2. 13), embraced, in Varro's work (c.37 BC), arable cultivation, livestock, arboriculture, market gardens, luxury foods, slave management, and villa construction. A century later, Columella doubted whether one man could know it all (*Rust.* 1. *praef.* 21; 5. 1. 1), and, from the early empire onwards, specialized works appeared, such as Iulius Atticus' monograph on vines (Columella *Rust.* 1. 1. 15). While Varro criticized the Greek writer Theophrastus for excessive theory (*Rust.* 1. 5. 2), modern scholars in their turn have doubted the practicality of the Roman writers. Recent rural archaeology has given grounds for greater confidence. The excavated *villa at Settefinestre in Etruria has substantiated in remarkable detail the recommendations

of Varro and Columella, as has the discovery of a large vineyard at *Pompeii. But the agricultural writers describe not just one ideal type of estate. Crop by crop they discuss a variety of methods of cultivation, according to species, soil, topography, and custom—a regional diversity confirmed by archaeological survey. See also AGRICULTURE, ROMAN. MSSP

agriculture, Greek The agriculture of Greece in the historical period shared the basic cultigens and techniques of most of the other contemporary civilizations of the Mediterranean. Life was sustained by barley and wheat, sown mostly in the autumn as field crops dependent on rainfall between autumn and spring. Hulled barley (two- and six-row) and hulled wheat (emmer and einkorn), introduced to the Aegean from the near east in the neolithic period, remained important crops. Naked wheats, especially tetraploid, durum wheat, evolved in the first millennium BC, but hexaploid bread wheat, better in colder climates, was imported from the north shores of the Black Sea. Cultivation with a simple wooden plough (*ard*), sometimes tipped with iron, to break up the surface of the soil for receiving seeds in autumn, is treated as normal by ancient sources but recently doubts have arisen as to whether smallholders could produce enough to feed a pair of plough-oxen in addition to their own households. For them hand cultivation by spade and hoe must have been common (see AGRICULTURAL IMPLEMENTS).

The practice of leaving half the land in uncultivated fallow is also regarded as normal by our sources while repeated ploughing of the fallow was desirable. But again, smallholders may have been forced to risk long-term depletion of the soil by resting much less than half their land each year. Some leguminous field crops (broad beans and various lentils (pulses)) were known in Mycenaean times and in *Homer. By the 4th cent. BC they were recommended as partial alternatives to fallow (either as crops in their own right or as green manure to be ploughed under); it is not clear how early or how widely they were employed in rotation with wheat and barley. The moisture and soil requirements of wheat made it an often unreliable crop in the Greek *climate. Barley, somewhat less nutritious and much less esteemed, was probably grown more widely. Frequent local crop failures required supplementation through trade with less affected neighbours or over longer distances. While it is unlikely that overseas settlements of the 8th and 7th cents. BC had as a prime goal assistance to the grain supply of the mother cities, once established in Magna Graecia and *Sicily or, later, on the northern Black (Euxine) Sea coast and its approaches, the existence of surpluses in the new settlements at times of shortage in

the old lessened the chances of famine and set in motion rhythms of trade with far-reaching consequences. How early the larger Greek towns came to depend on imported grain is disputed. Some have seen Athenian colonies on the Hellespont in the later 6th cent. as established on the route of the city's grain supply but for Athens explicit evidence comes only in the late 5th cent. Meanwhile by c.470 BC the Ionian city of Teos included interference with the city's grain supply among the targets of public curses (ML 30; Fornara, no. 63).

Other crops, chiefly olives, grapes, and the vegetables and fruits grown in irrigated gardens (*kēpoi*), supplemented the largely cereal diet. *Olive oil and *wine also permitted *trade, not least for the acquisition of grain in times of shortage. Greek settlement was rarely at elevations or latitudes too cold for the olive. Since the trees matured slowly (in ten to fifteen years), they were planted for long-term benefits and not in large numbers everywhere. Olive cultivation was not demanding once young trees had been established and no longer needed irrigation, but harvesting and, with only primitive *technology (though improved in the 4th cent. BC and again in Roman times), oil production required much labour. By contrast, vines grew fast and demanded much hard work from the start.

For the Greeks improvement of agricultural property meant, after the creation of suitable plots of land, investment in trees and vines together with the necessary equipment, including store-rooms and containers for storing and shipping oil and wine. However, interplanting of cereals, pulses, vines, and trees in a single plot, or polyculture using separate plots, were probably always more common than specialization in a single crop.

Animal husbandry on a small scale (plough-oxen and mules, donkeys as pack animals, some sheep, goats, and pigs) probably had a place on all but the smallest properties. Larger herds were moved to mountain pastures in the summer (so-called transhumance; see PASTORALISM, GREEK). The value of manuring was appreciated and organic wastes were collected conscientiously from settlements and applied especially to trees and vines. But the amount available in the absence of lush pastures and large numbers of cattle close to the farms limited its effect.

Nowhere in old Greece did the geography and the nature of the agriculture favour large, unitary estates farmed by a large labour-force, though properties increased in size in Hellenistic and especially Roman times. The wealthy usually owned several parcels of land whose environmental diversity may have been advantageous. Poorer farmers were more limited. The particular agricultural regimes in use varied with local social and economic conditions as well as with geography. *Thessaly's extensive good grain land was long controlled by a small upper

class and farmed by a large population of serfs, as were Laconia and Messenia, less suited to grains but probably slow to develop crops for trading. The islands of Chios and Corcyra had rich estates concentrating on vines and olives and cultivated by unusually large numbers of slaves (see SLAVERY).

Attica up to the Peloponnesian War was also known for its fine country houses, a measure of rural prosperity (Thuc. 2. 65. 2). Its relatively large landless (or inadequately landed) population were not primarily farm labourers, and significant use of slave labour by the top three property classes is indicated. But for all except the rich, hired or slave labour only supplemented that of the landowner and his family.

The range of possibilities open to the Greek farmer for increasing production were restricted and most required additional labour. Intensity and efficiency of agricultural production were neither uniform nor static, nor independent of social and economic factors, even if the ideal of self-sufficiency (*autarkeia*) was prevalent and other relevant concepts were largely unexamined. The agricultural information in *Xenophon's *Oeconomicus*, informative for us, was no doubt banal. But beginning in the 4th cent. BC an extensive technical literature developed (cf. references in Theophrastus' botanical writings) which was used by Roman writers (see AGRICULTURAL WRITERS) but is almost entirely lost to us. MHJ

agriculture, Roman By modern standards Roman agriculture was technically simple, average yields were low, transport was difficult and costly, and storage was inefficient. This limited urbanization (and hence 'industrialization') obliged the bulk of the population to live and work on the land. Nevertheless, in the late republic and earlier Principate agriculture and urbanization (see URBANISM (Roman)) developed together to levels probably not again matched until the late 18th cent. Roman agriculture broadly fits the ahistoric pattern which is commonly seen as characteristic of the Mediterranean region: based on the triad of cereals, vines (see WINE) and *olives, at the mercy of a semi-arid *climate with low and unreliable rainfall, and dominated by small farms practising a polyculture aimed principally at self-sufficiency and safety. But two factors—the geophysical diversity of Italy (let alone of Rome's provinces), and the effects of political and social developments—led to historically important variations between areas and across time in the organization and practice of agriculture. Since the 1950s there has been an enormous growth in archaeological research—surface survey of rural areas, excavations of farmsteads, study of the ancient environment (through pollen, seeds, bones)—which is taking our knowledge

and understanding of Roman agriculture far beyond what could be discovered from the evidence of the literary sources.

In archaic Rome the land seems to have been controlled by the élite, and the majority of Romans were dependant labourers (*nexi*). The concept of private ownership of land (*ager privatus*) had probably developed by the late 6th cent. BC, and by the later 4th cent. Rome had become a state of citizen-smallholders. The political aim behind this development was the creation of a large conscript army of smallholders who could afford to arm themselves (the *assidui*); as this army defeated Rome's Italian neighbours the Roman state annexed tracts of their territories which were often distributed in small plots to create more *assidui*, although some was left as nominally 'public' land (*ager publicus*) and appears to have been dominated by the élite who now used enslaved enemies as their main agricultural workforce. This cycle of conquest, annexation, and settlement continued, almost without interruption, into the early 2nd cent. BC, and settlement schemes, albeit thereafter using confiscated land, continued into the early Principate. The face of Italy was changed: forests were cleared and drainage schemes undertaken, as in south Etruria and in the Po valley; the territories of the ubiquitous Roman colonies were divided into small farms of similar size by rectangular grids of ditches, banks, and roads (*centuriation) which are often still traceable today; these examples and the obligation on most of Rome's Italian allies to supply infantry on the Roman model encouraged the wider diffusion of this pattern of peasant smallholding.

Rome's massive overseas expansion in the 2nd and 1st cent. BC boosted agricultural developments which had already begun in the 3rd cent. The large and long-serving armies of conquest required huge supplies of grain, wine, wool, and leather, the Celtic aristocracy under and beyond Roman rule enthusiastically adopted wine-drinking as a mark of status, and the city of Rome swelled as the capital of an empire and the centre for conspicuous consumption and display by its increasingly wealthy leaders. The boom in demand for agricultural produce, and the continuous supply of cheap slave labour, encouraged the élite to expand their landholdings and to invest in market-oriented production. A significant differentiation between larger and smaller farms emerges in the archaeological record, and also regional patterns of types of agriculture. While in southern Italy relatively extensive forms of agriculture, that is cereal cultivation using chain-gangs of slaves and large-scale stockbreeding with seasonal movement between upland summer pastures and winter stations in the coastal plains (transhumance), were probably predominant, central western Italy (the

semicircle around Rome and her main ports) was dominated by the so-called '*villa system', that is intensive production on medium-sized estates (around 25 to 75 ha.; 60 to 180 acres) of wine, olive oil, and other cash crops, including wheat, vegetables, fruit (*see* FOOD AND DRINK), and also small game and poultry, with a permanent nucleus of skilled slave labour topped up at seasonal peaks with casual labour hired from the free rural poor. These forms of agriculture flourished into the 2nd cent. AD with some reorientation: consumption by the frontier-based armies of the Principate and the Celtic aristocracy was increasingly met by the development of local Roman-influenced agricultural production, but the growth of Rome and general urbanization of Italy in the Augustan period greatly increased domestic demand in Italy. Roman estate owners showed considerable interest in technical and technological improvements, such as experimentation with and selection of particular plant varieties and breeds of animal, the development of more efficient presses and of viticultural techniques in general, concern with the productive deployment and control of labour, and, arguably, a generally 'economically rational' attitude to exploitation of their landholdings (*see* TECHNOLOGY). A technical literature of estate management emerged, drawing on Carthaginian and Hellenistic predecessors, which is represented to us principally by the manuals of *Cato the Elder, *Varro, and Columella (*see* AGRICULTURAL WRITERS).

The development of this estate agriculture put pressure on the peasant smallholders, although military needs led to some dramatic and bitterly opposed attempts to revive an independent peasantry in central Italy, notably the Gracchan programme (*see* GRACCHUS, GAIUS; GRACCHUS, TIBERIUS) of the later 2nd cent. and the settlement schemes for veterans in the 1st cent. BC. The decline of the peasantry should not be exaggerated: excavated small farms show that some peasants too produced for and profited from the same markets as the large estates, and in hillier areas and the Po (Padus) valley the peasantry remained strong. But as the Roman army became mercenary and then, under Augustus, professional and more cosmopolitan, the political will to maintain an independent peasantry in Italy gradually evaporated, and it seems that peasants increasingly became tenants rather than owners of small farms. The problems of the 3rd cent. AD reduced the inflow of imperial revenues to Rome and Italy, and as the level of urbanization and demand for agricultural produce declined, so did intensive farming. Large estates were becoming more concentrated in the hands of fewer noble families (and the Church), and the legal standing of the poor declined further. The result was a tendency, not general but widespread, to move to more

extensive agriculture based on the labour of tied tenants (*coloni*), although paradoxically this was the period in which Roman-influenced estate agriculture flourished most in some of the less troubled provinces, notably Britain and Egypt. See AGRICULTURAL IMPLEMENTS; PASTORALISM, ROMAN. DWR

Agrippa (Marcus Vipsanius Agrippa), the lifelong friend and supporter of *Augustus, was born in 64, 63, or even 62 BC of obscure but probably well-to-do family (he neglected his undistinguished family name). He accompanied Octavius (the future Octavian and Augustus) to Rome from Apollonia after *Caesar's murder, helped him to raise a private army, prosecuted Cassius in the court set up by Quintus Pedius in 43, and was prominent in the war against Lucius Antonius (*Pietas*). After being *tribune of the plebs in 43 or a little later, and so entering the *senate, he was urban praetor in 40. As governor of Gaul in 38 he suppressed a rebellion in Aquitania, led a punitive expedition across the Rhine, and either now or in 20 settled the Ubii on the left bank. As consul (37) he fitted out and trained a new fleet for Octavian's war against Sextus Pompeius, converting the lacus Avernus near Cumae into a harbour (*portus Iulius*) for the purpose, and in 36 won two decisive naval engagements at Mylae and Naulochus, where his improved grapnel was highly effective. In 35–34 he took part in the Illyrian War. Although an ex-consul he held the aedileship in 33, contributing greatly to Octavian's popularity. In 31 his vigorous naval operations were the primary cause of Mark *Antony's defeat; at *Actium he commanded the left wing. He next (31–29), with Maecenas, managed affairs in Italy in Octavian's absence. On Octavian's return he helped carry out a purge of the senate and a census (29–8) and he held second and third consulships in the crucial years 28 and 27. In 23 Augustus, ill and embroiled in political controversy, handed him his signet-ring, conferring an unofficial status (most importantly in the eyes of the armies) that would have meant his supremacy if Augustus had died. He was entrusted with a mission in the eastern half of the empire, probably with proconsular power, which he carried out from Mytilene. The claim that rivalry with Augustus' nephew Marcus Claudius Marcellus had sent him into virtual exile cannot be substantiated. More likely it was a constitutional crisis, with Agrippa put in easy reach of the armies of the Balkans and Syria if Augustus' position were undermined or his life threatened. He was recalled in 21 to represent Augustus in Rome; in 20 he proceeded to Gaul and in 19 to Spain where he quelled the Cantabri. In 18 he was given tribunician power (see TRIBUNE OF THE PLEBS) for five years, a power held otherwise only by Augustus, and his *imperium was renewed for the same period. In 13 his

tribunician power was renewed for five more years, and his *imperium* apparently made superior to that of all other holders, like that of Augustus (the extent and development of Agrippa's powers, outlined in the fragmentary papyrus (*Kölner Pap.* 1 (1976), 10 = EJ 366) that contains part of Augustus' funerary elogium on him, remains controversial). As a *quindecimvir sacris faciundis* or member of a college whose job it was to look after certain ritual texts (from before 37) he assisted in the celebration of the Secular Games in 17. His second mission to the east (17/16–13) is notable for the establishment of Polemon of Pontus in the Bosphoran kingdom, the settlement of veterans at Berytus and Helipolis, and his friendship with Herod and benevolent treatment of the *Jews. Early in 12 he went to Pannonia where there was a danger of revolt, but fell ill on his return and died about the end of March. After a public funeral he was buried in the mausoleum of Augustus.

Agrippa's wealth was spent freely in the service of the Roman people and the empire, winning him lasting popularity. He restored the sewers of Rome and reorganized the water supply, constructing two new *aqueducts (*Iulia*, 33 BC, and *Virgo*, 19 BC), and a network of distribution installations. *Virgo* fed Rome's first public *baths, close to his Pantheon, and the expanded *Saepta Iulia* (26 BC), all in a huge recreational area. He also built a granary (*horrea Agrippiana*) behind the Forum (*forum Romanum) and a new bridge over the Tiber. Constructions in the provinces included buildings at Nemausus (mod. Nîmes) and a road system radiating from Lugdunum (mod. Lyons). By his will Augustus received the greater part of his property, including the Thracian Chersonese (*Gallipoli*); he also made generous bequests to the people of Rome.

He wrote an autobiography (now lost) and a geographical commentary (also lost, but used by *Strabo and *Pliny the Elder) from which a map of the empire was constructed, to be displayed after his death on the porticus Vipsania (see MAPS).

Agrippa was married three times: in 37 to Caecilia Attica, in 28 to Augustus' niece the elder Marcella, whom he divorced in 21 to marry Augustus' daughter *Julia. The first two wives produced daughters, Attica's including Vipsania Agrippina, the first wife of the later emperor *Tiberius, Marcella's the Vipsania who married Publius Quinctilius Varus. Julia had three sons, Gaius and Lucius Caesar, who were adopted by Augustus in 17, and Agrippa Postumus; and two daughters, Julia the Younger and the Younger *Agrippina; through her he was grandfather and great-grandfather respectively of the emperors *Gaius and *Nero.

Agrippa, portrayed as upright, simple, and modest, a man who subordinated his ambitions to those of Augustus, was by 12 BC a partner nearly equal in power.

Refusing three *triumphs (19 BC onwards) and failing even to report his Spanish successes inhibited private men from applying and contributed to the end of such triumphs. Like his advocacy of public display of works of art (he was a noted collector), it went against the interests of the ruling class, who boycotted his funeral games. To Augustus he may sometimes have been an embarrassment.

GWR/TJC/BML

Agrippina, Iulia Agrippina, 'the Younger Agrippina' (AD 15–59), eldest daughter of *Germanicus and Vipsania Agrippina ('the Elder Agrippina'), was born on 6 November AD 15 at Ara Ubiorum. In 28 she was betrothed to Gnaeus Domitius Ahenobarbus, to whom she bore one son, the later emperor *Nero, in 37. During the principate of her brother *Gaius (37–41) her name, like those of her sisters, was coupled with the emperor's in vows and oaths; but when she was discovered at Mogontiacum late in 39 to be involved in the conspiracy of Gnaeus Cornelius Lentulus Gaetulicus, she was sent into banishment. She was recalled by her uncle *Claudius, who married her in 49. Aided by Marcus Antonius Pallas, the younger *Seneca, and Sextus Afranius Burrus, she

quickly achieved her ambitious purpose. Receiving for herself the title Augusta, she persuaded Claudius to adopt Nero as guardian of his own son Britannicus. She was generally believed to have poisoned Claudius, to make room for Nero (54). In the first years of Nero's rule she was almost co-regent with him but, after Pallas had fallen in 55 and Burrus and Seneca turned against her, she lost her power. In March 59 she was murdered at Baiae by a freedman, Anicetus, acting on Nero's instructions. She wrote an autobiography.

JPB/AJSS

Ai Khanoum (see ◀ Map 2a, Cb ▶), Greek Hellenistic city excavated (1965–78) by the French archaeological delegation in Afghanistan, is situated in the eastern part of *Bactria, at the junction of the river Oxus (mod. Amu Darya) and a tributary of the left bank, the Kokcha river, at the frontier between Afghanistan and the former Soviet Union. The Greek name of the city is uncertain. It seems to have been built as a fortified frontier town, to guard against the nomadic tribes to the north and the mountain peoples to the east (the Badakhshan range). It was founded, commanding a fertile plain, by the end of the 4th cent. or in the early 3rd cent. BC, in an area where

Ai Khanoum Exedra (recess with benches) in the *gymnasium at Ai Khanoum—a witness to the *Hellenism of this outpost of Hellenistic *colonization in modern Afghanistan. Dr. P. Bernard

there had been earlier settlement, as indicated by an irrigation system and an Achaemenid fortress. Ai Khanoum passed from Seleucid control to that of the so-called Indo-Bactrian kings, certainly by the reign of *Eucratides I (c.172–155 BC) of Bactria. In c. the mid-2nd cent. BC it was destroyed by invasions from the Saca tribes. The buildings discovered include administrative quarters, a *temenos* (sacred precinct), a *gymnasium, a theatre, several rich private dwellings, a citadel where a garrison was installed, a palace built on the Persian style, and two temples built to Mesopotamian plan and decorated in Mesopotamian style. The site was surrounded by vast, impressive fortifications. SS-W

Aias (Lat. Aiax, Eng. Ajax) (1) Son of Telamon, king of Salamis, hence Aias Telamonius, and also known as the Great(er) Ajax. He brought twelve ships from Salamis to Troy (*Il.* 2. 557). In the *Iliad* he is of enormous (*pelōrios*) size, head and shoulders above the rest (3. 226–9), and the greatest of the Greek warriors after *Achilles (2. 768–9). His stock epithet is 'bulwark (*herkos*) of the Achaeans', and his characteristic weapon a huge shield of seven-fold ox-hide. He clearly has the better of *Hector in a duel (7. 181–305) after which the heroes exchange gifts, Aias giving Hector a sword-belt in return for a sword; and he is at his memorable best when with unshakeable courage he defends the Greek wall and then the ships (see esp. 15. 676–88, 727–46, 16. 101–11). He is also a member of the Embassy to Achilles, when he gives a brief but effective appeal to Achilles on friendship's grounds (9. 624–42). At Patroclus' funeral games he draws a wrestling match with *Odysseus, strength against cunning (23. 708–39).

The lost epic *Aethiopsis* told how after Achilles' death Aias carried his body off the field of battle while Odysseus kept back the Trojans (cf. *Od.* 5. 309 f.). Another such epic, the *Little Iliad* told how the arms of Achilles were then adjudged to Odysseus instead of Aias, who went mad with anger, killed the herds of the Greeks, believing them to be the Greek leaders, and then committed suicide. *Sophocles dramatizes these later events in his *Ajax*, but at the end of the play Aias is taken to an honourable burial, in marked contrast to his treatment in the *Little Iliad* (fr. 3 Davies) where he is denied the customary burial honours (see J. R. March, *BICS* 1991–2, 1–36). In the *Odyssey*, when Odysseus is in Hades, he meets the shade of Aias who, in anger at his loss of Achilles' arms, refuses to speak and stalks away in magnificent silence (11. 543–64).

In the Hesiodic *Great Ehoiai* (fr. 250 M–W) and thence in Pindar (*Isthm.* 6. 35 ff.) *Heracles visits Telamon and, standing on the lion-skin, prays that his new-born son may be as stout (*arrēktos*) as the skin; *Zeus, in answer, sends an eagle, *aetos*, and hence the baby is named Aias.

From this develops the story (Lycoph. 455 ff.; cf. Aesch. *Thracian Women*, fr. 83 Radt) that Aias was invulnerable save at one point, where the skin had not touched him when (in this version) he was wrapped in it. It was later said that when he killed himself his blood flowed on the ground and there sprang up the iris (*hyakinthos*) which also commemorates the death of Hyacinthus; hence the markings on its petals recall the hero's name (*Aias*—*aiai*, see *Ov. Met.* 13. 394 ff.). Aias had a cult in Salamis, Attica, Megara (?), the Troad, and Byzantium: see L. R. Farnell, *Greek Hero Cults* (1921), 305 ff. and n. 58.

Scenes from Aias' life popular in art, some from the 7th cent. BC, are combats with Hector and others, dicing with Achilles, lifting Achilles' body, the argument and voting about Achilles' arms, and (an especial favourite) his suicide: see O. Touchefeu, *LIMC* 1/1. 312–36; Gantz, *EGM* 629–35.

(2) Son of Oileus or Ileus, the Locrian chieftain. In Homer Aias leads the Locrian contingent to Troy with 40 ships (*Il.* 2. 527 ff.). He is 'much lesser' than Telamonian Aias (hence often called the Lesser Aias), quick-footed, and often paired with his great namesake as a brave fighter. He can, however, be an unpleasant character, on occasion grossly rude (23. 473 ff.), hated by *Athena (*Od.* 4. 502), and finally drowned by *Poseidon for blasphemy against the gods while scrambling ashore after shipwreck (*Od.* 4. 499–511).

In the *Iliu Persis* he dragged Cassandra away from the statue of Athena to rape her, and in so doing loosened the statue from its plinth. This is a favourite scene in Archaic and Classical art: see O. Touchefeu, *LIMC* 1/1. 339–49; Gantz, *EGM* 651–5. In historic times the Locrians sent two virgins annually to serve in the temple of Athena at Ilium in expiation of this crime, the Locrians maintaining that this penalty was imposed for 1,000 years. HJR/JRM

Ajax See AIAS.

Alcaeus, lyric poet, of Mytilene on Lesbos. Probably born c.625–620 BC, since he was old enough to participate in the struggle against Athens for Sigeum in the Troad in the last decade of the century in which Pittacus distinguished himself (fr. 428; *Hdt.* 5. 95; *Diog. Laert.* 1. 74; *Strabo* 13. 1. 38). Lesbian politics at this period were violent and confused. The ruling dynasty, the Penthilidae, who traced their descent from Orestes, were weakened and finally overthrown by two successive coups (*Arist. Pol.* 1311^b26, 29). Power passed to a tyrant named Melanchrus, who was overthrown by a faction headed by Pittacus and Alcaeus' brothers c.612–609 (*Suda*, entry under *Pittakos*; *Diog. Laert.* 1. 74); Alcaeus (perhaps too young—fr. 75) was not involved (*Diog. Laert.* 1. 74). A new tyrant, Myrsilus, emerged, who was opposed unsuccessfully by a faction of exiles including Pittacus and Alcaeus (frs. 129,

114); Pittacus subsequently allied himself with Myrsilus, while his former comrades continued the struggle in exile (frs. 129, 70). After Myrsilus' death the people elected Pittacus *aisymmētēs* (dictator) to ward off Alcaeus' faction (frs. 70, 348; Arist. *Pol.* 1285^a35 ff.). Internal divisions within the faction contributed to its failure to oust Pittacus (fr. 70). Pittacus' marriage alliance with the Pentilidae probably belongs to this period (fr. 70), as may Alcaeus' journey to Egypt and his brother Antimenidas' service abroad (frs. 432, 350). An ancient critic (*POxy.* 2506. 98) indicates at least three periods of exile. Alcaeus' poetry is full of attacks on and abuse of Pittacus, for perjury and faithlessness, low birth (probably false), drunkenness, unbridled ambition, and physical defects (frs. 72, 129, 348; Diog. Laert. 1. 81). Popular opinion was with Pittacus, as in general is that of posterity. The tradition that Pittacus subsequently pardoned Alcaeus (Diog. Laert. 1. 76) is suspect.

Alcaeus' poetry was divided by the Alexandrians into at least ten books. It was monodic, and was composed in a variety of lyric metres in two- or four-line stanzas, including the alcaic stanza, named after him. The dialect is predominantly Lesbian vernacular, but epicisms are admitted. His range is rivalled only by *Archilochus in the Archaic period. He dealt with politics, war, wine, love, hymns to the gods, moralizing, and myth (though possibly both moralizing and myth were always subordinated to specific contexts). There is considerable variety in the treatment of each theme. Politics may be dealt with through personal abuse or the grandeur of myth and ritual or both (frs. 72, 129, 298; Diog. Laert. 1. 81); the invitation to drink may be supported by myth (fr. 38A) or the imperatives of the weather (frs. 338, 347). He is open to a range of influences. In his use of lyric for abuse he blurs the difference between lyric and iambus. His hymns are influenced by the rhapsodic tradition. Fr. 347 recasts a passage of *Hesiod in lyric form. He has a vivid descriptive power and an impressive vigour, particularly in his arresting openings; his control of form and mood (the developed contrasts of frs. 42 and 338, the changes of mood and register in fr. 129, the extended metaphor of storm for civil strife in fr. 326, the accelerating tempo of the list in fr. 140) is often underrated. He was popular at Attic *symposia and a favourite with *Horace (*Carm.* 1. 32. 5 ff., 2. 13. 26 ff.).

CC

Alcibiades (451/0–404/3 BC), son of Cleinias, Athenian general and politician. Brought up in the household of his guardian *Pericles, he became the pupil and intimate friend of *Socrates. A flamboyant aristocrat, he competed in politics with the new-style demagogues, and his ambitious imperialism drew Athens into a

coalition with Argos and other enemies of *Sparta. This policy, half-heartedly supported by the Athenians, was largely discredited by the Spartan victory at Mantinea (418). Though Alcibiades temporarily allied with *Nicias to avoid *ostracism, the two were normally adversaries and rivals, and when Alcibiades sponsored the plan for a major Sicilian expedition, Nicias unsuccessfully opposed it. Both were appointed, together with Lamachus, to command this expedition (415). After the mutilation of the herms (see HERMES), Alcibiades had been accused of involvement in other religious scandals, and soon after the fleet reached Sicily he was recalled for trial. He escaped, however, to Sparta, where he encouraged the Spartans to send a general to Syracuse, and to establish a permanent Spartan post at Decelea in Attica (which was eventually done in 413).

In 412 he was involved in Sparta's decision to concentrate on the Aegean rather than the Hellespont, but he soon lost the confidence of the Spartans and fled to the Persian satrap Tissaphernes. He tried to secure his return to Athens by obtaining the support of Persia and bringing about an oligarchic revolution, but the negotiations with Persia were unsuccessful. The Athenian fleet at *Samos appointed him general, and for several years he skilfully directed operations in the Hellespont, winning a brilliant victory at Cyzicus in 410. On returning to Athens in 407 he was cleared of the religious charges hanging over him and was appointed to an extraordinary command; but when a subordinate was defeated by *Lysander at Notium (406) he withdrew to Thrace, and his approach to the Athenians before Aegospotami was rebuffed (405). After he had taken refuge with the Persian Pharnabazus, he was murdered in Phrygia through the influence of the Thirty Tyrants and Lysander.

Alcibiades was a competent military leader and a master of intrigue, but his personal ambition and the excesses of his private life aroused the distrust of the Athenians, and he was not given the chance to show whether his ambitious policies, carried out under his leadership, could bring about success.

HDW/PJR

Alcman, lyric poet, active in the mid- to late 7th cent. BC in *Sparta. His birthplace was disputed. Some believed him a Laconian, while a number of ancient authors made him a Lydian (*Anth. Pal.* 7. 18, 19, 709; Ael. *VH* 12. 50; *Suda*, entry under *Alkman*, *POxy.* 2389, 2506, 3542; Vell. *Pat.* 1. 18. 2); the latter version (derived from fr. 16) was further embroidered to make him a freed slave (Heraclid. *Pont. Excerpt. Polit.* 9). The *Suda* credits him with six books of lyric songs (*melē*); a group called 'Diving women'/'Swimming women' (*kolymbōsai*), of which no certain trace survives, may have made up one of these or a seventh book. The lyric songs,

mostly choral, included maiden-songs (*parthenia*), which were probably arranged into two books by Alexandrian scholars (Steph. Byz. entry under *Erusichē*). We also hear of hymns and wedding-songs (*hymenaioi*). The *Suda* credits him with love-poetry, and fragments with erotic content survive (58, 59a).

The most important surviving works are fragments of two maiden-songs found on papyri. The first (fr. 1) shows many features of the developed choral lyric: a myth (1–35), gnomic moralizing (36 ff.), and (probable but not certain, since the opening is lost) framing reference to the present occasion. An account of the death of the sons of Hippocoön is followed by a gnomic transition (36 ff.) on divine punishment and mortal limitation. The rest of the fragment is devoted to praise of two females who play a major role in the ritual (Hagesichora and Agido) and description (with humorous self-deprecation) of the chorus. The song was performed at dawn (41 f., 60 ff.). The identity of the goddess honoured (87, *Aōtis*, lit. ‘the goddess at the dawn’) is unclear (conjectures include Helen, *Artemis Orthia, Phoebe daughter of Leucippus), likewise the nature of the festival, though many scholars detect a reference to a rival choir (60 ff.); there is uncertainty about the details of the myth and its relevance to the occasion. The second (fr. 3), more fragmentary, poem also concentrates on the actions of the leading figure (Astymeloisa). Both poems share a richness of sensuous imagery and a pronounced homoerotic tenor. There is an evident taste for puns, and a proliferation of proper names, many of significance only to the original audience. Alongside this parochiality we find a taste for the distant and exotic (1. 59, 100; cf. frs. 90, 148 ff.). Together the two songs show a gaiety and humour not usually associated with Sparta. Some other fragments come from maiden-songs (16, 26, 29, 38, 59b, 60), but many defy classification. Alcman’s descriptive power is shown in an account of the sleep of nature (fr. 89, context unknown). Mythic narrative is attested by a number of fragments (e.g. fr. 69 Niobe; fr. 77 addressed to Paris; fr. 69 the stone of Tantalus; fr. 80 *Odysseus and Circe). The dialect is west Greek with intermittent epic and aeolic forms; specifically Laconian features are few and some are certainly later intruders into the text. The poetry had achieved classic status by the late 5th cent. (Ar. *Lys.* 1247 ff.). CC

alcoholism

Greece

The ancient Greeks were unfamiliar with modern concepts of alcoholism, but they were well aware of self-destructive drinking and the effects of habitual drunkenness. In the *Odyssey*, *Homer makes a speaker

note that wine is a bane to those who drink it excessively, and identify overindulgence as the cause of the *Centaur Eurytion’s vile behaviour (21. 293–8). In *Hades, Homer’s Elpenor admits that heavy drinking was a key factor in his fatal plunge from Circe’s roof (*Od.* 11. 61). *Pythagoras is credited with the dictum that drinking to achieve drunkenness is a training-ground for madness, and he advises drunkards to take an unflinching look at their inebriate behaviour if they wish to alter it (Stob. *Flor.* 3. 18. 23, 33). In the *Republic*, *Plato writes about men who welcome any excuse to drink whatever wine is available (475a). *Aristotle’s treatise *On Drunkenness* has been lost, but his extant works confirm an abiding interest in wine’s pernicious effects. *Plutarch’s *Moralia* deplores the vicious cycle exhibited by habitual drunkards who seek wine in the morning to remedy their hangovers, noting that wine not only reveals the character but can alter it as well (127f, 799b–c). The value of abstention was recognized by the ancient Greeks, and Athenaeus devotes considerable attention to water drinkers in *The Deipnosophists* (2. 44b–f); abstainers, however, were rare in Greek antiquity. Athenaeus and Aelian discuss those groups—the Macedonians, for example—who drank with heroic intensity. Cleomenes I, *Alcibiades, *Philip II of Macedon, *Alexander the Great, Dionysius II, and Demetrius Poliorcetes can be counted among the most renowned toppers of the ancient Greek world. In classical antiquity, however, allegations of intemperance often serve as vehicles for character assassination; thus, each case must be considered on its own merits.

Rome

The ancient Romans were as interested in the harmful effects of excessive drinking and chronic intoxication as their Greek counterparts. In *On the Nature of Things*, *Lucretius writes that wine’s fury disturbs the soul, debilitates the body, and provokes quarrels (3. 476–83). The younger *Seneca warns that habitual drunkenness so weakens the mind that its consequences are felt long after the drinking has stopped (*Ep.* 83. 26). He notes that some men become so tolerant of wine that even though they are inebriated they appear to be sober (*Ep.* 83. 11). Seneca also suggests that drunkenness tends to disclose and magnify character defects (*Ep.* 83. 19–20). In his *Naturalis historia*, *Pliny the Elder finds irony in the fact that men spend hard-earned money on something that can damage the mind and cause madness (14. 137). Like the Greeks, Pliny comments on truth in wine (*in vino veritas*), but emphasizes that the truths therein revealed are often better left unspoken (*HN* 14. 141). Seneca’s and Pliny’s descriptions of the psychological and physical effects of chronic intoxication presage modern observations: memory loss, identity confusion,

narcissistic self-indulgence, antisocial behaviour, impaired speech and vision, distended stomach, halitosis, quivering, vertigo, insomnia, and early death (Sen. *Ep.* 83. 21, 95. 16; Plin. *HN* 14. 142). *Sulla, *Cato the Younger, Marcus Tullius Cicero (son of the famous orator), Mark *Antony, *Julia (daughter of Augustus), and the emperors *Tiberius, *Claudius, Vitellius, and *Commodus are among the prominent Romans accused of notorious tippling.

The alcoholic beverage of choice for both the ancient Greeks and Romans was *wine, customarily diluted with water, except perhaps in the case of the Macedonians who were reputed to drink their wine *akratos*, or unmixed. Distilled spirits, such as brandy and whisky, had not yet been invented, and beer was looked upon as a swinish potation better left to barbarians. JMO'B/BLR

Alexander the Great (see facing page)

Alexandria (see ◀ Map 2, Bb ▶) was founded by *Alexander the Great in 331 BC when he took *Egypt from the Persians. It was developed principally by the first two Ptolemies, who made it the capital of their kingdom and the main Mediterranean port of Egypt (see PTOLEMY I; PTOLEMY II). It was founded as a theoretically auton-

mous city (**polis*) of the traditional Greek type, modelled in several respects on Athens: it had an exclusive hereditary citizenship organized by demes (local districts; see DEMOCRACY, ATHENIAN), probably with an assembly (*ekklēsia*), council (*boulē*), and annually elected magistrates, it had its own territory, restricted to citizen-owners and exempt from direct royal taxation, its own coinage, and its own laws. Its founding citizens were recruited from all over the Greek world; there were also numerous non-citizen residents of Egyptian and other ethnic origin, including a large Jewish community which acquired special privileges though not full citizenship. Alexandria soon became one of the largest and grandest cities of the Mediterranean world, famed for the monumental magnificence of its two main intersecting streets, its palace-quarter with the tomb of Alexander and the Museum and *library, its Serapeum (see EGYPTIAN DEITIES), *gymnasium, and Pharos, the lighthouse at the entrance to its two capacious artificial harbours. As a royal capital Alexandria could not be a normal *polis*: its coinage and, probably, its laws were used throughout Egypt; in the course of the dynastic struggles of the later Ptolemies, in which its citizens naturally took a

[continued on p. 32]

Alexandria A late-antique school at Alexandria. The lecturer's seat is visible at the centre of the U-shaped lecture-hall. Alexandria retained its eminence as an intellectual centre throughout Roman times. A. K. Bowman

ALEXANDER THE GREAT

Alexander the Great (Alexander III of Macedon), 356–323 BC, son of *Philip II and Olympias.

1. As crown prince he was taught by *Aristotle (from 342); he was his father's deputy in Macedon (340) and fought with distinction at the battle of Chaeronea (338). Philip's last marriage created a serious rift, but a formal reconciliation had been effected by the time of his death (autumn 336), and Alexander was proclaimed king against a background of dynastic intrigue, in which his rivals (notably Amyntas, son of Perdiccas, and the faction of Attalus) were eliminated. A show of force in southern Greece saw him acknowledged Philip's successor as *hēgemōn* of the League of Corinth; and in 335, when the Thebans took advantage of his absence campaigning on the Danube and rebelled, he destroyed the city and enslaved the survivors. The exemplary punishment enabled him to leave the Greek world under the supervision of Antipater with little fear of revolt, while he turned to the war of revenge against Persia.

2. In early 334 Alexander led his grand army across the Hellespont. In all some 43,000 foot and 5,500 horse (including the expeditionary force under Parmenion), it was the most formidable array ever to leave Greek soil. The Macedonians were its indispensable nucleus. The infantry phalanx, c.15,000 strong and armed with the fearsome six-metre (19½-foot) pike (*sarisa*), comprised a guard corps (hypaspists) and six regionally levied battalions (*taxeis*); and the cavalry, originally 1,800 strong, was also divided into regional squadrons (*ilai*). In pitched battle the phalanx, in massed formation, was practically unbreakable on level ground, and Alexander was able to generate a cavalry charge from the flank which had decisive momentum. The men of the hypaspists, usually supplemented by Agrianian javelinmen and the corps of archers, were deployed in rapid-moving columns along with the cavalry, and were an irresistible combination in mountain warfare. These units were far superior to any they encountered (except arguably the armoured cavalry of *Bactria), and, supplemented by a large reserve of secondary troops (Thracians, Illyrians, and the hoplites of the Corinthian League), they gave Alexander an overwhelming military advantage.

Alexander the Great This Roman copy (the 'Azara' herm, 2nd cent. AD) of a lost Greek original probably reflects the god-like image of Alexander created by his favourite sculptor, Lysippos. © RMN-Grand Palais (Louvre Museum) / Hervé Lewandowski

3. Alexander's superiority was immediately asserted at the Granicus (334), where a composite satrapal army was outmanœuvred and its large mercenary phalanx exterminated. That allowed him to march directly to occupy Sardis, *Ephesus, and Miletus. The most serious threat came from a superior Persian fleet, which sustained the stubborn defence of Halicarnassus, and Alexander took the gamble of demobilizing his own fleet and abandoning the coast. He moved east via Lycia, Pamphylia, and Phrygia (where he 'cut' the Gordian knot, fulfilling a presage of empire), and largely ignored a major Persian counter-offensive in the Aegean, which—fortunately for him—the Great King (Darius III) crippled by withdrawing a large segment of the fleet to swell his royal army (summer 333). Alexander made Cilicia his base for the critical campaign and lured the vast Persian army into the narrow coastal plain south of Issus, where its numbers were ineffective. He disrupted the front line with his standard cavalry charge from the right and gradually forced the entire Persian army into panic retreat. This overwhelming victory (c. November 333) gave him control of the near east as far as the Euphrates. There was some resistance, notably at Tyre and Gaza, which he crushed in exemplary fashion, preferring protracted and costly sieges (seven months at Tyre) to diplomacy and negotiation. All challenges were met directly, whatever the human cost.

4. After a winter (332/1) in Egypt, which was surrendered peacefully, he invaded Mesopotamia and won his crowning victory at Gaugamela (1 October 331). Darius' forces were outmanœuvred again, on chosen ground and unrestricted plain; Alexander sacrificed his left wing, leaving it to be enveloped while he extended the enemy line to the right, created a gap and drove inwards at the head of his cavalry. Again a general rout ensued, and Mesopotamia in turn lay open to him. Babylon and Susa fell without resistance, and he forced the Persian Gates against determined opposition to occupy the heartland of Persis (winter 331/0). At *Persepolis he acquired the accumulated financial reserves of the Persian empire and incinerated its great palace during (it would seem) an orgiastic *symposium, subsequently representing it as the final act of the war of revenge. That in effect came during the summer of 330 when Darius fled from his last refuge at Ecbatana, to be murdered by his closest entourage (led by Bessus, satrap of Bactria). Alexander honoured his rival's body and closed the war by discharging his Hellenic troops *en masse*.

5. A new challenge arose when Bessus, who had withdrawn to his satrapy, proclaimed himself King of Kings under the regnal name Artaxerxes V. He appointed counter-satraps in central Asia and fomented revolt. Alexander left his satraps to cope with the insurgency, while he moved in a great swathe through Areia, Drangiana, and Arachosia (east Iran and west Afghanistan) and crossed the Hindu Kush to invade Bactria (spring 329). Bessus was soon gone, arrested in his turn by his nobles and surrendered to Alexander for exemplary punishment. Shortly afterwards, when Alexander reached the north-eastern limit of the empire (the Syr-Darya), a new uprising began in Sogdiana (Uzbekistan), rapidly spreading south to Bactria. One of Alexander's (non-Macedonian) columns was ambushed by the insurgents' nomad auxiliaries west of Marakanda (Samarkand), a military and moral reverse which impressed the need for slow, systematic pacification. The conquest of the area fortress by fortress witnessed deliberate massacre, enslavement, and transplantation of recalcitrant populations, and, when the revolt ended (spring 327), the north-eastern satrapies were left exhausted under a large garrison of mercenaries and a network of new city foundations, in which a Hellenic military élite was supported by a native agrarian workforce—the invariable model for the dozens of Alexandrias he founded in the eastern empire.

6. From Bactria Alexander moved into *India at the invitation of the local dynasts of the Kabul valley and Punjab. He was nothing loath to reaffirm the traditional Achaemenid claims to the Indus lands. Resistance was treated as rebellion, and his progress through Bajaur and Swat was marked by massacre and destruction, as in Sogdiana. Even the remote rock-fortress of Aornus (Pir-sar) was reduced by siege at the cost of prodigious hardship, to demonstrate that there was no escape from his dominion. The spring of 326 saw him at Taxila, east of the Indus, poised for a campaign against Porus, who held the Jhelum (Hydaspes) against him. After a series of diversionary manœuvres he crossed the river under cover of a spring thunderstorm and defeated Porus, whose war elephants could not compensate for his cavalry inferiority. The victory was commemorated in two city foundations (Bucephala and Nicaea), and a remarkable issue of silver decadrachms depicts Alexander (crowned by victory) in combat with Porus and his elephant. Alexander continued eastwards, crossing the rivers of the Punjab in the face of an increasing monsoonal deluge, until his troops' patience was exhausted. They refused to cross the Hyphasis (Beas) and invade the Ganges river system, and Alexander reluctantly acceded. A river fleet (commissioned in the summer) was ready at the Hydaspes by November 325, and the army proceeded by land and water to the southern Ocean. The journey was marked by a singularly vicious campaign against the Malli, unprovoked except for their failure to offer submission, and Alexander's impetuosity cost him a debilitating chest wound. Further south the kingdoms of Sambus and Musicanus were visited with fire and slaughter when their allegiance wavered, and, as he approached his base in the Indus delta (Patalene), the natives fled in terror (July 325).

7. Alexander now returned to the west, deputing Nearchus to take his fleet across the southern coastline while he led the main army through the Gedrosian desert (Makran), in emulation—so Nearchus claimed—of *Cyrus the Great and Semiramis. The horrors of heat and famine which ensued were considerable, but perhaps exaggerated in the sources, which attest no great loss of life among the Macedonian army. Reunited with the fleet in Carmania (c. December 325), he returned to Persepolis and Susa (March 324), where some 80 of his staff joined him in taking wives from the Persian nobility. For the next year there was a lull in campaigning (except for a punitive expedition against the Cos-saeans of the Zagros), but there were grandiose preparations in the Levant, where he commissioned a war fleet allegedly 1,000 strong, some of which was conveyed to Babylon in summer of 323. The first stage of conquest was certainly the Persian Gulf and Arabian littoral, which Alexander intended to conquer and colonize, but the sources, in particular the memoranda (*hypomnēmata*) reported by *Diodorus Siculus, refer to projects of conquest in the western Mediterranean aimed at Carthage and southern Italy—and plans are even alleged of a circumnavigation of Africa. The reality is perhaps beyond verification, but it is likely enough that Alexander conceived no practical limit to his empire.

8. Alexander's monarchy was absolute. From the outset he regarded Asia Minor as liberated territory only in so far as he displaced the Persians, and he announced the fact of possession by imposing his own satraps upon the erstwhile Persian provinces. By 332 he regarded himself as the proper ruler of the Persian empire, and after Gaugamela he was acclaimed king of Asia. From 330 his status was displayed in his court dress, which combined the traditional Macedonian hat (*kausia*) and cloak with the Persian diadem, tunic, and girdle. He used Persian court ceremonial and promoted Persian nobles, but there is no evidence of a formal 'policy of fusion' with Persians and Macedonians assimilated into a single ruling class. Except for a brief moment at Opis the Macedonians were entrenched in a position of superiority. The Susa marriages would indeed give rise to a mixed offspring (as would the liaisons of his soldiers with native women), but in both cases the ultimate aim was probably to counter the regional and family loyalties which had been the curse of both Persian and Macedonian monarchs. At another level he had cut across the traditional regional basis of his army and introduced Iranians even to the élite Companion cavalry. There was to be a single loyalty—to the crown.

9. Alexander naturally experienced opposition in various forms. His Macedonian troops proved increasingly reluctant to be enticed into further conquest. He gave way once, at the Hyphasis, but at Opis (324) he confronted their contumacious demands for repatriation with summary executions and a devastating threat to man his army exclusively from Persians. He had deliberately made his Macedonians dispensable and demonstrated the fact. The same ruthlessness marked his reaction to opposition at court. He isolated and struck down Parmenion because of his resistance to imperial expansion, and the adolescent pages, who seriously threatened his life for reasons which are obscure (but probably based on antipathy to the new absolutism), were tortured and stoned to death. Insubordination was as intolerable as conspiracy. Alexander's return to the west in 325/4 witnessed a spate of executions of satraps who had exceeded their authority or arrogated power (e.g. Astaspes in Carmania, Orxines in Persis). Misgovernment as such was a secondary consideration, as is shown by his remarkable offer of pardon to Cleomenes. Relations with the Greek world became increasingly strained. At first the machinery of the Corinthian League was effective; and the challenge by Agis III had limited support and was quickly crushed (? spring 330). But Alexander undermined the provisions of the league by his Exiles' Decree (324), which threatened Athens' possession of *Samos and gave almost every city the problem of repatriating long-term exiles. The last year of his reign was punctuated by tense and heated diplomacy, and his death was the catalyst for general war in southern Greece.

10. Given Alexander's uncompromising claims to sovereignty it can be readily understood how he came to conceive himself divine. A Heraclid by lineage, he believed himself the descendant of *Heracles, Perseus, and (ultimately) *Zeus, and by 331 he had begun to represent himself as the direct son of Zeus, with dual paternity comparable to that of Heracles. He was reinforced in his belief by his pilgrimage (in 331) to the oracle of Ammon (recognized as a manifestation of Zeus at Siwa), and thereafter styled himself son of Zeus Ammon. But divine sonship was not divinity, and by 327, after conquest had followed conquest, Alexander was encouraged (particularly in the liberated atmosphere of the symposium) to believe that his achievements deserved apotheosis at least as much as Heracles'. *Proskynēsis*, the hierarchical prostration of inferior to superior, was *de rigueur* at the Persian court, but Alexander attempted to extend it to Macedonians and Greeks, for whom the gesture was an act of worship. The experiment failed, thanks to the resistance of Callisthenes, but the concept remained, and there is an anecdotal (but probable) tradition that he wrote to the cities of Greece in 324, suggesting that it would be appropriate for divine honours to be voted him along with a hero-cult for his deceased favourite, Hephaestion. Cults were certainly established, predominantly in Asia Minor, and persisted long after his death, eclipsing the largely ephemeral worship of his successors.

11. Portraits of Alexander tend to follow the model created by his favourite sculptor, Lysippus, who perpetuated the leftward inclination of his neck and the famous *anastolē* (hair thrown back from a central parting). His profile, first illustrated on the 'Alexander sarcophagus' (311), appears repeatedly on coins, most strikingly on the commemorative tetradrachms of *Lysimachus. His personality is far more elusive, thanks to the tendency in antiquity to adduce him as a moral example of good or evil and the propensity of moderns to endue him with the qualities they would admire in themselves. His reputation for invincibility, which he studiously fostered, has been a source of fascination (notably for *Pompey, *Trajan, and Napoleon), mostly for ill. The process began when he died (10 June 323) after a ten-day illness (which contemporaries ascribed to poison), and the marshals who sought to emulate him rapidly dismembered his empire.

ABB

prominent part, Alexandria was, it seems, punished with the loss of its *ekklēsia* and *boulē*, and its magistrates became more like royal officials. These struggles also ignited the notorious antagonism between the 'Greek' citizen-body and the Jewish community, which continued to flare up in the Roman period (see JEWS).

When Egypt came under Roman rule the citizens of Alexandria retained most of their surviving privileges; they were also used extensively in the new administration of the province, and only they, in Egypt, could acquire Roman *citizenship. Despite several appeals to the Julio-Claudian emperors, Alexandria only regained a *boulē* in AD 200/1 when *Septimius Severus granted councils to all the cities of Egypt; this development, and the universal grant of Roman citizenship in AD 212, undermined Alexandria's political primacy in Egypt, but not her Mediterranean-wide economic and cultural importance. With over 500,000 inhabitants, Alexandria was the second city of the Roman empire; it was also the main port of the eastern Mediterranean for state and private shipping, straddling the luxury trade between India and Rome. Fine public and private buildings continued to be erected, and the arts and crafts and intellectual pursuits flourished: notable were glassware manufacture (see GLASS) and *medicine. In the 3rd cent. AD the reputed see of St Mark the evangelist became one of the main centres of the Christian church, revitalizing Alexandria's claims to intellectual, artistic, political, and economic prominence within and beyond Egypt.

DWR

Amazons, mythical race of female warriors. The name was popularly understood as 'breastless' (*maza*, 'breast') and the story told that they 'pinched out' or 'cauterized' the right breast so as not to impede their javelin-throwing (Apollod. 2. 5. 8, Strabo 11. 5. 1). No real etymology is known.

Epic

Amazons exist in order to be fought, and ultimately defeated, by men in an Amazonomachy ('Amazon-battle').

Already in the *Iliad* we hear of Bellerophon killing them in Lycia (6. 186), their defeat at the river Sangarios (near Pessinus, 3. 189), and a tomb of Myrrhine outside Troy (2. 814; cf. Strabo 12. 8. 6). In Arctinus' *Aethiopsis* their Thracian queen, Penthesilea 'daughter of Ares', arrives to help the Trojans, but *Achilles kills her (and Thersites for alleging Achilles loved her). *Heracles' ninth labour was to fetch the girdle of the Amazon queen, Hippolyte, which resulted in another Amazonomachy (Apollod. 4. 16). *Theseus joined Heracles and as a result had to defeat an Amazon invasion of Attica, a story told in a late 6th-cent. BC *Theseid* (story in Plut. *Thes.* 26).

Cult/commemoration

Amazon tombs are frequent in central Greece, presumably because of local Amazonomachy myths. They are found at Megara (Paus. 1. 41. 7), *Athens (Paus. 1. 2. 1), Chaeronea and Chalcis—as well as in *Thessaly at Scotussa and Cynoscephalae (Plut. *Thes.* 27). There was an Amazoneum (shrine of Amazons, implying tombs and cult) at Chalcis and Athens. At Athens there were annual sacrifices to the Amazons on the day before the Thesea. Many Asia Minor settlements were founded by Amazons: Amastris, Sinope, Cyme, Pitana, Priene, Mytilene (Lesbos), *Ephesus, Smyrna, Myrina (Diod. Sic. 3. 55. 6, Strabo 11. 5. 4). At Ephesus Hippolyte and her Amazons set up a *bretas* (old wooden statue) of Artemis and established an annual circular dance with weapons and shields (Callim. *Hymn* 3. 110; Pind. fr. 174 Snell–Maehler), as performed in historical times by maidens.

Ethnography

Amazons, appropriately for a group inverting normal Greek rules, live at the edge of the world. Their usual homeland is next to a river Thermodon in the city of Themiscyra in remote Pontic Asia Minor (Aesch. *PV* 723–5, Pherec. *FGrH* 3 F 15). Real Amazons would need men for procreation. *Diodorus Siculus' Amazons at the Thermodon cripple their male children (2. 45), but his

Amazons Athenian ceramic bowl showing a trousered Amazon rider attacking a fallen Greek, c.470 BC. The theme was popular in Greek art, especially after the Persian Wars, when Amazons were compared with Persians, another 'womanly' foe from the east. © The Metropolitan Museum of Art / Art Resource / Scala, Florence

second set, in Libya (3. 53–4), have house husbands to whom they return (like Greek males) after their period of military service. In Pseudo-Callisthenes, *Alexander Romance* (2. 25), they keep men across a river. It is part of the mythologizing of *Alexander the Great that stories were quick to surface that he had met Amazons and threatened (Arr. *Anab.* 7. 13; Plut. *Alex.* 46) or pleased (Diod. Sic. 17. 77) their queen.

Matriarchy and message

Especially since J. J. Bachofen's *Mutterrecht* (1859), Amazons have been used as evidence for an actual matriarchy in prehistoric times. This has seemed an attractive counter to modern male prejudices, but mistakes the nature of myth. Women warriors and hunters are quite frequent in myth and folk tale (Stith Thompson F 565) and inversely reflect the actual distribution of roles between

the sexes. It may be that such inversion in Greece goes back to rituals of the initiation of maidens (cf. Ephesus) and youths (cf. the Thesea), where the definition of gender roles is at issue.

Art

Amazonomachies and genre studies of Amazons are represented copiously in art from the late 7th cent. on, propelled by their special importance at Athens. *LIMC* catalogues 819 items. KD

Ammianus Marcellinus (c.AD 330–95), the last great Latin historian of the Roman empire, was born at Syrian *Antioch. His early entry, c.350, into the élite corps of *protectores domestici* may indicate family connections with the imperial service at Antioch, in which case an early acquaintance with the Latin language could be inferred, as well as the Greek which formed the base of his literary

education. Assigned by Constantius II to the personal staff of the general Ursicinus, Ammianus saw service in north Italy, Gaul, and Germany (the early campaigns of *Julian), Illyricum and Mesopotamia. It was here, in the siege and capture by the Persians of Amida (mod. Diarbakir) in 359, that the first phase of Ammianus' military career came to an end. He escaped from the city, but Ursicinus was dismissed from office in the aftermath of its fall. Ammianus seems to have returned to Antioch, but subsequently participated in the disastrous Persian campaign of Julian (363). In later years he travelled—to the Black Sea and Egypt, southern Greece, possibly to a Thracian battlefield from the Gothic invasions of 376–8—before he came to Rome in the mid-380s. It was here that he completed his history. The work is composed in 31 books, of which the first thirteen, covering the period from Nerva to 353, seem from the nature of a reference to them by the grammarian Priscian already to have been lost by the early 6th cent. The earlier of the lost books were apparently not very full or original, but the scale of the narrative enlarged as Ammianus approached his own day. The surviving books describe in great detail the events and personalities of Ammianus' active lifetime through a period of just 25 years, covering the reigns of Constantius II and Julian (353–63), the brief tenure of Jovian (363–4), the joint reigns of Valentinian I (364–75) and Valens (364–78), and the usurpation of Procopius (366). The culmination of the work is the Gothic invasions of 376–8 and the battle of Adrianople (9 August 378) at which Valens was killed. The period from 378 to the time of publication is alluded to only in passing references which are, however, of value in judging the date of composition of the work; the latest datable events referred to are of 390 and 391, and the history was probably completed very soon after this.

In the earlier books, narrating his service under Ursicinus, Ammianus' own experiences form a major element, and events are largely seen through the often biased eyes of his patron; with their vivid narrative of sometimes very detailed events and the subjectivity of their judgements, these books have seemed to readers to resemble personal memoir rather than formal history. Despite his own participation—which was at a less privileged level than his experiences with Ursicinus—his narrative of the Persian campaign of Julian is less personally involved, relying sometimes on written sources, and the books on Valentinian and Valens are less detailed, and despite moments of intense involvement, not focused on the author's own experiences. The centrepiece of the history was the government, first in Gaul as Caesar and then in the east as sole Augustus, of Julian the Apostate. Ammianus deeply admired Julian, particularly for

his military and administrative abilities. He was openly critical of other aspects of Julian's regime, not least his religious policies.

Himself a pagan of a more traditional cast, Ammianus disliked Julian's intolerance, and was hostile to the emperor's devotion to excessive sacrifice, and of his submission to the influence of philosophers who, in the end with disastrous results, indulged Julian's interest in Neoplatonic techniques of divination. The extent to which Ammianus was himself a polemical writer is debated. He did not adopt the openly ideological stance against *Christianity taken by his younger contemporary Eunapius (whose work he seems to have used from time to time). He is however scathing, in satirical fashion, about the ostentation of the bishops of Rome, criticizes those of *Alexandria for their ambition, and ironically refers to the failure of Christianity to live up to its 'pure and simple' professions.

Ammianus' elaborate, individual, and often very intense style is notable for its strong pictorial sense and for its ability to portray character, in which it displays the influence of physiognomical writing and exploits often very vivid comparisons of human character with that of wild beasts. It contains many passages, especially of military narrative, in which individuals are shown at close quarters and in situations of personal stress and great danger. It is influenced too by the language of *satire, as when Ammianus denounces the behaviour of the nobility and common people of Rome, or the behaviour of lawyers. The subject-matter is wide, and the history contains many geographical and ethnographical digressions (describing the non-Roman as well as the Roman worlds), as well as scientific and antiquarian excursions, in which the author's Greek culture is acknowledged, sometimes with quotations of Greek words in which Ammianus refers to Greek as his 'own' first language. The sources for the lost books are not known, except that Ammianus' back-references do not indicate the large-scale use of Greek sources that would have been possible for him, and there are occasional traces of the lost Latin history known as 'Enmann's *Kaisergeschichte*' which can be seen in other Latin writers of the period such as Aurelius Victor and Eutropius. For the contemporary period, Ammianus' narrative was based on personal knowledge and the accounts of eyewitnesses—those 'versati in medio' referred to in the preface of book 15; some of these, such as the eunuch Eutherius and the senator Praetextatus can be convincingly identified. Ammianus does not mention the orator Symmachus, and was certainly not the anonymous historian addressed by Symmachus in *Epistolae* 9. 110. In general, his affinities with Roman 'senatorial' circles have been much exaggerated by historians.

Ammianus' work, justly admired by Gibbon, is a classic of Latin historiography, though whether the influence of *Tacitus is more than formal (it would explain the starting-point at the reign of Nerva) is debated. The influence of *Sallust is indicated from time to time, but the most persuasive literary influence is clearly that of *Cicero, whose writings are constantly referred and alluded to. Greek authors, like *Herodotus, *Thucydides, and *Polybius, are acknowledged at suitable moments but do not seem otherwise to have exercised any real influence upon Ammianus' manner. *Homer and *Virgil are effectively used to give epic scale and colour to the narrative. Affinities with contemporary Latin prose writers are not obvious or extensive; the most obvious, both as to style and content, is perhaps the imperial legislation collected in the Theodosian Code—a comparison by which Ammianus, a lover of settled government and respect for institutions, might not have been offended. See HISTORIOGRAPHY, ROMAN.

JFMA

amphitheatres The earliest surviving permanent amphitheatres are found in Campania, the well-preserved example at *Pompeii, called *spectacula* by its builders (*CIL* 10. 852), being the only closely datable example (c.80 BC). At Rome, although gladiatorial games were held in the *forum Romanum from an early date with spectators accommodated in temporary wooden stands, the first permanent building was erected by Titus Statilius Taurus in the Campus Martius only in 29 BC. Nero built a much larger wooden structure there, destroyed by the fire of AD 64. Rome finally gained a permanent, monumental amphitheatre with the *Colosseum. Amphitheatres are common in the western provinces from the late republic but are rarer in the east, where from the 2nd cent. AD onwards many *theatres were instead adapted for this purpose. The use of gladiatorial techniques for training the Roman army led to small amphitheatres also becoming a normal adjunct of military *camps, the earliest surviving examples being Augustan. These and many of the minor amphitheatres in the provinces were cut into the natural rock or formed from simple earth mounds; wooden structures also continued to be built (*Tac. Ann.* 4. 62). The earliest masonry arenas such as Pompeii and Mérida (8 BC) had retaining walls to support earth mounds; self-contained monumental masonry structures (e.g. Arles (Arelate), El Djem), combining radial and annular vaulted passages to solve problems of access and circulation for large numbers of spectators, mainly appear under the inspiration of the Colosseum. The amphitheatre should be distinguished from the *ludus* or gladiators' training-school, generally having much less seating and a proportionately larger arena. See GLADIATORS.

IAR/JD

Anacreon, lyric poet, native of Teos. Little is known of his life. Born perhaps c.575–570 (Eusebius gives his *floruit* as 536/5), he probably joined in the foundation of Abdera in Thrace by the Teans fleeing before the threat of the Persian general Harpagus in 545 (Strabo 14. 1. 30; Aristox. fr. 12 Wehrli, Hdt 1. 168). He joined the court of Polycrates, tyrant of *Samos (Hdt 3. 121), the most illustrious Greek of the day; *Strabo claims that his 'whole poetry is full of mention of Polycrates' (14. 1. 16), though there is no reference in surviving fragments. Tradition made Anacreon and Polycrates rivals for the love of a Thracian boy, Smerdies, whose hair Polycrates cut off in a fit of jealousy (Stob. 4. 21. 24; Ath. 12. 540e; Ael. *VH* 9. 4); this may be false inference from Anacreon's poetry. After the murder of Polycrates by the Persian satrap Oroetes he joined the Pisistratid court at Athens (see *PISISTRATUS*); allegedly Hipparchus sent a warship to fetch him ([Pl.] *Hipparch.* 228c). According to Plato (*Chrm.* 157e) he praised the family of Critias (grandfather of the oligarch Critias), whose lover he was (schol. Aesch. *PV* 128). After Hipparchus' murder he may have gone to Thessaly (*Anth. Pal.* 6. 136, 142, if correctly attributed). The fragments suggest that he lived to old age, though the figure of 85 years ([Lucian] *Macr.* 26) cannot be verified. The tradition that he died by choking on a grape (Val. Max. 9. 12) displays the mythopoeia typical of ancient *biography.

He composed in elegiac distichs, iambic and trochaic rhythms, lyric stanzas consisting of glyconics with pherecratean clausula, and ionics (including a form with anacrusis named Anacreontic after him). The dialect is Ionic vernacular with some epicisms. The range of what survives is narrow. Wine and love (both homosexual and heterosexual) figure prominently. His control of form produces an appearance of effortlessness. Many poems have an epigrammatic quality. Words are positioned with great effect, as in fr. 357, a prayer to *Dionysus, with the play on the beloved's name and closing revelation that this is a love poem; 358 with the contrast between the fluent first and staccato second half reflecting the move from enchantment to rejection; 395 with its closing word-play; and 360 with the closing image of the beloved boy as charioteer of the poet's soul. Striking images for love abound (396, 398, 413). Delicacy, wit, paradox, irony, and self-mockery are prominent, as in 417, addressed to a coy girl, represented as a reluctant filly, 347 which laments the loss of a boy's hair in mock-epic terms, the bathos of 359, the idea of riotous decorum in 356a. He also produced biting abuse in the iambic tradition (346, 372, 388). Later sources ascribe maiden-songs to him (Ath. 13. 600d); a possible fragment survives (501). His work was edited by the Alexandrians into at least six books. His wit inspired a corpus of frivolous imitations in and after the Hellenistic

amphitheatres The amphitheatre and (background) theatre at Arelate (Arles), in S. Gaul (late 1st cent. AD). In the Roman west the amphitheatre was the usual setting for gladiatorial and wild-beast shows; in the east *theatres were adapted instead. Fototeca dell'Unione Internazionale, American Academy in Rome

period, the *Anacreontea*, which until the 19th cent. were believed to be his work. CC

anatomy and physiology

I

The examination of the parts of the body, their forms, location, nature, function, and interrelations (to adapt the list provided by Aulus Cornelius Celsus in the proem to book 1 of the *De medicina*)—whether through dissection (*anatomia*, the title of several ancient medical works, and of a lost work by *Aristotle) or as part of more abstract speculation about natural causes (*physiologia*)—was a concern not only for doctors. Physiology did not have the restricted range it has today; in antiquity it covered all kinds of speculative investigation into nature—in areas ranging from the search for the *soul and its physical location in the body to the explanation of organic processes in animals and plants. This means that ancient medical writers often paid close attention to the work of those whom we might regard today as having quite different concerns. Much early Greek cosmology, for example, was concerned (directly or indirectly) with problems surrounding the nature and origins of life, and the relations between the macroscopic structures of the universe and the microscopic structures of the body. Several Presocratic philosophers of nature advanced speculative models to explain physiological and pathological processes in terms of the transformation and balanced arrangement of one or more types of principal matter which they believed to constitute the universe as a whole. (Ideas of balance and imbalance, democracy and tyranny, symmetry and asymmetry can be seen shaping many different areas of Greek thought, cosmological, political, and physiological.) The influence, both positive and negative, of early cosmological models on Hippocratic physiological theories was often profound—so much so that the author of the Hippocratic treatise *On Ancient Medicine* directed a strong attack on those doctors who borrowed unverifiable hypotheses from the philosophers (see MEDICINE § 4).

Modern critics of Greek medicine—particularly those with scientific or medical backgrounds themselves—are often struck by the lack of agreement (even amongst ancient specialists) over the description of the human body's internal structures. And it is true that even in the Hippocratic corpus there is no single, dominant anatomical or physiological treatise. In fact there is little unambiguous, early evidence for dissection as an investigative tool either in the study of anatomy or in the development of physiological theories. It does seem surprising to find Aristotle noting towards the end of the 4th cent. (after

the bulk of the Hippocratic treatises were written) that 'the internal parts of the body, especially those of man, are unknown. We must as a result refer to the parts of other creatures with a nature similar to that of humans' (HA 494^b). Even Galen several hundred years later was still relying on dissections of the Barbary ape for his knowledge of some aspects of human anatomy—yet Galen himself was struck by the lack of interest in anatomy amongst the earliest Greek doctors.

The reasons for this state of affairs (which seemed as surprising to many later Greek medical authorities as it does to some of us today) are extremely complex and this article aims merely at summary and general description. Galen's explanation was simple: The earliest doctors treated medicine as a craft, and medical knowledge was handed down from father to son. There seemed little point in writing down information which could more readily be obtained by direct inquiry. In contrast, conventional modern explanations of the situation have tended to focus on the widespread ancient taboos against dissection—especially human dissection—which persisted throughout antiquity. Such taboos there certainly were, however surprising this may seem in societies which otherwise tolerated the murder of men and women in the name of public entertainment. In spite of evidence that the dissection of animals played an increasingly important role in the study of human medicine after Aristotle, it is not at all easy to assess the status of the early, pre-Aristotelian evidence.

While it is widely believed that early in the 5th cent. BC Alcmaeon of Croton pursued anatomical studies of animals, there is little agreement (modern or ancient) as to just how far he went. Later ancient witnesses attribute to him pioneering work on the anatomy of the eye and its communication with the brain, the ear, the nasal passages, and the embryo, and more controversially the blood-vascular system (DK 24 A 5–18). As none of his own work survives intact, we are hardly in a position to judge just how far his research was based on autopsy, let alone its general motivations. The judgement of the early evidence is further complicated by the problem of the lack of technical anatomical vocabulary. Much apparently technical information may have been more or less common knowledge. At Aristophanes' *Frogs* 134 for instance, the comic Dionysus fears that by jumping off a tall building he will 'destroy two rissole wrappers of his brain'; should this metaphor have occurred in a medical treatise, we might immediately assume that it displayed more or less specialized autoptic experience of the brain. In fact it is not until Hellenistic times that a detailed anatomical vocabulary develops in earnest, and even then it grows by naming parts of the body through analogy with

familiar external objects. This is the procedure which had already been advocated by the author of the Hippocratic treatise *On Ancient Medicine* (22) to aid the comprehension of the functions of internal parts, of which he had only the vaguest idea: 'It is necessary to learn about [internal structures] from external ones which are evident to us,' he notes. The problem of anatomical nomenclature, its poverty and the lack of standardization was still so serious in the 2nd cent. AD that Rufus of Ephesus and Galen himself devoted several treatises specifically to this subject.

Acute observations of physiological processes such as respiration, sensation, digestion, and excretion, were often incorporated into highly speculative theories without these observations themselves being the subject of practical verification. It seems that traditional anatomical models could also take on authoritative status in some quarters. Scenes of wounding in the Homeric epics point to the existence of traditional models to describe the internal structure of the body which became part of the furniture for some medical writers. For instance, *Il.* 13. 545–9: 'Antilochus watched Thoon as he turned around, and then rushed at him, thrusting. He severed the whole vein (*phleps*) which runs right up the back to the neck—he severed the whole of it. Thoon fell back and lay in the dust, stretching out both his hands to his friends.' In some cases it was a long time before this kind of literary tradition was displaced by the results of autopsy. A much later ancient commentator on this Homeric passage noted that 'here the poet is an anatomist. He refers to the so-called "hollow vein" [*koilē phleps*, the Greek term for the *vena cava*] which runs from the right of the spine, from the liver, passes over the diaphragm to the heart and from there to the neck.' Homer is a special case, of course, and the non-medical writers often preserve important observations which were never taken up at all. The phenomenon of contagion, for example, described by *Thucydides in his account of the great *plague at Athens in 430 BC (2. 47), and hinted at in the first choral ode of Sophocles' *Oedipus*, was not examined in detail by the very doctors who Thucydides tells us were the first to suffer.

II

Much early work on the structure of the body focused on the skeleton and the vascular system. One of the earliest surviving accounts of the way in which parts communicate with each other is preserved by Aristotle; it is striking for the few signs it shows of close acquaintance with the physical appearance of the structures it describes. Aristotle reports (*HA* 512^a4 ff.) that Diogenes of Apollonia in the 5th cent. had posited a blood-vascular system of ducts (*phlebes*) distributed throughout the body, divided into

two independent networks each serving one side of the body. The network on the right originated in the liver, and was probably called *hēpatitis*, while that on the left, *splēnitis*, came from the spleen. It is likely that surface anatomy (especially in connection with parts like the neck where internal structures stand out) played a part in the establishment of models such as this one; perhaps experience derived from the practice of therapeutic measures such as venesection was also relevant. Most significant, perhaps, is the underlying assumption here that the bilateral symmetry exhibited by the body externally should in some way be reflected internally.

Vessels, pores, and ducts, visible and theoretical, figure prominently in many ancient physiological theories. It is not clear from Aristotle's account of Diogenes exactly what the vessels carried, nor what function his model played in his physiological theory. One late doxographical source (Aëtius, DK 64 A 29) reports that they carried air. (Air was known to be necessary to life and vital for the functioning of the senses; it was not known until much later, of course, exactly what happened to inspired air. A large group of ancient theorists, many of them still active in Galen's day, believed that inspired air (*pneuma*) passes from the lungs via the heart into the arteries.) Diogenes' 'ducts' probably carried a variety of fluids around the body, including air. Diogenes may or may not have been a doctor himself; certainly he was a cosmologist, and it seems likely that his physiological and anatomical work was related to his cosmology, and in particular to his idea that air has some kind of elemental status, and is to be associated with the cognitive faculties in animals.

Aristotle mentions two other similar early models of internal anatomical structures; one he attributes to the otherwise unknown Syennesis of Cyprus, and the other to Polybus, supposed by many to have been the son-in-law of Hippocrates. An account similar to that of Polybus appears in the Hippocratic treatise *On the Nature of Man* (ch. 11); it might be noted that the surviving Hippocratic accounts of vascular anatomy are not as a rule as detailed as these three cited by Aristotle. (Although as exceptions, one should note the little-known Hippocratic treatises *On the Nature of Bones*, *On Anatomy*, *On Fleshes*, and the later (4th-cent.) work *On the Heart*.)

Along with early work on the anatomy of the vascular system comes speculation about the seat of cognition, and the ways in which the senses communicate with each other and the so-called 'command centre' of the body. Some early authorities, including in all probability Alcmaeon of Croton, Diogenes of Apollonia, and by implication the author of the Hippocratic *Sacred Disease*, argued for the brain's primary role here, but *Plato moved the command centre to the heart (*Ti.* 70a ff.), followed by

Aristotle and Diocles of Carystus. The debate continued until Galen reasserted the very early primacy of the liver in the 2nd cent. AD.

In the Hippocratic writings, then, pathological commentary and physiological theory tend to be more detailed than empirical knowledge of internal anatomy. The author of *Sacred Disease*, famous for the argument that epilepsy has a natural cause, offers a convenient example of the priority of theory, even in cases where autopsy is brought to the fore. He insists that epilepsy has its origin in the brain; assuming that the human brain is fundamentally the same as the brain in all other animals, he describes the examination of the brain of a similarly afflicted goat. 'On opening the head', he claims, 'the brain will be found to be wet, full of fluid and foul-smelling—persuasive proof that the disease and not a deity is causing the harm.' Adherents of humoral theories similarly tended to locate the source of the humours in specific organs which seemed a priori to be appropriate. Typically for many Hippocratic authors, bile comes from the liver and phlegm from the head. External examination of the state of the most prominent vessels which allowed the communication of these fluids through the body could be an important part of a general assessment of the state of the body.

III

With *Aristotle, there is much stronger evidence that physiological theory can be related to empirical investigation. (Some modern scholars hold that Aristotle may even have dissected a human embryo, but the evidence (HA 583^b14) is inconclusive. It seems unlikely, on balance, that Aristotle dissected human subjects.) In the first book of the treatise *On the Parts of Animals*, Aristotle stresses the importance of autopsy as a preliminary to theory, however disagreeable this may be. In the *History of Animals*, he went on to provide detailed, observationally based accounts of the vascular system and the internal geography of the body, and a whole range of physiological theories explaining digestion, respiration, etc. in the treatises which make up the so-called *Parva naturalia* (see ANIMALS, KNOWLEDGE ABOUT § II).

IV

After Aristotle, it seems that more and more doctors began to employ animal dissection—including *vivisection—but human dissection probably remained the exception and not the rule. Diocles of Carystus (credited by Galen with having composed the first anatomical handbook (fr. 23 Wellmann)) made important observations about the anatomy of the womb (fr. 27 Wellmann). Praxagoras of Cos is traditionally credited with drawing the distinction be-

tween veins and arteries, and doing important work on neural anatomy. As the teacher of Herophilus of Chalcidion, Praxagoras stands at the beginning of one of the most fruitful periods of anatomical investigation in the history of medicine. Herophilus' and Erasistratus' work in dissection—notably human dissection—led to a dramatic development of anatomical knowledge. Celsus reports that they were given condemned criminals and performed vivisections on them; although the evidence for this has been questioned in some quarters, most modern scholars seem to accept its plausibility, and, at the very least, it seems likely that Herophilus was one of the first physicians to make systematic use of human dissection. He made important discoveries about the anatomy of the eye, the male and female reproductive systems, and the blood-vascular system. Most famous perhaps was his work on the nerves; it seems likely that he was the first to discern them, and perhaps the first to make the distinction between motor and sensory nerves.

In Hellenistic physiological theory we find the marriage of physics and anatomy developing in many ways. Erasistratus, credited by Galen with new anatomical work on the structure of the heart and the blood-vascular system, developed a theory which explained the origins of the body in terms of agglomerations of an elemental complex of vein, artery, and nerve. Asclepiades of Bithynia seems to have taken this type of idea further, reducing the body's component parts to elementary corpuscles and pores whose constant motion accounted for the change and unpredictability of physiological and pathological phenomena. The Asclepiadean theory, with its insistence that health and disease—indeed all physiological processes—can be understood in terms of the proper movement of these corpuscles in the pores, had the effect of dampening commitment to anatomical investigation amongst his many intellectual progeny. But not all; although the Methodists argued that the study of anatomy was rather beside the point, given their insistence that all the doctor needed to know about disease could be learned from the phenomenal presentation of two or three morbid states in the body, Soranus of Ephesus made a considerable contribution to female anatomy in his *Gynaecology*. At the beginning of this work, Soranus notes that 'since we are now about to pass to the section on gynaecological hygiene, it will first be necessary to explain the nature of the female parts. Some of this can be learned directly, some from dissection. And since dissection, although useless, is nevertheless studied for the sake of profound learning, we shall also teach what has been discovered by it' (1. 2. 5, trans. O. Temkin). There follows a remarkably detailed account of the anatomy of the female reproductive system (see GYNAECOLOGY).

Not all doctors placed anatomy at the service of physiology. Another group, active from the 2nd cent. BC onwards, associated themselves more or less directly with a current in Pyrrhonian scepticism, and marshalled powerful arguments against the value of physiological speculation in the practice of medicine. Pointing to the kinds of disagreements amongst dogmatic exponents of medical theories which had so frustrated even the Hippocratic author of *On Ancient Medicine*, it was argued that experience was the only true teacher in medicine. Medical empiricism placed restrictions on the amount of research it was sensible for a doctor to pursue given the futility of theory-building, although anatomical investigation of accident victims remained—as it always had been—a valid way of gathering knowledge.

V

Galen's very importance as anatomist and physiologist makes any detailed treatment here quite impossible, and any summary treatment would be misleading. Best simply to quote Galen's own advice to the intending student of his anatomical and physiological theories, adapted from his work *On the Order of his Own Books*. '...*On Bones, for Beginners*. This is the first part of the course of anatomy;...then...approach the *Anatomical Administrations*. This work teaches the parts revealed in anatomy, their size, position shaping, interrelations, appearance, and similarities with each other. The man who is experienced in the observation of these things through anatomy will then go on to learn about their activities—their natural activities, written about in three books of comment entitled *On the Natural Faculties*. The faculties of the soul, as they are called, are dealt with in several other works, of which *On the Anatomy of the Dead* [lost] comes first, and then two books *On the Anatomy of the Living* [lost], and besides these, two more *On Anatomical Disagreements* [lost]. Next after these come three books *On the Motion of the Abdomen and the Lungs* [lost], two *On the Causes of Respiration*, and four books *On the Voice*. In the same category comes the work *On the Movement of the Muscles*. I have set out my investigations into the "ruling part", and all the other inquiries into physical and psychical activities in a number of books which I wrote *On the Doctrines of Hippocrates and Plato*. Next comes the specialized work *On the Seed*, and then *On the Anatomy of Hippocrates*. The treatise *On the Usefulness of the Parts* follows on all these.

"The material origins of the generation of all things in existence lie in the four elements, which are naturally mixed completely with one another, and which act on one another. This is proved in the first book of *On [Medical] Names*, and in *On the Elements according to Hippoc-*

rates. I do not cover everything relating to the proof of the elements in this little book, but only those features of it which were used by Hippocrates. For the most complete account of the science of the elements of the body the reader is referred to what I said in book 13 of *On Demonstration* [lost], and in books 5 and 6 of *On the Doctrines of Asclepiades* [lost]... Three books of comments *On Mixtures* follow the work *On the Elements according to Hippocrates*, and after these the treatise *On the Faculties of Simple Drugs*, followed by the treatise *On Compound Drugs*. In the first books the mixtures present in animals are discussed along with the special features of each, and in the third book the discussion is about the mixture of drugs. If you like, whether after two or after three books, you may read about the *Best Constitution of the Body* [lost], *On the Good State of Being*, and *On Anomalous Bad Temperament*, in that order...'

Galen's own work, and his summary of his predecessors' work, played the dominant role in preserving ancient anatomical and physiological knowledge for the Middle Ages and Renaissance. See MEDICINE. JTV

Andocides (c.440–c.390 BC), a member of a distinguished aristocratic family, whose grandfather had been one of the ten Athenian envoys who negotiated the Thirty Years Peace of 446. In 415, shortly before the great expedition to Sicily was due to depart, the Athenians were greatly dismayed one morning to discover that in the night the statues of *Hermes around the city had been mutilated: Hermes being the god of travellers, this act was presumably intended to affect the progress of the expedition, but it was also taken, curiously, as a sign that the democracy itself was in danger. In the subsequent accusations the young Andocides and his associates in a club (*hetaireia*), which was probably suspected of oligarchic tendencies, were named as having shared both in the mutilations of these herms and in the profanation of the Eleusinian mysteries (see DEMETER; ELEUSIS), and were arrested. Andocides, to secure immunity and, as he claimed, to save his father, confessed to a share in the mutilations and gave an account of the whole affair which, though it may have been far from the truth, was readily accepted by the Athenians. This secured his release, but shortly afterwards, when the decree of Isotimides, aimed at him especially, forbade those who had confessed to an act of impiety to enter temples or the *Agora, Andocides preferred to leave the city and began to trade as a merchant, in which role he developed connections all over the Aegean and in Sicily and Italy. In 411, seeking to restore himself to favour at Athens, he provided oars at cost price to the fleet in Samos, and shortly afterwards returned to Athens to plead for the removal of the limita-

tion on his rights. Unfortunately for him, the revolution of the Four Hundred (see ATHENS (HISTORY)) had just installed in power the very class of citizens whom his confession had affected, and he was put into prison and maltreated. Released, perhaps at the fall of the Four Hundred, he returned to his trading, in the course of which he was for a while imprisoned by Evagoras, the king of Cyprus. At some time after the re-establishment of the democracy in 410, he returned to the city to renew his plea (the speech *De reditu* belongs to this occasion) but he was again unsuccessful. Returning finally under the amnesty of 403, he resumed full participation in public life, and in 400 (or 399) successfully defended himself in the *De mysteriis* against an attempt to have him treated as still subject to the decree of Isotimides: the sixth speech of the Lysian corpus (see LYSIAS), *Against Andocides*, was delivered by one of his accusers. In 392/1 he was one of the Athenian envoys sent to Sparta to discuss the making of peace, and on his return in the debate in the assembly he delivered the *De pace* urging acceptance of the proffered terms, which were in fact very similar to those of the King's Peace of 387/386. The Athenians, however, rejected the peace, and Andocides and the other envoys were prosecuted by the young Callistratus. Andocides anticipated condemnation by retiring into exile, and we hear no more of him.

Speeches

In addition to the three speeches mentioned above, there is a fourth speech, *Against Alcibiades*, preserved under his name, which purports to be concerned with an *ostracism in 415; most scholars regard this as a forgery. Fragments of four other speeches are preserved.

Greek and Roman critics discovered in Andocides faults which, according to their canons, were serious; and admittedly the faults are there. He sometimes carries the use of parenthesis to absurd extremes; he cannot keep to one point at a time; his style is so loose that the argument is hard to follow. On the other hand, this inconsequential method of expression is at times effective, giving the impression of an eagerness which outruns premeditated art. He possessed a natural gift of expression, a fine flow of words, and a good narrative style. He was not a professional rhetorician, and if he neglected scholastic rules, it can at least be claimed for him that he was successful on his own unconventional lines. GLC

animals, attitudes to This was the subject of a huge debate among the philosophers. Already in the 6th and 5th cents. BC *Pythagoras and Empedocles had attacked the killing or maltreatment of animals, partly on the grounds that transmigration made us literally akin to

them. But vegetarianism was made difficult by the mutual interconnections between religious sacrifice and meat-eating. Justice was treated as a gift of God to benefit humans, not animals, both by *Hesiod and in the myth ascribed to Protagoras in *Plato's *Protagoras*. Little was conceded by Democritus' extending considerations of criminal justice to dangerous animals.

The decisive step, however, was taken not by the Presocratics, but by *Aristotle, who denied reason and belief to animals. Compensatingly, he allowed them a rich perceptual life, which he carefully disentangled from reliance on reason or belief. In ethics, he surprisingly combined the view that animals can be praised and blamed for their voluntary acts with the view that we owe them no justice, because we have nothing in common, and can conduct a just war against them. Aristotle's successor Theophrastus, disagreed. We are, in an extended sense, akin (*oikeioi*) even in reasonings, and killing non-dangerous animals is unjust.

The Epicureans and Stoics (see EPICURUS; STOICISM) sided with Aristotle in denying reason to animals, and hence justice. Only *Plutarch was to ask 'why not kindness, if not justice?' The Epicurean rationale, clearest in Hermarchus, is that justice is owed only where there is a contract, hence only among rational agents, *pace* Democritus. The Stoics denied that animals, as non-rational, could be treated as belonging (*oikeiōsis*: lit. a welcoming into the household)—and that despite the prevalence of animal pets. Hence justice could not be extended to them. Unlike Aristotle, they denied animals memory, emotion, foresight, intention, and voluntary acts.

From then on, the philosophical debate turned on animal rationality. Animal pain and terror were seldom cited before Porphyry. Pythagoras and Apuleius exploited them only in the case of humans transformed into animals. Outside philosophy, attitudes were sometimes broader. The Athenians punished a man for flaying a ram alive. When *Pompey staged a slaughter of elephants, the public was more concerned for the terrified elephants, the Stoic *Seneca for the loss of human life. The philosophers' praise of animals is sometimes only to downgrade humans (the *Cynics) or glorify the Creator (*Augustine), while vegetarianism was often based merely on ascetic or medical grounds.

The chief defenders of animals, in response to the Stoics, were the Neopythagoreans and certain Platonists. Defences are recorded in Philon *De animalibus* and Origen *Against Celsus*. Plutarch's *Moralia* contains three treatises in defence. But by far the most important work is Porphyry's *On Abstinence from Animal Food*. Of its four books, the first records the case against animals, but forbids meat on ascetic grounds; the second rejects

animal sacrifice; the third claims rationality and justice for animals; the fourth is an anthropology of vegetarian nations. But Porphyry's probable pupil Iamblichus felt it necessary to reinstate sacrifice. To defend this, he reinterpreted Pythagoras' and Plato's belief in transmigration of human souls into animals, the first as excluding sacrificial animals, the second as metaphorical. He denied a rational soul to animals, and his pupil Theodore insisted that human souls could act on animals only by remote control, not by genuine transmigration.

The western Christian tradition was fatefully influenced by Augustine who ignored the pro-animal side of this debate and backed the Stoic ground for killing animals, thus departing from such predecessors as Arnobius and Lactantius, who had allowed animals rationality.

Given the extensive use of animals in antiquity, it would have been as hard to give up killing them as to give up slaves, and one of the justifications offered was that civilization would break down.

animals, knowledge about

I

Animals are the mirror of nature, claimed *Epicurus (quoted in Cic. *Fin.* 2. 32), echoing a view widely held in different ways throughout antiquity. But others added that animals mirror culture as well; Greek and Roman writing and thinking about animals was as often ethical as what we might call scientific in character. Hardly surprisingly, the archaeological record provides ample evidence that animals were closely observed by artists, and further evidence for the ancient study of animals comes from early medical observations about the role of animals and animal products in human regimen. Yet the term *zōologia* seems not to occur in any surviving classical work, and the earliest English uses of 'zoology' refer more often than not to the study of the medicinal uses of animal products.

In the Homeric epics, animals exemplify many types of human qualities. Lions are brave, deer are prone to flight, bees swarm like crowds of people, dogs tread the treacherous path between loyalty and servility. (The story of Odysseus' dog, who died of joy on recognizing the scent of his long-lost master, was regarded by the later medical Empiricists as a miracle of diagnosis.) A great many similar examples can be found in the early Greek lyric poets. In the late 7th cent. BC, Semonides of Amorgos wrote a poem comparing animals with different types of women; the only good woman is like a bee, the best of a terrible collection. Specific qualities

retain their associations with specific animals. *Herodotus' story of Arion's rescue from pirates by a dolphin stands at the head of a long line of similar tales about these intelligent and compassionate creatures. Much later, *Plutarch marvelled at the society of ants in their anthills, and in a series of treatises (including the *De solertia animalium*, *De esu carniū*, and *Bruta animalia ratione uti*) considered the problems of whether animals have souls and the capacity for reason, and feeling. (The debate about the minds of animals, the morality of killing them for sport and food, or even using them as beasts of burden, was a lively one.) If Plutarch allowed animals some degree of intellect, the opposing view that animals possessed vitality (*anima*) without rationality (*animus*) was perhaps dominant; thus man and animals were kept apart. The ethical, metaphorical, use of animals to explain the organization of human society reaches its fullest expression in the anecdotal zoology of Aelian, which was composed in the time of Hadrian, in the Aesopic collection of fables, and ultimately in the medieval bestiaries.

Animals were also organized physically. The Romans in particular collected animals from all over the world in zoos and menageries, often preserving monstrous creatures from unnatural births as aids to divination.

Early philosophers of nature were not innocent of these ethical concerns. There was a considerable amount of cross-fertilization between what we might call ethical (or psychological) and 'scientific' zoology; *Aristotle for instance makes frequent observations about the social behaviour of animals in the *Historia animalium*, and throughout the zoological works he cites poets, dramatists, and historians as well as less 'high' literary sources. Yet the question of the physiological origins of animal life was, of course, a central concern for many Presocratic cosmologists, and fragments survive of a number of biological theories. Amongst the earliest surviving accounts is that of Anaximander, who is reported to have claimed that living creatures were generated in moisture, perhaps slime, protected by thorny bark, and that they grew drier and more self-supporting with age. Animals are soon able to sustain themselves, he claimed, but man alone, born initially inside some kind of fish, lacks self-sufficiency and needs prolonged nursing. Anaximander's account is notable for the importance it accords the animal's environment in its development. In Empedocles' theory on the other hand, blood, bones, and flesh arose out of combinations of the elements. They then formed solitary limbs which wandered the earth in search of other parts with which to combine. The evidence for Empedocles refers to monstrous creatures, men with the faces of oxen, and oxen with the faces of men, which lived during the

early stages of the development of man (see ANATOMY AND PHYSIOLOGY; ANTHROPOLOGY).

Early evidence for the systematic study of animal physiology is sparse, and signs of attempts at zoological taxonomy still more so. In one well-known early case, the author of the Hippocratic treatise *On Regimen 2* organizes the (mainly edible) animals which concern him into land, sea, and air creatures (2. 46–8), with further subdivisions on the basis of whether they are wild or domestic (see MEDICINE §4). Medical writers continued to preserve and amplify observations about the dietary and pharmaceutical properties of animals and animal products including hair, urine, and excrement.

Non-medical authors had their own interests. *Plato is particularly associated with the use of a method (variously applied) which involved the progressive division of objects into typical pairs. Setting up patterns based on pairs of opposed *differentiae*, he might divide animals into ‘walking’ or ‘aquatic’, and aquatic in turn into ‘winged’ and ‘water-dwelling’, and so on. It is not at all clear how far Plato developed this way of thinking in the direction of animal taxonomy, and the main Platonic texts (*Soph.* 220a–b, *Plt.* 264d, *Leg.* 823b) offer far from consistent examples of the uses to which division might be put. On the other hand, Aristotle seems to have Plato’s method of division in mind at several points where he is himself apparently dealing with the problems of animal classification (e.g. in *Top.* 6). Plato’s successor as head of the Academy, Speusippus, is credited in a few fragments with having written a work *On Similarities*, in which animals with similar appearances may have been grouped together (see *Ath.* 105b). Speusippus is also credited with some new coinages in which some scholars see signs of taxonomical concerns—the word *malakostraka*, for instance, to describe soft-shelled creatures is particularly associated with him. On balance, however, very little is known about Speusippus, and the motivations behind Plato’s method of division are certainly not linked primarily to zoological taxonomy.

II

The earliest surviving systematic studies of the physical nature of animals are those of Aristotle—many would insist that no one in antiquity after Aristotle rivalled the breadth and depth of his interests. The biological treatises account for well over 20 per cent of the surviving Aristotelian corpus, and lists of Aristotle’s works preserved by Diogenes Laertius and Hesychius suggest that there is much more that has not survived. In spite of the amount of material, there is little agreement today even about the aims of Aristotle’s zoological investigations. It is probably fair to say—though some are reluctant to go even this

far—that he was the first to devise a detailed zoological taxonomy and that this formed an important part of his general study of the *physics of the sublunary sphere. (His pupil Theophrastus carried this work further, applying Aristotelian methods to botany.)

In his famous exhortation to the study of animals (*De partibus animalium* 1. 5), Aristotle speaks of the low status enjoyed by the enterprise—some philosophers, he says, considered the subject-matter trivial or even disagreeable—but he maintains that the study of even the meanest of creatures is worth while if only because the means to discover their beauty, form, and purpose are close at hand. Modern disagreement about the nature of Aristotle’s zoological enterprise is due in part to the difficulty of arranging the relevant treatises in a clear chronological sequence. (In particular, it is very difficult to decide exactly when most of Aristotle’s empirical research was done. Some scholars feel that much must have been done during his stay on the island of Lesbos, in his middle years; others argue that the practical investigation was done late in life, after he had laid the theoretical foundations of his philosophy.) Aristotle himself would have us approach his work on animals as an example of his scientific method in action and in this briefest of summaries it is convenient to follow, albeit cautiously, Aristotle’s own plan.

In the treatises which make up the so-called *Organon* (in particular, the *Posterior Analytics*), Aristotle set out the goals of scientific inquiry. He stressed the importance of firm, logically tested scientific knowledge, and elaborated the deductive apparatus for its achievement. In practice, Aristotle’s method meant that he could begin an investigation into animals, for example, by collecting the relevant material—observations, information from others, along with the results of a preliminary assessment of these data, all of which go to make up what he calls the ‘phenomena’, together with the opinions of earlier authorities. Not all the phenomena are the result of autopsy—Aristotle himself acknowledges debts to all kinds of people, and *Pliny the Elder noted that with the help of *Alexander the Great, Aristotle was able to order thousands of fowlers, fishermen, beekeepers, hunters, and herdsmen to inform him about every creature they encountered (*HN* 8. 44). None the less, Aristotle’s commitment to personal, autoptic research, often through dissection, must not be forgotten.

The results of the first step in Aristotle’s zoological investigation are set out in the *Historia animalium* (‘Researches into Animals’). The range covered is extraordinary—the lives, breeding habits, and structure of some 540 different genera. Modern students of the Life Sciences tend to highlight certain areas of practical

research in which Aristotle was ultimately deemed by modern standards to have been particularly successful. The following (traditional) list is far from complete. (a) Investigations of the developing chick, the classic embryological subject ever since. (b) Detailed descriptions of the habits and development of octopuses and squids. (c) Anatomical accounts of the four-chambered stomach of ruminants, of the complex relations of the ducts, vessels, and organs in the mammalian generative system, and of the mammalian character of porpoises, dolphins, and whales, all unsurpassed until the 17th cent. (d) Accounts of exceptional modes of development of fish, among them a dog-fish (*Mustelus laevis*), the young of which is linked to the womb by a navel cord and placenta much as in a mammal. The accuracy of Aristotle's observations was only confirmed a century ago.

Such a huge amount of raw material needed to be organized in some provisional way; listing the 'differences' between animals, Aristotle arranged his evidence in the *Historia animalium* under preliminary headings. He drew a broad distinction, for example, between bloodless and blooded creatures. Bloodless animals (of which he enumerates around 120 altogether) are of four main types, usually rendered in the following way: cephalopods (*malakia*), crustacea (*malakostraka*), testacea (*ostrakoderma*), and insects (*entoma*). Blooded animals include man, viviparous quadrupeds and cetacea, oviparous quadrupeds and animals without feet, birds, and fish. This is seen in itself as an exercise in taxonomy by many modern scholars, but while taxonomy is certainly implicit throughout the work, Aristotle himself seems quite clear about his own goals. At *Hist. an.* 1. 1–6, he offers a list of very broad genera into which animals can be placed, but does not explain the list, remarking at 1. 6 that his talk of animal genera at this stage in the inquiry is a 'kind of sample of the range of subjects and attributes which we will need to think about. We will go into these problems in detail later on.'

In the *De partibus animalium* ('On the Parts of Animals') problems of division are addressed in detail, as are other theoretical questions about the relative importance of the various causal factors which all need to be understood if an animal's existence is to be properly explained. In general, Aristotle advocates investigating the attributes common to a group of animals, then explaining their existence ultimately in terms of their purpose (the Final Cause). He also includes accounts of the matter from which they come (the Material Cause), the process which led to their generation (the Efficient Cause), and their shape (the Formal Cause). The parts of animals are divided into those whose division yields a part which can be called by the same name as the whole—flesh, hair,

bone, blood, marrow, milk, cartilage, etc.—sometimes called *homoiomeria* or 'uniform' parts (dealt with especially at *Hist. an.* 3. 2–17, and *Part. an.* 2. 1–9), and those whose division yields something with a different name—hands for instance, whose parts cannot be called 'hands', faces, skeletal structures, the internal organs, and so on. These are the *anhomoiomeria* or 'non-uniform' parts, and they are chiefly described and their functions discussed at *Hist. an.* 1. 7–14, 2. 8–12, 3. 1–11, and *Part. an.* 2–4. Concentrating attention exclusively on these characteristics as a prelude to explanation is not enough, and Aristotle criticizes certain of his predecessors for privileging the matter of an animal, and the material aspects of its generation, over its *raison d'être*. Empedocles, for example, is criticized for explaining the articulation of the spine in man by arguing that the foetus is twisted in the womb. Aristotle on the other hand argued that the vertebrae exist because they existed in the father, because they allow movement, and because without them the offspring could not become a man. Aristotelian explanation in zoology is dominated by questions of purpose and function.

Aristotle's licence to study the biological world was bought partially by insisting that the kind of reality which Plato would only allow his perfect Forms exists in the forms of things around us. While the Creator of Plato's physical world strives to copy the Forms with varying degrees of success, Aristotle argued that the good of a particular animal, or part of an animal, is explicable in terms of that animal's contribution to its own survival, or the survival of its species. This does not lead to inflexibility; some things may be necessarily so without any obvious purpose—the colour of one's eyes, the existence of breasts in men, and so on—but Aristotelian teleological explanation can deal even with them as instances of natural necessity. (The discussion of so-called 'inessential characteristics' occupies much of *De generatione animalium* 5).

At the beginning of book two of the *Parts of Animals*, then, Aristotle is able to say, 'I have set forth the parts out of which each of the animals is composed, and their number, in the *Researches into Animals*. Now I must examine the causes by which each animal has the nature it does, leaving aside what was said in the *Researches*.' In the following three books, Aristotle proceeds to develop his classification, and in particular his ideas about how different groups and subgroups can be practically distinguished. The language Aristotle uses to describe these different groups and types varies somewhat. Terms like *genos* ('kind') and *eidōs* (often translated 'species') are to some extent context-relative, even if the Aristotelian species are themselves fixed and unchanging.

Problems related to the origins and means of animal locomotion are investigated in the *De motu animalium* ('On the Movement of Animals') and the *De incessu animalium* ('On the Progression of Animals'). But how does the soul move the body? What is the ultimate source of movement? Aristotle elaborates his ideas about the 'unmoved mover' in many different contexts, but the specific problems raised here lead into the detailed investigation presented in the *De anima* ('On the Soul'). Physiological and psychological problems—the nature of respiration, life and death, dreams, perception, etc.—are investigated in the nine short treatises which make up the *Parva naturalia*.

The temptation to portray Aristotle as a proto-Linnaeus, held back only by his speculative understanding of physiological processes, has proved a very strong one. Others are so keen to resist this temptation that they seek quite different motivations behind the zoology. They argue that Aristotle's central concern in gathering all the biological data is to test practically the theoretical and logical devices he developed in the *Organon*. It seems more reasonable to tread a middle path, which allows a proper appreciation of the striking amount of highly detailed, empirical research of great quality which is preserved in the Aristotelian zoological treatises, whilst also keeping in mind the role of Aristotle's conception of science and scientific method in guiding his eyes.

III

Zoological research of the type pursued by Aristotle seems subsequently to have been pursued with little commitment, although there is evidence to suggest that Diocles of Carystus performed animal dissections. Where botanical research (see BOTANY) often yielded important benefits in areas such as pharmacy, the pure study of animals attracted remarkably few students, and later, non-ethical, work on animals tends either to be practical—for example, in the form of anatomical studies for doctors who were fundamentally concerned with humans but unable to dissect them freely—or related to sport. There survive a number of prose and verse works on hunting, shooting, and *fishing in the style of *Xenophon's *Cynegetica*, or the hexameter poetry of Oppian. There also survives a considerable corpus of veterinary writings in both Greek and Latin.

Pliny's *Natural History* contains the most extensive collection of zoological and botanical material after Aristotle and Theophrastus. In fact, much of it comes ultimately from Aristotle and Theophrastus, although the material is not organized according to the same kinds of principles. Pliny begins his (often anecdotal) account of animals with those that live on land (book 8). First comes

the elephant, a creature which possesses a variety of human characteristics, or qualities that closely resemble them, including language, memory, sense of honour, and piety. Pliny evinces a romantic sympathy for many creatures; he relates the story of a literate elephant who was able to trace in Greek on the sand 'I, the elephant, wrote this' (8. 6). Creatures in the sea form the subject of book 9; birds and insects are dealt with in book 11, which ends with an enumeration of creatures notable for their small size. Animals, for Pliny, have their own worlds, their own societies, their own discoveries, which they make by accident, lacking the *ratio*—power of reasoning—necessary to solve their problems by deliberation. It might reasonably be said that this was the animal world which antiquity handed on to the Middle Ages. JTV

anthologies, Latin Modern usage distinguishes the anthology, consisting of self-contained or detached texts from a specific corpus with little or no intervention by the compiler, from the miscellany, in which an author flits from subject to subject, using other writers to make points, and the epitome, an abridgement of a single work, or works on the same subject, privileging content over style. In antiquity, however, both terminology and concepts are fluid: a great variety of names for works of mixed subject-matter is attested by Aulus *Gellius, *NA* praef. 6–9, though not all these works would nowadays count as either miscellanies or anthologies.

The metaphor of picking flowers from a meadow is widespread, giving rise to the titles *Leimōn* and *Pratum*, used respectively by *Cicero (as *Limon*) and *Suetonius for miscellanies, and *Florida*, used by Apuleius for an anthology of the best passages from his speeches. Republican writers from *Ennius on called their miscellaneous writings *saturae* (see SATIRE); Horace's friend Iulius Florus compiled an anthology of these pieces under the same title, possibly adding some of his own. The Greek loanword *epitome* was used, likewise Latin *breviarium* (not *abbreviatio* till the Middle Ages), but the boundary between anthology and epitome is porous: Justin presents his *Epitome* of Pompeius Trogus as a 'small body of flowers' (*breve... florum corpusculum*), and neither leaves his excerpts untouched nor rewrites them wholesale.

Some anthologies began as private collections that might be used in education or shared with friends: Cicero asked *Atticus for whatever he had on the nymph Amalthea, to whom he had built a shrine, and promised to send him 'something from my own writings' once it was ready (*Att.* 1. 16. 18); Calvus sent *Catullus (poem 14) selections from bad poets as a booby-present for Saturnalia; Marcus *Aurelius asked Fronto for excerpts from *Lucretius or Ennius (*M. Ant. Imp.* 4. 1. 3). The extant

collection of speeches and letters from Sallust's *Histories* may be classed as an anthology. There is evidence that *Propertius was anthologized; whether Gellius in *NA* 19.7 was using an anthology of early Latin epigrams is uncertain. A collection of recent poems known as the *Epigrammata Bobiensia* survives (with some later accretions) from the 5th cent. AD.

Collections of authors' *sententiae* were popular: Phaedrus (3. epil. 33–5) has such a line from Ennius imprinted on his memory from childhood. Those from (or attributed to) Publilius Syrus have survived as a Latin counterpart to the Menandrian *Monosticha*.

The anthology was adapted to Christian use in Cyprian's collection of scriptural texts entitled *Testimonia*; in the 5th cent., two anthologies were made of *Augustine's works. In the Middle Ages, the florilegium (a Latin translation of 'anthology') is a well-represented form: it may draw on classical and Christian literature at large, only a few authors, or even a single one; extracts may be verbatim quotations of independent textual value, or brief snippets wrenched out of context and distorted in both wording and sense. Like modern dictionaries of quotations, anthologies might be arranged either by source or by subject.

The so-called *Anthologia Latina* is a modern creation with a modern name sporadically used by editors of poetic selections, but bestowed by Alexander Riese on his edition (continued by other hands, 1869–1926) of all minor Latin poems from manuscripts (mostly themselves anthologies) and inscriptions; it is nowadays confined to the manuscript pieces, many of them late antique (especially from Vandal Africa) but including poems by classical authors and Renaissance forgeries. LAH-S

anthropology It is probably misleading, though not entirely inappropriate, to use this word to describe the ancient study of man and society. Misleading, because anthropology did not really exist as the kind of discrete discipline it is today. What follows here is a very brief summary of some central anthropological themes from antiquity, gathered from a variety of sources and contexts, ethical, scientific, and literary.

The Greeks and Romans developed a range of ideas about their own identity and the identity of others; about the nature of human societies, their history, and organization. It is well known that many Greeks designated non-Greek speakers '*barbarian',—after the Greek verb for 'babble'—and language of course remained an important index of racial and cultural difference. (*Herodotus' *History* introduced many Greeks to foreigners and their customs for the first time: Hdt. 4. 183 notes that the Egyptian Troglodytae 'squeak like bats'; elsewhere,

e.g. Aesch. *Ag.* 1050, Hdt. 2. 57, Theoc. *Id.* 15. 87 ff., etc., strange tongues are likened to the language of birds.) Language served equally to differentiate Greek-speaking groups—the various Greek dialects had their own distinctive written as well as spoken forms. But thought was also given by poets, philosophers, doctors, and others to defining what it is to be human (an *anthrōpos*), what separates mankind from animals and gods, men from women, men and women from children, and so on. Amongst many possible examples, one might mention the use of animal similes and metaphors in the Homeric epics (see HOMER) as aids to understanding human behaviour, Semonides' misogynistic poem attributing various animal characteristics to different kinds of women (see ANIMALS, KNOWLEDGE ABOUT), the Hesiodic *Works and Days* (see HESIOD) where man is distinguished from brute beasts through his possession of justice, and medical works concerned with issues such as the physiological difference between male and female, and the validity of using the study of animal physiology and anatomy to illuminate the human body (see ANATOMY AND PHYSIOLOGY; MEDICINE). To develop only the last point, many medical theories were formulated against a background of the assumed inferiority of the female sex. The natural world of *Aristotle—to take just one example—has man as opposed both to woman and mankind firmly placed in the centre; several hundred years later, the Methodist physician Soranus in his *Gynaecology* was still investigating the implications for the study of pathology of his belief that there are diseases specific to *women (see GYNAECOLOGY).

Moreover, there was widespread and sustained interest throughout Graeco-Roman antiquity in explaining the progress and evolution of human—not just Greek—civilization, language, culture, and behaviour. Modern scholars have tended to condense the variety of ancient models of human history into two broad lines of argument. One line is represented most clearly by the Homeric and Hesiodic poems, and argues nostalgically that human society declined from an ancient 'golden age' through other ages of increasing metallic baseness to the present. The 'golden age' type of model is especially common in poetry (both Latin and Greek) from *Pindar to *Juvenal and beyond. The other type of argument has it that civilization gradually progressed through the discovery of technological, political, and linguistic benefits. A fragment of the Presocratic philosopher Xenophanes offers a convenient illustration of this type of position: 'The Gods did not show everything to mortals from the beginning, but through investigation mortals have discovered over time what is better' (DK 21 B 18). On this view, man has some control over his progress.

Two distinct threads have in turn been discerned in this developmental model of human society. One, which has something in common with an influential strain of ancient empiricism, is represented ultimately by *Lucretius (especially book 5 of *On the Nature of the Universe*), *Diodorus Siculus, *Vitruvius, and parts of *Pliny the Elder, *Natural History* 7, and its origins are thought by many to lie with Democritus of Abdera. This group tends to the view that accidental discoveries like that of fire, the use of metals, links between diet and health, and so on provided the impetus for most major changes in society. On the second thread, the teleological view is taken that mankind's weakness in the face of a hostile world led to the development of essential means of protection. This 'challenge and response' model is associated with Protagoras (in Plato's dialogue of that name), with *Plato himself (who mapped out the ideal way forward in the *Republic*), *Aristotle, and to some extent the Stoic Posidonius of Apamea.

Behind this apparently straightforward dichotomous summary there lies much that is not at all straightforward. For a start, there was no single, orthodox 'Myth of the Golden Age' in which life for mankind becomes progressively worse with time. (Note, for example, the highly elaborate myth of ages set before the young Socrates at Pl. *Plt.* 269c–d.) Baser metallic ages, even in Hesiod, still have their good points, and Hesiod's golden age is apparently devoid of normal humans altogether—only godlike creatures remote and free from toil and grief (*Op.* 110–20). And the Roman encyclopaedist Aulus Cornelius Celsus held (*On Medicine* 1, proem 1) that in the distant past medicine was only necessary for the treatment of wounds and other injuries because men lived virtuous and moderate lives. Yet the development of medicine, he suggests, has gone a long way towards counteracting the effects of the decline in moral standards.

Generalization, then, is difficult. Certain philosophical models which allow that human society is capable of improvement often insist that this improvement is dependent on men embracing the appropriate philosophical way of life. (This is as true of Epicureans (see EPICURUS) like Lucretius as it is of Plato.) Moreover, it should be added that even those who saw social institutions and the arts constantly progressing had no place for progress on the part of nature herself—say, by suggesting that animal species too might be in a state of constant development. On the contrary, philosophers and natural scientists from Anaximander to *Aristotle and beyond seem to have held that the successful adaptation of animals to their environment was simply the result of one-off changes in their form. See RACE. JTV

Antigonus Gonatas (c.320–239 BC), king of Macedonia (c.277/6–239 BC), son of Demetrius Poliorcetes ('the Besieger') and Phila. (The meaning of his nickname 'Gonatas' is unknown.) He served under his father in Greece in 292, commanded his possessions there from 287, and took the royal title on Demetrius' death in 282, though he failed to gain Macedonia until 277/6. Before then his military ability won widespread recognition, not only in Macedonia, through a major victory near Lysimacheia in 277 over Celts who had overrun Macedonia and Thrace. Cassandrea still resisted him for ten months but his dynastic alliance with Antiochus I, whose sister Phila he married, ended Seleucid competition. Pyrrhus occupied western Macedonia and Thessaly in 274 but his death in 272 removed this threat. In Greece Demetrius' old naval bases—Piraeus, Chalcis, Corinth, and Demetrias—guaranteed Antigonus' influence, and although an alliance led by Athens and Sparta and supported by *Ptolemy II Philadelphus tried to eject the Macedonians (in the 'Chremonidean War' of c.267–261), Athens finally had to capitulate. Subsequently Antigonus, in alliance with Antiochus II, took the offensive in Ptolemy's preserve, the SE Aegean—a naval victory near Cos (perhaps 254) caused a modest spread of Macedonian influence which was reinforced by Antigonus' son Demetrius marrying Antiochus II's sister Stratonice. In Greece Antigonus became notorious for controlling cities by supporting tyrants, a practice which saved garrison troops but provoked serious local opposition, especially in the Peloponnese, where the Achaean Confederacy exploited dissatisfaction to extend its influence, even taking Corinth in 243. Nevertheless Demetrias, Chalcis, and the Piraeus remained Macedonian. In Macedonia Antigonus seems to have aimed at restoring the court tradition of *Philip II. In particular his own intellectual interests, fostered in his youth in southern Greece, led to frequent visits to Pella by historians, poets, and philosophers. The larger cities of the kingdom—at least Amphipolis, Pella, Cassandrea, and Thessalonica—encouraged by the stable conditions, acquired some limited rights of self-government, which were widely recognized before Antigonus' death. Antigonus also helped establish his dynasty by regulating the succession. His son Demetrius played a major part, from the 260s onwards, both in military and civil capacities; some historians even think he used the royal title in Antigonus' last years. Antigonus' long period of rule—37 years—and cautious policies provided a desperately needed consolidation for Macedonia. Characteristic for his later reputation is his reported comment, even if not authentic, that kingship is honourable servitude. RME

Antigonus the One-eyed (Monophthalmos) (c.382–301 BC), Macedonian noble, was prominent under *Philip II and governed Greater Phrygia for *Alexander the Great (334–323). Victorious in three battles over Persian refugees from Issus (332), he remained unchallenged in his satrapy until he fell foul of the regent Perdiccas whom he denounced to Antipater in Macedon (322), unleashing the First Coalition War. For his services he was given command of the campaign against Eumenes of Cardia and the remnants of the Perdiccan factions. In 319 he defeated both groups spectacularly, and Antipater's death, on the heels of his victories, encouraged him in his supremacist ambitions. He supported Cassander against the regent Polyperchon, and took the war against Eumenes (Polyperchon's appointee as royal general) into central Asia. The victory at Gabiene (316) gave him control of territory from the Hindu Kush to the Aegean, but his success brought immediate war with his erstwhile allies: Cassander, *Lysimachus and *Ptolemy I (315). The 'Peace of the Dynasts' (summer 311) briefly ratified the status quo, but it was a dead letter from the first. *Seleucus I invaded Babylon in 311 with Ptolemy's support, provoking full-scale war, and Ptolemy resumed hostilities in 310. Antigonus directed his attention to the Greek world, broadcasting his predilection for freedom and autonomy, and ultimately reactivated the Corinthian League of Philip II as a weapon against Cassander (303/2). Athens welcomed him and his son, Demetrius Poliorcetes, with open arms and exaggerated honours (307), and in the following year the two had themselves proclaimed kings (*basileis*). But the achievements belied the propaganda. The invasion of Egypt (306) was abortive, as was Demetrius' year-long siege of *Rhodes (305/4). Finally the coalition of 315 was reformed. At Ipsus (in Phrygia) the combined Antigonid forces were defeated decisively and Antigonus died in battle. His ambitions had been too patent, his resources inadequate to contain the reaction they provoked.

ABB

Antioch (see ◀Map 2, Cc▶), in *Syria, one of the Seleucid royal capitals, on the left bank of the Orontes, some 24 km. (15 mi.) from the sea, was founded in 300 BC by *Seleucus I, in a favourable position between his Anatolian and eastern possessions, on the edge of a large and fertile plain. Seleuceia, at the mouth of the Orontes, became its harbour. The king transferred thither the 5,300 Athenian and Macedonian settlers whom *Antigonus the One-eyed had planted at Antigoneia nearby in 307. His successors enlarged the city. Nothing of Seleucid Antioch survives. It was laid out on a grid plan (see URBANISM) and contained a large Aramaic-speaking, as well as a Jewish, community, whose privileges were said to go

back to Seleucus I. After an interlude of Armenian rule (83–66 BC) it was annexed by *Pompey (64 BC) and became the capital of the province of Syria; it was made an autonomous city by Caesar (47 BC). Having sided with Pescennius Niger, it was in AD 194 degraded by *Septimius Severus, but in 201 restored to its former rank, to which *Caracalla added the title of colony. Antioch administered an extensive territory. With a population of around 250,000, it was the third city of the east, after *Alexandria and Seleuceia on the Tigris, and later Constantinople (see BYZANTIUM). Its wealth was derived above all from its being a centre of civil, military, and later ecclesiastical administration of much of the near east, but also from its position on the commercial road from Asia to the Mediterranean, and the production of wine and olive oil. Rivalry of the patriarchates of Antioch and of Alexandria and the conflicting theologies of the two sees contributed to the Christological controversies, which after the council of Ephesus (431) and Chalcedon (451) resulted in the establishment of separate Nestorian and Monophysite churches, and greatly reduced the influence of the patriarchs of Antioch. In the 6th cent. Antioch was weakened by earthquakes and plague. It was sacked by the Persians (540), and occupied by them 611–28. Deprived of its administrative role after being captured by the Arabs (641), Antioch survived, a smaller but still major city. For Antioch's personification in art, see LIMC 1/1 (1981), 840–51. AHMJ/HS/WL/SS-W/ATLK

Antiochus III (Antiochus the Great) (c.242–187 BC), second son of Seleucus II, king of the *Seleucid empire (222–187). After the assassination of his elder brother, Seleucus III, who was childless, he was called from Babylon to *Antioch to be king. From the outset he faced many problems within the empire: in the east, a rebellion in Media led by the satrap Molon (222), with the support of the satrap of Persis, Alexander (brother of Molon); Molon invaded Babylonia, seized the royal capital, Seleuceia on Tigris, and took the title 'king'. In the west, Achaeus, viceroy of Seleucid Asia Minor, was in revolt and in control of the royal capital of Sardis. The Ptolemies still retained control of Seleuceia-Pieria in north Syria.

Within the next 25 years, Antiochus put down the revolt of Molon (220) (Polyb. 5. 51–4), regained Seleuceia-Pieria in the 'Fourth Syrian War' (219–217), but was defeated by Ptolemy IV at Raphia (217). He re-established control over Sardis (213), and in 212 began his *anabasis* (march up-country) to the 'Upper Satrapies', bringing Commagene and Armenia under direct Seleucid rule; he restored Seleucid suzerainty over *Parthia and *Bactria (210–206), renewed links with the *India of the Mauryas (Polyb. 11. 39. 11–12) and, on his return, mounted a naval

expedition to the Persian Gulf, where the Seleucids controlled the island of *Icaros, and waged a campaign against Gerrha, but in the end agreed a treaty that allowed the former status of the Gerrhaeans as independent to continue (Polyb 13. 9. 4–5). In 205 he took part in the New Year Festival at Babylon (Sachs–Hunger no. -204C: r. 14 ff.). It was as a result of these campaigns that Antiochus was given the epithet *meγas* (Great). In the ‘Fifth Syrian War’ (202–195) Antiochus finally established lasting Seleucid control over southern Syria, Phoenicia, and Judaea. He granted a charter to Jerusalem including the right to keep its own laws (Joseph. *AJ* 12. 138–44). Then (198) Antiochus launched an onslaught against Ptolemaic possessions in Lycia and Caria, which he took over (new inscriptions attest to the disruption and turmoil that this caused to the local populations). He moved thence to Thrace (197/6), where he refounded Lysimachea (Livy, 33. 38; App. *Syr.* 1). The campaign into Thrace, always (since Seleucus I) claimed as Seleucid, brought Antiochus up against the imperialistic Roman republic. In the protracted diplomatic exchange of 196–193, he and the senate were at cross purposes, and finally he invaded Greece. He was defeated by the Romans in two land battles, at Thermopylae in Greece (191) and at Magnesia in Asia Minor (190). He also lost a naval campaign to them.

By the peace of Apamea (188), Antiochus ceded Seleucid satrapies in Anatolia, north of the Taurus to *Pergamum and *Rhodes (Polyb. 21. 46. 9 f; Livy 38. 39. 14 ff.). He still ruled a huge realm, from southern Turkey, through Syria and Palestine to Babylonia, Iran, and central Asia. After his defeat by Rome, Antiochus went to Babylon, where he took part in rituals in temples and was shown (took?) the robes of Nebuchadnezzar (Feb. 187; Sachs–Hunger no. -187A r. 4’–18’), thus emphasizing that he was still ruler of Asia. On campaign to the ‘Upper Satrapies,’ he pillaged the temple of Bel/Zeus in Elymais, and was killed.

Antiochus was married (222) to Laodice, daughter of Mithradates II of Pontus, who bore him four sons, of whom Seleucus IV and Antiochus IV ruled as kings.

His reign was marked by continuous military campaigns to reconsolidate the Seleucid empire. He was also the first Seleucid to have organized, on a satrapal basis, a state *ruler-cult for the king, the *progonoi* (his ancestors) and, by 193, his queen, Laodice. GTG/SS-W/RJvds

Antiphon, of the deme (local district; see DEMOCRACY, ATHENIAN) of Rhamnus (c.480–411 BC), the first Attic orator whose works were preserved. From a prominent family, he participated in the intellectual movement inspired by the *sophists, taking a particular interest in law and rhetoric; he reportedly taught *Thucydides, among

others. Many (though not all) scholars are now inclined to identify him with Antiphon ‘the Sophist’ (Xen. *Mem.* 1. 6), fragments of whose work *Truth* are concerned with the nature of justice and the relationship between *nomos* (‘law, convention’) and *phusis* (‘nature’).

Thucydides (8. 68) praises Antiphon highly for integrity (*aretē*), intelligence, and power of expression, adding that he stayed in the background himself but made his reputation giving advice to others. He credits Antiphon with planning the oligarchic coup that overturned the democratic constitution of Athens for a few months in 411 BC (for this, the regime of the ‘Four Hundred,’ see ATHENS (HISTORY)). When democracy was restored, most leaders of the coup fled, but Antiphon and Archepolemus remained to stand trial for treason; both were convicted and executed. Antiphon’s speech in his own defence, a small papyrus fragment of which survives, was the finest speech Thucydides knew. When congratulated by Agathon on its brilliance, Antiphon replied that he would rather have satisfied one man of good taste than any number of common people (Arist. *Eud.* 1232^b 7).

Antiphon was apparently the first to compose speeches for other litigants and thus the first to write them down. His clients included well-known political figures and foreign allies of Athens. We have six complete works: three courtroom speeches and three *Tetralogies*. All concern homicide cases, though the fragmentary speeches treat many other issues. The courtroom speeches and the datable fragments come from the last two decades of Antiphon’s life (430–411). In *Against the Stepmother* (1) a young man accuses his stepmother of having employed a servant-woman to poison his father. He may have brought the case from a sense of duty, for he offers a vivid narrative but little evidence. In *The Murder of Herodes* (5) a Mytilenean is accused of murdering Herodes during a sea voyage: Herodes went ashore one stormy night and never returned. He defends his innocence by appeal both to facts and to probabilities (*eikota*), and accuses his opponent of trumping up the charge for political reasons and personal gain. In *On the Chorus Boy* (6) a *chorēgos* (‘chorus-leader,’ i.e. a man who trained and paid for a festival chorus; see TRAGEDY, GREEK §1.4) is accused of the accidental death of a boy who was given a drug to improve his voice. The *chorēgos* argues that he was not even present at the time and that the prosecution is politically motivated.

The *Tetralogies* are probably Antiphon’s earliest works. Their authenticity is disputed, but their arguments concerning probability, causation, and similar issues fit the period and Antiphon’s interests. Using the sophistic method of contrasting arguments (cf. Protagoras’ *Antilogiae*) and displaying a self-conscious virtuosity, the

Tetralogies illustrate methods of argument that could be applied to a wide variety of cases. Each consists of four speeches for hypothetical cases, two on each side. In the *First Tetralogy* (2) a man is murdered and circumstantial evidence points to the accused, who argues that others are more likely (*eikos*) to be the killers. In the *Second Tetralogy* (3) a boy is accidentally killed by a javelin; the defence argues that the boy himself, not the thrower, is guilty of unintentional homicide because he was the cause of his own death by running into the javelin. In the *Third Tetralogy* (4) a man dies after a fight and the accused argues that the victim is to blame because he started it.

Antiphon stands at the beginning of the tradition of literary Attic prose. He is an innovator and experimenter; he is fond of antithesis (in both word and thought), poetic vocabulary, the use of participles, and occasionally extreme asyndeton. In comparison to successors like *Lysias, Antiphon lacks grace of expression, clarity of organization, and the vivid presentation of character, but the force and variety of his arguments may account for his success.

MDG

anti-Semitism (pagan) Modern accounts of hostility to Jews in classical antiquity have often been complicated by a concern to relate pagan anti-Semitism to the anti-Judaism of some early Christians and to the history of anti-Semitism in more recent times. A literary tradition hostile to Jews and Judaism can be traced back to Greek writers in Egypt from the 3rd cent. BC. The social, cultural and political background to anti-Jewish invective cannot always be discerned, but it has been plausibly argued that propaganda aimed at Jews after the attack on the Jerusalem Temple by Antiochus IV Epiphanes and after the destruction of the Temple by Titus in AD 70 will have had a major impact: in the early 2nd cent. AD, Tacitus wrote of the Jews that they 'regard as profane all that we hold sacred; on the other hand, they permit all that we abhor' (*Hist.* 5.4.1). Hostility seems to have been directed to Jewish customs rather than race, so that apostate Jews were not generally taunted with their origins, but the causes of hostility are debated. Some have argued that Jews were disliked just because they were different, but other scholars have focused on local tensions, such as Jewish-Greek conflict in Alexandria in the 1st cent. AD (over Jewish aspirations to Alexandrian citizenship and Greek resentment of Roman protection of the Jews) and the periodic expulsions of Jews from Rome in the same period. The apparent significance of ancient anti-Semitism, compared to hostility to other minority groups, may be exaggerated by the preservation of unusual amounts of material

about Jews in the later Jewish and Christian traditions, and by the emphasis laid on the campaign in Judaea by the Flavian regime, which used celebration of the destruction of Jerusalem in 70 to disguise their seizure of power in the civil war of 68–69.

MDG

Antoninus Pius, Roman emperor AD 138–61, born at Lanuvium in Latium in 86, was the son of Titus Aurelius Fulvus (consul 89) and grandson of another Aurelius Fulvus (consul 70 and 85), from Nîmes (Nemausus). His mother Arria Fadilla was daughter of Arrius Antoninus (consul 69 and 97), whose names he bore as well as Boionius from his maternal grandmother: Titus Aurelius Fulvus Boionius Arrius Antoninus. He married Annia Galeria Faustina, and became consul in 120. Apart from the traditional magistracies, his only posts were those of imperial legate in Italy (an innovation of *Hadrian), in his case in Etruria and Umbria, where he owned land, and proconsul of Asia (135–6).

His links with the Annii Veri, combined with his wealth, popularity, and character, led *Hadrian to choose him as adoptive son and successor on the death of Lucius Aelius Caesar. Given *imperium and the *tribunicia potestas* (powers of a *tribune of the plebs) on 25 February 138, he became Emperor Titus Aelius Aurelius Antoninus Caesar and at Hadrian's wish adopted both the young son of Lucius Aelius (the future Lucius Verus) and his nephew by marriage Marcus Annii Verus (Marcus *Aurelius). His accession at Hadrian's death, 10 July 138, was warmly welcomed by the senate, which overcame its reluctance to deify Hadrian at Antoninus' insistence and named him Pius in acknowledgment of his loyalty. His wife Faustina was named Augusta and his only surviving child, also Annia Galeria Faustina, was betrothed to Marcus Aurelius Caesar, his nephew and elder adoptive son. Pius became consul for a second term and Pater Patriae in 139, consul for a third term in 140 with Marcus Aurelius as colleague, and held one further consulship, in 145, again with Marcus Aurelius, whose marriage to the younger Faustina took place the same year. On the birth of a child to this couple in late 147, Marcus Aurelius received *tribunicia potestas* and Faustina (whose mother had died in 140) became Augusta. The dynastic succession thus clearly established—but, despite Hadrian's intention, the younger adoptive son received neither any powers nor the name Caesar—Antoninus' longevity and steady hand made 'Antonine' a byword for peace and prosperity. This impression is largely influenced by Publius Aelius Aristides' *To Rome*, delivered in 143 or 144, by the portrayal of the tranquil life of the imperial family, entirely confined to Italy, in Fronto's *Letters*, by the

Antoninus Pius A slab from a monumental altar at *Ephesus (shortly after AD 169) shows members of the imperial family—Marcus *Aurelius, Antoninus Pius, the boy Lucius Verus, and *Hadrian—at the *adoption of Verus in AD 138. Adoption ensured unprecedented stability in the imperial succession for much of the 2nd cent. AD. Kunsthistorisches Museum, Vienna

impressive tribute to Antoninus in Marcus Aurelius' *Meditations*, and by the uniformly favourable attitude of the scanty historical sources.

Hadrian's policies were rapidly changed in some areas: the consular legates for Italy, unpopular with the senate, were abolished, and southern Scotland reconquered by the governor Qunitus Lollius Urbicus, Hadrian's Wall being replaced by the 'wall of Antoninus' between Forth and Clyde. This campaign, for which Antoninus took the acclamation 'Imperator' for the second time in late 142, was the only major war, but Moorish incursions in North Africa were dealt with by sending reinforcements to Mauretania in the 140s, minor campaigns kept the peace in Dacia, a show of force at the beginning of the reign deterred a Parthian invasion, and in the late 150s a minor extension of territory in Upper Germany was marked by the construction of a new 'outer' *limes (frontier). Direction of military policy (and much else) was doubtless left to the guard prefect Marcus Gavius Maximus, who held

office for almost the entire reign. The statement in the SHA (*Ant.* 5. 3) that he kept 'good governors in office for seven or even nine years' seems to be mistaken; the senatorial *cursum honorum* (career path)—and other parts of the imperial system—settled down in a stable pattern, contributing to the emperor's popularity with the upper order. Two conspiracies against him are mentioned in the SHA (*Ant.* 7. 3–4), the second, that of Cornelius Priscianus, 'who disturbed the peace of the province of Spain' being thus referred to in the *fasti Ostienses* for 145, but no further details are known. A highlight of the reign was the celebration of Rome's 900th anniversary in 148, when Antoninus' otherwise thrifty financial policy was relaxed (by a temporary debasement of the silver coinage). He cut down on excess expenditure, although relieving cities affected by natural disasters, and left a surplus of 675 million denarii at his death. In spite of his conservatism and sceptical attitude towards Greek culture, Greeks advanced to the highest positions in his reign (Tiberius Claudius Atticus Herodes, consul 143, being the best-known case); other provincials also rose, not least from Africa, helped by the prominence of Fronto, a native of Cirta. The long, peaceful reign allowed the empire a breathing-space after Trajan's wars and Hadrian's restless travels. Antoninus' last watchword for the guard, 'equanimity', sums up his policy well; but he was angry with 'foreign kings' in his last hours and clouds were looming. He died at Lorium near Rome on 7 March 161 and was deified 'by universal consent'. ARBI

Antony, Mark (Marcus Antonius), Roman statesman and general.

1. The truth of his career and personality has been heavily overlaid by legend, as first hostile propaganda presented him as a villain; then romantic biography turned him into a figure of tragic self-destruction.

2. Eldest son of Marcus Antonius (Creticus), he was born in 83 (or, less likely, 86) BC. His youth was allegedly dissipated. He distinguished himself as cavalry commander under Aulus Gabinius in Palestine and Egypt (57–4), then joined *Caesar in Gaul, where, apart from an interval in Rome (53–2), he remained till the end of 50; in 51 he was quaestor. As tribune in 49 he defended Caesar's interests in the senate, fled to his camp when the 'last decree' (i.e. emergency decree) (*senatus consultum ultimum*) was passed, took part in the fighting in Italy, and was left in charge of Italy during Caesar's Spanish campaign. In 48 he served in Greece and commanded Caesar's left wing at Pharsalus. Caesar then sent him to impose order on Italy as his 'master of the horse' (*magister equitum*) (till late in 47), but he was only partly successful, and he held no further post till 44 when he was Caesar's consular colleague. On 15 February 44 he played

a prominent role in the incident of the Lupercalia, offering a diadem which Caesar refused.

3. After the Ides of March he at first played a delicate game, combining conciliation of the Liberators with intermittent displays of his popular and military support. He acquired and exercised a strong personal dominance, but this was soon threatened by the emergence of Octavian (the future *Augustus), and the two locked in competition for the Caesarian leadership. Octavian deftly acquired support and allies, and by early 43 Antony faced an armed coalition consisting of Decimus Iunius Brutus Albinus, whom he was blockading in Mutina, the consuls Aulus Hirtius and Gaius Vibius Pansa Caetronianus, both moderate Caesarians, and Octavian, backed by the senate's authority and Cicero's eloquence. In April he was compelled by reverses at Forum Gallorum and Mutina to retreat into Gallia Narbonensis. He was however joined there by the governors of the western provinces, Marcus Aemilius *Lepidus, Gaius Asinius Pollio, and Lucius Munatius Plancus, and subsequently reconciled with Octavian.

4. By the *lex Titia* (November 43) Antony, Lepidus, and Octavian were appointed 'triumvirs for the restoration of the state' for five years. The *proscription of their enemies (especially the wealthy) was followed in 42 by the defeat of Cassius and *Brutus at Philippi, which firmly established Antony's reputation as a general. By agreement with Octavian he now undertook the reorganization of the eastern half of the empire; he also received Gaul, strategically vital if there were to be any renewal of fighting in the west. In 41 he met *Cleopatra at Tarsus and spent the following winter with her in Egypt. Their twins Alexander Helios and Cleopatra Selene were born in 40. The defeat of his brother Lucius Antonius (Pietas) in the Perusine War compelled him to return to Italy early in 40, despite the Parthian invasion of *Syria; but a new agreement was reached at Brundisium whereby Antony surrendered Gaul, which Octavian had already occupied, and married Octavian's sister Octavia. The division of the empire into east and west was becoming more clear-cut. At Misenum in 39 the triumvirs extended their agreement to Sextus Pompeius, after which Antony returned with Octavia to the east. By 38 his lieutenant Publius Ventidius had expelled the Parthians from Syria. In 37, new differences between Antony and Octavian were settled at Tarentum, and the Triumvirate was renewed for another five years; but this time he left Octavia behind when he left for the east, and renewed his association with Cleopatra on a firmer basis. Their third child Ptolemy Philadelphus was born in 36.

5. This liaison had political attractions. Egypt was one of several important kingdoms which Antony strength-

ened and expanded; nor did he grant all that Cleopatra wished, for he refused to take territory from Herod of Judaea, another able and valued supporter. The allegiance of the east was courted by religious propaganda. By 39 he had already presented himself as *Dionysus in Athens, and he and Cleopatra could now be presented as Osiris and Isis (or *Aphrodite; for Osiris and Isis, *see* EGYPTIAN DEITIES), linked in a sacred marriage for the prosperity of Asia (cf. Plut. *Ant.* 26). But in 36 Antony's Parthian expedition ended in a disastrous reverse, while the defeat of Sextus Pompeius and the elimination of Lepidus correspondingly strengthened Octavian. It still seems to have been some time before Antony accepted that a decisive clash with Octavian was inevitable. At first he continued to concentrate on the east, planning a further invasion of Parthia and annexing Armenia in 34: this was marked in *Alexandria by a ceremony (hostile sources regarded it as a sacrilegious version of a Roman *triumph) after which Cleopatra and her children—including Caesarion, whom Antony provocatively declared to be Caesar's acknowledged son—were paraded in national and regal costumes of various countries, just as if they might inherit them dynastically. The *propaganda exchanges with Octavian intensified in 33, then early in 32 Octavian intimidated many of Antony's supporters, including the consuls Gnaeus Domitius Ahenobarbus and Gaius Sosius, into leaving Rome. Antony divorced Octavia; then Octavian outrageously seized and published Antony's will, in which he allegedly left bequests to his children by Cleopatra and requested burial in Alexandria. Octavian proceeded to extract the annulment of Antony's remaining powers and a declaration of war against Cleopatra: Antony would now seem a traitor if he sided with the national enemy.

6. The spring and summer of 31 saw protracted military engagements in western Greece. Antony's initial numerical superiority was whittled away by *Agrippa's skilful naval attacks, then during the summer Antony was deserted by most of his most influential Roman supporters, including Plancus, Marcus Titius, and Domitius Ahenobarbus: they had allegedly been alienated by Cleopatra's presence. In September 31 Cleopatra and Antony managed to break the blockade at *Actium and escape southwards, but the campaign was decisively lost, and their supporters defected to Octavian in the following months. Antony committed suicide as Octavian entered Alexandria (August 30).

7. For all its romanticism, much of Plutarch's portrayal of Antony carries some conviction—the great general, with unusual powers of leadership and personal charm, destroyed by his own weaknesses. But it is easy to underestimate his political judgement. True, Octavian

won the war of propaganda in Italy, but till a late stage Antony continued to have strong support from the east and from influential Romans (many old republicans preferred him to Octavian). He looked the likely winner until the Actium campaign itself, and it is arguable that military rather than political considerations sealed his downfall. His administrative arrangements in the east were clear-sighted, and most were continued by Augustus.

8. His only literary publication was a pamphlet of c.33, 'On his own Drunkenness', evidently a reply to Octavian's aspersions rather than a tippler's memoir. Specimens of his epistolary style can be seen in *Cicero's correspondence, the thirteenth *Philippic*, and *Suetonius' *Augustus*.

9. Antony was married (1) to Fadia, though this is more likely to have been a careless affair; (2) to his cousin Antonia, daughter of Gaius Antonius 'Hybrida', whom he divorced in 47; (3) in 47 or 46, to Fulvia; (4) in 40, to Octavia. By Antonia he had a daughter Antonia; by Fulvia two sons, Marcus Antonius Antyllus and Iullus Antonius; by Octavia two daughters, Antonia the Elder and Antonia the Younger, through whom he was the ancestor of the emperors *Gaius, *Claudius, and *Nero. His 'marriage' to Cleopatra would not have been seen as such by an Italian audience. CBRP

Aphrodisias (see ◀Map 2, Bb▶) (mod. Geyre in south-western Turkey) was a Carian city, probably established in the 2nd cent. BC as the political centre of 'the Plarasans and Aphrodisians' (Plarasans dropped from the description under *Augustus); site of vigorous prehistoric and Archaic communities honouring a mother-goddess, called *Aphrodite perhaps from the 3rd cent. BC and later identified with Roman Venus. That identification encouraged a special relationship with Rome and with the family of *Caesar; so Aphrodisias resisted *Mithradates VI in 88 BC and the Liberators after Caesar's death, earning privileges which Rome conferred in 39 BC and confirmed up to the late 3rd cent. AD. The wall-circuit, c.3.5 km. (2.2 mi.) long and containing many inscribed blocks reused, a stadium, and columns have always been visible; excavation has now uncovered civic buildings and much sculpture, which is sometimes distinguished and often technically interesting. Intellectual pursuits were prized too—famous Aphrodisians included the novelist Chariton, the philosopher Adrastus and the philosophical commentator Alexander, and, in the late 5th cent. AD, Asclepiodotus. Numerous inscriptions, including an 'archive' of official communications from Rome inscribed on a wall in the theatre, throw important light on Roman history, late antiquity, ancient entertainments, and the Jewish Diaspora.

It was associated with the province of Asia to the mid-3rd cent. AD, then became part, perhaps capital, of Phrygia-Caria, and, under *Diocletian, capital of Caria, from which it derived its modern name. JMR

Aphrodite. Born from the severed genitals of Uranus according to *Hesiod (*Theog.* 188–206), or in the Homeric version (see HOMER) daughter of *Zeus and Dione (*Il.* 5. 370–417), Aphrodite is the the first anthropomorphic female form and she emerges in a mythical context of desire and violence, tension and appeasement, mirroring the ambivalence of her powers: seductive charm, the need to procreate, and a capacity for deception, elements also present in the person of the first woman, Pandora (*Hes. Op.* 60–8). There is no agreement on her historical origins; the Greeks themselves thought of her as coming from the east (*Hdt.* 1. 105, *Paus.* 1. 14. 7), and in literature she is frequently given the name Cypris, 'the Cyprian'. (See CYPRUS.) The double tradition of her birth shows how the Greeks felt Aphrodite to be at the same time Greek and foreign, but also, on the level of mythology, that they perceived her as a powerful goddess whom it would be prudent to place under the authority of Zeus.

Aphrodite's cults extend very widely over the Greek world, though her temples and festivals cannot compete with those of the other great figures of the pantheon. *Cyprus is the home of her most famous cults, for instance at Paphos and Amathus. There, probably in the Archaic period, the name Aphrodite became attached to an indigenous goddess who was also subject to numerous oriental influences. In Greece itself, one or more cults of Aphrodite are known in every region. She was worshipped above all as presiding over sexuality and reproduction—necessary for the continuity of the community. Thus in many cities girls about to be married sacrificed to Aphrodite so that their first sexual experience might be propitious (e.g. *Paus.* 2. 32. 7, 34. 12). This is the particular sphere of Aphrodite, compared with other goddesses involved in marriage like *Hera and *Demeter, a function especially emphasized in the Argolid by the mythological connections between cults of Aphrodite and the story of the Danaids. The close bond which the Greeks felt to exist between human fertility and the fruitfulness of the land lies behind Aphrodite's connections with vegetation and the earth in general: as Melainis at Corinth (*Paus.* 2. 2. 4) and Mantinea (*Paus.* 8. 6. 5) the 'black' Aphrodite shows her power over the 'black earth' as well as her links with the powers of the night. In Athens, Aphrodite *en kêpois*, 'in gardens', was connected with Athena at the Arrhēphoria, a kourtophobic rite concerned with fertility and with the production of children to assure the survival

of the community (Paus. 1. 27. 3). Aphrodite was also worshipped by courtesans and prostitutes. Epithets such as *Hetaira* ('courtesan') and *Porne* ('prostitute') show her as protectress of this profession, whose essential stock-in-trade was seduction. Corinth was particularly well known for the beauty and luxurious living of its prostitutes, who certainly revered the local Aphrodite. All the same, it is unlikely that her sanctuary on Acrocorinth was the location of an institutionalized form of what is usually called 'sacred prostitution'. The only source for such a remarkable practice in a Greek context, *Strabo (8. 6. 21 (378–9 C)), places it in a vague past time, and is surely influenced by the eastern practices with which he was familiar. Herodotus also mentions a similar practice in several parts of the Mediterranean area, and his silence in regard to Corinth should invite caution. See PROSTITUTION, SACRED and SECULAR.

If Aphrodite was worshipped primarily by women, men also took part in her cult, notably in connection with her role as patron of seafaring (Aphrodite Euploia, Pontia, Limenia: e.g. *IG* 2². 2872, Paus. 2. 34. 11). Aphrodite is also concerned with magistrates in their official capacity, acting as the deity of concord and civic harmony. The title *Pandemos*, which is hers conspicuously in Athens (*IG* 2². 659), indicates her protection of the whole citizen body, but she can also be linked with a particular civic office (e.g. as *Stratagis* in Acarnania (*IG* 9². 1. 2. 256), and as *Epistasis* on Thasos (J. Pouilloux, *Thasos* 1, no. 24)). In this context, she is frequently associated with *Hermes*, *Peitho*, and the *Charites*. Thus *Plato's interpretation of the epithets *Urania* and *Pandemos* as indicating respectively exalted and common love (*Symp.* 180^d–181) is completely unfounded. The title *Urania*, 'heavenly', occurs frequently in cult and refers to the power of the goddess who presides over every type of union. It is with this epithet that the name Aphrodite is used as the Greek designation of foreign goddesses, a process found already in *Herodotus and which accelerates with the syncretisms of the Hellenistic period. The title also expresses one of Aphrodite's ambiguities, making her simultaneously 'daughter of Uranus' and 'the goddess who has come from elsewhere'. According to Pausanias, there were several statues showing an armed Aphrodite, particularly at Sparta (3. 15. 10; 3. 23. 1). Here and there, the field of battle is not unfamiliar with the power of Aphrodite, as attested by her relationship with *Ares*, but it would be reductive to see her as 'a war-goddess'. Violent impulse, be it desiring or destructive, is at the heart of her prerogatives and explains the association between the goddess and the world of the warrior.

From *Sappho to *Lucretius, literature celebrates the power of love and the dominion of Aphrodite. *Ares*,

Adonis, *Hermes*, and **Dionysus* are all at various times given as her lovers, as is the mortal *Anchises*. On a cultic level, these gods may be associated with the goddess and each association attests to some aspect of her multifaceted powers. VP-D/AMOT

Apollo, Greek god, son of **Zeus* and *Leto*, brother of **Artemis*, for many 'the most Greek of Greek gods' (W. F. Otto). Among his numerous and diverse functions healing and purification, prophecy, care for young citizens, for poetry, and music are prominent (see Plat. *Cra.* 404d–405e). In iconography, he is always young, beardless, and of harmonious beauty, the ideal *epebe* (see GYMNASIUM) and young athlete; his weapon is the bow, and his tree the laurel.

His name is absent from Linear B (while *Paeon*, his later epiclesis and hymn, appears as *Paiawon* in the pantheon of Mycenaean Cnossus). In *Homer and *Hesiod, his myth and cult are fully developed, and his main centres, **Delos* and **Delphi*, are well known (Delian altar of Apollo, *Od.* 6. 162; Delphic shrine, *Il.* 9. 405 and *Od.* 8. 80; stone of Cronus, *Theog.* 499) though none goes back to the bronze age: Apollo's cult must have been introduced and brought to Panhellenic importance during the Dark Age, although his early presence on Cyprus remains difficult to explain. Epic poetry, where Apollo is prominent, had its decisive share in this development. The key document is the *Homeric Hymn to Apollo*; it consists of two aetiological parts, a Delian part which tells the story of Apollo's birth and a perhaps earlier Delphic part about the foundation of the oracular shrine in Delphi; opinions about structure and date vary, though a date in the 7th cent. BC for the Delian, and one slightly later for the Delphic part are also possible.

The origins of Apollo are debated; after earlier theories explaining the god from the sun (following an identification as old as the 5th cent., and adding the linguistic argument that the epiclesis *Lykeios* would derive from the stem *luc-*, as in Latin *lux*), partisans of an Anatolian, esp. Lycian, origin relied upon the same epiclesis and upon his mother's name being Lycian and connected with *lada*, 'earth'; the French excavations in Lycian **Xanthus* proved both assumptions wrong. More promising is the connection with Dor. *apella* 'assembly', i.e. annual reunion of the adult tribesmen which also introduces the young men into the community (W. Burkert, *Rh. Mus.* 1975, 1–21; but see R. S. Beekes, *Journal of Ancient Near Eastern Religions* 2003, 1–21). This explains his widespread role as the divinity responsible for the introduction of young initiated adults into society: he receives the first cut hair at the end of **initiation* (Hes. *Theog.* 347, mentioning Apollo together with *kourai*, 'Girls', i.e. nymphs, and rivers), and

Apollo This Athenian 'white-ground' cup (c.470 BC) depicts Apollo as a handsome youth. The lyre, his favoured instrument, denotes his association with *music, poetry, and, more generally, *education. Delphi Museum / Hellenic Ministry of Culture & Tourism Archaeological Receipts Fund (Law 3028/2002)

his cult has to do with military and athletic training (for Apollo Lycius at Athens, M. Jameson, *Archaiognosia* 1980, 213–35; the 'Wolf-Apollo' has to do with Archaic wolf-warriors) and with the citizen-right of the sons (for Apollo Delphinus, F. Graf, *MH* 1979, 2–22). His cult on the lonely island of Delos, where Leto gave birth after long search, became the religious focus of Archaic Ionia (*Hymn. Hom. Ap.* 147) at least from the late 8th cent. onwards; before this date, archaeology shows a more regional, Cycladic influence. While a Delian temple of Artemis was present already in the 8th cent. (bronze age origin and continuity are contested), a temple of Apollo was built only in the mid-6th cent.; his cult centred around the famous altar of horns (parallels from Archaic Drerus on Crete, from *Ephesus, and from Boeotian Hyampolis, are now archaeologically attested).

Apollo's interest in music and poetry could derive from the same source, music and poetry having an educational role in Greece (see EDUCATION, GREEK). Apollo's

instrument is the lyre whose well-ordered music is opposed to the ecstatic rhythms of flute and drums which belong to *Dionysus and *Cybele; according to the *Homeric Hymn to Hermes*, he received it from Hermes, its inventor. He is, together with the *Muses, protector of epic singers and cithara-players (*Hes. Theog.* 94); later, he is Musagetes, 'Leader of the Muses', in Pindar (fr. 91c Snell–Maehler) and on Archaic images. When philosophy takes over a similar educational function, he is associated with philosophy, and an anecdote makes him the real father of *Plato.

His own song, the Paean (*paian*; see L. Käppel, *Paian*, 1993), is sung and danced by the young Achaeans after the sacrifice to Apollo when bringing back Chryseis to her father (*Il.* 1. 473): even if not necessarily a healing-song in this passage, it was understood as such later and was accordingly transferred to Asclepius as well. In the *Iliad*, Paieon could still be understood as an independent healing god (5. 401); later, it is an epiclesis of Apollo the

Healer. The Ionian Apollo *iatros* ('Healer') had cult in most Black Sea cities, and as *Medicus* Apollo was taken over by the Romans during a *plague in the 5th cent. (Livy 4. 25. 3, see below). Only the rise of *Asclepius in the 5th and 4th cents. eclipsed this function, though in Epidaurus, where Apollo took over a bronze age hill-sanctuary of Maleatas, Apollo Maleatas preceded Asclepius in official nomenclature until the imperial period. In *Iliad* 1 he is responsible both for sending and for averting the plague. The image of a god sending plague by shooting arrows points to the ancient near east where Reshep 'of the arrow' is the plague-god in bronze age Ugarit/Ras Shamra and on Cyprus; details of iconography point to a transfer from Cyprus to Spartan Amyclae—and in the Archaic Dorian world of Crete and Sparta, the paeian is first attested as an individual poetical genre (Plut. *De mus.* 9. (1134c)); both in *Il.* 1. 473 and in the cultic reality of the Spartan Apollo, paeian and *kouroi* ('young men') are closely connected.

Disease is the consequence of impurity, healing is purification—in myth, this theme later crystallized around Orestes whom Delphic Apollo cleansed of the murder of his mother, and of the concomitant madness. Oracular Apollo (see ORACLES) is often connected with purification and plague; he decreed the Cyrenean purification laws (6th cent., R. Parker, *Miasma* (1983), 332–51) and the setting up of his statue to avert the Athenian plague of 430 BC (Paus. 1. 3. 4, 10. 11. 5). But this is only a small part of the much wider oracular function which Apollo had not only in his shrines at Delphi and the Ptoion on the Greek mainland, and at Branchidae, *Claros, and Gryneum in Asia Minor, but also in his relationship with the Sibyl(s) and other seers like Bacis or Cassandra; while the Sibyls are usually priestesses of Apollo (e.g. Erythrae, *PL* 8. 450, or Cumae, Verg. *Aen.* 6. 77), Cassandra refused Apollo as a lover. Apolline prophecy was usually ecstatic: the Delphic Python was possessed by the god (in NT Greek, *puthōn* is 'ventriloquist'), as were the Sibyls (see Verg. *Aen.* 6. 77–80), Cassandra, young Branchus (Callim. fr. 229 Pf.), and Bacis; and the priest of *Claros attained ecstasy through drinking water (Tac. *Ann.* 2. 54). Apollo's supreme wisdom is beyond human rationality.

In Archaic and Classical Greece, *Delphi was the central oracular shrine (see the quest of Croesus, Hdt. 1. 46). Though his cult had grown out of purely local worship in the 8th cent., myth saw its foundation as a primordial event, expressing it in the theme of dragon-slaying (*Hymn. Hom. Ap.* 287–374; see J. Trumpf, *Hermes* 1958, 129–57, and J. Fontenrose, *Python* (1959)); alternative myths gave an even longer prehistory to Apollo's taking over and his temple building (C. Sourvinou-Inwood,

'Reading' Greek Culture (1991), 192–216, 217–43). Like isolated Delos, marginal Delphi achieved international political importance in Archaic Greece simply for being marginal. But from his role as a political adviser, Apollo acquired no further political functions—and only a marginally moralistic character.

In Italy, Apollo's arrival in Rome during a plague in 433 BC was due to a recommendation of the Sibylline Books (Livy 4. 25. 3): to avert the plague, a temple of Apollo *Medicus* was vowed and built just outside the *pomerium*, where there had already been an *Apollinar*, presumably an open cult-place of the god (Livy 3. 63. 7, for the year 449). In Etruria, no cult of Apollo is attested, though his name, in the form *Aplu*, is read in mythological representations (with a Greek iconography): the form shows that the name was taken over from Latin *Apollo*, not directly from the Greek (A. Pfiffig, *Religio Etrusca* (1975), 251). Until the time of Augustus, the temple of Apollo *Medicus* was the only Roman temple of the god, and healing his main function; the Vestals addressed him as 'Apollo *Medice*, Apollo *Paeian*' (Macrob. *Sat.* 1. 17. 15). Mainly in response to Mark *Antony's adoption of Dionysus, and perhaps already stimulated by the victory of Philippi which Caesar's heirs had won in the name of Apollo, Augustus made Apollo his special god (P. Zanker, *The Power of Images in the Age of Augustus* (1988), 48–53). In 31 BC, Augustus vowed a second temple to Apollo in Rome after the battle of Actium, where, from his nearby sanctuary, the god was said to have helped against Mark Antony and Cleopatra; the temple was built and dedicated in 28, close to the house of Augustus on the Palatine, with a magnificent adjoining library. See ORACLES. FG

Apollonius of Rhodes (Apollonius Rhodius), a major literary figure of 3rd-cent. *Alexandria, and poet of the *Argonautica*, the only extant Greek hexameter *epic written between *Homer and the Roman imperial period.

Life

Our main sources are: *POxy.* 1241, a 2nd-cent. AD list of the librarians of the Royal Library at Alexandria; two Lives transmitted with the manuscripts of *Argonautica* which probably contain material deriving from the late 1st cent. BC; an entry in the *Suda*. (1) All four state that Apollonius was from Alexandria itself, though two 2nd-cent. AD notices point rather to Naucratis. The most likely explanation for the title 'Rhodian' is thus that Apollonius spent a period of his life there, which would accord well with what we know of his works (cf. below), though it remains possible that he or his family came from *Rhodes. (2) Apollonius served as librarian and royal

tutor before *Eratosthenes (*POxy.* 1241), and probably in succession to Zenodotus, thus c.270–45. It is to this period that the *Argonautica* should be dated. (3) All four sources make him a pupil of *Callimachus, which probably reflects beliefs about the indebtedness of his poetry to Callimachus (cf. below). (4) The *Lives* give confused and contradictory accounts of withdrawal to Rhodes after a poor reception for his poetry in Alexandria. Nothing of value can be retrieved from these stories, which may well be fictions based on the existence of a text of at least *Argon* 1 which differed significantly from the vulgate (the *proekdosis*, cited six times by the scholia to *Argon* 1). (5) Very flimsy ancient evidence has been used by some scholars to construct a ‘quarrel’ between Apollonius and Callimachus concerning poetic questions, particularly the value and style of epic. The many striking parallels between the works of Callimachus and the *Argonautica*, however, argue against, rather than for, any serious dispute; moreover, Apollonius does not appear in the list (*PSI* 1219) which seeks to identify Callimachus’ opponents, the Telchines, and Roman poets clearly align Apollonius with, rather than against, Callimachus. Two episodes in the *Argonautica* handle the same material as two poems of *Theocritus (*Hylas*, cf. *Id.* 13; *Amycus and Polydeuces*, cf. *Id.* 22), and this offers no reason to doubt the dating derived from other sources.

Lost works

(1) Poems (cf. Powell, *Coll. Alex.* 4–8). *Canobus*: choliambic poem on Egyptian legends. *Foundation Poems* in hexameters on Caunus, Alexandria, Naucratis, Rhodes, and Cnidus; poems of this type reflect the deep Alexandrian interest in local history and cult. Many other lost poems may also be assumed, including probably epigrams (cf. *Ant. Lib. Met.* 23); an extant epigram attacking Callimachus (*Anth. Pal.* 11. 275) is very doubtfully ascribed to Apollonius. (2) Prose Works. Apollonius’ scholarly interests were reflected in many works (cf. R. Pfeiffer, *History of Classical Scholarship* 1 (1968) 144–8), including a monograph on Homer (*Against Zenodotus*). *Archilochus and *Hesiod were also among the poets discussed by Apollonius; he defended the authenticity of the *Shield of Heracles* (*hypothesis* (introduction) A to the poem) and probably rejected Hesiodic authorship of the *Ornithomanteia* which was transmitted after *Works and Days* (corrupt scholium to *Op.* 828).

Argonautica

Hexameter epic on the Argonautic legend in four long books totalling 5,835 preserved verses. Fifty-two manuscripts are known, and a large body of papyri attests to the popularity of the poem in later antiquity. It was very

important at Rome, where it was translated by the neoteric Publius Terentius Varro Atacinus, is a major influence on *Catullus 64 and *Virgil’s *Aeneid*, and, with the *Aeneid*, forms the basis of *Valerius Flaccus’ *Argonautica*.

Books 1–2 deal with the outward voyage, to recover the golden fleece, from Iolcus in Thessaly to the Colchian city of Aia at the extreme eastern edge of the Black (Euxine) Sea (in modern Georgia), which is ruled over by Aeëtes, the cruel son of *Helios. The major events of this voyage are a stay at Lemnos where the local women, who have murdered the entire male population, seize the chance for procreation, and Jason sleeps with Queen Hypsipyle (1. 609–910); the loss of *Heracles from the expedition (1. 1153–1357); a boxing-match between Amycus, king of the Bebrycians, and Polydeuces (2. 1–163); meeting with the blind prophet Phineus whom the Argonauts save from the depredations of the Harpies and who, in return, tells them of the voyage ahead (2. 168–530); passage through the Clashing Rocks (*Symplēgades*) which guard the entrance to the Black Sea (2. 531–647); meeting on the island of Ares with the sons of Phrixus, who fled Greece on the golden ram (2. 1030–1230). In Book 3 Jason asks Aeëtes to grant him the fleece; this the king agrees to do on the condition that Jason ploughs an enormous field with fire-breathing bulls, sows it with dragon’s teeth, and slays the armed warriors who rise up from the ground. Jason succeeds in this, because, at the instigation of Jason’s protector Hera, the king’s daughter, Medea, falls in love with the hero and supplies him with a magic salve to protect him and give him superhuman strength. In Book 4 Medea flees to join the Argonauts and secures the fleece for them from the grove where it is guarded by a sleepless dragon. The Argonauts flee via a great river (the Danube) which is pictured as flowing from the Black Sea to the Adriatic; at the Adriatic mouth, Jason and Medea lure her brother, Apsyrtus, who commands the pursuing Colchians, to his death, a crime for which Zeus decides that they must be purified by Medea’s aunt Circe who lives on the west coast of Italy. They reach Circe via rivers (the Po (Padus) and the Rhône) imagined to link NE Italy with the western Mediterranean. From there they sail to Drepane (Corfu), Homer’s Scheria, where Jason and Medea are married, and are then driven to the wastes of Libya where they are again saved by divine intervention. They finally return home by way of Crete, where Medea uses her magic powers to destroy the bronze giant Talos who guards the island.

The central poetic technique of Apollonius is the creative reworking of *Homer. While the Hellenistic poet takes pains to avoid the repetitiveness characteristic of Archaic epic, Homer is the main determinative influence on every aspect of the poem, from the details of language

to large-scale *narrative patterns, material culture, and technology (e.g. sailing) which is broadly ‘Homeric’ (but note ‘Hellenistic’ architectural features at 3. 215 ff.). This is most obvious in set scenes such as the Catalogue of Argonauts (1. 23–233), corresponding to Homer’s Catalogue of Ships, the description of the cloak Jason wears to meet Hypsipyle (1. 721–67), corresponding to the Shield of *Achilles, the meeting of *Hera, *Athena, and *Aphrodite on Olympus at the start of book 3 which finds many fore-runners in Homer, the scenes in the palace of Aeëtes, corresponding to the scenes of the *Odyssey* on Scheria, and the voyage in the western Mediterranean, corresponding to *Odysseus’ adventures on his way home. These scenes function by contrast: the Homeric ‘model’ is the base-text by which what is importantly different in the later poem is highlighted. Individual characters too owe much to Homeric predecessors, while also being markedly different from them: e.g. Jason/Odysseus, Medea/Nausicaa and Circe. After Homer, the two most important literary influences are Pindar’s account of the Argonauts (*Pyth.* 4) and Euripides’ *Medea*; the events of the tragedy are foreshadowed in a number of places in the epic—perhaps most strikingly in the murder of Apsyrtus who goes to his death ‘like a tender child’ (4. 460)—and in one sense the epic shows us that the events of the tragedy were ‘inevitable’, given the earlier history of Jason and Medea.

A fundamental principle of composition for Apollonius is discontinuity, a feature shared with the poetics of Callimachus. The *Argonautica* is constantly experimental. This shows itself, for example, in the organization of the narrative both within books (e.g. book 2 where scenes of action—Amycus, the Harpies—stand in sharp contrast to long passages of ethnography and geography, and book 4 where different Argonauts and Medea take turns to play leading roles) and between books (thus book 3 stands apart as a tightly-knit drama of its own). Apollonius’ principles of characterization have also frequently been misunderstood; the two main sides of Medea’s character—impressionable virgin and dangerous sorceress—are only confusing if viewed from the perspective of that ‘consistency’ which *Aristotle prescribed for dramatic character. Apollonius is rather interested in the similarities and differences between the power of love, the power of persuasion, and the power of drugs, and this interest is explored through the presentation of Medea, whose character is thus a function of the narrative. Jason’s character, on the other hand, brings persuasion and stratagem to the fore (cf. esp. his testing (*peira*) of the crew after the passing of the Clashing Rocks (2. 607–49), and the praise of *muthos* and *mētis* at 3. 182–93). His story is of the familiar type of rite of passage (cf. Orestes, *Theseus, etc.) in which a young man must accomplish a

dangerous set of tasks before assuming his rightful position (in this case a kingship which had been usurped by Pelias); that Jason seems often overwhelmed (*amēchanos*) by the enormity of what he must do and only finally accomplishes it through Medea’s help finds many parallels in related stories, but also marks the difference between his exotic story and that of the Homeric heroes. With the partial exception of some of Odysseus’ adventures, magic and fantasy have little role in Homer, whereas they had always had a prominent position in the Argonautic myth and are very important in the *Argonautica*. Discontinuity is also seen in the divine element of the epic where different Olympian gods—Athena, *Apollo, and Jason’s main protector, Hera—and other minor divinities are all prominent at one time or another.

In common with other Alexandrian poetry, the aetiology of cult and ritual is very important in the *Argonautica*. Apollonius’ scholarly learning, visible also in his detailed manipulation of earlier texts, here emphasizes how the Argonautic voyage is in part a voyage of acculturation establishing Greek tradition. The repeatedly positive evaluation of Greek culture (including cult and ritual) should be connected with the Ptolemaic context of the work; the Ptolemies promoted themselves as the true heirs and champions of Classical Greek culture, and this strain should not be overlooked in the epic. It is even possible that the characters of King Alcinous and Queen Arete owe not a little to *Ptolemy II Philadelphus and his sister/wife. Just as Ptolemaic ideas are thus inscribed into prehistory, Apollonius also mixes the temporal levels of his poem in other ways too. One is by emotional authorial ‘intrusions’ (e.g. 1. 616–19, 2. 542–5, 4. 445–9) which strongly differentiate the *Argonautica* from the ‘impersonal’ Homeric poems; these are one manifestation of the strong literary self-consciousness of an epic which is much concerned with displaying the problems of *how* one writes epic poetry. Another is by reflections of Hellenistic science within the mythical material of the poem; Aphrodite bribes her son with a ball which is also a cosmic globe of a kind familiar in Apollonius’ time (3. 131–41), Medea’s suffering reflects contemporary physiological theories (3. 762–3), and Mopsus’ death from snakebite (4. 1502–36) is a very typical mixture of Alexandrian medicine and myth.

The language of Apollonius is based on that of Homer, constantly extended and varied by analogy and new formation, but Apollonius also draws upon the vocabulary of the whole high poetic tradition. Metrically, his hexameter shows similar developments to Callimachus’ and Theocritus’, and dactylic rhythm is more predominant than in Homer. Complex, enjambed sentences and syntactically sophisticated indirect speech reveal the

possibilities open to the poet of written, rather than oral, epic.

The *Argonautica* is a brilliant and disturbing achievement, a poem shot through with intelligence and deep ironies. Its reception at Rome is in stark contrast to its reception by modern critics who have tended to see it as a failed attempt to write like Homer; more recently, however, it has become the subject of serious literary study, and is thus coming into its own. RLHU

Apollonius of Tyana, a Neopythagorean holy man, conceivably the Lucius Pompeius Apollonius of an inscription from *Ephesus (C. P. Jones in Demoen and Praet 2009). According to the only full account, the novelistic (see NOVEL, GREEK) biography of Philostratus, he was born at Tyana in Cappadocia at the beginning of the 1st cent. AD and survived into the reign of *Nerva. He led the life of an ascetic wandering teacher, visited distant lands (including India), advised cities, had life-threatening encounters with *Nero and *Domitian, whose death he simultaneously prophesied (8. 25–6; cf. Cass. Dio 67. 18), and on his own death underwent heavenly assumption. He was the object of posthumous cult attracting the patronage of the Severan emperors; pagan apologists compared him favourably to Jesus. An epigram from Cilicia (SEG 28. 1251; 31. 1320, not before the 3rd cent. AD) describes him as ‘extinguishing the faults of men’. Of his writings there survive letters, some probably genuine, and a fragment of his treatise *On Sacrifices*. HJR/AJSS

Appian of Alexandria, Greek historian. Born in *Alexandria at the end of the 1st cent. AD, he experienced the Jewish rising of AD 116/17, became a Roman citizen, moved to Rome as an advocate and eventually gained, through the influence of his friend Marcus Cornelius Fronto, the *dignitas* of a *procurator under *Antoninus Pius, which enabled him to devote his time to writing a Roman History. After the preface and book 1 on early Rome in the period of the kings, this work is arranged ethnographically, dealing with the individual peoples as Rome conquered them: book 2, Italians; 3, Samnites; 4, Celts; 5, Sicilians; 6, Iberians; 7, *Hannibal; 8, Carthaginians (Libyans and Nomads); 9, Macedonians and Illyrians; 10, Greeks and Ionians; 11, Syrians (Seleucids) and Parthians; and 12, *Mithradates VI; 13–17 treat the Civil Wars; 18–21, the wars in Egypt; 22, the century up to *Trajan; 23, Trajan’s campaigns against Dacians, Jews, and Pontic peoples; and 24, Arabians. A survey of Rome’s military and financial system was apparently not yet written when Appian died in the 160s. The preface, books 6–9, and 11–17 survive complete, apart from 8b on the Nomads and 9a on the Macedonians (of which only fragments exist) as well as

11b on the Parthians (11b was perhaps unfinished at Appian’s death; the textual tradition preserves a Byzantine fake instead); 1–5 are fragmentary, 10 and 18–24 lost.

In order to accommodate a millennium of Roman history in a single work, Appian greatly, but not always successfully, reduced the material he chose from a variety of Greek and Latin authors, among them *Hieronymus of Cardia, *Polybius, and Roman annalists like Gaius Asinius Pollio, *Caesar, and *Augustus. Since some of his valuable sources, especially on the Civil Wars, are otherwise lost, his work gains historical importance for us, even though it does not simply reproduce these sources. Recent research has stressed Appian’s own conscious contribution not only in choosing, reducing, and organizing the material, but also in the independent composition of speeches, in the introduction of episodes from the rhetorical repertoire, and in detailed interference with the sources in view of his avowed aims: a proud citizen of Alexandria, Appian makes events in Egypt the climax of his work; a convinced monarchist, he explains, not always correctly, Roman republican institutions to his Greek audience (papyri show that his work was read in Dura-Europus); a stout conservative, he regards a lack of popular concord, as witnessed in the Civil Wars, as cataclysmic; unusually interested in administration and finance, he preserves more social and economic information than most historiographers; above all, an ardent admirer of Rome, Appian explains her success through reference to the Romans’ good counsel, endurance, patience, moderation, and, especially, overall virtue. KB

aqueducts In a Mediterranean climate, correcting the accidents of rainfall distribution through the management of water-sources transforms *agriculture by extending the growing-season through the dry summer by means of irrigation, allows agglomerations of population beyond the resources of local springs or wells, eases waterlogging through drainage in the wetter zones, and protects against floods caused by violent winter rainfall. The societies of the semi-arid peripheries had long depended on water-strategies such as irrigation drawn from perennial rivers, or the *qanat* (a tunnel for tapping groundwater resources).

Hydraulic engineering was therefore both useful and prestigious. It was quickly adopted by the nascent cities of the Greek world and their leaders: ground-level aqueducts bringing water from extramural springs into Greek cities were at least as old as the 6th cent. BC: notable late-Archaic examples are at Athens, using clay piping (see ATHENS (TOPOGRAPHY)), and on *Samos, where the water was channelled by rock-hewn tunnel through the acropolis—a remarkable engineering feat on which Herodotus (3. 60) comments. In the Classical period, an aqueduct system is attested for the refounded city of

Priene, presumably when it was moved to its new site in the 4th cent. BC. Water from springs at a distance of 2 km. (1 ¼ mi.), and above the level of the city, was fed through a terracotta pipe 25 cm. (10 in.) in diameter set in a trench covered with marble slabs and leading to a distribution tank within the city walls.

A more elaborate system was constructed in the 2nd cent. BC by Eumenes II at *Pergamum. A copious spring 25 km. (15½ mi.) (in a direct line) north of the city was brought through an extended pipeline, following the contours. This was constructed in various materials. It led to a basin from which it flowed under pressure through iron pipes (supported by stone blocks at intervals) up to the top of the citadel. The basin is at a height of 386 m. (1,266 ft.) above sea-level: at its lowest point, the pipe crossed a valley at only 175 m. (574 ft.) before rising to the citadel at c.330 m. (1,083 ft.) (Vitruvius (8. 6. 5) says the Greeks call this system a *koilia*). This system may have helped inspire the first important aqueduct at Rome, the aqua Marcia of 144 BC.

The city was, however, already served by two water-leats, for the most part in underground tunnels, called aqua Appia (312 BC) and aqua Anio Vetus (272); both were prestige works like the first generation of public roads, with which they had associations, and in the case of the Anio Vetus drawing to Rome the water of the river Anio from its upper course a considerable distance away. The ease of tunnelling in the volcanic tufa of Rome's neighbourhood had combined with the problems of water management on a relatively wet west-facing coast to create an indigenous tradition of hydraulic engineering in Etruria, where extensive networks of land drains (*cuniculi*) were developed.

A supply of copious clean water was needed for a steadily increasing population. Most aqueducts, moreover (more or less legally), provided some water for irrigation in the market-garden belts in and around city walls, while some were used to turn water-mills (notably at Barbégal near Arles). But the growing popularity of water-intensive services such as *baths and fountains also promoted the development of the aqueduct system, while there was considerable kudos to be gained by such spectacular reworkings of the dispositions of nature. By the imperial period, aqueducts became a widespread status symbol, and the great bridges (like the Pont du Gard on the aqueduct at Nîmes (Nemausus) or that at Segovia in Spain) which are so famous today owe something to the need for visibility and show.

Imperial benefaction created the most ambitious projects. As a sign of Rome's status as world-capital and to

supply their elaborate waterworks Agrippa and Augustus added three aqueducts to its supply (the first after the aqua Tepula of 125 BC), and established an administrative infrastructure for maintaining the system. Aquae Iuliae or Augustae became standard in the repertoire of what favoured cities in Italy might receive: the longest of all was that which conveyed the water of the Serino spring to the cities of Campania. The Claudian aqueducts at Rome, aqua Claudia and Anio Novus, were also on the most ambitious scale, with very long sections on arches to maintain the head of water necessary for access all across the city of Rome. Further additions to the network were made under Trajan and Caracalla (for his baths): we know less about the period after the work of Sextus Iulius Frontinus, our outstandingly detailed description of Rome's aqueducts in about AD 100. Dues were payable for private use of water, but no attempt was made in any city to cover the cost of the system, which always remained a public benefaction. See WATER. RAT/NP

Ara Pacis, a monumental altar erected in the northern Campus Martius near the via Lata (Corso), considered one of the major products of Augustan public art. It was voted in 13 BC by the senate, as *Augustus records in his Testament (see RES GESTAE), to commemorate his safe return from Gaul and Spain; and finished in 9 BC. The altar proper was surrounded by a walled precinct (11.6 × 10.6 m.; 38 × 34¾ ft.) with entrances to east and west, and decorated with sculptured reliefs on two tiers. Internally there were festoons slung from ox-heads above and fluting below; externally the lower frieze was filled with complex acanthus scrolls, above which on the east and west were mythological panels, on the north and south a religious procession showing the imperial family, lictors, priests, magistrates, and representations of the Roman people. Smaller reliefs on the inner altar showing Vestals (see VESTA, VESTALS), priests, sacrificial animals, etc., continue the procession on the outer walls. The event represented by this procession has been much disputed, a *supplicatio* (formal period of public rejoicing) of 13 BC being recently proposed rather than the consecration of the altar itself.

Several of the sculptured slabs were brought to light about 1568, others in 1859 and 1903. In 1937–8 the site was thoroughly explored and the monument reconstructed, with most of its surviving sculptures, between the Mausoleum of Augustus and the Tiber. See SCULPTURE, ROMAN. JD

CLASSICAL ARCHAEOLOGY

archaeology, classical, properly the study of the whole material culture of ancient Greece and Rome, is often understood in a somewhat narrower sense. Epigraphy, the study of inscriptions on permanent materials, is today more widely seen as a branch of historical rather than of archaeological inquiry; while numismatics, the study of coins (*see* COINAGE), has become a largely independent discipline. The chronological limits are also open to debate. In the case of the Greek world, it has become common to distinguish 'ancient' from 'prehistoric', and to treat the archaeology of early Greece—at any rate down to the late bronze age—as lying outside the scope of classical archaeology. For Italy, the same is true down to a later date, after the beginning of the iron age. There is wider agreement in treating the collapse of pagan civilization as the terminus at the lower end.

No less important than these explicit divisions are the unwritten, yet widely accepted constraints on the range of material culture accepted as appropriate for study. These constraints, which have helped to maintain an intellectual distance between classical and other archaeologies, have privileged the study of works of representational art and monumental architecture as the core, sometimes almost the entirety, of the subject. A second prominent attitude, one which indeed inspired the study of the material remains of antiquity in the first place, has been attention to the surviving ancient texts, with the aim of matching them with material discoveries. These assumptions can be traced back to the earliest stages of the history of the discipline; topographical exploration, which also began very early, understandably shared the same deference to the texts. The collection of works of art, a prerogative of wealth rather than of learning, helped to confer on the subject in its early years a social prestige at least as prominent as its intellectual. From Renaissance times in Italy and France, from the early 17th cent. in England, and from somewhat later in other parts of northern Europe and North America, these forces propelled the subject forward. Such excavation as took place before the mid-19th cent. was usually explicitly directed towards the recovery of works of art, with the textual evidence serving as a guide or, where it was not directly applicable, as a kind of arbiter. Once the volume of available finds reached a certain critical mass, a further motive came into play: that of providing models for the better training of artists and architects.

Textual evidence, collectors' preference, and the frequency of recovery combined to make *sculpture pre-eminent among the visual arts. It has retained this place even when the reaction against classicism has deprived it of virtually any bearing on contemporary artistic practice. From 1500 on, the finds from Rome and other Italian sites furnished an increasingly rich body of material. To J. J. Winckelmann (1717–68) belongs the credit for first attempting a systematic organization of this evidence, the limitations of whose range were hardly yet suspected. Only in the opening years of the 19th cent., with the transport of the Parthenon, Bassae, and Aegina sculptures to London and to Munich, did even the learned world begin to glimpse the true range of classical sculpture. From then on, leadership in this field passed to Germany: art history played a prominent part in university education there, and a German Institute in Rome was established as early as 1829. Over the next hundred years, the rate of new discoveries was on its own enough to maintain the vitality of this branch of study, with Adolf Furtwängler (1853–1907) as its most distinguished exponent. A period of consolidation then kept it alive until a series of new finds, some of them from underwater exploration, brought about a further revival of interest in the late 20th cent. (*see* ARCHAEOLOGY, UNDERWATER).

With classical *painting, the natural starting-point was the rich series of murals excavated at *Herculaneum, *Pompeii, and other sites from the Vesuvian destruction of AD 79, in the years from 1739 on. Some reflection of lost Greek masterpieces was recognized in these, but in this case there was no salvation to come from the later recovery of the originals. Instead, attention was diverted to Greek painted vases which (though not yet recognized as Greek) had begun to appear in numbers in Italian graves in the 1720s (*see* POTTERY, GREEK). Then, later in the same century, the foundations were laid for a branch of classical archaeology which, for the first time, owed almost nothing to the surviving textual evidence. Interest was at first directed to the interpretation of the figured scenes on the vases. Late in the 19th cent., there was a shift to the increasingly detailed study of classification, chronology, and, above all, attribution of the works to individual artists. This phase, with which the name of Sir John Beazley (1885–1970) is inseparably associated, lasted for three generations and absorbed the energies of some of the most distinguished figures in the history of the discipline. With Beazley's death, the unique authority of his attributions was no longer available and there was a marked reversion to the study of the content of the scenes (*see* IMAGERY). Two other strong directions in recent

ceramic studies have been laboratory work on the composition of the clay and the closer investigation of the contexts in which the vessels were made, used, and exchanged. Meanwhile Roman wall-painting and *mosaic came to be increasingly treated as manifestations of Roman culture in its own right, rather than as reflections of lost Greek work. The interaction of such art with its architectural setting has become a particular object of research. The study of classical *architecture itself, a central pillar of the discipline during its formative, 'instructional' period, has become a progressively more specialized field, with a largely separate group of practitioners.

The modern history of fieldwork in the Greek world—that is, its redirection towards the goal of recovery of the entire range of the preserved material culture—began with the adoption of a more systematic strategy in the excavation of Pompeii from 1860 on, and received its greatest single stimulus from the discoveries of Schliemann at *Troy, Mycenae, and Tiryns in the 1870s and 1880s. The revelation that the soil could still hold secrets on the scale of whole civilizations—those of the bronze age Aegean—whose existence had not previously been suspected, acted as a spur to many other large-scale projects. In Greece, these have primarily been directed at the great sanctuaries, with the German expedition to *Olympia (1875–) giving a notable lead, followed by the Greek excavations on the Athenian Acropolis (1882– ; see ATHENS (TOPOGRAPHY)), the French missions to *Delphi (1892–) and *Delos (1904–), and a number of others. Large areas of major settlement-sites have also been excavated, notably by the Americans at Corinth (1896–), Olynthus (1928–38), and the *Agora of Athens (1931–). Many of these projects are still in progress, adding vastly to knowledge and providing a training-ground for future practitioners. In Italy, the work has had a broader focus throughout, inspired perhaps by the continuing success of work at the Vesuvian sites. The greatest single focus of interest has naturally been Rome itself, where the discoveries cover almost every aspect of ancient urban life and span a chronological range of many centuries. By far the most extensive field of activity, however, involving intensive work in at least thirty modern countries, has been the archaeology of the Roman empire. While continental Europeans integrated this work into the study of classical antiquity of the historical period, English-speaking archaeologists were

archaeology, classical The first 'excavations' (1811/12) at the Apollo-temple, Bassae (Arcadia), rediscovered and removed its sculptures. The recovery of fine architecture and artworks for long remained the chief concern of classical archaeology in Greece. Photo: Walter Hege, DAI Athens, neg. no. D-DAI-ATH-Hege 2143. All rights reserved

quick to turn to the possibilities opened up in the field of Aegean prehistory, in the Cyclades and, after Evans's sensational discoveries at Knossos, in Crete (see MINOAN CIVILIZATION). Thus, within the space of a couple of generations, classical archaeology came to adopt an entirely new role as an instrument of general historical inquiry.

The most prominent recent innovation in fieldwork has been the introduction of intensive surface survey, first in central and southern Italy, then in the Aegean area and certain provinces of the Roman empire. This technique involves the systematic searching of a tract of landscape, without discrimination in favour of 'likely' locations, to find traces of the pattern of past settlement and activity, sometimes of a specific period but more often of all periods. In contrast with excavation, it is directed at the acquisition of regional knowledge, especially for the rural sector. In all these activities, the use of scientific techniques—for determining the provenance of manufactured objects, for the fuller classification of organic matter, for detection of buried features, and especially for dating—has become increasingly common. In the last-named field, the most striking progress has been made by dendrochronology which, by building up a sequence from a series of trees extending backwards in time, makes it possible to offer absolute dates for tree-rings in structural timbers and other large wooden objects.

Classical archaeology is probably the fastest-changing branch of Classical Studies. One symptom of this is that it is no longer possible to secure universal assent to any definition of its role, either within the study of the Classics or within world archaeology. But pluralism, at least in this case, is a sign of vitality. AMS

archaeology, underwater The potential richness of the sea for salvage or accidental finding of sunken valuables was recognized from earliest times, but the possibility of defining meaningful groups of wrecked material or of interpreting submerged sites scarcely predates the widespread adoption of underwater breathing-apparatus in the 20th cent. Standard apparatus, supplied with compressed air from the surface, as used by sponge divers, enabled the discovery and partial excavation of rich 1st-cent. BC cargoes at Antikythera (1900–1) and Mahdia (1908–13), but the unwieldy equipment, reliance on untrained working divers, and exclusion of archaeological direction from involvement under water remained serious limitations on progress. Self-contained breathing-apparatus (the aqualung) came into widespread use after 1945, and resulted in the growth of diving for sport and pleasure; many ancient wrecks were discovered, especially in southern France, and the importance of this resource was recognized by F. Benoit. However, he did not direct operations under water, and his main underwater project, the excavation at the islet of Le Grand Congloué (1952–7), has subsequently been shown to have confused two superimposed Roman wrecks. *In situ* recording and interpretation were developed especially by P. Tailliez at the Roman wreck of Le Titan, southern France (1957), but the combination of these techniques with archaeological project-design and report-preparation did not mature until the establishment of a French national underwater archaeological service in 1967, which, beginning with A. Tchernia (1967–70), has developed both field techniques and also regular publications. In Italy, N. Lamboglia recognized the value of wreck sites in the 1940s, and estab-

lished an underwater archaeological institute which carried out important excavations, e.g. at Albenga, though until recent years there remained a gap between the archaeological director (who dived only in an observation bell) and the excavation team of technicians. Meanwhile, British and American field-archaeology traditions resulted in the impact of H. Frost and P. Throckmorton on underwater sites, especially in the emphasis on methodical observation and recording before any excavation; this found expression in the successful Cape Gelidonya project (Lycia) led by G. F. Bass, which finally established underwater archaeology as a respectable, worthwhile branch of the discipline. Subsequently, work on shipwrecks has developed successfully not only under the aegis of foreign expeditions, notably those of the Institute of Nautical Archaeology, but also through the growth of national and university institutes in Israel, Greece, Italy, France, Spain, and Croatia. Important developments have included the integration of excavation, post-excavation, conservation and reconstruction of wrecks (notably at Kyrenia, Cyprus), and the development of remote sensing and of remotely operated or piloted submersibles for survey below the effective free-diving limit (50–70 m.; 160–230 ft.). Meanwhile, the study of sea-level change and submerged settlement sites, notably by N. C. Flemming, has emphasized the significant information which can be recovered from underwater sites (e.g. the plan of the bronze age settlement on the isle of Elaphonisos, off SE Peloponnese), and the importance of underwater investigation for understanding ancient harbours, not least Caesarea (by A. Raban). See 'RIACE WARRIORS'. AJP

archaeology, underwater Excavation of a bronze-age merchantman wrecked off the S. coast of Turkey (Uluburun) c.1350 BC. A floating treasury of metals, minerals, and exotic products, it is one of over 1,000 shipwreck sites known from the Mediterranean, and is the earliest ship to be found in the open sea. © Institute of Nautical Archaeology

Archilochus Greek iambic and elegiac poet, from Paros. He mentioned Gyges, who died c.652 BC (fr. 19), and a total solar eclipse which was almost certainly that of 6 April 648 (fr. 122); a memorial to his friend Glaucus, son of Leptines (fr. 131), in late 7th-cent. lettering, has been found on Thasos, where Archilochus spent part of his life (*SEG* 14. 565). His poetry was concerned with his personal affairs and with contemporary public events—politics, shipwrecks, war, etc. Its tone varied widely, from grave to gay, from pleasantly bantering to bitter. Archilochus was famous throughout antiquity for the stinging wit with which he lashed his enemies and sometimes his friends, and for what appeared to be carefree admissions of outrageous conduct such as fleeing from battle and abandoning his shield (fr. 5), or compromising young ladies. He repeatedly attacked one Lycambes, who had (or so the ancients understood) betrothed his daughter Neobule to Archilochus but later revoked the agreement. The vengeful poet then produced a series of poems in which he recounted in the most explicit detail the sexual experiences that he and others had enjoyed with both Neobule and her sister. This (so the legend goes) induced Lycambes and his daughters to hang themselves for shame. We have several fragments from sexual narratives (e.g. frs. 30–48). However, in the ‘Cologne Epode’ discovered in 1974 (fr. 196a) Neobule is represented as available for Archilochus but he dismisses her as overblown and promiscuous, while gently seducing the younger sister. The whole business has to be considered against the background of the Ionian *iambos* and its conventions of bawdy narrative and abuse of individuals.

The ancients arranged Archilochus’ work in four sections: Elegiacs, (iambic) Trimeters, (trochaic) Tetrameters, and Epodes, with a couple of inauthentic pieces (frs. 322–4) tagged on at the end. Most celebrated were the Epodes, songs in simple strophes usually made up of a hexameter or iambic trimeter plus one or two shorter cola. Most famous of all was the first Epode, in which Archilochus remonstrated with Lycambes using the fable of the fox and the eagle (frs. 172–81). He used an animal fable in at least one other Epode (frs. 185–7). The lubricious material is concentrated in the Trimeters, though they also contained some serious pieces. The Tetrameters and Elegiacs were also of mixed character, but Archilochus clearly favoured tetrameters for elevated subjects such as accounts of battles (e.g. frs. 94, 98) and warnings of political dangers (frs. 105–6). Several of the elegiac fragments (8–13) lament men drowned at sea. One (*POxy.* 4708) related an episode from heroic legend, probably as an example.

archives

Greek

(*ta dêmosia grammata* and variations; *archeion* is mainly Hellenistic). In Archaic Greece, documentation was minimal, laws being the most important public documents; lists of officials and agonistic victors (*see GAMES*) were evidently recorded (and later published), but the public inscriptions themselves were probably the ‘stone archives’ (*see RECORDS AND RECORD-KEEPING, ATTITUDES TO*). Temples were safe deposits from early on (e.g. Heraclitus deposited in a temple a copy of his own book), and might contain public inscriptions: hence they often came to house the archives of the city: e.g. the Athenian Metroon, also a shrine; archives of 2nd-cent BC Paros. Documents were also kept separately by the officials concerned, or in their offices (on wooden tablets (*pinakes*), or whitened boards (*leukōmata*), or papyri), e.g. the Athenian cavalry archive, the records of the *polētai* (Athenian officials who sold or leased state property) (*Ath. pol.* 47–8), and there was little centralization. Athens acquired a central archive, the Metroon, in the late 5th cent. BC; manned by slaves, this housed official documents of the Council (*boulē*) and assembly (*ekklēsia*), i.e. mainly decrees, some foreign letters, and treaties with other cities (previously kept in the Council chamber or *bouleuterion* or on stone); the laws were probably not kept there until the late 4th cent., nor were private documents like *Epicurus’ will. Even after the creation of the Metroon, public inscriptions are regarded as authoritative texts. There is a general increase in documentation and hence of archive use from the 4th cent., though the extent and sophistication of archives in Egypt must be exceptional (cf. the piecemeal organization in 2nd-cent. Paros, *Chiron* 1983, 283 ff.). Public archives are increasingly used, and sometimes compulsory (*Arist. Pol.* 1321b), for private documents (contracts etc.) in the Hellenistic period. The registration of property and documentation of other transactions is particularly elaborate in Ptolemaic and Roman *Egypt.

Roman

(*tabularia*, from *tabulae* as ‘records’). Rome’s early records were rudimentary: lists of magistrates (*fasti*), copies of treaties, and priestly records, which were not systematically organized till the late 4th cent. The main archive was the *aerarium*, in the temple of Saturn, established in the early republic and supervised by urban quaestors. It contained copies of laws and decrees of the senate (*senatus consulta*), which were not valid until properly deposited (*Suet. Aug.* 94; *Plut. Cat. Min.* 16–18); also *acta senatus* (later), public contracts, records of

[*continued on p. 70*]

ARCHITECTURE

architecture

Greek

The forms of Greek architecture evolved essentially in the 7th and 6th cent. BC. After the collapse of *Mycenaean civilization, construction methods relapsed into the simplest forms of mud-brick and timber, mostly in small hut structures, the main exception being the great 10th-cent. apsidal building at *Lefkandi, over 45 m. (150 ft.) in length and flanked by wooden posts, supporting a thatched roof, a form echoed also in early structures at Thermum.

The development of the Archaic period centred on temples, which in terms of size and expense always constituted the most important building type in the Greek world. Some of the earliest examples such as the little temple of c.750 BC at Perachora retained the apsidal form, while one at Eretria (the early temple of *Apollo Daphnephoros) was curvilinear. This soon gives way to the rectangular cella, in major buildings entered by a porch at one end, balanced by a similar but false porch at the back (west Greek temples omit this in favour of an adytum, an internal room at the back of the cella) and surrounded by a colonnade. Such temples of the first part of the 7th cent. BC as that to Poseidon at Isthmia, and to *Hera at the Argive and Samian Heraia were, like Lefkandi, 'hundred-footers' (*hekatompeda*), with steps and footings of cut stone, possibly with wooden columns (at Isthmia the walls imitated timber-reinforced mud-brick but were constructed entirely in limestone; here the existence of external wooden columns is doubted). It is assumed these were already anticipating the forms of the Classical orders of architecture though there is no material proof of this.

Construction in stone, employing the Doric or Ionic orders, developed in the late 7th cent. BC, when the Greeks began to have direct experience of Egypt, learning the methods of quarrying and working stone. The architectural form of temples built early in the 6th cent. BC, the temples of *Artemis at Corcyra (Doric), and the House of the Naxians on *Delos—probably a temple of Apollo—(Ionic), shows that the arrangements and details of the orders were established by then, and in the case of Doric seemingly imitating forms evolved for wooden construction. Thereafter architecture as applied to temples is a matter of refinement and improvement, rather than radical development and change. Ionic architects (especially in the Cyclades) were already using marble in the early 6th cent. Limestone remained the normal material in the Peloponnese, even for major temples such as that of *Zeus at *Olympia (c.470 BC), and in the temples of Sicily and Italy, but the opening of the quarries of Pentelicon in the late 6th cent. led to the splendid series of Athenian marble temples of the 5th cent.

Refinement concentrated on detail: the balance of proportions in all parts of the structure, in the precise form of column, capital, entablature, and above all the decorative mouldings. Colour was also used, now generally lost from temples and other normal buildings but well preserved on the façades and interiors of the built Macedonian vaulted tombs of the 4th cent. and later (such as the royal tombs at Vergina; see AEGAE). Here the façades, which imitate temple and related architectural forms, have their painted decoration perfectly preserved because they were buried immediately after the decoration was added. The colours are harsh, positive blues and reds, with some patterning in contrasting yellow and gold. Refinement of architectural form involves the use of subtle curves rather than straight lines for the profiles of the columns: these evolve from the cruder curvature of early Doric, perhaps itself derived from the naturalistic curvature of Egyptian plant-form columns, and curvature of the temple base or crepis carried up to the entablature may be intended to correct optical illusion, as also the slight inward inclination of columns. Ionic buildings always used slender columns; Doric, very massive at first, becomes more slender—though the continued refinement into the Hellenistic period suggests that the 5th-cent. marble forms of Periclean Athens were not recognized as ideal and Ictinus' interest in the mathematical relationship of various parts, particularly the ratio $2^2:3^2$, demonstrated in the Parthenon, is not generally imitated.

The procedures of design employed by architects are uncertain. Scale plans are known in Egypt, but their use in Greece was probably restricted by lack of drawing material and the limitations of the Greek numerical system, particularly for fractions. Procedures were more likely based on experience and tradition, details of layout being worked out *in situ*. 'Examples' (*paradeigmata*), probably full-scale, of detailed elements would be supplied to the quarries and craftsmen as necessary. Structural systems were simple, based on the principle of post and beam, and

dimensions were restricted by the size of available timber beams, generally not more than 12 m. (39 ft.); more complex woodworking systems may have been used in Macedon, where the palace at Vergina has rooms with a free span of more than 16 m. (52½ ft.). Macedon also developed the vault in the 4th cent. BC but this was not utilized generally in Greek architecture except for the Macedonian tombs and, in Hellenistic times, for gateways in fortifications. In temple architecture there is no complexity of plan, apart from the totally exceptional Erechtheum at Athens.

Other building forms evolve more slowly, and are always influenced by concepts employed in temples. Usually they are less lavish, and economy in construction is an important factor. Colonnades, which had developed largely as a decorative or prestige factor, could be employed extensively in more utilitarian structures, either as free-standing buildings (stoas) or extended round courtyards, both providing scope for adding rooms behind the resulting portico, which could be put to a variety of purposes. As a result, a new principle of architectural design emerges. Temples were essentially free-standing buildings, viewed from the surrounding space. Buildings based on the courtyard principle, which by the 6th cent. had been adapted as the normal arrangement for Greek *houses, were intended to be seen from within, from the space they surrounded. These developments are seen in more progressive places, such as Athens in the 5th cent. BC, particularly in the buildings surrounding the Agora. Theatre structures (see THEATRES (GREEK AND ROMAN), STRUCTURE) were still relatively undeveloped, and the theatre at Athens did not attain architectural form until the construction of the stone-seated auditorium in the second half of the 4th cent. Buildings might now be more complex in plan, though simple rectangles, or rectangular courtyards, were still preferred, with single roof levels. Curvilinear forms are rare, restricted to a few circular buildings (such as the tholos, and the curvilinear auditorium of theatres). Some complex plans exist, such as the Propylaea to the Athenian acropolis (436–432 BC), or the near contemporary Erechtheum, but even here it can be seen that the architect is constrained to think in terms of the juxtaposition of rectangular blocks, though using different roof levels, rather than a fully integrated overall design.

It is the Hellenistic age which sees the widest application of Greek architectural forms, with developed arrangements, based on courtyard principles, for exercise grounds and planned agoras. Much structure remained in mud-brick and timber, but there was now more application of stone construction, with columns, to buildings other than temples. Here the simpler Doric order was generally preferred to Ionic. There are some distinctive regional or local developments such as the tall tenement houses of *Alexandria, of which some footings, in regular ashlar blocks, have been discovered. In *Pergamum idiosyncratic architectural forms evolve, employing the local stone, trachyte, not generally used in Greek architecture; but more significant here are the variations in traditional styles, such as the introduction of a palm-leaf capital, and walls formed from inner and outer skins of squared stone with rubble packing, as well as variations in the details of the conventional orders. In the Hellenistic period generally there is some impact of non-Greek architectural form; and although in Ptolemaic Egypt there is a distinctive separation between the Greek form and the continuation of an Egyptian tradition, the development of the more ornate Corinthian order, in the Seleucid kingdom particularly, may well reflect the influence of a local taste derived from earlier architectural usage.

The establishment of Roman authority over the former Hellenistic kingdoms did not lead to any abrupt change in forms of architecture. The troubled years of the early 1st cent. BC must have imposed something of a moratorium on building; but with the establishment of the Augustan Principate conditions favourable to construction returned. (There was something of a false dawn under *Caesar.) Buildings in Athens are either developed from Hellenistic prototypes (the Odeum of Agrippa) or conceived as Classical derivatives (the temple of Roma and Augustus on the Acropolis, based on the details of the Erechtheum). In Asia Minor the distinctive pulvinated masonry style of the 2nd cent. BC continues into the 1st cent. AD. Many of the public buildings of Ephesus were reconstructed in the 1st cent. AD in Hellenistic form. Temples in the Greek areas were normally built with a stepped crepis (though they may well employ the Corinthian order); only 'official' Roman buildings such as the temple of Trajan at Pergamum are based on podia with steps only at the front. In the 2nd cent. this gives way to a more universal Roman style, ornately decorated, habitually using column shafts of smooth, coloured marbles and other stones. Even so, the construction did not employ Roman concrete techniques, though mortared work, and brickwork, occur more regularly. See ATHENS (TOPOGRAPHY); URBANISM.

Roman

Roman architecture represents the fusion of traditional Greek elements, notably the trabeated orders, with an innovative approach to structural problems resulting in the extensive exploitation of the arch and vault, the evolution of a new building material, concrete, and, probably, the development of the roof truss. While the orders remained synonymous with the Greek-inspired architecture of temples and porticoes, it was the structural experiments which facilitated the creation of new building types in response to the different political, social, and economic conditions of Rome's expanding empire.

The importance of the orders reflects the early pre-eminence of temple architecture in central Italy, where the Tuscan order evolved probably under the inspiration of Archaic Greek Doric. By the 2nd cent. BC distinctive Italian forms of Ionic and Corinthian were also in widespread use beside more purely Hellenistic Greek forms. The fully Roman form of Corinthian, distinguished by the scroll-shaped modillions of the cornice, probably of Alexandrian origin, emerged as a concomitant to the growing use of marble in public building during the Augustan age. Among the numerous variants on the Corinthian capital, the most successful was the Composite, combining the acanthus-clad bell of the Corinthian with the diagonal volutes of the Italic Ionic. A purely decorative use of the orders, incorporating many features later to be associated with the Italian 'baroque', was particularly common in the 2nd and 3rd cents. AD, gaining impetus from the increasing availability of various precious marbles. Monumental columnar façades, two to three storeys high, decorated theatre stages throughout the empire, and the device was also employed in the eastern empire and at Rome for public fountains, *libraries, and large bath-buildings (*see* BATHS). Colonnaded streets also became popular.

New building types evolved in the 3rd and 2nd cents. BC, some, such as the *amphitheatre, purely Roman, while *baths and *theatres, for example, showed more influence from Hellenistic Sicily and Magna Graecia. Sophisticated timberwork allowed for the roofing of large spans in the basilica, covered theatre (*odeum*), and atrium house (*see* HOUSES, ITALIAN), while the adoption of barrel-vaulting for terracing structures such as villa platforms and monumental sanctuaries (e.g. sanctuary of Fortuna at Praeneste) provided the basic structural system later used in utilitarian buildings such as the Porticus Aemilia and in free-standing theatres and amphitheatres. The high status of the orders in Roman architectural thought led to them being applied as decorous adjuncts to arcuated façades already by the late republic (e.g. the Forum façade of the Tabularium), a motif which found full expression in buildings such as the theatre of Marcellus and the *Colosseum and which was to have a strong influence on Renaissance and later architecture.

The decisive developments in Roman concrete architecture in the early imperial period also took place in the context of domestic or non-traditional building types, such as *Nero's *Domus Aurea* (Golden House), *Domitian's palace on the Palatine, and Hadrian's villa at Tibur as well as the great imperial baths, which in turn influenced the later Basilica of Maxentius; the Pantheon, as a temple, is exceptional. The flexibility and structural properties of the new material were used to create an architecture in which the dominant factor was not the solid masonry but the space which it enclosed. Instead of the structural rationality and sculptural quality of Classical Greek architecture, this was an architecture of illusion and suggestion, inspired by the ephemeral pavilions of Hellenistic palaces, in which subtly curvilinear forms based on complex geometries in plan and elevation, splendidly lit and clothed in light-reflecting material such as marble veneer and coloured-glass mosaic, contrived to negate the solidity of the structures themselves. Here too the columnar orders often formed an integral part of the visual effect, e.g. in the *frigidaria* of the imperial bath-buildings, although their structural role was generally negligible. Treatment of exteriors remained simple and traditional, often decorated in either veneer or stucco imitation of ashlar, although in the later empire the curves of the vaults were often allowed free expression outside as well as inside (e.g. the Hunting Baths at Lepcis Magna). It was this exploitation of interior space which found its logical conclusion in the architecture of Byzantium and remains the most important Roman contribution to all subsequent architectural thought.

JD

official oaths, lists of public debtors, and Marcus *Aurelius' new register of Roman births. It is unclear how strictly the archives were separated from the *aerarium's* financial functions; the closely associated monumental complex nearby on the slopes of the Capitol certainly contained a *tabularium* (CIL 1². 737), though its conventional identification as a Public Record Office is incorrect (it may in fact be the Atrium Libertatis). Romans continue to speak of records going into the *aerarium* (e.g. Tac. *Ann.* 3. 51). Access was not always straightforward (see RECORDS AND RECORD-KEEPING, ATTITUDES TO). Another archive was used by the *plebs* in the temple of Ceres (holding *plebiscita* and *senatus consulta*); censors' records went into the temple of the Nymphs and Atrium Libertatis; and private archives, e.g. of ex-officials, were also commonly kept (cf. Cic. *Sull.* 42). Inscriptions, like the bronze tablets of laws visible on the Capitol, formed a public source of reference. Under the empire, the focus is increasingly on the emperor's archival records, often called the *tabularium principis*: the emperor's *commentarii* (memoranda) included imperial edicts and letters (cf. Plin. *Ep.* 10. 65, 66); *commentarii* recording grants of Roman *citizenship (recorded in the *tabula Banasitana*) were established by *Augustus (JRS 1973, 86 ff.). RT

Ares, the Greek war-god as embodiment of the ambivalent (destructive but often useful) forces of war, in contrast to Athena who represents the intelligent and orderly use of war to defend the *polis.

The name is perhaps attested on Linear B tablets from Cnossus and, in a theophoric name, from Thebes. In *Homer's *Iliad*, his image is mostly negative: he is brazen, ferocious, 'unsatiable with war', his cry sounds like that of 'nine or ten thousand men', Zeus hates him (*Il.* 5. 890 f.), he fights on the Trojan side, his attendants are Deimos 'Fear' and Phobos 'Panic', and he is often opposed to *Athena (see esp. *Il.* 15. 110–42). On the other hand, a brave warrior is 'a shoot from Ares', and the Danaï are his followers. In epic formulae, his name is used as a noun ('the frenzy of fighting'); this must be metonymy, although the god's name could have originated as a personification of the warrior's ecstasy (Ger. *wuot*). As with the ecstatic *Dionysus, the myth (*Il.* 13. 301) of his origin in Thrace (roughly mod. Bulgaria) illustrates this position outside the ordered, 'Greek' world of the *polis and has no historical value.

Mythology makes Ares the son of *Zeus and *Hera (Hes. *Theog.* 922, together with their daughters Hebe and Eileithyia), thus inscribing him in Zeus' world-order, and the lover of *Aphrodite (*Od.* 8. 267–366) whose eroticism is at least as liable to subvert the polis order (as her birth-legend and some rites suggest). Offspring of Ares

and Aphrodite are Deimos and Phobos (Hes. *Theog.* 934), *Eros (Simonides, 575 PMG; it underlines the subversive aspect of Eros), the artificial Anteros (Cic. *Nat. D.* 3. 60), and Theban Harmonia. Among other children of Ares, unruly and disruptive figures abound (Diomedes the Thracian, Cycnus the brigand, Phlegyas the eponym of the ferocious Phlegyans).

Cults of Ares are rare, and details for ritual lacking; what we know confirms the god's distance to the polis centre (for Athens: Parker, *Polytheism* 398). Temples are known chiefly from Crete (Cnossus, Lato, Biannos, perhaps Olus) and the Peloponnese (Argos, Troezen, Megalopolis, Therapne, Geronthrae, Tegea), but also from Athens and Erythrae. Cretan towns offer sacrifices to Ares and Aphrodite (ML 42), who appear in interstatal and ephebic oaths; their combination seems to be typical for Archaic bands of warriors (see Plut. *Pel.* 19 who associates them with the homosexual bond among young warriors). See HOMOSEXUALITY. The Tegean women sacrifice to Ares *gunaikothoinas*, 'Who feasts the women' (Paus. 8. 48. 4), in a ritual of reversal which fits the nature of Ares. In Athens, he has a temple in Acharnae and a priest together with Athena Areia, and the two figure in the ephebic oath as the warlike protectors of the city's young soldiers, together with the pair Enyo and Enyalios.

In Thebes, mythology makes him the ancestor of the town (Aesch. *Sept.* 105): Cadmus slays the dragon whom some authors declare to be the offspring of Ares (schol. Soph. *Ant.* 126) and marries Harmonia, the daughter of Ares and Aphrodite. Actual Theban cult, however, is extremely reticent about Ares: again, he as well as Harmonia seem to belong to the Archaic heritage of warfare (see above); given his nature, it would be impossible to make him the central deity of a town.

In literature from Homer onwards, Ares is identified with Enyalios (e.g. *Il.* 13. 519 and 521, 17. 211, but see *Il.* 2. 651, etc.) whose name Homeric formulae also use as a noun and who is attested in Mycenaean Cnossus. In cult, the two are functionally similar but distinct war-gods, sometimes with cults in the same town; Enyalios is especially common in NE Peloponnese, but receives a marginal dog-sacrifice in Sparta (Paus. 3. 14. 9) where his cult statue was fettered (Paus. 3. 15. 7).

In Rome, Ares was identified with *Mars; the Augustan temple of Ares on the Athenian Agora (perhaps the transferred 4th-cent. temple of Acharnae) meant Mars as the ancestor of Rome; Greek Ares would have been unthinkable on an agora.

In early art, Ares appears exclusively in mythological scenes, together with the other gods (divine assemblies, as for the wedding of Peleus and Thetis or on the

Parthenon frieze). First a bearded warrior, he is later shown naked and young (Parthenon frieze), as a warlike ephebe (see GYMNASIUM) with whom not only the Athenians connected him. See MARS. FG

Aristophanes, the greatest poet of the Old Attic Comedy (see COMEDY (GREEK), OLD), was a native of *Athens and a member of the Athenian deme (local district) Kydathenaion. He was the son of Philippus and he himself had at least two sons, of whom at least one (Ara-ros) and possibly both were themselves composers of minor comedies. It has been inferred from *Ach.* 652 ff. that he lived, or owned property, on the island Aegina. Since he seems not to have produced his first two plays himself, and since he considered himself too young in 427 BC (*Ar. Nub.* 530 f. with schol.) to produce a play himself, he is unlikely to have been born earlier than 460 and may have been born as late as 450. He died in or shortly before 386. Eleven of his plays survive; we have in addition 32 titles (some of them alternative titles, and some certainly attributed to other authors) and nearly a thousand fragments and citations. Many of these are fragments in the literal sense of the word: phrases or single words. The surviving plays, and the datable lost plays (°) are:

427: °*Banqueters*, produced by Callistratus. It contained (frs. 198 and 222 and *Nub.* 529 with scholiast) an argument between a profligate son and his father and also between the profligate and a virtuous young man.

426 (City Dionysia): °*Babylonians*, produced by Callistratus. Dionysus was a character in the play (fr. 70), and by its 'attacks on the magistrates' it is said to have provoked a prosecution—apparently unsuccessful—by Cleon (schol. *Ar. Ach.* 378).

425 (Lenaean, first prize): *Acharnians* ('*Ach.*'), produced by Callistratus; the 'hero' makes, and enjoys to the full, a private peace-treaty.

424 (Lenaean, first prize): *Knights* ('*Eq.*'), produced by Aristophanes himself; Cleon is savagely handled and worsted in the guise of a favourite slave of Demos, and a sausage-seller replaces him as favourite.

423 (City Dionysia, bottom prize): *Clouds* ('*Nub.*'), ridiculing *Socrates as a corrupt teacher of rhetoric. We have only the revised version of the play, dating from the period 418–416; the revision was not completed and was never performed (schol. *Nub.* 552).

422 (Lenaean, second prize): *Wasps* ('*Vesp.*'), produced by Philonides, ridiculing the enthusiasm of old men for jury-service.

421 (City Dionysia, second prize): *Peace* ('*Pax*'), celebrating the conclusion of peace with Sparta.

414 (Lenaean): °*Amphiaraus*, produced by Philonides (hyp. 2 *Ar. Av.*).

414 (City Dionysia, second prize): *Birds* ('*Av.*'), produced by Callistratus, a fantasy in which an ingenious Athenian persuades the birds to build a city in the clouds and compels the gods to accept humiliating terms.

411: *Lysistrata* ('*Lys.*'), produced by Callistratus, in which the citizens' wives in all the Greek states compel their menfolk, by a 'sex strike', to make peace; and *Thesmophoriazusae* ('*Thesm.*')—datable in relation to *Euripides' *Helena* and *Andromeda*, and by political references—in which the women at the Thesmophoria plan to obliterate Euripides, and an elderly kinsman of his takes part in their debate, disguised as a woman.

408: the first °*Plutus* (schol. *Ar. Plut.* 173).

405 (Lenaean, first prize): *Frogs* ('*Ran.*'), produced by Philonides (again?, but the name is common in Attica), in which *Dionysus goes to *Hades to bring back Euripides, finds that he has to be the judge in a contest between *Aeschylus and Euripides, for the throne of poetry in Hades, and ends by bringing back Aeschylus.

392: *Ecclesiazusae* ('*Ecll.*'); the date depends on a partially corrupt scholium or ancient textual note (on *Ecll.* 193) and on historical references, and a case can be made for 391. In this play the women take over the running of the city and introduce community of property.

388: the second *Plutus* ('*Plut.*'), in which the god of wealth is cured of his blindness, and the remarkable social consequences of his new discrimination are exemplified.

After 388: °*Aiolosikon* and °*Cocalus*, both produced by Araros (hyp. 4 *Ar. Plut.*). *Cocalus* anticipated some of the characteristics of Menander, according to *Vit. Ar.* 1 pp. 1, 3.

In the first period, down to 421, Aristophanes followed a constant procedure in the structure of his plays, particularly in the relation of the parodos (entry of the chorus) and the parabasis (address by the chorus to the audience) to the rest of the play. From *Av.* onwards we see significant changes in this procedure, culminating, in *Ecll.* and *Plut.*, in the introduction of choral songs irrelevant to the action of the play (indicated in our texts by the word *chorou*), and in *Plut.* the chorus seems, for the first time, something of an impediment to the unfolding of the plot (see COMEDY (GREEK), MIDDLE). At the same time *Ecll.* and *Plut.* show a great reduction (though not a disappearance) of strictly topical reference. The evidence suggests that Aristophanes was a leader, not a follower, in the changes undergone by comedy in the early 4th cent. BC. Aristophanes' language is colourful and imaginative, and he composes lyric poetry in every vein, humorous, solemn, or delicate. He has a keen eye and ear for the absurd and the pompous; his favoured weapons are parody, satire, and exaggeration to the point of fantasy, and his favourite targets are men prominent in politics,

contemporary poets, musicians, scientists, and philosophers, and—as is virtually inevitable in a comedian writing for a wide public—manifestations of cultural change in general. His sympathetic characters commonly express the feelings of men who want to be left alone to enjoy traditional pleasures in traditional ways, but they are also ingenious, violent, and tenaciously self-seeking in getting what they want. The recurrence of the theme of peace in Ar. (*Ach.*, *Pax*, *Lys.*) has given rise to the notion that he was a ‘pacifist’. In so far as that implied that he would try to turn aside a spear by a sermon, the notion was mistaken. Greeks killed readily in defence of their own territory, but were also aware that a secure peace is enjoyable. Having been born into a radical democracy which had been created and strengthened by his father’s and grandfather’s generations, Aristophanes nowhere advocates oligarchic reaction, least of all in 411, when this reaction was an imminent reality. His venomous attack on Cleon in *Eq.* is adequately explained by Cleon’s earlier attack on him, whether or not this in fact took the form of a ‘prosecution’ (see above), and his treatment of other politicians does not differ significantly from the way in which ‘we’ satirize ‘them’ nowadays. No class, age group, or profession is wholly exempt from Aristophanes’ satire, nor is the citizen-body as a whole, and if we interpret his plays as moral or social lessons we never find the lesson free of qualifications and complications. In *Eq.* Cleon is worsted not by an upright and dignified man but by an illiterate and brazen cynic who beats him at his own game. In *Nub.* Socrates’ ‘victim’ is foolish and dishonest, and in the contest between Right and Wrong, Right, who is characterized by bad temper, sexual obsession, and vacuous nostalgia, ends by ‘deserting’ to the side of Wrong. In *Thesm.* Euripides, sharply parodied in much of the play, triumphs in the end. In *Ran.* the end of the contest between Aeschylus and Euripides finds Dionysus in a state of complete irresolution. Modern sentiment admires the heroine of *Lys.*, but possibly Aristophanes and his audience found preposterous much in her which seems to us moving and sensible. Aristophanes’ didactic influence (as distinct from his influence in raising the intellectual and artistic standards of comedy) does not seem to have been significant. Plato (*Ap.* 18bc, 19d) blames him for helping to create mistrust of Socrates. On the other hand, *Ach.* and *Lys.* do not seem to have disposed the Athenians to negotiate for peace (*Pax* did not mould public opinion, but fell into line with it), and Cleon was elected to a generalship shortly after the first prize had been awarded to *Eq.* The fact that Aristophanes survived not only Cleon’s attacks but also (with other comic poets) two oligarchic revolutions (see DEMOCRACY, ATHENIAN) and two democratic restorations should not be forgotten.

Aristophanes was intensively studied throughout antiquity, and the plays which are now lost, as well as those which have survived, were the subject of commentaries (cf. schol. Ar. *Plut.* 210).

Aristotle (see facing page)

armies, Greek and Hellenistic Apart from what little archaeology can tell us, our earliest evidence comes from *Homer, but it is uncertain how far the poems can be taken as depicting real warfare. To some extent, what happens on Homeric battlefields is dictated by the nature of the poetry. However, with the possible exception of those from Locris (*Il.* 13. 714 ff.), all troops are implied to be of the same type, and there is no cavalry, even the chariots not being organized as a separate force and only rarely being used for a massed charge (e.g. 15. 352 ff.), despite Nestor’s advice (4. 303 ff.). Nestor also recommends subdivision into *phylai* (‘tribes’) and *phratris* (2. 362 f.), and other passages suggest organization into lines and files (e.g. 3. 77, 4. 90), but the constant use of the throwing-spear implies a loose formation except in particular circumstances (e.g. 16. 211 ff.).

By Tyrtaeus’ time, the fundamental distinction between ‘heavy’ infantry fighting hand-to-hand and ‘light’ missile-armed infantry, has appeared, at any rate in *Sparta, but the chariot has disappeared, and there is still no cavalry. What organization there is, is based on the three Dorian *phylai*. Archaeological evidence confirms that by the mid-7th cent. BC hoplites had appeared, and thereafter, for some three centuries, they dominated the battlefield, though some states (e.g. *Macedonia and *Thessaly) relied more on cavalry and the Boeotians also had fine cavalry in addition to hoplites. Some of the less urbanized areas (e.g. Aetolia) also still tended to make more use of light, missile-armed troops, and all states probably had them. Most armies seem to have been recruited on a local basis. For instance, after the reforms of *Cleisthenes, Athenian hoplites were divided into ten units (*taxeis*) based on the ten *phylai*, and the cavalry was similarly divided into two groups of five units.

Most Greek troops were essentially militia. Cavalry and hoplites were drawn from the more well-to-do since they mostly provided their own equipment. Possibly for this reason, there appears to have been little or no training at least until the 4th cent., and very little organization. The smallest unit in the Athenian army, for example, seems to have been a *lochos*, probably consisting of several hundred men, and the same may have been true of the Argive and Theban armies.

[continued on p. 78]

ARISTOTLE

Aristotle (384–322 BC), philosopher, pupil of *Plato, was born in Stagira in Chalcidice.

1. His father Nicomachus, a member of the medical guild of the Asclepiadae (see ASCLEPIUS), was court physician to Amyntas II of Macedonia, and Aristotle may have spent part of his childhood at the court in Pella. Although his interest in biology may have developed early because of his father's career, there is no evidence that he began systematic study. Asclepiad doctors taught their sons dissection, but Aristotle probably did not receive this training, since both of his parents died when he was extremely young.

2. At the age of 17 he travelled to Athens and entered Plato's *Academy, remaining until Plato's death in 348/7 BC. Plato's philosophical influence is evident in all of Aristotle's work. Even when he is critical (a great part of the time) he expresses deep respect for Plato's genius. Some scholars imagine that no dissent was tolerated in the Academy; they therefore conclude that all works in which Aristotle criticizes Plato must have been written after Plato's death. This is implausible. Plato's own work reveals a capacity for searching self-criticism. Frequently these criticisms resemble extant Aristotelian criticisms. An attractive possibility is that the arguments of his brilliant pupil were among the stimuli that led Plato to re-examine his own ideas.

3. At Plato's death Aristotle left Athens, probably because of political difficulties connected with his Macedonian ties. (He may also have disapproved of the choice of Speusippus as Plato's successor.) Accepting an invitation from Hermias, ruler of Assos and Atarneus in the Troad and a former fellow student in the Academy, he went to Assos, where he stayed until Hermias' fall and death in 345, marrying his adopted daughter Pythias. While at Assos, and afterwards at Mytilene on Lesbos, he undertook extensive biological research on which his later scientific writings are based. (The treatises refer frequently to place-names and local species of that area.) His observations, especially in marine biology, were unprecedented in their detail and accuracy. (His work remained without peer until the time of Harvey (1578–1657), and was still much admired by Darwin. Many of his findings are only now being replicated or confirmed, with the assistance of the microscope.)

4. Invited by *Philip II of Macedon to Pella in 342 BC, Aristotle became tutor to Philip's son *Alexander the Great. His instruction focused on standard literary texts, but probably also included political theory and history. Aristotle's opinion of his pupil's philosophical ability is unknown, but in later years their relationship was distant. In the *Politics* Aristotle writes that rule by a single absolute monarch would be justified only if the person were as far superior to existing humans, in intellect and character, as humans are to beasts. He conspicuously fails to mention any case in which these conditions have been fulfilled.

5. In 335, after a brief stay in Stagira, Aristotle returned to Athens. As a resident alien (*metic) he could not own property, so he rented buildings outside the city, probably between Mt. Lycabettus and the Ilissus. Here, in what was called the Lyceum, he established his own school. (The school later took its name from its colonnade or *peripatos*.) He delivered some popular lectures, but most of his time was spent in writing or lecturing to a smaller group of serious students, including some, such as Theophrastus and Eudemus, who achieved distinction. He amassed a considerable library, and encouraged his students to undertake research projects, especially in natural science and political history (where he projected a collection of historical and comparative descriptions of 158 regimes).

6. Pythias died early in this period; they had one daughter. For the rest of his life Aristotle lived with a slave-woman named Herpyllis, by whom he had a son, Nicomachus. Although in his will Aristotle praises Herpyllis' loyalty and kindness, he freed her from legal slavery only then. On the death of Alexander in 323 BC, an outbreak of anti-Macedonian feeling forced Aristotle to leave Athens once again. Alluding to the death of *Socrates, he said that he was leaving lest the Athenians 'sin twice against philosophy'. He retired to Chalcis, where he died in 322 of a digestive illness.

7. Aristotle left his papers to Theophrastus, his successor as head of the Lyceum. *Strabo reports that Theophrastus left them to Neleus of Scepsis (in Asia Minor), whose heirs hid them in a cellar, where they remained unused until a rich collector, Apellicon, purchased them and brought them to Athens early in the first century BC. Current opinion takes Strabo's story to be seriously misleading. Some of Aristotle's major works were clearly used by his successors in the Lyceum, as well as by *Epicurus and numerous Alexandrian intellectuals (see ALEXANDRIA), although at this stage the works were not edited in the form in which we know them. A list of Aristotle's works, probably dating from the 3rd cent. BC, appears to include most of the texts we know, under some description, as well as some now lost. Among the

lost works are dialogues, some of which were still well known in *Cicero's Rome. Apparently their style was different from that of the extant works: Cicero describes it as 'a golden river'. We can reconstruct portions of several lost works through reports and citations.

8. When *Sulla captured Athens (86 BC), Apellicon's collection was brought to Rome, where it was edited around 30 BC, by Andronicus of Rhodes, whose edition is the basis for all subsequent editions. Andronicus grouped books into works, arranged them in a logical sequence, and left copious notes about his views on authenticity. We possess most of the works he considered genuine and important, in manuscripts produced between the 9th and 16th cents. The transmission during the intervening period is represented by several papyrus fragments. Greek commentaries produced between the 3rd and 6th cents. AD often testify to manuscript readings that are now lost, and hence can assist with establishing the text.

9. The extant works may be classified as follows:

(a) Logic and Epistemology: *Categories*, *De interpretatione*, *Prior Analytics*, *Posterior Analytics*, *Topics*, *Sophistici elenchi* (= *Top.* 9).

(b) Metaphysics, Nature, Life, and Mind: *Physics*, *Metaphysics*, *De caelo*, *De generatione et corruptione*, *Meteorologica* (bk. 4 of dubious authenticity), *Historia animalium*, *De partibus animalium*, *De motu animalium*, *De incessu animalium*, *De generatione animalium*, *De anima*, *Parva naturalia* (including *De sensu*, *De memoria*, *De somno*, *De somniis*, *De divinatione per somnum*, *De longitudine et brevitate vitae*, *De iuventute*, *De respiratione*).

(c) Ethics, Politics, Art: *Eudemian Ethics*, *Nicomachean Ethics*, *Politics*; *Magna moralia* (probably not written up by Aristotle, but closely based on Aristotelian lectures); *Athēnaiōn politeia* (authorship disputed); *Rhetoric*; *Poetics*.

Of the works surviving only in fragments, the most important and substantial is *Peri ideōn* (*On the Forms*), a critical discussion of Plato's theories; also significant are the dialogues *On Philosophy* and *On the Good*, and the *Protrepticus*.

Clearly spurious works transmitted along with the corpus include *De mundo*, *De spiritu*, *De coloribus*, *De audibilibus*, *Physiognomonica*, *De plantis*, *De mirabilibus auscultationibus*, *Mechanica*, *Problemata* (a compilation of materials from the school), *De lineis insecabilibus*, *Ventorum situs*, *De Melisso*, *Xenophane*, *Gorgia*, *De virtutibus et vitiis*, *Oeconomica*, *Rhetorica ad Alexandrum*.

10. Many questions have been raised about the status of the 'Aristotelian corpus'. The most plausible view is that the extant treatises are written lectures. The exact wording of most of the material is Aristotle's. We cannot assume that the order of books within a treatise, or even the grouping of books into a single treatise, is Aristotle's own. The titles and many introductory and concluding sentences are likely to be the work of later editors. Cross-references may be genuine if well integrated with their context. Throughout we are faced with textual problems, some of which require the transposition of substantial passages for their solution. Some sections, furthermore, may have been left poorly organized by Aristotle himself, and are best regarded as assorted notes that were never worked into a finished discussion (for example, *De anima* 3. 6–7). The most serious philosophical problems raised by the state of the corpus come from its duplications: (a) multiple discussions of a single problem, and (b) a single discussion repeated in more than one context. There are many cases of the first type; here we must ask whether differences amount to incompatibility or are best explained by a difference of perspective or starting point. Doublets of the second type may be very brief, or they may be several books long; sometimes repetition is verbatim, sometimes with changes. *Metaphysics* 1 and 13 have many chapters in common, with small but significant changes. *Metaphysics* 11 compiles material from other books of the *Metaphysics* and the *Physics*. Books 5–7 of the *Nicomachean Ethics* also appear as books 4–6 of the *Eudemian Ethics*. In each case, we must ask how likely it is that Aristotle himself would have put the repeated portion in both contexts himself. If such a hypothesis creates problems with the overall argument of the work, we should ask whether it is clear that Aristotle himself must have noticed those problems.

11. The medieval tradition regarded Aristotle's work as a closed, consistent system without internal chronological development. This view of the corpus was undermined in the 20th cent. by Werner Jaeger's important work, which stressed the flexible undogmatic character of Aristotle's philosophizing (and argued, controversially, for a particular chronological story of Aristotle's development). In the aftermath of Jaeger, scholars sometimes went to an opposite extreme, making irresponsible use of developmental explanations. In general, it is crucial to recognize the extent to which Aristotle's problems and questions in a particular work dictate his approach to an issue.

12. Aristotle was the first Greek philosopher to attempt a general account of validity in inference. The *Prior Analytics* is thus a towering achievement; though displaced in the Hellenistic period by Stoic propositional logic, it became the dominant account of formal logic from the early Middle Ages until the early 20th cent. The *Topics* and the *Sophistici elenchi* show Aristotle's keen interest in methods of dialectical argumentation and in the analysis of common fallacies and paradoxes; they give us a vivid picture of the philosophical culture of Aristotle's time.

13. In the *Posterior Analytics* Aristotle sets out the conditions under which scientific demonstration will convey genuine understanding (*epistēmē*). Conclusions must be deducible, ultimately, from first principles that are true, basic, necessary, and explanatory of the other conclusions of the science. The scientist has understanding when he is able to show how the more basic principles of his science explain the less basic. (Hence understanding must always be of the universal, since particulars cannot become part of a deductive explanatory structure; this does not, however, cast any doubt on our grasp of particulars.) *Posterior Analytics* 2. 19 argues that understanding is ultimately derived from experience of many particulars, and requires what he calls *nous* concerning the first principles. Although *nous* has often been taken to be a special faculty of mind that grasps first principles a priori, it is probably best understood to be mental insight into the explanatory role of principles that the thinker knows and uses already on the basis of experience. Thus Aristotelian science does not require an a priori foundation.

14. In *Metaphysics* 4, Aristotle defends two fundamental logical principles: the Principle of Non-Contradiction and the Principle of the Excluded Middle. Non-Contradiction, which is called 'the most basic starting point of all', is established not by a proof from other principles, but by an 'elenctic demonstration', i.e. one that establishes that the opponent who challenges this law actually must rely on it if he is to think and speak at all. For to say anything definite he must rule something out—at the least, the contradictory of what he sets forth.

15. Throughout his work Aristotle is intensely concerned with experience, including the experience recorded in what people typically say. He often begins an inquiry, in science as well as in ethics, by 'setting down the *phainomena*', the 'appearances', which usually include perceptual observation and reputable beliefs, frequently finding these embodied in language. Aristotle clearly believes that scientific inquiry involves examining common conceptions as well as looking at the world; indeed the two frequently interpenetrate, as in the inquiries into time and place in the *Physics*. Aristotle also carefully surveys the views of reputable past thinkers who have approached a problem. As he states at the start of his inquiry into number in *Metaphysics* 13, he hopes thereby to avoid making the same mistakes, and to progress somewhat beyond what has been previously accomplished. Although we may find fault with his treatment of some previous thinker, he was the first to make engagement with the ideas of other philosophers a central part of his method.

16. 'Metaphysics' is not really an Aristotelian term. If Aristotle or his ancient editors used it, they were probably only referring to the position of the work in question 'after the *Physics*'. Aristotle's study of the most general characteristics of things was to set the agenda for subsequent metaphysics. Although Aristotle's account of his central question about that which is (*to on*), as being a question of *ousia*, for both his predecessors and himself, is not perspicuous, since *ousia*, usually translated 'substance', is itself just a verbal noun formed from the verb 'to be'. But we can get a much better idea of what he is talking about from what he actually does in the text. When he asks what substance is, he seems to have two questions in mind: one about *change*, and one about *identity*. First, our experience of nature is constantly bound up with change—the cycle of the seasons, changes in living bodies—so any account of nature needs to speak coherently about process. Following Plato's *Theaetetus*, Aristotle holds that speaking about change must presuppose that we can single out some entities as (relatively) stable 'subjects' or 'substrates' (*hupokeimena*) of change, things to which the change happens. Second, in order to talk about the world we need to answer the question 'What is it?' about items in the world. This means being able to say what makes this individual the very thing it is, separating that aspect from other attributes that could be absent and yet the individual would still be the same thing. This 'what is it?' question is seeking what we now call the thing's 'essence' (this term being the Latin word that Cicero used for Aristotle's odd yet homely term, *to ti ēn einai*, 'the what it is to be'). Aristotle's two metaphysical questions seem to point in opposite directions: the first suggests that matter is the basic substance, since it persists while animals and people are born and die; the second suggests that essences are universals, since 'human being' or 'tree' seem promising answers when we ask 'what is it?' about particular things. But Aristotle thinks that the two will ultimately converge on a single account of the basic substances. For any adequate theory of change must single out as its substrates items that are not only relatively enduring, but also definite and distinct; and any account of the essence of a particular should enable us to say what changes it can undergo while still remaining one and the same.

17. Aristotle pursues the two prongs of his question through several treatises, with results that appear to undergo development and are always difficult to interpret. In the early *Categories*, Aristotle argues that the ‘primary substances’ and substrates of change are physical individuals, such as ‘this human being’ and ‘this horse’ (as contrasted both with individual qualities, quantities, relations, etc., and also with universals of all types). On the other hand, we can only individuate and identify them via ‘secondary substances’, species universals such as ‘human being’ and ‘horse’. Unlike Platonic forms, secondary substances have no existence apart from physical individuals, but they are fundamental to our grasp of them. In *Physics*, and *De generatione et corruptione*, Aristotle brings matter into the picture and asks about its relation to form or organization. Although he ultimately rejects the notion that a thing’s matter is substance, and more basic than its organization, he is apparently driven to grant that some cases of change—the comings-to-be and passings-away of substances—have to be explained with reference to material substrates.

18. Aristotle’s culminating inquiry into substance, in *Metaphysics* 7–8, is the subject of endless interpretative controversy. On one plausible reading, Aristotle concludes that the most basic substrates are also the essences of things, and that both of these are identical with the *form* (*eidos*) of a thing as a member of a certain species, for example, the humanness (characteristic human organization) of Socrates. This form is a particular in the sense that Socrates is a distinct human being from Coriscus; on the other hand, the account of Socrates’ essence or form mentions only those features he shares with other species members. In other words, what Socrates really is, and what must remain the same about him while other attributes change, is his characteristic species organization.

19. Other major topics in Aristotle’s metaphysical work include *potentiality* and *actuality* (concepts linked to substance and invoked in explaining the forms of living things); *number* (Aristotle attacks the Platonist separation of numbers from things); *unity* (organic living beings are more unified than artefacts); and the nature of the *study of being* itself (it may become a general study with substance as its focal point). In *Metaphysics* 12, Aristotle articulates his idea of god as an eternally active and unaffected substance, whose activity is thinking and who inspires movement in the heavenly spheres by becoming an object of their love.

20. According to the *Metaphysics* philosophy developed as a search for explanations of natural events that inspire wonder. In the *Physics* Aristotle describes the types of explanation a natural philosopher should give. He suggests that there are four basic ways in which we can answer the question ‘Why?’ about a thing or a state of affairs: first, we may cite the materials of which the thing is composed. This answer is inadequate on its own, since we need to be able to pick out the thing as a structure of a certain sort before we can enumerate its constituents. Second, we may mention a thing’s form or characteristic organization. Third, we may mention some agent or event that made the event or thing come about—this sort of answer is called by Aristotle ‘the origin of change’, and by the tradition ‘the efficient cause’. Finally, we may mention ‘the end’ or ‘that for the sake of which’ a thing is (its ‘final cause’). To explain processes or subsystems of creatures, we need to show how they contribute to the overall functioning of the creature. So the characteristic organization of a species turns out to be an ‘end’ towards which processes should be seen as contributing. Whether Aristotle also invokes this kind of purpose explanation for the relation of one species to another is highly uncertain, as is the question whether such explanations apply to the non-living. The *Physics* also contains valuable discussions of place, time, and the nature of change.

21. Aristotle’s work on *psychē* (*De anima*) is a general study of life and the living. After criticizing materialist and Platonist accounts of *psychē*, he defends the view that *psychē* is the substance of a living thing; he argues that this substance will be not its material constituents but its form. His working definition is that *psychē* is the ‘first entelechy of a natural organic body’. ‘First entelechy’ (or first actuality) takes the place of ‘form’ in order to stress the fact that it is not the actual functioning (e.g. actually seeing or thinking) that is the *psychē*, but the not yet actualized readiness, not mere potentiality but something that is already at the first stage of being equipped to function. ‘Organic’ means ‘equipped with tools suitable for performing the functions’. Aristotle proceeds to provide concrete accounts of self-nutrition, reproduction, perceiving, imagining, and thinking; these inquiries are further developed in the *Parva naturalia* and, in some cases, the biological writings.

22. Aristotle’s ethical treatises search for an adequate account of *eudaimonia*, a term usually translated ‘happiness’, but which might more perspicuously be understood as ‘human flourishing’. Although he thinks that there is general agreement that *eudaimonia* is the ‘target’ of human choice, and that it involves being active, there is no clarity on what it is to flourish. On reflection we find that common candidates such as pleasure and honour are inadequate; instead it must be ‘activity of soul in accordance with complete excellence’. But this is a complex comprising many constituent elements; there are excellences of character (such as courage, moderation, generosity, justice), which are, he suggests, stable dispositions to choose activities and to have responses that are in accordance with a ‘mean’, which is neither

excessive nor deficient in each area of choice. The standard is set by the choices that would be made by a 'person of practical wisdom': that is, it is set by reference to paradigms of human excellence. Excellence of character requires and is required by practical wisdom, which is itself an excellence of the intellect.

23. Aristotle holds that practical wisdom requires a grasp of many particulars. This comes through experience. As in medicine and navigation, good judgement (in both law and ethics) requires not only a grasp of rules, but also an ability to adjust one's judgement to the current situation. Aristotle's account of 'equity' (*epieikeia*) in public judgement is continuous with reflections in the Greek orators; it has had enormous influence in the history of western law. His important reflections on voluntary action, excusing factors, and choice (*prohairesis*), all develop out of his work on practical wisdom and happiness.

24. Friendship (*philia*), Aristotle holds, is a crucial element in a good human life. Even if one were free of need and doing well in all other respects, one would still view life as not worth living without friends. Although any genuine friendship requires mutual awareness and mutual activity seeking to benefit the other for the other's own sake, friendships come in different types. There are friendships based on pleasure, based on utility, and based on goodness of character, the last being the truest and most stable.

25. In two separate discussions Aristotle argues that pleasure is not equivalent to the good, though his accounts of pleasure differ, and may not be compatible. In the final book of the *Eth. Nic.* he then goes on to praise a life devoted to contemplating the eternal. He appears not to treat this activity as just one among many constituents of *eudaimonia*, but as something of supreme value, to which maximal attention should be given where possible. Scholars have long disagreed about these chapters, whether they conflict with the inclusive picture of *eudaimonia* in the rest of the work; incompatibilist interpretations have much force. But however we resolve this puzzle, the chapters are evidence of Aristotle's high evaluation of the contemplative life. This problematizes some simple-minded accounts of the relationship between Aristotle's ethical thought and Plato's.

26. The investigation of human flourishing is also part of the science of politics, since legislators need to know about human ends in order to design schemes that promote these ends. But *political theory requires, in addition, a critical and empirical study of different regimes, and an attempt, on that basis, to consider what the best form of government would be. In the process, Aristotle makes Greek philosophy's most distinguished contribution to *economic theory.

27. In the *Rhetoric*, Aristotle's great rhetorical treatise, he argues, against Plato, that rhetoric can be a systematic science. Defining rhetoric as 'the capability of recognizing in each case the possible means of persuasion', he argues for its autonomy and offers a comprehensive discussion of persuasion through speech. The work includes a survey of ordinary beliefs about many ethical topics, and an important analysis of the emotions (see RHETORIC, GREEK).

28. Aristotle's *Poetics* should be read in conjunction with his ethical writings, which insist, against Plato, that good people can sometimes fall short of *eudaimonia* through disasters not of their own making. Tragic action, Aristotle holds, inspires two emotions in its audience: *pity* (a painful emotion felt at the undeserved and serious suffering of another person), and *fear* (a painful emotion felt at the thought of serious disasters impending). We pity the tragic hero as someone undeserving of his misfortune, and fear for him, as someone similar to ourselves. (By contrast, Plato's *Republic* treated both of these emotions as pernicious: and banned such literature from its imaginary city.) Thus poetry proves more philosophical than historical narrative, since it presents universals, things 'such as might happen' in a human life. Like other forms of representation (*mimēsis*), it gives rise to the pleasure of learning and recognition. The tragic hero's reversal inspires pity provided it is due not to wickedness of character but rather to some *hamartia* which seems to mean some error in action, sometimes blameworthy and sometimes not. Scholars cannot agree on the meaning of what Aristotle calls (at one point) *katharsis*, which he claims results from pity and fear when watching tragedy. 'Purgation' is only one of several (problematic) possibilities; another, perhaps more in keeping with the rest of Aristotle's argument, is that the tragic experience removes obstacles to our recognition of the mutability of human life, and thereby 'cleans up' or 'clears up' our muddled view of human fortunes. The central concepts of this work are still subject to dispute and scholarly attention.

29. Aristotle's achievements had an unrivalled significance for the subsequent history of western philosophy. His undisputed greatness has sometimes led to an unfortunate attitude of deference. Yet few if any philosophers have so productively stimulated the inquiries of other distinguished philosophers; few philosophers of the remote past, if any, are so conspicuously alive in the range of questions they provoke and in the resourcefulness of the arguments they offer.

armies, Greek and Hellenistic A fragment from a public monument (early 4th cent. BC) showing a display of the Athenian cavalry. In Greek warfare the cavalry was never a battle-winner before the rise of *Macedonia, when it came into its own. American School of Classical Studies at Athens: Agora Excavations

The exception was Sparta. Not only were Spartan soldiers trained from boyhood and liable for service from 20 to 60, but their army was highly organized, giving it an ability to manoeuvre that other armies lacked. At the beginning of the 5th cent. it may have consisted of five *lochoi*, but these were possibly already subdivided into *enōmotiai* (cf. Hdt. 1. 65. 5), and by 418 BC at the latest, when there were at least six *lochoi*, possibly twelve, each was subdivided into four *pentēkostyes* and sixteen *enōmotiai*, with a proper chain of command (Thuc. 5. 66. 3, 68. 3).

By *Xenophon's time the largest unit was the *mora*, of which there were again six, but it is not certain how many sub-units each contained. Xenophon (*Respublica Lacedaemoniorum* 11. 4) appears to imply 4 *lochoi*, 8 *pentēkostyes*, and 16 *enōmotiai*, but it is possible that there were really 2, 8, and 32. It is thus also not possible to determine the strength of a *mora*, for which the sources give totals varying from 500 to 1,000: if each contained sixteen *enōmotiai*, its total strength was 640, if thirty-two, 1,280.

By Xenophon's time the cavalry was also organized into *morai*, of unknown size, with the rich providing the horses, but not as in other states actually serving.

The Spartan ideal was clearly an army of citizen-hoplites (*homoioi*, lit. 'equals', see SPARTA § 2), but by 425 it appears that they only made up c.40 per cent, and there were fewer still by the time of Leuctra. It is usually assumed that the numbers were made up by *perioikoi*, but it is possible that Spartans who had lost their full citizenship (*hypomeiones*) continued to serve in the army, and that the *perioikoi* were always separately brigaded.

The defeat of the Spartan army at Leuctra ushered in a short period of Theban dominance, and saw the beginnings of a new form of warfare, in which the traditional hoplite phalanx was combined with cavalry and other arms. These changes culminated in the army of *Alexander the Great, but it is possible that the chief innovator was his father, *Philip II. Macedonia had long had good cavalry, known as 'hetairoi' (i.e. 'companions' of the king), but it was possibly Philip who first raised and organized the

'*pezetairoi*' or 'foot companions', who, with the '*hypaspistai*' (lit. 'shield-bearers'), possibly derived from the old royal guard, constituted the heavy infantry. By Alexander's time the *pezetairoi* were divided into *taxeis* of 1,500 men, subdivided down to files of sixteen men, though still called 'decads'; the hypaspists into *chiliarchai* of 1,000 men, then possibly subdivided in a similar way to the *pezetairoi*.

But what marked Alexander's army out from its predecessors was the number of different types of unit all interacting with each other—*pezetairoi* and hypaspists, light infantry armed with missiles, heavy and light cavalry. Alexander's conquests owed as much to his soldiers' ability to cope with any situation, as to his own strategic and tactical skills.

Under his successors there was a tendency for the cavalry to decline, with a corresponding increase in the importance of the phalanx. The latter's unwieldiness was sometimes compensated for by interspersing more mobile infantry units among the heavy infantry, notably by Pyrrhus in his Italian campaigns, and the vulnerability of the phalanx to flank attacks was also sometimes offset by drawing up a second line. But, in the end, the Macedonian-type army proved no match for the Roman legions, and manpower problems, particularly in Macedonia itself, meant that its kings could not afford to lose even a single battle, whereas the Romans could survive even the most appalling defeats. JFLA

armies, Roman

Monarchy–3rd cent. AD

Traditionally, King Servius *Tullius (c.580–530 BC), made the first attempt to channel the resources of the Roman state into military organization by dividing the citizens into wealth groups, so that the weapons they could afford determined their military role, with the richest serving as cavalry. Below these groups were the *capite censi* ('assessed by a head-count'),—men with no property, who were excluded from the army. Military service, therefore, although integral to the duties of citizenship, was also a privilege. This organization of the citizens probably emerged gradually and not through the act of an individual, but there is little clear evidence for the early army until *Polybius in the 2nd cent. BC. By c.400 BC a small allowance had been introduced for each soldier to help pay his expenses on active service. The body of infantry was called the *legio* ('levying', legion) and by 311 had been divided into four legions; these were supported by contingents of Rome's Italian allies (*socii*) and subjects, grouped in formations comparable in size to the legions and commanded by Roman officers. Archers and other specialist fighters were supplied by *mercenaries.

The Punic Wars stretched Roman manpower resources to the limit. The system of recruitment had been designed for a small city-state fighting short annual campaigns in Italy. Rome now waged long wars, sometimes overseas, and after the defeat of *Carthage in 201 BC, began to acquire provinces that needed a permanent military presence. Consequently, there was a reduction in the property qualification for military service. The annual levy selected citizens of military age (17–46), who were expected to serve for up to six consecutive campaigns but be available for enlistment for up to sixteen years, or ten years in the case of a cavalryman. The army was commanded by the chief magistrates, the consuls.

Throughout the 2nd cent. there was increasing discontent with the levy as Rome faced a series of foreign wars, and the property qualification was further reduced. Then in 107 BC the consul Gaius *Marius extended this practice by accepting volunteers from the propertyless and had them equipped at the state's expense for the war in Africa. Undoubtedly conscription along the normal lines still continued, but many volunteers probably chose to serve for sixteen years, and this contributed to the development of a professional, long-term army. The consequences of the Social War (91–87 BC) were also far-reaching, since Rome's defeated Italian allies were absorbed into the citizen body, significantly increasing the reservoir of manpower. Non-Italians now provided auxiliary forces of cavalry (*auxilia*). But the state had no policy of granting appropriate discharge payments to its troops. Generals, often holding long-term commands, used their reputation, and promises of generous benefits, to recruit men with whom they then built up a personal rapport. Increasingly soldiers owed their allegiance to their commander rather than to the Roman state, and became instruments of violent political change. The precedent set by *Sulla in 88 BC of seizing power by military might was not to be expunged, and the republic succumbed to the rival mercenary armies of military dynasts.

*Augustus united these fragmented legions in loyalty to his person and created a fully professional, standing army. This was not revolutionary in itself, but his detailed provision for the troops' service conditions and emoluments, the incorporation of the non-citizen *auxilia* into the formal military structure, the establishment of a personal bodyguard (praetorians), the permanent policing of Rome, and the apportionment of legions and *auxilia* as permanent garrisons of individual provinces, shaped Roman military thinking until the 3rd cent. AD and made military organization an integral part of imperial policy. The most striking development in the command of the Roman army was that from the end of the 1st cent. AD onwards, the emperor, who in his nomenclature and

public portrayal bore the attributes of a Roman general, took personal charge of all major campaigns. JBC

Late empire

The army of the late empire is brilliantly described by *Ammianus Marcellinus, and its order of battle (c.AD 395) survives in the *Notitia Dignitatum, but its evolution is obscure. As pressure upon the frontiers grew, *Septimius Severus increased the number of legions and, by recruiting the praetorian guard from them, protected himself from other usurpers and formed a strategic reserve. This was supplemented on campaign by the usual frontier detachments. Emperors assumed personal command and, if they proved incompetent like *Severus Alexander, the army replaced them. Promotion of professional soldiers culminated in Gallienus' exclusion of senators from military service, and the premium on mobility in his creation of a separate cavalry force.

This 'élite', as Aurelian's army is called, was used by *Diocletian to reinforce frontier armies now increasingly commanded by professional *duces* (generals). But despite his emphasis on fixed defences, Diocletian retained a small mobile army of new units like the *comites* cavalry and the *Ioviani* and *Herculiani* legions. Units though numerous were comparatively small, and were conscripted from German prisoners and volunteers, as well as from soldiers' sons and peasants. Soldiers still received a cash payment (*stipendium*), but it was supplemented by free rations and regular donatives in gold and silver. *Constantine I, however, was the true innovator who greatly enlarged the mobile army with new units like the Germanic auxilia and by reducing the frontier armies. He disbanded the praetorian guard, and replaced its prefects as his lieutenants-general with a master of infantry (*magister militum*) and a master of cavalry (*magister equitum*). He created the distinctive strategy of the 4th cent.—frontiers garrisoned by *limitanei* (frontier units), *comitatenses* (mobile army-units) held in reserve—which was crippled by the Goths' defeat of Valens at Adrianople (378). So many *comitatenses* were lost here that the western empire was ultimately unable to preserve the logistic base its army required. RSOT

arms and armour

Greek

Most Homeric references to arms and armour are best interpreted in connection with Minoan and Mycenaean armaments, known from such representations as those on the shaft-grave daggers (see MINOAN CIVILIZATION; MYCENAEAN CIVILIZATION). The characteristic armour

here is a figure-of-eight-shaped shield made from a single ox-hide and swung from the neck by a strap. The only other protection was a helmet. The chief weapon was a long rapier-like sword. Towards the end of the bronze age this style was displaced by the use of a much smaller round shield carried on the arm; a change which involved the addition of a breastplate and greaves, while the sword became shorter and was used for cut as well as thrust. In the Homeric poems the champions begin by throwing spears at each other, and when these are gone they proceed to close combat with swords.

The standing type of the Archaic and Classical soldier was the hoplite (heavy infantryman), ultimately derived from the soldier of the transition to the iron age. The trend now was towards heavier armour and fighting based on weight of manpower. Shields were made of bronze and leather, and spears and swords of iron. In addition hoplites wore breastplates, greaves, and helmets as defensive armour. The spear as used by hoplites and cavalry had become a pike for thrusting, not throwing, and was usually some 2 m. (c.7 ft.) in length. Only light-armed troops and some light cavalry used instead the throwing-spear (*akontion*). Along with the use of the spear as a pike, the sword (at least of the Athenian hoplite) had developed a short, straight-edged blade; it could only be used for very close fighting.

The 4th cent. saw the evolution of a more flexible type of equipment than the hoplite's. Experiments were first made with the peltast (light infantryman), but the final change was the establishment of the Macedonian type as employed in the phalanx (close-packed infantry formation). The spear (*sarisa*) was increased still more in length to a maximum of just over 5 m. (17 ft.), and the shield reduced to a small target carried on the arm. The different ranks of the phalanx used different lengths of spear. The equipment for light-armed infantry and light- and heavy-armed cavalry was also specialized at this period. At all periods, soldiers competed over the excellence of their armour (e.g. Thuc. 6. 31. 3), some of which might be highly decorated. HWP/MV

Roman

Artistic representations, military treatises, other literary and subliterate references, and archaeological artefacts are the main sources of information. Pre-imperial artefacts are sparse and come mainly from siege sites. Imperial finds are most plentiful, associated mainly with ordered dismantlement-deposits in frontier installations. Late Roman equipment is again sparse, final site-abandonments being less ordered. Roman military equipment represented a constantly evolving and adapting *mélange* of cultural traits.

arms and armour, Greek Bronze panoply from a 7th-cent. BC grave at Argos. The bell-shaped corslet, later of leather or linen, was a standard item in the equipment of the Greek heavy infantryman (hoplite). French School at Athens. Photo: EFA/Émile Sérafi

In the regal and early republican periods the Roman infantry was equipped on the Greek hoplite (heavy infantryman) model, with Italic modifications. A long thrusting-spear (*hasta*) combined with javelins was the chief offensive weapon, and the defensive armour varied with individual wealth, the richest men having cuirasses (*loricae*), round shields, greaves, and helmets of Greek or Italic form.

By the mid-2nd cent. BC, however, the heavy javelin (*pilum*) replaced the *hasta* in the first two lines (*hastati* and *principes*) of the legion (see **ARMIES, ROMAN**). A short sword was used for close fighting, a Spanish form of which became dominant. Men of all three lines carried a long, curving, oval shield of Italic origin with a Gallic boss and central spine. Helmets were of the Gallic 'Montefortino' type. A bronze plate (*pectorale*) was worn by the less wealthy soldiers, and a coat of mail (*lorica hamata*) by the richest. The legionary light infantry (*velites*) had a small round shield, light javelins, sword, and helmet. The legionary cavalry wore a helmet and cuirass, and carried a round shield and spear. The allies (*socii*) were probably armed in corresponding fashion. During the last century of the republic (if not before) the *pilum* became universal for legionary infantry, a change associated perhaps with organization into cohorts (tactical units), relaxing property qualifications, and increased state equipment supply.

In the first two centuries AD new forms of helmets developed from Gallic models. The legionary shield continued to be large and curving, but oval, sub-oval, and rectangular variants were in contemporary use. Scale, mail, and articulated-plate cuirasses were current. The latter (modern usage: '*lorica segmentata*') consisted of steel plates articulated on internal leather strips, and developed from the 1st cent. BC into the 3rd AD. Additional arm- and leg-armour was also sometimes worn. Spears and light javelins were carried by some legionaries instead of *pila*, and all continued with the short sword. Auxiliary infantry and cavalry were also armoured in mail or scale (not plate), but large flat shields of varying shapes were carried. Infantry used short swords, cavalry the long Gallic *spatha*. The majority carried spears and/or javelins, while specialist units carried composite bows or lances (cavalry). Horsemen used Gallic saddlery, wore special helmet types, and had sports armour for training and displays.

The 3rd cent. saw distinctions between legionary and auxiliary and infantry and cavalry equipment disappear—all now carried slightly dish-shaped, oval shields, and wore mail or scale (the '*lorica segmentata*' eventually going out of use). Cavalry helmet forms were adopted by infantry. The legionary *pilum* was generally replaced by a

variety of spears and light javelins. Short swords continued in use but *spathae* took over as the main bladed weapon.

Increased emphasis on cavalry involved the use of heavily armoured mounted troops (*catafractarii*, *clibanarii*) on the Parthian/Sasanid model. Into the late Roman period infantry continued to be armoured; some troops carried flat, round Germanic shields; but a major change came with the introduction of simple, mass-produced infantry and cavalry 'Ridge' helmets c.AD 300.

In all periods the *mercenaries, allies, native levies, etc, valued for their specialized fighting skills, used their own ethnic military equipment.

Military status, especially during the imperial period, was defined by the right to carry arms and especially by military waist-belts. Fittings on the latter constantly evolved but were usually decorative and noisy.

Equipment was manufactured in cities and was largely a matter of individual acquisition and ownership before the 1st cent. BC. Thereafter, the state organized production, manufacture, and supply (individual ownership continued in the Principate), based principally on legionary workshops (*fabricae*) and craftsmen. Army expansion necessitated the establishment of additional, city-based, state arms factories from c.AD 300 onwards. JNCN

Arrian (Lucius Flavius Arrianus) c.AD 86–160. Born in Nicomedia in Bithynia, he held local office and pursued studies with Epictetus, whose lectures he later published (allegedly verbatim) as the *Discourses* and summarized in the *Encheiridion* ('Manual'). In Greece between 108 and 112 he attracted the friendship of *Hadrian, who later adlected him to senatorial rank and after his consulate (?129) employed him for six years (131–7) as legate of Cappadocia. Subsequently he retired to Athens, where he held the archonship (145/6), and perhaps survived into the reign of Marcus *Aurelius.

One of the most distinguished writers of his day, Arrian represented himself as a second *Xenophon and adopted a style which fused elements of Xenophon into a composite, artificial (yet outstandingly lucid) diction based on the great masters, *Herodotus and *Thucydides. The *Cynegeticus* is an explicit revision of Xenophon's monograph in the light of the revolution in hunting brought by the Celtic greyhound; and Xenophon's influence is demonstrable in the short essays he wrote in Cappadocia: the *Periplus* (c.131), the *Essay on Tactics* (136/7), and, most remarkable, the *Order of Battle against the Alans*, which expounds his tactics to repel the incursion of the Alans (135) in the style of Xenophon's *Cyropaedia*.

Celebrated as a philosopher in his lifetime, Arrian is today principally known as a historian. Works now lost include the eight-book *Bithyniaca*, the history of his native province from mythical times to its annexation by Rome, and the seventeen-book *Parthica* with its detailed narrative of *Trajan's campaigns (probably the source for *Cassius Dio). His most famous work deals with the age of *Alexander the Great. The period after Alexander's death (323–319 BC) was covered expansively in the ten books of *Affairs after Alexander* (significant fragments of which survive on palimpsest and papyrus). The only extant history is the so-called '*Anabasis of Alexander*', a history of Alexander the Great in seven books from his accession to his death. A short companion piece, the *Indike*, provides a digest of Indian memorabilia, based explicitly upon Megasthenes, *Eratosthenes, and Nearchus, and recounts Nearchus' voyage from south India to Susa. Arrian's work is conceived as a literary tribute to Alexander's achievements, to do for him what *Homer had done for *Achilles, and the tone is eulogistic, mitigating standard criticisms and culminating in a panegyric of extraordinary intensity. The sources Arrian selected were *Ptolemy I and Aristobulus, contemporaries and actors in the events and appropriately favourable to Alexander; and the narrative is in the main worked up from material they provided, supplemented by *logoi* ('stories'), mostly from late rhetorical sources and chosen for their colour. Arrian's priority was excellence of style, not factual accuracy. Consequently his account is rich in detail and eminently readable, but is marred by demonstrable errors and misunderstandings. ABB

art, ancient attitudes to

Artists and their work

The Greeks regularly equated art with craft, *technē*, which *Aristotle defined as the 'trained ability (*hexis*) of making something under the guidance of rational thought' (*Eth. Nic.* 1140^a9–10). Until the late Hellenistic period, there is no evidence that sculpture and painting were viewed as fundamentally different from shoemaking or any other profession which produced a product. Although a number of writers betray an instinctive recognition of a qualitative difference between the visual arts on the one hand and utilitarian crafts on the other, no formal distinction was ever made between the 'fine arts' and other arts in Greek thought.

From an aristocratic point of view artists were regarded as social inferiors because they were obliged to do physical work for others, and this type of life was held to have a degrading effect on their bodies and minds (*Xen. Oec.* 4. 2–3; *Arist. Pol.* 1281^b 1–3; *Lucian, Somn.* 6–9).

Although this aristocratic prejudice is documented throughout antiquity, there is also evidence that not everyone adhered to it. Artists like Phidias, Polyclitus, Parrhasius, and Zeuxis were clearly respected in their own time, and the quality and value of their work was recognized (Xen. *Mem.* 1. 4. 3; Isoc. *Antid.* 2). Respect for the art of painting in particular seems to have grown during the Classical period, and in the late 4th cent. BC, under the influence of the prestigious painter Pamphilus, painting was added to the normal curriculum of Greek education (Plin. *HN* 35. 77).

The modest position of artists in most Greek social and philosophical thought did not prevent some of them from attaining considerable prestige and even wealth. Phidias was part of *Pericles' inner circle; the painter Polygnotus, whom Plutarch describes as 'not just one of the common workmen' (*Cim.* 4. 6), served as Cimon's artistic impresario; the family of the sculptor Praxiteles belonged to the upper level of Athenian society in the 4th cent., and one of Praxiteles' sons, the sculptor Cephisodotus the Younger, undertook costly liturgies (*trierarchies) for the city; and in the Hellenistic period a number of sculptors are recorded to have held magistracies and been the recipients of honours in various Greek cities. The reputation and influence of artists was further enhanced by the *patronage of Hellenistic monarchs. *Alexander the Great gave special status to Lysippus and Apelles, for example; Demetrius Poliorcetes ('the Besieger') treated the painter Protogenes with special favour; and the early Ptolemies (see PTOLEMY I; PTOLEMY II) invited prominent artists to their court.

In the late Hellenistic period a new theory of artistic creativity was developed in which certain artists, especially Phidias, were recognized as inspired visionaries whose insight (*phantasia*) and creative ability surpassed that of ordinary people and made them sages of a sort. This '*phantasia* theory', which grew out of an amalgam of *Stoicism and Platonic idealism (see PLATO), left its mark on a variety of Roman and late Greek writers (e.g. *Cicero, *Dio of Prusa, and Plotinus) but was never part of the mainstream of Greek thought about art.

Evolving uses of art, Greek

There was a significant distinction in the Greek world between public and private art. The major arts of sculpture and painting fall primarily, if not exclusively, into the category of public art, which had two subdivisions: works with a religious purpose, such as cult images, temple sculptures, and votive offerings; and works with a political or cultural commemorative function, such as portraits of civic leaders, personifications of political ideas, paintings of famous battles, and victory monuments

connected with public competitions (see GAMES). Funerary sculpture, although usually privately commissioned, was essentially public in function and also belongs to the commemorative category. Although public monuments usually had a decorative aspect, there seems to have been hardly any public art that was designed to be purely decorative. Even stage paintings in the theatre were created for public religious festivals.

Small-scale works of art which had a primarily decorative purpose, such as paintings on *pottery, engravings on *gems, and jewellery, belong to the category of private art. Some terracotta statuettes may fall into this class, although the majority of these were probably votive. In the 4th cent. BC figural *mosaic pavements became an increasingly common decorative element in private houses, and Plutarch's story of *Alcibiades' efforts to compel the painter Agatharchus to decorate his house (*Alc.* 16) suggests that mural paintings could also be part of domestic decoration, at least in aristocratic circles.

Over time there were two major shifts of emphasis within these categories. First, beginning in the 5th cent. BC, the line between religious and commemorative-political art became blurred as traditional subjects were adapted to convey political meanings (e.g. the Amazonomachy, the Gigantomachy; see AMAZONS; GIANTS). The sculptures of the Parthenon and the great altar and other Attalid dedications at *Pergamum are notable examples of this trend. Second, as the idea of acquiring works of art for private delectation developed among Hellenistic monarchs, the major arts of sculpture and painting gradually also became part of the world of private art.

Evolving uses of art, Roman

Art in Rome had the same functions that it had in Greece, but private patronage of artists played a much wider role in the Roman world, and the commemorative aspect of public art tended to have a different emphasis.

The formation of private art collections was a distinctive phenomenon of the later Roman republic and was apparently first stimulated by the vast quantities of Greek art taken as booty by the Romans in the 3rd and 2nd cent. BC. Captured sculptures and paintings were first used to adorn triumphal processions and subsequently to decorate villas and houses of the triumphators. In time, possessing an art collection became a badge of cultural sophistication, and the drive to acquire collections spread beyond the world of victorious generals. When the supply of looted works of art dried up, the demand created by collectors was met by Greek artists who migrated to Rome, and some of them, like the sculptor Arcesilaus, were able to command huge prices for their

work (Plin. *HN* 35. 155–6). By the 1st cent. BC a lively ‘art world’ had taken shape, populated not only by artists and collectors but also by dealers and even forgers. One significant outcome of this development was the creation of Europe’s first public art galleries, in which extensive private collections could be exhibited.

Although historical subjects were occasionally depicted in Greek art, the Romans were much more consistently interested than the Greeks in using the arts to record the details of specific historical events. Public buildings, for example, frequently bore inscriptions celebrating the largess and achievements of the prominent citizens who had built them, and both paintings and relief sculptures documented military campaigns and important public ceremonies. *See* ARA PACIS.

A fusion of this deep-seated historical self-consciousness with the growing importance of private patronage in late republican Rome resulted in a significant expansion of the scope of ancient *portraiture. The Greeks had produced portraits only of prominent public figures (e.g. military men and civic leaders). By the early empire, however, Roman portraits came to be commissioned not only by rulers and aristocrats but also by citizens of relatively humble status, such as freedmen.

Art criticism

Ancient criticism of the visual arts was of four kinds. (a) Professional criticism, that is, criticism current among artists themselves. This focused on various technical achievements and improvements and was often propagated through professional treatises, like the canon of Polyclitus. A number of these were used and cited by *Pliny and *Vitruvius. The idea for such treatises seems to have originated among architects in the 6th cent. BC and was adopted by sculptors and painters in the Classical period. In the 3rd cent. the principles of professional criticism were incorporated into the first histories of sculpture and painting, which described these arts as progressing through a series of technical improvements towards a state of formal perfection. (b) Moralistic aesthetics. In Classical Greek philosophy the visual arts were viewed as forms of imitation, *mimēsis*, and their value was assessed on the basis of the moral and intellectual value of what they imitated (e.g. Plato’s criticism of painting for its failure to imitate reality, *Resp.* 10. 596e–597e, and Aristotle’s praise of ‘moral’ painters like Polygnotus in *Poet.* 1450^a23 and 1448^a1). The *phantasia* theory of the late Hellenistic and Roman periods, the essence of which is best

preserved in Philostratus, *VA* 6. 19, perpetuated this moralistic tradition in criticism but shifted its emphasis from *mimēsis* to the artist’s spiritual insight. (c) Popular appreciation of *mimēsis*. Throughout antiquity there was a tradition of informal criticism which praised works of art for imitating nature so closely that the viewer was deceived into thinking that the work of art was ‘real’. In the Archaic period this may have involved attributing magical qualities to works of art (as in the folk-tales about the works of Daedalus preserved in *Diodorus Siculus, 4. 76. 1–6). Later, in the hands of writers like Pliny, the Philostrati, and Callistratus the marvellous power of illusionism is the dominant theme. (d) Stylistic analogy with rhetoric and literature. Cicero, *Brut.* 70, Quintilian, *Inst.* 12. 10. 1–10, and *Dionysius of Halicarnassus in his essays on orators used the developmental histories that grew out of professional criticism as analogies for the stylistic development of rhetoric, prose, and poetry. This type of criticism is of particular interest in art history because it took note of the importance of personal styles in sculpture and painting and approached the idea of style with sympathy and understanding.

art, funerary, Greek This article covers both architecture and art made specifically to mark and monumentalize the grave; for grave goods (which may be of any sort, and in Greece were rarely, it seems, custom-made for the tomb): *see* DEAD, DISPOSAL OF.

Bronze age

(c.3000–c.1100 BC). The earliest monumental funerary architecture occurs in the Mesara plain of Crete, where hundreds of circular stone tholos-tombs were erected during the third millennium, each housing multiple burials. Late Minoan rulers were occasionally buried in sumptuous built tombs, like the Royal Tomb at Isopata and the Egyptian-style Temple Tomb at Cnossus (*see* MINOAN CIVILIZATION). On the mainland, the 16th-cent. shafts of Grave Circle A at Mycenae were surmounted by limestone steles showing battles and hunts from chariots, and from c.1400 the élite were buried in corbelled tholos-tombs, of which several hundred are known from all over Greece; the largest and most famous is the so-called Treasury of Atreus at Mycenae (*see* MYCENAEAN CIVILIZATION).

art, funerary, Greek Grave-marker for a young man from Athens (c.340 BC). The idealization of the deceased (handsome, athletic) and the reflective mood are typical of Athenian gravestones in the 4th cent. BC. Hirmer Fotoarchiv, Munich

Early iron age and geometric period

(c.1100–c.700). Greek monumental tomb-architecture stopped with the destruction of the Mycenaean palaces c.1200. Until recently, the subject's history would have resumed in the 8th cent., when large vases became popular in Athens as tomb-markers. In 1981, however, two rich 10th-cent. burials were discovered at *Lefkandi in Euboea, surmounted by an apsidal building 10 m. wide and 50 m. long (11 × 55 yds.): the earliest Greek hero-shrine or heroon. Such heroa were eventually to become a common feature of the Greek landscape. They assumed a wide variety of forms, from the simple triangular enclosure above the graves of seven late 8th-cent. heroes of Eretria to the heroon that Cimon built at Athens shortly after 474 to receive *Theseus' bones, lavishly embellished with frescos by the painter Micon.

Earth mounds topped by undecorated stone slabs were popular as grave-markers in many geometric communities, but at Athens and Argos large vases performed this function after c.800. At Athens, massive craters stood on men's graves and amphorae on women's, decorated with multifigured battles and funerals. Despite attempts to identify these scenes as episodes from Homer, they are probably all taken from contemporary life. The Argive vases are no less monumental, though quite different iconographically: their repertoire of birds, horses, fish, water, and men apparently reflects the landscape and inhabitants of the Argive plain. In other communities, most notably on Crete, the bronze age practice of burial in tholoi persists or is intentionally revived.

Archaic period

(c.700–c.480). The period's chief innovations were the funerary statue and carved gravestone. *Kouroi* (standing, usually nude, youths) marked graves on Thera by c.630, and some argue that the type was introduced for this purpose. Funerary *korai* (draped, standing young women) appear at the same time, and painted and sculptured gravestones shortly after 600. At Athens, these steles soon became extremely lavish, until banned by sumptuary legislation (Cic. *Leg.* 2. 26. 64), apparently c.490. Athletes, warriors, hunters, and elders are common subjects; women and children far less so. The less wealthy or less pretentious continued to favour earth mounds, though built tombs of stone or brick appeared around 600. These were sometimes embellished with clay plaques painted with mourning scenes; sets survive signed by Sophilus, Lydus, Execias, and others.

In other areas, funerary art varied widely. *Kouroi* rarely stood over graves in central and southern Greece,

but often did so in Miletus and *Samos. These cities' rich traditions of funerary sculpture also included *korai*, seated figures, and lions. Sarcophagi were popular in east Greece: Rhodians favoured plain stone ones, Clazomenians lavishly-painted clay ones. Aeolians and Macedonians liked large tumuli, Thessalians preferred tholos-tombs; and so on.

Classical period

(c.480–c.330). At Athens, the legislation mentioned above decreed that no tomb could be made by more than ten men in three days. So whereas high-quality grave-steles with single figures in relief remain in vogue in the Cyclades and Thessaly, until c.430 Attic funerary art is restricted to white-ground lecythi: small, clay oil-flasks usually painted with domestic or mourning scenes in applied colour. Some show scenes at the tomb itself, complete with lecythi standing on the stepped bases of the simple stone slabs that now served as tomb-markers.

Around 430, for reasons perhaps relating either to the outbreak of the Peloponnesian War (431) or the plague (430), grave-steles began to reappear in Athens. At first echoing Cycladic models, they soon developed a standard repertoire of subjects: athlete, warrior, mistress and maid, father and son, married couple, family group, funeral banquet, and so on. Though most are in the form of *naiskoi* (miniature shrines) in high relief, low-relief slab-steles furnished a cheap alternative; stone lecythi were also popular, and unmarried women received marble *loutrophoroi* (water jars). Dead and living are often linked by a handshake, and the mood is usually sombre. During the 4th cent., the steles became larger and more elaborate, until Demetrius of Phalerum banned them in 317; they were often imitated elsewhere in Greece.

In Asia Minor, Greek architects and sculptors built sumptuous tombs for local rulers. In Lycia, the most elaborate is the 'Nereid Monument' from *Xanthus, now in the British Museum. Constructed c.380, it consisted of a square podium embellished with battle-reliefs and surmounted by a small Ionic temple; Nereids stood between the columns, and other friezes, a sculptured pediment, and acroteria decorated its entablature, cella, and roof. The Carian ruler Mausolus used many elements of this design for his *Mausoleum at Halicarnassus. Begun around 365, this most grandiose of all sculptured tombs was widely imitated.

Hellenistic period

(c.330–c.30). *Alexander the Great's sumptuous hearse, described by *Diodorus Siculus (18. 26 ff.), set a new

standard in funerary magnificence. His own mausoleum at *Alexandria, the so-called Sema, has disappeared, but other royal tombs have survived. In Macedonia, kings and aristocrats were buried in vaulted chambers painted with a wide variety of subjects: hunts, Amazonomachies (see AMAZONS), Centauromachies (see CENTAURS), *Hades and *Persephone, chariot-races and so on. The most famous of these, tomb II at Vergina (see AEGAE), was probably constructed for King Philip Arrhidaeus and Eurydice (d. 317/6), not *Philip II (d. 336), as proposed by its excavator. Sculptured monuments range from the 'Alexander Sarcophagus' from Sidon (probably made for Abdalonymus, Alexander's puppet king), through the mausoleum at Belevi near *Ephesus (perhaps constructed for *Lysimachus, d. 281), to Antiochus I of Commagene's hierotheseion at *Nemrut Dağ in eastern Turkey (c.40).

The extinction of the Attic gravestone industry in 317 prompted an exodus of sculptors to Rhodes, Macedonia, and *Alexandria, where painted or carved imitations of Attic steles continued into the 3rd cent. Thereafter, Alexandrians interred their dead in underground *necropoleis*, decked out like houses with colonnaded or pilastered façades, and often painted inside. In *Cyrene, faceless female busts set over rock-cut tombs probably represent Persephone. A rich local stele tradition develops in the Asian cities around 200, featuring either funeral banquets or family groups where the dead are overtly heroized. Inscriptions also tell of built heroa with bronze funerary statues of the deceased, but few examples (and no statues) survive. In Tarentum, *naiskoi* embellished with reliefs of heroic fights, Achilles' last journey, and so on, are popular from c.330–250. See IMAGERY. AFS

art, funerary, Roman, Early republican tombs at Rome have none of the decorative features of contemporary Etruscan funerary art (see ETRUSCANS), but by the mid- to late republic some aristocratic tombs show a desire for elaboration (e.g. the sarcophagus of Lucius Cornelius Scipio Barbatus and the façade of the tomb of the Scipio family, painted and decorated with statues in niches). From the last years of the republic onwards funerary art ceased to be the prerogative of the rich: even *freedmen and slaves decorated their tombs and bought funerary monuments. Several media were used to decorate the tomb outside and inside, and to provide memorials for the dead. The exterior might have decorations in relief (stone or terracotta) alluding to the deceased's offices or profession (e.g. fasces and curule chair for a magistrate, or a scene of everyday business such as the baking depicted on the tomb of the baker Marcus Vergilius Eurysaces). Portraits of the deceased, represented

in the round or in relief, were also popular, especially with freedmen in the late republic and early empire. Inside the tomb there were sculptured free-standing monuments, including the containers for the remains of the deceased—ash-chests in the early empire and, increasingly from c.AD 100 onwards, sarcophagi. There were also commemorative monuments such as grave altars or *cippi*. The interior of the tomb itself might be decorated with stucco, painting, and mosaic. Stucco provided architectural and figured decoration for niches in the walls (e.g. the first tomb of the Caetennii and the tomb of the Valerii in the Vatican cemetery), and was also used on the ceilings, which could be subdivided into a complex pattern of smaller fields by stucco mouldings, each containing a painted or stuccoed motif (e.g. tombs 'of the Pancratii' and 'of the Valerii' on the via Latina, Rome). Painting provided colour, but also a variety of motifs placed inside niches, on ceilings, and on walls. In the *catacombs painting was the dominant form of decoration, but here biblical stories and Christian symbols replaced the pagan ones in use elsewhere. *Mosaic was used primarily for the floors of tombs, but also appears on ceilings and walls (the most spectacular being the ceiling decoration of the small tomb of the Julii—tomb M—in the Vatican cemetery, with Christ/Helios in his chariot amid a design of vines on a gold background).

Outside Rome, different areas of the empire developed their own types and styles of funerary monument and art: tombs of many kinds were decorated with sculpture, both statues and reliefs (e.g. the tomb of the Secundinii at Augusta Treverorum (Trier), with its scenes both of everyday life and of mythology). Tombstones or grave steles were also used in many areas to mark the grave and commemorate the deceased (e.g. the numerous tombstones of both soldiers and civilians from Roman Britain).

The iconographic repertoire of Roman funerary art is particularly rich. Motifs might refer directly to the deceased: *portraiture, whether full-length or in bust form, was popular throughout the imperial period, and portraits are found both on the façades of tombs and on a variety of monuments such as sarcophagi, where they can appear both in relief on the chest and as a reclining figure on the lid. The deceased might also be represented engaged in an everyday activity, on their death-bed, or in heroized and idealized form, with the attributes of a deity or hero, and women might be represented with the beauty and attributes of *Venus. Battle and hunt scenes, designed to show the deceased's manliness, were widely used on sarcophagi, as were other scenes designed to suggest his virtues. Mythological scenes were extremely popular, and a wide selection of episodes from Greek mythology was used in all contexts, but again especially

on sarcophagi. Motifs from the natural world (plants, birds, and animals) abound, possibly reflecting the desire to have one's tomb surrounded by a luscious garden teeming with life. In addition there was a host of other motifs, such as cupids, seasons, sphinxes, and griffins, which could be combined in a number of different ways. Clearly some of these designs had a significance beyond their surface meaning, and alluded allegorically to beliefs in and hopes for an after-life existence; however, this is an area of much scholarly disagreement, some maintaining that virtually all motifs used in funerary contexts have an eschatological meaning, others remaining more sceptical (e.g. some think that scenes of Tritons and Nereids swimming through the sea allude to the *soul on its journey to the Islands of the Blest, while others deny the motif any such significance). As the imperial period progressed the mystery religions (*see* MYSTERIES), with their promise of salvation, gained in popularity, and Bacchic themes (*see* DIONYSUS) and Hercules (paradigm of a mortal attaining immortality) appeared more frequently in funerary art.

Much of the private, non-state art of Rome was funerary, and the production of sarcophagi in particular became a major industry, with partially carved chests travelling considerable distances. Although some individual choice of design was possible, and some highly idiosyncratic pieces survive, for most purposes, standardized motifs taken from pattern books were used, personalization being achieved by the addition of an inscription or portrait. Nevertheless, commemoration of the dead, on as lavish a scale as could be afforded, was a major concern for most Romans of the imperial period. *See* DEAD, DISPOSAL OF; DEATH, ATTITUDES TO; IMAGERY; SCULPTURE, ROMAN. GD

art, Jewish Architecture, coinage, and funerary remains reflect distinctive Jewish modes of participation in the larger visual culture of the Graeco-Roman period. Jews tended to distance themselves from artefacts and imagery deemed potentially 'idolatrous', although this category was somewhat fluid. Hasmonaean and Jewish revolt coinage exhibits mainly floral motifs and a palaeo-Hebrew script, reminiscent of Tyrian numismatics. The Temple menorah and showbread table appear on lepta of Antigonus Mattathias (39 BC), and other Jerusalem cult objects are found on coins of the First Revolt (AD 66–74) and the Bar Kokhba Revolt (AD 132–5), which bear a tetrastyle representation of the lost Temple. The architecture of Herod's Temple (c.20/19 BC–AD 70) was consonant with Augustan imperial architecture, apart from the avoidance of human and most animal imagery. From the 3rd cent. AD, symbols drawn from the Temple cult (e.g. the menorah), some of which were carried over into

*synagogue liturgy (e.g. palm frond bundles and ram's horns), served, with images of Torah shrines, as markers of Jewish identity across the Roman and Sassanian domains. Wall-paintings depicting biblical scenes, such as those which appear in the Dura-Europus synagogue (c.AD 245), were likely widespread. Basilical synagogues with large Torah shrines, usually aligned toward Jerusalem, are attested in Palestine and diaspora communities from the late 4th cent.; many Palestinian mosaic pavements were decorated with zodiac and biblical imagery. SF

Artemis Daughter of *Zeus and Leto, *Apollo's elder twin sister, a very important Olympian deity, a virgin and a huntress, who presided over crucial aspects of life. She presided over women's transitions, most crucially their transformation from *parthenos* (virgin) to (fully acculturated and fully 'tamed') woman (*gynē*; *see* INITIATION), and over *childbirth and *kourotrophein* (the rearing of children). She was also concerned with male activities, often (as at Sparta, *see* below) with their rites of transition to adulthood, also hunting and certain aspects of war. Like all deities, she had different cults in the different parts of the Greek world, but the above-mentioned concerns are part of her panhellenic persona and recur commonly in local cults; the same is even more strongly the case with her firm association with the wild and her persona as protector of young animals as well as of hunting. It is possible to perceive that the core of her personality is a concern with transitions and transitional marginal places, such as marshes, junctions of land and water and so on, and marginal situations. There is some merit in this, but since such classifications are inevitably culturally determined, we cannot be sure whether this was indeed a core aspect of Artemis or a culturally determined construct created by our own assumptions and preferred conceptual schemata at a time when transitions and things marginal are at the forefront of scholarly discourse—especially since deities were complex beings and did not begin with one function which was then expanded.

In the Classical period Artemis' iconography crystallized into a particular version of the iconographical schema 'young *parthenos*', a version that includes several variants; usually she has a bow and arrow, and she is often associated with a deer. One of Artemis' epithets, it should be noted, is *Elaphēbolos* (the 'Shooter of Deer'), after which was named the month *Elaphebolion*. Sometimes, especially in the Archaic period, she was represented through the schema of *Potnia Thērōn*, 'Mistress of the Animals', usually winged, flanked by animals. Very rarely she is shown with wings but not as a *Potnia Thērōn*, that

is, not flanked by animals. Many, but not all, scholars believe that her name appears in the Linear B tablets of Pylos (PY Es 650. 5; Un 219. 5; *see* MYCENAEAN CIVILIZATION). One of the religious nexuses that contributed to the making of the divine persona that crystallized in the figure of the historical Greek goddess Artemis is the 'Potnia Thērōn' facet of a Minoan goddess. It is for this reason that Artemis sometimes became associated or identified with another 'later transformation' of that goddess, Britomartis/Dictynna.

In *Homer, Artemis was, like Apollo, on the side of the Trojans. She was a death-bringing deity, for she sent sudden death to women (cf. e.g. *Od.* 11. 171–3), as Apollo did to men. Apollo and Artemis together killed the children of Niobe, who had boasted about the large number of children she had in comparison to Leto's two. She or Apollo, or both, killed Tityus who had tried to rape Leto (or, in Euphorion fr. 105 Powell, Artemis herself). Some of the more important myths assigning her the role of punishing deity are that of Actaeon (whom she transformed into a stag and had torn apart by his own hounds), that of her companion Callisto (for having lost her chastity to Zeus), and her demand that Iphigenia (*see* AGAMEMNON) be sacrificed. According to one version of his myth she killed the hunter Orion for insulting her.

In Attica her most important cults are those of Artemis Brauronia, Munichia, Tauropolos, and Agrotera. As Brauronia and Munichia she was above all concerned with female transitions, especially that from *parthenos* to *gynē*. At her sanctuaries at *Brauron and Munichia little girls between the ages of 5 and 10 served Artemis as *arktoi* (bears), a pre-menarche ritual that turned girl-children into marriageable *parthenoi*. Artemis Brauronia was, in general, a women's goddess, and she included a strong kourotrophic function. Artemis Munichia was also a *kourotrophos*, and in addition she was also concerned with *ephēboi* (youths undergoing paramilitary service); at her festival, the Munichia, ephebes sailed from Zea to the harbour of Munichia in 'the sacred ships', and held races at sea. Then they processed for Artemis and sacrificed, celebrations said to be in commemoration and thanksgiving for the battle of Salamis. The cult of Artemis Phosphoros was also associated with that of Munichia at Munichia, while the torch-bearing Artemis, the iconographical representation of Artemis as Phosphoros, is one of the most frequently encountered types among the votives, especially votive reliefs, found at Brauron (L. Kahil, *AK* 1977, 86–98, and in W. G. Moon (ed.), *Ancient Greek Art and Iconography* (1983), 231–44; L. Palaiokrassa, *To hiero tēs Artemidos Mounichias* (1991), and *MDAI* 1989, 1–40; C. Sourvinou-Inwood, *Studies in Girls' Transitions* (1988); P. Brulé, *La Fille d'Athènes* (1987), 179 ff.).

The cult of Artemis Tauropolos at Halai Araphenides (E. Attica) appears to have been associated with a boys' initiation ceremony, reflected in the rite described at Eur. *IT* 1439 ff. as having been ordained by Athena. She ordered Orestes to take Artemis' Tauric statue to Athens, and set it up in a sanctuary that he was to found at Halai. There Artemis was to be worshipped as Tauropolos, and at her festival (as a compensation for the aborted sacrifice of Orestes) the sword was to be held to a man's throat and blood spilled. (F. Graf, *Antike Welt* 1979, 33–41; H. Lloyd-Jones, *JHS* 1983, 87–102.)

Artemis Agrotera had some involvement with war. The Spartans sacrificed a goat to her before battle, while the Athenians, we are told, before the battle of Marathon vowed to sacrifice to Artemis Agrotera as many goats as enemies killed. In the event they could not find enough goats, so they vowed to sacrifice 500 a year, which they did, on her festival on 6 Boedromion, which thus involved a strong element of thanksgiving for Marathon. This festival included a procession to the temple in which the ephebes took part. The sanctuary of Artemis Agrotera was peri-urban, at Agrae. The overwhelming (though not universal) scholarly opinion is that the temple of Artemis Agrotera is to be identified with the so-called Ilissus temple, built by Callicrates. (On Artemis and war cf. Burkert, *HN*, 65–7; J.-P. Vernant, *Mortals and Immortals* (collected essays ed. F. I. Zeitlin) (1991), 244–57, and *Figures, Idols, Masques* (1990), 162–81; H. W. Parke, *Festivals of the Athenians* (1977); P. Ellinger, *Arch. Anz.* 1987, 88–99 and *Quaderni urbinati di cultura classica* 1978, 7–35.)

In some places, including Athens, Artemis' role as protector of women in childbirth is expressed through her epithet Loch[e]ia (cf. e.g. Eur. *IT* 1097, *Supp.* 958; *IG* 2². 4547; Sokolowski, *LSCG* 154 A 16–17 (Cos)). Elsewhere it is expressed in her identification with Eileithyia (cf. e.g. Artemis Eileithyia at Thebes, Orchomenus, Thespieae, Chaeronea, Tanagra, Thisbe, Anthedon: A. Schachter, *Cults of Boeotia* 1 (1981), 94, 98, 101–6); cf. on both epithets Plut. *Mor.* 658 f. It has been suggested that in *IG* 2². 4547 Eileithyia is not a separate deity but belongs with *Artemidi Lochiai* as a second epithet (M. Guarducci, in D. W. Braeden and M. F. McGregor (eds.), *Phoros* (1974), 60)).

At Sparta Artemis had several cults, the most important of which was that of Artemis Orthia (*see* SPARTAN CULTS), a cult closely associated with the *agōgē* or state training, the long process through which Spartan boys became élite warriors and citizens, though Artemis Orthia also had other functions, not least ones pertaining to female concerns, and there was clearly a close association between Artemis Orthia and Eileithyia since many dedications to Eileithyia were found in this sanctuary. (R. M. Dawkins (ed.), *The Sanctuary of Artemis Orthia*

(1929); C. Calame, *Les Chœurs de jeunes filles en Grèce archaïque* (1977), 276–97; J.-P. Vernant, *Mortals and Immortals* (1991), 225–43; R. Parker, in A. Powell (ed.), *Classical Sparta* (1989), 151–2.)

A ritual practice broadly comparable to the Attic *arkteia* (but in much closer proximity to marriage) has been convincingly reconstructed (P. Clement, *Ant. Class.* 1934, 393–409) as having been associated with the cult of Artemis Pagasitis at Pagasae-Demetrias and the cult of Artemis Throsia at Larissa, the *nebreia*, which consisted of the consecration of girls to Artemis for a certain period during which they were called *nebroi* (fawns). (Cf. also K. Dowden, *Death and the Maiden* (1989), 41–2; P. Brulé, *La Fille d'Athènes* (1987), 191.)

At Patrae the festival Laphria in honour of Artemis Laphria included a procession in which the virgin priestess rode in a chariot drawn by deer and the holocaust sacrifice of many animals; these were thrown alive into the altar enclosure, and included wild animals such as deer and boar, which were not normally sacrificed in Greek religion (cf. Paus. 7. 18. 8–13; G. Piccaluga in *Le Sacrifice dans l'antiquité*, Entretiens Hardt 27 (1981), 243–77).

The cult of Artemis at Ephesus (on which cf. A. Bammer, *Das Heiligtum der Artemis von Ephesos* (1984)) includes Asiatic elements; but this does not make Artemis an eastern goddess.

Artemis was often identified with other goddesses whose name she sometimes bore as an epithet, for example, besides Artemis Eileithyia referred to above, Artemis Hecate (cf. e.g. Aesch. *Supp.* 675–7). CS-1

artillery Evidence for Greek and Roman artillery comes from the surviving technical treatises, incidental historical and subliterate references, and, most importantly, finds of both machine-fittings and projectiles. The latter at present date from the 2nd cent. BC to the 4th cent. AD.

In 399 BC artificers of *Dionysius I apparently invented the first artillery piece (Diod. Sic. 14. 42. 1). The *gastraphetēs* shot arrows only, and somewhat resembled an early medieval crossbow. Propulsion force was supplied by a composite bow, which, being too powerful for a man to draw by hand, was bent by means of a slide and stock. Later *gastraphetai*, some of which were stone-throwers, used a winch and had a stand.

Torsion catapults appeared around 340 BC, possibly invented by *Philip II's engineers. Stock, winch, and base remained much the same, but two springs, bundles of rope made from animal sinew, horsehair, or human hair, and held at high tension in a metal-plated wooden frame, now provided propulsive power. Torsion machines improved continuously in efficiency through the Roman

period. From c.270 BC a technical literature of calibrating formulae and standard dimensions developed. However, torsion catapults did not supersede the large non-torsion types before the later 3rd cent. and small composite machines continued into the late Roman period.

The torsion *katapultēs oxybelēs* shot bolts only (main calibres: one to four bolt), the *lithobolos* hurled stone-shot (weights of ten *minae* to three talents). Both types had a maximum effective range well in excess of 300 m. (330 yds.). Schramm reached 387 m. (423 ft.) with a full-size reproduction of a two-cubit (approx. 100-cm./40-in.) machine employing horsehair springs. Modifications devised between 200 and 25 BC are reflected in machines described by *Vitruvius, and by fittings from Ephya, Mahdia, and Ampurias.

Each imperial Roman legion had integral artillery specialists and workshops to design, manufacture, repair, and deploy its c.70 *catapultae* and *ballistae* (Cf. 1st-cent. AD Cremona finds; also *ILS* 2034). The small but powerful engines illustrated on Trajan's Column and described by Heron of Alexandria (*chiroballistra*), with all-metal frames, were probably developed in the 1st cent. AD. They continued in use into the late Roman period, as evidenced by finds from Lyons, Gornea, and Orsova, and the accounts of Vegetius, Procopius, and Mauricius. By the 4th cent. AD the one-armed, stone-throwing *onager* was also developed.

Artillery figured most prominently in sieges, especially those associated with Rome's eastern wars, and its use may have spread to the Sasanids through Roman contacts. Whilst the 4th-cent. BC general Onomarchus and *Alexander the Great used artillery in the field, lack of mobility restricted it before the Roman period. Long range made artillery a valuable naval weapon (e.g. Demetrius Poliorcetes ('the Besieger') off Salamis and *Agrippa at Naulochus). JNC

artisans and craftsmen In Greece the prejudices of the (largely landowning) citizen-élites against the activities of 'mechanics' (*banausoi*), often slaves, *freedmen, or *metics, subjected artisans to formal handicaps in the oligarchic *polis, including limitation of political rights (Ptolemaic *Cyrene: *SEG* 9. 1, para. 8, unfortunately corrupt), restriction of their freedom of movement (Thesalian cities: Arist. *Pol.* 7. 12, 1331a31–5), and exclusion from the *gymnasium (Beroea in the 2nd cent. BC: P. Gauthier and M. Hatzopoulos, *Meletemata* 1994, 21, line 29), although in the Athenian *democracy their social standing was higher, notwithstanding the condescension of Athenian 'intellectuals'. Craftsmen themselves could be proud of their products, if the 'signatures' on painted *pottery are really those of their makers, as too of their

occupations, to judge from the Athenian artisans who stated them in their dedications, including a 'washer-woman' (*pluntria*) (A. Raubitschek, *Dedications from the Athenian Acropolis* (1949), 464–5), the last a reminder of the considerable involvement of women in the humbler crafts, especially *textile production. Although entrepreneurs could prosper through artisanal activity, craftsmen as a group were largely powerless, since the citizen-group, beyond taxing sales and charging rents for market- and workshop-space, had no interest in promoting industry as such.

The larger scale of the Roman economy gives greater visibility to the entrepreneurial artisan in Roman society, such as the contract-baker Marcus Vergilius Eurysaces, whose grandiose tomb at Rome still stands (Richardson, *A New Topog. Dict. Ancient Rome*, entry under Sep. Eurysaces), although there is little clear evidence for manufacturing enterprises of more than local significance and—apart from the exceptional case of brick production—the Roman élite cannot easily be linked with manufacture. On the other hand, upper-class disdain for the crafts, as at Cic. *Off.* 1. 42, hardly encouraged the open admission of such links, which certainly accounted for some of the wealth of successful Roman *freedmen. Roman craftsmen are widely attested in rural villages as well as cities. (See ART, ANCIENT ATTITUDES TO; INDUSTRY; MARKETS AND FAIRS). AJSS

Asclepius (Lat. *Aesculapius*) Hero and god of healing. In *Homer's *Iliad*, he is a hero, the 'blameless physician' (formula in *Il.* 4. 194, 11. 518), taught by the *centaur Chiron (*Il.* 4. 219); his two sons, the physicians Machaon and Podalirius, lead a contingent from Tricca in *Thessaly (*Il.* 2. 729–33). Late Archaic authors fit him into two different genealogies: in a Thessalian version alluded to in a Hesiodic poem (fr. 60 M–W; see HESIOD) and narrated more fully in *Pindar (*Pyth.* 3), he was the son of *Apollo and Coronis, daughter of Phlegyas. Coronis had become Apollo's beloved, but then married the mortal Ischys; when a raven denounced the girl to the god, he (or his sister *Artemis) killed her, but snatched the unborn baby from the pyre, and entrusted him to Chiron (see CENTAURS). When grown up, Asclepius became a great healer who even raised men from the dead, which provoked *Zeus into killing him with his thunderbolt. Angered, Apollo retaliated by killing the Cyclopes who had made the thunderbolt; in order to punish him, Zeus sent him into servitude with Admetus, king of Pherae. In the Hesiodic *Catalogues*, however, Asclepius is the son of Arsinoë, daughter of Messenian Leucippus (Hesiod fr. 50 M–W), although the story must have followed about the same course as in Pindar, with Asclepius' death by lightning

and Apollo's anger and servitude (frs. 51, 52, 54b, c). Thus, already in the 6th cent. BC two local versions of the myth are well attested and show a very early double location of Asclepius; in both, Apollo is already present. A later, Epidaurian version retained 'the daughter of Phlegyas' (Coronis or Aigle) as mother but made Epidaurus his birthplace, where the baby was exposed, nurtured by a goat, and protected by a dog (Paus. 2. 26. 3, an aetiological story for the prohibition of goat sacrifices and the existence of sacred dogs in Epidaurus and elsewhere; W. Burkert, *The Orientalizing Revolution* (1992), 77 connected the dog with the companion of the Babylonian healing goddess, Gula).

The two early local myths complicate the question of his local origin. It seems prudent to assume two Archaic foci of a healer-cult of Asclepius, in Tricca in Thessaly and in Messenia. Unlike ordinary heroes, Asclepius must have been very early emancipated from the attachment to a local grave; this allowed him to develop a god-like stature, though in most places he stayed attached to his father Apollo. Tricca had 'the oldest and most famous sanctuary' of Asclepius (Strabo 9. 5. 17, p. 437) that still awaits full discovery (on possible archaeological remains in modern Trikala, see *AJArch* 5 (1958), 12; 12 (1965), 14), while the Asclepieum of Messene has revealed an important Hellenistic complex of inner-city sanctuaries briefly described by Pausanias (4. 31. 10), whose pre-Hellenistic roots are still unknown.

Expansion of Asclepius must have begun in late Archaic times; both Cos and Epidaurus became famous during the 5th cent. Cos was the home of a school of physicians which was organized in a pseudo-gentilicial way (i.e. as if it was a *genos*): following the lead of the Homeric *Asclēpiadai*, they all called themselves the descendants of Asclepius or Asclepiadae (Pl. *Phdr.* 270c). Local tradition insisted on a Triccan origin (Herod. 2. 97). The site of an early sanctuary is uncertain; when, in 366/5BC, the city of Cos was rebuilt, Asclepius received a sanctuary in a grove of Apollo Cyparissius (*LSAM* 150 A, dated 325–300 BC); the famous oath, sworn to Apollo, Asclepius, (his daughters) Hygieia and Panacea, 'and all gods and goddesses', belongs to the same period. At Epidaurus, Asclepius must have arrived in about 500 BC when his first sanctuary was built below the hill-sanctuary of Apollo Maleatas where cult went back to the bronze age (first *ex-voto*: Jeffery, *LSAG* 180). Epidaurus became the centre for later expansion. Already in the 5th cent., Asclepius had come to Sicyon, brought on a mule cart and in the form of his snake (Paus. 2. 10. 3). Similarly, the god sent his snake to Athens where he arrived in 420/19, coming by sea to his sanctuary in the Piraeus (see the account in the Telemachus monument, reconstructed

by L. Beschi, *ASAA* 1967/8, 381–436 and *AAA* 1983, 31–43); not long after, he was transferred by cart, together with Hygieia, to his main city sanctuary on the west slope of the Acropolis, well above the theatre of Dionysus. Perhaps already in the 4th cent. BC, a certain Archias who had found healing in Epidaurus, brought the cult to *Pergamum (Paus. 2. 26. 8 f.). To cure a plague in 293 BC, the Sibylline books caused the Romans to fetch the god's snake by ship from Epidaurus to Rome, where the snake chose the Tiber island as its home (Livy 10. 47. 7), but a 5th-cent. dedication from Tuscany points to much earlier acquaintance with the cult elsewhere in peninsular Italy, and the architectural layout of the Hellenistic Asclepieum at Fregellae shows Coan influence (F. Coarelli, *Fregellae* 2 (1986)). Epidaurian foundations might in their turn become foci for further Asclepiea, like the one in Cyrenean Balagrae from which derives the sanctuary on Crete at Lebena, or Pergamum mother of the Smyrnaean sanctuary (Paus. 2. 26. 9). The origins of many other Asclepiea are less well documented, but not necessarily late—the Olympian dedication of Micythus of Rhegium who lived in Tegea after 467 BC dates Asclepius' Tegean cult not much later than the Coan or Epidaurian one (Paus. 5. 26. 2); this sanctuary, as many others in the Peloponnese, might derive from Messenia, not from Epidaurus—though later combinations obscure the picture, like the cult of Machaon in Messenian Gerenia (Paus. 3. 26. 9).

The success of Asclepius was due to his appeal to individuals in a world where their concerns became more and more removed from *polis* religion and even from the healer Apollo, whose appeal still was discernible in his expansion to Rome in 433 BC and in his popularity in the Black (Euxine) Sea towns: with the one exception of Asclepius' transfer to Rome, it was individuals who were responsible for the expansion. The hero, 'best of the physicians', son of Apollo but still enough of a human to try to cancel death, the fundamental borderline between man and god in Greek thinking, was more easily accessible than Apollo who could proclaim lofty indifference towards man and his destiny (*Il.* 21. 462–6); even as a god, Asclepius was never so distant (see the very personal attachment of Aelius Aristides (see *SECOND SOPHISTIC*) in the 2nd cent. AD to Pergamene Asclepius).

Most Asclepiea share common features. The children of Asclepius, his sons Machaon and Podalirius and his daughter Hygieia, have cult in most, as has Apollo whom official inscriptions from Epidaurus always name before Asclepius. Most sanctuaries contain a sacred snake, some—like Epidaurus—also sacred dogs. A central feature of the cult is incubation, the receiving of dreams in which the god prescribes the healing; such dreams are

preserved in the long 'Sacred Discourses' (*hieroi logoi*) of Aelius Aristides and in the accounts of more or less miraculous healings inscribed in Epidaurus, Pergamum, Lebena, and Rome (M. Guarducci, *Epigrafiá greca* 4 (1978), 143–66; H. Müller, *Chiron* 1987, 193–233). Often, actual medical therapy followed the dream: Asclepiea developed into sacred hospitals and nursing-homes, but, owing to their wide appeal, also constituted meeting-places for local intellectuals and places of philosophical instruction (as in Cilician Aegae, Philostr. *VA* 1. 7). Besides the healing rites, other rituals are possible (initiatory dedications of ephebic hair in Paros (*IG* 12. 2. 173); burnt sacrifices in Titane (Paus. 2. 12. 7), with archaic cult images). Most Asclepiea were situated outside the town, sometimes on the seashore or in a lone valley, or at least in a marginal position in town. They share such sites with oracular shrines; both constituted places where humans could experience the divine directly (in his sanctuary, Asclepius 'reveals himself in person to man', Philostr. *VA* 1. 7).

In iconography, Asclepius generally appears as a mature, bearded man, similar to Zeus, but with a milder expression; a beardless Asclepius, as portrayed by Calamis and Scopas, is the exception. His most constant attributes are the staff (see ritual 'putting up the staff' at Cos, [*Hippoc.*] *Ep.* 11. 778 Kühn) and the snake, often coiled about the staff. Generally, the god is standing; in the famous chryselephantine statue from Epidaurus (Paus. 2. 27. 2, see coins), the god is seated, the staff in his left hand, his right extended above the head of a serpent, and beside the throne lies a dog.

FG

Asia, Roman province (see ◀Map 4, Dc▶) Attalus III of Pergamum bequeathed his kingdom to the Romans. After his death in 133 BC it was constituted as *provincia Asia* by Manius Aquillius. Originally it consisted of Mysia, the Troad (Troas), Aeolis, Lydia, Ionia, the islands along the coast, much of Caria, and at least a land corridor through Pisidia to Pamphylia. Part of Phrygia was given to Mithradates V Euergetes and was not made part of the province until 116 BC. Lycaonia was added before 100 and the area around Cibyra in 82 BC. After 80 BC, the SE portion was removed and joined to the new province of Cilicia, as were the Phrygian assize-districts of Laodicea, Apamea, and Synnada between 56 and 50 BC. Under the empire Asia included all the territory from Amorium and Philomelium in the east to the sea; it was bounded in the north by Bithynia, in the south by Lycia, and on the east by Galatia.

The province of Asia was rich in natural resources and in the products of agriculture and industry. Woollen fabrics were a speciality of the interior. Long-established

trade routes ran from the interior along the valleys of the Hermus and the Maeander to the harbours of the Aegean. Roman republican governors and capitalists exploited the new province with predatory rapacity and aroused widespread hatred, which was exploited by *Mithradates VI when he stirred up much of Asia to revolt between 88 and 85 BC. Allegedly 80,000 Italians were murdered in a single day at his instigation. After defeating Mithradates *Sulla reorganized the province in 85/4 BC and revised the administrative pattern into eleven assize-districts. This occasion marked the beginning of a new era for many cities, especially in the interior regions of Lydia and Phrygia. Methods of taxation were taken over from the Attalids, but Roman innovations included new customs arrangements introduced by a law of 75 BC, which, with several revisions, was still in force in AD 62. Asia continued to suffer from heavy taxation and arbitrary exactions through the civil wars of the late republic. The province had the misfortune to pick the losing side in the wars between Mithradates and Rome, between *Pompey and *Caesar, between the tyrannicides (Caesar's murderers *Brutus and Cassius) and Mark *Antony, and between Antony and Octavian. Neither victors nor losers in these wars hesitated to milk its rich resources. The principate of Augustus brought relief and was welcomed with genuine hope and enthusiasm, which is reflected above all in the organization of *ruler-cult, both at provincial and civic level, throughout the province.

Asia was now governed by a proconsul (a promagistrate, in this case an ex-*consul), who normally served for one year, assisted by three legates (*legati*) and a quaestor. He traditionally landed at *Ephesus, the headquarters of the republican *publicani* (tax-collectors) and later of the imperial *procurators, but spent much of his time visiting the assize centres (*conventus*) of the province according to a fixed rotation, where he heard cases and conducted other judicial business. The structure of the assize-districts is illustrated by an inscription of the Flavian period from Ephesus, which lists the assize centres and the smaller cities which were subordinate to them. Ephesus eclipsed the old Attalid capital of *Pergamum, although these cities and Smyrna remained locked in rivalry for the rank of leading provincial city. The other assize centres included Adramyttium, Cyzicus, Synnada, Apamea, Miletus, Halicarnassus (*JRS* 1975, 64–91).

Under the Principate new cities were created in the interior regions of Mysia, Lydia, and Phrygia; the province thus comprised a conglomeration of self-governing cities on which the Roman system of provincial government depended. The cities were responsible for local administration, for their own finances and building (sometimes

under the supervision of an outside *curator*, an official of the central government), for law and order on their territories, and for tax collection. The province was represented as a unity by the council (*koinon*) of Asia, a general assembly of representatives from all the cities and other communities, which met annually in one of the five provincial cities (Ephesus, Smyrna, Pergamum, Sardis, and Cyzicus) and organized the provincial imperial cult. Members of the most prominent families in the Asian cities became high priests (*archiereis*) of the imperial cult and were responsible for organizing an elaborate programme of sporting and artistic festivals in the provincial centres. Progress towards provincial unity, however, was always hampered by inter-city rivalry, particularly among the communities of the west coast and the Maeander valley.

Asia was supposedly one of the ungarrisoned provinces of the empire. No full legions were stationed there, but legionary detachments were present at various periods at the Phrygian cities of Apamea and Amorium, there was an auxiliary cohort stationed at Phrygian Eumeneia, and smaller contingents of soldiers were regularly used to patrol routes through mountainous areas. During the 3rd cent. AD soldiers were increasingly present in hitherto peaceful rural areas, leading to conflict and bitter complaints from the rural civilian population.

In the first two centuries AD the cities of Asia enjoyed great prosperity, attested by splendid ruins and handsome monuments, and reflected, for instance, in the panegyric speeches of Aelius Aristides (*see* SECOND SOPHISTIC). The wealth of inscriptions, locally minted coins, and material remains makes Asia one of the best documented of all Roman provinces. The cities had changed from autonomous city-states into administrative centres, but countless inscriptions attest the eagerness of members of the city aristocracies for public service, their generosity in providing civic amenities (doubtless at the expense of the rural populations which they exploited), and the entry of many families into the senatorial and equestrian orders. The glittering and extravagant society of the coastal cities, with their wealthy rhetors and sophists, contrasts with the traditional, rural-based society of the Anatolian interior. Urbanization brought Graeco-Roman culture up-country, but the basic Anatolian character of the population of regions such as Lydia and Phrygia was of enduring importance and was particularly conspicuous in their religious cults. The strict, self-disciplined morality of Anatolian pagan belief in the hinterland of the province of Asia provided fertile ground where Jewish and early Christian groups flourished. Much of the interior had apparently converted to Christianity before the beginning of the 4th cent.

In the 3rd cent. AD the province suffered not only from the indiscipline of the soldiery and a general decline in voluntary civic generosity, but also from a collapse in security prompted by Gothic invasions of the 250s and 260s, which led many cities to pull down their public buildings to provide material for hastily improvised fortifications. As the political and strategic emphasis shifted away from the Aegean to the Anatolian plateau and to the overland routes between the Balkans and the eastern frontier, Asia lost some of its former prominence and was divided into seven smaller provinces by *Diocletian. In the political order of the 4th cent. the leading cities which served as new provincial capitals—such as Ephesus, Sardis, and *Aphrodisias—retained much of their former glory, but most of the cities of the interior declined until they were barely distinguishable from villages.

Asia Minor (see ◀ Map 2 ▶)

Pre-Classical

Palaeolithic and mesolithic occupation was in caves and rock-shelters and has left simple paintings. The neolithic (c.8000–6500 BC) brought settlement in plains and valleys, growth of villages, and the domestication of plants and animals. Vigorous wall-paintings at Çatal Hüyük and clay statuary at Hacilar emphasize hunting, virility, fertility, and childbirth. Painted pottery first appears in the chalcolithic (c.6500–3400 BC). An economic upsurge in the early bronze age (c.3400–2000 BC) was made possible by developments in metallurgy, attested in metalwork from Troy and from royal burials at Alaca Hüyük, and was perhaps stimulated by Mesopotamian demand for native Anatolian metals. Greater wealth led to universal fortification of settlements and the rise of citadels (e.g. *Troy) and of palaces (e.g. Norşun Tepe). By the middle bronze age (c.2000–1700 BC) Assyrians had trading-stations in central Anatolia on which indigenous rulers at (e.g.) Kültepe, Alişar, and Acemhöyük imposed levies. Cuneiform writing was introduced. In the late bronze age (c.1700–1200 BC) the Hittites dominated central Anatolia from Hattuša (mod. Boğazköy). Extreme western and northern regions remained largely independent, but a north Syrian province was administered from Carchemish. Famine and Sea-Peoples are thought to have been responsible for extinguishing the state c.1200 BC, but the royal line continued at Carchemish and in other north Syrian kingdoms, where Hittite culture survived into the iron age (c.1200–700 BC). Central Anatolia was dominated by the Phrygians (capital at Gordium) and eastern Anatolia by the kingdom of Urartu.

Classical

The geographical term Asia Minor is used to denote the westernmost part of the Asian continent, equivalent to modern Turkey between the Aegean and the Euphrates. The western and southern coastal fringes were part of the Mediterranean world; the heartland of Asia Minor lay in the interior of Anatolia, comprising the hilly but fertile uplands of Phrygia, the steppic central plateau, and the rugged and harsh country of Cappadocia. These areas were framed by the Pontic ranges which rise steeply from the Black Sea in the north, and the long range of the Taurus which snakes through southern Anatolia from Lycia to the Euphrates and separates Asia Minor from Syria. In the Graeco-Roman period the region's history is illuminated by an almost limitless flood of historical information, which makes it possible to identify the separate languages, cultures, and religious traditions of its various regions—Bithynia, Mysia, Lydia, Caria, Lycia, Pisidia, Cilicia, Cappadocia, Galatia, Paphlagonia, and Pontus—and also to document the influence of external powers and cultures, above all of Persia, Greece, and Rome. Asia Minor was one of the economic powerhouses of the Persian empire. Much of the population of eastern Anatolia had strong Iranian connections, and Persian settlements were also widespread in the west after the mid-6th cent. BC. Many endured until late antiquity. Greek influence—*Hellenism—was naturally strongest in the coastal areas, where Greeks had established settlements between c.1100 and 600 BC. The cultural process, however, was not one-way, and the Greeks of Caria and Pamphylia were also much influenced by pre-existing Anatolian cultures. During the 4th cent. BC Hellenization spread to the indigenous inhabitants of Pisidia and Lycia in the south-west; most of the interior, however, was barely touched before the 1st cent. BC. Roman rule made the strongest impact. In the time of Hadrian Asia Minor was divided into six provinces: Asia, Pontus and Bithynia, Galatia, Lycia and Pamphylia, Cilicia, and Cappadocia, although provincial boundaries and administrative arrangements were more flexible in Anatolia than in almost any other part of the empire. The creation of an all-embracing road network, the universal *ruler-cult, the founding of cities to act as administrative centres, a permanent military presence, and the creation of far-reaching systems of taxation (see FINANCE, ROMAN) forged a new society in Asia Minor, which was as much Roman as it was Anatolian.

The indigenous regional cultures of Asia Minor, however, survived until the end of antiquity, preserving their native languages and their religious practices, above all in the rural parts of the interior and in the mountains. These were only finally erased by the spread of Christianity,

which became strongly rooted as early as the 3rd cent. and extended, except for obstinate, usually urban, pockets of paganism, across the whole of the peninsula by the end of the 4th century. Neither Christianity nor the introduction of Islam by the Turks between the 11th and 14th centuries obliterated the basic patterns of Anatolian life, which were rooted in a traditional rural economy. There was a continuity of population and settlement pattern which can be observed even in contemporary Turkey. SM

astrology, the art of converting astronomical data (i.e. the positions of the celestial bodies) into predictions of outcomes in human affairs. Astrology developed in the Hellenistic age, essentially as an import from Babylon, which equally furnished many of its astronomical parameters. *Alexandria was its major centre. By the 1st cent. BC, it had emerged as a sophisticated technical art, commanding widespread credence and respect. So it remained until the late empire, when its incompatibility with *Christianity led to its formal suppression (though not extinction).

There are several branches of astrology, of which the most important is genethliology, the art of foretelling an individual's life from the positions of the stars (i.e. sun, moon, planets, and fixed stars) at birth or conception. The basic astronomical data for calculating a 'nativity' (i.e. a horoscope) are (a) the positions of the seven known planets (including sun and moon) relative to one another (their 'aspects') and to the twelve signs of the zodiac, and (b) the position of the circle of the zodiac (and thus of the planets moving round it) relative to a second circle of twelve 'places' (mod. 'houses') whose cardinal points ('centres') are the rising- and setting-points on the horizon and the zenith and nadir. The whole may be likened to a complex clock whose seven hands (the planets) turn anticlockwise at various mean speeds (from the moon's month to Saturn's almost 30 years) against a dial whose twelve hours are the signs of the zodiac; simultaneously, the dial and its hands together rotate clockwise (in a 24-hour period corresponding to the apparent daily revolution of the heavens) against a second, fixed dial which is the local frame of reference for the nativity, itself divided into twelve sectors (the 'places') with the rising and setting points at 9 and 3 o'clock and the zenith and nadir at about 12 and 6. The astrologer reads this clock at the time of birth and then assigns meanings, in terms of the 'native's' destiny, character, and occupation, to the various positions and relationships in the 'nativity'. In antiquity, as now, astronomical tables rather than direct observation were used.

Actual horoscopes survive from antiquity, both simple (as in papyrus fragments) and complex (as in

professional treatises, e.g. the *Anthologies* of Vettius Valens). Astrology was popular with all classes; similarly, astrologers spanned a wide social and intellectual range. At the pinnacle were men such as Tiberius Claudius Thrasyllus and his son Tiberius Claudius Balbillus who were theoreticians and practitioners of the art, confidants and functionaries of emperors from *Tiberius to *Vespasian, and connected by marriage both to powerful Romans (*Sejanus and Macro) and to the Greek client kings of Commagene (SE *Asia Minor). Because it was so widely believed, astrology was potentially subversive of public order. Accordingly, astrologers were periodically expelled from Rome, and Augustus forbade both consultations in private and those concerning deaths (AD 11).

From a modern perspective it is the postulated link, causal or semiotic, between celestial and terrestrial events that renders astrology suspect. Most ancients took that link for granted, under a belief in a 'universal sympathy' which connects all parts of the cosmos in a harmoniously functioning whole. *Stoicism legitimized divination of all sorts, and the worship of the stars, especially the sun (*see* HELIOS), added further authority to astrology, as did the common belief in the *soul's celestial origin and destiny. Many intellectuals accordingly accepted and justified the art, including such astronomers as Ptolemy who makes a well-reasoned case (*Tetrabiblos* 1. 1–3) that astrology is but the application of *astronomy, in a necessarily fallible way, to the sublunary environment. There were, however, sceptics and critics, among the most cogent being Sextus Empiricus (*Math.* bk. 5) and Favorinus of Arles (reproduced in summary by Gell. *NA* 14. 1); and low-grade practitioners preying on the superstitious attracted inevitable scorn.

The most important extant astrological writings are, in chronological order, Marcus Manilius' *Astronomica*, c.AD 14 (ed. and trans. Goold (1977)); the poem of Dorotheus of Sidon transmitted in Arabic, 1st cent. AD (ed. and trans. Pingree (1976)); Ptolemy's *Tetrabiblos*, mid-2nd cent. (ed. and trans. Robbins (1940)); the *Anthologies* of Vettius Valens, late 2nd cent. (ed. Pingree (1986)); bk. 1 ed. and trans. Bara (1989)); the *Mathesis* of Firmicus Maternus, mid-4th cent. (ed. Kroll-Skutsch-Ziegler (1913), trans. Forbes (1970), ed. and trans. Monat (1992)); the *Apotelesmatica* of Hephaestion of Thebes, c.415 (ed. Pingree (1973); and Rhetorius, c. 620 (ed. Pingree (2007)). There is much otherwise unpublished material in CCAG. Extant horoscopes are collected in O. Neugebauer and H. van Hoesen, *Greek Horoscopes* (1959); more recent horoscopes in A. Jones, *Astronomical Papyri from Oxyrhynchus* (1999), nos. 4236–4300a. The fundamental modern treatment remains A. Bouché-Leclercq, *L'Astrologie grecque*

(1899). See also F. Boll, C. Bezold, and W. Gundel, *Sternnglaube und Sterndeutung*, 6th edn. (1974). RLB

astronomy 1. The use of the heliacal rising and setting of prominent stars or star-groups to mark points in the year is found in the earliest literature of the Greeks (*Homer and *Hesiod, e.g. *Op.* 619 ff.), and no doubt goes back to prehistoric times. This 'traditional' Greek astronomy continued (with some refinements borrowed from 'scientific' astronomy) to the end of antiquity. It was embodied in the 'astronomical calendars' (or *parapēgmata*, so called from the practice of sticking a peg to mark the current day in holes along the sides) which began with Meton and Euctemon in the 5th cent. BC and of which several examples are preserved in manuscript and on stone. These mark important points of the year (including solstices and equinoxes), and use the risings and settings of stars as a basis for weather predictions (the latter already in Hesiod).

2. Scientific astronomy in Greece hardly predates the 5th cent. BC. The cosmological speculations of the earlier Presocratics are irrelevant, and the scientific feats attributed to some of them (e.g. Thales' prediction of an eclipse) by later writers are unworthy of belief. However, some of the basic concepts necessary to later astronomy were enunciated in the course of the 5th cent. Parmenides (A 44 DK) mentioned the sphericity of the earth and stated that the moon receives its light from the sun (B 15). Empedocles went beyond this to infer the cause of solar eclipses (B 42), as did Anaxagoras. Yet how unfamiliar this was even to an educated man of the late 5th cent. is shown by the remark of *Thucydides (2. 28) that solar eclipses *seem* to occur only at new moon. There seems to have been general ignorance about the planets: Democritus, according to Seneca (*QNat.* 7. 3. 2), said that he *suspected* that there were several (*plures*) planets but gave neither number nor names. Significant for the future development of Greek astronomy is the transmission of elements from *Babylonia (which had a tradition of observational astronomy going back to the 8th cent. BC): the twelve signs of the zodiac appear in Greece perhaps as early as the late 6th cent. (if the lines quoted from Cleostratus of Tenedos (DK 6) are genuine); certainly the nineteen-year lunisolar cycle of Meton was derived from Babylon; but this, like Meton's solstice observations, is still directed towards the goals of 'traditional' astronomy.

3. The 4th cent. saw the introduction of the most characteristic Greek contribution to astronomical theory, the idea that the apparently irregular motions of the heavenly bodies should be explained by geometrical models based on uniform circular motion. Later sources attribute this to *Plato (Simplicius on Arist. *Cael.* 219^a23), but although it is not inconsistent, in a general sense, with

views expressed in his dialogues, the only certainty is that the first system embodying this idea was constructed by Plato's contemporary Eudoxus. It is significant that Eudoxus was also the first to establish axiomatic rigour in geometry: we may conjecture that it was this success which led to the notion of extending the explanatory power of geometry to other fields, including the heavens. Eudoxus' system of 'homocentric spheres', centred on the fixed, spherical earth, and rotating with uniform motions about different poles, combined simplicity with mathematical ingenuity, and was able, in principle, to account for the retrogradations of the planets and the latitudinal deviations of all bodies, including the moon. The observational elements involved were few, namely crude synodic and sidereal periods for the planets and the moon. Yet even these represent a considerable advance over the ignorance prevalent 50 years earlier: Eudoxus is the first Greek who is *known* to have recognized all five planets (the passages in Plato *Resp.* 616d–617b and *Ti.* 38cf, where the five planets are hinted at, may well have been written later than Eudoxus' book). Here again we may suspect Babylonian influence in the observational data, particularly since there are Mesopotamian elements also in the description of the constellations which Eudoxus published. For all its mathematical elegance, Eudoxus' system exhibited serious discrepancies from easily observable facts. In particular no homocentric system could account for the obvious variations in size and brightness of e.g. the moon and Venus. Nevertheless Callippus modified Eudoxus' model to eliminate some of the grosser discrepancies, and this revised model has come down to us because *Aristotle accepted it (*Cael., Metaph.* 1073^a14–1074^b14), transforming what had probably been for Eudoxus a purely geometrical scheme into a physical mechanism with contiguous solid spheres. Scientific astronomy in the 4th cent. remained at this purely theoretical level: practical astronomy was concerned with traditional topics, the calendar (Eudoxus' *Octaeteris* and Callippus' 76-year cycle), and the risings and settings of stars. The earliest extant astronomical works, those of Autolycus and Euclid, are little more than a treatment of the latter in terms of elementary geometry.

4. At an unknown date, probably not long after Callippus, the epicyclic and eccentric hypotheses for planetary motion were proposed. These provided a remedy for the most glaring defect of the homocentric system, by producing variation in the distance of a heavenly body, while at the same time giving a simple representation of the 'anomalies' (variations in speed and direction) of the bodies; they became the standard models used in Greek theoretical astronomy. No doubt the complete geometric equivalence of epicyclic and eccentric forms (under

suitable conditions), which was assumed in the planetary theory of Apollonius (Ptolemy, *Almagest* 12. 1), was discovered soon after these models were proposed. One might conjecture that it was in examining the transformation of one to the other that Aristarchus of Samos (c.280 BC) came to the realization that one can transpose the geocentric universe to a heliocentric one, and so put forward his famous hypothesis. This, like the earlier suggestion of Heraclides Ponticus that the earth rotates on its axis, appears never to have been taken seriously by practising astronomers, although the grounds for rejecting it were 'physical' rather than astronomical. The 3rd cent. probably saw much astronomical activity, but our knowledge of it, derived mostly from incidental remarks in the *Almagest*, is slight. There was more observation, of solstices by Aristarchus and Archimedes, of the declinations of fixed stars (presumably for delineating a star-globe) by Aristyllus and Timocharis, and of the moon (including eclipses) by Timocharis. But theoretical astronomy remained at the stage of explaining the phenomena by means of geometrical models and deriving the mathematical consequences. This is evident in Apollonius' use of the epicyclic/eccentric hypothesis to determine stationary points on planets' orbits, and also in the single astronomical work surviving from this time, Aristarchus' treatise on the distances of the sun and moon: this is a mathematical exercise showing how the limits for those distances can be derived from certain numerical assumptions (about the inaccuracy of which the author appears unconcerned, although it must have been obvious). The topic of the distances of the heavenly bodies was much discussed, by Archimedes and Apollonius amongst others, but no-one before Hipparchus devised a reliable method of computing even the moon's distance.

5. Astronomy was transformed by Hipparchus between c.145 and 125 BC. His great innovation was the idea of using the geometrical models, which his predecessors had developed to *explain* the phenomena, in order to *predict* or calculate them for a given time. He did not himself fully succeed in this (we are specifically informed that he renounced any attempt at constructing a theory of the planets), but he contributed several essential elements, including the development of trigonometry, ingenious methods for the application of observational data to geometrical models, and the compilation of observations, not only of his own and other Greeks, but especially from the massive Babylonian archives (to which he seems to have had privileged access). Although sporadic Mesopotamian influences appear in Greek astronomy from at least the time of Meton, Hipparchus was apparently the first Greek to have extensive knowledge of Babylonian astronomy, including not only observations, but also

astronomical constants (e.g. very accurate lunar periods), metrology, and methods of calculation. The latter were sophisticated arithmetical procedures for predicting celestial phenomena, and now that the original cuneiform documents have been analysed, it seems likely that it was the Babylonian success in applying mathematical methods to astronomical prediction which inspired Hipparchus to attempt the same within the Greek theoretical framework. He got as far as constructing a viable epicyclic model for the moon, and made many other individual advances, including the discovery of the precession of the equinoxes, to which he was perhaps led by noticing the discrepancy between the year-length which he had derived from observations of equinoxes (the tropical year) and that used by the Babylonians (which was in fact a sidereal year). He also recorded a large number of star positions to be marked on his star-globe.

6. The history of astronomy in the 300 years between Hipparchus and Ptolemy is very obscure, because the unchallenged position of the *Almagest* in later antiquity resulted in the loss of all earlier works on similar topics. However, the evidence from Indian astronomy (the *siddhāntas* based on lost Greek treatises from late Hellenistic times) and from Greek papyri shows that the process begun by Hipparchus was continued by his successors, who produced predictive mathematical models for all the heavenly bodies. This undoubtedly contributed to the enormous growth in genethliological *astrology (which requires calculating the celestial positions for a given time) in the period following Hipparchus. But theoretical astronomy was characterized by a bewildering profusion of Babylonian arithmetical methods (which Hipparchus himself had not hesitated to use, even in his lunar theory), combined with geometrical planetary models which, although producing numerical results, lacked logic and consistency. This situation satisfied the professional needs of astrologers such as Ptolemy's contemporary Vettius Valens, but was repugnant to the scientific purism of Ptolemy himself. In his magisterial *Almagest* (c.AD 150) he ignores (apart from an occasional contemptuous aside), the work of his immediate predecessors, singling out Hipparchus as the sole peer worthy of his imitation and criticism. Starting from first principles, and rigidly excluding arithmetical methods, he constructed an edifice of models for sun, moon, planets, and fixed stars based on a combination of epicycles and eccentrics employing uniform circular motions, the numerical parameters of which he determined by rigorous geometrical methods from carefully selected observations. These were supplemented by tables allowing the computation of all celestial positions and phenomena pertinent to ancient astronomy, to a suitable accuracy (Ptolemy regarded agreement with

astronomy The high level of craftsmanship attained by Greek astronomical instruments is shown by this device, recovered from a 1st-cent. BC shipwreck off the SE coast of Greece. The bronze fragment belongs to a complex mechanism representing the relative motions of sun and moon. Antikythera. National Archaeological Museum, Athens / Hellenic Ministry of Culture & Tourism Archaeological Receipts Fund (Law 3028/2002)

observation within 10" of arc as acceptable). The result is a work of remarkable power and consistency, which dominated astronomy for 1,300 years.

7. Ptolemy himself regarded his work as provisional, but it was treated as definitive by his ancient successors, who produced nothing of significance in astronomy, confining themselves to explicating the *Almagest* (and other treatises by him), despite the fact that there were serious defects in it even by ancient standards, notably in the solar theory, producing errors which increased with the lapse of time. That these were completely unnoticed in later antiquity is an indication both of the lack of independent observation and of the state of the science after Ptolemy. However, important corrections to the solar theory and other individual details of Ptolemaic astronomy were made after it experienced a revival through its transmission to the Islamic world (the *Almagest* was translated into Arabic c.AD 800), but even there the edifice as a whole remained undisturbed, and criticisms of Ptolemy were concerned mainly with his alleged violation of the principle of uniform circular motion in introducing the equant. Ancient astronomy did not begin to become obsolete until Copernicus, and the process was not completed until Kepler.

8. The astronomy of the Greeks covered only a part of what is now comprised in the term. It can be considered the most successful of the ancient applied sciences, if one

accepts the ancient view that its task is confined to describing and predicting observed motions by means of a consistent mathematical model. Physical astronomy, however, remained at a very low level (like physics in general). But it is not entirely ignored even in the *Almagest*, and in his *Planetary Hypotheses* Ptolemy attempted to fit the kinematical models of the *Almagest* into a unified physical system. This was based on Aristotelian notions, including the crucial thesis that nature is not wasteful. In it Ptolemy describes a universe in which each planetary 'shell' is contiguous with that of the bodies immediately above and below it. This system enabled him to compute the absolute dimensions and distances of all parts of the universe out to the sphere of the fixed stars, which he found to be less than 20,000 earth-radii from the central earth (less than the distance from the earth to the sun by modern computation). This vision of a small and completely determined universe, although not universally accepted even in late antiquity, became the canonical view in the Middle Ages, in both east and west, and is enshrined in biblical exposition and learned poetry as well as in the works of professional astronomers. It was a strong argument against consideration of the heliocentric hypothesis, which entailed a vastly larger universe in which the fixed stars were at enormous distances. GJT/AJ

Athena In *Iliad* 5. 733–7, *Homer describes how Athena took off the finely-wrought robe 'which she herself had made and worked at with her own hands' and 'armed herself for grievous war.' This incident encapsulates the paradoxical nature of a goddess who is as skilled in the preparation of clothes as she is fearless in battle; who thus unites in her person the characteristic excellences of both sexes. At the greater Panathenaea in Athens, she was presented with a robe, the work of maidens' hands, which traditionally portrayed that battle of the gods and giants in which she was the outstanding warrior on the side of the gods.

Her patronage of crafts is expressed in cults such as that of Athena Erganē, Athena the Craftswoman or Maker; it extends beyond the 'works' of women to carpentry, metal-working, and technology of every kind, so that at Athens she shared a temple and a festival with *Hephaestus and can, for instance, be seen on vases seated (in full armour!) in a pottery. Her love of battle is seen, as we saw, in myth, and also in such cults as that of Athena Victory (*Nike); she is regularly portrayed fully armed, one leg purposefully advanced, wearing her terror-inducing aegis (a large all-round bib with scales, fringed with snakes' heads and decorated with the head of the female monster Gorgo).

She is also closely associated with the masculine world in her mythological role as a helper of male heroes, most memorably seen in her presence beside Heracles on

several of the metopes of the temple of *Zeus at *Olympia. Indeed her intervention in battle often takes the form of 'standing beside' a favourite (e.g. *Il.* 10. 278–94). (She has accordingly been seen as every man's ideal elder sister, in contrast to the tomboy Artemis and sexy Aphrodite (P. Friedrich, *The Meaning of Aphrodite* (1978)); but these modern western categories scarcely fit the Greek family.) Her virginity is a bridge between the two sides of her nature. Weaving is a characteristic activity of ordinary young girls, but a perpetual virgin, who is not subject to the distinctively feminine experience of *childbirth, is a masculine woman, a potential warrior.

The warlike Athena is scarcely separable from Athena Polias, the goddess of the Acropolis (see ATHENS (TOPOGRAPHY)) and protectress of cities. 'City-protecting' was most commonly performed by goddesses rather than gods; and the other great protectress was the other great warrior-goddess of the *Iliad*, Athena's close associate *Hera. Athena exercised this function in many cities besides Athens, including Sparta and (in the *Iliad*) Troy. Athens was unique only in the degree of prominence that it assigned her in this role.

A few cult titles and festivals of Athena seem to indicate interests other than those discussed so far; and it has often been suggested that her familiar classical functions have been pared down from a much broader original competence. But this is too much to deduce from stray allusions to cults the details of which are usually very little known. The 'Athena Mother' of Elis (Paus. 5. 3. 2) is a puzzle; and Athena's limited intrusions upon the preserves of other gods at Athens—the cult of Athena of Health (Hygieia) for instance—may simply reflect a tendency of city-protecting gods to have a finger in every pie.

Athena is unique among Greek gods in bearing a connection with a city imprinted in her very name. The precise linguistic relation between place and goddess is teasingly difficult to define: the form of her name in early Attic inscriptions is the adjective *Athēnaia*, which suggests that she may in origin be 'the Athenian' something, the Athenian Pallas for instance (*Pallas Athēnaiē* being a regular Homeric formula). But this account still leaves the shorter name-form Athena unexplained. Athenians themselves, of course, stressed the goddess's association with their city enthusiastically. She was foster-mother of the early king Erechtheus/Erichthonius, and had competed, successfully, with Poseidon for possession of Attica. In Panhellenic mythology, however, she shows no special interest in Athens or in Athenian heroes. The association with Athens does not appear to affect her fundamental character.

Her most important myth is that of her birth from the head of Zeus. It stresses her unique closeness to Zeus, a

vital quality in a city-protecting goddess, and at the same time the gap that divides her, a child without a mother, from the maternal side of femininity. In the oldest version (Hes. *Theog.* 886–90) Zeus became pregnant with Athena after swallowing Metis; she was thus also a kind of reincarnation of *mētis*, 'cunning intelligence'.

It has in fact been suggested that Athena's characteristic mode of action, a mode that unifies her apparently diverse functions while differentiating them from those of other gods with which they might appear to overlap, is the application of *mētis*. Her *mētis* appears obviously in her association with crafts and in her love (Hom. *Od.* passim) for wily *Odysseus; more obliquely, it is argued, it is for instance to be seen in her title Hippiā, 'of horses', which she acquires via a product of *mētis*, the bridle, whereas *Poseidon Hippius embodies the animal's brute strength. In warfare she would express rational force, *vis temperata*, in contrast to the mindless violence of Ares. One may doubt, however, how fundamental the opposition to Ares and the role of *mētis* in fact are in defining her military function.

Precursors of Athena have been identified in Mycenaean military or palace-protecting goddesses; the only solid evidence is a tantalizing reference in a Linear B tablet from Cnossus to A-ta-na po-ti-ni-ja. RCTP

Athens (history) (see following page)

Athens (topography) (see ◀ Map 1, Cc ▶)

Acropolis

The central fortress and principal sanctuary of *Athena, patron goddess of the city. In the later 13th cent. BC the steep hill was enclosed by a massive wall. Within, there are Mycenaean terraces, perhaps once supporting traces of 'the strong house of Erechtheus' (Hom. *Od.* 7. 81). The first monumental temples and sculptural dedications date to the 6th cent. BC. Two large Doric temples of limestone with marble trim were built, along with a half-dozen small temples or treasuries. Later quarrying has obliterated the foundations of all but one of the peripteral temples (c. 510 BC) which stood on the north side of the hill, just south of the later Erechtheum. A marble temple, the Older Parthenon, was under construction on the south half of the hill in 480 BC when the Persians took and sacked the city. The debris from this devastation was buried on the Acropolis and no major construction took place for about a generation. In the 450s a monumental bronze statue of Athena Promachus was set up to celebrate victory over the Persians and in the second half of the 5th cent. four major buildings were constructed at the instigation of *Pericles, with Phidias as general overseer.

[continued on p. 102]

HISTORY OF ATHENS

Prehistory

The more substantial remains of later periods have largely effaced prehistoric settlement evidence, apart from subterranean features like tombs and wells. The distribution of these suggests that there was a nucleus of habitation on and around the Acropolis, particularly to its south, and a wider spread of hamlets and farms. The settlement's earlier history is obscure, but it clearly became one of the more significant Mycenaean centres (*see* MYCENAEAN CIVILIZATION), as indicated by wealthy 14th-cent. BC tombs and the later 13th-cent. BC fortification and water-supply system on the Acropolis. Twelfth-cent. remains are scanty, but cemetery evidence indicates a wide spread of communities, mostly small, by the Submycenaean phase; overall, the evidence offers no support for the theory that Athens attracted large 'refugee' groups.

OTPKD

History

Tradition held that *Theseus was responsible for the *synoecism, in the political rather than physical sense, of the Athenian (Attic) state. More prosaically put, this would imply a unified kingdom, centred on Athens, in the late bronze age. But if there was any such kingdom it did not survive the collapse of Mycenaean civilization, and the synoecism is now generally put c.900 BC, after a tumultuous period in which refugees from Attica settled in Ionia (W. *Asia Minor) from c.1050 BC onwards. Athenian imperial *propaganda later exaggerated the organized character of this process, turning it into a movement of *colonization which would justify the metropolis making hegemonical demands of the 'daughter-cities'. Another later propaganda item was the myth of 'autochthony' (Attica had 'always had the same inhabitants'). This was false, but useful for scoring off the Dorian 'newcomers'.

The Attic countryside was settled from the centre in the 8th cent. by 'internal colonization': Athens was not among the first genuinely colonizing states. The early Attic state was aristocratic and politically hardly distinctive. There was nothing even embryonically democratic about the annual *archontes* who began in 684/3 BC and were the chief officers of state: Thuc. 1. 126, correcting Hdt. 5. 72 which says an obscure group ran Athens, the '*prytaneis* of the naukraries', a title which implies ships (*nau-*). But early Athenian naval activity is plausible, because Attica's long coastline is one of the features which did make it exceptional. Others were an imposing city acropolis, with its own water-supply; a mountain-system which formed a first line of defence for Athens itself; and valuable resources in the silver-bearing Laurium region of east Attica.

In 632 'the Athenians', a collective noun now first used as a political agent, resisted Cylon's attempt at a *tyranny (Thuc., as above); there is no reason to link this rejection of constitutional upheaval with Draco's law-code in the 620s. Athens' first overseas settlement at Sigeum in c.610 may be an indicator of economic restlessness of the kind which produced *Solon. His economic and political reforms in the 590s created an Attica of smallholders; enhanced Athenians' sense that they were a political élite; and widened eligibility for political office. But proper democracy was still in the future and Solon could not save Athens from the tyranny, later in the 6th cent., of *Pisistratus and sons. The tyranny was not oppressive until shortly before the end (510), and did more for Athens' later military and naval prominence than 5th-cent. historians allowed.

*Cleisthenes in 508, after a short phase of aristocratic struggle, established the democracy which provoked Persia by helping the *Ionian Revolt, and then defeated Persia at Marathon and ten years later at Salamis. The Cleisthenic state was however aristocratic in many ways, and full democracy did not arrive until the 460s and the reforms associated with Ephialtes and *Pericles. But meanwhile Athens had in 478/7 become an imperial city: *see* DELIAN LEAGUE. Against a background of increasing tension with Sparta, the displaced leader of Greece, the Athenians now capitalized on their Persian War achievement. Military successes against Persia culminated in the battle of the Eurymedon in the early 460s, and more subject-allies were brought under Athenian control; art and architecture, poetry and rhetoric continued to insist on the Persian Wars theme in a way hardly guessable from the history of *Thucydides. The Athenian empire survived the First Peloponnesian War of c.461–46, though the Thirty Years Peace of 446 ended Athens' ten-year control of Boeotia. But increasing Athenian expansionism in the early 430s alarmed Sparta and the outbreak in 431 of the 27-year Peloponnesian War ended the *Pentekontaetia* or 50-year period from the Persian Wars; this was the period of maximum Athenian cultural achievement.

In the Archidamian War, the Spartans failed in their programme of 'liberating' Greece from the tyrant city, Athens. Nor did Athens' catastrophic Sicilian Expedition of 415–413 or the oligarchic regime of the Four Hundred (411), or even the definite commitment of wealthy Persia to the Spartan side (407) end the war, which included Athenian successes like Cynossema (411), Cyzicus (410), and Arginusae (406) before the final defeat at Aegospotami in 405. Athens became a subject-ally of Sparta and a second, Spartan-sponsored oligarchy took power in 404, the Thirty Tyrants.

But by a recovery even more remarkable than that of 413, Athens climbed back to independent and even semi-imperial status in the early 4th cent. Fifth-century Athens had been an imperial, Hellenistic Athens was a university, city; 4th-cent. Athens was something in between. Democracy was restored in 403 and the constitution was mildly reformed, though not in a way which can be associated with any named reformer. From now on the democracy was more efficient but noticeably less radical (*see* DEMOCRACY, ATHENIAN). In foreign affairs, Athens soon dared to confront the Spartans as one of the coalition which fought the Corinthian War of 395–386 and, remarkably, included Sparta's recent backer Persia. The battle of Cnidus of 394 was a naval victory over Sparta, won by a Persian-sponsored fleet but with an Athenian commander, Conon. The King's Peace of 386 (*see* GREECE, HISTORY) ended this first phase of Athenian recovery. But Spartan aggressions and unpopularity enabled Athens to launch a Second Athenian Confederacy in 378.

Initially the confederacy was successful and welcome: its members included Thebes, now a rising power. Athens defeated Sparta at Naxos and Alyzia in the mid-370s. But Thebes' defeat of Sparta at Leuctra in 371 led to a *rapprochement* between Athens and Sparta in the 360s. Meanwhile Athenian attempts to turn their empire into something more like its 5th-cent. predecessor, especially attempts to recover Amphipolis and the cleruchy put in on *Samos in 366, were unpopular. Major island allies rebelled in the Social War of 357–355. Because of distractions like this and the Third Sacred War, not to mention sheer short-sightedness, it was not until 351 that Athens and *Demosthenes realized the threat posed by *Philip II of Macedon. A brief war (early 340s) ended with the Peace of Philocrates (346); Athens now acknowledged the loss of Amphipolis. The end, militarily, to Athenian great-power status came in 338 at Chaeronea, though modern historians rightly insist that this did not signal either the death of the *polis generally or of Athens in particular.

The Athens of Eubulus and Lycurgus pursued, in the 330s and 320s, ostensibly backward-looking policies of retrenchment which actually anticipate Athens' Hellenistic role as cultural centre. Athens did not openly resist *Alexander the Great, but when at the end of his life he restored Samos to the Samians, Athens embarked on and was defeated in the Lamian War of 323–322 (naval battles of Abydos and Amorgos, land battle of Crannon), after which democracy was suppressed. There were however later democratic restorations and reactions, the first as early as 318 (democracy installed by Polyperchon).

Under Cassander, Athens was ruled tyrannically by Demetrius of Phalerum (318–307), a period of peace but imposed cultural austerity. He was expelled by the rapturously welcomed Antigonid Macedonian Demetrius Poliorcetes ('the Besieger'). Another Cassander-supported tyrant Lachares seized power in 300; the hoplite general Charias resisted him unsuccessfully in 296 in the name of democracy. Lachares fell in 294 and Athens submitted to the Antigonids for much of the century until the 220s; the exceptions were a precarious period of freedom in the 280s/early 270s (a period associated with the name of the patriot commander Olympiodorus) and the Chremonidean War of the 260s, which ended with Athens' surrender in 262 (*see* ANTIGONUS GONATAS). In the 220s, under the regime of Euryclides and Miccion, Athens managed to stay on good terms with the Ptolemies as well as with Macedon, as Rome's shadow lengthened over Greece. SH

Roman

Friendly with Rome from 229 BC (Polyb. 2. 12. 8), Athens was rewarded for her support against Perseus with the gift of *Delos (166 BC), its possession fuelling an economic boom, peaking by 100 BC (S. Tracy, *Harv. Stud.* 1979, 213 ff.) and linked with (if not prompting) a copious ('New Style') silver coinage. In 88 BC, under the tyrant Aristion, Athens enthusiastically supported *Mithradates VI; the city was sacked as a result by *Sulla (86 BC), and a timocratic constitution imposed, but it retained 'free' status (Strabo. 9. 1. 20). From the 50s BC on *philhellenism prompted Roman nobles, then emperors, to become benefactors of the city. *Hadrian transformed it with a lavish building programme and made it the seat of the Panhellenion. Thereafter it flourished culturally as a centre of Greek rhetoric (*see* SECOND SOPHISTIC), and it remained a bastion of philosophy, above all (from c.AD 400) Neoplatonism, until c.530. Damaged by the Herulian Goths (267) and besieged by the Visigothic leader Alaric (396; *see* ROME (HISTORY)), the city acquired major new buildings in the 5th cent., notably the vast 'Palace of the Giants'. *Christianity was slow to make inroads; the Parthenon may not have become a church before the 6th cent. AJSS

First came the Parthenon (447–432); the Propylaea (437–432), gateway to the Acropolis, occupied the western approaches to the citadel. Soon after, an old shrine of Athena Nike (Victory) was refurbished and a small temple of the Ionic order, tetrastyle amphiprostyle in plan, was built just outside the Propylaea. Finally, the Erechtheum was constructed during the last quarter of the 5th cent. Only a few buildings were added to the Acropolis in later times: a sanctuary of Brauronian *Artemis (see BRAURON) and the Chalkotheke, where bronzes were stored. A tall pier built just outside the Propylaea in the 2nd cent. BC first carried statues of Eumenes II and Attalus II, kings of *Pergamum and benefactors of Athens, later replaced by one of *Agrippa. The Roman presence in Greece is reflected on the Acropolis by the construction after 27 BC of a small round monument dedicated to Roma and Augustus and built in an Ionic style closely copying the Erechtheum.

Environs of the Acropolis

Numerous sanctuaries clustered around the base of the Acropolis rock. The sanctuaries of 'the nymph' (7th cent. BC), *Asclepius (420 BC), and *Dionysus (c.500 BC) were on the south slope. The theatre of Dionysus was built of limestone and marble in the 330s BC and renovated several times in the Roman period. To the west was a stoa built by King Eumenes II of Pergamum (197–159 BC) and beyond that the local millionaire Herodes Atticus built a huge odeum (concert hall) in memory of his wife Regilla (c.AD 160). The ground east of the theatre was taken up by the odeum of Pericles (c.443 BC), a replica of the tent of Xerxes, captured by the Greeks at the battle of Plataea (479 BC). A broad street lined with tripods set up by victorious *chorēgoi* (producers) in the choral lyric contests led from the theatre around the east end and north side of the Acropolis. The small Corinthian Lysicrates monument (335 BC) is the best-preserved surviving tripod base. In this eastern area were to be found several other cults (Aglaurus, Dioscuri, *Theseus), as well as the *Prytaneion*, hearth of the city. The north side of the Acropolis sheltered cults of *Aphrodite and *Eros, *Pan, *Apollo, and *Demeter and *Persephone (Eleusinium). The Areopagus, a low hill north-west of the Acropolis, was the seat in early times of a council and lawcourt as well as a shrine of the Eumenides (Furies). St *Paul addressed the court of the Areopagus, though by the 1st cent. AD the council almost certainly met in the lower city and not on the hill.

Agora,

the civic centre of Athens, was located north-west of the Acropolis on ground sloping down to the Eridanus river.

Traversed by the Panathenaic Way, the Agora was a large open square reserved for a wide variety of public functions, lined on all four sides by the principal administrative buildings of the city. First laid out in the 6th cent. BC, it remained a focal point for Athenian commerce, politics, and culture for centuries, surviving the Persian sack of 480 BC and the Sullan siege of 86 BC (see SULLA). Here in the Classical period were to be found the *bouleutērion* (council-house), the Tholos (dining-hall for the *prytaneis*), the Metroon (archives), mint, lawcourts, and magistrates' offices (Royal Stoa, and South Stoa I), along with sanctuaries (Hephaisteion, Altar of the Twelve Gods, Stoa of Zeus Eleutherius, Apollo Patrous), fountain-houses, and stoas (Stoa Poecile, Stoa of the Herms). More large stoas (Attalus II, Middle Stoa, South Stoa II) were added in the 2nd cent. BC. To the 2nd cent. perhaps should be dated (controversial) the elaborate octagonal marble water-clock known today as the Tower of the Winds, built some 200 m. (220 yds.) east of the Agora. This eastern area was later occupied by the market funded by Caesar and Augustus, which supplanted many of the commercial functions of the old Agora. In the 2nd cent. AD a huge peristyle complex with library was built by Hadrian just to the north of the Roman market. Roman additions to the Agora also reflect Athenian prominence in cultural and educational affairs: an odeum given by *Agrippa (c.15 BC) and a library dedicated by Pantaenus (c.AD 100). Badly damaged and partially abandoned as the result of the sack by the Herulian Goths in AD 267, the Agora was finally destroyed by Alaric and the Visigoths in AD 395.

Pnyx,

the meeting-place of the Athenian assembly (*ekklēsia*), was built on a low ridge west of the Acropolis. Originally laid out in either c.500 or 462/1 BC, and remodelled in 403 under the Thirty Tyrants (Plut. *Them.* 19; see ATHENS (HISTORY)), the final phase was built in c.340 BC. This third phase consists of a rock-cut speaker's platform (*bēma*) and a massive curved retaining wall for the auditorium. Stoas were laid out on the ridge above but never finished. By the Hellenistic period most meetings took place in the theatre of Dionysus, and a small open-air sanctuary of Zeus Hypsistos was established just south-east of the *bēma* in the Roman period. North of the Pnyx the ridge was given over to the worship of the Nymphs, while the south end of the ridge (the Museum) was the site first of a Macedonian garrison fort in Hellenistic times and then the marble tomb of Philopappus, member of the deposed royal house of Commagene in SE Asia Minor (d. AD 114/16).

South-east Athens

In this quarter of town were to be found the oldest cults of the city: Dion. in 'the Marshes', Olympian Zeus, Gē (Earth), and Pythian Apollo (Thuc. 2. 15). Best preserved is the colossal Olympieum. The centre of *Hadrian's worship in the Greek world, it was approached through an arch bearing inscriptions which may delimit the old town of Theseus from the new Athens built by Hadrian (*IG* 2². 5185). Nearby, to the north, a gymnasium with a sanctuary of Apollo Lyceus gave its name to *Aristotle's school, the Lyceum. Other shrines and the old Enneakrounos fountain-house lay further out, along the banks of the River Ilissus. Across the river lay the Panathenaic stadium, built by Lycurgus (338–326 BC), rebuilt in marble by Herodes Atticus (AD 139–44), and restored in 1896.

Fortifications

An Archaic city wall was replaced in 479 BC, immediately after the Persian sack, by a new expanded circuit, hastily constructed at the behest of Themistocles (Thuc. 1. 90). Its length of 6.5 km. (4 mi.) was pierced by at least fifteen gates, the principal one being the Dipylon, to the north-west. Moats and outer walls were added in the 4th cent. in response to threats from Macedonia, and a large extension was added to the east in Roman times. Destroyed in AD 267, the walls were replaced in part by a new, much more constricted, circuit, though the outer wall was eventually refurbished as well. Communication between Athens and the harbours of Piraeus was assured by means of three Long Walls.

Cemeteries

Burials were made outside the city walls, all around the circuit. The principal cemetery, known as the Ceramicus, lay along the two major roads leading north-west from the city. It was used as a burial ground from c.1100 BC until the 6th cent. AD, and excavations have recovered hundreds of graves, along with sculptured and inscribed grave-markers. In this same vicinity lay the *dēmosion sēma*, the state burial ground for the war-dead as well as other notables. Farther on lay the *Academy. JMCKC

athletics

Greek

At the core of Greek athletics was an individual's hard physical struggle in order to gain victory over an opponent; hence, it included not only (as 'athletics' implies nowadays) track and field events but also boxing, wrestling, and equestrian events, and excluded team competitions, fun-running, and performances aimed at setting records (cf. the derivation of 'athletics' from the root

athl- denoting struggle, competition for a prize, and misery). Athletics was a popular activity; valuable contemporary evidence for it is provided by vase-paintings and the victory odes of *Pindar and *Bacchylides.

The first substantial description of Greek practice comes from *Homer's account of the funeral games for Patroclus (*Il.* 23. 262–897; cf. *Od.* 8. 120–30). Eight events are mentioned there (*chariot-racing, boxing, wrestling, running, javelin*, an event similar to fencing, throwing the weight, and archery); the five in italics regularly formed the central part of all later games.

From the middle of the 5th cent. the four major venues for athletics competitions were the Olympian, Pythian, Nemean, and Isthmian Games. The running-races were the *stadion* (a length of the stadium, 192 m. (210 yds.) at Olympia), *diaulos* (there and back), and *dolichos* (twelve laps at Olympia). There was no marathon or event of similar length, although according to Herodotus (6. 105) Phidippides, who ran from Athens to Sparta, trained as an ultra-distance runner for the purpose of delivering messages. A race in armour, derived from military training, was introduced into athletics programmes at the end of the 6th cent., and there was a pentathlon consisting of long-jump, *stadion*, discus, javelin, and wrestling. At the Olympic and Pythian Games there were separate events for men and boys, while at the Nemean and Isthmian Games there was also an intermediate category for youths (*ageneioi*, lit. 'beardless').

Training took place in the *gymnasium, or *xystos* (covered colonnade); for the running events, especially the *dolichos*, long training-runs must have been done outside the confines of these buildings. The need for athletes to have a suitable diet was widely recognized (Hippoc. *VM* 4; Arist. *Eth. Nic.* 2. 6. 7; Pl. *Resp.* 410b; Paus. 6. 7. 10). Sometimes an athlete's father would act as his coach (Pind. *Isthm.* 6. 72–3); often, past victors became coaches (Melesias of Athens, Pind. *Ol.* 8. 54–64; see THUCYDIDES; Iccus of Tarentum, Paus. 6. 10. 5). Before the Olympia, the wise precaution was taken of making competitors swear by Zeus that for the previous ten months they had trained properly (Paus. 5. 24. 9). When training or competing, athletes covered their bodies with olive oil to keep off the dust and were generally naked, though there is some disputed evidence pointing to the use of loincloths (e.g. Thuc. 1. 6. 5 and the Perizoma group of vases, Beazley, *ABV* 343–6; see M. McDonnell, *JHS* 1991, 182–93). Male sexual interest in young athletes, admired for their physique, was commonplace (e.g. Xen. *Symp.* 1. 2–10; Aeschin. *In Tim.* 156–7; see HOMOSEXUALITY).

Women competed at Olympia in separate games, the Heraea in honour of *Hera; there was just one event, a shortened *stadion*-race (Paus. 5. 16. 2–3). During the

athletics Athenian ceramic oil-jar of c.525 BC, given as a prize in the Panathenaic *games, showing a jumper, discus-thrower, and two javelin throwers. Male nudity was a feature of Greek athletics. © The Trustees of the British Museum

men's athletics, married women were forbidden to watch, but virgin girls were permitted (Paus. 6. 20. 9), a custom perhaps derived from a conception of the games as an occasion for girls to meet future husbands.

It is hard to evaluate athletics performances, because running-races were not timed, and distances in field events not measured; one indication that standards may have been low is the fact that Pausanias records many examples of men who had been able to win in several different types of event (cf. Paus. 6. 3. 7, 6. 13. 3, 6. 15. 8–9).

Roman

At Rome colourful *circus spectacles (especially chariot-racing) and ball games were the most popular sporting activities. But Augustus promoted traditional athletics, staging athletics competitions in the Campus Martius and exhibition-running in the Circus (Suet. *Aug.* 43. 1–2); he himself was keen on watching boxing (45. 2). Ultra-distance running was also practised: 'Some men can do 160 [Roman] miles in the Circus' (Plin. *HN* 7. 84). Interest in athletics was maintained by the establishing of

Greek-style games at Rome and elsewhere. In (?)⁴ BC *Tiberius won the chariot-race at the Olympian Games; from then on, Romans (mostly either eastern provincials with Roman citizenship, or those with sufficient authority to bend the rules, as Nero did in AD 67) won at Olympia with increasing regularity. See GAMES. SJI

atomism, a term used of theories that posit the existence of small indivisible particles as the ultimate components of matter. The Greek term *atomon*, used by some ancient philosophers to describe these ultimate components, means 'uncuttable' or 'indivisible'. The theories in ancient philosophy that fall under the general term 'atomism' share certain features: all posit an infinite number of these microscopic particle-type entities (*atoma*, atoms) as the physical occupants of the universe; these atoms are in motion through empty space, and the space itself has neither boundaries nor distinct places within it; atoms come in different varieties, which are differentiated in shape and have certain fundamental features such as solidity, resistance, texture, and possibly

weight. The atom's intrinsic features never change, but when the atoms gather together to form larger bodies (either collections of several atoms of the same sort, or an assortment of different kinds) their intrinsic or primary qualities account for other secondary effects that are features of larger bodies, including the appearance of colour, flavour, and scent (what we might call secondary qualities). These derivative effects can change as the arrangement of the atoms in a body or collection of bodies change, even though the atoms themselves do not acquire or lose any properties of their own.

Leucippus and Democritus in the early period, and *Epicurus and his followers in the Hellenistic period (including the work of the Roman poet *Lucretius), are the primary candidates for the description 'atomists'. For none of them was the atomic hypothesis either prompted or defended by means of experimental investigations into physics, and the atoms that they posited were all supposed to be too small to see and hence could not be detected by observation any more than they can now. All the atomistic theories were prompted by theoretical questions, including metaphysical puzzles about the nature of reality, and its permanence, and questions about whether things really change, and how we can know. Some were also prompted by puzzles in mathematics and logic, such as Zeno's puzzles about divisibility.

Because these puzzles arise from difficulties raised by other philosophers, the atomistic theories need to be placed in their context. The early atomists Leucippus and Democritus can be treated as a group, since it is hard to disentangle the record of what each separately might have contributed to what has come to be seen as a joint enterprise. Chronologically they occupy a position at the very end of what we call Presocratic philosophy. Democritus' working life actually coincides with that of Socrates. He is regarded as 'Presocratic' because he is primarily responding to his predecessors, at least in his work on physics. In metaphysics, the chief concern of the early atomists seems to have been to counter the arguments against plurality and change that had been put forward by Parmenides, and then reaffirmed by other thinkers, including Zeno of Elea and Melissus. Some, at least, of Zeno's notorious paradoxes seem to be designed to show that division into parts is logically impossible, whether that division is supposed to end up with finite numbers of discrete component parts or an unending succession of finer divisions and subdivisions. Leucippus and Democritus respond by proposing finite discrete component parts, themselves solid matter and uncuttable, but separated by portions of empty space or nothingness.

This latter proposal, asserting the existence of 'nothing' or 'what is not'—and that this 'nothing' occupied space

between things—was the most controversial. Such apparent nonsense flies in the face of Parmenides' foundational claims (to the effect that only what *is* something can be included in the contents of the logically possible world). On the contrary, the atomists boldly claim, the world contains what is something and what is nothing, and parts of space, between the things that are something, is occupied by what is nothing. This means that bodies can be distinguished by being detached from each other, so that there can be more than one thing in reality even if all bodies are made of the same kind of stuff.

The suggestion that there is empty space also solves another puzzle, namely Melissus' claim that motion is impossible because things would need empty space to move about in. By positing the void, the atomists make space for the movement of atoms within it, and thereby explain changes in the macroscopic appearance of things. Since arrangements and collections of atoms account for the perceivable appearance, while atoms themselves are too small to see, it is only the appearance of things that changes. There is no change in what is there underneath: atoms themselves never change their shape or their intrinsic features. In this way the atomists deny that anything real has ceased to exist, since the impressions created by conglomerations of things are mere appearances, not genuine parts of reality. This kind of escape route from problems of change, and the consequent distinction between the primary and secondary qualities of things, motivates the sceptical attitude to the senses that is prominent in Democritus' work.

In the Hellenistic period, Epicurean philosophy advocates atomism along similar lines. Developments can be identified in the conception of the void (arguably now envisaged as pure extension, which may be occupied or unoccupied, as opposed to being a place occupied by 'nothing') and in the idea that atoms themselves contain 'minimal parts': that is, even though an atom is small, it has some size, and we can think of it having an edge and a middle, a left side and a right side; these parts not only cannot be physically cut apart, but they also have finite size: here too there is a limit to how far we can subdivide the magnitude in our mind, and the result must be a finite number of parts of finite size. These and other features of the Epicurean version of atomism were prompted by work on time, space, and infinite tasks by *Aristotle and Diodorus Cronus.

Epicurus also invoked the atomic theory in a range of other areas besides physics and metaphysics strictly understood. Perception, thought, dreams and other psychological phenomena, religious belief, freedom of the will and causation in general are all to be accounted for with reference to a generally materialistic vision, in which

the possibilities are defined by what can be supposed to happen to minute bodies falling randomly through an infinite universe of empty space. The most accessible and systematic exploration of this vision that survives intact for us to read as a whole is provided (with missionary zeal) by Lucretius in *De rerum natura*. CJO

Atticus (Titus Pomponius Atticus), b. 110 BC as the son of a cultured *equus* (see *EQUITES*) of a family claiming descent from Numa Pompilius, legendary second king of Rome, was later adopted by a rich uncle (Quintus Caecilius), whose wealth he inherited. He was a friend of *Cicero from boyhood (Cicero's brother Quintus married Atticus' sister), and Cicero's *Letters to Atticus*, probably published in the reign of *Nero (though parts were known to some before), are the best source for his character, supplemented by an encomiastic biographical sketch by his friend Cornelius Nepos. In 85 Atticus left Italy after selling his assets there, in order to escape the civil disturbances he foresaw. He lived in Athens until the mid-60s (hence his *cognomen* 'Atticus', i.e. 'Athenian'), among other things studying Epicurean philosophy (see *EPICURUS*), to which however he never wholly committed himself. Henceforth he combined a life of cultured ease (*otium*) with immense success in various business activities and an infallible instinct for survival. He privately urged Cicero to determined action on behalf of the *optimates* ('best men'), with whom he sympathized, but himself refused to take sides in politics and personally assisted many prominent politicians from *Marius to Octavian (see *AUGUSTUS*), without regard for their differences and conflicts. He was Cicero's literary adviser and had his works copied and distributed. He himself wrote a *Liber Annalis* (a chronological table of world, and especially Roman, history), which became a standard work, eulogistic histories of some noble families, and minor works. (All are lost.) He lived to become a friend of *Agrippa, who married his daughter. In 32 he committed suicide when incurably ill. EB

Augustine, St (Aurelius Augustinus) (AD 354–430) was born at Thagaste (mod. Souk Ahras, Algeria), son of Patricius, a modest town councillor of pagan beliefs, and a dominant Catholic mother, Monica. Educated at Thagaste, Madauros, and Carthage, he taught rhetoric at Thagaste, Carthage, and Rome and (384–6) as public orator at Milan, then the capital of the emperor Valentinian II. Patronized at Rome by Symmachus, the pagan orator, he hoped, by an advantageous marriage (to which he sacrificed his concubine, the mother of a son, Adeodatus—d. c.390) to join the 'aristocracy of letters' typical of his age. At 19, however, he had read the *Hortensius* of *Cicero. This early 'conversion to philosophy' was the prototype

of successive conversions: to Manichaeism, a Gnostic sect promising Wisdom, and, in 386, to a Christianized Neoplatonism patronized by Ambrose, bishop of Milan. Catholicism, for Augustine, was the 'Divine Philosophy', a Wisdom guaranteed by authority but explored by reason: 'Seek and ye shall find', the only scriptural citation in his first work, characterizes his life as a thinker.

Though the only Latin philosopher to fail to master Greek, Augustine transformed Latin *Christianity by his Neoplatonism: his last recorded words echo Plotinus. Stimulated by abrupt changes—he was forcibly ordained priest of Hippo (Bone, Algeria) in 391, becoming bishop in 395—and by frequent controversies, Augustine developed his ideas with an independence that disquieted even his admirers. He has left his distinctive mark on most aspects of western Christianity.

Augustine's major works are landmarks in the abandonment of Classical ideals. His early optimism was soon overshadowed by a radical doctrine of grace. This change was canonized in an autobiographical masterpiece, the *Confessions* (c.397–400), a vivid if highly selective source for his life to 388 and, equally, a mirror of his changed outlook. *De doctrina Christiana* (begun 396/7) sketched a literary culture subordinated to the Bible. *De Trinitate* (399–419) provided a more radically philosophical statement of the doctrine of the Trinity than any Greek Father. *De civitate Dei* (413 to 426) presented a definitive juxtaposition of Christianity with literary paganism and Neoplatonism, notably with Porphyry. After 412, he combated in Pelagianism views which, 'like the philosophers of the pagans', had promised men fulfilment by their unaided efforts. In his *Retractationes* (427) Augustine criticized his superabundant output of 93 works in the light of a Catholic orthodoxy to which he believed he had progressively conformed—less consistently, perhaps, than he realized.

Letters and verbatim sermons richly document Augustine's complex life as a bishop; the centre of a group of sophisticated ascetics (notably Paulinus of Nola), the 'slave' of a simple congregation, he was, above all, a man dedicated to the authority of the Catholic Church. This authority had enabled his restless intellect to work creatively: he would uphold it, in Africa, by every means, from writing a popular song to elaborating the only explicit justification in the early Church of a policy of religious persecution. Augustus (see *facing page*)

Aurelius, Marcus, emperor AD 161–80, was born in 121 and named Marcus Annius Verus. His homonymous grandfather, Marcus Annius Verus, from Ucubi (Espejo) in Baetica, consul for the third time (as *ordinarius*) in 126

[continued on p. 111]

AUGUSTUS

Augustus (63 BC–AD 14), the first emperor at Rome, who presided over the inception of much of the institutional and ideological framework of the imperial system of the first three centuries AD. The long survival of his system, and its association with a literary milieu that came to be regarded as the golden age of Latin literature, make him a uniquely important figure in Roman history, but no narrative history of his lifetime survives except for the account of *Cassius Dio (incomplete 6 BC–AD 14), and the rest of the evidence is very deeply imbued with partisan spirit of various kinds. An estimation of his personal contribution is hard to achieve.

Son of a *novus homo* or first man of his family to reach the senate (Gaius Octavius, praetor 61, d. 59) from Velitrae in the Alban Hills, the younger Gaius Octavius was typical enough of the milieu of junior senators in the third quarter of the 1st cent., perceiving that the way to success lay through the support of the great dynasts for their agents and followers. In this he had a head start: his mother Atia (of a family from Aricia, next door to Velitrae) was the daughter of *Caesar's sister, which made Octavius one of the closest young male relatives of the dictator, a connection emphasized when in 51 BC he gave the funeral oration for his maternal grandmother. In 47 he was made pontifex (a member of one of the four major colleges of the Roman priesthood: see PRIESTS (GREEK AND ROMAN)); with Caesar in Spain in 45, he was enrolled as a patrician, and when the dictator drew up his will (13 September 45) he adopted the 17-year-old Octavius and made him his heir. The young man spent the winter in study at Apollonia in Dalmatia, but reacted with decision and alacrity when Caesar was murdered and the will read. Over the next months he consolidated his position as the leader of the friends of Caesar, commemorating his adoptive father, and wooing his veterans; a course of action which brought him into conflict with Mark *Antony, and support of the cause against him which was victorious at Mutina (April 43), after which he seized the consulship by force. At Bononia the differences between him, Antony, and *Lepidus were resolved and the Triumvirate (board of three men assuming supreme authority in the state) established. The next years were marked by the crushing of Antony's brother, Lucius Antonius (Pietas) and his wife Fulvia at Perusia, with singular violence, the settling of veterans, on confiscated land, and the *proscriptions, in which he was as ruthless as the others. He married Scribonia as a gesture to Sextus Pompeius (*Pompey's son, and she bore his only child *Julia (in 39 he divorced her to marry *Livia); to seal the political dispositions made at Brundisium in October 40 Antony married his sister Octavia. All the politicians of the time made use of *imperium, one of the only surviving constitutional principles of any potency, and Caesar's heir now took the first name Imperator.

Over the 30s, events combined with astute responses enabled Imperator Caesar to represent himself as defender of an Italian order. His principal local rival for this position, Sextus Pompeius (finally defeated at Naulochus in 36), he represented as a pirate-leader. He took advantage of his control of the ancient centre of *imperium* and (especially through the singular post-consular aedilate of *Agrippa in 33) maintained the favour of the disaffected and volatile *populus* (people) who still in theory granted it. After a half-hearted attempt to attain some military reputation against a foreign enemy (the Illyrians) he turned to representing Antony in *Alexandria as alien, immoral, and treacherous. In 32 a formal oath expressed the mass loyalty of Italy to his cause. The advantages of this policy were not wholly symbolic. Italy offered material resources, manpower, and the land with which to reward its loyalty. Imp. Caesar and his close supporters of these years and afterwards (especially Agrippa, Titus Statilius Taurus, and *Maecenas) were victorious against Antony, whose pro-Egyptian policy and failure in Armenia had lost him much of his eastern support. The battle of *Actium (31 BC) was the turning-point; the capture of Alexandria in the next year ended the war and led to the incorporation of Egypt in the *imperium*. Victory in the east, the vindication of his political promises in Italy, and the booty of the Ptolemies gave him an unassailable position, soon expressed in terms of divinity.

From his consulship of 31 (he held it every year down to 23) there began a down-playing of the irregularity of the triumviral system, which culminated in a formal *restitutio* (restoration) of the *res publica* (constitutional organs of state), a restoration in the sense of repair or revival rather than a return to a different constitution. He returned to Rome in mid-29, triumphed, beautified the city by the dedication of important temples, and signalled an end to war by the closing of the temple of *Janus. Agrippa was his colleague in the consulship for 28 and 27: at the beginning of 27 he made the formal gesture of reinstating the magistrates, senate (reduced in numbers through a purge of undesirable elements), and people in their old constitutional role. In return he received a major grant of proconsular *imperium*, and many honours, including the name Augustus, and departed to carry out the military duties of his new command.

Before 7 BC Augustus spent a great deal of time in the provinces (only in 23, 18, 17, and 12 did he spend the whole year in Rome, and he was absent for the whole of 26/5, 21/0, and 15/4). The Civil Wars had shown that power at Rome was to be won in the provinces, and with ever greater numbers of Roman citizens outside Italy, Augustus had to form an empire-wide system. The creation of a huge proconsular **provincia* on the model of the commands of Pompey and the triumvirs, which gave Augustus *imperium* over most of the *milites* (troops) of the *res publica*, was the core of this, and the most important part of the 'settlement' of 27. Delegation was essential in so unwieldy an entity, and, like his predecessors, Augustus appointed senatorial legates and equestrian prefects to serve his *imperium*. If these men ran units which were analogous to the *provinciae* of the proconsuls who continued to be sent to the parts of the Roman dominion that lay outside Augustus' command, that is not to say that the settlement envisaged two types of province. Such an innovation would have been far less subtle than the skill with which the legal flexibility of the assignment of proconsular commands and the convenient precedents of the previous generation were adapted to Augustus' purpose.

There were difficulties, since holders of *imperium* had been accustomed to a greater independence than Augustus could afford to allow them. Already in 30 the claim of Marcus Licinius Crassus (grandson of **Crassus*) to the *spolia opima* (spoils offered by a Roman general who had slain an enemy leader in single combat) had tested the limits of self-determination; this bid for an antique honour was, characteristically, thwarted by a display of greater erudition from Augustus. Egypt's temptations proved too much for even the equestrian prefect Gaius Cornelius Gallus (26). Marcus Primus came to grief because his informal instructions were inconsistent (c.24). In 23, again following the precedent of Pompey, the proconsular *imperium* was clearly labelled *maius* (superior), which also clarified the position of the other holders under Augustus of wide-ranging commands, such as Agrippa and Gaius Caesar.

The maintenance of the loyalty of the soldiers finally depended on Augustus' capacity to pay them. That in turn depended on the organization of revenues so that they would regularly accrue to him directly. A simple fiscal logic thus operated which transformed the empire: previously, the maintaining of cash flows to the centre, where they might be squandered by one's enemies, was of little interest to provincial governors. Now, the efficiency of the exaction system was the only guarantee of the survival of the new order. The whole world was enrolled, and noticed it (Luke 2: 1, even if the process was not so sudden as the experience of Judaea implied). Taxation was reformed and new provinces made so that their tribute might swell Augustus' takings. The enthusiastic imposition of such burdens caused rebellion and disaster, especially in Germany. A military treasury on the Capitol announced the theoretical centrality of the fiscal arrangements to the whole *imperium* from AD 6.

The incorporations of this period doubled the size of the provincial empire: NW Spain and the provinces of the Alps and the Alpine foreland, Raetia, Noricum, and Pannonia, with Germania and Moesia beyond them, saw most of the military aggression, the provincialization of Galatia (central **Asia Minor*) and Judaea (see JEWS) being relatively peaceful. A reasonably high level of military activity was a sensible ingredient in Augustan political strategy, and provided the *gloria* which fuelled the *auctoritas* (prestige) of the ruling cadre. Some of this took the form of expeditions which bore no fruit in terms of the all-important taxation, either directly (or in some cases ever): like Augustus' own trip to the Danube (35–33 BC), Aelius Gallus' Arabian campaign (25–24), and the wars in southern Egypt of Cornelius Gallus (29) and Gaius Petronius (25). The main point of such trips was the glamour of the geography and ethnography, celebrated in poetry and on Agrippa's map, which propagated the belief that Augustus' Rome ruled the whole inhabited world. This impression was reinforced by Augustus' generally successful use (continued in the east from Antony's careful practice) of the traditional diplomatic relations with local magnates, kings, or communities, in places outside the direct *imperium* of a Roman governor. Ritual courtesies on both sides could suggest that the empire included **India* or **Britain*, and had a practical role in settling outstanding issues with Parthia in 20 in a negotiation which Augustus made a great deal of. When a serious military threat appeared, in the shape of the Pannonian Revolt, 'the worst war since those against Carthage', or the German war that followed the massacre of Quinctilius Varus and his three legions, the system all but collapsed.

For all his absences, Rome itself was at the heart of Augustus' vision. City-foundations in the provinces, and benefactions to existing *coloniae* (colonies) and *municipia* (municipalities), encouraged the imitation of the metropolis and

Augustus This trophy, set up in 6 BC at La Turbie (above Monaco), commemorated Augustus' victory over 44 Alpine tribes, resulting in the province of Alpes Maritimae, constituted in 14 BC. Military operations under Augustus doubled the size of the empire and helped to maintain the prestige of his regime. Giraudon / The Bridgeman Art Library

the recognition of that constituency of Italians spread across the Mediterranean world that had played such a vital part in the Civil Wars. He could not avoid a real concern for the urban populace of Rome itself, who caused major disturbances of the traditional kind at intervals throughout his ascendancy. In 23, the choice of *tribunicia potestas* (see TRIBUNE OF THE PLEBS) as the 'indication of the highest station', and the way in which Augustus counted the years of his 'reign' thereafter, signalled also his descent from the *populares* (popular politicians) of the late republic, many of whose policies he continued (albeit sometimes with a show of reluctance): he made provision against famine, fire, and flood, and reorganized the districts of the city (spreading his own cult in the process). The popular assembly duly ratified his legislation, and was represented *en masse* in displays of loyalty at important moments.

*Varro had taught the Romans to be at home in their own city, and Augustus was an eager interpreter of the process. The ancient messages of cult and civic ritual offered many opportunities, which he was making use of already in the 30s. After Actium the serious development of the cult of Palatine Apollo as a parallel for Capitoline Jupiter, and the restoration of dozens of Rome's ancient sanctuaries; after 12 (when he finally became pontifex maximus or head of the college of *pontifices* (see PRIESTS (GREEK AND ROMAN)) on the death of Lepidus) the formation of the House of the Pater Patriae, in 2 BC the inauguration of a replacement forum (the forum Augustum: see ROME (TOPOGRAPHY)), to which many state ceremonies were removed; throughout the creation of a 'suburb more beautiful than the city' on the Campus Martius, for the amenity of the populace: the reduplication of Rome's glories cleverly allowed him to be a new founder without damaging the old system, and to surpass all past builders and benefactors without the solecism of departing from or belittling their precedent. He thus underlined his relationship with the previous centuries of Roman history in a Roman Whig history that culminated in his ascendancy.

His management of *lex* (statute) was equally historic: giving his name to far more *leges* than any legislator before him, and announcing his control of the legislative assembly in the process, he became the city-founding lawgiver of the new Rome. The control of religion, that mirror of the *res publica*, was the interpretative vehicle of much of this, and learning, interpretation, and doctrine, of law or ritual precedent, history or geography, were the indispensable servants of all these projects. Hence the cultural and literary acme that later generations of Romans perceived at this epoch. These processes came together in the pivotal years 19–17 BC, when he had made the last modifications to his position in the *res publica*, settled the eastern and western provinces, and acquired his first grandson (Gaius Caesar, the child of Julia and Agrippa). Now came the ethical and social laws, and in 17 the great celebration of the divine diuturnity that the Fates had given to Rome by making her populace virtuous and therefore fecund, in the *ludi saeculares* (Secular Games).

His concern for the institutions of state allowed him to insert himself into the annals of Roman history as a continuator or reformer rather than as an intruder or revolutionary, while the inherent flexibility of the institutions gave him a wonderful repertoire of gambits both for shaping opportunities for political success for his supporters and for social promotion, of which the most important form of all was the identification of a successor to his office. The very happy accident of his long life allowed readjustment of many of his innovations in a process of trial and error, a refining process which explains the success and long survival of many of them: the city prefect, the public *postal service, the *vigiles* (fire brigade), and so on.

The arrangement of a successor proved the most difficult task of all. The calculation of *auctoritas* in which he excelled, and which his very name evoked, entailed that no merely dynastic principle could be guaranteed; it would belittle his own carefully constructed practical reputation for real ability to have a successor who owed everything, as he had done, to a name. At the same time he had been unable (and had perhaps not wanted) to avoid accumulating honours for his family, and using for that very consolidation of *auctoritas* the image of a Father and the model of the state as a super-household, one conducted like his own and under his benign but omniscient tutelage. There was in the end a dissonance between the role of those who had to be permitted to acquire the necessary *auctoritas* to maintain the image of effective governance, especially through largely factitious military escapades, and the need to rely on his own blood-line to keep alive the charisma of his own divine associations. Agrippa was a compliant assistant in the public sphere, and Livia happy and expert at propagating the necessary pictures in the private; but *Tiberius and Drusus, Livia's children by her first marriage, were not good at being second fiddle, and Julia, his daughter and only child, on whom the whole dynastic construction relied, nearly wrecked the whole thing by probably calculated sexual misbehaviour. This called into question the credentials of the model family, the legitimacy of her offspring, and the feasibility of using ethics as a constitutional strategy, while potentially irradiating her partners (who included Antony's son Iullus Antonius) with her share of the ancestral charisma.

The dynastic policy was not overtly monarchic either, however, and what saved Augustus was the fact that he had (since he did not have the option of destroying them wholesale) recreated the Roman aristocracy and given them a

new role in his social system. As an antidote to the Civil War social mobility was to be curbed; freedmen were discouraged from promotion, the *plebs* was indulged but controlled; the two upper classes were encouraged to procreate, and each had its precise place in the religious system, at the theatre, and in government. As an ornament to the whole thing, and to camouflage the prerogatives that he ascribed to his own family, survivors of the great lines of the historic Roman past were encouraged to live up to their ancestors' images, and given an honorific but circumscribed part to play in a system whose regulation, through his censorial function, it was Augustus' job to manage. Hence—and the power derived also from his fatherly pretensions—the ethical content of much of his legislation, which did the nobility the credit of thinking them worthy of the past while giving their arbiter a useful way of coercing them if they failed to live up to it. The seeds of the disastrous use of the laws on *adultery and *maiestas* (treason, broadly defined) over the next generations were therefore sowed by Augustus, who was not himself faced by any very coherent opposition.

Later authors dated the establishment of the imperial monarchy to 31 or 27 BC. In many ways, as Augustus probably saw, and Tacitus appreciated, the new arrangements, many times modified, and threatened by diverse instability, could not be regarded as established until someone had succeeded to them, and then shown himself willing to continue their essentials. Although the *optimus status* ('best state of affairs') was in most respects in place by the climax of the legislative phase and the announcement of the *saeculum* in 17, and the pinnacle of *auctoritas* was commemorated in 2 BC, the Augustan empire could have been dissolved in AD 14. The achievement of Augustus lay in the flexibility with which he and his advisers responded to a period of striking social change in the Mediterranean world, the legacy of the Roman/Italian diaspora of the previous century. But in controlling a dynamic process there is more continuity and less revolution than is usual in the foundation of a monarchy, and that may well help to account for the stability of the system that Augustus' successors developed out of his innovations (see also ROME (HISTORY), § 2.1). NP

and city prefect, a relative of *Hadrian and an influential figure, brought him up after his father's early death. His mother Domitia Lucilla inherited the fortune created by Gnaeus Domitius Afer. From early childhood Marcus was a favourite of Hadrian, who nicknamed him *Verissimus*. At the age of 15 he was betrothed at Hadrian's wish to Ceionia Fabia, daughter of the man Hadrian adopted as Lucius Aelius Caesar. In 138 Hadrian ordered his second heir *Antoninus Pius, whose wife was Marcus' aunt Annia Galeria Faustina, to adopt Marcus along with Aelius' son Lucius: he now became Marcus (Aelius) Aurelius Verus Caesar. When Hadrian died, Marcus was betrothed to Antoninus' daughter, his own cousin Annia Galeria Faustina, instead of Ceionia. Quaestor in 139, first elected consul in 140 and again in 145, he married in the latter year; his first child was born on 30 November 147; the next day he received *tribunicia potestas* (see TRIBUNE OF THE PLEBS) and **imperium* and Faustina became Augusta (*fasti Ostienses*). Marcus was educated by a host of famous teachers, one being the orator Fronto; many of their letters survive. His leaning to philosophy, already manifest when he was 12, became the central feature of his life. He was much influenced by Quintus Iunius Rusticus (elected to a second consulship in 162), son or grandson of the Stoic 'martyr' (see STOICISM) of AD 93, and by the teaching of Epictetus. Although Marcus is called a Stoic, his *Meditations* (see below) are eclectic, with elements of Platonism and Epicureanism as well.

Further, he was much indebted to Antoninus, who receives a lengthier tribute than anyone else in the *Meditations* (1. 16; another version, 6. 30). His tranquil family life is vividly portrayed in his correspondence and recalled with affection in the *Meditations*. Faustina bore him further children; several died in infancy, but the couple had four daughters when Marcus succeeded Antoninus on 7 March 161; and Faustina was again pregnant.

Marcus at once requested the senate to confer the rank of co-emperor on his adoptive brother Lucius, as Hadrian had intended. Lucius took Marcus' name Verus, while Marcus assumed that of Antoninus. There were thus two Augusti for the first time, equal rulers, except that only Marcus was *pontifex maximus* (head of the *pontifices*: see PRIESTS (GREEK AND ROMAN)) and he had greater *auctoritas*. The coinage proclaimed the *concordia Augustorum* (concord of the emperors), Lucius Verus was betrothed to Marcus' eldest daughter Annia Aurelia Galeria Lucilla, and the *felicitas temporum* (happiness of the times) was further enhanced when Faustina gave birth to twin sons on 31 August, their names honouring Antoninus (T. Aurelius Fulvus Antoninus) and Lucius (L. Aurelius Commodus). But Antoninus' death had unleashed trouble on the frontiers: in Britain, dealt with by Sextus Calpurnius Agricola; Upper Germany, to which Marcus' close friend Aufidius Victorinus, Fronto's son-in-law, was sent; along the Danube; and, most seriously, in the east. The Parthians seized Armenia and

Aurelius, Marcus Aerial view of Carnuntum, a legionary fortress on the Danube, where Marcus was based during the Marcomannic wars and wrote part of his *Meditations*. The civil settlement, made a municipality under *Hadrian, is in the left foreground. Dr. Lothar Beckel

defeated the governor of Cappadocia, who took his own life, and invaded Syria. It was decided that an expeditionary force was needed, to be led by Lucius Verus, with an experienced staff. Verus left Italy in 162 and was based at Antioch until 166 (with a visit to Ephesus in 164 to marry Lucilla), but was merely a figurehead. After the expulsion of the Parthians from Armenia by Statius Priscus (163), he took the title Armeniacus (accepted by Marcus in 164), crowning a new king, Sohaemus. Other generals, notably Avidius Cassius, defeated the Parthians in Mesopotamia: Ctesiphon was captured and Seleucia on the Tigris sacked at the end of 165. Verus became Parthicus Maximus, Marcus following suit after a short delay. In 166 further success led to the title Medicus. But plague had broken out in the eastern army; the threat in the north was becoming acute—the despatch of three legions to

the east had weakened the Rhine–Danube **limes*. Verus was obliged to make peace, celebrating a joint triumph with Marcus (12 October 166). Each became Pater Patriae (Father of the Fatherland) and Marcus' surviving sons, *Commodus (whose twin had died) and Annius Verus (b. 162), became Caesar.

Marcus planned a new campaign to relieve the Danube frontier. New legions, II and III Italicae, were raised in 165; V Macedonica, formerly in Lower Moesia, was moved to Dacia on its return from the east. But the *plague, reaching Rome in 166, delayed the expedition until spring 168; meanwhile Pannonia and Dacia were both invaded. The emperors went to the Danube in 168 and reinforced the frontier, stationing the new legions in western Pannonia under Quintus Antistius Adventus (*ILS* 8977). They wintered at Aquileia, where the plague

broke out; the praetorian prefect Furius Victorinus was a victim and Galen, the imperial physician, refused to stay. At Verus' insistence, he and Marcus also left in January 169, but Verus had a stroke on the journey and died a few days later. Marcus deified him and obliged the widowed Lucilla to marry the Syrian *novus homo* (first of his family to reach the senate) Tiberius Claudius Pompeianus, who had distinguished himself in Pannonia. In spite of further bereavement—his younger son Verus died—he pressed on with preparations, auctioning imperial treasures to raise funds, and returned north, to Sirmium, in autumn 169.

Apparently planning to annex territory beyond the Danube, he launched an offensive in spring 170, but incurred a severe defeat. The Marcomanni and Quadi of Bohemia and Slovakia invaded, outflanked Marcus and swept over the Julian Alps, sacking Opitergium (Oderzo) and besieging Aquileia. It was the worst such crisis since the German invasions at the end of the 2nd cent. BC. Desperate measures, led by Pompeianus and Publius Helvius Pertinax, cleared Italy, Noricum, and Pannonia. The Marcomanni were defeated as they tried to recross the Danube with their booty. But the Balkans and Greece were invaded by the Costoboci, requiring further emergency measures, and Spain was ravaged by the Moors, dealt with by Marcus' friend Victorinus. Marcus, based at Carnuntum, first used diplomacy to detach some tribes from the 'barbarian conspiracy'; some peoples were settled within the empire. The offensive, resumed in 172, is depicted at the start of the Aurelian column in Rome. In spite of the death of the praetorian prefect Vindex, the Marcomanni were defeated: victory was claimed, with the title Germanicus. In a battle against the Quadi Roman troops were saved by a 'rain miracle', shown on the column, later claimed to have been achieved by the prayers of Christian legionaries; Marcus gave the credit to the Egyptian Hermes 'Aerius'. In 173 he pacified the Quadi, moving to Sirmium in 174 to take on the Sarmatian Iazyges of the Hungarian plain. After some successes, he was obliged to make an armistice when Avidius Cassius, who had had special powers in the east, was proclaimed emperor. The revolt collapsed after three months, but Marcus, now Sarmaticus, toured the east, taking Faustina, who died in late 175 and was deified, and Commodus. He went through Asia and Syria to Egypt, returning via Athens to Rome. Here he held a triumph (23 December 176) and raised Commodus to Augustus. In summer 178, renewed warfare in the north took him northwards again. He remained, evidently planning to annex Marcomannia and Sarmatia, until his death (17 March 180).

Marcus has been universally admired, as a philosopher-ruler, to the present day, criticized only for leaving

his unworthy son as successor. This no doubt seemed the best way to ensure stability, and he left Commodus experienced advisers, including his numerous sons-in-law. Despite Marcus' lack of military experience he took personal command against the first wave of the great *Völkerwanderung* that ultimately destroyed the empire, setting an example that inspired his contemporaries in the view of *Ammianus Marcellinus (31. 5. 14). ARBI

Meditations

Marcus is most famous for a work his subjects never saw, the intimate notebook in which he recorded (in Greek) his own reflections on human life and the ways of the gods, perhaps before retiring at night. The title *Meditations* is purely modern: *ta eis heauton* ('to himself'), found in our MSS, may not go back to the author, but is surely accurate. Internal evidence suggests that he was past his prime when he wrote (2. 2, and other references to his age or imminent death), and that at least parts were composed during his lengthy campaigns against the German tribes. It seems to have survived almost by accident; it was unknown to the writers of his time and for long afterwards, but seems to have surfaced in the 4th cent. (Them., *Or.* 6. 81c, not a certain allusion). In general the closest analogies for the thought are with Epictetus, but Marcus is interested less in sustained exposition. The style, often eloquent and poetic, can also be compressed, obscure, and grammatically awkward. All of this is understandable if he was writing memoranda for his eyes alone.

Although divided by moderns into twelve 'books', the work seems not to have a clear structure. Brief epigrams are juxtaposed with quotations (usually of moral tags, occasionally of longer passages: esp. 7. 38–42, 11. 30–9) and with more developed arguments on divine providence, the brevity of human life, the necessity for moral effort, and tolerance of his fellow human beings. Frustratingly, these *pensées* are almost invariably generalized: we do not learn Marcus' secret thoughts about his family, members of the court, or military policy. We do, however, get some idea of his personality and preoccupations.

The first book of the *Meditations* is a different matter, being more coherent than the others; it may have been composed independently. Here Marcus goes through a list of his closer relatives and several teachers, recording what he owes to each—in some cases a specific lesson, but more often a general moral example. This list culminates in two long passages on what he owes to his predecessor *Antoninus Pius, and to the gods (1. 16 and 17). Though often allusive and obscure, these give us unique access to the mind of an ancient ruler, and the whole book is a precious personal document.

In the rest of the work, though technical discussion of Stoic doctrine is avoided, certain recurrent themes stand out: the need to avoid distractions and concentrate on making the correct moral choice; the obligation of individuals to work for the common good (e.g. 6. 54: 'What does not benefit the hive does not benefit the bee'); the unity of mankind in a world-city (4. 4; cf. G. R. Stanton, *Phronesis* 1968, 183 ff.); insistence on the providence of the gods, often combined with rejection of the Epicurean alternative that all is random movement of atoms (e.g. 6. 17, 8. 39). Duty and social responsibility are strongly emphasized; Marcus was keenly aware of the temptations of power (e.g. 5. 16, 6. 30 'do not be Caesarified'). Thoughts of providence lead him to contemplate the vastness of

time and space, and the guiding pattern that according to the Stoics gives order to the universe (e.g. 10. 5). There is also a more melancholy note, of resignation and pessimism. Though determined to persevere in his moral efforts, the author is often resigned to their futility (8. 4; 9. 29 'who will change men's convictions?'). Hymns to the grandeur and order of the universe (4. 23, 5. 4) can give way to revulsion and disgust (8. 24). Above all, Marcus is fascinated by life's transience and the way in which all great men, even philosophers and emperors, pass on and are forgotten (4. 32, 33, 48, 50, etc.). His most lasting achievement is a work which has inspired readers as different as Sir Thomas Browne, Matthew Arnold, and Cecil Rhodes.

RBR

B

Babylonia (see ◀ Map 2, Dd ▶), country in south Iraq, stretching from modern Baghdad to the Arab-Persian Gulf, drained by the Euphrates and Tigris rivers. Settlement (dependent on irrigation) is first attested in the sixth millennium BC. The population was mixed; non-Semitic Sumerian dominates the literary record in the third millennium, gradually replaced by Semitic Akkadian in the second millennium, which in turn was displaced by Aramaic in the later first millennium.

Babylonia's political pattern until the 15th cent. BC was one of contending city-states, some of which succeeded in imposing control on their rivals (e.g. Agade: 2340–2200; Third Dynasty of Ur: 2100–2000; Babylon: 1760–1595). From then on, Babylonia formed a territorial state with Babylon as its capital. Babylonia was subject to Assyria from the late 8th cent. until the Babylonian general, Nabopolassar, fought back the Assyrians and, with Median help, destroyed Assyria's empire (626–609). Nabopolassar founded the Neo-Babylonian empire, stretching from Palestine to the Iranian frontier, ruled from Babylon. The most famous Neo-Babylonian king was his son, Nebuchadnezzar II (604–562), who rebuilt Babylonia's cities extensively and sacked Jerusalem (587). The last Neo-Babylonian ruler, Nabonidus (555–539), was defeated in battle at Opis by *Cyrus the Great of Persia (559–530), who turned Babylonia's imperial territory into a single satrapy of the Achaemenid empire (see PERSIA). It was divided early in *Xerxes I's reign (486–465) into two provinces: the satrapy of Babylonia stretched from the Persian Gulf to Assyria and north-west to the east bank of the Euphrates. *Alexander the Great conquered Babylonia in 331, detaching its northern region (Mesopotamia); he planned to turn Babylonia into one of his chief bases. *Seleucus I and *Antigonos the One-eyed disputed, and fought for, control of Babylonia (316–309) and it became a core-region of the Seleucid empire. After lengthy struggles (141–127), Babylonia came under Parthian control in 126, and henceforward formed part of the empires of the Arsacids, then the

Sasanids. Babylonia's strategic location on north–south and east–west routes and its legendary fertility (Herodotus 1. 193; Strabo 16. 1. 14) meant that it continued to play an important role in the Persian, Seleucid, Parthian, and Sasanian periods. Important royal centres were founded by Seleucus I at Seleucia on Tigris and by the Parthians at Ctesiphon.

Babylonian learning, writing, cultic, and literary traditions proved tenacious, and survived alongside the increased use of new languages (such as Aramaic, Persian, and Greek). The latest cuneiform text dates to AD 78. Classical writers frequently confused Babylonia with Assyria, to which Berosus objected with little effect. Babylonia was perceived by Greeks and Romans as the source of astronomical and astrological lore. They associated this activity with 'Chaldaeans'—the name of a number of tribal groups in Babylonia. There is no evidence that Babylonians ever linked any particular learning with these tribes. *Astronomy and *mathematics were an important and highly developed part of Babylonian scholarship; most of the latest preserved cuneiform texts are of this scientific nature. To what degree Babylonian astronomy and mathematics influenced Greek science is debated. See ASTROLOGY; ASTRONOMY §5; MATHEMATICS. ATLK

Bacchanalia can be used to mean either 'Bacchic festival' or 'Bacchic places of worship', but usually translates the Greek *mysteries (*orgia*), with special reference to the worship suppressed by the Roman authorities in 186 BC. We have an account of the suppression in Livy (39. 8–18) and an inscribed version of the senatorial decree (*ILLRP 511*) against the cult, in the form in which it was circulated to the allied states of Italy. These sources can be supplemented by references in Plautus' plays and now by archaeological evidence to show that the Bacchic cult, perhaps of south-Italian Greek origin, was widespread in Italy, central and south, decades before the senate chose to act against it. The form of the Italian cult seems to differ from other Hellenistic examples in admitting men

as well as women to the mysteries and in increasing the frequency of meetings. It is a matter of debate how far the cult's followers were forming a movement of protest against the Roman authorities.

The surviving decree concentrates on the structure of Bacchic cells—their oaths of loyalty, their organization and funding, their membership, their property. This suggests that it was the power of cell-leaders over worshippers, cutting across traditional patterns of family and authority, that disturbed the senate, rather than alleged criminal actions or orgiastic rites; but any allegation would have helped in the discrediting of a powerful and well-embedded cult; Livy's vivid account has valuable elements, and in substance shows knowledge of the decree itself; but its highly literary elaboration shows the influence of the senate's propaganda against the cult.

The senate's persecution succeeded at least in removing the cult from prominence, though artistic evidence shows its long-sustained influence. Later Italian evidence, especially the great Bacchic inscription of Agrippinilla, shows a domesticated, family version of the cult, well subordinated to élite authority.

See DIONYSUS.

JN

Bacchylides (c.520–450 BC), lyric poet, of Iulis in Ceos, son of Midon (or Midylus, *Etym. Magn.* 582, 20), nephew of *Simonides (Strabo 486, *Suda*, entry under 'Bakchulidēs'). His floruit was given as 480 by *Chron. Pasch.* 162b (304. 6), as 467 and 451 by *Eusebius–Jerome (the entry in Eusebius, *Chron.* Olympian Odes 87.2 = 431 BC, refers to a flute-player Bacchylides mentioned by the comic poet Plato in his *Sophistai*, fr. 149 R. Kassel and C. Austin, *PCG* 7. 494, see G. Fatouros, *Philol.* 1961, 147). The assumption that he was younger than *Pindar (Eust. *Prooem. ad Pind.* 25 = scholiast Pindar 3, p. 297. 13 Dr.) is unfounded and unlikely in view of the early date of his poem in praise of the young prince Alexander, son of Amyntas (fr. 20b Snell–Maehler), who succeeded his father as king of Macedon in c.494. Although Bacchylides was one of the canonical nine lyric poets (*Anth. Pal.* 9. 184 and 571; schol. Pind. 1, p. 11. 20 Dr.), and although he was well known in Hellenistic and Roman times (imitated by Horace *Carm.* 1. 15, quoted by *Strabo, *Plutarch, ['Longinus'], *Subl.* and by the emperor *Julian who 'enjoyed reading him', as *Ammianus Marcellinus 25. 4. 3 says), only a handful of lines had survived in quotations when a papyrus containing his book of victory odes almost complete and the first half of his book of *dithyrambs was found at Meir, near Al-Kussiah, south of Hermopolis Magna, in 1896 and published by F. G. Kenyon in 1897. Since then, remains of fifteen more papyri have been attributed to him, and two papyri contain scholia on his

epinician odes and dithyrambs. The known dates of his epinician odes are: 476 (5, for Hieron's horse-race victory at Olympia, also celebrated by Pindar, *Ol.* 1), 470 (4, for Hieron's chariot victory at Delphi, for which Pindar sent *Pyth.* 1), 468 (3, for Hieron's chariot victory at Olympia), and 452 (6, for Lachon's sprint victory as a boy at Olympia); likely dates are: c.485 (13) and 454 or 452 (1 and 2); the Third Dithyramb (17, 'The Youths' or 'Theseus') seems to date from the early 490s; it is really a paeon sung by a Cean choir at *Delos. Bacchylides spent some time in exile in the Peloponnese (Plut. *De exil.* 14). Like Simonides and Pindar, he may have stayed at *Syracuse as Hieron's guest (Ael. *VH* 4. 15), but the alleged rivalry between him and Pindar seems to be a figment of some ancient biographers.

His patrons, apart from Hieron, included athletes from Ceos, Aegina, Phlius, Metapontum, and *Thessaly; a poem in honour of a magistrate of Larissa seems to have been added at the end of the book (14b, cf. Pindar's *Nem.* 11). Several of his dithyrambs were composed for competitions at Athens (15?, 18, 19, 23?), one for Sparta (20). The Alexandrian editors gave them titles and arranged them in alphabetical order. Stylistically, his dithyrambs are like ballads, using lively narrative, often allusive and selective, as well as direct speech. They exploit the pathetic potential of the myths, as do those epinician odes which contain a mythical narrative as their centre-piece. *Dith.* 2 (16, 'Heracles' or 'Deianira'?) appears to assume familiarity with *Sophocles' *Trachiniai*; *Dith.* 4 (18, 'Theseus') is unique in being a dialogue between the chorus as people of Athens and the chorus leader, their king, Aegeus; this may have been influenced by Attic drama (plays like Aesch. *Supp.* or *Pers.*), rather than being an archaic form of dithyramb. Bacchylides also wrote hymns (frs. 1–3), paeans, of which fr. 4 + 22 contain a fine eulogy of peace, processional songs (frs. 11–13), maiden-songs (Plut. *De mus.* 17), dancing-songs (hyporchemata, frs. 14–16), songs about love (erotica, frs. 17–19), and songs of praise (encomia?, frs. 20–20f). Didymus wrote a commentary on the epinician odes and probably also on other books. The textual transmission must have broken off sometime in the Roman period; later authors like Athenaeus and Clement of Alexandria seem to quote from anthologies. HMA

Bactria (see ◀Map 2a, Cb▶), Enormous region lying (roughly) between the Oxus (Amu-Darya) to the north and the Hindu Kush to the south; the term occasionally also includes Sogdiana to the north (Tadjikistan/Uzbekistan). The Achaemenid Persian satrapy (Bāxtriš) is cited several times in the *Persepolis tablets. Because of the silence of the classical sources, Bactrian history only

becomes more fully recoverable with *Alexander the Great, who had to fight tough battles here. The discovery of 30 parchments and 18 wooden boards from the late Achaemenid period (Artaxerxes III to Alexander the Great), including two possibly dating to the 5th cent. (as well as palimpsests), written in Aramaic, is now revealing some details of the Achaemenid administration of the region (Bagavant, governor of Khulmi, under Akhvmāsda, satrap of Bactria) and Persian-held domains. Recent excavations have profoundly enhanced our knowledge, especially excavation of the site of *Ai Khanoum, a Hellenistic city (possibly), founded by Alexander himself, on the upper Oxus (Alexandria Oxiana?). Surveys in eastern Bactria, on both banks of the Oxus, have revealed that the agricultural prosperity, for which the country was famed, goes back to the bronze age. From this time on, networks of irrigation canals were constructed, which were maintained and extended throughout the Achaemenid and Hellenistic periods. Under the early *Seleucids, Bactria was extensively colonized, and Bactra (mod. Balkh) served as a temporary residence for Antiochus (the future Antiochus I), son of *Seleucus I. Inscriptions found on several Bactrian sites have provided new insights into Iranian and Greek settlement and into the process of acculturation. A Graeco-Bactrian kingdom was created by Seleucid breakaway satraps. This secession is generally thought to have been achieved by Diodotus c.230 BC, linked to the invasion by the Parni (see PARTHIA) of the Iranian plateau, but this chronology is debated. In 206, following a campaign by *Antiochus III, the Graeco-Bactrian king Euthydemus I accepted Seleucid supremacy. In the reign of *Eucratides I, people from beyond the Oxus invaded Bactria and destroyed the city of Ai Khanoum c.145 BC. At the end of Heliocles' reign (c.130 BC), another invasion virtually obliterated the Greek presence in Bactria.

PB/ATLK

banks in antiquity supplied a selection of the services familiar from their modern counterparts. None the less, the essential banking function, receipt of deposits which might then be lent at interest to a different set of customers, appears only fleetingly in ancient texts (Dem. 36. 11). Many temples, both Greek and Roman (e.g. *Apollo on *Delos, Castor and Pollux at Rome) took deposits and even lent money; but deposits remained untouched and cash was lent from the temple's own funds. Similarly, moneylenders who lent from their own resources, even on a regular basis, were not bankers; nor were usurers, specializing in short-term, high-interest loans of small sums—the common Greek term is *obolostatēs* ('a lender of obols'). Banking in the Greek world appears to have evolved out of professional money-changing: a response

to the multiplicity of state coinages (*trapezitēs* or 'banker' refers to the *trapeza* or changer's table). Changers, and presumably bankers, existed all over the Classical and Hellenistic Greek worlds, but our knowledge is concentrated in Athens, where, from the 4th cent. BC, the names are known of some twenty bankers. Money-changing remained important; otherwise, the emphasis and impact of the services provided by Athenian bankers is disputed. Modernizing approaches treat banks as central not only to fringe economic activity, but to the whole *polis: primarily through the linked taking of deposits and extension of credit. Alternative readings, stressing differences between ancient and modern economies, see bankers (often themselves non-Athenians) as more marginal to the citizen-structure of the *polis*, providing a peripheral range of credit and other services (including acting as witnesses and guarantors). The majority of their clients would then be persons themselves not fully integrated into the *koinōnia* (community) of the *polis*: traders, other visitors to Athens, and a minority of citizens who urgently needed money or the support of specialist banking skills. Not disputed is the wealth of the most successful Athenian bankers. Pasion, beginning as a bankers' slave, gained his freedom, took over control of his former masters' bank, and eventually became a citizen. Remarkably, his own banking slave, Phormion, followed an almost identical path from rags to riches (Isoc. 17; Dem. 36, 45, [46], [49], [52]). Bankers from the Greek world seem to have operated in isolation; there is no clear evidence for any integrated banking system. A letter of credit is introduced to an Athenian jury as something needing explanation (Isoc. 17. 35 ff.). This is in contrast to Ptolemaic Egypt, where surviving papyri reveal a complex system of giro payments and bills of exchange. There was a range of banking institutions, changing through time: a network of royal or state banks (based on *Alexandria with branches in local capitals, banks operated on license, private banks, and *logētēria* (royal treasuries). By the 2nd cent. BC, and into the Roman period, the scene was dominated by state and private banks.

For the Roman west, literary evidence for banking operations is unsystematic. The basic problem is distinguishing between wealthy men of affairs who might offer financial services, including credit (e.g. *Atticus) and professional dealers in money. Whereas the former might be wealthy through ownership of land, the latter were generally of lower status, made most of their living through financial transactions, and might be organized into *collegia* (private clubs). Three identifiable groups had banking interests: *argentarii*, *coactores argentarii*, and *nummularii*. The earliest testimony from Rome and Italy (down to c.100 BC) mentions only *argentarii*, who resembled Greek

trapezitai in offering a range of functions: changing, deposit, and credit. Specialization is evident from the 1st cent. BC, with *argentarii* continuing to take deposits and lend, but money-changing becoming the province of the *nummularii*. There also emerge from c.50 BC the *coactores argentarii*, who offered credit facilities to those purchasing goods at auction. This marks a possible partial break with the tendency for credit in antiquity to be economically non-productive. Against this (as for the Greek world), there is no hard evidence for Roman bankers lending in maritime loans. Though possibly prosperous, none of these financiers came from the upper end of society: Mark *Antony could insult Octavian (the future *Augustus) by claiming his grandfather was an *argentarius* (Suet. *Aug.* 2. 6; cf. 4. 2 for *nummularius*). Nor did they number among their clients the Roman élite, who generally had their own safe deposits and sources of credit. As in Athens, Italian bankers regularly crop up in connection with the affairs of merchants (as indicated by the affairs of Caecilius Iucundus, auctioneer at *Pompeii). This tripartite system of finance was restricted to the western empire, and possibly only to Italy. Even there, from AD 200, distinctions begin to disappear, with a return to the idea of the all-embracing *argentarius*. A final (if problematic) perspective on Roman banking from the 6th cent. AD is provided by the *Digest*. PCM

barbarian Social groups frequently assert their cohesiveness by emphasizing the differences between themselves and 'outsiders'. Individuals belong to a range of groups, and which they choose to emphasize will depend on particular historical situations. While we associate Classical culture primarily with emphasis on *citizenship (membership of a *polis), Classical Greek literature also assigns considerable importance to defining a common Greek identity and creating the figure of the 'barbarian' in contrast.

That contrast was not important in Archaic literature. The factors that brought it to the fore were (a) the imposition of Persian control over western Asia Minor from the mid-6th cent. BC and the successful armed resistance to Persia by many Greek states in 480/79 BC (see PERSIAN WARS); (b) justification of Athenian hegemony over the *Delian League on the grounds that Greeks should unite to continue resistance against Persia; and (c) the appearance of considerable numbers of non-Greek slaves at Athens (where the economic exploitation of the indigenous poor had been curtailed by *Solon's *seisachtheia* (alleviation of *debt)).

With *Aeschylus' *Persians* (performed 472 BC), a consistent image of the barbarian appears in Athenian literature and art. Apart from a lack of competence in Greek

(e.g. Ar. *Thesm.*), the barbarian's defining feature is an absence of the moral responsibility required to exercise political freedom: the two are connected, since both imply a lack of *logos*, the ability to reason and speak (sc. Greek) characteristic of the adult male citizen. Barbarians are marked by a lack of control regarding sex, food, and cruelty. In *Homer, the breaking of such taboos had been associated with superhuman heroes; in Classical thought, they were 'barbarous' (the myth of Tereus, thought originally to have been a Greek (Megarian) hero, includes rape, tearing out a tongue, a mother's murder of her own child, and cannibalism: consequently Tereus had to be reclassified as a 'barbarian' (Thracian) king). Absence of political freedom entails rule by tyrants, and frequently women, and the use of underhand weaponry like bows and poison; the absence of moral self-control entails the wearing of wasteful and 'effeminate' clothing, drinking wine neat, and enjoying emotional ('Lydian' or 'Ionian') music. Somatic differences might be used by writers (or vase-painters) to reinforce the image of the barbarian, but it did not matter whether the typology was black African or Thracian.

The Greek/barbarian polarity continued to be a major element in Greek literature throughout antiquity; it compensated for the military and political powerlessness of Greek cities in the Hellenistic and Roman periods. Along with other elements of Greek culture, it became part of the ideological baggage of Latin literature. Its importance in practical terms is less clear: 'barbarians' were excluded from the Olympic Games and other religious ceremonies, e.g. at *Eleusis, and a 4th-cent. BC lawcourt speech could make capital out of an opponent's alleged 'barbarian' descent (Dem. *Meid.* 149 f.). Roman rhetoric, too, could represent opponents, both non-Roman and Roman, as either 'barbarians' or 'barbarous' (Cic. *Font.*, etc.; representations of *Cleopatra VII or Boudicca), though such language masked much more real distinctions (principally that between the Roman citizen and the non-citizen), and Roman moral discourse symbolized disapproval in different terms (e.g. Etruscan luxury). While some Greek intellectuals stretched the polarity to its limits (Isoc. *Paneg.* and *Philippus*; Arist. *Politica* 1. 2–7 and 3. 14 on barbarians being slaves 'by nature'), others questioned the usefulness of the concept (Pl. *Resp.* 262de). The polarity might be associated with a more universal distinction between 'us' at the centre of the world and 'them' at the periphery: the barbarians who inhabited the 'edge' of the world might be savages without laws, settled homes, or agriculture (see NOMADS), but alternatively they might have created an earthly paradise (the Hyperboreans, the 'Kingdom of the Sun' in the Indian Ocean). Like kings, women, children, old people, or

barbarian Gaulish prisoners on a Roman triumphal arch at Carpentras (France). Rome took over from Greek thought the idea of the barbarian. Classification of conquered peoples (like Gauls) as (inferior) barbarians offered a justification of Roman imperialism. Giraudon / The Bridgeman Art Library

slaves, some barbarians might be closer to the divine world than the adult male citizen (Celtic Druids, Persian magi, Indian gymnosophists; cf. the Christian Salvianus' positive judgement of 5th-cent. AD Germanic invaders).

In the Hellenistic period, the distinction between Greek and barbarian came to be seen as insignificant even by some of those imbued by the literary culture (*Stoicism); its irrelevance was explicitly expressed by Christians (Colossians 3: 11; 1 Corinthians 7: 21; cf. Acts 8: 27). Nevertheless the prejudice against 'barbarians' remained latent in the literary tradition, to be exploited by late antique Christians like Prudentius (*C. Symm.* 2. 807–19) as well as non-Christians such as Ammianus when they wished to parade their scholarship. With the rediscovery of *Aristotle in the 12th cent., it became one of the roots of western self-definition first against Muslims and the 'orient', and later against subject populations around the globe. See ORIENTALISM; RACE.

TEJW

baths, one of the most characteristic and widely distributed types of Roman buildings, had their origins in the Greek world where public baths were common from at least the 4th cent. BC. Surviving 3rd-cent. Greek baths centre on a series of hip-baths arranged around the walls of one or more rooms, often circular (*tholoi*), with niches above the tubs, and were furnished with hot water which was poured over the seated bather. Baths of this type are found in southern Italy (e.g. Stabian baths, *Pompeii, first phase) and Sicily, where, together with local traditions of therapeutic baths at volcanic springs and fumaroles, they were instrumental in the development of the purely Roman type. These replaced the individual tubs with communal pools, and often incorporated the dry sweating-rooms (*laconica*) and exercise grounds (*palaestrae*) of the Greek *gymnasium in the same establishment (Stabian baths, later phases; republican baths at Regio VIII, 5, Pompeii). The basic features of these early Roman

baths Air view of the baths of *Diocletian at Rome, AD 305–6. The grandiose public baths built by imperial *patronage in the capital spawned numerous paler imitations in the provinces. Fototeca dell'Unione Internazionale, American Academy in Rome

baths were a changing-room (*apodyterium*), an unheated *frigidarium* with a cold-water basin, an indirectly heated warm room (*tepidarium*) sometimes containing a tepid pool, and a strongly heated room (*caldarium*) containing a hot plunge pool and a separate water-basin on a stand (*labrum*). The evolution of the hypocaust and wall-heating systems after c.100 BC, replacing the less efficient braziers, and the introduction of window-glass in the 1st cent. AD permitted the development of an elaborately graded system (Sen. *Ep.* 90. 25; Celsus, *Med.* 1. 4, 2. 17) often with the incorporation of several wet and dry sweating-rooms (*sudatoria*). With increasingly assured water supply to towns (see *AQUEDUCTS*), large cold and even heated swimming-pools (*piscina, natatio*) also became common adjuncts.

Public baths, often located near the forum (civic centre), were a normal part of Roman towns in Italy by the 1st cent. BC, and seem to have existed at Rome even earlier. The baths in the Campus Martius donated to the Roman people by *Agrippa c.20 BC set new standards of luxury and architectural elaboration, and heralded a new civic role for the baths in the towns of the empire. At Rome they were followed by the baths of *Nero, *Titus, and *Trajan, the latter being the first of the truly monumental complexes set in a vast enclosure containing *gardens, lecture-halls, *libraries, and other cultural facilities, reflecting the influence of the Hellenistic gymnasium. The symmetrical plan of the bathing-block, perhaps originating with the baths of Nero, centred on a triple cross-vaulted *frigidarium*, and incorporating a large *natatio* and twin colonnaded *palaestrae*, sometimes interpreted as basilical halls, was highly influential both at Rome (baths of *Caracalla and *Diocletian) and in the provinces with such buildings as the Antonine baths at *Carthage, the Barbara baths at Augusta Treverorum (Trier), and the Hadrianic baths at Lepcis Magna. Even when the architectural form was not imitated so closely, the influence of the 'imperial' type can be seen in the increased size and elaboration of many baths in the provinces from the late 1st cent. onwards, along with an increase in the amount of space devoted to non-bathing functions. Regional variations developed, central Italy and North Africa producing many buildings of highly complex curvilinear plan (e.g. at Hadrian's villa near Tibur and Theneae in Tunisia). Roman-style baths were widely adopted in the eastern provinces, forming a distinctive type in Asia Minor (e.g. at *Ephesus and Miletus) where they were assimilated to the Hellenistic gymnasium.

Bathing occupied a central position in the social life of the day; by the 2nd cent., any community of any substance, civil and military, had at least one set of public baths, while private baths are common in country *villas

and in wealthier town houses. Larger towns often had one or more substantial buildings (*thermae*) which were show-pieces for the community as well as a number of smaller, privately owned *balnea* to serve everyday needs. See *HOUSES, ITALIAN; WATER*. JD

belief (ancient religious) Currently 'belief' has at least three different meanings in the context of religion: (1) an inner psychological state of pious commitment; (2) the acceptance of received ideas; and (3) the doctrines held by others, contrasted with 'our' knowledge. Granted this polysemy, the use of the term 'belief' in the study of other societies has often introduced confusion. Furthermore, a particular western history beginning with the rise of Christianity (see below) has fundamentally shaped contemporary understandings of 'belief', rendering it inapplicable to pre-Christian antiquity. This history includes the advent of Protestant sects emphasizing the individualistic interiority of faith, and the Enlightenment propagation of a scientific rationality that displaced belief in God amongst a significant portion of the population. Belief has today become, implicitly, if not always explicitly, an affirmation of religious conviction in the face of surrounding scepticism. The peculiarity of modern belief is this propositional and assertive quality.

The embrace of the gods throughout Greek and Roman antiquity was, by contrast, dispositional—a fact of socialization only infrequently subjected to sceptical reflection. Belief in the gods was normally a matter of unchallenged acceptance, not of debate: the jurisdiction of the Olympian gods is so pervasively assumed in *Homer's *Iliad* that even the Trojans perform rituals for the Olympians and enjoy their protection. As *Herodotus wrote (2.3): 'All men know equally about the gods.'

The ancient Greeks did not develop a clearly bounded idea of 'religion' as a core of doctrinal teachings upon which to focus the act of 'believing'. In a polytheistic cosmology, new gods could be assimilated to an existing god or added as another power in the pantheon. When Herodotus considered the Egyptians he noted different practices, such as priests shaving their bodies every other day, or aversion to pigs, while maintaining that the Egyptians and Greeks basically worshipped the same gods under different names (2. 37, 47, 50).

Followers of Orphism and Pythagoreanism (see *PYTHAGORAS*) advocated reform within the pre-existing ritual system, exceptions that defined the rule, rather than theological renunciations forcing reflection on correct beliefs. Philosophical rationalism, similarly, did not necessarily threaten inherited assumptions about the gods. The Hippocratic treatise on the 'sacred disease' (epilepsy) excoriates quacks who pretend to treat it by

magical means not because they wished to eliminate religion from medicine, but rather because the writer held all diseases to be both divine and natural. Epilepsy had no special sacred status. All diseases were sacred (*Sacred Disease* 18. 1–2).

The first Roman efforts to understand and react to these Greek debates about the gods are found in the philosophical work of *Cicero. He staged debates in dialogue form about the existence of the gods (*Nat. D.*) and about their ability to communicate with human beings (*Div.*). Cicero himself, however, was far from recommending the weakening of religious practice, as opposed to its modification, and he includes a traditional, if refined, religious system in his *De legibus* (2. 19–22). It used to be argued that *Livy and *Tacitus, despite reporting religious events, exhibited a learned scepticism; but in fact they seem more concerned to demonstrate religious expertise. In fact, as *Polybius shows, the Romans were famous for their piety and emphasized its importance to their success as imperialists. Debates over religion apparently had no detrimental effect on religious practice. The epigraphic and archaeological records indicate widespread pious commitment throughout the first centuries AD. The ubiquity of the divine presence perhaps explains the shortage, at least until late antiquity, of any terms for what we today understand as religion: neither the Greek *thrēskeia* nor the Latin *religio* refer to any overall system of worship, only to acts of worship.

The authorities of ancient cities did not seek professions of belief from their citizens. Where a public act of commitment was sought, it usually took the form either of a ritual action, such as a sacrifice, or an oath; these actions implied recognition of the city's gods without using explicit belief-statements. A possible understanding of the relation between ritual and belief is that believing was implicit in the action, but not normally to be understood separately from it (see I. Scheid, *Quand faire, c'est croire* (2005)). It is the rise of new forms of religion, especially Christianity, in the later centuries of the Roman empire that brought with it creedal statements, which the faithful member had to know and accept. The credo fetishizes belief; it sets the act of believing as itself something one should believe in. It gives belief an objectified status. It also makes it a performative utterance (i.e. it creates the fact of 'belief' and 'believers'), emphasizes the 'inner experience' of belief, and ritually reinforces its significance within the community. These are all breaks with previous configurations. Such explicit belief-statements then came to function as markers of rival groups, whether seen as different religions or as sects or heresies within a single religion. The meaning of 'belief' and its social signifi-

cance must therefore be seen as changing radically in the course of the early centuries AD.

These changes set western 'belief' on the Christian and, ultimately, secularist trajectory outlined in the first paragraph of this entry. Assuming Christianity to typify 'religion', early scholars of comparative religion thought the study of other religions must focus on the 'beliefs' of adherents. As with Greek and Roman religion, however, many other religions are oriented around practices rather than beliefs. Various ancient phenomena might be labelled 'beliefs' in senses (1), (2), and (3) above; but if more precise terms such as 'knowledge', 'awe', 'fear', or 'customary ritual practice' can replace 'belief', this usage avoids the implication that the ancients were 'believers'. CST/JN

bilingualism Widespread bilingualism at some level was characteristic of the ancient world, whether we look for (a) bilingual *communities*, in which two languages are in use (e.g. official and popular languages, written and non-written, formal and informal), or (b) bilingual individuals who know two languages at some level. Perfect capacity in two languages, a modern ideal, was probably both rare and unnecessary, and, despite Hdt. 8. 144 on Greek (see GREEK LANGUAGE), the close modern identity of language and nation seems to have been relatively unimportant. But bilingualism implies language choice: according to context, the associations of each language, or social ambition. Latin and especially Greek, were the languages of culture and education (in the Roman empire, Latin was the language of law and army), as well as power, so that while many other languages coexisted alongside Latin and Greek, neither Greeks nor Romans ever had to impose their language on others. Greek and Roman writers tended to be uninterested in other languages, or they were never written down, so our evidence (written) is slight and misleading (e.g. we learn about Getic in Tomis from *Ovid's complaints (e.g. *Pont.* 4. 13, 17 ff.), not from inscriptions).

Greek unwillingness to learn other languages, linked to their assurance of cultural superiority, is well known (Momigliano). *Herodotus learned no other languages (and suffered at interpreters' hands: e.g. 2. 125), Greek thinkers say little about foreign languages or revealingly categorize languages simply as Greek or *barbarian (e.g. *Plato, *Cra.*). Yet this monolingualism may be more characteristic of the literary élite and of high culture. Other Greeks must have acquired other languages: e.g. the Ionian and Carian *mercenaries in Egypt in the Archaic period, the Greeks in Persian service, e.g. Democedes (see D. M. Lewis, *Sparta and Persia* (1977), 12–15), traders and colonizers—Massalia was still trilingual in the 1st cent. BC—and often married non-Greek women (cf. for

the reverse, the unfortunate Scylas, Hdt. 4. 78 ff., with Scythian father and Greek mother). The orientaling period of Greek culture is hard to envisage with merely monolingual Greeks. Late 5th-cent. Athens has a mixture of customs and languages 'from all the Greeks and barbarians' (Old Oligarch 2. 8). However, by the Classical period, the bilinguals in a Greek city would be mainly foreigners, traders, and slaves, i.e. outsiders (e.g. Scythian archers, *Ar. Eccl.* 1001–225).

The picture becomes more complex with *Alexander the Great's conquests of large non-Greek-speaking areas. The idea that Greek was always imposed as the language of administration in the Hellenistic kingdoms is increasingly doubtful. In the Seleucid empire, there is a mixture of Greek and Aramaic in the administration and, at least east of Asia Minor, evidence for bilingual Greeks. In Ptolemaic Egypt, Greek did become the language of administration; the extent to which Egyptians learnt Greek and became bilingual, however, or Greeks integrated at all into Egyptian society, is extremely difficult to gauge, and some recent work stresses bilingualism and at least limited interaction. There is evidence for individuals with double names, one Egyptian, one Greek, and for scribes fluent in both demotic and Greek. So the weight of administrative documents in Greek may hide greater Egyptian participation. Individual bilingualism, especially among prominent and ambitious Egyptian officials, must have been widespread.

The Roman empire was bilingual at the official, and multilingual at the individual and non-official, level. With the increasing Hellenization of Rome itself (*see HELLENISM*), educated Romans were expected to be bilingual in Latin and Greek, especially from the 1st cent. BC, at least for cultural purposes (there were tensions: *Juvenal complains about women who irritate their husbands by speaking Greek, *Sat.* 6. 184 ff.). Quintilian advised that children start learning Greek before Latin (*Inst. Or.* 1. 1. 12–14). Greek was widely used in diplomatic activity from the republic: Publius Licinius Crassus, proconsul of Asia in 131 BC, who spoke five Greek dialects (Val. Max. 8. 7. 6) was exceptional, but by Cicero's time, interpreters were not always needed for Greek in the senate (Cic. *Fin.* 5. 89, with *Div.* 2. 131). *Tiberius tried, too late, to discourage Greek in the senate, a rare case of Latin chauvinism (Suet. *Tib.* 71: this failed). Most Roman emperors were fluent in Greek: Marcus *Aurelius, despairing of Latin, wrote his private *Meditations* in Greek; while *Septimius Severus may have been trilingual (Lat., Gk., Punic), *Severus Alexander perhaps better at Greek than Latin (SHA *Alex. Sev.* 3. 4).

The Romans made remarkably little attempt to impose Latin on the empire. The language of administration in

the west was certainly Latin, and ambitious provincials simply had to acquire it themselves (see P. Brunt, *Imperial Themes* (1990), 267 ff.). In the Greek-speaking east, administration was mostly conducted in Greek, mainly from pragmatism, and edicts, imperial constitutions, and letters sent by Rome to Greek cities were usually translated into Greek first (and inscribed in Greek). Greek speakers were markedly unenthusiastic about learning Latin, and Roman colonies in the east were linguistically quickly absorbed. However the extent of bilingual inscriptions implies there was no strict single language policy (see J. Kaimio, *The Romans and the Greek Language* (1979)). Decisions of the Roman courts were probably always given in Latin, and Latin was necessary in law for certain documents for Roman citizens. With the widening of Roman *citizenship (AD 212), *Severus Alexander (222–35) allowed Greek in the wills of Roman citizens. From the 4th cent., Latin was increasingly used in government and court when the government transferred to the east; this was deplored by educated Greeks. Greek became less widely known even in educated circles in the west from the 4th cent. (cf. Symmachus, *Ep.* 4. 20).

The many other languages in the Roman empire tend to be submerged in our evidence because they were unwritten, or non-literary, and many gain prominence with Christian preoccupations, but must always have been there: e.g. Gallic, Getic, neo-Phrygian, Aramaic, Coptic, and Syriac which develop as literary languages after AD 200, Iberian, Thracian, Punic (noted by St *Augustine), not to mention Hebrew. Romanized provincials presumably knew the 'vernacular' as well as Latin, and the languages each had their own milieu. The Roman army in particular brought together a multilingual force where the lingua franca was Latin (cf. Tac. *Hist.* 2. 37, 3. 33, for problems of polyglot armies). This substratum is indicated by the later adaptation of Roman law to the extension of Roman citizenship: Ulpian allowed 'even Punic, Gallic, Syriac, and other languages' for certain transactions (trusts) under Roman law (*Dig.* 32. 11 pref.). *See also* TRANSLATION. RT

biography, Greek 1. Biography in antiquity was not a rigidly defined genre. *Bios*, 'life', or *bioi*, 'lives', could span a range of types of writing, from *Plutarch's cradle-to-grave accounts of statesmen to Chamaeleon's extravagant stories about literary figures, and even to Dicaearchus' ambitious *Life of Greece*. Consequently the boundaries with neighbouring genres—the encomium, the biographical novel on the model of *Xenophon's *Cyropaedia*, the historical monograph on the deeds of a great man like *Alexander the Great—are blurred and sometimes artificial. One should not think of a single 'biographical genre'

with acknowledged conventions, but rather of a complicated picture of overlapping traditions, embracing works of varying form, style, length, and truthfulness.

2. The impulse to celebrate the individual finds early expression in the dirge (song of lamentation) and the funeral oration; organization of a literary work around an individual's experiences is as old as the *Odyssey* (see HOMER), and various *Heracleids* and *Theseids* seem to have treated their subjects' deeds more comprehensively. In the 5th cent. biographical interest was pursued in various ways. Ion of Chios gossiped about contemporary figures in his 'Stays' or 'Spells of Residence' (*Epidēmiai*), while Stesimbrotus wrote colourfully on *Themistocles, Thucydides son of Melesias, and *Pericles. The historian *Thucydides included selective sketches of several figures, notably the regent Pausanias (see SPARTA) and Themistocles. In the 4th cent. appeared two influential encomia, *Isocrates' *Evagoras*, enumerating its subject's qualities in a loosely chronological framework, and Xenophon's *Agésilas*, giving first a focused narrative of achievements, then a catalogue of virtues. Xenophon's *Cyropaedia* also set the model for the idealizing and largely fictional biographical novel, while his 'Socratic Memoirs' (*Memorabilia*), along with the Platonic corpus, developed the personality of Socrates in different literary forms.

3. *Aristotle gave biography a new impetus. Under his influence interest in ethical and cultural history encouraged the writing of more generalized *bioi*. Dicaearchus and Clearchus treated different lifestyles; Theophrastus' *Characters* are clearly related; while Dicaearchus' three-volume *Life of Greece* traced the origins of contemporary Greek culture. Aristoxenus wrote *Lives of philosophers*, in which an interest in lifestyle combined with malicious stories about *Socrates' irascibility and *Plato's plagiarism. This anecdotal style heralds a distinctive style of biography of cultural figures. Chamaeleon's *Lives of various poets* were notable for their wild inferences of biographical data from an author's work, and his model was followed by Hermippus of Smyrna, Satyrus (who adopted dialogue form), and Sotion, who presented in thirteen books a *diadochē*, 'succession', of great philosophers. This tendency to collect *Lives* in series became a standard mode of presenting intellectual history, and the 'succession' of teachers and pupils was a helpful idiom for explaining influences. Little can be said of the literary form of these works, except that it varied.

4. Biography of political figures is more problematic. Dicaearchus presented philosophers as men of action as well as intellectuals, and the active life was prominent in discussion of lifestyles; several monographs also approximated to biographies or to series of biographical

sketches, such as *Theopompus' *Philippica*, Phaenias' *On the Sicilian Tyrants*, and Idomeneus' *On the (Athenian) Demagogues*. Both Phaenias and Idomeneus also wrote on the Socratics, and other works similarly spanned politicians and intellectuals: Hermippus of Smyrna included (often mythical) lawgivers in his series, and Satyrus treated *Philip II. But political history had an adequate alternative mode of presentation in the various forms of *historiography, which themselves increasingly stressed human personality.

5. Rather than clear-cut political *bioi*, we thus have works with biographical affinities. The impact of *Alexander the Great was here important. Such early monographs as those of Cleitarchus, *Ptolemy I and Aristobulus centred on the king's person; the fragmentation of the Hellenistic world into dynasties encouraged monographs on other kings, such as a Duris' four-volume *History of Agathocles* (see SYRACUSE), and perhaps the works on Agathocles and *Pyrrhus which formed a four-volume supplement to *Timaeus' *History*. The biographical novel on the model of *Cyropaedia* also revived, with its typical emphasis on a king's upbringing. Onesicritus' *How Alexander Was Brought Up* belongs here, and so later does Nicolaus of Damascus' *On Augustus' Life and Education*. This genre overlapped with encomium, which also flourished: *Polybius 10. 21 mentions his earlier three-volume work on Philopoemen (2nd cent. AD), and distinguished the 'inflation' appropriate to that work from the truthfulness required of continuous history. The monographs may not have been full on childhood, and ranged beyond their subject's personal achievements; the novels (see NOVEL, GREEK) were largely idealized and partly fictional. But the biographical interest of these works is still strong, and the dividing line from biography is not clear.

6. About 240 BC Antigonus of Carystus displayed a new accuracy in describing contemporary philosophers; and in the scholarly atmosphere of *Alexandria there developed a different style of biography, revaluing the findings of the Peripatetics (Aristotle's school) and re-establishing their chronological data. Commentaries and epitomes called for biographical introductions, which generally avoided chronological narrative: between the particulars of birth and death short notes elucidated the mode of life, friends, students, works, etc. Typical of this school is Posidonius' pupil Jason of Nysa; later Didymus' *On Demosthenes* collects many learned items in conjunction with a commentary on the *Philippics* of *Demosthenes. The artistic pretensions of this tradition are not great.

7. A type of autobiography goes back to early lyric poetry, to Xenophon's *Anabasis*, and to such self-defences as Isocrates' *Antidosis*, Demosthenes' *On the Crown*, and

Plato's *Seventh Letter*. By the 3rd cent. men of action were elaborating the memoir: Aratus was here most influential. With Nicolaus of Damascus' *Autobiography* the technique extends to an intellectual figure; he finds a follower in *Josephus.

8. The Christian Gospels have points of contact with the Greek tradition, with their charismatic hero and their anecdotal narrative texture. A different moral earnestness is found in Plutarch's *Parallel Lives*, which mark a considerable new achievement. Their scale, ambition, and historical sobriety are hard to parallel in the antecedent traditions; so is the depth of characterization. Important here is the technique of comparison of a Greek and Roman hero, drawing attention to nuances of personality. The moralizing is sometimes subtle; the psychological interest is uneven, but can be penetrating.

9. Philostratus' *Life of Apollonius* (see APOLLONIUS OF TYANA) veers towards hagiography: readers would probably not have taken it as literal truth. Eunapius (4th cent. AD) broke up the Alexandrian form. More learned were the Neoplatonist biographies of Porphyry and Marinus. The first book of Marcus *Aurelius provides a more exploratory form of intellectual autobiography. Galen is similar but less perceptive, while *Lucian's *Dream* is more playful; Libanius (4th cent. AD) goes back to the model of Isocrates' *Antidosis*. Diogenes Laertius exemplifies the abridging and synthesizing of the materials of literary biography.

Much of Greek biography is lost; the range and richness of its remains are still striking. CBRP

biography, Roman Roman biography did not wholly derive from its Greek equivalent: their own political and family customs led Romans to value the recording of the deeds of their great men. We hear of songs at banquets praising the famous, of dirges (*nenia*) at funerals, and of a native tradition of funeral laudations (*laudatio funebris*). Such laudations were preserved and kept among the family records, together with the likenesses (*imagines*) of distinguished ancestors: *Cicero (*Brut.* 62) complains about the inaccuracies of these laudations. Sepulchral inscriptions were important too, and became very elaborate, often giving details of private as well as public matters (cf. the 'laudations' of Murdia and Turia, *CIL* 6. 2. 10230 and 1527, 31670). The flavour of such formal memorials is as recurrent in Roman biography as that of encomium in the Greek counterpart; it is, for instance, one of the elements detectable in *Tacitus' *Agricola*.

2. The competitive quest for glory also stimulated writers to self-justification and self-defence.

The award of a triumph might depend on the bulletins sent home by generals; such writing naturally goes back

to an early period. More elaborate apologetic or propagandist autobiography found a natural home in Rome: examples were the three books of Marcus Aemilius Scaurus, the five or more of Publius Rutilius Rufus, and Quintus Lutatius Catulus' single book *On his Consulship and his Achievements*. The twenty-two books of *Sulla's memoirs owed something to the Greek precedent of Aratus. *Caesar's *Commentaries* presented a particularly nuanced form of self-projection; Cicero too wrote about his own career and achievement both in Latin and in Greek. Under the Principate, it was especially members of the imperial family who wrote political memoirs: *Augustus, *Tiberius, *Agrippina, *Hadrian, *Septimius Severus.

3. Justification was not limited to autobiography. Gaius *Gracchus' two books *To Pomponius* presented a picture of his brother Tiberius *Gracchus which similarly contributed to contemporary debate. Equal generosity, even when the political point was less immediate, was surely to be found in the memoirs written by clients or freedmen of the great, Marcus Tullius Tiro on Cicero and Plotus (= Lucius Voltacilius (?) Pilutus or Pitholaus) on the Pompeii (Suet. *Rhet.* 6, cf. Peter, *HRRel.* 1. cclxxxiii–cclxxxiv). Such works can be hard to distinguish from the historical monograph: in his letter to Lucius Lucceius (*Fam.* 5. 12) Cicero seems to assume that such a monograph will naturally centre on a single person and his achievements, and playfully pleads for a liberal attitude to the truth. *Sallust's extant monographs notably avoid such a sharp focus on Jugurtha or *Catiline, but Gaius Oppius' work on Caesar may belong here.

4. The political heat of the late republic produced further writings designed to praise and defend, or sometimes attack, not only political actions but private character or philosophy. The influence of forensic rhetoric, so often describing the life of client or opponent, is here strong. The death of *Cato the Younger inspired works by Cicero and *Brutus, which were answered first by Aulus Hirtius, then by Caesar's own counterblast the *Anticato*; this in its turn was countered by Munatius Rufus. Lucius Calpurnius Bibulus wrote on the other philosopher-statesman, Brutus. These works represent the beginnings of a considerable literature, a blend of martyrology and ideological propaganda, which came to cluster around the Stoic opponents of the 1st-cent. Principate (see STOICISM). *Deaths of Famous Men*, such as Gaius Fannius' three books on *Nero's victims, dwelt especially on the theatrical martyrdoms: Quintus Iunius Arulenus Rusticus' *Life of Thræsea Paetus* and Herennius Senecio's of Helvidius Priscus are mentioned by Tacitus in the preface to his *Agricola*, and this must have been a further influence on that work. *Agricola* too explores political life under a tyrant, though it praises restrained collaboration

rather than ostentatious martyrdom; its use of an individual's life to sketch a political ambience is most deft.

5. Jerome named *Varro, Cornelius Nepos, Hyginus, Santra, and *Suetonius in a canon of biographers (*De vir. ill.* 2. 821 Vull.). The contributions of Hyginus and Santra are obscure, but the list still brings out the range of literary form which the genre could accommodate. Varro may be named for his *On Poets* or for his *Imagines* ('Likenesses', a work which added some sort of brief description to a series of 700 portraits), or even for his *Life (Vita) of the Roman People*, a Roman imitation of Dicaearchus. Besides longer works on *Cato the Elder and on Cicero, Nepos wrote sixteen or eighteen books containing some 400 short *Lives*: the series *On Foreign Generals* survives, together with *Cato* (an abbreviation of the longer version) and the more elaborate and eulogistic *Atticus*, both it seems from the series *On Roman Historians*. His enterprise owed something to Greek writing 'On Famous Men,' and Nepos was perhaps trying to make the great men of history accessible to a wider Roman audience. Suetonius' *Caesars* pointedly reduce the element of historical narrative, instead providing a learned survey of an emperor's character and behaviour under a series of headings. There is some generic similarity with his lives of grammarians and rhetors, but the scale and ambition is much greater. The style of the *Caesars* proved congenial as spectators increasingly saw Roman history in terms of the ruling personality, and biography supplanted historiography as the dominant mode of record: Marius Maximus and then the *Historia Augusta* continued Suetonius and followed his model.

6. There is little intimacy in Roman biography. Much Latin poetry is self-revealing and self-analytical, but the most ambitious formal autobiography and biography centred on public figures, and exploration of spiritual life is felt as inappropriate. Cicero (*Brut.* 313 ff.) does tell us something of his education and development, analysing his debt to various teachers; but there are no Latin pieces of self-exploration comparable with Marcus *Aurelius' *Eis Heauton* ('To himself') until we reach St *Augustine. CBRP

biology See ANATOMY AND PHYSIOLOGY; ANIMALS, KNOWLEDGE ABOUT; BOTANY; GYNAECOLOGY.

body The history of the body is a discipline which emerged in the 1980s; it questions the extent to which the body is 'natural', and asks whether all societies have experienced the body in the same way. Recent developments include approaching the body by studying its parts—examining changing understandings and representations of one specific body part across time—or looking at the experience of the body by its 'users'. The

combined classical and Christian heritage of western civilization has assigned the body a subordinate place in its value systems, but dichotomies such as mind/body and soul/body are by no means universal. The subject is associated in particular with the work of Foucault, although his studies of the classical world have been criticized for relying unduly on élite philosophical texts, neglecting Rome, and ignoring female sexuality. In a widely-challenged book, Laqueur presented the period before the eighteenth century as dominated by the 'one-sex body' in which the female and male genitalia were seen as the same organs, but positioned either inside or outside (T. Laqueur, *Making Sex* (1990)).

It is in medical texts that the differences between ancient and modern experiences of the body are perhaps most obvious. Graeco-Roman *medicine often regarded the female body as unstable; the womb could move around the body, and strong affinities existed between the top and bottom, so that defloration deepened the voice, while menstrual blood could come out of the nose (see GYNAECOLOGY). Issues including the seat of consciousness (the liver, the heart, and the brain were suggested) and the origin of male seed (from the brain, the blood, or the whole body) were also widely debated.

In addition to the female body, scholars have recently focused on the body as enslaved, disabled, ageing, suffering, violated or modified; definitions of beauty and ugliness are no less culturally determined than any other aspects of the body, while myths of metamorphosis also examine the limits of the body.

Another clear distinction between our own society and the ancient world concerns nakedness. Clothing was one of the features believed to set humanity apart from the animals. In Homer, nakedness is associated with vulnerability and shame; Odysseus covers himself before Nausicaa (*Odyssey* 6. 126–9). For the Greeks of the Classical period, however, nudity becomes the costume of the citizen; because male nudity is seen as normal, only *barbarians are represented as feeling shame when a man is seen naked (Hdt. 1. 10. 3 on the Lydians). Female nudity, meanwhile, continues to be associated with vulnerability and shame; the girls of Miletus (W. Asia Minor) are persuaded to end a mass suicide epidemic by the threat of exposure after death (Plut. *Moralia* 249bd). Nudity is also associated with *initiation (e.g. *Brauron) and fertility. In Athenian vase-paintings, men are represented naked in outdoor scenes, never in private domestic space. Women are generally shown naked only in private scenes when nudity is to be expected—for example, when washing—or when they are about to be killed or raped. In Etruscan art, in contrast, men wear shorts or loincloths in situations when Greek men would be shown naked—for instance

when exercising. In Roman art, nudity continues to be the costume of the male hero.

From childhood, the body needed to be controlled. Roman child-nurses were advised on how to mould the shape of the body, by swaddling and massage (Sor. *Gynaecia* 2. 15, 32). For men, correct control of the body was a further part of the costume of a good citizen. The orator, in particular, was advised on every aspect of presentation of self (e.g. Cic. *De off.*; Quint. *Inst.* 11. 3) (see RHETORIC, LATIN). The state too had a role in controlling the body, by instilling obedience through *education and, above all, through military training. Physiognomy used the body to reveal character, but recognized that individuals could learn to conceal their faults by changing their outward appearance. From Pandora's adornment by the gods onwards, women were represented as deceptive and frivolous, their elaborate clothing, wigs, and make-up concealing the vices underneath. Both Greek and Roman sources praise the unadorned woman (e.g. Xen. *Oec.* 10. 2–13; Seneca, *De consolatione* 16), while Roman sumptuary legislation tried to set limits on the expense of women's clothing (see DRESS).

St *Augustine (e.g. *De civ. D.* 19. 13) draws a parallel between the ordered arrangement of the parts of the body and the ordered arrangement of the appetites of the soul. Peace and health consist of both. Within the order of nature, the soul must control the body and reason the appetites, just as master controls slave and man controls woman. Some Christians positively valued neglect of the body—seen in abstinence from food and sex (see CHASTITY), or lack of interest in one's appearance—as evidence of a proper rejection of this world, whereas Graeco-Roman philosophy urged the care of the body as evidence of the virtue of *enkrateia* or self-control.

The body is also a central metaphor for political and social order. In Livy, Menenius Agrippa (*consul 503 BC) uses the body as an analogy for the body politic; the rest of the body revolts against the stomach (i.e. senate), perceived as idle, but soon weakens and has to recognize its dependence (2. 32). Disease in the body politic was a way of expressing social disorder. HK

books, Greek and Roman (see following page)

books, sacred and cultic Texts produced by religions of classical antiquity fall into three broad categories: (1) Texts emanating from or inspired by a divinity. Some of them reached the status of sacred books, and formed a notionally immutable foundation of a creed, such as the books of the Judaean and Christian canon; here also belong, albeit to a lesser extent, because

they were never definitely codified, various scripts of mystery cults: Dionysiaca, Hermetica, Isiaca, Orphica, also texts of Mithraism (see MITHRAS), of Judaean and Christian sects, of Gnostics and Manichaeans. All these texts (also Christian books until the victory of the Church) existed at the religious margins of Greek and Roman society. Gods also communicated through oracles, *dreams, the words of prophets, and a variety of signs (divination, portents), but these messages mostly referred to particular situations, and thus only rarely could acquire a general ethical or theological dimension. (2) Official (and dominant) religions of classical antiquity (with the partial exception of Etruscan religion) were not based on divine proclamations encased in sacred books. They were empirical creeds: their knowledge of the Divine was not revealed, but was acquired through experience. Their main preoccupation was not theology but ritual: how to ascertain the gods' will and gain their favour. Hence the importance of detailed prescriptions and regulations concerning divination, sacrifices, festivals, and calendar, and of records of past performances and of divine communications. Such texts were inscribed on stones or kept on tablets and rolls; as they pertained to cult (but themselves were in no respect sacred—it is a misnomer to speak of *leges sacrae*), and were composed by religious officials, it is best to describe them as cultic and priestly documents. In Rome we hear of *libri* and *commentarii* of the pontiffs and augurs; records of *fratres arvales* are partially extant on stone; and the *quindecimviri sacris faciundis* consulted the Sibylline books. (3) Texts of interpretation, as the Jewish midrash, and a large portion of patristic literature; here may also be classified the pronouncements of Greek *exēgētai* and *responsa* of Roman priests. JL

booty 'It is a law established for all time among all men that when a city is taken in war, the persons and the property of its inhabitants belong to the captors' (Xen. *Cyr.* 7. 5. 73). This universal ancient conception is reflected in the wide range of meanings of the ancient terminology for 'booty' (notably *leia*, *laphura*, and *ōpheleia* in Greek, *praeda* and *spolia* in Latin). It referred not just to movable and inanimate objects (e.g. precious metals), but could also include animals and livestock, human beings, and even whole cities and territory. War, for instance, was one of the major suppliers of the slave trade (see SLAVERY). It was rare after *Homer for wars to be fought solely and openly for acquisitive purposes. But it was always assumed that success in war would lead to appropriation by the victor of the property and persons of the vanquished, and sometimes of territory as well. Hence the largest sudden transfers of wealth in the ancient world were the

[continued on p. 131]

GREEK AND ROMAN BOOKS

books, Greek and Roman Books existed in *Egypt long before they came into use in Greece. Systems of writing had been invented and developed for administrative purposes in both Egypt and Mesopotamia by c.3000 BC. While the Sumerians and Babylonians (*see* BABYLONIA) used clay tablets for their cuneiform (wedge-shaped) scripts, the Egyptians used papyrus. A blank sheet of papyrus was found in the tomb of the vizier Hemaka in Saqqara of c.3000 BC. The oldest surviving inscribed papyrus texts are the temple accounts of Abusir of c.2450 BC. A number of fine statues of seated scribes of the same period suggests that this profession was already well established and that writing had been practised for centuries, long enough for the 'hieratic' script to develop through the adaptation of hieroglyphs to the use of reed brush and papyrus. The hieroglyph for 'book-roll' is first attested in the first dynasty (c.3000–2800 BC), and Egyptian literature was supposed to have begun with the writings of Imhotep, the architect of the first pyramid under King Djoser in the third dynasty (c.2600 BC). Religious books were kept in temples; although temple 'libraries', i.e. chambers designated for the storage of books, have survived only in Ptolemaic temples (Edfu, Philae, ed-Tod), literary references to books and libraries suggest their existence in the Middle Kingdom (thirteenth dynasty, c.1700 BC), and *Diodorus Siculus (1. 47, using the account of Hecataeus) describes the library in the Ramesseum at Egyptian Thebes.

The papyrus plant (*Cyperus papyrus*) grew mainly in the swamplands of lower Egypt and especially the Nile delta. It was used for many purposes: to make ropes, sandals, baskets, boats, and—most importantly—writing material. The Greeks called it *byblos* or *biblos* (*see* below), later *papyros* (first attested in Theophr. *Hist. pl.* 4. 8. 2), believed to be derived from Egyptian *pꜣ-n-pr-ꜣꜣ* 'that of Pharaoh', which suggests that its manufacture and marketing were a royal monopoly. The *locus classicus* describing its manufacture is Plin. *NH* 13. 74–82 (translation and discussion in N. Lewis, *Papyrus in Classical Antiquity* (1974), 34–69). The triangular-sectioned stem is cut into segments c.30–40 cm. (12–16 in.) long, from which the outer hull is then removed; the white pith is sliced lengthwise into thin strips, which are placed vertically parallel to each other on a plane surface; over these, a second layer of strips is placed horizontally, and the ends squared off. They are then pressed in presses (*prelis*); the plant's natural juice glues the layers firmly together. After drying, the sheet is smoothed with a stone or a sea-shell. According to *Pliny the Elder, twenty sheets (*kollēmata*, *plagulae*) were then glued together to form a roll (*chartēs*, *charta*), on average 6–8 m. (20–26 ft.) long (in Pharaonic times, too, papyrus rolls of twenty sheets had been standard). If a longer roll was required, it had to be manufactured specially. The narrow edge (*kollēsis*, 'gluing') of a sheet which, in Greek books, overlaps that of the sheet to its right is usually 20–25 mm. (3/4–1 in.) wide. In rolls of Egyptian texts, however, the right-hand sheet overlaps the one to its left, so that the scribe, writing from right to left, had his reed brush travelling 'downhill' over the joins. If this was the way in which rolls were originally manufactured, Greek scribes turned them upside down, so that they, too, could write 'downhill' over the joins. The sheets on the inside of the roll show horizontal fibres; in this way the joins are better protected from being pulled apart. Only the first sheet of the roll has its vertical fibres on the inside, at right angles to those of the following sheets; this is the 'protocol' (*protocollon*) which protected the outside of the book when it was rolled up; it was sometimes a parchment sheet (cf. [Tib.] 3. 1. 9), or reinforced with parchment. Whether the ends of rolls were similarly reinforced is not clear; the surviving ends of book-rolls show no sign of an *eschatocollion* (Mart. 2. 6. 3). Rollers (*umbilici*, Hor. *Epist.* 14. 8; Mart. 4. 89) with decorative knobs (*cornua*, Mart. 11. 107) attached to the last sheet survive in some rolls from *Herculaneum but none have been found in Egypt.

As the pen runs more smoothly along the fibres than across, the scribes normally used the inside of the roll first where the glued join (*kollēsis*) runs at right angles to the fibres; this is conventionally called 'recto', its back 'verso', but these terms should only be used with regard to codices ('recto' = right-hand page), whereas for rolls the terms 'front'/'back', or 'inside'/'outside' are preferable. In some rolls, however, the writing runs across the fibres on the inside, parallel to the joins, in long lines from edge to edge. Such rolls (*rotuli*) were employed only for Greek and Latin documents, never for literary texts which were designed for continuous reading. Documents, on the other hand, were often glued together to form rolls, the blank backs of which could then be used for literary texts (for private use, not for sale). As the inside of the roll was nearly always used first, a dated document may provide a *terminus post quem* for the literary text; the reverse case (document on the back of a book roll; cf. Mart. 8. 62) is relatively rare. Papyrus rolls were dressed with cedar-oil (*kedria*, *cedrium*) to protect them against worms (Vitr. *De arch.* 2. 9. 13).

A papyrus roll would take a book of *Thucydides, or a play of c.1500 lines, or two to three books of *Homer. The length of the books of *Apollonius of Rhodes' *Argonautica*, or the books of *Polybius, *Strabo, or *Diodorus Siculus,

may have been determined by this standard format. The text is arranged in columns (*selides, paginae*); the number of lines per column, usually between 25 and 45, varies with the height of the column and the size of the writing. The length of the lines also varied; in hexameter and trimeter poetry it was determined by the verse, but lyric poetry and prose were (at any rate, from the 2nd cent. BC onwards) written in shorter lines of between 5 and 10 cm. (2–4 in.), with an average of between 18 and 25 letters per line. Some book rolls have wide upper and lower margins as well as generous spaces between columns. Sometimes a line accidentally omitted from the text is added in the upper or lower margin, usually with a reference mark.

Apart from papyrus, leather was also used in Egypt to produce rolls for literary texts. The *Annals* of Thutmosis III were written on leather rolls and deposited in the temple of Amūn at Karnak. The inscription in the library of the Edfu temple also lists leather rolls. In the ancient near east, leather was widely used as a writing material. Ctesias (in Diod. Sic. 2. 32. 4) describes the ‘royal hides’ (*basilikai diphtherai*) which the Persians used for their chronicles; from Persia, leather rolls may have come into use in Ionia and then in other parts of Greece. In Italy, too, animal hides were used at an early stage (Dion. Hal. 4. 58). While leather had to be tanned, vellum or parchment was manufactured by placing the hide in slaked lime for some days; then flesh and hairs were scraped off and the hide was rubbed with calcium oxide, stretched in a frame, and finally smoothed with pumice. The name ‘parchment’ (*pergamēnē, pergamēna*) is derived from *Pergamum, which became a centre of production and export in the 2nd cent. BC when papyrus from Egypt was in short supply. The earliest extant Greek documents on vellum (parchment), however, prove that the manufacturing process had been known earlier.

In the production of books parchment played only a minor role compared with papyrus, which remained the dominant writing material throughout Greek and Roman antiquity. In *Crete, papyrus may have been used as early as the second millennium BC, as strands of papyrus have been found baked into Minoan clay sealings. Egyptian papyrus was also exported to Phoenicia (see PHOENICIANS) and beyond; the story of Wen-Amūn (11th cent. BC) mentions 500 rolls of finished papyrus sent to Byblos in return for timber. The fact that in Greek (Aesch. *Supp.* 947, Hdt. 2. 100, etc.) *byblos* means ‘papyrus roll’ suggests that originally it may have been imported from Byblos, Phoenician Gubla. So it is at least possible that papyrus as a writing material was known in the Greek world in Mycenaean times, but there is as yet no firm evidence for its use as a vehicle for Greek literature before c.500 BC when book-rolls of papyrus first appear on Attic vases. Herodotus’ remark (5. 58) that the Ionians had used leather rolls at a time when papyrus was scarce, and hence kept the word *diphthera* (‘hide’) for ‘book’ (*byblos*), does not rule out early acquaintance with papyrus. In the 8th cent. BC, papyrus is mentioned in cuneiform texts in Assyrian accounts as ‘reeds from Egypt’, and an 8th-cent. palimpsest papyrus written in Hebrew has come to light near Murabba’ at on the Dead Sea (*PMur.* 17 = *Discoveries in the Judaean Desert of Jordan* (1960) 2 pp. 93–100).

Although writing may have been employed early on in the composition of Greek poetry (and the complex structure of both *Iliad* and *Odyssey* is hardly conceivable without it), the performance of poetry continued to be oral throughout the Archaic and Classical periods. When *Archilochus describes himself as a ‘woeful messenger-stick’ (*achnymenē skytalē*, fr. 185 W), he does not necessarily imply that his epode was transmitted on a piece of papyrus or leather, wrapped round a stick. On the other hand, much of early epic poetry is reflected in both lyric poetry and black-figure vase-painting, Corinthian and Attic (see POTTERY, GREEK), and it seems doubtful whether this can be accounted for by oral transmission (by itinerant rhapsodes (professional poetry reciters) and choirs) alone. It is therefore reasonable to assume that book-rolls played a part in the transmission of Greek poetry in the 7th and 6th cent., if only as *aides-mémoire* to the performers. In the 6th cent., the tyrants Polycrates of Samos and *Pisistratus of Athens are said to have been admired for their collections of books (Athen. 1. 3a). Pisistratus is credited with a revision of the texts of Homer which until then had been ‘confused’ (Cic. *De or.* 3. 137); he is also said to have inserted lines about Salamis and *Theseus into the texts (*Il.* 2. 558, *Od.* 11. 631). On the other hand, [Pl.] *Hipparch.* 228b says that Pisistratus’ son Hipparchus brought the poems of Homer to Attica and forced the singers at the Panathenaea to perform them—in preference, perhaps, to other parts of the Epic Cycle. In any case, there clearly was, in the later 6th cent., an authoritative text of Homer which served as a basis for rhapsodic recitals at the Panathenaea.

From c.500 onwards, book-rolls (evidently of papyrus) appear on Attic vases; as far as the writing can be identified, they all contain poetry. The Duris cup in Berlin of c.485 BC (Beazley, ARV² 431. 48) illustrates the use of book-rolls in schools, and Ar. *Nub.* 961–72 describes the ‘ancient education’ (*archaia paideia*), i.e. in the schools of c.500 BC, where the children were made to memorize epic poetry and to sing it in the traditional mode. Reading books for pleasure is mentioned in Eur. *Erechtheus* (fr. 369 N, of 422 BC?), and in Ar. *Ran.* 52 f. (405 BC) *Dionysus says he read *Euripides’ *Andromeda* on board ship. The earliest references to booksellers are in Eupolis (*PCG* fr. 327) and in *Plato (*Ap.* 26d),

where *Socrates says that a copy of Anaxagoras could be bought 'from the orchestra' (in the Agora of Athens?) for one drachma 'at most'. The term 'bookseller' (*bibliopōlēs*) is first attested in Theopompus the comic poet, active c.410–370 BC (fr. 79 KA). *Xenophon (*An.* 7. 5. 12–14) refers to 'many written books' being exported on ships from Athens to the Black (Euxine) Sea, and in *De memoria* 4. 2. 10 Socrates asks Euthydemus whether he wants to become a rhapsode, having bought the complete works of Homer.

The intellectual revolution of the *sophists and the interest in dithyrambs and tragedy boosted demand for books in Athens, where book production and the book trade flourished in the 4th cent. BC. It made the vast collecting activities of *Aristotle and his pupils possible and led to the formation of *libraries, notably that of Aristotle himself (Strabo 13. 608).

The oldest surviving specimens of literary papyrus rolls date from the second half of the 4th cent. The Timotheus papyrus (*P Berol.* 9875, *Persians*), found at Abusir north of Memphis, written in long lines in large, clumsy letters, may antedate *Alexander the Great's conquest of Egypt. The carbonized papyrus roll found at Derveni, near Thessalonica, a commentary on an Orphic cosmogony, is written in small letters (c.2 mm. (1 10 in.) high) in a careful, skilled hand which makes the columns look almost like *stoichēdon* inscriptions (i.e. exactly aligned vertically). Given the regularity and elegance of Attic writing on vases and also of private letters on lead tablets, such as the letter of Mnesiergus in Berlin (*Syll.*³ 1259), the Derveni papyrus has a far stronger claim to being a typical representative of a 4th-cent. book. From the beginning of the Ptolemaic period through to the 8th cent. AD, an uninterrupted series of book-rolls and, later, codices chiefly from Egypt illustrates the development of Greek (and, to a lesser extent, Latin) books and their scripts.

The museum and the *library at *Alexandria, founded by *Ptolemy I, became the most important centre of scholarship, and literary criticism in particular, for centuries to come. The work of the Alexandrian scholars led to a standardization in the formats of Greek books and in the layout of the texts. While in early 3rd-cent. BC texts of poetry, verse (other than hexameters and trimeters) is not written metrically, books from the 2nd cent. BC onwards show lyric passages arranged in short metrical units or *kōla*; their colometry is preserved in the medieval manuscripts of *Pindar's *epinikia* and the choruses of Attic drama (see COMEDY; TRAGEDY). Prose texts are usually set out in fairly narrow columns in lines of equal length. Aids to the reader, such as spaces between sentences, punctuation, or horizontal dashes (*paragraphoi*) in the left-hand margin or between line-beginnings, very rare at first, become more frequent in the 2nd and 1st cent. BC and increasingly common during the Roman period, as do accents and breathings. The librarian Aristarchus devised a system of critical reference signs to alert the reader to textual problems and their discussions in commentaries; most of these appear in book-rolls, though not always with the functions assigned them by Aristarchus. Commentaries (*Hypomnēmata*) were written in rolls separate from the texts on which they comment, but the rolls carrying texts often have notes or excerpts from commentaries in the margins, although they are rarely as copious as in the Louvre papyrus of *Alcman's *Partheneion*.

Greek book-rolls continued the Egyptian tradition of book illumination; the surviving illustrated papyri are mostly scientific or mathematical books, or magical papyri; fragments of illustrated papyrus rolls of Homer or drama are very rare. Book illumination becomes more common only in the later Roman period, with the victory of the codex (see below). Titles, too, were added, either in the left-hand margin against the opening line, or at the end of a book under its last line. Title-tags (*silyboi*) were sometimes appended to book-rolls. Book titles first came into use with Attic drama, because the titles of plays had to be entered for the competition. While the older lyric poems are usually referred to by their opening lines, *Aristophanes (*Nub.* 553 f.) quotes Eupolis' *Marikas* by title and then his own play, the *Knights* (*tous hēmeteras Hippeas*). *Dithyrambs, too, may have been entered for competitions by their titles, perhaps as early as the 6th cent., if Herodotus' statement that Arion 'gave his dithyrambs names' (*onomasanta*, 1. 23) is to be trusted. Prose works in the 5th and 4th cents. BC generally do not seem to have had titles, even though Plato (*Plt.* 284b) refers to his dialogue *Sophist* by this title (*en tō sophistēi*). Normally, prose works, too, are referred to by quoting their opening words, a practice which may have been promoted by *Callimachus' catalogue of the Alexandrian library, the *Pinakes* ('Panels'). The division of longer works into books must be attributed to the Alexandrian scholars who edited them.

Rolls were kept on shelves, or in boxes or buckets (*teuchos, capsā, scrinium*). Sometimes rolls were kept in a vellum cover (*διφθέρα, paenula*) with a coloured label. The vellum label with *Pindaros holos* ('The Complete Pindar', *P. Antinoop. Papyri* 1. 21) may have been attached to a box or bookcase containing the seventeen books of the Alexandrian edition. While private libraries had boxes or movable cases, as did the library of King Eumenes II of Pergamum, the great public libraries of early imperial Rome had bookcases inserted in niches (*thyris, fenestra*) in the walls. This is a

feature of both Egyptian temples (Edfu, Philae, ed-Tod: see above) and Coptic monasteries; it seems probable that Caesar saw them in Alexandria (in the Serapeum library?) and hence planned to introduce them in Rome's first public library, a plan which Asinius Pollio carried out after Caesar's death in the Atrium Libertatis, thus creating the model for Augustus' library on the Palatine.

The most important innovation in the shape of the book was Roman in origin. The codex was created when the wooden panels of writing-tablets fastened together with thongs were replaced by parchment (*membrana*). At first used as notebooks (Hor. *Sat.* 2. 3. 2; Quint. *Inst.* 10. 3. 31), parchment codices had come into use for classical literature by the 1st cent. AD (Mart. 14. 184–92 advertises them as cheap pocket editions), while the normal form of the book was, in the Latin west as in the Greek east, the papyrus roll. What eventually established the codex was its adoption by the Christians; the vast majority of biblical and NT texts from the early 2nd cent. onwards are in codex form. Pagan classical authors appear in parchment and papyrus codices from the 2nd cent. AD and more frequently in the 3rd; by the 4th cent., three out of four literary texts were in codex form.

Codices were assembled from quires consisting of wide sheets folded vertically in the middle and then stitched together along the fold. Quires of four or five sheets (*quaterniones*, *quiniones* = 8 or 10 leaves) are common, thinner or thicker quires are exceptional and may be early experiments. Sheets of papyrus were often placed so that on facing pages the direction of the fibres was the same (recto pages with horizontal and vertical fibres alternating), but the alternative arrangement (i.e. vertical facing horizontal fibres, and vice versa) is not uncommon. Vellum sheets were usually arranged with hair sides facing and flesh sides facing. While papyrus sheets in Greek book-rolls, and in codices of the 2nd and 3rd cents., rarely exceed 35 cm. (13½ in.) in height and 23 cm. (9 in.) in width, wider sheets (30–35 cm.: 12–13½ in.) were often used in Greek and Coptic codices of the 4th, 5th, and 6th cents., when large parchment codices were also common. Small formats (even miniature codices like the Cologne parchment codex of the life of Mani with pages of 38 × 45 mm. (1½ × 1¾ in.)) are also found in this period.

The text was written before the sheets were stitched together, usually in one column per page, prose texts sometimes in two narrow columns like those in rolls (more frequently in parchment than in papyrus codices). Pagination is frequent; sometimes quires are also numbered on their first pages. Codices were bound between wooden panels covered in leather. Papyrus codices remained common in Egypt until the late 6th cent.; elsewhere, parchment codices begin to prevail from the later 3rd cent. onwards. For codices, the advantages of parchment over papyrus are obvious: less fragile folds, greater durability, greater capacity, and they are easier to use. *Constantine I ordered 50 parchment copies of the Scriptures for the churches in Constantinople, and Jerome records that the papyrus manuscripts in the library of Caesarea, having become worn by use, were replaced by parchment codices.

Little is known about the book trade in the Greek world, probably because the private copy always remained the commonest form of book production. In the 4th cent. there seem to have been itinerant booksellers who 'carried around' bundles of *Isocrates' speeches (Dion. Hal. *Isoc.* 18). More information is available on the book trade in Rome from the 1st cent. BC onwards, and some publishers like *Cicero's friend *Atticus, or the Sosii, Horace's publishers, or *Martial's and Quintilian's publisher, Tryphon, are well attested; *Pliny the Younger (*Ep.* 11. 11. 2) was surprised to learn that booksellers in Lyons (Lugdunum) were selling his books. The evidence for book prices is scanty and contradictory; on the whole, it seems that in Rome books were not expensive: Martial quotes 5 denarii as the price of a luxury edition of his poems (1. 117), while a cheap one would cost 6 to 10 sesterces (1. 66). Palimpsests, i.e. texts written on reused papyrus or parchment after the original writing had been rubbed or washed off, were cheaper still (Catull. 22).

HMA

result of successful warfare: for example *Sparta's conquest of Messenia (see PELOPONNESE) and the Messenians in the late 8th cent. BC, the *Persian Wars and their sequels, *Alexander the Great's conquest of the Persian empire and the wars of the Successors, who all regarded their conquests as 'spear-won territory', and the numerous wars of the expanding Roman republic. On a smaller scale raiding between neighbouring states was endemic, as were *piracy at sea and *brigandage on land,

except when a stronger power was able to impose peace in its sphere of influence (Athens in the 5th cent., Rhodes in the Hellenistic period, Rome under the empire). Throughout antiquity, it was also assumed that armies would sustain themselves from the territory in which they operated.

MMA

botany From earliest times, Greeks and Romans had expert familiarity with plants and their growth cycles;

agriculture dominates, alongside acute command of medicinal herbs, including production of oils and perfumes. Exact nomenclatures were quite irrelevant; everyone 'knew' plants and flowers carpeting fields and mountain valleys in season; flower metaphors became common in *Homer and the lyric poets. There is nothing esoteric about early botanical lore; locals understood their plants—from various wheats and vegetables to the widespread poisons (hemlocks, mandrake, the opium poppy, etc.)—and they spoke of parts (roots, seeds, flowers, stems, leaves) as plants providing particulars: food, medicines, poisons, oils, beverages (wine, beer).

Botany figures in Mycenaean Greek texts, suggesting a sophisticated perfume and perfumed oil industry at Pylos, Cnossus, and elsewhere (see MINOAN CIVILIZATION). Few species are imported exotics, and Homer's flowers are likewise local, e.g. the saffron crocus (*Il.* 14. 348: *Crocus sativus* L.), galingale (*Il.* 21. 351; *Od.* 4. 603: *Cyperus longus* L.), lotus (*Il.* 14. 348: *Lotus corniculatus* L.), the bluebell (*Il.* 14. 348: *Cyclamen graecum* Link), the asphodel (*Od.* 11. 359, 24. 13: *Asphodelus ramosus* L.), the laurel or bay (*Od.* 9. 183: *Laurus nobilis* L.), and others. Homer mentions the opium poppy and its sleep-inducing latex (*Il.* 8. 306–7; *Od.* 4. 220–30: *Papaver somniferum* L.), but the poet credits it to Egypt, an anomaly since *P. somniferum* is native to Asia Minor. Influence also came from herbalists of Assyrian origin; *Aristotle's *dēmiourgos* (*Pol.* 1282a3) mirrors a hoary tradition of skilled rootcutters (the *rhizotomoi*) who gained their craft and plied their trade in the countryside. Interwoven with medical botany is religion and myth, and typical is Homer's 'gift' of the unknown *moly* to Odysseus (*Od.* 10. 305) to ward off Circe's evil drug (*Od.* 10. 394), a gift from Hermes, long celebrated as the deity who gave herbs to man: 'O Hermes, benefactor, discoverer of drugs' (*PGM* 8. 27 f.). Moderns need not untangle this medley of beliefs about botany: the ancient mind did not wall *magic away from pure philosophy, any more than there were strict divisions between botany and herbal lore. Deep traditions speak through the poetry of *Sappho and Theognis, using flowers and herbs in metaphor with telling effect; Sappho speaks of cassia (*Supp.* 20c2: *Cinnamomum cassia* Blume), roses blooming, the tender chervil, and flowery melilot (all no. 96. 11. 13–14 (Loeb 1, p. 120)), along with edible chickpeas (no. 143 (Loeb, 1, p. 156)). Locals knew what plants were like nettles, and Theognis (537) knows the nasty effects of squill (*Urginea maritima* (L.) Baker), long storied in tales of what a community *pharmakos* endured. Not coincidental is *pharmakos* = 'scapegoat' and the neuter *pharmakon* usually = 'drug' or 'magical spell'.

Debate began early about the nature of plants in relationship to other forms of life. Aristotle, *De anima* 410^b22,

botany The castor oil plant as illustrated in a 6th-cent. AD copy of the herbal of Pedanius Dioscorides (1st cent. AD). His work, 'Materials of Medicine', lists around 700 plants and is an important source of knowledge about earlier Greek botany. Austrian National Library

in noting faulty Orphic notions on how plants breathe, indicates how old was this discussion; speculation on Medea's *pharmakon* (lulling to sleep the golden fleece's guardian reptile) also was quite early: Musaeus, semi-legendary and pre-Homeric, stated that Medea used a drug with *arkeuthos*, the prickly juniper, *Juniperus oxycedrus* L. (schol. on *Ap. Rhod.* 4. 156), faithfully reproduced by *Apollonius of Rhodes in his *Argonautica* many centuries later. Musaeus wrote poems on healing plants: Theophrastus (*Hist. pl.* 9. 19. 2) cites Musaeus and *Hesiod on the properties of *tripolion*, the sea starwort (*Aster tripolium* L.), encapsulating folk tradition with accuracy in citation and current use: 'It is useful for every good treatment, and they dig it up at night, pitching a tent there.' *Pindar (*Pyth.* 3. 51–3) says that traditional medical treatments of *Asclepius were incantations, surgery, soothing potions, and amuletic drugs, reflecting *medicine's dual therapies, herbal drugs and surgery. Athenian playwrights record well-known herbs and plants with

some frequency; e.g. *Sophocles' lost *Rhizotomoi* ('Rootcutters' = Macrob. *Sat.* 5. 19. 9–10) noted the professional status of rootcutters and herbal experts, even as Medea uses *thapsia*, the deadly carrot (*Thapsia garganica* L.), to induce frenzy; *Aristophanes' *Peace* (712) and *Lysistrata* (89) show the commonplace use of pennyroyal (*Mentha pulegium* L.) as a female contraceptive; these examples could be severally multiplied.

Striking is the *mélange* of herbal lore and specific plants indicated for women's ailments (see GYNAECOLOGY) in the Hippocratic *Diseases of Women* and similar tracts (see MEDICINE §4.2); there are over 300 identifiable species, collected expertise of midwives (also recorded by the gifted Soranus of Ephesus in his *Gynaecology* (c.AD 117)). Analogy was crucial: the Hippocratic *Nature of the Child* and the shorter *Seed* liberally employ agricultural terms; the author (probably mid- or late 4th cent. BC) is well acquainted with growth patterns in plants, from seed through germination into seedling, a 'youth', followed by maturity and senescence. Aristotle incorporated plants into his scheme of living things, endowing them with three faculties of the *soul: nutrition, growth, reproduction, but not motion or perception. Pseudo-Aristotle, *Plants*, summarizes ideas on botany at the Lyceum, but it is Theophrastus (c.370–288/5 BC) who provides the best Greek account of botany in *Inquiry into Plants* (*Hist. pl.*) and *Causes of Plants* (*Caus. pl.*); as Aristotle's foremost student, Theophrastus certainly echoed his mentor's paradigms of nature.

An acute observer of plants, Theophrastus distinguished long before modern botany between dicotyledons and monocotyledons, based on precise morphology; he is not ignorant of plant sexes (see *Hist. pl.* 2. 8. 1 on fertilization in figs; 2. 8. 4 on fertilization in date palms; cf. Herodotus 1. 193 on similar understanding about Assyrian figs and palm-trees), but chooses to tabulate by forms, flower to fruit, defining flowers as epigynous, perigynous, and hypogynous, showing that he understood the essential relation of flowering to fruiting; anticipating Dioscorides, Theophrastus notes geography to account for differences in shapes and properties of plants when used as medicines—and very good are his descriptions of plants and their parts (root, stem, leaves, flowers, seeds or fruits, and so on), their cultivation as crops or as pot-herbs—and he often quotes from the ubiquitous *rhizotomoi*, the special uses of plants, from medicines to quasi-magical potions and aphrodisiacs; Book 9 of *Historia plantarum* is a priceless document in its own right, the first herbal manual in Greek to survive.

Hellenistic botany extended its scope, resulting in part from the far-flung expeditions of *Alexander the Great into India; many spices trickled into Greek cooking and

pharmacy owing to voyages to India, fairly common by 200 BC. Much Hellenistic botany and pharmacology is lost excepting citations, especially by Dioscorides of Anazarbus (fl. c.AD 65), *Pliny the Elder's marvellous pot-pourri, the *Natural History* of AD 77, the doctor Galen of Pergamum (AD 129–after 210), and a few others. The *Preface* of Dioscorides' *Materia Medica* demonstrates use of earlier Greek texts, and through Dioscorides, Pliny, Galen, etc. we know of Iollas of Bithynia (? 250–200 BC), Heraclides of Tarentum (fl. c.100 BC), Crateuas (fl. c.100 BC), Asclepiades of Bithynia (d. 92 BC.), Andreas (d. 217 BC), as well as Dioscorides' near-contemporaries Sextius Niger, Julius Bassus, Niceratus, Petronius, Diodotus, and several more. Pliny's botany is good when he remains in Italy, but his polymathic curiosity led him to copy all non-Italian sources as being of equal merit; Pliny's plants compared with corollary passages in Dioscorides (both independently used Sextius Niger's lost works) display reasonable accuracy, and species and genera are often keyed with some assurance. Crateuas produced an illustrated herbal, but it is not ancestral to most later illuminated herbals (e.g. the Vienna Dioscorides of AD 512). Together, Pliny and Dioscorides provide details of about 600 species; Pliny gives much on various wheats and vines, vegetables, apples, olives (following in the steps of *Cato the Elder, and *Varro), and several cultivars, while Dioscorides provides precise accounts—though not much morphology—of medically useful plants, arranged according to a drug affinity system (what the drug did when given to a patient for a particular ailment). Botanical drugs likewise figure heavily in the works of Galen of Pergamum, who quotes voluminously from earlier authorities, attempting (unsuccessfully) to organize his materials.

Among writers in Latin, Cornelius Celsus' *De medicina* (c.AD 37) has a good account of medical plants, derived partially from Hellenistic sources, and Scribonius Largus' *Compositiones* (AD 43 or later) details 242 botanicals (from *abrotanum* (*Artemisia abrotanum* L., a wormwood) to *zea* (*Triticum spelta* L., spelt)), 36 minerals, 27 animal products (beeswax, honey, eggs, beaver testicle, etc.); Scribonius carefully considers certain poisonous drugs (e.g. aconite, hyoscyanus, hemlock (*Conium maculatum* L.), various mushrooms, the opium poppy), crucial at the Roman imperial court (Scribonius was a physician in the house of *Claudius, who succumbed to mushroom poisoning in AD 54). *Compositiones* in turn became a source for several later Latin texts in medical botany, including the *De medicamentis* by Marcellus Empiricus (c.AD 400), a trove of Gallicisms creeping into Latin.

Characteristic of botanical and pharmacological texts is continuous adaptation of written documents to local

conditions; numerous ‘substitution lists’ in Greek and Latin were circulating by AD 200, clearly seen in the Galenic tract by that title. By AD 400, the major lines of Graeco-Roman medical botany—as well as pure botany, best discerned in the works of Theophrastus—are well defined; certain flowering-plant families are well represented in folklore, agriculture, and botany: prominent among the dicotyledons are Labiatae, Umbelliferae, Boraginaceae, Ranunculaceae, Convolvulaceae, Compositae, Salicaceae, Rosaceae, Cruciferae, Leguminosae, Solanaceae, and Coniferae; and frequently included among the monocotyledons are Liliaceae, Gramineae, and Orchideae; there is detailed expertise on trees and woods, as well as fungi, lichens, and algae. See AGRICULTURAL WRITERS; CONTRACEPTION; OLIVE; TIMBER; WINE. JSCA

boulē, council of 500 at Athens. See DEMOCRACY, ATHENIAN, §§2 and 3.

Brauron (see ◀Map 1, Cc▶), site of a sanctuary of *Artemis on the east coast of Attica at the mouth of the river Erasinos. It is included in Philochorus’ list of twelve townships united by *Theseus (FGrH 328 F 94). Archaeological evidence indicates human presence in the area of the sanctuary and the acropolis above it from neolithic times onwards, and there is an important late Helladic cemetery nearby. In the sanctuary itself there is a continuous tradition from protogeometric on, with a temple built in the 6th cent. (Phot. *Lexicon*, entry under *Braurōnia*) and an architecturally innovative *pi*-shaped stoa with dining-rooms built in the later part of the 5th cent. Flooding in the early 3rd cent. BC led to the abandonment of the site. Some traditions associate the Pisistratids (see PISISTRATUS) with Brauron (Phot., as above), or with the local residential centre called Philaidai which lay a short distance inland from the sanctuary (Pl. [*Hipparch.*] 228b).

Cult activity at Brauron was particularly associated with the *arkteia*, a ritual, known also at the sanctuary of Artemis Munichia in the Piraeus, in which young girls between the ages of 5 and 10 ‘became’ bears. The aetiological myth for the *arkteia* related that this service was required of all Athenian girls before marriage because of an incident in which a bear belonging to the sanctuary had been killed after becoming savage with a young girl (schol. Ar. *Lys.* 645). Modern scholars suggest that the ritual was a rite of passage which marked the physical maturation of pubescent girls and prepared them for taming by marriage by stressing their wildness. Some pottery vessels of a shape particularly used for dedications to Artemis (*krateriskoi*) excavated at Brauron show naked girls running and part of a bear, and scholars have suggested that these illustrate the ritual. The sanctuary included a cave sacred to Iphigenia, and dedications were

also made in celebration of successful *childbirth. The Brauronia was a quadrennial festival organized by *hieropoioi* appointed by the city by lot, and involved a procession from Athens out to Brauron. We also hear of a sacred hunt. RGO

breast-feeding was a proof of maternal devotion and, according to some philosophers, a good woman’s duty (there is a detailed discussion in Gell. *NA* 12. 1). It was acknowledged to be tiring, but it increased the mother’s affection for the child, and the baby was thought to be morally, as well as physically, influenced by the milk it drank and the milk’s provider: breast-milk was explained as a further transformation of the blood which had gone to form the embryo. Mothers who were unwilling to breast-feed might be blamed for laziness, indifference, or vanity about their breasts. But wet-nursing was a standard practice. The Greek and Latin words for ‘nurse’ (*tithḗ*, *trophos*; *nutrix*) have the primary meaning of someone who feeds the child; the bond between nurse and nursling was acknowledged to be strong and is often commemorated in inscriptions. There has been extensive recent discussion on the psychological effects of shared child-rearing.

Soranus (*Gyn.* 2. 11. 18) prefers that the mother should breast-feed, but advises the use of a wet-nurse if the mother is ill or may become exhausted. He recommends giving boiled honey (the equivalent of glucose) with or without goat’s milk (which is closest in composition to human milk) for the first two days of a newborn’s life, then, if possible, using a wet-nurse until the mother’s body has stabilized after *childbirth and her milk is less heavy. (The manuscripts have the figure twenty for the number of days this takes; some editors correct to three.) Soranus notes that some doctors think breast-feeding should start at once. He devotes several chapters (2. 12. 19–15. 29) to the choice of a wet-nurse, explaining how to test her milk and to ensure that she leads a healthy life: in particular, she should not drink *wine, which affects the milk as well as making her incapable. He envisages a wet-nurse who lives in the household, and recommends employing several so that the child is not dependent on one. At 2. 17. 36–40 Soranus gives detailed instructions on how and when to feed the child: he does not approve of feeding on demand, but does not specify the number of feeds per day; 2. 21. 46–8, on weaning, suggests that the child will not be ready for solid food before the sixth month, or for complete weaning until the third or fourth half-year when the teeth can deal with food; the majority of wet-nursing contracts from Egypt (see below) also envisage breast-feeding for two years. In the section on childbirth, 2. 5. 7–8 offers treatments for engorged breasts

and for suppressing lactation in women who do not intend to breast-feed. Plutarch (*Mor.* 609e) praises his wife for undergoing surgery to her nipple so that she could continue nursing. Some folk remedies for breast problems are included in Pliny's *Natural History* (28. 77. 250; 30. 45. 131).

Because breast-milk was explained as a transformation of surplus blood, which would otherwise be shed in menstruation or used in the growth of an embryo, nursing women were advised (Sor. 2. 12. 19) to abstain from sexual activity: even if they did not become pregnant, intercourse might stimulate menstruation, and would in any case cause disturbance to the milk and the nursling. The contraceptive effect of lactation was thus reinforced. One motive for not breast-feeding may have been the mother's wish for more children.

Contracts with wet-nurses, which survive from Egypt, set out the rules of life which the wet-nurse must follow to safeguard her milk supply. Wages were low in comparison with those of a trained weaver, but the total cost of hiring a wet-nurse, for instance to rear a foundling child, was a large investment. Contracts include provision for the return of wages, and further penalty clauses, if the child dies or the nurse becomes unable to feed. The wet-nurse in these contracts may be free-born and living outside the household (if so, she must make regular visits for the child to be inspected), or may be a slave hired from another owner. Within households, slave mothers may have been obliged to hand over children to a wet-nurse so that they could return to work.

Several Greek deities have a title *Kourotrophos*, meaning 'concerned with child-rearing', but no Greek or Roman goddess is specifically concerned with lactation and there are few examples in art of the 'nursing goddess'.
EGC

bribery, Greek Much Greek vocabulary for bribery is neutral ('persuade by gifts/money', 'receiving gifts'), although pejorative terms like 'gift-swallowing' are found as early as Hesiod (*Op.* 37 ff.). Attic tragedy contains accusations of bribery against e.g. seers like Tiresias (Soph. *OT* 380 ff.); Thucydides' *Pericles (2. 60. 5, cf. 65. 8) finds it necessary to say that he has *not* taken bribes; clearly the normal expectation was that politicians did. Accusations of bribery are frequent in 4th-cent. orators, partly because you had to prove bribery in order to make a treason accusation (*eisangelia*) stick: Hyperides 4. 29 f. Hyperides 5. 24 f. (with D. Whitehead's comm., 2000) implies an Athenian distinction between bribes taken for and against the state's interests; the latter type have been called 'catapolitical' (Harvey; but see H. Wankel, *ZPE* 85 (1991), 34 ff.). See also CORRUPTION. SH

bribery, Roman Latin *ambitus*, a 'going round', is related to *ambitio*, the pursuit of public office, but always, unlike *ambitio*, denotes reprehensible activity which has been declared illegal.

Specifically it refers to obtaining electoral support (see ELECTIONS AND VOTING (Roman)) through gifts, favours, or the promise of these. According to *Polybius, the Romans had made the manifest use of money to buy votes a capital offence, but we have no other evidence for this in the last two centuries of the republic (the early books of Livy refer to laws in 432, 358, and 314 BC, the last two of which at least may have some historical substance). In 181 BC a *lex Cornelia Baebia* instituted a system of non-capital trials, which was developed in the late republic by further laws about *ambitus* and related matters—the use of bribery agents, associations, and expenditure on public dinners. These laws seem to have been a response to greater competition for office. However, Roman tradition did not discourage the cultivation of voters through material benefits (see especially the *Commentariolum petitionis* and Cic. *Mur.*). What established politicians disliked was the stealing of votes by new men (a *novus homo* was, roughly, the first man of his family to reach the senate or consulship) who outbid former patrons and the damage this caused to traditional claims of *patronage. In the late republic the distortion of politics by massive expenditure became scandalous in spite of the new legislation. Under the Principate, in so far as genuine competition for office persisted, *ambitus* remained an issue both in Rome and, perhaps more importantly, in the municipalities throughout the empire. The fact that penalties do not seem to have been very severe (Suet. *Aug.* 40. 1) suggests toleration of traditional behaviour. See also CORRUPTION. AWL

brigandage (Gk. *lēsteia*, Lat. *latrocinium*), the unlawful use of personal violence to maraud by land, was not condemned wholesale by the Classical Greeks. A carry-over from pre-state times, it remained a respectable occupation among some communities (Thuc. 1. 5). In the 3rd cent. BC central Greece was dominated by the Aetolians, whose confederacy protected, indeed quasi-institutionalized, their traditional way of life as bandits and pirates. As with Aetolia, brigandage was particularly prevalent in geographically more marginal zones, especially uplands, over which even the ancient empires exercised only nominal control (in the heart of the Persian empire, note the Uxii, Arr. *Anab.* 3. 17. 1; Isauria is the classic Roman case), and where pastoral mobility (see NOMADS) facilitated illegal behaviour. With the Roman state's claim to the monopoly of force, *latrocinium* acquired a wider semantic range than modern

'brigandage' (it included e.g. 'feuding' and 'raiding'). The urban populations saw brigandage as such as an all-pervasive threat beyond the city gates (this was true even in Italy at the height of empire). In its attempts to control bandits (never permanently successful, not least because they often had the support of élite landowners), the Roman state relied on the army, including the occasional all-out campaign (as by Augustus in the Alps: Strabo 4. 6. 6), more usually on the uncoordinated efforts of local police and vigilantes (western cities had their *viatores*, 'road patrols', eastern ones their *diognitai* commanded by irenarchs, lit. 'peacekeepers'), backed up by the most brutal forms of exemplary punishment of culprits. Whether antiquity knew the phenomenon of the 'social bandit' (E. Hobsbawm, *Bandits*, 2nd edn. (1985)) is debated, although the admiring tales attached to a few 'super-brigands' (Iulius Maternus; Bulla Felix) suggest the ideological appeal of such a type. See PIRACY.

AJSS

Britain, Roman (see facing page)

Brutus (Marcus Iunius Brutus), son of another Marcus Iunius Brutus and of Servilia, born (probably) 85 BC, was adopted by his uncle (?) Quintus Servilius Caepio by 59 and was henceforth called Quintus Caepio Brutus. Brought up by *Cato the Younger, he was educated in oratory and philosophy and long retained a fierce hatred for his father's murderer *Pompey. In 58 he accompanied Cato to *Cyprus and in 56 lent a large sum to Salamis at 48 per cent interest p.a., contrary to the *lex Gabinia*, procuring a senate decree to validate the loan. As moneyer (perhaps 55) he issued coins showing *Libertas* (*freedom) and portraits of his ancestors Lucius Iunius Brutus (who overthrew *Tarquinius Superbus) and Gaius Servilius Ahala, the tyrannicide (*RRC* 433). As quaestor 53 he went to Cilicia with Appius Claudius Pulcher, whose daughter he had married, and there lent King Ariobarzanes I a large sum, probably to enable him to pay interest on his huge debt to Pompey. When *Cicero succeeded Appius, he found that an agent of Brutus had been made prefect of cavalry to extort money from Salamis and that five Salaminian senators had been killed. He cancelled the appointment, but to avoid offence to Brutus gave a similar post to Brutus' agent in Cappadocia and recognized the validity of the loan to Salamis (*Cic. Att.* 5. 21–6. 1). In 52 Brutus defended Titus Annius Milo and in a pamphlet attacked Pompey's wish for a dictatorship, but in 50 they both defended Appius against Publius Cornelius Dolabella, and in 49 he joined the republican cause and was formally reconciled with Pompey. After the battle of Pharsalus he successfully begged Caesar for pardon and, no doubt through Servilia's influence, became one of his

protégés. He was made a pontifex (a member of one of the four major colleges of the Roman priesthood: see PRIESTS (GREEK AND ROMAN)) and in 47 sent to govern Cisalpine Gaul, while Caesar went to Africa to fight Cato and the republicans. During this time he developed relations with Cicero, who dedicated various philosophical and rhetorical works to him and, at his request, wrote an eulogy of Cato after Cato's death. (Finding it unsatisfactory, Brutus wrote one himself.) Although he now divorced Claudia and married Cato's daughter Porcia, widow of Marcus Calpurnius Bibulus, he remained on good terms with Caesar, met him on his return from Munda, assured Cicero of Caesar's laudable optimate intentions, and was made *praetor urbanus* (urban praetor) for 44 and designated consul for 41. But when Caesar became *dictator perpetuo* ('perpetual *dictator': February 44), Brutus, reminded of his heritage, joined, and *ex officio* took the lead in, the widespread conspiracy that led to Caesar's assassination before his departure for his Parthian War. Outmanoeuvred by Mark *Antony, whose life he had spared on the Ides of March, he and Cassius (Gaius Cassius Longinus) had to leave Rome and, failing to win popular approval, left Italy for Greece (August 44). With Antony now openly against them, Brutus collected close to 400 million sesterces from the treasuries of Asia and Syria and confiscated the supplies Caesar had prepared for his campaign. He and Cassius gradually seized all the eastern provinces, building up large armies, partly of veterans. When Cicero, in his *Philippics*, swung the senate behind them, they received **imperium maius* in the east. Brutus captured, and later executed, Antony's brother Gaius Antonius; after Publius Cornelius Dolabella's death he acquired Asia and completed its conquest, and during 43 and 42 squeezed it dry for his armies. The money was turned into a large coinage (*RRC* 500–8) and Brutus, alone among the republicans, put his own head on one of the gold coins. He also won the title of *imperator* in Thrace. In 42 he and Cassius, with about 80,000 legionaries plus auxiliaries, twice met Antony and Octavian at Philippi. In the first battle Cassius, defeated by Antony, committed suicide, while Brutus impressively defeated Octavian. In a second battle, forced on Brutus, he was defeated, deserted by his soldiers, and also committed suicide. His body was honourably treated by Antony.

Arrogant, rapacious, calculatingly ambitious, Brutus yet professed a deep attachment to philosophy. Cicero admired but never liked him, and ignored his warnings not to trust Octavian. A renowned orator, with an austere and dignified style, he despised Cicero's as 'effeminate and spineless' (*Tac. Dial.* 18. 5). His literary works (philosophy, historical epitomes, poetry) are lost, as are his letters,

[continued on p. 139]

ROMAN BRITAIN

Britain, Roman (see ◀Map 5, Ba▶), the province of Britannia. The oldest name of the island known to us is Albion; the earliest form of the present name, *Prettania*, was used by the Greeks. The Latin *Britannia* was in use by the 1st cent. BC. It has no direct Celtic origin and is probably a Latin abstraction from an earlier form.

The iron age communities of Britain showed a variety of social organization, although all were agrarian peoples organized into tribal territories dominated by a range of enclosed settlement sites. Many were agriculturally sophisticated and had developed an impressive Celtic art style. The peoples of the south-east had a long history of shared culture with northern Gaul. The islands were known to the Mediterranean world from at least the 3rd cent. BC. After 120 BC, as trading contacts between Transalpine Gaul and areas to the north intensified, Britain began to receive goods such as wine amphorae, and Gallo-Belgic coinage was introduced. Close political contacts with northern Gaul provided the pretext for *Caesar's expeditions in 55 and 54 BC and the context for the migration of the Belgae to Britain which he mentions (*B Gall.* 5. 12). His campaigns did not result in conquest although he imposed tribute on King Cassivellaunus (supreme commander of the south-east Britons) before withdrawing. Contacts with the continent intensified with the *Romanization of Gaul from *Augustus onwards, and Rome maintained an interest in British affairs. Several burials of this period include luxury Roman goods probably sent as diplomatic gifts. Enhanced external contact stimulated internal political change culminating in the expansion of the Catuvellauni (the most powerful southern British tribe) who, under their king Cunobelinus, obtained territorial dominance in the south-east.

Annexation had apparently been contemplated by Augustus and *Gaius but was only achieved by *Claudius in AD 43. The army of four legions, with *auxilia*, quickly overran the territory of the Catuvellauni, with a set-piece battle at Camulodunum (Colchester). The army then moved west and north so that by the time of the revolt of Boudicca, queen of the Iceni in East Anglia (AD 60/1), the lowlands south of the Trent and much of Wales were held. Romanization was under way and towns were well established at *Londinium (London), Verulamium (St Albans), and Colchester. The revolt was crushed but territorial expansion slowed for perhaps a decade. A succession of able Flavian governors enlarged the province by completing the conquest of Wales and pushing into Scotland. The last of these, Gnaeus Iulius Agricola (c.AD 77/8–83/4), advanced far into Scotland and defeated the Caledonians in a great battle at Mons Graupius. Its location is unknown but camps associated with his campaigns have been identified as far north as

Britain, Roman This collection of church silver from Water Newton (probably c. AD 300) may well be the earliest of its kind. The inscriptions on some pieces reveal the patronage of wealthy women donors. The extent of *Christianity's acceptance in 4th-cent. Britain, however, is disputed. © The Trustees of the British Museum

the Moray Firth. After his withdrawal the rest of Scotland remained unconquered and there began a gradual retreat, eventually to the Tyne–Solway line (by the period of Trajan). The Stanegate road which marked this line became a *de facto* frontier until the construction of the *wall of Hadrian from c.AD 122. Although Scotland was again occupied first in the period c.139–64, when the wall of Antoninus was the frontier, and then during *Septimius Severus' campaigns of 208–11, it was never successfully incorporated, and Hadrian's Wall remained the effective permanent frontier of the province.

Britain was an imperial province which contained a very substantial military garrison throughout the Principate. In the 2nd cent. the army comprised three legions—II Augusta at Isca (Caerleon), XX Valeria Victrix at Deva (Chester), and VI Victrix at Eboracum (York)—and perhaps 75 auxiliary units. These were predominantly based in the north and Wales and brought considerable wealth to these regions, which nevertheless remained less Romanized than areas to the south and east.

Local government was based on the Gallic cantonal system, with the following sixteen *civitates* (civic communities) known: the Brigantes (capital at Aldborough), Parisi (Brough-on-Humber), Silures (Caerwent), Icenii (Caistor-by-Norwich), Cantiaci (Canterbury), Carvetii (Carlisle ?), Demetae (Carmarthen), Reg(i)ni (Chichester), Dobunni (Cirencester), Durotriges (Dorchester, Dorset, and also later Ilchester), Dumnonii (Exeter), Corieltauvi (Leicester), Catuvellauni (Verulamium/St Albans), Atrebates (Silchester), Belgae (Winchester), and Cornovii (Wroxeter). In addition there were four *coloniae* (Roman colonies) at Colchester (founded AD 49), Lindum (Lincoln, 90–6), Glevum (Gloucester, 96–8), and York (early 3rd cent.), together with Londinium which, although the provincial capital, is of uncertain status. The *civitates* were large and as many as seventy lesser urban centres served the countryside away from the principal towns. Although relatively large, none of the towns was well provided with public buildings. Most of those known are of later 1st- and 2nd-cent. date. During the 2nd and 3rd cents. most towns (including the lesser centres) were provided with defences, although there is debate over why these were built. In the 4th cent. the principal towns continued to be occupied but they became characteristically residential rather than productive centres. Although important as defended locations, none of them survived with urban characteristics for long into the 5th cent.

The single province of the Principate, governed from London, was divided in the early 3rd cent. into Upper (with its capital at London) and Lower (capital York). A further subdivision into four provinces (Maxima Caesariensis, capital London; Flavia Caesariensis, capital Lincoln; Britannia Prima, capital Cirencester; and Secunda, capital York) took place under Diocletian. Valentia, known in northern Britain in the 4th cent., was probably the result of a further division of Secunda, although its location remains obscure.

The countryside was already extensively farmed before the conquest and agriculture remained the mainstay of the province with perhaps 90 per cent of the late Roman population of about 3.6 million living rurally. Most of these people continued to inhabit traditional farmsteads with only about one in a hundred sites becoming a *villa. Villa-building began soon after the conquest and continued steadily through the 2nd and 3rd cents. with a peak in both numbers and opulence during the 4th cent. The villas were generally modest by Mediterranean standards and most developed piecemeal through the aggrandizement of existing houses. *Mosaics were common by the 4th cent. and there is abundant evidence for the existence of a wealthy, rurally based aristocracy in southern Britain.

Other economic activities known from archaeology show growth to a peak of prosperity during the 4th cent. Metal extraction (for gold, silver, and lead) began very soon after the conquest but did not become dominant. Local craft-based production was widespread, its success attested by the very abundant collections of objects found on most settlements. In the early empire there was great dependence on other provinces for the supply of consumer goods, imported initially through the military supply networks. Later local production grew to sustain the bulk of the province's needs and very substantial manufactories for items like pottery developed, especially in rural locations in the south and east (*see* POTTERY, ROMAN). None of these, however, became major exporters to other provinces.

Art and culture in Britain developed as a hybrid of Celtic and classical features. The religions of the Mediterranean spread to Britain with the army and administrators, but the Celtic gods were worshipped across most of the province. However, they took on new forms, with the increased use of Romano-Celtic styles of temple architecture (first found at the end of the iron age) and the adoption of Latin epigraphy on altars and dedications. Particular gods are associated with certain regions and *civitates*. Many soldiers also adopted Celtic gods whom they identified with gods of the Roman pantheon. Christianity is found throughout the province in the 4th cent., although the extent of its acceptance is disputed. In art new materials (especially stone sculpture and mosaic) supplanted the metalwork used in the iron age La Tène styles. Not all the results are aesthetically pleasing today but some mosaics show an innovatory blend of ideas. Latin was widely adopted, although a study of the graffiti illustrates that writing was most used on military and urban sites (*see* VINDOLANDA TABLETS).

During the later empire Britain enjoyed relative peace compared with other provinces. A series of usurpers emerged from the province, Albinus (193–6), Carausius (286–93), Allectus (293–7), Magnus Maximus (383–8), and Constantine III (407). Problems with raiders from across the North Sea may have led to the piecemeal construction of the Saxon Shore forts from the middle of the 3rd cent. onwards. These and other coastal installations in the north and in Wales hint at increasing military threats, although the continued use of the traditional style of garrisons on Hadrian's Wall, combined with the general absence of the late Roman field army, implies that there were few serious military problems. In 367 there were concerted barbarian attacks from the north, which necessitated a military campaign, although the account by *Ammianus Marcellinus probably exaggerated these events. There is little else to suggest any serious military threats until early in the 5th cent. By then the depleted British garrison could not cope and the more pressing threats to Rome herself prevented aid from being sent. Britain, left to defend herself, gradually fell to the Saxons.

MJM

except for a few surviving among Cicero's. With Cassius, he was officially condemned under the empire, but revered by many as the last defender of Roman freedom. EB

Byzantium (see ◀ Map 1, Ea ▶), a famous city on the European side of the south end of the Bosphorus, between the Golden Horn and the Propontis (mod. sea of Marmara). The Greek city occupied only the eastern tip of the promontory, in the area now covered by the Byzantine and Ottoman palaces of Constantinople/Istanbul. The evidence of cults and institutions confirms the claim of the city of Megara (between Athens and Corinth) to be the main founders, but groups from the Peloponnese and central Greece probably also participated in the original colony, which is to be dated 668 (Hdt. 4. 144) or 659 BC (Euseb. *Chron.*). Little material earlier than the late 7th cent. has yet emerged from excavations. Except during the *Ionian Revolt the city was under Persian control from *Darius I's Scythian expedition until 478. In the Athenian empire (see DELIAN LEAGUE) it paid fifteen talents' tribute or more, deriving its wealth from tuna fishing and from tolls levied on passing ships. The city also had an extensive territory not only in European Thrace (roughly mod. Bulgaria) but also in Bithynia and Mysia in NW Asia Minor. It revolted from Athens in 440–39 and 411–408. Although under

Spartan control after the battle of Aegospotami (405) alliance coins show that it joined the anti-Spartan sea league formed after the battle of Cnidus in 394. It became a formal ally of Athens from c.378 to 357 and also when resisting *Philip II of Macedon in the siege of 340–39. The goddess Hecate is supposed to have helped the besieged on this occasion and her symbols, the crescent and star (later adopted as the emblem of the Turkish state), appear on the city coinage. It suffered from the attacks and exactions of the Galatians in the 270s but picked the winning side in Rome's Macedonian wars in the 2nd cent. BC. Byzantium's strategic position enabled it to enjoy privileged status under the Roman empire, which did not, however, protect the city from the depredations of passing armies and rapacious officials. All privileges were lost when it supported Pescennius Niger against *Septimius Severus, and fell after a two-year siege (AD 193–5; *Cassius Dio, 75. 12. 1, gives a brilliant although exaggerated account). Severus reduced Byzantium to village-status and caused much destruction, but rebuilding soon followed and traces of the subsequent Severan restoration have been archaeologically identified. *Constantine I refounded Byzantium as New Rome, Constantinople, on 11 May 330, extending its bounds to new city walls and adorning it with magnificent new buildings.

C

Caesar, Julius (see page 142)

cakes (flour-based sweetmeats or fancy breads) were given many names in Greek and Latin, of which the most general were *pemmata*, *popana* in Greek, *liba* (sacrificial cakes), and *placentae* (from Greek *plakountes*) in Latin. The Greeks especially had a vast number of different kinds, and several monographs were written on the subject (on these see Ath. 3. 109b–116a, 14. 643e–648c; Poll. 6. 72 ff.). Most were regarded as a luxurious delicacy, to be eaten with fruit after the main course at a special meal. Cakes were also very commonly used in *sacrifice, either as a peripheral accompaniment to the animal victim or as a bloodless sacrifice. Sacrificial cakes very often had a special form characteristic of the relevant divinity or rite; among the more spectacular examples are the Attic amphiphōn, stuck with lights and offered to *Artemis on the full-moon day, or the Sicilian *mullos*, shaped like female genitals and offered to the Two Goddesses, *Demeter and *Persephone.

EKE

Caligula, Roman emperor. See GAIUS.

Callimachus, of *Cyrene, Greek poet and scholar, ‘Battiades’ (*Epigr.* 35), i.e. son (or descendant?) of Battus; his grandfather was a general (*Epigr.* 21). He flourished under *Ptolemy II (285–246 BC) and continued into the reign of Ptolemy III (*Suda*); he mentions the Celtic invasion of 279 (*Hymn* 4. 171 ff.; fr. 379); the marriage (c.275) and apotheosis (270? 268?) of Arsinoë II Philadelphus (frs. 392, 228); and the Laodicean War of 246/5 (fr. 110). Other work for Berenice II, wife of Ptolemy III (*Epigr.* 51?, frs. 387–8, *Suppl. Hell.* 254 ff.), and perhaps the *Victory of Sosibius* (fr. 384), belong to the same late period. Callimachus stood close to the Alexandrian court; it may be accident that we have no works datable between Arsinoë’s death and the accession of Berenice (herself a princess of Cyrene).

Callimachus was credited with more than 800 books (*Suda*). Michael Choniates, c.AD 1200, may still have

possessed copies of *Aetia* and *Hecale*. But, apart from the six hymns and some sixty epigrams, and a selection from the prose *Paradoxa* (fr. 407), only fragments now survive. The Milan *Diegeseis*, a papyrus of c.AD 100, contains summaries of the poems, in the order *Aetia*, *Iambi*, *Lyrice*, *Hecale*, *Hymns*.

Works

1. *Aetia*, in four books (some 4,000 lines in all?): a miscellany of elegiac pieces, from extended epigrams (fr. 64, on the tomb of *Simonides; fr. 114, on the Delian statue of *Apollo) to narratives of 100–200 lines (frs. 67–75, Acontius and Cydippe; *Suppl. Hell.* 254–69, *Victory of Berenice*). The common subject is ‘origins’: the origins in myth or history of Greek cults, festivals, cities, and the like. Episodes are chosen and rehearsed with antiquarian relish. In the ‘prologue’ (fr. 1) the poet answers the critics who complain that he does not compose a ‘continuous poem’ on the deeds of kings or heroes: poetry should be judged by art, not quantity; Apollo recommended the slender Muse, the untrodden paths; better be the cicada than the braying mule. Like *Hesiod, he had met the *Muses, in a dream, and they related the *Aetia* to him (fr. 2). Books 1 and 2 were structured, at least in part, by a dialogue between the poet-researcher and the Muses; books 3 and 4 are framed by the substantial court-poems *Victory of Berenice* and *Lock of Berenice*. Within books, poems may be grouped thematically. The ‘epilogue’ (fr. 112) recalls Hesiod’s meeting with the Muses; and leads over to the ‘pedestrian field of the Muses’, i.e. (probably) to the *Iambi*. It is generally (but controversially) argued that the *Aetia* went through two editions: the poet in old age added ‘prologue’ and ‘epilogue’, and perhaps books 3–4 entire.

2. *Iambi*: thirteen poems, written in scazons or other iambic metres. In the first, Hipponax speaks, returned from the dead; in the last, the poet names Hipponax as the exemplar of the genre. Personal invective (1–5), and the fable (2, 4), play their part, as in the traditional

cakes Ceramic cakes in *likna* (winnowing baskets), left as offerings in the sanctuary of *Demeter and Kore at Corinth. They imitate the real-life cakes accompanying Greek *sacrifice. (The right-hand object was stolen from the Corinth Museum in 1990 and is as yet unrecovered.) American School of Classical Studies at Athens, Corinth Excavations. Photo: E. Seraf

iambus. But these poems range much wider: 6 (the statue of *Zeus at *Olympia) reads as an epodic epigram, 8 as an iambic epinician; 7–11 record various *aitia*; 12 celebrates a birth. The framing poems continue literary polemic: in 1 against quarrelling scholars, in 13 against those who think that an author should confine himself to a single genre.

3. Miscellaneous poems include the lyric *Apotheosis of Arsinoë* (fr. 228), and the elegiac epinician for Sosibius (fr. 384).

4. *Hecale*, a hexameter narrative of something over 1,000 lines. *Theseus leaves Athens secretly to face the bull of Marathon; a storm breaks; he takes shelter in the cottage of the aged Hecale; he leaves at dawn and subdues the bull; he returns to Hecale, finds her dead, and founds the deme (country district) of Hecale and the sanctuary of Zeus Hekaleios in her memory. This heroic (but not Homeric) material was deviously elaborated, with Hecale rather than Theseus at the centre. The scene of rustic hospitality became famous; talking birds diversify the narrative; the action ends in another *aition*, perhaps drawn from the *Atthis*.

5. The *Hymns* reanimate the traditional (Homeric) form, but with no view to performance. The hymns to Zeus, *Artemis, and *Delos (nos. 1, 3, 4) elaborate the god's birth and virtues with quizzical learning and virtuoso invention. Those to Apollo (no. 2), *Athena (no. 5), and *Demeter (no. 6) are framed as dramas, in which the narrator-celebrant draws the hearer into an imagined

ritual; 6 (Doric hexameters) and still more 5 (Doric elegiacs) deliberately cross generic boundaries (*see* GENRE).

6. The *Epigrams* (a selection preserved in Meleager's anthology) cover the full range of literary, erotic, dedicatory, and sepulchral themes; scattered fragments (frs. 393–402) hint at more.

7. Callimachus wrote prose works on nymphs; on athletic contests (*see* GAMES); on the foundation of islands and cities; on winds, on rivers, on 'marvels', and on birds; on 'barbarian customs' and on local names of fish and of months. He was among the founders of lexicography and paradoxography (descriptions of marvels). The *Pinakes* ('Tables of Those who have Distinguished themselves in Every Form of Culture and of What they Wrote') presented, in 120 books, a bibliography of Greek literature and a catalogue of the Alexandrian *library, organized by subject ('rhetoric', 'laws', 'miscellaneous prose'); they included some biographical notes, and cited the first line of each work, and the number of lines. Callimachus also 'arranged' the poems of *Pindar and *Bacchylides (fr. 450, *Suppl. Hell.* 293).

Callimachus often states his preferences in poetry and among poets. He defends shorter (and discontinuous) poems (fr. 1), the small drop from the pure spring (*Hymn* 2. 107 ff.), diversity of genre (*polueidia*) (fr. 203); 'a big book equals a big evil' (fr. 465), 'slim' poetry (fr. 1. 24) is better than 'thick' (fr. 398). This 'new' aesthetic (which might seem less novel if we had the

[continued on p. 146]

JULIUS CAESAR

Caesar, Julius (Gaius Iulius Caesar), son of another Gaius Iulius Caesar and of Aurelia, born 100 BC (Suet. *Iul.* 88. 1) on 12 Quintilis, the month soon after his death renamed Iulius by a law passed by the consul Mark *Antony, quoted by Macrobius, *Sat.* 1. 12. 34, which incidentally secures the actual date. Through his aunt Julia's marriage to Gaius *Marius he was Marius' nephew, and he was related to Lucius Iulius Caesar and to Gaius Iulius Caesar Strabo Vopiscus. When his father withdrew from Rome, he remained behind, and Lucius Cornelius Cinna, as consul, gave him his daughter Cornelia in marriage and then appointed him *flamen Dialis*. It was a position of the highest distinction, but because of its ritual restrictions, normally precluded an official career. He probably thought that Caesar would share his father's lack of political ambition. *Sulla, after his victory in the civil war, annulled all of Cinna's measures, including Caesar's appointment. Caesar refused to resign or to divorce his wife, but Sulla spared his life, probably because he was a fellow Patrician. (Cf. Lucius Cornelius Scipio Asiagenus, whom he allowed to escape to Massilia, even though he had broken a treaty with him: see Broughton, *MRR* 3. 71.) Caesar's refusal left the office in abeyance until the time of Augustus, although Caesar soon broke the ritual restrictions for the sake of a career. Not feeling at home in post-Sullan Rome, where he failed to convict two notorious Sullani (Gnaeus Cornelius Dolabella and Gaius Antonius) though his speeches in the prosecutions laid the foundation of his fame as an orator, he left for Asia, where he spent the greater part of the 70s, pursuing his studies and gaining a reputation as a soldier. He won a victory over a small advance guard of *Mithradates VI, and an act of singular bravery won him the *corona ciuica*, the Roman equivalent of the Victoria Cross. In 73 he was co-opted a pontifex (a member of one of the four major colleges of the Roman priesthood: see PRIESTS (GREEK AND ROMAN)), largely through his family connections. This appointment restored his *dignitas* (personal honour) and allowed him to resume what he felt was his proper place in Rome. He was at once elected a military tribune. Staying in Rome, he used the office to support amnesty for the associates of Marcus Aemilius Lepidus and he won election as quaestor for 69.

Before going to his province of Further Spain, he lost both his aunt Julia and his wife. He conducted their funerals in the grand aristocratic manner, stressing his aunt's (and thus partly his own) descent from kings and gods (Suet. *Iul.* 6. 1) and, for the first time since Sulla, displaying Marius' *imago* (wax funerary mask) and distinctions in public. (He no doubt similarly displayed Cinna's at Cornelia's funeral.) On his return from Spain he found the Latin colonies beyond the Po (Padus) vigorously demanding Roman citizenship and supported their agitation, but did nothing to further their cause in Rome. He supported the laws of Aulus Gabinius and Gaius Manilius, conferring extraordinary commands on *Pompey (clearly a most useful patron), and he married Pompeia, a granddaughter of Sulla. With Pompey overseas, he courted another powerful ex-Sullan, *Crassus, Pompey's enemy, joining him in various political schemes in return for financial support, which enabled Caesar to spend large sums as curator of the via Appia and as aedile (65). In 64, in charge of the murder court, he resumed his vendetta against Sulla by offering to receive prosecutions of men who had killed citizens in Sulla's proscription.

In 63 Quintus Caecilius Metellus Pius' death left the chief pontificate vacant, a post normally held by eminent ex-consuls. Although two (Publius Servilius Isauricus, to whom Caesar was bound in loyalty as to his old commander in Cilicia, and Quintus Lutatius Catulus) sought the office, Caesar announced his candidacy and through lavish bribery won the election. This and his election to a praetorship for 62 established him as a man of power and importance. He supported *Catiline, who advocated a welcome cancellation of debts, but covered his tracks when Catiline turned to conspiracy. The consul *Cicero, who to the end of his days was convinced of Caesar's involvement, had to proclaim his innocence. In his prosecution of Gaius Rabirius he left the legality of the so-called *senatus consultum ultimum* ('ultimate' i.e. emergency decree of the senate) in doubt, and when Cicero wanted the death penalty under that decree for the conspirators betrayed by the Allobrogan envoys (the Allobroges were a Gallic tribe), Caesar persuaded most senators to vote against it, until a speech by *Cato the Younger changed their minds.

As praetor he joined the tribune Quintus Caecilius Metellus Nepos in agitating for the recall of Pompey against Catiline's forces. Suspended from office, he demonstratively submitted, and the senate, eager to avoid alienating him, reinstated and thanked him. In December, when Pompeia was *ex officio* in charge of the rites of the Bona Dea, from which men were strictly excluded, Publius *Clodius Pulcher gained access disguised as a woman—it was said, in order to approach Pompeia in her husband's absence—and was ejected. Caesar, while asserting the innocence of Clodius

(a man congenial to him and worth cultivating) and of Pompeia, divorced her, proclaiming that his household must be free even from suspicion. With his consulship approaching, he could now seek a more advantageous marriage.

But first he had to go to his province of Further Spain. His creditors applied for an injunction to stop him from leaving, and he was saved from this unprecedented indignity by Crassus' standing surety for part of his debts: his provincial spoils would cover the rest. He now 'had to make a bigger profit in one year than Verres had in three' (W. Will, *Julius Caesar: Eine Bilanz* (1992)) and, largely neglecting his routine duties, he concentrated on attacking independent tribes. The booty enabled him to clear his debts and pay large sums into the treasury, all without incurring a risk of prosecution. About mid-60 he returned to Rome, was voted a *triumph by a co-operative senate, and prepared to claim his consulship. There was a technical obstacle: to announce his candidacy for the consulship he had to enter Rome long before the triumph could be arranged, but that would forfeit his *imperium and right to triumph. The senate was ready to give him a dispensation, but his enemy Cato, although only an ex-tribune, arranged to be asked to speak and talked the proposal out. Caesar decided to put power before glory and entered the city.

He now could not afford to lose, so he needed allies and a massive infusion of money. A brilliant stroke secured both. In his absence Pompey and Crassus had failed—partly because each had opposed the other—to obtain what they respectively wanted from the senate: ratification of Pompey's eastern settlement and land for his veterans, and a remission of part of the price offered for the title of Asia by the *publicani. Caesar, on good terms with both, persuaded them to support his candidacy: he promised to give each what he wanted without harm to the other, provided they refrained from mutual opposition. Pompey now persuaded his wealthy friend Lucius Lucceius to join Caesar in his canvass: in return for paying the expenses for bribery (no doubt with Crassus' help), he could expect to succeed through Caesar's popularity. But Caesar's enemies, led by the upright Cato, collected a huge bribery fund for Cato's son-in-law Marcus Calpurnius Bibulus, who secured second place after Caesar.

As consul Caesar appealed to the senate for co-operation in formulating the laws to satisfy his allies. Frustrated by his enemies, he passed them in the assembly by open violence, aided by friendly tribunes. Bibulus withdrew to his house, announcing that he was stopping all future meetings of the assemblies by watching the sky for omens. This unprecedented step, of doubtful legality, was ignored by Caesar, who satisfied Pompey and Crassus and went on to pass further legislation, *inter alia* on *repetundae* (extortion) and on the publication of senate debates. Pompey and Crassus, satisfied (especially) with his assuming the onus for his methods, now joined him in an open alliance (sometimes erroneously called the 'First Triumvirate'). Pompey married Julia and Caesar married Calpurnia, whose father, Lucius Calpurnius Piso Caesoninus, was made consul 58, with Pompey's aide Gabinius as colleague. For further insurance, Clodius was allowed to become a plebeian and tribune 58. Caesar's reward was a law of Vatinius, giving him Illyricum and Cisalpine Gaul for five years. The senate obligingly added Transalpine Gaul. Early in 58 attempts to prosecute Caesar were averted, and moderates in the senate attempted conciliation by offering to have his legislation re-enacted in proper form. But Caesar refused, since this would admit guilt and impair his *dignitas*. The breach between him and the senate majority thus became irreparable.

A movement by the Helvetii gave him an unforeseen chance of starting a major war, which after nearly a decade and many vicissitudes led to the conquest of the whole of Gaul. It was in Gaul that he acquired the taste and the resources for monarchy and trained the legions that could 'storm the heavens' (*BHisp.* 42. 7). Young Roman aristocrats flocked to him to make their fortunes, vast sums (sometimes made palatable as loans) flowed into the pockets of upper-class Romans and, as gifts, to cities and princes, to support Caesar's ambitions. The depleted treasury received none of the profits and was forced to pay for his legions. In his triumphs of 46 (see below) he displayed 63,000 talents of silver and spent about 20,000 of his own money (together enough to create the fortunes of 5,000 *equites), much of it booty from Gaul. Plutarch, on the basis of Caesar's figures, reports that a million Gauls were killed and another million enslaved. Requisitions of food and punitive devastations completed a human, economic, and ecological disaster probably unequalled until the conquest of the Americas.

In Rome Caesar's position remained secure until 56, when his bitter enemy Lucius Domitius Ahenobarbus, confident of becoming consul 55, promised to recall and prosecute him, and Cicero, back from exile, hoped to detach Pompey from him. Crassus informed him of what was going on, and they summoned Pompey to Luca, where he was persuaded to renew the compact. Pompey and Crassus became consuls 55, receiving Spain and Syria respectively for five years, while Caesar's command was renewed for five years in Gaul; Pompey was to stay near Rome to look after their interests, governing Spain through *legati* (legates). But the alliance soon disintegrated. Julia died (54) and Crassus, attacking *Parthia, was killed at Carrhae (53). In 52 Pompey married a daughter of Caesar's enemy Quintus Caecilius Metellus Pius Scipio and made him his colleague as consul. Caesar now secured legal authorization to stand

for a consulship in absence in 49; but the legality of this became doubtful, and his claim that it included the right to retain *imperium* (hence immunity from prosecution) was denied by his enemies. (The legal position is obscured by partisan distortion.) Pompey was gradually (perhaps reluctantly) forced to co-operate with them, to avoid a consulship by Caesar in 48, which would have left him irreversibly at Caesar's mercy. In 49 Caesar invaded Italy and started a civil war, nominally to defend the rights of tribunes who had been forced to flee to him for protection, but in fact, as he later admitted (Suet. *Iul.* 30. 4), to escape conviction and exile.

He rapidly overran Italy, where there were no reliable veteran legions to oppose him. As he moved down the peninsula, he kept making specious peace offers, retailed with considerable distortion in book 1 of his *Civil War*. Ahenobarbus was forced to surrender at Corfinium. He was allowed to depart unharmed and to continue the war against Caesar—the first conspicuous example of Caesar's 'clemency', a quality on which he particularly prided himself. (It was of course limited to Roman citizens: see on the victims of his Gallic War above.) Among the honours voted to him in 44 was a temple to *Clementia Caesaris*. See esp. the coin of (probably) 44, with the legend *CLEMENTIAE CAESARIS* (*RRC* 480, no. 21) with Crawford's commentary pp. 494–5, stressing the connection with the title *PARENS PATRIAE* on coins in the same series and citing the literary sources. (The series ends with a portrait of the consul Mark Antony, who passed the law changing the name of the month *Quintilis* to *Iulius*: see above.) Syme has pointed out that Caesar's *clementia* was not a virtue acceptable to Roman aristocrats, for it implies the superiority of the one offering it to the one receiving it (R. Syme, *The Roman Revolution* (1939)).

Pompey, knowing that Italy was untenable, to the chagrin of his aristocratic supporters crossed to Greece, hoping to strangle Italy by encirclement. Caesar broke it by defeating Pompey's *legati* in a brilliant campaign in Spain and then taking Massalia (Marseilles). In 48 he crossed to Greece, though Pompey controlled the seas, and besieged him at Dyrrhachium. A tactical defeat there turned into *de facto* strategic victory when Pompey withdrew to Thessaly, where both sides received reinforcements. Persuaded, against his better judgement, to offer battle at Pharsalus, Pompey was decisively defeated, escaped to Egypt and was killed. Caesar, arriving there in pursuit, intervened in a domestic conflict over the kingship and was cut off for months in Alexandria, until extricated by troops from Asia Minor and a Jewish force under Antipater. He spent three more months in Egypt, chiefly with *Cleopatra VII, whom he established on the throne and who after his departure bore a son whom she named Ptolemy Caesar. Then, moving rapidly through Syria and Asia Minor, he reorganized the eastern provinces, easily defeated Pharnaces II at Zela, and in September 47 returned to Italy. There he had to settle an army mutiny and serious social unrest, fanned during his absence by Marcus Caelius Rufus and Titus Annius Milo and after their death by Publius Cornelius Dolabella.

Meanwhile the republican forces had had time to entrench themselves in Africa, where Metellus Scipio assumed command, aided by Juba I. Caesar landed in December. After an inauspicious beginning he gained the support of Bocchus II and Publius Sittius and, deliberately inviting blockade at Thapsus, won a decisive victory that led to the death of most of the republican leaders (including Scipio and Cato). On his return he was voted unprecedented honours and celebrated four splendid triumphs (20 September–1 October 46), nominally over foreign enemies, to mark the end of the wars and the beginning of reconstruction. But Gnaeus Pompeius Magnus (Pompey's son), soon joined by his brother Sextus Pompeius and Titus Labienus, consul for the second time, raised thirteen legions in Spain and secured much native support. In November Caesar hurriedly left Rome to meet the threat. The Pompeians were forced to offer battle at Munda (near Urso) and were annihilated with the loss of 30,000 men in Caesar's hardest-fought battle. After reorganizing Spain, with massive *colonization, he returned to Rome and celebrated a triumph over 'Spain'.

Caesar was renowned for his love affairs, especially with aristocratic married women. Suetonius (*Iul.* 50. 1) names four and notes that the only woman he really loved (apart from Cleopatra, treated later) was Servilia. Popular rumour freely embroidered: e.g. that Servilia had prostituted her daughter Iunia Tertia to Caesar for the sake of a reduction in the price of an estate, a rumour that was gleefully exploited by Cicero (*Iul.* 50. 2). Suetonius indicates that Caesar behaved no differently in Gaul, quoting as evidence the scurrilous verses chanted by his soldiers at his Gallic *triumph:

urbani, seruate uxores, moechum caluom adducimus.
aurum in Gallia effutuisti, hic sumpsisti mutuom.

(Men of Rome, look after your wives: we are bringing a bald adulterer with us./You whored away your gold in Gaul and here you have had to borrow.) Suetonius found no details, but the soldiers obviously knew. To be effective, satire must be based on fact. There was a 'secret history' of the Gallic War, for Caesar's affairs must have had diplomatic, perhaps even military, consequences. Support for Caesar or opposition to him must at least in part have been affected by the Gallic chieftains whose wives were involved. Not all would necessarily have been outraged. Suetonius cites the

parallel of Bogud to show that complaisant husbands might be richly rewarded and would presumably become allied. In Rome, none of the husbands of the four ladies he names became Caesar's enemies as a result of this. Indeed, two were or became Caesar's allies, as Pompey did—after divorcing Mucia.

The other important item of information given to us by the soldiers (although of course satirically distorted) is that Caesar had to borrow money for his lavish spending after his return. His love affairs are unlikely to have been the main expense. Much was used to buy important Roman politicians, who were as venal as they had been at the time of Jugurtha and who knew their price. Young men joined him in Gaul to be *inaurati* (encased in gold), as Cicero wrote. The only reliable figure we have for what a prominent politician would cost (other amounts are variously reported) is the sum of 1,500 talents given to Lucius Aemilius Paullus, who was notably active on Caesar's behalf as cos. 50. The sum (reported by App. *BCiv.* 2. 26 and Plut. *Pomp.* 58.1), at the conventional exchange rate, yields the astonishing figure of 22½ million sesterces. How much, e.g. Gaius Scribonius Curio received, we do not know; but since the amounts were common knowledge, the figure must have been in the same range, and it changed him during his tribunate (50) from an outspoken enemy into an active supporter. Nor do we know what Paullus' brother, the later Triumvir *Lepidus was paid for his outstanding service in his praetorship, when he 'persuaded' the Senate to initiate a law allowing him, contrary to all constitutional practice, to name Caesar *dictator (Caesar, *BCiv.* 2. 21.5; cf. Plut. *Caes.* 37.1; hostile reports that there was no authorization are probably false). Caesar's expenses on distributions to soldiers and citizens, for public feasting, and for expropriation of estates were almost unimaginably enormous. (For a summary, see *Gnomon* 62, 1990, 30–31.) He may also have paid for the initiation of some of his vast building projects, as he had certainly started on the literary ones (Suet. *Iul.* 44).

A final question, however, must remain unanswered: did he really need the sums he borrowed, or were political motives involved? There was no better way of ensuring that wealthy and important men were interested in his life and success than by making them his creditors.

Caesar had been dictator (briefly), nominally for holding elections, in 49, consul for the second time in 48, and dictator for the second time after Pharsalus; he was consul for the third time and *curator morum* (supervisor of public morals) in 46 and dictator for the third time (designated for ten years ahead, we are told: Cass. Dio 43. 14. 3) after Thapsus; he held his fourth, sole, consulship for nine months and his fourth dictatorship in 45, and was consul for the fifth time and (from about February) *dictator perpetuo* (see *RRC* 480/6 ff.) in 44. The specification of his dictatorships after the first is lost in the *fasti* (official calendars and records of magistracies). Mommsen conjectured *rei publicae constituendae* ('for settling the republic'). He has been proved right by the discovery of a fragmentary inscription referring to the fourth (and last time-limited) dictatorship, and describing the dictator, with a necessary supplementation, as (dict.) *rei publicae constituendae*. (See Broughton, *MRR* 3. 106–8 for discussion of Caesar's consulships and dictatorships, with quotation of the epigraphic fragment, as restored by Gasperini.) How his perpetual dictatorship could be described is beyond conjecture. Whatever it was, it must have seemed to him less offensive, and less dangerous, than the title of *rex* (king). The major part of his work of reform came after Thapsus. His most lasting achievement was his reform of the calendar, which has in part survived to this day. To improve the administration of the empire, now much too large for the traditional apparatus, he considerably increased the number of senators and magistrates and, in order to maintain their chances of social distinction, the number of priests and (for the first time since the foundation of the republic) he promoted some distinguished Plebeian families to Patrician status—a practice soon followed by the emperors. Numerous colonies in the provinces helped to relieve poverty and dissatisfaction in Rome and Italy, while some of them, founded on historic sites like Carthage and Corinth, would serve as centres for trade and for strategic control.

However, he had no plans for basic social and constitutional reform. The extraordinary honours heaped upon him by the Senate, nearly all of which he accepted, merely grafted him as an ill-fitting head on to the body of the traditional structure, creating an abyss between him and his fellow *nobiles*, whose co-operation he needed for the functioning and the survival of the system. When he finally, not long before his death, accepted deification (Mark Antony was designated his *flamen*: see *PRIESTS (GREEK AND ROMAN)*), it made the abyss unbridgeable: perhaps, as the sources suggest, the vote, the culmination of the other excessive honours, was supported by his enemies and intended to make his position intolerable, especially since he was openly preparing an ultimate successor to that position. Having no legitimate sons, he had made his great-nephew Gaius Octavius (see *AUGUSTUS*) a pontifex at the age of sixteen and, although the boy had no military experience, had designated him his *magister equitum* ('master of the horse') for the war against Parthia that he was planning. For he came to recognize that he had arrived at an impasse in Rome and, as Gelzer has noted, wanted to escape into what he knew he could do best: a major military command, with Parthia the obvious victim.

What he did not realize was that he had made it impossible for the governing class, and even many men below it, to allow this. They well remembered the disruption and humiliation caused by his temporary absences during the civil wars, when the Senate and magistrates had no power to take major decisions and to deal with constant disorder and violence in Rome and Italy. (Cass. Dio, Bk 42, paints a vivid picture.) Italy was under the inefficient control of a *tribune of the plebs (Mark Antony), whom Caesar had appointed *pro praetore* (as a magistrate substituting for a praetor; see Broughton, *MRR* 2. 258, 260), and when an embassy from the east was sent to the Senate in the traditional way, it had to be sent on to Caesar in Spain. It was easy to foresee that, with Caesar in Babylon or Ecbatana, Rome and Italy could expect total disintegration. The political class saw that it was essential to prevent his departure. A conspiracy was hastily stitched together, with even some of his friends either participating or standing aside, and on 15 March (the Ides of March) 44 Caesar was assassinated in the Curia (senate house). Octavius was too young to be regarded as a danger, and there were some who hoped that with Caesar's person removed, his divine monarchy might turn out to be a temporary interlude in the long history of the republic.

Caesar was a distinguished orator in the 'Attic' manner, believing in 'analogy' (on which he wrote a treatise, *De analogia*) and in the use of ordinary words (Gell. *NA* 1. 10. 4). His speeches, at least some of which were published, and his pamphlet attacking Cato's memory, are lost. Seven books on the Gallic War (an eighth was added by Aulus Hirtius) and three on the Civil War survive, written to provide raw material for history and ensure that his point of view would prevail with posterity. Distortion at various points in the *Civil War* is demonstrated by evidence surviving in Cicero's correspondence. For praise of Caesar's style, see Cic. *Brut.* 262 (strongly tinged by flattery). For fragments of his speeches, see *ORF* no. 121.

EB

poetry of the 4th cent.) quotes the example of past poets. Callimachus invokes Hesiod (frs. 2, 112; *Epigr.* 27), and condemns the Epic Cycle (*Epigr.* 28); Homer is all-present, but formal emulation and verbal pastiche are rigorously avoided. From Pindar he borrows the critical images of the 'fine flower' (*Hymn* 2. 112, *Isthm.* 7. 18) and the 'carriage road' (fr. 1. 25–8, *Pae.* 7b. 11). Mimnermus (late 6th cent. BC) and Philitas (late 4th cent. BC) exemplify the short poem, Ion of Chios (5th cent. BC) *polueidia*. Antimachus (fl. 400 BC), *Plato, and Praxiphanes (end of 4th–mid-3rd cent. BC) are variously dispraised (frs. 398, 589, 460). Of contemporaries, Callimachus commends Aratus (*Epigr.* 27, fr. 460); the story of his quarrel with *Apollonius of Rhodes (and of the *Ibis*, frs. 381–2) is now generally discounted.

Callimachus says little about Egypt (though some have tried to find Pharaonic ideology in *Hymn* 4). From *Alexandria he looks to Greece, and the Greek past; he has a scholar's systematic knowledge of the Greek literary inheritance, an exile's feeling for the old country and its links (through *aitia*) with the contemporary world. His work often reaches out to the archaic world, crossing the centuries of drama and prose—to Hesiod, Hipponax, Pindar. But this past is transmuted. Verbal borrowing is rare; genres are shifted or mixed, myth transformed by mannerism, words and motifs juxtaposed in post-modern incongruities. *Victoria Berenices* may serve as an example. This epinician is also an *aition* (the foundation of the Nemean Games (see *ATHLETICS*)). It borrows words from Pindar, and story from Bacchylides, in the wrong

dialect (Ionic) and the wrong metre (elegiac). The narrative dwells not on *Heracles but on the rustic hospitality of the peasant Molorcus; Molorcus' war with the mice parallels Heracles' fight with the lion. Callimachus' poems are (by epic standards) short; various in style, metre, and genre; experimental in form, recondite in diction, polished in versification, devious, elaborate, allusive, and sometimes obscure (the earliest surviving papyrus, within a generation of Callimachus' death, includes an explanatory paraphrase). To Roman poets he became the exemplar of sophistication, *princeps elegiae* ('master of elegy': Quint. *Inst.* 10. 1. 58): *Catullus translated him (66), *Propertius invokes him (3. 1. 1). The *Aetia* in particular stands behind *Ovid's *Fasti* and Propertius 4; *Georgic* 3 begins with an allusion to it. But classicizing snobbery took him to represent technique without genius (Ov. *Am.* 1. 15. 14).

Callimachus commands an extraordinary variety of tone: tongue-in-cheek epic (*Hecale* fr. 74 Hollis), versified statistics (*Iambus* 6), classic pathos (*Epigr.* 19), Catullan elegance (fr. 401). The scholarship is integral to the poetry, which even quotes its own sources (frs. 75. 54, 92. 3, *Schol. Flor. Callim.* 35?). But irony and invention dominate.

PJP

camps When *Polybius (6. 27–32) described the construction of a military camp (*castra*) c.143 BC, he was referring to a well-established practice. *Liv, writing of 294 BC, assumes the existence of a fixed layout, without explaining it (10. 32. 9). The invention of castrametation by

the Romans was probably connected with orientation, town planning, and land division, which themselves were associated with augural practices. Land division, with its careful delineation of areas and use of boundary lines intersecting at right angles, was well suited to military planning. Roman camp-building techniques emphasize the professionalism of their military establishment.

Archaeological and aerial surveys have revealed about 400 marching-camps in Britain, generally square or oblong in shape, protected by a ditch and rampart of turves surmounted by a palisade, and with at least four gates, often guarded by a ditch or curving extension of the rampart (*clavicula*). Some were construction, or practice camps (to teach soldiers building techniques); others were large enough to accommodate an army (e.g. a group in SE Scotland of 67 ha. (165 acres), perhaps associated with the campaigns of *Septimius Severus in AD 208). At *Masada in Judaea several siege camps with their internal stone walls have survived.

However, archaeological evidence rarely illuminates the internal layout of temporary camps. According to Polybius, when a consular army of two legions and an equal number of allies encamped, the general's tent (*praetorium*) was located in a central position, with an open space (*forum*) on one side, and the quaestor's tent (*quaestorium*) on the other. In front of these were the tribunes' tents. The main street (*via principalis*—about 30 m. (33 yds.) wide), ran parallel to the *praetorium*, being intersected at right angles by other streets along which were encamped the legions and allies. The most important of these streets was the *via praetoria* (about 15 m. (16½ yds.) wide), which formed a T-junction opposite the *praetorium*. The legionary cavalry was positioned in troops on either side of the *via praetoria*; then the legionary infantry (grouped respectively as *triarii*, *principes*, and *hastati*) in maniples, with the *triarii* back to back to the cavalry. In front of the *triarii* ran other roads parallel to the *via praetoria*, beyond which were positioned the *principes* back to back to the *hastati*. Beyond the *hastati* the allied cavalry and infantry were similarly encamped. The *via quintana*, running parallel to the *via principalis*, divided the first to fifth maniples from the sixth to tenth. Behind the *praetorium* were the élite allied infantry and cavalry, and local auxiliary troops. The camp was square, surrounded by a ditch, rampart, and palisade, with a space (*intervallum*) of about 60 m. (66 yds.) from the tents. Each of the two main roads of the camp led to fortified gates. Polybius perhaps refers to half of a four-legion camp, when both consular armies were camping together. In the complete layout they would be positioned back to back, in a camp of oblong shape, with the legions and allies at either end. However,

when a two-legion army encamped alone, the layout was perhaps changed to accommodate the *praetorium* between the two legions, as apparently confirmed by a camp excavated in Spain, associated with Roman attempts to capture Numantia in the 150s BC.

The *De munitionibus castrorum* ('On Camp Fortifications'), an anonymous treatise (probably 2nd cent. AD), is a theoretical work, presumably for the guidance of military surveyors, and differs significantly from Polybius' version. The tripartite rectangular layout contained a combined *praetorium* and *principia* (headquarters), in front of which ran the *via principalis*, intersected at right angles by the *via praetoria*; here in the *praetentura* (one-third of the layout), auxiliaries were encamped in centuries, and also behind the *praetorium* along the *via quintana* in the *retentura* (the remaining two-thirds), where the *quaestorium* was now situated; praetorians were encamped next to the *praetorium*, and legionaries next to the *intervallum* along the *via sagularis*, encircling the entire camp. JBC

capitalism is a term freighted with heavy ideological baggage. For economists and historians working within a Marxist tradition (*see* MARXISM AND CLASSICAL ANTIQUITY) it has a specific reference to an advanced socio-economic formation in which value, profit, and rationality are determined according to the productive modalities and mentalities of large-scale competitive businesses and price-fixing markets. On this view, the economies of Greece and Rome would be classed as pre- or non-capitalist. For non-Marxists of various stripes, capitalism in the sense of the productive deployment, especially investment, of fixed or variable capital assets may occur within a wider range of political, social, and economic contexts, including the societies of Greece and Rome.

The disagreement is not only ideological. To define Greece and Rome as pre-capitalist may imply also, for instance, the view that 'the economy' as a separately instituted sphere did not exist in classical antiquity and that the ancients therefore did not, because they could not, practise economic analysis properly so called (*see* ECONOMY, GREEK); or that ancient economic institutions with apparent modern equivalents in fact functioned quite differently from their modern counterparts or namesakes—ancient *banks, for example, being seen as merely glorified money changers and usurers rather than lenders of risk or venture capital for productive economic investment. Those who, in contrast, regard the economy of the ancient world or local sectors thereof as in some useful sense capitalist detect differences of scale and sophistication rather than of fundamental nature.

Such ideological and pragmatic disagreements have a century-long pedigree within Ancient History, going back to the creative controversy between Karl Bücher and Eduard Meyer over the proper periodization of world history in economic perspective. They received a further injection of fuel in the second quarter of the 20th cent. from the anthropologically influenced theorist Karl Polanyi, whose outlook owed more to Max Weber than to Karl Marx. But his 'substantivist' views engendered an equal and opposite reaction from those who, without necessarily accepting the pejorative labels of 'formalists' or 'modernizers' that Polanyi and his followers had foisted upon them, nevertheless argued that the ancients were motivated by a recognizably capitalist rationality and to that end instituted processes of wealth-creation susceptible of analysis in the formal terms of neoclassical micro-economic theory, including such mathematical tools as Leontief-style input-output tables.

The dispute shows no sign of proximate resolution, and indeed cannot formally be resolved in the absence of the requisite quantities of the right types of evidence, above all data amenable to statistical or quasi-statistical analysis. But whereas for exponents of the 'capitalist' hypothesis that absence is merely an accident of non-survival, for the Marxist or Weberian 'primitivists' or 'substantivists' it is itself further evidence in support of their classificatory hypothesis. Students of Rome (*see ECONOMY, ROMAN*) tend to fall into the former rather than the latter camp. PAC

Caracalla, nickname (from his Celtic dress) of Marcus Aurelius Antoninus (AD 188–217), emperor AD 198–217. Elder son of Lucius *Septimius Severus, originally called Septimius Bassianus; renamed after Marcus *Aurelius and made Caesar in 195. Augustus in 198, he was consul for the first time with his father in 202 and for the second time with his brother Publius Septimius Geta in 205, when he had his hated father-in-law Gaius Fulvius Plautianus killed. Consul for the third time in 208, again with Geta, whom he also hated, he accompanied his father to *Britain, sharing command against the Caledonians. When Severus died, he and Geta abandoned Scotland, making the *wall of Hadrian the frontier again, and returned to Rome. After having Geta killed (26 December 211), a drastic purge followed. To conciliate the soldiers, he raised their pay, creating financial problems. One solution was the 'Antonine constitution' (*see CITIZENSHIP, ROMAN*); he simultaneously doubled the inheritance tax paid only by citizens, which funded the *aerarium militare* (military treasury). In 215 a new coin was struck, the so-called *antoninianus*, evidently tariffed at two denarii, but weighing only 1.5: this was to lead to inflation.

In 213 he fought the Alamanni (the first time they are mentioned), evidently gave the Raetian **limes* a stone wall, and became Germanicus Maximus. In 214 he attacked the Danubian Carpi and reorganized Pannonia, each province now having two legions (Britain was split into two provinces at this time; Hither Spain was also subdivided). Obsessed by *Alexander the Great, he raised a Macedonian phalanx and went east in his footsteps, through Asia and Syria to *Alexandria, where large numbers who had mocked him were killed. When his offer to marry a Parthian princess was rejected, he attacked Media. While preparing a further campaign he was murdered near Carrhae (8 April 217). Macrinus deified him as Divus Antoninus Magnus. ARBI

careers

Greek

In virtually all the Greek-speaking areas, pressures to evolve clear career structures in public life were countered by social or political considerations, thereby preventing the emergence of recognizable *cursus honorum* (career paths) on the Roman republican model. Though, for example, *Thucydides (5. 66. 3–4) credited the Spartan army with a clear hierarchical command structure, promotions and careers within it were by appointment and co-optation rather than by election. Hence they were as much a matter of belonging to a notable lineage, or of influence with kings or ephors, as of merit. At Athens a simple hierarchy of military command in both infantry and cavalry is attested, while re-election to the post of general (*stratēgos*) was common and helped to provide a clear career path for professional soldiers, often interspersed with spells of mercenary command abroad. In contrast, careers in civilian office-holding in Classical Athens were effectively precluded by the short-term tenure and non-repeatability of office, by collegiality, and above all by selection by lot. A young politician had to use the assembly (*ekklesia*) rather than office-holding, and tended to begin by lawcourt advocacy or by serving a senior politician as his 'friend' or 'flatterer' (e.g. [Dem] 59. 43) before establishing his own position and his own clique of followers. Public career structures in other Greek states are barely traceable for lack of detailed evidence.

The Hellenistic courts developed more of a career structure, alike for their ministers, envoys, and army commanders, ostensibly formalized by the growth of graded titles such as 'friend', 'first friend', 'companion', and 'relative' (of the king). (*see FRIENDSHIP, RITUALIZED*.) However, here too patronage could easily override merit, status was precarious, and recruitment as much a matter of family succession as of individual promise.

Outside public life, some professions such as doctors or performing artists formed guilds with their own procedures and officers, but little in the way of formalized career structures is perceptible. JKD

Roman

Ancient society was not so organized as to provide a course of professional employment which affords opportunity for advancement. The Latin phrase normally translated as 'career' is the Ciceronian *cursus honorum*, which refers to the series of elective magistracies open to senators: those of quaestor, held at 30 from *Sulla's legislation onwards, but five years younger under the Principate; of aedile; of praetor, held at 39 under the late republic, but by some at 30 under the Principate; and of *consul, held at 42 after Sulla (cf. the career of *Cicero), by patricians at 33 under the Principate, and by new men (*novi homines*, i.e. the first of a family to reach the consulship) at 38 or later (cf. the career of Gnaeus Iulius Agricola). Successful election to these posts depended on birth and achievement (cf. Tac. *Ann.* 4. 4: high birth, military distinction, and outstanding gifts in civil life, i.e. forensic or political oratory, knowledge of the law: note the order). Success might be achieved not only in the magistracy that preceded but in preliminary offices civil and military (as one of the *vigintisexviri* (six boards of minor magistrates) or *tribuni militum* (six legionary tribunes)), and in positions held at Rome, in Italy, or the provinces, under the republic often involving command of troops, that normally followed the praetorship and consulship (propraetorships, -consulships, allocated by seniority and by lot); or that were devised under the Principate to get previously neglected work done (e.g. curatorships of roads in Italy). After AD 14 elections were effectively conducted in the senate and a man's success depended on the verdict of his peers or on his ability to strike bargains with his rivals' supporters; but *Augustus' *lex Iulia de maritandis ordinibus* (see MARRIAGE LAW, ROMAN) provided speedier advancement for men married with children, while the opinion of the emperor, known or surmised, was of great and increasing weight (cf. *ILS* 244. 4; Pliny, *Pan.* 66), hence too the favour of his advisers. Some posts, notably legionary commands and governorships of regions that were part of his 'province' (e.g. *Syria, *Gaul (Transalpine) outside Narbonensis), were in his direct gift, though the senate ratified such appointments (both types of officer were 'legates (*legati*) of Augustus'). The influence exercised by the emperor has given rise to the view that there was a special type of career 'in the Emperor's service' regularly involving particularly speedy advancement (especially between praetorship and consulship) enjoyed by 'military men' (*virii militares*). A

more cautious hypothesis is that men advanced themselves using what gifts they had; those who took to army life necessarily were the appointees of the emperor. Each appointment was ad hoc and might depend on a number of factors, e.g. current needs, a man's availability, experience, record, current effectiveness of his supporters, but precedent was also relevant.

The word 'career' is often applied to the posts offered by the emperor to men of equestrian and lower status, whether in official positions (e.g. *praefectus praetorio* = prefect of the praetorian guard, or *procuratores Augusti* in his provinces, supervising tax collecting) or as his private agents (also *procuratores*) managing his private estates (see PROCURATOR). But although such posts mostly had their distinctive standing, and were normally preceded by up to three military posts, and although (because of this) recognizable patterns of advancement developed (cf. the two Trajanic 'careers' *ILS* 1350 and 1352), appointments were again ad hoc, *ad hominem* (cf. *AE* 1962, 183), intermittent, and accepted on a basis of mutual goodwill, with character rather than professionalism the overt criterion. Imperial freedmen and even slaves who held subordinate positions in the organizations enjoyed lower standing, but their continuous service over long periods of time justifies the application of the term 'career' to their activities (see FREEDMEN; SLAVERY).

In the army below the rank of tribune it is legitimate to speak of a career, since the minimum period of service outside the praetorian guard was twenty years. Men frequently record their advance through minor posts of privilege (e.g. *tesserarius*, 'Officer Commanding the Watchword') to (e.g.) one of the 60 centurionates of a legion, or upwards through legionary centurionates (e.g. *ILS* 2653).

Elsewhere the word is inappropriate; outside the limited state apparatus the ancient world lacked the great organizations that now provide methodical advancement in business and industry. BML

Carian language Direct evidence for the Carian language is limited to approximately 30 inscriptions from Caria proper and well above 200 inscriptions (some still unedited) written by Carian-speakers in Egypt (from the 7th cent. BC). There are also miscellaneous short texts from other sites and two short texts from Greece (6th and 5th cent. BC). The alphabet, which in Caria shows a great deal of variation, is clearly derived from the Greek alphabet with some additions but a number of letters have different values from those of the equivalent Greek letters. The brilliant decipherment started by the English Egyptologist John Ray in the 1980s and then completed by the Spanish scholar Ignacio Adiego and the German

scholar Diether Schürr from the 1990s has shown that all earlier readings (partly based on the assumption that the script was half syllabic, half alphabetic) were misguided. The recent discovery of a short Greek–Carian bilingual from Kaunos (late 4th cent. BC) has confirmed the new values. We still know little about the language, since the texts are short and fragmentary and largely consist of names, but it is now clear that it belongs to the Anatolian group of Indo-European and it is close to Luwian and Lycian (nominative sing. with no ending; accusative sing. in *-n*; genitive sing. in *-ś*; accusative plur. in *-s*; cf. Cun. Luw. *-nz(a)*; ted ‘father’ c;f. Cun. Luw. *tātiš* vs. Hitt. *attaš*). The puzzle of why some of the letters which are recognizably Greek in appearance have such different values remains unsolved though various suggestions have been made. All the evidence is admirably collected in I. J. Adiego, *The Carian Language* (2007). AMDA

Carthage (see facing page)

Cassius Dio (c. AD 164–after 229), Greek senator and author of an 80-book history of Rome from the foundation of the city to AD 229. His full name was perhaps Lucius Cassius Dio, as on M. M. Roxan, *Roman Military Diplomas* 2 (1985), no. 133 (‘Cl.’ on AE 1971, 430, could attest the further name ‘Claudius’, but is probably a stone-cutter’s error; ‘Cocceianus’ may have been added in Byzantine times through confusion with Dio of Prusa). Dio came from a prominent family of Nicaea in Bithynia (mod. Iznik). His father, Cassius Apronianus, entered the senate, attaining a consulship and several governorships. Dio’s senatorial career was even more distinguished. He was praetor in 194 and suffect consul probably c. 204. From 218 to 228 he was successively *curator* (state finance official) of *Pergamum and Smyrna, proconsul of *Africa, and legate first of Dalmatia and then of Upper Pannonia. In 229 he held the ordinary consulship with *Severus Alexander as colleague and then retired to Bithynia. Dio lived through turbulent times: he and his fellow senators quailed before tyrannical emperors and lamented the rise of men they regarded as upstarts, and in Pannonia he grappled with the problem of military indiscipline. These experiences are vividly evoked in his account of his own epoch and helped to shape his view of earlier periods.

Dio tells us (72. 23) that, after a short work on the dreams and portents presaging the accession of *Septimius Severus, he went on to write first a history of the wars following the death of *Commodus and then the *Roman History*, and that for this work he spent ten years collecting material for events up to the death of Severus (211) and a further twelve years writing them up. Nothing survives of the early works or of other historical writings

attributed to Dio by the *Suda*. The dates of composition of the *Roman History* are disputed, but the most natural interpretation of Dio’s words is that he began work c. 202. His plan was to continue recording events after Severus’ death as long as possible, but absence from Italy prevented him giving more than a cursory account of the reign of Severus Alexander and he ended the history with his own retirement (80. 1–5).

The *Roman History* is only partially extant. The portion dealing with the period 69 BC to AD 46 (36. 1. 1–60. 28. 3) survives in various MSS, with substantial lacunae after 6 BC. For the rest we depend on excerpts and the epitomes of the 12th cent. historian Zonaras (down to 146 and 44 BC to AD 96) and the 11th-cent. monk Xiphilinus (from 69 BC to the end).

Like its author, the work is an amalgam of Greek and Roman elements. It is written in Attic Greek, with much studiedly antithetical rhetoric and frequent verbal borrowings from the classical authors, above all *Thucydides. The debt to Thucydides is more than merely stylistic: like him, Dio is constantly alert to discrepancies between appearances and reality. In its structure, however, the history revives the Roman tradition of an annalistic record of civil and military affairs arranged by the consular year. Dio shows flexibility in his handling of the annalistic framework: there are many digressions, usually brief; external events of several years are sometimes combined in a single narrative cluster; introductory and concluding sections frame the annalistic narratives of emperors’ reigns.

For his own times Dio could draw on his own experience or oral evidence, but for earlier periods he was almost entirely dependent on literary sources, chiefly earlier histories. Attempts to identify individual sources are usually futile. Dio must have read widely in the first ten years, and in the ensuing twelve years of writing up he probably worked mainly from his notes without going back to the originals. Such a method of composition may account for some of the history’s distinctive character. It is often thin and slapdash; errors and distortions are quite common, and there are some surprising omissions (notably the conference of Luca (see CAESAR, JULIUS)). However, Dio does show considerable independence, both in shaping his material and in interpretation: he freely makes causal links between events and attributes motivations to his characters, and many of these explanations must be his own contribution rather than drawn from a source.

One notable feature of the work is the prominence of the supernatural: Dio believed that divine direction played an important part in his own and others’ lives and he devoted much space to portents. Another is the

[continued on p. 154]

CARTHAGE

Carthage (*Qrthdšt* (= 'New Town'); Gk. *Karchēdōn*; Lat. *Carthago*) (see ◀ Map 4, Ac ▶), a *Phoenician colony and later a major Roman city on the coast of NE Tunisia.

History

According to tradition (*Timaeus, *FGrH* 566 fr. 60) Carthage was founded from Tyre in 814/13 BC, but no archaeological evidence has yet been found earlier than the second half of the 8th cent. BC. The site provided anchorage and supplies for ships trading in the western Mediterranean for gold, silver, and tin, and soon outstripped other Phoenician colonies because of its position, its fertile hinterland, and its better harbour.

Trade was more important to Carthage throughout its history than perhaps to any other ancient state. Initially most of it was conducted by barter with tribes in Africa and Spain, where metals were obtained in return for wine, cloth, and pottery; but early contact with the Greek world is shown by the presence of Attic amphorae (transport jars) in the earliest levels at Carthage. Voyages of exploration were undertaken along the Atlantic coast of North Africa and Spain. Carthage controlled much of the trade in the western Mediterranean, settling its own trading-posts in addition to those founded by the Phoenicians, so that Carthaginian influence extended from Tripolitania to Morocco, as well as to western Sicily, Sardinia, and southern Spain. From the 4th cent. Carthage also exported agricultural produce and was integrated into the wider Hellenistic *economy of the Mediterranean world. Pottery from levels of the last Punic phase (first half of the 2nd cent. BC) shows significant quantities of imports from Greece, Italy, and the Iberian peninsula.

Carthage was ruled at first by a governor (*skn*), responsible to the king of Tyre; whether by the 7th cent. she had her own kings (*mlk*) is far from clear. At any rate by the 6th cent. the constitution had become oligarchic, headed by at first one, later two 'judges' (*šptm*), called *suffetes* in Latin; they were elected annually on a basis of birth and wealth. Military commands were held by separately elected generals. There was a powerful 'senate' of several hundred life-members. The powers of the citizens were limited. A body of 104 judges scrutinized the actions of generals and other officials. Largely through this body the ruling class was successful in preventing the rise of *tyranny either through generals manipulating the mercenary armies or officials encouraging popular discontent. Military service was not obligatory on Carthaginians, whose population was too small to control a large citizen army; instead mercenaries were hired from various western Mediterranean peoples.

In the 5th cent., owing to setbacks in Sicily, Carthage occupied much of the hinterland of north and central Tunisia, and settled agriculture flourished. The native Numidian population in the areas to the west of Carthage adopted settled urbanism and other elements of Punic culture and religion from the late 3rd cent. onwards, and especially under enlightened rulers such as Masinissa, so that considerable parts of North Africa outside formal Carthaginian control were already to a greater or lesser extent Punicized before the arrival of Rome.

The chief external policy of Carthage was control of the sea routes to the west. From c.600 BC it was clear that rival claims must lead to war between *Etruscans, Carthaginians, and Greeks. The westward thrust of Phocaea (western Asia Minor) and her colony Massilia (mod. Marseilles) was crushed off Alaia in Corsica by the Etruscan and Carthaginian fleets (c.535). This led to the consolidation of Carthaginian control of southern and western Sardinia and parts of southern Spain. Earlier Malchus (fl. 580–550 BC) had won successes in *Sicily, where the western end of the island remained in Carthaginian hands down to the 3rd cent. BC. For three centuries Carthaginians and Greeks fought intermittently for Sicilian territory and the allegiance of Sicans, Sicels, and Elymians. In 480 BC a great Carthaginian army under Hamilcar was defeated at Himera by the tyrants Gelon and Theron. His grandson *Hannibal avenged the defeat by destroying Himera (409) and a succession of Greek cities on the south coast; but the ensuing wars with *Dionysius I of Syracuse ended with Carthaginian power confined to the far west of the island, and with the destruction of one of their three cities, Motya (to be replaced by the new Carthaginian stronghold of Lilybaeum). The tyrant Agathocles later carried the war into Africa, but was defeated near Tunis (307).

Carthage In the 2nd cent. BC Punic Carthage reached its greatest extent, including these houses on the Byrsa hill, built over an archaic cemetery. When Carthage was refounded by *Augustus as a Roman colony, the hill lay at the centre of the Roman street grid. Simon Keay

With Rome Carthage concluded treaties in 508 and 348, in which she jealously guarded her monopoly of maritime trade while refraining from interference in Italy. When *Pyrrhus attacked (280), her fleet helped Rome to victory. But sixteen years later Sicilian politics brought the two states into open conflict. Carthaginian intervention on the side of the Mamertines at Messina in 264 precipitated the first of the Punic Wars (*see* ROME (HISTORY) §4), which ended in the destruction of Carthage (146 BC). Rome decreed that neither house nor crop should rise again. But Carthaginian blood survived, and the awesome pantheon still persisted: worship of Baal-Hammon, Tanit, Eshmoun, and Melqart was too deep-rooted in many parts of North Africa to die with the destruction of Carthage, and it was to continue, under a thinly Romanizing veneer, until the rise of *Christianity.

Carthage never developed a distinctive art of her own, but was content to copy and adapt styles imported from Egypt and Greece. She manufactured and exported carpets, rugs, purple dyes, jewellery, pottery, lamps, tapestry, timber, and hides. Her agricultural skill, which made excellent use of the fertile Tunisian plains, profited her Roman conquerors: Mago's 32 books on scientific farming were translated into Latin; *see* AGRICULTURAL WRITERS.

The site of Carthage was too attractive to remain unoccupied for long. The attempt of Gaius *Gracchus to establish the colony of Junonia on suburban land failed, but the city was colonized by Augustus in fulfilment of Caesar's intentions, and became the capital of Africa Proconsularis (see AFRICA, ROMAN). By the 2nd cent. AD Carthage had become the second city only to Rome in the western Mediterranean. A few urban troops and a cohort of the Third Augustan legion sufficed to keep order. But through his control of the vital African corn-trade, the proconsul was a potential danger to the emperor, as shown by the rebellions of Clodius Macer (68) and Gordian I (238).

Carthage became an outstanding educational centre, especially famous for orators and lawyers. In the 3rd cent. the genius of the apologist Tertullian and the devotion of Cyprian (bishop of Carthage) made her a focus of Latin Christianity. Her bishop held himself the equal of the bishop of Rome, and Carthage played a great part in establishing western Christianity on lines very different from the speculation of the Greek churches. As a great Catholic stronghold she fought against the Donatist heresy. When the Vandals overran Africa, she became the capital of the Vandal king Gaiseric (428–77) and his successors, who embraced the Arian version of Christianity. After Belisarius' victory Catholicism was restored on stricter lines. Carthage remained loyal to the eastern Roman empire and beat off the earlier Muslim invasions, until captured in 697.

Topography

Carthage was founded on part of a large peninsula which stretched eastwards from lagoons into the gulf of Tunis; the isthmus linking it to the mainland further west is c. 5 km. (3 mi.) wide at its narrowest point. Scanty remains of houses of the last quarter of the 8th cent. BC have been found, at one point up to 350 m. (380 yds.) from the shore, suggesting that the settlement then was already of considerable size; but the original nucleus, if there really was a colony here a century earlier to correspond with the traditional foundation date, has yet to be found. Little is known of the archaic urban layout, but surface evidence and cemeteries to the north and west suggest that it covered at least 55 ha. (136 acres). Pottery kilns and metal-working quarters have been identified on its fringes, and the *tophet*, where child sacrifice to Baal and Tanit took place, has been located on the south; this was in continuous use from the later 8th cent. down to 146 BC. Substitution of animal for child was practised from the start: one in three archaic sacrifices in the sector excavated in the 1970s were of animals, declining to one in ten in the 5th/3rd cent. BC.

In the late 5th cent. massive fortifications, 5.20 m. (17 ft.) wide, were erected with projecting towers and gates; Livy (*Epit.* 51) says they were 32 km. (20 mi.) long. Substantial houses, some with peristyles and simple *terrazzo* or tessellated floors, are known from the Hellenistic period, when the city reached its greatest extent: a new area of housing was laid out on the slopes of the Byrsa hill soon after 200 BC, covering an archaic necropolis. Also to the last Punic phase belong the two artificial harbours to the south near the *tophet*, one rectangular (later adapted into an elongated hexagon), the other circular around a central island. The first was the commercial harbour, and the latter housed the warships of the Carthaginian navy: *Appian reports a ship-shed capacity of 220 vessels here. Little is known of the disposition of the harbour(s) at an earlier date.

Roman Carthage has suffered greatly from stone-robbing, but the regular Augustan street grid centred on the Byrsa hill is known in detail, as well as the position of the principal public buildings, including the *amphitheatre on the western outskirts, the circus on the south-west, the theatre, and the odeum. The 2nd cent. AD saw the apogee of the city's prosperity: a massive forum and basilica, the biggest known outside Rome, was erected on the Byrsa in Antonine times, and also Antonine is the huge and lavish bathhouse down by the sea, designed on a symmetrical layout like the great imperial *baths of Rome. It was probably to supply it that Carthage's 132-km. (82-mi.) *aqueduct was constructed, the longest anywhere in the Roman world. The forum on the Byrsa is unlikely to have been the only one: recent work (since 1990) near the coast midway between the Antonine baths and the harbours, alongside the *cardo maximus* (main thoroughfare), has revealed part of what is probably the forum of the Augustan city; a Punic temple, perhaps that of *Apollo mentioned by Appian as bordering the Punic agora, has been located below. The 4th cent. and later saw a rash of extramural church-building, and c.425 a massive new defensive circuit was erected on the landward side against the Vandal threat; despite it the city fell easily to the Vandals in 439. Several houses of the 5th and 6th cents. are known, when Carthage continued to prosper: survey work in the Carthaginian hinterland shows rural settlement at its densest in the 5th and 6th cents., matching and even outstripping that of the 2nd and 3rd cents.

speeches, which are free inventions and sometimes on a very ample scale. Many of them are commonly dismissed as mere rhetorical set-pieces, but they generally have a dramatic function, often heavily ironic. In *Maecenas' speech of advice to *Augustus (52. 14–40) Dio combines an analysis of the problems facing Augustus and of the imperial system as it evolved under the emperors with a sketch of how he himself would have liked to see the empire governed.

The *Roman History* is dominated by the change from the republic to the monarchy of the emperors, repeatedly endorsed by Dio on the grounds that only monarchy could provide Rome with stable government. The late republic and the triumphal years are accorded much more space than other periods. Dio anachronistically treats the conflicts of the late republic as struggles between rival contenders for supreme power. His account of the settlement of 27 BC perceptively explores the ways in which it shaped the imperial system under which he still lived (53. 2. 6–21. 7). Dio's treatment of individual emperors' reigns reflects the values and interests of the senator: his overriding concern is with the respects in which emperors measured up to or fell short of senators' expectations. JWR

catacombs, Jewish, subterranean cemeteries comparable to the early Christian catacombs of Rome. Jewish catacombs have been discovered in Beth She'arim (Galilee) (2nd–4th cents. AD) and Rome (1st–5th cents. AD). They contain Jewish artwork (menorah) and many Jewish epitaphs, mostly composed in *koinē* Greek and vulgar Latin. Recent radiocarbon dating suggests the Jewish catacombs of Rome may have inspired the early Christian ones. LVR

Catiline (Lucius Sergius Catilina), of *patrician, but not recently distinguished, family, served with *Pompey and *Cicero under Gnaeus Pompeius Strabo in the Social War (91–89 BC: see *ROME (HISTORY)* §1.5). He next appears as a lieutenant of *Sulla both in the *bellum Sullanum* after Sulla's invasion of Italy and in the *proscriptions when, incited by Quintus Lutatius Catulus, he killed his brother-in-law Marcus Marius Gratidianus. There is no further record of him until his praetorship (68 BC), after which he governed Africa for two years. Prosecuted *repetundarum* (i.e. on a charge of provincial extortion) on his return, he was prevented from standing for the consulship for 65 and 64, but was finally acquitted with the help of his prosecutor Publius *Clodius Pulcher. In 66/5 he was said to be involved in a plot with Publius Autronius and Publius Cornelius Sulla; the details are obscured by gossip and propaganda, and his involvement is doubtful.

Frustrated ambition now became his driving force. In the elections for 63 he made a compact with Gaius Antonius 'Hybrida' and gained the support of *Caesar and *Crassus, but was defeated by Cicero. He then began to champion the cause of the poor and dispossessed: dissolute aristocrats, bankrupt Sullan veterans, and those whom they had driven from their lands. Again defeated for 62, he organized a widespread conspiracy with ramifications throughout Italy. Cicero, kept informed by his spies, could not take decisive action owing to lack of sufficient support, for Catiline—an old Sullan, a patrician, and now a demagogue—was both popular and well connected. In November Cicero succeeded in frightening Catiline into leaving Rome to join a force of destitute veterans in Etruria. Soon afterwards, some Allobrogan envoys, carelessly given letters by conspirators in Rome, provided Cicero with the written evidence he needed. The leaders of the conspiracy in Rome were arrested and, after a long debate and a vote in the senate, executed. The consul Antonius marched out against Catiline, who was caught between two armies and was defeated and killed by Marcus Petreius near Pistoria (early January 62). Cicero was hailed as saviour of Rome, but was open to the charge of having executed citizens without trial. EB

Cato the Elder (Marcus Porcius Cato), or 'Cato the Censor' ('Censorius') (234–149 BC), was a dominant figure in both the political and the cultural life of Rome in the first half of the 2nd cent. BC. A *novus homo* (roughly, the first man of his family to become a senator and/or consul), he was born at Tusculum, but spent much of his childhood in the Sabine country, where his family owned land. He served in the Hannibalic War, winning particular praise for his contribution at the battle of the Metaurus in 207. He embarked on a political career under the patronage of the patrician Lucius Valerius Flaccus, who was his colleague in both consulship and censorship. As quaestor 204 he served under *Scipio Africanus in Sicily and Africa; a constant champion of traditional Roman virtues, he looked with disfavour on Scipio's adoption of Greek customs and relaxed military discipline in Sicily, but the story that he came back to Rome to express his criticisms should be rejected. He is said to have returned from Africa via Sardinia, bringing thence the poet *Ennius to Rome. He was plebeian aedile 199 and praetor 198, when he may have carried the *lex Porcia* which extended the right of *provocatio* (appeal to the people against the action of a magistrate) to cases of scourging. He governed Sardinia, expelling usurers and restricting the demands made on the Sardinians for the upkeep of himself and his staff. He reached the consulship in 195: after unsuccessfully opposing the repeal of the

lex Oppia, he went to Spain, where, in a campaign which may have extended into 194, he suppressed a major rebellion, extended the area under Roman control, and arranged for the exploitation of the gold and silver mines; he returned to Rome to celebrate a triumph. In 191, as military tribune, he played an important part in the defeat of *Antiochus III at Thermopylae, and was sent to Rome by Manius Acilius Glabrio to report the victory.

Cato was constantly engaged in court cases, both as prosecutor or prosecution witness and as defendant. He was an instigator of the attacks on the Scipios (Africanus and his brother Lucius Cornelius Scipio Asiagenes), and two of his other targets, Quintus Minucius Thermus and Glabrio, can be seen as allies of the Scipios. The attack on Glabrio was connected with the censorial elections of 189, when Cato and Flaccus stood unsuccessfully. Five years later they were elected, having stood on a joint programme of reversing the decline of traditional morality. They were severe in their review of the rolls of the senate and the *equites, removing Lucius Quinctius Flamininus from the senate and depriving Lucius Cornelius Scipio Asiagenes of his public horse. High levels of taxation were imposed on what the censors regarded as luxuries, and the public contracts were let on terms most advantageous for the state and least so for the contractors. They undertook extensive public works, including major repairs and extensions to the sewage system. The controversies caused by his censorship affected Cato for the rest of his life. But he courted conflict and spoke his mind to the point of rudeness. He rigidly applied to himself the standards he demanded of others and made a parade of his own parsimony: when in Spain he had made a point of sharing the rigours of his soldiers.

Though he held no further public offices Cato continued to play an active role in politics. He was probably an augur (*MRR* 3. 170). He opposed the modification of the *lex Baebia* of 181 which had provided for the election of only four praetors in alternate years, and of the *lex Orchia*, a sumptuary law. Soon after 179 he attacked Marcus Fulvius Nobilior, and in 171 was one of the patrons chosen by the peoples of Spain to present their complaints against Roman governors. A critical remark about King Eumenes II of *Pergamum in 172 and speeches in 167 against declaring war on *Rhodes and in favour of leaving Macedonia free are probably part of a general reluctance to see Rome too directly involved in eastern affairs. It was also in 167 that he opposed the attempt by Servius Sulpicius Galba to block the *triumph of Lucius Aemilius Paullus; Cato's son later married a daughter of Paullus, and it thus seems that the old enmity between Cato and the family of the Scipios was at an end. In the last years of his life, after serving on an embassy to *Car-

thage in 153, Cato convinced himself that the existence of Carthage constituted a serious danger to Rome; he ended each speech in the senate by saying that Carthage must be destroyed. Despite the opposition of Publius Cornelius Scipio Nasica Corculum war was eventually declared in 149. Shortly afterwards came the last speech of Cato's life, against Galba.

Cato has rightly been called the 'virtual founder of Latin prose literature'. Among works that were known to later generations—though not necessarily intended for publication by Cato himself—but of which we know little, are the *Ad filium* ('to his son'), perhaps no more than a brief collection of exhortations, a letter to his son, the *De re militari* ('on military matters'), a work dealing with civil law, the *Carmen de moribus*, probably a prose work on behaviour, and a collection of sayings.

Cato was the foremost orator of his age, and made many speeches. Over 150 were known to *Cicero, and we possess fragments of eighty. There can be little doubt that he intended his speeches to survive, though it is an open question whether he revised them for publication and conceived of himself as creating Latin oratory as a literary genre.

Previous Roman historians, starting with Quintus Fabius Pictor, had written in Greek; Cato's *Origines*, begun in 168 and still in progress at the time of his death, was the first historical work in Latin. It consisted of seven books. The first dealt with the foundation of Rome and the regal period; Cato had little or nothing to say about the early republic. The second and third covered the origins and customs of the towns of Italy (the title of the work is appropriate only for these three books). His approach was probably influenced by Greek *ktisis* (foundation) literature and/or *Timaeus. The remaining books described Rome's wars from the First Punic war onwards. Cato is said to have written in a summary fashion, though some episodes were given detailed treatment, and he devoted more space to the events of the period during which he was writing; the last two books cover less than twenty years. He chose to omit the names of generals and included at least two of his own speeches (those on behalf of the Rhodians and against Galba).

The only work of Cato which survives intact is the *De agri cultura* ('on agriculture'). It is concerned not with agriculture as a whole, but principally with giving advice to the owner of a middle-sized estate, based on slave labour, in Latium or Campania, whose primary aim was the production of wine and olive oil for sale. It also includes recipes, religious formulae, prescriptions, and sample contracts. The work is disordered and some have wondered whether Cato himself is responsible for the shape of the text as we have it. See further appendix, below.

Cato sometimes expressed great hostility to all things Greek: in the *Ad filium* he called the Greeks a vile and unteachable race; in 155, worried by the effect their lectures were having on Roman youth, he was anxious that an embassy of Athenian philosophers should leave Rome rapidly. But he knew Greek well and had a good knowledge of Greek literature. His objections were to an excessive *philhellenism and he probably thought that contemporary Greeks were very different from the great figures of the past.

Cato was married twice, to Licinia and to Salonia (daughter of one of his clients), and had a son by each wife; the first died as praetor-designate in 152; the second, born when his father was 80, was the grandfather of Cato the Younger; see next article. JBR

Appendix: Cato the Elder, *De agricultura*

'Cato first taught agriculture to speak Latin' (Columella *Rust.* 1. 1. 12). The work (c.160 BC) was both innovative and part of an established Greek genre. Indications of acquaintance with Greek technical literature are clear, while the largely shapeless structure of the treatise reflects the infancy of Roman prose writing. Later authors (Varro *Rust.* 1. 2. 12–28) defined and systematized *agriculture, discarding Cato's recipes and encomium of cabbage. Cato wrote for the young man who expected to make money and to enhance his public reputation by successful agriculture (3. 2). Thus the *villa should be sited near good access routes (1. 1. 3), and wine and oil stored until prices are high (3. 2). The treatise's essential subject is the slave-staffed villa in Latium or Campania practising mixed farming with an emphasis on vines and olives. The archaeological record documents a gradual spread of villa sites in these regions from the beginning of the 2nd cent. BC and a remarkable diffusion of Italian *wine-amphorae (transport jars) in the western Mediterranean from the mid-2nd cent. BC. MSSP

Cato the Younger Marcus Porcius Cato, or 'Cato of Utica' ('Uticensis') (95–46 BC), great-grandson of Cato the Elder (see preceding entry), nephew of Marcus Livius Drusus, and brought up in the Livian household with the children of his mother's marriage to Gnaeus Servilius Caepio. Quaestor probably in 64, in 63 he became tribune-designate in order to check Quintus Caecilius Metellus Nepos, supported Lucius Licinius Murena's prosecution, and intervened powerfully in the senate to secure the execution of the Catilinarians (see CATILINE). As tribune he conciliated the mob by increasing the numbers eligible to receive cheap corn, but in all else remained uncompromising; *Cicero (*Att.* 1. 18. 7; 2. 1. 8) deplors his lack of realism which prevented

revision of the Asian tax-contracts (61)—thus alienating the *equites—and which frustrated every overture of *Pompey until the coalition between Pompey, *Caesar, and *Crassus was formed. In 59 he opposed Caesar obstinately and was temporarily imprisoned, but next year Publius *Clodius Pulcher removed him by appointing him to undertake the annexation of *Cyprus. Though King Ptolemy of Cyprus (an illegitimate son of Ptolemy IX and brother of Ptolemy XII Auletes) killed himself and Cato's accounts were lost on the voyage home, his reputation for fairness remained unimpaired. After Luca (see POMPEY) he persuaded his brother-in-law Lucius Domitius Ahenobarbus not to give up hope of being elected consul for 55, but Domitius' candidature collapsed because of physical intimidation by the supporters of Pompey and Crassus. Publius Vatinius defeated Cato for the praetorship by bribery, but Cato was eventually praetor in 54. In 52, abandoning his constitutional principles, he supported Pompey's election as sole consul; he himself stood for 51 but failed. In the war he tried to avoid citizen bloodshed but resolutely followed Pompey: he served in Sicily, but was expelled from there by Gaius Scribonius Curio. Then he served in Asia, and held Dyrrachium during the campaign of Pharsalus (48). After Pompey's defeat, Cato joined the quarrelling Pompeians in Africa and reconciled them; he had Quintus Caecilius Metellus Pius Scipio made general. During the war he governed Utica with great moderation, and was honoured by the city's inhabitants when after Thapsus in April 46 he committed *suicide rather than accept pardon from Caesar, an act which earned him the undying glory of a martyr.

Cato's constitutionalism, a mixture of *Stoicism and old Roman principles, was genuine. After death he was more dangerous than ever to Caesar, who in his *Anticato*, a reply to Cicero's pamphlet *Cato*, pitched the hostile case too high, and allowed the fame of Cato's life and death to give respectability to the losing side, and to inspire later political martyrs: 'the victors had their cause approved by the gods, the vanquished by Cato' (Lucan 1. 128). GEFC/MTG

Catullus (Gaius Valerius Catullus), Roman poet. He was born to a distinguished and wealthy family of Verona around 84 BC and died after 54, probably in Rome. His dates are incorrectly reported in the *Chronicle* of Jerome as 87 to 58, but Jerome's observation that he died in his thirtieth year is perhaps correct: his poems mention no event datable after 54. He came to Rome at an unknown date and embarked on the public career expected of a young man of his class, serving on the staff of the propraetor Gaius Memmius, who was governor of Bithynia

in 57–56. The service was uncongenial, as he notes in poems 10 and 28; and it seems to have been his last foray into public life. Instead, he devoted himself to poetry, becoming a major figure in a group of poets (dubbed ‘neoterics’ or ‘new poets’ in modern scholarship) who took their models and aesthetic principles from Hellenistic Alexandria. His closest associates in this group seem to have been Gaius Helvius Cinna (see poem 95) and Gaius Licinius Calvus (poems 14, 50, 53, 96). The poetry of the group was not always apolitical: both Calvus and Catullus wrote attacks on *Caesar. One of the few details of Catullus’ biography recorded in ancient sources is the story in Suetonius (*Iul.* 73) that Catullus made an apology for his invectives on Caesar and his henchman Mamurra (poems 29 and 57) and that the great man magnanimously accepted it. Another important ancient biographical snippet is also related to the poetry: Apuleius’ remark (*Apol.* 10) that Lesbia, the name of Catullus’ most famous subject, was a pseudonym for Clodia. Clodia, a sister of Publius *Clodius Pulcher, was a member of one of the richest and most powerful families in Rome. She is usually identified with *Clodia Metelli, whom *Cicero slanderously attacks in *Pro Caelio*; but Clodius had three sisters and the identification is not certain. Catullus himself provides a further detail, elsewhere unattested: the existence of a brother, whose death he laments in poems 65, 68, and 101.

A number of Catullus’ poems are set in the territory of Verona, and he returned from time to time to the north: notably to Sirmio (modern Sirmione on Lake Garda) after coming home from Bithynia (poem 31), and to Verona after his brother’s death (poem 68). But he made his life in Rome, as he says in poem 68: ‘I live in Rome. That is my home, / that is my place, there my life is spent’ (68.34–5). Rome is not the subject of his poetry, but its politics, social life, and culture—especially literary culture—are evoked in almost every poem. Catullus addresses several major political figures of his turbulent era, more often than not in invectives. Caesar appears in poems 11, 29, 54, 57, and 93, *Pompey in 29 and 113, Cicero in 49, Clodius in 79, where he is called Lesbius in allusion to his incestuous relationship with Catullus’ Lesbia. Catullus’ poetry is set in a social world appropriate to the unsettled period: sophisticated, pleasure loving, and more interested in private concerns (*otium*) than in public responsibility (*negotium*). The new literary movement to which he belonged was equally concerned with sophistication and private life. Like the other neoterics, Catullus wrote about what interested him—not the themes of earlier Roman poetry. He espoused the learned poetics of the Greek Alexandrians, especially *Callimachus, translated and imitated Alexandrian poetry, and

focused on the minutiae of poetic style. He also wrote very personal poetry about his love affairs, the kind of poetry he liked, and his friends and enemies—all with the same attention to artful technique that characterized his more obviously Alexandrian works.

Modern editions include 113 poems. The collection falls into three sections of different metrical and formal character. Poems 1 to 60 (often called the polymetrics) are short poems in lyric or iambic metres addressed to an assortment of friends, lovers, and enemies; their tone may be correspondingly friendly, passionate, or abusive (the abuse is often viciously obscene). Poems 61 to 68 are Alexandrian and neoteric works in several meters: two epithalamia (61 and 62), a *recherché* poem on Attis in galilambics (63), a miniature epic or *epyllion* on the marriage of Peleus and Thetis dominated by a long digression on *Theseus and Ariadne (64), and four elegies (65–68). Poems 69 to 113 are epigrams, metrically homogeneous but various in content; their themes range from love and grief to obscene invective. Whether Catullus himself arranged the poems in their present order is controversial and likely to remain so. The length of the collection (around 2,300 verses) seems to argue against its circulation in a single roll or book, and the different character of the three sections suggests that the present collection originated in at least three separate books. Within the three sections, however, scholars have identified several cycles ordered by content. The strongest case has been made for the opening sequence (poems 1 to 11), in which poems to friends alternate with Lesbia poems (2, 3, 5, 7, 8, and 11). The poems on friendship show Catullus in his everyday life with his male contemporaries; the Lesbia poems present a narrative: courtship (poems 2, 3), happiness (5, 7), estrangement (8), and final renunciation (11).

Catullus’ variety defies easy classification. Some poems are deeply moving, others (about a quarter of the collection) obscene or vitriolic, others conspicuously learned. Their common quality is an intensity and apparent sincerity of feeling that claims readers’ sympathies and draws them into the emotional world of the poet. In the Lesbia poems he presents an original and moving treatment of heterosexual erotic love, using the vocabulary of familial love and aristocratic friendship to elevate it into a realm of commitment of high moral value to Roman men. Catullus’ brother is a foil to Lesbia, representing the pull of Verona and familial love against that of Rome and eros. Juventius presents another foil; he is the conventional boy of pederastic poetry, not an object of idealistic emotional aspiration. Catullus uses obscenity more as a bludgeon than as a scalpel, but never gratuitously. Poems with obscenity or vulgarisms that are of special art and interest include 6 (on Flavius and his

girlfriend), 16 (a poetic manifesto addressed to Furius and Aurelius), 28 (on Memmius), 37 (on Lesbia), 41 (on Ameana), 57 (on Caesar and Mamurra), 58 (on Lesbia). The Alexandrian poems are both learned and personal. Catullus laments his brother in 65 and 68, but his characteristic feelings of love, separation, and loss are also legible in *Attis* (poem 63), *Ariadne* (64), the lock of *Berenice* (66), and *Laodamia* (68).

Catullus greatly influenced both the Augustan poets and *Martial, but his poems had fallen out of fashion by the end of the 2nd cent. They survived the Middle Ages in a single manuscript, which came to light in Italy around 1300. In the 15th cent. Catullus' lyrics and epigrams were imitated by Giovanni Gioviano Pontano and other important Neo-Latin poets in Italy. By the 16th cent. interest in Catullus had spread to the rest of Europe; now the long poems (especially 63) were also being imitated, and imitators were working in both Latin and modern European languages.

censorship See INTOLERANCE, INTELLECTUAL AND RELIGIOUS.

Centaur (Greek *Kentauroi*), a tribe of 'beasts' (*Il.* 1. 268, 2. 743), human above and horse below; the wild and dangerous counterpart of the more skittish *satyrs, who are constructed of the same components but conceived of as amusing rather than threatening creatures. In both cases it is the very closeness of the horse to humanity that points up the need to remember that a firm line between nature and culture must be drawn. Pirithous the king of the Lapiths, a Thessalian clan, paid for his failure to absorb this lesson when he invited the Centaurs to his wedding-feast; the party broke up in violence once the guests had tasted *wine, that quintessential product of human culture (Pind. fr. 166 Snell-Maehler), and made a drunken assault on the bride (see the west pediment of the temple of Zeus at *Olympia). 'Ever since then,' says Antinous in the *Odyssey* (21. 303), 'there has been conflict between centaurs and men.' Their uncontrolled lust, violence, and greed for alcohol (see ALCOHOLISM) challenge the hard-won and ever fragile rules of civilization, which are symbolically reasserted by the victories of *Heracles (whose wife Deianira the Centaur Nessus tried to rape) and *Theseus (who sometimes fights alongside his friend Pirithous in the wedding-fight) over the savage horde. Centaurs belong to the forested mountains of Arcadia (see PELOPONNESE) and northern Greece, the fringes of human society, so it is natural that in the 'Centauromachies' (battle-scenes between Lapiths and Centaurs) so popular in Archaic art (e.g. the François vase) they fight with uprooted trees and boulders against

Centaur Terracotta figurine of a Centaur, c.950–900 BC, from *Lefkandi. British School at Athens

armed and disciplined Greek heroes; it is with fir-trunks that they pound the invulnerable Lapith Caeneus into the ground.

Their double-natured ambivalence is further emphasized in traditions which single out two of their number, Chiron and Pholus, as wise and civilized exceptions to the general rule. Pholus, it is true, eats his steak raw like an animal when entertaining Heracles in his Arcadian cave (Apollod. *Bibl.* 2. 5. 4), but his self-control is shown by the fact that he is capable of holding his liquor—a specially aged vintage donated by Dionysus—until the other members of his tribe scent the bouquet of the wine, go berserk, and have to be shot down by Heracles. Chiron is a more complex character, blurring the human–animal boundary still further: vase-painters often make the point by giving him human rather than equine front legs and draping him in decorous robes. His bestial side is demonstrated by the way he feeds the baby *Achilles, deserted by his mother Thetis, on the still-warm blood of the hares which in art he habitually carries over his shoulder as a portable game-larder (hence, in turn, the savagery of the hero); but he is also a source of wisdom on natural medicine (*Il.* 4. 219, 11.

831), and is recorded as an educator of Jason and *Asclepius as well as Achilles.

By the 5th cent. BC, Centaurs (like *Amazons) come to symbolize all those forces which opposed Greek male cultural and political dominance; on the Parthenon metopes, with their heroically nude boxers and wrestlers, the triumph over Persia is a clear subtext (see PERSIAN WARS). Of later literary treatments, *Ovid's magnificently gory, over-the-top account of the Lapith wedding (*Met.* 12. 210 ff.) is not to be missed.

AHG

centuriation, a system of marking out the land in squares or rectangles, by means of *limites*, boundaries, normally prior to distribution in a colonial foundation.

(The units above and below the *centuria* are explained by Varro, *Rust.* 1. 10.) The practice appears with the second phase of Latin colonization (see COLONIZATION, ROMAN) beginning after 338 BC, perhaps at much the same time as apparently similar approaches in such cities of Magna Graecia (Greek S. Italy) as Heraclea and Metapontum. (There is no good evidence that in the Roman world the earliest stage involved marking out only in strips, rather than in squares or rectangles.) Centuriation was widespread in Italy between the 4th cent. BC and the early empire, spreading to the provinces with the projected colony of *Carthage-Junonia in 122 BC. In so far as a single plot of land in a single location was distributed, the practice was not rational in the normal conditions of Mediterranean

centuriation Aerial photography has been instrumental in revealing traces of ancient centuriation, as here in Italy's Po valley, where the system originated with the great wave of Roman *colonization in *(Cisalpine) *Gaul in the 2nd cent. BC. British School at Rome

agriculture: peasant strategies probably depended then as now on farming scattered plots with different soils, altitudes, and aspects, and therefore minimizing the risk of total crop failure; and marriage and inheritance probably rapidly fragmented originally unitary holdings. Those centuriation systems which remain visible today are on the whole those in relatively homogeneous terrain, especially where the *limites* between lots were also ditches which served for drainage, as in the Po (Padus) valley. *Limites* might otherwise be anything from a drystone wall to a row of markers. The *limites* which run east–west are usually known as *decumani*, those which run north–south as *cardines* or *kardines*. There is an abundant, if often desperately obscure, literature on centuriation and similar matters in the writings of the *gromatici* or *agrimensores*, land surveyors, dating from the 2nd cent. AD to the late empire and beyond. The identification, never mind dating, of centuriation systems known only from aerial photographs is often uncertain in the extreme. MHC

chastity *Before Christianity* Chastity was not recommended in classical Greek *medicine before Soranus. In pagan religion, certain goddesses chose to remain virgins (e.g. Hestia/*Vesta,*Artemis/*Diana) and some priestesses—nor necessarily those serving virgin goddesses—remained life virgins. (e.g. Artemis Hymnia in Arcadia, Paus. 8.13.1) while others could only hold the position until the age of marriage (e.g. *Poseidon at Calauria, Paus. 2. 33. 3). They did not support their other human followers who emulated this behaviour (e.g. *Euripides' Hippolytus).

In contrast to the Hippocratics (see MEDICINE §4) who believed a girl must be 'opened up' for the sake of her health, Soranus recommended perpetual virginity as positively healthful for both men and women (*Gynaceceia* 1. 30–2). These chapters were omitted in the Latin versions of his work compiled in late antiquity. He argued that desire harms the body, and loss of seed is damaging to health, while pregnancy and *childbirth exhaust the body. However, Soranus ends the section by conceding that intercourse is necessary for the continuance of the human race.

In contrast to Christian writers of the early Roman empire (see below), Soranus recommends virginity neither for spiritual health nor as part of rejecting the world, but to make the present life easier. HK

Christian

Celibacy and asceticism are endemic to Christianity and are typical of the distinctive outlook on life which runs throughout much of early Christian literature. The practice of holiness, which, at least in general terms, Chris-

tianity inherited from the Hebrew Bible, required the fulfilment of certain norms of sexual and marital behaviour, though abstinence was not typical of Jewish life, except in certain circumstances, e.g. ascetic practices were a central part of the apocalyptic tradition of Judaism (e.g. Daniel 10). The level of purity demanded by the Qumran sect (see DEAD SEA SCROLLS) reflects the regulations with regard to sexual activity in Leviticus, and the requirements laid upon men involved in a holy war in Deuteronomy 20–21 probably explain the reference to virginity in Revelation 14.4.

The life-style of John the Baptist, and the canonical gospels' portrayal of the apparent celibacy of Jesus, set the pattern for subsequent Christian practice. While the influence of Greco-Hellenistic ideas cannot be ruled out, the background of this form of religious observance is to be found in the ascetical practices of certain forms of sectarian Judaism. The centrality of eschatological beliefs for Christianity meant that from the earliest period there was a significant component of Christian practice which demanded a significant distance from the values and culture of the present age. The hope for the coming of a new age of perfection, in which members of the church could already participate, meant that baptized men and women thought they could live like angels (cf. Luke 20.35), putting aside all those constraints of present bodily existence as well as the institution of marriage. St *Paul's approach in 1 Corinthians 7 in dealing with the rigorist life-style of the Corinthian ascetics is typical of a compromise that evolved in which there is a grudging acceptance of marriage and an exaltation of celibacy. The emerging monastic movement, therefore, drew on a long history of ascetical practice, which was taken to extremes in some Enkratite circles. CCR

chemistry See PHYSICS.

childbirth was generally the concern of women, either family and neighbours or experienced midwives who were sometimes ranked as doctors, but male doctors expected to be called in for difficult cases. Several treatises in the Hippocratic corpus (see MEDICINE §4) include some discussion of childbirth. *On the Nature of the Child* ascribes the onset of labour to the movement of the foetus, which breaks the membranes. *Diseases of Women* says that prolonged and unsuccessful labour usually means a difficult presentation, stillbirth, or multiple birth. Suggestions include vigorous shaking to stimulate delivery, and drugs to speed labour (*ōkytokia*); if all else fails, the doctor may resort to embryotomy, the extraction by instruments of a foetus which is still-born or impossible to deliver alive. The uterus is envis-

aged as a container rather than as a powerful muscle, and labour is described as pains not contractions. *Aristotle (*HA* 586^b) notes that pains can occur in the thighs and the lower back as well as the lower abdomen, and that women can help delivery by effort and correct breathing. Dissection by Herophilus, in the 3rd cent. BC, revealed that the uterus is muscular, and Galen (*Nat. Fac.* 3. 3) argues that it has the power to retain or expel the foetus.

The most detailed account of labour and delivery is in the handbook written by Soranus (early 2nd cent. AD) for midwives, the *Gynaecology*. Soranus envisages delivery on a birthing-chair, or on a hard bed if the mother is weak. He does not discuss contractions or distinguish stages of labour, but does describe dilation of the cervix and the breathing-technique to be used in delivery. Pain relief is provided by warm cloths on the abdomen and sharp-scented things to smell, and Soranus emphasizes that the midwife and helpers must reassure the mother and be careful not to embarrass her. At the birth, the midwife signals whether the baby is male or female, then lays the baby on the ground and assesses whether it is 'worth rearing'. She judges when to cut and tie the umbilical cord, cleans and swaddles the baby, and puts it to bed.

Soranus invokes psychological and physical factors in the mother, as well as big babies, multiple births, and abnormal presentations, to explain difficult labour. He offers techniques for relieving a narrow or obstructed cervix (these do not include episiotomy) and for turning a foetus, but makes no mention of obstetric forceps or of Caesarean section as an alternative to embryotomy: a mother could not have survived the trauma of a Caesarean. He has no confidence in drugs, induced sneezing, and shaking to stimulate delivery of the baby or the placenta, and disapproves of cold baths, tight swaddling, and hard beds for newborns. He notes the belief that delivery is impeded if the woman's hair or belt is tied, and the reluctance of some midwives to cut the cord with iron.

Maternal mortality, like neonatal and infant mortality, is often assumed to have been high, but estimates of the maternal death rate range from 5 in 20,000 to 25 in 1,000. Women may have died from exhaustion and haemorrhage in a difficult delivery (especially if they had poor health or were very young) or from eclampsia, a kind of epilepsy which can now be detected early; puerperal fever occurred, but infection is relatively unlikely in home delivery.

In Greek tradition, childbirth ritually polluted those present because blood was shed, and delivery on sacred ground was therefore forbidden (*see* POLLUTION). Olympian

goddesses are not represented as giving birth. The deities most often invoked in labour were *Artemis Eileithya (sometimes regarded as separate deities) or *Hera in Greece, *Juno Lucina in Rome. Roman childbirth rituals are briefly described by *Augustine (*De civ. D.* 6. 9), but his source is the antiquarian *Varro rather than common practice. There are also allusions to rituals in which the father lifts the child from the earth (*tollere liberum*) or carries the child round the hearth (*amphidromia*), but these would not always be practicable—for instance, in a house with no central hearth or when the baby was born on the upper floor of a tenement—and it was the name-day celebration, approximately ten days after the birth, which publicly acknowledged the child as a family member. Cicero (*see page 166*)

Cincinnatus Lucius Quinctius Cincinnatus, a *patrician listed in the *fasti* as suffect consul (*see* CONSULY) in 460 BC. In 458, according to tradition, when a Roman army under the consul Lucius Minucius Esquilinus Augurinus was besieged by the Aequi on Mt. Algidus, Cincinnatus was called from the plough and appointed *dictator. Within fifteen days he assembled an army, defeated the Aequi, triumphed, laid down his office, and returned to his ploughing. The story was frequently cited as a moral example, illustrating the austere modesty of early Rome and its leaders. An area on the right bank of the Tiber called the 'Quinctian Meadows' (*prata Quinctia*) was regarded as the site of Cincinnatus' four-*iugera* farm (*Livy.* 3. 26. 8). He is said to have been appointed dictator a second time in 439 BC during the Spurius Maelius crisis; Cicero says that it was on this occasion that he was called from the plough (*Sen.* 56). It was this detail that was firmly fixed in the Roman tradition; the historical context was less certain. The campaign of 458 recalls the rescue of Gaius Minucius in 217, and Cincinnatus' supposedly crushing victory is suspect, since the Aequi returned to the attack again in 457 and 455. TJCO

circumcision of male genitalia was widely practised in the ancient near east, as Herodotus (2.104) was aware. In general both Greeks and Romans found the custom repulsive and ridiculous, which led to tensions especially with Jews, for whom circumcision, as a religious imperative,

[*continued on p. 173*]

CHRISTIANITY

Christianity began as a Jewish sect and evolved at a time when both *Jews and Christians were affected by later *Hellenism. Following the conquests of *Alexander the Great, some Jews found Hellenistic culture congenial, while others adhered to traditional and exclusive religious values. When Judaea came under direct Roman control soon after the death of Herod the Great in 4 BC, cultural and religious controversies were further exacerbated by the ineptitude of some Roman governors. Jesus therefore, and his followers, lived in a divided province.

The 'historical Jesus' is known through the four Gospels, which are as sources problematic. Written not in Aramaic but in Greek, the four 'Lives' of Jesus were written some time after his death (and, in the view of his followers, resurrection) and represent the divergent preoccupations and agendas of their authors. The Gospels of Mark, Matthew and Luke (to give their probable chronological order) differ from John in such matters as the geographical scope of Jesus' ministry, which John expands from Galilee to include Judaea and Samaria as well; John also is more influenced by Greek philosophical thought. Through them, we can see Jesus as a rabbi and teacher, whose followers included socially marginal women (e.g. Mary Magdalen) as well as men, as a worker of miracles, as a political rebel, or as a prophet, who foresaw the imminent ending of the world, and the promised Jewish Messiah. For later critics of Christianity, such as the pagan Celsus, whose work survives in 'rebuttal' by Origen of Alexandria (c. 185–254), the crucifixion of Jesus, on the ground that he had claimed to be 'King of the Jews', alongside two bandits, was an invitation to accuse Christians of worshipping a condemned criminal.

The missionary journeys of the Apostle *Paul, as recorded in the Acts of the Apostles, have been held to signal the 'parting of the ways' between Judaism and Christianity. In fact, neither was a centrally organised or entirely coherent unity and both Christians and Jews lived in a religiously flexible and pluralist environment. Priests, sacrificial rituals, initiation rites and lifestyle choices were elements in many ancient Mediterranean religions. The various religious systems grouped under the collective label of Gnosticism drew on different traditions, including Christianity, to explain the cosmos and man's place in it. Individuals, such as Justin Martyr in the 2nd cent., and, in the 4th cent., Marius Victorinus and *Augustine, experimented with different philosophies and systems of belief before making a commitment to Christianity; the search for religious truth is also satirized in *Lucian's *De morte Peregrini*. Interest in Christian belief and practice did not always lead to *conversion, in the sense of rejecting previous beliefs and practices.

Over time, however, Christian religious practice established a separate identity. This was achieved partly through deliberate emphasis on difference; as late as the 4th cent., John Chrysostom vigorously attacked the Jews of Antioch, perhaps from fear that they would in turn win converts from Christianity, or from awareness that his hearers did not see a difference. Christian initiation was distinctive. Baptism, often in adulthood, was preceded by a period of education in Christian doctrine and scripture, and instruction, as documented later in Augustine's treatise on 'catechizing the uninstructed learned' (*De Catechizandis Rudibus*), a masterly demonstration of the need for tact when instructing converts from different educational and social backgrounds. Baptized Christians shared bread and wine in the Eucharist ('thanksgiving', also called 'communion'), which commemorated the sacrifice of Christ and his Last Supper with his disciples, before an audience of the baptized and was followed by a ritual meal, the Agape. Christian communities, which evolved based on cities, at first had various forms of organisation. From early in the 2nd cent., most were headed by a bishop (*episkopos*, 'supervisor'), supported by priests, deacons (*diakonoi*, 'servants' or 'administrators'), exorcists, readers, and other church officials. The power of the bishop in the Christian community was extensive; he controlled finances, appointed and disciplined clergy, baptized converts and provided inspiration through preaching and other forms of spiritual leadership. Public liturgical ceremonial, in the form of processions and ritual acts, including fasting, reinforced the symbolic and historical identity of the new faith.

The *Acts of the Apostles and the letters of Paul record hostile reactions to Christian missionary activity. Paul's journeys round the cities of the near east took him to communities of the Jewish diaspora, where he might also encounter devout non-Jews. Like other wandering preachers, he found audiences in the public spaces of cities, such as the Agora at Athens (Acts 17.17; see ATHENS (TOPOGRAPHY) (*agora*)). But his presence also provoked public disorders, such as the riots of the silversmiths at Ephesus who saw him as a threat to trade, leading to expulsion or imprisonment. According to Acts, he was finally accused by the Jewish religious establishment before the Roman governors Felix and

Porcius Festus, and deported to Rome to stand trial as a Roman citizen before the emperor. His letters, and those wrongly but generally ascribed to him, celebrate opposition and adversity, although he personally avoided martyrdom for as long as he could.

Accounts of persecution for the sake of their faith were integral to the evolving identity of early Christians, but instances of hostility on the part of the Roman or local authorities were in fact limited. *Nero's notorious persecution of Christians, whom he blamed for the Great Fire of Rome in 64, established an imperial precedent. In c.110, *Pliny the Younger, as governor of Bithynia, inquired of *Trajan what he was to do about Christians, and, after an investigation, he had found no evidence for deviant practices, although he continued to execute those who had refused to recant, on grounds of 'the name' (*nomen Christianum*); Trajan's reply was that anonymous accusations were to be rejected and those who renounced their faith by honouring the Imperial cult were allowed to go free. The ban on anonymous accusations against Christians, a general feature of Roman legal practice, was reiterated in *Hadrian's rescript to Minicius Fundanus, proconsul of Asia. According to Christian authors, in general, until 250, persecution was triggered by local suspicions of a cult regarded as deviant because of Christians' secret and allegedly cannibalistic and incestuous rites, and their refusal to participate in civic religious ceremonies. Mob demonstrations led to the burning of the aged bishop Polycarp of Smyrna in 155 and the condemnation to the arena of the martyrs of Lyon and Vienne before the governor in 177. The Acts of Perpetua and Felicitas, martyred at Carthage in 203, contain vivid dream accounts and evidence for challenges to episcopal authority within the local Christian community, perhaps associated with Montanism.

In 250, the emperor Decius ordered all in the Roman empire to sacrifice, and to acquire a certificate for doing so. Christians' failure to obey resulted in a series of imperial attempts to enforce conformity, which lasted until the defeat of Valerian in 260; among the victims, in 258, was Cyprian, bishop of Carthage. With the accession of *Diocletian and the creation of the Tetrarchy, new impetus was given to the revival of traditional pagan religion and the outlawing of deviant cults, such as Manichaeism, which was associated with the arch-enemy, Persia. Inaugurated in February 303, the 'Great Persecution' of Christians continued, especially in the eastern parts of the Empire and Africa, until Galerius' Edict of Toleration in 311, though persecution finally ceased only with the death of Maximinus in 313. Meetings of Christians were forbidden, clergy imprisoned and books and treasures seized; Christians who refused obedience to the emperors' decrees were publicly and painfully executed. The effects of persecution continued after 313, causing divisions within the Christian community. In Africa, in the mid-3rd cent., Cyprian as bishop confronted rigorists who believed that those who lapsed through fear could not be readmitted to communion. In 313, the controversy took a new form with the rigorists, who would be known as the Donatists, refusing to recognize a bishop consecrated by a 'traditor', a hand-over of the sacred books. Repeated interventions by *Constantine I failed to resolve the issue and the Donatist schism, with its separate, parallel church organization, continued to divide African Christians until the time of *Augustine.

It is difficult to assess the numbers of Christians at any period, especially as, by the early 4th cent., one in ten of the population of the empire may have been Christian, although most main Christian centres were concentrated in the eastern empire. Motives for conversion are obscure. Christian monotheism had become increasingly compatible with wider preferences for a single supreme deity, and Christian identity was not always as distinct and consistent as Christian leaders wanted. Christian intellectuals, such as Tertullian in Carthage and Origen and *Eusebius of Caesarea, had taken on pagan religious controversialists on their own terms, using the sophisticated linguistic and rhetorical armoury common to the educated classes. This helped to make Christianity acceptable, but more important for the ordinary citizen was the social role of the Church in the community. The exercise of charity and giving to the poor was central to Christian teaching and practice; Christians also looked after the widows and orphans unable to fend for themselves, sometimes inducting women into 'orders' of virgins and widows. Christianity may also have provided avenues for advancement for those who were unable to achieve social recognition in other ways. Unlike some cults, Christianity charged no entry fee, and was open to women (as the cult of *Mithras was not) and to slaves, who could expect equality of status in the next world, though not in this. But the role of Christianity as a social equalizer should not be overplayed. Bishops tended to be drawn from families already eminent in the community, who could have owned the houses in which Christians originally met and who also possessed the literary skills and confidence to sustain a public role.

The era of the Tetrarchs and Constantine I saw a shift in religious discourse. Eusebius of Caesarea formulated a new comparative chronology integrating Christian and biblical history with the histories of Greece and Rome. His *Ecclesiastical History* broke with tradition in creating a new and extensively documented history of Christianity, the

Church and heresy (which he saw as an external menace, inspired by the devil); and his biography of Constantine (the *Vita Constantini*) offered a new model of a 'pious' emperor. At the same time Lactantius demonstrated the workings of Providence through his celebration of the *Deaths of the Persecutors*; more theologically significant was his redrawing in the *Divine Institutes* of the Christian philosophy of virtue with reference to *Cicero, arguing that the reward for Christian virtue was immortality and that adversity was required as part of the divine order, because it served as a test of virtue. Later in the 4th cent., some Christians, of an ascetic bent, found classical culture incompatible with Christianity; Jerome, for example, dreamt that he was visited with divine chastisement for being a 'Ciceronian' rather than a Christian. Others, however, Jerome (despite himself) included, used their classical learning not only to convey the Christian message but also to demonstrate Christian ownership of the ancient literary forms.

The conversion of Constantine to Christianity changed fundamentally the relationship of the Christian Church with the emperor and the Roman authorities. In the aftermath of his victory over Maxentius at the Battle of the Milvian Bridge in 312, won, in some sense, under Christian auspices, Constantine confirmed the Church's financial position, ordering property confiscated under the persecutions to be restored; he also gave money to Christian communities in Africa and began the building of imperially-sponsored churches at Rome. For the first time, bishops had access to the emperor and, sometimes through officials, sought his legal opinion on such matters as the functioning of episcopal courts in relation to their lay counterparts, and how the Sunday holiday should be observed. Constantine's legislation on marriage and the family is sometimes viewed as being influenced by Christianity, but is more likely to reflect the general, less permissive, moral climate of the time.

Constantine was less successful, however, in resolving the Donatist schism in Africa; after a series of councils and an ineffective military intervention, the African Christians were left to fend for themselves. Nor, ultimately, did he succeed in reconciling the disputants in the so-called Arian controversy, concerning the nature of the substance of God the Father and God the Son. After his victory over Licinius, Constantine convened the ecumenical Council of Nicaea, the first of its kind, which debated in his presence and accepted his formula for reconciling the parties. Despite this, the issue continued to divide the churches in the reigns of Constantine's sons; and, although the doctrines associated with Arius were rejected by Theodosius I, peoples outside the Empire, notably the Goths, had already accepted 'Arian' Christianity, thanks to the missionary activities of the bishop Ulphilas.

Christianity now began to make an impact on the physical appearance of cities. Initially confined to meetings in house-churches or graveyards, Christians acquired the confidence and resources to build churches and shrines of their own. Many such were, still, based outside cities, in the areas where local saints and martyrs were buried; only slowly did Christians come to make an impact on the landscapes of cities by building churches within the walls. An exceptional case in Constantine's reign was the rapid rise of Jerusalem, hitherto a neglected outpost of empire, to wealth and prominence as a centre for pilgrimage and religious tourism, a development furthered by the alleged discovery of the True Cross and by imperial women, notably *Helena Augusta, Constantine's base-born mother, and, in the mid-5th century, Aelia Eudocia, the empress of Theodosius II.

Although many aristocrats retained their previous beliefs, there were several 'conversions of convenience' among aspiring careerists. Men such as Ambrose of Milan (bishop 374–397), who might have pursued a career in the secular administration, found a new outlet for their energies in the episcopates of major cities, where they employed their rhetorical and networking skills, supported by the wealth of their churches, to further the cause of their religion. In addition to his more obviously political activities, Ambrose was also a pioneer in the development of saints' cults, 'discovering', miraculously, the relics of the Milan martyrs Gervasius and Protasdius, some of which he distributed to his episcopal and aristocratic connections. As the reality of martyrdom receded into the past, the celebration of saints' cults reshaped the public ceremonial of city churches and their liturgical year, while local civic identities were reformulated to incorporate the idea of saints as patrons and protectors. Bishops preached on the martyrdoms of their saints, generating a literature of persecution, which emphasized (and exaggerated) the sadistic anger of the persecuting governors and the gory details of the tortures inflicted, to enhance the constancy of the Christian 'witness' (*martys*). Episcopal eloquence mattered, given the bishop's role as preacher, but, equally important, was his ability to interact with his unsophisticated flock (as Augustine's sermons, with their backchat with his audience, illustrate).

Not all Christians were happy with the new prosperity. Already in the 3rd cent., men were withdrawing from the world to engage in the life of ascetic contemplation. In Egypt, the monk Antony, whose Life was written by Athanasius, withdrew ever further into the desert to avoid both other hermits and those eager to benefit from his wisdom.

Two basic models of the ascetic life evolved: the solitary hermit; and the monk (or nun) who lived as part of a religious community, with varying degrees of contact with fellow ascetics. Based initially largely in Egypt and Syria, the monastic movement spread westwards, and in Gaul was furthered by the monk-bishop, Martin of Tours, whose simple lifestyle allegedly provoked mockery among his (unworthy) fellow-bishops. At Rome, a group of single or widowed, wealthy senatorial women, guided in the 380s by Pope Damasus' secretary, Jerome, and later by the British monk Pelagius, withdrew from the Roman social round to engage in bible study, a restricted diet, and the surrender of their worldly goods for the benefit of the poor. Some left Rome for the east, to visit the pilgrimage sites in the Holy Land and found monasteries, as Jerome and his disciple Paula did at Bethlehem. At first regarded with suspicion by the established churches, ascetics and their monasteries were gradually assimilated into mainstream Christianity. In Gaul, while Martin (372–397) was seen as a divisive figure in the 4th cent., in the 5th Germanus of Auxerre (bishop 418–448) combined the austerity of the ascetic with the diplomatic skills and political clout of the aristocrat.

By the end of the 4th cent., Christianity had largely triumphed over its religious competition, although a pagan Hellenic tradition would continue to flourish in the Greek world and rural and local cults also persisted. However, the spread of Christianity often encountered spirited, if localized, resistance. At Rome, in the late 4th cent., an influential group of senators, led by Quintus Aurelius Symmachus and Vettius Agorius Praetextatus, promoted observance of both public and mystery religions. Praetextatus succeeded in protecting the Mysteries of *Eleusis under Valentinian I and Symmachus led senatorial resistance to the removal of the Altar of Victory, arguing vigorously but unsuccessfully against Ambrose for its restoration in 384. The usurpation of Eugenius (392–394) had distinctively pagan overtones, largely due to the initiatives of Nicomachus Flavianus. There was also violent resistance to Christian encroachment on a local level, as pagans sought to protect their sacred trees (as at Tours), subvert offensive Christian processions (as at Calama in North Africa) and, in extreme cases, lynch local bishops who had gone too far.

The spread of Christianity was helped by pressure from emperors exerted through legislation. The sons of Constantine outlawed sacrifice and closed temples to religious celebration (although they could remain open for social purposes). The emperors also allowed the preservation of statues, on the grounds that they were works of art. *Julian, however, used legislation to reverse the Christian tide, reopening temples, banning daylight 'funerals', which could include processions in honour of martyrs, and ordering councils not to allow the appointment of Christians as official teachers of the pagan classics (a ban which could extend in practice more widely). More insidiously, he backed anti-Christian factions in local disputes and issued no more than a mild rebuke to those who had lynched the bishop of Alexandria, George of Cappadocia. The decisive break with the past came in the 380s and 390s. Gratian resigned the ancient title of pontifex maximus (head of the college of priests) and removed the Altar of Victory from the senate house; and in 391–392, Theodosius I not only banned sacrifices but also made it incumbent on governors to ensure that the legislation was enforced. Also, crucially, public funding for pagan offerings was withdrawn. The Roman state thus no longer acknowledged the power of the old gods to protect it, a measure which, in the view of opponents of Christianity, led directly to the Fall of Rome to the Goths in 410. Augustine's lengthy refutation of this claim, in his 22-book *City of God*, rejected the practices of traditional religion and the arguments of non-Christian philosophers for the worship of lesser divine beings as well as the one God. He offered a vision of a Christian community defined by love of God, not by membership of the institutional church. Its citizens live intermixed with the city of this world, whose citizens are defined by love of self, not by membership of a political grouping. Only God knows who belongs to which city. Augustine wanted Christians to be clear about their Christian identity and moral values, and to be inspired by those whose love of God had led them to accept martyrdom or to prefer life in a monastic community to life in Roman society. He also argued that in a fallen world, order and sometimes force are needed to maintain peace, and Christians who hold public office must accept the task. Christians cannot separate themselves from the world in which they live. He turned to *Varro and Cicero for inspiration on the nature of the citizen community, while also offering counsel on, among other things, the trauma of rape, the morality of *suicide and the nature of saints' cults.

CICERO

Cicero (Marcus Tullius Cicero), the famous orator.

Life

The first of two sons of a rich and well-connected *eques* (see *EQUITES*, *Origins and republic*) of Arpinum, he was born on 3 January 106 BC, the year following the first consulship of *Marius, with whose family (also from Arpinum) his grandmother Gratidia had marriage connections. His intelligent and ambitious father (who was to die in the year of Cicero's canvass for the consulship), advised perhaps by Lucius Licinius Crassus, gave his two sons an excellent education in philosophy and rhetoric in Rome and later in Greece, with their two first-cousins as their fellow students. Cicero did military service in 90/89 under *Pompey's father, Gnaeus Pompeius Strabo, and attended legal consultations of the two great Scaevolae (both called Quintus Mucius Scaevola). He conducted his first case in 81 (*Pro Quinctio*) and made an immediate reputation through his successful defence of Sextus Roscius of Ameria on a charge of parricide in 80, a case which reflected discreditably on the contemporary administration of the dictator *Sulla. Cicero was then from 79 to 77 a student of philosophy and oratory both in Athens and in *Rhodes, where he heard Posidonius; he visited Publius Rutilius Rufus at Smyrna.

He returned to Rome, his health greatly improved, to pursue a public career, and was elected quaestor for 75, when he served for a year in western Sicily, and praetor for 66, in each case at the earliest age at which he could legally become a candidate. By securing the condemnation of Gaius Verres for extortion in Sicily in 70 he scored a resounding success against Quintus Hortensius Hortalus, eight years his senior, whom he was to replace as the leading figure at the Roman bar. In a cleverly disarming speech delivered during his praetorship (*De imperio Cn. Pompei*) he supported, against strong opposition from the so-called 'optimates' ('best men', i.e. the office-holding upper class), the tribune Gaius Manilius' proposal to transfer the command in the war against *Mithradates VI to *Pompey; this was the first public expression of his admiration for Pompey who was, with occasional short interruptions, henceforward to be the focus of his political allegiance. He was elected consul for 63—the first *novus homo* (first man from his family to reach the consulship) with no political background whatever since 94—because, in a poor field (including *Catiline, who had tried for the office twice before), his reputation as an orator and his cultivation of aristocrats, *equites*, and prominent Italians paid off. Hampered by a weak and indeed suspect colleague, Gaius Antonius 'Hybrida', Cicero did very well to secure evidence which convinced the senate of the seriousness of Catiline's conspiracy. After the 'last [i.e. emergency] decree' (*senatus consultum ultimum*) was passed, and Catiline left Rome for his army in Etruria, five conspirators prominent in Roman society and politics, including a praetor, Publius Cornelius Lentulus Sura, were arrested and executed on 5 December (the Nones). Although, after debate, the senate, influenced by *Cato the Younger, had recommended their execution, the act itself, a violation of the citizen's right to a trial, could be justified only by the passing of the last decree and was Cicero's personal responsibility. Though approved in the first moment of panic by all classes of society in Rome, its legality was strictly questionable, and Cicero was unwise to boast as loudly of it as he did (even in a long and indiscreet letter to Pompey in the east, *Sull.* 67, *Planc.* 85; cf. *Fam.* 5. 7). He published his speeches of 63, including those against Catiline, in 60, wrote of his action in prose and verse, in Greek and Latin, and invited others, including Posidonius, to do the same; and to the end of his life he never wavered in his belief that he had acted rightly and had saved Rome from catastrophe.

Though it was unlikely that he would escape prosecution, Cicero refused overtures from *Caesar, which might have saved him at the price of his political independence. In 58 Publius *Clodius Pulcher, whom he had antagonized in 61 when Clodius was charged with incest, moved a bill as *tribune of the plebs re-enacting the law that anyone who had executed a citizen without trial should be banished. Without awaiting prosecution Cicero fled the country, to Macedonia, and Clodius passed a second bill, which Cicero regarded as unconstitutional, declaring him an exile. His house on the Palatine was destroyed by Clodius' gangsters, part of its site to be made a shrine of Liberty, and his villa at Tusculum was also badly damaged. With Pompey's belated support and with the support of the tribune Titus Annius Milo, who employed violence as irresponsibly as Clodius had done in the previous year, Cicero was recalled by a law

of the people on 4 August 57 and was warmly welcomed on his return both in Italy and in Rome, which he reached on 4 September.

He returned to a busy winter, fighting to secure adequate public compensation for the damage to his property and, in the senate and in the courts, supporting those chiefly responsible for his recall. Hopes of dissociating Pompey from his close political connection with Caesar, attempts which Clodius was employed by Caesar to interrupt, were at an end when Caesar, Pompey, and *Crassus revived their political union at Luca in April 56, and Cicero was sharply brought to heel (*Att.* 4. 5, on his 'palinode' or recantation; cf. *Fam.* 1. 9 for his later account of his conversion). He at once spoke warmly in the senate (e.g. in *De provinciis consularibus*) and on the public platform in favour of Caesar, as of a long-standing political friend. He claimed that it was the act of a realist, a *sapiens*, to accept the indisputable predominance of the Three ('temporibus adsentendum', *Fam.* 1. 9. 21) and only revealed in conversation and in letters to such close friends as Titus Pomponius *Atticus the deep wound which his pride—his *dignitas*—had suffered. He took no more part in the collapsing world of republican politics, devoting himself to writing, which he never regarded as anything but a poor substitute for active political life (the *De oratore* was published in 55, and the *De republica* finished in 51); and he was humiliated by briefs which, under pressure from Pompey and Caesar, he was forced to accept. He defended Publius Vatinius successfully and Aulus Gabinius unsuccessfully in 54. He was humiliated too by his failure, in a court packed with troops, to defend Milo adequately when, with the case already prejudiced, Milo was impeached for the murder of Clodius early in 52. The period brought him one consolation, when he was elected augur in 53 or 52 in the place of his earlier protégé, young Publius Licinius Crassus, who had been killed at Carrhae.

Cicero was out of Rome during the eighteen months preceding the outbreak of the Civil War, being selected under regulations following Pompey's *lex de provinciis* of 52 to govern Cilicia as proconsul from summer 51 to summer 50. He was a just, if not a strong, governor, but he regarded his appointment with horror as a second relegation from Rome. However, his despatches recording the successful encounter of his troops with brigands on mons Amanus earned a *supplicatio* (ritual thanksgiving) at Rome and he returned, the *fasces* of his lictors wreathed in fading laurels, hoping that he might celebrate a triumph. Instead he was swept into the vortex of the Civil War.

Appointed district commissioner at Capua by the government, he did not at first follow Pompey and the consuls overseas. Caesar saw him at Formiae on 28 March 49, and invited him to join the rump of the senate in Rome on terms which with great resolution Cicero refused to accept (*Att.* 9. 11 a, to Caesar; 9. 18). His long indecision up to this point which was anything but discreditable was now at an end, and he joined the republicans in Greece, irritating their leaders by his caustic criticism, himself dismayed by the absence of any idealistic loyalty on their part to the cause of republicanism. After the battle of Pharsalus (48 BC), in which he took no part, he refused Cato's invitation to assume command of the surviving republican forces and, pardoned by Caesar, he returned to Italy. But political life was at an end, and he was utterly out of sympathy with Caesar's domination. All that he could do was to return to his writing, his only important speech being that delivered in the senate in 46 (the year in which the *Brutus* was written) in praise of Caesar's pardon of Marcus Claudius Marcellus (consul 51), who had done so much to precipitate the outbreak of the Civil War.

That Cicero was not invited to participate in the conspiracy to kill Caesar in 44 is not insignificant. He hailed the news of the murder on 15 March with intemperate delight (e.g. *Fam.* 6. 15). Political life began again, and Cicero had all the prestige (*auctoritas*) of a senior consular. Within three months he was saying openly that Mark *Antony should have been killed too (*Att.* 15. 11. 2). He accepted the overtures of the young Caesar (Octavian; see AUGUSTUS), uncritical of the lawlessness of many of his acts, misled by his youth into a mistaken underassessment of his political acumen, and he closed his eyes to the fact that Octavian could never be reconciled to *Brutus and Cassius. He struggled in speech after speech (the *Philippics*, the first delivered on 2 September 44, the last on 21 April 43) to induce the senate to declare Antony a public enemy. After Antony's defeat in Cisalpine Gaul in April 43, Octavian fooled Cicero for a time, perhaps with the suggestion that they might both be consuls together. But Octavian's intentions were different. After his march on Rome to secure the consulship for himself and his uncle Quintus Pedius, and the formation of the Triumvirate, he did not oppose Antony's nomination of Cicero as a victim of the *proscriptions which were the inauguration of the new regime (for this phase see ROME (HISTORY) §1.5). The soldiers caught Cicero in a not very resolute attempt to escape by sea. His slaves did not desert him, and he died with courage on 7 December 43.

In politics he hated Clodius, with good reason, and he hated Marcus Crassus and, at the end of his life, Antony. For the character of Cato, eleven years his junior, he had unqualified respect, and he published a panegyric of Cato in 45, after his death; but in politics, especially in the years following Pompey's return from the east in 62, he thought Cato's uncompromising rigidity (his *constantia*) impolitic, and Cato never concealed his distaste for Cicero's policy of temporizing expediency, both at this period and when he capitulated to the Three in 56. With Pompey Cicero never established the intimacy to which, particularly after Pompey's return in 62, he aspired, suggesting that he might play a second Laelius to Pompey's Scipio. Few of his contemporaries, perhaps, held him in higher esteem than did his constant opponent Caesar who, though often with an imperiousness which Cicero could not tolerate, was always friendly in his approach. Cicero was not a discriminating judge of the political intentions of others, being far too susceptible to, and uncritical of, flattery; and he was demned to a certain political isolation. Loyally and not very critically devoted to the existing republican constitution, and fascinated by the mirage of a political consensus ('*concordia ordinum*'), he was never a liberal reformer (*popularis*); yet he was never completely acceptable to the established *optimates*, the worst of whom despised his social origin, while the rest mistrusted his personality as much as he mistrusted theirs. And, not having the *clientela* of the noble or of the successful general, he lacked *auctoritas*. It was this political isolation which (cf. *Att.* 1. 17; 1. 18. 1, of 61/60 BC) enhanced the importance for him of his close association with the knight Titus Pomponius Atticus, a man of the highest culture in both languages, his banker, financial adviser, publisher, and most generous and tolerant friend.

His marriage to Terentia had issue: a daughter Tullia, to whom he was devoted, whose death in 45 was the hardest of the blows which afflicted his private life, and a son called (like himself) Marcus Tullius Cicero. His marriage survived the storms and stress of thirty years, until he grew irritated with Terentia and divorced her in winter 47/6, to marry the young Publilia, from whom in turn he was almost immediately divorced. Cicero was a good master to his slaves and, with the rest of his family, was devoted to Tiro (Marcus Tullius Tiro), to whom twenty-one of his letters in *Fam.* 16 are addressed. He gave him his freedom in 53, 'to be our friend instead of our slave', as his younger brother Quintus Tullius Cicero wrote (*Fam.* 16. 16. 1).

Cicero, who was never a really rich man, had eight country residences, in Campania, at Arpinum, at Formiae, and, his suburban villa, at Tusculum; in Rome he was extremely proud of his house on the Palatine, which he bought in 62 for 3½ million sesterces (*Fam.* 5. 6. 2).

Apart from the surviving histories of the late republic and, in particular, Plutarch's *Lives of Cicero* and of his outstanding contemporaries, the bulk of our knowledge of him derives from his own writings, in particular from his letters, only a minority of which was written with any thought of publication. His reputation has therefore suffered from the fact that we have intimate knowledge of the most private part of his personal life; in this respect he has been his own worst enemy, and his critics have given undue prominence to his extremes of exaltation and depression and to the frequent expression of his evident vanity. (See J. P. V. D. Balsdon, 'Cicero the Man', in T. A. Dorey (ed.), *Cicero* (1965).)

Works

Speeches

Fifty-eight speeches of Cicero survive in whole or part; numerous others were unpublished or lost (88 are recorded by Crawford).

Cicero's normal practice, if he decided to publish a speech, was to 'write up' (*conficere*) a version after the event. In one case we know that he delivered a speech from a script (*Post reditum in senatu*); otherwise it seems that only a few important passages, chiefly the exordium and peroration, were written out *in extenso* beforehand. The published versions of court speeches in many instances certainly represent a shortened version of the actual proceedings, as shown by Humbert; the examination of witnesses is largely omitted, and some sections of argumentation are represented only by headings. The extent to which Cicero changed the content or emphasis of his speeches when preparing them for publication is disputed. It has been thought that the speeches were regularly altered to suit the political circumstances of the time of publication, rather than the time of delivery. On the other hand, it has been pointed out that Cicero's overt reason for publication was to provide examples of successful oratory for posterity to imitate and admire, and this would naturally place limits on the degree of alteration that could reasonably be made, as would the presence among his readership of a substantial number of those who had been present at the delivery of the speech.

In certain cases there is evidence that our text does not represent a speech that was actually delivered. The five parts of the *Actio secunda in Verrem* were prepared for use in court but it is generally held that they were not delivered, since Verres withdrew into exile after the *Actio prima*. The second *Philippic* was not delivered as a speech, but circulated as a pamphlet, although it observes the conventions of a senatorial speech. But these are exceptions. The *Pro Milone* is an exception in another way, being a rare example of an unsuccessful speech that was nevertheless published; our sources claim or imply that they had access to a transcript (complete with interruptions) of the actual speech, which differed from Cicero's published version, although it is not proved that the difference in content was much greater than in the case of most of Cicero's other speeches (J. N. Settle, *TAPA* 1963, 268–80).

Cicero's reputation as an orator depended on consistent practical success, although his detractors in antiquity made as much capital out of his relatively rare failures as their modern equivalents have done. In these successes a large part must have been played by his manner of delivery, of which virtually no impression can be given by a written speech; yet it is possible to see in the published versions something of the powers of advocacy that made Cicero the leading courtroom orator of his time (this has been brought out particularly clearly by Stroh). The political speeches are perhaps more difficult for a modern reader to appreciate: Cicero's self-glorifications and his unbridled invectives tend to repel those brought up in a modern western society, while adverse judgement of his political position can hinder appreciation of his oratory. It is easy to be cynical about what *Juvenal called the 'divine Philippic' (the Second) without coming to terms with the historical circumstances that produced this and other speeches, and the oratorical qualities that made them into objects of near-universal admiration.

The style of Cicero's speeches did not remain entirely uniform. As he himself observed, in his youth he had a tendency to exuberance (so-called Asianism), best exemplified in the *Pro Roscio Amerino* (cf. F. Solmsen, *TAPA* 1938, 542–56); this was later tempered by increasing maturity and by a change in oratorical fashion. The style also depended to some extent on the occasion; there are variations in manner between Cicero's addresses to senate and people, to a full jury, and to a single arbitrator, and Cicero himself talks of the different styles appropriate for the different sections of a speech (plain for narration, grand for the final appeal to the emotions, etc.). However, Cicero's speeches throughout his life are consistent in their rhythmical regularity, their smooth and balanced sentence-construction, and their careful choice of vocabulary and idiom (on the style of the speeches, see Laurand). Cicero's style was criticized by some of his contemporaries for lacking vigour (Tac., *Dial.* 18) and by later rhetoricians for longwindedness and lack of quotability (ibid. 22).

Cicero made good use of the theories of rhetoric current in his time, and, still more, of the great classical models of Athenian oratory. Most of the ancient structural conventions, figures of speech, and standard modes of argument can be exemplified from his writings, and some of the speeches were consistently taken as copy-book examples by later rhetoricians such as *Quintilian; but Cicero never merely followed the rules for their own sake, and examples can be found of highly effective departures from the recommended practice of the rhetoricians.

Of the extant speeches, three belong to the period before Cicero's Sicilian quaestorship (*Pro Roscio Amerino*, from Cicero's first major public trial in 80 BC, together with *Pro Quinctio* and *Pro Roscio Comoedo*). Then follows the series of speeches from the trial of Verres in 70: *Divinatio in Caecilium*, the *Actio prima in Verrem*, and the five speeches of the *Actio secunda* generally referred to as the Verrines. The *Pro Tullio*, *Pro Fonteio*, and *Pro Caecina* date from 69. Two of the extant speeches belong to Cicero's praetorship, the *Pro lege Manilia* (alias *De imperio Cn. Pompei*) and the *Pro Cluentio*. Of the 'consular' orations which Cicero himself published (a collection of twelve according to *Att.* 2. 1. 3; but see W. C. McDermott, *Philologus* 1972, 277–84), we have the three speeches *De lege agraria contra Rullum*, the *Pro Rabirio perduellionis reo*, and the four *Catilinarians*; the *Pro Murena* also dates from this year. From the years succeeding the consulship the *Pro Sulla*, *Pro Archia* (both 62), and *Pro Flacco* (59) survive. Another group is formed by the speeches made on returning from exile in 57 and in the following year: *Post reditum in senatu*, *Post reditum ad Quirites*, *De domo sua*, *De haruspicum responsis*, *Pro Sestio*, *In Vatinius interrogatio*. To the year 56 also belong the senatorial speech *De provinciis consularibus* and the defences of Caelius Rufus and Lucius Cornelius Balbus; the invective *In Pisonem* was published in 55. From 54 we have the *Pro Plancio* and the *Pro Rabirio Postumo*. In 52, Cicero defended Titus Annius Milo without success, publishing a version of the speech before departing to govern Cilicia. In 46–45, Cicero addressed the victorious Caesar on behalf of Marcus Claudius Marcellus, Ligarius and King Deiotarus of Galatia. Otherwise Caesar's dictatorship offered no opportunity for Cicero to exercise his forensic gifts, and he devoted himself to the writing of treatises on rhetoric and philosophy. During his brief return to public life in 44–43, Cicero delivered the series of speeches known (at his own joking suggestion: *Ad Brut.* 2. 3. 4) as the *Philippics*, which directly or indirectly expressed his opposition to Mark Antony; cf. DEMOSTHENES. Fourteen of these survive; at least three more have been lost.

Works on rhetoric

(a) *De inventione*, written in Cicero's youth, is a treatise on some techniques of rhetorical argument, which has a close resemblance to parts of the anonymous *Rhetorica ad Herennium* (once falsely attributed to Cicero).

(b) *De oratore* (55 BC), *Brutus*, and *Orator* (46) represent Cicero's major contribution to the theory of Latin *rhetoric, and he himself grouped them with his philosophical works. They present an idealized picture of the orator as a liberally educated master of his art, a picture in which the technical aspects of Greek rhetorical theory still have their place, but are supplemented by knowledge of literature, philosophy, and general culture, and by the qualities of character required of the ideal Roman aristocrat. This was endorsed by later Roman authors such as Quintilian, and it was one of the formative influences on Renaissance ideals of character and education. The *De oratore* was closely linked with the more ambitious *De republica* which followed it, and the ideal orator depicted in the former is little different from the ideal statesman in the latter. The *Brutus* is devoted largely to a history of Roman oratory, while the *Orator* deals with more technical points of style. These last two works were written against a background of controversy regarding the desirable style or styles in oratory, in the course of which Cicero had been criticized for persisting (as it seemed) in the 'Asian' fashions of his younger days, and a plain 'Attic' style had been held up as an ideal. Cicero reacts to this by attempting to demonstrate that different styles are effective for different purposes, that there was more variety in actual Athenian oratory than the 'Atticists' allowed, and that the ideal orator should be master of several styles, including (where appropriate) the Ciceronian grand manner itself, for which *Demosthenes, rather than the Asian rhetoricians, is claimed as a precedent. Although this controversy was in some senses an ephemeral one, these works contain much of interest concerning the way Roman orators regarded their art, and the *Brutus* is a mine of prosopographical information (see PROSOPOGRAPHY) as well as of Roman rhetorical criticism.

(c) Cicero's minor works on the subject comprise: *Partitiones oratoriae*, a dialogue in which Cicero instructs his son in the elements of the art; the date is uncertain, but it must belong to a time at which Cicero's son was approaching maturity; *Topica*, written in 44 BC and dedicated to Gaius Trebatius Testa, an exposition of the content of *Aristotle's work of the same title; and *De optimo genere oratorum*, of disputed authenticity, an introduction to translations (which may or may not have existed) of *Aeschines' *In Ctesiphontem* and Demosthenes' *De corona*.

Poems

Cicero early acquired a reputation as a bad poet on the basis of two lines from his autobiographical compositions, 'o fortunatam natam me consule Romam' ('O happy Rome, born in my consulship') and 'cedant arma togae, concedat laurea laudi' ('yield arms to the toga, the bay to achievement') (the variant *linguae* 'to the tongue', was probably satirical). The obvious faults of these lines are a naïve self-esteem and a somewhat old-fashioned taste for assonance; in general, Cicero was a competent enough versifier, and despite his admiration for the older poets, his verse technique is more modern than that of his contemporary *Lucretius. He appears at times to have had serious poetic ambitions and to have regarded verse-writing as more than an amateur's accomplishment. It is perhaps less surprising in an ancient than it would be in a modern context that he chose to make verse a vehicle for personal propaganda, in the *Consulatus suus* (of which a substantial passage is quoted by Cicero himself in *Div.* 1. 17) and *De temporibus suis*. Apart from these, Cicero composed an original (probably fairly short) epic poem on his fellow-Arpinate *Marius; this must have been in circulation in the 50s BC (he refers to it at the beginning of the *De legibus*). The only part of his poetry to survive in a manuscript tradition is the so-called *Aratea*, 469 lines from a verse translation of Aratus' *Phaenomena*; this is of interest as part of the tradition of adapting Hellenistic didactic poetry and as a precursor of *Virgil's *Georgics*. There are some other scattered fragments of lost poems, and Cicero translated a number of passages of Greek poetry *ad hoc* for quotation in his philosophical works (in preference to the original Greek).

Letters

Cicero's surviving correspondence is an invaluable collection of evidence for his biography, for the history of the time, and for Roman social life. The sixteen books *Ad familiares* were published after Cicero's death by his freedman Marcus Tullius Tiro. Cicero's letters to *Atticus were preserved (without the replies) by the latter and seen by Cornelius Nepos (*Nep. Att.* 16. 2–4, referring to a collection in 11 books). They were in circulation in the reign of Nero and later, but the silence of Asconius suggests that they were not available to him. Our present collection *Ad Atticum* consists of sixteen books, probably an augmented version of the collection known to Nepos. We also have the smaller collections *Ad Quintum fratrem* (including the *Commentariolum petitionis*) and *Ad Brutum*. Further collections of Cicero's letters

apparently existed in antiquity. The *Ad familiares* collection contains, in addition to Cicero's own, letters from a variety of correspondents to him.

The letters were not in any sense written for publication; as far as is known, it was not until 44 BC that Cicero thought of publishing a selection of them (*Att.* 16. 5. 5; cf. *Fam.* 16. 17. 1), and it is not clear that this idea was ever put into practice in that form. They vary greatly in their level of formality. At the one extreme they include official despatches and letters of a semi-public nature on matters of political importance, whose style is similar to that of the public speeches; at the other may be found casual notes to members of the family and informal exchanges with Atticus, often highly allusive and colloquial.

JGFP

Philosophica

Apart from the treatises on rhetoric, an important part of the Hellenistic philosophical curriculum (though see below), these fall into two parts:

(a) the writings on political philosophy and statecraft of the years immediately preceding Cicero's governorship of Cilicia, and

(b) the works on epistemology, ethics, and theology (standing in the place of physics) which were produced in the incredibly short period between February 45 and November 44. Cicero gives a list and account of his own philosophical writings at *De divinatione* 2. 1.

In the *De republica*, a dialogue between *Scipio Aemilianus, Gaius Laelius, and others, of which we have only parts of the six books (including the *Somnium Scipionis*, preserved as a whole by Macrobius), Cicero discusses the ideal state, always with an eye on the history of the Roman republic, and favours a constitution combining elements of all three main forms, monarchy, oligarchy, and democracy. His discussion reflects the political conditions of the time and looks to a wise counsellor (for which part Cicero may at one time have cast *Pompey) as a remedy for Rome's political sickness. But its chief attraction for posterity lay in its assertion of human rights and of man's participation in humanity and the cosmos, a notion which eclectic developments in *Stoicism and Cicero's own predilections helped to foster. Cicero probably worked on the *De legibus* immediately after the *De republica* (cf. *Leg.* 1. 15), but did not publish it. (It does not appear in the list in *De divinatione* 2. 1 ff., and is not specifically mentioned in the letters.) In the three extant books (Macrobius quotes from a fifth book, and the reference to *iudicia* in 3. 47 has generally been taken to point to the subject of the fourth book) Cicero expounds the Stoic conception of divinely sanctioned Law, based on reason, and discusses legal enactments connected with religion and magistracies, drawing heavily on the 2nd-cent. BC Stoic Diogenes of Babylon.

Politically inactive under Caesar's dictatorship, the death of his daughter Tullia finally led Cicero to seek consolation in writing about philosophical subjects which had always interested him, from the early days of his studies under the Epicureans Phaedrus and Zeno of Sidon (cf. EPICURUS), the Academics Philon of Larissa, Antiochus of Ascalon, at Athens and on *Rhodes the Stoic Posidonius, through the years of his association with Diodotus the Stoic (who lived and died in his own home), to the time immediately after the Civil War, when Gaius Matus urged him to write on philosophy in troubled times (*Fam.* 11. 27. 5). What had formerly been for Cicero a useful exercise (cf. *Tusc.* 2. 9, and his claim at *Orat.* 12 to be a product of the *Academy rather than of the rhetoricians' workshops) and a source of oratorical material (cf. *De or.* 1. 5 and *Orat.* 113 ff.; the *Paradoxa Stoicorum*, published, it seems, as late as the beginning of 46, may be an exercise in the preparation of such material) became now a haven of refuge (*Fam.* 7. 30. 2), a *doloris medicina* (*Acad. post.* 1. 11). Cicero needed to reassure himself, and hoped as well to make a name for himself as a philosophical writer (at *Off.* 1. 2 ff. he admits his inferior philosophical knowledge, but contraposes his virtues as a stylist). But Cicero was well prepared for the task, having learnt Stoic dialectic from Diodotus, rhetoric and arguing both sides of a question from the Peripatetics, while the Academics had taught him to refute any argument. In addition Cicero had heard, and listened carefully, to the most charismatic philosophers of his time, the showmen of the day. He had a profound admiration and respect for *Plato (*deus ille noster*—'our divine Plato': *Att.* 4. 16. 3) and *Aristotle. His claim to look to *Socrates (*Acad.* 1. 3) belies his sceptical method of inquiry and emphasis on ethics. He aimed above all at giving the Romans a philosophical literature and terminology, which would take the place of the Greek philosophers, on whom the Romans had been hitherto intellectually dependent. The surviving work of the Hellenistic philosophers suggests that Cicero would not be alone in following his Greek sources closely in order to engage them polemically. But some scholars have understood Cicero's words: '*apographa* sunt, minore labore fiunt; verba tantum adfero quibus abundo' ('They are copies. They're no trouble. I just bring the words, and I've plenty of them': *Att.* 12. 52. 3) too seriously (i.e. without a hint of false modesty), and Shackleton Bailey has suggested that they do not even pertain to the *philosophica*.

More trustworthy are Cicero's claims (*Off.* 1. 6) to follow the Stoics (in that work) not as a mere translator but drawing from Stoic sources as he thinks fit, and (*Fin.* 1. 6) to add his own criticism (*iudicium*) and arrangement (*scribendi ordo*) to the chosen authority.

Several lost works probably came first: a *De gloria* (a eulogy of *Cato the Younger); the *Consolatio*, an attempt to console himself for the loss of his daughter Tullia (and unique in being addressed to himself); and the *Hortensius*, a plea for the study of philosophy, which profoundly affected St *Augustine (it turned him to God: *Confessions* 3. 4. 7). The list in *Div.* 2. 1 shows that Cicero swiftly proceeded with the construction of what is by his own description an encyclopaedia of Hellenistic philosophy: the protreptic *Hortensius* is followed by the *Academica*, on epistemology or theory of knowledge (especially concerned with the criterion of truth), originally in two books, entitled *Catulus* and *Lucullus*, of which only the second survives, but later recast in four books, of which we possess part of the first (*Academica posteriora*). It treats of the views of the New Academy after Arcesilaus, and in particular of Carneades on the impossibility of attaining certain knowledge, but conceding some *realia* as more compelling or probable than others. The recommendation (*Div.* 2. 150) to give unprejudiced consideration to different theories before approving *simillima veri* appealed to Cicero, who sometimes portrayed himself as belonging to this philosophical school (*Tusc.* 2. 5, 4. 47). In fact Cicero remained generally true to Philon's early teaching, rejecting the possibility of certain knowledge, but retaining and asserting the right to adopt whatever position seemed most compelling on each occasion.

Thus in questions of ethics Cicero often inclined toward Stoic doctrine as he recoiled from the Epicurean, as is evident in the *De finibus bonorum et malorum*, where he compiles and answers in turn the theories on the *summum bonum* ('highest good') propounded by the Epicureans and Stoics, before giving the views of Antiochus' so-called 'Old Academy' in book 5. From this encyclopaedic survey of the various schools' positions on ethics, Cicero turned in the *Tusculan Disputations* to the problems of the psychology of the happy life: death, grief, pain, fear, passion, and other mental disorders, and of what is essential for happiness, including (according to the Stoics) virtue. Concerned largely to allay his own doubts, and impressed by Stoic teaching on these subjects, he writes here with a passionate intensity and lyrical beauty.

As in the case of the contemporary Epicurean Philodemus, theological speculation stands for Cicero in the place of a full account of natural philosophy and physical causes (such as is found, for example, in *Lucretius, Epicurus, or Chrysippus, though *Tusc.* 1 also treats materialism in its concern for the material composition of the soul and a rational chain of causation). Thus Cicero next composes *De natura deorum* in three books, each devoted to the view of a different school (Epicurean, Stoic, Academic) on the nature of the gods and the existence of the divine, its role in human culture and the state. Having allowed Cotta to present the sceptical Academic view in book 3, after Velleius' presentation of the Epicurean in book 1, and Balbus' of the Stoic in book 2, Cicero rounds off the debate with a typically Academic expression of his own opinion: that the Stoic's argument is more likely to be right (*ad veritatis similitudinem... propensior* 3. 95). In a later work, Stoic beliefs concerning Fate and the possibility of prediction are examined, with more use of anecdote and quotation perhaps indicative of a popular exposition, in the two books of the *De divinatione*, published just after Caesar's murder (*Div.* 2. 4). In this case Cicero displays no sympathy with the views of the Stoics, whose commitment to the validity of divination was based on complex principles of logic and cosmic sympathy. Cicero's pious reaffirmation (2. 148) of his belief in the existence of a divine being, maintaining that it is prudent to keep traditional rites and ceremonies, belies his concerns in matters of theology and religion for the state above all else. Finally, the fragmentary *De fato* discusses the more specialized problem of volition and decides against Stoic determinism.

Equally specialized are the two genial and polished essays *Cato Maior de senectute* (written probably just before Caesar's murder and included in *Div.* list) and the *Laelius de amicitia*, which show once again Cicero's anxiety to reassure or occupy himself in times of stress and danger, and his last work on moral philosophy *De officiis* (finished November 44) aims at giving advice, based on Stoic precepts and in particular (for books 1 and 2) on the teachings of Panaetius, on a variety of problems of conduct (ostensibly to Cicero's son).

These three works, along with the *Tusc.* and the *Somnium Scipionis*, were the most popular among readers in the Middle Ages, when the work of Cicero the politician and orator was almost forgotten, to be rediscovered in the Renaissance. Cicero's influence on European thought and literature ensured that what he found interesting and important in Greek philosophy became the philosophical curriculum of the Renaissance and Enlightenment. His achievement stands out as the creator of philosophical vocabulary in Latin, and as a philosophical stylist.

played a central role in establishing cultural identity. Jewish circumcision was prohibited by Antiochus IV Epiphanes and probably by *Hadrian, but *Antoninus Pius specifically permitted Jews to circumcise their own sons (*Dig.* 48.8.11). Although Josephus wrote that other peoples, including Egyptian priests, practised circumcision in his day (*Ap.* 2.141–44), it was generally regarded as a distinctively Jewish custom by Greeks, Romans, and early Christians. Apostates from Judaism sometimes used epispasm, a surgical procedure to reverse circumcision, and rabbis after the Bar Kokhba revolt changed the method of Jewish circumcision to make such reversal more difficult. MDG

circus, the Roman arena for chariot-racing. The most important at Rome was the Circus Maximus (c.650×125 m.: c.711 × 137 yds.), in the Murcia valley between the Palatine and Aventine, traditionally founded in the regal period and progressively adorned during the republic. The distinctive form with parallel sides and one semi-circular end fitted with tiered seating, and with twelve starting gates (*carceres*) at the open end, was created under *Caesar and preserved in the monumental rebuilding by *Trajan. The area was divided into two tracks by a long central barrier (*euripus* or *spina*), marked at the ends with conical turning-posts (*metae*) and decorated with Augustus' obelisk and other monuments, including the movable eggs and dolphins which marked the ends of the seven laps in each race. Four, six, eight or twelve teams of horses competed under different colours, red and white at first (*Tert. De spect.* 5, 9), then also green (*Suet. Calig.* 55) and blue (*Suet. Vit.* 7), *Domitian's purple and gold (*Suet. Dom.* 7) being temporary. Other circuses at Rome included the Circus Flaminius in the Campus Martius, formalized c.220 BC but without permanent seating, and the Vatican Circus of *Gaius and *Nero (*Plin. HN.* 36. 74; 16. 201), the site of Christian martyrdoms, close to the later St Peter's basilica. Best preserved is the Circus of Maxentius outside the city on the via Appia, dedicated in AD 309 (*ILS* 673).

Circuses are found elsewhere in Italy and in many parts of the empire. In the east those of *Antioch and *Alexandria were famous, while Spain provides notable examples such as Merida (Emerita Augusta) and Urso, the latter famous for its racing-stables (*Plin. HN.* 8. 166). In the late empire circuses became increasingly associated with the emperor and were built in connection with imperial residences as at Constantinople (*See* BYZANTIUM) and Milan (Mediolanum). JD

cities *See* POLIS; URBANISM.

citizenship, Greek Greek citizenship stemmed from the fusion of two distinct but related elements, (a) the notion of the individual state as a 'thing' with boundaries, an ongoing existence, and a power of decision, and (b) the notion of its inhabitants participating in its life as joint proprietors. The first element was a product of the various processes of state formation which eroded personal chieftainship by centralizing power and exercising it through a growing number of offices or magistracies with limited length of tenure: at first denoted by an extended use of the word **polis* (cf. ML 2), it later engendered the more abstract term *politeia*, 'polity', 'constitution', or 'commonwealth'. The second element developed from the informal but ineradicable roles which *epic already portrays as being played in communal life by the *dēmos* (the territory or settlement and its inhabitants) and the *laos* (the people in terms of roles—especially military—and relationships): reflected in various ways in early texts such as ML 2 (Dreros on *Crete), ML 8 (Chios), or the Great Rhetra of *Sparta (*Plut. Lyc.* 6), it was formalized in the word *politēs* (citizen) and in the assembly (*ekklesia*, *apellai*, etc.) as an institution. The fusion of the two elements was expressed in the fundamental phrase 'to have a share in the polity' (*metechein tēs politeias*), which is widespread in Greek texts. It implied that all citizens shared in public responsibilities (deciding, fighting, judging, administering, etc.) and in public privileges (access to land, distributions, or power) as if they were shareholders in a company.

Political pressures and political theory (cf. especially Arist. *Pol.* 3) crystallized round the questions 'Should shares be equal?' and 'Who should be a citizen?'. Aspirations towards equality, opposed by oligarchs, were expressed by terms such as *homoioi* ('peers', full Spartiates), *isēgoria* ('freedom to speak in assembly'), and *isonomia* ('equity of power between rulers and ruled'), by the diffusion of power among the citizenry, and by the notion of 'ruling and being ruled by turns' which shaped *Aristotle's functional definition of citizenship (*Pol.* 1277^a27). In consequence, the boundary between citizen and non-citizen needed explicit definition. Some formulations admitted all free residents, as *Cleisthenes's reform in Athens probably did. Others required descent from a real or imagined founder or group, and therefore emphasized legitimacy of birth. Others envisaged 'those best able to help (the city) with their property and persons' (*Thuc.* 8. 65. 3), or (as in Sparta) disfranchised those unable to contribute fully to the common table. Such formulations tended to equate citizenship with the four abilities—to fight, to vote, to hold office, to own land—and thereby to make citizen bodies into closed, privileged, all-male corporations, outside which lay various inferior or adjunct statuses such as

perioikoi ('dwellers-around'), *metoikoi* (*metics) or *paroikoi* ('resident free aliens'), and *apeleutheroi* ('freedmen'). However, need and advantage forced states to make individual exceptional enfranchisements, e.g. for men with particular resources or talents (cf. the seer Teisamenos, Hdt. 9. 33). Collective grants (e.g. ML 94) or amalgamations of citizenship also remained rare except as a product of *synoecisms such as *Rhodes or Megalopolis (Arcadia).

Such exclusivity gradually broke down in the Hellenistic period, as citizenship became more an honour and a status than a function. The purchase of citizenship became a common practice, as did plural citizenship or the mutual permeability of citizenship represented by treaties of *isopoliteia* ('equal citizenship'). By the Roman period active citizenship in the Greek states required previous service in the upper-class *ephēbeia* (see GYMNASIUM). JKD

citizenship, Roman In both the Greek and the Roman world in the Archaic period, it seems that communities were open to the arrival of people from elsewhere, at all social levels, whether one thinks of Hesiod's father, Demaratus of Corinth (mid-7th cent.) in Tarquini (see ETRUSCANS), the Tarquins (see TARQUINIUS SUPERBUS, LUCIUS), or Attus Clusus and his followers in Rome. Detailed rules for citizenship were of course developed in both civilizations, as the city evolved, in the 7th to 5th or 6th to 5th cents. BC. In the case of Rome, though the

details are obscure, Roman citizenship clearly developed in dialogue with the citizenships of other Latin communities. It involved the observance of the Roman civil law; and the struggles of the plebeians gradually brought protection for citizens from magisterial *imperium.

At all events, Roman citizenship came to possess two features which distinguished it from *polis citizenship and which later surprised Greek observers: the automatic incorporation of freed slaves of Romans into the Roman citizen body; and the ease with which whole communities of outsiders could be admitted as citizens. By the time Rome faced the invasion of *Hannibal in 218 BC, she had a long history of giving citizenship to Italian communities, either with the vote (*optimo iure*) or without the vote (*sine suffragio*). (The latter communities, as with Arpinum, the place of origin of *Marius and *Cicero, were usually later granted the vote.) Apart from Roman communities of these two types and allies, *socii*, Italy also contained numerous Latin communities, whose members shared a number of rights with Romans, one of which was *conubium* (right of marriage). A child born to two Romans was a Roman; but so was a child born to a Roman father and a mother from a people possessing *conubium*.

All citizens, after the abolition of the ban on *conubium* between patricians and plebeians, had *conubium*; they were also liable to *tributum and military service. If they had the vote, they were also eligible to stand for

citizenship, Roman Grants of Roman citizenship were the most important of the privileges conferred on veteran auxiliaries in the Roman imperial army. This Latin 'diploma' (two inscribed bronze tablets wired together) records a grant to one Gemellus on 17 July AD 122. Both views © The Trustees of the British Museum

magistracies. (Individuals were occasionally deprived of the vote as a punishment, becoming *aerarii*, ‘payers.’) It is unlikely that communities without the vote were bound by the Roman civil law.

In the course of the 2nd cent. BC, grants of citizenship dried up, except for a few communities *sine suffragio* granted the vote; and Rome sought also to restrict the access of Latins to Roman citizenship. Attempts were made to respond to the desire of Latins and Italians alike for citizenship, by Marcus Fulvius Flaccus in 125 BC, by Gaius *Gracchus in 122 BC, and by Marcus Livius Drusus in 91 BC. The failure of Flaccus provoked the revolt of Fregellae (near mod. Leprano); and when the last attempt failed, most of the allies went to war with Rome to achieve their end, the so-called Social War; and in order to ensure the loyalty of the rest, as also of the Latins, who had for the most part remained loyal, Rome granted them citizenship by the *lex Iulia* of 90 BC. Although the details of the process are obscure, citizenship was in fact also extended to former rebels. By the time of *Sulla, Italy south of the Po (Padus) and former Latin colonies north of the Po were Roman, with the possible exception of the Ligurians; actual registration in the Roman census, however, remained very incomplete.

The last generation of the Roman republic and the civil wars which followed witnessed demands for citizenship in those areas of Italy which still did not have it—demands which were satisfied by *Caesar—and the increasing spread of citizenship overseas as a reward for service of one kind or another, in the Greek world as well as in the west. In the established imperial system, Roman citizens enjoyed in theory and often in practice protection against the *imperium* of a provincial governor, and a relatively favourable tax status.

Roman citizenship continued to spread, for four principal reasons. (1) Communities were granted Latin status and their magistrates automatically acquired Roman citizenship, a right which was probably created after the Social War for new Latin communities north of the Po and perhaps in Liguria. (2) Citizenship was granted to auxiliaries and their families on discharge. (3) Legionaries were supposed to be recruited among citizens only, but were clearly also recruited among provincials and deemed to be citizens. Their families on their discharge—between *Augustus and *Septimius Severus serving soldiers could not marry—if their wives were of citizen status, helped to spread Roman citizenship. (4) In the east, from *Pompey on, citizenship was conferred on individuals, typically members of the provincial city-élites.

Citizenship was finally granted to virtually all the free population of the empire by *Caracalla, in the so-called Antonine constitution. But by this time, the right to vote

had long disappeared; provincial Romans had lost their exemption from taxation; and many of the most important personal privileges of citizenship had been restricted to the élite, the *honestiores*, as opposed to the *humiliores*. And thereafter the essential distinction was between slave and free—which also in due course became less important with the depression of the status of the free tenant—and, within those who were still free men, between *honestiores* and *humiliores*. MHC

Civil Wars, Roman *See* ROME (HISTORY).

Claros (see ◀ Map 1, Ec D), *oracle and grove of *Apollo belonging to the city of Colophon (western Asia Minor). The oracle appears to have been founded by the 8th cent. BC, as stories about its foundation appear in the *Epigoni* (attributing the foundation to Manto), *Hesiod mentions the site in connection with a contest between the seers Calchas and Mopsus, and it is mentioned as a residence of Apollo in the Homeric *Hymn to Apollo*. The sanctuary was discovered 1907, and an excavation, begun under the direction of Louis Robert in the 1950s, turned up the oracular chamber under the temple and numerous inscriptions relating to its operation. On the basis of these inscriptions and literary texts, we know that there were ‘sacred nights’ upon which the consultations would take place, when there would be a procession of consultants to the temple of Apollo with sacrifices and singing of hymns. Consultants would then hand over questions to the priests who would descend into the adytum (innermost sanctuary), through the blue marble-faced corridors underneath the temple, to a place outside the room in which the divine spring flowed. Within this room the *thespiōdos*, a man, would drink from the spring and utter his responses to the questions of each consultant. These would then be written down in verse by the *prophētēs* and delivered to the consultants. An inscription of Hellenistic date confirms *Tacitus’ statement that the Colophonians imported people of Ionian descent to act as prophets (*thespiōdoi*), though he confuses the issue by mentioning only one official instead of two.

Inscriptions are now revealing the nature of Claros’ clientele among the cities of Asia Minor and further afield in greater detail. These inscriptions, along with various discussions in the literature of the empire, reveal that Claros was one of the most important oracular sites in Asia Minor from roughly the 3rd cent. BC to the mid-3rd cent. AD. A number of responses are preserved on inscriptions and in the *Tübingen Theosophy*. DSP

class struggle, as a concept and phrase, is indelibly associated with the Marxist tradition of socio-historical analysis and practical political endeavour. ‘The history of

all hitherto existing society is the history of class struggles', is the opening sentence of the first main section of *The Communist Manifesto* (1848). Karl Marx, moreover, did not only apply the phrase to the societies of Greece and Rome (among others) but also acknowledged his debt to the 'giant thinker' *Aristotle for demonstrating, as he saw it, the general utility of the concept for historical analysis and explanation. See MARXISM AND CLASSICAL ANTIQUITY. Marx, however, nowhere in his voluminous writings gave an extended and coherent definition of 'class', which remains one of the most essentially contested terms of art in all socio-historical theory. His omission has been variously repaired by historians sympathetic to Marxist theory. Conversely, the very applicability and utility of any definition of class for the understanding of Greece and Rome have been equally passionately denied.

Economic class is an objective actuality, a relationship subsisting among persons similarly placed in an economic system. But when used as a dynamic term of historical analysis, or a fortiori as a political slogan, it may comport also a psychological ingredient of self-consciousness, so that membership of a certain economic class may crucially determine the members' conscious behaviour towards each other and towards members of another class or classes. Economic classes, moreover, in order properly to constitute classes, are usually thought of as being in some relation of hierarchy and antagonism towards each other. Definition of class-membership is difficult enough for any society, but it is often held that the societies of Greece and Rome raise peculiarly recalcitrant obstacles.

Suppose that people are classed according to their relationship to the means and labour of economic production: between those who do and do not own such means, between those who do or do not have to work for a living and/or for others. Are the richest Roman senator (see SENATE) and the non-working owner of a relatively modest pottery manufactory therefore to be placed in the same class? Or consider ownership of land, always the most basic and coveted means of production. In most Greek cities at most periods non-citizens were normally debarred from legal ownership of land, even if they happened to possess the economic means to work it (see CITIZENSHIP, GREEK). That legal obstacle could be circumvented by leasing land from others, but would that place the lessee in the same class as the citizen lessor?

If class definition is problematic for the ancient world, so too is the identification of class struggle. In so far as chattel slaves were legally rightless and limitlessly exploitable productive labourers, they stood in a relationship of class to their masters and mistresses, but in what sense

could they be said to have conducted a 'class struggle' against them? Outright slave revolts (see SLAVERY) were rare, and there is little or no sense of a shared consciousness of identity and purpose among them. On the other hand, the masters and mistresses may justly be held to have waged a constant class struggle against their slaves, with the aid of those free, non-slaveowners who identified their interests with the maintenance of the institution of slavery (as practically all ancient free people almost always did).

By contrast, in political struggles within the citizen estates of the Greek world (*stasis*), as in the city of Rome under the late republic, there is no doubting the high degree of self-conscious solidarity between the two great antagonistic groups of the 'rich' and the 'poor' (otherwise known as 'the few' and 'the many', and a host of other binary terms). Since the root of their antagonism lay in differential ownership of the means of production, and the aim of their struggle was often the control of the organs of government, this looks very much like political class struggle—except that the classes are defined not purely by economic but by a mixture of economic and legal criteria, and the solidarity of 'the poor' was less organic and more soluble than that of 'the rich.' PAC

Claudius (Tiberius Claudius Nero Germanicus) (10 BC–AD 54), the emperor Claudius I, was born at Lugdunum (Lyons) (1 August), the youngest child of Nero Claudius Drusus (the younger brother of *Tiberius) and of Antonia (Mark *Antony's younger daughter). Hampered by a limp, trembling, and a speech defect all perhaps due to cerebral palsy, and by continual illnesses, he received no public distinction from *Augustus beyond the augurate, and was twice refused a magistracy by Tiberius. Enactments of AD 20, the *tabula Siarensis* (ZPE 55 (1984), 58 f., fr. 1, 11. 6 f.; 19–21.) and the *senatus consultum de Cn. Pisone patre* (ed. W. Eck and others, 1996) 1. 148, like Tac. *Ann.* 3. 18. 4, illustrate his low position in the imperial family. Claudius retained the status of a knight until on 1 July 37 he became suffect consul with his young nephew, the emperor *Gaius; for the rest of the reign he received little but insults. What role, if any, he played in planning the assassination of Gaius in 41 is disputed. After the murder he was discovered in the palace by a soldier, taken to the praetorian barracks, and saluted emperor while the *senate was still discussing the possibility of restoring the republic. Senators did not easily forgive him for the way he came to power, but he had the support of the army: the revolt of Lucius Arruntius Camillus Scribonianus in Dalmatia (42) was short-lived. Claudius stressed his bond with guard and legions and, making up for previous inexperience, briefly took a personal part in

the invasion of *Britain (43). The capture of Camulodunum occasioned an impressive pageant, and Claudius made a leisurely progress back to Rome for his *triumph (44). By the end of his principate he had received 27 salutations as *imperator*, more than any other emperor until *Constantine I. He was also consul four more times (42, 43, 47, and 51), and revived the office of censor, which he held with his favourite Lucius Vitellius in 47–8.

Although he reverted from the pretentious absolutism of Gaius (whose acts, however, were not annulled wholesale), and stressed civility to the senate, the precariousness of his position made him liable to take sudden and violent action against threats real, imagined by himself, or thought up by advisers; offenders who were given a trial were often heard by few advisers in private. His early career and mistrust of the senate led him to rely on the advice of freedmen, especially Narcissus and Marcus Antonius Pallas, whose influence and wealth were hated; but his dependence on his third and fourth wives Valeria *Messal(l)ina and Iulia *Agrippina was due as much to their political importance as to uxoriousness. Messallina was the mother of his only surviving son Britannicus, born 41 (Claudius' earlier wives, Plautia Urgulanilla and Aelia Paetina, left him only with a daughter, Antonia). She was hard to dislodge for that reason, but fell in 48, in what looks like a struggle between freedmen on the one hand and senators and knights on the other. Agrippina, daughter of Claudius' popular brother *Germanicus, was a figure in her own right, and particularly desirable after the loss of face entailed by Messallina's fall. The son she brought with her was more than three years older than Britannicus, and in 50 he was adopted by Claudius as a partner for his own son to assure their joint accession to power; in 53 Nero married Claudius' daughter Claudia Octavia. But while Nero's career was accelerated, with a grant of proconsular power outside Rome coming in 51, Britannicus was pushed aside. Claudius' death on 13 October 54 conveniently made it impossible for him to give his natural son the toga of manhood, but the story that he was poisoned by Agrippina has been questioned.

In youth Claudius wrote works on Etruscan and Carthaginian history (see *ETRUSCANS*; *CARTHAGE*). From *Livy he acquired a knowledge of Roman history, and he was steeped in religion and tradition, but his celebration of the Secular (hundred-year) Games (47), extension of the *pomerium* (Rome's religious boundary), and taking of the *augurium salutis* ('augury of security', 49) had the political purpose of reassuring the Roman people about the stability and success of his regime.

Claudius paid particular attention to the welfare of the populace. Building the harbour at *Ostia and draining the Fucinus Lacus (central Italy) were intended to secure or

increase the grain supply, as was his offer of privileges to those who invested in the construction of grain ships.

Claudius' interest in government, from which he had been excluded, inclined him to intervene whenever he found anything amiss, and he berated senators who failed to take an active part in debate. He was particularly interested in jurisdiction, and was indefatigable, if emotional and inconsistent, in dispensing justice. Legislation had clear aims: to discourage sedition; to protect inheritance within the clan and the rights of individual property owners; more 'liberal' measures increased the rights of slaves, women, and minors. Arguments for his legislation invoked traditional *mores* and the upholding of status, but in his senatorial speech advocating the admission of Gauls to the senate, Claudius' preoccupation with the place of innovation in Roman life shows him coming to terms with changes in economy and society.

Claudius was noted for generosity with the citizenship, though his advisers also sold it without his knowledge. (See *CITIZENSHIP, ROMAN*.) A few widespread grants of Latin rights, along with his favourable response to the request of long-enfranchised Gallic chieftains for permission to stand for senatorial office (resented by existing senators), made him seem more generous than he was: proved merit was his own criterion for grants. Administrative changes have also been given undue weight, as also the influence of the *freedmen, who were emerging in previous reigns and have wrongly been claimed to have become the equivalent of modern 'ministers' as part of a policy of 'centralization'. Claudius' grant of additional jurisdiction to provincial *procurators, and the introduction of that title for equestrian governors of provinces, previously called 'prefects', simply relieved him of the job of hearing appeals and stressed the dependence of the governors upon their emperor.

Claudius added other provinces to the empire besides Britain, although that left few resources for an active policy against the Germans: the two Mauretaniae (whose last king, Ptolemy, had been executed by Gaius), Lycia (43), and Thrace (46); and he resumed overseas colonization. His dealings with Judaea and the Parthians (see *PARTHIA*), however, were inept. In Judaea (see *JEWS*) the procurators who replaced the deceased King Agrippa I in 44 proved unsatisfactory, and by 54 Claudius' eastern governors had allowed the Parthians to gain control of Greater Armenia, a serious blow to Roman prestige.

Claudius was deified on death, enhancing his adoptive son's prestige, but in Nero's early years the failings of the regime (influence of women and freedmen, corruption, trials held in private, the bypassing of the senate, favour to provincials), were excoriated: the younger Seneca's *Apocolyntosis* reveals the tone. Under *Vespasian a more

Claudius Sardonyx cameo (*see *GEMS*) portraying Claudius in the guise of *Jupiter (mid.-1st cent. AD). Since cameos circulated in private, they offered a medium for more overt imperial self-advertisement than was usually thought suitable for public monuments. The Royal Collection © 2011 Her Majesty Queen Elizabeth II / The Bridgeman Art Library

balanced view prevailed and Claudius' temple was completed, but *Tacitus, though he exploits Claudius' speeches, is merciless. Modern writers have overreacted, exaggerating his purposefulness in encouraging the development of the provinces; his accession and survival, preserving the imperial peace, and his recognition of social changes were his main domestic achievements. JPB/BML

Cleisthenes, Athenian politician, of the Alcmaeonid family, son of Megacles and Agariste, daughter of Cleisthenes tyrant of Sicyon. He was archon (magistrate) under the Pisistratid tyrant Hippias in 525/4 BC, but later in Hippias' reign the Alcmaeonids went into exile and put pressure on Sparta through the *Delphic oracle to intervene in Athens and overthrow the tyranny. In the power vacuum which followed, Cleisthenes and Isagoras were rivals for supremacy; Isagoras obtained the archonship (the supreme magistracy) for 508/7; but Cleisthenes appealed for popular support with a programme of reform. Isagoras appealed to King Cleomenes I of *Sparta, who came to Athens with a small force, invoked the hereditary curse of the Alcmaeonids, and forced Cleisthenes and others to withdraw; but he met with strong popular resistance and was forced to withdraw in turn, taking Isagoras with him. Cleisthenes returned, and his reforms were enacted and put into effect.

Cleisthenes' main achievement was a new organization of the citizen body. The four Ionian tribes (*phylai*) and other older units were left in existence but deprived of political significance. For the future each citizen was to be a member of one of 139 local units called *demes (*dēmoi*), and the demes were grouped to form 30 new *trittyes* ('thirds') and 10 new *phylai*; citizenship and the political and military organization of Attica were to be based on these units (e.g. *Solon's council, *boulē*, of 400 became a council of 500, with 50 members from each tribe and individual demes acting as constituencies). The main purpose of the reform was probably to undermine the old channels of influence (and perhaps to give the Alcmaeonids an advantageous position in the new system); its main appeal to the ordinary citizens was perhaps the provision of political machinery at local level; and working this machinery educated the citizens towards democracy. (See DEMOCRACY, ATHENIAN.) The institution of *ostracism is almost certainly to be attributed to Cleisthenes.

In the 5th cent. Cleisthenes came to be regarded as the founder of the democracy, but in the political disputes at the end of the century the democrats looked further back, to Solon or even to *Theseus. TJC/PJR

Cleopatra VII (69–30 BC), the final and best known of the Ptolemies, was daughter of Ptolemy XII (Auletes).

On the latter's death in 51 she became queen, alone at first and subsequently with her younger brothers, first Ptolemy XIII (who opposed *Caesar) and then (47–45) with Ptolemy XIV. A joint reign with Ptolemy XV Caesar (Caesarion, reputedly Caesar's son) is recorded from 45 BC. Her later children by Mark *Antony were the twins Alexander and Cleopatra (born 40 BC after Antony's winter in *Alexandria), and Ptolemy Philadelphus (born 36). In 37/6 she marked Antony's gift to her of Chalcis in Syria by instituting a double numeration of her regnal years (year 16 = 1). She died by her own hand (and the bite of a royal asp) soon after Octavian (see AUGUSTUS) took Alexandria on 3 August 30.

Best known for her successful relations first with Caesar, who besieged and captured Alexandria in 48–47, and later with Antony, following a colourful encounter at Tarsus (SE *Asia Minor) in 41, she managed to increase her kingdom territorially in return for financial support. Caesar restored *Cyprus to *Egypt and in 34, in a magnificent ceremony at Alexandria, Cleopatra appeared as Isis (see EGYPTIAN DEITIES) to mark the division of the earlier kingdom of *Alexander the Great between the royal couple and their children. Cleopatra ruled Egypt and Caesarion Cyprus as Queen of Kings and King of Kings; Antony's children Alexander Helios (the Sun) and Ptolemy Philadelphus were named kings east and west of the Euphrates respectively, with Cleopatra Selene (the Moon) queen of *Cyrene. The symbolism of the ceremony was more important than any reality.

Internally Cleopatra was strong, using her position as pharaoh to gain backing from all the people. To her title of Philopator ('father-loving') was added Philopatris ('loving her country') (BGU 14. 2377. 1). In the final struggle against Octavian however she confiscated temple lands. In Greek she was known also as Thea Neotera, 'the younger goddess'. An expert linguist, she was reportedly the first Ptolemy to have known Egyptian, and *Plutarch reports it was her conversation rather than her looks which formed the secret of her success.

The legend of Cleopatra has proved even more powerful than her historical record. Thanks to her successful liaisons with men of power she was named as the author of treatises on hairdressing and cosmetics. Her exploitation of Egyptian royal symbolism with its eastern tradition of luxury was used against her by her antagonists; for Roman poets she was 'monster' and 'wicked woman'. Her visit to Rome in 46–44 achieved little but embarrassment for Caesar. Following his murder, her attempts to aid the Caesarians in 42 were thwarted by Cassius, and by contrary winds. The summons to Tarsus by Antony followed. Her liaison with Antony formed the focus of Octavian's propaganda,

Cleopatra VII Silver coin inscribed 'Queen Cleopatra, the younger goddess', minted c.34 BC. In *Plutarch's view her success lay in her conversation, not her looks. East

based on fear of Egyptian wealth. Yet the skilful manipulation of power by this queen preserved Egypt from the direct rule of Rome longer than might otherwise have been the case. *See* ACTIUM.

DJT

climate The ancient climate was very similar to the modern climate. The Mediterranean climate is characterized by cool, wet winters and hot, dry summers. There is a very high degree of interannual climatic variability, which makes farming (*see* AGRICULTURE) risky and sometimes causes *famines. The ordinary run of interannual climatic variability is taken for granted by literary sources. Only exceptional years stood a chance of being recorded. The rain, predominantly in winter, is usually adequate for dry-farming of cereals, and for evergreen trees resistant to the summer drought. However, it is not sufficient for dense coniferous or deciduous forests. Westerly winds bring most of the rain, so that areas in the rain shadow on the eastern side of Greece, e.g. Attica (the rural territory of Athens), are much drier than regions in western Greece. Rainfall often takes the form of short, intense showers. It runs off the land and does not help

plants. There are statistical correlations between cereal yields, total annual precipitation and the monthly distribution of rainfall during the year. The winters generally remain warm enough for plants like the olive-tree, with a low degree of frost tolerance, while the summers are hot enough to support subtropical vegetation. The Mediterranean climate and much of the flora associated with it is quite young in terms of geological time. For ancient views on the weather *see* ARISTOTLE'S *Meteorologica*, and Theophrastus, *On Weather Signs*.

Various methods are used to investigate the ancient climate. Palynology (pollen studies) enables us to make inferences about climate by examining the geographical distribution in antiquity of plants with known climatic requirements. Theophrastus' botanical works also indicate that the mean temperature c.300 BC was within a degree of modern values. In the future the most important source of information will probably be tree-ring studies. We can construct tree-ring chronologies (dendrochronology) reaching as far back as several thousand years ago, and then make inferences about climate in each year from the thickness of the ring. This technique has already been

employed on subalpine conifers to show that the year 218 BC, when *Hannibal crossed the Alps, was a mild year, helping to explain the success of Hannibal's audacious enterprise. Information derived from tree-ring studies should eventually resolve a number of controversies among modern historians about the possibility that there were secular climatic variations in antiquity. JRS

Clodia, second of the three sisters of Publius *Clodius Pulcher, born c.95 BC, had married her first cousin Quintus Caecilius Metellus Celer by 62 (Cic. *Fam.* 5. 2. 6). Her bitter enemy *Cicero (but gossip said she had once offered him marriage, Plut. *Cic.* 29) paints a vivid picture of her in his *Letters*, and above all in the *Pro Caelio* of April 56. Her affair with *Catullus—the identification with Lesbia is widely admitted—began before the death of Metellus in 59, which Clodia was said to have caused by poison: by the end of that year Marcus Caelius Rufus was perhaps her lover. After the Caelius case her political importance ceases, but she may have been still alive in 45 BC (Cic. *Att.* 12. 38, etc.). GEFC/RJS

Clodius Pulcher, Publius, youngest of six children of Appius Claudius Pulcher (consul 79). He was born c.92 BC (since quaestor in 61). In 68 he incited the troops of his brother-in-law Lucius Licinius Lucullus to mutiny in Armenia. When prosecuting *Catiline in 65 he was, according to *Cicero, in co-operation with the defence. On his return to Rome he had been apparently friendly with Cicero (Plut. *Cic.* 29), but in May 61 Cicero gave damaging evidence against him when he was on trial for trespassing on the Bona Dea festival disguised as a woman the previous December. However Clodius was narrowly acquitted by a jury said to have been heavily bribed. Next year, on returning from his quaestorian province of *Sicily, he sought transference into a plebeian *gens* (see PLEBS): this was at first resisted, but in March 59 *Caesar as pontifex maximus (senior member of the *pontifices*: see PRIESTS (GREEK AND ROMAN)) presided over the *comitia curiata* (assembly of citizens voting in units called *curiae*) at which the adoption was ratified. There were suggestions of subsequent disagreements with Caesar and *Pompey and of his departure from Rome, but in the event he was elected tribune for 58. His measures included free corn for the *plebs*, restoration of *collegia* (private clubs), repeal or modification of the *leges Aelia et Fufia*, grant of new provinces to the consuls Aulus Gabinius and Lucius Calpurnius Piso Caesoninus, a bill exiling those who had condemned Roman citizens to death without popular sanction, a bill confirming the exile of Cicero (who departed in late March), the dispatch of *Cato the Younger to *Cyprus, and grant of title

of king and control of Pessinus (central *Asia Minor) to Brogitarus, ruler of the Galatian tribe of the Trocmi. Clodius then turned against Pompey, allowing the escape of the Armenian prince Tigranes, threatening Pompey's life, and (Cic. *Dom.* 40; *Har. resp.* 48) suggesting that Caesar's acts of 59 were invalid because of Marcus Calpurnius Bibulus' religious obstruction. These attacks on Pompey were continued in 57, especially over the question of Cicero's recall, and in the early part of Clodius' aedileship in 56; but after the conference at Luca (see CAESAR) his attitude changed and by agitation and violence he helped to bring about the joint consulship of Pompey and *Crassus in 55. He still continued to control large sections of the urban *plebs* (*plebs urbana*). He stood for the praetorship of 52 but owing to rioting the elections had not been held when he was murdered by Titus Annius Milo on 18 January of that year. His clients among the *plebs* burned the senate-house as his pyre.

Clodius, who like two of his sisters used the 'popular' spelling of his name, probably saw the tribunate as a vital step in his political career: revenge on Cicero need not have been his main aim in seeking transfer to the *plebs*, nor (despite Cic. *Dom.* 41; *Sest.* 16) Caesar's aim in granting it. Moreover, the view that Caesar was at any time his patron seems misconceived. In 58–56 he may have been allied with Crassus; but he was surely both opportunist and independent, for before as well as after Luca he was friendly with various *optimates* (Cic. *Fam.* 1. 9. 10, 19), and in 53 he was supporting the candidates of Pompey for the consulship (Asc., 26, 42). The one consistent motif is his courting of the urban *plebs* and the promotion of its interests. The daughter of his marriage to Fulvia was briefly married to Octavian (later *Augustus) in 42. GEFC/AWL

closure, the sense of finality or conclusiveness at the end of a work or some part of it. In addition to the basic fulfilment of expectations raised by particular texts, some ancient genres show marked closural conventions; examples include the choral coda of Euripidean tragedy, the *plaudite* of Roman comedy (see COMEDY, LATIN), and the rhetorical peroration. We also find a variety of closural modes across genres: authorial self-reference, generalization, prophecy, prayer, motifs such as death, marriage, ritual, and departure. Our understanding of ancient closure is limited by what we have; some endings have been lost, some works were never finished, and some extant endings may be interpolations. Our uncertainties about ancient closural convention in turn lead us to disagree about whether in fact we do possess the actual endings of works such as *Herodotus' *Histories*, *Euripides' *Iphigenia at Aulis*, *Lucretius' *De Rerum Natura*, and

*Catullus 51. Even when we have the ending we may have difficulties in assessing closure. Closure may be unexpected or false, undercut or ironized; it is often hard to interpret the effect on closure of the audience's knowledge of later events in the continuing myths from which so many ancient narratives are taken. *Aristotle tells us in the *Poetics* that a plot must have an ending, which follows from something but from which nothing follows (ch. 7), and that different endings suit different genres (ch. 13); further discussion of closure may be found in the rhetorical tradition and in remarks on particular endings. But the most telling ancient comment on the interpretative significance of endings as the opportunity for what B. H. Smith calls 'retrospective patterning' is to be found in *Solon's advice at Herodotus 1. 32: that we call no one happy until death.

Cocceius Nerva, Marcus, Roman emperor. See NERVA.

coinage, Greek

Definitions

Coinage to the Greeks was one of the forms of money available to measure value, store wealth, or facilitate exchange. Coins were made from precious metal such as gold or silver, or from a copper alloy; they were of regulated weight and had a design (type) stamped on one or both sides. Lumps of bullion too could be weighed to a standard and stamped with a design, but the stamp on a coin indicated that the issuing authority, normally a state or its representative(s), would accept it as the legal equivalent of some value previously expressed in terms of other objects, including metal by weight. Merchants and others therefore were expected to accept it in payment. A coin of precious metal might weigh the same as the equivalent value of bullion, but would normally weigh less, to cover minting costs and, in varying degrees, to make a profit for the mint: in other words, coins were overvalued relative to bullion.

The scope of Greek coinage is wide, both geographically and chronologically. In the Archaic and Classical periods many of the Greek communities established around the Mediterranean and Black (Euxine) Seas produced coins, and they often influenced their neighbours to do the same: Persians (see PERSIA) in western Asia Minor, Carthaginians (see CARTHAGE) in North Africa and Sicily, *Etruscans in Italy, Celts in western Europe. The coins of these peoples, although they usually bear images and inscriptions appropriate to their traditions, were in general inspired by Greek models, and they tend to be catalogued as part of Greek coinage. After 334 the

conquest of the Persian empire by *Alexander the Great inaugurated a massive extension of the area covered by coinage, in particular in the successor kingdoms, Syria, Egypt and so on. In effect the term Greek coinage includes most of the non-Roman coinage of the ancient world issued between the Straits of Gibraltar and NW India.

Beginnings

Literary and archaeological evidence combine to show that coinage began in western Anatolia, at the point of contact between Greek cities on the Aegean coast and the Lydian kingdom in the interior. The first coins were of electrum, an alloy of gold and silver occurring naturally in the river Pactolus, which flowed into the Hermus to the west of Sardis, the Lydian capital. A date of c.600 BC or a little later for their introduction fits their appearance in a miscellaneous deposit of jewellery and figurines discovered in the foundations of the temple of Artemis at *Ephesus, and also the subsequent development of coinage in Asia Minor and the wider Aegean world. The first coins of electrum were followed in Lydia by coins of pure gold and silver, with the type of confronting foreparts of a lion and of a bull. Such coins have traditionally been attributed to the Lydian king Croesus (c.561–547), but hoard evidence suggests that most, if not all, are later than his reign and were part of the coinage issued in the area by the Persians.

Purpose

In the modern world the role of coinage in everyday buying and selling is clear, but this does not mean that similar commercial reasons prompted its introduction. Coins were not necessarily advantageous in large transactions, and their usefulness in exchanges between cities was inhibited by various factors, including the diversity of weight-standards in the Greek world. For example, the weight of the drachma differed in cities as close together as Aegina, Corinth, and Athens. As for small transactions, although it is clear that the incidence of small denominations was greater than was once thought, many early coinages were issued only sporadically and even the lowest known denomination of early electrum coinage (1/96) represented a large sum. Given the nature of the earliest coins—in particular their standardized weights and the lion's head that features on many of them—it is a plausible hypothesis that they were issued to make a large number of uniform and high-value payments in an easily portable and durable form, and that the authority or person making the payment, perhaps to *mercenaries, was the king of Lydia. For the original recipients coins were simply another form of movable wealth, but many

pieces might thereafter be exchanged for goods or services and so pass into general circulation as money. But the progress towards a monetary economy was by no means straightforward or immediate. The fact that many of the early electrum coins are covered in small punch-marks suggests that it was some time before such coins were universally acceptable.

Minting technique: Implications for study

The first task of the Greek moneyer was to create from metal of the required quality the blanks, or flans, of suitable shape and correct weight. Blanks were normally made by casting, that is, pouring the molten metal into moulds. (In the Greek world coins themselves were rarely made by casting.) To convert the blank into a coin it was struck with dies made from either toughened bronze or iron, and hand-engraved in negative (*intaglio*). One die, which was to produce the obverse, was set in an anvil. The blank was placed on top of it and the metal forced into the die beneath by a short stout bar (*charaktēr*), its butt resting on the blank while its top was struck with a hammer. On the earliest coins the butt simply reproduced its own rough surface on the reverse; at a later stage, in many places by the end of the 6th cent., the practice arose of engraving the butt also with a device, thus creating a coin with types on both sides.

Minting was thus a relatively simple process, but at each stage there are implications for the modern study of its products. At the preparatory stage great care was generally taken to ensure both the purity of the metal and the accurate weight of the blanks: modern methods of non-destructive metal analysis can detect any significant differences in the composition of a metal alloy and thus help to classify the coins or to signal a change of monetary policy. Sometimes it was not—for whatever reason—convenient to prepare fresh blanks, and new types were overstruck on old coins. In cases where the undertypes were not totally obliterated by the restriking process, such ‘overstrikes’ can provide valuable evidence for relative dating and for the circulation of coins. When the blanks were being struck, the alignment of the two dies might be fixed or it might be variable: similarities or differences in the patterns of alignment may again help to classify or date some coins. Studies of the dies employed are of fundamental importance in modern numismatics. A single coin in isolation can provide a certain amount of information, but the significance of the information is immeasurably enhanced when two or more coins can be shown to have been struck from the same die(s). Coins sharing dies in this way must normally have been struck at the same place and at approximately the same time. Furthermore, since in practice the punch dies were more exposed to

wear and/or damage than anvil dies and tended to be discarded more frequently, it is often possible to build up a sequence of issues sharing either an obverse or a reverse die. Finally, die-studies form the basis of attempts to estimate the size of a coinage. Using a variety of statistical methods, it may be possible to work out from a sample of dies the total number of dies used to produce a given coinage. To estimate the amount of bullion required, that total must be multiplied by the number of coins that were struck from each die. But in any individual case, that figure is elusive. There is no means of telling when a particular die was under-used, though conversely there is frequently evidence for the use of dies in an advanced stage of deterioration, and dies were sometimes recut, to repair them or to update them. The size of an issue of coins depended on many factors, not least the availability of bullion.

Coin types

The type of a Greek coin is a mark of its origin, whether a community or an individual. The earliest coins, found in the temple of Artemis at Ephesus, had types only on the obverse and their variety makes it difficult to assign them to a specific minting authority. The commonest type, a lion's head, has been attributed to the kingdom of Lydia; others, such as a seal's head or a recumbent lion, may belong to Phocaea and Miletus (western *Asia Minor) respectively. The significance of the earliest types was not usually reinforced by any letter or inscription. On one coin from the Artemision with the type of two lions' heads the inscription WALWEL has been read. This cannot refer to king Alyattes of Lydia (c.610–560) since another name, KALIL, has been identified on a similar issue. The identity of these persons remains unknown. Rather more revealing are the inscriptions on two early coins showing a stag. One has a simple name in the uncontracted genitive, *Phaneos*, ‘of Phanes’, the other reads *Phanos emi sēma* ‘I am the badge of Phanes’. The identity of the Phanes referred to is not known (a mercenary captain of that name from Halicarnassus employed in Egypt in the 530s is too late for the coin), but with a different name and device the formula occurs on an archaic seal-stone probably from Aegina (J. Boardman, *Archaic Greek Gems* (1968), no. 176). The analogy makes clear the origin of a coin type in the personal seal or badge of the authority responsible for its issue. Apart from these examples coin legends are rare in the 6th cent. By its end the initial letter or letters of an ethnic might be introduced (as a *koppa* on coins of Corinth or *Athe* on those of Athens), and in course of time the tendency was to lengthen the inscription. When written out in full it was frequently

(a)

(b)

(c)

coinage, Greek Greek cities used their coinage to project a local identity in a variety of ways. (a) An issue of Sicilian Naxos (c.530–510 BC) used a grape-cluster and a portrait of *Dionysus to celebrate Naxian wine. East (b) An issue of *Pergamum (AD 180–92) adroitly couples the suckling of its mythical founder Telephus, son of *Heracles, with a portrait of *Commodus, the new Hercules (Roman Heracles). Professor Stephen Mitchell, Dr Ov. Vacano, and Collection H.I. (c) Kings used coins to present the royal image. Here *Eucratides I of *Bactria appears as a warleader and claims the title Great King (*Megas Basileus*). East

in the genitive case, signifying [a coin] of whoever the issuing authority was.

After an initial period of variation the types of individual cities settled down and changed little: familiarity encouraged acceptability. Most coin types are connected with religion in the widest sense. Sometimes a divinity is represented directly, in other cases indirectly, through an animal or an attribute. Even some of the types illustrating a local product belong in this category: for example an ear of barley can symbolize *Demeter, goddess of corn. Many types refer to local myths or religious traditions, for example those connected with the foundation of a city. Only rarely do types refer to historical events, at least in the Archaic and Classical periods. In this respect they share the preference of Greek art in general for the allusive and symbolic, rather than for direct and literal references to political matters.

The spread of coinage

Archaic and Classical

Electrum, with its variable content of gold and silver, did not last long as the primary metal for coining, and in the second half of the 6th cent., with a few exceptions such as Cyzicus, Phocaea, and Mytilene, the coin-producing cities of Asia Minor turned exclusively to silver. Coinage in gold became a rarity both there and elsewhere, although from the early 5th cent. the Persians issued gold darics with the same type as their silver sigloi, a crowned figure representing the king of Persia. ('Darics' were so named by the Greeks after the Persian king *Darius I; 'siglos' is a Greek form of the Semitic 'shekel'.) These coins were issued for use in those parts of the Persian empire in closest contact with the Greeks, and the institution of coinage did not initially travel far to the east of its birthplace in western Asia Minor.

To the west and north the story was different. By c.550 coinage had crossed the Aegean to communities close to the isthmus of Corinth—Aegina, Corinth, and Athens—and not much later had taken root among the Greek cities and the tribes of the Thracio-Macedonian area (see MACEDONIA). The rich metal resources of the latter gave rise to coinage in a remarkable range of denominations, including the heaviest of all Greek silver coins, the double octadrachm. Such coins travelled far, especially to the east, and may have been made for export. The first Athenian coins, the so-called *Wappenmünzen*, share some of the characteristics of the early coins of Asia Minor, notably their changing types, their lack of any indication of origin, and the use of electrum as well as silver for some issues. In the later part of the 6th cent., perhaps under the tyrant Hippias (527–510), these issues were replaced by the famous 'owls', with

obverse helmeted head of *Athena, reverse owl, and the abbreviated name of the city. These coins too travelled a long way, another example of the export in the form of coin of silver mined in the territory of the issuing state.

From the Aegean area the medium of coinage spread rapidly to the western Greeks settled around the coasts of southern Italy and Sicily, France, and Spain. Early Corinthian coinage in particular influenced some of the first coinages in the west both in production technique and because imported Corinthian coins were often used as flans for overstriking. There was also a notable willingness to experiment: the first Italian coins were made using the sophisticated 'incuse' method, unique in the Greek world, in which the obverse type appears normally in relief, while on the reverse a closely similar version of the same type is struck in negative, the two types exactly aligned. To the western cities also belong the first bronze coins, at Thurii (S. Italy) from c.440, at Acragas (Sicily) from c.430, and thus the development of the idea of fiduciary coinage in which the worth of a coin was not related to the intrinsic value of its metal content. The coins of the western Greeks attained the highest standards of artistic excellence and especially in the late 5th and early 4th cents. the careers of many of the artists can be traced from their signatures on dies.

Hellenistic

In the 4th cent. the Greek world of independent city-states began to give way in the eastern and western Mediterranean to the ambitions of individuals and the growing power of Rome. In the east the exploitation by *Philip II of Macedon of the mines of Pangaea after 356 left a rich legacy of coinage in gold and silver which was adapted and expanded by his son *Alexander the Great to cover the whole near east. He adopted the Attic weight-standard for both his gold and silver coinage, and struck coins with the same designs at more than one mint. After Alexander's death in 323, the currency system he had put in place remained remarkably stable. In the world of territorial states and kingdoms that emerged in the 3rd cent. only *Ptolemy I in Egypt introduced major innovations in the types and weights of his coins, to produce an autonomous system of coinage. The change to larger political units, kingdoms, states, and leagues was reflected in the coinage. Many individual cities coined from time to time, but mostly in bronze; only Athens and Rhodes coined continuously in silver down to the 1st cent. BC. Coins with Alexander's types played an important role as international currency, especially in Asia Minor, where 'posthumous Alexanders' were produced in quantity until 175 BC and even later.

The types of Hellenistic coins, like those of earlier periods, are for the most part religious in content; and although they display a strong historical consciousness in line with the culture of the time, they rarely refer directly to historical events. The major innovation was the introduction of the portrait of a ruler. Few portraits of living persons have been recognized on Greek coins before Ptolemy I shortly after 305/4. A reverse of Abdera (north Aegean coast) in the last quarter of the 5th cent. realistically depicts a male head which might be the portrait of an individual (Pythagoras) named on the coin. In the 4th cent. fine portraits occur on the coins of Persian satraps or Lycian dynasts in Asia Minor (e.g. Pericles of Limyra). From the Hellenistic period we have a whole gallery of portraits of rulers in which idealized images of royal power are often combined with realism and insight into character. On the far eastern fringes of the Hellenistic world the kings of *Bactria are known to us largely through their brilliant coin-portraits. See **PORTRAITURE, GREEK**.

In the last two centuries BC, as Roman power spread inexorably eastwards, Hellenistic coinage evolved new forms. League coinages had already played a leading role, for example those of the Arcadian and Achaean Confederacies (see **FEDERAL STATES**) in Greece. At Athens 'New Style' coinage began around 170, and *Pergamum at about the same time began to issue cistophoroi, so called from the adoption as their obverse type of a *cista mystica*, a basket used in the celebration of the rites of Dionysus. After the battle of *Actium (31 BC) Rome's control over the eastern Mediterranean was complete and Greek coinage had virtually ceased. The subsequent plethora of city coinages with Greek legends and local types which were issued in the eastern provinces of the Roman empire (the so-called 'Greek imperials') until well into the later 3rd cent. AD are more Roman in appearance and conception; see **COINAGE, ROMAN**. NKR

coinage, Roman There are two related stories about Roman coinage, the one of its internal evolution, the other of its progressive domination of the Mediterranean world, its use throughout the Roman empire, and finally its fragmentation into the coinages of the successor kingdoms in the west and the Byzantine empire in the east.

Rome under the kings and in the early republic managed without a coinage, like the other communities of central Italy, with the episodic exception of some Etruscan cities; bronze by weight, *aes rude*, with a pound of about 324 g. (11½ oz.) as the unit, served as a measure of value, no doubt primarily in the assessment of fines imposed by a community in the process of substituting public law for private retribution; this stage of Roman

monetary history is reflected in the *Twelve Tables. The progressive extension of Roman hegemony over central Italy brought booty in the form of gold, silver, and bronze; the means to create a coinage on the Greek model were at hand. The stimulus was probably provided by Roman involvement with the Greek cities of Campania, with the building of the via Appia in the late 4th cent. BC; Rome had struck a diminutive coinage of bronze at Neapolis after 326 BC, with the legend *ΠΩΜΑΙΩΝ*; she now struck a coinage of silver pieces worth two (probably) drachmas, with the legend *ROMANO*, otherwise indistinguishable from the Greek coinages of the south. But the continuing irrelevance of coinage to Rome emerges from the fact that there was nearly a generation before the next issue, probably contemporary with the Pyrrhic War. (See **PYRRHUS**.) From this point, there is a virtually unbroken sequence of Roman coinage to the end of the Roman empire in the west.

To the basis of silver didrachms was added a token coinage in bronze; the curious decision was also taken to produce a cast bronze coinage, the unit (or *as*) of which weighed a pound; this coinage is now known as *aes graue*, though the Latin writers who spoke of the bronze coinage of early Rome as *aes graue* probably had little idea of what was involved. Bronze currency bars were also cast for a short time, in the period of the Pyrrhic and First Punic Wars (see **ROME (HISTORY)** §1.4), now very misleadingly known as *aes signatum* (to a Roman, this phrase simply meant 'coined bronze'). It is striking that even now the coinage of Rome remained on a relatively small scale, compared with those of Carthage and the Greek cities of Italy.

The silver coinage with its token coinage in bronze (changing the ethnic in due course from *ROMANO* to *ROMA*) and the heavy cast bronze coinage went on side by side down to the outbreak of the Second Punic War in 218 BC. It is probably in this period after the Samnite wars that Roman coinage penetrated the territories of the peoples of the central Apennines for the first time; and it is likely that, just as military needs may explain much of the production of Roman coinage in this period, so it was returning soldiers who carried it to Samnite and other communities.

The enormous strain of the war against *Hannibal led to a reduction in the metal content of the heavy cast-bronze coinage, an emergency issue of gold and finally the debasement of the silver coinage. The first coinage system of Rome collapsed and in or about 211 BC a new system was introduced; it included a new silver coin, the denarius, which remained the main Roman silver coin until the 3rd cent. AD. The issue was financed initially by

unprecedented state levies on private property, thereafter by booty as the war went better for Rome. The unit (or *as*) of the bronze coinage by this stage weighed only about 54 grams (2oz.), the denarius (or 'tenner') was worth ten of these; there were subsidiary denominations in both silver—including a piece known as the *victoriatus*, without a mark of value, weighing three-quarters of the denarius, but with a low and erratic silver content—and bronze and a short-lived issue of gold. The end of the war saw the virtual cessation of minting by other Italian communities; and coinage other than Roman on the whole disappeared rapidly from circulation in Italy. When the Italians produced a rebel coinage in 90–88 BC, it was modelled on the denarius, apart from a single issue of gold, in which they anticipated *Sulla (see below).

Despite the creation of the denarius, bronze remained the most important element in the Roman monetary system for some years; a belief similar to those held by *Cato the Elder even led to the virtual suppression for a decade of the silver coinage, a symbol of increasing wealth and of declining public morality. But the consequences of Rome's conquest of the world could not be suppressed for ever; the *booty in silver *inter alia* which flowed into Rome from 194 BC onwards and the mines in *Macedonia which Rome controlled from 167 BC found expression in a vastly increased issue of silver coinage from 157 BC. It became normal for Rome to coin in a year as much as a Greek city might coin in a century; and it was only with Sulla that the mint abandoned the practice of producing a large part of what was needed each year as new coin; the mint then went over to what remained standard practice, to top up revenues already in the form of Roman coin with issues largely from newly mined metal. In the years after 157 BC, the coinage came accurately to reflect the position of Rome as ruler of the world by omitting the ethnic: no identification was needed.

The relative unimportance of the bronze coinage after 157 BC led to the cessation of production of the *as* and to the production of its fractions on a very reduced weight standard; and in about 141 BC the bronze coinage was effectively devalued when the denarius was retariffed as the equivalent of 16, not 10, *asses*; its name, however, remained unchanged. By the end of the 2nd cent. BC, *victoriati* in circulation weighed only about half a denarius; and halves of the denarius, or *quinarii*, were henceforth intermittently struck, often for the Po valley or Provence (see below).

The period after the Second Punic War saw the beginning of the process whereby Roman coinage came to be the coinage of the whole Mediterranean world. The denarius rapidly became the silver coin of Sicily, flanked both by Roman bronze and by bronze city issues. In Spain, the

Romans permitted or encouraged the creation of silver and bronze coinages modelled on the denarius coinage, probably in the 150s BC. In the Po valley and in Provence, the Romans accepted for their own purposes the local monetary unit, equivalent to half a denarius, and indeed on a number of occasions struck such a unit for those areas. By way of contrast, the Greek east remained largely uninfluenced by Roman monetary structures until the 1st cent. BC. But as more and more of the Mediterranean world came under direct Roman rule and became involved in the civil wars that brought the republic to an end, so the use of Roman monetary units and Roman coins spread, to Africa, Greece and the east, and Gaul. Only Egypt, incorporated in 30 BC, remained monetarily isolated from the rest of the Roman world.

The military insurrection of Sulla in 84 BC had seen the production of a gold as well as a silver coinage, the availability of the metal combining with an urgent need for coinage to pay his soldiers; the precedent of Sulla was followed by *Caesar in this if in no other respect: the vast quantities of gold derived as booty from Gaul and Britain were converted in 46 BC by Aulus Hirtius (consul 43) into the largest gold issue produced by Rome before the reign of *Nero; by 44 BC the distribution of gold coins, or *aurei*, to the troops was a normal occurrence. Caesar's rival *Pompey had become from the exploitation of the provinces of the east the wealthiest man of his time; in attempting successfully to outdo him in wealth as well as in prestige, Caesar in effect superseded the state as a minting authority.

The civil wars which followed the death of Caesar saw the production of coinage in a variety of metals—including bronze on more than one standard—by most of the rival contenders; unity of minting authority and uniformity of product returned when the last survivor of the civil wars finally suppressed the institutions of the free state and established an autocracy. The coinage of Caesar Octavianus (see AUGUSTUS) became the coinage of Rome.

Meanwhile, the types displayed by the Roman republican coinage had also come to mirror accurately the escalating internal conflict of the nobility. By 211 BC, the production of coinage was in the hands of men called *moneyers*, young men at the beginning of a political career. The possibilities offered by the coinage for self-advertisement gradually became apparent during the 2nd cent. BC and by the last third of the century the issue produced by a moneyer was as far as its types were concerned effectively a private concern; a moneyer might recall his town of origin, the deeds of his ancestors, eventually the contemporary achievements of a powerful patron; with Caesar, the coinage began to display his

portrait, an overtly monarchical symbol; even *Brutus, the self-styled Liberator, portrayed on his last issue two of the daggers which had murdered Caesar on one side and his own portrait on the other side. In striking contrast to Mark *Antony, the future Augustus gradually suppressed on his coinage any reference to his lieutenants; and the coinage with which he paid the troops who defeated Antony and *Cleopatra VII at the battle of *Actium was already a coinage which displayed only the portrait and attributes of a single leader.

One important change in the structure of this coinage took place under Augustus: the silver fractions of the denarius, which had filled the gap between the denarius and the as, were largely replaced by *orichalcum* multiples of the as, the sestertii and dupondii which are among the most familiar components of the Roman imperial coinage. At the same time, the as and the smallest denomination now struck, the quadrans, or quarter, were produced in pure copper. The most probable view is that the letters SC on the new base metal coinage of Augustus reflect the fact that the new structure was endorsed by a decree of the senate (*s(enatus) c(onsultum)*); the reform perhaps involved the revaluation of surviving republican asses, heavier than Augustan asses, as dupondii.

The mainstream coinage of the Roman empire, then, consisted of aurei and denarii, at a ratio of 1:25, and base metal fractions. Although at all periods much, even most, was struck at Rome, this was not necessarily so: it is likely that between Augustus and the changes under *Nero most of the precious metal coinage was struck in Gaul. In addition, the empire continued in the east to produce coinages modelled on the earlier coinages of a number of areas, for instance cistophori in Asia till the 2nd cent. AD, tetradrachms in *Syria till the early 3rd cent. AD, tetradrachms in Egypt till *Diocletian (285–305). But the shift of minting from Gaul to Rome began a process of concentration of minting which lasted till the Severans (*see* ROME (HISTORY)). Thereafter, the evolution of the empire saw an inexorable tendency for more and more of the mainstream coinage to be produced in the provinces, though there were ebbs and flows in the pattern. And the base metal coinage of the east consisted for a long time not of the familiar sestertii, dupondii, asses, and quadrantes of the mint of Rome, but of a range of provincial bronze coinages. The kaleidoscopic variety of the coinage of the empire was completed by hundreds of city coinages, in the west till *Claudius, in the east (the so-called 'Greek imperials', now better known as Roman provincial coinage) till the 3rd cent. AD. All these coinages, however, were probably based on, or compatible with, Roman monetary units. It is less clear how far the empire formed a single circulation area: the most probable view is that

even mainstream coinage, once it had reached an area, tended to stay there, even in the 1st and 2nd cents. AD; but there is no doubt that the compartmentalization of circulation became even more marked with the shift from a monetary to a natural economy in the third century AD (*see* below).

The monetary system of the Roman empire always operated on very narrow margins. It is possible to calculate that in normal times perhaps 80 per cent of the imperial budget was covered by tax revenues, the rest by the topping up of what came in with coins minted from newly mined metal. Prudent emperors managed; the less prudent did not.

In AD 64 Nero reduced the weight of the aureus and the weight and fineness of the denarius; and despite attempts under the Flavians (*Vespasian, *Titus, *Domitian) to reverse the trend, the next century and a half saw a slow decline in the silver content of the denarius, paralleled by a similar or worse decline in that of the provincial 'silver' coinages. *Commodus further reduced the weight of the denarius and *Septimius Severus drastically reduced its fineness; while *Caracalla chose to issue a coin, known to modern scholars as the antoninianus, with the weight of about one and a half denarii, but (probably) the face value of two. Since the imperial portrait bore a radiate crown, not the laurel wreath of the denarius, the coin may have been known as a 'radiate'. The tax-paying population of the Roman empire was not to be deceived and the state found its revenues increasingly arriving in the form of recent issues of poor quality, while older issues of better quality were hoarded or melted down. The combination of this process with the increasing demands on the empire as barbarian pressure increased led from AD 238 onwards to the complete collapse of the silver coinage: the denarius ceased to be produced and by AD 270 the antoninianus had ceased to contain more than a trifling percentage of silver. The weight even of the gold unit fluctuated, presumably as emperors divided what was in the kitty by the number of aurei it was necessary to pay out. In a sense, all that happened was that what had always been the underlying reality was revealed: an agricultural surplus supported an army and a bureaucracy. For on the whole taxes and payments were slow to catch up with the declining value of the coinage; and as the monetary circle—levies of taxes, payments to soldiers and others, payments to cultivators for grain for soldiers and others, providing the source for yet further levies of taxes—became increasingly meaningless, so it became ever more apparent that the 'real' wage of a soldier, for instance, was his ration of corn. And the institutional structures of the empire slowly changed to accommodate this fact.

At the same time, the sheer bulk of coinage produced and its appalling quality facilitated the production of imitations: the *nummularii*, whose profession it had been to test for forgeries, could not cope. A large part of the hoards of the late 3rd cent. AD, particularly in the west, is made up of coins known to modern scholars as 'barbarous radiates'.

By a series of reforms, the details of which remain obscure, Aurelian and the immediately subsequent emperors attempted to reform and stabilize the coinage. Aurelian produced coins marked *XXI* or *KA* (in Greek), to indicate 5 per cent silver content; and there followed coins marked *XI* or *IA* (in Greek), to indicate 10 per cent silver content. The next major reform is that of Diocletian, who stabilized the gold coinage at 60 aurei to the Roman pound, restored a pure silver coinage at 96 units to the pound, and produced in addition a large bronze denomination with some silver content, known at the time as the *nummus*, and also small bronze pieces, doubles with a radiate head and no silver content, the ultimate descendants of Caracalla's double denarius, and singles with a laureate head. The gold unit was henceforth known as the *solidus*. Further adjustment was necessary in AD 301, the year of the Prices Edict, when Diocletian issued a revaluation edict, attested by the coins and by one of the two texts on a fragmentary inscription from *Aphrodisias. Diocletian also consolidated the distribution of production in twelve to fifteen mints distributed through most of the Roman empire; their products on the whole circulated in the areas where they were struck.

*Constantine I reduced the weight of the *solidus* to 72 to the Roman pound, but managed not to wreck the system completely; his gold coin remained standard for many centuries. A pure silver piece, however, never again played a major part in production or circulation, except to a certain extent between about AD 350 and 400. Nor did the Diocletianic *nummus* really survive, though some of the bronze issues of his successors approach it in diameter. Rather the coinage of the late Roman empire consists essentially of *solidi* and vast quantities of small bronze denominations of changing face value. There is a long series of reforms and revaluations, until some sort of stability is finally achieved in the 5th cent. AD, with the emergence of very small bronze *nummi*, followed by the substantial 'reforms' associated with the names of Anastasius and Justinian (527–65). It is this pattern which is initially replicated by the coinages of the successor kingdoms of the west, before they develop the silver coinages characteristic of the Middle Ages. In the east, the coinages of the Arab successors to much of the territory of the Byzantine empire are likewise of silver. See FINANCE, ROMAN.

MHC

colonization, Greek 'Colonization', in the language of a former imperial power, is a somewhat misleading definition of the process of major Greek expansion that took place between c.734 and 580 BC. In fact, the process itself was not so much 'Greek' as directed in different ways and for different reasons by a number of independent city-states (see POLIS). This at least emerges with relative clarity from both the historical and the archaeological evidence. For the rest, the mass of general and particular information that has accumulated under these two headings is only rarely susceptible to a single uncontroversial interpretation. Although the position has greatly improved since the 1930s, it is still only too true that archaeologists and ancient historians do not always appreciate each other's aims and methods—a problem that is exacerbated by the fact that on the subject of colonization ancient no less than modern authors are more than usually influenced by their own political agenda and accordingly more than usually liable to project the priorities, practices, and terminology of their own times onto the much earlier events they purport to describe.

The actual course of early Greek expansion is reasonably clear, in terms both of the areas colonized and of the identity of the chief colonizing cities: Chalcis, Eretria, Corinth, Megara, Miletus, and Phocaea. Of these, the Euboean cities (Chalcis, Eretria) must rank as pioneers. Eretrian Corcyra was the first Greek colony in the Adriatic, which suggests that it was intended mainly as a way-station on the route to the west; and the primarily Chalcidian foundation of Cumae on the bay of Naples is the most northerly as well as the earliest (before 725) Greek colony on the mainland of southern Italy—known to later historians as Magna Graecia. Cumae was a logical extension of the pioneering Euboean venture at the *emporion* (trading place) of Pithecusae (mod. Ischia), itself a result of earlier commercial experience—not least in a Levant (Al Mina) that had been aware of western resources (Sardinia) since the bronze age. Chalcidians extended their reach to eastern Sicily with the foundation of Naxos in 734, soon followed by Leontini and Catania; on the straits of Messina, they were joined by Cumaeans at Zancle, whence Mylae provided much-needed land, and control of the vital passage was completed at Rhegium c.720. Nearer home, the Chalcidice peninsula takes its name from the early and extensive Euboean presence on the northern shores of the Aegean, notably at Torone (Chalcis; this is controversial) and at Mende, founded by Eretria, as was Methone (for refugees from Corcyra) on the gulf of Salonica (Thessalonica). The Euboean domination of this area, motivated by land hunger rather than commerce, was not broken until c.600, when Corinth established Potidaea to trade with *Macedonia. By then,

colonization, Greek The site of Pitheculasae (mod. Ischia) in the Bay of Naples, an example of a trading place (*emporion*) rather than a colony (*apoikia*). Active from the mid-8th cent. BC, it was the first and most northerly Greek establishment in the west. Estate of Dr. Francesca R. Serra Ridgway

Corinthians (and Corinthian pottery) had long enjoyed a substantial western presence, built on early experience that had extended to expatriate ceramic production at Euboean Pitheculasae. In 733 Corinth evicted the Eretrians from their port of call at Corcyra and founded *Syracuse, which had the best harbour in eastern Sicily and for long conditioned the history of nearby Megara Hyblaea, founded by Corinth's near neighbour at home, Megara—which elsewhere gained control by c.660 of the approaches to the Black (Euxine) Sea with Chalcedon and the superior site of *Byzantium.

Early Euboean and Corinthian achievements in the west concentrated the attention of others, both on the west itself and on other areas as yet unopened. Of the former, the Achaeans were responsible from c.720 for Sybaris, Croton, Caulonia (founded from Croton), Metapontum, and Poseidonia (i.e. *Paestum, probably founded from Sybaris)—the latter, on the Tyrrhenian coast, was situated at the end of an overland route from the south that provided a serious challenge to the well-

established trade (ultimately with Etruria) through the straits. In the last decades of the 8th cent., *Sparta founded its only colony by taking possession of the finest port in south Italy, Tarentum; Rhodians and Cretans (*see RHODES; CRETE*) combined to establish Gela on the south coast of Sicily in 688; Locri Epizephyrii is said to have been founded by settlers from Locris in central Greece in 673, Siris from Colophon in Ionia (western *Asia Minor) before 650. By now, daughter-foundations were a standard feature of the western scene: two of them, Selinus and Acragas, representing extensions into western Sicily by Megara Hyblaea and Gela respectively, boast temples that are no less magnificent than those of Greece itself.

At the other end of the Greek world, the literary evidence is less reliable than it is for the west, and excavation has been less extensive: but it is claimed that Miletus founded a great number of cities along the Turkish coast to Trapezus, north from the Bosphorus to the Danube, and in the Crimea. In a completely different direction, Thera

founded *Cyrene in North Africa c.630. And from c.600, Phocaeans safeguarded their far western trade by founding colonies on the Mediterranean coast on either side of the Rhône delta: Massalia (mod. Marseilles), Nicaea (mod. Nice), and Antipolis (mod. Antibes) in what is now southern France, and the aptly named Emporion in northern Spain.

It is no exaggeration to say that by 580 all the most obvious areas in the then available world had been occupied to at least some extent by Greeks, and that the meeting of Greek and indigenous priorities was in the process of giving rise to new historical realities. The factors that influenced any given colonizing city, or indeed the foundation of any given colony, were inevitably many and various: it is not possible to compile a generally applicable assessment of the interlocking claims of overpopulation and land hunger at home, opportunities for commercial or social advancement abroad, 'internal' (Greek vs. Greek) rivalry and reaction to external pressure. No less various were the relations between colony and mother city, and the effects of Greek colonization on the indigenous inhabitants of the regions colonized. Many different natural resources were doubtless targeted for exploitation, and markets were accordingly made: but the cultural 'Hellenization of the *barbarians' (see HELLENISM) was at no time consciously planned, nor did all the 'barbarians' share the unswerving predilection for the Greek point of view displayed by all ancient and most modern commentators on colonial matters. It remains true that the history of the Greeks abroad is an indispensable element of the history of the Greeks at home.

DWR

colonization, Hellenistic *Plutarch, in the eulogy of his hero *Alexander the Great (*De Alex. fort.*), made the foundation of cities the linchpin of the achievement of Alexander, who wished to spread Greek civilization throughout his realm. Although we must be mindful of the predictable ideology which has structured Plutarch's argument, as well as distrustful of the number of cities attributed to the conqueror (70!), it is nevertheless true that Alexander's conquest opened the countries of the middle east to Greek immigration. The Greeks, however, could only imagine life in cities with Greek-style houses, streets, public buildings, civic institutions, and a rural territory where the colonists could hold plots of land (*klēroi*). Begun by Alexander, usually as military colonies rather than cities proper (*Alexandria in Egypt is an exception), this policy was followed by his successors and developed further by the *Seleucids. Every region of their empire was included, but it is possible to distinguish four arenas in particular: *Babylonia (including Susiana and

the Persian Gulf), where Seleucia on Tigris filled the role of royal residence (Akkad. *āl šarrūti*), and the military colonists of the islet of *Icaros (mod. Failaka) held land-grants; north *Syria, the 'new Macedon', sown with dynastic foundations (*Antioch, Apamea, Seleucia in Pieria, Laodicea-on-the-Sea); *Asia Minor, where new cities were planted on older sites (e.g. Celaenae/Apamea, Laodicea-Lycus, etc.); and, last but not least, central Asia, where the best-documented example is *Ai Khanoum (perhaps originally an Alexandria). All the foundations received a Greek and/or Macedonian population, as the onomastic evidence shows; the Seleucids wanted, in effect, 'to create Greek colonies and to instal citizens of Greek cities in Phrygia, in Pisidia, and even in the Persian Gulf region' (Louis Robert). When Antiochus I wanted to strengthen the city of Antioch-Persis, he asked Magnesia ad Maeandrum (western Asia Minor) to send a contingent of new colonists. Even the most distant foundations remained in direct contact with their Aegean counterparts: we know, for example, that the philosopher Clearchus of Soli, a pupil of Aristotle, stayed at Ai Khanoum, leaving as evidence a copy of the Delphic maxims; the family of the Graeco-Bactrian king Euthydemus I (last quarter of the 3rd cent. BC) came from Magnesia ad Maeandrum, and influences from the Maeander valley are also detectable in a statuette found in the Bactrian sanctuary of Takht-i Sangin; the Greek inscriptions found in Arachosia use a language and syntax which imply regular links with the Aegean cities. However, the Graeco-Macedonian dominance in the new cities implies neither an enforced Hellenization of the local peoples nor their marginalization. (See HELLENISM.) In Babylonia, what is striking is the continuity and survival of traditional social, political, and religious institutions. Anu-uballit, governor of Uruk in the reign of Seleucus II (240–225), is a specially interesting case: he had received permission from the Seleucid king to add to his Babylonian name the Greek 'Nikarchos'; at the same time he continued to watch over and care for the Babylonian sanctuaries of the city.

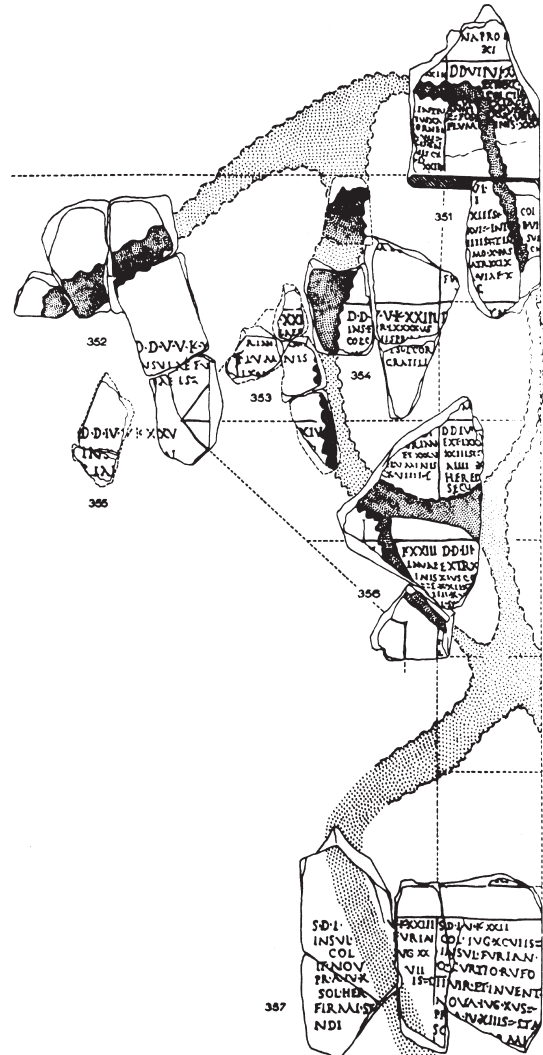

PB

colonization, Roman The earliest colonies of Roman citizens were small groups of 300 families at *Ostia, Antium (mod. Anzio, 338 BC), and Tarracina (mod. Terracina, 329 BC). Others were added as the Roman territory expanded, through reluctance to maintain a permanent fleet. In 218 there were 12 such '*coloniae maritimae*'. The older view that such small communities were to serve as garrisons guarding the coasts of Italy, and even their title, have been disputed and a more political 'Romanizing', or 'urbanizing' purpose envisaged. (See ROMANIZATION; URBANISM.) *Coloni* retained Roman citizenship because

the early colonies were within Roman territory, and were too small to form an independent *res publica*; some colonies, such as those at Antium and Minturnae (295 BC), seem to be part of a double community, rapidly assimilated, even if the relations between the two populations is obscure. Later 'double communities', though often doubted, are attested, as at Interamnina Praetuttiorum (ILLRP 617 f.). Citizen colonies are distinct from Latin, which, though largely manned by Romans, were autonomous states established outside Roman territory and with acknowledged strategic aims, clear for the 6,000 sent to Alba Fucens in 303 BC; the two-*iugera* plots ascribed to Tarracina (however supplemented by access to undistributed land) were smaller than those allotted to Latin colonists (15 at Vibo Valentia (mod. Monteleone) in 192 BC). 'Coloniae maritimae' seem to have been normally exempt from legionary service, though the exemption was revocable, and *coloni* were bound not to absent themselves by night from their colonies in time of war. (Arguments brought against this *vacatio militiae* are not wholly convincing.)

About 177 BC the system of citizen colonies was reorganized. They were assimilated to Latin colonies, and the use of the latter to all appearances abandoned. Henceforth citizen colonies were large—2,000–5,000 men—and were employed for the same purpose as Latin colonies formerly. It should not be assumed, however, that all the original Roman colonies remained small and static. Puteoli (mod. Pozzuoli, 194 BC), though exceptional because of its position, was showing administrative complexity and magisterial jurisdiction in a public building contract of 105 BC (ILLRP 518). It is worth noting too that the first deployment of large Roman colonies is in Cisalpina (2,000 at Parma and Mutina, 183 BC), where the strategic and cultural situation was different from that of 4th-cent. Latium. Generous allotments of land were given to the new colonies and their internal organization was changed also. They remained citizen colonies but received extensive powers of local government for their annual magistrates—*duoviri, praetores, or duoviri praetores*—and council (*consilium*). Not many of the new-style colonies were founded till the time of Tiberius and Gaius *Gracchus, when a further change took place in their employment. Henceforth they were founded for social and political as much as for strategic reasons, either as emigration schemes for the landless or to provide for veteran soldiers. They could, as with the Sullan settlements in Etruria and *Pompeii (see SULLA), cause friction with the original inhabitants and give rise to unrest, notably the revolts of 78 and 63 BC.

The first foundation outside Italy was the Gracchan Junonia at *Carthage (122 BC). Its charter was revoked,

colonization, Roman This marble map shows the colonial plots of land created by *centuriation of islands formed by the river Rhône in the territory of Arausio (Orange), a veteran-colony. As was usually the case with Rome's overseas colonies, Arausio was founded on land taken from subject peoples. Museum of Orange

but the *coloni* retained their allotments. In 118 BC Narbo Martius in Provence was successful despite senatorial objections. In 103 and 100 BC, Lucius Appuleius Saturninus (*tribune of the plebs 103) and *Marius proposed large-scale colonization in certain provinces, and effected a few settlements in Africa, Corsica, and Provence. But extensive colonization outside Italy became regular only under *Caesar and Octavian (the future *Augustus), when, reflecting the change in the locus of political

power, colonies began to adopt the names of their founders and benefactors as titles of honour (so *Colonia Claudia Ara Agrippinensium*, Cologne, AD 50). Some colonists were still being drawn from the civilian population, notably at the refounding of Carthage and Corinth and at Urso in Spain (all about 44 BC). Such exceptional colonies were known as *coloniae civicae*. Augustus, discharging his veterans and avoiding Italy after 27 BC, established numerous colonies not only in Narbonensis (see GAUL (TRANSALPINE)), the Spanish provinces, *Africa, and Mauretania, but also in the east. There had already been Caesarian foundations in *Asia Minor (e.g. Apamea Myrlea). After Philippi, Octavian gave veterans Italian land (Cass. Dio 49. 14 records the allocation to Capua of Cretan territory in compensation), but the Perusine war (42) showed that if not sent home (*Mon. Anc.* 16) they would have to be settled elsewhere, and the numbers of Antonian troops to be discharged indicated the east. (See ANTONY, MARK.) Augustan colonies were thickly scattered, mainly on the seaboard of Greece and NW Asia Minor. In Pisidia (25 BC), surrounding the mountains that sheltered the rebellious Homanadenses, and at Berytus (c.14 BC) they provided a military presence when legions could not be afforded. In the East an existing *polis* could survive colonization: at Iconium in Phrygia and at Ninica in Cilicia native communities continued; colonization may be seen as part of a movement in populations that included the individual settlement of Italian businessmen, soldiers, and others, as well as the creation of hybrids like *Nicopolis in Epirus: colonization was sometimes unofficial in both east and west. In the later republic, casual immigrants established the *pagus* and *conventus civium Romanorum*, 'community of Roman citizens', in native settlements, thus forming the basis of future *municipia*, municipalities.

Eastern colonies used the standard constitution of *duoviri* and *ordo* (see below); where there was a genuine settlement the use of Latin for official purposes was persistent, and the eastern colonies were a fruitful source of senators and **equites*, for their size, but the overall picture, in language, constitution, religion, and architecture, is of a rich mix. To possess a Capitolium (temple of *Jupiter) was important, and some colonies, Ariminum (268 BC and Augustan), Puteoli, Pisidian Antioch (25 BC), were miniature Romes (Gell. *NA* 16. 13. 8 f.), even organized into seven districts (*vici*). If colonies sent to places where native communities already existed provided the latter with the model of how Romans and Italians lived, and brought some means of following it, that was incidental (see ROMANIZATION). None the less the original communities would often eventually receive citizenship and coalesce with the colony.

Eastern colonization continued under *Claudius and *Vespasian (Ptolemais, AD 51, mod. Acco; Caesarea in Palestine, c.AD 70) but increasingly became a means of enhancing the status of existing cities (even though the concomitant privileges did not include exemption from tribute) rather than of finding homes for veterans or of constructing military outposts. *Colonia Aelia Capitolina* (Jerusalem, AD 135) was a special punitive case (see JEWS). Claudius also began the regular colonization of the Balkan provinces and the northern frontier, which continued till *Hadrian. Thenceforth no new colonies were founded. Instead, the title colony with *ius coloniae* ('colonial status') became a privilege increasingly sought out by *municipia* as the highest grade of civic dignity. The process began when Claudius conferred the title on the capital cities of certain Gallic communities, but only became considerable in the 2nd cent.

The arrangements for local government in Caesarian and imperial colonies were a more complex development of the earlier system. Colonial magistracies were always more standardized than municipal and eventually came to resemble a small-scale replica of the Roman constitution; so the 300 families of early Roman colonies echoed threefold divisions of the Romulan state. (Hence the later popularity of the *ius coloniae*.) However, the evolution of constitutions in Italy was very gradual. *Duoviri iure dicundo* ('two magistrates for interpreting the law') appear under the republic only at Pompeii and Ostia. While there is evidence for standardization in Cic. *Leg. agr.* 2. 92 f., and Caesar was responsible for developments in connection with his agrarian legislation, the *lex Mamilia Roscia Peducaea Alliena Fabia* (FIRA 12, 138 no. 12), archaic elements persisted ('*manus iniectio*' occurs in the Caesarian law for Urso, 177 no. 21 (= Dessau, *ILS* 6087), 61). Aediles and sometimes quaestors are also attested, the former before republic passed into empire: at Venusia the colony began electing quaestors in 34 BC (*fasti Venusini*, *CIL* 9. 422). The census was taken by *duoviri quinquennales* ('quinquennial magistrates'), replaced in some Italian colonies by *censores*. Even under the empire individuality was not wiped out: Abellinum had *censores*, *praetores duoviri*, and *aediles duoviri*, the last apparently unique, and some colonies in Narbonensis may have had *quattuorviri* (A. Degrassi, *Scritti vari* 1 (1962), 127–143; aediles 179–83). Ex-magistrates passed into the council of *decuriones*, sometimes called *conscripti*. See CENTURIATION; MAGISTRACY, ROMAN. ANS-W/BML/EHB

Colosseum, the medieval name of the Amphitheatrum Flavium, near the colossus of *Nero on the site of the lake of Nero's palace, the Domus Aurea (Golden House). Begun by *Vespasian, it was continued by *Titus, and

dedicated in June AD 80. *Domitian was probably responsible only for the complex substructures of the arena. The building measures 188 × 156 m. (205 × 170 yds.) along the axes, and is 52 m. (170 ft.) high. The travertine façade has three storeys of superimposed arcades framed by half columns of the Doric, Ionic, and Corinthian orders, surmounted by a masonry attic decorated with Corinthian pilasters on a low podium; there are windows in the podium and in the spaces between the pilasters, alternating with bronze shields. There were also mast-corbels for the awning, worked by sailors. The seating, supported by concrete vaults, was in three tiers, with standing room above it. The arena was cut off by a fence and a high platform carrying marble chairs for guilds and officials, including boxes for the emperor and magistrates on the short axis. The arena was floored in timber, covering cages for beasts, mechanical elevators, and drains. Audiences, estimated at 50,000, were marshalled outside the building in an area bordered by bollards, and held tickets corresponding to the 76 numbered arcades, whence an elaborate system of staircases serviced all parts of the auditorium.

The amphitheatre was restored by *Nerva and *Trajan (CIL 6. 32254–5), *Antoninus Pius (SHA *Ant. Pius* 8), after the fires of 217 (Cass. Dio 78. 25; SHA *Heliogab.* 17; *Alex. Sev.* 24; *Maximus et Balbinus* 1. 14) and of 250 (Jer. *Ab Abr.* 2268), after 442 (CIL 6. 32094), and in 523 (Casiod. *Var.* 5. 42).

IAR/DES/JD

colour, ancient perception of W. E. Gladstone's 19th-cent. philological studies of Greek colour terms led him to conclude that the Greeks suffered from defective vision (1858). More recently, in the wake of Berlin and Kay (1969), ancient colour perception has been a locus for debating cross-cultural universals and cultural relativism.

Ancient concepts of colour were in fact contested and negotiable even amongst ancient theorists. The Greeks could certainly distinguish hues (*pace* Gladstone), and the etymology of the Greek *chrōma* implies that Greek conceptions of colour were closely related to skin, bodily complexion (*chrōs*, *chroia*), and to the surface of the body as an index of what is subjectively felt or lies within. But Greek colour terms do not organize visual experience primarily according to hue as does the modern English lexicon, but, rather, luminosity, texture, contrast, and further properties of the objects or phenomena they qualify.

Ancient colour vocabulary, then, must be approached with the awareness that 'colour' as an English speaker would understand it, may not be the primary referent at all. Ancient Greek, for instance, furnished its speakers with a system of sensory adjectives that pick out visually and conceptually salient reference points encountered in several

different cognitive domains of sensory experience, of which our 'colour' is only one. Cases in point are: *chlōros*, commonly translated as 'green', but used also of dew, tears, limbs, and blood, and evoking primarily fecundity, freshness or vitality; *porphureos*, commonly translated as 'purple', but also related to the concept of heaving movement (*porphurō*), hence, used of the surging sea; *argos*, 'bright, gleaming white', but also 'nimble' or 'swift-moving' activity, as of dogs and horses, likely because the strobing of light refracted through running legs was felt to approach the term's core concept of bright flashing light.

Philosophers of the 5th and 4th cents. do theorize primary colours between the poles of *leukon* ('bright' or 'light') and *melan* ('dark') but display limited consensus as to their number or identity. Empedocles, Democritus, and *Plato, who can be read as positing four basic colours of which the third is *eruthron*, 'red', notably disagree about the fourth (positing *ōchron*, 'pale', *chlōron*, and *lampron*, 'shining', respectively: Empedocles. A92 DK; Democr. A135. 73–5 DK; Pl. *Tim.* 67c–68b). *Aristotle, in concert with his views on tastes, diverges still further, enumerating seven of which none is *eruthron* (*Sens.* 442a20–8), while beyond his four primaries, Democritus allows for an indefinite further number of colours (A135. 78 DK).

Latin colour categories display analogous cultural idiosyncrasies and present similar headaches for translators. The Latin *color*, from which our 'colour' derives, holds a plethora of meanings. Roman writers of the early empire connect *color* to the surface of an object, pigment, and dye, but also to character and rhetorical self-presentation. For *Ovid, *Seneca, and *Pliny the Elder the discourse of *color* constitutes a potent site for debating the relation between perception and knowledge and the moral and ethical charge of *luxuria*. Artificially coloured surfaces, in particular, draw the attention of Roman moralists as a locus of deception and moral decadence, foregrounding concerns about the epistemological veracity of appearances which also mark late republican and Imperial discussions of rhetorical *color* ('character') in the context of Latin oratory (Cic. *De or.* 3.199; Quint. *Inst.* 2.5.12; 4.2.88; 8.3.6). Roman writers are heavily informed throughout by the philosophical doctrines of the Stoics and the Epicureans. The clearest example is *Lucretius' epic, *De rerum natura*, where he presents colour as a real entity (following *Epicurus), but also recapitulates its epistemic limitations as a stable locus of knowledge about the world (Lucr. 2. 730–841).

OLD, MIDDLE, AND NEW GREEK COMEDY

Old Comedy

1. For practical purposes, 'Old Comedy' is best defined as the comedies produced at Athens during the 5th cent. BC. An early form of comedy was composed in *Sicily, the connection of which with Attic comedy is hypothetical. At Athens itself no transition from Old to Middle Comedy occurred precisely in 400 BC, but the two extant plays of *Aristophanes which belong to the 4th cent. differ in character from his earlier work (see COMEDY (GREEK), MIDDLE). The provision of comedies at the City Dionysia each year was made the responsibility of the relevant magistrate in 488/7 or 487/6 BC; Aristotle's statement (*Poet.* 1449^b₂) that before then comic performances were given by 'volunteers' (*ethelontai*) is probably a guess, but a good one. Comedies were first included in the Lenaea shortly before 440 BC. Before and after the Peloponnesian War (431–404) five comedies were performed at each festival; there is evidence that the number was reduced to three during the war, but this question is controversial. In the 4th cent. comedies were performed also at the Rural Dionysia (cf. Aeschin. 1. 157), and it is likely, given the existence of early theatres in several Attic demes (districts: see DEMOCRACY, ATHENIAN), that such performances were widespread before the end of the 5th cent. No complete plays of any poet of the Old Comedy except Aristophanes survive, and he belongs to the last stage of the genre, but we have a great many citations from the work of his elders (notably Cratinus, 2nd half of the 5th cent) and contemporaries (notably Eupolis). Some of these support generalizations about Old Comedy based on Aristophanes, but where support is absent or doubtful it is important not to assume that the structural features common to his earliest plays constitute, as a whole, a formula of great antiquity.

2. The chorus, which had 24 members (cf. *Ar. Av.* 297 ff., with scholia (ancient commentaries) and on *Ach.* 211), was of primary importance in Old Comedy, and very many plays (e.g. *Babylonians*, *Banqueters*, *Acharnians*) take their names from their choruses. In Aristophanes (the practice may have been different in Cratinus) the chorus addresses the audience in the parabasis, which has a central position in the play, and again at a later stage. In parts of the parabasis the chorus maintains its dramatic role (as *Acharnians*, knights, clouds, jurymen, etc.), while in others it speaks directly for the poet. It is also possible for the chorus to have one role in one part of a play and a different role in another, as the chorus in *Frogs* plays the part of frogs in its first appearance, but subsequently the ghosts of Greeks who had been initiated at *Eleusis (see INITIATION). The entry of the chorus is sometimes a moment of violence and excitement. It may be (as in *Acharnians* and *Wasps*) hostile to the 'hero' of the play, and it has to be won over; but it is also possible for the chorus to be divided into opposing halves or for it to 'hold the ring' in respect of two opposed individual characters (as in *Clouds* and *Frogs*).

3. The plots of Old Comedy are usually fantastic. Typical features are an indifference to the passage of time, the ease with which a change of scene may be assumed without any complete break in the action (places which in reality would be far apart can be treated as adjacent), and the frequency of their references to the audience, the theatre, and the occasion of performance. In Aristophanes' *Peace*, for example, the 'hero', Trygaeus, arrives in Olympus on the back of a monstrous dung-beetle, and the goddess Peace is hauled by sturdy peasants (where, in the scene so far, have *they* been?) from a pit into which War had cast her. *Lysistrata* is in many ways unrealistic. Can an old woman really intimidate a policeman? As for the sex-strike, did not the men own female slaves? Didn't any of these 'sex-starved' men realize their 'gay' potential, as they do in many modern jokes about soldiers and sailors, and ancient jokes too, e.g. *Eubulus* fr. 118?

4. The comic possibilities of the hero's realization of his fantasy are often exploited by showing, in a succession of short episodes, the consequences of this realization for various professions and types. The end of the play is generally festive in character, a kind of formal recognition of the hero's triumph, but the logical relation between the ending and the preceding events may be (as in Aristophanes' *Wasps*) very loose, as if to drown the question 'But what happened *then*?' in the noise of song and dance and to remind us that we are gathered together in the theatre to amuse ourselves and Dionysus by a cheerful show.

5. An important function of Old Comedy was ridicule of prominent individuals, but the spirit in which this treatment was taken by its victims and by the audience raises (and is likely always to raise) the most difficult question in the study of Old Comedy. There is some evidence (schol. *Ar. Ach.* 67, cf. schol. *Ar. Av.* 1297) for attempts to restrict the

ridiculing of individuals by legislation; the evidence for their scope and effect is scanty. Among the extant plays we find 'Socrates' in *Clouds* and 'Euripides' in *Women at the Thesmophoria* appearing under their own names as comic characters, but *Plato *Apol.* 18D seems not to regard the (unnamed) comic poet's treatment of *Socrates as important; an anecdote represented Eupolis as thrown overboard to drown by *Alcibiades in revenge for the play *Baptai*, but there is a lack of comparable anecdotes about men whose names were given to (presumably uncomplimentary) comedies, e.g. *Hyperbolus*, *Kleophon*. Prominent politicians are always fair game for satire. Equally, artistic or intellectual change is a more obvious and rewarding target for ridicule than traditional practices and beliefs. There is nothing in the comic poets' work to suggest that as a class they positively encouraged an oligarchic revolution, and their own art was characterized by elaborate and continuous innovation.

6. The essential spirit of Old Comedy is the ordinary man's protest—using his inalienable weapons, humour and fantasy—against all who are in some way stronger or better than he: politicians, generals, artists, intellectuals, and also the gods. Mythology and theology are treated with extreme irreverence in Old Comedy; some plays were burlesque versions of myths, and gods (especially Dionysus) were made to appear (e.g. in Aristophanes' *Frogs* and Cratinus' *Dionysalexandros*) foolish, cowardly, and dishonest. Yet the spectator or reader must comprehend a civilization in which the *Bacchae* of Euripides and the *Frogs* of Aristophanes were both composed very close in time and for the same theatrical audience. In *Bacchae* the god Dionysus takes terrible revenge, while in *Frogs* the same god falls a victim to diarrhoea when frightened and has to be cleaned up by his (human) slave. Using 'faith' as meaning a belief which the believers choose because they like it, we can say that the Athenians had faith in the gods of Olympus, including faith that most of these gods would be willing on certain festal occasions to play the fool. The gods did that in comedy. See also: ARISTOPHANES. KJD

Middle Comedy

The term 'Middle Comedy' was coined by a Hellenistic scholar (? Aristophanes of Byzantium) as a convenient label for plays produced in the years between Old and New Comedy (c.404–c.321 BC). This was a time of experiment and transition; different types of comedy seem to have predominated at different periods; probably no single kind of play deserves to be styled 'Middle Comedy' to the exclusion of all others.

The defeat of Athens in 404 BC vitally affected the comic stage; the loss of imperial power and political energy was reflected in comedy by a choice of material less intrinsically Athenian and more cosmopolitan. In form at least the changes began early. *Aristophanes' *Ecclesiazusae* ('Assemblywomen': probably 393 BC) and *Plutus* ('Wealth': 388), now generally acknowledged to be early examples of Middle Comedy, reveal the atrophy of the comic chorus. The parabasis has disappeared; instead of lyrics specially composed for the chorus, interpolated pieces (*embolima*) were used at points marked in the MSS by the word *chorou*, '(song) of the chorus'. Already in the *Plutus* the lines expressly written for the chorus are virtually reduced to an entrance dialogue and duet. This decline of the chorus was probably gradual but not rectilinear. Throughout the period plays that took their titles from the chorus (e.g. Eubulus' *Stephanopolides*, 'Garland-sellers'; cf. Heniochus fr. 5) continued to be written, and examples can be found of choruses that still conversed with the actors (Aeschin. 1. 157, 345 BC; cf. Alexis fr. 239 KA) or sang specially composed lyrics (Eubulus frs. 102, 103 KA). Yet the typical New Comedy chorus, which took no part in the plot, must have become the norm by the end of the period, together with the five-act structure that its four unscripted interludes made possible.

The dangling phallus and grotesque padding of Old Comedy costume were probably given up during the period, but it is uncertain whether this was the result of legislation (the politician Lycurgus' theatrical reforms 338–c.325/4) or a change in popular taste.

Yet the specific flavour of Middle Comedy remains elusive. The pronouncements of ancient scholarship (e.g. Platonius 10–11 Kaibel = 50 ff. Perusino, emphasizing the lack of political criticism and the popularity of mythological burlesque; *Aristotle, *Eth. Nic.* 4. 6, 1128^a22 ff., claiming that contemporary comedy had replaced the foul language of Old Comedy with innuendo) seem reasonably accurate, provided they are not interpreted too rigidly. In the absence of any complete play (after the *Plutus*) judgements about Middle Comedy almost entirely depend on the interpretation of a large number of fragments, often quoted along with their play titles, but it cannot be stressed too greatly that the bias of the main preserver of these fragments, Athenaeus, may give a distorted impression of the part that descriptions of food and drink played in Middle Comedy.

Even so titles and fragments, when carefully examined, can be very informative. The variety of subject, especially in contrast with New Comedy, is striking. Plays with political themes were still produced, mainly but not exclusively in the early part of the period (notable titles are Eubulus' *Dionysius*, Mnesimachus' *Philip*), and politicians such as *Demosthenes and Callimedon were frequently ridiculed, if rarely criticized outright. As in Old Comedy, philosophers were pilloried and their views comically misrepresented; *Plato and the Pythagorean sects (see PYTHAGORAS) seem to have been the commonest victims. In the earlier part of the period mythological burlesque played a prominent role, doubtless continuing Old Comedy traditions. There may have been two main types of such burlesque: straight travesty of a myth, with or without political innuendo, and parody of tragic (especially *Euripides') versions. The aim was often to reinterpret a myth in contemporary terms; thus *Heracles is asked to select a book from Linus' library of classical authors (Alexis fr. 140 KA), and Pelops (see OLYMPIA §1) complains about the meagre meals of Greece by contrast with the Persian king's roast camel (Antiphanes fr. 172 KA). Popular also were riddles, long descriptions of food and feasting (often in extravagantly poetic language or anapaestic dimeters), and the comedy of mistaken identity (Middle Comedy originals have been suggested for *Plautus' *Menaechmi*, 'The Brothers Menaechmus', and *Amphitruo*).

Numerous fragments and titles show that the presentation of contemporary types, manners, and pursuits (e.g. *kitharōidos*/lyre-player and singer, *mempsimoiros*/fault-finder, *skyteus*/cobbler, *philothēbaios*/the 'I love Thebes' man) was a characteristic of Middle Comedy. This interest in the details of ordinary life may well have been associated with the development of one particular type of play, which dealt with a series of more or less plausible everyday experiences such as love affairs and confidence tricks, and featured a group of stock characters ultimately (though with the distortions of caricature) drawn from life. This was the type of play that later prevailed in New Comedy. Virtually all its stock figures (e.g. cooks, parasites, pimps, soldiers, courtesans, angry or avaricious old men, young men in love) can be identified in the fragments and titles of Middle Comedy. Although several of these characters can be traced back, at least embryonically, to Old Comedy (thus the braggart soldier has a prototype in the Lamachus of Aristophanes' *Acharnians*; Eupolis named one play *Kolakes*, 'Flatterers', after its chorus; courtesans were title-figures in several of Pherecrates' comedies), it is clear that the middle of the 4th cent. had the greatest influence on their typology. That was the time

when, for instance, the cook began to receive his typical attributes of braggadocio and garrulousness, and the parasite to be called regularly by this name (*parasitos*) in place of the older term *kolax*.

Plots of the standard New Comedy pattern can already be detected in the surviving fragments of Middle Comedy; Alexis' *Agonis* (datable to c.340–330 BC) featured a courtesan named Agonis, a young man in love, and probably too a confidence trick and recognition. Some of the typical plot elements (e.g. low trickery, the clever slave) go back to Old Comedy and probably beyond that to popular farce; others (e.g. recognition scenes) owe much to tragedy, especially Euripides. Although several of the sources are disputed, the part played by Middle Comedy in the complicated story of the development of the typical New Comedy plot must not be underestimated. Aristophanes is said to have introduced rape and recognition into comedy, but only in a mythological burlesque, the *Cocalus*, a late play written in the Middle Comedy period. Rapes and recognitions are likely to have been themes of other Middle Comedy burlesques such as Eubulus' *Auge* and *Ion* and Anaxandrides' *Helen*, all perhaps incorporating parodies of Euripidean tragedies which were famous for their rapes and recognitions. Consequently, when the *Suda* (α 1982) claims that it was Anaxandrides who invented 'love affairs and the rapes of maidens', this probably means that this comic poet was the first to use them as incidents of contemporary life in a non-mythological framework.

To 57 poets Athenaeus attributes more than 800 plays. We know the names of about 50 poets, many of them non-Athenian but writing for the Attic stage. The most important are Alexis (who continued writing well into the New Comedy period), Anaxandrides, Antiphanes, Eubulus, and Timocles. WGA

New Comedy,

comedy written from the last quarter of the 4th cent. BC onwards, but generally regarded as ending its creative heyday in the mid-3rd cent., composed mainly but not exclusively for first performance at Athens. At some stage the author of an anonymous treatise on comedy reckoned to know that there were 64 playwrights of New Comedy, of whom the most distinguished were Philemon, Menander, Diphilus, Philippides, Posidippus and Apollodorus (*Prolegomena de comoedia*, ed. W. J. W. Koster (1975), 10); the first three are commonly seen as the leading playwrights of the period, and above all Menander, who, though not the most successful in his own lifetime, was soon recognized as the outstanding practitioner of this type of drama. The volumes of Kassel and Austin, *Poetae Comici Graeci*, include nearly 80 playwrights dated with some probability as active between 325 and 200, and over 50 of later date; but many are simply names (or even fragments of names) found on inscriptions. A large number of fragmentary papyrus texts are believed to be from New Comedy (because of their similarity to identifiable texts), but they remain anonymous.

New Comedy Roman *mosaic from Mytilene (*Lesbos) with scene from the play 'Girl from Samos' (*Samia*, inscribed top left) by Menander, a title savouring of the love-interest which the plots of New Comedy favoured. From S. Charitonidis et al., 'Les mosaïques de la maison du Ménandre à Mytilène', *Antike Kunst*, Beiheft 6 (Bern 1970) pl. 4.1

Texts of Menander (and perhaps others) circulated widely until the 7th cent. AD but were then completely lost; only with the discovery of papyri in the 20th cent. did it again become possible to form a picture of some plays at first hand. In the mean time, knowledge of the genre was based very largely on the Latin adaptations by *Plautus and *Terence, though there are also echoes in later Greek authors such as Alciphron (2nd or 3rd cent. AD) and *Lucian. Even now we have perhaps 8 per cent of Menander's total output and otherwise very little in Greek except scrappy fragments and short quotations. But there is enough in common between the surviving Greek remains and the Latin adaptations for us to feel confident about picking out certain features as characteristic of the genre as a whole (see COMEDY (GREEK), MIDDLE).

Athens continued (at least at first) to be the magnet that attracted playwrights like Diphilus and Philemon from far away. But the plays themselves were quickly exported all over the Greek-speaking world, as is shown by the large number of terracotta masks and other artistic representations that have been discovered and by the evidence for travelling companies of 'artists of Dionysus'. Although Athenian citizenship and marriage-laws are integral to many of the plays, the presentation of characters, situations, and relationships is true to such universal elements of human experience that the plays could be enjoyed then as now by audiences far removed from Athens. Political references are rare and subordinate to the portrayal of the private and family life of fictional individuals; there are social tensions (between rich and poor, town and country, citizens and non-citizens, free and slave, men and women, parents and children), but they are not specific to one time or place. Love or infatuation (always heterosexual) plays a part and is regularly shown triumphing over obstacles in a variety of contexts. But this is not the only ingredient; Menander excelled at the sympathetic portrayal of many kinds of personal relationship and of the problems that arise from ignorance, misunderstanding, and prejudice. These generate scenes that the audience can perceive as comic because of their own superior knowledge, enjoying the irony of the situation; but Menander often plays games with his audience's expectations as well. Menander may have been exceptional, both in the skill with which he handled all these elements and altogether in the elegance and economy of his plot-construction; but this is the type of play that is accepted as typical of New Comedy.

The playwrights' skill lay partly in their ability to give fresh treatment to familiar material. In some ways comedy had become simpler and tamer by the end of the 4th cent.: there was little metrical variety (and the chorus was reduced to performing interludes that marked the act-breaks in a standard five-act structure) and very little obscenity (the costume of male characters no longer included a phallus), and the exuberant fantasies of Old Comedy were not found. But there were boastful stock characters (such as cooks, parasites, and soldiers), stock situations (such as the rediscovery of long-lost children), and familiar comic routines (such as the door-knocking scene which is central to the presentation of the main character in the third act of Menander's *Dyscolus* and can be traced back to *Aristophanes' *Acharnians*). The terracottas show that there was also a standard repertoire of masks; some correspond closely with the descriptions in the list of 44 'masks of New Comedy' by the scholar Pollux of Naucratis (*Onom.* 4. 143–54, 2nd cent. AD), but the status of that list is unclear since the repertoire must have evolved flexibly. It has been suggested that particular masks were attached to particular names and that in some sense the same character was seen to appear in play after play with the same name and mask; on the whole the evidence of the plays tells against this. PGM

comedy, Latin This term has come to be synonymous with *fabula palliata* ('drama in a Greek cloak'), since the *palliatae* of *Plautus and *Terence are the only complete Latin comedies to have survived from antiquity. But there were other types of comedy in Latin (*Atellana*, a masked drama named after the town Atella in Campania; *togata*, '(drama) in a toga'; mime; and others), and there was clearly some overlap of subject-matter, titles, and style between the various types. *Varro praised Titinius, Terence, and Quinctius Atta for their character drawing, combining authors of *palliata* and *togata* in the same list, and both types were influenced by Menander. The creative heyday of the *palliata* is thought to have been from Livius Andronicus (2nd half of the 3rd cent. BC) to Turpilius (?d. 103 BC), that of the *togata* from Titinius to

Atta; most productions cannot be dated, but the two types probably flourished side by side in the mid-2nd cent. BC. This may reflect a development within the *palliata*; at first happy to allow the inclusion of Roman elements in its Greek setting (as seen most clearly in the plays of Plautus), it came to favour greater consistency and thereby perhaps encouraged the development of a separate type of comedy with an Italian setting.

Plautus and Terence continued to be performed, and new *palliatae* to be written, at least until the time of *Horace, and *togatae* too were occasionally revived; but the comic stage came to be dominated by the coarser *Atellana* (still performed in *Juvenal's day) and above all (for several centuries) the mime. The comedies of Pomponius Bassulus (?early cent. AD) and his ?contemporary

Vergilius Romanus were doubtless written for recitation, like the *togatae* mentioned by Juvenal at about the same time.

*Livy's account of the evolution of drama at Rome (7. 2; cf. Hor. *Epist.* 2. 1. 139 ff.) does not explicitly distinguish comedy from tragedy, and its value is questionable. But it does include an informal tradition of 'jesters in improvised verse' as a relevant factor in the period before Livius Andronicus introduced plays with coherent plots. The Romans were doubtless also familiar with native Italian traditions such as the *Atellana* before they began to enjoy the *palliata*, and there are clear signs of the influence of the former on the latter, at least in our texts of Plautus; in turn, when the *Atellana* became scripted in the time of *Sulla, it was influenced by the *palliata*. Furthermore, knowledge of Greek drama was widespread in southern Italy well before Livius Andronicus, and many Romans must have seen or heard of performances in Greek by travelling 'artists of Dionysus' (though perhaps not normally in Rome itself); such performances may themselves have influenced the native Italian traditions.

It is generally assumed that all actors were male, except in mimes. They certainly wore masks in *Atellana*, almost certainly in *palliata*, and perhaps also in *togata*, but not in mimes.

For an attempt to show that satyr-plays were written and performed at Rome, see T. P. Wiseman, *JRS* 1988.

commerce See TRADE.

Commodus, Lucius Aurelius, sole emperor AD 180–92, one of twin sons born to Marcus *Aurelius and Annia Galeria Faustina in August 161, the first emperor 'born in the purple'. Given the title Caesar in 166, he was summoned to his father's side after the usurpation of Avidius Cassius in 175, received *imperium* and *tribunicia potestas* (see TRIBUNE OF THE PLEBS) at the end of 176, and was consul in 177, now Augustus and co-ruler. He was married in 178 to Bruttia Crispina and left Rome with Marcus for the second Marcomannic War. On his father's death on 17 March 180 he became sole emperor, taking the names Marcus Aurelius Commodus Antoninus, rapidly made peace, and abandoned the newly annexed territories, holding a triumph in October 180.

Major wars were avoided during the reign, the exception being in Britain, where, following a breach of the northern frontier, victories were won by Ulpius Marcellus, for which Commodus assumed the title Britannicus in AD 184. There were minor disturbances on the Danube frontier and in Mauretania (NW Africa), and serious problems with *brigandage and deserters, as well as mu-

tinies in the British army. Commodus at first retained his father's ministers, e.g. the guard prefect Tarutienus Paternus, but after an assassination attempt in 182, in which the emperor's sister Annia Aurelia Galeria Lucilla was implicated, Paternus was dismissed and soon killed along with many others. The guard prefect Tigridius Perennis effectively ran the government from 182 to 185, when he was lynched by mutinous troops. Marcus Aurelius Cleander, the freedman chamberlain, was the next favourite to hold power, even becoming guard prefect. After his fall in 190, following riots at Rome, power was shared by the emperor's favourite concubine Marcia, the chamberlain Eclectus, and (from 191) the guard prefect Quintus Aemilius Laetus. Commodus, by now obsessively devoted to performing as a *gladiator, appeared to be dangerously deranged. Proclaiming a new golden age, he shook off his allegiance to his father's memory, calling himself Lucius Aelius Aurelius Commodus, as well as eight other names, including Hercules Romanus: each month was given one of these names; Rome itself became the *Colonia Commodiana*. Numerous senators had been executed; others feared the same fate, and Laetus, probably with the connivance of Publius Helvius Pertinax and others, had Commodus strangled in the night of 31 December 192. His memory was at once condemned, but was restored by *Septimius Severus in 195. ARBI

consul, the title of the chief annual civil and military magistrates of Rome during the republic. Two consuls were elected annually for most, if not all, of the republic by the *comitia centuriata* (wealth-based citizen-assembly voting in centuries) at a meeting called for the purpose, normally by a consul, exceptionally by a *dictator, *interrex* (a *patrician senator chosen to supervise consular elections when both consuls died in office), or military tribune with consular power. Before 153 BC their year of office began on 15 March (possibly earlier in the years before c.220), thereafter on 1 January.

According to tradition the dual annual magistracy succeeded immediately to the kingship. Most of the powers of the king (including military command and the right to summon the senate and the people, but excluding certain religious functions, reserved for the *pontifices* (see PRIESTS (GREEK AND ROMAN))) and the *rex sacrorum* ('king for sacred rites', a patrician priest) fell to a pair of annual magistrates, called originally praetors (Livy 3. 55. 12; Festus 249 Lindsay) and subsequently consuls, the powers now

[continued on p. 204]

CONSTANTINE I

Constantine I, 'the Great' (Flavius Valerius Constantinus) (c.AD 272/3–337), born at Naissus, was son of Constantius I and Helena. When his father was appointed Caesar (293) Constantine remained as a tribune at the court of *Diocletian (ruled 285–305). He fought alongside the emperor Galerius against Persia (298) and the Sarmatians (299), and was at Nicomedia (Bithynia) in 303 and again in 305 when Diocletian abdicated. Constantius was now senior Augustus; his eastern partner Galerius reluctantly released Constantine for service with his father. Constantine, fearing interception by the western Caesar, Flavius Valerius Severus, hastened to *Britain to aid his father against the Picts.

When Constantius died at York (Eboracum, 306), his troops proclaimed Constantine Augustus; Galerius gave this rank to Severus, but grudgingly conceded Constantine the title Caesar. Based mainly at Trier (Augusta Treverorum), Constantine ruled his father's territories of Spain, Gaul, and Britain. At Rome Maxentius usurped power; Severus and then Galerius failed to dislodge him. For Constantine an alliance with Maxentius was welcome. The usurper's father, the former emperor Maximian, returned to power, visited Constantine in Gaul (307), and gave him the title Augustus and his daughter Fausta in marriage. Constantine sheltered Maximian when driven from Rome after failing to depose his son (308). At the conference of Carnuntum on the Danube Galerius gave the title Augustus to Licinius; like Maximinus in the east, Constantine spurned the style *filius Augustorum* (son of the Augusti) and retained that of Augustus, which Galerius recognized (309/10). Meanwhile he defended the Rhine, warring against the Franks (306–7), raiding the territory of the Bructeri, and bridging the river at Cologne (Colonia Agrippinensis, 308). He was campaigning against the Franks (310) when Maximian tried to regain power. Constantine forced him to surrender and commit suicide. As the connection with the Herculian dynasty was now discredited, a hereditary claim to the throne was invented for Constantine: it was alleged that his father had been related to Claudius II (268–70). On the death of Galerius (311), Maximinus and Licinius narrowly avoided war when partitioning his territories, and as Maximinus looked for support to Maxentius, Constantine looked to Licinius. In 312 Constantine invaded Italy. Victorious over Maxentius's northern forces near Turin and Verona, he marched on Rome. Maxentius gave battle at Saxa Rubra, was defeated, and was drowned near the pons Mulvius, the Mulvian Bridge across the Tiber. The senate welcomed Constantine as liberator and made him, not Maximinus, senior Augustus. He took over the rule of Italy and Africa, and disbanded the praetorian guard which had supported Maxentius.

Two years earlier it had been given out that Constantine had seen a vision of his tutelary deity the sun-god *Apollo accompanied by Victory (*see* NIKE) and the figure XXX to symbolize the years of rule due to him. By the end of his life Constantine claimed to have seen a (single) cross above the sun, with words 'Be victorious in this'. At Saxa Rubra, Constantine as the result of a dream sent his soldiers into battle with crosses (and no doubt other symbols) on their shields; heavily outnumbered, he defeated Maxentius. No more, yet no less, superstitious than his contemporaries, he saw the hand of the Christian God in this, and the need to maintain such support for himself and the empire. (*See* CHRISTIANITY.) From that moment he not merely restored Christian property but gave privileges to the clergy, showered benefactions on the Church, and undertook a massive programme of church building. At Rome a basilica was provided for the Pope where the barracks of the mounted branch of the praetorians had stood, and other churches, most notably St Peter's, followed. His religious outlook may have undergone later transformations, and was affected by his encounters with problems in the Church. In Africa he confronted the Donatist schism: the Donatists (members of a puritanical church of the martyrs) objected to the largess for their opponents and appealed to him. To the *vicarius* (supreme governor) of Africa, a 'fellow worshipper of the most high God', he wrote (314) of his fear that failure to achieve Christian unity would cause God to replace him with another emperor. Sincerity is not determinable by historical method; it is, in any case, not incompatible with a belief that consequential action may have political advantage. He had been present at Nicomedia when persecution began in 303; he knew that the problem with Christianity was that its exclusiveness stood in the way of imperial unity. If he threw in his lot with the Christians, there could be no advantage if they were themselves not united. Following a papal council in 313, his own council at Arles (Arelate) in 314, and his investigation into the dispute, he saw the refusal of the Donatists to conform as obtuse. From 317 he tried coercion; there were exiles and some executions. Totally failing to achieve his object, he left the Donatists to God's judgement (321). Weakness in the face of a movement widespread in Africa was seen when the Donatists seized the basilica Constantine built for the Catholics at Cirta; he left them in possession and built the Catholics another one.

Constantine I Portrait of Constantine I from Rome. The soldier-emperors of the later 3rd cent. were shown in Roman *portraiture as tough and ill-shaven. With the imperial recovery, Constantine revived the clean-shaven look. DAI Rome, neg. no D-DAI-ROM-57.998

At Milan (Mediolanum, 313) he met Licinius, and gave him his half-sister Constantia in marriage. Back at Nicomedia, Licinius published regulations agreed with Constantine on religious freedom and the restoration of Christian property (the so-called Edict of Milan). Licinius struck down Maximinus, and the two emperors were left to rule in harmony. In 313 the Rhine frontier engaged Constantine's attention; in 314 after attending the council of Arles he campaigned against the Germans; in 315 he spent two months in Rome.

The concord with Licinius was unstable. A first war was decided in Constantine's favour by victories at Cibalae (316) and Campus Ardiensis. Licinius ceded all his European territories except for the diocese of Thrace. In 317 Crispus and Constantine II, sons of Constantine, and Licinius II, son of Licinius, were made Caesars. Constantine spent 317–23 in the Balkans. Licinius became increasingly distrustful of him and suspicious of his own Christian subjects, whom he began to persecute. Constantine defeated a Gothic invasion (323) but was accused by Licinius of usurping his function; war followed. Constantine was victorious at Adrianople, in the Hellespont, and at Chrysopolis, and forced the abdication of Licinius at Nicomedia (324). Though his life was spared after his wife intervened with her brother, Licinius was later accused of plotting and executed, with his Caesar Martinianus (325); the Caesar Licinius II was executed in 326. Implication in the supposed plot may have been the excuse also for Constantine to remove one of the consuls of 325, Proculus. In a mysterious scandal, he even ordered the deaths of his son Crispus and his wife Fausta (326). Only one usurpation is recorded in the rest of his reign: Calocaerus in Cyprus (334), who was burnt alive by the emperor's half-brother Dalmatius.

On 8 November 324 Constantine made his third son Constantius II Caesar and founded Constantinople on the site of *Byzantium. The need for an imperial headquarters near the eastern and Danubian frontiers had been seen by Diocletian, who preferred Nicomedia (mod. Izmit, NW Turkey); Constantine will have recognized the strategic importance of Byzantium in his war with Licinius. The city's dedication with both pagan rites and Christian ceremonies took place on 11 May 330. From the beginning it was 'New Rome', though lower in rank. Pagan temples and cults were absent, but other features of Rome were in time reproduced (Constantius II upgraded the city council to equality with the Roman senate). To speak of the foundation of a capital is misleading; yet a permanent imperial residence in the east did in the end emphasize division between the empire's Greek and Latin parts.

In a reunited empire Constantine was able to complete Diocletian's reforms and introduce innovations. The separation of civil and military commands was completed. A substantial field army was created under new commanders, *magister equitum* (master of the horse) and *magister peditum* (commander of the infantry), responsible directly to the emperor: its soldiers (*comitatenses*) had higher pay and privileges than the frontier troops (*limitanei*). The number of Germans seems to have increased, especially in the higher ranks. Praetorian prefects and *vicarii* (overall governors in charge of the dioceses or groupings of provinces) now had purely civilian functions. In a reorganization of the government, the *magister officiorum* (master of the offices) controlled the imperial bureaux (*scrinia*), a new corps of guards (*scholae*) which replaced the praetorians, and a corps of couriers and agents (*agentes in rebus*); the *quaestor sacri palatii* (quaestor of the sacred palace) was chief legal adviser; the *comes sacrarum largitionum* (count of the sacred largesses) and the *comes rei privatae* (count of the imperial domains) handled those revenues and expenditures not controlled by the praetorian prefects. The Emperor's council (*consistorium*) had the above as permanent members, as well as *comites* (counts). These at first were men who served at court or as special commissioners, but the title 'count' was soon given freely as an honour. He also resuscitated the title of patrician. He tried vainly to stop corruption in the steadily growing bureaucracy. He gave senatorial rank freely, and reopened many civilian posts to senators who began to recover some of their lost political influence. From his reign survive the first laws to prevent tenant farmers and other productive workers, not to mention town councillors, from leaving their homes and work. His open-handedness harmed the economy: taxation (mostly in kind) rose inexorably despite the confiscation of the vast temple treasures. He established a gold coinage of 72 solidi to the pound, but the other coinage continued to depreciate (*see COINAGE, ROMAN*).

Resident now in the more Christianized east, his promotion of the new religion became more emphatic. He openly rejected paganism, though without persecuting pagans, favoured Christians as officials, and welcomed bishops at court, but his actions in Church matters were his own. He now confronted another dispute which was rending Christianity, the theological questions about the nature of Christ raised by the Alexandrian priest Arius. To secure unity Constantine summoned the council which met at Nicaea (mod. Iznik) in 325 (later ranked as the First Ecumenical Council), and proposed the formula which all must accept. Dissidents were bludgeoned into agreement; but bishop Athanasius of Alexandria's view that his opponents had put an unorthodox interpretation on the formula was seen by Constantine as vexatious interference with attempts to secure unity. Even if his success in this aspect was superficial, he nevertheless brought *Christianity from a persecuted minority sect to near-supremacy in the religious life of the empire.

He spent the generally peaceful last dozen years of his reign in the east or on the Danube, though he visited Italy and Rome (326), and campaigned on the Rhine (328/9). Victory over the Goths (332) was followed (334) by a campaign against the Sarmatians, many thousands of whom were then admitted within the empire as potential recruits. In 336 he fought north of the Danube, even recovering part of the lost province of Dacia. The empire's prestige seemed fully restored; a Persian war loomed but did not break out until after his death.

His youngest son Constans gained (333) the title Caesar already held by Constantine II and Constantius II. A believer in hereditary succession, Constantine groomed these to succeed along with his nephews Dalmatius (Caesar 335) and Hannibalianus, hoping they would rule amicably after his death. Baptized when death approached (such postponement was common at the time), he died near Nicomedia (22 May 337). RPD

tempered by the principle of collegiality and limited tenure of office. Against this it has been held that the dual collegiate system must have been some time in developing, and scholars have pointed to the fact that for most of the years from 448 to 368 there were more than two chief magistrates (the military tribunes) and to Livy 7. 3. 5, where an 'ancient law' (*lex vetusta*) is referred to that mentions a *praetor maximus*, taken to refer to a sole (or pre-eminent) chief magistrate. The title praetor (from *prae-ire*, to go before; the etymology of 'consul' is not clear) suggests military leadership, and many have seen in the *praetor maximus* the supreme magistrate of the early republic, with the fully collegiate magistracy appearing in its final dual form only much later, perhaps as late as 367. The traditional view that republican and dual magistracy were coeval is supported by the *fasti* (inscribed records of consuls), which show a succession of two annual consuls in the years before 451, and was apparently in place by the time *Polybius wrote (see 3. 22. 1–2). The testimony of the *fasti* has yet to be successfully impugned, and modern supporters of the traditional view have seen in Livy's *praetor maximus* a descriptive reference to the senior (but not more powerful) of the two collegial magistrates or an indication of the superiority of their office. The Greek translations (*stratēgos* for praetor and *stratēgos hypatos*, or *stratēgos* or *hypatos* alone, for consul) may be indicative, but they are not attested before the early 2nd cent. BC and seem more likely to reflect contemporary Greek perceptions than Roman antiquities.

As the highest office of state the consulship figured in the 'struggle of the orders' between patricians and plebeians (see PLEBS). Analysis of the *fasti*, however, suggests that the tradition may have been wrong in regarding the consulship as an office from which plebeians were at one time excluded by law. Plebeian consuls were, nevertheless, few in the 5th cent., and it was not until 367 BC that a Licinian plebiscite required the election of at least one plebeian consul and not until 342 that this became regular in fact. The first entirely plebeian college held office in 172.

The consul's power, or **imperium*, was effectively that of the king, limited by the period of office and the presence of a colleague with the same *imperium*. The importance of the principle of collegiality here is reflected in the fact that if a consul died or resigned, his colleague was bound to hold an election to fill his place for the remainder of the year (as *suffect consul*). Over time, some functions were removed from the consuls. The conduct of the census was taken over by the censors from 443, and civil jurisdiction passed effectively to the praetor from 366. In the city consuls could exercise *coercitio*, a general power of enforcing order and exacting obedience to their commands, but the extent of their power within the city (*imperium domi*) was subject from the earliest times to *provocatio* (appeal made to the Roman people against the action of a magistrate). The power of the consul in the field (*imperium militiae*) was virtually unrestricted, as symbolized by the addition of the axe to the *fasces* (bundles of rods—emblems of magisterial authority) when the consul left the city on campaign. It was probably not until a law of Cato Censorius in the 190s that the citizen's right of *provocatio* was extended beyond the precincts of the city. The consuls could and usually did act together, for example in calling the senate or an assembly, and use of the veto (*intercessio*) against one another was rare. When division of labour in the city was indicated, this might be arranged by agreement or by lot, or by use of the custom whereby each assumed duties (and the *fasces*) for a month at a time. When both consuls were on campaign together, the normal practice was for each to assume overall command for a day at a time.

Under the empire consuls continued, but in an appropriately attenuated way. With *Augustus consular *imperium* came to be part of the emperor's arsenal and to be held by the emperor independently of the office of consul itself. With the suppression of the centuriate assembly and popular election, the emperors either recommended the candidates or held the office themselves. The position continued to confer honour, as is indicated by the increasing use of pairs of *suffect consuls*

during the same year after the initial brief tenure of the *consules ordinarii* (ordinary consuls), who gave their name to the year as the republican consuls had done. The republican age limits (fixed initially by the *lex Villia annalis* of 180 BC and later by a law of *Sulla's dictatorship; in the late republic no one under 42 could be elected) were often disregarded as imperial relatives and protégés were signalled by the bestowal upon them of the consulship. In these circumstances children might become consuls, and Honorius was made consul at his birth in AD 384. The consulship continued in the western empire for 150 years after that. PSD

contraception played a minor role in Hippocratic medicine, where the emphasis was rather on helping women to conceive. (See MEDICINE §4.) The exception is a substance called 'misy', possibly copper ore, recommended as having the power to prevent conception for a year (e.g. Hippoc. *Mul.* 1. 76 and *Nat. mul.* 98). It was erroneously believed that the most fertile time of the month was just before or just after a menstrual period, when the womb was open to receive semen. Any attempt to use this information in reverse, in order to avoid conception, would thus in fact have led to intercourse at the most fertile days of the month.

However, it has been argued that many of the remedies given as general gynaecological cures (see GYNAECOLGY) in the ancient medical tradition did in fact contain substances, mostly of plant origin, effective both as contraceptives and as early-stage abortifacients. Some substances were used as barriers; for example, sponges soaked in vinegar or oil, or cedar resin applied to the mouth of the womb. These could have acted as spermicides. Others could either be taken orally or used as pessaries, and included pomegranate skin, pennyroyal, willow, and the squirting cucumber, which forcefully ejects its seeds. The degree to which these would have been effective is, however, very difficult to assess. The widespread practice of polypharmacy, by which a combination of several different remedies were used at once, together with the use of amulets, other magical techniques, and non-fertile sexual positions would have made it difficult to judge which method was responsible in the event of a long period without pregnancy ensuing. There is considerable debate also over the use of coitus interruptus, which is not discussed in the sources (see however 'landing in the grassy meadows' in *Archilochus, *PColon.* 7511 = *SLG* 478²) but which is nevertheless assumed by some modern commentators to have been widespread. The physician Soranus (early 2nd cent. AD) recommends a form of withdrawal by the female partner, in order to prevent the ejection of semen deep into the

womb, as well as sneezing after intercourse, washing the vagina, and drinking cold water (*Gynaecia* 1. 20).

An additional problem is that, although some distinction between *abortion and contraception was made in the ancient world—at least by Soranus (*Gynaecia* 1. 20)—conception was often seen as a process, and any intervention in early pregnancy could thus be seen as 'contraceptive'. This confusion is heightened by the fact that the substances used as contraceptives or abortives would perhaps also work as emmenagogues. What was envisaged as action to bring on a delayed period could thus have been an early abortion—or, indeed, vice versa. See BOTANY. HK

conversion In classical Greek *metanoia* signifies change of heart or purpose rather than renunciation of one way of life or worship for another. Latin *conversio* may suggest alteration of principle, but not a metamorphosis (Cic. *Nat. D.* 1.27; Plin. *Ep.* 9.13). It is possible, as Apuleius boasts (*Apol.* 55), to be an adept of numerous mysteries; Nock read too much history into his tongue-in-cheek romance the *Golden Ass*, in which the hero's return from asinine to human shape, perfunctorily explained as an allegorical deliverance from the sins of the flesh, is crowned by initiation into the cult of his saviour Isis. This fanciful scenario at least confirms Nock's maxim that in ancient times philosophy did the work that we associate with religion. Change could be incremental or instantaneous. The Stoic Polemon is said to have turned from debauchery to austerity after breaking in on a lecture; Antisthenes and Plotinus, already bent on philosophical studies, had frequented a number of schools without profit before a single audience convinced them that they had found their teacher at last. These are dramatic counterparts to the inward phenomenon characterized by Platonists as turning the eye of the soul (*Resp.* 533b).

In the Old Testament Abraham is the archetype of the Gentile convert, Moses of the returning Israelite. In Philon's reading one is the embodiment, one the amanensis of philosophic virtue. Paul of Tarsus, however, was a Jew no longer once he had met the risen Christ in a scene reminiscent of Moses' burning bush (Acts 9.3–5). Acts of other apostles and later saints suggest that miracles outweighed preaching with the vulgar, but testimonies of educated neophytes were more likely to commence with a philosophical apprenticeship. Thus Justin, after trying various schools, espouses Platonism only to meet an old man who exposes the poverty of this system and persuades him to seek the truth in a single book (*Trypho* 4 ff.). In a hereditary Christian, 'conversion' means the rekindling of belief. The *Confessions* of *Augustine offer a circumstantial history of his transition from lukewarm

acquiescence to Manichaeism, then to Platonizing Christianity and at last to biblical faith. His final shift, occasioned by a voice and a single text, is anticipated in the story of Antony's departure for the desert, while Augustine himself records the conversion of Victorinus from wary Platonism to open churchmanship (*Conf.* 8.3). It would appear, then, that even this narrative of a sincere conversion derives its shape from antecedents. The sign that converted Clovis the Frank is similarly modelled on the vision that promised Constantine victory at the Mulvian Bridge. His imitators, Ethelbert and Reccared, were moved by desire for alliance with Christian dynasties; nevertheless, accounts of the mass conversion of barbarians teem with miracles, and under Christian rulers it was the pagan Hierocles (*Golden Verses*, proem) who represents philosophy as the fruit of *metanoia*. MJE

cookery The religious importance of *sacrifice gave cooking a powerfully expressive role in ancient society: the order of the exposing of meat to different sources of heat, especially boiling and roasting, mattered ritually. The public meat-cook (*mageiros*) was a man; other food preparation was among the private, household tasks of an adult woman (see *HOUSEWORK*). Food could be prepared at the hearth of the city and consumed as a public activity, like the meals of the Athenian *prytaneion* (state dining facility); it was more normally regarded as a household matter. But the staples of domestic diet (see *MEALS*), especially grains (of which there was a considerable variety), could also be cooked in special forms as offerings (a wide range of sacred breads and *cakes is known).

Cereals could be boiled (like pulses, which were also important) or made into coarse or fine flours, which could also be boiled; the heat necessary for bread-making makes provision of communal ovens desirable outside very large households. The spread of bakeries is a part of a gradual, partial, controversial, and never very advanced displacement of cookery from the household, reaching its acme in the Roman tavern, with its cheap wine and cooked food a sign of the advantages available to urban populations. Even in urban settings much cooking was still done in the household on a brazier, using techniques like the sealed broiling of the *clibanus* or roasting-pot; samovar-like water-heaters, often highly ornamented, were also used. Casual finds and the kitchens of *Pompeii and *Herculaneum have provided copious information on practical technique, not for all that yet exhaustively studied.

The standard pattern of meals remained the combination of nutritious staples with tasty condiments.

Quality in food reflected the excellence of these, and became—by 5th-cent. BC Athens if no earlier—an ingredient in social stratification. Raw materials were carefully calibrated: their places of origin acquired precise reputations. The preparation of speciality vegetables or meats through careful tending was part of the process. The combination of condiments, often exotic—for instance as sauces based on fish products (see *FISHING*), *wine and its derivatives, *olive oil, or the cooking juices of fish or meat—was also a matter for considerable ingenuity and skill, and this (rather than the precise execution of the cooking and serving of the food) was the base of the claim of the ancient connoisseur to knowledge of an *ars*.

Ancient *cuisine* did therefore become *haute*, and resembled the high style in the cooking of other élites in being to some extent regional (the specialities of the various homes of *truphē*, 'luxury', such as south Italy, are an example). There was therefore a considerable literature, much of it comic or semi-serious; but although Athenaeus provides a huge store of culinary anecdote and quotation from earlier sources, and the moral indignation of the Roman writers spices it with tales of culinary excess, reinforced by occasional description like Trimalchio's parody meal in *Petronius Arbiter's *Satyricon*, the reconstruction of *system* and *style*, as opposed to the understanding of individual recipes, in ancient cooking still rather eludes us, and the only surviving text on cookery [Apicius] *De re coquinaria*, with its odd combination of the bizarre and the everyday, helps surprisingly little. NP

Coriolanus (Gnaeus Marcius Coriolanus) (Gaius in Dion. Hal. and Plut.), a Roman aristocrat who supposedly received his surname from his part in the Roman capture of Corioli from the Volsci (493 BC). According to the story he went into exile when charged with tyrannical conduct and opposing the distribution of grain to the starving *plebs. Welcomed by the Volscians of Antium he became their leader in a war against Rome. In two devastating campaigns he captured a series of Latin towns and led his forces to the gates of Rome, where he was persuaded to turn back by his mother Veturia and his wife Volumnia (in *Plutarch they are named as Volumnia and Vergilia respectively). He was then killed by the Volscians (although Quintus Fabius Pictor, fr. 17 Peter, believed that he lived into old age). It is uncertain how much, if any, of this famous story is based on fact. Coriolanus does not appear in the *fasti*, and although *Livy makes him a

cookery Bronze cooking pots in the cramped kitchen servicing the House of the Vettii at *Pompeii, a relatively lavish Italian *house equipped with two or three dining areas. Archivi Alinari-archivio Alinari, Florence

*patrician (as indeed the plot of the story requires), in historical times the Marcii were a plebeian clan (*see* PLEBS). The setting of the story recalls a time when the Volscians overran southern Latium and threatened the very existence of Rome; this conforms to what is otherwise known (partly from archaeological evidence) of the situation around 490 BC. Finally, the tale of a Roman becoming leader of the Volsci is an example of ‘horizontal social mobility’, a phenomenon that occurs in other stories of this period (e.g. Tarquinius Priscus, Appius Claudius Crassus Inregillensis Sabinus, Mastarna) and may be a genuine feature of the society of central Italy in the archaic period. corn supply *See* FOOD SUPPLY.

corruption is a difficult term; its use largely a matter of perspective. Indeed, from a modern, western point of view, many practices widely accepted in antiquity seem both immoral and detrimental to good government. But beyond underlining the difference between classical societies and our own, the imposition of expectations or prescriptions derived from contemporary ideals does little to advance our understanding of the past.

Charges of corruption (fraud, *bribery (*ambitus*), double-dealing, speculation, or the sale of offices) must always be viewed against the norms of the society in which the accusation is made. It should also be recognized that the majority of the surviving classical evidence comes from works whose primary purpose is denigration. Accusations of corruption—along with other vices and depravities—were part of a complex moralizing rhetoric of execration intended to damn an opponent in as many memorable ways as possible. These claims should be accorded the same degree of credibility as invective concerning dubious ancestry, sexual perversion, or physical deformity.

It is within this framework that texts on corruption should be read. The insults traded between the 4th-cent. BC Athenian orators *Demosthenes and *Aeschines were an accepted part of their rivalry and their advocacy of competing political programmes (Dem. *De cor.* 126 ff.; Aeschin. *In Ctes.* 102 ff.). Such abuse was unexceptional. In his speech against Verres (governor of Sicily, 73–71 BC) *Cicero included accusations of extortion, bribery, and taxation fraud (Cic. *Verr.* esp. 2. 3). These were aspects of a long, lurid, and highly rhetorical description of Verres’ vices—indispensable elements in any properly constructed character assassination. More broadly, before accepting Cicero’s version, it should be noted that provincial governorships were widely regarded as a legitimate source of income (Cicero himself did well while gov-

ernor of Cilicia) and that very few cases of maladministration were ever successfully prosecuted in the Roman courts.

Of course, in the ancient world there were those who acted illegally or immorally. Sometimes they were caught and punished. In AD 38, the citizens of *Alexandria secured the conviction of Avillius Flaccus, a former prefect of Egypt, on charges of extortion (but see entry on him). He was exiled and later—in a display of imperial probity—executed on the orders of the emperor *Gaius (Philo, *In Flacc.* esp. 125 ff.). In the early 3rd cent. AD, the emperor *Severus Alexander discovered an official receiving money for his (apparently illusory) influence at court; a practice known colloquially as *fumum vendere*—selling smoke. In one of the blunter examples of imperial wit, Severus ordered a fire of wet logs to be made. The offender was suffocated to death (SHA *Alex. Sev.* 36). But, again, these incidents must be seen in context. On the whole, they represent isolated reactions. They are attempts to police particularly blatant or excessive abuses or to eliminate rivals, rather than evidence of any widespread condemnation of these practices themselves. No doubt the majority played safe, following the maxim of the emperors Septimius Severus and *Caracalla that governors should be careful to take ‘neither everything, nor every time, nor from everyone’ (*Dig.* 1. 16. 6. 3).

The continued acceptance of activities which we would regard as corrupt has been seen by some commentators as a sign of an unchecked moral and administrative malaise. These conclusions should be handled with care. It is not clear that officials who profited from their offices were any less reprehensible, or any less effective, than early modern tax farmers. For officials—otherwise unsalaried—the charging of fees for their services was a convenient way both of securing an income and of regulating the many demands on their time. Equally, in societies where access to power and position was dominated by networks of influential connections (*see* PATRONAGE (NON-LITERARY)), it may be that the payment of money offered an important, alternative channel of advancement. In turn, for peasants, the payment of fees—albeit irksome—offered a simple and affordable means of mollifying a hostile and ever-threatening officialdom.

These are possibilities. But when dealing with highly emotive or unashamedly moralizing terms, they indicate the importance of viewing the Classical world in its own context. Sweeping condemnations of the persistence or toleration of ‘corruption’ should be resisted. If we insist on judging the ancient world against contemporary standards, we will not achieve much—other than a misplaced smugness as to our own superiority. CMK

court, in medieval and early-modern times the ruler's household and retinue, its spatial and institutional setting, and, by extension, the ruling power as constituted by monarch and helpers in governance. Ancient Greek *'aulē'*, a domestic 'hall' or 'courtyard', acquired some, if not all, of this abstract sense of 'court': cf. *'hoi peri tēn aulēn'*, literally 'the people about the courtyard', to describe *Alexander the Great's courtiers (Diod. Sic. 17.101.3). Having come to denote the courts of the Hellenistic monarchs, the word, Latinized as *'aula'*, was taken over by the Romans as the normal term for the imperial court.

Courts are best understood as 'universal social configurations' (G. Herman) which arise in societies where power becomes the monopoly of a monarch. Modern court studies owe much to the sociologist Norbert Elias. In *The Court Society*, based on a German PhD first published in 1933, Elias used the Versailles of Louis XIV of France to construct a model of the court as a system of power. The seemingly trivial routines of palace life, along with tight control of access to his person, help the ruler to consolidate his hold on the élites; king and courtiers constitute a 'court society' with its own social codes, offering a 'trickle-down' school of manners for everyone else. This ideal type has since been much debated. Anthropological emphasis on the 'theatre of power' underscores the importance of 'trappings' in sustaining monarchy: ceremonies and spectacle, *dress, palaces and the arts, the main fields of 'court culture'. Modern historians of Greece and Rome have always been interested in ancient rulers' courts. In recent years their focus has begun to shift from the descriptive and from unspoken assumptions to a conscious engagement with the agenda of court studies.

In the historic period the earliest Greek courts formed de facto around the archaic tyrants. The elaborate and hierarchical court of the Persian Achaemenids made a great impression on the ancient Greeks (*Herodotus; Ctesias; Dinon). Thereafter court life, along with *kingship, became an enduring site of moralizing discussions in classical literature about *tyranny, flattery, luxury, and the illegitimate exercise of power (especially by *women, eunuchs and, at Rome specifically, *freedmen). The Persian court formed an inevitable model for lesser courts on its western periphery, e.g. *Xanthus and, to some extent, Pella. Four years into his invasion of the Persian empire, the Macedonian king Alexander started (330 BC) to remodel his court ceremonial on Persian lines as part of a larger bid to win consensus among Asian, especially Persian, élites used to a court culture expressing near eastern ideals of monarchy. Surviving Alexander historians discuss this move in (mainly negative) moral terms, emphasizing Macedonian and Greek resistance, especially to

prostration (*proskynēsis*), seen as unacceptably Oriental and despotic. Unsurprisingly, the Persian model was not adopted by the Hellenistic royal courts, heavily dependent on Greek-speaking regions for the recruitment of élite administrators and soldiers. In other ways they perpetuated certain features of the Macedonian court which are among the closest instantiations from classical antiquity of Elias's 'domestication of the nobility' thesis: the élite groupings of *hetairoi*, now known as *philoi* (Friends), and the corps of 'royal boys' (*basilikoi paides*, so-called pages). These courts influenced Roman republican nobles during their encounter with *Hellenism in the 2nd and 1st cents. BC: e.g. the practice of grouping friends by grades of admission at the morning *salutatio* (note Sen. *Ben.* 6.34). Paradoxically the political revulsion for monarchy felt by the Roman élites required *Augustus to present his new position as *primus inter pares*. Nonetheless his household, including his influential wife *Livia Drusilla, at once became the real centre of power, towards which the Roman élites, in competing for his all-encompassing *patronage, were compelled to orientate themselves socially and politically. The early emperors routinely made themselves available to the élites through the court rituals of the *salutatio* and the *convivium*. Emperors deemed more or less reputable by the senatorial élite steered clear of courtly practices associated with 'Oriental despotism'. Even so, the vast and luxurious villa at Tibur of *Hadrian, a ruler who claimed to model himself on Augustus, demonstrates the inexorable growth in the functional and organizational complexity of the imperial court by the 2nd cent. AD. Freed from the pretence of social equality with the old senatorial class, late Roman emperors used court ceremonies to display the hierarchies of their new service aristocracy and to construct a more autocratic image, possibly turning to eastern, Sasanid, models (cf. 'the adoration of the purple': Amm. Marc. 15.5.18). AJSS

Crassus, (Marcus Licinius Crassus), son of Publius Licinius Crassus (consul 97 BC), escaped from Lucius Cornelius Cinna's occupation of Rome (87) to Spain, joined *Sulla after Cinna's death, played a prominent part in regaining Italy for him, and made a fortune in Sulla's *proscriptions. After his praetorship he defeated Spartacus, leader of the slave revolt (72–71 BC), but *Pompey, after crucifying many fugitives, claimed credit for the victory, deeply offending Crassus. Formally reconciled, they were made *consuls 70 and presided over the abolition of Sulla's political settlement, though his administrative reforms were retained. During the next few years Crassus further increased his fortune and, relying on his connections, financial power, and astuteness, gained consider-

able influence. After 67, overshadowed by Pompey's commands (which he had opposed), he is associated by our sources with various schemes to expand his power and perhaps gain a military command. As censor 65, he tried to enrol the Transpadanes (*see GAUL (CISALPINE)*) as citizens and to have *Egypt annexed; he was foiled by his colleague Quintus Lutatius Catulus and their quarrel forced both to abdicate. Always ready to help eminent or promising men in need of aid, he shielded the suspects in the 'first conspiracy' of *Catiline and supported Catiline until the latter turned to revolution and a programme of cancelling debts. He may have supported the law of Publius Servilius Rullus (63). A patron of *Caesar (without, however, detaching him from Pompey), he enabled him to leave for his province in 62 by standing surety for part of his debts. On Caesar's return, he was persuaded by him to give up his opposition to Pompey, which during 62–60 had prevented both of them from gaining their political objectives, and to join Pompey in supporting Caesar's candidacy for the consulship. As consul (59), Caesar satisfied him by passing legislation to secure remission of one third of the sum owed by the *publicani* of Asia for their contract (Crassus presumably had an interest in their companies), and he now joined Pompey and Caesar in an open political alliance. After Caesar's departure for Gaul he supported Publius *Clodius Pulcher, who soon proved to be too ambitious to make a reliable ally and tried to embroil him with Pompey and Cicero. He welcomed Cicero on his return from exile, but in 56 alerted Caesar to the attempts by Cicero and others to recall him and attach Pompey to the *optimates* (lit. 'the best men'). Caesar and Crassus met at Ravenna and Pompey was persuaded to meet them at Luca (mod. Lucca) and renew their alliance. The dynasts' plans were kept secret, but it soon became clear that Pompey and Crassus were to become consuls for a second time by whatever means proved necessary and to have special commands in Spain and Syria respectively assigned to them for five years, while they renewed Caesar's command for five years.

Late in 55, ignoring the solemn curses of the tribune Gaius Ateius Capito, Crassus left for Syria, determined on a war of conquest against *Parthia. He won some early successes in 54 and completed financial preparations by extorting huge sums in his province. In 53 he crossed the Euphrates, relying on his long-neglected military skills and the recent ones of his son Publius Licinius Crassus. Although deserted by King Artavasdes II of Armenia and the king of Osroëne, he continued his advance into unfamiliar territory. After Publius died in a rash action, he himself was caught in a trap by the Surenas (the Parthian king's hereditary commander) near Carrhae (Mesopotamia) and, trying to extricate himself, died fighting.

After playing the game of politics according to the old rules, in which he was a master, he in the end found that unarmed power no longer counted for much in the changed conditions of the late republic, and he died while trying to apply the lesson. His death helped to bring Caesar and Pompey into the confrontation that led to the Civil War.

EB

creolization is a term referring to the process by which elements of different cultures are blended together to create a new culture. The word creole was first attested in Spanish in 1590 with the meaning 'Spaniard born in the New World'. In the 1970s the term was widely adopted by linguists, who used it to denote a contact language or 'pidgin' that is spoken as a first language by subsequent generations. Since that time creolization has emerged as an important paradigm throughout the social sciences. It is employed today in varied ways by anthropologists, ethnographers, and archaeologists working on multicultural adjustment in a wide range of colonial and post-colonial contexts.

Creolization models have been advanced with reference to provincial material culture change in the Roman world, particularly among non-élites. In common with cognate concepts such as cultural hybridity, bricolage and discrepant experience, creolization enjoys popularity among scholars questioning the value of *Romanization, the traditional paradigm for acculturative cultural change in the Roman world. Similar concepts have in fact existed in Roman studies for decades but whilst 'Romanization' models assume a largely intact transposition of Roman culture into a given area, creolization models envisage a creative fusion of Roman and local culture, resulting in a unique, third entity.

The term creolization was first explicitly employed in a Roman context in 2001, in work on Romano-Celtic religion. The notion of Romanization has perhaps been most fully challenged by British archaeologists, and this may help to explain why British scholars have also shown a particular interest in creolization. In recent years, for example, creolization theory has explicitly informed the study of Romano-British 'small find' assemblages.

In the Americas, creolization models have found particular favour among archaeologists exploring the material world of slaves. Since the 1990s some archaeologists with an interest in Greek and Roman slavery have drawn on these North American studies in developing a cross-cultural or comparative approach to classical slavery. Examples here include the analysis of the material culture of Thracian and Phrygian slaves in Attica and recent studies on the material culture of slaves in Roman Britain.

Whilst creolization has emerged as a major theme in historical archaeology, some linguists and anthropologists have begun to question its value. Despite these doubts—

perhaps inevitable as a new paradigm emerges—the creolization concept remains a fertile one, and may prove to be of lasting value in modelling contact and cultural change in the Roman world. jwe

Crete, Greek and Roman (see ◀ Map 4, Cc ▶) (for prehistoric Crete, see MINOAN CIVILIZATION). Evidence for the history of the island comes both from literary sources, inscriptions, and coins, and from excavation and (increasingly) field survey. The transition from bronze to iron age is still not fully understood, but some sites go back into the Dark Ages (Dictaeon cave; the Idaean cave—finds start in the 8th cent.; refuge sites, e.g. Karphi and Vrokastro), but in historical times the island was predominantly Dorian (Eteocretan, a non-Greek language, was used in places in the Archaic period, and traces survived into the 2nd cent. BC). Cretans prided themselves that *Zeus was born on Crete, they developed a peculiar temple form, and also eschewed the hero-cults found on the Greek mainland. Of *Homer's 'Crete of the hundred cities' over 100 names survive, but there seem to have been in the Classical and Hellenistic periods only about 40 city-states: Archaic Dreros, Prinias, and Axos, and 5th–2nd-cent. Lato, are well known archaeologically; Knossos, Gortyn, and Lyttus were initially the most important, along with Cydonia and Hierapytna. The island's position on the sea-routes to and from *Cyprus, the Levant, and *Egypt secured it an important place in the development of Archaic Greek art: important innovations were attributed to the mythical Cretan Daedalus. It had a reputation as the home of mercenary slingers and archers, and of lawgivers (see LAW IN GREECE). Aristocratic society persisted in the island, and the constitutions (though without kings) resembled that of *Sparta, which was said to have been derived from Crete, and impressed *Plato and *Aristotle. In the Classical period the island lay outside the mainstream of Greek history. From the mid-3rd cent. her foreign relations centred on the new and unstable Cretan League, the Attalid dynasty (see PERGAMUM), and the intrigues of Macedon. In 216 BC the cities accepted King Philip V of Macedon as protector, but strife soon returned, both against Rhodes and still more between the cities, especially Knossos and Gortyn. By this time Crete was reputed as a home of pirates second only to Cilicia (see PIRACY). Their activities were encouraged by Philip, who realized his hope of thereby injuring Rhodes. The pirates supported *Mithradates VI of Pontus against Rome, and when Marcus Antonius (Creticus) intervened to punish them, he was beaten off Cydonia (71), but Quintus Caecilius Metellus (Creticus) crushed the islanders (69–67). Crete became a Roman province, united with *Cyrene, under a senator of praetorian rank, and the old league became the provincial

council; from the 4th to 7th cent. AD Crete formed a province on its own in the diocese of Macedonia. *Jews are known on Crete from the 1st cent. BC to the 5th cent. AD, and Christians from the earliest times (St Paul's Epistle to Titus). The prosperity of the island under Roman rule was disrupted by major *earthquakes in the 4th cent., though between c.450 and 550 numerous Christian basilicas were built. From the early 7th cent. Crete was increasingly vulnerable to raids by Slavs and then Arabs, to whom it fell in AD 827–8. WAL/LFN/SRFP

curses A curse is a wish that evil may befall a person or persons. Within this broad definition several different types can be distinguished, according to setting, motive, and condition. The most direct curses are maledictions inspired by feelings of hatred and lacking any explicit religious, moral, or legal legitimation. This category is exemplarily represented by the so-called curse tablets (Gk. *katadesmos*, Lat. *defixio*), thin lead sheets inscribed with maledictions intended to influence the actions or welfare of persons (or animals). If a motive is mentioned it is generally inspired by feelings of envy and competition, especially in the fields of sports and the (amphi)theatre, litigation, love, and commerce. Almost without exception these texts are anonymous and lack argumentation or references to deserved punishment of the cursed person(s). If gods are invoked they belong to the sphere of death, the Underworld, and witchcraft (*Demeter, *Persephone, Gaia, *Hermes, Erinyes, Hecate). In later times the magical names of exotic demons and gods abound. Spirits of the dead are also invoked, since the tablets were often buried in graves of the untimely dead as well as in chthonian sanctuaries and wells. The tablets might be rolled up and transfixed with a needle and sometimes 'voodoo dolls' were added. These tablets first appear in the 6th cent. BC with often simple formulas ('I bind the names of...') and develop into elaborate texts in the imperial age. More than 1,500 have been recovered.

Also included in the well-known collections of *defixiones*, although in fact a distinct genre, are prayers for justice or 'vindictive prayers'. Often inscribed on lead tablets, but also in other media, they differ from the binding curses in that the name of the author may be mentioned, that as a rule the action is justified by a reference to some injustice wrought by the cursed person (theft, slander), that the gods invoked may belong to the great gods (including for instance *Helios), and they are supplicated in a submissive way to punish the culprit and rectify the injustice. This variant becomes popular only in the Hellenistic and Roman periods and is found all over the Roman empire, but especially in *Britain.

Both these types of curse are concerned with past and present occurrences. Another type refers to future

cursus A Latin curse tablet on lead from the Sacred Spring at Aquae Sulis (Bath) in Roman *Britain. Springs and wells, since they gave access to the Underworld, were popular sites for depositing curses. © Bath & North East Somerset Council

events. Conditional curses (imprecations) damn the unknown persons who dare to trespass against certain stipulated sacred or secular laws, prescriptions, treaties (e.g. the famous curses from Teos in W. *Asia Minor, *Syll.*³ 37–8). They are prevalent in the public domain and are expressed by the community through its representatives (magistrates, priests). The characteristic combination of curse and prayer, a feature they share with judicial prayer, is already perceptible in the Homeric term *ara*. The culprit thus found himself in the position of a man guilty of sacrilege and so the legal powers could enforce their rights even in cases where only the gods could help. A special subdivision in this category is the conditional self-curse as contained in oath formulae. Here, too, the person who offends against the oath invokes the curse he has expressed himself and the wrath of the gods. Similar imprecations, both public and private, are very common in funerary inscriptions against those who violate graves, especially in Asia Minor. All these curses may be accompanied with ritual actions, and most of them have left traces in literature, especially in ‘curse poetry’.

HSV

cursus honorum, ‘career path’ at Rome. See CAREERS, ROMAN.

Cybele (Gk. *Kybelē*; Lydian form *Kybebē*, Hdt. 5. 102), the great mother-goddess of Anatolia, associated in myth,

and later at least in cult, with her youthful lover Attis. Pessinus in Phrygia was her chief sanctuary, and the cult appears at an early date in Lydia. The queen or mistress of her people, Cybele was responsible for their well-being in all respects; primarily she is a goddess of fertility, but also cures (and sends) disease, gives oracles, and, as her mural crown indicates, protects her people in war. The goddess of mountains (so *Mētēr oreia*; Meter Dindymene), she is also mistress of wild nature, symbolized by her attendant lions. Ecstatic states inducing prophetic rapture and insensibility to pain were characteristic of her worship (cf. especially Catull. 63).

By the 5th cent. BC Cybele was known in Greece; she was soon associated with *Demeter (H. Thompson, *Hesp.* 1937, 206) and perhaps with a native ‘Mother of the Gods’, but—except possibly at such places as Dyme and Patrae in the NW *Peloponnese (Paus. 7. 17. 9; 20. 3), and private cult associations at Piraeus, the port of *Athens, where Attis also was honoured—it is likely that the cult was thoroughly Hellenized. (See HELLENISM.) Cybele was officially brought to Rome from Asia Minor in 205–204 (for the conflicting legends see H. Graillot, *Le Culte de Cybèle* (1912), ch. 1), but under the republic she was limited to her Palatine temple and served only by oriental priests (Dion. Hal. *Ant. Rom.* 2. 19. 3 ff.) apart from the public games, the Megalesia, which were celebrated by the aediles and the old *patrician families, and processions of the priests of Cybele with the participation of one of the colleges of Roman *priests, the *quindecimviri sacris faciundis* (Lucr. 2. 624 f.; Luc. 1. 599f.). The consultation of the Sibylline books and the cult of Cybele were under the control of the *quindecimviri sacris faciundis*. The cycle of the spring festival, mentioned in public documents from *Claudius’ reign, when it began to take form, is not fully attested till AD 354. The rites began on 15 March with a procession of the Reed-bearers (*cannophori*), and a sacrifice for the crops. After a week of fasting and purifications, the festival proper opened on the 22nd with the bringing of the pine tree, symbol of Attis, to the temple. The 24th was the Day of Blood, commemorating the castration and probably the death of Attis. The 25th was a day of joy and banqueting, the Hilaria, and after a day’s rest the festival closed with the ritual bath (*Lavatio*) of Cybele’s image in the Almo. The rubric for the 28th (*Initium Caiani*) is apparently unrelated. The relation of this spring festival to the Hellenistic mysteries of Cybele is uncertain. Of the later mysteries, in which Attis figured prominently, we again know little. The formulae preserved (Firm. Mat. *Err. prof. rel.* 18; Clem. Al. *Protr.* 2. 15) mention a ritual meal; the carrying of the *kernos*, a vessel used in the *taurobolium* (‘bull sacrifice’) to receive the genitals of the bull; and a descent into the *pastos*, prob-

ably an underground chamber where certain rites were enacted; but one can also think in terms of a metaphor for *initiation.

The ritual of the *taurobolium* originated in Asia Minor, and first appears in the west in the cult of Venus Caelesta (i.e. -is) at Puteoli (mod. Pozzuoli) in AD 134 (*ILS* 4271, but cf. 4099 of AD 108). From the Antonine period, numerous dedications to Cybele and Attis record its performance in this cult 'ex vaticinatione archigalli' (i.e. with official sanction), on behalf of the emperor and the empire. From Rome the rite spread throughout the west, notably in *Gaul (Transalpine). It was performed also on behalf of individuals, up until the later 4th cent. AD. It was sometimes repeated after twenty years; one late text (*ILS* 4152) has 'taurobolio criobolium in aeternum renatus', 'reborn into eternity through the *taurobolium*, and *criobolium*' (a concept possibly borrowed from Christianity). According to a hostile account in Prudentius (*Perist.* 10. 1011–50), the recipient descended into a ditch and was bathed in the blood of a bull, or ram (*criobolium*), slain above him. There has been much speculation, ancient (e.g. Julian, *Orationes* 5. 9. 168df.) and modern, about Cybele and her cult, but these theories are either late allegorizations or in recent times, inspired by the modern 'myth' of the Great Mother.

A belief in immortality was perhaps part of the cult from early times, and the after-life may at first have been thought of as a reunion with Mother Earth. Later, Attis became a solar god, and he and Cybele were regarded as astral and cosmic powers; there is some evidence that the soul was then thought to return after death to its celestial source.

Thanks to its official status and early naturalization at Rome and in *Ostia, the cult spread rapidly through the provinces, especially in Gaul and *Africa, and was readily accepted as a municipal cult. Its agrarian character made it more popular with the fixed populations than with the soldiery, and it was especially favoured by women.

Cybele is generally represented enthroned in a *naiskos* ('shrine'), wearing either the mural crown or the *calathos* ('basket'), carrying a libation bowl and drum, and either flanked by lions or bearing one in her lap. FRW/JSch

Cynics ('the doggish'), term used of the philosopher Diogenes (c.412/3–c.324 BC) 'the dog' (by-word for shamelessness) and his followers. The genesis, status, significance, and influence of Cynicism were already anciently controversial. Interpretative problems arise from Cynic behaviour and sayings, from the loss of nearly all Cynic writings (admittedly less important than in the case of other philosophies), and from diverse distortions in the tradition (invention of sayings and anecdotes; arti-

ficial integration of Cynicism into a formal philosophical succession from *Socrates to the Stoics (see STOICISM); bowdlerization; polemical misrepresentation).

Cynicism was less a school than a way of life grounded in an extreme primitivist interpretation of the principle 'live according to nature'. Diogenes having discovered the truth, there was relatively little diversity or development within Cynicism, though 'hard' Cynics (adherents of the original prescription, found at all periods) can be distinguished from 'soft' (who compromised varyingly with existing social and political institutions), practical Cynicism from literary, and Cynics (in whatever sense) from the Cynic-influenced.

'Hard' Cynicism was expounded by Diogenes and (to some extent) Crates of Thebes (d. c.288/285 BC). From 320 to 220 BC 'soft' Cynicism was represented by Onesicritus, whose *History* portrayed *Alexander the Great as a Cynic philosopher-king; the eclectics Bion of Borysthenes, court philosopher of *Antigonus Gonatas, and Teles, schoolteacher; and Cercidas, politician, lawgiver, and social reformer. Practical Cynicism declined in the 2nd and 1st cents. BC but revived in the early empire. Greek cities swarmed with Cynics. Cynicism produced remarkable individuals (Demetrius, friend of *Seneca; *Dio of Prusa; in the 2nd cent. AD Demonax, Peregrinus, and Oenomaus). The Roman authorities clashed with 'hard' Cynics (*qua* anarchists). Cynics are mentioned until the 6th cent.

Cynicism greatly influenced Greek and Roman philosophy, rulership ideology, literature, and (later) religion. Crates' follower Zeno founded *Stoicism, a development of Cynicism with a proper theoretical grounding: Stoic ethics are essentially Cynic ethics, Stoic cosmopolitanism a development of Cynic; Diogenes' *Republic* influenced Zeno's and Chrysippus'. Stoic reactions to Cynicism ranged from nearly total acceptance (Ariston of Chios) to partial acceptance (Zeno, Chrysippus), to rejection (Panaetius of Rhodes), to bowdlerizing and idealizing redefinition (Epictetus). The very extremeness of Cynic positions on material possessions, individual ethics, and politics catalysed the definition of other philosophies' positions: the Epicureans (see EPICURUS), though greatly influenced by Cynic ethics, polemized against Cynicism. Diogenes and Crates are heroes of popular philosophy. While Cynic kingship is a moral concept opposed to worldly kingship, Onesicritus (following Antisthenes, the associate of Socrates, and *Xenophon) facilitated its appropriation and redefinition by rulership ideology (as in Dio of Prusa's Kingship Oration); see KINGSHIP. Cynic ethics influenced Christian asceticism from Jesus onwards. European philosophy has shown interest in Cynicism.

To maximize mission the anti-intellectual Cynics wrote more voluminously and variously than any other ancient philosophers: relatively formal philosophical treatises, dialogues, epitomes, tragedies, historiography, letters, diatribes, various kinds of poetry and parody, prose-poetry hybrids (Menippus). The Cynic diatribe, anecdotal tradition, satiric spirit, and serio-comic discourse had enormous and varied philosophical and literary influence (e.g. on the diatribes of *Seneca and *Plutarch; philosophical biography and the gospels; Roman satire; the epistles of *Horace, St. *Paul, and Seneca; *Lucian). JLMO

Cyprus, (see ◀ Map 2, Cc ▶) third largest *Mediterranean island (9,282 sq. km.: 3,584 sq. mi.) was of strategic and economic importance to the Mediterranean and near eastern powers, and significant both to their relations with western Asia and with one another. It is vulnerable to the power politics of its neighbours, by one or other of whom it has often been occupied or governed, and whose mutual conflicts have sometimes been fought out on its soil or its seas. Though mountainous (the highest points on its Troödos and Kyrenia ranges are 1,951 and 1,023 m. (6,403 and 3,357 ft.) respectively), its central plain (Mesaoria) is fertile, while its extensive piedmont and river-valley systems are suited to crop and animal husbandry. The island suffers intermittently from serious seismic disturbance. Rainfall is uncertain, drought endemic, and fertility dramatically responsive to irrigation capacity. Copper ore, chiefly located in the Troödos foothills at the junction of igneous and sedimentary deposits, has been exploited since prehistory. *Timber resources played a major role in the region's naval history.

The character of the first human traces, found with extinct pleistocene animal species at the Akrotiri (*Aetokremnos*) rock-shelter, with a carbon-14 date of c.8500 BC, is uncertain, as is their relationship with the c.6000 BC pre-ceramic neolithic phase, best seen at the type-site, Khirokitia, but distributed at numerous other locations, coastal and inland. Successive phases of neolithic and chalcolithic settlement embrace a 3,500-year period; excavation has established the general character of several sites spanning this period, yet origins and interrelationships between its successive episodes are alike uncertain. The gradual introduction of metal technology during the third millennium greatly accelerated social and material development; the main stimulus may have been the disruption and dispersal of more advanced societies in adjacent Anatolia (see ASIA MINOR). The 1,500 years of the Cypriot bronze age (early, middle, and late) were marked by a progression from isolated rural communities linked by shared traits in material civilization (typifying the late third mil-

lennium) to what by the 13th cent. had become an urbanized hierarchical society, enriched by the international exchange systems in which raw copper played a major role (symbolized by the cargoes of the wrecked Ulu Burun and Cape Gelidonya ships off SW Turkey). This change saw a shift from the north and south piedmont of the Kyrenia mountains to the south and east coasts, to new towns founded at the end of middle Cypriot (17th cent.) at river mouths (Enkomi, Maroni, Palaepaphos) or on natural harbours (Citium, Hala Sultan Tekke). While Egypt and the cities of the Levant (notably the kingdom of Ugarit, SE Turkey) enjoyed regular exchanges with Cyprus, Minoan Crete played a part and, from c.1400 Mycenaean Greece was prominent, even dominant (see MINOAN CIVILIZATION; MYCENAEAN CIVILIZATION). The island was literate during late Cypriot, using the Cypro-Minoan script. Objective proof of the identification of Cyprus with the 'Alasya' of Hittite, Egyptian, Ugaritic, and other documents remains elusive, for all its appeal. The final bronze age years (1200–1050) knew turbulence, violence—and remarkable prosperity, in which there was a fruitful coalescence of the native Cypriot with migrant Aegean and Levantine elements that produced a distinguished but short-lived material civilization whose ceramic design, metalwork, *ivory carving, and glyptic were pre-eminent; perhaps iron technology was disseminated westward at this time. By 1050 virtually all the old settlements had been abandoned, in some cases to be replaced nearby by communities under the strongest Greek influence yet seen, including Mycenaean types of tomb and, very probably, the Arcadian dialect. This process may dimly be reflected in the legends, where figures from the *Nostoi* (returns of various Greek heroes after Troy) are credited with the foundation of the later cities—Teucer at Salamis, Agapenor at Paphos, etc. Classical Cypriot script, adapted from Cypro-Minoan, lasted for some purposes almost to 200 BC (and was the vehicle too for the undeciphered Eteo-Cyprian of Amathus, east of mod. Limassol).

The iron age settlement-pattern was based on a nexus of city-kingsdoms (sometimes seen as a Mycenaean legacy)—Salamis, Citium, Amathus, Paphos, Curium, Soli, Marion, Tamassus, Idalium, Chytri—which largely lasted throughout antiquity. Citium was for long a *Phoenician city (Phoenician influence was very strong elsewhere in the island), Amathus was 'Eteocypriot'. The kings ruled as autocrats; only at Idalium may power have been shared with a 'dēmos'. The 8th- and 7th-cent. 'royal' tombs at Salamis suggest both the wealth and foreign connections of these rulers. From the late 8th cent., if no earlier, Cyprus was sucked into east Mediterranean politics; its kings acknowledged at least the nominal suzerainty of a succession of great powers. The Sargon II stela

said to have been found at Citium (Larnaka) reports the submission of the kings to Assyria in 709; the information is repeated on other Assyrian documents. While the 7th cent. seems to have been largely a period of independence, the island was dominated by *Egypt in the earlier 6th cent. In 545 came voluntary submission to *Persia; there was Cypriot help for the Persians in the Carian War, the conquest of *Babylonia and, in 525, their attack on Egypt. Sufficient independence remained for the kings to issue their own coinage, starting c.538 with Euelthon of Salamis (the same Euelthon to whom Pheretime of *Cyrene vainly appealed for help against her son Arcesilas III—further symptom of independence). When *Darius I reorganized the empire, Cyprus found itself in the fifth satrapy with Phoenicia and *Syria-Palestine; tribute was imposed, but the amount is unknown. The cities (except Amathus) joined the *Ionian Revolt, egged on, it seems, by dissidents who gained control in Salamis, where crucial land and sea battles were fought. Though the Ionian fleet was victorious, ashore the Cypriots were defeated, and their leader, Onesilus, killed. The cities were reduced by the Persians, Soli holding out the longest. The Cypriots had an uncomfortable time in the subsequent long struggle between Greece and Persia; their ships fought poorly on the Persian side in the Persian Wars of 480–79 (see GREECE (HISTORY)). The island was constantly campaigned over during Athenian efforts under the statesman Cimon to deny it to the Persians, but Cimon's death during the 449/8 campaign raised the siege and, temporarily, pro-Persian rulers became everywhere dominant; but the Teucrid king of Salamis, Evagoras I (c.411–374), was conspicuously pro-Greek, in fact as well as theory. Later, the kings intervened decisively on behalf of *Alexander the Great at the siege of Tyre in 331, where their ships were badly mauled. Alexander's successors (the Diadochi), usually violently, abolished the city-kings, and with them any pretence of an independent Cyprus. The island became part of the Ptolemaic share of Alexander's legacy (see PTOLEMY I) and thereby lost most of what remained of its idiosyncratic material civilization. In the 1st cent. BC the island passed to and fro between Roman and Ptolemaic rule until its final annexation after *Actium by Octavian, the future *Augustus; in 22 BC it was ceded as a minor public province. Its Roman history was (apart from serious *earthquakes and the Jewish revolt of 115/16 (see JEWS)) relatively tranquil and—to judge from surviving monuments at Salamis, Curium, and Nea Paphos—prosperous. HWC

Cyrene (mod. Shahat) (see ◀ Map 2, AC ▶), the major Greek colony in Africa (see COLONIZATION, GREEK), was founded from Thera (mod. Santorini) c.630 BC, and reinforced by later groups of colonists, who were, before the

Hellenistic period, predominantly Dorian. It gave its name to the surrounding territory (mod. Cyrenaica), apparently claiming authority (sometimes resisted) as *mētropolis* of all Greek settlements there; it is not always clear whether ancient references to Cyrene are to the city or to this territory. Information about it has been significantly increased by 20th-cent. excavation; there is now material evidence from at least the 7th cent. BC to at least the 7th cent. AD, but its interpretation is often debatable.

For the foundation, the account in Herodotus (4. 150–8) is supplemented by an inscription purporting to give the substance of the Theraean decree which organized the colonial expedition (SEG 9. 3, 20. 714); after two initial failures, a site was found, with Libyan help, on the northern edge of the Gebel Akhdar, 621 m. (2,037 ft.) above and c.12 km. (7½ mi.) from the sea, in a fertile area with a freshwater spring and normally good rainfall, but shading into pre-desert southwards; other Greek settlements followed swiftly, for example a dependent port near by, the city of Taucheira farther off. Communications with these and exploitation of the country required Libyan co-operation, which was withdrawn on arrival of a new wave of colonists in the 6th cent. Libyan/Egyptian opposition was defeated c.570 and Greek expansion continued, with more dependent settlements and the cities of Barca and Euhesperides. Evidence for the Libyan relationship is unsatisfactory. Within city territories they presumably provided dependent labour; outside them they were free, although in the adjacent pre-desert perhaps tributary, and, apparently, peaceable; Herodotus notes their Hellenization (see HELLENISM), as well as their cultural influence on Greeks (4. 170–1, 186, 189), there was intermarriage and, by the Hellenistic period, marked racial mixture. Hostile raiding, sometimes serious, may have been initiated by more distant tribes (Diod. Sic. 3. 49). Cyrene's own territory became unusually large for a *polis, with organized villages reminiscent of Attic demes (i.e. constitutional subdistricts as well as rural districts); its cereals, vines, olives, and grazing were notable, and the grazing extended into the pre-desert, which was also the source of silphium, Cyrene's characteristic export and emblem; like silphium-collection, animal husbandry must often have been in the hands of Libyans. The horses were particularly famous, horse-drawn chariots became a feature of Cyrene's armies, and chariot-racing, with teams victorious in Greek *games (Pind. *Pyth.* 4, 5), a predilection of the rich. The resultant wealth financed buildings, sculptures, painting, and a tradition of learning and literature; if the great names (e.g. Aristippus, Carneades, *Calimachus, *Eratosthenes) cluster in the Classical and Hellenistic periods, Roman Cyrene made some contribution to Hadrian's Panhellenion and in late antiquity produced Synesius (c.AD 370–413).

The founder (Aristoteles Battus) and his heirs ruled as kings. The dynasty survived civic unrest and revolution as well as family infighting, submitted to *Persia in 525, but recovered independence in the 5th cent.; it was finally overthrown c.440. The subsequent republican regime is obscure; 4th-cent. monuments suggest a prosperous élite and further expansion, perhaps including an extension of influence, to Great Catabathmus (Sollum) in Marmarica, and Arae Philaenorum (Ras el Aali) in Syrtica; this, it has been suggested, would open access to trans-Saharan trade-goods. All Cyrenaica offered allegiance to *Alexander the Great. After his death, and an attempted coup by the adventurer Thibron, it became a dependency of the Ptolemaic kingdom of *Egypt. *Ptolemy I gave Cyrene a moderately oligarchic constitution under which his own authority was ensured by his permanent office as *stratēgos* ('general') (SEG 9. 1). A date in 322–1 is now generally accepted for this, but almost all dates and many details after that are disputed. He and his successors aroused some local opposition, and their representatives tended to assert independence (Ophellas, Magas); briefly, in the middle of the 3rd cent., there was, apparently, a free interlude when Demophanes and Ecdeclus established a federation of the cities; but it ended when Magas' daughter Berenice married Ptolemy III. Cyrene seems to have been the royal capital but must have lost prestige through Ptolemaic patronage of the other cities (Berenice/Euhesperides, Arsinoë/Taucheira, Ptolemais/Barca), especially if it was a Ptolemy who raised her port to city status as Apollonia (but the earliest evidence for this is of 67 BC); all cities presumably lost cohesion by the introduction of new colonists beholden to the Ptolemies (certainly Jews and probably ex-soldiers of the Ptolemaic army); while in the 2nd cent. Ptolemy Physcon (later Ptolemy VIII of Egypt) enlisted diplomatic support from Rome and reinforced it by bequeathing Cyrenaica to Rome should he leave no heir (SEG 9. 7). At his death in 116 there were in fact heirs, two of whom, as is now known, succeeded him in turn, Ptolemy IX of Egypt and Ptolemy Apion; but when Apion died in 96 the kingdom did pass to Rome, who accepted the royal property but gave the cities freedom.

Internal factions and external pressures (piratical assaults, perhaps coinciding with Libyan raiding) caused a breakdown of order; the senate authorized annexation in 75/4, but the organization of the new province is uncertain. *Pompey's defeat of the pirates (see PIRACY) in 67 relieved one pressure but the Roman Civil Wars brought others, especially severe when Mark *Antony garrisoned Cyrene and restored Cyrenaica to the Egyptian crown. After *Actium, Cyrenaica was combined with *Crete in a public pro-

vince governed by an annual praetorian proconsul, whose main seat in Cyrenaica was at Cyrene, where the provincial council also met. The imperial-period monuments suggest modest prosperity, evoking standard signs of élite loyalty to Rome; but it was sharply interrupted c.2 BC–AD 2 by a Marmaric war, after which a small Roman garrison was introduced to guard the Syrtican approaches to Cyrenaica, again in 115–17 by a Jewish Revolt (see JEWS), after which legionary veteran colonists were sent to compensate for the casualties, and under Claudius II Gothicus when there was another Marmaric war (SEG 9. 9), from whose effects Cyrene may have been slower to recover; that perhaps explains why *Diocletian preferred Ptolemais as metropolis of his new province of Upper Libya. This was a loss of status to Cyrene which altered her civic character, but the life and works of Synesius seem to show that intellectual pursuits continued there; and, despite severe earthquake damage in the late 4th cent. and further Libyan raiding in the 5th, her Christian monuments are not negligible. Some life survived on the site after the Arab invasions in the 7th cent. JMR

Cyrus the Great (OP *Kurus*), son of Cambyses I, who became c.557 BC king of the small kingdom of Anshan in *Persia, at that time subject to the Median king. Beginning in 550 he fought extensive campaigns in which he conquered, respectively, Media (550/49), Sardis and Lydia (W. *Asia Minor) (546), *Babylonia, and the neo-Babylonian empire (539). At some point (before or after 539?) he conquered central Asia. He was thus the first Persian king to bring together territories into an imperial framework, to whose organization he contributed substantially. In general, the Greek (especially the *Cyropaedia* of *Xenophon), Babylonian ('Cyrus cylinder'), and Judaean sources (Ezra) present him as a conqueror welcomed by the local inhabitants. This apologetic tendency reflects both the expectations nourished by certain groups (e.g. the *Jews later associated permission to rebuild the Jerusalem temple with Cyrus' Babylonian conquest) and a policy continued by his successors: i.e. forging collaborative links with the local élites. This willingness to accommodate local conditions went hand-in-hand with tight control, as shown by the fact that land was confiscated to benefit the crown and Persian nobility. The royal administration also maintained a close watch over the fiscal obligations of the Babylonian sanctuaries. His achievement as founder of the empire was symbolized by the building of a royal residence in Persia, Pasargadae, where his tomb was also constructed. He was buried here by his son, Cambyses II, after his death in 530 following a campaign in central Asia. PB

D

dance (reception) Recent scholarship on ancient pantomime has led to an interest in its impact on the development of modern ballet, *ballet d'action*, in the 18th cent. When the dancing masters and choreographers John Weaver and Jean-Georges Noverre sought to dignify dance as an art form *sui generis* (after its generic separation from opera from the end of the 17th cent. onwards), it was to the ancient treatises of *Lucian (*Salt.*) and Libanius that they turned. The 'first' modern attempts to revive ancient pantomime were a danced version of Act IV of Corneille's *Horace* by Louis XIV's daughter-in-law, the Duchesse du Maine (nr. Paris, 1714) and John Weaver's *Loves of Venus and Mars* (London, 1717). But the most prolific, and notorious, choreographer of *ballets d'action* was Noverre whose treatise, *Lettres sur la danse* (1803–1804) was the first serious account of modern dance. Noverre looked to ancient pantomime for its mimetic and expressive power in order to demonstrate that ballet was no mere virtuoso art form, but a potential rival to both painting and opera in its ability to deal with serious subjects and tell a story with gesture and movement alone. Many of Noverre's *ballets d'action* draw the source of their inspiration from Greek tragedy, the most famous of which is *Medée et Jason* (1776). In his collaborations with the composer C. W. Gluck (notably with *Alceste*, 1767 and *Iphigénie en Aulide*, 1777), Noverre could be said to have been the first to bring ancient tragedy's synthesis of word, music, and dance to the modern stage.

The impact of ancient dance on modern dance was evident before the 18th cent., notably in the 15th-cent. mimed or danced interludes known as *moresche* and in the Stuart masques, where ancient mythological subjects and ancient dance metres afforded new political and aesthetic possibilities. The moral taint associated with the ancient dancer provided much ammunition for those who found dance offensive and/or subversive in the modern world. Prejudices from the Church Fathers are recycled in early modern Europe, especially in the

baroque period, and resurface again very acutely in the age of Modernism when there was a counterblast in the Anglo-Saxon world to the cult of the body (*Körperkultur*) that emanated from the German-speaking world.

Ancient mythology has proved the staple of the modern dance repertoire down to the modern day, but it was during the Modernist period, above all, that the ancient dancer was to prove most alluring. Nietzsche's *The Birth of Tragedy* (1872) privileged the ancient choric dancer and at the end of the century the Cambridge Ritualists put the dancing maenad centre stage, when they designated dance a form of primitive prayer and maintained that Greek tragedy had grown out of the ritual dances in honour of *Dionysus. Also very influential was the research of the French musicologist Maurice Emmanuel who claimed in the wake of experiments in chronophotography that the dance images on Greek vases could provide a key to the revival of Greek dance. The pioneers of Modern Dance, notably Isadora Duncan, were said to have danced like maenads, straight off a Greek vase.

Even if much dance, from George Balanchine's mid-20th-cent. works onwards, has striven to resist the mimetic function of dance that Noverre sought to privilege, the ancients have remained central to the dance repertoire. Developments in modern psychology have very often paralleled those in Modern Dance and Martha Graham's Greek-tragic ballets not only provided new insights into Greek tragedy at a time when it was rarely performed on stage (e.g., *Cave of the Heart* (= E. Med.) 1946, *Night Journey* (= S. OT) 1947, *Clytemnestra* 1958, *Phaedra* 1962, *Phaedra's Dream* 1983), they did so by taking their cues from the psychoanalytical theories of Freud, Jung, Klein, and Fromm. Dance theory has often adopted the Nietzschean terminology of the Apolline and the Dionysiac in order to analyse the work of 20th- and 21st-cent. choreography; yet by striving to privilege one element at the expense of the other (in Balanchine's case, the formal, Apolline; in Graham and other women choreographers,

very often the visceral, Dionysiac), the choreographies regularly move beyond the agonistic and mutually inter-related terms set out in *The Birth of Tragedy*. Recent scholarship on the ancient singing and dancing chorus has been matched by a resurgence of interest in choruses in performance—both in non-western theatrical traditions and within western theatre, where collective movement is often sought as an antidote to the modern, atomized world.

FM

dancing From earliest times, the dance played an important role in the lives of the Greeks, and was sometimes regarded by them as the invention of the gods. It was generally associated with music and song or poetry in the art called *mousikē*, and frequently made use of a body of conventionalized gestures, *cheironomia*. The dance had a place (usually ritualized) in religious festivals, in the secret rites of *mysteries, in artistic competitions, in the education of the young, and even in military training, especially in *Sparta. People danced at weddings, at funerals, at the 'naming-days' of infants, at harvests, at victory celebrations, in after-dinner merrymaking, in joyous dance processions (*kōmos*) through the streets, in animal mummery, and even in incantations. Performances by professional dancers were enjoyed, especially at the *symposium; such dancers were almost all slaves and *hetairai* (lit. 'companions'; a type of female prostitute: see PROSTITUTION, SECULAR).

Among particularly famous dances of the Greeks were the *geranos* (a nocturnal serpentine dance the name of which is probably derived from the root †*ger-*, 'to wind', and not from the word for 'crane'); the pyrrhic and related dances by men and boys in armour; the *partheneion*, a song-dance performance by maidens; the *hyporchēma*, a lively combination of instrumental music, song, dance, and pantomime; the skilful 'ball-playing' dance; and the uproarious *askōliastos*, performed on greased wineskins. In the worship of *Dionysus the wild *oreibasia*, or 'mountain-dancing' of frenzied women, by classical times was toned down into a prepared performance by a thiasos, or group of trained devotees.

In the Athenian theatre, the *tyrbasia* of the cyclic choruses, the lewd *kordax* of comedy, the stately *emmelleia* of tragedy, and the rollicking *sikinnis* of the satyr-play were distinctive. The actors in the *phlyakes*-plays of Magna Graecia (S. Italy) apparently at times burlesqued the dignified dances of the religious festivals.

The Romans were much more restrained than the Greeks in their use of the dance. Some of them, including *Cicero (*Mur.* 6. 13), openly expressed contempt for dancers. There are records of a few ancient dances used in religious ceremonies—e.g. the leaping and 'three-foot'

dances (*tripudia*) of the armed Salii and the Arval Brothers, and the 'rope dance' of maidens in honour of *Juno (Livy 27. 37. 12–15). *Etruscan and Greek dancers, from the 4th cent. BC on, exerted some influence, and the introduction of various oriental cults brought noisy and ecstatic dances to Rome. Dancing by professionals, usually slaves, often furnished entertainment at dinner-parties. With the coming of the pantomime, popular interest in the dance became great. See MUSIC.

LBL/AJSS

Darius I (OP *Darāyavauš*), son of Hystaspes, a Persian of noble lineage already known in the reigns of *Cyrus the Great and Cambyses. He seized power after a bloody struggle against an individual said by him to have been the magus Gaumata. It is quite possible that the person he in fact assassinated was Bardiya (Gk. Smerdis), the brother of Cambyses (522 BC). He then had to quell numerous revolts by subject peoples and deal with the in-subordinate Oroites, satrap of Sardis (W. *Asia Minor). His achievements were commemorated for posterity, in text and picture, on the rock of Bisitun in Media (SW of the Caspian Sea). To mark what he presented as a refoundation of the empire, he created two new royal residences: Susa in Elam (SW Iran) and *Persepolis in *Persia. He also extended the empire in the east (Indus valley) and west (Thrace). Soon after his brutal crushing of the *Ionian Revolt (c.500–493), he put Datis in command of an army which conquered the Aegean islands, before meeting a setback at the battle of Marathon (490; see GREECE (HISTORY)). Until his death in 486, Darius worked to perfect the administration and tributary structure of the empire, as shown by a famous passage in *Herodotus (3. 89–97). It is illustrated even better by the thousands of Elamite tablets found in the treasury and fortifications of Persepolis.

PB

dead, disposal of Correct disposal of the dead was always a crucial element in easing the *soul of the deceased into the next world. However, the forms of burial varied enormously. Great significance was attached to the choice of inhumation, cremation, or some other rite (e.g. Hdt. 3. 38; Lucr. s 3. 888–93), but there is rarely any reason to see a direct correlation between specific methods and specific racial, class, or religious groups.

Greece

In prehistory there was enormous variation. An inhumation burial is known from mesolithic times in the Franchthi cave (Argolid), while in Thessaly cremation cemeteries go back to early neolithic. In the early bronze age rich grave goods were sometimes used, particularly in the multiple inhumation tombs of the Cyclades and

*Crete. In the late bronze age, there was for the first time considerable uniformity on the mainland, with multiple inhumations in rock-cut chamber-tombs being the norm. In early Mycenaean times a few people were buried in spectacular tholos- (beehive-) tombs. Very large cemeteries of chamber-tombs have been found at Mycenae and other sites. This pattern extended as far north as *Thessaly, but in *Macedonia and Epirus (NW Greece) individual inhumation in stone-lined cist-graves, grouped together under mounds of earth, was normal. After the destruction of the Mycenaean world c.1200 BC, regional variations returned in the 'Dark Age'. Inhumations in cists with the body contracted were normal at Argos; cremation on a pyre with just a handful of the ashes scattered in the grave at *Lefkandi; on Crete, chamber-tombs with multiple inhumations until about 1000, and then multiple cremations with the ashes placed in urns. At Athens, adult rites changed frequently—inhumations in cists in the 11th cent.; cremations with the ashes in urns, c.1000–750; inhumations in earth-cut pit-graves, c.750–700; cremations in the grave itself, c.700–550; and then inhumations in pit-graves, tile-covered graves, or sarcophagi from about 550 onwards. Early archaeologists associated both cist burial and cremation with the Dorian invasion (mythical Greek migration into the *Peloponnese after *Troy's fall) at various times, but these correlations are not convincing.

There were, however, a few generally observed rules. Cremation with the ashes placed in a metal urn (usually bronze), in the Homeric style, tended to be associated with warrior burials throughout antiquity. Children were rarely cremated, and in most places infants were buried inside amphoras or storage pots. Starting in the 6th cent. there was a general trend towards simpler burials, which may have been accompanied by sumptuary laws. Inhumation in pit-graves or tile-graves was adopted for adults in most parts of Greece by the 6th or 5th cent. The main exception was western Greece, where adults were inhumed in giant storage pots from the Dark Age to Hellenistic times.

Rich grave-goods and elaborate tomb-markers went out of style everywhere for most of the 5th cent., but returned around 425. There was a great flowering of funerary sculpture at Athens in the 4th cent. Funerary spending escalated still further after 300, and in the 3rd–1st cents. BC the massive 'Macedonian'-style vaulted tombs, often with painted interiors, are found all over Greece. The most spectacular of these are the late 4th-cent. royal tombs, possibly of *Philip II and his court, at Vergina in Macedonia (see AEGAE). Athens was an exception to this general pattern. *Cicero (*Leg.* 2. 66) says that Demetrius of Phalerum banned lavish tombs, probably in

317, and indeed no monumental burials are known from Attica between then and the 1st cent. BC. *Lucian (*On Mourning* 21) called cremation a 'Greek custom', but he was probably thinking in purely literary terms, drawing on classical passages such as *Hdt.* 3. 38. In Roman times inhumation was the strict rule throughout the whole Greek east, although the precise forms varied—from tile-graves at Athens to chamber-tombs at Cnossus, built tombs at Dura Europus (*Syria), and spectacular rock-cut tombs at Petra (Arabia). Greek settlers in the near east, from *Egypt to *Bactria, generally adopted rites very similar to the local population's practices.

Rome

Burial customs in prehistoric *Italy were as varied as those in Greece. The earliest graves found at Rome date to the 10th cent. BC, and include both urn cremations and inhumations. There is, however, no reason to see these as belonging to different racial groups. Roman burials were until about 100 BC generally rather simple, in marked contrast to their neighbours the *Etruscans, who built complex chamber-tombs which often housed cremations in unusual urns, accompanied by rich grave-goods. From the 8th cent. on the customs of southern Italy were heavily influenced by Greek settlers, and inhumation generally replaced cremation. Impressive local traditions of tomb-painting developed, particularly in Campania.

At Rome itself, few burials are known from republican times, suggesting that rites were so simple as to leave few archaeological traces. Across most of Europe in the 5th–3rd cents. the bulk of the population was disposed of relatively informally, often by exposing the body on platforms. In Italy there is some evidence for mass burial of the poor in huge open pits. The use of these *puticuli* at Rome in the late republic is mentioned by *Varro (*Ling.* 5. 25; cf. *Hor. Sat.* 1. 8; *Festus*, entry under 'puticuli'), and a few were excavated in the 1880s. By the 3rd cent. BC some of the rich were being cremated with their ashes placed in urns and buried in communal tombs. By the 1st cent., cremation was the norm, and according to *Cicero (*Leg.* 2. 57) and *Pliny the Elder (*HN* 7. 187) even the ultra-conservative Cornelia gave up inhumation in 78 BC. At about the same time, Roman nobles began building very elaborate tombs modelled on those of the Greek east, with monumental sculptures and elaborate stone architecture.

The spiralling cost of elite tombs ended abruptly under *Augustus, who built himself a vast mausoleum. Other nobles were careful to avoid being seen as trying to rival the splendour of the imperial household. Simpler tombs, organized around modest altars, came into fashion for the very rich, while the not-quite-so-rich and the growing

number of funerary clubs (*collegia*) adopted the *columbarium* (a word meaning 'dovecot', coined by modern scholars). The earliest example dates to c.50 BC, but they became common after c.AD 40. They were barrel-vaulted brick and masonry tombs with niches for urns, usually holding 50–100, although one example found at Rome in 1726 held 3,000 urns.

Urn cremation was adopted all over the western empire in the 1st and 2nd cents. AD, although there were always significant local variations. By about AD 150, the empire can be divided into a cremating, Latin-using west and an inhuming, Greek-using east. But during the 2nd cent. members of the Roman élite adopted inhumation, probably as a conscious emulation of Hellenistic practices, and in the 3rd cent. this rite gradually swept across the whole west. The change has no obvious links to *Christianity or any other religious movement. However, it was certainly convenient for the spread of Christianity, which generally opposed cremation, which destroyed the body and posed difficulties for some visions of the day of resurrection. By the late 4th cent., certain practices found widely in western cemeteries—an east–west orientation, the use of lime on the walls of the grave, and the decline of grave-goods—might indicate the presence of Christians. At Rome itself, there was a general shift around 300 away from traditional cemeteries in favour of *catacombs and burial within basilicas. See ART, FUNERARY, GREEK; ART, FUNERARY, ROMAN; DEATH, ATTITUDES TO. IMO

Dead Sea Scrolls, documents made of leather and papyrus, and, in one case, of copper, found between 1947 and 1956 in caves near Qumran by the Dead Sea. The scrolls, written by Jews, are mostly in Hebrew and Aramaic, but a small number are in Greek. Many are fragments of biblical texts from the Old Testament and from Jewish religious compositions otherwise only preserved through Christian manuscript traditions. The scrolls were written in the last centuries BC and 1st cent. AD.

Of particular significance in the study of Judaism in this period are the texts composed by sectarians, whose relationship to the nearby settlement site at Qumran is debated. These texts include community rules, hymns, liturgical texts, calendars, and works of bible interpretation. Among this last group is found the *pesher* type of interpretation, characteristic of this sect and rarely found elsewhere in Jewish literature, in which the real meaning of scriptural passages is alleged to lie in hidden allusions to more recent events.

The Community Rule (1QS, also called the Manual of Discipline), a composite work found in various manuscripts in different caves, laid down the rules for initiation into the community and for living within it. The Rule

of the Congregation or Messianic Rule (1QSa) gives regulations for the eschatological integration of the 'congregation of Israel' into the sectarian community. The Damascus Rule (CD) is also attested in a medieval manuscript (the Zadokite Fragments) discovered in Cairo in 1896. The War Rule (1QM) is a rather different text which regulates the behaviour of the 'sons of light' in the eschatological war against the 'sons of darkness'. The Temple Scroll (11QT) contains a systematic statement of the regulations pertaining to the Temple cult, derived from the Pentateuch but with frequent non-biblical additions which are presented as the direct words of God. 4QMMT, found in six copies (all very fragmentary), takes the form of a letter in which legal views, mostly on issues of purity, are presented to authorities external to the sect.

How many of those documents were originally composed by adherents of one particular sect is debated. If the scrolls were deposited in the caves for safe keeping, they may have been placed there by more than one group, perhaps after the destruction of the Jerusalem Temple in AD 70. The contents of the Copper Scroll (3Q15), a prosaic list of the hiding-places of an immensely valuable treasure, might support this hypothesis, but finds of multiple copies of some sectarian texts in different caves may suggest that only one sect was responsible for placing them there. In that case doctrinal differences between texts must be accounted for by supposing either variant branches of the sect or a gradual development of the sect's ideas over time.

Many attempts have been made to connect the scrolls to the Jewish groups of this period known from other sources. Most such attempts assume that the scrolls were deposited by the inhabitants of the site at Qumran, where excavation may have revealed a small community, isolated in the desert, with a deep concern for ritual purity. The most plausible of such identifications is with the Essenes, who are known primarily from descriptions by Philo of Alexandria, *Josephus, and Pliny the Elder. However, the classical evidence is equivocal and contradictory, and some aspects of the Essene society depicted there do not fit the evidence from the scrolls, so that those who hold this hypothesis have to consider the scrolls community as Essenes of a peculiar type. It may be better to take the sectarian material in the scrolls as evidence of a type of Judaism otherwise unknown. See RELIGION, JEWISH. MDG

death, attitudes to

Greek

The Greek attitude towards *Hades is best summed up by *Achilles, 'I'd rather be a day-labourer on earth working

for a man of little property than lord of all the hosts of the dead' (*Od.* 11. 489–91). The Homeric dead are pathetic in their helplessness, inhabiting draughty, echoing halls, deprived of their wits (*phrenes*), and flitting purposelessly about uttering batlike noises (*Od.* 24. 5 ff.). Athenian law-court speeches urge the jury to render assistance to the dead as if they were unable to look after their own interests (e.g. *Lys.* 12. 99). The precise relationship between the living body and the *psychē* (spirit of the dead) is unclear, since the latter is only referred to in connection with the dead. The necessity of conducting burial rites (e.g. *Il.* 23. 71) and the insult to human dignity if they are omitted (cf. *Soph. Ant.*) are frequently mentioned in literature. Except in philosophy and Orphism (cf. *Pind. Ol.* 63–88; *Pl. Resp.* 2. 363c–e, *Phaedo* 113d–114c; see ORPHEUS), belief in a dualistic after-life is largely absent from Greek eschatology. In *Homer the Underworld judge Minos merely settles lawsuits between the litigious dead (*Od.* 11. 568–70). Only gross sinners (e.g. Tantalus, Tityus, and Sisyphus) receive retributive punishment, while the favoured few end up in the Elysian Fields (4. 561 ff.). Fear of the after-life was therefore largely absent (but cf. *Pl. Resp.* 1. 330d). Though powerless in themselves the dead had access to the infernal powers, notably Pluto (Aedoneus) and Persephone, for which reason folded lead plaques (*katadesmoi*) inscribed with *curses bearing the name of the person to be 'bound down' were occasionally placed in graves.

The deceased's journey to the next world was effected by elaborate ritual conducted by the relatives of the deceased, primarily women. The funeral, from which priests were debarred for fear of incurring *pollution, was a three-act drama which comprised laying out the body (*prothesis*), the funeral cortège (*ekphora*), and the interment. We only rarely hear of undertakers (*nekrothoptoi*, *nekrophoroi*) and other 'professionals'. We know of no burial 'service' as such. Cremation and inhumation were often practised concurrently in the same community, with no apparent distinction in belief. From c.500 BC intramural burial was forbidden in Athens (cf. *Plut. Lyc.* 27 for Sparta). No tomb-cult was practised in early times, but in Classical Athens women paid regular visits to the grave. Offerings included cakes and *choai*, i.e. libations mainly of pure water. The attention that the dead received from the living in this period was judged to be so important that it constituted a reason for adopting an heir (*Isae.* 2. 36, 7. 30). In the Archaic period a funeral provided a perfect showcase for the conspicuous display of aristocratic wealth, power, and prestige, and many communities passed legislation designed to limit its scope and magnificence (e.g. [Dem.] 43. 62 and *Plut. Sol.* for *Solon's legislation; *Syll*³ 1220 for *Delphi).

Funerary ritual was substantially modified for those who died in their prime, the unburied dead, victims of murder, suicides, heroes, etc. Special sympathy was felt towards women who died at a marriageable age but unmarried. To underline their pathos, a stone marker in the form of a *loutrophoros* (i.e. vase used in the nuptial bath) was placed over the grave. Victims of murder were vengeful and malignant, as indicated by the grisly practice of cutting off their extremities. Most powerful were the heroic dead, who even in *Plutarch's day still received blood *sacrifice (*Plut. Arist.* 21).

Geometric vases depict only the *prothesis* and *ekphora*, whereas Athenian white-ground *lēkythoi* (oil flasks) frequently depict tomb-cult. Hades is rarely represented in Greek art (but cf. *Paus.* 10. 28–31 for Polygnotus' lost painting, the *Nekyia*) or in literature (*Od.* 11 and *Ar. Frogs* are notable exceptions; cf. too 'Orphic' gold leaves). Though the belief in Hades as the home of the undifferentiated dead predominated and never lost its hold over the popular imagination (cf. its persistence as a theme in epitaphs), other concepts include the transformation of the dead into stars (e.g. Castor and Pollux), their absorption into the upper atmosphere or aether (e.g. *IG* 1³. 1179), the Pythagorean (e.g. H. Diels and W. Kranz 14, 8a) and Platonic (e.g. *Phd.* 107d) belief in transmigration, and the indistinct 'blessedness' promised to initiates in the mysteries of *Eleusis. See PLATO; PYTHAGORAS.

Roman

In the Roman tradition death is conceived of essentially as a blemish striking the family of the deceased, with the risk of affecting all with whom it had contact: neighbours, magistrates, priests, and sacred places. For this reason ritual established a strict separation between the space of the deceased and that of the living. Cypress branches announced the blemished house, and on days of sacrifices for the dead sanctuaries were closed.

The time of death spanned above all the period when the deceased's corpse was exposed in his or her home, its transport to the cemetery, and its burial. These operations were usually completed after eight days. The transformation of the corpse was achieved in the course of 40 days. The deceased did not, in the course of the funerary ritual, arrive at life eternal, but joined, as it were, a new category: those members of the community, the *di manes*, who lived outside towns on land set aside for this purpose and managed by the *pontifices* (see PRIESTS (GREEK AND ROMAN)). The legal status of these tombs was that of the *religiosum* (see RELIGION, ROMAN). The *di manes* were thought of as an undifferentiated mass or (rather) a collective divinity (Romans spoke of the *di manes* of such-and-such a person), and received regular cult during

the Parentalia of 13–21 February and at other times. The immortality which they enjoyed was conditional on the existence of descendants, or at least of a human presence (a proprietor of the land on which the tomb was located, or a funerary *collegium* or club), since it was the celebration of funerary cult, in the form of sacrifices, which ensured the deceased's survival.

The unburied dead were called *lemures* and thought of as haunting inhabited areas and disturbing the living. Usually anonymous (being no longer integrated into any social context) they none the less received cult at the Lemuria in May, supposedly to appease them.

Along with these forms of survival, conceived generally as menacing and undesirable, there existed a third belief about life after death—deification. Combining Roman tradition with Hellenistic practices and ideas deriving from Hellenistic philosophy, the deification of exceptional individuals was instituted at Rome after *Caesar's assassination. Thereafter elevation to the status of a god (*divus*) by a senatorial decree (*senatus consultum*) became the rule for emperors and some members of their families (see RULER-CULT).

To these traditions was added, from the last centuries of the republic on, a series of Hellenistic concepts, ranging from speculation about the immortality of the soul to images of hell. Verse epitaphs prove that these ideas were rarely exclusive and coherent. We are dealing with speculations rather than beliefs capable of shaping a person's whole existence. See DEAD, DISPOSAL OF; EPIGRAM, GREEK.

RSJG/JSch

debt, the creation of obligations in cash or kind, existed at all levels of society throughout the ancient world: from loans of seed and implements between peasants (Hes. *Op.* 396 ff., 453 ff.) to lending of small sums and household objects between city-dwellers (Theophr. *Char. passim*), from borrowing to cope with unforeseen crises (Dem. 53. 4 ff.) to substantial cash loans between the wealthy to support an élite lifestyle (Ar. *Nub.*; Plut. *Mor.* 827 ff.). More generally, the partly random testimony of papyri from Ptolemaic and Roman *Egypt hints at the likely frequency of loan transactions in other times and places, largely concealed by the perspective of surviving sources. The part played by debt in funding *trade and commerce is disputed; but always to the fore were the socio-political implications of widespread indebtedness, plausibly linked with the so-called 'Solonic Crisis' (see SOLON) in Archaic Athens and the 'Struggle of the Orders' in early *Rome. In time of siege or revolution, the indebted could be a force to be reckoned with (Aen. *Tact.* 5. 2, 14. 1; Thuc. 3. 81.). Athens after Solon was exceptional in its successful prohibition of loans secured on the

person (*Ath. pol.* 6. 1); debt-bondage and other forms of debt-dependence were common throughout the remainder of the Greek and Roman worlds. Frequent laws intended to regulate debt were rarely enforceable and generally had only limited or temporary effect. Forms of debt-bondage continued in Rome long after the *lex Poetelia de nexis* (326 BC), which reputedly prohibited imprisonment for debt. Wider implications of indebtedness were also apparent at the upper end of society. Wealthy Athenians risked their status by raising loans on the security of property to fulfil *eisphora* (tax) and prestigious liturgy obligations. In the late Roman republic, indebtedness was intertwined with élite politics: the massive debts incurred by politicians in the pursuit of power could result in credit crises (49 BC, on the eve of the Civil War) and, in extreme cases, point the way to revolution (the conspiracy of *Catiline). A possible alternative was exploitation of the provincials: *Cicero, while governor in Cilicia (S. *Asia Minor), records with more dismay than surprise loans at usurious rates of interest by *Brutus to the nearby city of Salamis on *Cyprus, and by *Pompey to Ariobarzanes III, king of neighbouring Cappadocia (*Att.* 5. 21; 6. 1).

PCM

Delian League, modern name for the alliance formed 478/7 BC against the Persians (also known as the 'Athenian empire'). In 478 the Greeks, led by the Spartan Pausanias, campaigned in *Cyprus and secured *Byzantium; but Pausanias abused his power and was recalled to Sparta. At the request of the allies, who pleaded Pausanias' behaviour and 'Ionian kinship' (Thuc. 1. 95. 1), Athens accepted leadership. The Peloponnesians acquiesced (some evidence suggests reluctance), and a new alliance was formed with its headquarters on the sacred island of *Delos—a traditional Ionian festival centre but one which had appeal for Dorian islanders also. Athens provided the commander of the allied forces and settled which cities were to provide ships and which money; the treasurers also, ten *hellēnotamiae*, were Athenians, and the Athenian politician Aristides made the first assessment. But at the outset policy was determined at meetings on Delos at which every member, including Athens, had just one equal vote. The nucleus of the alliance was formed by the Ionian cities of the west coast of *Asia Minor, the Hellespont (Dardanelles), and the Propontis (mod. sea of Marmara), and most of the Aegean islands. Chios, *Samos, *Lesbos, and some other states with a naval tradition provided ships; the remainder brought annual tribute to the treasury at Delos. Members took permanently binding oaths of loyalty. From 454 we have (often) securely dated lists of the one-sixtieth fractions of tribute paid to Athena, the so-called 'Athenian tribute

lists', and though this evidence is both fragmentary and also incomplete in that not every year survives, it has been intensively and fruitfully analysed.

At first the anti-Persian objectives were vigorously pursued. Persian garrisons were driven out of Thrace (except at Doriscus on the Hebrus) and Chersonesus; Greek control was extended along the west and south coast of Asia Minor; new members joined until there were nearly 200. The climax was the Athenian general Cimon's victory at the Eurymedon, SW Asia Minor (466). Meanwhile Carystus in Euboea was forced to join (c.472), the Cycladic island of Naxos tried to secede and was forced back in (c.467), and in 465 wealthy Thasos (N. Aegean) revolted because of Athenian encroachment on Thasian mainland holdings. Thasos surrendered 462 and stiff terms were imposed, but nearby on the Strymon a large colony of Athenian allies was wiped out by the local inhabitants. If Cimon made a first peace of Callias after Eurymedon it ended with his *ostracism and fighting against Persia resumed in 460, when a strong Athenian force sailed to Cyprus but was diverted to Egypt to support Inarus, a Libyan prince in revolt from Persia. The Egyptian expedition ended in disaster for Athens in 454, and it was perhaps in that year that the treasury was moved from Delos to Athens (?for security in this moment of peril; but the date of the move is not absolutely certain). But Athenian power spread in Greece and the Aegean: the Dorian island of Aegina was coerced in 458, and the First Peloponnesian War gave Athens control over Boeotia 457–446: the Boeotian towns Orchomenus and Acraephnum were actually tributary members of the league, which was therefore not purely maritime. At sea Cimon, back from ostracism, led a force to Cyprus but this phase of resumed expansion ended with his death at the end of the 450s.

The main Callias Peace of 450, if historical, restricted Persian movement west of Phaselis (SW Asia Minor) and outside the Black (Euxine) Sea, and Persia made other concessions. The removal of the original justification of the league seems, on the evidence of the tribute lists, to have led to restlessness among Athens' allies, but this was checked and tribute-levying (perhaps discontinued for a year) was resumed. Cleruchies (a type of Athenian citizen colony) and other repressive institutions were now imposed, though the greater bulk of epigraphic evidence after mid-century creates a risk of confusing first occurrence with first attestation (and see below for dating problems). The first known cleruchy was at Andros 450, also perhaps Naxos and Euboea (Carystus); Chersonesus was settled by *Pericles in 447. By now only Chios, Samos, and Lesbos contributed ships, the rest paid tribute and had no effective means of resisting.

Traditionally, Athenian inscribed decrees, dated by letter-forms, have been used to trace changes in Athenian policy, and in particular an increasing tendency towards mid-century harshness: on this view, Pericles turned the 'league' into an 'empire'. Critics (notably M. Finley, *Economy and Society in Ancient Greece* (1981), ch. 3) had already insisted that Athenian behaviour had never been anything but harsh (see Cimon for the coercion of Scyros etc., 470s). But now the criteria for dating 5th-cent. Attic inscriptions has been radically and generally questioned (one scholar had long argued on these lines: see H. Mattingly, *The Athenian empire restored* (1999), a collection of older papers). In particular, a key text has been, ever more confidently, down-dated from 458/7 to 418 (ML no. 37, an Athenian alliance with Sicilian Segesta; see *SEG* 39. 1 and 52. 44. The crucial letter form here is that of sigma). The result, assuming that the case has been proved, has been to make it extremely difficult to write a narrative history of the Delian League based solely or even primarily on the evidence of inscribed decrees (as opposed to securely dated tribute lists). The recent tendency has been to lower the datings of many such decrees, often from the 440s to the 420s (but not all: see Rhodes, *CQ* 2008, 500 ff. a useful attempt to sort out which inscriptions should and which should not be down-dated). There is a risk, in all this, of a kind of scholarly reversion to an old-fashioned, personality-based, association of tough measures with identifiable tough men—but now with demagogues such as Cleon, rather than with Pericles. This should probably be resisted (against personality-based reconstructions of any sort, see esp. Kallet in J. Ma, N. Papazarkadas and R. Parker (eds.), *Interpreting the Athenian empire* (2009)). Despite these uncertainties, the position is not desperate: in favour of gradual deterioration and growing Athenian unpopularity is Thucydides 1. 99, an important chapter. And a structural and institutional, rather than narrative, approach may be preferable anyway. We are at an exciting time in the history of the study of Athenian imperialism, and it will be interesting to see what sort of history of it can now be written.

Boeotia revolted in 447 or 446, the Athenians were defeated at Coronea, and the ensuing crisis—revolts by Megara and Euboea, and a Spartan invasion—was settled by the Thirty Years Peace (446). In 440 Samos defied Athens, was besieged and subdued and forced to pay a large indemnity. Whether or not a technical democracy was now installed or an *oligarchy tolerated is unclear; it was perhaps more important to Athens, here and elsewhere, that the governing group should be pro-Athenian. Back at Athens, the people's courts or *dikastēria* (see *LAW AND PROCEDURE, ATHENIAN*) played a major part in the control of empire.

Delian League Fragment from one of the inscribed lists set up on the Athenian Acropolis as a record of the quotas set aside for *Athena from the annual payments of the allies. The lists give a valuable indication of which states paid tribute, and how much they paid, from one year to another. From J. Kirchner, *Imagines Inscriptionum Atticarum*, Gebr. Mann Verlag. By permission of the Syndics of Cambridge University Library.

When the Peloponnesian War began (431), this Athenian control was firm; Spartan hopes for large-scale revolt from Athens were disappointed, nor did the Spartans make best use of their opportunities, e.g. on Lesbos, which Athens crushed. In 425 the Athenians increased the tribute assessment to nearly 1,500 talents (the original assessment is said to have been 460 talents). In 416 when the Cycladic island of Melos refused to join the alliance, Athens reduced the island, executed the men, and enslaved the women and children, a small-scale atrocity but one long remembered against Athens. After the Sicilian disaster of 415–413 Chios, Miletus, Thasos, Euboea, and other key places revolted, but even this wave of revolt was contained, partly because of Persian behaviour and Spartan limpness, partly because Athens had learned to avoid counter-productive reprisals.

The Athenian empire brought benefits to the poorer cities: *piracy was suppressed to the great advantage of trade, and the Athenian navy offered well-paid service, particularly attractive to the population of the islands. Pride in Athenian imperial success and cultural achievement may not have been confined to Athens' own citizens, though these are not aspects on which our main source Thucydides dwells. He does not even bring out the extent to which the upper classes at Athens benefited (as inscriptions like *Hesperia* 1953, 225ff. attest) from overseas territorial possessions in the empire, acquired in defiance of local rules. But such possessions help to explain why there was so little principled objection to the empire, and the democracy which ran it, on the part of the Athenian social and intellectual élite. They also show that the literary picture of solidarity between the Athenian *dēmos* (common people) and the *dēmos* in the allied states is too simple. Thucydides or rather one of his speakers hints that the allies would prefer independence from either Athens or Sparta. Nevertheless, and in Athens' favour, the same chapter (8. 48) is surely right to acknowledge that at worst, arbitrary judicial process and violent killings could be expected from the oligarchies which Sparta had to offer instead.

The allies did not in fact contribute much to Athens' defeat, and when Sparta took Athens' place the cities soon had reason to regret the change. In less than 30 years they again united under Athenian leadership in the Second Athenian Confederacy. But it is a significant indicator of the reasons for Athenian unpopularity in 431 (Thucydides 2. 8) that in 377 Athens repudiated cleruchies, garrisons, and overseas possessions. RM/SH

Delos (see ◀Map 1, Cc▶), a small island (3 sq. km.: 1.2 sq. mi.) between Myconos and Rheneia, regarded in antiquity as the centre of the Cyclades. Composed of gneiss

and granite, it is barren and almost waterless and was incapable of supporting its inhabitants.

Delos, the only place to offer shelter to Leto, was the birthplace of *Apollo and *Artemis, as recounted in the Archaic *Homeric Hymn to Apollo*. This was the basis of its historical importance. It was also the burial-place of the Hyperboreans (a legendary race of Apollo-worshippers in the far north). Anius was its heroic founder, son and priest of Apollo, later associated with the Trojan cycle.

Early bronze age occupation on Mt. Cynthus was succeeded by a Mycenaean settlement on the low ground later occupied by the sanctuary. Two Mycenaean graves were later identified as the tombs of the Hyperborean maidens (the Theke and the Sema). Continuity of cult into historic times is unlikely.

Delos was colonized by Ionian Greeks c.950 BC but the sanctuary's prominence originates in the 8th cent. It became the principal cult centre of the Ionians of the Cyclades, *Asia Minor, Attica, and Euboea, and was perhaps the centre of an Ionian amphictiony (cultic league of neighbours). Naxos and Paros were its most conspicuous patrons in the early Archaic period. In the later 6th cent. first *Pisistratus and then the tyrant Polycrates of *Samos asserted their authority. The Athenians purified the island by removing burials within view of the sanctuary and perhaps built a temple of Apollo (the *pōrinos naos*). Polycrates dedicated Rheneia to Apollo, providing the basis for the sanctuary's subsequent wealth. Delos emerged unscathed from the Persian Wars (490–479 BC) and subsequently became the meeting-place and treasury of the *Delian League. After their removal to Athens in 454 BC the Athenians assumed administration of the sanctuary but did not impose tribute. In 426 BC Athens carried out a second purification, clearing all burials and depositing their contents in the Purification Trench on Rheneia. Henceforth women about to give birth and the dying had to be removed to Rheneia. They also reorganized their quadrennial festival (the Delia), celebrated with particular splendour by *Nicias in 417 BC, perhaps to inaugurate the new temple of Apollo. In 422 BC the Delians were expelled by Athens on a charge of impurity but were soon recalled. Its independence following liberation in 405 BC was short-lived, administration of the sanctuary reverting to Athens from 394 BC.

Athenian domination lasted until *Antigonos the One-eyed's foundation of the League of Islanders in 314 BC, championed by the Ptolemies in the early 3rd cent. but redundant after the Chremonidean War (260s). For a century and a half Delos was independent and functioned as a normal city-state, with an archon as its chief magistrate and the sanctuary's administration entrusted to a board of *hieropoioi* (religious officials). This was a

period of extensive new public building, some provided by foreign patrons (e.g. the stoas of *Antigonus Gonatas and Philip V of Macedon). These and the festivals instituted by successive Hellenistic kings were more a display of religious patronage than an assertion of political domination. Although Delos' population remained relatively small (c.3,000–4,000) it began to develop as a commercial centre, attracting foreign bankers and traders, Italians prominent among them.

Independence ended in 166 BC when Rome handed control of Delos to Athens. Its inhabitants were expelled and replaced by Athenian cleruchs (citizen-colonists). Delos was made a free port to the detriment of Rhodian commerce (see RHODES). In conjunction with its commercial growth in the later 2nd and early 1st cent. its population expanded enormously and it became increasingly cosmopolitan, merchants and bankers from Italy and the Hellenized East forming distinct communities. Delos became the most important market for the slave trade (see SLAVERY). Although Athenians filled the civic posts (chief magistrate, the *epimelētēs*), guilds and associations of the foreign communities and trading groups administered their own affairs. Sacked in 88 BC by Archelaus, *Mithradates VI's general, and again in 69 BC by pirates (see PIRACY), Delos never recovered its former greatness. By the end of the 1st cent. BC its importance as a sanctuary as well as a commercial centre were lost. Its decline, which became a *topos in Roman literature, owed as much to shifts in trading patterns as the destructions. A small community survived into late antiquity.

The cults of Apollo, Artemis, and Leto were naturally the most prominent and among the most ancient, though none need be earlier than the 8th cent. Apollo was the focus of the annual Ionian festival (the *panēgyris*) celebrated with games, singing, and dancing. Individual cities sent delegations to the major festivals and some, such as Andros, Ceos (mod. Kea), and Carystus (Euboea), had their own *oikoi* (buildings) within the sanctuary. It was administered by boards of officials responsible for managing the property of Apollo and guarding the temple treasures, as well as maintaining the buildings of the officially recognized cults. However, as in any normal *polis, the gods charged with other communal concerns were given due attention, each having its own cult and annual festival. From the late 3rd cent. and especially after 166 BC foreign cults multiplied, reflecting the cosmopolitan character of the city. Most were of oriental origin, such as Sarapis, Isis (see EGYPTIAN DEITIES), and the Syrian gods Hadad and Atargatis, but Italian divinities, such as the *Lares compitales*, also occur and, from the early 1st cent. BC, a *synagogue served the Jewish community. Many were the concern of private groups and not officially recognized.

Among the more curious cult rituals were the sacred offerings sent to Delos by the Hyperboreans, passed from city to city along a fixed route, apparently modified under Athenian influence to pass through Attica. The 'crane' dance (*geranos*; see DANCING; PYGMIES), initiated by *Theseus and the Athenian youths returning from *Crete, was performed at the Altar of Horns. *Callimachus alludes to self-flagellation around the altar and gnawing the trunk of the sacred olive.

The archaeological exploration of Delos, conducted by the French school since 1873, has unearthed the sanctuary and large parts of the ancient city. Its public buildings, commercial installations, and residential quarters, combined with a mass of epigraphic documentation from the 4th cent. BC, give a detailed picture of its political, religious, social, and economic history. Nevertheless, the identification of many of the monuments is disputed.

Most of the ancient cults lay in the low ground on the sheltered west side of the island. Here were the temples of Apollo, the Artemision, and, to the north, the Letoon, as well as the Dodekathemon (sanctuary of the twelve gods) and others not securely identified. In the same area are the *oikoi* of various cities, dining-rooms, and the altars; the site of the Altar of Horns (the *keratinos bōmos*), reputedly built by Apollo himself, is debated. The Heraion, one of the earliest temples, stood apart at the foot of Mt. Cynthus, whose peak was crowned by a sanctuary of *Zeus and *Athena. The cult of Anius was housed in the *archēgesion* (founder's shrine) in the north-east. Originally the sanctuary was approached from the north, passing the Lion Terrace, but subsequently it was entered from the south. The later cults, especially those of oriental origin, were for practical and religious reasons concentrated below Mt. Cynthus and around its peak. The synagogue, on the north-east coast, was isolated from the other sacred areas. Many of the associations named after a particular divinity (e.g. the Poseidoniasts of Berytus (mod. Beirut) and the Hermaists) combined cult with commercial and social functions.

The sanctuary of Apollo was also the focus for the city's political institutions, housing the *prytaneion* (town hall), the *bouleutērion* (council chamber), and *ekklēsiastērion* (assembly hall). Associated with the social and religious life of the city were the hippodrome, *stadium, and *gymnasium on the low ridge north-east of the sanctuary. North of the Sacred Lake were two palaestras and on the lower slopes of Cynthus, in the old town, was the theatre. Around the sanctuary and encroaching on the sacred precincts were many of the commercial establishments, such as the markets of the Delians and the Italians. Warehouses fringed the shore south of the port. Residential areas surrounded the sanctuary on the north,

east, and south. No trace of the early city remains. The old town of the 3rd cent., with its unsystematic plan of winding streets and irregular houses, lay to the south at the base of Mt. Cynthus. The expansion of habitation in the later 2nd and early 1st cent. matched the increase in population after 166 BC. Houses of this period are larger, more regular, and organized on a rectilinear street grid. Their affluence testifies to the wealth of the city. Many contain *mosaics and traces of wall-paintings and the largest have colonnaded courts. Some 15,000 clay sealings found in one house are all that remains of a private *archive. Delos remained unwallled until 69 BC when, following the pirate sack, the Roman commander Triarius constructed a wall encompassing the main sanctuary and the residential areas to its north and south. The city's vast necropolis covered the SE shore of Rheneia. RWVC

Delphi (see ◀ Map 1, BC ▶) (See also DELPHIC ORACLE). Delphi, one of the four great Panhellenic *sanctuaries (the others are Isthmia, *Olympia, Nemea), is on the lower southern slopes of Mt. Parnassus, c.610 m. (2,000 ft.) above the gulf of Corinth.

Before 300 BC

There was an extensive Mycenaean village in the *Apollo sanctuary at the end of the bronze age; the area was resettled probably during the 10th cent., and the first dedica-

tions (tripods and figurines) appear c.800. The settlement was probably relocated after the first temple was built (late 7th cent.). The first archaeological links are with Corinth and Thessaly. The 6th cent. Homeric hymn to Apollo says Apollo chose Cretans for his Delphic priests, and early Cretan metal dedications have been found, but Cretan material could have come via Corinth, and Cretan priests may have been invented because *Crete was distant i.e. this is a way of stressing the end of local domination. The first Pythian Games were held in either 591/0 or 586/5.

The sanctuary, for which our main literary evidence is *Pausanias 10, consisted of a *temenos* (sacred precinct) enclosed by a wall. Inside it were the monuments dedicated by the states of Greece to commemorate victories and public events, together with about twenty 'treasuries' (the oldest are those of Cypselid Corinth; Sicyon (northern *Peloponnese), c.560; Cnidus (SW *Asia Minor), c.550; and the Cycladic island of Siphnos, c.525), a small theatre, and the main temple of Apollo to which the Sacred Way wound up from the road below. The Persian Wars (490–479) were architecturally celebrated with special panache, and heroes like the Athenian general Miltiades were commemorated more assertively here (Paus. 10. 10) than was possible back at democratic Athens. The first temple was destroyed by fire in 548 BC; debris, including many votives (notably chryselephantine statuary), was buried under

Delphi The panhellenic prestige of Archaic Delphi and the wealth of its clientele are reflected in this lifesize dedication of a silver-gilt bull, made somewhere in the E. Aegean or W. *Asia Minor c.600–550 BC. French School at Athens. Photo: Efa/H. P. Coulon.

the Sacred Way. This destruction led to an architectural reorganization of the *temenos*. The great new temple was constructed in the late 6th cent. with help from the noble Athenian Alcmaeonid clan, and was itself destroyed by *earthquake in 373. A new temple was built by subscription. The physical organization of the *Delphic oracle is controversial.

Delphi was attacked by the Persians in 480 and by the Gauls in 279 BC, but suffered little damage. Excavations were begun by French archaeologists in 1880, when the village of Kastri was moved from Delphi to its present site some way away. Apart from the revelation of the main buildings of the enclosure and the remains of numerous buildings (such as the base of the Serpent Column and the Spartan general *Lysander's victory-monument for the battle of Aegospotami), there have been notable finds of sculpture: the metopes of the Sicyonian building and the metopes of the Athenian treasury, the frieze of the Siphnian treasury, pedimental sculptures of the 'Alcmaeonid' temple, the bronze Charioteer, and the remnants of the 4th-cent. sculptor Lysippus' memorial for a Thessalian dynast (the 'Daochos monument'). Below the modern road and the Castalian Spring are public buildings (palaestra, etc.), the mid-7th-cent. temple of Athena Pronaia, the 4th-cent. tholos, and the treasury of Massalia (mod. Marseilles, c.530), in the area called the Marmaria, where there are also boulders which have fallen from the rocks above (the Phaedriades).

The affairs of the sanctuary were administered by an ancient or ostensibly ancient international organization, the Delphic amphictiony (cultic league of 'dwellers-around'). Influence at Delphi could be exercised in various ways and (mostly) via this amphictiony: by imposing fines for religious offences, by declaring and leading Sacred Wars, and by participation in prestigious building projects. Thus from the age of Archaic *tyranny to the Roman period, Delphi (like other Panhellenic sanctuaries but more so, because of its centrality and fame) was a focus for interstate competition as well as for contests between individuals. The four Sacred Wars are therefore only the moments when such competition flared up into overt military clashes. But even 'conventional' wars like the Peloponnesian Wars had a religious aspect: *Sparta's foundation of Heraclea Trachinia (in central Greece) during the Archidamian War (431–421) was arguably an attempt to increase Sparta's influence in the amphictiony. And at all times in Greek history, control of *Thessaly was desirable because Thessaly had a built-in preponderance of amphictionic votes. In the 3rd cent. BC the power of Aetolia (see FEDERAL STATES) was linked to its possession of Delphi, and significantly

Rome's first alliance with a Greek state (212 or 211) was with Aetolia.

Delphi was also a *polis (IACP no. 177) and issued decrees that survive on stone. Finally, Delphi had military importance as a place of muster in central Greece (e.g. Thuc. 3. 101).

After 300 BC

New Hellenistic powers used patronage of Delphi to gain legitimation; the Aetolian Confederacy certainly (see FEDERAL STATES), and perhaps Attalus I of *Pergamum, made dedications promoting their victories against the Gauls as Panhellenic services. The appropriation (168 BC) by the victorious Lucius Aemilius Paullus of a monument destined for King Perseus of Macedonia announced *de facto* Roman domination of the sanctuary. Although *Augustus reformed the amphictiony (mainly to serve the interests of *Nicomolis) and *Domitian repaired the temple (AD 84), the only emperor to take a real interest in Delphi was *Hadrian, who held the city's archonship twice, toyed with enlargement of the amphictiony (ending up instead founding the Panhellenion, an Athens-based organization of Greek cities), and sponsored building (Syll³ 830); whether the orchestrator (*kathēgemōn*) of Roman Delphi's beautification in a debated passage of *Plutarch (*De Pyth. or.* 409c) is Hadrian or the author himself, a Trajanic priest of Apollo, is debated. A regional Greek interest in the cult endured into the 3rd cent. AD, but international attention was now confined largely to *tourism and the Pythian Games. Delphi was still a 'sacred city' (*hiera polis*) under Constantine (Syll³ 903D); the steps in the installation of *Christianity remain obscure.

CAM/SH/AJSS

Delphic oracle, *oracle of *Apollo. Its origins are dated to the very end of the 9th cent. BC and eventually it developed into the most important Greek oracle. It was consulted by *poleis* (see POLIS) as well as individuals, and played an important guiding role in the formation of the Greek *poleis* and in *colonization; it gave guidance on *pollution, 'release from evils', (rarely) laws, and, above all, cult. The story that Apollo was not the original owner of the oracle, but replaced an earlier deity (different versions naming different deities, but all including Gaia or Themis, or both) is unlikely to reflect cult history; it is a myth, expressing the perception that at Delphi the chthonian (lit. 'of the earth'), dangerous, and disorderly aspects of the cosmos have been defeated by, and subordinated to, the celestial guide and lawgiver. Apollo's oracle has tamed the darker side of the cosmos—both at the theological (Gaia's defeat) and at the human level: it therefore

gives men divine guidance through which they can cope with this side of the cosmos.

The earliest temple for which there is evidence belongs to the second half of the 7th cent. The temple whose remains are visible was built in the 4th cent. Its predecessor was built in the last quarter of the 6th cent. after the earlier temple had been burnt down in 548/7. The full oracular consultation, available regularly on only nine or perhaps twelve days each year, took place in the *adyton* (innermost sanctuary), in which stood the *omphalos* (navel) marking the centre of the world as determined by *Zeus, who released two eagles, one from the east and one from the west, which met at Delphi (cf. Pind. fr. 54). Another story makes the *omphalos* the mythical Python's (see APOLLO) or *Dionysus' tomb. The *adyton* also included a living laurel tree and, according to an ancient tradition which recent geological discoveries support, a chasm emitting vapours (see Y. Ustinova, *Ancient Caves and the Greek Mind* (2009), 121–53). The inquirer had to pay a consultation tax called *pelanos* (which had begun as a bloodless offering and kept the name when it became a monetary contribution). At the altar outside the temple was offered the preliminary sacrifice before the consultation, the *prothesis*, which was offered either by the Delphic *polis* on behalf of all inquirers, or sometimes by the inquirer—to be more precise, on behalf of the inquirer by the *proxenos* (local representative) of his city, who necessarily introduced him to the sanctuary: non-Delphians were treated at the Delphic oracle as *xenoi*, foreigners, worshipping at the sanctuary of another *polis*. If the preliminary ritual was successful, i.e. if the animal had reacted as it should when sprinkled with water (cf. Plut. *Mor.* 437a, 438a–b), it was sacrificed, and the inquirer entered the temple, where he offered a second *sacrifice, depositing either a whole victim or parts of one on a *trapeza*, offering-table, at the entrance of the *adyton*. He then probably went with the *prophētai* (interpreters) and other cult personnel to a space from which he could not see the Pythia in the *adyton*. The Pythia, who had prepared herself by purification at the Castalian Spring, burnt laurel leaves and barley meal on the altar called *hestia* inside the temple (which came to be seen as the common hearth of Greece); crowned with laurel, she sat on the tripod, became possessed by the god, and, shaking a laurel, prophesied under divine inspiration—a state which may correspond to what in non-religious explanatory models would be considered a self-induced trance. Her pronouncements were then somehow shaped by the *prophētai*. Exactly what form the Pythia's pronouncements took and what the *prophētai* did are matters of controversy. One possibility is that she felt that she received partial signs transmitting fragmentary

visions—not gibberish—and that the *prophētai* interpreted these, shaping them into coherent, if ambiguous, responses; this was not an attempt to hedge their bets, but a result of the ambiguity inherent in the god's signs and the Greek perception that ambiguity is the idiom of prophecy, that there are limits to man's access to knowledge about the future: the god speaks ambiguously, and human fallibility intervenes and may misinterpret the messages.

The most important of the oracle's religious personnel (consisting of Delphians) were: the Pythia, an ordinary woman who served for life and remained chaste throughout her service; the *prophētai*; the *hosioi*, who participated in the ritual of the consultation and shared tasks with the *prophētai*, and the priests of Apollo. The Pythia is not mentioned in the oldest 'document' informing us about the Delphic cult and oracle, the *Homeric hymn to Apollo*, where the god gives oracular responses 'from the laurel tree' (393–6), an expression that corresponds closely to that ('from the oak tree') used in the *Odyssey* (14. 327–8; 19. 296–7) for the prophecies at Dodona (NW Greece), where the oak tree spoke the will of Zeus, which was interpreted by priests. A similar practice involving the laurel may perhaps have been practised at Delphi at an early period. Whether divination by lot was practised at Delphi as a separate rite is a matter of controversy. Control of the oracle was in the hands of the Delphic amphictiony (cultic league of 'dwellers-around'), run by the amphictionic council, whose duties included the conduct of the Panhellenic Pythian Games, the care of the finances of the sanctuary, and the upkeep of the temple. The amphictiony, we are told, fought a war against Crisa and defeated it; this is the First Sacred War, the historicity of which has been doubted, but the traditional date for its end (c.590 BC) coincides with the beginning of a period of transformation, a serious upgrading of the sanctuary, not the least of its manifestations being the building of several treasuries. The first Pythian Games were held to celebrate the amphictiony's victory. Other Sacred Wars took place subsequently, of which the fourth ended in 338 with the victory of *Philip II of Macedon at the battle of Chaeronea. It is not true that the oracle's influence had diminished as a result of its suspect position in the Persian Wars (490–479). Its influence continued, only its 'political' role inevitably diminished in the radically changed circumstances of the Hellenistic and Graeco-Roman world.

CS-I

deme, local district/village. At Athens, see CLEISTHENES.

Demeter, the Greek goddess of corn, identified in Italy with Ceres. The second part of her name means 'mother', and *dē* (or *da*) was thought to mean 'earth' in antiquity,

but the Greeks had a separate goddess of the Earth, and Demeter came later in the pantheon, as granddaughter of Ge (Gaia) and sister of *Zeus. An alternative modern theory connects *dē* with *dēai*, the Cretan word for 'barley' (cf. *zeia*, 'spelt'), but this is linguistically doubtful. She is, however, certainly the goddess who controls all crops and vegetation, and so the sustainer of life for men and animals. In early epic corn is called 'Demeter's grain' (*Dēmēteros aktē*), and in a Homeric simile 'blonde Demeter' herself winnows grain from chaff (*Il.* 5. 500 f.). Her daughter by Zeus, *Persephone (Attic Pherrephatta), was called simply *Korē*, 'the Girl', and the two were so closely linked that they were known as 'the Two Goddesses' (*tō theō*) or even sometimes as 'the Demeters' (*Dēmēteres*). Because the life of plants between autumn and spring is one of hidden growth underground, Persephone was said to have been carried off by her uncle *Hades, lord of the Underworld, and compelled to spend the winter months with him as his wife, returning to the upper world with the flowers of spring. Thus as *Kore* she was a deity of youth and joy, the leader of the nymphs (young women divinities), with whom she looked after the growth of the young, but as Hades' wife she was also queen of the dead, governing the fate of souls, and thus an awesome and dread goddess.

As deities of *agriculture and growth, associated with a settled rhythm of life, Demeter and *Kore* were regarded as important influences in the development of civilization. Their title Thesmophoros was traditionally interpreted as due to their role as givers of law and morality. The Greek religious calendar was closely linked to the farmer's year, and many of their festivals coincided with the seasonal activities of ploughing, sowing, reaping, threshing, and storing the harvest. One of the most important and widespread, the Thesmophoria, normally took place in autumn (11–13th of the month Pyanopsion in Athens), near to sowing-time, and included ceremonies intended to promote fertility. Like many festivals of Demeter, it was secret and restricted to women. Their secrecy seems to have been due primarily to the sense of awe and fear generated by contemplation of the powers of the earth and Underworld.

The most important festivals of Demeter and *Kore* were the ceremonies of *initiation known as 'mysteries', the most famous of which were those of *Eleusis. By guaranteeing to initiates the favour of the goddesses, they offered above all the promise of a better fate after death, but they also promised prosperity in life, personified by Plutus (Wealth), who was the child of Demeter, born from her union with the Cretan hero Iasion 'in a thrice-ploughed field' (*Hom. Od.* 5. 125–8; cf. *Hes. Theog.* 969–74, *Hym. Hom. Cer.* 486–9).

Many legends told how, when Demeter was searching for her daughter after Hades had carried her off, she received information or hospitality from the local inhabitants of different places in Greece, and in gratitude taught them how to practise agriculture and to celebrate her rituals. The chief claimants for this honour were Eleusis and *Sicily, her most important cult centres. The oldest and best-known version of the myth is the *Homeric Hymn to Demeter*, an epic poem probably of the Archaic period. This tells how, after *Kore* was carried off, Demeter wandered the earth in search of her, disguised as an old woman, until she came to Eleusis where she was welcomed by the family of King Celeus. She became the nurse of his baby son Demophon, and tried to immortalize him by anointing him with ambrosia and holding him in the fire at night to burn away his mortality. She was interrupted by Metanira, Celeus' wife, and so prevented from making him immortal. Instead, she revealed her true identity, promised Demophon heroic honours after death, and ordered the Eleusinians to build her a temple and altar. She then withdrew to her new temple and caused a universal *famine, until Zeus was forced to order Hades to release her daughter. Hades, however, gave Persephone a pomegranate seed to eat, and because she had tasted food in the Underworld she was compelled to spend a third part of every year there, returning to earth in spring. Demeter then restored the fertility of the fields and taught the princes of Eleusis how to perform her mysteries, whose absolute secrecy is stressed. The poem closes with the promise of divine favour to the initiates both in life and after death.

The Great Mysteries at Eleusis were celebrated in early autumn (in the Athenian month Boedromion), and were preceded by the Lesser Mysteries at Agrae, just outside Athens, in spring (in the month Anthesterion). Some modern scholars have rejected the predominant ancient view which connected Persephone's absence with winter, arguing that her descent should coincide with the storing of seed-corn in underground granaries after harvest, during the period of summer dryness, to be taken out in autumn for sowing. This fits some near eastern myths of a similar type about a disappearing deity, but the story was never understood in this way by the Greeks, and the traditional explanation agrees much better with the agricultural condition of Greece itself.

The famine, in the *Homeric Hymn*, reflects another form of the belief that the death of vegetation has a divine cause. Persephone's absence and Demeter's anger and grief both combine to create sterility. The hymn assumes the existence of agriculture already before the Rape, but the Athenians in the Classical period claimed that Demeter had given to Triptolemus, one of the princes

of Eleusis, the gifts of corn and the arts of agriculture, and that he then travelled over the world teaching these to other nations.

Sicily was always regarded as especially consecrated to the Two Goddesses, and in the Hellenistic and Roman periods versions of the myth of Kore which placed her Rape and Return here became popular. She was said to have been carried off from a meadow near Enna in the centre of the island, and to have disappeared underground at the site of the spring Cyane (*Kuanē*) near *Syracuse, where an annual festival was held. Other major festivals took place at the times of harvest and sowing.

In Arcadia (central *Peloponnese) Demeter was worshipped with *Poseidon. The Black Demeter of Phigaleia and Demeter Erinys of Thelpusa were both said to have taken the form of a mare and to have been mated with by Poseidon in horse shape, and at Phigaleia she was shown as horse-headed. Their offspring were Despoina ('the Mistress') and (at Thelpusa) the horse Arion. At Phigaleia she was also said to have caused a universal famine because of her anger both with Poseidon and over the loss of her daughter (Paus. 8. 25 and 42).

These motifs of Demeter's anger and a consequent famine recur in the story of Erysichthon, who incurred her wrath by trying to cut down a grove sacred to her, although warned by the goddess in disguise not to do so. She punished him with an insatiable hunger which ruined all his household (Callim. *Hymn* 6).

A unique genealogy of Demeter makes her the mother of *Artemis (Aesch. fr. 333 S. Radt): Herodotus says that this was due to syncretism (mingling) with Egyptian mythology (2. 156. 5–6).

In art Demeter is shown both on her own and with Persephone, with related figures of cult such as Hades and Triptolemus, and in groups with the other Olympian deities. Particularly popular scenes are those of the Rape and Return of Persephone, and the Mission of Triptolemus. She carries a sceptre, ears of corn and a poppy, or torches, and she and her daughter are often portrayed as closely linked and similar in iconography. NJR

diagrams Illustrations were extremely rare in ancient literary texts. They were only occasionally used in medical texts (Apollonius of Citium, Dioscorides, perhaps Soranus; lost works by *Aristotle). Illustrations, or diagrams, were mandatory in the exact sciences—the unique genre of illustrated text in antiquity. Such diagrams were formed by a network of straight and curved

lines (certainly drawn with ruler and perhaps by compass as well; the few extant arcs on papyri are drawn free-hand). In the extant literature, diagrams are always labelled by letters of the alphabet, standing typically at the intersection points of the lines. The diagrams are crucial to the logical development of the text and encode some of the information the text takes for granted, in a non-verbal way. At the same time, diagrams are drawn schematically so that the apparent metrical relations of the diagram are not meant to represent the metrical relations of the object studied. Thus, diagrams encode topological rather than metrical properties. The major editions of the late 19th and early 20th cents. ignored the manuscript evidence for diagrams, but now it is considered essential to produce a critical edition of the diagrams as part of the edition of a text in the Greek exact sciences. RN

Diana (root †*dyw*-‘the bright one’ (cf. *Jupiter), originally a moon goddess, *contra* Altheim, *Griechische Götter im alten Rom* (1930), 93 ff.), an Italian goddess anciently identified with *Artemis, from whom she took over the patronage of margins and savageness. But the modalities of this evolution remain puzzling (moonlight as the contrary of daylight, and so of civilized life?). Her cult was widespread; see Birt in Roscher, *Lex.* 1. 1003–4 for details. One of her most famous shrines was on Mt. Tifata near Capua (Vell. Pat. 2. 25. 4 and elsewhere in literature, supported by much inscriptional evidence); the name Tifata means ‘holm-oak grove’ (Festus (Paul) *Glos. Lat.* 54), which suits Diana's character as a goddess of the wilderness. Most famous of all was her ancient cult near Aricia (on the shore of the volcanic lake known as the Mirror of Diana, *Speculum Dianae*, below the modern Nemi, i.e. *nemus*, ‘grove’). Her temple stood in a grove, which was recorded as dedicated to her by Egerius Baebius (?) of Tusculum, *dictator Latinus* (Cato, *Orig.* 2, fr. 28 Chassignet). It was therefore an old religious centre of the Latin League and it is probable, though direct proof is lacking, that the foundation of her temple (probably preceded by an altar) on Rome's Aventine hill, traditionally by Servius *Tullius (Livy 1. 45. 2 ff.), was an attempt to transfer the headquarters of this cult to Rome, along with, what Livy mentions (*ibid.* 3), the headship of the league. For the Massiliote and Ephesian connections of the Aventine temple, *see* ARTEMIS.

That she was later largely a goddess of women is shown by the processions of women bearing torches (symbols of her name and original function) in her honour at Aricia (Prop. 2. 32. 9–10; Ov. *Fast.* 3. 268–9), also by the character of many of the votive offerings there, which have clear reference to children and *childbirth (Wissowa,

[*continued on p. 236*]

ATHENIAN DEMOCRACY

democracy, Athenian from 508/7 to 322/1 BC is the best known example in history of a 'direct' democracy as opposed to a 'representative' or 'parliamentary' form of democracy.

1. Ideology

Today democracy is invariably a positive concept, almost a buzzword, whereas *dēmokratia* in ancient Greece was a hotly debated form of constitution, often criticized by oligarchs and philosophers (see PHILOSOPHERS AND POLITICS) alike. The Athenian democrats themselves, however, connected *dēmokratia* with the rule of law (Aeschin. 1. 4–5) and, like modern democrats, they believed that democracy was inseparably bound up with the ideals of liberty and equality (Thuc. 2. 37). Democracy was even deified, and in the 4th cent. BC offerings were made to the goddess Demokratia (*Inscriptiones Graecae* 2². 1496. 131–41).

Dēmokratia was what the word means: the rule (*kratos*) of the people (*dēmos*), and decisions of the assembly were introduced with the formula *edoxe tō dēmō*, 'it seemed good to the people' (IG 2². 28). When an Athenian democrat said *dēmos* he meant the whole body of citizens, irrespective of the fact that only a minority turned up to meetings of the assembly (Aeschin. 3. 224; Thuc. 8. 72). Critics of democracy, on the other hand, especially the philosophers, tended to regard the *dēmos* as a class, i.e. the 'ordinary people' (Arist. *Pol.* 1291^b17–29; *Ath. pol.* 41. 2) or the 'city poor' who by their majority could outvote the minority of countrymen and major property-owners (Pl. *Resp.* 565a).

The fundamental democratic ideal was liberty (*eleutheria*; see FREEDOM IN THE ANCIENT WORLD), which had two aspects: political liberty to participate in the democratic institutions, and private liberty to live as one pleased (*zēn hōs bouletai tis*) (Arist. *Pol.* 1317^a40–^b17; Thuc. 7. 69. 2). The most important aspect of liberty was freedom of speech (*parrhēsia*) which in the public sphere was every citizen's right to address his fellow citizens in the political assemblies, and in the private sphere was every person's right to speak his mind (Dem. 9. 3). The critics of democracy, especially the philosophers, took democratic *eleutheria* to be a mistaken ideal that led to a deplorable pluralism and prevented people from understanding the true purpose in life (Pl. *Resp.* 557b–558c).

The democrats' concept of equality was not based on the view that all are equal (although the philosophers wanted to impute this view to the democrats, Arist. *Pol.* 1301^a28–35). The equality advocated by the democrats was that all should have an equal opportunity to participate in politics (*isonomia*, Hdt. 3. 80. 6; Eur. *Supp.* 353, 408, 441), especially an equal opportunity to speak in the political assemblies (*isēgoria*, Hdt. 5. 78; Dem. 15. 18) and that all must be equal before the law (*kata tous nomous pasi to ison*, Thuc. 2. 37. 2). The concept of equality was purely political and did not spread to the social and economic sphere of society.

2. Institutions

A description of the political system must focus on the 4th cent. BC, especially on the age of *Demosthenes (355–322) where the sources are plentiful enough to allow a reconstruction of the democratic organs of government.

Political rights were restricted to adult male Athenians. Women, foreigners, and slaves were excluded (Dem. 9. 3). An Athenian came of age at 18 when he became a member of his father's deme (constitutional subunit) and was enrolled in the deme's roster (the *lēxiarchikon grammateion*, Aeschin. 1. 103); but, as *ephēboi* (see GYMNASIUM), most young Athenians were liable for military service for two years (*Ath. pol.* 42) before, at the age of 20, they could be enrolled in the roster of citizens who had access to the assembly or *ekklēsia* (the *pinax ekklēsiastikos*, Dem. 44. 35). And full political rights were only obtained at the age of 30 when a citizen was allowed to present himself as a candidate at the annual sortition of magistrates (Xen. *Mem.* 1. 2. 35) and jurors (*Ath. pol.* 63. 3) (who served as both legislators and judges).

The citizen population totalled some 30,000 adult males over 18, of whom some 20,000 were over 30 and thus in possession of full political rights. The population of Attica—citizens, foreigners, and slaves of both sexes and all ages—may have amounted to some 300,000 persons. (See POPULATION, GREEK.)

Any citizen over 20 had the right to speak and vote in the people's assembly (*ekklēsia*) (Xen. *Mem.* 3. 6. 1). The people met 40 times a year (*Ath. pol.* 43. 3), mostly on the Pnyx hill (Aeschines 3. 34); a meeting was normally attended by at

least 6,000 citizens, the quorum required for (among other things) ratification of citizenship decrees (Demosthenes 59. 89), and a session lasted a couple of hours only (Aeschines 1. 112). The assembly was summoned by the 50 *prytaneis* (see below) and chaired by the nine *proedroi*, 'chairmen' (*Ath. pol.* 44. 2–3). The debate consisted of a number of speeches made by the politically active citizens, and all votes were taken by a show of hands (*cheirotonia*), assessed by the *proedroi* without any exact count of the hands (*ibid.* 44. 3) (see ELECTIONS AND VOTING). The Athenians distinguished between laws (general and permanent rules, called *nomoi*) and decrees (temporary and/or individual rules, called *psēphismata*, Andoc. 1. 87); see LAW AND PROCEDURE, ATHENIAN. The assembly was not allowed to pass *nomoi* but did, by decree, make decisions on foreign policy and on major issues of domestic policy (*Ath. pol.* 43. 6). Furthermore, the people in assembly were empowered (a) to elect the military and financial magistrates (*ibid.* 43. 1, 44. 4); (b) to initiate legislation (*nomothesia*) by appointing a panel of legislators (*nomothetai*, Dem. 3. 10–3); and (c) to initiate a political trial (*eisangelia eis ton dēmon*) by appointing a panel of judges (a *dikastērion*, *Ath. pol.* 43. 4).

Citizens over 30 were eligible to participate in the annual sortition of a panel of 6,000 jurors (*hoi omomōkotes*, Ar. *Vesp.* 662) who for one year served both as legislators (Dem. 24. 21) and as judges (*ibid.* 148–51). When a *nomos* was to be enacted, the assembly decreed the appointment, for one day only, of a board of e.g. 1,000 legislators (*nomothetai*) selected by lot from the 6,000 jurors (Dem. 24. 20–38; Aeschin. 3. 38–40). Having listened to a debate the *nomothetai* decided by a show of hands all amendments to *Solon's laws', i.e. the Solonian law code of 594/3 as revised and codified in 403/2 (Andoc. 1. 82–5). Boards of *nomothetai* were appointed only infrequently, and to legislate once in a month was considered excessive (Dem. 24. 142).

Jurisdiction was much more time-consuming. The popular courts (*dikastēria*) met on roughly 200 days in a year. On a court day members of the panel of 6,000 jurors showed up in the morning in the Agora (see ATHENS (TOPOGRAPHY)), and a number of courts were appointed by sortition from among those who presented themselves. These courts consisted of 201 or 401 judges each in private actions and 501 or more in public actions. Each court was presided over by a magistrate and in a session of some eight hours the judges had to hear and decide either one public action or a number of private actions (*Ath. pol.* 63–9). The two most important types of political trial were (i) the public action against unconstitutional proposals (*graphē paranomōn*), brought against proposers of decrees (Aeschin. 3. 3–8), and (ii) denunciation to the people in assembly (*eisangelia eis ton dēmon*, Hyp. 3. 7–8), used most frequently against generals charged with treason and *corruption (Dem. 13. 5).

In addition to the decision-making organs of government (*ekklēsia*, *nomothetai*, *dikastēria*) Athens had about 1,200 magistrates (*archai*), elected from among citizens over 30 who presented themselves as candidates (Lys. 6. 4). About 100 were elected by the *ekklēsia* (Aeschin. 3. 14) whereas the other 1,100 were chosen by lot (Dem. 39. 10), viz. 500 councillors and c.600 other magistrates, often organized in boards of ten with one representative from each tribe (*IG* 2². 1388. 1–12). The period of office was restricted to one year and a magistrate selected by lot could only hold the same office once whereas elected magistrates could be re-elected (*Ath. pol.* 62. 3). Before entering office magistrates had to undergo an examination (*dokimasia*) before a *dikastērion* (*ibid.* 55. 2–5) and, on the expiration of their term of office, to render accounts (*euthynai*) before another *dikastērion* (*ibid.* 54. 2; 48. 4–5).

The magistrates' principal tasks were to summon and preside over the decision-making bodies, and to see to the execution of the decisions made (Arist. *Pol.* 1322^b12–17). Apart from routine matters, the magistrates could not decide anything but only prepare the decisions (*ibid.* 1298^a28–32). The council of 500 prepared business for the *ekklēsia* (*Ath. pol.* 45. 4) and the *nomothetai* (Dem. 24. 48), the other magistrates for the *dikastēria* (Aeschin. 3. 29).

By far the most important board of magistrates was the council of 500 (*hē boulē hoi pentakosioi*). It was composed of 50 persons from each of the ten tribes who for a tenth of the year (a *prytany* of 36 or 35 days) served as *prytaneis*, i.e. as executive committee of the council, which again served as executive committee of the assembly. The council met every day except holidays in the *bouleutērion* on the Agora to run the financial administration of Athens and to consider in advance every matter to be put before the people (*Ath. pol.* 43. 2–49. 5).

Of the other boards of magistrates the most important were the ten generals (*stratēgoi*) who commanded the Athenian army and navy (*ibid.* 61. 1–2), the board for the Theoric Fund (*hoi epi to theōrikon*) who in the 350s under the politician Eubulus supervised the Athenian financial administration (Aeschin. 3. 24–5), and the nine archons, who in most public and private actions had to summon and preside over the popular courts and supervised the major festivals, e.g. the Panathenaea and the Dionysia (*Ath. pol.* 55–9).

In all matters the initiative was left to the individual citizen, in this capacity called *tōn Athenaiōn ho boulomenos hois exestin* (*SEG* 26. 72. 34). At any time about 1,000 citizens must have been active as speakers and proposers of *nomoi* and *psēphismata* or as prosecutors and *synēgoroi* before the people's court. But it was always a small group of about twenty

democracy, Athenian This inscribed law against *tyranny (337/6 BC), passed at Athens in the tense period following *Philip II's victory at Chaeronea, stresses the democratic context with a relief of Demokratia (democracy) crowning Demos (the people). American School of Classical Studies at Athens: Agora Excavations.

citizens who more or less professionally initiated Athenian policy. They were called *rhētores* (Hyp. 3. 4, 8) or *politeuomenoi* (Dem. 3. 29–31), whereas the ordinary politically active citizen is referred to as an *idiōtēs* (Dem. *prooemium* 13). There were no political parties and the people did not just vote according to the crack of their leaders' whip. But by persuasion and charisma major political leaders sometimes succeeded in dominating the political assemblies for a longer period, as did *Pericles from 443 until his death in 429 (Thuc. 2. 65. 10), and *Demosthenes in the period 341–338 (Dem. 18. 320).

The ordinary citizens were reimbursed for their political activity as *ekklēsiastai*, or *nomothetai* or *dikastai* or *bouleutai* (Ath. pol. 62. 2; Dem. 24. 21). Very few of the magistrates were paid on a regular basis, but many obtained perquisites instead (Isoc. 7. 24–7). Speakers and proposers in the political assemblies were unpaid, and those who attempted to make a profit out of politics were regarded as *sycophants and liable to punishment (Dem. 59. 43).

The council of the Areopagus was a survival of the Archaic period and in the period 461–404 mainly a court for cases of homicide (Philoch. *FGrH* 328 F 64). In the 4th cent., however, the activity of the Areopagus was again progressively enlarged in connection with the attempts to revive the 'ancestral' or 'Solonian' democracy (Din. 1. 62–3; Lycurg. 1. 52).

3. History

In 510 BC the Pisistratid tyrants (*see* PISISTRATUS) were expelled from Athens, but the revolution ended in a power struggle between the returning aristocrats led by *Cleisthenes and those who had stayed behind led by Isagoras. With the help of the ordinary people (the *dēmos*) Cleisthenes successfully opposed Isagoras (Hdt. 5. 66–73) and, reforming the Solonian institutions of 594 BC, he introduced a new form of popular government which was in fact arising in several Greek city-states at the time. The term *dēmokratia* can be traced back to c.470 (SEG 34. 199; Aesch. *Supp.* 604) and may go back to Cleisthenes' reforms of 508/7 (Hdt. 6. 131. 1). Cleisthenes' major reforms were to divide Attica into 139 municipalities (demes or *dēmoi*) which, in turn, were distributed among ten tribes (phylai). Citizen rights were linked to membership of a deme, and a council of 500 (*boulē*) was introduced, with 50 representatives from each of the ten tribes, and a fixed number of seats assigned to each of the demes (Ath. pol. 21. 2–6). Finally, to avoid a repeat of the power struggle of 510–507 Cleisthenes introduced *ostracism (ibid. 22. 1, 3–4).

During the next century the new democracy was buttressed by other reforms: in 501 command of the army and navy was transferred from the polemarch to a board of ten popularly elected generals (*stratēgoi*) (Ath. pol. 22. 2). In 487/6 the method of selection of the nine archons was changed from election to selection by lot from an elected shortlist (ibid. 22. 5). The politician Ephialtes' reforms of 462 deprived the council of the Areopagus of its political powers, which were divided between the assembly, the council of five hundred, and the popular courts (ibid. 25. 2). Shortly afterwards, on the initiative of Pericles, political pay was introduced for the popular courts (Arist. *Pol.* 1274^a8–9) and the council or *boulē* (*Inscriptiones Graecae* 1³. 82. 20), so that even poor citizens could exercise their political rights. Athenian citizenship became a much-coveted privilege, and in 451 Pericles had a law passed confining *citizenship to the legitimate sons of an Athenian mother as well as father (Ath. pol. 26. 4).

The defeats in the Peloponnesian War (431–404) resulted in a growing opposition to democracy and twice the antidemocratic factions succeeded for some months in establishing an *oligarchy, in 411 a moderate oligarchy led by the council of Four Hundred (Thuc. 8. 47–98, Ath. pol. 29–33) and in 404–3 a radical oligarchy under a junta which fully earned the name 'the Thirty Tyrants' (Xen. *Hell.* 2. 2–4; Ath. pol. 35–8; Diod. Sic. 14. 3. 7). In 403/2 democracy was restored in a modified form. Legislation (in 403) and all jurisdiction in political trials (in c.355) were transferred from the people in assembly to the panel of 6,000 jurors acting both as legislators (*nomothetai*) and judges (*dikastai*). In the 330s a kind of minister of finance was introduced (*ho epi tē dioikēsei*) (SEG 19. 119). He was elected for a four-year period and could be re-elected, and for twelve consecutive years the administration of Athens was entrusted to the politician Lycurgus (Hyp. fr. 139 Sauppe). These and other reforms were allegedly a return to the 'ancestral' or 'Solonian' democracy (Andoc. 1. 83; Aeschin. 3. 257), but the gradual and moderate transformation of the democratic institutions came to an abrupt end in 322/1 when the Macedonians after their victory in the Lamian War (323–322 BC) abolished the democracy and had it replaced by a 'Solonian' oligarchy (Diod. Sic. 18. 18. 4–5). During the Hellenistic age democracy in some form was restored several times i.e. in 318/7, 307–298(?), 287–103, and 88–85.

4. Tradition

Between 322 BC and c.AD 1850 Athenian democracy was almost forgotten, and, if mentioned, the focus was on the mythical 'Solonian democracy' known from *Plutarch's *Life of Solon* and *Aristotle's *Politics* (1273^b35–1274^a21). It was

not until c.1800, when history began to emerge as a scholarly discipline, that the Athenian democratic institutions were studied seriously and reconstructed, e.g. by August Böckh, from sources such as *Thucydides, Demosthenes, and inscriptions. And it was only from c.1850 that the new understanding of Classical Athenian democracy was connected, principally by George Grote, with a budding interest in democracy as a form of government, though now in the form of a 'representative' or 'parliamentary' democracy and no longer as an 'assembly' democracy in which power was exercised directly by the people.

MHH

RK 248). Her links with women, along with slaves (Festus 460. 33 ff. *Gloss. Lat.* 432) and asylum (Dion. Hal. *Ant. Rom.* 4. 26. 3), seem to inscribe her within the frame of her real field of action—namely, margins.

At Aricia she was associated with Egeria, and Virbius, an obscure male deity (Ov. *Met.* 15. 544; Servius on *Aen.* 7. 84 and 761). Identifications with foreign deities are common all over the west.

HJR/JSCh

dictator, an extraordinary supreme magistracy at Rome, used first in military, later in domestic crises.

In Latin cities we find the name 'dictator' given to a regular magistracy, but there is no evidence that this was ever Roman practice. As an emergency magistracy the dictatorship is found frequently in the annals of the Roman republic down to the end of the 3rd cent. BC; it was not used during the 2nd cent. but reappeared in a more powerful form, when granted to *Sulla and then *Caesar. Possible parallels are the Oscan (see ITALY) *med-dix tuticus* and the *Etruscan *zilath* or *purth*, but there is no reason to derive the Roman office from them. Although Quintus *Fabius Maximus Verrucosus is said to have been elected dictator in the centuriate assembly (*comitia centuriata*, Livy 22. 8), normally dictators were simply nominated in public by a magistrate with *imperium (*consul, praetor, or *interrex*) after authorization by the senate—for Sulla and Caesar the authorization was provided by a law. The dictator's function was either to command the army or to perform a specific task, such as holding elections or dealing with a sedition. His 24 licitors (attendants) indicated not so much a revival of the kingship, as *Appian *Bella civilia* 1. 98–9 suggests, as a concentration of the powers of the consuls. The dictator (who was also known as *magister populi*, master of the infantry, and had to get permission to mount a horse while in office) immediately appointed a cavalry commander (*magister equitum*) as his subordinate. Existing magistrates remained in office but were generally subordinate to him. Originally dictators resigned as soon as their task was completed, being permitted at most to remain in office for six months. They were therefore not appropriate for emergency overseas commands, and specially chosen proconsuls were used instead. Contrary to the

antiquarian tradition about the origin of the dictatorship, in the middle and later republic the dictator's actions were in theory exempt neither from veto by the *tribunes of the plebs (Livy 27. 6. 5) nor from *provocatio* (appeal to the Roman people) (Livy 8. 33. 8). Nor was he himself free from prosecution after leaving office (*CIL* 1². 583. 8–9). Although after 202 BC no short-term dictators were appointed, it appears that this was contemplated in 54/3 BC, and in 52, on the senate's advice, *Pompey was created sole consul instead (senators apparently feared he might abuse dictatorial power). Both Sulla and Caesar, when they were appointed to this office in order to lend constitutional form to their *de facto* supremacy, were given the task of restoring the constitution. Cicero portrays *Scipio Aemilianus dreaming that he would be appointed to a dictatorship with this function (*Rep.* 6. 12), and the anachronistic fiction suggests that in the 50s BC such a wide-ranging office was now acceptable to many of Cicero's readers. However, when Caesar was eventually appointed *dictator perpetuus*, this completely subverted the original notion of the dictatorship as an emergency office: it became a quasi-monarchy.

ANS-W/AWL

Dio (Cassius), historian. See CASSIUS DIO.

Dio of Prusa (Dio Cocceianus, later called Dio Chrysostom ('Golden-Mouthed')) (c.40/50–110/120 AD), Greek orator, writer, local politician and moralist, pursued a double career, as member of the governing élite of his home town of Prusa (mod. Bursa, NW Turkey) in Bithynia, and as public speaker and intellectual in pursuit of an international reputation. His oratorical ability took him at a relatively young age to the fringes of the Imperial court, where his contacts included the future Emperor *Nerva. Under *Domitian, another connection earned him a sentence of exile from Italy and Bithynia that was not rescinded until Nerva's accession in late 96. After his recall, Dio re-established himself at Prusa, and as an international speaker, making appearances in Tarsus and at *Olympia, as well as in the cities of Bithynia. *Pliny the Younger's letters to *Trajan (*Epp.* 10.81–2) show him still engaged in local wrangles in 109/10. How close a relationship with Trajan he himself enjoyed in his later career is debatable.

[continued on p. 240]

DEMOSTHENES

Demosthenes (384–322 BC), the greatest Athenian orator. When Demosthenes was 7 years old his father died, leaving the management of his estate to his brothers, Aphobus and Demophon, and a friend, Therippides. The trustees mismanaged the business, and Demosthenes at the age of 18 found himself almost without resources. He claimed his patrimony from his guardians, who spent three years in attempts to compromise. In the mean-time, he was studying rhetoric and legal procedure under *Isaeus and at 21 he brought a successful action against his guardians, but two more years elapsed before he received the remnants of the property. By now he was engaged in the profession of *logographos* (speech-writer) and the reputation gained in private cases led to his being employed as an assistant to prosecutors in public trials.

From 355/4 onwards he came more and more to devote himself to public business. It is not clear how far Demosthenes' sympathies were engaged in his first public trials, the prosecutions of the politicians Androtion and Leptines in 355 and of Androtion's associate, Timocrates, in 353: *Against Androtion* and *Against Timocrates* he wrote for a Diodorus, and in any case the political tendency of the trials is unsure; *Against Leptines* Demosthenes did deliver himself, and, since Leptines' law was defended by the politician Aristophon, it is possible that all three trials centred on his policy and that Demosthenes was one of his opponents. This would be consistent with the policy he supported in *On the Symmories* in 354/3: a rumour came that the king of Persia was preparing to attack Greece, as he had threatened to do in 356/5, and Demosthenes, arguing that the city was not properly prepared, opposed the advocates of war, certainly not the Eubulus group, possibly that of Aristophon. In 353/2 he turned on the politician Eubulus: *On the Syntaxis* seems directed partly against the allocation of surpluses to the *theōrika* (state grants to Athenian citizens to attend major festivals at the Theatre)—at § 30 he sneers about the public works of Eubulus—and partly against the policy of abstaining from all but essential military enterprises.

For the next few years Demosthenes was regularly on the losing side and of minor importance. Early in 352 in *For the Megalopolitans* he argued in favour of promising to support Arcadia, if Sparta carried out her plan of exploiting Thebes' preoccupation with the Third Sacred War: since Athens based her policy on concord with Phocis and *Sparta, the decision to do no more than give a guarantee to Messenia was probably right. A few months later Demosthenes wrote *Against Aristocrates* for use in the attack on a proposal to honour Charidemus in gratitude for his offices in the cession of the Chersonesus by Cersobleptes: the speech is notable both as a source of information about the law of homicide and also for the manner in which it regards Cersobleptes, not *Philip II of *Macedonia, as the real enemy in the north. Demosthenes did not yet see what was plain to those he opposed. In late 352 Philip's attack on Cersobleptes carried him very near the Chersonesus, and Demosthenes' eyes were opened. In 351 he delivered the *First Philippic* which pleaded for more vigorous prosecution of the war for Amphipolis: his proposals were not accepted; deeper involvement in the long fruitless struggle may have seemed to endanger the power to defend the vital areas of Thermopylae and Chersonesus. Late in 351 in *On the Liberty of the Rhodians* he urged support of the Rhodian *dēmos* against the oligarchs supported by the Carian dynasty (see RHODES): but the Persian attack on Egypt prompted caution, and Demosthenes' arguments were far from strong. In mid-349 Olynthus (Chalcidice), which had by then lapsed from Philip's alliance, was attacked by Philip and appealed to Athens for help: in the three *Olynthiacs*, delivered in quick succession, Demosthenes demanded the fullest support and, in the last, an end to the law assigning surpluses to the *theōrika*; again he scathingly alluded to the works of Eubulus. There is, however, no reason to suppose that the three expeditions voted were not supported by Eubulus or indeed that they satisfied Demosthenes, and the implementation of his proposals might have brought even greater disaster than the loss of Olynthus. Early in 348 the party of Eubulus involved the city in a costly and inconclusive intervention in Euboea to prevent the island falling into the control of those hostile to Athens: Demosthenes later claimed to have been alone in opposing the expedition; either he was not truthful or he had taken a curious view of Athens' interests. One consequence of his opposition to Eubulus was that he became embroiled in an absurd wrangle with Midias, a prominent supporter of Eubulus, who had slapped his face at the Dionysia of 348: the case was settled out of court and the speech *Against Midias* was never delivered.

In mid-348, before the fall of Olynthus, Demosthenes successfully defended Philocrates when he was indicted under the *graphē paranomōn* for his proposal to open negotiations with Philip, and in 347/6, when Demosthenes like

*Aeschines was a member of the *boulē*, the partnership continued and Demosthenes played a leading part in securing acceptance of the Peace of Philocrates. On the two embassies to Macedon he cut a poor figure before Philip and got on badly with his fellow ambassadors, but the decisive moment came after the second embassy's return when in the assembly on 16 Scirophorion, it was known that Philip had occupied the Gates of Thermopylae and that Phocis could not be saved. Demosthenes was shouted down and Aeschines made the speech to which Demosthenes constantly recurred. What Demosthenes wanted that day is not clear: if he did want the city to denounce the new Peace, to march out to support Phocis attacked by the Macedonians and Thessalians from the north and the Thebans from the south, his judgement was seriously awry. From that day Demosthenes determined to undo the Peace. Shortly after, however, in *On the Peace* he counselled caution, and for the moment contented himself with the attack on Aeschines from which he was forced to desist by the successful countercharge against his own associate, Timarchus.

The year 344 brought Demosthenes his opportunity to attack the Peace. Rumours reached Athens that Philip was preparing to intervene in the Peloponnese in support of Argos and Messene, and Demosthenes went on an embassy to those cities to warn them of the dangers of consorting with Philip: Philip protested, and shortly after Demosthenes' return the embassy of Python and all Philip's allies protested against his misrepresentations, and offered to turn the Peace into a Common Peace (i.e. applicable to all cities); first reactions were favourable, but in the assembly Hegesippus succeeded in having the status of Amphipolis referred to Philip—an oblique way of sabotaging the whole affair—while Demosthenes' contribution was the *Second Philippic* in which he denounced Philip as not worth an attempt at negotiation. (The alternative reconstruction would deny this conjunction and put Python's embassy in early 343.) In mid-343, after the success of Hyperides' prosecution of Philocrates, Demosthenes judged the moment suitable to resume his attack on Aeschines; *On the False Embassy* sought to exploit the support of Eubulus' party for continuing the Peace and to suggest that Aeschines was really responsible for Philip's use of the peace negotiations to intervene in Phocis in 346. With the support of Eubulus and Phocion, Aeschines was acquitted by a narrow margin.

With the final collapse in early 342 of proposals to amend the Peace, Philip either began to intervene directly in Greece or was represented by Demosthenes as so doing, and amidst mounting hostility to Macedon Demosthenes went on an embassy to the Peloponnese to set about the organization of an Hellenic alliance for the war he was determined to have. For the moment his efforts came to little, but in 341 in *On the Chersonese* and shortly after, in the *Third Philippic*, he defended the aggressive actions of Diopieithes against Cardia in the NE Aegean by arguing that, since Philip's actions already amounted to war, it was absurd to heed the letter of the Peace. Not long after, he delivered the *Fourth Philippic* (of which the authenticity was long doubted but is now widely accepted); in it Demosthenes appears so confident of his control that he dismissed the notion of harm being done by the theoretic distributions in words inconceivable in 349, and he successfully demanded an appeal to Persia to join in attacking Philip. In 341/0 he also formed an alliance with *Byzantium, and by autumn 340, when Philip finally declared war and seized the Athenian corn fleet, Demosthenes was in full charge of the war he had sought, though he was unable to restrain Aeschines from his unwise intrusion at Delphi into the rivalries of central Greece (see AESCHINES). In mid-339 he moved the suspension of the allocation of surpluses to the *theōrika*, and with Thebes unlikely to side with Philip after having expelled the Macedonian garrison from the Gates, Demosthenes could expect not to have to face Philip in Greece. The sudden seizure of Elatea in Phocis threw Athens into horrified perplexity, but Demosthenes proposed and effected alliance with Thebes, which he later pretended always to have wanted, and Athens and Thebes fought side by side at Chaeronea in autumn 338.

Demosthenes was present at the battle, and returned so quickly to organize the city's defences that Aeschines could accuse him of running away. He provided corn, repaired the walls, and was so much the man of the hour that he was chosen to deliver the Funeral Oration for 338. With Philip in Greece, the people looked to Demosthenes and he successfully met the frequent attacks on him in the courts. In 337/6 he was theoretic commissioner, and Ctesiphon proposed that he be crowned at the Dionysia for his constant service to the city's best interests: perhaps encouraged by the opening of the Macedonian attack on Persia, Aeschines indicted Ctesiphon, but with the changing events of the next few months he preferred for the moment to let the case lapse. Demosthenes, hoping that the death of Philip was the end of Macedonian domination in Greece, sought to foment troubles for his successor, but *Alexander the Great quickly marched south and Demosthenes had to accept the new monarch. In 335 Demosthenes actively aided the Thebans in their revolt and narrowly escaped being surrendered to Alexander. From then on he seems to have looked to Persia to accomplish the liberation of Greece: such at any rate seems to be the meaning of the many charges of receiving money from the Persians. Demosthenes gave no support to the Spartan king Agis III at any stage and, when Persia was crushed at Gaugamela (331) and the revolt of Agis collapsed, Athens was left in disastrous isolation. Aeschines seized the opportunity to renew his attack on Demosthenes through Ctesiphon. The case was heard in

mid-330, and Demosthenes defended his acts in *On the Crown*, which is his masterpiece. He declined to fall into the trap of discussing recent events and with supreme art interspersed his discussion of events long past with lofty assertions of principle. Fewer than one-fifth of the jury voted for Aeschines, and he retired to Rhodes. Demosthenes was left in triumph, and the city settled down to acceptance of Macedonian rule, until in 324 word reached Greece that at the coming Olympian Games Alexander's emissary Nicanor was to make public a rescript ordering the restoration of exiles. Since this would affect the Athenian cleruchy (citizen colony) on *Samos, an agitation began which was to end in the Lamian War (323–322 BC). Demosthenes led a deputation as *architheōros* to protest. Subsequently he engaged in the discussion at Athens about divine honours (*see* RULER-CULT) for Alexander, having also taken the lead in dealing with the sudden appearance of Alexander's fugitive treasurer Harpalus by proposing first that Harpalus be kept prisoner and his money stored on the Acropolis, and later that the Areopagus investigate the losses. It is difficult to assess Demosthenes' policy in this year: he may have foreseen the new uprising under Leosthenes and planned to involve Athens, but, since the especial ally of Leosthenes was Hyperides, who led the attack on Demosthenes in the prosecution of early 323, Demosthenes appears to have been at odds with the war-party. Equally unsure is his guilt in the Harpalus trial: the Areopagus declared him guilty of appropriating 20 talents, and he was found guilty and fined 50 talents, but, even if he did take the money, he may have intended to use it in service of the state; the whole affair is most obscure. He retired into exile, and lent his support to Hyperides in the creation of the alliance for the Lamian War. He was then recalled to Athens, but after the Macedonian victory at Crannon in 322 he left the city again, and was condemned to death by the decree of Demades. Pursued by the agents of Antipater, he committed suicide in Calauria (*mod. Poros*) (322).

Modern opinions of Demosthenes' political importance have varied greatly, often in discernible relation to contemporary events. He has been lauded as a solitary champion of liberty and censured as the absurd opponent of progress. With the latter view English scholars have, happily, had little sympathy, but the high esteem in which the works of Demosthenes have been rightly held as works of art has tended to obscure the possibility that, while his devotion to liberty is one of the supreme monuments of liberty, his methods and his policies were not the best suited to attain their end, and that those of his opponents, which we must largely infer from his attacks, were no less directed to maintaining the city's power and independence, and perhaps more apt.

Demosthenes has much to say about Philip's success being due to *bribery and was convinced that his own opponents had been corrupted, but in his obsession with this dubitable view he seems blind to the real problem of his day, which was how Greece could be united to counter effectively the military power of the new national state so far greater than the power of any single city-state. There was much to be said against Demosthenes' determination to involve the full military resources of Athens in a war in the north, in particular that in such a war Athens stood to gain most and the other Greeks would not unite for that result. For the defence of Greece itself against invasion there was a real hope of uniting the cities in a Common Peace, and this appears to have been the policy of Demosthenes' opponents. There was perhaps more enthusiasm than judgement in his military assessments, and since the defeat of Chaeronea appears to have produced a Greece that could never wholeheartedly unite in a war of liberation, it is possible that, if such a decisive battle was inevitable, his opponents might have united Greece for it more effectively. But the situation of Greece was tragic, and Demosthenes was certainly of heroic stature.

Private lawcourt speeches

(*dikai*). The series of private speeches begins with those against Aphobus and Onetor (363–362), in which Demosthenes claimed recovery of his property from his guardians, and continues throughout his life (*Against Dionysodorus*, 323–322). Several private speeches attributed (perhaps wrongly) to Demosthenes were delivered on behalf of the Apollodorus who was his opponent in the *For Phormion*. The speech *For Phormion* (350) and the first *Against Stephanus* (349; the second *Stephanus* is undoubtedly spurious) raise a question of professional morality. Pasion, the banker, appointed his chief clerk Phormion trustee for his sons; the elder son, Apollodorus, subsequently claimed a sum of money allegedly due to him, but Phormion proved that the claim had been settled some years previously. Apollodorus then prosecuted Stephanus, one of Phormion's witnesses, for perjury. If, as *Plutarch states, Demosthenes wrote *Stephanus A* as well as *For Phormion*, he was guilty of a serious breach of faith, for while the earlier speech extols Phormion's character, the later one contains insinuations against him. The evidence for the authenticity of *Stephanus A* is, however, inconclusive (cf. L. Pearson, *Antichthon* (1969), 18–26). Aeschines asserts that Demosthenes showed to Apollodorus a speech composed for Phormion, but this may be a misrepresentation of some attempt by Demosthenes to act as mediator.

The subjects of the private speeches include guardianship, inheritance, claims for payment, maritime loans, mining rights, forgery, trespass, assault, etc. In the *Callicles* (which has flashes of humour, seldom found in Demosthenes) the plaintiff alleges that the defendant has flooded his land by blocking a watercourse; in the *Conon*, a brilliant piece of writing, combining Lysianic grace (see *LYSIAS*) and Demosthenic force, some dissolute young rowdies and their father are summoned for assault.

Demosthenes had many rivals in his lifetime; but later critics considered him the greatest of the orators. His claim to greatness rests on his singleness of purpose, his sincerity, and his lucid and convincing exposition of his argument. In many instances he produces a great effect by the use of a few ordinary words. In his most solemn moments his style is at its plainest and his language most moderate. A master of metaphor, he uses it sparingly, and hardly at all in his most impressive passages. His style varies infinitely according to circumstances; sometimes as simple as *Lysias, now polished like *Isocrates, again almost as involved as *Thucydides, he follows no scholastic rule; long and short periods follow each other, or are mingled with passages in the running style not according to any regular system. Thus his carefully prepared utterances give an impression of spontaneity. Such was his control of language that he was generally able to avoid hiatus without any dislocation of the order of words. He had an instinctive aversion to a succession of short syllables, and even tribrachs are of comparatively rare occurrence. GLC

Dio's works are divided by the manuscript tradition into (i) the *Kingship* and *Diogenic Orations* (1-6, 8-10); (ii) the major city orations (7, 11-13, 31-6); (iii) the local-political orations delivered in Bithynia, principally in Prusa (38-51); and (iv) a collection of largely moral-philosophical addresses, essays, dialogues and excerpts (14-30, 52-80). Other oratorical pieces (e.g. *Against the Philosophers*, *Encomium of a Parrot*) and a work *On the Goths* (*Getica*) are attested but now lost. This range makes Dio a hugely valuable source for many aspects of the culture of his times, from local city politics to the history of literary taste, via the diffusion and uptake of philosophical thinking about kingship, social harmony, the good community, and personal values in the later first and early second centuries AD.

How he himself is best characterized has been controversial since antiquity. For Philostratus (*VS* 1.7) he was an example of a philosopher with a name also for sophistic (i.e. epideictic rhetorical) virtuosity. Synesius, building on the image projected by Dio himself in his later (post-exilic) work, saw him as a mid-career convert from irresponsible sophist to weighty philosopher (*Dion* 1). A notable strand in modern scholarship has highlighted his use of the figure of Diogenes, and given him an important place in the history of Cynicism (see *CYNICS*). His doctrinal affinities are in fact fundamentally Stoic (see *STOICISM*), conveyed in forms and styles that owe much to Platonic dialogue and other early Socratic writing. Ultimately, neither 'sophist' nor 'philosopher' seems exactly the right way to describe Dio at any stage of his career, and this may be due to deliberate effort on his own part to avoid easy characterization as either. His subsequent high reputation in later antiquity and the Byzantine period rested both on his achieve-

ment as a prose stylist ('Golden-Mouthed') and on his morally improving content. MBT

Diocletian (Gaius Aurelius Valerius Diocletianus), originally named Diocles. Of obscure origins, born in Dalmatia perhaps in the early 240s AD, he rose to command the *domestici* (bodyguard) of the emperor Numerianus on the Persian campaign of 283-4. When Numerianus was killed by his praetorian prefect Aper, the army proclaimed Diocles Augustus at Nicomedia (20 November 284); he killed Aper. He campaigned (285) against Numerianus' brother Carinus, who was killed at Margus. A usurper Iulianus was also removed, and Diocletian was sole emperor. Visiting Italy, he proclaimed his comrade-in-arms Maximian as Caesar and sent him to suppress the Bacaudae. Maximian was made Augustus (286) and spent the next years defending Gaul. Diocletian spent most of his reign on the Danube or in the east. In 287 he installed Tiridates III as king of Armenia and reorganized the Syrian frontier. He campaigned on the Raetian frontier (288); he fought the Sarmatians (285 or 289), and the Saracens (290).

But the problems of the empire remained serious. On 1 March 293 he established the 'tetrarchy'. To the two Augusti, now known as Iovius and Herculius respectively to emphasize their quasi-divine authority, were added Caesars, Constantius and Galerius; these were adopted into the Jovian or Herculian houses by the marriage of Galerius to Diocletian's daughter Valeria and of Constantius to Maximian's (?step-)daughter Theodora. The arrangement would provide an imperial presence in different areas; it might deter usurpers; and the Caesars might become acceptable to the armies and live to succeed as Augusti (but it is most unlikely that the Augusti had yet

planned to abdicate). To raise the dignity of the imperial office Diocletian adopted an oriental court ceremonial (*adoratio*) and seclusion. Each tetrarch had his own staff (*comitatus*), and was often on the move in his territory, though Nicomedia, Trier (Augusta Treverorum), and Sirmium (on the Sava river in Pannonia (Inferior)) often provided an imperial residence; Rome was of lesser importance. In practice the empire was divided into two; Maximian and Constantius ruled the west, Diocletian and Galerius the east. Diocletian employed Galerius in Oriens until 299, thereafter on the Danube. Diocletian defeated the Sarmatians (294) and campaigned against the Carpi (296); many Bastarnae (a German tribe) and Carpi were settled on Roman soil. In Egypt a revolt broke out (297) under Domitianus and Aurelius Achilleus; present in person, Diocletian suppressed this after a long siege of *Alexandria, reorganized the administration of *Egypt, and negotiated with the Nobatae on the extreme southern frontier (298). Meanwhile he had sent Galerius to deal with the situation on the Syrian frontier: the Persian king Narses had expelled Tiridates from Armenia. Though defeated in his first campaign, Galerius won a total victory (298) and added significant territories to the empire. Campaigning by Constantius continued on the Rhine, but from 298 there was a general lull in rebellions and wars; tetrarchic authority was secure.

Diocletian pursued systematically a long-established policy of dividing provinces into smaller units; by 314 there were about 100, twice the number of a century earlier (see *PROVINCIA*). The purpose was to ensure closer supervision, particularly over law and finance, by governors and their numerous staffs; critics saw it as leading to never-ending condemnations and confiscations. All provinces were governed by equestrian *praesides* except Asia and Africa (by senatorial proconsuls) and the divisions of Italy (by senatorial officials called *correctores*). To oversee the *praesides*, Diocletian grouped the provinces into twelve new 'dioceses', each under a new equestrian official, the *vicarius* or 'deputy' of the praetorian prefects. In the later part of his reign, Diocletian began an important reform, separating military from civil power in frontier provinces; groups of provincial armies were put under the command of *duces* ('dukes'), so that *praesides* were left with civilian duties only. Senators remained excluded from military commands. His conception of defence was conservative; he made little or no effort to increase the size of the élite field army (*comitatus*), which had been formed in the late 3rd cent. But a huge programme of building and reconstruction of defensive works was undertaken on all frontiers, and these were to be held by sheer force of numbers; the size of the Roman army was perhaps nearly doubled.

The army and the increase of administrative personnel were a heavy financial burden. Diocletian reformed the system of taxation to take inflation into account and to regularize exactions in kind. Taxation was now based on the *iugum*, a new concept, a unit of land calculated from its productivity as much as by its area, and on the *caput*, the unit of human resource. Most revenue and expenditure was now in kind; every year an assessment of all levies payable on each fiscal unit was declared (*indictio*) by the praetorian prefects. By the Currency Edict (301) Diocletian attempted to create a unified currency, doubling the value of at least some coins and decreeing that the retariffed currency be used both for paying debts to the *fiscus* (central imperial treasury) and in private contracts. But he could not establish confidence in this revaluation. Late in 301 he tried to halt inflation by the Price Edict. In great detail this fixed maximum prices and wages; despite savage penalties it became a dead letter, as goods disappeared from the market.

Many legal decisions show Diocletian's concern to maintain or resuscitate Roman law in the provinces. He was an enthusiast for what he understood of Roman tradition and discipline, to reinforce imperial unity: hence he decreed the suppression of the theosophical sect known as the Manichees. This policy forms the backdrop to the persecution of Christians, undertaken possibly on the insistence of Galerius. (See *CHRISTIANITY*.) Earlier attempts had been made to purge the court and the army, but the first persecuting edict, issued at Nicomedia (23 February 303), was designed to prevent the Church from functioning, by requiring the burning of Scriptures and the demolition of churches, and the banning of meetings for worship; recusants were deprived of any rank, and thus made liable to torture and summary execution and prevented from taking action in court; imperial freedmen were re-enslaved. In Gaul and Britain Constantius contented himself with demolishing churches, and the later edicts were not promulgated outside the areas controlled by Diocletian and Galerius. The second edict imprisoned all clergy; the third released them, but they were to sacrifice first. The fourth edict ordered a universal sacrifice, but implementation was patchy, most severe it seems in Palestine and Egypt.

Late in 303 Diocletian visited Rome for the only time, to celebrate with Maximian his *vicennalia* (the 20th anniversary of his accession). A collapse in health caused him to return to Nicomedia, where on 1 May 305 he abdicated (Maximian reluctantly did the same at Milan), leaving Constantius and Galerius as Augusti, with Flavius Valerius Severus and Gaius Galerius Valerius Maximinus as Caesars. He attended Galerius' conference at Carnuntum (308) but refused to reassume the purple and spent his

last years at Saloniae (mod. Split); remains of the palace he built survive. He died about 312. His wife Prisca and only child Valeria were exiled by Maximinus and beheaded by Valerius Licinianus Licinius. Diocletian's genius was as an organizer; his measures did much to preserve the empire in the 4th cent., and many lasted much longer in the east. The co-operation between rival emperors broke down when Diocletian's personality was removed, but for most of the 4th cent. more than one emperor was the rule. His reforms were completed by *Constantine I, who introduced further innovations, most notably in the army and in religion. RPD

Diodorus (Diodorus Siculus) of Agyrium, *Sicily (hence *Siculus*), is the author of the *Bibliothēkē* ('Library'), a universal history from mythological times to 60 BC. Only 15 of the original 40 books survive fully (bks. 1–5; 11–20); the others are preserved in fragments. Despite his claim to cover all of known history, Diodorus concentrates on Greece and his homeland of Sicily, until the First Punic War (264–241 BC), when his sources for Rome become fuller. But even in its fragmentary state, the *Bibliothēkē* is the most extensively preserved history by a Greek author from antiquity. For the period from the accession of *Philip II of Macedon to the battle of Ipsus (301 BC), when the text becomes fragmentary, it is fundamental; and it is the essential source for classical Sicilian history and the Sicilian slave rebellions of the 2nd cent. BC. For many individual events throughout Graeco-Roman history, the *Bibliothēkē* also sheds important light.

Diodorus probably visited *Egypt c.60–56 BC, where he began researching his history. By 56, he may have settled in Rome, completing the *Bibliothēkē* there around 30. He read Latin and had access to written materials in Rome, but, despite his admiration for *Caesar, there is no evidence that he personally knew Romans of prominence. Diodorus originally intended to cover events to 46; perhaps the dangers of writing contemporary history of a turbulent period influenced his decision to conclude with the year 60.

Books 1–6 include the geography and ethnography of the *oikoumenē* ('inhabited world') and its mythology and paradoxology (descriptions of marvels) prior to the Trojan War; bks. 1–3 cover the east, bks. 4–6 the west. Of special significance are the description of Egypt in bk. 1, drawn from Hecataeus of Abdera; the discussion of *India in bk. 2, drawn from Megasthenes; passages from the works of Agatharchides in bk. 3; and the highly fragmentary material in bk. 6, derived from Euhemerus of Messene.

The fully preserved historical books cover 480–302 and are organized annalistically, with Olympian, Athenian

archon, and Roman consular years synchronized—often erroneously. The fragmentary final books, which draw on Posidonius, are probably organized episodically. Occasionally including the same incidents from different authorities or failing to understand the organizational habits of an individual author, Diodorus created numerous, sometimes serious doublets.

The main source for most of the narrative of the Greek mainland is *Ephorus; *Hieronymus of Cardia is the prime authority for the outstanding narrative of the Diadochi (*Alexander the Great's successors). Sicily receives important attention, in which Diodorus employs *Timaeus extensively. For much of the later Roman period, Diodorus follows *Polybius closely, as the preserved Polybian text shows; he employs Posidonius for many events after 146. But the 19th-cent. belief that all of Diodorus' sources could be identified proved over-confident and attempts to make such identifications continue to provoke great controversy. Further, because few of his sources survive outside his own work, precisely what Diodorus has taken verbatim, what he has confused and entered in error, and what he has consciously interpolated are matters of great dispute. It appears at least that certain themes recur throughout the *Bibliothēkē* independently of Diodorus' current source. Character assessments, with a strong insistence on personal and collective morality, and an emphasis on the civilizing power of individual benefactors suggest late Hellenistic influence and therefore Diodorus' own philosophy. KSS

diolkos, stone trackway across the isthmus of Corinth, for transporting ships and/or cargoes between the Saronic and the Corinthian gulfs. Archaeology suggests a date under the tyrant Periander (c.627–587 BC); there is literary evidence that he considered a canal. Wheeled wagons (see TRANSPORT, WHEELED) ran in carved grooves c.1.5 m. (5 ft.) apart; traffic probably moved in one direction at a time. *Triremes used it during the Peloponnesian War (431–404 BC), perhaps after modifications; but it was probably constructed for merchant vessels. It may quickly have become incapable of transporting most vessels fully laden, so that cargoes alone were carried. It was used by a fleet as late as AD 883. JBS

Dionysius I, born c.430 BC, son of Hermocritus, a well-to-do Syracusan; wounded (408) in Hermocrates' attempted coup; secretary to the generals (406), he distinguished himself in the Acragas (mod. Agrigento) campaign. By unscrupulous demagoguery he secured the dismissal of the generals and his own election as general plenipotentiary (a title he may have used until 392),

diolkos View of the *diolkos*, the stone haulway across the isthmus of Corinth probably built c.600 BC. Its chief aim was probably to levy dues on *trade, especially the long-distance seaborne commerce between the Aegean and Italy and the west. From Ralf Krumeich, 'Porträts und Historienbilder der klassischen Zeit', in *AM* 71 (1956) 209–240, fig. 5. © WBG Darmstadt.

obtained a bodyguard, occupied and fortified the citadel (Ortygia), and assumed control of the state. With a large allied army, he failed to raise the siege of Gela (405), but crushed a revolt of the aristocracy (confiscating their properties), and concluded the Peace of Himilco, which stripped Syracuse of her possessions. Besieged in Ortygia by the rebellious Syracusans (404–3), he came to terms with them (less the exiled aristocracy), giving them, although disarmed, a measure of autonomy. After subjugating eastern Sicily (south of Messina (mod. Messina)) with a mercenary army (402–399), he prepared for war with *Carthage, fortifying Epipolae, amassing war-material, building a huge fleet, rearming the Syracusans, hiring mercenaries, and forming matrimonial alliances with Syracuse (Andromache, sister of his father-in-law Dion) and Locri Epizephyrii (Doris). He invaded the Carthaginian province (397) and stormed Motya (Mozia), but (396) retired before Himilco to Syracuse; here, following the defeat of his navy off Catania (Catania), he was besieged until 395, when, with some Corinthian and Spartan aid,

he overthrew Himilco's plague-stricken forces. He restored his east Sicilian empire (incorporating Messina), attacked Rhegium (Reggio) and countered a new Carthaginian threat (395–2); but when the Syracusan army mutinied, he concluded a peace with Carthage (392) that recognized his suzerainty of eastern Sicily. He again attacked Rhegium (390) and starved it into surrender (387), allied himself with the Lucanians (mod. Basilicata), crushed the forces of the Italiot League on the Eleporus (Galliparo) (389), and incorporated Iapygia (southern Calabria) in his empire. The year 388 (or 384) witnessed the fiasco of Dionysius' attempt to compete at *Olympia. In 387 he helped Sparta to impose the King's Peace on Greece; and in 386 a palace conspiracy (probably) led to the banishment of some of his courtiers, including his brother Leptines (later recalled) and the historian Philistus. To improve his supply of silver, timber, horses, and mercenaries, he extended his power into the Adriatic, founding colonies and establishing friendly relations with the Senones. He raided Pyrgi (384), the port of Caere (mod. Cerveteri). The chronology and details of his greatest war (383–probably 375), against the Italiots and allied Carthage, are unclear, owing to a failure in the transmission of *Diodorus' text (15.15–17, 24). Attacking Thurii, he lost his fleet in a storm, but he gained Croton. In Sicily he routed the Carthaginians at Cabala but was totally defeated at Cronium (Leptines was killed), and made a peace that established the Halycus (Platani) as the common frontier. He sent expeditions to Greece (369, 368), to assist Sparta against the Boeotians; and Athens, hitherto hostile, voted him a crown and (368) conferred her citizenship on him and his sons. He again invaded western Sicily (368) and besieged Lilybaeum (Marsala), but his fleet was captured at Drepana (Trapani) and he concluded an armistice. At the Lenaea at Athens in 367 his play, *The Ransom of Hector*, won the prize, and a mutual defence treaty was negotiated, whose ratification was perhaps prevented by his death.

Dionysius, who probably styled himself *archōn* (ruler) of Sicily, was a born leader of men, in peace and war; orator and diplomat, planner and administrator, patron of religion, of his native city, of literature and the arts, a dramatist perhaps no worse than the generality in an age of decline—above all, the greatest soldier that, apart from the Macedonians, ancient Greece produced. He applied his mind to warfare, introducing *artillery, Phoenician siege-technique, and the quinquereme (warship rowed by oarsmen grouped in fives). He could handle large *mercenary armies and small light-infantry detachments; he appreciated the importance of reconnaissance. If his subordinates had not constantly let him down, he might well have achieved his life's ambition, to drive the Carthaginians from Sicily. Dionysius represents the irruption onto

the historical scene of the new individualism of his age. Portrayed by the anecdotal tradition, above all by the *Academy, as the archetypal tyrant—paranoid, oppressive, obsessed with power—he looms through the historical tradition (Diodorus and Polyaeus), going back through *Ephorus and *Timaeus to Philistus) rather as the first of the Romantic ‘great men’; the precursor of *Alexander the Great, *Hannibal, and Napoleon: obsessed not with power but with glory. BMC

Dionysius of Halicarnassus, Greek critic and historian, lived and taught *rhetoric at Rome, arriving ‘at the time *Augustus put an end to the civil war’, and publishing the first part of his *Roman Antiquities* (*Rhōmaikē archaiologia*) 22 years later (*Ant. Rom.* 1. 7). This great work was in twenty books, going down to the outbreak of the First Punic War; we have the first eleven (to 441 BC), with excerpts from the others. Dionysius used the legends of Rome’s origins to demonstrate that it was really a Greek city, and his whole history is an erudite panegyric of Roman virtues. It is also very rhetorical, abounding in long speeches. He doubtless thought of it as exemplifying his literary teaching, which was directed towards restoring Classical prose after what he saw as the aberrations of the Hellenistic period. The treatises in which he developed this programme seem mostly to have been written before the *Antiquities*, though their chronology is much disputed. These are: (1) *On imitation* (*Peri mimēseōs*), in three books, of which only fragments survive; the judgements on individual authors coincide largely with those in *Quintilian *Inst.* 10. 1; (2) a series of discussions of individual orators (*Lysias, *Isocrates, *Isaeus, *Demosthenes), prefaced by a programmatic statement of distaste for ‘Asiatic’ rhetoric, hope for an ‘Attic’ revival, and the writer’s consciousness that this happy change is due to the good taste of the Roman governing class; (3) a group of occasional works: *On Dinarchus*, *On *Thucydides* (important), two letters to Ammaeus (one on Demosthenes’ alleged indebtedness to *Aristotle, the other on Thucydides), and a letter to Gnaeus Pompeius on *Plato, of whose ‘dithyrambic’ style Dionysius was very critical; (4) *On Arrangement of Words* (*De compositione verborum, Peri suntheseōs onomatōn*), the only surviving ancient treatise on this subject, full of interesting observations on euphony and onomatopoeic effects (note especially ch. 20, on *Odyssey* 11. 593–6); this was a fairly late work, but the second part of *Demosthenes* (35 ff.) presupposes it.

For all the traditional terminology and character of Dionysius’ criticism—he frequently gives the impression of ‘awarding marks’ for good qualities narrowly and unimaginatively defined—he is an acute and sensitive styl-

istic critic, whose insights deserve attention; and he understood the importance of linking historical study (e.g. on questions of authenticity) with the purely rhetorical and aesthetic. DAR

Dionysus (Linear B Diwonosos), is the twice-born son of *Zeus and Semele. His birth alone sets him apart. Snatched prematurely from the womb of his dying mother and carried to term by his father, he was born from the paternal thigh. Perceived as both man and animal, male and effeminate, youthful as well as mature, he is the most versatile and elusive of all Greek gods. His myths and cults are often violent and bizarre, a threat to the established social order. He represents an enchanted world filled with extraordinary experiences. Always on the move, he is the most epiphanic god, riding felines, sailing the sea, and even wearing wings. His most common cult name was *Bakch(e)ios* or *Bakchos*, after which his ecstatic followers were called *bakchoi* and *bakchai*. Adopted by the Romans as *Bacchus*, he was identified with the Italian Liber Pater. While modern scholars inevitably regard Dionysus as a construct of the Greek imagination, in the eyes of his ancient worshippers he was a god—immortal, powerful, and self-revelatory.

Throughout antiquity, he was first and foremost the god of *wine and intoxication. His other provinces include ritual madness or *ecstasy (*mania*); the mask, impersonation, and the fictional world of the theatre; and, almost antonymically, the mysterious realm of the dead and the expectation of an after-life blessed with the joys of Dionysus. If these four provinces share anything in common that reflects the nature of this god, it is his capacity to transcend existential boundaries. Exceptionally among Greek gods, Dionysus often merges with the various functions he stands for and thus serves as a role model for his human worshippers. In the Greek imagination, the god whose myths and rituals subvert the normal/social identities of his followers himself adopts a fluid persona based on illusion, transformation, and the simultaneous presence of opposite traits. Both ‘most terrible and most sweet to mortals’ in Attic tragedy (Eur. *Bacch.* 861), he was called ‘Eater of Raw Flesh’ (*Ōmēstēs*) on *Lesbos as well as ‘Mild’ (*Meilichios*) on Naxos in actual cult (Alc. fr. 129.9 L.-P., P. Oxy. 53.3711; *FGrHist* 499 F 4).

The name Dionysus appears for the first time on three fragmentary Linear B tablets from Mycenaean Pylos (W Peloponnese) and Khania (*Crete) dated to c.1250 BC. The tablets confirm his status as a divinity, but beyond that they reveal little about his identity and function in Mycenaean religion. One of the Pylos tablets may point to a tenuous connection between Dionysus and

wine; on the Khania tablet, Zeus and Dionysus are mentioned in consecutive lines as joint recipients of libations of honey. However, thus far no physical remains of his cult have been identified with absolute certainty. A Dionysiac connection has been claimed for several archaeological finds. The most spectacular is the discovery in the early 1960s of a large number of terracotta statues in a Late Cycladic shrine at Ayia Irini on Ceos (mod. Kea). Tentatively dated to 1500–1300 BC, these fragmentary, nearly life-sized figures represent mature women who stand or, perhaps, dance. A much later deposit of Attic drinking-vessels was found in the same room; among them is a scyphus of c. 500 BC inscribed with a dedication to Dionysus by Anthippus of Iulis (*SEG* 25.960). According to the excavators, the temple was in continuous use from the 15th to the 4th cent. BC. This remarkable find does not prove, however, that Dionysus was worshipped on the site before the Archaic period, let alone continuously from the bronze age to the classical period. Given the prominence of women in Minoan (i.e. bronze age Cretan) religion generally, it is equally far-fetched to identify these figures as Dionysus' female attendants, whether nymphs (young female divinities), nurses, or *maenads. Yet it is striking that typical features of Dionysus and his religion—including wine and ivy; divine epiphanies and ecstatic forms of worship; women dancing, handling snakes, or holding flowers; the divine child surrounded by nurturing females; and bulls with and without anthropomorphic features—are all prominent in Aegean, especially Cretan religion and art. The earliest Dionysus may indeed be sought in the culture of Minoan Crete.

If we had more information on the bronze age Dionysus, he would probably turn out to be a complex figure with a substantial non-Greek or Mediterranean component. Absolute 'Greekness' is a quality that few, if any, Greek gods can claim. This is especially true of their names. If Dionysus signifies '†nyssos (son?) of Zeus', as some linguists believe, the god's name would be half Greek and half non-Greek (not Thracian however, as its occurrence in Linear B demonstrates). But such etymological neatness is just as improbable as a divine name derived from the god's genealogy. Hardly more plausible is the derivation from *nysai*, the dubious designation for three nymph-like figures on a vase fragment by Sophilos (Beazley, *ABV* 39.15). Attempts to derive the name Semele from Phrygian, *bakchos* from Lydian or *Phoenician, and *thyrsos*—the leafy branch or wand carried by the god and his followers—from Hittite (see *ASIA MINOR*), though highly speculative, reflect the wide spectrum of potential cross-cultural contacts that may have influenced the early formation of Dionysus and his cult.

In Archaic epic, Dionysus is referred to as a 'joy for mortals' (*Il.* 14.325) and 'he of many delights' (*Hes. Th.* 941). The source of all this pleasure is wine, the god's ambivalent 'gift' (*Hes. Op.* 614) which brings both 'joy and burden' (*Hes. fr.* 239.1). Dionysus 'invented' wine, just as *Demeter discovered *agriculture (*Eur. Bacch.* 274–83). By a common metonymy, the wine-god is also synonymous with his drink and is himself 'poured out' to other gods as a ritual liquid (*Bacch.* 284). Libations (liquid offerings) of mixed or, occasionally, unmixed wine normally accompanied animal *sacrifice; wineless libations were the exception. In vase-painting, Dionysus is never far from the wine. Surrounded by cavorting *satyrs and silens, nymphs, or maenads he presides over the vintage and the successive stages of wine-making on numerous black-figure vases. Holding in one hand a grapevine and in the other one of his favourite drinking vessels, either a cantharus or a rhyton, he is often depicted receiving wine from a male or female cupbearer such as Oenopion, his son by Ariadne, or pouring it on an altar as a libation, or lying on a couch in typical symposiast posture (see *SYMPOSIUM*). Yet he is never shown in the act of consuming his own gift. His female followers, too, keep their distance from the wine, at least in maenadic iconography. While maenads may carry drinking-vessels, ladle wine, or pour it, they are never shown drinking it.

Longus' Dionysiac love story of Daphnis and Chloe (see *NOVEL, GREEK*) culminates in the celebration of the vintage on the Lesbian estate of Dionysophantes, whose name evokes the divine epiphanies (appearances) of Dionysus. Wine festivals were celebrated in many regions of the Greek world; in Elis (W *Peloponnese) as well as on the Aegean islands of Andros, Chios, and Naxos, they were accompanied by wine miracles. The oldest festival of Dionysus, the Ionian-Attic Anthesteria, was held each spring. In Athens, the highlight consisted of the broaching of the new wine followed by a drinking-contest. On this occasion, as on others, citizen women were excluded from the ceremonial drinking of wine. The admixture of wine and water was allegorized as the nurturing of Dionysus by his mythical nurses (*FGrHist* 325 F 12, 328 F 5), or more ominously, as the 'mixing of the blood of *Bakchos* with fresh-flowing tears of the nymphs' (Timoth., *PMG* fr. 780). In Attica, myths were told which connected the arrival of Dionysus and the invention of wine with the murder of Icarus (schol. *D Il.* 22.29; *LIMC* Dionysos/Bacchus no. 257). Here and elsewhere, Dionysiac myths emphasize the darker aspects of the god, and the perversion of his gifts.

Of Dionysus' four provinces, wine is the most dominant; it often spills over into the other three. Drunkenness

can cause violence and dementia (Pl. *Leg.* 2.672d, 6.773d, *mainomenos oinos*). Yet the ritual madness associated with Dionysus in myth and cult had nothing to do with alcohol or drugs. Seized by the god, initiates into Bacchic rites acted much like participants in other possession cults. Their wild dancing and ecstatic behaviour were interpreted as 'madness' only by the uninitiated. As numerous cultic inscriptions show, the actual worshippers did not employ the vocabulary of madness (*mania*, *mainesthai*, *mainades*) to describe their ritual ecstasy; rather, they used the technical but neutral language of *bakcheia* and *bakcheuein*. The practitioners of *bakcheia* were usually women; the exception is Scyles, the 'mad' Scythian king who danced through the streets of Olbia—an early centre of Dionysiac cult—as a *bakchos* (Hdt. 4.79). While men, too, could 'go mad' for Dionysus, they could not join the bands (*thiasoi*) of maenadic women who went 'to the mountain' (*eis oros*) every other year in many Greek cities to celebrate their rites. Their notional leader was always the god himself (Eur. *Bacch.* 115 f.; 135 ff.; Diod. Sic. 4.3.2–3), who appears already in the Homeric version of the Lyncurus myth—the earliest reference to maenadic ritual—as Dionysus *mainomenos*, 'the mad god' (*Il.* 6.132). Known mainly from post-classical inscriptions and prose authors like *Plutarch and *Pausanias, ritual maenadism was never practised within the borders of Attica. Athenian maenads went to *Delphi to join the Delphic Thyiads on the slopes of Mt. Parnassus (Soph. *Ant.* 1126–52; Plut. *De mul virt.* 13, 249e–f; Paus. 10.4.3). Halfway between Athens and Delphi lies Thebes, the home town of Dionysus and 'mother city' (*mētropolis*) of the Bacchants' (Soph. *Ant.* 1122), from where professional maenads were imported by other cities (*IMagn.* 215). Erwin Rohde and E. R. Dodds were the first scholars to take a comparative approach to the psychological and anthropological aspects of maenadic ritual and behaviour, but they ignored the fundamental distinction between myth and *ritual.

In poetry and vase-painting, Dionysus and his mythical maenads tear apart live animals with their bare hands (*sparagmos*) and eat them raw (*ōmophagia*). But the divinely inflicted madness of myth was not a blueprint for actual rites, and the notion that maenadism 'swept over Greece like wildfire' (Rohde, Nilsson, Dodds) is a Romantic construct that has now been abandoned along with the suggestion that the maenads sacramentally consumed Dionysus in the shape of his sacred animal. The 'delight of eating raw flesh' (Eur. *Bacch.* 139 *ōmophagōn charin*) appears in maenadic myth, where it can escalate into cannibalism. In the entire cultic record, however, omophagy is mentioned only once. In a maenadic inscription from Miletus (SW *Asia Minor), the following

directive occurs: 'Whenever the priestess performs the rites of sacrifice on behalf of the [entire] city, no one is permitted to "throw in" (deposit?) the *ōmophagion* before the priestess has done so on behalf of the city' (LSAM 48, 276/5 BC). Although the ritual details escape us, a piece of raw meat was apparently deposited somewhere for divine or human consumption. The mere reference to eating raw flesh is significant, given that sacrificial meat was normally roasted or cooked. In this instance, the perverted sacrifice, a mainstay of Dionysiac myth, has left its mark also on Dionysiac cult.

Dionysiac festivals were ubiquitous throughout the Greek world; in Athens alone there were seven such festivals in any given year, five of which were dedicated chiefly to Dionysus as wine god and patron god of the theatre—Oschophoria, Rural Dionysia, Lenaea, Anthesteria, and City Dionysia. The name Oschophoria involved cross-dressing and the ritual carrying of vine branches hung with bunches of grapes. The Lenaea and both Dionysia featured performances of *tragedy and *comedy. Apart from the new wine, the Anthesteria celebrated the spring-time arrival of Dionysos from across the sea. Less is known about two other Dionysiac festivals at Athens, the *Theoinia* and the *Iobakcheia* ([Dem.] 59.78). Festivals of Dionysus were often characterized by ritual licence and revelry, including reversal of social roles, cross-dressing by boys and men, drunken komasts in the streets, as well as widespread boisterousness and obscenity. In Athens, as throughout Ionian territory, monumental phalli (erect penises) stood on public display, and phallophoric processions paraded through the streets (Semos of Delos *FGrHist* 396 F 24). But, unlike *Pan or the *Hermes of the herms (pillars surmounted with a bust and, when male, given genitalia), Dionysus himself is never depicted with an erection. The god's dark side emerged in rituals and aetiological myths concerned with murder and bloodshed, madness and violence, flight and persecution, as well as gender hostility (as during the Agrionia). Throughout the Athenian Anthesteria festival, merrymaking predominated, but it was punctuated by ritual reminders of a temporary suspension of the normal structures of daily life—the invasion of the city by strangers perhaps called 'Carians'; the silent drinking at separate tables, explained by the myth of the matricide Orestes' arrival in Athens and the fear of pollution it provoked; the 'sacred marriage' (*hieros gamos*) of the wife of the *basileus* (an Athenian magistrate) to Dionysus; and the cereal meal prepared on the festival's last day for Hermes Chthonios and the survivors of the Great Flood.

Tragedy and comedy incorporate transgressive aspects of Dionysus, but they do so in opposite ways. While comedy re-enacts the periods of ritual licence associated

with many Dionysiac festivals, tragedy dramatizes the negative, destructive traits of the god and his myths. Innocent and humorous in comedy, wine and inebriation are problematized in tragedy. *Aristotle connected the origins of tragedy and comedy with two types of Dionysiac performance—the *dithyramb and the phallic song respectively. Yet, in his own analysis of the tragic genre, he ignored not only Dionysus but also the central role of the gods in the drama. In addition to the mask worn by the actors in character, including the disguised god himself in both *Bacchae* and *Frogs* (see ARISTOPHANES), the choral dance is the most palpable link between Attic drama and Dionysiac ritual. Tragic and comic choruses who refer to their own dancing invariably associate their choral performance with Dionysus, *Pan, or the maenads. Despite Aristotle's silence, tragedy in particular has a lot to do with Dionysus. The tragedians set individual characters, entire plays, and indeed the tragic genre as a whole in a distinct Dionysiac ambience (see COMEDY (GREEK); TRAGEDY, GREEK).

The god so closely associated with exuberant life is also connected with death, a nexus expressed as 'life-death-life' in one of the Dionysiac-Orphic (see ORPHEUS) bone inscriptions from Olbia. '*Hades and Dionysus are the same' according to Heraclitus (fr. 15 DK). On an Apulian funerary crater (4th cent. BC) by the Darius painter, Dionysus and Hades are shown in the underworld each grasping the other's right hand while figures from Dionysiac myth surround them (Toledo 1994.19). A 'sacred tale' ascribed to *Orpheus and modelled on the Osiris myth describes the dismemberment of Dionysus Zagreus by the Titans and his restoration to new life; his tomb was shown at Delphi (Orph. 322 F Bernabé; Callim. fr. 643 Pf.). According to another myth, Dionysus descends to the underworld to rescue Semele from Hades (Iophon, *TrGF* 22 F 3); Aristophanes' comic parody of the god's catabasis (descent) has Dionysus retrieve *Aeschylus (Ar. *Frogs*). In a related ritual, the Argives summoned Dionysus ceremonially 'from the water' with the call of a trumpet hidden in thyrsi 'after throwing a lamb into the abyss for the gate-keeper', i.e. for Hades (Plut. *De Is. et Os.* 35, 364 F). Dionysus loomed large in the funerary *art and afterlife beliefs of Greeks and Romans alike. In many regions of the ancient world, tombs were decorated with Dionysiac figures and emblems like the maenad, the *kantiaros*, and the ivy, or bore inscriptions with a Dionysiac message. The tombstone of Alkmeionis, chief maenad in Miletus around 200 BC, announces that 'she knows her share of the blessings' (*kalōn moiran epistamenē*)—a veiled reference to her eschatological hopes (GVI 1344). Found in tombs from southern Italy to *Thessaly, the so-called Bacchic gold tablets contain ritual instructions and

underworld descriptions for the benefit of the deceased. Two ivy-shaped specimens refer to a ritual rebirth under the aegis of Dionysus and to wine-drinking in the after-life; a third identifies the dead person as a Bacchic initiate (*mystēs*) (see DEATH, ATTITUDES TO).

No other deity is more frequently represented in ancient art than Dionysus. Until about 430 BC, Dionysus is almost invariably shown as a mature, bearded and ivy-wreathed adult wearing a long chiton often draped with the skin of fawn or feline, and occasionally presenting a frontal face like his satyrs; later he usually appears youthful and beardless, effeminate, and partially or entirely nude. From his earliest depictions on vases by Sophilos and Clitias (c.580–570 BC) to the proliferating images of the god and his entourage in Hellenistic and Roman imperial times, Dionysiac iconography becomes more varied while remaining remarkably consistent in its use of certain themes and motifs. Major mythical subjects comprise the Return of *Hephaestus and the Gigantomachy (see GIANTS); Dionysus' birth and childhood; his punishments of Lycurgus, Pentheus, and the impious sailors whom he turns into dolphins; and his union with Ariadne (as on the Derveni crater of c.350 BC). Cult scenes in vase painting include those on the so-called Lenaia vases, which show a makeshift image of Dionysus—fashioned from a mask attached to a pillar—surrounded by women carrying or ladling wine. It is unclear whether these settings refer to a single festival or represent an artistic montage of authentic ritual elements. The Hellenistic friezes of his temples at Teos and Cnidus displayed the *thiasos* (group of worshippers) of satyrs, maenads, and centaurs; at Perge (S. Asia Minor) we find scenes from the god's mythical life. Most conspicuously, sarcophagi of the imperial period abound with scenes from Dionysiac mythology such as the god's birth and his Indian triumph—the theme of Nonnus of Panopolis' monumental epic.

The very existence in the bronze age of a divinity named Dionysos came as a complete surprise when it was first revealed by Michael Ventris in 1953. His discovery disproved the widespread theory of Dionysus as a latecomer who arrived on the Greek scene just in time to receive the barest mention in Homeric epic. Throughout antiquity Dionysus was considered a foreign god whose original home was Thrace or Asia Minor and who was unknown in Greece before the 8th cent. BC. Modern scholarship followed suit. Friedrich Nietzsche's *Die Geburt der Tragödie aus dem Geiste der Musik* (1872) fundamentally changed the perception of the god in literature and art by contrasting the 'Apollinian' with the 'Dionysian' and emphasizing the suffering Dionysus as the divine archetype of the tragic hero. Nietzsche's essay remains a milestone

in the modern reception of the god. Nevertheless, like Friedrich Creuzer before him, Nietzsche believed that the Greeks had Hellenized the 'Asian' worship of Dionysus by mitigating it. The non-Greek origin of Dionysus achieved the status of scholarly dogma with the second volume of Rohde's *Psyche* (1894). In Rohde's view, which echoes Nietzsche's, the Thracian Dionysus invaded Greece, where his wild nature was ultimately civilized and sublimated with the help of the Delphic *Apollo, a process commemorated in the myth of Dionysus' exile abroad, the resistance with which his cult was met upon its arrival in Greece, and his ultimate triumph over his opponents. Rohde's Dionysus—*barbarian but happily Hellenized, occasionally wild but mostly mild—appealed to successive generations of scholars from Jane Harrison to Dodds. Wilamowitz derived Dionysus from Phrygia and Lydia rather than Thrace, while Nilsson adopted a theory of multiple foreign origins. As early as 1933, however, Walter F. Otto (*Dionysus: Myth and Cult*, (1965), Eng. trans.) dissented, emphasizing instead the Greek nature of Dionysus as the epiphanic god who comes and disappears. According to Otto, the myths of Dionysus' arrival—with their dual emphasis on resistance to his otherness as well as on acceptance of his gifts—articulate the essential aspects of the god's divinity rather than the historical vicissitudes of the propagation of his cult. Otto's notion of a polar and paradoxical Dionysus categorizes the diversity of Dionysiac phenomena, thus making them more intelligible. It has been argued, after Otto, that the 'foreign' Dionysus is a psychological rather than a historical entity which has more to do with Greek self-definition and the 'Dionysus in us' than with the god's actual arrival from abroad. More recently, Dionysus has emerged as the archetypal 'Other'—in a culturally normative sense—whose alterity is an inherent function of his identity as a Greek divinity. However, if such abstractions are pushed too far, Dionysus ceases to be the god he was to the Greeks—present in his concrete manifestations, and in the perplexing diversity of his myths, cults, and images—and is reduced to a modern concept. AH

disease, the main cause of death in antiquity, is a topic for which there are more sources than for most aspects of life in the ancient world, thanks principally to the Hippocratic corpus (see **MEDICINE** §4), Aretaeus of Cappadocia, and the numerous works of his contemporary, Galen of Pergamum (2nd cent. AD). Additional information may be obtained from palaeopathology, the study of diseases found in human skeletal remains. Ancient medical literature concentrates on chronic and endemic diseases, rather than the major epidemic diseases. In fact the Greek word *epidēmios*, in a medical context, means 'endemic' rather than 'epidemic'.

Malaria and tuberculosis are the most prominent diseases in ancient literature. Malaria occurred in antiquity in three forms, vivax, the commonest, falciparum, the most dangerous, and quartan, which has the longest periodicity. All three produce periodic fevers recurring every two or three days which were noticed easily, if not understood, by ancient doctors. The epidemiology of malaria in antiquity resembled that of recent times. In the highly seasonal Mediterranean

disease Disease was one of the chief reasons for the prevalence of congenital deformity in antiquity. This Hellenistic ivory statuette depicts a hunchback with Pott's disease. © The Trustees of the British Museum.

climate malaria occurs mainly in the summer and autumn and affects adults at least as much as children, helping to explain its importance for ancient doctors. It depends for its transmission on certain species of mosquitoes, and was probably absent from some regions where these vectors did not occur. It is not necessarily associated with marshy environments. The chronology of the spread of malaria in the Mediterranean is disputed. All three types existed in Greece in the 4th cent. BC, but it is uncertain how long before that falciparum malaria had been present. The disease which struck the Athenian forces outside *Syracuse during the Peloponnesian War (see ATHENS (HISTORY)) may have been falciparum malaria, which was not yet present in Attica, but this interpretation is controversial. The hypothesis of W. H. S. Jones that the spread of malaria caused the decline of ancient Greek civilization is an exaggeration. However there is no doubt that malaria spread widely in central and southern Italy during the late republic and early Roman empire and had a major impact on human populations. It has also been argued that malaria did not exist in Sardinia before *Phoenician and Roman colonization.

Tuberculosis mostly affected young adults. One Hippocratic text describes it as invariably fatal, probably an exaggeration, but Aretaeus gives the best ancient description of tuberculosis. Both human pulmonary and bovine tuberculosis were present in antiquity. It was probably common in crowded urban centres.

Ancient authors say hardly anything about childhood diseases, but enteric diseases such as infantile viral diarrhoea and amoebic dysentery probably accounted for most of the high infant mortality observed in cemeteries. Chickenpox, diphtheria, mumps, and whooping cough are all described in connection with attacks on adults, but there is no definite evidence for measles or rubella in antiquity. Cholera was absent. The presence of influenza is uncertain, but the common cold certainly existed. Leprosy was probably endemic in the near east in the bronze age and spread slowly westwards in the Hellenistic period. It probably only occurred sporadically. There is no conclusive evidence for gonorrhoea or syphilis, but some sexually transmitted diseases certainly existed, such as genital herpes and trachoma. The latter was also the main infectious cause of blindness. Brucellosis from contaminated goat's milk was common at Herculaneum. Heart disease is not prominent in ancient literature, but palaeopathology suggests that underlying conditions such as atherosclerosis were common. Some cancers were well known. Galen states that breast cancer was common. Aretaeus described diabetes.

Some chronic malnutrition diseases were quite common, especially in childhood, e.g. iron-deficiency

anaemia, rickets, bladder-stone disease, and night blindness. The Greeks and Romans also took an interest in diseases of plants and animals because of their importance in agriculture. See PLAGUE. JRS

dithyramb, choral song in honour of *Dionysus; the origins of dithyramb, and the meaning of the word itself, have been the subject of speculation since antiquity. There are three phases in the history of the genre: (1) pre-literary dithyramb; (2) the institutionalization of dithyramb in the 6th cent. BC; and (3) the latest phase, which began in the mid-5th cent.

Already in phase (1) dithyramb was a cult song with Dionysiac content. It was sung by a group of singers under the leadership of an *exarchōn*, as shown by the oldest piece of literary evidence, *Archilochus fr. 120 West. Phase (2) has its roots in the cultural and religious policies of the tyrants (see TYRANNY; PISISTRATUS) and the young Athenian democracy (see DEMOCRACY, ATHENIAN; TRAGEDY, GREEK). *Herodotus (1. 23) says that the musician Arion in late 7th-cent. Corinth was the first to compose a choral song, rehearse it with a choir, and produce it in performance, and that he finally gave the name 'dithyramb' to this new kind of choral song. (Some scholars take *ōnomasanta* to mean 'he gave it a title', but titles are not associated with dithyrambs before the 5th cent.) Lasus of Hermione (6th cent. BC) is connected with dithyramb at Athens: he organized a dithyrambic contest in the first years of the democracy. Each of the ten Athenian tribes entered the competition with one chorus of men and one of boys, each consisting of 50 singers. The financing of the enterprise (payment for the poet, the trainer of the chorus (*chorodidaskalos*), and the pipe-player; and the cost of equipping the chorus) was the responsibility of the *chorēgos* (financial backer). The winning *chorēgos* could put up a tripod with a dedicatory inscription in the Street of the Tripods. The dithyrambic contest was a competition between the tribes, not the poets, who are never mentioned on the victory inscriptions. Dithyrambs were performed at the following Athenian festivals: the City or Great Dionysia, the Thargelia, the (Lesser) Panathenaea, the Prometheia, the Hephaestia; cf. Lys. 21. 1–4; ps.-Xen. *Constitution of the Athenians* (Old Oligarch) 3. 4; Antiphon 6. 11. The first victor at the Dionysia at Athens was the otherwise unknown Hypodicus of Chalcis (509/8 BC). In the first part of the 5th cent. *Simonides (with 56 victories), *Pindar, and *Bacchylides were the dominant dithyrambic poets. Pindar's dithyrambs (frs. 70–88 Maehler) are recognizable

as such by their Dionysiac character. The standard content of a Pindaric dithyramb included some mention of the occasion which had given rise to the song, and of the commissioning *polis; praise of the poet; narration of a myth; and some treatment of Dionysiac theology. By contrast, Bacchylides' dithyrambs, with the exception of *Io*, lacked these topical allusions. Hence the difficulties of classification which have been felt since Alexandrian times (see ALEXANDRIA): there was a discussion between Aristarchus and *Callimachus over whether the *Cassandra* of Bacchylides (fr. 23 Snell–Maehler) was a dithyramb or a Paean: *Oxyrhynchus Papyri* 2368. From the mid-5th cent. (phase 3), dithyramb became the playground of the musical avant-garde, as we see from the criticisms of Pherecrates (fr. 155 K–A) and the reaction of Pratinas (fr. 708 Page). Melanippides, Cinesias, Timotheus, and Philoxenus are the best-known exponents of phase (3): they introduced astrophic form (i.e. their poems were not arranged according to strophe and antistrophe), instrumental and vocal solos, and 'mimetic' music. In the course of the 4th cent., a recognizably dithyrambic manner and idiom developed, and penetrated other lyric genres also. Songs with dithyrambic content were composed, like Philoxenus' *Banquet*; and in Middle comedy (see COMEDY, GREEK (MIDDLE)) we find fairly long passages in dithyrambic style. In the Hellenistic period dithyrambs were performed at the festivals of the Delia and Apollonia on *Delos; and at the City Dionysia in Athens until the 2nd cent. AD. But post-Classical fragments (citations) allow no confident judgement about these compositions.

Our knowledge of dithyrambic poetry, esp. Pindar and Bacchylides, is based chiefly on papyrus finds. For phase (3) we are chiefly dependent on citations by Athenaeus and on the criticisms of the comic poets and *Plato.

divorce See MARRIAGE LAW.

Domitian (Titus Flavius Domitianus), son of the emperor *Vespasian, was born on 24 October AD 51, and remained in Rome during his father's campaign against Aulus Vitellius. Surrounded on the Capitol with his uncle, Flavius Sabinus, he managed to escape and on Vitellius' death was saluted as Caesar by the Flavian army, though the real power lay in the hands of Gaius Licinius Mucianus until Vespasian's arrival. In 71 he participated in the triumph of Vespasian and *Titus, and between 70 and 80 held seven consulships, being twice ordinary consul (73 and 80; see CONSUL). Although Domitian exercised no formal power, he was clearly part of the dynastic plan, and there is no convincing evidence that he was kept in

the background or consumed by jealousy of his brother, whom he succeeded smoothly in 81.

The literary sources, especially *Tacitus and *Pliny the Younger, represent a senatorial tradition hostile to Domitian. But this is a legitimate and important viewpoint, illustrating the tension between aristocratic officials and autocrat. *Suetonius' account, though basically hostile, is more balanced and suggests that a more favourable view did exist, apart from the flattery of poets like *Statius and *Martial.

Domitian was conscientious in the performance of his duties, adopting a stance of moral rectitude, maintaining public decency at shows, and showing respect for religious ritual; three Vestal virgins (see VESTA) suffered capital punishment for breaking their vows of chastity; later, Cornelia, the chief Vestal, was buried alive. He promoted festivals and religious celebrations, showing particular devotion to *Jupiter and *Minerva, and performed the Secular Games; many public buildings were erected, completed, or restored, including the Capitol, the *Colosseum, and a great palace on the Palatine. For the people there were frequent spectacles and banquets, though his cash grants were restrained. He raised military pay by a third, and bestowed by edict additional privileges on veterans and their families; he remained popular with the army and praetorians.

Domitian administered legal affairs diligently and tried to suppress corruption. Suetonius' contention that he achieved equitable provincial administration through careful supervision of officials and governors (*Dom.* 8. 2) has been challenged, but other evidence indicates that Domitian, although authoritarian in his attitude to the provinces (e.g. his abortive order to cut down at least half the provincial vineyards), tried to impress probity and fairness on his appointees; he sensibly granted rights of ownership to those who had appropriated tracts of unused land (*subseciva*); Pliny the Younger's letters to *Trajan show that Domitian's administrative decisions were generally endorsed. The role and influence of equestrians in the administration increased in his reign, but as part of a continuing trend rather than deliberate policy. The effectiveness of his management of imperial finances is disputed, but he probably left a surplus in the treasury; his confiscation of the property of his opponents was for political rather than financial reasons.

Domitian was the first reigning emperor since *Claudius in 43 to campaign in person, visiting the Rhine once, and the Danube three times. Frontinus in his *Strategemata* reports favourably on Domitian's personal control of strategy and tactics. In 82/3 he fought a successful war against the Chatti on the middle Rhine, brought the Taunus area under Roman control, and accepted a

triumph and the name 'Germanicus'. But the military balance was shifting towards the Danube, and in 85 the Dacians, under king Decebalus, invaded Moesia killing its governor, Oppius Sabinus. Domitian came in person in 85 and 86; and after the defeat and death of Cornelius Fuscus (praetorian prefect), Tettius Iulianus, governor of Upper Moesia, won a victory at Tapae in 88. Since Domitian was facing trouble from the Marcomanni and Quadi in Pannonia, he made peace with Decebalus before launching a campaign against them (spring 89); at the end of 89 he celebrated another triumph. Then early in 92 a legion was destroyed in Pannonia by an incursion of the Sarmatian Iazyges and the Suebi, which was eventually contained under Domitian's personal direction. There was also considerable military activity in Britain, where Gnaeus Iulius Agricola continued the invasion of northern Scotland; his recall in 84 after an unusually long governorship of seven years, probably reflects military needs elsewhere rather than imperial jealousy.

Domitian failed to find a working relationship with the *senate. He was sometimes tactless and did not conceal the reality of his autocracy, holding ten consulships as emperor, wearing triumphal dress in the senate, having 24 lictors, and becoming *ensor perpetuus* in 85, symbolically in charge of the senate; his manner was arrogant, and he allegedly began an official letter: 'Our lord god orders that this be done'. There was a conspiracy in 87, and a rebellion in 89 by Lucius Antonius Saturninus, governor of Upper Germany. He apparently had little support among his troops and was easily crushed, but Domitian thereafter forbade two legions to be quartered in one camp. He became more ruthless against presumed opponents, and factions in the aristocracy produced many senators willing to act as accusers. The executions of at least twelve ex-consuls are recorded in the reign, mainly for dissent or alleged conspiracy, and not because they were Stoics (see STOICISM), although Domitian did expel philosophers. The emperor himself observed: 'no one believes in a conspiracy against an emperor until it has succeeded'. The execution in 95 of Flavius Clemens, his cousin, whose sons he had adopted as heirs, was a mistake since it seemed that no one now was safe. A plot was formed by intimates of his entourage possibly including his wife, Domitia, and he was murdered on 18 September 96; his memory was condemned by the senate. JBC

drama See COMEDY (GREEK) OLD; COMEDY (GREEK) MIDDLE; COMEDY (GREEK) NEW; COMEDY, LATIN; TRAGEDY, GREEK; TRAGEDY, LATIN.

dreams fascinated the ancients as much as they do us, though it is illegitimate to employ Freudian categories in

interpreting ancient dreams: their categories must not be subverted by our own culturally relative theories. Most ancients accepted that there were both significant and non-significant dreams (e.g. Hom. *Od.* 19. 562–7: true dreams come from gates of horn, delusory dreams from gates of ivory; cf. Verg. *Aen.* 6. 893–6). This basic division might itself be subdivided, most elaborately into a fivefold classification: non-predictive dreams, subdivided into *enhyphnia* caused by the day's residues and *phantasmata* or distorted visions that come between sleeping and waking states; predictive dreams subdivided into: *oneiroi* that need symbolic interpretation, *horamata* or prophetic visions, and *chrēmatismata* or advice from a god (e.g. Macrob. *In Somn.* 1. 3). The last category is well attested epigraphically by votives put up by people as the result of successful advice or instructions from a god received in a dream, and in the remarkable diary kept by Aelius Aristides which included numerous visions of *Asclepius and other gods. Dreams were indeed an important aspect of diagnosis in sanctuaries of Asclepius.

The idea that dreams could be significant, but might need professional interpreters, is found from Homer onwards (*Il.* 1. 62–7, 5. 148–51; Hdt. 5. 55–6; Theophr. *Char.* 16. 11). Dream-books were written from the 5th cent. BC onwards; the only surviving example from antiquity is that by Artemidorus.

Philosophers and others discussed whether dreams had a divine origin. The Hippocratic author of the treatise *On the Sacred Disease* urged that dreams were caused merely by disturbances in the brain, and the author of *On Regimen* 4 explained how to use dreams for medical diagnosis. *Plato argued that some dreams came from the gods and were reliable sources of knowledge, *Aristotle that physiological explanations applied, while *Epicurus and *Lucretius located dreams in a theory about the nature of sense perceptions. For *Cicero the possibility of prophetic dreams was an example of divination that worked in practice, but which was impossible to justify theoretically (*Div.* 1. 39–65, 2. 119–48, with Pease's comm.). Cicero also used a dream narrative (the Dream of Scipio) as part of his *Republic*, the part to which Macrobius devoted his commentary.

Christian texts also developed the importance of dream visions, in a variety of styles: the Book of Revelation or the *Shepherd* of Hermas both stand as reports of visions; the *Martyrdom of St Perpetua* includes a vivid firsthand report of a dream vision she had of her martyrdom; Synesius, *On Dreams* (AD 405–6) offered an allegorical interpretation of dreams. Eight handbooks of dream interpretation survive from the Byzantine period. SRFP

dress In classical antiquity, items of clothing and jewellery were major personal possessions. The prominence of drapery, i.e. clothing, in Greek and Roman art reflects the importance of dress in daily life.

Most garments were made of wool, though linen was used for some tunics and underclothing and silk was worn by richer women; most frequently, the fibre was left undyed, though women's clothes were more colourful than men's; the clothing of both sexes commonly had areas of decoration in wool dyed either with 'real purple' from sea snails or in imitation of purple; such decoration was generally very simple, consisting of woven bands and geometric motifs; figurative decoration, where it occurred, was usually tapestry-woven and only rarely embroidered. Clothes were made of large pieces of cloth with simple outlines which had been woven to shape on traditional looms; though certain garments were characteristic of the Greeks and others of the Romans there was no real difference between Greek and Roman clothes in techniques or materials; most classical garments belonged either to the category of mantles and cloaks that were 'thrown around' and for which the general terms were *periblēma* and *amictus*, or to those items, including tunics, that were 'entered into', *endyma* and *indumentum*; the former often served at night as blankets; all clothes were cleaned by washing and were stored folded-up in chests.

Draped mantles were the characteristic garment of freeborn citizens. The mantle worn by Greek men, and eventually by men and women throughout the eastern Mediterranean and by Roman women, was the *himation*, in Latin *pallium* or *palla*. This was a rectangle, measuring approximately 2.8 × 1.75 m. (9 × 6 ft.), which could be draped in various ways but which was usually supported on the left arm, leaving the right arm free. The mantle worn by Roman men, the Etruscans, and, originally, Roman women too was the *toga, a semicircular piece of cloth which over time became extremely large.

Cloaks were worn by men, either pinned on the right shoulder or joined at the front of the body. Pinned cloaks, used especially by horsemen, could be rectangular or semicircular: two Roman military cloaks, the *paludamentum* and the *sagum* (of Celtic origin), were rectangular; *chlamys*, the old Greek term for a pinned cloak, had by the 1st cent. AD come to mean specifically a semicircular cloak. The closed cloaks, in Latin *birrus* and *paenula*, were also based on semicircles and, being hooded, were suitable for travellers.

The traditional Greek woman's garment, the *peplos*, somewhere between a mantle and a tunic, was an approximately square piece of cloth worn with the top third or so folded over and pinned on both shoulders. By the 4th cent. BC the *peplos* had been largely replaced in the cities by the *himation* but was still worn in the country and by all women during cold weather.

According to tradition, the *peplos*, *himation*, and toga had all at first been worn without a tunic. However, the tunic, *chiton* or *tunica*, had an early history as an independent garment and by the 4th cent. the combination of draped mantle and tunic was the normal form of civilian dress for both men and women. Most tunics were sleeveless, made of two rectangular pieces joined at the sides and on the shoulders or of a single piece folded lengthways or widthways. An alternative to sewing, used to fasten women's tunics on the shoulders, was a series of button-like discs around which fabric from both front and back was wrapped and tied. Sleeved tunics only became common in the late Roman period, when two clearly defined varieties emerged, the narrow-sleeved tunic known in Latin as *strictoria*, and the wide-sleeved *dalmatica*. While the dalmatic was worn ungirt, tunics generally were worn with a belt, *zōnē* or *cingulum*, as had been the *peplos*.

Underclothes, like tunics, were probably worn more widely than ancient art or literature suggests. A tunic of linen was often worn under a tunic of wool and men probably mostly wore a triangular loincloth (*perizōma*, and perhaps also *zōnē*; Lat. *subligar* or *licium*), as did women in menstruation. A number of cloth bands were also used as underclothes, notably the *strophion* or *mamil-lare*, with which women bound their breasts.

Garments used on the extremities of the bodies illustrate a number of non-woven techniques: the Greek woman's *sakkos* or hairnet was made by a method now known as sprang; stretchy socks, *sokkoi*, employed a looping technique resembling knitting; certain men's hats and some foot-coverings were made of felt, *pilos* or *pilleus*. Leather was the usual material for shoes and sandals but, except in the army, was not employed for clothing. Fur, characteristic of barbarian dress, was not used at all.

The simplicity and conservatism of classical dress was set off, in the case of women, by elaborate coiffures, jewellery, and make-up. For both men and women, hairstyles and footwear shapes changed more rapidly than those of clothing and are consequently a better guide when dating works of art. See TEXTILE PRODUCTION. HG-T

E

earthquakes The Mediterranean is a zone of intense earthquake activity because the plates carrying Africa and Europe are slowly moving together, according to the theory of plate tectonics. Notable earthquakes in antiquity include: *Sparta c.464 BC, where several thousands may have perished; Helice in Achaëa 373 BC, where the city was submerged under the sea; *Rhodes 227/6 BC, when the Colossus statue collapsed; *Pompeii AD 62, which suffered severe damage. Some destructions of Mycenaean and Minoan palaces are also attributed to earthquakes. Earthquakes were associated with *Poseidon in mythology: Poseidon the Homeric 'earth-shaker' (*ennosigaios*) was fervently worshipped also as 'earth-holder' (*gaiaochos*) and 'stabilizer' (*asphalios*), in Sparta and elsewhere. King Agesipolis of Sparta was as distinctly unusual in his pragmatic approach to an earthquake in the Argolis in 388 BC (*Xen. Hell.* 4. 7. 4–5) as Herodotus (7. 129. 4) was in his rationalist, seismological explanation of Thessalian geomorphology (see **THESSALY**). Ancient philosophers and 'scientists', however, frequently speculated about the causes of earthquakes (*Sen. QNat.* bk. 6). Thales thought that the earth moved upon the primeval waters. Anaximenes reckoned that variations in wetness and aridity caused cracks in the earth. Several philosophers, including Anaxagoras, Democritus, *Aristotle, and Posidonius, produced theories which involved water or air entering the earth and causing explosions. PAC/JRS

ecology (Greek and Roman) A modern concept with numerous antecedents in antiquity, when attitudes towards nature (*physis*) varied greatly. Empedocles devised the theory of the four elements, leading to the idea of opposites and the theory of the four humours (*Hippoc. Nature of Man* 4–8), in which an imbalance of the humours causes disease. Different climates cause different humours to prevail in different peoples, producing the theory of environmental determinism in Hippocrates (*Aer.*). The observed regularities in nature led to a belief

in purpose in nature. *Herodotus (3. 107–9) thought that different types of animal had different rates of reproduction appropriate to their natures, an argument for purposeful creation. Other arguments invoked in favour of purposeful creation included the unity and harmony of the universe; the apparent design of human organs, e.g. the eye (*Socrates in *Xen. Mem.* 1. 4. 4–15); the regularities in astronomical phenomena, which led to *astrology and Ptolemy's theory (*Tetr.*) of cosmic environmentalism in which the stars influence life on earth; and the idea that the creator acted like an artisan, a theory—very important for *Plato (*Ti.* 27–33), *Cicero, and the younger *Seneca—that was adopted by the early Christian Fathers and laid the foundations for natural theology in later ages. *Aristotle (e.g. *Pol.* 1256^{a-b}) turned the concept of purpose in nature into an all-embracing teleology, but rejected Plato's artisan deity. Possibly Aristotle thought that nature advances unconsciously towards ends. Theophrastus expressed doubts about teleology in biology, invented plant biogeography, and considered climatic change caused by human modification of the environment. The Epicureans (see **EPICURUS**) rejected design in nature. The Stoics (see **STOICISM**) fused the aesthetic attitude towards nature, evident in Hellenistic bucolic poetry, with utilitarian attitudes. The earth is beautiful and useful. JRS

economic theory (Greek) It is a commonplace that the Greek philosophers had no economic theory. Three reasons are advanced for this absence: (1) the merely embryonic existence of the relevant institutions, especially the market; (2) upper-class disdain for personal involvement in *trade and exchange; (3) the priority assigned to ethical and political concerns over technical considerations of exchange and accumulation. While each of these claims contains some truth, the third assumes a modern conception of the autonomy of economics against which ancient theory may make a pertinent challenge.

*Plato's discussion of the market is sketchy. The *Republic* describes the creation of a market in the 'first city'; money (see COINAGE, GREEK) will be used for internal exchange, and barter for foreign trade. In the Ideal City the lowest class, ruled by bodily appetites, is also called the moneymaking class. The ideal city of *Laws* 5 will have no money, and strict lower and upper limits on amount of ownership. The market legislation of bks. 8 and 11 permits money, but most transacting is done by aliens; again, the state fixes strict limits to acquisition and ownership.

Economic analysis proper begins in *Aristotle's *Nicomachean Ethics* and *Politics*. Fundamental to the entire discussion is the idea that material goods are tools of human functioning. Their proper use has a limit set by those requirements. Poverty placing one beneath this limit is a problem for public planning; accumulation above this limit for its own sake is 'unnatural' and morally problematic. Thus Aristotle criticizes the saying of *Solon, 'Of wealth no boundary stands fixed for men.' The accumulation of goods began as a way of ensuring the presence of needed resources. Because some of these had to be imported from a distance, barter arose; barter led, in turn, to the temporary accumulation of surpluses useful for trade. Eventually coin money was introduced to facilitate deferred exchanges. This, however, gave rise to the idea of accumulating a surplus without reference to need or limit, as if wealth were an end in itself.

Aristotle's analysis is pertinent to recent criticisms of welfare and development economics which appeal to notions of human functioning in interpreting economic notions such as 'the standard of living' and 'the quality of life.'

Elsewhere in the *Politics*, Aristotle analyses the relationship between level of wealth and political behaviour, arguing that the essential difference between *democracy and *oligarchy lies in whether rule is by the poor or the rich; it happens that in every city the poor are many and the rich are few.

Hellenistic thought about money focuses on limiting the desire for possessions. Stoic teleology (see STOICISM) is the background for Adam Smith's conception of the 'invisible hand', which should not be understood apart from Stoic ideas of providence and justice. See ECONOMY, GREEK; ECONOMY, HELLENISTIC; WEALTH, ATTITUDES TO. MCN/PAC

economy, Greek Even if there was 'an economy' in ancient Greece (see CAPITALISM), Greece itself was not a single entity, but a congeries of more than a thousand separate communities. One should therefore speak of Greek economies rather than the Greek economy, and for simplicity's sake it is convenient to divide them into three groups, types, or models. First, there is the 'Archaic'

group of which *Sparta can stand as the representative instance. At the opposite extreme is Athens, distinguished both by the exceptional size and number of its economic transactions, and by the exceptional sophistication of its economic institutions. In between fall the vast range of 'normal' Greek cities or communities, differentiated from the latter chiefly in the scale, and from the former principally in the nature, of their economic arrangements.

Consider the last group first. Our 'economy' is derived from the ancient Greek word *oikonomia*, but this meant originally and usually the management of a private household (*oikos*) rather than that of a 'national' economy (see HOUSEHOLD (GREEK)). Ideally, for sound prudential reasons as well as ideological, moral, or political ones, each 'normal' Greek household (comprising a two-generation nuclear family, free and unfree dependants, slaves, animals, land, and other property) aimed to be as self-sufficient as possible, making all due allowance for the basic constants of the changing domestic life-cycle, and the amount and nature of available land and labour. Household economy in Greece was overwhelmingly rural economy, the number of genuine cities or even genuinely urban residential centres being countable on the fingers of a single hand. See URBANISM (Greek and Hellenistic).

Most Greeks living in 'normal' communities were peasants of one description or another, farming a couple of hectares (say, 5 acres) planted to a mix of cereals (mainly barley, some wheat) and xerophytic crops (*olives, grapevines (see WINE), figs above all). Small stock animals, especially sheep and goats (see PASTORALISM, GREEK), constituted a necessary, not a purely optional, complement to agriculture and herbiculture in the absence of artificial fertilizers. In some areas local conditions favoured specialization in one or other crop, or an exceptional amount of stockraising. In coastal settlements there were always some specialist fishermen (see FISHING), but, apart from the Black Sea, Greek waters were not especially favourable to sizeable and predictable shoals of easily catchable fish. Fish remained something of a luxury food by comparison with the staple 'Mediterranean triad' (grain, wine, olive oil) of the Greek peasant diet.

In practice, of course, self-sufficiency remained for most an ideal rather than a lived actuality, so that economic exchange of various kinds was obligatory (see TRADE, GREEK). But such exchanges were typically conducted between individuals—neighbours or at any rate members of the same community—either directly and by barter in kind or through the use of some monetary medium in the local village or town market. The economy of Athens was wholly exceptional in the degree to which

the very viability of the civic community depended on the exchange through long-distance trade of a staple commodity, grain (*see* FOOD SUPPLY). Fortunately, and not incidentally, Athens was exceptionally blessed with a near-unique means of paying for such imports in the shape of the silver (strictly, argentiferous lead) deposits in the Laurium district of SE Attica. The mines were worked almost entirely by chattel-slave labour (*see* SLAVERY). To ensure that the silver bullion was channelled productively into the grain trade the Athenian community instituted a wide range of preferential measures backed by severe and enforceable legal sanctions against both citizen and non-citizen miscreants. Athens was also fortunate, and unusual, in that much of Attica's soil and climate was peculiarly well suited to olive cultivation; the export of olive oil was officially encouraged from as early as 600 BC.

These factors permitted the development in the course of the 5th cent. BC of a genuinely urban sector of the Athenian citizen population, concentrated in what was almost a second city around the port of Piraeus. But most of those directly and exclusively engaged in Piraeus commerce, as in the other non-agricultural sectors of Athenian economy, were non-Athenian and often non-Greek foreigners, resident (free *metics and slaves) and transient. Both absolutely and as a proportion of the total population (which itself was hypertrophied by 'normal' Greek standards) the foreign element was sensibly greater in Athens than in any other Greek community.

Sparta in its economy as in some other respects represented the opposite pole from Athens. So far from being encouraged as economically desirable or even necessary, foreigners—Greek as well as non-Greek—were periodically expelled from Sparta (*xenêlasiai*). The Spartans did regularly practise economic exchange, but within rather than outside their territory, and with a politically subordinate free population known as *perioikoi*, on whom they depended, not least, for supplies of iron. Agriculture and stockraising were left to, or rather forced upon, a subjugated local population of helots, Greek in speech and culture but servile in status. By dint of exploiting the helots, the Spartans themselves contrived to do no economically productive work whatsoever (except in the sense that war, 'the business of Ares', was itself a means of production). Some other Greek communities exploited workforces of a similar collective character and servile status, but none combined that exploitation with the Spartans' peculiar disdain of all non-military forms of economic activity. The Spartans were not unique in refusing to coin silver or bronze for economic or political purposes, but their retention of a non-convertible domestic 'currency'

of iron spits nicely symbolizes their economic eccentricity. *See* COINAGE, GREEK. PAC

economy, Hellenistic The regions brought under the control of the Hellenistic kingdoms showed little economic unity or uniformity. Land-use systems ranged from irrigation regimes in Egypt, Mesopotamia, and parts of Iran (Polyb. 10. 28) through widespread dry farming to the nomad or transhumant *pastoralism of the deserts and the mountains. Land tenure arrangements included, besides private beneficial ownership at all levels of magnitude, land owned by cities, cantons, or temples but rented out to individuals or worked by 'slaves of the shrine' (*hierodouloi*), and above all land owned by the kings. Such land might be held in direct tenure and worked by serfs, or alienated to large-scale proprietors (e.g. Austin nos. 164 and 173), or bestowed as allotments (*klêroi*) in various ways on individuals in return for military service, or have its use and revenues assigned to individuals (*dôrea*). Such lands mostly had arable and arboricultural use in producing the basic Mediterranean triad (cereals, vines (*see* WINE), *olives) and other supplementary foodstuffs, while other land uses included pasturage, ornamental ground such as the ex-Persian *paradeisoi*, quarries, *mines, and forests.

Most foodstuff production will have been consumed locally, but some established long-distance flows continued, such as corn from Egypt to the Aegean, cattle and slaves (*see* SLAVERY) from the Black Sea (Polyb. 4. 38), or spices and precious stones from India to the Mediterranean. They may well have grown in importance in the Hellenistic period, thereby assisting the growth and enrichment of entrepôt and trading cities such as *Rhodes, *Alexandria, and Petra. Such cities seem also to have become the main centres of both the production and the consumption of fine decorative goods such as silverware, *glass, and jewellery, while the creation and use of more basic artefacts remained local unless used, as amphorae universally were, as containers for transport and storage. The growth in the numbers of coin-hoards and of shipwrecks during the period, together with the development of institutions (e.g. public and private *banks) and installations (harbours, lighthouses, etc.), suggest an increase both in the volume of trade and in the monetization of some transactions: the activities of Cretan and other pirates (*see* PIRACY) increased accordingly.

Rulers and polities affected all such economic activities by their needs, exactions, and benefactions. Old and new Greek cities levied taxes and rents on transactions, statuses, properties, and commodities, but rarely covered expenses comfortably. They tended instead to elicit loans, donations, or endowments from wealthy and benevolent

citizens or outsiders, whose services prompted honorary decrees (e.g. Austin nos. 116 and 132) and shifted power relationships in their favour (see *EUERGETISM*). On a larger scale kings and rulers did the same, redistributing resources via systematic taxation to pay for armies and wars, courts and bureaucracy, gifts and benefactions, disaster relief and city foundations. For fiscal reasons all royal governments showed some interest in increasing the productive capacity of their territories, e.g. by opening mines, extending the agrarian base or transplanting species, but the older picture of a managed 'royal economy' is not now accepted, even for Egypt. The political act with the biggest impact on the Hellenistic economy was probably Rome's creation of a free port at *Delos in 166 BC, which moved some trade routes and badly damaged Rhodes (Polyb. 30. 31). JKD

economy, Roman The economic history of Rome from the first, like all ancient Mediterranean economies, involved the interaction of the circumstances of local *agriculture with the available *labour supply in the context of opportunities for interregional redistribution in which the exchange of other commodities was involved. It is now certain that from the 7th cent BC. Rome was privileged among other Tiber valley communities as a centre for the movement of people and materials from peninsular Italy out into the world of Mediterranean contacts. The Romans believed that they had imported cereals from Campania from at least the early 5th cent., and that they had freed their citizens from the risk of debt-bondage (*nexum*; see *DEBT*) at the end of the 4th. It was important to their self-image that they considered the area around their city to be of only moderate productivity, and that it had been assigned in lots from an early period to citizens who worked them independently. Historically, this enthusiasm for the lot was of more significance in the concept of public ownership of land, and the practice of dividing and assigning it (*ager publicus*). This was attested in the formation of new *tribus in the 4th cent. and widely practised in the establishment of *coloniae* in the 3rd and 2nd cents., especially on land which had belonged to defeated opponents of Rome (see *COLONIZATION, ROMAN*). But the exploitation of allotted land was perhaps never intended to be in theory, and was certainly not in practice, a matter of basic household subsistence. It rapidly became linked with the formation of estate centres (*latifundia*) for the production of cash crops for mass-marketing, the *villas of the late republican landscape, which were also central to the cultural life of the wealthy families which owned them. The cities grew as *markets and centres of processing, administration, and consumption of the products of this

agriculture, and as centres for the control and management of a mutable labour force which included, as a result in part of the victories of the 2nd cent. BC, significant numbers of slaves (see *SLAVERY*), though their large-scale use in agriculture was generally perceived by the Roman tradition as undesirable. From the beginnings of the large-scale export of *wine from Italy in the mid 2nd cent. the network of economic exchanges involved entrepreneurs, Roman military forces in the field, more or less dependent consumers inside and outside Roman territory, and the city of Rome itself in an increasingly complicated web, in which the non-agricultural resources of the growing imperial state, especially metals (see *MINES AND MINING*), were an important ingredient. The development over the next centuries of this state of affairs saw frequent changes in the specifics of the geography of the centres of exchange, and the favoured places of investment in production: *olive oil and wine remained important, though we should recall that they are particularly visible archaeologically, and the production of Baetica, *Africa, and Tripolitania transformed these regions, with concomitant gain to their market centres and port outlets. The economy of the empire included significant connections with networks of exchange reaching across northern Europe, central Asia, and the Sahara, but most importantly via the Red Sea with the increasingly complex economy of the Indian Ocean area, to which *Alexandria was central. Rome itself was a consumer on an enormous scale, and therefore exerted a considerable influence on Mediterranean production and exchange, which were also promoted by the need to pay state exactions in cash. But the complexity of the network, the continued local interdependence of the regions of the empire, and the existence of very many smaller centres of consumption, management, and marketing, ensured that the economic life of the Roman world was not wholly oriented on Rome. The social and political forms of economic life were sophisticated and various, though they did not much resemble the practices of early modern Europe: the role of ex-slaves (see *FREEDMEN*) and the public contract may be singled out, while the availability of credit and the nature of accounting deserve further investigation. See *ARTISANS AND CRAFTSMEN*; *COINAGE, ROMAN*; *INDUSTRY*; *TRADE, ROMAN*. NP

ecstasy In classical Greek the term *ekstasis* may refer to any situation in which (part of) the mind or body is removed from its normal place or function. It is used for bodily displacements, but also for abnormal conditions of the mind such as madness, unconsciousness, or 'being beside oneself'. In the Hellenistic and later periods the notion is influenced by the Platonic concept of 'divine

madness', a state of inspired possession distinct from lower forms of madness and as such providing insights into objective truth. *Ekstasis* now acquires the notion of a state of trance in which the soul, leaving the body, sees visions (Acts 10: 10; 22: 17). In later, especially Neoplatonist theory (Plotinus, Porphyry), *ekstasis* is the central condition for escape from restraints of either a bodily or a rational-intellectual nature and thus becomes the gateway to the union with the god (*unio mystica*); see DIONYSUS. Egypt (See ◀ Map 2, Bd ▶)

Pre-Ptolemaic

Egypt began its historic period c.3200 BC. By a convention derived from Manetho this era is divided into 31 dynasties which are currently grouped into several phases: the Thinite or Archaic period (Dynasties 1–2, c.3200–2700) is the formative stage of pharaonic civilization. The Old Kingdom (Dynasties 3–4, c.2700–2159) sees the establishment of a highly centralized state which peaked in the Fourth Dynasty with the builders of the Giza pyramids. Foreign relations, peaceful and otherwise, were maintained with Nubia to the south, Libya, and Asia, but there was no attempt to establish an empire. Culturally, this age is distinguished by work of the highest quality in architecture, sculpture, and painting. The fabric of government collapsed at the end of the Sixth Dynasty to create the First Intermediate period (Dynasties 7–mid-11, c.2159–2040), an age of political dissolution and cultural decline. The country was reunited by Montuhotep II c.2040 to create the Middle Kingdom (mid-Dynasty 11–12, c.2040–1786). The major new initiative of this period was the integration into the Egyptian state of Lower Nubia as far as the Second Cataract. This development was paralleled by significant involvement in Asia, but this stopped short of imperial control. As in the Old Kingdom, there is ample evidence of high-quality work in the visual arts, but this epoch is distinguished culturally above all as the classic age of Egyptian language and literature. The Middle Kingdom disintegrated in the Thirteenth Dynasty to inaugurate the Second Intermediate period, the most important event of which was the establishment of Asiatic control by the Hyksos over most of Egypt, an episode which conferred major military and cultural benefits as well as providing the impetus for expansion into Asia during the New Kingdom (Dynasties 18–20, c.1575–1087). This great age of Egyptian militarism created in the Eighteenth Dynasty an empire

which stretched from the Euphrates to beyond the Fourth Cataract in Nubia, and the resources generated made possible a great flowering of achievement in the visual arts, in particular great temples such as those of Karnak and Luxor and the mortuary temples of western Thebes as well as the brilliantly decorated tombs in the Valleys of the Kings and Queens. The decline in Egypt's imperial position at the end of the dynasty was reversed by Seti I and Ramesses II in the early Nineteenth Dynasty, but they never succeeded in recovering all the lost territory in Asia. The later New Kingdom is largely characterized by gradual decline generated by internal divisions, economic difficulties, and foreign aggression. The Late Dynastic period (Dynasties 21–31, c.1087–332) is marked by long periods of foreign occupation by Libyans, Nubians, and Persians punctuated by short, if sometimes brilliant, periods of national resurgence. It terminates with the occupation by *Alexander the Great in 332. ABL

Ptolemaic

In the period from the death of Alexander the Great in 323 BC until Octavian's conquest and the death of *Cleopatra VII in 30 BC the Egyptian throne was held by Macedonians, and from 304 by the one family, the Ptolemies (who were descended from Alexander's general *Ptolemy I son of Lagus). Externally the main problem remained the extent of the kingdom, while internally the nature of administrative control and relations with the native Egyptians formed the major concerns of this new resident dynasty of foreign pharaohs. For the modern observer it is the incomplete nature of the historical record which presents problems. Contemporary historical analysis is limited in period (*Polybius, *Diodorus Siculus), much of it concentrating on the scandalous and sensational (Pompeius Trogus, Justin), and while numerous papyri and ostraca, preserved through the dry desert conditions, join with inscriptions to make Egypt better documented than other Hellenistic kingdoms, these illustrate the details of administration and everyday life without its wider context.

Territorially the Nile valley formed a natural unit. Ptolemy I added *Cyrene and *Cyprus to the kingdom, both significant territories in Ptolemaic history. Under *Ptolemy II control was extended over much of the Aegean and the coast of *Asia Minor organized as the Island League; this was later lost. But the territory most fought over with the Seleucid rulers of Syria was Coele ('Hollow') Syria: Palestine and the Gaza strip. This strategic area was Ptolemaic until the battle of Panion in 200, when it passed to Seleucid control. The final episode in the struggles of these two kingdoms came in 168 when

GREEK AND ROMAN EDUCATION

education, Greek

1. Early period

Greek ideas of education (*paideia*), whether theoretical or practical, encompassed upbringing and cultural training in the widest sense, not merely schooling and formal education. The poets were regarded as the educators of their society, particularly in the Archaic period, but also well into the classical, when *Plato could attack *Homer's status as educator of Greece (e.g. *Resp.* 606e, and generally, bks. 2, 3, 10; cf. *Xen. Symp.* 4. 6 for the conventional view). Much education would have taken place in an aristocratic milieu informally through institutions like the *symposium (as in the poetry of Theognis or festivals (cf. the children reciting *Solon's poetry at the Apaturia, *Pl. Ti.* 21b), backed up by the old assumption that the aristocracy possessed inherited, not instructed, excellence. Important educational functions were seen by some in the relationship of a boy and an older lover (see HOMOSEXUALITY); or in the very institutions of the city-state (*polis), the city festivals and rituals (e.g. *Aeschin.* 3. 246; see N. Loraux, *Invention of Athens* (1986; Eng. trans.). Even in the 4th cent. BC, Plato (*Laws*), for instance, saw the laws as performing educational functions, Lycurgus of Athens the democratic processes; cf. DEMOCRACY, ATHENIAN.

There is a tendency in modern work to overformalize Greek education. Before the 5th cent. BC, there must have been some sort of training for any specialized skills (cf. the scribal skills needed by the Mycenaean), but most of this was probably on an ad hoc and quite individual basis (more like an apprenticeship, as was surely the case with oral epic bards). The evidence for early schooling (i.e. formal group teaching) is remarkably slight: the school laws attributed to Solon (594 BC) by Aeschines (1. 9 ff.) may be later and are in any case primarily about morality; the traditions about Chiron (see CENTAURS) and Phoenix (cf. *Il.* 9. 443) as ideal educators, teaching their charges all the known skills may reflect some form of early aristocratic instruction. The earliest school mentioned is at Chios, in 494 BC (*Hdt.* 6. 27); we also hear of schools at Astypalaea (an Aegean island between Amorgos and Nisyros) in 496 BC (*Paus.* 6. 9. 6), at Troezen in 480 (*Plut. Them.* 10), at Mycalessus in Boeotia in 413 (*Thuc.* 7. 29), and less reliably, among allies of the Mytilenaeans in c.600 (*Ael. VH* 7. 15). Fifth-cent. Attic vase-paintings show scenes of schooling. But it is likely that at least before the mid-5th cent., education was elementary in our terms, probably confined to the aristocratic strata, and organized simply for individuals (the figure of the later *paidagōgos* may have retained something of an earlier individual tutor; cf. *Xen. Mem.* 2. 2. 6 on home education). That education would also be non-technical, and, as indicated by discussions of the 'old' and the 'new' education in the 5th cent. (cf. *Ar. Clouds*), would be primarily concerned with music and gymnastics. This type of education, or at least its higher levels, was transformed by the *sophists and their successors into one involving the techniques of prose rhetoric, which then came to form the most typical part of ancient education at the higher level.

2. Sparta

Certain Dorian states like *Crete and Classical *Sparta practised a totalitarian and militaristic form of education controlled by the state. By Classical times, Sparta had adapted its educational system entirely for the purposes of maintaining military strength. From the age of 7 the child was entirely under the control of the state, living in barracks away from parents. The aim of education was to produce efficient soldiers, and though their training included *music and how to read and write, physical education received first priority (see *Xen. Respublica Lacedaemoniorum*; *Plut. Lyc.*). Girls, too, were also educated in the interests of the state, to be the future mothers of warriors (*Xen. Lac.* 1. 3–4): gymnastics and sport were emphasized, as well as music and *dancing.

3. Classical Athens

Elementary education

It is unclear how early elementary schooling began in Athens (from which most evidence comes): explicit evidence for schools (see above) is much later than the introduction of the alphabet to Greece in the mid-8th cent. BC, and though it has been thought that the alphabet implies schools to teach it, instruction at this low level could have been

carried out without formal institutions. However, *ostracism at Athens may presuppose widespread basic *literacy in the time of *Cleisthenes, and schooling is definitely attested for early 5th-cent. Greece.

There were three main elements to elementary education, normally taught in different establishments. The *paidotribēs* dealt with gymnastics, games, and general athletic fitness, mainly in the palaestra (e.g. Pl. *Grg.* 452b, *Prt.* 313a). The *kitharistēs* taught music and the works of the lyric poets, the lyre school inheriting the musical education of the Archaic period. The *grammatistēs* taught reading, writing, and arithmetic, as well as literature, which consisted of learning by heart the work of poets, especially Homer, who were regarded as giving moral training (see Protagoras on the moral function of music and poetry, *Prt.* 326a). Thus after learning the alphabet (see Pl. *Resp.* 402a–b; *Plt.* 227e–278b, for the methods of learning to read), pupils would progress to learning the poets by heart (*Prt.* 325e). Gymnastics and music (including poetry), then, were the fundamentals. The ‘Old Education’ parodied in *Aristophanes *Clouds* (961–1023) gives most emphasis to physical education and music, saying nothing about letters, either because it was a minor element or too basic to mention. But the predominance of music—which included poetry and dance, and emphasized actual performance—and physical training in the basic Greek education is attested elsewhere (e.g. Pl. *Resp.* 376e); the conservative Plato sees lack of musical training (*achoreutos*) as synonymous with lack of education (*apaideutos*) (*Leg.* 654a–b).

In a single day, the pupil might start with gymnastics, then proceed to the lyre school, and end with letters. But the system was private and fee-paying, far from rigid, and parents might not want their children to participate in all three. Girls as we see from vase-painting, might be educated in all three elements, as well as dancing, though not normally in the same schools as boys or to the same extent. The teacher was normally a free man enjoying the same social status (and remuneration) as a doctor—though in fact often not so highly regarded (cf. *Demosthenes on *Aeschines, *De cor.* 265). Assistants might be slaves or free men. Boys were always accompanied to school by a *paidagōgos*, a slave and highly trusted part of the family (cf. Themistocles’, *Hdt.* 8. 75), who helped to bring up the child and at school must have been a helpful overseer. Discipline at school was strict: the symbol of the *paidotribēs*’ power to punish was the

education, Greek Learning to write, along with reading, dominated Greek elementary education. This wooden tablet (2nd cent. AD) shows a Greek maxim in the master's hand (top) and the pupil's two copies. Such maxims were used as school texts. © British Library Board/Robana/TopFoto.

forked stick, of other teachers the *narthēx* (cane). Pupils regularly had to recite what they had learned, and the regular public competitions (all illustrated in vase-scenes), whether literary, musical, or athletic, were an important forum for proving their skill.

The development of group schooling, in which the education previously reserved for the aristocracy is spread to other citizens, may be related, at least in Athens, to the development of the *democracy, but cannot have originated with it. The balance between the physical and intellectual aspects may not have been as harmonious as some modern observers have suggested; it was certainly disputed by Greek thinkers, and the military uses of physical education may have given that side ascendancy (cf. *Prt.* 326 b–c, on gymnastics as useful training for war). Xenophanes (c.500) (DK 21 B 2) and *Euripides scoffed at the *athletic (and aristocratic) ideal, while *Pindar, perhaps Aristophanes, and *Xenophon (*Cyn.* 13) supported it. Plato, *Isocrates, and Aristotle (*Pol.* 8) subordinated the physical side to the intellectual.

Higher education

From the late 5th cent. it was possible to pursue further and more specialist education by joining one of the courses offered by the sophists, or listening to their lectures and disputations. Or there were the specialized schools of *rhetoric or philosophy or of *medicine (possible early ‘schools’ (e.g. of medicine, *Hdt.* 3. 129, 131), may have been more like loose semi-religious foundations). The most famous were Isocrates’ school of rhetoric, founded about 390 BC, Plato’s *Academy with its scientific, mathematical, and philosophical curriculum founded soon after, and Aristotle’s Lyceum (see ARISTOTLE, para. 5), founded in 335 BC. Some of these higher schools prescribed propaedeutic courses (e.g. geometry for Plato’s Academy), which have been seen as the origin of ‘secondary education’.

The great educators and theorists

The sophists were itinerant teachers, who offered education for a fee on a variety of specialized and technical subjects. In general, they claimed to teach political virtue (*aretē*), and most laid great stress on skills useful for political life, especially rhetoric (e.g. *Prt.* 318e–319a). In that sense they rivalled the poets’ claim as educators; they offered techniques useful in the Athenian democracy (and open to anyone who could pay), and in charging for their services, aroused much distrust. They were progressive and pragmatic in their views and methods, and belonged to the liberal, democratic tradition of Greek education. They were effectively the first to create a standard teaching system at an advanced level, and the first to include the basic sciences in their schema (note especially the polymath Hippias, *Prt.* 318e). But they were part of the mainstream of Greek cultural heritage, which they accepted, taught, and enhanced, and against which *Socrates and Plato reacted so violently. Their ideas initiated and propelled the ferment of discussion about education—including the ‘nature versus nurture’ debate—that continued so intensely in the 4th cent.

Socrates, on the other hand, distrusted the sophists’ claim to be able to teach everything, or indeed even to know anything. Socrates sought not to impart a body of knowledge, but to progress, with his followers, in seeking it. In the educational sphere, he seems to have had a rather conservative reliance on innate gifts; his great influence lies in the famous ‘Socratic’ method of teaching (below), and in his equation of virtue with knowledge. Plato, however, gives us the most extensive theory of education, in the *Republic* and, in a less extreme form, the *Laws*, where he sets forth the ideal state of a totalitarian mould, influenced by Sparta, and a corresponding system of education in which everything, including most forms of literature and art, which does not serve the interests of the state, is rigidly excluded: his elementary education, for all citizens to the age of 17 or 18, was otherwise rather conservative. Plato’s *Timaeus* provided the Middle Ages with the rationale for their quadrivium: though this in fact derived ultimately from Hippias’ insistence (*Prt.* 318e) on the four sciences, namely arithmetic, geometry, astronomy, and music. In his early works he strongly opposed the teaching of rhetoric, but later allowed it to be taught in the Academy alongside the more important scientific, mathematical, and philosophical studies. His concept of an educational establishment with permanent buildings, specialist teachers, and an integrated curriculum, may be seen as a precursor of the secondary school (see *Resp.* 536–41 for the appropriate age-range for each stage in Plato’s scheme), his founding of the Academy, an association of scholars, as the first university. It was, however, the Lyceum (see ARISTOTLE, para. 5), which became the greatest research institute of antiquity. In Isocrates’ educational innovations, one sees the further development of the rhetorical side of late 5th-cent. culture, as opposed to the philosophical emphasized by Plato and left by Isocrates as marginal to the ultimate rhetorical focus. He owed much to the sophists in subject-matter and teaching methods; his educational aims were to train (a few) students in morality and political skill, hence rhetoric (e.g. *Panath.* 30–2; *Antid.* 231; *C. Soph.* 21), and ultimately to produce political leaders. Other subjects were subservient to the pursuit of rhetorical skill: among these was knowledge of the past, and he distinguished between useful, or cultural, and purely disciplinary subjects like

eristic and mathematics (*Antid.* 261–9). His teaching methods also laid immense stress on the literary composition of prose, seeking to oust the dominant position of the poets in education. It was this primarily rhetorical basis of further education that became the dominant characteristic of ancient education.

Teaching methods

Private tuition, individual tuition, and teaching in small groups are all attested, even for gymnastics (Pl. *Plt.* 294d–e). Learning by heart, for the purposes of recitation, was standard. Even Pl. accepted the usefulness of games in elementary education (arithmetic), though he was generally hostile to any experimentation in scientific teaching. At a higher level, pedagogic techniques were most developed in rhetorical teaching. Students memorized commonplaces, stock situations, and stock phrases, along with sample passages like *Gorgias's *Funeral Oration* as material for later improvisation (on which much store was set). Psychology, techniques of persuasion, and the art of arguing both sides of a case were also taught. In addition, the sophists, and in particular, Isocrates, supplemented this with further general knowledge (see RHETORIC, GREEK).

The sophists developed both the dialectical method and the lecture, which might take the form of the display *epideixis* or the full technical lecture, which even Plato frequently used though he preferred dialectic. The dialectic method involves question and answer, in which the respondent makes a real contribution to discussion (as opposed to the Socratic technique). This method was developed by Isocrates into a seminar technique of group discussion and criticism. The Socratic method proceeds by reducing the pupil to a state of *aporia* (or puzzlement) and admission of complete ignorance (not to mention irritation), and then drawing out knowledge by a process of questioning, a process of intellectual 'midwifery' (Pl. *Tht.* 150c). It is well illustrated in the geometry lesson of Plato's *Meno* (see *Meno* 85d–86b for the Socratic explanation given there). *Xenophon advocated the 'activity' method in the *Cyropaedia* where pupils learn justice by practising it in real-life group situations.

4. Hellenistic education

For the Hellenistic period, there is a wealth of inscriptions which illuminate the public side of education, and rich papyrological evidence for school activity (e.g. school exercises). The pattern of education established in Classical Athens was brought in the early years of the Hellenistic era to a definitive form which endured with only slight changes to the end of the ancient world. Greater attention was paid to the education of the ordinary citizen, as reflected in the many separate philosophical treatises on education by thinkers such as Aristippus, Theophrastus, Aristoxenus, Cleanthes, Zeno, Chrysippus, Clearchus, and Cleomenes. There is definitely an extension of elementary education, with generous foundations set up in some cities to fund teachers: at Teos (*Syll.*³ 578 = Austin no. 139) all free boys were to receive education; *Rhodes, funded by Eumenes II (Polyb. 31. 31), probably came nearest to universal public education (for boys) in antiquity (cf. also at *Delphi, *Syll.*³ 672 (= Austin no. 242), and Miletus, *Syll.*³ 577 (= Austin no. 138)). Girls also received more education than before (e.g. Teos, *Pergamum), but cannot have been educated everywhere as fully as boys. But how far one can really claim universal education among Greek children in the period is controversial, and formal education was surely mostly confined to the cities. Greek *paideia* was now regarded as the essential badge of Greekness, and educational institutions—particularly the *gymnasium—were thought necessary to maintain, or assert, Greek identity.

Organization

Education was still mostly paid for by parents, but generous private benefactions in some cities provided for teachers' salaries (esp. Teos, Miletus, Delphi, Rhodes, above), and the cities seem to have taken more formal interest in education, organizing ephebic institutions (see GYMNASIUM) and regulating private benefactions themselves. Most had one gymnasium, some more. This would be the focus for physical training, which became transformed into an educational centre with schooling for *paidēs* (12–17) and ephebes: some space was devoted to schooling and lectures, with teachers of literature, philosophy, music (though the evidence suggests that this was not universal: the law from Beroea (*BÉ* 1978, 274 = Austin no. 137) implies the activity was overwhelmingly athletic). Thus it was a centre for Greek culture in the widest sense. The gymnasiarch (*kosmētēs* in Athens), a state official, was elected for a year to run the gymnasium, and to supervise all aspects of the education (public or private) of the *ephēboi* or *neoi* (ex-ephebes, i.e. in their twenties). He might be expected to contribute financially, buying oil or providing extra oil for athletic activity (very widely attested), and paying for one or more teachers' salaries. The increasing financial burdens of the office led to its decay in imperial times to a mere liturgy with wealth the only qualification. The *paidonomos* had similar duties for elementary

education. Girls also sometimes had special officials (e.g. Smyrna, Pergamum). These officials organized numerous public competitions and awards, sometimes paid for by the gymnasiarch: preserved lists of prizewinners mention (among others) those successful in reading, writing, painting, recitation, verse and song-writing, running, boxing. Class loads tended to be high, as the recorded complaints of teachers indicate, and the social standing of teachers rather low.

Other innovations of this period were the concentration of all educational activity into a single building; examinations; and the formal division of pupils into educational age groups, though these seem to vary from place to place: *paides* (boys), aged 12–17, *ephēboi*, aged 18–20 in Athens (younger elsewhere), and *neoi*, ex-ephebes, in their twenties. The ephebate, which began as a predominantly military training organized for young men by the state, and in Athens was reinvigorated in the 330s as a two-year training, spread over the Greek world with enormous vitality, and became a kind of cultural-athletic institution for the leisured classes. This came (in Athens from the late 2nd cent. BC) to include intellectual studies in its make-up, though as sport took first place, it is questionable how intellectual any of this education really was.

Elementary and secondary education

Elementary education was dominated by learning to read and write, and learning by heart, by what seem from the papyri to be unnecessarily tedious methods (sport, of course, was also important). At secondary level, adolescents progressed to an overwhelmingly literary curriculum that still involved learning by rote and recitation, and was dominated by the reading and exposition of texts under the care of the *grammaticus*. The canonization of classical literature progressed rapidly, and anthologies used for teaching crystallized certain authors and passages in the educational curriculum. Physical education and music continued; the ancient idea of the *enkyklios paideia*, or general education, was evolved to include the four main sciences, following Hippias, and looking forward to the Seven Liberal Arts of the Middle Ages (grammar, rhetoric, dialectic, geometry, arithmetic, astronomy, music). But it is unclear how keenly the scientific subjects were really pursued, and literary studies seem to oust the others. The Classics, particularly Homer, were studied in minute detail and according to rigidly formal rules. The study of grammar (in the modern sense) was added later (1st cent. BC), also composition, and preliminary rhetorical material.

Higher education

After secondary level there were several options of varying levels. The *ephēbeia* did include further cultural studies (literature, rhetoric, philosophy) accompanied by lectures and *libraries; similarly with the older *neoi*. But for really serious 'higher education' in the recognizably modern sense, there were the great centres of learning—Athens, Pergamum, and Rhodes for philosophy and rhetoric; Cos, Pergamum, or Ephesus for medicine; *Alexandria for the whole range of higher studies.

The teachers

Teachers were elected by the cities for a year at a time and supervised by the gymnasiarch and *paidonomos*. There were three grades of literary teacher: the *grammatistēs* (elementary level), *grammaticus* (secondary), and rhetor or sophist (higher). The *paidonomos* and ephebes might engage skilled itinerant teachers for short periods. Ordinary teachers received little more pay than a skilled workman, private ones less than those provided with a salary by the city: music teachers received most, then the literary teacher, then the *paidotribēs*. A good teacher would receive gifts, prizes, and sometimes tax-exemption (teachers were exempt from the salt tax in Ptolemaic Egypt).

FAGB/RT

education, Roman

1. Early Italy and the republic

There is very little reliable evidence bearing upon formal education in the early period. Education was then certainly centred on the family and was probably based upon apprenticeship supervised by the father—in poorer homes an apprenticeship to agriculture or trade, in more aristocratic circles to military service and public life (what later became known as the *tirocinium militiae* and the *tirocinium fori*). The authority of the father, legalized as *patria potestas*, was absolute and could only in theory be questioned by the censors. The Roman mother had a more restricted, domestic role but she too was traditionally expected to take a personal, central responsibility and to set a strong moral example. It is not certain when reading and writing became a serious part of Roman education: the 7th-cent. BC ivory writing-

tablet with inscribed alphabet found at Marsiliana d'Albegna and 6th-cent. *bucchero* (pottery) models of wooden writing-tablets (*tabulae ansatae*) from Etruria may imply that *literacy was then already making some headway. Institutions like the religious calendars, the census, and the codification of the *Twelve Tables point in this direction and by the end of the 4th cent. BC it would certainly have been hard for a Roman senator to do without reading and writing. It is not known how such elementary instruction was given though it was often reckoned to be a parental responsibility; references to schools in the 5th and 4th cents. BC are probably anachronistic.

2. The later republic and the empire

As Rome's contacts with the Greek-speaking world grew in the 3rd and 2nd cents. BC, a predominantly Greek pattern of education evolved (see EDUCATION, GREEK), omitting however the *gymnasium and emphasis on competitive physical education. Aristocratic Roman families often employed Greek-speaking tutors for their children (Livius Andronicus and *Ennius were early and conspicuous examples) and these tutors—often slaves or freedmen—commonly taught both Greek and Latin; competence in both languages remained a feature of an upper-class education until the western and eastern empires parted company. This tradition of tutors in wealthy families continued alongside the growth of schools. A freedman, Spurius Carvilius, is credited with opening the first fee-paying school for elementary reading and writing in the second half of the 3rd cent. BC and thereafter the elementary teacher (*ludi magister* or *litterator*) running a small school became a lowly, noisy, and familiar part of Roman life. The Greek custom of a family *paedagogus* who took the children to and from school and supervised their life and habits was also adopted; the custom burgeoned especially after the Third Macedonian War when cheap, well-qualified Greek slaves became easily available. The second stage of education was in the hands of the *grammaticus* who taught language and poetry and who might be either a private tutor with a family or a teacher with his own school. He could be a person of some learning and consequence. Teachers of *rhetoric, the third stage of Greek and Roman education, first appear in the 2nd cent. BC at Rome—Crates of Mallus was said to have been influential—and, in the absence of Latin instructional material, taught Greek theory and practice. Latin materials corresponding to the Greek rhetorical manuals appeared in the 1st cent. BC (e.g. the *Rhetorica ad Herennium*) and Plotius Gallus is said to have opened the first school for teaching rhetoric in Latin about 94 BC. Cicero's works on oratory were a major contribution to teaching rhetoric in Latin and Quintilian's *Institutio Oratoria* published about AD 95 includes a developed and humane picture of Roman rhetorical training at its best. From the middle of the 2nd cent. BC, when three visiting Greek philosophers made a great impression with their lectures in Rome, philosophy could play a significant part in the education of some wealthier young Romans. Teachers were soon available in Italy, though no philosophical schools were founded in Rome until Plotinus and Porphyry attracted pupils in the 3rd cent. AD: the young were glad to travel and to visit one of the four famous schools in *Athens or other centres where philosophers taught. From the 1st cent. AD there were law schools at Rome which founded an important tradition of legal education culminating in the great law school at Berytus (mod. Beirut) in the eastern empire. Augustus attempted with some success to use Roman and Italian traditions to create a Roman counterpart to the Greek *ephebeia* (see GYMNASIUM) in the revival of the *lusus Troiae* at Rome and the *collegia iuvenum* in the Italian cities; in this there was more than a hint of political education. Later emperors, local communities, and benefactors like *Pliny the Younger sometimes subsidized charitable and educational activity from personal interest, generosity, public duty, or political expediency but there was nothing like national or regional provision for education.

3. Levels and subjects of study

The three levels of Roman education represented by the *ludi magister*, the *grammaticus*, and the rhetor were probably never rigidly differentiated. Although formal education usually began when children were about 7 years old and transfers to the *grammaticus* and rhetor frequently happened at about the ages of 12 and 15 respectively, progress between the levels was often more a matter of achievement than age group; the roles of teachers sometimes overlapped considerably. All three levels followed a Greek pattern: the elementary teacher, for instance, taught reading by the familiar progression—letters, syllables, words—with much use of the gnomic example sentence (*sententia*). Writing and some basic mathematics were also his province. Echoes of the ancient schoolroom can be heard in the *colloquia* ('discourses') which occur in the bilingual school-books known as the *Hermeneumata*. The *grammaticus* advanced the study of both language and poetry (rarely prose). As Roman grammarians like *Varro and Remmius Palaemon adapted Alexandrian grammatical theory to Latin (especially that of Dionysius Thrax), some systematic morphology was taught; syntax was rather diffusely approached via correctness of speech and the avoidance of solecism. In teaching poetry, attention was paid to expressive reading (*lectio*) followed by the teacher's explanation (*enarratio*) and, where

appropriate, analysis (*partitio*). Homer's pre-eminent place in Greek schools was originally taken by poets like Livius Andronicus (who supplied the *Odyssey* in Saturnian verse translation), Naevius, and Ennius. Quintus Caecilius Epirota is credited with the introduction of contemporary poetry to Roman schools in 26 BC and later Virgil supplanted most earlier poets (Terence becoming the Roman counterpart to Menander. The teaching of rhetoric followed the Greek model closely with a series of preliminary exercises (*progymnasmata*—sometimes taught by the *grammaticus*) leading on to the theory and practice of declamation with the two major groupings of *suasoriae* (advice offered in historical or imaginary situations) and *controversiae* (courtroom cases). The five traditional parts of rhetoric were the basis of instruction: *inventio*, *dispositio*, *elocutio*, *memoria*, and *actio* (see RHETORIC, LATIN). The teaching of philosophy which young Romans encountered seems to have been based very much upon studying the works of the founder of a philosophical school and the commentaries of his successors.

4. Schools and teachers

Elementary teachers usually seem to have worked in suitable spaces in public porticoes or squares, in hired accommodation off the street, or in their own rooms; the idea of the school as a dedicated building is misleading. The *grammaticus* and the rhetor probably commanded better but not institutional accommodation. It is likely that most schools were small and though the monthly fees doubtless varied, such evidence as there is suggests that elementary teachers of some kind were affordable by all but the poor. Towns but not villages under the empire might be expected to have teachers and schools. Boys were almost certainly in a majority but some girls did attend too. The regular equipment for pupils consisted of waxed or whitened wooden writing-tablets, pen, and ink (though exercises were certainly written on papyrus when it could be afforded). In the elementary school lessons began at dawn and discipline was strict and unashamedly physical. There is some evidence for the education of slaves in *paedagogia* or training-schools attached to wealthy houses; the training sometimes included reading and writing as well as the household tasks required of them.

The status of elementary teachers was low; many were ex-slaves and had only a small and hazardous income. The *grammaticus* was better respected and *Suetonius' *De grammaticis* gives sketches of a poor but not ill-regarded profession. The rhetor could charge higher fees and the most famous could become men of some consequence under the empire. The ratio of maximum fees payable to the *ludi magister*, the *grammaticus*, and the rhetor in *Diocletian's Price Edict was 1:4:5. The rhetor was at first an object of some suspicion in Rome; in 161 BC rhetors were expelled from the city and Latin rhetoricians suffered the same fate in 92 BC. However, from the time of *Caesar teachers were more favoured; now and then they received various immunities, exemptions, and privileges by imperial edict, though imperial patronage was largely reserved for the highest levels. *Vespasian for instance endowed imperial chairs in Greek and Latin rhetoric at Rome, *Quintilian being the first holder of the Latin chair; Marcus *Aurelius endowed four chairs of philosophy and a chair of rhetoric at Athens. Emperors and politicians looked for visibility and prestige in exchange for their generosity.

JVM

Antiochus IV's successful invasion of Egypt was halted at Eleusis (a suburb of *Alexandria) by Roman intervention. To the south the doubtful loyalty of the Thebaid proved an ongoing threat to the traditional unity of Upper and Lower Egypt. The area was in revolt from 206 to 186, under the control of rebel kings Haronnophris and Chaonnophris and again for three years from 88. The destruction of Egyptian Thebes by Ptolemy IX brought relative peace to the south for 55 years. See NATIONALISM (Hellenistic and Roman).

Internally the Ptolemies used local expertise as they set up their royal administration based on the traditional divisions or nomes of Egypt. Self-governing cities were few: *Alexandria, which served as capital from 312 BC, the Greek Delta port of Naucratis and Ptolemais Hermiou (mod. El-Menshā) founded by Ptolemy I as a Greek city

in the south. Through a hierarchical bureaucracy, taxation of rich agricultural land and of the population and their livestock was based on a thorough census and land-survey. Greek was gradually introduced as the language of the administration and Greeks were privileged, both socially and in the tax-structure. The categorization however of Greek was now not an ethnic one, but rather one acquired, through employment and education. The wealth of the country (from its irrigation-agriculture and from taxes) was employed both for further development in the countryside (with agricultural initiatives and land-reclamation, especially in the Fayūm) and, in Alexandria, for royal patronage and display. The cultural life of the capital, with the Museum and *Library strongly supported under the early Ptolemies, played an important role in the definition of contemporary Hellenism.

Like other Hellenistic monarchs, the Ptolemies depended for security on their army, and Ptolemaic troops were tied in loyalty to their new homes by land-grants in the countryside. From the reign of Ptolemy VI local *politumata* were also founded as settlements for both soldiers and attached civilians. As the flow of immigrant recruits grew less, Egyptian troops were increasingly used, a development Polybius noted (5. 107. 3) as dangerous to the country. These troops too might become settlers (cleruchs) in the countryside (with smaller plots), as might the native police and other security forces. Land was further used in gift-estates to reward high-ranking officials; the *dioikētēs* ('finance minister') Apollonius under Ptolemy II was one of these.

In a soft approach to Egyptian ways, the Ptolemies early recognized the importance of native temples, granting privileges, and supporting native cults. For the Ptolemies were both Egyptian pharaohs and Greek monarchs. The new god Sarapis with his human aspect, an extension of the native Osiris-Apis bull, typifies this dual aspect of the period. Royal co-operation—for mutual ends—with the high priests of Memphis, central city of Lower Egypt where from the reign at least of Ptolemy V the king was crowned Egyptian-style, contrasts with the problems posed by the breakaway tendencies of Thebes and Upper Egypt. General tolerance and even financial support for native temples characterize the religious policy of the regime. In the important field of law two separate legal systems continued in use.

The sister-marrying Ptolemaic dynasty is, from the late 3rd cent., consistently represented as in decline. From the mid-2nd cent. the shadow of Rome loomed large, yet Egypt was the last Hellenistic kingdom to fall under Roman sway. DJT

Roman

After two centuries of diplomatic contacts, Egypt was annexed as a province of the Roman people in 30 BC by Octavian (the future *Augustus) after his defeat of Mark *Antony and *Cleopatra VII. Although the Romans adapted many individual elements of the centralized bureaucracy of the Ptolemaic kingdom, and although the emperor could be represented as a pharaoh, the institutions of the Ptolemaic monarchy were dismantled, and the administrative and social structure of Egypt underwent fundamental changes. The governor (prefect) and other major officials were Roman **equites* appointed, like the administrators of other 'imperial' provinces, by the emperor for a few years. Egypt was garrisoned with three, later two, legions and a number of auxiliary units. For private business pre-existing Egyptian and Greek legal forms and traditions were generally respected, but under

the umbrella of the principles and procedures of Roman law. A closed monetary system based on the Alexandrian silver tetradrachm was maintained, but the tetradrachm was made equivalent to the Roman denarius. The Egyptian temples and priesthood were allowed to keep most of their privileges, but in tacit return for the ubiquitous spread of the Roman imperial cult (*see* RULER-CULT). Local administration, previously entrusted to salaried officials and private contractors, was gradually converted to a liturgic system, in which ownership of property brought an obligation to serve. This was enabled by Augustus' revolutionary conversion of the category of 'cleruchic' land, allotments held in theory at royal discretion in return for military service, into fully private property, of which there had been very little in Ptolemaic Egypt. The Romans also increased the status of the towns and their inhabitants. Alexandria enjoyed the greatest privileges, but the *mētropolis* ('mother-city', i.e. chief town) of each regional administrative unit (nome), was under Augustus given some self-administration through liturgic magistrates, then encouraged to erect public buildings and to behave like cities elsewhere, until in AD 200/1 *Septimius Severus granted *boulai* (councils) to Alexandria and all the *mētropoleis*. As part of this urbanization the Romans introduced a strict social hierarchy with ethno-cultural overtones: Roman and Alexandrian citizens were legally marked off, mainly by their exemption from the poll-tax, from the other inhabitants, who were called 'Egyptians'. Within the category of 'Egyptians' the metropolitans (original residents of the *mētropoleis*) enjoyed some privileges, principally a reduced rate of poll-tax, and within them a theoretically hereditary group of 'Hellenic' descent, defined by membership of the *gymnasium, formed the socio-political élite of each *mētropolis*. Large private estates developed in the 2nd cent. and flourished in the 3rd, so that Egypt, like other eastern provinces, was dominated and run by a local 'Greek', urban-based land-owning aristocracy. Despite urbanization, the bulk of the population remained peasants, many of them tenant-farmers of 'public' (previously 'royal') and 'sacred' land for the traditional, variable, but quite high, rents in kind. The imperial government exported some of this tax-wheat to feed Rome, but it was equally if not more interested in the cash revenues of Egypt. Roman tax-rates often followed Ptolemaic precedent, though the annual poll-tax in cash was a striking novelty; the chronic fiscal problems uniquely documented in the papyri were probably typical of much of the ancient world. Whether economic conditions were better or worse than in previous periods is difficult to judge. The single greatest disaster of the Roman period was the Antonine *plague of the mid-160s to 170s, but the country seems to have recovered

fully by the early 3rd cent. Generally Roman Egypt had a vigorous and increasingly monetized economy. The main cultural division was between the 'Hellenic' life of the metropolitans and the village life of the Egyptian-speaking majority, even after the universal grant of Roman citizenship in 212. But most peasants were involved in the money economy, many acquired some literacy in Greek, and the scale of urbanization implies considerable social mobility. The political and fiscal reforms of *Diocletian at the end of the 3rd cent., capping longer-term developments such as the growth of *Christianity—which led to the re-emergence of Egyptian as a literary language (Coptic)—brought about another social, administrative, and cultural revolution which marked the end of 'Roman' Egypt. Egypt remained a province of the Byzantine empire until it came under Arab rule in AD 642. (See RACE; FOOD SUPPLY (Roman))

DWR

Egyptian deities the Graeco-Roman view of Egyptian religion is sharply fissured. Despite Herodotus 2. 50. 1 (comm. A. B. Lloyd, 1975–88), many writers of all periods, and probably most individuals, found in the Egyptians' worship of animals a polemical contrast to their own norms (though cf. Cic. *Nat. D.* 1. 29. 81 f.), just as, conversely, the Egyptians turned animal-worship into a symbol of national identity (cf. Diod. Sic. 1. 86–90). The first Egyptian divinity to be recognized by the Greek world was the oracular Ammon of the Siwa oasis (Hdt. 2. 54–7); but *oracles have a special status. The only form of Late-period Egyptian religion to be assimilated into the Graeco-Roman world was to a degree untypical, centred on anthropomorphic deities—Isis, Sarapis, and Harpocrates—and grounded in Egyptian vernacular enthusiasm quite as much as in temple ritual. The other gods which became known in the Graeco-Roman world, Osiris, Anubis, Apis, Horus, Bubastis, Agathodaemon, Bes, etc., spread solely in their train. Moreover, especially in the Hellenistic period, a nice balance was maintained between acknowledgement of their strangeness (Isis *Taposirias*, *Memphitis*, *Aigyptia*, etc.) and selection of their universal, 'hearkening', 'aiding', 'saving' roles.

From the late 4th cent. BC, these cults were most commonly introduced into the Greek world, primarily to port- and tourist-towns, by (Hellenized) Egyptians, i.e. immigrant metics: cf. *IG* 11. 4. 1299, comm. H. Engelmann (1975²). Sometimes they were introduced by Greeks who had served or lived in Egypt (e.g. *SEG* 38. 1571, 217 BC). There is a growing consensus that they were often indirect beneficiaries of Ptolemaic political suzerainty. Within a generation or two they became sufficiently attractive to Greeks of some social standing to be able to press for recognition as *thiasoi* (groups of worshippers of

a god): it was when they proselytized among the citizen body that they were regulated by city governments and incorporated as civic deities. Full-time Egyptian priests were then obtained for larger temples, and subordinate *synodoi* (associations) formed, e.g. *melanophoroi* (lit. 'the black-clad'), *pastophoroi* ('shrine-carriers'), analogous to a development widespread in Late-period Egypt. In many smaller communities the Greek model of annual priesthoods was adopted (see PRIESTS (GREEK AND ROMAN)). In the west, Isis reached Campania from *Delos in the late 2nd cent. BC. At Rome the situation was initially volatile: the private *Isium Metellinum* (75–50 BC) and an illegal shrine on the Capitol were pulled down in 53 BC (Dio Cass. 40. 47. 3, cf. 42. 26. 2). The first public temple was the *Isium Campense* (43 BC). The cults became attractive to members of the decurial class in the 1st cent. AD, spreading from Italy unevenly into the western empire. Neither slaves nor the poor are anywhere much in evidence.

RLG

ekklesia, democratic assembly at Athens. See DEMOCRACY, ATHENIAN, §§2 and 3.

ekphrasis, an extended and detailed literary description of any object, real or imaginary. 'There are *ekphraseis* of faces and objects and places and ages and many other things' (Hermog. *Prog.* 10; cf. Dion. Hal. *Rhet.* 10. 17, Lucian, *Hist. conscr.* 20, Athonius, *Progymnasmata* 12). The rhetoricians thus systematized into a rhetorical exercise (*progymnasma*) a poetic technique stretching from the description of the shield of Achilles in the *Iliad* to that of Hagia Sophia by Paulus Silentiarius. Most were of works of art. *Ekphraseis* was a work by Callistratus, and *Eikones* was the title of works by Philostratus, *Lucian, and others.

JSR

Elagabalus (Marcus Aurelius Antoninus), emperor (AD 218–22) was the son of Sextus Varius Marcellus and Iulia Soaemias Bassiana, niece of Iulia Domna. Born probably in 203, as Varius Avitus Bassianus, he was holding the priesthood, hereditary in his mother's family, of the presiding deity of Emesa in Syria, in 218, when his mother and grandmother Iulia Maesa used him as figure-head of a rebellion against Macrinus. He was proclaimed to be son of his mother's cousin *Caracalla and renamed Marcus Aurelius Antoninus after him. After the victory, he took the cult of the god by whose name he is known to Rome, which he reached in July 219. In late 220 his intention to make Elagabalus ('deus Sol invictus', 'the invincible sun god') supreme god of the empire aroused open hostility at Rome when he divorced his first wife Iulia Paula and married the Vestal virgin Aquilia Severa, a 'sacred marriage' to match the union of the god with Juno

Caelestis. He was forced to adopt his cousin Alexianus, renamed Alexander (26 June 221), and to divorce Aquilia in favour of a descendant of Marcus *Aurelius, Annia Faustina; but by the end of 221 took Aquilia back and tried to get rid of Alexander. This provoked renewed outrage, which came to a head with his murder on 11 March 222 and replacement by Alexander. His flouting of conventions in the choice of officials, combined with disgust at the orgiastic ceremonial of the Syrian cult had proved too much for senate, praetorians, and *plebs alike. See SEVERUS ALEXANDER. ARBI

elections and voting

Greek

In the Greek states voting was used in councils, assemblies, and lawcourts; appointments were made by election or by allotment or sometimes by a combination of the two. In Athens and elsewhere *psēphisma* (from *psēphos*, 'voting-stone') became the standard word for a decree of the council (*boulē*) or assembly (*ekklēsia*), and *cheirotonia* ('raising hands') was used for elections; but in *Athens voting was normally by show of hands (not precisely counted) in the council and assembly both for decrees and for elections, but by ballot in the lawcourts (see DEMOCRACY, ATHENIAN). Ballots seem first to have been used on occasions when a count was necessary to ensure that a quorum was achieved, but by the end of the 5th cent. BC it had been realized that voting by ballot could be secret voting. In *Sparta voting by acclamation survived to the Classical period for elections and for decrees of the assembly. In the Hellenistic and Roman periods some decrees of some states report numbers of votes cast for and against. PJR

Roman

At Rome adult male citizens had the right to vote to elect the annual magistrates, to make laws, to declare war and peace, and, until the development of the public courts in the late republic, to try citizens on serious charges. But the remarkable feature of the Roman system was that matters were never decided by a simple majority. Votes were always cast in assigned groups, so that a majority of individual votes decided the vote of each group, and a majority of groups decided the vote of the assembly as a whole. The three groupings of the 30 *curiae* (the most ancient divisions), centuries (*centuriae*), and tribes (*tribus) made up the different types of *comitia* (assembly).

In the two important *comitia* the overall procedures for voting were similar. Cicero (*Flac.* 15) noted that Romans considered matters and voted standing up, whereas the Greeks sat down. The vote was preceded by a *contio*, a

public meeting, to present the issues or the candidates involved. The presiding magistrate dissolved this by the command to the citizens to disperse (*discedere*) into the areas roped off for each group. From their enclosures the groups of citizens proceeded, when called, across raised gangways (*pontes*), erected at the site of the assembly. Originally each voter was asked orally for his vote by one of the officials (*rogatores*), who put a mark (*punctum*) against the appropriate name or decision on his official tablet. From 139 to 107 BC a series of four laws introduced the secret ballot. Now the voter was handed a small boxwood tablet covered in wax on which he recorded his vote with a stylus. In most cases a single letter was sufficient: in legislation, V for assent (*uti rogas*) and A for dissent (*antiquo*); in judicial cases L for acquittal (*libero*) and C for condemnation (*condemno*); in elections the voter was expected to write the names for himself (*Cato the Younger is supposed to have rejected many votes clearly written in the same hand, Plut. *Cat. Min.* 46). The completed tablet was then dropped into a tall wickerwork voting-urn (*cista*) under the control of guardians (*custodes*), who forwarded it to the tellers (*diribitores*). The process of casting the vote is illustrated on a coin of Publius Licinius Nerva of the late 2nd cent. BC. In the *comitia centuriata* people voted successively, class by class, and the results were announced as they went along. In the *comitia tributa* successive voting was used in legislative and judicial assemblies, but simultaneous voting probably in elections. This may explain why legislative assemblies regularly took place in a variety of places, some quite restricted, such as the *forum Romanum, Capitol, and Circus Flaminius (see CIRCUS), while the large spaces of the Campus Martius were needed for elections. It was here that Caesar planned a huge building, the Julian Enclosures (Saepta Iulia), to house the electoral process. The project was continued by the triumvir *Lepidus and completed in 26 BC under Augustus by *Agrippa, who was also responsible for beginning a connected building to house the tellers (the Diribitorium).

The lot played a vital role in the electoral process. It was used to pick the tribe (designated as the *principium*) or the century (*centuria praerogativa*) which voted first and provided a lead for the other voters. The lot also determined the order of voting by the tribes or the order in which the votes were announced. This was important, because the first candidates to achieve a simple majority of the groups were declared elected up to the number of posts available, even though they might not have polled the largest number of votes, if all the votes of all the groups had been counted.

The significance for Roman politics of this elaborate and time-consuming voting process has often been

played down by historians. However, the great lengths to which members of the élite went to win votes is testimony to the fact that the voting assemblies represent a truly democratic element in republican Rome. In typical Roman fashion the voting procedures, in a modified form, remained under the Principate, even when the substantive decision-making had passed to the emperor and the senate. JJP

Electra, in mythology: (1) daughter of Oceanus and Tethys, wife of Thaumias, mother of Iris and the Harpyiae (Harpyliae; Hes. *Theog.* 265 ff.).

(2) Daughter of Atlas and Pleione, and one of the Pleiades (Apolloclod. 3. 10. 1); mother by Zeus of Dardanus and Iasion (ibid. 3. 12. 1).

(3) Daughter of *Agamemnon and Clytemnestra, and sister of Orestes. She does not appear in epic, the first certain mention of her being in the *Oresteia* of *Stesichorus (fr. 217 Davies, *PMGF*), although she was said to be Homer's Laodice, renamed because of her long unwedded state (*Il.* 9. 145; cf. Xanthus fr. 700 *PMG* Page). Our major source for her story is Athenian tragedy, where she plays a central role in Orestes' vengeance on Clytemnestra and her lover Aegisthus for the murder of Agamemnon. Her first appearance is in the *Choephoroe* of *Aeschylus, where she is unalterably hostile to her mother and Aegisthus, welcoming her brother, joining with him in an invocation to Agamemnon's ghost, but not actively involved in the killings. In fact here the focus is still mainly on Orestes, with Electra disappearing from view once the vengeance begins. But her role is very much developed in *Sophocles and *Euripides.

In Sophocles' *Electra*, the main focus of the play is Electra herself, a steadfast, enduring figure, passionately grieving over her father's murder and passionately set on revenge. She rescued Orestes, then a young child, from his father's murderers (12, 296–7, 1132–3), and now longs for his return. The move from despair to joy in the scene where she laments over the urn, believing it to hold the ashes of her dead brother, then learns that the man beside her is in fact the living Orestes himself, gives us perhaps the most moving recognition scene in extant tragedy. She is a strong and determined character who, when she believes Orestes dead, is willing to kill Aegisthus entirely unaided (947 ff., 1019 ff.); then, when it comes to the murder of Clytemnestra, she urges Orestes on, shouting out to him at the first death-cry of her mother, 'Strike, if you have the strength, a second blow' (1415).

In Euripides' *Electra* she is even more active in the murder: Orestes is weak and indecisive, and it is Electra who is the dominant figure, driving him to kill Clytemnestra and even grasping the sword with him at the

moment of murder (1225), although afterwards she is full of remorse as before she was full of lust for revenge. In Euripides' *Orestes* she appears as a desperately faithful nurse and helper to her mad brother, abetting him and his comrade Pylades in their attacks on Helen and Hermione. In some accounts she later marries Pylades (Eur. *El.* 1249; *Or.* 1658 f.; *Hyg. Fab.* 122, where she also meets Orestes and Iphigenia at Delphi and, failing to recognize them, nearly murders Iphigenia, who she thinks has killed Orestes).

There is no certain representation of Electra in art before the beginning of the 5th cent. BC, where she is present at the murder of Aegisthus; later her meeting with Orestes at the tomb of Agamemnon became popular: see I. McPhee, *LIMC* 3/1. 709–19; Gantz, *EGM* 676–85. HJR/JRM

elegiac poetry, Greek This may be initially defined as poetry in elegiac couplets (hexameter followed by a pentameter), one of the most popular metres throughout antiquity. The term *elegeion*, normally meaning 'elegiac couplet', is derived from *elegos*, a sung lament that must have been characteristically in this metre, but the metre was always used for many other purposes. We also find the feminine *elegeia*, 'elegy', i.e. a poem or poetry in elegiacs.

A stricter definition distinguishes between elegiac poetry (elegy) and epigram (which was often but not necessarily in elegiac metre). Elegy, in the early period, was composed for oral delivery in a social setting, as a communication from the poet to others; an epigram was information written on an object (a tombstone, a dedication, etc.). The distinction was not always so clear after the 4th cent. BC, when the epigram came to be cultivated as a literary genre, but on the whole it can be sustained. As Greek *epigram has its own entry in this volume, we shall concentrate here on elegy.

All archaic elegy is in (epic-)Ionic dialect (see GREEK LANGUAGE, § 4), whatever the author's provenance, and the form must have evolved among Ionians side by side with hexameter poetry. It is already established on both sides of the Aegean by c.650 BC when the first recorded elegists appear: *Archilochus, Callinus, and Tyrtaeus. From then till the end of the 5th cent. BC elegy was a popular medium; some poets used no other. Extant poems vary in length between two lines and 76 (*Solon fr. 13 West); Solon's *Salamis* was of 100 (Plut. *Sol.* 8. 2), while such poems as Mimnermus' *Smyrneis* and *Simonides' *Battle of Plataea* may have been longer still.

Many pieces presuppose the *symposium as the setting in which they were designed to be heard (e.g. Thgn. 467, 503, 825, 837, 1047, 1129; Xenophanes 1; Simon. eleg. 25 W;

Dionysius Chalcus 1–5; Ion 26–7). Theognis (239–43) anticipates that (his elegies addressed to) Cyrnus will often be sung by young men at banquets in a fine, clear voice to the accompaniment of *auloi* (flutes, oboes). There are other mentions of an aulete accompanying the singing of elegy in the symposium (Thgn. 533, 825, 941, 943, 1056), and an early 5th-cent. vase-painting (Munich 2646) shows a reclining symposiast with words of an elegiac verse issuing from his mouth while an aulete plays. Presumably there were conventional melodies that the aulete could repeat or vary for as long as required, without his having to know what verses were to be sung, as he would need to in the case of lyric. Certain elegists (Tyrtaeus, Mimnermus) are said to have been auletes themselves. Other settings are occasionally suggested: carousal through the streets after the party (Thgn. 1045, cf. 1065, 1207, 1351); a military encampment (Archil. 4; Thgn. 887, 1043); a public square in the evening (? Thgn. 263). Elegiac laments may sometimes have been sung at funerals, and these or other elegiac compositions at certain festivals where prizes were awarded for aulody, i.e. singing to *aulos* accompaniment, as happened at the Pythian festival (held at *Delphi) in 586 BC (Paus. 10. 7. 4–6) and at the Panathenaea from about 566.

A common use of elegy in the 7th cent. was in exhorting the poet's fellow citizens to fight bravely for their country (Callinus 1, Tyrnt. 10–1, 18–23a W, as well as Mimnermus 14 W, Solon 1–3 W); Callinus' opening 'How long will you lie there?' may imply the symposium setting. In other poems of Tyrtaeus and Solon the exhortation is political, presumably not delivered before a mob but to a social gathering from which participants might pass the message on to other gatherings. Solon, at least, also wrote elegies of a more personal, convivial character. Mimnermus was famous for elegies celebrating the pleasures of love and youth. He also used the versatile elegiac for his *Smyrneis*, a quasi-epic (for the symposium?), complete with invocation of the Muses, on the Smyrnaeans' heroic repulse of the Lydians around the time of the poet's birth.

The largest surviving body of archaic elegy is the collection of poems and excerpts, some 1,400 lines in all, transmitted under the name of Theognis. He is actually only one among many poets represented, ranging in date from the 7th to the early 5th cent. BC. Here we find a wide cross-section: political and moralizing verse, social comment, personal complaint, convivial pieces, witty banter, love poems to nameless boys. Other items are reflective or philosophic, and develop an argument on some ethical or practical question. This dialectic element was a feature of elegy from the start, but became more prominent later, for example in Xenophanes and Euenus.

With the publication of *Oxyrhynchus Papyri* 3965, Simonides now appears as the major 5th-cent. elegist. He used the medium to celebrate the great battles of 480/79 BC; his grandiose poem on Plataea (eleg. 10–17 W) recalls Mimnermus' *Smyrneis*. His more personal poetry is now also represented by some fine fragments. Lesser 5th-cent. elegists include Euenus, Dionysius Chalcus, Ion of Chios, and Critias. They are all symposium-oriented, and this is still the situation in what looks like an early 4th-cent. piece, Adesp. eleg. 27 W. But the symposium was fast losing its songfulness, and elegy in the classical style was drying up. Isolated poems are quoted from Philiscus of Miletus and *Aristotle, containing posthumous tributes to *Lysias and *Plato respectively. Meanwhile, Antimachus' use of elegiac metre for a long mythological poem, his *Lyde*, set a new pattern. (The existence of long antiquarian elegiac poems by Semonides, Xenophanes, and Panyassis is doubtful.) Antimachus and (nominally) Mimnermus were the two principal models for Hellenistic elegists such as Philitas, Hermesianax, Phanocles, Alexander Aetolus, *Callimachus (*Aetia*), *Eratosthenes (*Erigone*), Parthenius, who combined romantic subject-matter with mythological learning, sometimes on a large scale. But the metre was now taken up again by many poets for diverse purposes; witness its use for a hymn (Callim. *Hymn* 5), a bucolic singing-contest (Theoc. *Id.* 8. 33 ff.), medicinal didactic (Nic. frs. 31–2 Gow–Scholfield, Eudemus in *Suppl. Hell.* 412A). This last application continued into the 1st cent. AD (Aglaïas, Philon of Tarsus, Andromachus). Otherwise the elegiac metre rather fell out of favour under the empire except for epigrams. Gregory of Nazianzus made some use of it, and it appears in a 4th-cent. encomium of a Beirut professor (*Pberol.* 10558).

MLW

elegiac poetry, Latin *Ennius introduced the elegiac couplet into Latin (Isid. 1. 39. 15); four epigrams, epitaphic in form, survive under his name (*var.* 15–24 Vahlen; 43–6 Courtney). Lucilius (bks. 22–5) used the metre for epitaphs and other short poems descriptive of slaves. An anecdote in Aulus *Gellius (19. 9) offers an early glimpse of elegiac epigram on erotic themes, Hellenistic in flavour (Valerius Aedituus, Porcius Licinus, and Quintus Lutatius Catulus, c.150–100 BC); a Pompeian wall bears witness to the popular diffusion of such work in the second quarter of the 1st century BC (D. O. Ross Jr., *Style and Tradition in Catullus* (1969), 147–9). The careers of *Catullus and *Ovid bound the elegiac genre's most concentrated and distinctive period of Roman development. In particular, by early Augustan times elegy emerges as the medium for cycles of first-person ('subjective') poems describing the tribulations, mostly erotic,

of a male poet who figuratively enslaves himself to a single (pseudonymous) mistress, distances himself from the duties associated with public life, and varies his urban *mise en scène* with escapist appeals to other worlds, mythological (*Propertius, Ovid) or rural (*Tibullus). 'Love-elegy', though the term is widely used by modern critics, was not for the Romans a formal poetic category. However a canonical sequence of Cornelius Gallus (as originator), Tibullus, Propertius, and Ovid is explicitly offered by Ovid (*Tr.* 4. 10. 53–4; cf. *Ars am.* 3. 536–8); and Quintilian's later adoption of this same canon to represent Latin elegy at large arguably reflects the central role of Augustan 'love-elegy' in defining the genre. Among elegiac works by other hands in the *Corpus Tibullianum* especially noteworthy is the group associated with the female poet Sulpicia.

The question of Greek precedent for the format of Latin 'love-elegy' has long been disputed. Propertius repeatedly pairs *Callimachus and Philitas as literary models. The latter is among a number of late Classical and Hellenistic elegists who wrote extended poems in which (this is controversial) mythological narratives may have been framed or unified by 'subjective' discussion of the poet's own beloved (cf. esp. Antimachus, test. 7 Wyss, *POxy.* 3723); Catullus 68 has been adduced as a possible link to such a tradition. This search for origins remains inconclusive, and is further hampered by a lack of reliable knowledge concerning Gallus; the new fragment published in 1979 only adds to the uncertainty concerning the format and development of Gallan elegy. More accessible are continuities in Augustan 'love-elegy' with the erotic conceits of short Hellenistic epigram, and with the situations and characters of New Comedy. Most immediately important is the influence of Catullus' portrait of Lesbia as developed piecemeal in the elegiac epigrams, in 68, and in the polymetrics.

Even in the heyday of 'love-elegy', the associations of the genre were never exclusively amatory. *versibus impariter iunctis querimonia primum, | post etiam inclusa est voti sententia compos*, 'Verses unequally joined framed lamentation first, then votive epigram': Horace's interest (*Ars P.* 75–6) in defining the genre in terms of its traditional origins finds some reflection in the practice of his own elegiac contemporaries (cf. Ovid's poem of mourning for Tibullus at *Am.* 3. 9. 3–4). With its stress upon separation and loss, and its morbid flights of fancy (especially in Propertius), Roman elegiac love may be implicated from the outset in funereal lament. The association with votive epigram is no less available for reclamation: allusions to fictional inscriptional contexts, funereal or otherwise dedicatory, abound in literary elegy. To some extent, as in Greek, the elegiac couplet is an all-purpose metre, save

that its sphere of operation can often be defined negatively as 'not epic'. The paired contrasts between public and private, martial and peaceful, hard and soft, weighty and slight which dominate the aesthetic and moral vocabulary of late republican and early imperial poetry are associated above all with an opposition between *epic and elegy, deriving ultimately from Callimachus' *Aetia* prologue. Epic is constantly immanent within elegy as the term against which it defines itself—even in those long narrative elegies which come near to closing the gap between the two genres. Ovid's career as an elegist, from 'subjective' *Amores* to epistolary *Heroides*, didactic *Ars Amatoria*, aetiological *Fasti*, funereal *Tristia*, and vituperative *Ibis*, is the pre-eminent demonstration of the ability of a classical Roman genre to expand its range without losing its identity.

After Ovid the metre was used chiefly for epigrams and short occasional poems (many examples in *Anthologia Latina*). The use of elegy for epigram reached a peak in the work of *Martial, whose couplets can excel Ovid's in wit and technical virtuosity. The elegiac couplet is favoured by many late antique poets, including Ausonius and Claudian, but generally with no strong sense of linkage between metre and subject-matter.

Metre

The elegiac hexameter differs little from the heroic. The special effects appropriate to epic were not often required in elegiac writing, and the general character of the line is smooth and fluent. Of five pentameters by Ennius which survive four end in disyllables, and it may be that this rhythm was the most satisfactory to the Roman ear: certainly, though the epigrammatists mentioned above, para. 1, and Catullus freely admitted words of from three to five syllables to the end of the line, following Greek practice, the disyllabic ending became the rule in Propertius' later poems and in Ovid (however, in *Her.* 16–21, the *Fasti*, and the poems of exile he reverts occasionally to the looser usage). After Catullus elision became both rarer and, when used, less harsh. These developments were undoubtedly dictated by artistic preferences, but Catullus' 'un-Augustan' usages must not be interpreted as evidence of technical incapacity: the occasionally harsh rhythms of e.g. poem 76 are part of the designed effect of the poem (cf. E. Harrison, *CR* 1943, 97 ff.; Ross, 115 ff.). From the very beginning the Latin couplet, unlike the Greek, tended to be self-contained: genuine enjambment between couplets is extremely rare. For modern Latin verse-writing, from the Renaissance onwards, the strict Ovidian form of the couplet has generally been the preferred model. It is above all ideally suited to pointed

expression, conveyed through variation and antithesis: half-line responding to half-line, pentameter to hexameter, couplet to couplet. EJK/SEH

elephants Although *ivory was known to the prehistoric Greeks and is mentioned in *Homer, they first encountered war-elephants at Gaugamela in 331 BC. The ivory probably came originally from Africa, but the first war-elephants were Indian (*Elephas maximus*). Although not used by *Alexander the Great, war-elephants were used by his successors, particularly the *Seleucids and Ptolemies.

When the Seleucids gained control of the Indian sources, the Ptolemies managed to capture and train African 'forest' elephants (*Loxodonta africana cyclotis*), then found in the hinterland of the Red Sea. Smaller than Indian elephants, they are not to be confused with East African 'bush' elephants (*Loxodonta africana*), the latter being larger than the Indian and unknown to the ancients. The 'forest' elephant is now almost extinct, but until comparatively recently was still found in the Gambia. The main difference between the two types was that the Indian was large enough to carry a howdah containing one or more missile-armed soldiers in addition to the mahout, whereas the African carried a single mahout, and although he could carry javelins, the elephant itself was the main weapon. When the two types met at the battle of Raphia (217 BC), the Africans were defeated, but they were heavily outnumbered.

The Romans first encountered elephants when *Pyrrhus used Indians in his invasion of Italy, hence the term 'Lucanian cows'. Both at Heraclea in 280 BC and at A(u)sculum Satrianum in 279, they had considerable success, in the first routing the Roman cavalry—untrained horses will not face elephants—in the second actually breaching the Roman infantry line after it had been driven back by Pyrrhus' phalanx.

By this time the Carthaginians were also using African elephants, drawn from the forests of the Atlas region. They fought against the Romans in the First Punic War (see ROME (HISTORY), §1.4), in Sicily and in the defeat of Marcus Atilius Regulus in Africa. Their appearance is clearly shown on Carthaginian coins minted in Spain. *Hannibal, famously, took elephants across the Alps in 218 BC. They helped win his first victory at the Trebia, but all save one died during the winter of 218/17. This carried Hannibal through the marshes of the Arno in 217, and may be the one called 'Surus', mentioned by *Cato the Elder (in Plin. *HN* 8. 5. 11). But although Hannibal received more in 215, and used them in an attempt to break the siege of Capua in 211, it was only at the battle of Zama that he used them again in quantity, and there *Scipio

Africanus nullified their effectiveness by opening lanes through his ranks.

The Seleucids continued until their downfall to make use of elephants, but although the Romans also sometimes used them in war (e.g. at Cynoscephalae, Numantia, and Thapsus), they were mainly kept for the arena or ceremonial. During the empire there was an imperial herd in Latium. It is strange that they were never used as pack-animals or for road-building, as they were by the British army as late as the Second World War. JFLA

Eleusis (see ◀Map 1, Cc▶), the most famous deme (local district: see DEMOCRACY, ATHENIAN) in Athens after Piraeus, on a land-locked bay with a rich plain, was a strong prehistoric settlement but merged with Athens sometime before the 7th cent. BC. Its hill (called Akris) and sanctuary were enclosed by fortification walls in the late 6th cent. and it became one of the three main fortresses for the defence of W Attica (with Panakton and Phyle). There was an important theatre of *Dionysus there, and the sanctuary of *Demeter and Kore (see PERSEPHONE) was the site of many festivals of local or national importance (Eleusinia, Thesmophoria, Proerosia, Haloa, Kalamaia), but the fame of Eleusis was due primarily to the annual festival of the *Mysteries, which attracted initiates from the entire Greek-speaking world. Within the sanctuary of the Two Goddesses the earliest building that may be identified as a temple is geometric. Its replacement by increasingly larger buildings (two in the Archaic period, two attempted but not completed in the 5th cent.), culminating in the square hall with rock-cut stands built under *Pericles, the largest public building of its time in Greece, bears eloquent witness to the ever increasing popularity of the cult. The unusual shape of this temple reflected its function as hall of initiation (usually called Anaktoron, sometimes Telesterion). Destroyed by the Costoboc in AD 170, it was rebuilt under Marcus *Aurelius, who also brought to completion the splendid propylaea, a copy of the Propylaea on the Athenian Acropolis. In this he followed the initiative of *Hadrian, who was primarily responsible for the physical renewal of the sanctuary in the 2nd cent. The sanctuary evidently ceased to exist after AD 395. KC

emotions (see page 273)

encomium/enkōmion The word *enkōmion* is probably derived from *kōmos*, 'revel', though some ancient writers preferred to connect it with *kōmē*, 'village': there was a similar dispute about the origin of *kōmōidia*. It denotes praise or congratulation. Some poems of *Simonides, *Pindar, and *Bacchylides were classified as *enkōmia* by Alexandrian scholars (see LYRIC POETRY).

Eleusis Model showing the sanctuary of Eleusis following rebuilding in the later 2nd cent. AD. The hall of initiation dominates the complex. The monumental propylaea (gateway) to the right, rebuilt by Marcus *Aurelius, reflects the intense Roman interest in the cult. Eleusis Museum / TAP Service, Athens

Prose *enkōmia* begin to appear in the 5th cent. They are not always a serious substitute for poetry, but more *jeux d'esprit*. *Gorgias describes his *Helen* as his *paignion* (*jeu d'esprit*), and the sophist Polycrates is credited with paradoxical pieces on salt and mice. This tradition persisted; good later examples are *Lucian's *Fly* and Synesius' *Baldness*. A well-defined rhetorical structure developed early, exemplified by the praises of Eros in *Plato's *Symposium* (esp. Agathon's speech), *Isocrates' obituary of Evagoras, and *Xenophon's *Agesilaus*. Family and birth come first, then achievements and virtues, some or all of the four cardinal virtues forming the usual framework. This pattern proved adaptable to, for example, the praise of cities; it also influenced the development of biography (see BIOGRAPHY, GREEK; BIOGRAPHY, ROMAN). Theory too began in the 4th cent. The *Rhetorica ad Alexandrum* emphasizes the need to exaggerate good points and play down bad, while *Aristotle speculates on the nature of praise and the praiseworthy (goods of the soul, rather than those of the body, or external goods), and appears to regard *enkōmia* as a response to actions and *epainos* ('praise') to character (*Eth. Nic. Eth. End.* 1101b, *Eudemean Ethics* 1219b). For later theory, see EPIDEICTIC. Verse

encomia continued to be produced, from *Theocritus 16 (*To Ptolemy*), down to Claudian's poems on Honorius and Stilicho. Prose versions however were more common, a ubiquitous feature of public life throughout Roman and Byzantine times. In the rhetorical schools, encomium, though viable as a complete speech, was commonly included in the course of progymnasmata, where instruction was given on how to praise men, cities, institutions, animals, and various natural phenomena. Libanius' set of models, for example, comprises *Diomedes*, *Odysseus*, *Achilles*, *Thersites* (a favourite paradoxical subject), and *Demosthenes*, but also *Justice*, *Farming*, *An Ox*, and *Palm-Tree and Apple-Tree*. The opposite of encomium is *psogos*, 'blame', which uses the same rhetorical structure, but says bad things instead of good about each stage of its victim's life.

DAR

Ennius, Quintus (239–169 BC), epic and dramatic poet. He was an immigrant of upper-class Messapian origin, brought to Rome in 204 by *Cato the Elder (consul 195) and given Roman *citizenship in 184 by Quintus Fulvius Nobilior (consul 153). Cato found him serving in a Calabrian regiment of the Roman army in Sardinia. At Rome

EMOTIONS

emotions Although generated by neurobiological processes, emotions (*pathē, affectus*) also consist in a process of appraisal and individual judgement, which depends on social and cultural norms and individual proclivities. As they heavily influence social relations and the behaviour of individuals and groups, emotions are socially relevant and, consequently, subject to scrutiny, judgement, and normative intervention. They fulfil social functions and follow social rules. Hence, they are potentially subject to change and are shaped by the society in which they operate. Although it can be argued that emotions are a universal phenomenon, they do have a history and are a very important subject of historical research. This applies both to emotions closely connected with socio-cultural norms (e.g. friendship, pity, honour, shame, pride) and to 'basic emotions' (e.g. fear, hope, joy, grief, disgust, despair, love, lust, envy).

In Classics, the study of emotions is a multidisciplinary task that profits from the findings of the neurosciences, exploits the evidence in a large variety of sources, and takes into consideration diverse parameters (aesthetic, social, and cultural). Classicists and ancient historians can study filtered representations of and reflections on emotions as well as the parameters which explain why a feeling is represented in a particular manner in ancient texts and images. A variety of factors influence the manifestation of emotions: the display of emotions as a persuasion strategy (e.g. in oratory, petitions, prayers); dramatizations and aesthetics; the influence of norms, especially of norms that aimed at restraining emotional display; gender roles; the character of the audience; linguistic usage. Although Greek and Latin terms designating emotions usually correspond to modern categories, the overlap varies, and there are nuances which can be understood only if the cultural context and the language of emotion is taken into consideration.

Much emphasis has been placed on the representation of emotions in literature (*tragedy, *lyric poetry, *historiography) and on the perception of emotions in moral philosophy. Systematic studies have been devoted to the representation and perception of emotions in Greek literature, philosophy, and medicine, and to individual emotions, such as anger, greed and generosity, courage, friendship, honour and shame, pity, envy and jealousy, love and desire. As regards the representation of emotions in art, special emphasis has been placed on gestures and body language as reflections of emotions.

Most (if not all) textual and pictorial sources at our disposal are directly or indirectly generated by emotions, display emotions or aim to arouse emotions. Admittedly, the emotional background is more evident and significant in some sources than in others (e.g. in tragedy, oratory, the *novel, and historiography more than in laws or in cooking recipes); the realistic expectation to understand the emotional background is higher in some sources (e.g. private letters, letters of consolation, petitions, funerary reliefs, *curses) than in others (deeds of sale or loomweights). But even as technical a work as *Aeneas Tacticus' treatise *How to Endure a Siege* often clarifies which emotions can be helpful (loyalty, zeal), and which should be taken into consideration (mistrust) and explains the means by which certain emotions can be provoked and others avoided. Exactly because emotions have shaped the Greek and Roman source material, their study is of great significance for the understanding of history, literature, art, and culture.

Emotions are important both as subject and as background of textual sources. The early epic is dominated by emotions: the wrath of *Achilles, *Odysseus' wish for return, the revenge of *Poseidon, Penelope's affectionate faith towards her husband, the suitors' ambitions and greed, the sailors' fear of the unknown, a dog's love. Lyric poetry in Archaic Greece (e.g. *Archilochus and *Sappho) and love poetry in Rome (e.g. *Catullus, *Propertius, *Ovid) purport to be describing the poet's emotions. Emotions are the background of drama and are addressed by *Aristotle in his definition of tragedy (*eleos* and *phobos*). *Thucydides, the most influential among Greek historians, regarded emotions such as greed, anger, envy, and honour as motors of historical processes; *Tacitus claimed to have banned emotions influencing his historical narrative (*Ann.* 1.1.3: *sine ira et studio*). *Pothos* ('desire', 'longing') was often used by our sources in connection with decisions of *Alexander the Great which seemed hard to explain or even irrational. The manipulation of audiences' emotions was the subject of law-court performances in Classical Athens, *epideictic orations in the Roman Empire, and rhetorical handbooks. Moral philosophers, with *Aristotle as their most influential representative, and physicians reflected on the nature of emotions. Emotional display can also be observed in private letters (e.g. *Cicero) and novels.

Although emotions have primarily been studied in connection with literary sources and with the history of literature and philosophy, documentary sources (inscriptions and papyri) also display, express, arouse, and at times aim to

control emotions. These sources clearly reveal the importance of emotions in the study of political history, law, religion, culture, and society beyond the world of literary fiction and philosophical theorizing. The documentary sources exceed the thematic range and the geographical, chronological, and sociological background of literary sources. Inscriptions (e.g. epitaphs, acclamations, decrees, honorary inscriptions, oracular enquiries, confession inscriptions, dedications, curses, graffiti) and papyri (e.g. letters, petitions, testaments, contracts, letters of consolation) have been found beyond the major urban centres; they were sometimes composed by individuals who belong to low social strata and come from bilingual or multicultural backgrounds; *women are more strongly represented in the documentary than in the literary sources. See BILINGUALISM.

Emotions, both in their pre-verbal manifestations and in the way they have been expressed in text and image, have been shaped to a great extent by specific features of Greek and Roman society and culture. For instance, responses to death depend on such diverse factors as eschatological beliefs, philosophical ideas about life and the human condition, rituals, normative restrictions on mourning and the display of grief, concepts of self-sacrifice, and military training. See DEATH, ATTITUDES TO. Consequently, they may range from grief and hope for life after death to pride in self-sacrifice and relief at the escape from the pains of life. Love and sexual desire were strongly influenced by social conditions and cultural norms (e.g., the social position of women, marriage practices and family law, education) and consequently they were subject to changes that are sometimes reflected by changes in the meaning of words (e.g. in Greek, *phileō*, *eraō*, *stergō*, *agapaō*).

As historical factors emotions are important *inter alia* for the justification of political decisions; the transformation of social norms; the understanding of groups as 'emotional communities'; the interaction between groups, particularly in multicultural environments; the interaction between different genders, *age classes, and social groups; *education; the understanding of ethnic stereotyping; and the construction of divine power. Ach

Ennius had friendly relations with the Cornelii, the Sulpicii, and the Caecilii, and the Fulvii; Marcus Fulvius Nobilior took him on his staff to Aetolia in 189. Ennius is said to have lived in a modest house on the Aventine and to have been a teacher of Greek and Latin. He composed plays for the public festivals down to the year of his death, a major narrative epic, a large amount of non-dramatic verse and at least one work in prose.

At least two of the surviving titles of his works (*Caupunculus*, *Pancratiastes*) are redolent of (Greek) New Comedy (see COMEDY (GREEK), NEW). To some of the twenty recorded tragic titles (*Achilles*, *Ajax*, *Alcmeo*, *Alexander*, *Andromacha*, *Andromeda*, *Athamas*, *Cresphontes*, *Erechtheus*, *Eumenides*, *Hectoris Lytra*, *Hecuba*, *Iphigenia*, *Medea*, *Melanippa*, *Nemea*, *Phoenix*, *Telamo*, *Telephus*, *Thyestes*) are attached fragments sufficiently extensive to indicate that Ennius had a particular liking for *Euripides as a model (see TRAGEDY, GREEK) and that he adapted his tragedies in the free manner Latin poets had been using for half a century. Compared with Euripides, he seems to us to have written rather grandly. To Cicero's contemporaries, comparing him with his successors Pacuvius and Accius, he seems to have made his personages use the everyday language (Cic. *Orat.* 36). Ennius also produced *fabulae praetextae*: he wrote a serious play on an incident of early Roman history (*Sabinae*) and another on Nobilior's deeds in Aetolia (*Ambracia*). The character of the *Scipio* is disputed.

A narrative poem (originally in fifteen units) on the history of the Roman people from the fall of Troy to the seizure of Ambracia and the triumphal return of the elder Nobilior gave the Romans their first true national epic. Its title, (*libri*) *Annales*, appropriated that of the records which the *pontifices* (see PRIESTS (GREEK AND ROMAN)) kept in notoriously simple prose of religiously significant events. Instead of the ancient *Camenae*, Ennius invoked the *Musae* (*Muses), newly imported and given a home by Nobilior in a new temple on the Campus Martius. Ennius represented himself as a reincarnation of Homer and replaced the Saturnian verse (used by Livius Andronicus and *Naevius) with a Latin version of the dactylic hexameter (to become the canonical metre of Roman epic). The archaic vocabulary of his predecessors was pruned but some items survived, and many novelties appropriate to dactylic metrical patterns of a Greek origin were introduced. Books 1–3 took Ennius' story down to the expulsion of the last king and the foundation of the republic; 4–6 dealt with the reduction of Etruria and Samnium and the seeing off of the Epirote king *Pyrrhus; 7–9 with the driving of the Carthaginians back to North Africa and the incorporation within the Roman state of the old Greek cities of southern Italy and Sicily; 10–12 with the campaigns of the first decade of the 2nd cent. on the Greek mainland and in Spain; 12–15 with the defeats inflicted on Philip V of Macedon, *Antiochus III, and the Aetolian Confederacy. Ennius later added a further three books to

the *Annales*; these featured the deeds of junior officers in the wars of the 180s and 170s against the Istrians, Ligurians, and other minor tribes. The poem emphasized the constant expansion of the Roman empire and the eclipse suffered by the Greek states that had sacked Troy and by their descendants. The gods of Olympus were made to support and assist the expansion. There was little about the internal politics of the city of Rome. A number of Ennius' themes were foreign to the old Greek epic tradition, e.g. autobiography, literary polemic, grammatical erudition, and philosophical speculation.

Whereas it had been the custom to write epitaphs for leading men in Saturnian verses and even in senarii, Ennius composed pieces on *Scipio Africanus (d. 184) and on himself in a Latin version of the elegiac couplet. The notion that Scipio's soul may have been assumed into heaven went against conventional Roman doctrine on the after-life, as did the deification of Romulus narrated in the first or second book of the *Annales*. Ennius was influenced by a number of Greek philosophical doctrines and contributed to promoting those in Rome.

The *Epicharmus* offered, in trochaic septenarii of the theatrical type, an account of the gods and the physical operations of the universe. The poet dreamed he had been transported after death to some place of heavenly enlightenment.

The *Euhemerus* presented a theological doctrine of a very different type in a prose modelled on the Greek accounts of the early Hellenistic writer Euhemerus of Messene and earlier theological writers. According to this doctrine the gods of Olympus were not supernatural powers actively intervening in the affairs of men, but rather great generals, statesmen, and inventors of olden times commemorated after death in extraordinary ways.

The *Hedyphagetica* must have seemed to move from yet another philosophical position. It took much of its substance from the gastronomical poem of Arcestratus of Gela, a work commonly associated with Epicureanism. The eleven extant hexameters with a catalogue of fishes have prosodical features not found in the more serious *Annales*.

The *Sota* employed a metrical form associated with Sotades and probably presented similar themes to his in a similar tone.

The remains of six books of *Saturae* show a considerable variety of metres. There are signs that Ennius sometimes varied the metre within a single composition. A frequent theme was the social life of Ennius himself and his upper-class Roman friends and their intellectual conversation. Some scholars have detected an influence of *Callimachus's *Iambi*. The character of the *Protrepiticus* and/or *Praecepta* is obscure.

Ennius stands out among Latin writers for the variety of the works he produced. Some of his tragedies were still performed in the theatre during the late republic. The *Annales* was carefully studied by *Cicero, *Lucretius, *Cattullus, *Virgil, *Ovid, and *Lucan. Its text was still available in the Flavian period, but copies had become rare by the 5th cent. Commentators on Virgil's *Aeneid* liked to point out borrowings from the older poem. Nonius Marcellus is the only late writer who can be shown to have read any of the tragedies. Apuleius was able to find in a library a copy of the *Hedyphagetica* and Lactantius one of the *Euhemerus*. See TRAGEDY, LATIN; EPIC. HDJ/GM

Epaminondas (d. 362 BC), Theban general, famous for his victories at the battles of Leuctra and Mantinea. Of his early career little is known. He is said to have been a pupil of Lysis of Tarentum, and to have saved the life of Pelopidas at Mantinea, presumably during the Spartan siege in 385, but played a minor role in the liberation of Thebes in 379, and in the subsequent rebuilding of the Boeotian Confederacy. However, by 371 he was one of the boeotarchs (Boeotian federal officials), and, as such, represented Thebes at the peace conference in Sparta, walking out when the Spartan king Agesilaus refused to allow him to take the oath on behalf of the Boeotians as a whole.

Although all seven boeotarchs were at Leuctra, Epaminondas was clearly regarded as the architect of victory, and was re-elected for 370. Late in the year he went to the aid of the Arcadians, and was largely responsible for the crucial decision to press on with the invasion of the Spartan homeland—the first in historical times—and, above all, to free Messenia. In the summer of 369 he led a second invasion of the Peloponnese, which succeeded in further eroding Spartan influence, without quite matching previous triumphs. But his successes and, possibly, high-handed behaviour, aroused jealousy, and he was not re-elected boeotarch for 368, though legend has it that while serving as an ordinary hoplite (heavy infantryman) he was called upon to rescue the Boeotian army when it got into difficulties in *Thessaly. Re-elected for 367, his third invasion of the Peloponnese finally put an end to Sparta's 300-year-old Peloponnesian League. The removal of the fear of Sparta, however, aroused old antagonisms, and by 362 Thebes found herself fighting many of her erstwhile allies in alliance with Sparta. At the battle of Mantinea, Epaminondas was killed in the moment of victory.

Though an innovative tactician, Epaminondas' strategic and political sense may be questioned. His attempt to challenge Athenian supremacy at sea in 364 had little lasting effect, and some of his dealings in the

Peloponneses were questionable. But his traditional nobility of character presumably reflects how he appeared to contemporaries, and he possibly lacked the ruthlessness necessary to impose Thebes' will on her quarrelsome allies, once they ceased to fear Sparta. He may honestly have wanted to create an alliance of independent states in which Thebes would be no more than first among equals. JFLA

Ephesus (see ◀ Map 1, Ec ▶), city at the mouth of the river Caÿster on the west coast of *Asia Minor, which rivalled and finally displaced Miletus, and owing to the silting up of both harbours since antiquity has itself been displaced by Izmir (Smyrna) as the seaport of the Maeander valley. Ephesus was founded by Ionian colonists led by Androclus son of Codrus. It had little maritime activity before Hellenistic times, was oligarchic in temper, and open to indigenous influences. The city maintained itself against the Cimmerians and also Lydia until its capture by Croesus, who contributed to the construction of the great temple of Artemis. Under *Persia it shared the fortunes of the other coastal cities; it was a member of the *Delian League, but revolted c.412 BC and sided with Sparta. The Archaic Artemesium, burnt down in 356 BC, was rebuilt in the 4th cent. BC, the Ephesians refusing *Alexander the Great's offer to fund the cost (Strabo 14. 1. 22). The city was replanned by *Lysimachus, considered one of their city-founders by later Ephesians, and passed with the kingdom of Attalus III of *Pergamum to Rome in 133 BC. An enthusiastic supporter of *Mithradates VI (88–85 BC), it was deprived by Sulla of its free status. Under the Principate it eclipsed Pergamum as the economic and administrative hub of provincial *Asia. Seat of Roman officialdom and one of the province's original *conventus* (assize) centres, it was also its chief centre for the (Roman) *ruler-cult and thrice *neōkoros* (having a temple to the Roman emperor) by the early 3rd cent. AD. Acts of the Apostles ch. 19 gives a vivid picture of the Artemesium's religious and economic importance for the Roman city. As seen today Ephesus is the product of the prosperous centuries of late antiquity, when it was the seat of the governor of *Diocletian's reduced province of Asia and a metropolitan archbishopric. Among urban developments was the creation of the Arcadiane, a major colonnaded thoroughfare with street lighting, dominated by statues of the four evangelists. Several important Christian shrines include the tomb of St John, where Justinian built a major basilica, round which the Byzantine town grew after Arab attacks in the 7th cent. Ephesus again became an administrative centre in the 8th cent., and remained important until captured by the Turks in 1304. WMC/JMC/CR/AJSS

Ephorus, of Cyme (c.405–330 BC), a historian whose now lost work is of great importance because *Diodorus Siculus followed it extensively. In antiquity, he was thought to have been a student of *Isocrates; there are in fact clear echoes of Isocratean sentiments in the Ephoran parts of Diodorus, and some of the character assessments found in Diodorus are in the Isocratean style. His pro-Athenian bias might also have come from Isocrates.

The 30-book *History* avoided the mythological period—although it included individual myths—beginning with the Return of the Heraclidae and reaching the siege of Perinthus, in 340. His son, Demophilus, completed the work with an account of the Third Sacred War. His work was grand in scope and far longer than 5th-cent. histories. According to *Polybius, he was the first universal historian, combining a focus on Greek history with events in the barbarian east. Ephorus may have been the first historian to divide his work by books, and he provided each with a separate proem. Individual books were apparently devoted exclusively to a particular area (southern and central Greece, Macedonia, Sicily, Persia), but within each book events were sometimes retold episodically, sometimes synchronistically.

Ephorus drew on a diversity of sources, historical and literary, at times using good judgement (he preferred the Oxyrhynchus historian to *Xenophon), at other times making unfortunate choices (he coloured *Thucydides' account with material from 4th-cent. pamphleteers). Of special interest to Ephorus were migrations, the founding of cities, and family histories (see GENEALOGY).

The *History* was widely quoted in antiquity and was generally complimented for its accuracy (except in military descriptions). It was known to Polybius and was extensively used by *Strabo, Nicolaus of Damascus, Polyaeus, *Plutarch, and possibly Pompeius Trogus. But its greatest significance lies in the probability that Diodorus followed it closely for much of Archaic and practically all of Classical Greek history. In paraphrasing Ephorus, Diodorus supplies critical information, especially about 4th-cent. mainland history.

His other works include a history of Cyme (*Epichōrios logos*), a treatise on style (*Peri lexeōs*), and two books (*Peri eurēmātōn*, 'On inventions') which aimed at satisfying the demand for popular information on diverse topics characteristic of the period. KSS

epic The purely metrical ancient definition of epic, or *epos*, *epē* (lit. 'word', 'words'), as verse in successive hexameters includes such works as *Hesiod's didactic poems and the philosophical poems of the Presocratics. In its narrower, and now usual, acceptance 'epic' refers to hexameter narrative poems on the deeds of gods, heroes, and

men, a kind of poetry at the summit of the ancient hierarchy of genres. The cultural authority of epic throughout antiquity is inseparable from the name of *Homer, generally held to be the earliest and greatest of Greek poets; the *Iliad* and the *Odyssey* establish norms for the presentation of the heroes and their relation with the gods, and for the omniscience of the inspired epic narrator. According to Herodotus (2. 53), Homer and Hesiod established the names, functions, and forms of the Greek gods; a typical specimen of the biographical and critical idolatry of Homer in later antiquity is found in the pseudo-Plutarchan *On the Life and Poetry of Homer*.

Post-Cyclic Greek epics on mythical or legendary subjects included Panyassis' *Heraclea* (5th cent. BC) and Antimachus' *Thebais* (late 5th cent. BC); Antimachus' scholarly and self-conscious reworking of the epic traditions anticipated the Alexandrian scholar-poets such as *Apollonius of Rhodes, the author of the surviving *Argonautica* (mid-3rd cent. BC). Historical epic began with Choerilus of Samos' *Persica* (late 5th cent. BC), and flourished in the panegyric epics written to heroize the achievements of *Alexander the Great and his successors, as well as in nationalistic epics like Rhianus' *Messenica*; but such works did not enjoy a long life (fragments in *Suppl. Hell.*).

The history of epic in Rome begins with Livius Andronicus' translation in the native Saturnian verse of the *Odyssey* (3rd cent. BC). This was followed by *Naevius' historical epic in Saturnians, the *Bellum Poenicum*. The commemorative and panegyric functions of epic particularly appealed to the Romans; for a century and a half the classic Roman epic was *Ennius' *Annals*, the hexameter narrative of Roman history (finished before 169 BC). Republican generals and statesmen had themselves commemorated in both Greek and Latin epics; *Cicero gives a portrait of a typical Greek epic panegyrist in his speech in defence of Aulus Licinius Archias, and himself composed autobiographical epics on his own successes. *Virgil revolutionized the genre by combining the legendary and the historical strands of epic in the *Aeneid*, which immediately established itself as the central classic of Roman literature. Later Latin epics, both legendary (*Ovid's *Metamorphoses*, *Statius' *Thebaid*, Valerius Flaccus' *Argonautica*) and historical (*Lucan's *Bellum civile*, *Silius Italicus' *Punica*), are composed through a continuous dialogue with the *Aeneid*.

In later antiquity panegyric (Claudian in Latin; for the Greek fragments see E. Heitsch (ed.) *Die griechischen Dichterfragmente der römischen Kaiserzeit*: 1. *Abhandlungen der Akademie der Wissenschaften in Göttingen, ph.-hist. Kl.* 3. Folge no. 49/1961 (2(1963)); II. no. 58/1964 1) and mythological (Quintus Smyrnaeus, Nonnus) epic continued in

abundance. Virgil and his Latin successors were the main models for the epics of the Latin Middle Ages and the Renaissance. PRH

Epicurus (b. *Samos, 341 BC; d. Athens, 270 BC), moral and natural philosopher. His father Neocles and mother Chaerestrate, Athenians of the deme (local district: see DEMOCRACY, ATHENIAN) Gargettus, emigrated to the Athenian cleruchy (citizen settlement) in *Samos. As a boy he was taught by a Platonist, Pamphilus. He served as an ephebe (see GYMNASIUM) in Athens, when Xenocrates was head of the *Academy and *Aristotle was in Euboean Chalcis; the playwright Menander was in the same class of the ephebate as Epicurus. He rejoined his family, who had then settled on the Asian mainland at Colophon. At this time or earlier he studied under Nausiphanes, from whom he learnt about the atomist philosophy (see ATOMISM) of Democritus. At 32 he moved to Mytilene in *Lesbos, then to Lampsacus on the Hellespont; at both places he set up a school and began to acquire pupils and loyal friends.

About 307/6 he bought a house in Athens, with a garden which thereafter gave its name, 'the Garden', to his school. Apart from occasional visits to Asia Minor, he remained in Athens until his death in 270, when he bequeathed his garden and school to Hermarchus of Mytilene (his will survives, in Diog. Laert. 10, the main source for his biography).

The Epicurean school

(The Garden). He and his followers lived together, secluding themselves from the affairs of the city and maintaining a modest and even austere standard of living, in accordance with the Master's teaching. They included slaves and women. Contemporary Epicureans mentioned in the literature include his most devoted companion, Metrodorus of Lampsacus, who died before Epicurus; Leontius and his wife Themista, also of Lampsacus; Hermarchus, his successor; Polyaeus, formerly a distinguished mathematician; Leontion, a former courtesan; and a slave called Mys.

The school was much libelled in antiquity and later, perhaps because of its determined privacy, and because of Epicurus' professed hedonism. The qualifications that brought this hedonism close to asceticism were ignored, and members of rival schools accused the Epicureans of many kinds of profligacy. In Christian times, Epicureanism was anathema because it taught that man is mortal, that the cosmos is the result of accident, that there is no providential god, and that the criterion of the good life is pleasure. Hence such caricatures as Sir Epicure Mammon, in Ben Jonson's *Alchemist*, and the modern use of the word 'epicure'.

Epicurus New fragment discovered in 2012 of a massive inscription in which a local philosopher, Diogenes of Oenoanda in SW *Asia Minor, presented basic doctrines of Epicureanism to his fellow-citizens and foreigners, probably around AD 100-150. The text is evidence for the continuing appeal of Epicurus into the Christian era. Professor Martin Ferguson Smith

Writings

Diogenes Laertius 10. 26 reports that Epicurus wrote more than any of the other philosophers (with the debatable exception of Chrysippus)—about 300 rolls. Most of these are now lost. Fragments of his 37 books *On Nature* survive among the *Herculaneum papyri, and include incompletely deciphered copies of books 2, 11, 14, 15, 25, and 28. The following three letters and two collections of maxims have been preserved intact, the first four all in Diogenes Laertius 10: (1) Letter to Herodotus (*Ep. Hdt.*): a summary of his philosophy of nature; (2) Letter to Pythocles (*Ep. Pyth.*): a summary of astronomy and meteorology; (3) Letter to Menoecus (*Ep. Men.*): a less technical summary of Epicurean morality; (4) *Kyriai doxai* (KD), *Ratae sententiae* (RS), or *Principal Doctrines*: 40 maxims, mostly moral; (5) *Vatican Sayings*, = *Gnomologium Vaticanum* (*Sent. Vat.*): 81 similar short sayings identified in a Vatican manuscript by C. Wotke in 1888.

Present-day knowledge and appreciation of Epicurean philosophy depends very largely on the great Latin epic poem of his later follower, *Lucretius' *De rerum natura*.

Doctrines

The purpose of philosophy is practical: to secure a happy life. Hence moral philosophy is the most important branch, and physics and epistemology are subsidiary. (For this tripartition, see Sext. *Emp. Math.* 11. 169, and for the comparative evaluation RS 11 and Diog. Laert. 10. 30).

1. Epistemology

The main sources are *Ep. Hdt.*, Lucretius 4, and critical comments in Sext. *Emp. Adversus math.*. Epicurus held that sense perception is the origin of knowledge, and defended its reliability with a physical account of it. Physical objects, being made of atoms, give off from their surface thin films of atoms, called *eidōla*, which retain the shape and some other characteristics of their parent body and implant its appearance on the eyes of the perceiver. Analogous accounts are offered for the other senses. This appearance is somehow transmitted to the soul-atoms which constitute the mind. The appearance itself is never false: falsehood occurs only in the opinion (*doxa*) the mind forms about it. If these opinions conflict, a closer look or a sound argument or experience of the context may serve to 'counter-witness' all but one consistent set of opinions: in some cases (especially in astronomy, where no closer look is possible) we must accept that all beliefs not counter-witnessed are somehow true.

The extant texts show frequent use of analogical reasoning, from phenomena to theoretical entities. Alongside perceptions and feelings, Epicurus introduced a third criterion of truth, which he named *prolēpsis*: roughly, the empirically acquired generic conception of a thing.

2. Physics

Epicurus adopted the atomist theories (see ATOMISM) of Democritus, with some changes that can often be seen as attempts to answer Aristotle's criticisms.

The original atomist theory was a response to the Eleatic school of Parmenides, Zeno, and Melissus. Arguments about Being and Not-being show that there must be permanent elements—atoms of matter. Arguments about divisibility show that there must be indivisibles—construed by Epicurus as inseparable parts of atoms. The observed fact of motion proves that there must be empty space in which atoms can move.

Change is explained as the rearrangement of unchangeable atoms. The universe is infinite, both in the number of atoms and in the extent of space. Our world, bounded by the region of the heavenly bodies, came into being through random collisions of suitable atoms, and it will some day dissolve again into its component atoms. It is one of an indefinite number of worlds, past, present, and future.

Atoms move naturally downwards at constant and equal speed because of their weight, unless they collide with others. But they would never collide unless some of them sometimes swerved from the straight downward path. (This postulate, which also accounts for the self-motions of animals (see below), is not mentioned in any surviving text of Epicurus, but is set out at some length by Lucretius, 2. 216–332, mentioned by other classical writers, and generally agreed to have been advanced by Epicurus himself.)

Gods exist (whether as objectively living beings or as human thought-constructs has become a matter of controversy). They take no thought for this world or any other, living an ideal life of eternal, undisturbed happiness—the Epicurean ideal. It is good for human beings to respect and admire them, without expecting favours or punishments from them.

The divine creation of the world and its eternal continuation, as described in *Plato's *Timaeus*, are rejected: natural movements of atoms are enough to explain the origin and growth of everything in the world. A theory of the survival of the fittest explains the apparently purposeful structure of living things.

Epicurus was a physicalist in his philosophy of mind. The soul is composed of atoms, all extremely small but distinguished by shape into four kinds: fire, air, and breath (but all somehow different from their ordinary namesakes), and a fourth, unnamed kind. At death the component atoms are dispersed.

The swerve of atoms somehow accounts for the possibility of actions performed by choice, by humans and some other animals: without the swerve, apparently, all actions would be as fully determined as the fall of a stone dropped from a height. How this works is a matter of continuing controversy.

3. Moral philosophy

'We say that pleasure is the beginning and end of living happily' (*Ep. Men.* 128). It is a datum of experience that pleasure is naturally and congenitally the object of human life. Since it is a fact, however, that some pleasures are temporary and partial, and involve pain as well, it is necessary to distinguish between pleasures, and to take only those which are not outweighed by pains. Pain is caused by unsatisfied desire; so one must recognize that those desires that are natural and necessary are easily satisfied. The limit of pleasure is the removal of pain; to seek always for greater pleasure is simply to spoil one's present pleasure with the pain of unsatisfied desire. The state of painlessness is already the height of pleasure ('*katastematic* pleasure'), and the pleasures that consist in change ('*kinetic* pleasures'), such as eating and drinking, merely vary it, rather than, as most people assume, increase it.

Pleasure of the *soul, consisting mainly of contemplation or expectation of bodily pleasure, is more valuable than bodily pleasure. The ideal is *ataraxia*, freedom from disturbance. The study of philosophy is the best way to achieve the ideal. By teaching that the soul, made of atoms as the body is, dies with the body, it persuades us that after death there is no feeling: what happens after our death, like what happened before our birth, is 'nothing to us.' By teaching that the gods do not interfere and that the physical world is explained by natural causes, it frees us from the fear of the supernatural. By teaching that the competitive life is to be avoided, it removes the distress of jealousy and failure; by teaching one how to avoid intense emotional commitments, it frees us from the pain of emotional turmoil. (The main sources are Epicurus *Ep. Men.*, *RS*, and *Sent. Vat.*, and Lucretius 3 and 4.)

Epicurean moral philosophy thus finds room for most of the conventional Greek virtues of the soul; its main difficulty is to justify the virtues that are concerned with the well-being of other people—especially justice. Those who are wise will avoid injustice, Epicurus argues, because one can never be certain of remaining undetected. But Epicurean morality was less selfish than such statements made it appear. The Epicurean communities were famous even among their enemies for the friendship which bound members to each other and to the founder. DJF/DNS

epideictic The *epideiktikon genos* (Lat. *Genus demonstrativum*) covers all forms of public speaking which are not directed to convincing a judge or a deliberative body. Whatever the original force of the term, it commonly denoted the 'display' or 'exhibition' of the orator's skill. It aims at the admiration of an appreciative audience, or, at

best, the creation of a mood. The declamation, though often an exhibition of ingenuity, is not strictly 'epideictic', because it usually mimics a judicial or deliberative situation (Men. Rhet. 331.16 Spengel). Synonymous with epideictic in many contexts are 'encomiastic' and 'panegyric', the former because praise and blame form the commonest theme (see ENCOMIUM), the latter because the occasion of such speeches is commonly some festival (*panēgyris*). Typical occasions include weddings, arrivals and departures, and various religious festivals. Many such occasions were also commemorated in poetry, and rhetoricians drew heavily on classical lyric for topics and allusions, while later poets (e.g. *Stattius in *Silv.*) composed occasional poems consciously on rhetorical lines.

Epideictic oratory begins in the 5th cent. BC, with the Athenian funeral speeches and the work of *Gorgias; it was greatly developed in the 4th cent., especially by *Isocrates, whose careful and abundant style became canonical for the whole genre. It continued to be important till the late empire, reaching its fullest development in the Roman period, when it was a major feature of social and political life. Theory too begins in the 4th cent. BC, with *Aristotle's *Rhetoric* (1.9, 3.13 ff) and the *Rhetorica ad Alexandrum*, but reaches its height under the Roman empire, with Quintilian (3.7), Menander Rhetor, and a treatise wrongly ascribed to *Dionysius of Halicarnassus. Examples of epideictic can be found (e.g.) in *Plutarch, *Dio of Prusa, *Pliny the Younger (*Pan.*), Aelius Aristides (perhaps the greatest master), Apuleius, Libanius, Themistius, the Latin *Panegyrici*, and such Christian works as Gregory Thaumaturgus' speech on Origen (ed. H. Crouzel, 1969).

DAR

epigram, Greek

Archaic

An epigram was originally nothing more than an inscription on an object or monument to say whose it is or who made it, who dedicated it to which god, or who is buried beneath it. The earliest known are in hexameters (*CEG* 1.432 and 454, the Dipylon oenochoe and Pithecusae scyphus, both c.720 BC), but by c.500 they were predominantly in what was to be the classic metre of epigram, the elegiac couplet. The earliest consist largely of formulae (e.g. *τύμβος ὄδ' ἐστὶ, στήθι καὶ οἴκτιρον, ... ἐπέθηκε θανόντι, ... μὲν ἀνέθηκε* 'this is tomb (of so-and-so), stand and take pity... (so-and-so) set up (this) for the deceased... (so-and-so) dedicated me') plus the appropriate proper names in stereotyped epicizing phraseology. The material in Peek, *GVI* 1 (limited to epitaphs) is arranged by such formulae.

Classical

Epigrams written for monuments are normally anonymous; the earliest signed by the author date from c.350 (*CEG* 2.819, 888.ii). The first poet credited with writing epigrams is *Simonides, though only one of the many ascribed to him (Page, *FGE* 119–23, 186–302) can be accepted, the simple and dignified epitaph on the seer Megistias (Hdt. 7.228; *FGE* 195–6). Many others are attributed in Hellenistic and later times to famous poets (Page, *FGE*), but even if authentic present generic problems. For example, the couplet *πολλὰ πῶν καὶ πολλὰ φαγῶν καὶ πολλὰ κακ' εἰπῶν | ἀνθρώπους κείμαι Τιμοκρέων Ῥόδιος*, 'I, Timocreon the Rhodian, lie here after drinking and eating a lot and uttering a lot of abuse' (*FGE* 252) is certainly a 5th-cent. parody of funerary epigram, but at the time it would have been called a scolium and sung at the *symposium. It is hard to believe *Euripides wrote the undistinguished distich that *Plutarch read on a monument to the Athenians who died in Sicily (*FGE* 155–6), but there seems no reason to doubt *Aristotle's authorship of the epigram on a statue of his friend Hermias at Delphi (*FGE* 31–2). On the other hand, the love epigrams attributed to *Plato are 'plainly Alexandrian in tone, contents and style' (Page, *FGE* 125–7). Down to c.400 BC study of the epigram is in effect limited to anonyma: P. Friedländer and H. Hofleit, *Epigrammata* (1948), remains a useful companion to *CEG* 1–2.

Hellenistic

With the 3rd cent. we find an enormous expansion of non-inscriptional epigram. Reitzenstein distinguished two schools: the Dorian-Peloponnesian and Ionian-Alexandrian. The first represents a natural development from inscriptional poetry: literary embellishments of epitaphs and dedications. Fictitious dedications were a neat way to treat the lives of humble folk rather than kings and generals, through the different objects vowed by rustics, hunters, and fishermen—or even hetairai. Anyte of Tegea wrote on women and children and pastoral themes, epitaphs on animals rather than humans. Leonidas of Tarentum was the most influential writer of this school, influential too in establishing an ornate style and dithyrambic vocabulary as its medium. Asclepiades and *Callimachus wrote about wine, women, boys, and song, renewing the themes of Classical sympotic elegy and lyric, though they were selective in the motifs they treated, investing them with that combination of allusiveness, conciseness, and wit that were ever after to be the hallmarks of the genre (Giangrande, in *L'Épigramme grecque*, Entretiens Hardt (1968)). The simple exchange between passer-by and tomb we find in Classical epitaphs is expanded into witty dialogue under the influence of

mime. The epitaph is developed into poems on those long as well as recently dead, and epigrams on writers are especially common (M. Gabathuler, *Hell. Ep. auf Dichter*, 1937). The dedication also evolved into the *ekphrasis on a work of art, another form with a long future. In addition to more conventional themes, Alcaeus of Messene wrote political lampoons. Poets would vie with each other in treating the same themes.

Early Hellenistic epigrams were often quite long and in metres other than elegiacs. Most of the major poets published books of *Epigrammata*. The first known to consist entirely of elegiacs (on the evidence of the Milan roll) is Posidippus. It has sometimes been argued that epigrams were now 'book-poetry', but they continued to be written for their original function as well as for the symposium. Callimachus and Posidippus in particular wrote a number of epigrams for Alexandrian monuments. Hellenistic epigrams on victors in the games became less factual and more literary, characterized by mythological allusion and motifs from Classical epinicion (J. Ebert, *Epp. auf Sieger* (1972), 19–22, 191–2, 205–8). The Milan roll has revealed that Posidippus wrote almost twenty epigrams on equestrian victors.

Graeco-Roman

Epigrammatists of the late republic and early empire, most now writing for Roman patrons, represent a striking change of direction, away from the erotic and sympotic (with the exception of Philodemus and Marcus Argentarius) to the ekphrastic (i.e. involving extended and detailed descriptions of real or imagined objects) and epideictic: jokes, paradoxa, witty anecdotes, invitations to dinner, epigrams to accompany presents or congratulate on birthdays or the cutting of a son's first beard. The late 1st cent. AD saw the development of the satiric epigram, best represented by the Neronian Lucilius: attacks on the faults, not of individuals, but of entire classes and professions (doctors, athletes, thin men). There was also a short-lived revival of the erotic with Rufinus (under Nero) and the pederastic with Straton (under Hadrian).

Not the least interesting development of the 3rd and 4th cents. is the re-emergence of the anonymous inscriptional epigram. Honorific inscriptions that in the early empire would have been in prose are increasingly in verse, often verse of some distinction and elegance. There is unfortunately no modern corpus, but many are quoted and discussed in L. Robert's *Épigrammes du Bas-Empire* (1948).

Byzantine

Towards the end of the 4th cent. the Alexandrian schoolmaster Palladas wrote satiric epigrams with a difference,

powerful, pessimistic tirades against his profession, and rueful laments on the impotence of a declining paganism. At the same time Gregory of Nazianzus (*Anth. Pal.* bk. 8) was writing epigram after epigram on his family (12 on his father, 52 on his mother), conventional in every respect (vocabulary, imagery, variation, point) except their Christianity and their disregard of Classical prosody. The age of Justinian saw a remarkable renaissance of the classicizing epigram. Agathias, Paul the Silentiary, Macedonius the consul, Julian the Egyptian, and many other professional men and civil servants returned to Hellenistic models, writing erotic, sympotic and dedicatory poems in a remarkably homogeneous style, a fusion of the traditional conventions and motifs with the bombast and metrical refinement of Nonnus. Their literary paganism is so thoroughgoing that we are astonished by the occasional use of the same style and vocabulary to describe a Christian icon (R. C. McCail, *Byzantium* 1971, 205–67). This was the end of creative writing in the genre. ADEC

epigram, Latin The use of metrical inscriptions in Latin is attested from the second half of the 3rd cent. BC. The two most ancient *elogia* in the tomb of the Scipios (*CIL* 1². 9, probably from around 230 BC, and *CIL* 1². 7 cut around 200 BC) are in Saturnians, and limit themselves to a sober indication of the name, career, achievements, and civic virtues of the subject, in accordance with traditional Roman models for the praise of the great (cf. also the inscription in Saturnians from the 3rd cent. BC quoted in *Cic. Fin.* 2. 116). There is greater elaboration in the two Scipionic inscriptions in Saturnians datable to around the middle of the 2nd cent. BC which lament figures whose early deaths prevented their attaining glory (*CIL* 1². 10 and 11). There is little trace of Greek culture or stylistic sensibility in these early epitaphs or in the rare dedicatory inscriptions in Saturnians from the same period, but the Latin taste for verbal effects such as alliteration, tricola, and antithesis is much in evidence. Saturnians continued to be used for commemorative inscriptions, in homage to Roman tradition, up to at least 133 BC (*Schol. Bob. ad Cic.*, p. 179 Stangl, on an epigram commissioned from Accius), long after the form had been abandoned in literature.

*Ennius introduced into Latin not only the hexameter but also the elegiac couplet, the usual metre of Greek epigram. All the extant epigrams of Ennius preserve the norms of Roman honorific inscriptions and could have been inscribed, though *Cicero, who quotes them, did not know of any actual inscriptions. Two refer to the tomb of Scipio Africanus (and are thus to be dated after his death in 183 BC), and another two, of uncertain

authenticity, refer to a portrait (on a tomb ?) and to the poet's own grave. The sober, monumental solemnity, the recall to communal values (Ennius celebrates his role as poet of Roman glory), and the usual verbal effects of archaic Latin style recall the Scipionic *elogia*, but the metre, the density of expression (three of the epigrams consist of a single couplet), the motif of the dead man speaking in the first-person from his tomb and declining lament, the elevated conception of the poet's role, and the very fact that he dedicates an epigram to himself as poet—all these are to be explained by Ennius' grafting of Hellenistic Greek culture onto the Roman tradition. Also in evidence is a clear articulation of the logical divisions of the poem, something which remains a feature of the Latin elegiac epigram. There is a possible echo of a contemporary Greek epigram (*Alcaeus *Mess. Anth. Pal.* 9. 518), but these austere and elevated epigrams of Ennius still remain far from the light charm of Hellenistic Greek epigram.

*Gellius (*NA* 1. 24) quotes the epigrams that *Naeuius (in Saturnians), *Plautus (in hexameters), and Pacuvius (in senarii) supposedly wrote for their tombs. The authenticity of Pacuvius' epitaph, of a studied simplicity and modesty and recalling formulae of 2nd-cent. BC inscriptions (*CLE* 848, and cf. 53) is not impossible: but the other two are typical celebrations of dead poets, with clever elaboration in archaic style of commonplaces of Hellenistic epigram (the genre practised by the dead poet is orphaned or ceases all together, the deities of poetry are in mourning). Gellius found the Plautus epigram, and perhaps the other two, in *Varro: all three may have been written by a 2nd-cent. BC grammarian, perhaps to be included in biographies of the poets, in accordance with a Hellenistic custom continued also at Rome. One may compare *Virgil's famous epitaph, *Mantua me genuit* . . ., 'Mantua bore me', cited in Aelius Donatus' *Life: Varro* himself in his *Imagines* provided epigrams to accompany a series of portraits of famous men, and we know of similar series of epigrams by *Atticus (*Nep. Att.* 18. 5 f.) and Octavius Titinius Capito (*Plin. Ep.* 1. 17. 3, 1st cent. AD). In the same tradition is the self-presentation in a single distich of the obscure poet Pompilius, who claims to be a pupil of Pacuvius, and is thus datable to the 2nd cent. BC. We also have the epitaph, certainly fictitious, written by Lucilius for one of his slaves (*frs.* 579 f. Marx), a couplet in which the formality of epigraphic convention is lightened by familiar language and a tone of ironic and affectionate condescension. This is from book 22 of the *Satires*: there are other fragments in couplet form on Lucilius' slaves in the same book, which some think was a collection of epigrams.

The latest epitaph in the tomb of the Scipios (from a little after 139 BC) is in elegiacs: the Greek metre introduced by Ennius became the commonest form used in both literary and inscribed epigrams, though the hexameter became popular in inscriptions after the Augustan period, and from the end of the 2nd to the 1st cent. BC senarii were also common. Inscriptional verse, especially epitaphs for the dead, from which the Latin epigram had developed in the first place continued with its own development. There is clear evidence for a degree of professional composition, using a repertory of formulae and motifs dealing with the dead, their virtues, their survival through renown or the affection of their loved ones, and the loss felt at their departure: a repertory which for all its conventionality provides insight into the mentality and beliefs prevalent in the Roman world. Many of these motifs continued, albeit transformed, into Christian epitaphs, which are extremely common from the 4th cent. AD. Throughout, the influence of high-style poetry, especially Virgil and *Ovid, is strong.

From the end of the 2nd cent. BC, the band of Greek intellectuals attached to the great Roman families began to include epigrammatists, whose poems served as a cultured accompaniment and ornament for the lives of their patrons. From the hand of one of these patrons, Quintus Lutatius Catulus (consul 102 BC), an important member of the Roman nobility and a passionate admirer of Greek culture, who was the patron of the Greek epigrammatists Antipater of Sidon and Aulus Licinius Archias, we have two homoerotic epigrams. One of the two (clearly inspired by Callim. *Epigr.* 41) is cited by Gell., *NA* 19. 9, together with two epigrams of Valerius Aedituus and one by Porcius Licinus. We do not know what if any connection there was between these three 'pre-neoteric' figures, but the poems are the earliest Latin epigrams of the Hellenistic type, on sentimental themes and independent of the epigraphic tradition. They share a manneristic treatment of the commonplaces of Greek love poetry, with an obvious striving for conceptual and pathetic effects and emphatic figures (questions, apostrophe, antithesis): a concentration of devices that perhaps shows the traces of the expressionism of the archaic Roman tradition. The slightly later epigrams of Tiburtinus, of which we have graffiti fragments from the smaller theatre at Pompeii (*CLE* 934 f.), show that these tendencies were widely diffused. With Catulus the epigram becomes for the first time at Rome the ideal genre for the leisure hours of the refined and recherché upper-class amateur. From the time of Cicero we have many references to (and a few fragments of) short poems written for pleasure and cultural display by leading Romans, or composed by more important authors as a marginal addition to their more

serious productions. As well as elegiacs, we find poems in hexameters, phalaecian hendecasyllables, and iambs, together forming a Roman genre of short poetry in various metres on erotic, polemical, or humorous themes. In this genre, Greek traditions of epigram and iambus interact with Roman traditions (influenced themselves by Greek iambus) of personal and political polemic, attested from the time of Naevius and then common from the time of Caesar, and of humorous or satirical verse of popular origin, found, for example, in the scurrilous verses sung by soldiers at Roman triumphs. This varied genre had no fixed name, but 'epigram' was certainly one of the terms used (cf. Plin. *Ep.* 4. 14. 9), and *Martial's usage gave it currency. The first two modest examples of polemic or humorous epigram known to us are quoted by Varro and ascribed to one Manilius (in senarii) and Papius (elegiacs): they are full of the verbal play used for humorous polemic, but, like a similar couplet attributed to Cicero, they show no significant contact with Greek Hellenistic epigram. They are perhaps related to the *epigrammata* ascribed to the comic poet Quinctius Atta (d. 77 BC).

This production of everyday minor verse at Rome, the product of leisure and an ingredient in social relations, increased in the time of Caesar and Augustus. It was still practised by Greek epigrammatists living in Roman high society (e.g. Philodemus, and later Crinagoras and Antipater of Thessalonica), and it was an important element in the work of *Catullus and the other 'new poets', who wrote short poems to accompany gifts, to console or thank, invite or congratulate, to celebrate (seriously or humorously) the most diverse events of the society in which they lived, and to engage in polemic and invective on public or private matters. Collections of *epigrammata* are attested for Helvius Cinna, Gaius Licinius Calvus, and Cornificia, but other terms (*poemata* etc.) were used to refer to the same sort of poems. Amongst the meagre remains may be noted the poems written by Furius Bibaculus for his friend Valerius Cato (two friendly jests in senarii, one inspired by Leonidas, *Anth. Pal.* 6. 226, and one more complimentary poem in hendecasyllables), the poems of Calvus mocking Caesar (senarii) and *Pompey (an elegiac couplet), and the refined elegiacs in which Cinna (echoing Callimachus, *Epigr.* 27) presented a deluxe edition of Aratus. The verses of these poets, with those of Catullus, signal the birth of a new literary language for the description of everyday life, at times delicate, at times realistic and incisive, even crude and obscene, but always artistically light and elegant. The Catullan or neoteric 'revolution' was the use of this genre and language to express an intensely personal emotional world and to affirm a system of values in which even the

smallest day-to-day event, rather than being merely the subject of amateur versifying, became the occasion for poetry of the highest level which could absorb all the energies of a poet of the greatest ambition. In this way, Catullus gave pride and full literary dignity to Roman minor verse, and became its classic practitioner. In the Catullan collection as we have it the 'epigrams' in elegiacs (poems 69–116) are separate from the 'polymetrics' in iambs, hendecasyllables, and lyric metres (1–60), but it is uncertain to what extent this represents Catullus' own distinction. The two groups share themes to an extent, but the epigrams show a neater composition and a more rational analysis of emotion, with extensive use of antithesis and parallelism but a less unusual and innovative language. This may be due, as D. O. Ross (*Style and Tradition in Catullus* (1969)) suggests, to the greater influence of the native Roman tradition on the elegiacs: the presence of Hellenistic epigram is more marked in the polymetrics. At any rate, already in the pseudo-Virgilian *Catalepton*, and later in the *Priapea* and Martial, elegiacs are freely mixed with poems in the other Catullan metres within a single collection, which suggests that Catullus' short poems were viewed collectively as a distinct genre. Catullus never uses epigraphic forms: they are avoided even in the poems for the death of his brother (101) and the sparrow (3) and on the dedication of the boat (4), even though these draw on elements of the funerary and votive epigram. In Catullus, the short poem expresses a vivid subjectivity which is nourished not only by Hellenistic epigram but also by the traditions of Greek lyric, archaic elegy, and iambus, with the latter's harshness and obscenity, and it accordingly has no place for the 'objectivity' proper to the epigraphic form.

Martial considers Catullus the canonical model of Latin epigram, placing alongside him as second in importance Domitius Marsus, of whom we possess a few fragments, all in elegiacs. His collection entitled *Cicuta*, 'Hemlock', seems to have consisted largely of invectives, and includes an epigram very much in Catullus' manner against Virgil's adversary the poet Bavius: an interest in literary polemic is confirmed by attacks on two famous grammarians. Other epigrams by Domitius Marsus attempt a recuperation of the epigraphic form, with a lament for *Tibullus (and Virgil) which shows a Hellenistic delicacy and one for Atia, the mother of Octavian (the later *Augustus), which in its single couplet recalls the solemn and concise monumentality of Ennius. Like another epigram for Atia it involves itself in the contemporary political debate not, as was usual in epigram, through insulting the enemy but through the celebratory function that epigram had had in early Rome and to which it returned in the Augustan and imperial periods,

as can be seen also in Greek epigrams such as those of Crinagoras. We do not know if Domitius' collection, like Catullus', included love poetry (cf. Mart. 7. 29. 8). The treatise on wit (*De urbanitate*) ascribed to him suggests that Domitius' poetry had a systematic interest in comic effects that could have interested Martial. Martial's other named models were Albinovanus Pedo (an epic poet, friend of Ovid) and Cornelius Lentulus Gaetulicus (consul AD 26): all we know of their epigrams is that Martial cited them as precedents for his own obscenity. We do not know if Gaetulicus sang of his love for Cesennia in his epigrams, and it is also uncertain whether he is to be identified with the Gaetulicus who is the author of several epigrams in the Greek Anthology.

We have only scant remains of the epigrams written by the Augustan elegist Valgius Rufus and Ovid. The epigrams of the pseudo-Virgilian *Catalepton*, some of which go back to the Augustan period and may even be by Virgil, show clear Catullan influence in metre, in various echoes and parodies, and in general in the concept of the short poem: a space for jokes, polemic, and wordplay, but also for expressions of friendship and affection or for autobiographical meditations. There is also an 'epideictic' poem of moralizing content, a type of composition that reappears in Martial and which must have been practised also as a school or occasional exercise. This form predominates, along with poems on friendship, love, and polemic, in a series of about 70 epigrams (*Anth. Lat.* 232, 236–9, 396–463 Riese, almost all in elegiac couplets) that have been attributed to *Seneca the Younger. Three are so ascribed in two manuscripts, while the others follow on from two of them in a third manuscript: some refer to the Corsican exile or Cordoban birth of Seneca, or to people of his circle, and the moral themes dealt with have affinities with Seneca's philosophical works. They may be by Seneca (especially from the time of his exile: there are links with Ovid's exile poetry) or from his circle, but they may also be school exercises of a later date. One noteworthy cycle (419–26 R) deals with the British triumph of Claudius, which took place during Seneca's exile: the celebratory epigram thus begins to encompass official events connected with the imperial *ruler-cult, as it will do frequently in Martial.

In contrast to these serious epigrams, the anonymous collection of *Priapea* offers licentious entertainment with more than a hint of pornography. It consists of about 80 poems in Catullan metres, often dedicatory, in which the heavily obscene content contrasts with the elegance of the form and the admirably varied treatment of a single theme (with its own literary tradition, from Greek epigram—there are around 40 *Priapea* in the Greek Anthology—to Catullus (fr. 1), *Horace (*Sat.* 1. 8), and

Tibullus (1. 4)). The collection is often dated to the Augustan period, but must be later than book 1 of Martial, since *Priapea* 1. 1 f. recalls Martial 1. 4. 1 (the reverse process is unlikely, since Martial would hardly defend himself against charges of obscenity by citing the opening of a pornographic collection).

Martial's own epigrams, though drawing extensively on Greek epigram, reflect above all the varied and lively nature of the preceding Roman tradition: they offer homage and celebrate events public and private, accompany the events of everyday social life and turn them into elegant expressions of culture, offer space for moral reflection and for literary and personal polemic, and entertain with pungent wit, jokes, and pornography. On the other hand the erotic or sentimental element and the affirmation of personal individuality which play so large a part in Catullus' claim to fame are more marginal in Martial. He develops rather the satiric epigram and the epigram as a part of social relationships: that is, precisely those aspects which seem to a modern most 'epigrammatic'. To this minor genre, developed in its apparently most superficial aspects, Martial attributes the full dignity of an artistic instrument adapted to offer a realistic interpretation of the world. Like Catullus, but on different grounds, he is bold in contrasting it with the more prestigious and elevated genres, which are seen as divorced from the real-life experience of the reader. It is with good reason that he became for modern writers the classic epigrammatist, and helped to fix the form. Developing tendencies seen in Greek Hellenistic and imperial epigram and in Catullus (and even Ennius), he offers at the end of many of his epigrams that incisive, and often unexpected, 'pointed' formulation of the essential meaning of the poem which is seen as the essence of modern epigram.

Martial's original attempt to give importance to the genre was not taken entirely seriously by contemporary authors: *Pliny the Younger (*Ep.* 3. 21) considers Martial's aspiration to immortality little more than a naive illusion. Pliny himself and their mutual friends composed for entertainment, and with a certain condescension, elegant and trifling verses of which Pliny quotes a few examples (*Ep.* 4. 27, 7. 4, 7. 9). This type of amateur production assured continued success for the epigram as a minor genre, though it tended to lose its identity, never in any case very clear, within a more general generic framework of minor poetry. This can be seen in the experimental lyric/epigrammatic works of the so-called *poetae novelli* (Florus, the emperor *Hadrian, and Annianus at the beginning of the 2nd cent. AD, then later Septimius Sere-nus and Alfius Avitus). In an archaizing and 'decadent' style they recall the formal experimentation of Laevius,

writing in rare lyric or dramatic metres on sentimental, erotic, didactic, or pastoral themes in a light, affected manner which at times is subtly melancholic. Amongst the few fragments that we have, it is the work of Florus, with its prevailing gnomic element, which has the most epigrammatic character, but as a whole the remains do not show any influence from Martial nor relevant affinities with Greek epigram. In the 4th cent. AD, however, the epigram is again popular, with its more frivolous aspects still to the fore. Ausonius composed a short collection of varied epigrams, some translated or adapted from extant Greek epigram (by authors of the 1st and 2nd cents. AD). They also show little influence from Martial, and even though they are frequently satirical and sometimes obscene, they lack real aggression. In contrast to Catullus and Martial, hendecasyllables and choliambics are avoided. We find similar characteristics (except for the absence of obscenity) in the *Epigrammata Bobiensia* collected and in large part written on the model of Ausonius by the senator Naucellius around AD 400. As in Ausonius and the late antique epigram in general, there are frequent descriptions of objects, buildings, and works of art (*ekphraseis*: see EKPHRASIS), versified maxims, and elegant and leisurely variations on the same theme. A novelty in the tradition on the other hand is Ausonius' collections of epigrams on a single theme, either of some poetic weight (*Parentalia*, *Commemoratio professorum*), or with a slighter didactic or rhetorical character. Their brevity and occasional nature bring many of Ausonius' other poems close to the epigram, and in Claudian's minor poetry we find a number of true and proper epigrams (satirical, erotic, on objects, etc.). The Christian poets of the 4th and 5th cents. used the genre essentially for practical purposes, didactic or commemorative. Thus we find sepulchral epigrams in praise of martyrs and others (only later collected in books), such as those written for inscription by Damasus I; epigrams for sacred edifices (churches, baptisteries), usually with citation of the dedicator, the architect, and the occasion, and praise of the saint to whom they are dedicated (we have examples by Damasus, Ambrose, and Paulinus of Nola); and epigrams on themes from Scripture, supposedly to accompany visual representations, though whether this was actually true is uncertain. We have examples of this last group by Ambrose (21 hexameter couplets), Prudentius (the *Dittochaeon* in groups of four hexameters), and about a century later the hexameter triplets of Rusticus Elpidius. St *Augustine's follower Prosper Tiro of Aquitaine wrote a series of epigrams to illustrate maxims taken from Augustine's works. In the 5th cent., the pagan tradition was continued by two bishops well trained in classical rhetoric, Sidonius Apollinaris and Ennodius. The

former wrote on objects, gifts, and secular buildings, and short verse letters, at times with elegant concluding points; although he was well acquainted with Martial, he did not develop the satiric or comic aspects, which prevail, on the other hand, in Ennodius, even with a certain amount of obscenity. But Ennodius' 150 or so epigrams are far from the spirit of Martial, with the rhetorical and recherché nature of their fictitious themes, their general absence of liveliness, and the recurrence of descriptive poems on objects, places, animals, works of art, etc. (as in Ausonius, Claudian, and Sidonius). Both Sidonius and Ennodius also give space to the values and motifs of the pagan tradition even in their poems on the dead and on sacred places. At the beginning of the 6th cent. the Carthaginian Luxorius composed a book of 89 epigrams modelled on Martial in both tone and metre, with a prevalence of satiric poems, including some on contemporary persons, and some notable obscenities. Luxorius' vivacity and energy is considerable, even if theme and treatment also show the artificiality that late antique epigram derived from rhetoric. Luxorius' book was included in a large collection put together in Africa in the Vandal period, around 534, preserved in the Codex Salmasianus (Par. Lat. 10318) and sometimes called the *Anthologia Latina*, though that term is usually used for the whole of the Codex Salmasianus collection, with the other collections included in Riese's Teubner edition. Most of the poems are anonymous and late, though some are attributed to classical poets, and they are mainly rhetorical in character (on mythological and historical themes, on objects, etc.), with a few satirical epigrams. They included a series of 100 riddles by Symphosius in hexameter triplets, with ingenious and entertaining descriptions of everyday objects, the prototype of many similar medieval collections. In the second half of the 6th cent. Venantius Fortunatus returned to the epigram and related forms to describe his own experiences, personal relationships, and journeys: poetic epistles for friends and patrons, convivial poems, and poems for gifts are joined by numerous epitaphs and poems on sacred buildings. Finally, from the 6th and 7th cents. we may note the epigrams of Isidorus of Seville on authors and books both Christian and pagan, and those of Eugenius of Toledo, who took up again many of the themes of the late antique epigram (epitaphs, poems for churches and everyday objects) with a variety of moralizing, didactic, and autobiographical elements, but without any satirical touches and showing a strong Christian spirit. In one sense, the epigram had come a long way from its origins: in another, the sternly serious early Romans who had begun the tradition could not but have approved.

epinician poetry, or Greek poetry composed ‘for victory’ (cf. NIKE), praised victors in athletic and equestrian competitions (see GAMES), and is associated particularly with *Bacchylides and *Pindar and before them Ibycus and *Simonides; but also Posidippus for the Hellenistic period. The standard 5th- and 4th-cent. (and even later) expression for such a poem was *enkōmion*, though Pindar (*Nem.* 4. 78) speaks once of ‘epinician songs’. The classification of epinician as a separate genre of lyric poetry was a development of the Hellenistic period (see LYRIC POETRY (GREEK)). SH

equites

Origins and republic

The early history of the cavalry at Rome is overlaid with legend and speculation. The kings are said to have enrolled 300 *celerēs* or *trossuli* (later doubled) for the legion. They wore loincloths, tunics with the *clavus* (stripe), *trabeae* (short embroidered cloaks), and *mullei* (strapped red shoes); they were armed with lances and their horses were adorned with *phalerae* (silver discs). Their insignia, in various adapted forms, later became the distinctive attire of patricians, magistrates, and senators. Twelve hundred *equites* were allegedly added by Servius *Tullius. These 1,800 had their horses supplied and maintained by the state (hence *equites equo publico*), out of the property taxes paid by widows and orphans. They had to serve ten campaigns. In the centuriate assembly they formed eighteen *centuriae*, later including (it seems) those too old for service. This voting privilege survived in essence as long as the assembly. In the classical republic these *equites* were enrolled by the censors, after financial, physical, and moral scrutiny (*recognitio*). At least since 304 BC, though rarely in the late republic, they paraded to the Capitol in the *transvectio* on 15 July. Men of aristocratic birth always had preference for enrolment.

About 400 BC, men on their own horses (*equites equo privato*) were added to the cavalry. They did not share the voting privilege, but were given at least some of the status marks, of the others. In the 3rd cent. Roman cavalry proved increasingly ineffective in war and by 200 was largely replaced by *auxilia*. But *equites* retained their social eminence and became a corps from which officers and the staffs of governors and commanders were drawn. This new ‘equestrian’ service was within the reach of any wealthy and well-connected family and the old exclusiveness was undermined. In 129 senators (but not their non-senatorial relatives) were excluded from the equestrian centuries (Cic. *Rep.* 4. 2). Whatever the motive, this marks the beginnings of the later *ordo equester* as a distinct body. Gaius *Gracchus excluded senators from

service on the *repetundae* (extortion) court. Although the positive qualifications for service are largely lost, various considerations, especially the need to exclude senators (*FIRA* 7 ll. 13 and 16), make it certain that the jurors were not defined as registered *equites equo publico*, i.e. the qualification must have been by wealth. The law on the Asian taxes is therefore also unlikely to have defined bidders as belonging to that class. Gracchus’ prescription was followed in other *quaestiones* (tribunals), permanent or special; as a result, the composition of juries became, for a generation (106–70), an object of bitter contention between the senatorial and the equestrian *ordo*, firmly establishing their distinctness.

Another result was the transformation of the *ordo* itself. Pliny (*HN* 33. 34) derives the later *ordo equester* from the Gracchan jurors, and what evidence we have supports him. The wealthy **publicani* gradually became the dominant element on juries and within the *ordo*: Cicero could rhetorically identify them with it. The ‘public horse’ and the annual parade are nowhere mentioned in our ample record of the age of Cicero, except for one political demonstration by *Pompey in 70. Between 70 and at least 50, there were no censorships culminating in a *lustrum*, so the list of strictly defined *equites* could not be kept up. By 50 (even), the influx of Italians, to whose leading men the jury courts had been opened since 70, made a return to the old restriction politically impossible. The law of Lucius Roscius Otho allocating special rows of seats to *equites* probably confirmed the definition by wealth: we cannot be certain, but Cicero (quoted by Asc. p. 78 C) links it with the judiciary law of Lucius Aurelius Cotta, which certainly did. The attested objection of the *plebs* was no doubt precisely to that definition: the Roman *plebs* never objected to traditional status distinctions.

The new *ordo* was a disparate body. Round an aristocratic Roman core (men like *Atticus) were grouped leading men from colonies and *municipia*, *publicani*, and even *negotiatores* (businessmen)—many of similar background, but some self-made men. Free birth and a landed interest were prerequisites for social recognition (cf. Cic. *Offi.* 1. 51). Senators and *equites* in the late republic thus formed a plutocracy sharing both landed and business interests, in a continuous range of proportions.

In social standing, *equites* were almost equal to senators, freely intermarrying even with patrician nobles and gaining entry to the senate (though not the consulate) if they wanted it (see Cic. *Sest.* 97). But as a class they preferred the pursuit of money and pleasure to political responsibility, and they thus formed the non-political section of the upper class rather than (as in the empire) an intermediate class. Their history is an important part

of that of the late republic, particularly in view of their control of the *quaestiones* during most of that time. Various *populares* tried to mould them into a political force opposed to the senate and the *nobilitas*; but their social and economic interests, especially after the enfranchisement of Italy, were basically too similar to permit this. *Sulla, after decimating them in the proscriptions, followed the example of Marcus Livius Drusus the Younger and deprived them of leadership by adlecting the most prominent survivors to the senate, and of power by taking the courts from them. But strengthened by the influx of Italians and by increasing financial power, wooed by Pompey, and largely restored to the courts by the law of Cotta, they rose to unprecedented influence in the 60s, when Cicero and the senate—aware of the basic community of interests of the two classes—tried to unite them behind the *principes* in a *concordia ordinum*. Yet, though often united on a single issue (e.g. against threats to financial stability by demagogues or threats to freedom of profiteering by statesmen), sometimes even for a lengthy period, they were too disparate in composition and too non-political to form a stable grouping. Preventing necessary reform (especially in the provinces), they remained a disruptive and irresponsible element with no programme or allegiance, until the Civil War substituted military for economic power. Caesar deprived them of the Asian tithe, but opened a new avenue for them by making prominent *equites* like Gaius Oppius and Lucius Cornelius Balbus—a splendid example of a non-traditional *eques*—his political and financial agents. The support of these men, as well as the precedent, proved important to Augustus. EB

Imperial period

Under the emperors the *equites* constituted a second aristocratic order which ranked only below the senatorial order in status. *Equites* in the wider sense (see below) provided the officer corps of the Roman army and held a wide range of posts in the civil administration (see PROCURATOR) as it developed from its limited beginnings under *Augustus.

The precise criteria for membership of the order remain disputed. On a wider definition, which will be accepted here, all Roman citizens of free birth who possessed the minimum census qualification of 400,000 sesterces automatically qualified as members of the order. Thus when *Pliny the Younger (*Ep.* 1. 19) offered a friend from Comum a gift of 300,000 sesterces 'to make up the wealth required of an *eques*', he implies that this gift of itself would be sufficient to make his friend an *eques*. However, it remains possible that these were necessary but not sufficient criteria and that, in addition, some formal act of

authorization, perhaps even the grant of the public horse (see below), by the emperor was necessary.

The equestrian order, widely defined, was much more numerous than the senatorial order and socially and politically (in terms of the range of its public roles) more heterogeneous. Although the total number of *equites* at any time cannot be determined, already under Augustus they were relatively numerous. Strabo records that recent censuses had revealed 500 men of equestrian census at both Gades and Patavium (Strabo 169, 213C). During the course of the first two centuries the possession of equestrian rank spread widely through the provinces. This diffusion mirrored the extension of Roman *citizenship. From the beginning of the Principate Baetica and Narbonensis are well represented, in the 1st cent. AD and after Africa and the Greek east. Far fewer *equites* are attested in the Danubian provinces, Germany, Gaul, and Britain. The vast majority of the order came to be constituted by the landed gentry of the municipalities of Italy and of the cities of the most urbanized provinces. Although these men were eligible to take up the military and civilian posts reserved for *equites*, the majority of them continued rather to play a local political role as senior local magistrates and councillors or as high priests of the imperial cult.

Within the order three specific subsets of unequal importance can be identified, namely the holders of the public horse (*equus publicus*), the jurors at Rome, and the military and civilian office-holders. The re-emergence of the category of *equites equo publico* under Augustus formed part of his traditionalist social policies. He restored the long disused parade (*transvectio*) of July 15, while allowing men handicapped by age or ill health to parade on foot, and those over 35 to have the choice of retaining or giving up the (notional) *equus publicus*; the occasion was also combined with an examination by Augustus of the physical and moral fitness of these *equites*. On one occasion more than 5,000 men are recorded as taking part in this ceremony (Dion. Hal. *Ant. Rom.* 6. 13). This subset of *equites* formed a distinct corporation which might dedicate statues or play a role in the funeral of an emperor. The grant of this status was at the discretion of the emperor who could also withdraw it.

Augustus also established four boards (*decuriae*) of jurors (*iudices*), each of 1,000 men, who were of equestrian rank but, according to *Pliny the Elder (*HN* 33. 30–3), were not as such called *equites* until AD 23. Owing to the pressure for places Gaius added a fifth *decuria*. Like the public horse the status of juror was solely in the gift of the emperor. For example a Qunitus Volteidius Optatus Aurelianus, from Carthage, was granted the public horse by *Trajan and entry to the *decuriae* by *Hadrian; another

local notable from Africa received both statuses from *Antoninus Pius (*ILS* 9406–7). Both statuses, as dignities conferred by the emperors, came to some extent to be honorific privileges which did not necessarily involve the expectation of the exercise of actual duties at Rome. Both statuses cease to be attested after the first part of the 3rd cent.

Within the political system of the Principate the most significant, if a minority, subset of equestrians was constituted by those who served as equestrian officers in the army and as senior civil administrators. Each year there were about 360 posts available for senior officers of equestrian rank: prefectures of cohorts, military tribunes, and prefectures of cavalry units. A minority of these officers were not typical equestrian landed gentry but instead ranking soldiers who had attained the rank of senior centurion (*primipilus*) in a legion and thereby acquired equestrian status. Tenure of these officer-posts was normally the necessary precursor for advancement to the senior civil administrative posts, reserved for *equites*, though from the early 2nd cent. tenure of the post of *advocatus fisci* became an alternative precursor. In the provinces emperors appointed *equites* as procurators who had prime responsibility for fiscal administration; at Rome from the reign of Augustus key posts, such as the praetorian prefecture or the prefecture of the corn supply, were reserved for equestrians. From the late 1st cent. the posts of the palatine officials, for example, control of the imperial correspondence, were transferred from freedmen to equestrians. Senior equestrian administrators formed with senior senators the political élite of the empire. They intermingled socially with senators; they married into senatorial families; like senators they could be summoned to serve on the emperor's *consilium* (emperor's body of advisers). Sons of leading equestrian officials were the prime source of recruitment of new senatorial families. On occasion, especially under *Vespasian and Marcus *Aurelius, senior equestrians might be adlected by the emperor into the senate.

From the latter part of the 2nd cent. equestrian officials began to acquire regular appellations of rank—*vir eminentissimus* ('most renowned') for the praetorian prefects, *vir perfectissimus* ('most accomplished') for the other prefects and higher procurators, *vir egregius* ('excellent') for the rest. In the course of the 3rd-cent. crisis equestrian officers, often men who had risen to equestrian status via the chief centurionate, began to replace senators as army commanders and provincial governors. This process culminated in the reforms of *Diocletian under whom the higher military posts and almost all administrative posts passed into the hands of *equites*. During the first half of the 4th cent. repeated attempts were made

to confine equestrian rank to office-holders and to exclude *curiales* (town councillors). In the same period the title *perfectissimus* (*egregius* disappears under *Constantine I) was extended downwards to officials of minor rank, eventually being awarded in three grades. By the end of the century this process had been overtaken by a similar diffusion of senatorial honours among officials, and at this point the equestrian order ceases to be a recognizable element in the Roman state. FGBM/GPB

Eratosthenes, of Cyrene (c.285–194 BC), pupil of *Callimachus and Lysanias of *Cyrene. After spending several years at Athens, where he came under the influence of Arcesilaus and Ariston of Chios, he accepted the invitation of Ptolemy III Euergetes to become royal tutor and to succeed *Apollonius of Rhodes as head of the Alexandrian Library. He thus became a member of the Cyrenaean intelligentsia in Alexandria, of which the central figure was Callimachus. His versatility was renowned and criticized, and the eventual Alexandrian verdict was to describe him as *bēta*, 'B-class' (that is to say, not 'second rate' but 'next after the best specialist in each subject'), and *pentathlos*, an 'all-rounder'. Others, more kindly, called him 'a second Plato' (see PLATO). In more than one field, however, and particularly in chronology and mathematical and descriptive *geography, of which, thanks to *Strabo, we know most, his work long retained much of its authority.

Works

(almost entirely lost in direct quotation).

1. Literary criticism. Eratosthenes evidently attached considerable importance to his researches in this field, for we are told by *Suetonius that he was the first scholar to call himself by the proud title of *philologos* ('scholar'). His most important work seems to have been the treatise *On Ancient Comedy*, in at least twelve books; this dealt with literary, lexical, historical, and antiquarian matters, and problems of the authorship and production of plays.

2. Chronology. His *Chronographiai* represented the first scientific attempt to fix the dates of political and literary history. He also compiled a list of Olympian victors. In this field his most significant achievement (later abandoned) was to replace a partly mythical pre-historic chronology by one based on supposedly assured data (the fall of *Troy).

3. Mathematics. He investigated a wide range of mathematical and geometrical problems and was accepted as an equal by Archimedes, who addressed his *Methodus* to him, after the death of his earlier disciple Conon of *Samos. In his *Platonicus* (perhaps a dialogue) he apparently discussed mathematical definitions and the principles of music.

Among his geometrical works were the *On Geometrical Means* and *On the Duplication of the Cube*. The latter included his poem on that well-worn theme, addressed to Ptolemy III. In his *On the Measurement of the Earth* (probably a preliminary work to his *Geographica*) he treated mathematical geography, calculating with a higher degree of accuracy than his predecessors the circumference of the earth. He was the first systematic geographer, and the *Geographica* (*Geōgraphika*, three books) dealt with mathematical, physical, and ethnographical geography, being based on a division of continents on a geometrical basis into 'seals' (*sphragides*), a term perhaps borrowed from contemporary Ptolemaic terminology of land-measurement. The work opened with a sketch of the history of the subject, with especial reference to the Homeric poems, and this, along with the mathematically more exact work of Hipparchus, formed the main source of Strabo's theoretical geography in books 1–2. For the Asiatic section his work was based to a considerable extent on the data provided by the bematists (surveyors) of *Alexander the Great and the early *Seleucids.

4. Philosophy. His works in this field, the *Platonicus*, mentioned above, and the *Ariston* (named after the Chian philosopher Ariston whom Eratosthenes had heard with some scepticism in Athens) were severely criticized by Strabo for their dilettanteism, but we know virtually nothing of their contents, and Strabo, as a good Stoic, was nettled by Eratosthenes' disenchantment with his Stoic teachers. (see STOICISM.) Archimedes, in sending to Eratosthenes the text of his *Methodus*, called him 'a leader of philosophy' (*philosophias proestōs*), and there is no reason to regard this as polite condescension. It seems likely that these philosophical writings belong to the pre-Alexandrian phase of Eratosthenes' career.

5. Poetry. As a poet Eratosthenes for the most part eludes us, though his 'Alexandrian' characteristics are evident in theme and occasional quotation. His statement that the aim of poetry is to entertain, not to instruct, reflects a coherent *ars poetica*. His short epic *Hermes* described the birth of the god Hermes, his youthful exploits, and his ascent to the planets. The short epic *Anterinyos* or *Hesiod* dealt with the death of *Hesiod and the punishment of his murderers. [Longinus] (Subl. 33. 5) praises the elegy *Erigone*, which told the myth of Icarus and his daughter, as 'a faultless little poem' (*dia pantōn amōmēton poiēmation*). These, however, have vanished, and the longest surviving fragments of his versatile muse are the delightful poem on the Duplication of the Cube (see above), and the short piece on the youth of Hermes.

Eratosthenes' intellectual calibre is seen both in chance utterances which reveal him as a man of insight and conviction (perhaps also of prejudice) and also in an

occasional glimpse of a wide moral and political comprehension, notably in his comment in his *Geographica* (Strabo 66) that Greek and 'barbarian' (the Indians and the Arians, the Romans and the Carthaginians, 'with their wonderful political systems') should be judged by the unique criterion of morality and not of race (see BARBARIAN). His candour and independence of judgement may go some way towards explaining that, although the names of some of his direct pupils are known, he seems to have established no lasting following associated with his name; we hear of no 'Eratostheneioi', as there were 'Callimacheioi', 'Aristarcheioi', and others. See GEOGRAPHY; MAPS. P.M.F.

Eros, god of love. Eros personified does not occur in Homer, but the Homeric passages in which the word *erōs* is used give a clear idea of the original significance. It is the violent physical desire that drives Paris to Helen, Zeus to Hera, and shakes the limbs of the suitors of Penelope (*Il.* 3. 442, 14. 294; *Od.* 18. 212). A more refined conception of this Eros who affects mind and body appears in the Archaic lyric poets. Because his power brings peril he is cunning, unmanageable, cruel (Alcman 36; Ibycus 6; Sappho 136; Thgn. 1231); in *Anacreon he smites the lovestruck one with an axe or a whip. He comes suddenly like a wind and shakes his victims (Sappho, Ibycus). Eros is playful, but plays with frenzies and confusion. He symbolizes all attractions which provoke love. He is young and beautiful, he walks over flowers, and the roses are 'a plant of Eros' of which he makes his crown (*Anacreonta* 53. 42). He is sweet and warms the heart (Alcman 101).

With Himeros ('Desire') and Pothos ('Longing'), Eros is a constant companion of *Aphrodite, although he can appear with any god, whenever a love story is involved. Hesiod seems to have transformed the Homeric conception of Eros. Although he describes Eros in terms almost identical with Homer as the god who 'loosens the limbs and damages the mind', he also makes him, together with Earth and Tartarus, the oldest of all gods, all-powerful over gods and men. With Eros as a cosmic principle, Parmenides found a place for him, perhaps as the power which reconciles opposites. This philosophic conception contributed to the Epicurean picture of omnipotent Eros (*Ath.* 13. 561), took abstruse mythological shape in Orphic cosmogonies (*Ar. Av.* 696) (see ORPHEUS), and formed the background for Plato's discussions of Eros in *Symposium* and *Phaedrus*.

Hellenistic poets continue the more playful conception of Anacreon, the tricks Eros plays on mortals, the tribulations of those who try to resist him, and the punishments he receives for his misdeeds. His bow and

arrows, first mentioned by Euripides (*Iphigenia Aulidensis* 548–9), play a great part in these accounts. Frequently a plurality of Erotes is introduced (*Anacreonta*; *Anth. Pal.*; *Ap. Rhod.* 3. 452, 687, 765, 937) because both love and the god who symbolized it could multiply.

Eros had some ancient cults and much individual worship. He was always the god of love directed towards male as well as female beauty. Hence his images in the gymnasium, his cult among the Sacred Band in Thebes (*Ath.* 13. 561f, 602a), and the altar in Athens erected by Hippias' lover (*Ath.* 13. 609d). As a god of fertility Eros is celebrated in the very old cult in Thespieae (*Paus.* 9. 27. 1–5), and in the joint cult with Aphrodite on the north slope of the Athenian Acropolis. In Thespieae Eros was represented by an aniconic image; in Athens phallic symbols have been found in the sanctuary. In both cults festivals were celebrated; that in Thespieae, called Erotidia, incorporated art, athletics, and equestrianism. Altars to Eros at the *Academy in Athens and the gymnasium at Elis were matched by ones to Anteros (*Paus.* 1. 30. 1, 6. 23. 3), whom Eros sometimes wrestles. In Philadelphia, worshippers called themselves Erotes; other cult centres include Leuctra, Velia (in south Italy), and Parium in Mysia.

Eros in Archaic art is hard to differentiate from other winged males. An Attic plaque shows him wingless. On vases, he appears alone, carrying lyre or hare, or in myth, especially accompanying Aphrodite, winged, boyish, sometimes with bow and arrows. During the Classical period he increasingly associates with women, in domestic scenes or weddings. He appears in military and athletic scenes, and was painted by Zeuxis and Pausias. The Erotostasia occurs occasionally. Scopas' group of Eros, Pothos, and Himeros at Megara is an early sculpture. In the Hellenistic period, he is a putto, common in terracottas and with Psyche.

ethics 'Ethicals' or *ta ēthika* ('moralia') was the standard label from *Aristotle onwards for treatises on ethics. Aristotle also uses the adjective to describe forensic and political speeches, and literary works (e.g. tragedy, and the *Odyssey* by contrast with the *Iliad*), as expressive of moral character. Using it as a title of treatises reflects a deliberate determination, again consolidated by Aristotle, to distinguish types of inquiry ('ethical' versus 'physical', 'logical' and so on) in terms of their subject-matter, on the assumption that different subject-matters not only rest on different first principles but call for different methods and different standards of accuracy and completeness. The root word *ēthos*, which occurs from *Hesiod and *Homer onwards, means, in the plural, 'haunts' or 'customary abodes' (e.g. of animals) and 'manners' or 'customs' (*mores*); in the sin-

gular, 'disposition', 'character', or 'characteristic way of behaving'. Importantly, *ēthē* (like *mores*) are only ever ascribed to sentient beings (thus it is a narrower concept than the modern philosopher's 'dispositional properties'). It is implied that the subject desires to behave in the specific 'way', but also that once a particular passage of behaviour is traced to an *ēthos*, no further explanation is forthcoming. In general, the use of *ēthos* and *ēthē* tends to be implicitly comparative: it presupposes a class of behaviours and habits (e.g. obtaining food, dealing with danger) taken as common or analogous over a range of types of subject, and then on that basis picks out specific cases as realizing the pattern in a specific 'way' stemming from the animal's or person's own constitution (whether natural or the result of conditioning) as distinct from external circumstances. The comparison may be made as between types of animals (comparison by *ēthē* is one of Aristotle's tools in his zoological inquiries), between nations and tribes etc., and between different persons in the same community. This last context is the one in which attributions of *ēthos* are most obviously 'moralistic', being typically charged with praise or reproach (using virtue- and vice-vocabulary) and the intention of influencing people's conduct. Whether or not there is a genuine etymological connection between *ēthos* and *ēthos* ('accustomed practice', 'way of behaviour acquired by getting used to engaging in it'), the verbal closeness was significant for Plato and Aristotle. In Aristotle it became the foundation of his distinction between the 'ethical' or 'moral' virtues (*ēthikai aretai*) and the virtues of thought or intellect. The distinction reflects two theoretical contrasts, also pre-figured in *Plato. (a) Each type of virtue is acquired in its own way, the ethical ones (and corresponding vices) arise through *ethismos*, i.e. becoming habituated to patterns of action and emotional response through practice, while the intellectual ones arise through 'teaching', i.e. verbal explanation. (b) The intellectual virtues are qualities of the strictly rational 'part' of the soul, while the ethical ones are conditions of the appetitive and emotional part (or, in Plato, parts), which can be trained to 'respond to reason' but cannot 'give itself reason'. As well as the virtues and their opposites, the study of ethics covered actions, passions, pleasure and pain, friendship, and of course *eudaimonia* ('happiness'). The importance of *ēthos* and the 'ethical' is usually taken for granted, but can be analysed to some extent. (1) In a sense, behaviour in accordance with *ēthos* is basic because the subject has not adopted it for a reason; instead, a given *ēthos* expresses itself in part in terms of the specific reasons that weigh or fail to weigh with the subject. Yet (2) the *ēthē* of human beings can

be acquired, strengthened, or reduced by training and the culture in general. Given (1) and (2), the art of managing people (which is a great part of *politikē*) must pay attention to *ta ēthika*, whether or not the management has people's individual *eudaimonia* in view. However, since (1) means that the individual's fundamental responses in a given situation stem from his or her *ēthos*, this *ēthos*, for as long as the person has it, will (in that situation) rule the person's life in terms of actions and emotion. To the extent that happiness depends not just on having things (wealth, position, even wisdom) but on how people use what they have (a standard motif in ancient Greek ethics), personal happiness depends on personal *ēthē*. The idea is encapsulated in Heraclitus' dictum that *ēthos* is a human being's *daimōn*, i.e. the personal spirit that supposedly determines whether one has a good life. SBR

ethnicity (See RACE). In social science usage, a term coined (in 1953) to describe that condition 'wherein certain members of a society in a given social context choose to emphasize as their most meaningful basis of primary extrafamilial identity certain assumed cultural, national or somatic traits' (O. Patterson in N. Glazer and P. Moynihan (eds.), *Ethnicity* (1975), 308); a socio-political strategy of selective advantage enacted within a dominant political organization, which rests on insistence upon the significance of group distinctiveness and identity, and the rights that derive from it. Ethnic identity is not a 'natural' condition, but rather a self-conscious statement using selected cultural traits as diacritical marks. Ethnic groups are thus mutually exclusive, and are more usually constituted with reference to kinship than to territory. Dynamic and strongly contextualized, ethnic expression is characteristic of complex societies.

In the ancient Greek world, ethnic terminology is found from Homer onwards. Ethnicity, in the above sense, is of importance in two principal areas. First, in the context of the *ethnos*, a category of state which existed alongside the **polis*, but which is only rarely treated by ancient sources. *Ethnē* are diverse, with no single form of constitution. They are characterized by the fact that by contrast with *poleis* (which retained total autonomy), individual communities surrendered some political powers (usually control of warfare and foreign relations) to a common assembly. Their inhabitants were thus required to express a range of local and regional loyalties of varying degrees of complexity and strength. By contrast with *poleis*, the role of urban centres in *ethnē* varied greatly; settlement structures range from a high degree of urbanization and local autonomy (e.g. Boeotia, which was tantamount to a collection of small *poleis*) to scattered small

villages with little urban development (e.g. Aetolia). According to *Aristotle (*Pol.* 1326^b), *ethnē* are characterized by their large populations. Although the *ethnos* is sometimes equated with primitive tribalism, social and political developments from the 8th cent. BC onwards (in religion and colonization, for example) often bear comparison with evidence from *poleis*, and the *ethnos* was a varied and long-lived phenomenon. Equally, *ethnē* have been seen as the origin or precursors of the federal states created from the 4th cent. onwards (e.g. the Achaean and Aetolian Confederacies). These, however, incorporated many former *poleis*, and relations between citizen groups were thus more formally constituted, often drawing on earlier concepts of *sympoliteia* and *isopoliteia* ('joint/equal citizenship').

In Hellenistic and Roman times, the concept of ethnicity may be applied to a variety of 'outsider' groups (e.g. Jews) who sought or were accorded particular status or rights within a broader imperial context. Hence the status and political role of these groups varied over time, and ancient sources are often imprecise in distinguishing between ethnic groups, the *natio* (or nation, usually the dominant ethnic group in a region), and the tribe (which in the case of the Roman division of state, may originally have been constituted on an ethnic basis). See MIGRATION; NATIONALISM; RACE.

Ethnicity has become particularly contentious in Late Antiquity. Traditional narratives of the *Völkerwanderungen* (4th–6th cents. AD) assumed that the outsiders moving onto Roman soil had long-established group identities based on shared material and non-material cultural norms. New understandings of ethnicity have combined with reconsiderations of the archaeological and historical sources to undermine this view. The old *migration models have consequently required revision, and sometimes heated debate has followed on which particular sub-groups within units like the Visigoths or Vandals were responsible for asserting these group identities, based on what degree of continuity from the past, or whether, indeed, the coherence of such groups was largely an invention of Roman commentators. CAM/PJH

Etruscans (Gk. Tyrsēnoi, Lat. Tyrrheni, Etrusci), historically and artistically the most important of the indigenous peoples of pre-Roman Italy, and according to *Cato the Elder the masters of nearly all of it (*Serv. on Aen.* 11. 567)—a claim confirmed by archaeology for the area between the Tridentine Alps and the gulf of Salerno. Modern research has resulted in the emergence of a recognizably Etruscan cultural identity that amounts to much more than the traditional images of a poor relation of Greece and a mysterious prelude to Rome.

The conflict in the sources between the Etruscans' alleged eastern (Hdt. 1. 94) and autochthonous (Dion. Hal. *Ant. Rom.* 1. 25–30) origins has been resolved by D. Briquel's convincing demonstration that the famous story of an exodus, led by Tyrrhenus from Lydia to Italy, was a deliberate political fabrication created in the Hellenized milieu of the court at Sardis in the early 6th cent. BC. Herodotus' authority is not diminished by this: his account is indeed prefaced by the words 'The Lydians say...'. Archaeologically, M. Pallottino's hypothesis of ethnic formation in Etruria itself has long provided the best explanation of the facts: the possessors of the indigenous Villanovan culture between the Arno and the Tiber were iron age Etruscans, who gained much in the 9th and 8th cents. from the interest shown by the outside world in their mineral resources, and in the 7th were able to acquire and commission luxury goods and adornments of east Mediterranean ('orientalizing') types for the tombs of their 'princes'. Foremost among the early bearers of outside influences were the Euboean traders who had established themselves at Pithecusae by the mid-8th cent.: their alphabet was modified to accommodate the pre-existing phonetic systems already characteristic of different Etruscan-speaking zones, and there can be little doubt that it is the first western Greeks who are ultimately responsible for the exaggerated perception of ethnic unity ('Tyrsēnoi') in an area that had in fact inherited a significant degree of regional individuality from its final bronze age.

The continuity in settlement and in the basic culture of the 8th and 7th cents. at the mainstream Villanovan–Etruscan centres was accompanied by major developments both in society and in artistic production. The *praenomen–nomen* combination, a clear sign of proto-urban organization, is attested epigraphically from the beginning of the 7th cent., as are recognizably local schools of fine painted pottery, soon joined by *bucchero* (the only exclusively Etruscan product), bronze-work, and jewellery—categories in which the contributions of native Etruscan and expatriate Greek and Levantine specialists and entrepreneurs are inextricably linked. Oil and wine were also produced and exported on a large scale by the mid-6th cent. By then, too, the social class represented by the early orientalizing princely tombs had given way to a broader, *polis*-based, category of prosperous merchants and landowners. Their last resting-places take the form of single-family chamber-tombs, ranged along streets in well-planned cemeteries which have yielded a rich harvest of imported vases from all the best Attic black-figure and red-figure workshops. The chambers at Tarquinii and a few other centres have preserved the largest extant complex of pre-Roman painting

in the Classical world: prior to the 4th cent., its naturalistic and frequently cheerful depiction of banquets, games, and hunting affords a welcome glimpse of the 'real' Etruscan character underneath the veneer of Hellenization (see HELLENISM) constituted by the mass of prestige goods imported (and made locally) not only for deposition in tombs but also—and increasingly—to supply the votive requirements of major sanctuaries like that at Pyrgi.

The expansion of some Etruscan centres beyond the relatively narrow confines of Etruria proper began at an early stage with the foundation of the Tarquin dynasty at Rome by Lucius Tarquinius Priscus (reigned traditionally 616–578). The presence of the Tarquins, who turned Rome into a city, doubtless facilitated control of the land route to Campania, where Volturnus (Capua) became the chief Etruscan city. To the north, Felsina (Bologna) enjoyed a similar status in the Po valley from the late 6th cent., when growing Greek activity on land and at sea to the south made it imperative to cultivate new markets—not least with the mysterious Celtic communities north of the Alps, who had acquired a taste for the contents of the fine bronze flagons made in Vulci when Arruns of Clusium (Chiusi) set off to entice them into Italy for his own purposes at the end of the 5th cent. (Livy 5. 33). In the event, the Celts added their own not inconsiderable weight to the pressure on the Etruscans that was already building up from Rome (whence the Tarquins were expelled in 509), from the Greek south (where the battle of Cumae was lost in 474) and from other quarters as well (the Carthaginians and the Italic peoples). Of these, the inexorable advance of Rome into Etruria and Umbria was by far the most serious threat to the survival of what was still an essentially cantonal phenomenon as distinct from a nation: city-states, loosely organized in a League of Twelve Peoples, capable of meeting in council at the federal sanctuary of Voltumna near Volsinii—and of denying federal assistance to Veii, threatened by Rome since the end of the 5th cent., for primarily religious reasons. Livy's comment (5. 1. 6) on this episode, to the effect that the Etruscans paid more attention than any other people to religious considerations, is one of the relatively few positive statements about the Etruscans in the ancient sources: no Etruscan literature has survived, and Greek and Roman authors were far from objective observers of such matters as commercial rivalry (which they defined as piracy) and social customs (notably those concerning the position of women) that were not those of Greece and Rome.

DWRR

Eucratides I ('the Great'), Graeco-Bactrian king c.170–145 BC. His brilliant but warlike reign marked the climax

of Greek rule in *Bactria(-Sogdiana). Justinus' *Epitome* 41. 6. 1–5 compares him to Mithradates the Great of *Parthia, while Apollodorus of Artemita (quoted at Strabo 15. 1. 3) calls him 'ruler of a thousand cities'. His parents Heliocles and Laodice, commemorated on a special series of his coins, are otherwise unknown; however, Laodice is portrayed wearing a diadem and was therefore from a royal family. Some believe her to be a sister of *Antiochus (III) the Great, but most scholars reject this view and associate her with either the family of Diodotus II or Euthydemus I. Eucratides apparently seized power in Bactria, and then waged wars in Sogdiana, Arachosia, Drangiana, Aria, and finally NW India. His principal adversary was probably King Demetrius I (son of Euthydemus I), though some argue for Demetrius II. After enduring a long siege, Eucratides overcame Demetrius and claimed the territories of Parapamisadae and Gandhara. It is likely that he also defeated the relatives of Demetrius I, including the ephemeral kings Euthydemus II, Agathocles, and Pantaleon. A campaign against Menander I is also possible.

The career of Eucratides may be traced in his voluminous coinage, which is among the finest and most innovative from antiquity. Besides commemorating his parents, he portrayed himself in heroic pose and added the epithet 'Great' to his royal title. His standard coin-type, the charging Dioscuri, seems to celebrate the famous cavalry of Bactria. South of the Hindu Kush mountains, he issued rectangular and bilingual coins (Greek/Prakrit) on an Indian standard for local commerce. He also struck the largest known gold coin from the ancient world, a numismatic masterpiece weighing 20 staters (169 g.: almost 6 oz.).

Eucratides was brutally assassinated c.145 BC by one of his sons, probably Plato. Another son, Heliocles 'the Just', avenged the crime, but Bactria-Sogdiana soon fell victim to nomadic invaders from the north and Parthian encroachment from the west. Eucratides was the last king to rule at *Ai Khanoum. FLH

euergetism, neologism of French scholarship (*évergétisme*, from *euergetēs*, 'benefactor') to describe the socio-political phenomenon of voluntary gift-giving to the ancient community. Embracing the beneficence of Hellenistic kings and Roman emperors, whose subjects saw such philanthropy as a cardinal virtue of rulers (see KINGSHIP), it has been studied in recent years above all in relation to the *polis, of which benefaction by wealthy citizens and citizenesses becomes a defining characteristic from the 3rd cent. BC until late antiquity, as is attested by thousands of honorific inscriptions memorializing donors; it is also a feature of republican Rome, where the

liberalities of senators in kind at least (public building, spectacle) resemble that of their humbler Greek contemporaries, and of the (Mediterranean) Roman city in general. In Greece the origins of euergetism go back to the aristocratic ideal of liberality found in Homer and echoed by Aristotle, who included acts of 'magnificence' (*megaloprepeia*) such as feasting the city among the virtues of the well-born man (*Eth. Nic.* 1119^b19–1122^a17). In Classical Athens beneficence in this tradition, while lingering into the 5th cent., was essentially inimical to the ideal equality of Athenian *democracy, which preferred instead to impose on rich citizens the compulsory duty of the liturgy. Although 4th-cent. Athens conferred the title 'benefactor' on foreigners, only in the 3rd cent. does the type of the 'benefactor politician' emerge clearly in the Greek city, as with one Boulagoras of Samos (c.245 BC), who combined office-holding with gifts from his own purse to his city, in return receiving a crown and inscription (*Syll.*³ 366 = Austin no. 113). *Aristotle saw munificence in office as a cynical device of rich oligarchs (*Pol.* 1321^a31–42); P. Veyne (*Bread and Circuses* (abr. Eng. trans. 1990)) sees Hellenistic 'benefactor politicians' as symptomatic of a weakening of democracy in favour of increasing dependence on the rich few. Others (following P. Gauthier, *Les cités grecques et leurs bienfaiteurs* (1985)) postpone this 'decline' until the advent of Roman domination, when (largely unaccountable) regimes of gift-giving notables in effect became the system of government in the Greek city; it is to this phase (from c.150 BC) that the extreme forms of honours for local benefactors, including cult, belong (as well as the hailing of the Romans by some Greek cities as 'common benefactors', *koinoi euergetai*). Civic euergetism was a mixture of social display, patriotism, and political self-interest. It was not charity, since its main beneficiary was the citizen-group, although its increasing embrace under Roman rule of the whole city (i.e. slaves and foreigners) prepared the way for the emergence of bishops and wealthy lay Christians as local benefactors, whose protection and material assistance, however, now specifically included the *humiliores* (non-élite persons). Probably at no time was the economic significance of euergetism as great as the vast number of honorific inscriptions might suggest. AJSS

Euripides (see following page)

Eusebius, of Caesarea (c.AD 260–339), prolific writer, biblical scholar and apologist, effective founder of the Christian genres of Church history and chronicle, and the most important contemporary source for the reign of *Constantine I. His intellectual formation at Caesarea in

[continued on p. 297]

EURIPIDES

Euripides, Athenian tragic playwright.

Career

Euripides was born probably in the 480s. He first took part in the dramatic competitions of the City Dionysia at Athens in 455 BC, the year after the death of *Aeschylus (Life 32: he came third; the plays included *Daughters of Pelias*, his first treatment of the story of *Medea); he died in 407–6, leaving, like *Sophocles later in the same year, plays still unperformed (*Iphigenia at Aulis*, *Alcmaeon in Corinth*, *Bacchae*: schol. Ar. *Frogs* 67), with which he won a last, posthumous victory (*Suda*, entry under the name). His first victory came only in 441 (*Marm. Par.* 60; plays unknown). He won again in 428 (hypothesis ('preface' to *Hippolytus*), but in his lifetime won only four victories at the Dionysia (*Suda*): he was thus far less successful in the competition than Aeschylus (thirteen victories) or Sophocles (eighteen victories). In 438 he was defeated by Sophocles (hyp. *Alc.*; Euripides' plays were *Cretan Women*, *Alcmaeon in Psophis*, *Telephus*, *Alcestis*); in 431 he was third to Aeschylus' son, Euphorion, and Sophocles (hyp. *Medea*: his plays were *Medea*, *Philoctetes*, *Dictys*, *Theristae*); in 415 second to Xenocles (Ael. *VH* 2. 8; Euripides' plays were *Alexander*, *Palamedes*, *Trojan Women*, *Sisyphus*); in 409 second, perhaps to Sophocles (hyp. *Phoen*; his plays included *Phoenissae* and perhaps *Oenomaus* and *Chrysippus*). In 408 he probably competed at the Dionysia for the last time with plays that included *Orestes* (schol. *Or.* 371). He is said to have left Athens soon afterwards on a visit to Macedon, as guest of the Hellenizing king Archelaus, to have written a play there about an eponymous ancestor of the king (much as Aeschylus had written a play about the foundation of the city of Aetna while in Syracuse as guest of the tyrant, Hieron), and never to have returned to Athens but to have died in Macedon: but for doubts about that whole tradition see S. Scullion, *CQ* 2003, 389–400. There is certainly no good reason to accept the ancient tradition that he left Athens an embittered man, finally despairing after a series of defeats by almost unknown playwrights (Satyrus, *Life of Eur.* fr. 39; Philodemus *de vitiiis*, col. 13; Satyrus' *Life* is largely a work of fiction).

Plays

Euripides wrote some ninety plays (*Suda*, entry under the name). By chance we have more than twice as many of them as we have plays by either Aeschylus or Sophocles. They fall into two categories: the first, a group of ten plays which have been transmitted to us in our medieval manuscripts complete with the accumulation of ancient notes and comments that we call scholia. They represent the same kind of volume of 'selected plays' as we have for the other two playwrights. They are: *Alcestis*, *Medea*, *Hippolytus*, *Andromache*, *Hecuba*, *Trojan Women*, *Phoenissae*, *Orestes*, *Bacchae*, and *Rhesus*. The last is almost certainly not by Euripides; the plays are in their likely chronological order; *Bacchae* has lost its scholia and the end of the play is partly missing. The other nine plays are: *Helen*, *Electra*, *Heraclidae*, *Heracles*, *Suppliant Women*, *Iphigenia at Aulis*, *Iphigenia among the Taurians*, *Ion*, *Cyclops*. They have been transmitted in only a pair of closely related 14th-cent. manuscripts (known as L and P); they have no scholia and they are in a rough (Greek) alphabetical order. There is little doubt that they represent the chance survival of one volume (perhaps two) of the 'complete plays' of Euripides, which circulated in alphabetical order, as we know from ancient lists of plays and collections of 'hypotheses' (prefaces) to the plays (see Barrett, ed. *Hippolytos*, 45–61): they therefore represent a random sample of Euripides' work. Nine of the surviving plays are dated: *Alcestis* (438), *Medea* (431), *Hippolytus* (428), *Trojan Women* (415); *Helen* (412); *Phoenissae* (409); *Orestes* (probably 408); *Bacchae* and *Iphigenia at Aulis* (between 408 and 406). The remaining plays can be dated more roughly but with some confidence on the evidence of Euripides' writing of the verse of spoken dialogue in his plays. Statistical studies have shown that the tendency he clearly displays to write an ever freer, looser iambic verse line, by replacing 'long' syllables with pairs of 'short', is steadily progressive and not subject to sudden fluctuations (Dale, ed., *Helen*, with references to earlier work). The likely sequence (with approximate dates) is: *Heraclidae* (430), *Andromache* (426), *Hecuba* (424), *Suppliant Women* (422), *Electra* (416), *Heracles* (414), *Iphigenia among the Taurians* (413), *Ion* (410). The satyr-play *Cyclops* is late, probably around 408. We also have, mostly from papyrus texts, sizeable fragments of several other plays: *Telephus*, *Cretans*, *Cresphontes*, *Erechtheus*, *Phaethon*, *Alexander*, *Oedipus*, *Hypsipyle*, *Archelaus* (in their probable chronological order).

'Realism', fragmentation, formalism

Ever since *Aristophanes' portrayal of Euripides, in his play *Frogs*, as an intellectual iconoclast who insisted on confronting the darker and more disturbing aspects of everyday reality (*Frogs* 959), and Aristotle's quotation of an opaque remark attributed to Sophocles, to the effect that he (Sophocles) presented men 'as they ought to be', while Euripides presented them 'as they are' (*Poet.* 1460^b33 ff.), Euripides has tended to be read as a 'realist'. Plays such as *Trojan Women* (which sharply focuses on the savage brutality of war, in the middle of war); *Aeolus* (which takes incest as its theme: we know of it only from its 'hypothesis') and *Cretans* (whose action turns on sexual intercourse between a woman and a bull) have been cited in evidence. Moreover it has seemed obvious to many critics (already in antiquity: [Longinus], *Subl.* 15. 4–5) that a naturalistic treatment of human psychology, particularly female psychology, is another hallmark of Euripidean theatre: witness *Medea*, *Phaedra*, *Hecuba*, *Electra*, *Creusa* but also *Ion*, *Orestes* (in *Orestes*), and *Pentheus*. It is undoubtedly true that there are strands of 'realism' in Euripides' writing for the theatre: for example, *Medea's* presentation of herself as mistrusted 'foreigner' and oppressed and exploited 'woman' (*Med.* 214–58) and her subsequent slow, tortured progress to infanticide; *Orestes* sickened and eventually driven mad by the corrosive effects of guilt (*Or.* 34–45; 208–315, including the only 'mad scene' in extant Greek tragedy); or the voyeurism of *Pentheus* in *Bacchae*. But these are strands only in an extremely fragmented whole. For it is arguable that a vision of human experience as inherently fragmented and as defined by the co-existence of disparate, even contradictory, strands forms the very heart of Euripidean sensibility.

If we go back to *Medea* and read it attentively, we shall find that the *Medea* we have encountered in the passage already referred to exists, within the world of the play, alongside other *Medeas*: before the passage mentioned, she has been heard off-stage, giving incoherent voice only to pain and articulate only in universal cursing and damnation, of herself and her own children as well as of her enemies; immediately after it, she is transformed into a subtle adversary who patently and easily outwits her most powerful enemy. Subsequently she becomes successively brilliant orator, pathetic victim, devious manipulator, exultant (and uncanny) avenger, tormented mother until her final metamorphosis (involving a stunning *coup de théâtre*) into the demonic figure who, in an aerial chariot drawn by snakes, closes the play with prophecies and taunts sent down from beyond his reach upon the husband who deserted and humiliated her.

Hippolytus too introduces us to a similarly fragmented world: the play is framed by the appearance of two human-like divinities, cool, articulate, and frighteningly rational in their revenges; in between it is given over to humans, in three very disparate and distinct 'movements'. The first of these movements comprises the uncanny and disturbing passage across the stage of *Hippolytus*, who, it is clear, lives apart in a world of his own making and accompanied by his own, personal, chorus; as he leaves, we are confronted, first, by a world of women, characterized by an intimacy which is warm and close but also painful, and by a *Phaedra*, who is successively delirious with hunger and unspoken sexual desire and then, immediately, rational, articulate, and analytical in presenting her decision to take her own life. That world is shattered by its own intimacies, which lead by slow degrees but with a sense of psychologically convincing inevitability first to deadly revelation and then to misguided intervention. The intervention goes terrifyingly astray. *Phaedra* dies and the world of women in which she has lived is replaced by a world of men, that of her husband and *Hippolytus*, the stepson with whom she had, by *Aphrodite's* will, fallen obsessively in love. This male world is characterized no longer by intimacy and warm relationship but by distance and cold rhetoric: in this world there is no communication, only speech-making and the cut-and-thrust of distichomythia (the formal exchange of pairs of lines). The scene ends in *Theseus's* invocation of a male divinity, his own father, to destroy his son and it is followed at once by the messenger's description of that destruction: the description demonstrates that divinity is not human, but bestial and capable of tearing men literally apart and of bringing about the annihilation of all that they have made.

Moreover, Euripidean 'realism' is conveyed to the reader/spectator through the medium of a marked, if equally fragmented, formalism. It has been a stumbling-block for many critics that Euripidean theatricality is expressed in stiffly formal, often detached, 'set pieces'. Euripides characteristically opens his plays with a markedly non-naturalistic 'prologue', in the form of a monologue, which acts as a kind of separate overture. Almost as characteristically he closes them with a detached tailpiece: the shape of the action is broken and brought to a halt by the intervention, sometimes (as in *Medea*) of a character from that action, now transformed, but more often a divinity (as in *Hippolytus*, *Andromache*, *Suppliant Women*, *Electra*, *Iphigenia among the Taurians*, *Ion*, *Helen*, *Orestes*, *Bacchae*). The divinity often apparently makes a highly theatrical apparition off the ground in mid-air, the so-called '*deus ex machina*' (already a problem for Aristotle: *Poet.* 1454^b2 ff.). Confrontation between dramatic persons frequently takes the form of an exchange of

symmetrical and brilliantly rhetorical speeches, transparently forensic in tone, a special kind of bravura set-piece which modern scholars have called an *agōn*.

Innovation and recurrence

In *Frogs* Aristophanes presents Euripides (comically) as a compulsive innovator and subverter of tradition. In his handling of the traditional stories which he (like the other 5th-cent. playwrights) took as the material out of which to make his plays, he clearly innovates: Medea's infanticide; Heracles' killing of his wife and children after, not before, the labours; Electra's marriage to a peasant farmer; the trial of Orestes before the Argive assembly; Thebes, years after Oedipus' discovery of the truth, still inhabited by Iocasta, Oedipus, and Antigone (and by a transient chorus of Phoenician girls!)—all these seem to be Euripidean innovations. There is a kind of restlessness to Euripidean experimentation (*Phoenissae* provides a good example) that many critics have taken to be definitive of his theatrical imagination. But innovation is not in itself a peculiarly Euripidean trait: Aeschylus (especially in *Suppliant Women* and *Oresteia*) and Sophocles (especially in *Philoctetes*) both gave themselves the freedom to reshape traditional stories in order to create new fictional worlds for the tragic theatre.

At least as characteristic of Euripides is the tendency to create theatre, almost obsessively, out of recurring dramatic situations which echo and resonate with each other. Very often these situations have women at their centre, women as victims and/or deadly avengers: examples are *Medea*, *Hippolytus*, *Andromache*, *Hecuba*, *Electra*, *Trojan Women*, *Ion*, *Helen*, *Iphigenia at Aulis*. Sometimes structural echoing (as between *Medea* and *Hippolytus*), situational parallels (as between *Electra* and *Orestes* or between *Hecuba* and *Trojan Women*), or emotional resonances (as between *Medea* and *Ion*) almost give the impression that the later play is a reworking of the earlier. Similarly *Bacchae* returns to the theme of divine revenge through the subjugation and perversion of human will that he had treated in *Hippolytus*. But these are not 'revivals' under another name. Each reworking offers a different vision of the human condition and these disparate visions are enacted in very different structural forms: the ending of *Hecuba*, for example, is quite other than, and carries a very different sense of '*closure' from, that of *Trojan Women*.

Speech and song: the late plays

The late plays of Euripides (roughly those of the last decade of his life, the plays that come after *Trojan Women* and *Heracles*) have thrown up major problems of interpretation and have led to strong critical disagreement. In so far as there has been a consensus, plays such as *Iphigenia among the Taurians*, *Ion*, and *Helen* have been characterized as 'escapist' or as 'tragicomedies', while others such as *Phoenissae*, *Orestes*, and *Iphigenia at Aulis* (*Bacchae*, it is agreed, is somehow 'different') have been called 'epic theatre' or 'melodrama'. The underlying assumption has been that Euripides has turned away from the painful realities of tragic experience to offer his audiences less demanding, more 'entertaining' forms of theatre: the very real sufferings caused by the Peloponnesian War (431–404 BC) between Athens and the Spartan alliance have often been invoked in explanation.

The late plays are also often seen as the moment in Athenian theatre history when the chorus goes into terminal decline: its songs become fewer, more 'irrelevant' to the action and more purely decorative in function. (The charge of 'irrelevance' has indeed been laid against Euripides' use of the chorus even in his earliest surviving plays, for example in the third *stasimon* of *Medea*, ll. 824–65.) The two issues (of the changing nature of late Euripidean theatre and the 'decline of the chorus') need to be taken together.

Sung and spoken text together form the 'script' of the Greek tragic theatre from the earliest surviving play, Aeschylus' *Persians* of 472 BC, to the last, Euripides' *Bacchae* and *Iphigenia at Aulis* and Sophocles' *Oedipus at Colonus*, and in almost all the plays that we have actors and chorus both sing and speak (it is generally assumed that the spoken lines marked 'Chorus' in our manuscripts were in fact spoken only by the chorus-leader). But song is the characteristic mode of choral utterance and speech that of actors. In the late plays of Euripides this distinction becomes very much less clear as actors are increasingly given arias and duets to sing and moments of great emotional intensity in these plays are marked by such songs. Thus, for example, Creusa's anguished and distracted aria of self-revelation at *Ion* 859–922; the recognition duet of Menelaus and Helen at *Helen* 625–97; the murder scene of *Orestes* 1246–1310; and the final encounter and last farewells of Antigone and Oedipus at *Phoenissae* 1539–81, 1710–57. Sung text is also used to convey young innocence at *Ion* 82–183 and *Phoenissae* 103–92. At the same time choral songs are becoming more infrequent, though the stanzas that form them are getting longer.

Moreover, Euripides increasingly uses 'astrophic' song, that is song not composed of the responding, metrically rhymed stanzas that throughout the history of tragedy had characterized the song of both chorus and actors. We have

external evidence that connects these changes to new developments in musical composition, developments that were seemingly designed to make possible freer, aurally less predictable vocal lines. The key figure in these developments appears to have been Euripides' younger contemporary, Timotheus, who is plausibly associated with Euripides in a number of ancient anecdotes. Such music and the writing that goes with it, composed of long sentences, free in syntax, that seem to float without ultimate closure (they are brilliantly parodied by Aristophanes in *Frogs*), are clearly the medium for a different perception of human experience than that of the earlier plays. It is not that Euripides' perception is no longer 'tragic' (though a number of the late plays, such as *Ion*, *Iphigenia among the Taurians*, and *Helen*, do end with apparent 'happiness'); rather Euripides now seems to see human beings not just as articulately analytical in confronting suffering but simultaneously as living in a world of shifting, unstable, and often contradictory emotions. It is through song, and the associative juxtaposition of sensations, thoughts, and experiences that have always characterized Greek song, that such fleeting and unstable forms of consciousness are conveyed in the late plays.

Alongside this almost operatic use of song, Euripides also employs in the late plays other new formal devices to create new versions of the tragic. They include vastly extended passages of stichomythia (exchanges of single lines, dialogue at its most tensely formal) and the use of metres taken from much older forms of tragedy, such as the trochaic tetrameter (*Or.* 729–806, which includes 25 successive lines divided between two speakers, shows both formal devices together). The result is a series of plays whose emotional atmosphere is much more difficult to seize and characterize. Their themes still include human isolation and inexplicable suffering, failures of communication, the victimization of women, and the drive to revenge, even the terrors of madness, themes that have marked earlier Euripidean theatre but in a bewildering variety of new dramatic modes.

The last two plays that we have, *Bacchae* and *Iphigenia at Aulis*, point up the paradoxical and disconcerting multiplicity of Euripides' theatrical imagination. *Bacchae* eschews almost all the formal innovations of the other late plays (though not the freer iambic verse nor the extended stichomythia scenes) and offers a vision of human experience that combines a stark and shocking view of the power of divinity with a luxuriant but ambiguous emotionalism which veers from joyful calm to exultant savagery: men and women are crushed and overwhelmed by collision with a divine power which they cannot comprehend. *Iphigenia at Aulis* takes us into another world. It makes much use of actor arias and duets (including an extended passage of sung text given to Agamemnon, as well as long arias for Iphigenia); it deploys greatly extended passages of stichomythia, much of it in trochaic tetrameters and involving free use of broken lines. The choral songs are more numerous than in other late plays and the first of them (the entry-song of the chorus) is very long. Above all it creates an emotionally charged but unstable world marked by botched deception and exciting disclosure, by an anti-hero, Agamemnon, who is tormented by indecision, and by a young Iphigenia, who combines a childlike innocence with heroic self-determination. The worlds of *Iphigenia* and of *Bacchae* barely touch and yet, in the theatre, they were juxtaposed, played one after the other before the same audience. They attest not merely the variety of Euripides' theatrical imagination (to the very end of his life) but also a fact that we should always remember: that his audiences, like those of Aeschylus and Sophocles, were accustomed to the experience of tragedy not in the form of a single play but as a sequence of three disparate tragic fictions, rounded off by anti-tragic burlesque. The disparateness of Euripides' theatrical imagination plays to that expectation. See also TRAGEDY, GREEK. JPAG

Palestine owed much to the influence of Pamphilus (martyred 310), by whom he was apparently adopted, and to their joint use of the library of Origen. From his election as bishop of Caesarea c.313 until his death in 339, Eusebius played a significant role in ecclesiastical politics in the eastern empire. He attended and assented to the decisions of the Council of Nicaea in 325, having been readmitted to communion after recanting his earlier views; but though he delivered a speech at the dedication of Constantine's church of the Holy Sepulchre in Jerusalem (335) and encomia for the emperor's *decennalia* (315–16) and *tricennalia* (335–36), he was probably not such a con-

fidant of Constantine as has commonly been supposed. He was present at the council of Tyre in 335 as an opponent of Athanasius, and shortly afterwards at Jerusalem when Arius was readmitted to the church. His *Life of Constantine*, left unfinished at his death, sought to create the impression of a harmonious and consistent imperial religious policy from the accession of Constantine (306) to the reign of his three sons, beginning in September 337.

Eusebius wrote biblical commentaries, in which the profound influence exerted on him by Origen is tempered by his own historical perspective; his *Onomasticon*,

‘a biblical gazetteer’, is an important source for the historical geography of Palestine. The two editions (? before 303 and 325–6) of his lost *Chronicle*, represented by Jerome’s Latin version and by an Armenian translation, synthesized Old Testament, near eastern, and Graeco-Roman history into a continuous chronological sequence accompanied by chronological tables. The object, as in his *Ecclesiastical History*, was to demonstrate that God’s plan for salvation subsumed the whole of history. The same thinking lay behind his *Preparation for the Gospel* and *Proof of the Gospel* (after 313), apologetic works in which pagan philosophy is refuted and the Roman empire seen as the necessary background for the coming of Christ and the establishment of Christianity. The *Preparation* reveals Eusebius’ immense debt to the library of Origen, with its many citations from Greek historians, Philo Judaeus, and especially Middle Platonist philosophy. An early work, *Against Hierocles*, attacks the comparison of the pagan *Apollonius of Tyana with Christ; in the *Preparation* the main target is Porphyry, whose anti-Christian arguments Eusebius systematically set out to refute. The later *Theophany* (325–6 or later), extant in Syriac translation, and his last works repeat many of the same apologetic themes.

Eusebius’ integrity as a historian has often been challenged, and indeed the later part of his ten-book *Ecclesiastical History* (which may have been begun in the 290s but only reached its final form in 324–5) was successively extended and clumsily revised as immediate circumstances changed. The *Life of Constantine*, in four books, has seemed so suspect on the grounds of bias and inconsistencies that Eusebian authorship has been denied. But the authenticity of the many documents cited or mentioned has been vindicated in one major case by the identification of the same text on papyrus, and modern scholarship is more willing than before to recognize the complexity of Eusebius’ methods. The citation of documentary evidence marks both works off from secular historiography. However, Eusebius’ aim was not so much objectivity as persuasion: close study of the reworking of parts of the *Ecclesiastical History* in the *Life of Constantine* shows that he deliberately developed and enhanced his own earlier argument in the light of later reflection. Both works reflect the powerful impact of Christian persecution on Eusebius’ thought but unlike the *Ecclesiastical History*, which took its main shape before or during the persecution of 303–13, and went on to cover only the part of Constantine’s reign up to the defeat of Licinius in 324, the much later *Life of Constantine* reflects Eusebius’ mature, if one-sided, understanding of the implications of a Christian imperial system.

AMC

experiment Greek and Roman scientists did not refer directly to the experimental method. However, in a variety of contexts they described testing procedures that were clearly deliberate investigations designed to throw light on problems or to support theories. Examples can be found in the Presocratic philosophers, the Hippocratic writers, *Aristotle, Erasistratus, Heron, Philon, Ptolemy, and Galen.

We should distinguish first the areas where experimental investigation is possible from those where it is not. Direct experiments in astronomy are out of the question. This was also true, in antiquity, in relation to most problems in meteorology (thunder and lightning) and in geology (*earthquakes). In such cases ancient scientists often conjectured analogies with other more accessible phenomena that were directly investigable. Thus Anaximenes may have tried to support Anaximander’s theory of lightning as caused by wind splitting the clouds by suggesting that it is like the flash of an oar in water. Similarly some of the experimental interventions described in the Hippocratic writers (see MEDICINE §4) incorporate an element of analogy. The writer of *Diseases 4*, for instance, describes a system of intercommunicating vessels which can be filled or emptied by filling or emptying one of them. He uses this to explain the movements of the humours between the main sources in the body (stomach, heart, head, spleen, liver). What this shares with an experiment is the careful construction of an artificial set-up. Where it differs from experiment in the strict sense is that its relevance to the physiological problem discussed depends entirely on the strength of the analogy suggested (in this case a mere conjecture).

Sometimes, however, direct interventions are proposed. Examples can be given from *physics, harmonics, optics, mechanics, pneumatics, physiology, and *anatomy. Thus Aristotle states that he has proved by testing (*pepeiramenoi*) that the evaporate of sea water is fresh (*Meteor.* 358^b 16ff): however he then goes on to claim that the same is true of other flavoured liquids including wine—a typical risky extension of an experimental result. In harmonics, testing procedures were used by pre-Platonic Pythagoreans (see PYTHAGORAS) in their investigations of the numerical relations expressed by the concords of octave, fifth, and fourth, although later writers who report that those relations were discovered by Pythagoras himself are generally untrustworthy. Some such reports claimed, for example, that he made that discovery by weighing hammers that gave certain notes: yet that would not yield the result described.

Optics provides one of our fullest examples of a series of careful experiments, though the results have been adjusted to suit the general theory proposed. In his *Optics*

(5. 8 ff.) Ptolemy describes his investigations of refraction between three pairs of media (from air to water, air to glass, and water to glass). He describes the apparatus used and records the results to within a half degree for angles of incidence at 10-degree intervals. However, the results all exactly confirm the general 'law' that takes the form $r=ai-bi^2$, where r is the angle of refraction, i the angle of incidence, and a and b constants for the media concerned. Elsewhere he provides convincing experimental proof of the elementary laws of reflection (3. 3), to establish, for instance, that the angle of incidence equals the angle of reflection.

Experiments in the strict sense were attempted also in the life sciences. Erasistratus described one in which a bird is kept in a vessel without food for a given period of time, after which he weighed the animal together with the visible excreta and compared this with the original weight. This he took to show that there are invisible

effluvia from animals—again an overinterpretation of a correct result. Galen used experimental *vivisections on animals to investigate a variety of problems. He showed the peristalsis of the stomach in one, and produced a detailed account of the courses of the nerves in systematic experiments on the spinal cords of pigs. In the latter case no general theory is at stake: what the experiments reveal is the precise connection between vital functions and particular nerves.

Ancient scientists thus showed considerable ingenuity in devising testing procedures. However what this exemplifies is not so much the idea of a crucial experiment, an ideally neutral means of adjudicating between theories antecedently deemed to be of equal plausibility, as the appeal to tests specifically to support or to falsify a theory. In this way, experiments in antiquity are an extension, though an important one, of the use of evidence.

JEF/GERL

HISTORICAL EXPLANATION

1. 'Which of the gods was it that brought the two together in strife?', asks the *Iliad* as it launches its narrative (1.8); early in the *Odyssey* *Zeus complains that mortals blame the gods when they are responsible for their own sufferings (1.32–3). Both poems however swiftly complicate any attempt to limit explanations to either the human or the divine level. Achilles and Agamemnon quarrel, Achilles kills Hector, and Odysseus gets home, largely because they are the people that they are, but gods often intervene too. The Greeks win because they are better fighters; they also win because more gods are on their side. The poems also suggest another form of explanation, not tracing events to their origins but relating them to a familiar pattern of human life. Suffering is the lot of humanity (*Il.* 2.4.525–6); outrages like those of the suitors are punished. Life is like that, and one should not be surprised.

2. Interest in causal explanation is also a feature of Greek and Roman historiography. *Herodotus' proem promises treatment, along with 'other things', of 'the reason why Greeks and barbarians came to war against one another'; *Thucydides weighs the 'truest explanation' of the war against the 'grievances' which were aired at the time (see para 5 below); *Polybius presents 'the contemplation of causes' as a preoccupation of those who are eager for knowledge (6.1.8); *Tacitus echoes a proverb in speaking of 'matters that at first seem slight but from which great things are often set in motion' (*Ann.* 4.32.2). Individual authors have different preoccupations and slants, but many of those Homeric features are recurrent: the double levels of causation, their complex interaction, the importance but also the limitation of explanations based on individual personality, the relevance of national characteristics and weaknesses, the recurrent patterns of human experience.

3. Greek historians sometimes highlight the role of the divine, especially when particularly momentous or morally satisfying events are in point (e.g. *Hdt.* 2.120.3, 4.205; *Xenophon *Hell.* 5.4.1, 7.5.13); Thucydides is an exception, though he does, very occasionally, draw in religion as an important explanatory strand (esp. 7.18.2–3). Still, the divine register rarely precludes explanations on the human level as well, any more than Polybius' stress (1.4.1) on the role of Fortune in Rome's rise precludes him from stressing the importance of the Roman constitution (6.1.8–10). It can be left open whether a particular success requires a divine or human explanation (*Xen. Hell.* 7.5.12), but more often the two levels simply co-exist. Nor are the gods always friendly: Tacitus' *Histories* will show, so he says, that 'gods do not care about

our safety but do about our vengeance' (*Hist.* 1.3.2), whether that means that they take vengeance themselves or simply show interest in the vengeance that humans take on one another.

4. In other ways too historians can accumulate different explanatory strands. In Herodotus patterns of reciprocity and vengeance, with aggression provoking counter-aggression, co-exist with an imperialistic rhythm whereby a run of success tempts an over-confident leader to a step too far (e.g. 1.27, 1.71). Croesus' motive for fighting Cyrus is pre-emptive (1.46.1), and it is also his desire for land (1.73.1). This need not be regarded as simple-minded; modern historians too debate how far events are over-determined, either because of complex motives or because of a plurality of forces or influences. But not all explanations are as good as one another. Herodotus can already contrast real motives with professed ones (4.167.3, 8.3.2), and debate what was the real reason why Athens was the saviour of Greece (7.139).

5. Such weighing invited the development of a causal vocabulary, and much of it has a rhetorical tinge: that is why 'explanation' is often the better word, an argument put forward for others to weigh. Recurrent Greek words are *aitia* often 'grievance', or *aitios/-on* 'who' or 'what is to blame'; *prophasis*, normally connected with *phēmi* and interpreted as 'what is proffered as a reason', true, false, or half-true (an alternative derivation from *prophainō* is sometimes suggested to give a 'phenomenon' that 'precedes' something else); and more rarely *proschēma*, a 'front' that one puts up before others. Thucydides contrasts the 'truest explanation' (unexpectedly, *prophasis*) of the war—Athenian expansion and the fears this caused in Sparta—with the 'causes' or 'grievances' (*aitiai*) aired at the time, centring on Corcyra or Potidaea (1.23.6), and this vocabulary and conceptual framework are echoed when Athens launches the Sicilian expedition (6.6.1). Elsewhere too different explanations are weighed against one another (esp. 2.65.11 and 7.57.1). As in similar league-tables of causes in the Hippocratic (e.g. *Aer.* 24, *On Breaths* 15), the 'less true' explanation is not wholly rejected but simply explains less: thus Corcyra and Potidaea may explain why the war happened in 431 rather than 425, but the 'truest cause' explains why it happened at all. Polybius develops this to a threefold scheme of 'cause', 'pretext', and 'beginning' (3.6, 9.6–10.6, 15.9). He has there been thought to trivialize Thucydides' scheme, and to fail to produce deeper explanations of Thucydidean profundity; it is arguable though that his earlier narrative has already brought out Thucydides-like ideas of a clash of empires and fearful responses on both sides, and he can now take this for granted.

6. *Cicero's requirements for historiography include the demand 'that all causes should be laid out, whether of chance or of rashness or of wisdom' (*De or.* 2.63): to modern tastes a rather narrow repertoire, with human strengths or failings as the only alternatives to chance. Sempronius Asellio had similarly distinguished annals from history in that the first chronicled actions, the second showed 'the planning and the thinking' with which they were carried out (fr. 1 P). Roman historiography does indeed follow Greek in dwelling on human personality; *Livy's Scipio and Hannibal and *Tacitus' Tiberius and Nero make a great difference, just as Herodotus' Themistocles and Thucydides' Pericles had done; so do *Sallust's Jugurtha and Catiline, less in their case as exemplars of the vices they exploit in others than of a corrupted form of virtue. But there is also an embedded tendency to look beyond the personal to wider explanations centring on Rome itself, not unlike (but often more morally triumphalist than) the way that Greek historiography found explanations in the characteristics of autocratic Persians, innovative Athenians, or cautious Spartans. *Cato the Elder left out the generals' names (*Nepos Cato* 3), presumably to highlight the achievements of the Roman people (though he found room to include his own speeches); Sallust found the relevant background to the events of 63 BC not in Cicero's or *Catiline's past life but in the social, moral, and economic crisis in Rome and Italy (*Cat.* 6–13, 36–9). Livy's linking themes are often based on Rome's moral strengths and resilience, though his later books also indicate the dangers of contact with eastern wealth and luxury; and Tacitus distances his history from imperial biography by indicating themes such as the hypocrisies embedded in the imperial system, with senators just as insincere and vindictive as their dissimulating or ruthless *principes*, or the legions' growing awareness of the power they could exercise.

7. Such explanatory strands have something of the life-is-like-that pattern: Romans are virtuous and martial, and so one is less in need of (though one can still find) particular explanations for individual successes. The patterning can be more universal still: big cities become small and small become big (*Hdt.* 1.5.4), just as the wheel of fortune can always turn for individuals (*Hdt.* 1.29–33). Thucydides probes an underlying human nature that, despite the important local variations, all may share, and war shows such human nature at its worst; brutal, vindictive, and often wildly askew in its calculation of self-interest. The history of empires and regimes here raised questions of special concern. Are there universal patterns here too, so that a great power, whatever the particular reasons for its growth, will take its place in a 'sequence of empires' that have risen and fallen? Herodotus and Thucydides play, more or less explicitly, with the idea of Athens as the new Persia. Polybius first suggests that Rome's constitutional strengths may make her different from

past great powers (Book 6); with his continuation to include events to 146 BC, darker questions are raised, and *Scipio Aemilianus may have reasons to fear that the fate of Carthage may one day befall Rome (38.21–2). Livy's history of the regal period (Book 1) prefigures some of the rhythms of the Republic, with the growth of violence and ambition and an autocrat eventually overthrown by a Brutus to begin a new Roman era. Tacitus too ponders the possibility of some sort of cycle, this time in morality and luxury (*Ann.* 3.55.5). The possibility of such patterning underpins the historians' concern to teach lessons for the future, whether pragmatic (how to avoid the mistakes of the past), analytic (how to understand events), or morally improving (how to behave well): all depend on some assumption that the past affords some guide to what may come back in the future.

8. Modern theorists debate how far historical explanation is the same as scientific explanation, where one might confidently predict that the same relevant circumstances would produce the same result, or whether we should think rather of 'narrative codes' by which we apply familiarizing templates to the messiness of experience (e.g. L. O. Mink, *Historical Understanding* (1987)). On either the scientific or the narrative-code model, recurrent patterns are still crucial, whether these are regarded as inherent in the events or in the narratives or in a mixture of both. For their own reasons, ancient writers were equally concerned with recurrence; they were also alert to how much difference individual humans have made in the past and can make now—and sometimes how little, when faced with the bigger and more brutal elements of the human condition, which explain more than individuals ever can. *See also* HOMER, HISTORIOGRAPHY (various articles), and under names of individual historians mentioned. Fabius Maximus Verrucosus, Quintus, grandson or great-grandson of Quintus Fabius Maximus Rulianus, as consul 233 BC celebrated a *triumph over the Ligurians and unsuccessfully opposed the agrarian bill of Gaius Flaminius. He was censor 230, consul for the second time 228, and *dictator (probably) 221. In 218 he perhaps opposed an immediate declaration of war on Carthage. Dictator again in 217, after the Roman defeat at Lake Trasimene, he began his famous policy of attrition, believing that Hannibal could not be defeated in a pitched battle; this earned him the name 'Cunctator' (the Delayer). He allowed Hannibal to ravage the Campanian plain, but then blocked his exits; Hannibal, however, escaped by a stratagem. Opposition to Fabius' policy at Rome led to his *magister equitum* (master of the horse), Marcus Minucius Rufus, receiving **imperium* equal to his. When Minucius was enticed into a rash venture, Fabius rescued him. The traditional policy of fighting fixed battles was resumed in 216, but after the disaster at Cannae there was no alternative to Fabius' policy. With the help of his position as the senior member of the college of *augures*—he is said to have been an augur since 265—he became suffect consul for the third time for 215, operating in Campania. He was re-elected for 214, helped to recapture Casilinum and had a number of successes in Samnium. In 213 he perhaps served as legate to his son. Direct control of affairs now passed to other men, but Fabius reached his final consulship in 209, when he recaptured Tarentum and was made *princeps senatus* (acknowledged senior senator). In 205, together with Quintus Fulvius Flaccus, he strongly opposed *Scipio Africanus' plan to invade Africa. He was no doubt alarmed by Scipio's growing prestige, but genuinely believed that taking the war to Africa posed unnecessary dangers. It was Scipio who brought the war to an end, but Fabius' cautious strategy which made victory possible. Fabius died in 203. He had been *pontifex* (see PRIESTS (GREEK AND ROMAN)) since 216 as well as augur, a rare distinction. JBR

Failaka (off Kuwait). See ICAROS.

family, Roman English 'family' has connotations which have changed during its long history and vary according to context. Biologically, an individual human being is related to parents, through them to ascendants, aunts, uncles, siblings, and cousins, and may, by sexual intercourse with someone of the opposite sex, in turn become a parent, linked by blood to descendants. Blood relations for Romans were *cognati*, the strongest ties normally being with parents and children and the siblings with whom an individual grew up. Relationship established through the sexual tie of marriage was *adfinitas*; kin by marriage were *adfines* (in strict usage from engagement until dissolution of the marriage). Law initially stressed blood relationship through males: *agnati* (father's other children, father's siblings, father's brothers' children, a man's own children, etc.) inherited on intestacy. By entering *manus* (marital power), a married woman came into the same agnate group as husband and children; if she did not, her legal ties and rights were with her natal family.

The group under the power of a *paterfamilias* (father or grandfather), whether or not they lived under the same roof, was sharply distinguished; there might be other living agnates outside this group. Agnatic forebears were present in family consciousness as recipients of ritual, as *imagines* (portraits) in an aristocratic house, and as links between the living. For the Romans, *familia* could originally mean the patrimony; its more normal usages were to describe (1) those in the power of a *paterfamilias*, kin, or slaves, or (2) all the agnates who had been in such power, or (3) a lineage, like the Julian house, or (4) a group or household of slaves (Ulpian, *Dig.* 50. 16. 195. 1–4). A lineage in the broadest possible sense, a group allegedly descended from a common mythical ancestor, was *gens*; its members shared a middle name (*nomen gentilicium*), e.g. Tullius/a, as members of an agnatic *familia* might share a last name (*cognomen*), e.g. Cicero. (The class of those

sharing a *gentilicium* extended to newly enfranchised citizens, slaves, and their descendants.) *Domus*, besides meaning the building in which someone lived (home or residence: see HOUSES, ITALIAN), covers (1) the *household of free, slave, and freed persons and (2) a broader kinship group including cognates (e.g. the imperial 'family' or dynasty, *domus Caesarum*). Increasingly, descent in the female line (*maternum genus*) came to be valued in sentiment, appraisal of status, and inheritance practices.

The nuclear family is described, in relation to its male head, as consisting of wife and children (*uxor liberique*). Similarly a list of those closest to a particular individual would be drawn up to suit various contexts: Cicero for instance in writing to his brother Quintus at an emotional moment might stress his brother, his daughter, his own son, his nephew (his only surviving close kin), his wife (*QFr.* 1. 3. 3). In relation to an individual, the kin or affines who count change with the phases of life and accidents of survival. The evidence of epitaphs illustrates close family ties as they existed at the time of commemoration: the person(s) who pay for a monument may do so out of love, duty as kin, or duty as beneficiary/ies. Where the commemorator is specified we get a glimpse of how the family operated, as we do from juristic sources, e.g. on dowry or succession, or literary sources, which chiefly reflect the expectations and practice of the upper classes. Although ties with remoter relations by blood or marriage are acknowledged when they exist, emphasis is normally on the nuclear family (one's wife/husband and children, or parents and siblings). In the absence of these, as for soldiers debarred from legal marriage or ex-slaves who theoretically had no parents and in practice might have been prevented from forming a family, comrades or fellow freedmen/women (*conliberti/ae*) might form a substitute family. SMT

famine Catastrophic breakdowns in the production and distribution of essential foodstuffs, resulting in exceptionally high mortality from attendant epidemic *diseases, were rare in the ancient world. The typical natural and man-made causes of famine were omnipresent: crop failure caused by the unreliable Mediterranean rainfall (see CLIMATE) or pests and diseases, destruction in war, state oppression and incompetence, poor arrangements for transport, storage, and distribution, and profiteering by the élite. Specific food-shortages of varying intensity and chronic malnutrition of the poor were common, but most of the population were subsistence farmers whose primary strategy of production was to minimize risk, and the political culture helped town-dwellers to pressure their leaders to resolve food crises

before they became critical. The exaggerated references to 'famine' in the ancient sources echo the political rhetoric of an urban society where famine was a frequent threat but a very infrequent experience. Local climatic variation meant that relief supplies were normally available within the region, given the political will to obtain them. The severe food-shortages over extensive areas of the eastern Mediterranean world attested in 328 BC, AD 45–7 (the 'universal famine' of Acts 11: 28), and AD 500 were quite exceptional. Most famines were local, brief, and primarily man-made, such as the three best-attested famines in Athens of 405/4, 295/4, and 87/6 BC, all the result of siege, or the food-shortages at Rome in 67 BC and AD 5–9, the former apparently intensified, if not caused, by Pompey's manipulation of the supply network, the latter by the diversion of supplies to emergency military operations in Dalmatia and Germany. See FOOD SUPPLY. DWR

fantastic literature, or fiction of the unreal, took two forms in antiquity: (a) fantasies of travel beyond the known world; (b) stories of the supernatural. Both look back to the Phaeacian tales in the *Odyssey*, which became a byword for the unbelievable (cf. [Longinus] *Subl.* 9. 14).

From the Hellenistic period we know of a series of descriptions of imaginary lands, such as those by Euhemerus, Hecataeus of Abdera, and Iambulus. Their primary purpose was social and moral comment, but they often seem to have been authenticated by an adventure story, which provided entertainment but also drew attention to the question of how literally they were to be believed. Antiphanes of Berge's account of the far north was so transparently fictitious that 'Bergaeon' became synonymous with 'fantasist'. Although these works were criticized as falsehoods, some recognized that undisguised fiction represented an area of licence for the imagination (e.g. Strabo 2. 3. 5). Fantasies of this kind are parodied in the space-travel of *Lucian's *True History*, but, despite his satirical programme, Lucian's invention acquires its own fantastic momentum.

Tales of the supernatural also make doubt and belief their central theme. Lucian's *Philopseudes* tells stories of ghosts and magic, including the Sorcerer's Apprentice, while mocking those who believe them. Fantastic episodes occur in the novels, notably of Iamblichus and Apuleius, whose characters share the reader's hesitation as to the nature of the phenomena (see NOVEL). The fragments of Phlegon of Tralles contain the story of an amorous revenant, while Philostratus (*Vita Apollonii* 4. 25) narrates the detection of a vampire. Photius (*Bibliotheca* cod. 130) knew the collection of ghost stories of the

neoplatonist Damascius (d. c. AD 458), but most literature of this kind has been lost. Papyrus fragments include two ghosts (*Oxyrhynchus Papyri* 1368, from the *Phoenicia* of Lollianus; *Michigan Papyri* inv. 3378) and a wizard (*Michigan Papyri* inv. 5+PPal. Rib. 152).

The two strands of fantasy united in the *Wonders beyond Thule* of Antonius Diogenes, which combined travel beyond real geography with witchcraft, Pythagorean philosophy, and self-conscious authentication, all arguably intended to subvert the reality of the perceptible world. JRMO

federal states are found in the Greek world from the late 6th cent. BC. The term is used of those organizations in which the separate city-states (*see* POLIS) of a geographical and ethnic region were combined to form a single entity at any rate for purposes of foreign policy, while for local purposes retaining their separate identity as city-states and their separate citizenship. Thus Boeotia was a federal state in which the individual communities were still regarded as cities, whereas Attica formed the city-state of Athens and the demes (local districts: *see* DEMOCRACY, ATHENIAN) did not have the degree of autonomy appropriate to cities. Tribal states in the less urbanized parts of Greece were like federal states in that the tribal organization comprised units with a considerable degree of local autonomy. There is no ancient Greek term which precisely denotes a federal state: the words most often used are *koinon* ('commonwealth') and *ethnos* ('nation'; *see* ETHNICITY). An account follows of some of the more important federations.

The earliest evidence of a federal state is in (probably) 519 BC, when Plataea resisted incorporation in a Boeotian federal state dominated by Thebes and gained the protection of Athens (Hdt. 6. 108); there are references to the boeotarchs, the chief magistrates of the federation, in 480–479 (Paus. 10. 20. 3; Hdt. 9. 15. 1). The federation may have broken up after the Persian Wars, and for a time Boeotia was controlled by Athens, but it was revived after 446 and we have evidence for its basic mechanisms (Thuc. 5. 38. 2; *Hell. Oxy.* 19 Chambers). The individual cities had similar constitutions, with one quarter at a time of the full citizens who satisfied a property qualification acting as a probouleutic council. The federation was based on electoral units, eleven after 427 and perhaps nine before; the largest cities with their dependencies accounted for more than one unit, while the smallest were grouped together to form a unit; each unit provided one boeotarch and 60 members of a council of 660, and within the council one quarter at a time acted as the probouleutic body. In 386 *Sparta regarded the federation as infringing the principle of autonomy enshrined in the

Peace of Antalcidas or King's Peace, and insisted on its dissolution. The federation as revived in the 370s had boeotarchs again but probably not electoral units; its decision-making body was an assembly, and it was dominated to a greater extent by Thebes. Thebes was destroyed after revolting against *Alexander the Great in 335, and was refounded c.316; the federation survived in the Hellenistic period, based now not on electoral units but on cities.

*Thessaly was divided regionally into four tetrads, each of which came to be headed by a tetrarch; the tetrads could combine to elect a military leader, the *tagos*, but there seem to have been substantial periods when there was no *tagos*. The peoples of the surrounding mountains were *perioikoi* ('dwellers around'), whom the Thessalians controlled when they were strong enough to do so. During the 5th cent. cities developed, and became more important than the tetrads. At the end of the century a dynasty of tyrants came to power in Pherae; c.375 Jason of Pherae aspired to rule all Thessaly, with the title of *tagos*; in the 360s the opponents of Pherae, led by the Aleuadae family of Larissa, organized themselves in a *koinon* with an *archōn* ('ruler') and four polemarchs ('war-rulers'); appeals for support to Macedon and to Thebes culminated in the overthrow of the tyrants by *Philip II of Macedon in 352 and his being made *archōn* of Thessaly. In the course of his later interventions Philip revived the old tetrarchies. Thessaly survived into the Hellenistic period as a federation of cities under the control of the Macedonian king, and a new federation was created by the Romans in 194.

In Arcadia moves towards unity in the 5th cent. seem not to have gone very far, but a federal state was founded after the battle of Leuctra and a new capital was created for it at Megalopolis. There was an assembly of the Ten Thousand, probably all citizens, and also a council; the chief magistrates were 50 *damiorgoi* ('public workers'), representing the cities in proportion to their size, and a single *stratēgos* ('general'). Before long the federation split: one of the two divisions certainly claimed to be the Arcadian *koinon* and the other may have done so. No more is heard of an Arcadian League after the 320s.

The Aetolian Confederacy (like the Achaean, *see* below) began as a tribal state in the Classical period, and in the Hellenistic period developed into organizations with members from outside their original *ethnos*. The Aetolians in the 5th and 4th cents. had both tribal units and city units, and some kind of federal organization. When the confederacy expanded, in the 3rd cent., neighbouring peoples were designated *telē* and perhaps given a status equivalent to that of one of the three Aetolian tribes, while more distant recruits were given *isopoliteia*

(‘equality of citizenship’) either with an Aetolian city or with the whole confederacy. The confederacy had an assembly which held two regular meetings a year, with voting by individuals, a large representative council, and a smaller executive committee, the *apoklētoi* (‘those called away’); the principal magistrates were the *stratēgos* and the hipparch (‘cavalry commander’).

The Achaean Confederacy already had outside members in the 4th cent. It broke up at the end of the century but was revived in 281/o and began to acquire outside members in 251/o. There were four regular *synodoi* (‘meetings’) a year, attended by both a representative council and an assembly, in both of which voting was by cities; later in the 3rd cent. major questions of foreign policy were transferred to extraordinary *synklētoi* (‘summoned meetings’), which involved usually both council and assembly but sometimes only the council. The confederacy had two *stratēgoi* until 255, one thereafter. The individual cities of the confederacy continued to have an active political life of their own.

JAOL/PJR

film Greece, Rome, and the other civilizations of the ancient Mediterranean have provided the world of cinema with some of the oldest and most powerful stories of Western culture and history. They have also provided cinema with narrative, iconographic, and generic structures and genealogies whose force has informed not only specific films but also the principles themselves of scriptwriting and film design. In addition, they have provided film theorists and practitioners with ways of conceptualizing the sensorial and cognitive experience of film-viewing itself. The classical antiquity of cinema is not a single and unified film genre but a complex body of film practices and theories diffused across a wide range of cinematic traditions, cultural contexts, and aesthetic experiences.

In its turn, cinema has played a prominent role in debates about the ever-changing nature of the past, whether accused of killing history and usurping other forms of memory, viewed as a factory of regressive nostalgia, or celebrated as enriching and broadening the ways in which we think of the past as altering the present and shaping the future. Film provides opportunities for historically situated, transnational and multicultural studies of the ancient world; for scrutinizing the wider appeal and accessibility of ‘the classics’, and for questioning what is valuable and canonical about them; for working with interpretative models which are derived not only from literary theory but also from visual culture, media studies, and cultural studies, and which broaden our understanding of the intersection between the textual and the

visual. Film offers an engagement with modern popular culture that can go beyond the polarities of compliance and resistance associated with ideology, while also holding the promise of a rebuttal of the Platonic critique of the arts. It can address cultural syncretisms, contradictions, and negotiations, while also providing insights into the transformative nature of the encounters between modern viewers and the utopian or dystopian fantasies the classical past has inspired.

The ancient world in film is usually studied with a focus on specific texts, individuals, genres, or periods, whether ancient or modern. Like the cultural turn in reception studies at large, the study of the Classical world in film is faced with inter-related challenges: on the one hand it has to identify and analyse the filmic texts that provide the raw material for the disciplinary awareness and theoretical sophistication that are taken for granted in other areas of classical studies. On the other hand, it has also to defend modern popular culture and media against accusations of commodification and reification. Cinema has been proclaimed ‘an invention without future’ ever since its emergence at the end of the 19th cent. Film, however, like the classics, maintains its place in the age of global multimedia, migrating from the cinema screen to the television screen and the computer screen, from film reels to magnetic tapes and digital bytes, and from collective and passive spectators to individualized and active ‘users’. The technological possibilities, conceptual challenges, and historical awareness created by the emergence of new types of information storage and retrieval in recent years provide opportunities for exciting new work on the relation between film and classical antiquity. The fascination of the arts of the screen with ancient civilizations does not confine itself to what has been called the ‘classical’ Hollywood period or to the representational strategies and techniques of realism. Experimental cinema, world cinema, the cinema of the silent era, television, and digital technologies ranging from the dvd format to computer games provide important correctives to homogenizing and essentializing assumptions around ‘cinema’ and to reductive definitions of popular culture and art associated with ‘the movies.’

PMi

finance, Greek and Hellenistic The collective deployment of resources by the community inevitably has socio-political implications (who pays? who benefits?). But public finance in Greek states rarely had economic aims beyond the broad balancing of incomings and outgoings: demand-management through running a budget deficit or surplus was unknown. *Oikonomia* (‘economics’) as applied to state finance preserved autarkic attitudes appropriate to its original meaning of ‘household

management' (Xen. *Mem.* 3. 4). Recurring expenditure (primarily on administration, cult, ambassadors, defence, maintenance of fortifications, gymnasia, and public buildings) would be met from a variety of revenues (rents and royalties from state property, including mines and quarries, court fees and fines, taxes on non-citizens, sales taxes, excise duties and customs dues). Collection of taxes was regularly farmed out by auction to private individuals (*Ath. pol.* 47. 2ff). Extraordinary expenditure (typically through warfare or food shortage; occasionally, on public building) was met through ad hoc measures: property and poll taxes, public loans, creation of monopolies, *epidoseis* (contributions), or confiscations ([Arist.] *Oec.* 2). Warfare itself was seen as potentially productive (Arist. *Pol.* 1256^b), and might occasionally prove so. Systems of Greek public finance may be assessed in so far as they conform to or deviate from these norms.

Minoan and Mycenaean communities seem to have been unique in the Greek world in their degree of direct, central control over resources. The testimony of the Linear B tablets, in conjunction with extensive storage facilities within the palaces, suggests a 'redistributive' system of economic exchange, rigidly controlled from the centre (there are parallels in temple-based economies of the near east; see MINOAN CIVILIZATION; MYCENAEAN CIVILIZATION). All this ended with the onset of the so-called Dark Age (c.1100 BC). The well-stocked storerooms of the *Odyssey* (2. 337 ff.) may dimly recall Mycenaean palaces, but redistribution was replaced in the world of Homer by *reciprocity between and within aristocratic *oikoi* (households). Resources were deployed by the giving of gift and counter-gift: in return for their contributions to the élite, the people received protection (*Il.* 12. 310 ff.; *Od.* 13. 13 ff.). Arrangements in Archaic and even Classical *Sparta resembled Homeric organization in the near absence of any centralized system of finance. The mainstay of the regime was the agricultural produce appropriated from the helots (state slaves) by individual Spartiates, who passed on a portion to their *sussition* (public mess). Details are obscure (the *perioikoi* ('dwellers around'—not full citizens) may have made contributions in cash or kind), but the small scale of resources under central control helps to account for the poor showing of late 5th-cent. Sparta as a city (Thuc. 1. 10). Much the same might be said of the rudimentary systems of finance (e.g. the *naukrariai* and *kōlakretai* in Athens) deployed by the aristocracies dominating early Archaic *poleis*. Archaic tyrants provide a stark contrast: their characteristically heavy expenditure on public buildings and central, civic institutions gave the *polis* a new, urban emphasis. Necessary resources were raised by a combination

finance, Greek and Hellenistic An inscribed decree (late 4th cent. BC) records honours awarded by an Athenian deme (village) to two *chorēgoi* (financial backers) of local dramatic performances. In finance, as in other ways, an Athenian deme behaved like a *polis in miniature. Photo: Hermann Wagner, DAI Athens, neg. no. D-DAI-ATH-Akropolis 1506. All rights reserved.

of personal taxes and other, extraordinary measures: in Athens, a tax on agricultural produce (Thuc. 6. 54). Also characteristic of Archaic tyranny was the effective merging of the tyrant's own resources with those of the state (*Ath. pol.* 16. 1). The ending of *tyranny caused an immediate reaction against the tyrants' financial methods: taxes on the person became a symbol of oppression, restricted to non-citizens and those of low status.

Archaic Athens broadly conformed to this pattern; as late as the 480s, it was proposed that a windfall gain of 100 talents from the silver mines at Laurium be parcelled out among the citizen body (*Ath. pol.* 22. 7). Shortly after, Athenian finances were transformed by the acqui-

sition of a tribute-paying empire (see DELIAN LEAGUE). Figures from the eve of the Peloponnesian War give a crude impression of scale: from a total annual revenue (internal and external) of approximately 1,000 talents (Xen. *An.* 7. 1. 27), some 600 talents derived from the empire (Thuc. 2. 13). This made possible the maintenance of a massive navy, an extended programme of public building, provision of public pay, and the accumulation on the Acropolis of a strategic reserve of at least 6,000 talents (Thuc. 2. 13). Against this, expenses of war were heavy: one talent in pay to keep one trireme at sea for one month. As the Peloponnesian War progressed, there was (in addition to an upward reassessment of the tribute in 425: *ML* 69) increasing reliance on payments of *eisphora*—an extraordinary property tax falling on the wealthy. By contrast, the Spartan system was poorly placed to generate the resources needed for extended warfare. Appeals for contributions from sympathetic individuals proved inadequate (*ML* 67), and only massive subventions of Persian gold made possible the eventual Spartan victory. The importance of imperial revenues for Athens' *democracy became apparent in the 4th cent., when the range of public payments was actually extended to include assembly pay and payments from the theoric fund. Collective aspirations may be read into the explicit aim behind the proposals in *Xenophon's *Poroï* ('Revenues'): maintenance of the citizen body at public expense. Attempts to revive the tribute-paying empire failed and heavier burdens therefore fell on the wealthy (Xen. *Oec.* 2. 5ff). The degree to which increasing demands disrupted and alienated the Athenian élite is disputed. There emerged in the course of the 4th cent. a group of financial experts (including Eubulus and culminating in Lycurgus), who occupied tailor-made offices and made the most of Athens' internal resources.

Characteristic of finance in Classical Athens was the liturgy system, placing the élite under an obligation to perform public services (notably the *trierarchy and *chorēgia* (financing choruses for festivals)). Liturgies were an integral part of the democratic system: in return for public services, liturgists might (or might not) receive popular consideration in politics and the courts. Significantly, Aristotle (*Pol.* 1321^a) recommends that oligarchies attach expensive duties to high public office, so excluding all but the wealthy. The citizens of 4th-cent. Pharsalus handed over their acropolis and control of their finances to their wealthiest citizen; in return he used his fortune as a revolving loan-fund, smoothing out imbalances in income and expenditure (Xen. *Hell.* 6. 1. 2). This privileging of wealth ties in with the broadly post-democratic practice of *euergetism, common in Hellenistic cities. The *euergetēs* ('benefactor') earned enhanced status, and pos-

sibly material rewards, by making donations in cash or kind to the advantage of the citizen body.

Amongst the Hellenistic monarchies, Ptolemaic *Egypt had a system of public finance of exceptional complexity. Revenues from farmland were assessed in painstaking detail and collected directly; collection of dues from vineyards, orchards, and gardens was farmed out. Additionally, the *apomoira* (a tax on wine, fruit, and vegetables) was assessed by royal officials, but the right to collect was sold to contractors. Customs dues were graduated from 20 to 59 per cent, according to the goods involved (contrast the flat 5 per cent tax from Classical Athens). There were varying rates of tax on sale and gift of property and privileges (e.g. tax concessions) and, apart from sundry minor taxes (including a poll tax), intricately organized *monopolies on an extended range of goods and services. Other Hellenistic kings raised revenue from their subject cities partly by imposing specific taxes, partly by levying contributions (*phoros*), which were creamed off internal revenues, raised in the usual ways. PCM

finance, Roman 'Taxes are the sinews of the state.' So claimed both Cicero and the great jurist Ulpian. Despite this recognition of the central importance of taxation no systematic ancient treatment of Roman public finance survives. Extended financial documents are also rare (though see now the elaborate schedule of the *portoria* (customs duties) of Asia in M. Cottier and others, *The Customs Law of Asia* (2008)). Therefore many details about (e.g.) the allocation and collection of taxes or about the character of fiscal institutions (such as the *fiscus*, the *patrimonium*, and the *res privata*) remain obscure and disputed. Despite the serious deficiencies in our evidence the broad features of the history and development of Roman public finance through the republic and the Principate to the later empire can be delineated with some confidence.

In the republic there were, traditionally, two major types of revenue namely the regular *vectigalia* (public revenues and rents) and the **tributum*, an extraordinary (in principle) levy on the property of Roman citizens. The total size of this levy was decided by the senate and varied from year to year. The earliest detailed account of republican public finance survives in the sketch of the Roman constitution in the sixth book of *Polybius, reflecting conditions in the mid-2nd cent. BC. The *aerarium*, the central depository of the state for both cash and documents, was managed by two urban quaestors; but all decisions as to payments from it were made by the senate. On setting out on campaign a *consul could draw funds on his own responsibility. But further payments, for the

supplies, clothes, or pay of the army, had again to be authorized by the senate. The senate also made a quinquennial grant to the censors, on the basis of which they let out contracts for building and repairs of public buildings in Rome and the *municipia* (municipalities) and *coloniae* (colonies) of Italy and for the exploitation of public properties—rivers, harbours, gardens, *mines, and land. Ultimate control of the contracts, for instance in altering the terms, again lay with the senate.

The most important development, not reflected in Polybius' account of the last two centuries of the republic, was the acquisition of a territorial empire overseas. At first resources were extracted from the conquered via *booty and war indemnities, in the medium term by the imposition of regular taxation (tribute) in cash or kind. Provincial governors (and their quaestors) were responsible for the supervision of the collection of tribute and for expenditure in their province. After 123 BC in Asia certainly (and perhaps elsewhere) the process of collection of tribute was contracted out to **publicani*. Two prime consequences ensued from this development. First, the levying of tribute on Roman citizens in Italy was abandoned from 167 BC onwards. Secondly, the revenues of the state were greatly increased. On one speculative estimate (Frank, *Econ. Survey* 1. 141) annual revenues in the early 2nd cent. BC were 12.5 to 15 million denarii. By the late 60s BC they had increased to 50 million; and according to a difficult passage of Plutarch (*Pomp.* 45), Pompey's great conquests in the 60s further increased revenues to either 85 or 135 million. The continuing access of new revenues both meant that Rome's continuous wars were in the long term self-financing and allowed the creation of novel forms of public expenditure such as the distribution of subsidized, later free, corn to Roman citizens. (See FOOD SUPPLY.) Even so, as in many pre-industrial societies, public revenues remained modest in relation to the private wealth of the élite. So the fortune of *Crassus alone amounted to 48 million denarii.

The establishment of imperial rule entailed far-reaching changes in public finance and the creation of an elaborate fiscal state. First, although the senate retained the function of making routine votes of funds, effective control over the state's finances came to lie with the emperor and his agents. Under Augustus we meet for the first time the publication of general accounts (*rationes*) of the public funds. At his death full details of the state's finances were in the hands of his personal slaves and freedmen. The public post of a *rationibus* (first held by imperial freedmen, later by senior equestrians) soon emerged. By the late 1st cent. AD this official was responsible for estimating the revenues and expenditure of the state.

Secondly, direct taxation in the provinces, in the form of the poll tax and the land tax, was placed on a new footing through the introduction by *Augustus and *Agrippa of periodic provincial censuses. These mapped out the human and physical resources of the provinces and formed the basis for the assessments of tribute for each city and its territory. Whenever a new province was annexed, a census was taken. Provincial governors and imperial procurators supervised the collection of tribute; the process of collection devolved on the individual civic authorities. Thirdly, Rome's revenues were vastly increased, although no secure figures survive. The annexation of new provinces (that of Egypt in 30 BC was especially important) of itself increased revenues. A new array of indirect taxes were introduced. The most important were, probably, the *vicesima hereditatum* (5% tax on inheritances) of AD 6 (hypothecated to the discharge payment for veterans) and the *quinta et vicesima venalium mancipiorum* (4% tax on the sale of slaves) of AD 7 (hypothecated to the pay of the *vigiles*). The first three centuries AD also saw the steady accretion of landed property (via legacies, gifts, and confiscations) in the hands of the emperor. The importance of revenue from such crown property was considerable, if unquantifiable, and is already manifest in Augustus' own account, in his *Res gestae*, of his expenditure on public needs. By the late 2nd cent. there were two departments of crown property, the *patrimonium* and the *res privata*, though the distinction between them remains obscure. This formidable array of revenues (tribute in cash and kind, indirect taxes, revenues from crown property) enabled the imperial state to carry out, on a *routine* basis, key political functions such as the distribution of the corn-dole at Rome, the upkeep of the imperial court, the construction and maintenance of an elaborate road network (see ROADS) across the empire, the payment of salaries to senatorial and equestrian officials, and, above all, the funding of the vast standing armed forces of c.350,000 men. This fiscal system was predicated, in its mature form in the 2nd cent., on a basic predictability of expenditure and revenue and on the state's ability to exercise uncontested authority over the territory of the empire. However, potential problems in the form of sudden emergencies or increases in expenditure were already apparent in the later 2nd cent. The great northern wars under Marcus *Aurelius rapidly depleted the reserves of the treasury. In turn the major pay rises for the army of *Septimius Severus and *Caracalla were funded in part by significant debasements of the silver coinage. (See COINAGE, ROMAN.) The generalized political and military crisis, which enveloped the empire from the 230s onwards, was to shatter the fiscal apparatus and its preconditions. The state's ability to raise revenues

was undermined by its failure to maintain routine central authority over the empire; the census-system collapsed, invasion and civil war destroyed accumulated capital and crops. To meet its needs the state resorted to irregular and arbitrary requisitions in kind and to runaway debasement of the coinage. By the 260s the precious-metal content of the silver coinage had been reduced to about 5 per cent. Hyper-inflation wrecked the whole monetary system.

A measure of stability was only restored to the public finances with the reassertion of central authority over the empire. *Diocletian, in a striking repetition of the measures of Augustus, re-established censuses throughout the empire. Payments of tax (predominantly in kind) were assessed by units of population (*capitatio*) and of land (*iugatio*), although the principles and workings of this system, which certainly varied from area to area, are still subject to debate. The finances of the empire were now managed through three departments. The *res privata* dealt primarily with imperial property. The *sacrae largitiones* controlled mines, mints, and state factories, collected taxes and levies in cash, and paid donatives (irregular disbursements) to the troops. The office of the praetorian prefects, the most important of the three, was responsible for the rations of soldiers and officials, for the maintenance of the *cursus publicus* (see POSTAL SERVICE) and of most public buildings, and for calculating annually the required rate of the indiction to produce the supplies in kind. GPB

fishing Fish populations of the *Mediterranean are less abundant than those of the oceans. Gradients of temperature and salinity resulting from the depth and the closure of the ecosystem, however, promote the life cycle of several important species on the continental shelves (but see FOOD AND DRINK). The migratory habits of many important species bring them into contact with many Mediterranean islands and coastlands.

Since the routes of the shoals are far from predictable, places where their movements are topographically constrained (such as straits like Messina, the Bosphorus, or Hellespont, or lagoons and their entries) are of obvious importance. Numbers are very variable from year to year: gluts occur, but dearth is so frequent as to make it unwise to make fish protein more than a supplement (if a locally and occasionally important one) to a subsistence diet. The nutritional usefulness is greatly increased by processing to make the resource sustainable in times of general dearth, and movable inland or by sea: drying and salting are the principal techniques, and the evaporite salt of pans on the fringes of lagoons used for fishery anyway constituted an important symbiotic resource. The salt in

salt fish (with the minerals in the fish) was probably of as much dietary importance as the protein.

Even in conditions of glut, and assuming very favourable conditions for fishing, total yields cannot have constituted an important aggregate contribution to the protein needs of even small ancient populations, compared with cereal or legume staples. They did, however, play a significant role in diversifying a diet based on those staples, which was important both nutritionally and culturally in the classic Mediterranean pairing of staple and 'relish'—in Greek *opson*. Salted or pickled fish was the *opson par excellence* (the mod. Greek *psari*, 'fish', is derived from *opsarion*), and widely available for use in small quantities.

To the producer, this demand gave the catch the economic status of a cash crop, and enabled the secondary purchase of more protein than could easily have been acquired through consuming the fish. On this base of widely disseminated eating of fish-pickle, the fisherman could rely on a still more lucrative market in fresh fish which could fetch high prices in luxury provision markets. This combination of an urbane—and urban—ready availability of fish *opsa* with the opulent associations of fresh fish prized by the connoisseur underlies the great prominence of fish in the Athenian comic tradition. What had been characteristic of Athens became a feature of most towns in the Hellenistic and Roman periods; study of the amphorae reveals the scale and complexity of the trade in *garum* (as the pickle came to be known), while the competitive consumption of the exquisites of high society provided a continuing stock of anecdote about colossal prices and singular specimens. The fisherman became a type of opportunism and poverty, proverbially wild, but a familiar and parasitical accompaniment to all that was best about stylish living.

Fishing in the open sea was chancy and hazardous, but essential for the most prized fish. Many local markets were supplied from the rocky shores. The fisheries of the formerly extensive wetland lagoons of the Mediterranean coasts were the easiest to develop artificially, because they were sheltered, shallow, and had controllable inlets and outlets, and systematic pisciculture grew from their management. Both archaeological and literary evidence shows the extent to which Roman pisciculture developed, and the elaboration of fishponds for both fresh and salt-water fish. Processing plants for making pickle were also built on a grand scale, from the early Hellenistic period in the Black Sea area, and in the Roman period on the coasts of southern Spain and Mauretania. This economy depended on, and is an interesting indicator of, a developed interdependence of markets in the Mediterranean. See MEALS. NP

Flamininus Titus Quinctius Flamininus, Born c.229 BC, military tribune 208 under Marcus Claudius Marcellus, then quaestor, probably at Tarentum, where he held praetorian **imperium* for some years from 205. Decemvir for distributing land to **Scipio Africanus'* veterans 201, he concurrently became triumvir to supplement Venusia (200). In 198, against some opposition but with the support of the veterans he had settled, he was elected **consul* and sent to take over the war against Philip V of Macedon with a new army and a new political approach. After driving Philip from a strong position in the Aous gorge separating Macedonia from Epirus, he moved towards central Greece against stiff resistance, but with his brother's help forced the Achaean Confederacy into alliance and now gained some further allies. Meeting Philip late in 198, he demanded the evacuation of all of Greece (unacceptable to Philip at this point), but apparently hinted to Philip that the **senate* might modify the terms. He instructed his friends in Rome to work for peace if he could not be continued in command and for war if he could complete it; he was prorogued, and the senate insisted on his terms. In spring 197, after gaining the alliance of most of Greece, he decisively defeated Philip by superior tactical skill at the battle of Cynoscephalae. He now granted Philip an armistice on the same terms, which the senate confirmed as peace terms. Advancing implausible excuses, he refused to allow his Aetolian allies to annex some cities promised to them. He thus secured a balance of power in the north, but gravely offended the Aetolians, making them eager to welcome **Antiochus III*. In a spectacular ceremony (see Polyb. 18. 46) he announced the unrestricted freedom of the Greeks in Europe at the Isthmia of 196 and persuaded a reluctant senate commission that this pledge had to be carried out if Greek confidence was to be retained against Antiochus, who was about to cross into Europe. He now initiated a diplomatic effort to keep Antiochus out of Europe and deprive him of the Greek cities in Asia Minor. The final settlement of Greece involved a difficult war against the Spartan tyrant Nabis (see SPARTA), nominally as head of an almost Panhellenic alliance. The settlement paralleled that with Philip: Nabis was left to rule Sparta, to secure a balance of power between him and Rome's Achaean allies. In 194 all Roman troops were withdrawn. Henceforth Flamininus was showered with honours (including divine honours) in Greece. He issued a commemorative gold coin with his portrait (RRC 548) and left for Rome to celebrate an unparalleled three-day triumph (Livy 34. 52). A bronze statue with a Greek inscription was erected to him in Rome by his Greek clients (Plut. *Titus* 1. 1).

In 193 he was entrusted with secret negotiations with Antiochus' envoys; when they refused his offer of

undisturbed possession of Asia in return for withdrawal from Europe, he proclaimed to the Greek world that Rome would liberate the Greeks of Asia from Antiochus. Sent to Greece to secure the loyalty of the Greeks and of Philip, he was partly successful; but Demetrias, afraid of being surrendered to Philip, became an Aetolian bridgehead for Antiochus. He remained diplomatically active in 191–190, both in the war and in Peloponnesian affairs, handing Messene over to the Achaeans and annexing Zacynthus for Rome. In 189 he was censor. In 183, sent to Asia on an embassy, he unsuccessfully tried to intervene in Peloponnesian affairs on his way, then took it upon himself to demand the extradition of **Hannibal* from Prusias I. (Hannibal committed suicide.) With the senate working to substitute Demetrius, Philip's pro-Roman younger son, for Perseus as designated successor, he hatched a plot to substitute Demetrius for Philip as king (see Polyb. 23. 3, cf. 7; Livy 40. 23, denying the charge). The result was Demetrius' execution (181). After this failure he disappears from public affairs until his death (174).

A typical patrician noble, he saw his world in terms of personal ambition, Roman patriotism, family loyalty, and patron–client relationships. He was the first to develop a policy of turning the Greek world—cities, leagues, and kings—into clients of Rome and of himself, nominally free or allied, but subject to interference for Rome's advantage. The Greeks, whom he had liberated, he expected to follow his instructions even without a public mandate. Aware of Greek history and traditions, he attracted many Greeks by charm and tact, but aroused antagonism by unscrupulous trickery. Midway between arrogant imperialists and the genuine philhellenes of a later period, he laid the foundations of the uneasy acceptance of Roman hegemony by the Greek world. See also PHILHELLENISM. EB

food and drink The ancient diet was based on cereals, legumes, oil, and wine. Cereals, especially wheat and barley, were the staple food and the principal source of carbohydrates. They were eaten in many different ways, e.g. as porridge and bread. The rich could afford a more diversified diet and ate less cereal than the poor. Athenaeus describes many types of bread and **cakes*. Probably only the rich could afford 'white' bread, but even the best bread available in antiquity was much coarser than modern bread.

Legumes (field beans, peas, chick-peas, lentils, lupins, etc.), a common find in archaeological excavations at **Pompeii*, were an important part of the diet. They were incorporated into bread and complemented cereals because they are a rich source of protein.

The Greeks used the generic term *opson* for 'food eaten with bread or other cereal products' (*sitos* and *frumentum*). Fish, which might be fresh, dried, or pickled, occupied a prominent place in *opson*, especially at Athens. It was important as a source of protein and oils. Many species were known. However, fish are scarce in the Mediterranean because of the absence of large stretches of continental shelf off the coast (see *FISHING*). They probably did not make a major contribution to the diet. Shellfish were also eaten.

*Olive oil was the main source of fats, which are necessary to make a cereal-based diet palatable. Fats, which have a very high calorific value, were also obtained from other sources, e.g. sesame oil. The use of butter was a mark of *barbarians; so was the drinking of beer and to some extent that of milk. Milk was generally used for making cheese. The most important beverage was *wine, usually diluted and often artificially flavoured. It was even consumed by young children. Honey was used for sweetening.

Meat was a luxury for most people. In classical Athens it was generally eaten only at feasts accompanying religious festivals. (See *SACRIFICE*.) Poultry, game, and eggs played a large part in Roman cookery, but there was comparatively little butcher's meat, apart from pork and sometimes veal. Peasants generally kept pigs. Wild birds (partridges, quails, pheasants) were also eaten. The soldiers of the Roman army had a higher standard of living and a more varied diet than the bulk of the population of the Roman empire.

For ordinary people vegetables (e.g. onion, garlic, turnip, radish, lettuce, artichoke, cabbage, leek, celery, cucumber) provided the most important addition to the basic diet. Wild plants were also gathered for eating. Among fruit, figs, grapes, apples, and pears played a leading part. (Potato, tomato, most citrus fruits, and banana were not available in antiquity.) Sauces, such as the Roman fish-sauce *garum* (see *FISHING*), and condiments and herbs were very popular. The Romans disliked the natural tastes of most cooked foods. This partiality for flavourings is an important thread of continuity from past to present in Mediterranean cookery. See *COOKERY*. JRS

food supply

Greek

For Greek city-states of the Archaic and Hellenistic periods the ethos of self-sufficiency (*autarkeia*) dominated the ideology of food supply. In reality few Greek cities ever outgrew the food production capacities of their territory and the small number which did re-

sponded by intensifying agricultural production. This is well documented in the case of Athens. However, most Greek states operated in politically and environmentally unstable conditions. Weather (see *CLIMATE*) and warfare posed constant, but unpredictably timed, hazards. Consequently, some degree of shortfall in food supply could be expected perhaps as often as once in five years.

By 'food' (*sitos*) is meant cereals. Though other crops were grown and important in the ancient Greek diet, grain was the preferred staple, especially wheat and barley. Hence shortfalls in these crops proved the most problematic at all levels. Grain was at the heart of the political discourses which evolved around the problem of food supply in most city-states.

Grain was grown not by cities but by individual households, on private land. Therefore shortages had to be met with ad hoc measures on the part of government, city-states virtually never having either central grain production or storage facilities. General shortfalls in the cereal harvest enhanced class tensions, since wealthy landowners would not have suffered to the same degree as small-scale cultivators. Shortfalls also provided opportunities for the rich to gain political capital and to manipulate grain supplies. From the 4th cent. BC onwards, benefactions of grain by wealthy individuals are regularly documented in inscriptions, and become part of the political strategies employed in elite competition for power (see *EUERGETISM*).

City-states were empowered to do little in the likely event of grain shortage. Only one free, state-sponsored, grain distribution is known (Samos: *SEG* 1. 366). Generally states behaved as middlemen, aiming to encourage imports, or donations and subsidized sales by the rich (e.g. *IG* 5. 1. 1379; J. Pouilloux, *Choix d'inscriptions grecques* 34 (1960), 126; *IDélos* 442A 101; 399A 69–73). Incentives might be offered to private traders, but many were not citizens, and the profits they made were greatly resented (*Lys.* 22).

It is sometimes difficult to ascertain how 'genuine' food shortages were. It is perhaps significant that with one possible exception, barley, which was considered inferior for food, was not imported. Wheat, the preferred cereal (and most of the time probably the prerogative of the rich) was the usual grain from overseas. It is difficult to know how much of this imported wheat the poor ever ate. However, ensuring the supply of wheat itself became a political issue, as is shown by the careful diplomacy with which the Bosporean kingdom (a major supplier of wheat to Athens) was treated. See *AGRICULTURE, GREEK; FAMINE; FOOD AND DRINK*. LF

Roman

The growth of Rome to a city of perhaps 250,000 inhabitants in the time of the Gaius and Tiberius *Gracchus and of up to one million under *Augustus, far outstripping the productive capacity of her hinterland, created an unprecedented demand for imported foodstuffs. The supplying of Rome was always left mainly to private enterprise, and the main source was always Italy (including Sicily and Sardinia), but the political pressure on the Roman government to deal with actual or feared shortages led to some institutionalized public underpinning of the mechanisms of supply, which were enabled by exploitation of Rome's imperial revenues. In the early and middle republic individual magistrates competed either to win popular favour by securing extra supplies from subject or allied states where they had some personal influence, or to win noble approval by quashing popular complaints. Gaius Gracchus took the momentous step of establishing a regular public distribution of a set monthly ration of grain (*frumentatio*) at a set price to adult male citizen residents, which Publius *Clodius Pulcher made free in 58 BC. Other legislation alternately cut and increased the number of entitled recipients, called the *plebs frumentaria*, until in 2 BC Augustus stabilized it at or below 200,000. Augustus also reorganized the system of storage and distribution under an imperial appointee of equestrian status called the *praefectus annonae*, who also had a more general remit to watch over food supplies. This public supply (*annona*), drawing on the grain paid to the state as rent or tax in Sicily, Africa, and (from 30 BC) Egypt, helped the privileged minority who held tickets of entitlement (*tesserae*), which could be inherited or sold. But the monthly ration did not meet a family's need for grain, and the tickets did not necessarily go to the poor. All residents will still have relied on the private market to some extent (or, if they had them, on produce from their farms), and the majority will have used it for most of their supplies. Shortages could and did occur, especially in the supply of wheat, leading emperors to make ad hoc interventions to hold down prices, or stimulating long-term improvements such as the successive new ports at *Ostia. Wealthy private individuals often gave free meals or tokens for food to their clients, but this generosity was unreliable and also not particularly directed at the poor. At the end of the 2nd cent. AD *Septimius Severus added free *olive oil to the rations received by the *plebs frumentaria*, and in the 270s Aurelian added free pork and cheap *wine, and the monthly wheat ration was replaced with a daily issue of bread. As Rome ceased to be the empire's capital in the 4th cent., the responsibility for maintaining supplies to the decreasing population fell first on the senatorial nobility and then on the Church. See FAMINE.

JDWR

Forma urbis, a plan showing the city of Rome after AD 203 at a scale of roughly 1:240, engraved on 151 slabs of marble decorating a wall of the temple of Peace, perhaps in the office of the *praefectus urbi* (urban prefect). About 10 per cent of the total remains, some fragments being known only from Renaissance drawings. A few pieces appear to belong to an earlier version presumably from the Flavian complex.

JD

forum Romanum, the chief public square of Rome, surrounded by monumental buildings, occupied a low-lying area between the Palatine, Velia, Quirinal, and Capitol. An early iron age cemetery here was abandoned in the 9th cent. BC; recent research has dated the first paving to the late 8th/early 7th cent, following the deposition of considerable quantities of fill. The Regia and temple of *Vesta were traditionally associated with the regal period; the temples of Saturnus and Castor date to the early years of the republic. The forum became the centre of Roman religious, ceremonial, legal, and commercial life, as well as the political activities which took place in the adjacent Comitium; balconies (*maeniana*) were in 338 BC built above the shops surrounding the forum, to allow for the viewing of the gladiatorial shows which took place there. Butchers and fishmongers were eventually relegated to the *macellum* (see MARKETS AND FAIRS) and *forum piscarium*, as more monumental buildings were constructed around the forum. Basilicas (public halls) were introduced in 184 BC by *Cato the Elder; his work was soon imitated by the basilica Aemilia et Fulvia (179 BC) on the north side of the square, and basilica Sempronia (169 BC) on the south, replacing the house of P. Cornelius *Scipio Africanus.

The growing population of Rome and the increasing importance of popular politics were reflected by the transfer from the Comitium to the forum of the *comitia tributa* in 145 BC; in 121 Lucius Opimius restored the temple of Concord, following the death of Gaius *Gracchus and his supporters, and built a new adjacent basilica. In the same year the first triumphal arch was set up by Quintus Fabius Maximus (Allobrogicus) over the via Sacra beside the Regia. The temple of Castor was rebuilt in 117 BC.

Much of the present setting, however, is due to *Sulla, *Caesar, and *Augustus. Sulla rebuilt the Curia on a larger scale to accommodate the senate of 600 members, obliterating part of the Comitium in the process; Caesar planned a new basilica Iulia, to replace the old basilica Sempronia, which, like his Curia Iulia, was finished by Augustus. After Caesar's assassination a column was erected to mark the site of his pyre and later (29 BC)

Forma urbis Fragment of the *Forma urbis* or marble plan showing the city of Rome after AD 203. It shows a group of 2nd-cent. BC temples: those of Jupiter (Aedes Iovis) and Juno (Aedes Iunonis) were the first temples in Rome faced with marble; the third, for Hercules and the Muses, was funded and adorned with Greek booty. Fototeca dell'Unione Internazionale, American Academy in Rome.

replaced by the temple of Divus Iulius; this, and the adjacent Parthian arch of Augustus (19 BC), had the effect of monumentalizing the east end of the forum. New rostra in front of the temple of Divus Iulius faced the 'old' Rostra, rebuilt by Caesar and then Augustus. Many ancient monuments were restored: the Regia (36 BC), the basilica Paulli (successor of the basilica Aemilia et Fulvia) (14 BC), and the temples of Saturnus (42 BC), Castor (AD 6), and Concordia (AD 10).

Comparatively few changes were made to the topography of the forum under the empire; the imperial fora, the Campus Martius, and the Palatine provided more scope for emperors keen to make their mark on the city. New temples were, however, dedicated to deified emperors and empresses (Augustus, *Vespasian, Annia Galeria Faustina, and *Antoninus Pius) while Domitian set up an equestrian statue of himself in AD 91; and the arch of Septimius Severus was built in AD 203. A major fire in AD 283, however,

forum Romanum The open area of the forum seen through the columns of the temple of *Antoninus Pius and Faustina. Under the empire new additions served chiefly to glorify the Roman emperors, as also with (middle ground) the triumphal arch of *Septimius Severus. Fototeca dell'Unione Internazionale, American Academy in Rome.

provided an opportunity for a major reconstruction under Diocletian, with a row of monumental columns set up in front of the basilica Iulia, and the Curia rebuilt. Later structures included a statue of Stilicho and the column of Phocas (AD 608). IAR/DES/JRP

freedmen, freedwomen Emancipated slaves were more prominent in Roman society (little is known of other Italian societies before their enfranchisement) than in Greek city-states or Hellenistic kingdoms (see SLAVERY). In Greek the words *apeleutheros/a* and *exeleutheros/a* are used; in Latin *libertus/a* designates the ex-slave in relation to former owner (*patronus/a*), *libertinus/a* in relation to the rest of society. In Greek communities, freed slaves usually merged with other free non-citizens. In Rome, the slave freed by a citizen was normally admitted to citizenship (see CITIZENSHIP, ROMAN). A slave might be released from the owner's control by a fictitious claim before a magistrate with executive power (*imperium*) that he/she was free (manumission

vindicta), by being ordered to present himself to the censors for registration as a citizen (manumission *censu*: in these forms public authority attested citizen status and made it impossible for the slave to be a slave), or by will (manumission *testamento*, where implementation of the owner's command was postponed until he/she died and depended on acceptance of the inheritance and public validation). A slave freed informally lacked citizenship and other rights, but was protected by the praetor, until Augustus introduced Latin rights, with the possibility (expanded by later emperors) of promotion to full citizenship. Augustus also, by the Fufio-Caninian law of 2 BC (introducing a sliding scale to limit the number of slaves who could be freed by will) and the Aelio-Sentian law of AD 4 (a comprehensive law, which included minimum ages for slave and manumitter and barred from citizenship slaves deemed criminal), regulated the previously untrammelled right to manumit.

In Greece, the ex-slave might be bound to perform services while the ex-owner lived; in Rome, continuing dependency took the form of part-time services (*operae*; *libertae* married with patron's consent were exempt from paying these to a male patron), possible remunerated work, the obligation of dutifulness, and some inheritance rights for the patron and descendants against the freed slave's heirs other than non-adopted children. Freedmen were usually registered in the four urban voting tribes (**tribus*), excluded from major public offices and military service, but given a role in local elective office and cult. Children born after their mother's manumission were free-born and under no legal disabilities, though servile descent might be remembered (especially by the upper classes) for several generations. Freed slaves document their activity in urban trades and crafts; the most prominent, wealthy, and envied were usually freed by the upper classes: literature emphasizes the exceptions—writers such as *Terence, the fictitious millionaire Trimalchio (see PETRONIUS ARBITER) or the bureau-chiefs of the early emperors such as Narcissus and Marcus Antonius Pallas. MIF/SMT

freedom in the ancient world (see following page)

friendship, ritualized (or guest-friendship), a bond of trust, imitating kinship and reinforced by rituals, generating affection and obligations between individuals belonging to separate social units. In Greek sources this bond is called *xenia*, *xeniñē*, and *xeiñeiñē*; in Latin, *hospitium*. The individuals joined by the bond (usually men of approximately equal social status) are said to be each other's *xenos* or *hospes*. As the same terms designated guest–host relationships, *xenia* and *hospitium* have sometimes been interpreted in modern research as a form of

[continued on p. 316]

FREEDOM IN THE ANCIENT WORLD

freedom in the ancient world On the individual and social levels, the distinction between free and unfree is as old as slavery, and individual or collective freedom from dues, taxes, and other obligations as old as communities with centralized government. These concepts are attested in Egyptian and Mesopotamian documents and the Hebrew Bible. Nevertheless to these civilizations—as to ancient China—the concepts of free citizens or of political freedom were unknown. Typically, near eastern societies were characterized by a plurality of statuses ‘between slavery and freedom’ (Pollux) and ruled by autocratic and divinely sanctioned monarchs or an absolute divine law. Obedience and integration into a given order were the prime virtues; the rise and fall of empires and cities, protection from foreign enemies, or, individually, status change or protection from domestic exploitation were seen as results of divine will. Such conditions were not conducive to recognizing freedom as a political value. Despite their charter myth of liberation from Egyptian slavery, even the Hebrews (*see* JEWS) began to use freedom politically only under Hellenistic influence. About Phoenician city-states we know too little to judge.

Eleutheros and *liber* probably both derive from IE †*leudh-* (perhaps initially ‘grow’), designating the legitimate member of a descent group or community. The distinction free–unfree is attested in the earliest Greek and Roman texts (Linear B, Homer (e.g. *Il.* 6. 455, 463), *Twelve Tables). As ‘chattel *slavery’ became predominant, earlier status plurality was often replaced by a sharp contrast: slave–free. *Freedmen were enfranchised in Rome but not in Greece (*see* CITIZENSHIP, GREEK; CITIZENSHIP, ROMAN).

Current evidence indicates that freedom was first given *political* value by the Greeks, in a world of small *poleis* (*see* POLIS) which were not subject to imperial control, where power was not centralized, autocratic, or divinely sanctioned but broadly distributed, and communal well-being depended on many citizens, so that early forms of equality survived and gained importance over time. Loss of freedom was frequent, both for individuals (war, piracy, debt bondage), and communities (tyranny).

Nevertheless, freedom was articulated politically only when Lydian and especially Persian expansion to the Aegean for the first time subjected Greek *poleis* to foreign rule, often supporting local tyrants (*see* TYRANNY). This danger of double ‘enslavement’ and the confrontation with the autocratic Persian state made the Greeks aware of the free character of their societies. Earliest allusions to political freedom and the emergence of an abstract noun (*eleutheria*) date to the Persian Wars of 480/79 and their aftermath (e.g. *Aeschylus, *Persae* 403).

Vowing the continued defence of Greek liberty against Persia. Athens assumed leadership in the *Delian League (478) which was soon converted into a naval empire; allies became subjects who could hope only to preserve self-administration (*autonomia*). Freedom quickly deteriorated into a political slogan. In the Peloponnesian War (431–404), *Sparta propagated the liberation of Hellas from Athens as ‘tyrant city’ (*polis tyrannos*), though primarily protecting its own interests and soon turning oppressor itself.

Domestically, freedom initially meant ‘absence of tyranny’. Constitutional development was dominated first by ‘order’ (*eunomia*: *see* LYCURGUS), then by equality (*isonomia*), which, in democracy, eventually included all citizens, thus approximating *isonomia* to *demokratia* (Hdt. 3. 80. 6.). *Eleutheria* was claimed by democracy when democracy and *oligarchy were perceived as mutually exclusive, partisan forms of rule, so that the *dēmos* could be free only by controlling power itself (ps.-Xen. *Ath. pol.* 1. 6. 9). Similarly, a new term for ‘freedom of speech’ (*parrhēsia*) supplemented ‘equality of speech’ (*isēgoria*). Rejecting the extension of full rights to all citizens, oligarchs accepted as ‘free citizens’ only those wealthy enough to engage in liberal arts and occupations (*eleutherios paideia*, *eleutherioi technai*) and communal service. When *eleutherios* was set against *eleutheros* the concept of the ‘free citizen’ was divided ideologically, as proportional equality was opposed to numerical equality. Aristotle later included liberality (*eleutheriotēs*) in his analysis of virtues (*Eth. Nic.* 4. 1).

In the 4th cent. BC Sparta, Athens, and Thebes claimed to promote the liberty of those subjected by others. The liberty of the Greeks in Asia, sacrificed by Sparta in 412, was definitively yielded in the King’s Peace (386). The charter of the Second Athenian Confederacy guaranteed the members’ *eleutheria* and *autonomia*. The Messenian helots (state slaves of Sparta) were freed by Thebes after Leuctra (371). To end continuous internecine warfare, *Isocrates called for a Panhellenic crusade against Persia to liberate the Hellenes—a programme realized by *Alexander the Great only after Greek liberty was crushed at the battle of Chaeronea (338).

In the Hellenistic period, politics were controlled by the great powers; local autonomy was the best that could be attained. Yet the kings, competing for political and material support, presented themselves as protectors of Hellenic civilization and liberty. Declarations of freedom for the Hellenes were thus an old tradition when, after his victory over Philip V of Macedon, *Flamininus in 196 pronounced that the king's Greek subjects 'shall be free, exempt from tribute, and subject to their own laws' (Livy 33. 32. 5–6).

The use of freedom in philosophy was more complex. Fifth-century *sophists emphasized the strong individual's right to erupt from enslavement by the conventions of *nomos* and rule over the weaker in accordance with nature (Antiphon, Callicles in *Plato's *Gorgias*). Others contested the validity of traditional social distinctions; Alcidas declared slavery as contrary to nature. Despite *Aristotle's elaborate refutation (*Politics* 1), this view was echoed by the Stoics (see STOICISM) and discussed thoroughly by Roman jurists. Yet other sophists propagated cosmopolitanism, individualism, and 'freedom from the state' (Aristippus).

One aspect of democratic *eleutheria* was 'to live as you like' (Aris. *Pol.* 1317^b 11). Plato caricatured such 'excessive' freedom in *Republic* 8–9; Isocrates denounced it when advocating *patrios politeia* ('ancestral constitution': *Areop.* 20). Generally, *Socrates and his pupils avoided *eleutheria*. Originating in popular morality (echoed in *Euripides), the notion of freedom from all kinds of dependencies (especially on material goods and passions) induced generations of thinkers (Antisthenes, Diogenes, Bion) to stress self-control (*sōphrosynē*, *enkrateia*) as decisive means to achieve inner freedom.

Loss of political freedom and the need for new orientations gave philosophy broad appeal as a means to achieve happiness (*eudaimonia*). Despite fundamental differences, both Epicureans (*Sent. Vat.* 77) and Stoics (Epictetus 4. 1) believed in freedom as the goal and principle of life. (See EPICURUS; STOICISM.)

Lack of contemporary sources allows no certainty about the process by which *Libertas* was politicized in Rome. The expulsion of the kings or the struggle for abolition of debt bondage are possible contexts. The late republican élite developed an aristocratic concept of *libertas*, supporting equality and opposing *regnum* ('kingship') and extraordinary power of individuals and factions. By contrast, the *libertas populi* was not egalitarian and did not aim at political participation. It was primarily defensive, focusing on equality before the law and the protection of individual citizens from abuse of power by magistrates. *Libertas* rested on institutions, *ius*, and *lex*; it was embodied by the *tribunes of the plebs and their rights of *provocatio* (appeal) and *auxilium* ('defence' of the property and persons of members of the plebs); these are called the *duae arces libertatis tuendae* ('twin poles of the defence of liberty': Livy 3. 45. 8). In late republican conflicts *libertas* was claimed by *populares* against oppression by *optimates* ('best men'—i.e. the office-holding upper class: thus connected with the secret ballot) or a *factio paucorum* ('party of the few') (Caes. *B Civ.* 1. 22. 5; Augustus, *RG* 1).

During the empire, power was concentrated in one man's hands. Although *libertas* remained a favoured slogan of imperial ideology, nevertheless, according to *Tacitus (*Agr.* 3. 1), *principatus ac libertas* were not reconciled before *Nerva. Even so, liberty was increasingly reduced to the elementary meaning of security and protection under the law.

While freedom lost political significance, *eleutheria/libertas* became an important element in Christian teaching, emphasized especially by St *Paul. Through God's gift and Christ's sacrifice his followers are liberated from sin, the finality of death, and the old law. Such freedom, however, involves subjection to the will of God: Christ's followers are God's 'slaves.' The freedom promised to Christians is available to all humans, including the lowly and slaves, but it is not of this world and does not militate against existing social dependencies and political or ethical obligations. Accordingly, Christians did not oppose slavery as an institution, but in accepting slaves into their community they anticipated the universal brotherhood of the free expected in another world.

KR

hospitality. *Xenia*, *hospitium*, and hospitality do overlap to some extent but the former relationships display a series of additional features which assimilate them into the wider category called in social studies ritualized personal relationships, or pseudo-kinship. The analogy with kinship did not escape the notice of the ancients themselves. According to *Aristotle's *Magna Moralia*, *xenia* was the strongest of all the relationships involving

affection (*philia*) (2. 1381^b29). Aulus *Gellius wrote that a relationship with a *hospes* should take precedence over kinship and marriage in matters of affection and obligation (*NA* 5. 13. 5).

The lexicographer Hesychius defined *xenos* as 'a friend (*philos*) from abroad', and this definition holds good for the Roman *hospitium*: a ritualized friendship dyad could consist, for example, of an Athenian and a Spartan, a

Thessalian and a Persian, a Carthaginian and a Syracusan, or a Roman and an Epirote, but very rarely consisted of two Athenians or two Romans. From its first appearance in *Homer (e.g. *Il.* 6. 224–5) onwards, ritualized friendship has been abundantly attested in both Greek and Latin sources from all periods and areas of classical antiquity. In late antiquity, it disappears from view. There are good reasons to assume, however, that it was gradually annexed by the Christian Church, since it reappears in a new guise in the early medieval variants of godparenthood: Latin *compaternitas*, and Byzantine *synteknia*.

One feature that ritualized friendship shared with kinship was the assumption of perpetuity: once the relationship had been established, the bond was believed to persist in latent form even if the partners did not interact with one another. This assumption had two practical consequences. First, the bond could be renewed or reactivated after years had elapsed, a variety of symbolic objects signalling that it once existed (*symbolon, pista, tessera hospitalis*). Secondly, the bond did not expire with the death of the partners themselves, but outlived them, passing on in the male line to their descendants.

If ritualized friends belonged to separate social units, how did their paths come to cross? Random encounters were made possible by the extraordinary geographic mobility of the Greeks and Romans, as well as by circumstances such as wars, festivals, and *colonization. Stories of how two eminent people first met and developed a liking for each other, and how they (or their descendants) recognized each other after many years of separation, undoubtedly exercised a special fascination over the ancients (e.g. *Hdt.* 3. 139 ff.).

The beginning of the relationship had to be marked with a ceremony, as did the reactivation of a relationship after many years. The rites of initiation into *xenia* and *hospitium* consisted of a diversity of symbolic elements enacted in sequence: a solemn declaration ('I make you my *xenos*', and 'I accept you'), an exchange of symbolic gifts, a handshake, and finally feasting (*Xen. Hell.* 4. 1. 39; *Curt.* 6. 5. 1ff; *Cic. Deiot.* 8; *Livy* 23. 9. 3–4; *Aeschin.* 3. 224. See SYMPOSIUM). The rites were obviously intended to lend the bond an aura of sacrosanctity, rendering it indissoluble. In practice, the bond could fade away through disuse. Its moral context was, however, such that only exceptionally was it interrupted by means of a formal ceremony (e.g. *Hdt.* 4. 154. 4, 3. 43. 2).

Ritualized friends were, by virtue of their prescribed duties, veritable co-parents. A *xenos* or *hospes* was supposed to show a measure of protective concern for his partner's son, to help him in any emergency, and to save his life (*Hom. Il.* 21. 42; *Dem.* 50. 56; *Hdt.* 9. 76; *Lys.* 18. 10; *Plaut. Mil. gl.* 133–45). A father's partner in relation to the

former's son was designated by a technical term: *patrikos* (or *patrōios*) *xenos* in Greek, and *paternus hospes* in Latin. If the natural father was absent, ill, or dead, this paternal friend was expected to act as a substitute father. According to Euripides' *Electra* and *Orestes*, for instance, Orestes was brought up, following the murder of *Agamemnon, in the household of Agamemnon's *xenoi*. Similarly, in real life, Aratus, following the murder of his father, was brought up in the household of his father's *xenoi* at Argos (*Plut. Arat.* 2–3). Cicero relates that on sensing danger he sent his children to the court of his *hospes* Deiotarus, king of Galatia (*Att.* 5. 17, cf. 18. 4). Neglect of co-parental duties was strongly disapproved of, often evoking violent emotions (*Eur. Hec.* 689–714; *Aeschin.* 3. 225). Betrayal of ritualized friendship in general sometimes appears as a sin against the gods (*Diod. Sic.* 20. 70. 3–4).

In conformity with the co-parental obligations, a father was supposed to name a son after his partner. The custom is more often found in Greek than in Roman sources (*Thuc.* 8. 6. 3; *Diod. Sic.* 14. 13. 5; *Hdt.* 3. 55). No explanation of its rationale survives, but a belief that some of the paternal friend's character traits will be passed on to the child with his name can be inferred from the paternal friend's obligation to take a share in the child's education (*Hom. Il.* 9. 483 ff., with *Plut. Phil.* 1; *Livy* 9. 36. 3, 42. 19. 3).

Ritualized friendship was an overwhelmingly upper-class institution in both Greece and Rome. The people involved in it belonged to a small minority, renowned for their wealth and identified by lofty titles such as 'hero', 'tyrant', 'satrap', 'nobleman', 'consul', 'governor', and 'emperor'. Throughout antiquity, such people lent each other powerful support, often at the expense of their inferiors, so frequently that ritualized friendship may justly be regarded as a tool for perpetuating class distinctions. The forms of mutual support practised included the exchange of valuable resources (e.g. money, troops, or grain), usually designated gifts, and the performance of important services (e.g. opportune intervention, saving life, catering for every need) usually designated benefactions (Greek *euergesiai*, Latin *beneficia*: see EUERGETISM). The circulation of these goods and services created what may be described as networks of ritualized friendship. The Greek and Roman worlds differed markedly in how these informal networks were integrated into their wider political systems.

In the world reflected in the Homeric poems, *xenia* and the networks to which it gave rise were of paramount importance to the hero. The hero abroad found in a *xenos* an effective substitute for kinsmen, a protector, representative, and ally, supplying in case of need shelter, protection, men, and arms; the community was not

sufficiently organized to interfere with this sort of cooperation. The relationship being largely personal, ritualized friendship was, together with marriage, the Homeric forerunner of political and military alliances. The emergence of the *polis during the 8th and 7th cents. BC was accompanied by significant interactions between its nascent systems and this pre-existing network of personal alliances. Nor did the fully-fledged polis lead to the abolition of this network: throughout the Classical age, dense webs of ritualized friendship still stretched beyond its bounds, at times facilitating, at times obstructing the conduct of foreign affairs (e.g. Andoc. 2. 11; Thuc. 2. 13). For the upper classes of the Classical age, these networks offered an alternative means to the civic system of pursuing their own interests. In the Hellenistic age, the circles of 'friends' (*philoï*) came to be recruited from among the personal or paternal *xenoi* of the kings; having turned royal officials, these members of governing élites are often found to be acting as mediators between the kings and their own communities of origin, deriving substantial benefits from both systems. The impact of *xenia* upon the Greek civic system is most evident in the creation by the polis of *proxenia*, a bond of trust, clearly modelled upon *xenia*, between a polis and a prominent individual outside it.

Under the republic, prominent Romans maintained extensive ties of *hospitium* with prominent non-Romans both elsewhere in Italy and overseas. In the lawcourts, for instance, both *Cicero and *Caesar defended members of the aristocracy from various Italian communities. Pompey had hereditary ties of *hospitium* with the

Numidian king Juba (Caes. *BCiv.* 2. 25), while Mark *Antony was an ancestral *xenos* of the Herods of Judaea (Joseph. *AJ* 14. 320). *Livy was probably attributing contemporary customs to an earlier age when he assigned to the Etruscan king *Tarquinius Superbus motives epitomizing the role of ritualized friendship in a country of separate communities: 'the Latin race he strove particularly to make his friends, so that his strength abroad might contribute to his security at home. He contracted with their nobles not only ties of *hospitium* but also matrimonial connections' (Livy 1. 49. 9). The sort of upper-class coalitions reflected in this example could, however, easily be overpowered by the state, and therefore posed less of a threat to the Roman community than such coalitions previously had to any single Greek city-state. Rome followed in Greece's footsteps by devising *hospitium publicum*, a public institution analogous to *proxenia*, modelled on *hospitium*.

Hospitium, like *patronage, was instrumental in the *Romanization of local élites (Livy 9. 36. 3, 42. 19. 3–6), in their upward social mobility, and in their integration into the Roman ruling class (e.g. Cic. *Clu.* 25. 165, with *Vir. ill.* 80. 1). Within the Roman empire, the communities in which ritualized friends lived gradually became part of a larger-scale political system, and this change tended to relax the principle that ritualized friends must belong to separate communities. Fronto saw nothing unusual in characterizing as a *hospes* a friend who originated from the same African city as himself, and a 2nd-cent. AD inscription from Spain sees *hospitium* as compatible with kinship ties (*Ad amicos* 1. 3; *CIL* 2. 2633). GHE

G

Gaius (Gaius Iulius Caesar Germanicus) ('Caligula'), (AD 12–41), emperor, son of *Germanicus and Agrippina the Elder, born at Antium (31 August). In 14–16 he was on the Rhine with his parents and, dressed in miniature uniform, was nicknamed 'Caligula' ('Bootee') by the soldiers. He went with his parents to the east in 17 and, after Germanicus' death in 19, lived in Rome with his mother until her arrest in 29, then successively with Livia Drusilla and Antonia until he joined *Tiberius on Capreae. The downfall of Tiberius' favourite *Sejanus in 31 was to Gaius' advantage, and it was probably engineered by him and associates such as the prefect of the watch (*vigiles*) Macro, who also benefited. After the death of his brother Drusus Iulius Caesar in 33 Gaius was the only surviving son of Germanicus and, with Tiberius Iulius Caesar Nero 'Gemellus'—*Claudius' claim not being considered—next in succession. He became *pontifex* (see PRIESTS (GREEK AND ROMAN)) in 31 and was quaestor two years later, but received no other training in public life. Tiberius made Gaius and Gemellus joint heirs to his property, but, supported by Macro, now prefect of the praetorian guard (*praefectus praetorio*), Gaius was proclaimed emperor (16 March 37), Tiberius' will being declared invalid by the senate, although his acts as a whole were not invalidated; Gaius made an appropriately perfunctory effort to have him deified.

Gaius' accession was greeted with widespread joy and relief, and his civility promised well. One symbolic gesture was the restoration of electoral choice to the popular assemblies, taken from them in 14 (it failed and Gaius had to revert to Tiberian procedure). Gaius needed to enhance his authority and held the consulship four times, in 37 (suffect, so that the men in office in March were not disturbed), 39, 40 (sole consul), and 41; he became *Pater Patriae* (father of his country), a title refused by Tiberius, on 21 September, 37. In the early months of his rule he honoured the memory of his mother, father, and brothers and spoke abusively of Tiberius. Antonia, a restraining influence, died on 1 May 37. In October Gaius was seriously

ill; Philon Judaeus' view (*Leg.* 14, 22) that this unhinged him has been given too much attention. But the illness may have brought the succession question into prominence: some time before 24 May 38, Gaius executed both Macro and his rival Gemellus. In 39 Gaius quarrelled with the senate, revised his attitude towards Tiberius' memory, announcing the return of slandering the emperor as a treasonable offence. The same year he married his fourth wife, Milonia Caesonia, who had already borne him a daughter, proving her fertility. The autumn and winter of 39–40 Gaius spent in Gaul and on the Rhine; a conspiracy was revealed whose leader, Gnaeus Cornelius Lentulus Gaetulicus, commander of the Upper Rhine army, was executed. This conspiracy may be connected with the simultaneous disgrace of his brother-in-law (and possible successor) Marcus Aemilius Lepidus and of Gaius' surviving sisters *Agrippina ('Agrippina the Younger') and Iulia Livilla. After his return to Rome (in ovation, on 31 August 40) Gaius was in constant danger of assassination, having no successor to avenge him, displayed increasing brutality, and was murdered in the palace on 22 or 24 January 41. His wife and daughter were also murdered.

The government of Gaius was autocratic and capricious, and he accepted extravagant honours which came close to deification. His reign has been interpreted as a departure from the Augustan Principate to a Hellenistic monarchy. Rather, Gaius seems to have been engaged in discovering the limits of his power ('for me anything is licit', Suet. *Calig.* 29). He was a person of the highest descent (he once banished *Agrippa from his ancestry by postulating incest between Augustus and his daughter *Julia), which helps to account for the unprecedented attention paid to his sisters, Iulia Drusilla, whose death in 38 was followed by a public funeral and consecration, Livilla, and Agrippina; he possessed an exceptional intellect and a cruel and cynical wit; and he demanded exceptional homage and was savage if his superiority was not recognized. A gifted orator, who delivered Livia's *laudatio*

funerbris (funerary oration) at the age of 17, he enjoyed writing rebuttals of successful speeches. By insisting on primacy in everything Gaius left even courtiers no role of their own. He had terrified the senators, humiliated officers of the praetorian guard (who carried out the assassination), and only the masses seem to have regretted his passing.

Gaius was a keen builder, interested in the state of Italy's roads and in Rome's water supply (he began the aqua Claudia (see *AQUEDUCTS*) and Anio Novus). For the sake of the grain supply he began to improve the harbour at Rhegium in south Italy. He also completed the reconstruction of the theatre of Pompey and created a circus in the Vatican; other constructions were for his own pleasure, for instance the bridge of boats from Puteoli to Bauli (39), an ephemeral extravagance to outdo *Xerxes or overawe a Parthian hostage.

Gaius' high expenditures were economically advantageous, ending the sluggishness of Tiberius' regime. His achievements abroad, with the exception of his deployment of client rulers, were negative. He probably raised two new legions (XV and XXII Primigeniae) for an invasion of Germany or *Britain. However, his forays into Germany in the autumn of 39 may have been exercises intended to restore discipline after the fall of Gaetulicus and to commemorate the campaigns of Germanicus in 13–16 (the famous collection of sea shells, 'spoils of Ocean', probably alludes to the North Sea storms that Germanicus had encountered); here the Chauci and Chatti were still causing trouble in 41. The conquest of Britain was only mooted, and was considered achieved when Cunobelinus' (Cymbeline's) son Adminius came to render homage (Gaius could not afford to leave the centres of empire in 39–40). By deposing and executing Ptolemy of Mauretania he provoked a war that was brought to an end only in the next reign. For the Jews under Gaius see below. JPB/BML

Gaius and the Jews

Soon after his accession, Gaius conferred a kingship in Palestine upon his friend, the Herodian Agrippa I. However, their understanding did not prevent discord between the inconsistent emperor and his Jewish subjects. A savage conflict between Jews and Greeks in *Alexandria stood unresolved when Gaius died. The prefect, Aulus Avillius Flaccus, seemingly abandoning any pretence at even-handedness when Gaius succeeded, had backed the Greek side in the long-standing dispute with the Jews over citizen rights. Agrippa I, visiting *en route* for his kingdom, was mocked by the crowd and a full-scale attack was thereby unleashed. On the emperor's birthday, Jews who had survived the assaults on the Jewish quarter

were rounded up in the theatre and made to eat pork. Gaius had Flaccus arrested and replaced in late 38, but he disdainfully ignored the delegations sent to Rome by both groups, leaving his successor to settle the matter.

Among the Jews of Palestine, Gaius' policy was heading for disaster when he died. A statue of the emperor was to be placed in the Jerusalem Temple, perhaps as a reaction to the Alexandrian Jewish delegation (Josephus), perhaps a response to the destruction by Jews at Jamnia of their pagan neighbours' altar to the emperor (Philo). Stalling by Publius Petronius, governor of Syria, apparently sympathetic to Jewish pleas, delayed developments; and the intervention of Agrippa, whose long and perhaps genuine letter to Gaius is quoted by Philo, is alleged to have halted the plan. Philo claims that it was then reinstated by secret orders; but this he could scarcely have known. In general lines, however, the events are well documented: Philo was himself a participant, heading the Alexandrian Jews' delegation to Gaius, while *Josephus offers two distinct accounts of the events in Palestine. TR

games (see facing page)

gardens Two strands of landscape management coalesce in ancient Mediterranean garden culture: the intensification of agricultural production in fertile places where a high input of *labour can achieve very high yield per unit area; and the local improvement of the amenity of the natural environment for human activities of all kinds, like building a house but relying much more on what nature provides. Both, above all else, depend on use of *water, and are inextricably linked.

Culturally, the main traditions (including the amenity of plants and trees in Minoan art) all go back to the gardens of the Fertile Crescent. The Persian combination of preserve and pleasure known as *paradeisos* has a special place. Early Greek intensive horticulture created places whose amenity, for abundance of shade or the presence of water, was esteemed (already in Homer, esp. *Od.* 7. 112 ff.), and this was the style of the famous Garden of the philosopher *Epicurus. Trees were planted in *sanctuaries for their cultic significance or for shade, and by extension, in public places such as the *agora. But a high aesthetic tradition dates only from the domestication of the *paradeisos* in the 4th cent. BC and especially the Hellenistic and Roman periods.

This garden-art aimed particularly at reshaping place, and gave rise to the Roman name of formal gardening, *ars topiaria* (which went far beyond 'topiary', though this was one of its techniques). Use of slopes, views of different scenery, the deployment of architectural adjuncts

[continued on p. 322]

GAMES

games (agōnes) Gatherings of people for formal contests usually in honour of a Greek god or local hero.

Before 300 BC

Prior to the 8th cent. BC they seem to have been small-scale events, centring round a shrine or sanctuary. But the *agōn* (agonistic festival) at *Olympia came to acquire a special status: traditionally founded in 776 BC, by the end of the 8th cent. it was, because of the wide range of *athletics contests it offered and its lack of political ties, attracting increasing numbers of foreigners (especially from among the athletic Spartans) and was organized as a Panhellenic *agōn* (i.e. the contests were open to all Greeks). With interstate relationships assuming increased importance during the 7th cent., local *agōnes* were reorganized at other places too. The Pythian Games at *Delphi became Panhellenic in 582 BC; its range of athletics events followed the Olympian model, but it preserved its identity and associations with *Apollo through its emphasis on musical competitions. With the reorganization of the Isthmian (c.581) and Nemean Games (c.573), a group of four Panhellenic *agōnes* came to form an athletics circuit (*periodos*), as the Olympics, World Championships, European, and Commonwealth Games do for some athletes nowadays. At Athens the Great Panathenaea (founded 566) was also Panhellenic, but for athletes never achieved the status of the other four. Despite this development, local *agōnes* with athletics contests continued to flourish: *Pindar's victory-odes mention more than twenty local games (cf. *Ol.* 13. 107–13; also Simon. *Epig.* 43 Page), and a 5th-cent. Laconian inscription records 72 victories won by Damonon and his son Enymacratidas at eight *agōnes* in the Peloponnese (*IG* 5. 1. 213, trans. W. Sweet, *Sport and Recreation in Ancient Greece: A Sourcebook with Translations* (1987), 145–6).

Contests were often in athletics, but music, poetry, and equestrian events were also popular. *Hesiod won a poetry-singing competition in Chalcis (*Op.* 657); the Pythian Games included three types of musical contest (singing to the accompaniment of cithara or aulos, and solo aulos) and a painting competition (Plin. *HN* 35. 58). In Athens tragedies, comedies, and dithyrambs (choral songs) were performed in competitions at the City Dionysia, and at the Panathenaea rhapsodes (professional reciters of poetry) competed in Homer-reciting contests. Horse- and chariot-races were mainly entered by wealthy individuals who paid charioteers or jockeys to ride on their behalf, and hoped for political prestige from good performances (cf. Alcibiades' boast, Thuc. 6. 16. 2). The chariot-race was often long (about 14 km. (nearly 9 mi.) at the Olympian Games) and dangerous (Pind. *Pyth.* 5. 49–51: the victor was the only one of 40 starters to finish with chariot intact). Beauty contests, drinking contests, and even a wool-carding contest are also recorded.

At the four major Panhellenic *agōnes*, victors were honoured with a wreath: olive at Olympia, laurel at the Pythian Games, varieties of *selinon* (parsley or celery) at the Isthmus and Nemea (but cf. hyp. c *Nem.*, hyp. b *Isthm.*; Paus. 8. 48. 2). At other venues wreaths were made of date-palms (Paus. 8. 48. 2) or myrtle (Pind. *Isthm.* 4. 88). The victor might also be showered with leaves (*phyllobolia*). On returning home he could receive more substantial rewards: free meals (*sitēsis*), the privilege of a front seat (*prohedria*) when spectating at *agōnes*, and gifts. Athens was especially generous to victors: *Solon passed legislation to award Athenian victors at Olympia 500 drachmae (Plut. *Sol.* 23; monetary prizes are however anachronistic at this early date—see COINAGE, GREEK), and at the Great Panathenaea in the 4th cent. BC money, gold crowns, bulls, and large numbers of amphorae containing olive oil were awarded as prizes (*IG* 2². 2311, trans. S. Miller (ed.), *Arete: Greek Sports from Ancient Sources*, 2nd edn. (1991), 80–3; 100 amphorae, c.4,000 l. (880 gal.), for a victor in the men's *stadion* race, a very valuable prize). Local *agōnes* also awarded prizes: silver cups at Sicyon (Pind. *Nem.* 10. 43), a bronze shield at Argos, and a thick cloak at Pellene (Pind. *Ol.* 7. 83, 9. 97–8).

To lose in a contest was shameful, and the incidence of failure-induced depression and mental illness is likely to have been high (cf. Pind. *Ol.* 8. 68–9, *Pyth.* 8. 81–7; Paus. 6. 9. 6).

After 300 BC

The spread of 'periodic' contests in the Greek style is a defining feature of post-Classical *Hellenism. In the 3rd and 2nd cents. BC they were sponsored by kings (the Alexandrian Ptolemaea and Pergamene Nicephoria) and leagues (the Soteria of Delphi, by the Aetolian Confederacy) as well as cities great and small (e.g. the plethora of Boeotian *agōnes* by c.50 BC: A. Gossage, *BSA* 1975, 115 ff.). Under the Roman Principate this expansion continued; provincial cities

founded new games as late as AD 275–6; by the 3rd cent. they were celebrated from *Carthage to Zeugma. Beginning with *Augustus (see NICOPOLIS), Roman emperors became major patrons of *agōnes*. *Nero introduced them at Rome, with later foundations by *Domitian, *Gordian III, and Aurelian (the *agōn* of the Sun (Sol), 274). Frowned on by Christianity, Greek games (shorn of pagan ritual) none the less survived until at least 521, when Justinian banned the Olympia of *Antioch.

The distinctiveness of ‘sacred’ games, celebrating a deity (often the city’s patron god or, under Rome, the *ruler-cult) and (at first) offering only a symbolic prize (typically a crown, *stephanos*), is fundamental. In the Hellenistic age the recognition of new ‘sacred’ games required cumbersome interstate diplomacy by the promoter (best attested with the Leucophryena of Magnesia on the Maeander in W. *Asia Minor (*I. Magn.* 16–87)). From 30 BC Roman emperors decided ‘the gift of a sacred contest’, weighing up cost, a city’s record of loyalty and, in 3rd-cent. Cilicia (SE Asia Minor), its support for imperial troop-movements. An élite group of ‘iselastic’ games emerged, often named after one of the famous games of the ‘ancient circuit’ (*archaia periodos*), and distinctive for the privileges which victors could demand of their home cities, notably a triumphal entry, pension (*opsonion*, *suntaxis*), and tax-immunity (*ateleia*). Otherwise there were prize-games (*thematitai*, *themides*), also subject to Roman control.

‘Sacred’ contests comprised a sacrifice, to which other Greek cities sent representatives (*theōroi* or more often, under Rome, *synthutai*), and a profane festival (*panēgyris*), often incorporating *markets and fairs, as well as the contests proper, supervised by an *agōnothetēs*. Funding of new contests relied heavily on civic *euergetism; infrequently emperors stepped in—notably *Hadrian (C. P. Jones, *JRA* 1990, 487) who also drastically reorganized the schedule of iselastic games to accommodate his new festivals in *Athens and elsewhere (*AE* (2006), 1403a-c). From the 2nd cent. AD the pantomime, and from the 3rd the mime, joined the more traditional events.

Supported by the imperial state, *agōnes* were absorbed into the Graeco-Roman cultural synthesis. Élite Greeks still sought athletic success; the world of *agōnes*, past and present, is a prominent theme among Greek writers of the *Second Sophistic. See ATHLETICS; COMEDY (GREEK); MUSIC; TRAGEDY, GREEK. SJI/AJSS

and numerous sculptures, and the evocation of specific literary or traditional landscapes or stories were among the themes (as in *Hadrian’s villa at Tibur); natural features such as springs, streams, hills, caves, and woods, were improved or created *ex novo*. In all this plants were important, but not central; specimen exotics (*viridia*, whence *viridarium*) evoked alien worlds (as birds and animals, which might also be ultimately destined for the table, did too) or pleased through scent, foliage contrast, or shade. Flowers were prized, but in Mediterranean conditions and before much improvement of the strain, were very limited in their season (hence the value of twice-blooming roses) and grown more for their use in garlands than for their effect in a bed.

Remembering the days when a *hortus* was the lot of a citizen, the whimsical Roman élite labelled its suburban garden-palaces ‘vegetable gardens’, *horti*, and these often achieved remarkable levels of costly and allusive complexity. On a humbler scale, the features of *ars topiaria* were very widely disseminated across the Roman world. For our understanding, the town gardens of *Pompeii are especially important, with the garden-paintings which complemented them, but good examples come also from

Fishbourne in Britain and Conimbriga in Portugal, Thuburbo Maius in Africa, and several cities of southern France. NP

Gaul (Cisalpine) (See ◀ Map 5, Cc ▶) The prosperous northern region of modern Italy, comprising the Po (Padus) plain and its mountain fringes from the Apennines to the Alps, was known to the Romans as Cisalpine Gaul. In the middle republic it was not even considered part of Italy, which extended only to the foothills of the Apennines along a line roughly from Pisa to Rimini (Ariminum). Beyond the Apennines lay Gaul, a land inhabited by Celtic peoples whom the Romans looked upon with fear and wonder. (See GAUL (TRANSALPINE).)

The background to this situation is difficult to reconstruct in detail. Archaeological evidence broadly confirms literary reports of *Etruscan settlement in Emilia-Romagna during the 6th cent. BC, and of the infiltration of Celtic peoples from beyond the Alps during the 5th and 4th cents. Rich warrior graves of the iron age Golasecca culture in Piedmont and Lombardy point to a warrior aristocracy similar to that of the Halstatt culture of

gardens A wall-painting from *Pompeii (c. AD 70) evokes Roman garden-art. It shows a statue of Mars, lush planting, and exotic birds. © Julian Money-Kyrle / Alamy

central Europe; and these same Golasecca sites during the 5th and 4th cents. contain increasing amounts of La Tène material. Further south there is evidence of a growing Celtic presence in Emilia-Romagna, where Etruscan and La Tène graves are found side by side in the same cemeteries.

The most detailed literary account of the Gallic occupation of the Po valley is that of *Livy (s. 34–5), who describes a succession of migrations by different tribes, beginning with the Insubres, who moved into the region around Milan (Mediolanum) in the 6th cent. BC. They were followed, in the course of the next two centuries, by the Cenomani, Libui, Salui, Boii, and Lingones. The last group to arrive were the Senones, who by the start of the 4th cent. had occupied the strip of land along the Adriatic known as the *ager Gallicus*. This account, which can be supplemented by other sources, is compatible with the archaeological evidence, although the latter implies a process of gradual infiltration rather than violent invasions. By the early 4th cent. the Gauls had completely displaced the Etruscans in the Po valley, and had begun to make occasional raids across the Apennines into peninsular Italy (in one of which, in c.386 BC, they sacked Rome). Further Gallic invasions occurred sporadically throughout the 4th and 3rd cents. (Polyb. 2. 18–31), culminating in the great invasion of 225 BC, which the Romans and their Italian allies defeated at Telamon.

The Romans responded by invading Cisalpine Gaul, which they overran in a three-year campaign of conquest ending with the capture of Mediolanum (Milan) in 222. Their efforts to consolidate the conquest, which included the foundation of colonies at Placentia (Piacenza) and Cremona, were however interrupted by *Hannibal's invasion, which prompted the Gauls to rebel. After defeating Hannibal, the Romans resumed their plan of conquest, which they completed in 191 with a victory over the Boii, the most powerful of the Cisalpine Gallic tribes. The colonies at Placentia and Cremona were refounded (190 BC), and further colonies were settled at Bononia (= Bologna, 189 BC), Parma, and Mutina (both 183). In 187 the via Aemilia (from which the modern region of Emilia takes its name) was constructed from Ariminum to Placentia. As a result of this great programme of colonization (still evident in aerial photographs which show traces of *centuriation throughout the region), virtually all of the land south of the Po was occupied by settlers from peninsular Italy, while the northern part of the plain remained largely in the hands of its Celtic inhabitants, who were henceforth known to the Romans as Transpadani.

After the Social War of 91–89 BC (see ROME (HISTORY) §1.5) Cisalpine Gaul was formally separated from Italy

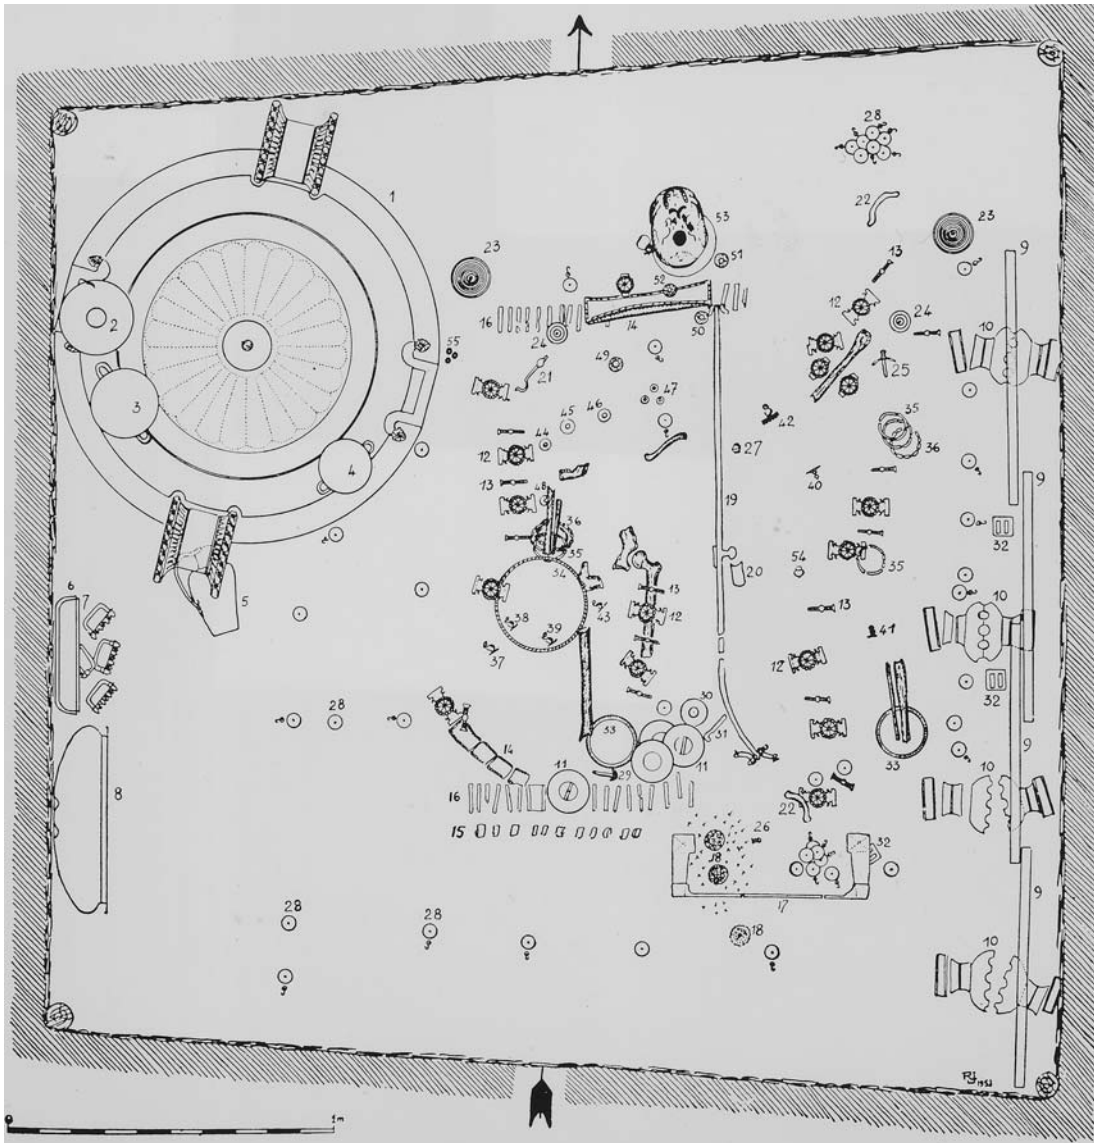

and became a province, with its southern border at the Rubicon; but all the colonial settlers who were not already Roman citizens were enfranchised. The rest of the free population, which effectively meant the Transpadani, were given Latin rights, a decision that they greatly resented; the demand for full citizen rights became a hot political issue in the following decades, until the Transpadani were finally enfranchised by Caesar in 49. In 42 Cisalpine Gaul was fully integrated within Italy, and under Augustus was divided into four of the eleven administrative regions of Italy (VIII–XI).

In the centuries after 200 BC Cisalpine Gaul was rapidly and thoroughly Romanized, and few traces of Celtic language and culture remained by the time of the empire. An area of rich agricultural land, much of which was reclaimed by Roman drainage schemes in the lower Po valley, Cisalpine Gaul achieved great prosperity; by the time of *Strabo, who gives an eloquent description of it (s. 1. 12, 218 C), it had become what it still is today, one of the most wealthy and prosperous parts of Europe. TJCO

Gaul (Transalpine) (see ◀Map 5▶) comprised the area from the Pyrenees and the Mediterranean coast of modern France to the English Channel, and the Atlantic to the Rhine and the western Alps. As a geopolitical entity, it emerged in the 1st cent. BC and lasted into the 5th cent. AD. Augustus divided Gaul into four provinces: Narbonensis, Lugdunensis, Aquitania, and Belgica. The Flavians annexed the Agri Decumates and attached them to Upper Germany—carved, like Lower Germany, out of Belgica. *Diocletian subdivided all six Gallic provinces, making a total of thirteen.

Gaul was predominantly Celtic in culture, but it did not include the Celts of the Danube and northern Italy; and it contained Ligurians and Iberians in the south, and Germanic immigrants in the north-east. The south had also been heavily influenced by Greek *colonization. Hence 'Gaul' was not a natural unit, but a Roman artefact. In order to protect the route to Spain, Rome helped Massalia (Marseilles) against bordering tribes. The result was, in 121 BC, the formation of 'the Province' (*Provincia*), from the Mediterranean to Lake Geneva, with its capital at Narbo. In 58–51 BC, Caesar seized the remainder of Gaul, justifying his conquest by playing on Roman memories of savage attacks over the Alps by Celts and Germans. Italy was now to be defended from the Rhine (Rhenus).

Initially, indeed, the Romans treated the Gauls as *barbarians. They disparaged Gaul beyond the Province as *Gallia Comata*—'Long-haired Gaul', and generally mismanaged the Province itself. However, Gaul was not far behind Rome. Ligurian communities had long emulated Massilia;

Gaul (Transalpine) Drawing of the burial chamber of a Gallic aristocrat at Vix (Châtillon-sur-Seine), France, c.500 BC, the finds including Mediterranean imports of wine-drinking vessels. From the 2nd cent. BC this taste of the Celtic élites was expressed in imports of Italian *wine, until S. Gaul itself became a wine-exporter in the 1st cent. AD. and, in the Celtic core, Caesar found nations (*civitates*) establishing urban centres (*oppida*) which, though hardly classical cities, had significant socio-economic functions. Under the more prudent rule of the emperors, the Province, now Narbonensis, was seeded with military colonies, and became a land of city-states, comparable with Italy. In the other 'Three Gauls', colonies were few and the *civitates*

were retained, but their leaders vied with each other in acquiring the conquerors' culture.

The *Romanization of northern Gaul is illustrated by the dominance of Latin, and the emergence of the Graeco-Roman city. The *civitates* were too large to be city-states, but they contained towns that could be designated as their administrative centres and developed,

under local magnates, in accordance with classical criteria. Most were unwallled. On the land, Romanization took the form of *villas—at this time working farms as much as country residences.

The population of Gaul was large: c.10,000,000. Agriculture flourished. One of the great engines of its success was the Rhine army, which stimulated trade by purchasing supplies from the interior. Commerce was facilitated by an extensive road and river network. The metropolis of high imperial Gaul was Lugdunum (Lyons), at a main junction of these networks. There was little resistance to Roman rule. Localized revolts in AD 21 and 69–70 were easily suppressed; they probably accelerated the demise of the pre-Roman aristocracy. Few Gauls subsequently involved themselves in Roman imperial careers.

Early Roman Gaul came to an end late in the 3rd cent. External pressures exacerbated internal weaknesses, and neglect of the Rhine frontier resulted in barbarian invasions and civil war. For a while Gaul was governed by a separate line of emperors (beginning with Postumus). Though order was restored, much had changed: the Agri Decumates were abandoned; and cities began to be fortified. However, there had still been no move to gain independence; and, after the restructuring of the empire by Diocletian and Constantine I, Gaul enjoyed stability and enhanced prestige.

For Rome renewed its commitment to defend Italy from the Rhine. A praetorian prefect was based in northern Gaul, usually in Augusta Treverorum (Trier), and rulers frequently sojourned there. Though the frontier was occasionally broken, it was always restored. There was a recovery of economic prosperity, though uneven. Trier was endowed with magnificent buildings, but most cities never recovered their former grandeur. The upper classes now eagerly sought posts in the imperial administration, making much of their rhetorical skills (the 4th cent. saw the blossoming of Gallic education). When not at court, influential Gauls, such as Ausonius, favoured the country life and built themselves palatial villas. Christianity spread; an episcopal hierarchy developed, and monasticism was introduced.

From 395, the division of the empire between eastern and western rulers again caused the neglect of the Rhine frontier, reflected in the transfer of the Gallic prefect to Arelate (Arles). By 418, as the consequence of Germanic invasion and civil war, Franks and Burgundians were established over the Rhine, and the Visigoths in Aquitania. These were kept in check, until the death of Flavius Aetius and the growing debility of the western government created a power-vacuum. The 460s and 470s saw Visigothic encroachment on Roman territory to the east,

while the Burgundians expanded westwards from Savoy. In 476, the last imperial possessions in the south were ceded to the Visigoths.

Gaul suffered badly. Refugees fled southwards, only to find high taxation and corruption. Yet, as is evident from the writings of Sidonius Apollinaris, the aristocracy remained remarkably resilient. Down to the mid-5th cent., its members tolerated the Germans while still looking to Rome for status and protection. Thereafter, they increasingly worked for the barbarian kings. Thus, at least in the centre and south of the country, the Gallo-Roman cultural legacy was bequeathed intact to the successor-kingdoms.

Roman Gaul seemed destined to become Visigothic Gaul until, late in the 5th cent., Clovis led the Salian Franks south, and eventually drove the Visigoths into Spain. JFDR

Gellius, Aulus, Roman miscellanist, born between AD 125 and 128, author of *Noctes Atticae* ('Attic Nights') in twenty books. Internal evidence suggests publication c.180; an apparent echo in Apuleius' *Apology*, sometimes used to support an earlier date, can be otherwise explained. A probable reference in Fronto apart, all knowledge of Gellius comes from his work: reconstruction of his life depends on the assumption, so far unfalsified, that his anecdotes, even if fictitious, are not anachronistic. There are slight but uncertain indications that he came from a Roman colony (*colonia*) in Africa: however, most of his life was spent at Rome. He studied with Sulpicius Apollinaris, and knew Fronto; but the deepest impression was made on him by Favorinus. He spent at least a year in Athens completing his education as a pupil of Calvenus Taurus; he visited Tiberius Claudius Atticus Herodes in his summer retreat at Cephisia, attended the Pythian Games of (probably) August 147, and enjoyed the life of a student and a tourist. After his return he was appointed a judge to try private cases (14. 2. 1); but his interest in the law is essentially antiquarian.

The *Noctes Atticae* (of which we lack the start of the preface, the end of bk. 20, and all bk. 8 except the chapter-headings) is a collection of mainly short chapters, based on notes or excerpts he had made in reading, on a great variety of topics in philosophy, history, law, but above all grammar in its ancient sense, including literary and textual criticism. According to his preface, Gellius conceived the notion of giving literary form to his notes during the long winter's nights in Attica (whence the title), but completed the project (some 30 years later) as an instructive entertainment for his children. Variety and charm are imparted by the constant changes of topic, purportedly reproducing the chance order of Gellius'

notes (a cliché of such works), and by the use of dialogue and reminiscence as literary forms for conveying information; the dramatizations are generally fictitious, though in settings based on Gellius' own experience. The characters of Gellius' friends and teachers are finely drawn; the fictitious persons are less individual.

Gellius is well read in Latin, less so in Greek (though he shows some knowledge of Homeric scholarship); his judgement is sensible rather than incisive. His style blends the archaic, the self-consciously classical, and the new: he lifts words from early authors but also invents new ones, he construes *plenus* only with the genitive but occasionally admits *quod* clauses instead of accusative and infinitive. He shares the age's preference for Early Latin and *Sallust over Augustan and Silver writers, but admires *Virgil and will hear no ill of *Cicero (10. 3; 17. 5); most striking, however, is his liking for Claudius Quadrigarius, of whom he supplies almost half the extant fragments.

In later antiquity Gellius was admired by St *Augustine and diligently read by Nonius Marcellus, *Ammianus Marcellinus, and Macrobius; in the Middle Ages he was esteemed by Carolingian and 12-cent. scholars; he was also excerpted in several florilegia. For the Renaissance he was a well-spring of learning and a model for humanistic writing; though subsequently displaced from his central position and in the 19th cent. disparaged along with his age, he has never lacked readers who relish not only the information he conveys, the quotations he preserves, and the reflections he arouses, but also the charm of his style and his infectious love of books. LAH-S

gems Precious stones were valued in antiquity as possessing magical and medicinal virtues, as ornaments, and as seals when engraved with a device. Such engravings (intaglios) in soft media like steatite or *ivory are found in early Minoan days; the use of hard stones dates from the middle Minoan age. Late Minoan and Mycenaean gems have a rich repertory of human and animal designs; the favoured shapes are the lenticular (round) and amygdaloid (sling-stone) (see MINOAN CIVILIZATION; MYCENAEAN CIVILIZATION). In sub-Mycenaean and geometric times the art of working hard stones was largely lost. A revival in the 7th cent. BC is usually associated with the island of Melos, and the commencement of Classical gem-engraving in the 6th cent. is marked by the introduction of the scarab (beetle) form of seal from Egypt. This was soon abandoned in Greece for the scaraboid, which omits the beetle-back. The late 5th and 4th cents. mark the high point of Greek gem engraving. In Hellenistic times the choice of subjects grows restricted, but excellent work was done in portraiture. In Italy the Etruscans

used the scarab until the 3rd cent.; gems of the later Roman republic show a wide range of subjects, combined with clumsiness of execution. With Augustus begins the large series of 'Graeco-Roman' gems. A period of indifferent work in the middle empire is succeeded by a revival under Constantine I.

Several gem-engravers are recorded in literature, e.g. Pyrgo teles, who worked for *Alexander the Great; others are known from their signatures on extant stones, though many signatures are false. Engravers of gems used the drill and the wheel. These had to be coated with powdered emery (of which Naxos was and is an important source), except for working softer stones such as steatite, which was consequently often used in the earlier periods. The stones most favoured for engraving in view of their durability, moderate hardness, and absence of grain were quartzes, especially those of the crypto-crystalline variety such as agate, plasma, jasper, carnelian, and most popular of all, sard. Red garnet, amethyst, lapis lazuli were much prized in jewellery. Cameos in which design and background were in contrasted colours were made of layered stones such as onyx and sardonyx. Of the hardest stones, emeralds, aquamarines, and sapphires were rarely engraved, while the diamond, probably unknown before the 1st cent. AD, was not even cut. The diamond-point, however, was sometimes used for engraving other stones. Imitations of gems in glass paste were apparently much in demand; in the British Museum collection they even outnumber sards. Glass imitations of rock crystal and red garnet were considered particularly convincing. FNP/DEE/MV

gender, the social construction of sexual difference, was an important Greek and Roman means of apprehending and explaining their world. It has also been central to modern understandings of Greece and Rome. But those understandings have changed over the years. The men and women of antiquity were once thought of as operating in separate spheres. Public space and the world outside the home were reserved for men; women were restricted to the home and even to some portions of it. But this model—derived largely from the Enlightenment struggle for the Rights of Man (alone)—fitted Greece unevenly at best. Poor women went outside the home to work, even into the fields beyond the city walls. Those better off were likely to play prominent roles in religious cults and festivals. Among the Romans, the home was used for public purposes and women of the élite were much involved in competition for political power behind the scenes and even as players. Meanwhile, the study of Greek and Roman sexuality occupied a separate sphere of its own, the province of antiquarian

investigations removed from the mainstream of scholarship. All that changed with the work of Kenneth Dover and the use made of it by Michel Foucault. A sexual act—penetration—was found to separate the men from the boys and slaves as well as from women. At the same time, gender was observed in almost every facet of Greek and Roman life; masculinity and femininity figured as an attribute of directions (right and left), occasions for speech, literary genres, as well as plants, animals and human beings. This approach has encouraged close attention to once overlooked texts (rhetoricians, medical writers, the novel) and fruitful new readings of familiar

ones. But it too has proved problematic. The gods transcend categories—Athena is a warrior, Hera minimally maternal, Dionysus feminized by the company of women yet strangely asexual despite his association with satyrs. Both Greeks and Romans worked with two genders, based on the biological fact (as they understood it) of two biological sexes. But they knew of natural exceptions too (hermaphrodites, androgynes). Other groups further confound the mapping of gender onto sex: cinaedi (men who flaunted femininity without renouncing penetration), eunuchs, tribades (women who took a man's active role in same-sex couples). Or so men

thought. What were women's views of such relationships or of gendered identities in general? Like men's? Perhaps so, judging by the grave goods they allocated to ancient graves (strigils for men, jewellery for women). Perhaps not, if the poets *Sappho and Sulpicia subvert (as some believe) conventional codes. In any case, few fields of scholarship are more open to the influence of our own perceptions and presuppositions. See HOMOSEXUALITY; MASCULINITY; WOMEN. MG

genealogy, the enumeration of descent from an ancestor. Legendary pedigree was particularly important in Greece. Before fighting, *Homer's heroes boast of their ancestry, citing between two and eight generations of ancestors (e.g. *Il.* 6. 145–211, Glaucus). *Hesiod's poetry is preoccupied with legendary ancestry (*Theogony*, *Catalogue of Women*); even aristocrats in Classical Athens (which put more stress on recent achievements) claimed descent from important local and Homeric heroes, and thence from the gods: cf. the Philaid genealogy (Marcellin. *Life of Thucydides* 3); *Andocides was descended from *Odysseus and therefore Hermes (Hellanicus, *FGrH* 323a F 24), *Alcibiades from Eurysaces (and *Zeus) (*Pl. Alc.* 1. 121a), *Plato from *Solon and Codrus (*Plut. Sol.* 1. 2). Other groups, cities, colonies, or tribes (see ETHNICITY), might trace descent from a single legendary figure, and genealogies were sometimes akin to king-lists (e.g. *Sparta), or assimilated with lists of office-holders. Some of the first prose writers recorded (or worked out) genealogies, mostly legendary, as well as their chronological implications: Hecataeus of Miletus (c.500 BC), Acusilaus of Argos, Pherecydes, Hellanicus. Genealogies and their enumeration were evidently popular (Polyb. 9. 1. 4), especially in Sparta, as Hippias found (*Pl. Hp. mai.* 285d), despite Plato's criticisms (*Th.* 174e ff.). They reflect the enormous significance attributed by the Greeks to origins and the original ancestor in determining the character of future generations. Prestige, status, even moral character, might be derived from the original progenitor, preferably legendary, heroic, or divine. (The Romans, more interested in their recent ancestors (Polyb. 6. 53 f.) only adopted the Greek penchant for legendary ancestry in the course of Hellenization (see HELLENISM) from the 2nd cent. BC (T. P. Wiseman, *G & R* 1974, 153 ff.).) Political and tribal affiliations might, similarly, be seen in genealogical terms. Given the value of the original ancestor, it is therefore unsurprising that the intervening links were sometimes vague or forgotten, and it may be the professional genealogists who did much to create continuous and coherent stemmata (R. Thomas, *Oral Tradition and Written Record in Classical Athens* (1989)). However, intermediate ancestors would also, obviously, carry prestige or opprobrium, and unsuitable ancestors would drop from view. Such is

the moral or political importance of ancestry, that genealogy tends to reflect the current position or claims of a family, and thus it is usually the least reliable of historical traditions. Numerous inconsistencies would arise from the symbolic reflection of current status in past genealogy, and it is these contradictions which the genealogists were in part trying to resolve. RT

genre, a grouping of texts related within the system of literature by their sharing recognizably functionalized features of form and content. Theory of genre as such is quite lacking in antiquity (its place is taken by theories of *imitatio*) and ancient theoretical discussions of specific literary genres are few and for the most part unsatisfactory. They operate according to criteria which are one-sidedly formal (generally metrical), thematic (the characters' moral or social quality, the general subject-matter), or pragmatic (the situation of performance), but scarcely attempt to correlate or justify them; they are more interested in classifying existing works than in understanding the mechanisms of literary production and reception and are directed to the needs of the school and the library, not to the critic's; they bungle some genres (lyric) and ignore others (the novel). Rhetorical handbooks sometimes distinguish among oratorical genres, but the precise relation between their (often pedantic) prescriptions and the literary works remains uncertain.

*Plato (*Resp.* 3. 392d–394c) differentiates a number of existing poetic genres in terms of their constitutive modes of presentation: mimetic (tragedy, comedy), diegetic (dithyramb), or mixed (epic). But among the theoreticians it is only *Aristotle who provides *in nuce* a genuinely complex theory, combining considerations of form, content, the author's and audience's psychology, metre, language, performance, traditionality, and evolution. Yet his surviving *Poetics* focuses mostly upon a single genre and is often elliptical and tentative: it furnishes many of the elements of a useful theory but does not fully work them out. Later theories tend restrictively to prescribe appropriate contents or style (*Horace, *Ars poetica*), to speculate about historical origins (Hellenistic theories of tragedy and pastoral), or to list the multiplicity of transmitted forms (Proclus' *Chrestomathia*).

Modern attempts to found genre theories upon these ancient discussions have usually been sterile. Instead, more progress can be made by concentrating upon the actual practice of ancient poets, which reflects a much more sophisticated and supple sense of how genres really function. In Archaic Greece, poetic genres seem to have been defined not only by immanent characteristics of form and content but also by communally recognized, often ritually sanctioned situations of performance. The gradual emancipation of literature from such performative

contexts facilitated the poets' awareness of and artistic experimentation with genres. Even before the Hellenistic period, poets designated genres by the names of their 'inventors' (*Homer for epic, *Archilochus for iambic invective) and *Euripides and *Aristophanes ironically juxtaposed elements from disparate genres. But the Hellenistic philologists' classification of earlier literature into catalogues and canons made it easier for poets definitively to isolate formal and thematic constants as specifiable rules for determining generic identity: already Accius wrote, *nam quam varia sint genera poematorum, Baebi, quamque longe distincta alia ab aliis, nosce* ('Learn, Baebius, how various the genres of poems are and how much they differ from one another': Charisius, *Gramm.* 141. 34=Accius fr. 8 Funaioli); and a strong interest in genres is obvious among the Augustan poets, manifested for example in *Virgil's exploration of the boundary separating elegy from pastoral (*Ecl.* 10), in Horace's discussion of the 'empty slot' of Augustan tragedy (*Epist.* 2. 1), and in *Ovid's witty experimentation with new and paradoxical genres (*Heroides, Remedia amoris*).

Much confusion has been caused in modern times both by attempts to hypostasize genres, attributing to them an existence independent of the particular literary works, and by the opposed overreaction, denying the very existence of genres. But even without handbooks, genres function within texts as a way of reducing complexity and thereby not only enriching, but even enabling literary communication: for, by guiding *imitatio* and identifying as pertinent the strategic deployment of *topoi* (see *ΤΟΠΟΣ*) and of conspicuous stylistic and thematic features, they select only certain contexts out of the potentially infinite horizon of possible ones. Hence genre is not only a descriptive grid devised by philological research, but also a system of literary projection inscribed within the texts, serving to communicate certain expectations to readers and to guide their understanding.

GBC/GWM

geography The Homeric poems (see *HOMER*) display a quite complex sense of place, and of the ordering of the world, in which there is already a notable sense of theory. The *Iliad's Catalogue of Ships* systematically evoked the Greek homeland, and its names remained recognizable for the most part (though in some cases perhaps by learned re-creation); the wider world was much less precisely docketed (making later authorities such as *Eratosthenes believe—the theory of *exōkeanismos*—that Homer had deliberately relegated *Odysseus' wanderings to a vague outer darkness), and there was therefore much less onomastic continuity. The listing of such places begins more recognizably in *Hesiod, and some

quite elaborate conception of the layout of the *Mediterranean was clearly associated with the complex movements of people and materials in the Archaic periods, and indeed already present in the Phoenician, Euboean, and Corinthian ambits of the 8th cent. BC; the choice of name for the later *apoikiai* (overseas settlements) reflects a geographical sophistication in which the toponyms of the homeland are replicable in an alien world, a habit of thought which remained common in Macedonian and Roman practice (see *COLONIZATION, GREEK*). From the relatively undocumented practice of the Archaic period the practical literature of coastwise description or *periploi* developed, to be given a *prōtos heuretēs* (discoverer) in Scylax of Caryanda, and first represented for us by the 4th-cent. text known as [Scylax] or pseudo-Scylax. The first notion of geographical description as a discipline is connected conceptually: the *periodos gēs* ('circuit of the earth') that goes back to the Hesiodic corpus.

Geography by the 5th cent. had three distinct strands: this small-scale documentation of the actualities, as of particular sea routes; wider theories about the layout of land and sea on a global scale; and ideas about the place of the *oikoumenē* (inhabited world) in the order of the cosmos. Both of the more theoretical approaches are apparent in Hecataeus of Miletus and *Herodotus (who combined a geographical and ethnographical perspective): it is plausible to suggest an origin in 6th-cent. Ionia, in which new approaches to the physical nature of the universe, inspired in part by contacts with the Fertile Crescent and Egypt, combined with the active seafaring experience of states like Miletus and Samos. The role of *Pythagoras (who postulated a spherical earth) and his followers should also be noted. The invention of the map was attributed to Anaximander.

Learned geography, in tandem with *astronomy, came during the 4th cent. to an advanced understanding of the nature of the earth as a rotating sphere of a realistic size (the role of *Aristotle and Dicaearchus should be noted); and the theory of the latitudinal zones or *klimata* was refined. A mathematical geography emerged (limited in the end by the available instruments), advanced in the work of Eratosthenes of Cyrene and Hipparchus of Nicaea, which culminated in the 2nd cent. AD in the work of Claudius Ptolemy, the most detailed attempt made in antiquity to project the layout of the physical and human world on the surface of the globe. By 300 BC it was known to the informed that the *oikoumenē* of which detailed information was available could only occupy a small portion of the northern hemisphere. It was also at this time, by coincidence or not, that the idea of accumulating information systematically on the edges of received knowledge began, in a way that suggests comparison with the

‘voyages of discovery’ in the first age of European colonialism. The work of the companions and followers of *Alexander the Great, above all, established a link between formal geography and political dominion which was to be of great importance to the Roman experience. It also offered, through the development of the ethnographic tradition, an analytical content for the genre which went beyond description and cataloguing, though it continued to use these techniques.

Eratosthenes, whose contribution, in late 3rd-cent. *Alexandria, to *geōgraphia* as a separable discipline was enormous, needs separate consideration. He set new standards of verification by rejecting the Homeric tradition and insisting on a clear distinction between fictitious wonder-descriptions and the recording of fact, established a blend of descriptive and mathematical geography as a new genre, made the mapping of the *oikoumenē* its centre, systematized the deployment of a system of co-ordinates of latitude and longitude in order to do so, and applied the benefits of Ptolemaic statecraft: for instance his accurate estimate of the earth’s circumference depended on the measurement of *Egypt in the interests of land management, and his theory of the *sphragides*, conceptual units for the subdivision of space, was also indebted to agrimensorial practice.

Geographical ordering became central to the formation of administrative units. Borrowing perhaps from the geographically defined satrapies of the Achaemenid dominion, the Athenians had subdivided their *archē* (‘empire’) in a practical way into five units. Geographical organization of a sometimes complex kind was also a feature of the states of Alexander and his Successors (*Diadochi*), and the usefulness of correct topographical information for coercion and exaction was established. In this way geographical work in the Hellenistic period, by *Timaeus, Eratosthenes, Artemidorus, *Polybius, Posidonius, and eventually *Strabo, had a practical relationship to history, and came to be a major ingredient in the self-definition of the nascent Roman, Mediterranean-wide state. Roman contributions were of a practical kind: the *commentarii* (memoranda) of commanders and governors; *Caesar has a place of honour here, blending the claim to practical personal observation with Herodotean ethnographical themes; later exemplars, such as Licinius Mucianus, consul AD 70 and 72, were more given to the thaumatological: Strabo was not complimentary about the Roman contribution to geography (3. 4. 19 (166 C)). The Augustan epoch, with its spectacular universal claims to rule in time and space, made very full use of the geographical tradition in its construction of images, while putting it to practical use too. Thereafter geography as such became an ingredient in the encyclopaedic

tradition, and the later authors who survive are mainly excerptors or epitomizers of the earlier tradition (like *Pliny the Elder’s geographical excursus in *Natural History* 2–6). The exceptions are Pomponius Mela, who represents an attempt at a Latin geography, and *Arrian’s rather self-conscious *periplus* of the Euxine (Black Sea), deliberately mixing the *genres, as was common at the time. NP

Germanicus (Germanicus Iulius Caesar), (before adoption Nero Claudius Drusus Germanicus), elder son of Nero Claudius Drusus and Antonia, was born 24 May 15 or 16 BC and adopted in AD 4 by his uncle *Tiberius. As Tiberius was immediately adopted by *Augustus, Germanicus became a member of the Julian *gens* (family) in the direct line of succession; and his career was accelerated by special dispensations. He served under Tiberius in Pannonia (7–9), and Germany (11). In 12 he was consul, and in 13, as commander-in-chief in Gaul and Germany, he won his first salutation as *imperator* (EJ 368) in a campaign against the Germans, clearing them out of Gaul and re-establishing order there. By now he was a popular figure, held like his father to entertain ‘republican’ sentiments, and his affability contrasted with Tiberius’ dour reserve. But, though by no means incapable, he was over-emotional, and his judgement was unsteady. When, on the death of Augustus, the lower Rhine legions mutinied, his loyalty was proof against the (perhaps malicious) suggestion that he should supplant Tiberius, but his handling of the situation lacked firmness: he resorted to theatrical appeals and committed the emperor to accepting the mutineers’ demands. On dynastic matters the two were at one, but their political style was different, and there was soon a marked difference of view as to how Germany should be handled, Tiberius adhering to the precept of the dying Augustus that rejected immediate territorial advance.

In the autumn of 14 Germanicus led the repentant legions briefly against the Marsi. But he was eager to emulate his father and reconquer parts of Germany lost after the defeat of Publius Quinctilius Varus. He campaigned in the spring of 15 against the Chatti, Cherusci, and Marsi, and rescued the pro-Roman Cheruscan Segestes from Arminius. In the summer he attacked the Bructeri, reached the saltus Teutoburgiensis, paid the last honours to Varus, and recovered legionary standards: after an indecisive battle with the Cherusci under Arminius, his forces suffered heavy losses on their way back. For the main campaign of 16 a great fleet was prepared and the troops were transported via his father’s canal and the lakes of Holland to the Ems, whence they proceeded to the Weser and defeated Arminius in two battles at

Idistaviso (near Minden) and somewhat to the north; the fleet suffered considerable damage from a storm on its homeward journey.

Although Germanicus claimed that one more campaign would bring the Germans to their knees, Tiberius judged that results did not justify the drain on Roman resources, and recalled him to a *triumph (26 May 17) and a command to reorder the ‘overseas’ provinces as proconsul with *maius* (‘greater’) **imperium* (subordinate to that of Tiberius). Germanicus entered on his second consulship (18) at *Nicompolis, crowned Zeno, son of Polemon, king of Armenia (so winning an *ovatio*—a lesser honour than a triumph), and reduced Cappadocia and Commagene to provincial status. In 19 he offended Tiberius by entering Egypt, which Augustus had barred to senators without permission, and by the informal dress he wore there; his reception was tumultuous (EJ 320(b), 379; Smallwood, *Docs...* *Gaius* 370, lines 24–7). On his return to Syria the enmity between him and Gnaeus Calpurnius Piso, whom Tiberius had appointed governor as a check on Germanicus, led to his ordering Piso to leave the province. He fell mysteriously ill, and on 10 October died near *Antioch, convinced that Piso had poisoned him. His death—compared by some with that of *Alexander the Great—provoked widespread demonstrations of grief and in Rome suspicion and resentment; many honours were paid to his memory; his ashes were deposited in the mausoleum of Augustus at Rome. His reputation remained as an overwhelming political advantage to his brother and descendants.

Germanicus married Agrippina the Elder, the daughter of *Agrippa and *Julia. She bore him nine children, among whom were Nero Iulius Caesar (d. 31), Drusus Iulius Caesar (d. 33), *Gaius (later emperor), *Agrippina the Younger, Iulia Drusilla, and Iulia (sometimes called Livilla). Eloquent and studious, he wrote comedies in Greek (all lost) and Greek and Latin epigrams; he also translated into Latin the *Phaenomena* of Aratus, bringing it up to date and adding further matter on the planets and the weather.

AM/TJC/BML

ghosts Identifying a ghost in Greek literature and distinguishing it from what we might call a delusion or a supernatural entity can sometimes pose difficulties: *Homer tends to use the term *psychē* to describe his spirits, but we also find *skia*. In later writers, *eidōlon* is used (Hdt. 5.92.7 and Pl. *Leg.* 959b of the corpse), which can also mean a phantom of the mind, or even just a likeness. Later still, *daimōn*, alone, or combined with other words to evoke particular forms of demon (see below) appears. Other terms (which will appear throughout the entry) evoked the particular ways in which individuals died and became

ghosts. This entry will focus on appearances in the mortal realm of spirits connected to a death, indicating where there are any ambiguities of spectral terminology. As the move from *psychē* to *daimōn* might suggest, there seems to be a gradual development in the strength, substance and presence of ghosts in the ancient world; while living mortals seem, in turn, to find increasingly sophisticated ways to manipulate their spectral visitors and their needs for their own ends.

The first ghost story could be said to appear in Book 11 of the *Odyssey*, when *Odysseus makes his way to the edge of the Underworld (‘where the River Acheron meets the River Styx’) and summons the dead, so that he may seek the advice of the dead prophet Tiresias. The dead arrive in droves, and are clearly fearsome: we are told that Odysseus goes pale with fear, and that he keeps the ravenous ghostly hordes from consuming the blood of the sacrifice he has made by wielding his silver-studded bronze sword. On the other hand, in many ways, this account is the opposite of a ghost story as we now understand it: it involves a mortal going to the realm of the dead. The spirits described are insubstantial (*Od.* 11.204–8; see also 10. 495); until they drink the blood of Odysseus’ sacrifice, their faculties are impaired (*Od.* 11.98–99). Odysseus’ own mother at first does not recognize him, and, apart from Elpenor, a companion of Odysseus who died falling off a roof, and comes to ask for burial, they find it hard to speak (elsewhere, they squeak, *Il.* 23.101 and *Od.* 24.5. and 9). Indeed, across the *Iliad* and *Odyssey*, Homeric spectres seem more or less safely sequestered from mortal experience (Odysseus’ mother emphasizes how difficult it is to cross from the realm of the living to that of the dead, *Od.* 11.155–59). If the dead must visit mortals, they may appear to them in their dreams—as the spirit of Patroclus appears to Achilles in the *Iliad* (23.65 ff.). In general, ghosts seem powerless and ineffectual.

Nevertheless, the story includes ideas about ghosts that persisted: e.g. other sources mention similar methods of keeping ghosts at bay (for the idea that they fear certain metals, see Ps-Quint. *Decl.* 10, as well as stories about the binding of ghosts, e.g., Paus. 9.38.5, although Lucian, *Philops.* 15, suggests it is the sound that disturbs them). Later sources, especially binding curses, also indicate similar ideas about what made ghosts wander in the first place. In Homer, both Elpenor and Patroclus seek a proper burial; the latter describes how Achilles must bury him so that he may pass ‘beyond the River’—without proper interment, we learn, he is doomed to wander through the house of Hades (*Il.* 23.73–74). This desire for proper burial remains a continuing motivation for ghostly manifestations. Similarly, the first

hints of the desires and needs that motivate a haunting appear in this earliest ghost story, in the description of the spirits that arrive in response to Odysseus' ritual. This crowd includes brides, unmarried youths, old men who had endured much, maidens still merry, new to sorrow, and warriors killed in battle. This gives us some idea of the kinds of fatal experiences that might provoke anger or restlessness and produce a ghost. Some of these have died violently; others have perished before they have achieved their *telos*, that is, their life's goal.

How this anger might manifest itself varied: not only was there the ghost itself, but some sources seem to suggest a link between ghostly anger and *pollution—and thus with catastrophic events like plague or episodes of madness. For example, although some accounts of the Spartan general Pausanias's death and its aftermath seem to have included mention of a ghost (see below), others do not, indicating instead that Pausanias' manner of death itself caused a state of pollution (Thuc. 1.134). The relation between haunting and pollution may lie behind the story that Athens summons Epimenides from Knossos after the sacrilegious murder of the Cylonians around 630 BC in order to resolve a plague that was caused by pollution (FGrH 475, Diog. Laert. 1.109–112). Meanwhile, explanations for madness that depend on the idea of blood-guilt are given by characters in 5th-cent. Greek drama (see Eur. *HF* 965–67, *Hipp.* 142); by *Plato (*Leg.* 865d5–e6); and as part of medical explanations (*Morb. Sacr.* 4.30–33).

The usual first step to take in response to the presence of ghosts or manifestations of supernatural anger was to consult the *Delphic oracle. Different approaches might then follow: in the various accounts given of Pausanias' death and its aftermath, for example, we find the propitiation and drawing away of a ghost (*Plutarch *De sera* 560 f); the erection of bronze statues (*Thucydides and the *Suda* s.v. 'Pausanias' [to resolve pollution], Paus. 3.17.7 and *Diodorus Siculus 11.45 [to propitiate the goddess], Aristodem. FGrH 104 F 8 [to propitiate the spirit of Pausanias]) as well as the hiring of *psychagōgoi*. These were specialists (literally, 'spirit-raisers') who appear to have made a living not simply summoning spirits, but raising them in order to help them to rest in peace. The *Suda* (s.v. *psychagōgias*) provides a description of how they might work under its entry for the related practise of *goeteia*—it involves sacrifice to summon the ghost, and then a conversation to find out why it is angry. The stories relating to Pausanias alone suggest that *psychagōgoi* might be summoned from distant communities: we find *psychagōgoi* summoned from Italy (Plut. *De Sera*. 560 f), and Thessaly (scholium to Eur. *Alc.*, 1127–8, with Plut. *Homeric Studies* 12b Sandbach) to lay Pausanias' ghost, while Pausanias

himself in one account consults Arcadian *psychagōgoi* to lay the ghost of Kleonike, a young woman he has inadvertently murdered (Paus. 3.17.9).

Still in terms of laying the ghost: it was also possible to learn what a ghost wanted by visiting a *nekuomanteion* or 'oracle of the dead': in some accounts, Pausanias went to the oracle of the dead at Heraclea Pontica, in order to speak with Kleonike (Plut. *Cimon* 6 and 555c). There is also evidence for remedies closer to home: an inscription from the city of Cyrene (*SEG De Sera* 9 72, LSS 115) may provide instruction about how to lay a ghostly visitant—the account involves the creation of *kolossoi*, little figures, which recall the statues created to lay the ghost of Pausanias; similarly, the *Lex Sacra* from Selinous appears to give instructions about how to lay various forms of ghost, and how relationships between living and dead may cause mutual suffering. Meanwhile, the festival of Genesia at Athens appears to have been intended to avert, appease or control the dead; while the festival of the Anthesteria, *Choes*, also had associations with the dead (according to Photius s.v. *miara hēmera*, the dead were supposed to come up on that day and, a Greek proverb may imply, were chased away at sunset on the third day); there were probably similar festivals in other communities.

Alternatively, you might try to use such ghosts in aggressive magical spells. This was another practice of *psychagogia*, according to Plato (*Leg.* 909a–d). In binding spells that invoke the dead, we find 'those who died before marriage: and the untimely dead' and 'youths and maidens' (*DT* 52; *SGD* 45, 271, *DT* 22 and 25). In the *Greek Magical Papyri*, spells address those who are either dead by violence (*biaiothanatoi*), 'unburied' or not properly attended to in death (*ataphoi* or *atelestoi*), or 'untimely dead' (*āōroi*); we also find those who are unmarried (*PGM* IV. 296–466). Sometimes, the identity of a particular dead person is given; one example also features a drawing of the corpse it addresses (*Suppl. Mag.* 1, no. 37 [*SGD* 158–159] the corpse's name is Horion, son of Sarapous). Pre-Imperial curses tend to invoke the dead as witnesses, and emphasize their weakness (e.g. *DT* 43 and 44). Later spells, especially those from Egypt, clearly imagine them as more substantial in appearance, activity, and power. They are addressed as, or alongside, *daimōnes* (whether or not these are the same entities is hard to tell); sometimes a particular *nekudaimōn* ('corpse-daimōn') is instructed to carry out the spell (e.g., *Suppl. Mag.* 1, nos. 46–51 [all erotic charms], *Suppl. Mag.* 2, no. 57. [*SGD* 162] a curse). These developments may indicate influence from Egyptian temple ritual, in which ghosts were sent 'letters' with instructions.

A blossoming interest in ghosts may be indicated by the plethora of spectral appearances in 5th-cent. Greek

drama: famous examples include the ghost of *Darius I, raised in *Aeschylus' *Persai*, the ghost of Clytemnestra in the *Eumenides*, Polydorus in Euripides' *Hecuba*. Meanwhile Aeschylus wrote a play called the *Psychagogoi*, now lost, to which *Aristophanes playfully alludes in the *Birds* (1553 ff.). On the stage, the dead tend to provide two key plot devices: as well as pursuing those who have killed them, they provide information. Thus, Darius foretells the fate of Xerxes; Polydorus tells of his sister Polyxena's death. This secret knowledge reflects elements found in other stories, e.g. the Corinthian tyrant Periander in *Herodotus (Hdt. 5.92) raises the ghost of his dead wife in order to ask her to locate some hidden wealth (she will not answer his questions until he provides her with appropriate costume so that she can rest in peace). As our sources for magical activities become more plentiful they appear to indicate an increasing interest in divination using the souls of boys (e.g., *PGM* VII.348–58), and we find enemies accuse each other of sacrificing boys for this purpose (Philostr., *VA* 7.11; *Cicero, *In Vatinius* 6.14).

Within Roman culture, something of the same ambiguity of language appears: *umbra* is poetic and close to Greek *skia*, meaning shadow; *idolum* (which appears to be a transliteration of the Greek *eidolon*), *imago*, and *simulacrum* all suggest likenesses. *Manes* may refer to deified souls or the gods of the infernal realm; indeed, the *Di Manes* encompass the benign *Lares* (household protectors) and the more malevolent *larvae*, restless spirits, debarred from a home because of the transgressions committed while alive (see Apuleius, *De deo Soc.* 15). *Lemures* were another flavour of less benign ghost: at the festival of 'Lemuria', held in May, the Romans appeased the ghosts of the departed who were thought to return home, hence the festival was held at home (*Ov. Fast.* 5.451–80); in contrast, the festival of Feralia or Parentalia (*Ov. Fast.* 2.533 ff.) took place at the graveside. The motivations that animated earlier ghosts persist: thus, *Suetonius describes how Nero claimed to be haunted by the ghost of his mother whom he had murdered (*Ner.* 34); while Tertullian (*De Anima* 56–57) draws on Greek sources to give a detailed description of the different categories of restless dead. Meanwhile, whether or not they are the result of magical attack, we also find increasing stories of people, as well as houses or places, being possessed, and resulting exorcisms; however, as above, it is not always clear whether the demons in these stories are ghosts or not.

Apparently, ancient Greek mothers told their children ghost stories, drawing on the vast body of myth (*Pl., Resp.* 2.381e), although we do not have specific examples. But ghost stories can still be traced (e.g. the story of the Hero at Temesa [*Paus.* 6.6. 7–11 and *Strabo* 6.1.5]). It may be

that we see their legacy in the stories that appear throughout later literature: e.g. the traditional haunted house story, in which a brave man confronts a violent ghost and lays it to rest following the discovery and proper burial of its corpse, emerges in the early Roman period (*Plaut. Mostell.* 446–531, *Plin. Ep.* 7.27.5–11, and *Lucian *Philops.* 30 ff.). The ghost stories of later Greek and Roman literature give us a more detailed account of the activities of ghosts and their appearance: thus, in Apuleius (*Met.* 9.29–31) a resentful ghost is sent to commit a vengeful murder; this spectre, like many of these later ghosts, enjoys a lurid appearance (yellow and emaciated), and provides perhaps a precursor of modern apparitions. EE

Giants, a mythological race of monstrous appearance and great strength. According to *Hesiod they were sons of Ge (Earth) from the blood of Gaia/Uranus which fell upon earth; he describes them as valiant warriors (*Theog.* 185). *Homer considers them a savage race of men who perished with their king Eurymedon (*Od.* 7. 59). The prevailing legend of the fight of the gods and the Giants was formulated in Archaic epics and was embroidered by many later writers. A substantial account is given by Apollodorus (1. 6. 1.). When the gods were attacked by the Giants they learned that they could win only if they were assisted by a mortal. They called in *Heracles, who killed the giant Alcyoneus and many others with his arrows. *Zeus, who led the gods, smote with his thunderbolt Porphyryon who attempted to ravish *Hera; *Athena killed Pallas or Enceladus; *Poseidon crushed Polybotes under the rock that became the island of Nisyros (*Strabo* 489); *Apollo shot Ephialtes; Hermes slew Hippolytus; *Dionysus killed Eurytus and many other Giants besides who were caught in his vine; and *Hephaestus aided the gods, throwing red-hot iron as missiles. The Giants were defeated and were believed to be buried under the volcanoes in various parts of Greece and Italy, e.g. Enceladus under Aetna. Bones of prehistoric animals were occasionally believed to be bones of giants.

The Gigantomachy was one of the most popular myths in Greece and accordingly the names of participants and the episodes of the battle vary from writer to writer and from representation to representation. Zeus, Heracles, Poseidon, and later Athena, are the usual protagonists. In its early stage the myth seems to represent a variation of the popular motif of the tribe that attempted to dethrone the gods; in a more advanced stage of culture the myth was interpreted as the fight of civilization against barbarism.

In art the Giants are first shown as warriors or wild men, later as snake-legged monsters. The most famous

sculptural renderings are found on the Archaic treasury of the Siphnians at *Delphi and on the Hellenistic altar of *Pergamum. GMAH

gladiators, combatants at games Gladiatorial combats, held at the funerals of dead warriors in Etruria (see ETRUSCANS), were introduced to Rome (perhaps by way of Samnium and Campania) in 264 BC, when three pairs fought at the funeral games given in honour of Decimus Iunius Pera. Down to *Caesar's Games in 46 BC the justification (or pretext) was always the death of a male relative, but these were in part commemorative of Caesar's daughter *Julia, in part not commemorative at all. These contests, like beast-fights, became increasingly important as a route to popular favour for their promoter, forming an important, though normally brief (because highly expensive) item in games held at Rome and in other towns. However, 5,000 pairs fought in eight different games given by *Augustus (RG 22. 1) and the same number in a single series of games given by *Trajan to celebrate the conclusion of the Dacian War in AD 107. At Rome the original venue was the *forum Romanum. The first stone amphitheatre was built by Statilius Taurus under Augustus, but it was only with the building of the Flavian amphitheatre (*Colosseum) that Rome had a specialized venue larger than those in quite small Italian towns (the fine amphitheatre to be seen at Pompeii goes back to the early years of the Sullan colony). Antiochus IV Epiphanes introduced these games to the Syrian capital, *Antioch, c.170 BC and later they spread to all parts of the Roman empire. Gladiators were of four types: the *murmillo*, with a fish for the crest on his helmet, and the Samnite, both heavily armed with oblong shield, visored helmet, and

short sword; the *retiarius*, lightly clad, fighting with net and trident; and the Thracian with round shield and curved scimitar. Prisoners of war and condemned criminals were compelled to fight as gladiators. Those who fought on a professional basis were either slaves, bought for the purpose, or free volunteers who for a fee bound themselves to their owner by an oath (*auctoramentum gladiatorium*) which permitted him to kill or maim them (in practice a gladiator was too valuable an investment to be wasted outside the games and the life of a defeated combatant was often spared by the audience's wish). They were trained in schools under a *lanista* (who was sometimes a retired gladiator) and might be acquired as an investment, to be hired or sold to games-promoters. In the late republic they were frequently used as the core of a gang or armed entourage. It appears that even members of the senatorial and equestrian orders were attracted to a gladiatorial career, which had a macabre glamour deriving from courage, physical strength, and sexual potency. In consequence there was legislation under Augustus and *Tiberius to prevent members of these orders becoming gladiators (B. M. Levick, *JRS* 1983, 97 ff.), which remained an infamous profession (*Dig.* 28. 2. 3 pref.). After *Domitian gladiatorial games could only be given at Rome by emperors; outside Rome they required official sanction. Restrictions on games in the towns of the empire seem to be related more to the expenditure involved for the promoters than to any distaste. Opposition to the idea of such games centred on their being bloodshed for fun, but for *Cicero (*Tusc.* 2. 41) and *Pliny the Younger (*Pan.* 33. 1) this did not apply if those fighting were condemned criminals. Gladiatorial combats were first prohibited in AD 325, when *Constantine I decided

gladiators A 4th-cent. Roman *mosaic showing pairs of gladiators in combat. In spite of the violence depicted, in practice the lives of defeated gladiators were often spared by popular demand. Borghese Gallery, Rome / Archivi Alinari-archivio Alinari, Florence

that they were too bloodthirsty a peacetime activity (*Cod. Theod.* 15. 12. 1; *Cod. Iust.* 11. 44). JPB/AWL

glass (Gk. *hyalos* (also 'rock crystal'), Lat. *vitrum*). The art of producing a vitreous surface on stone, powdered quartz (faience), or clay was known in pre-dynastic Egypt and passed to Crete during the second millennium BC. Glazed objects are common on Greek sites of the Archaic period, some of them Egyptian imports, others probably made locally. In Hellenistic and Roman times Egypt and Asia Minor were centres of fabrication of glazed wares, which often imitated bronze.

Objects composed entirely of glass paste begin to appear in Egypt about 1500 BC, when two allied processes seem to have been in use: modelling molten glass about a core of sand, and pressing it into an open mould. The chief Mycenaean glass is dark blue imitating lapis lazuli, used for beads, inlays, and architectural ornaments. In the 6th cent. small vases made by the sand-core process became known in Greece; they have opaque blue, brown, or white bodies and a marbled effect was produced on their surface by means of a comb or spike. In the Hellenistic period mould-made bowls come into fashion; these were produced mainly in Egypt. Here the tradition of opaque polychrome glass was continued into Roman times with *millefiori* bowls, in which marbled and other polychrome patterns were formed by fusing glass canes of various col-

ours and pressing them into moulds. In the same tradition are the vessels in two layers carved in imitation of hard-stone cameos: the Portland vase in London is the best-known example.

The invention of glass-blowing in the 1st cent. BC (probably in Syria) wrought great changes in the glass industry, which, hitherto limited to relatively expensive surrogates for luxury goods, now became capable of cheap mass-production, but even then the most highly valued glass was 'colourless and transparent, as closely as possible resembling rock crystal' (Plin. *HN* 36. 198). Glass was used in the home and for funerary furniture. Glass-works have been located in many provinces, but in the later western empire, Belgic Gaul and Germany had taken the place of Italy and southern Gaul. Even Britain had some glass-works. The vessels, even when plain, show much variety of form, and there are several styles of decoration—tooling or applying relief ornament to the surface when warm, cutting or engraving or painting when cold. Window glass, made by a primitive process of rolling, was known at *Pompeii, and later became common; in the later empire also begins the use of glass for mirrors. Gemstones were imitated in glass paste at all periods from the 7th cent. BC onwards (*see* GEMS). Burning-glasses were used, and these may conceivably have been used as magnifying glasses by gem engravers; spectacles were unknown. FNP/MV

glass A selection of Roman glassware. The invention of glass-blowing (1st cent. BC) allowed the cheap mass-production of what formerly had been a relatively expensive product. © The Trustees of the British Museum

Gordian III (Marcus Antonius Gordianus), grandson of Gordian I by a daughter, was forced on Balbinus and Pupienus as their Caesar and, after their murder (mid- AD 238), saluted emperor by the praetorians at the age of 13. The conduct of affairs was at first in the hands of his backers but, as fiscal and military difficulties increased, it passed to the praetorian prefect Gaius Furius Sabinus Aquila Timesitheus (241). Timesitheus prepared a major campaign against Persia which, beginning in 242, achieved substantial success before his death, by illness, in 243. Gordian replaced Timesitheus with one of the latter's protégés, Marcus Iulius Philippus, who continued the war. However, the Roman army suffered defeat near Ctesiphon, and shortly afterwards Gordian died of his wounds (early 244). He was succeeded by Philippus.

Though the period of the Gordians shows some of the characteristics of the 3rd-cent. 'crisis', it is best interpreted as a reversion to the Severan monarchy after the aberrance of Maximinus. JFDR

Gorgias, of Leontini (c.485–c.380 BC), one of the most influential of the *sophists, important both as a thinker and as a stylist. He is said to have been a pupil of Empedocles; his visit to Athens as an ambassador in 427 is traditionally seen as a landmark in the history of rhetoric, introducing Sicilian techniques into the Athenian tradition of oratory (see RHETORIC, GREEK). However this may be, his stylistic influence was enormous. The extant *Encomium of Helen* and *Defence of Palamedes*, as well as the fragment of his *Epitaphius* (DK 82 B 6), illustrate clearly the seductions of his antithetical manner, with its balancing clauses, rhymes, and assonances: antithesis, homoeoteleuton, and parisosis became known as the 'Gorgianic figures'. There is a wonderful parody of the style in Agathon's speech in *Plato's *Symposium* (194e–197e). At the same time, these speeches also contain serious reflection on the power of words (λόγος) and on moral responsibility. We also possess summaries of a philosophical work (Sext. Emp. *Math.* 7. 65 ff. = DK 82 B 3), and *On Melissus, Xenophanes and Gorgias* (preserved among the works of *Aristotle, 974^a–980^b Bekker). From these, it is apparent that Gorgias argued that 'nothing is', and even if anything is, it cannot be known, or indicated by one person to another. How serious these sceptical arguments were has been much debated. DAR

Gracchus, Gaius (Gaius Sempronius Gracchus), younger brother of Tiberius *Gracchus, served under his cousin and brother-in-law *Scipio Aemilianus at Numantia. A member of his brother's land commission, he supported the plans of Marcus Fulvius Flaccus in 126 BC, then went to Sardinia as quaestor. Returning before his

commander in 124, he was accused before the censors but acquitted, and elected tribune for 123 and again for 122, when he was joined by Flaccus, by then *consularis* and *triumphalis*. After laws meant to avenge his brother and secure himself against a similar fate, he embarked on a programme of reform, aided by friendly colleagues. The most important measures were: (1) a *lex frumentaria* (corn law) assuring citizens of wheat, normally at a subsidized price; (2) laws providing for the resumption of land distribution and the foundation of colonies, including one on the ritually cursed site of *Carthage, which Gracchus himself, as commissioner, helped to establish; (3) laws regulating army service and providing for public works—all these to gain the support of the plebs and relieve poverty and exploitation; (4) a law to have the *decuma* (grain tax) of the new province of Asia sold by the censors in Rome; (5) laws (probably two) regulating *repetundae* (provincial extortion) trials, the second (passed by Manius Acilius Glabrio) introducing elements of criminal procedure and taking juries from the **equites*—these to protect provincials from magistrates' rapacity, to secure the treasury's major revenue against speculation, and to set up members of the non-political class to control politicians; (6) a law to make the senate's designation of consular provinces immune to tribunician veto and to have it before the elections—this to remove the most important administrative decision of the year from personal prejudice. This law shows how far he was from being a 'democrat'.

Finally, in 122, he proposed to offer citizenship to Latins and Latin status to Italian allies, both to protect them from the excesses of Roman magistrates and to make them subject to his brother's agrarian law. The law was opposed by Gaius Fannius, whom he had supported for the consulship, and by Marcus Livius Drusus, who outbid him with an unrealistic colonial programme. It was defeated, and Gracchus was not re-elected. In 121, with his legislation under attack, Gracchus, supported by Flaccus, resorted to armed insurrection. It was suppressed after the first use of the so-called *senatus consultum ultimum* (a declaration of emergency); they and many of their supporters were killed, others executed after arrest.

Gaius Gracchus had more ambitious plans than his brother, whose memory he revered. He saw the need for major administrative reforms. A proud aristocrat, he wanted to leave the Senate in charge of directing policy and the magistrates in charge of its execution, subject to constitutional checks and removed from financial temptation, with the people sharing in the profits of empire without excessive exploitation of the subjects. The ultimate result of his legislation was to set up the **publicani*

as a new exploiting class, not restrained by a tradition of service or by accountability at law. But this did not become clear for a generation, and he cannot be blamed for not foreseeing it. EB

Gracchus, Tiberius (Tiberius Sempronius Gracchus), elder brother of Gaius *Gracchus and son of another Tiberius Sempronius Gracchus (consul 177) and of Cornelia (daughter of *Scipio Africanus), served at Carthage under his cousin *Scipio Aemilianus, who married his sister. As quaestor in Spain (137 BC), he used his father's connections to save the army of Gaius Hostilius Mancinus by a treaty later disowned by the senate on Scipio's motion. Thus attacked in his *fides*, he joined a group hostile to Scipio: his father-in-law Appius Claudius Pulcher, *princeps senatus* (designated senior senator) and augur; the consul for 133 Publius Mucius Scaevola and his brother Publius Licinius Crassus Dives Mucianus, both eminent lawyers and *pontifices* (see PRIESTS (GREEK AND ROMAN)). As tribune 133, in Scipio's absence, he proposed, with their aid and advice, a law designed to solve Rome's interlocking problems: departure or expulsion of small landowners from their properties, leading to insuperable difficulties in recruiting armies; danger from increasing numbers of slaves; and lack of an assured food supply for the capital. The law reaffirmed the long-ignored limit of 500 *iugera* (c.135 ha.) of arable public land per person and instituted a commission (to which he, his brother Gaius and his father-in-law were ultimately elected) to find and confiscate surplus land and distribute it in small lots to poor citizens. A compromise offering 250 additional *iugera* for each child was withdrawn when it failed to secure his opponents' acceptance of the law. Following good precedent and with his eminent supporters' approval, he submitted the law to the *plebs without previous discussion in the senate. It was vetoed by M. Octavius, taken to the senate for adjudication, and rejected. Gracchus none the less resubmitted it, and Octavius persisted in his veto, both contrary to *mos maiorum* (ancestral custom). To end the unprecedented impasse Gracchus had Octavius removed from office—again an unprecedented step, but without objection by the other tribunes, who did not veto it. When Pergamene envoys brought news of Attalus III of *Pergamum's death and will, leaving his estate to Rome, Gracchus (with whom they probably stayed owing to his father's *hospitium* (see FRIENDSHIP, RITUALIZED) with the dynasty) proposed to prejudge the issue of acceptance, ignoring the senate's traditional right to guide foreign affairs, and to distribute Attalus' property to Roman citizens, perhaps as equipment grants for his new allotment-holders.

He next sought re-election, to escape certain conviction on charges of *perduellio* (activity hostile to the state). This last unprecedented step alienated earlier supporters and increased fear of tyranny among opponents. When the consul Scaevola refused to stop him by force, the *pontifex maximus* (see PRIESTS (GREEK AND ROMAN)) Publius Cornelius Scipio Nasica Serapio led a mob of senators and their clients 'to save the Republic'. Gracchus and many of his supporters were killed on the Capitol, others were later punished by a commission under Publius Popillius Laenas, consul 132. The land commission, however, continued unimpeded until 129.

His tribunate marks the beginning of 'the Roman Revolution': the introduction of murder into politics and the breakdown of Concordia (the tradition of not pushing legal powers to extremes) on which the republic was based. See also AGRARIAN LAWS AND POLICY. EB

Greece (geography) (see ◀ Map 1 ▶) Greece with the Aegean basin is part of the great mountain zone running from the Alps to the Himalayas. For 70 million years the land mass of Africa has been burrowing irresistibly under Europe. This mighty force has displaced, shattered, crumpled, and stretched the rocks, creating mountain ranges, ocean trenches, gorges, and upland basins. The Cretan island arc displays one of Europe's most dramatic changes of level, from the Hellenic trench, 4,335 m. (14,222 ft.) deep, immediately to the south, to peaks up to 2,456 m. (8,058 ft.) high on *Crete itself. Northward lies the Cycladic chain of volcanoes, from Nisyros through Santorini (Thera) and Melos to Methana, the volcano within sight of Athens. Mainland mountains range from Taygetus (2,407 m.: 7,897 ft.) in the south through Parnassus (2,457 m.: 8,061 ft.) to Olympus in the north, at 2,917 m. (9,570 ft.) the highest peak in modern Greece. Mountain-building continues, as shown by frequent *earthquakes in ancient and modern Greece.

The geology is very varied. Most of the higher mountains are of hard limestone, but there are also phyllites, gneisses, granites, serpentines, and volcanic rocks. Softer marls, sandstones, and clays, occurring at lower altitudes, were laid down during periods of submergence later in geological history.

Erosion has gone on since the mountains began to form: whole mountain ranges have been carried away and their remains deposited to form new rocks. It was particularly active during the ice ages, 2 million to 12,000 years ago, when there were violent changes of climate (although little development of glaciers). Erosion has created cultivable land in the plains, into which sediments were washed off the hillsides. It continues conspicuously in the Pindus mountains, the northern *Peloponnese,

and *Rhodes; elsewhere, as in Crete, most deposits are strongly consolidated and hold together despite very steep slopes. Erosion has been increased by human activity, but by how much is controversial.

Greece is rather poor in minerals. Clay for pottery comes from particular local sources. Sometimes limestone has been turned into a crystalline form under great pressure; hence the marbles of Paros, Naxos, Thasos, and of Pentelicon in Attica. Small deposits of iron ore are frequent, but tin and most of the copper for making bronze had to be imported. The silver-mines of Laurium were essential to the economy of Athens.

Greece has a sharply seasonal Mediterranean *climate. The winter rainy season (typically October–May) is warm, seldom frosty, and the time of activity and growth. The dry season of summer is hot, rainless, relentlessly sunny, and is the dead season. The mountains intercept rain-bearing depressions, producing a disparity between the wet west of Greece (e.g. Ioannina, 1,195 mm. (47 in.) of rain in an average year) and the dry east (Athens, 384 mm.: 15 in.). The west coast of Asia Minor is again well watered in winter (Smyrna, 719 mm.: 28 in.). Summer temperatures sometimes reach 40°C (104°F), especially inland, but are tolerable because of north winds and dry air. Mountain areas, as in Pindus and Arcadia, are difficult to live in all the year, because there are cold winters as well as dry summers: the growing season is very short, and frost-sensitive crops, especially olives, cannot be grown.

The prehistoric climate, as inferred from pollen cores, had been less arid than today's. How far climate differed in classical times is uncertain. Known fluctuations such as the Little Ice Age (AD 1550–1750) forbid us to assume it as constant. Ancient accounts suggest that it may have been slightly less strongly seasonal than today, with rivers more dependable and snow less rare. The deadly heat of the *kávsoma* (heatwave) in the modern Athenian summer is aggravated by the urban microclimate and air pollution.

Traditional Greek *agriculture, now much in decline, was based on cereals, olives, vines, and herding animals. (New World crops—potato, tomato, tobacco, maize—were unknown in antiquity.) It involved seasonal hard work, ploughing, sowing, picking olives, and tending vines; an unhurried harvest; and long periods of relative leisure.

Inland transport is relatively easy for a mountainous country; it was seldom difficult to make *roads between the fertile basins. Seafaring called for great skill: the coasts are wild and terrible with cliff-bound promontories, razor-edged reefs, and surf-pounded beaches. There were few good harbours, and no tide to help in

getting in or out. Sailors feared the sea in winter, and land travel was then difficult because of flooded fords. See TOURISM. OR

Greece, prehistory and history of (*see following page*)

Greek language

1. Introduction

In the Classical period Greek was spoken in mainland Greece (including the Peloponnese), in the islands of the Aegean (including Crete, Rhodes, and Cyprus), and in the Greek colonies in Asia, Africa, and Italy. It is the European (and Indo-European) language with the longest attested history; the first documents belong to the second half of the second millennium BC and there is no real break between ancient Greek and the modern language of Greece. Most of the evidence from the 8th cent. BC until now is written in the Greek alphabet, but at an early stage two syllabic scripts were also in use: Linear B in the second half of the second millennium rendered the Greek spoken by the exponents of *Mycenaean civilization while during the first millennium BC a distantly related script, syllabic Cypriot, was used for the local dialect of Cyprus and remained in use until the 3rd cent. The language changed in time: conventionally we distinguish an ancient period which goes from the first attestation of Mycenaean Greek (in Linear B) to the end of Hellenistic Greek (roughly in AD 300), a Byzantine and medieval period (until c.1650), and a modern period. Here we concentrate on the central period of ancient Greek in the 5th and 4th cents. BC. After a general account of its development we give a very brief discussion of the main features of the language.

2. Origins

Greek is related to language groups such as Italic, Germanic, Indo-Iranian, Celtic, Slavic, Anatolian, Armenian, Albanian, etc., all of which descend from an unattested parent language (conventionally called Indo-European or IE), which we partially reconstruct through. It is not possible to establish whether Greek belongs to a wider subgroup of IE; the old theory that it was closely related to Latin or Italic has long since been exploded. It shares a number of features with Armenian and Indo-Iranian, but they are not sufficient to define specific subgroups. The ancient belief that the language was autochthonous cannot be accepted; Indo-European speakers must have reached Greece from elsewhere, though the language may have acquired its main characteristics in Greece itself. Some specific features which distinguish ancient Greek from the Indo-European parent language are listed below.

[*continued on p. 347*]

PREHISTORY AND HISTORY OF GREECE

Greece, prehistory and history of (See ◀Map 1▶)

Stone age

The stone age is divided into the palaeolithic (to c.9000 BC), mesolithic (c.9000–7000 BC) and neolithic (7th–4th millennia BC); metallurgy began during the neolithic, before the conventional neolithic–bronze age transition.

Classical Greece was an essentially agricultural society and as such can trace its origins back to the first farming communities in Greece in the early neolithic (7th millennium BC). Some at least of the domestic livestock and crop species were introduced from the near east, but Greece had long been occupied by palaeolithic and mesolithic gatherer-hunters (e.g. at Franchthi cave, Argolid). It is unclear whether the first farmers were of indigenous, immigrant or mixed stock. Known early farming settlements (e.g. Argissa) are heavily concentrated in the fertile lowlands of the eastern mainland, particularly in *Thessaly. The southern mainland and smaller Aegean islands, the heartland of both bronze age palatial civilization and the classical *polis, were not widely colonized by farmers until the later neolithic and early bronze age (5th–3rd millennia BC). The earliest farmers laid the biological foundations of classical agriculture, growing a range of cereal and pulse crops and keeping sheep, goats, cattle, and pigs. The vine was a significant resource (possibly cultivated) by c.5000 BC, but systematic use of the *olive and the introduction of the horse and donkey are not attested until the bronze age. There is no evidence for the plough in neolithic Greece, and early farming may have resembled the intensive 'horticulture' and small-scale stock-rearing still practised in some hill-villages, rather than the extensive agriculture and specialized *pastoralism which dominate the present landscape and, to some extent, the ancient sources. Neolithic subsistence was probably based on grain crops, with livestock most important as an alternative food source after crop failure. Farmers introduced fallow deer to many islands, making hunting a viable option, but the principal mechanisms for coping with the risk of crop failure in the arid south-east of Greece were social. Field surveys indicate that early farmers lived in small village communities. Excavations at sites such as Sesklo and Nea Nikomedeia have shown that the basic residential and economic unit was a family household, but houses were crowded close together and cooking facilities were located outdoors, ensuring social pressure to share cooked food. In the colonization of agriculturally marginal regions, sharing with close neighbours will have been less effective as a defence against local crop failure. Here a dispersed pattern of 'hamlet' settlements developed, with greater emphasis on distant social ties. Distant social contacts are more difficult to cultivate than close neighbours but are potentially more effective as a source of hospitality in the event of local crop failure. Early neolithic communities were probably egalitarian in the sense that there was no inequality independent of age, gender, and ability. Villages rarely grew to a size demanding institutionalized authority to maintain order. In some late neolithic (6th-millennium BC) villages (e.g. Dimini), however, a central house was segregated within a large courtyard and probably housed some sort of community leader. From the final neolithic (5th millennium BC) onwards, settlements frequently exceeded the organizational limits of egalitarian society. The economic isolation of the family household was now reinforced by moving cooking facilities into an internal 'kitchen' (as at Sitagroi) or walled yard (as at Pevkakia), suggesting that sharing between neighbours had given way to centrally controlled redistribution. By the end of the neolithic, with consolidation of the domestic mode of production and the attendant struggle between household self-sufficiency and indebted dependence on a wider community, the most basic elements of classical rural society may already have been in place.

PH

Bronze age

Viewed at its broadest, the history of bronze age Greece seems a cyclical alternation between periods of expansion, fuelled by increasingly intensive exploitation of the land and involvement in overseas exchange, and contraction to a more nearly self-sufficient 'village' level. While warfare and population movement may have been additional contributory factors in periods of decline, they are unlikely to have played a very significant role; in particular, there is no good evidence that a 'coming of the Greeks' (at whatever date this is placed) had a very marked impact. Rather, the most significant development was the establishment of the *Minoan civilization of Crete, which evidently did not use the Greek language, but had an essential formative influence on the *Mycenaean civilization, which evidently did, at least

Greece, prehistory and history of The battle of Salamis between the Persian and Greek fleets (480 BC) was fought in the straits between the island of Salamis (foreground) and the Athenian mainland to the east. What actually happened is obscure, but the Persian fleet was defeated and soon afterwards withdrew to Asia Minor. © 1989 Loyola University of Chicago. Photo: R.V. Schoder, S.J.

in its core region, the southern mainland. The effective domination of the Aegean by Mycenaean civilization from the 14th cent. BC onwards marks a step towards the creation of 'Greece'; but the development of many characteristic features of later Greek civilization was a very complex process, much of which took place after the bronze age (e.g., for the most typical form of religious *sacrifice, N. Marinatos and B. Bergquist, in R. Hägg, N. Marinatos, and G. Nordquist, *Early Greek Cult Practice* (1988)).

Obviously this is very different from the picture of early Greece that *Thucydides built up (1. 1–20) from analysis of his only available source, the legendary traditions; these gave no suggestion of the length of that past, the long-term stability of the agricultural economy, the importance of exchange, the high level of social organization in the palace societies, or the very existence of 'pre-Greek' civilizations. This is hardly surprising, for to judge from other cultures the primary purpose of such traditions is not the transmission of factual information but the validation of claims to territory and status (*see ORALITY*), and they can only too readily be tampered with, as in the historical period in Greece. The most vivid elements in the traditional material, the Homeric epics, belong to a genre that cannot be expected to offer a wholly realistic picture of life; but where their setting is realistic, it is becoming increasingly apparent that, while incorporating late bronze age details, it has much more to do with the early iron age. OTPKD

Archaic, classical, Hellenistic

'Dark Ages'

(c.1100–776 BC). The period after the Mycenaean collapse and before the 8th-cent. BC renaissance is traditionally regarded and described as the Dark Age of Greece. For several centuries after the disappearance of Linear B, writing ceases to be a category of evidence, and the only other source of information, archaeology, shows that contact even between closely neighbouring communities sank (e.g. in Attica) to low levels. But this picture has been modified by

brilliant 10th-cent. finds at *Lefkandi on Euboea, attesting eastern connections and memories of a Mycenaean past. The Dark Age of Greece should not, in fact, be seen entirely negatively, but as an exploratory period in which Greece itself was gradually resettled by pioneers (the prime instance is Attica: *see* ATHENS (HISTORY)), and in which Greeks settled areas like Ionia for the first time. But the word colonization, which implies a central organizing authority, is not yet appropriate for this sort of tentative internal expansion and haphazard overseas movement. And the absence of writing had its positive side, the creation in an originally oral mode of the great epics of *Homer, the *Iliad* and *Odyssey*.

Archaic age

(776–479 BC). The conventional date for the beginning of the historical period of Greece is 776 BC, the date of the first Olympic Games on the reckoning of Hippias of Elis. This is probably not too far out for the event in question; but the early 8th cent. was a turning of the page in several other ways as well. Iron began to be worked with new sophistication; the alphabet was taken over from the east; and colonies began to be sent out in a more organized way (*see* COLONIZATION, GREEK), above all from Euboea, which between 750 and 730 colonized Cumae and Pithecusae in the west and was involved in Al Mina in the east. The 8th cent. was also the age of *polis formation and political *synoecism, perhaps themselves a result, in part, of the colonizing movement, but also of the rise of religious leagues or amphictionies. (Religious factors have certainly been urged in recent years by students of the emergent polis: it has been remarked that polis formation was marked by the placing of *sanctuaries, often and for no obvious reason dedicated to *Hera, at the edge of polis territory.) Some of all this, not just writing, but perhaps even the idea of the self-determining polis community, may actually be Phoenician not Greek in inspiration, and there was a famous and perhaps influential early first-millennium amphictiony of Israel. But whatever the truth about Semitic primacy, early Greek society soon acquired distinctive features and institutions, most of which continued to be important in Classical times and later. Among these were athletics and religiously based athletic events like the Olympian Games, already mentioned (*see* GAMES); the *gymnasium which provided training for both athletics and its elder brother, warfare; the *symposium, at which aristocratic values were inculcated; and *homosexuality, which was related to all the other phenomena just mentioned. Some other characteristic features of Greek society are more easily paralleled elsewhere, e.g. ritualized *friendship; but institutionalized proxeny, which developed out of this, was specifically Greek: this was a system of the diplomatic representation of state x in state y by nationals of state y .

All this contributed to such shared Greek consciousness as there was (*see* ETHNICITY; NATIONALISM), but the chief way in which early Greek states interacted was through warfare, a paradoxical activity in that in Greece at most periods it was a ritualized, i.e. shared, activity (*see* WARFARE, ATTITUDES TO) but at the same time war is, obviously, an assertion of separateness. Equally the four great Panhellenic ('all-Greek') sanctuaries, *Olympia, *Delphi, Isthmia, Nemea, were a symbol of what Greeks had in common, but they were also a focus for interstate competition exercised in various ways (*see* DELPHI), and constituting an alternative to war; indeed struggles for influence at sanctuaries sometimes developed into wars proper, so-called Sacred Wars. And sanctuaries were the repositories of tithes or tenth-fractions of the *booty which was a reason for and result of warfare; this booty was often turned into dedications, producing a connection between great art and great suffering which was noticed by Jacob Burckhardt.

The first war which can be called in any sense general was the Lelantine War (late 8th cent.) fought by Chalcis and Eretria for control of the plain between them; but each side had allies from further away and links with rival colonial networks have been suspected. But exaggeration on the part of ancient, and anachronism on the part of modern, writers make the truth about this early conflict hard to establish. If there were networks at this time they are less likely to have been firm interstate groupings for purposes of trade or politics than informal systems of aristocratic friendships between entrepreneurial individuals like Sostratus of Aegina, whose prosperous commercial activities in Italy were interestingly illuminated by archaeology and epigraphy in the 1970s.

Commercial and economic prosperity on the one hand, and individual dynamism on the other, combined on *Thucydides' view (1. 13. 1) to produce *tyranny. There is much to be said for this: colonization and trade were connected, and the combination meant that Greece was exposed to luxuries on a new scale. Until recently, the chief modern explanation for tyranny has been military, in terms of hoplite (heavy-armed infantry) warfare, a partial repudiation of individual aristocratic fighting methods, corresponding to that political repudiation of control by hereditary aristocracies which was the essence of tyranny. A main attraction of this theory seemed to be coincidence of time: the first tyrannies, of Pheidon at Argos and Cypselus at Corinth, can be plausibly put at mid-7th cent., roughly when hoplites

appear (though there is a risk of circularity over the shadowy Pheidon at least). But Thucydides knows nothing of a link between tyranny and hoplites, though he had thought hard about both (see 5. 71.1 for hoplite fighting); and the theory is vulnerable in other ways too. Thus it may be better to suppose that hoplite fighting spread only gradually and may even have reached its developed form as late as the Persian Wars.

Two states which did not have tyrannies in this first phase are *Sparta and *Athens, indeed Sparta famously avoided tyranny until Hellenistic times. Sparta was remarkable in other ways also, for instance by not sending out many colonies in the historical period (with the important exception of Tarentum, Greek Taras, in south Italy) but above all in having annexed its next-door neighbour Messenia in the later 8th cent. The inhabitants were turned into state slaves or helots. Other neighbours of Sparta became *perioikoi*, a subordinate status to which some communities of Laconia also belonged. Sparta later became a tight and repressive place, but Archaic Sparta guaranteed political power to the *damos* or people—meaning perhaps only the class of hoplite fighters—at an impressively early date (?7th cent.) when *democracy elsewhere was still in the future. But the political momentum at Sparta was lost, partly through the need to hold down Messenia and the helots; this in turn called for the strict *agōgē* (the public upbringing of Spartan boys). Simple infantry strength enabled Sparta to coerce much of the *Peloponnese by the later 6th cent., though propaganda also helped, the deliberate muting of Sparta's unpopular Dorian aspect.

Athens was also unusual among Greek states, above all in the size of its directly controlled territory, Attica, its natural assets (including a supply of silver), and its physical suitability for a naval role (see ATHENS (HISTORY)). Athens, like Sparta, avoided tyranny in the 7th cent., but unlike Sparta, Athens did experience an attempt at one at this time, the failed coup of Cylon c.630. But a generation later *Solon's reforms (594) both resembled and circumvented—for the moment—tyrannical, anti-aristocratic solutions carried out elsewhere. His creation of a new *boulē* (council) of 400 members was an important move towards democracy, as was the opening of high political office on criteria of wealth not birth; but even more crucial was abolition of the demeaning if not always economically crippling status of hectemorage (the payment of one sixth of agricultural produce). Indirect but important consequences of this abolition were the development of a self-conscious citizen élite (see CITIZENSHIP, GREEK) and the related rise of chattel-*slavery. Solon also permitted appeal to the *dikastērion* (see DEMOCRACY, ATHENIAN; LAW AND PROCEDURE, ATHENIAN), and legislated in the social sphere; but some of the detailed traditions about his economic reforms are suspect because they imply the existence of *coinage, which in fact begins in the middle of the 6th cent., too late to be relevant to developments at the beginning of it (though accumulation of gold and silver may well be relevant, cf. above on the effects of colonization).

Solon's reforms were critical for the longer-term development of Athens and indeed Greece, but in the short term they were a failure because Athens did after all succumb, for much of the second half of the 6th cent., to a tyranny, that of *Pisistratus and his sons Hippias and Hipparchus. Under these rulers, Athenian naval power was built up, a vigorous foreign policy pursued, splendid buildings erected, and roads built. But the tyrants were driven out in 510 and *Cleisthenes reformed the Athenian constitution in a democratic direction in 508/7.

Meanwhile Achaemenid *Persia had been expanding since *Cyrus the Great overthrew Croesus in 546, and the new power had begun to encroach on the freedom of the East Greeks in Ionia and even islands like *Samos. The Athenians, like other mainland Greeks, were insulated from immediate danger by their distance from geographical Ionia, but they were in the racial and religious senses Ionians too, and when in 499 the *Ionian Revolt broke out, itself perhaps the result of restlessness induced by awareness of Cleisthenes' democratic reforms, Athens sent help to the rebels, who, however, were defeated at Lade (494).

How far this help provoked the Persian Wars, by drawing *Darius I's vengeful attention to Athens, and how far they were simply an inevitable consequence of Persian dynamism, is not clear from the account of our main source *Herodotus. A first expedition led by Datis and Artaphernes failed at the battle of Marathon, in Attica (490); then at the battles of Thermopylae, Artemisium, Salamis (all 480), and Plataea (479) a far larger Persian invasion by *Xerxes was beaten back. The Greek successes of the Persian Wars were of enormous importance in conditioning Greek attitudes to themselves, to each other, and to the '*barbarian' (as Persians were now more aggressively defined), for centuries to come. The victories were immediately commemorated by state dedications in the great sanctuaries (see DELPHI; OLYMPIA), except that Nemea got no big dedication. Poetry by *Aeschylus and *Simonides, and the prose of Herodotus, signalled the Great Event in literature, as did buildings on the Athenian acropolis; only *Thucydides and his speakers show some impatience with the theme.

The pentekontaetia

(c. 50-year period 480–430 BC). In the west (Italy and Sicily), the Greek states shared the culture of their *métropoleis* in Greece itself (see esp. OLYMPIA), but there were differences. Here Greeks (like North African *Cyrene with its Berber neighbours) always had to live alongside non-Greeks, both relatively small-scale but vigorous indigenous groups like Messapians in the hinterland of Taras (Tarentum), and great powers like *Etruscans in central Italy, or *Carthage whose base was in North Africa but which had outposts in Sicily. Herodotus (7.170) reports a huge massacre of Tarentines by Messapians c.475 and this threat conditioned much of Tarentine history for centuries. And at Himera and Cumae the western Greeks under their tyrants Gelon and Hieron defeated Carthage and the Etruscans in battles which contemporaries compared to the high points of the Persian Wars. But inter-Greek tensions were no less acute: Croton and Locri (Epizephyrii) fought a great Archaic battle at the Sagra river, and when Thurii in the mid-5th cent. replaced Archaic Sybaris, destroyed in 508, it soon found itself at war with neighbouring Taras. But more peaceful developments were possible, as at Elea, where a medical school connected with the cult of *Apollo 'Ouliades' flourished from the 5th cent. BC to Roman times; Parmenides was involved with it. Athenian and Peloponnesian interest in the west was always lively, partly for grain and partly for shipbuilding *timber from south Italy; but partly also because ties of *kinship (*syngeneia*) between colonies and *métropoleis* were taken seriously.

The great struggle of the 5th cent. was between Athenians and the Peloponnesians led by Sparta. The germs of this are detectable even in the Persian Wars, and when the Athenians took over the leadership of Greece in 487 (see DELIAN LEAGUE), Sparta's response was mixed. But Sparta, despite having crushed for the moment the perennially ambitious rival Argos in 494, had internal problems in the Peloponnese and, for several years from the mid-460s, difficulties with the helots to cope with. So stretched were the Spartans that they invited the Athenians in to help them against the helots, but the Athenian democracy moved on a step in just this period (the reforms of Ephialtes) and the Athenians under Cimon were dismissed from Sparta. Sparta's troubles meant that the Athenian empire was able to expand without check from the Greek side until the end of the 460s and the outbreak of the First Peloponnesian War (460–446), when Sparta did, as often in its history, take some action to protect or further its interests (including religious) in central Greece. So far from curbing Athenian expansion, that war saw Athenian influence rise to its maximum extent: for over ten years after the battle of Tanagra Athens even controlled Boeotia (457–446). It may be that the take-over was possible because Athens capitalized on *stasis* (civic dissension) inside the cities of Boeotia. (Throughout Classical Greek history there was a risk that *stasis* would open the door to outside interference. But Thucydides may be right to link it particularly with the period introduced by the main Peloponnesian War: in the *pentekontaetia* a degree of stability was guaranteed by the existence of two power blocs: contrast the post-431 period and the 4th cent.) Democratic Athens did not however insist on democracy in Boeotia, allegedly permitting oligarchies instead; nor is it certain that the Boeotian Confederacy ceased to exist in the Athenian period, although Athens' departure in 446 may have led to a federal reorganization.

Despite preoccupations in Greece, Athens in this period continued the struggle against Persia which was the ostensible purpose of the Delian League; but after the Eurymedon victory of 466 a preliminary 'peace of Callias' may have been made. A great Athenian expedition against Persia in Egypt in the 450s failed utterly, and in 450 the main Callias peace was made, though this is controversial. Thereafter, until 413, Athens and Persia were in a state of uneasy peace.

The Peloponnesian War

The First Peloponnesian War ended with the Thirty Years Peace of 446, and this instrument regulated Athenian–Spartan relations until the great Peloponnesian War of 431–404. The Archidamian War, ended by the Peace of *Nicias, failed to achieve the Peloponnesian objective of 'liberating' Greece, i.e. breaking up the Athenian empire. *Propaganda, such as the exploiting of sanctuaries like Delphi and Ionian *Delos, was as much a weapon as open fighting. Athenian exuberance climbed to its highest level in 415, when the Sicilian expedition was launched, to end in catastrophe two years later. Persia re-entered the picture in 413, an important moment because it introduced a long phase of Greek history, ending only with *Alexander the Great, in which Persia's voice would often be decisive. As Athens and Sparta wore each other down, other emergent powers like *Macedonia, itself destined to overthrow Persia eventually, grew in resources and self-confidence, especially under the strong rule of Archelaus; and Thebes, another 4th-cent. giant, profited from the war, notably by annexing Plataea in 427. Small states tried to protect their territorial integrity by allying with the strongest and closest power of the moment.

The Fourth Century

The end of the war in 404 coincided with another equally momentous event, the establishment in power of *Dionysius I in Sicily, the prototype for many a 4th-cent. and Hellenistic strong man: tyranny, in fact, revives. Even in conservative Sparta there are traces of personality cult, detectable in *Lysander's victory monument at Delphi for the final victory at Aegospotami. And he got cult at *Samos. (see RULER-CULT (GREEK).)

Lysander's methods were harsh, and Spartan aggression in this period led, startlingly soon after the end of the Peloponnesian War, to the outbreak of the anti-Spartan Corinthian War, ended by the King's Peace. This curtailed Sparta's activities in Asia Minor (of which the most famous episode was the *Anabasis* or Persian expedition of *Xenophon and the Ten Thousand, in its initial phase a covertly Spartan operation to replace Artaxerxes II by his brother Cyrus the Younger). But the price of eliminating Sparta was surrender of the region to Persia, and a general Greek political retreat east of the Aegean. However over the next 50 years cultural *Hellenism advanced, alongside Persian and indigenous culture, through activity by e.g. the Carian satrap Mausolus.

Much strengthened in Greece by the King's Peace, Sparta proceeded to fresh aggressions in north and central Greece, always a tendency when domestic or other preoccupations permitted. Sparta's coercion of Olynthus aroused no general protest but the occupation of the Cadmea (acropolis) of Thebes in 382 shocked and alarmed Greek opinion, and in 379 Thebes was liberated with Athenian help. Thebes and other places now joined a Second Athenian Confederacy (378). But as Thebes' power itself grew, especially after it defeated Sparta at the battle of Leuctra (371), Athens and Sparta found themselves driven together in the 360s when Thebes tried to usurp Athens' position at sea and (with more success) to weaken Sparta in the Peloponnese by founding Arcadian Megalopolis and reconstituting Messenia after centuries and equipping it with a new physical centre, the city of Messene.

*Philip II of Macedon succeeded to a politically weak but economically strong Macedon in 359, which he rapidly strengthened further at the expense of all his neighbours, Greeks included. The story of Athens' diplomatic relations with him is intricate (see DEMOSTHENES); features of the Peace of Philocrates may indicate that he planned a Persian invasion as early as 346, but he was obliged to defeat the Greeks at the battle of Chaeronea in 338 before the expedition could start. In the event he was assassinated in 336. Alexander, his son, carried the project through (334–323) in a whirlwind campaign which took him to Egypt, Persia, Afghanistan, India, and the Persian Gulf. For the campaigns, see *Alexander the Great. The city-foundations of Alexander (see ALEXANDRIA) are the most important part of his legacy but hard to estimate in detail: archaeological evidence is spectacular (see AI KHANOUM) but patchy, and the literary record is contaminated by rivalries between Seleucids and Ptolemies (see below).

Hellenistic period

(323–31 BC). After Alexander died aged 32 there was never much chance that the unity (*τὰ ὅλα*) of his improvised empire would be perpetuated by any one of his Successors (the 'Diadochi')—the name given not to an orderly sequence of post-Alexander rulers (they adopted the title 'king' in a rush in 306) but to a whole clutch of his former marshals, controlling different areas but at overlapping times. The 'satrapies' were distributed at Babylon in 323 and again at Triparadeisus in 320; another arrangement was reached in 311. The generation after Alexander's death is full of complex military and political history, recorded by *Hieronymus of Cardia, who described the Successors' attempts to acquire as much 'spear-won territory' as possible, while mouthing slogans about the 'freedom of the Greeks' (see FREEDOM IN THE ANCIENT WORLD); the closest any of them got to a dominant position was *Antigonus the One-eyed (helped by his son Demetrius Poliorcetes ('the Besieger')), but his desire to reconstruct Alexander's empire is not certain and anyway he was killed at Ipsus in 301. This battle and Corupedium (281), where Seleucus defeated *Lysimachus of Thrace, determined that Asia would be Seleucid, though Lysimachus' defeat also led indirectly to the emergence of an important minor kingdom, that of the Pergamene Attalids. See PERGAMUM.

The first and longest-lasting Successor empire to establish itself was that of the Ptolemies (see PTOLEMY I) in Egypt, partly because its physical base was self-contained and hard to strike at. But Ptolemaic foreign policy was not insular or pacific; the dynasty had overseas possessions such as *Cyprus and *Crete, exercised hegemonical policies in Greece and the Aegean, and fought six Syrian wars in the Hellenistic age against the *Seleucids, the most spectacularly successful of all the Successor rulers.

Seleucid methods owe much to Achaemenid Persia, but were innovative too; but as with Alexander, the difficulty of assessing Seleucid urbanization is particularly tantalizing (the Ptolemies founded only one Greek city in Egypt, Ptolemais Hermiou). Some recent writers urge that Mesopotamia as opposed to Anatolia or Syria was the engine-room of Seleucid power, and claim that Babylonian and other non-Greek elements in Seleucid culture played a prime

role; others remind us that the Seleucids were always conscious of their Macedonian origins. Evidence from epigraphy (inscriptions) continues to emerge, and to shed light on these topics. Macedon itself was much fought over and partitioned: at different times it was subject not only to Demetrius Poliorcetes, but to Cassander, Lysimachus, and *Pyrrhus of Epirus. Not until after 276 did Demetrius' son *Antigonus Gonatas consolidate the kingdom properly. Thereafter under the Antigonid rulers (Antigonus Doseon; Demetrius II; Philip V) Macedon reverted to something like its historical role as it had been before it ballooned under Alexander, though older conceptions of an essentially Macedonian kingdom, supporting its supporters in Greece, have had to be modified in the light of new evidence from Labraunda in Caria for 3rd-cent. Antigonid activity in the area.

In Greece itself a major development of the age (already adumbrated in the 4th cent.) was the further development of federations or leagues (*see* FEDERAL STATES), not just the old-established Boeotian Confederacy, but the Arcadian (with its centre at Megalopolis), the Achaean and the Aetolian, which controlled Delphi for much of the 3rd cent. Sparta's history continues to be distinctive: it stayed out of the Achaean Confederacy until the 190s. Social problems were more acute here than elsewhere, but not different in kind.

Rome made its first decisive eastern intervention in 229, the first Illyrian War; but significant contacts, e.g. with Egypt, antedate this. Philip V's alliance with *Hannibal meant that there would certainly be an eventual Roman reckoning with Macedon, and Philip was defeated in 197 at Cynoscephalae and his son Perseus at Pydna in 168, after which Macedon was divided into four republics. Meanwhile the Seleucid *Antiochus III had been defeated at the battle of Magnesia in 190, though the resulting Peace of Apamea was an amputation not a death: Seleucid power in the east was unaffected (at least until the defeat of Antiochus VII Sidetes by the Parthians in 129), nor should the rise of new splinter kingdoms and states in *Bactria and Judaea, for example, be straightforwardly taken as indicating terminal Seleucid decline.

The Achaean Confederacy rose against Rome in 146 and was smashing defeated; Corinth was destroyed. SH

Roman

After 146 BC Rome supervised Greece through the governors of Macedonia; a separate province called Achaia was first created in 46 BC. Parts of Greece supported *Mithradates VI in 88 BC, *Athens with enthusiasm, and suffered accordingly in Sulla's campaigns; the earliest evidence for regular Roman taxation follows. Until Actium Greece remained a theatre for Roman warfare, piratical and civil, imposing heavy demands on her cities, sometimes met with difficulty, as at Gytheum in 71 BC (*Syll.*³ 748 = Sherk, *Augustus* 74). In the early Principate, with Roman *philhellenism conferring few tangible benefits, the mainland Greeks at first remained—with the notable exception of *Sparta—reluctant subjects; there was unrest at Augustan Athens, and the imperial cult in Greece shows a retarded development, with no supra-city collaboration on record before *Nero. Reconciliation was hardly advanced by the colonial foundations of Caesar at Corinth and Augustus at Patrae and *Nicomolis, the last two accompanied by enforced movements of local populations and cults, or by Rome's proprietary attitude to Greece's heritage, evinced by imperial projects to translate works of art and even a whole cult (*Eleusis) to Rome (*Suet. Calig.* 22; *Claud.* 25). Nero's short-lived restoration of Greece's autonomy in AD 66 (date: T. Barnes, *JRA* 1989, 252–3), in spite of causing local hardship (*IG* 4². 80–1 = Sherk, *Hadrian* 73), won him some Greek approval. Under Trajan the recruitment of Roman senators from Athens and Sparta advanced Greek political integration; writing at the time, *Plutarch (*Praec. ger. reip.*) counselled resigned acceptance of Roman dominion. *Hadrian conferred benefaction throughout the province; his foundation of the Panhellenion (131/2) promoted an influx of easterners to Greece, among them the travel-writer *Pausanias. In the later 2nd and early 3rd cents. Greece flourished as a cultural centre (*see* GAMES; SECOND SOPHISTIC). Levels of prosperity varied regionally; ancient writers stress depopulation in Roman Greece, but the archaeological evidence for an emptied countryside down to 200 (S. Alcock, *Graecia Capta* (1993)), rather than merely confirming this picture, may point as well to greater nucleation (i.e. rural villages and migration to urban centres); certainly some cities now prospered, as could a small place like Aedepsus; *tourism was probably a significant source of wealth. The Heruli (267) damaged Athens, prompting Athenian self-defence. In the 4th cent. gradual Christianization wound down traditional cults, although the Panathenaea were still being celebrated *c.*410 (*IG* 2². 3818 with *PLRE* 2 'Plutarchus' 2). In 396 Alaric sacked Corinth, Argos, and Sparta, prompting a wave of defensive building throughout the province. Recent archaeology shows a previously unsuspected prosperity in the 5th–6th cents., down to the Slav invasions (from 582); many basilical churches were built, and the countryside was densely populated. AJSS

3. Dialects

When we speak of Greek we often mean Attic, i.e. the dialect of Athens. Yet from the Mycenaean period until the late Hellenistic period there was no standard Greek language and all cities or regions had different forms of speech, which they transmitted to their colonies. Even Mycenaean is only one of the varieties of second-millennium Greek. These local 'dialects' had equal or similar status and presumably most of them were mutually intelligible. Until the late 4th cent. BC (and often much later) they were used in normal oral intercourse and for written documents, laws, letters, etc. The contemporary inscriptions provide the best evidence for the differences, which encompass phonology, morphology, syntax, and lexicon (e.g. Lesbian *παίσᾱς* 'of all' (fem. sing.), Attic *πάσης*; Lesbian *ἔμμεναι* 'to be', Attic *εἶναι*; Thessalian *αἰ μά κε κίς*, Arcadian *εἰ δ' ἄν τις*, Ionic-Attic *εἰ ἄν δέ τις* 'but if anyone' with a different order of the indefinite pronoun and the potential particle *κε/κα/ἄν* from e.g. Phocian *αἰ δέ τις κα*; West Greek *λε(ί)ω* 'I want', Attic *θέλω*). On the basis of shared features modern scholars classify the various forms of Greek (partly on the model of the ancient grammarians) into groups: Ionic-Attic, Arcado-Cypriot, Aeolic (which includes Lesbian, Boeotian, and Thessalian), Doric (which includes dialects like Laconian, Argolic, etc.), and North-West Greek.

In spite of the absence of a standard language, from the 5th cent. BC at the latest—but probably much earlier—the Greeks thought of themselves as speaking a common language; for Herodotus (8.144) τὸ Ἑλληνικόν ('Hellenism') was based on shared blood, language, customs, and religion. See HELLENISM. Greek was not identified with any of the dialects, but by the early 3rd cent. the Athenians were reproached for behaving as if Greek and Attic were the same thing (Posidippus, fr. 30 KA). In the same period we begin to find that in the local inscriptions the dialect is sometimes replaced by a form of language which is very close to Attic though not identical with it; it is the beginning of the so-called Ionic-Attic *κοινῆ διάλεκτος* (common language), which eventually prevailed and provided Greece with a standard language from which the later dialects developed. By the end of the 2nd cent. BC most local inscriptions were no longer in dialect; in contrast with the many dialects of the earlier colonies, the language brought to Asia and Africa by *Alexander the Great and his Successors was a form of *κοινῆ*. For a brief period other forms of common language, such as the so-called Doric *koina* of Peloponnese, prevailed in certain areas of mainland Greece, but in the end they were all replaced by the *koinῆ* (in the inscriptions at least).

4. Literary Greek

Literary texts too were composed in different dialects but the dialect was mostly determined by the literary genre and its origin rather than by the author's origin. *Hesiod, who spoke Boeotian (an Aeolic dialect), composed hexameters in the same mixed dialect (based on Ionic) as Homer, while *Pindar, also a Boeotian, wrote choral poetry in a very different mixed dialect which included some Doric features. The iambic trimeters of Attic tragedy are written in a very literary Attic heavily influenced by Homer and by Ionic, but the choruses are written in Doric or rather in a literary form of Attic with superimposed Doric features (*μάτηρ* for Attic *μήτηρ* 'mother', etc.). Notice that for the literary dialects we tend to speak, as the grammarians did, of Aeolic, Ionic, and Doric rather than of Thessalian, Euboean, Cretan, and the like (Attic and Lesbian are exceptions), since the dialect used does not normally show features specific to a town or locality: it is more a generic colouring.

The history of literary Greek starts with *Homer, i.e. with a poetic language which, because of the various stages of its formulaic development, is remote from the language of normal conversation and under an Ionic patina includes both late and early features as well as features of different dialects: Mycenaean, Aeolic, Ionic. Because of its cultural importance and its wide diffusion epic poetry provided a common linguistic ground for a linguistically divided culture; in spite of its Ionic colouring the epic language is used for Tyrtaeus' elegiac poetry which exhorted the Doric Spartans to war and for the verses of the oracle at Delphi, a North-West Greek city. The risk was that the prestige and all-pervading influence of the epic language might have led to the fossilization of all literary language. Yet the dialects—and the way in which they were tied to different literary genres—provided a source for linguistic renewal. Elegiac poetry was composed in epic language but some forms of it were in a more or less purified form of Ionic. We have melic poetry in Lesbian (*Sappho and *Alcaeus), Ionic (*Anacreon) and even Boeotian (Corinna, though we are uncertain about the date); in these texts we observe not only the phonology and morphology of the various dialects but presumably also some new lexicon and the characteristics of a simpler style. Iambic and trochaic verses favoured Ionic and we find in Hipponax' poetry, for instance, a rich vocabulary full of colloquialisms and of foreign words; *Archilochus too comes much closer to the language of conversation than Homer. Comedy, which can be in Attic but also in Doric, allows colloquialisms not tolerated in tragedy. Yet the multiplicity of literary dialects also leads to new forms of artificiality. The language of choral poetry

is a mixed language which is characterized by a 'Doric' (i.e. non-Attic-Ionic) patina, but in fact exploits elements of all forms of poetry. The result of so much mixture may be magnificent as in Pindar but may also sound baroque: *Aristophanes's parody of Pindar (*Av.* 941 ff.) makes this clear. Literary prose can, though need not, be closer to conversational language. Its first forms came from Ionia; even a Doric doctor like Hippocrates wrote of medicine in Ionic. Attic literary prose, which started in the 5th cent., shows clear signs of Ionic influence but eventually acquires linguistic forms and a style of its own. We have limited evidence for Doric prose.

In Hellenistic times the use of the literary dialects becomes more artificial; *Theocritus wrote his *Idylls* in epic language, in Doric, and in Aeolic (i.e. Lesbian), a *tour de force* which reflects the learned style of Alexandrian poetry. At a later stage we find deliberate attempts to spurn the *koinē* and to prefer an accurate imitation of Attic. At the same time a prose text like the New Testament shows both Semitic influences and a higher level of colloquial simplicity.

5. Development

The presence of dialects effectively prevents us from treating the development of ancient Greek as a continuous process from Homer (or Mycenaean) to the *koinē*. Yet some changes seem to be widely attested in the Greek-speaking area either because of similar structural forces or because of mutual influences between dialects. In the official or literary language the complexity of sentences increases and the simpler patterns are reserved for the colloquial style or specific rhetorical effects. The article, which is absent from Mycenaean and still vestigial in Homer, is generalized in all dialects and is used to nominalize adjectives, participles, infinitives, and whole sentences. A new abstract and technical vocabulary is created through the use of suffixation (*-ικος*, *-ισμος*, *-μα*, etc.) or of composition. Greek is the one European language in which we can follow the independent creation of an abstract or technical vocabulary; the other languages, Latin included, directly or indirectly exploited Greek as a model or as a source of loan words.

6. Linguistic features

We list here some of the main features of ancient Greek, with special reference to classical Attic.

Phonology

The phonological system of Classical Attic is relatively well known. In the Classical period the vocalic system had five short vowels ([a, e, o, i, y]) written *α, ε, ο, ι, υ* and seven long vowels ([a:, ε:, e:, ο:, ο:, ι:, y:]), written *α, η, ει, ω, ου*,

ι, υ (the letters in square brackets [] are phonetic symbols, with the colon indicating length). Four diphthongs were relatively frequent: [ai, au, eu, oi], written *αι, οι, αυ, ευ*. The so-called long diphthongs ([a:i, ε:i, ο:i], i.e. *αι* (or *α*), *ηι* (or *η*), *ωι* (or *ω*)), were rarer and tended either to merge with the short diphthongs or to lose the second element.

The consonantal system included the dental fricative [s], the glottal fricative [h] (the rough breathing) which had a very limited distribution, and four sonorants: the two liquids [l, r] and the two nasals [n, m]. The nine stops were organized according to three modes of articulation (voiceless, voiceless aspirate, and voiced) and three places of articulation: labial ([p, p^h, b]), dental ([t, t^h, d]), velar ([k, k^h, g]). Unlike the modern language ancient Greek had geminate consonants such as [pp, ll, mm] etc.

Some dialects have five long vowels (a:, e:, o:, u:, i:), instead of seven, and in most dialects we find a [u, u:] pronunciation of *υ*. The distribution of vowels also differs. Attic and Ionic changed the inherited [a:], which is preserved in all other dialects, into [ε:], written *η*, though in Attic this change was never completed and after [ε], [i], [r] the sound reverted to [a:]. Hence Doric and Aeolic *μᾶτηρ* vs. Attic-Ionic *μήτηρ* and Attic *χώρα* vs. Ionic *χώρη*. The tendency to monophthongize diphthongs, which is typical of later Greek, is implemented earlier in dialects like Boeotian.

The consonantal system is relatively stable in all varieties of Greek, but some dialects still preserve [w] (written with *Ϝ*, the so-called digamma), which was lost in Attic. Other dialects tend to change the aspirated stops into fricatives at an early stage or to lose the (secondary) intervocalic [s] which is found elsewhere. Hence Laconian *σιός* 'god' for Attic *θεός*, where *σ-* may well indicate a dental fricative [θ] (cf. English *th*) and Laconian *ἐνίκαθε* 'won' corresponding to Attic *ἐνίκησε*.

The accentual system of Greek and the major phonological changes which mark the shift from classical to Byzantine Greek are not discussed here but are discussed in the entry 'pronunciation, Greek' in OCD⁴.

The system just described contrasts with that reconstructed for Indo-European. The Indo-European 'laryngeal' consonants were lost; the voiced aspirate stops (+*b^h*, etc.) yielded voiceless aspirates; the vocalic resonants *†r*, *†l*, *†m*, *†n* were replaced by vowels or combinations of consonant and vowel, while the consonantal variants [j, w] of *i* and *u* tended to disappear; the inherited labiovelar stops (+*k^w*, *g^w*, *g^{wh}*) merged with velars, dentals, or labials, depending on the environment. Indo-European *s* changed to *h* word-initially before a vowel and internally between vowels, where it was eventually lost; all word-final stops were lost and final *-m* changed to *-n*. Not all of these changes are pre-Mycenaean, but those concerning

the aspirates, the vocalic resonants, +s, probably final +m, and the final stops are. Other changes involved sound clusters and differed in the various dialects; in Mycenaean, Arcado-Cypriot, Ionic-Attic, and Lesbian, but not in Doric and North-West Greek, -ti became -si (cf. Att. *δίδωσι* 'gives' and Dor. *δίδωτι*); in most dialects (including Ionic) *[kj, tj] became [ss], but in Attic and Boeotian we find [tt] (cf. Ion. *θάλασσα*, Att. *θάλαττα*).

Morphology and syntax

Greek is a heavily inflected fusional language where the different grammatical categories are mostly marked by suffixes (nominal and verbal endings) or, far less frequently, by prefixes (e.g. the verbal augment or the reduplication). Infixation in verbs like *λαμβάνω* 'I take' vs. *ἔλαβον* 'I took') is at best marginal. Note that one unsegmentable morpheme fulfils various functions: [o:], written -ov in *πολίτου* 'of the citizen' marks genitive, singular, and masculine. Suffixation and composition are the two most productive means of word-formation.

Nouns and adjectives are classified into inflexional classes (declensions) according to their phonological shape (o-stems, a-stems, consonantal stems). In the Classical period the nominal inflexion distinguished five cases (nominative, vocative, accusative, genitive, dative), three numbers (singular, dual, plural) and three genders (masculine, feminine, and neuter). Later developments led to the loss of the dual (which in some dialects is absent from the earliest attestations) and even later ones to that of the dative. Gender was determined by agreement patterns rather than by semantic factors or the phonological shape of the word (*ἵππος* 'horse/mare' can be masculine or feminine without any difference in inflexion). It was normal (though not compulsory) to use masculine and feminine for males and females but words for inanimate objects could be masculine, feminine, or neuter. In progress of time inflexional classes came to be tied to gender as is the case in Modern Greek. At the same time in Hellenistic Greek we witness a drastic simplification of the earlier inflexional variety.

Verbal morphology is highly complicated. A first distinction is between finite and non-finite forms; the former are characterized by personal endings for the singular, dual, and plural (there is not a full complement of dual endings and they too tend to disappear). The latter include participles, verbal adjectives, and infinitives, which are marked by special suffixes and share some of the syntactical, and in some instances morphological, properties of the noun.

In the finite verb the main grammatical categories are aspect, which indicates the way in which action etc. is envisaged (durative or imperfective, punctual or aoristic,

stative or perfective), time (present, past, future), mood (indicative, subjunctive, optative, and imperative), voice (active, middle, passive), person (first, second, and third singular, dual or plural). Most verbs have three main stems (distinguished by vocalic alternation or affixation or more rarely by different roots) which indicate different aspects: durative/imperfective (e.g. *πειθ-* with the present *πείθω* 'I persuade, am persuading' and the imperfect *ἔπειθον* 'I was persuading'), or punctual/aoristic (e.g. *πεισ-* with the aorist *ἔπεισα* 'I persuaded'), or stative/perfective (e.g. *πεποιθ-* with the perfect *πέποιθα* 'I am persuaded' and the pluperfect *ἔπεπειθειν* 'I was persuaded'). Except for the future the so-called tenses (present, imperfect, aorist, perfect, pluperfect, future, future perfect) in the non-indicative moods and the non-finite forms mark primarily contrasts of aspect, while the indicative forms indicate both time and aspect distinctions: Xen. *Cyr.* 5. 5. 22 *ἔλθων ὄν ἔπειθον αὐτούς, καὶ οὗς ἔπεισα τούτους ἔχων ἐπορευόμεν σου ἐπιτρέψαντος*, 'I went (part. aorist) and I tried to persuade them (imperfect) and keeping (part. present) with me those whom I persuaded (ind. aorist) I continued on my expedition (imperfect), since you allowed it (part. aorist)'. The perfect is a special case; it starts indicating a state (*πέποιθα* 'I am convinced') and then develops a resultative use often accompanied by new forms (5th cent.: *πέπεικα* 'I have persuaded'), which makes it very similar to the aorist. Eventually it is lost and replaced by periphrastic forms. Contrasts of voice and person are marked by the endings. The middle voice emphasizes the participation or the involvement of the subject: active *δικάζω* 'I sit/am sitting in judgement', middle *δικάζομαι* 'I go/am going to law (on my own behalf)'. There are a few forms marked by suffixes which are exclusively passive, but otherwise the middle has also passive value, a pattern which will eventually prevail.

Word order is relatively free. The verb may precede or follow the object; similarly the subject may precede or follow the verb. Clitic particles tend in the early stages to occupy the second position in the clause (Xen. *Hell.* 3. 1. 11 *ὁ ἀνὴρ σοι ὁ ἐμὸς καὶ τὰλλα φίλος ἦν...*, 'my husband was devoted to you in other things too...'), but they often gravitate towards the word with which they have the closest semantic links. In Homer we still find preverbs separated from verbs in so-called tmesis (*ἐπι... ἔτελλε*), but there too and in Classical prose 'preverbs' are either compounded with verbs (cf. *ἐπέτελλε* 'enjoined') or serve as prepositions which 'govern' an inflected noun. The simple sentence may be limited to a verb without expressed subject (*ῥεῖ* 'it rains'). In longer sentences grammatical agreement is regular: the verb normally agrees in number with the subject; the adjective agrees in number,

gender, and case with the noun to which it refers. Attic, however, preserves the inherited rule by which a subject in the neuter plural can agree with a verb in the singular: τὰ ζῶα τρέχει, 'the animals run.' Nominal sentences composed of subject and predicate without any finite verb are frequent: Thuc. 2. 43. 3 ἀνδρῶν γὰρ ἐπιφανῶν παῖσα γῆ πάρος, 'for of famous men the whole earth [is] a memorial.' Attic prose develops complex forms of subordination; dependent clauses with finite verbs are normally introduced by conjunctions or relative pronouns, while verbs of saying and other verbs may be followed by 'accusative with infinitive' constructions: Xen. *Hell.* 2. 2. 10 ἐνόμιζον δὲ οὐδεμίαν εἶναι σωτηρίαν..., 'they believed that there was no escape.'

Dialects show considerable morphological differences, partly determined by their different phonological development, partly by separate analogical processes (cf. e.g. the Aeol. dat. plur. of the type πόδεσσι 'to the feet', with a new ending -εσσι, vs. Att.-σι in ποσί). They do not, however, differ substantially in their morpho-syntactic categories. Some syntactic differences are well known (e.g. Arcadian and Cyprian construe prepositions like ἐς (Att. ἐκ) and ἀπύ (Att. ἀπό) with the dative instead of the genitive found in Attic; Elean uses the optative in commands, etc.); others may not have been detected. Even so, there is remarkable similarity in the whole of the Greek-speaking area. If contrasted with IE, Greek has lost some case distinctions: the IE ablative and genitive have merged into the Greek genitive, and similarly the instrumental, locative, and dative into the Greek dative. The extensive use of prepositions is new. The complex arrangement of the verbal system is largely inherited and shows remarkable similarities with that of Indo-Iranian (Vedic and Greek are the only languages to preserve the distinction between optative and subjunctive). Greek has introduced new regularities—the creation of a contrast between middle and active perfect and of a resultative perfect; the pluperfect (to match the imperfect), the future, a separate passive, etc. Later developments show a preference for analytic rather than synthetic forms. It is still disputed how far IE allowed subordination, but the complex patterns found in Greek prose are certainly due to innovation. Perhaps the most important development is the creation of the article. In Homer ὁ, ἡ, τό still largely function as demonstrative or relative pronouns but in Classical prose they are used as articles. The article allows the creation of nominal forms which would be impossible otherwise (e.g. τὸ κακόν, τὸ εὖ, τὸ εἶναι, lit. 'the bad', 'the well', 'the be') and also marks the distinction between attributive and predicative function as in ὁ καλὸς παῖς or ὁ παῖς ὁ καλός 'the handsome boy' as contrasted with καλὸς ὁ

παῖς 'the boy (is) handsome.' The development of intellectual language owes more to the article than to any other syntactical feature of Greek.

Lexicon

Though lexical differences between dialects are commonplace, if we allow for phonological differences, most of the basic vocabulary of Greek is shared by all dialects. The bulk of the early Greek lexicon is built on inherited Indo-European roots but numerous words cannot be etymologized and presumably belonged to pre-Greek populations. They include nouns and place names ending in -ινθος and -σσος / -ττος and a number of words for flora, fauna, etc. of Mediterranean origin (σύκον 'fig', μίνθη 'mint', etc.). In addition even by Mycenaean times we find words of Semitic origin like σήσαμον 'sesame', κύμινον 'cummin', χρυσός 'gold', χιτών 'tunic', etc. In the Classical period it is noticeable that the cultural insularity of the Greeks and their reluctance to learn foreign languages led to very few borrowings from the outside; by contrast the later contacts with the Romans produced a large crop of loanwords or calques. New vocabulary is normally built via suffixation and composition; both processes are productive all through the history of the language. Compounds are characteristic of literary language (where they may be new creations or may be taken from the epitheta of the religious language and the formulae of oral poetry), but also occur in everyday language: the flavour of Pindar's μελησίμβροτος 'which is an object of care to men' or of the comic σαρκασμο-πιτυο-κάμπτης 'sneering pine-bender' (Aristophanes) is different from that of the innumerable -πωλης compounds of Attic inscriptions (κριθοπώλης 'barley seller', ἄρτοπώλης 'bread seller', etc.) which have only practical overtones. AMDA

gymnasium In Greek cities, the gymnasium originated as a place of exercise for the citizens specifically to fit the **ephebōi*, 'ephebes', for the rigours of service as hoplites, i.e. heavy-armed infantrymen. (Ephebes were (i) in 4th-cent. Athens, boys aged 18–20 in paramilitary training; (ii) more generally, well-to-do boys passing through a voluntary one-year finishing school.) At first gymnasia were no more than an open space, with a water supply, often sited in conjunction with a sanctuary or shrine; and as late as the 5th cent. BC gymnasia seem not to have needed architectural development, shade and shelter being provided rather by groves of trees. Descriptions of the Athenian gymnasia, the Lyceum, Cynosarges, and above all the Academy conform with this (see ATHENS (TOPOGRAPHY)).

Frequented also by older citizens, and particularly from the connection with the 4th-cent. philosophers, they became more intellectual centres. Though the ele-

ment of exercise was never lost, the concept of education became more important. Some—those at Athens in particular—through the interests of the philosophical schools became in effect universities. More usually in the cities of the Hellenistic age they functioned as secondary schools. More specialized architecture was required, and the gymnasia became enclosed areas, their buildings arranged largely on the courtyard principle. The *Academy at Athens acquired such a courtyard, with shrine-building and fountain-house, but is badly preserved and not fully understood. Better-preserved examples are found in the Asia Minor cities. The lower gymnasium at Priene is adjacent to the stadium which provides facilities for *athletics. The gymnasium itself is wholly a school building, comprising a small courtyard with rooms opening off. One, its walls liberally inscribed by the pupils, is the classroom; another provides tubs and running cold water for washing. The gymnasium at *Pergamum is larger and more complex (the details partly obscured by the later intrusion of a Roman bath-building) but included its own running-track. A similar running-track, roofed but with ample ventilation, has been identified next to the so-called forum of Caesar at *Cyrene, indicating that this was originally a colonnaded exercise ground of a Hellenistic gymnasium.

Gymnasia were generally provided by the city. That at *Alexandria was situated at the city centre, close to the agora. As a place of education it became a focus for maintaining Greek identity in the face of non-Greek settlement and Roman political control.

In their function as schools gymnasia continued to flourish in the Greek cities during the Roman period. In the west the exercise facilities were more usually developed in the context of the bath-buildings, especially at Rome in the imperial *thermae* (see BATHS). See EDUCATION, GREEK. RAT

gynaecology existed in the ancient world as a medical specialism, but its separate identity was not always permitted by wider medical theories. The significant question was this: do women have diseases peculiar to their sex, or are they subject to the same conditions as men, only requiring a separate branch of medicine to the extent that they have different organs to be affected? In other words, is gynaecology necessary?

The majority of the surviving gynaecological treatises come from the Hippocratic corpus (see MEDICINE §4) and probably date to the late 5th and early 4th cents. BC. These treatises include three volumes of *Gynaecia* (*Mul.*), usually translated as 'Diseases of Women', but which can also mean women's sexual organs, menstruation, or therapies for women's diseases. In contrast to the rest of the

Hippocratic corpus, these texts include long lists of remedies using plant and animal ingredients. The third volume concerns the treatment of barren women. A separate short treatise discusses the medical problems of unmarried girls at puberty (*Virg.*) while others focus on the process of generation. A large number of the case histories in *Epidemics* trace the progress of disease in women patients.

In keeping with a culture in which women could be seen to constitute a separate 'race', *Mul.* 1. 62 criticizes those doctors who make the mistake of treating the diseases of women as if they were men. For the Hippocratics of the *Gynaecia*, women require a separate branch of medicine because they are seen as fundamentally different from men, not merely in their reproductive organs, but in the texture of their flesh, seen as 'wet' and 'spongy', like wool. Because of this texture, women are thought to absorb more fluid from their diet, menstruation being necessary to remove the surplus. There was, however, no uniformity on female difference, other Hippocratic texts applying identical principles—such as the theory of 'critical days', in which certain numbered days were seen as those on which the crisis in a disease occurred—to diseases of both men and women.

The debate on the status of gynaecology continued. Alexandrian anatomy, associated in particular with Herophilus, moved from fluids to organs, and women came to be seen more as reverse males than as a separate race. Whereas men's reproductive organs are outside, women were seen as having the same organs inside. Papyri show that Hippocratic recipes for women's diseases continued to be transmitted. Soranus summarizes the position before his own time; writers such as the early 4th-cent. BC Diocles of Carystus and the Empiricist sect believed there were conditions specific to women, while the 3rd-cent. Erasistratus and Herophilus, together with writers of the Methodist persuasion (see MEDICINE, § 5. 3), believed there were not. Instead, Methodists thought that the same principles governed all diseases, men and women being made of the same materials behaving according to the same rules. Soranus himself claimed that although some conditions, such as pregnancy and lactation, were specific to women, their diseases were not generically different. Galen (*Parts of Medicine* 1. 2–3 and 5. 8) lists as legitimate medical specialisms pediatrics and geriatrics, but not gynaecology.

Despite these changes from Hippocratic beliefs, some forms of therapy for women's diseases continued to be used more readily than in the treatment of men with analogous conditions. Foremost among these was the fumigation, in which vapours were passed into the womb through its mouth. These were believed to open the

womb, thus permitting retained matter to be expelled and semen to enter. Ancient gynaecological recipes, like purificatory ritual, made use of sulphur, asphalt, squill, and laurel, as well as animal excrement. The large amount of such recipes in the Hippocratic gynaecological texts has been used as an argument in favour of their origins in women's traditional lore, but this is not necessarily conclusive.

Beliefs about the interior of the female body were also remarkably persistent, despite evidence to the contrary. For example, although Herophilus discovered the

ovaries and the uterine ligaments, the function of the former was not understood—women continued to be seen as containers for male seed—and the presence of the latter was not widely seen as contradicting the Hippocratic notion that the womb was capable of some degree of movement within the body. Instead, the 'wandering womb' theory was merely rephrased, for example being seen in terms of 'sympathy' between upper and lower parts of the body permitting the latter to cause symptoms in the former. *See* ANATOMY AND PHYSIOLOGY; BOTANY; CHILDBIRTH. HK

H

Hades, son of Cronus and Rhea (Hes. *Theog.* 453–56) and husband of *Persephone (*Od.* 10.491), is ‘Lord of the dead’ (*Il.* 20.61) and king of the Underworld, the ‘house of Hades’ (Hom., Hes.), where he rules supreme and, exceptionally, administers justice (Aesch. *Suppl.* 228–31, *Eum.* 273–5). After Homer, Hades is not only the god of the dead, but also the god of death, even death personified (Semon. 1.14; Pind. *Pyth.* 5.96, *Nem.* 10.67, *Isthm.* 6.15; Soph. *Ant.* 581; Eur. *Alc.* 262; R. Seaford on Eur. *Cyc.* 397). Hades refers normally to the person; in non-Attic literature, the word can also designate the Underworld (*Il.* 23.244, *Od.* 11.635, Heraclitus fr. 98 DK, Anac. 50.9 f. Page, Luke 16.23). Cold, mouldering, and dingy, Hades is a ‘mirthless place’ (*Od.* 11.94; Hes. *Op.* 152–5). The proverbial ‘road to Hades’ (Lucian *Catapl.* 14) is ‘the same for all’ (*Anth. Pal.* 7.477.3 f., 11.23.3). Aeacus, son of Zeus, ‘keeps the keys to Hades’ (Apollod. *Bibl.* 3.12.6, cf. GVI 1906.4, PGM IV 1464 f.); the same is said of Pluton (Paus. 5.20.3), Anubis (love charms from Roman Egypt: PGM IV 341 f., 1466 f.; *Suppl. Mag.* 2.299 entry under *kleis*), and Christ (Rev. 1.18). The ‘gates of Hades’ (*Il.* 5.646) are guarded by ‘the terrible hound’, Cerberus, who wags his tail at the new arrivals, but devours those attempting to leave (Hes. *Theog.* 311 f., 767–73). Hades, too, was sometimes perceived as an eater of corpses (Soph. *El.* 542 f.). Without burial, the dead cannot pass through Hades’ gates (*Il.* 23.71–4, Eur. *Hec.* 28–54). Once inside, they are shrouded in ‘the darkness of pernicious Hades’ (*SEG* 26.1139.9).

Like the Erinyes/Eumenides (‘Angry/Kindly Ones’) and *Demeter (‘Earth-mother’, cf. Eur. *Bacch.* 275 f., Derveni papyrus col. 22.7–12 (eds. T. Kouremenos, G. M. Parássoglou and K. Tsantsanoglou, 2006, 104 f.), Hades lacked a proper name; as in the case of other nameless chthonians (‘gods of the earth’, as opposed to Olympians, ‘of the heavens’), the reluctance to name him was a precaution (Pl. *Cra.* 403a7). He was referred to by descriptive circumlocutions as ‘chthonian Zeus’ (*Il.* 9.457; M. L. West on Hes. *Op.* 465), ‘the chthonian god’ (Hes. *Theog.*

767), ‘king of those below’ (629), ‘Zeus of the departed’ and ‘the other Zeus’ (Aesch. *Suppl.* 156 f., 231), ‘the god below’ (Soph. *Aj.* 571; Eur. *Alc.* 424), or simply ‘lord’ (Eur. *Alc.* 852). As the Lord of the Dead, he was dark and sinister, a god to be feared and kept at a distance. Paradoxically, he was also believed to ‘send up’ good things for mortals from his wealth below (West on Hes. *Theog.* 969; Ar. fr. 504 K-A; Pl. *Cra.* 403a3–5); he is a ‘good and prudent god’ (Pl. *Phd.* 80d7).

The two opposite but complementary aspects of his divinity are reflected in a host of positive and negative epithets. Of the latter, Hades, ‘the invisible one’ according to ancient etymology (E. R. Dodds on Pl. *Grg.* 493b4, cf. Soph. *Aj.* 607, but modern linguists are divided on this), recalls the darkness of his realm. The ‘wolf’s cap of Hades’, worn by *Athena in the *Iliad* (5.844 f.) and by Aita/Hades in Etruscan art (LIMC ‘Hades/Aita’ nos. 5–6, 10–12, 21), makes its wearers invisible (Ar. *Ach.* 390, Pl. *Resp.* 612b). Other negative epithets are ‘hateful’ (*Il.* 8.368 *stugeros*, like the Styx), ‘implacable and adamant’ (*Il.* 9.158), ‘tearless’ (Hor. *Carm.* 2.14.6) and ‘malignant’ (*baskanos*, cf. M. W. Dickie, *ZPE* 100 (1994), 111–14). Epithets which euphemistically address his benign and hospitable aspects include Clymenus (‘Renowned’), Eubouleus (‘Good Counsellor’, Nic. *Alex.* 14; GVI 2030.9), Euchaites (‘the Beautiful-haired One’: Clarian oracle *ISestos* 11.24, c.AD 166), Eukles (‘Of Good Repute’: Orph. fr. 488–491.2 Bernabé; Hsch. e 6926), Hagesilaos (‘Leader of the People’, Aesch. fr. 406 Radt; A. W. Bull-och on Callim. *Hymn* 5.130; GVI 1370.2), Pasianax (‘Lord over All’: *Def. tab.* Audollent, nos. 43–4), Polydektes or Polydegmon (‘Receiver of Many’: *Hymn. Hom. Cer.* 9, 17), Polyxeinos (‘Host to Many’: Aesch. fr. 228 Radt; Callim. fr. 285 Pf.), and Pluton (‘Wealth’, *ploutos*, personified; cf. Soph. fr. 273 Radt). Originally a divinity in his own right, during the 5th cent. BC Pluton became Hades’ most common name in myth as well as in cult (first attested on a phiale by Douris, LIMC ‘Hades’ no. 28, c. 490 BC; Soph. *Ant.* 1200, Pl. *Grg.* 523a4, Isoc. 9.15;

IG 1³.5.5, 386.156, 2².1363.21 'priestess of Pluton,' 1672.169, 1933.2; *Hymn. Orph.* 18).

Hades was not a recipient of cult (Soph. *Ant.* 777–80). Like Thanatos, 'Death,' he was indifferent to prayer or offerings (Aesch. fr. 161 Radt, Eur. *Alc.* 424). The abnormal cult of Hades at Elis, with a temple open once a year, then only to the priest (Paus. 6.25.2 f.), and his *temenos* at Mt. Minthe near Pylos (Strabo 8.344) are the exceptions that prove the rule. But throughout the Greek world—at *Eleusis, *Sparta, *Ephesus, Carian Cnidus, and Mytilene on *Lesbos, among numerous other places—he received cult in his beneficial aspect as Pluton, often alongside his consort *Persephone. The couple were widely worshipped as Pluton and Kore (IG 2². 1672. 182, 4751; CEG 2.571); at Eleusis, they were also known as Theos and Thea. Pluton is related to the Eleusinian cult figures Plutus and Eubouleus as well as to other friendly chthonians such as Zeus Meilichios and Zeus Eubouleus. In various curse tablets, however, he is invoked along with *Demeter and Kore or, more menacingly, with the Erinyes, Hecate, *Hermes, Moirai, and Persephone (J. G. Gager, *Curse Tablets and Binding Spells from the Ancient World* (1992), nos. 53, 84, 89, 110, 134); *curses in the name of Hades and Persephone are less common (*Def. tab. R.* Wünsch, no. 102b13–16; W. Peek, *Kerameikos* 3 (1941), 98 no. 9. 18). So-called Plutonia marked entrances to the Underworld (Strabo 5.244).

Apart from the story of Persephone's abduction by him, few myths attach to Hades. By giving her the forbidden food of the dead to eat—the pomegranate—he bound Demeter's daughter to return periodically to his realm (*Hymn. Hom. Cer.* 370 ff.). Their union was without issue; its infertility mirrors that of the nether world (Apollodorus of Athens, *FGrH* 244 F 102a2). When the sons of Cronus divided the universe amongst themselves, Hades was allotted the world of the dead, Zeus obtained the sky, and Poseidon the sea (R. Janko on *Il.* 15.185–93; Richardson on *Hymn. Hom. Cer.* 86). As ruler of the dead, Hades was always more ready to receive than to let go (Aesch. *Pers.* 688–90). Two kindred gods, Demeter and *Dionysus, as well as heroes like *Heracles, *Theseus, and *Orpheus, descended alive to Hades and returned to earth. Ordinary mortals went there to stay; Alcestis, Eurydice, and Protesilaus were among the few allowed to leave (cf. Plat. *Symp.* 179c). Heracles wrestled with Thanatos (Eur. *Alc.* 843–9) and wounded Hades with his arrows (*Il.* 5.395–7; Paus. 6.25.2 f.). Hades' mistress Minthe was changed into the mint plant by Persephone (Strabo 8.344, *Ov. Met.* 10.728–30; cf. Oppian, *Halieutica* 3.486 ff.).

Alcestis' death vision of Hades, who comes to get her, is dim but frightening (Eur. *Alc.* 259–62 Diggle: 'Someone

is leading me, leading me away—don't you see—to the hall of the dead. He stares at me from under his dark-eyed brow. He has wings—it's Hades!'). In Greek art, Hades and Pluton—differentiating between the two is not always possible—are wingless human figures lacking any terrifying aspects. Zeus-like and bearded, Hades-Pluton is a majestic, elderly man holding a sceptre, twig, cornucopia, pomegranate, or cantharus. On some vases, Hades is shown averting his gaze from the other gods (*LIMC* nos. 14, 22, 148). Unlike Hades, Thanatos is represented with wings (Eur. *Alc.* 843; often in vase-painting, e.g. Euphronios, calyx-crater, formerly New York, Met. Mus. 1972.11.10, now in Rome; Thanatos Painter, lecythus, London, BM D 58). Conceptually and iconographically, Dionysus (Heraclitus fr. 15 DK) and Sarapis (H. Heubner on Tac. *Hist.* 4.83 f.) in their chthonian aspects have affinities to Hades-Pluton.

Hades was the universal destination of the dead until the second half of the 5th cent. BC, when we first hear of the souls of some special dead ascending to the upper air (*aithēr*), while their bodies are said to be received by the earth (Athenian epitaph, c. 432 BC, IG 1³.1179.6 f. = CEG 1.10.6 f.; Eur. *Supp.* 533 f.; CEG 2.535, 558). Notably, the souls of the heroized daughters of Erechtheus 'do not go to Hades,' but reside in heaven (Eur. *Erech.* fr. 65.71 f. Austin). The various Underworld topographies found in Homer (*Od.* 11) and Virgil (*Aen.* 6), in the esoteric gold leaves containing descriptions of Hades, and in the apocryphal *Apocalypse of Peter* reflect changing constructs of the afterlife. See DEATH, ATTITUDES TO (GREEK). AH

Hadrian (Publius Aelius Hadrianus), emperor AD 117–38. The Aelii of Italica were among the earliest provincial senators; his mother Domitia Paullina was from Gades (mod. Cádiz). When his father died, Hadrian became the ward of *Trajan, his father's cousin, and of Publius Acilius Attianus (85). Early devotion to Greek studies earned the nickname *Graeculus* ('little Greek'); a passion for hunting was apparent when he visited Italica (90). After the vigintivirate (a minor magistracy), he was tribune in Legio II Adiutrix (95) and V Macedonica (96). Sent to congratulate Trajan on his adoption in 97, he remained in Upper Germany as tribune of XXII Primigenia, under Lucius Iulius Ursus Servianus, husband of his sister Paulina. In 100 he married Trajan's great-niece Sabina Augusta, a match arranged by Pompeia Plotina, a devoted supporter. As Trajan's quaestor (101) he had to polish his Latin (his 'rustic accent' was mocked). He joined Trajan for the First Dacian War (101–2); was *tribune of the *plebs*; then legate of I Minervia in the Second Dacian War (105–6), perhaps being praetor *in absentia*. He governed Lower Pannonia and was suffect

Hadrian View of the Canopus, an ornamental piece of water providing a view for diners, one of the many exotic features of Hadrian's villa at Tibur (Tivoli), the largest ever built. Like all early Roman emperors, Hadrian worked from home, and governance as well as leisure filled his visits to Tibur. DAI Rome, neg. no. D-DAI-ROM-57.1085

consul (108). When Trajan's closest ally Lucius Licinius Sura died, Hadrian took over as imperial speech-writer. In 112 he was archon at Athens, where he was honoured with a statue; its inscription (*ILS* 308 = Smallwood 109) confirms the career in the SHA. When the Parthian expedition began (October 113), he joined Trajan's staff, becoming governor of Syria at latest in 117; and was designated to a second consulship for 118. His position was thus very strong when Trajan died at Selinus in Cilicia on 8 August 117. The next day his adoption by Trajan was announced. A single aureus with the reverse *HADRIANO TRAIANO CAESARI* (*BM Coins, Rom. Emp.* 3. lxxxvi, 124) cannot dispel the rumours that Plotina had staged an adoption after Trajan died. Hadrian was disliked by his peers and had rivals, but the army recognized him; the senate had to follow suit. Plotina and the guard prefect Attianus took Trajan's body to Rome, while Hadrian faced the crisis in the east. He abandoned the new provinces (Armenia, Mesopotamia, and Assyria), dismissed Trajan's favourite Lusius Quietus from his command in Judaea, and probably wintered at Nicomedia, leaving Catilius Severus as governor of Syria. A rising in Mauretania, no doubt provoked by the dismissal of Quietus, a Moor, was suppressed by Hadrian's friend Quintus Marcius Turbo. Britain was also disturbed; Quintus Pompeius Falco, gov-

ernor of Lower Moesia, was probably sent to Britain to restore control when Hadrian reached the Danube in spring 118. He negotiated with the Roxolani and evidently evacuated the Transdanubian part of Lower Moesia annexed by Trajan. Gaius Iulius Quadratus Bassus, governor of Dacia, had died campaigning; Hadrian summoned Turbo to govern part of Dacia, with Lower Pannonia. Dacia was divided into three provinces. Turbo, an equestrian, was given the same rank as a prefect of Egypt.

Meanwhile Attianus was active. Four ex-consuls, Gaius Avidius Nigrinus, Cornelius Palma Frontonianus, Publius Celsus, and Lusius Quietus, were killed for plotting treason. When Hadrian reached Rome (9 July 118), the senate was hostile. He claimed not to have ordered the executions but took steps to win popularity. First came a posthumous triumph for Trajan's Parthian 'victory'. Crown-gold (*aurum coronarium*) was remitted for Italy and reduced for the provinces; a new, more generous, largess was disbursed to the *plebs*; overdue tax was cancelled on a vast scale; children supported by the *alimenta* received a bounty, bankrupt senators a subsidy; lavish gladiatorial games were held.

Hadrian, consul for the second time for 118, took as colleague Pedanius Fuscus, husband of his niece Julia: Fuscus was a likely heir. In 119 he was consul for the third and

last time, and changed guard prefects. One new prefect was Septicius Clarus, to whom *Pliny the Younger had dedicated his Letters; *Suetonius, protégé of Pliny and Septicius' friend, became *ab epistulis* (in charge of imperial correspondence). The second prefect was Turbo: he was to take charge during Hadrian's absences, together with Marcus Annii Verus, a senator of Spanish origin, linked by kinship to Hadrian. Verus, consul for the second time in 121 and urban prefect, was rewarded by a third consulship in 126. On 21 April 121, the birthday of the city, Hadrian inaugurated a vast temple of *Venus and Roma in the forum Romanum, designed by himself: one of many fields in which he dabbled and claimed expertise. A poet, he boasted of his cithara-playing and singing, was expert in mathematics—and in military science. A favourite occupation was debating with sophists (*see* SECOND SOPHISTIC). Favorinus yielded: 'who could contradict the Lord of Thirty Legions?' To the legions Hadrian now turned, leaving in 121 for the Rhineland. In Upper Germany and Raetia he erected a continuous palisade, Rome's first artificial **limes*, symbolizing his policy of peace within fixed frontiers. Legions and *auxilia*—with a few exceptions—were to remain in the same bases, local recruiting became prevalent. Hadrian set out to improve discipline and training—*Arrian was to dedicate his *Tactica* to Hadrian, registering the emperor's innovations. In 122 he crossed to Britain, taking his friend Platorius Nepos, promoted from Lower Germany to Britain, and VI Victrix. The empress Sabina, the prefect Septicius, and Suetonius also went. An obscure imbroglio involving these three led to the men's dismissal. The main business was 'the wall to separate Romans and barbarians', as the SHA *vita* tersely puts it. The *wall of Hadrian was far more elaborate than any other *limes*: the bridge at the eastern end of the wall bore his name, Pons Aelius (Newcastle upon Tyne)—perhaps he designed it. From Britain he made for Spain, via southern Gaul, where he commemorated his horse in verse and Plotina with a basilica (she died early in 123). He wintered at Tarragona, calling a meeting of delegates from the peninsula: military service was on the agenda. Italica was not favoured with a visit, although—showing disdain—he granted it the status of *colonia*. Conscious perhaps of the coming 150th anniversary of 27 BC, Hadrian now shortened his names to Hadrianus Augustus: a claim to be a new founder of the empire.

A Moorish uprising was dealt with at this time, perhaps without his personal involvement. News from the east determined his next move. Perhaps visiting Cyrenaica *en route*—he resettled refugees from the Jewish uprising in a new city (Hadrianopolis)—his goal was the Euphrates, to confirm peace with Parthia. After an

extensive tour of Asia Minor, he sailed (autumn 124) to Athens. There he was initiated in the Eleusinian *mysteries, visiting many other cities before his return to Rome, via Sicily, in summer 125. He stayed in Italy for three years, touring the Po valley for six months in 127; during this period he created four 'provinces' in Italy, each with a consular governor. The senate was displeased—Antoninus abolished them (*see* ANTONINUS PIUS). In 128 he accepted the title *pater patriae* ('father of the fatherland'); then began his last tour with a visit to Africa and Mauretania, creating another *limes*; he lectured the troops at Lambaesis, displaying his knowledge of manœuvres (Smallwood 328). Briefly at Rome in late summer, he crossed to Athens, where he wintered again, dedicated the Olympieum and assumed the name Olympius. After participating in the mysteries (spring 129), he went via Ephesus to Syria, wintering at Antioch, visiting Palmyra in spring 130, and going through Arabia and Judaea to Egypt. In Judaea he founded a *colonia* at Jerusalem, Aelia Capitolina; and banned circumcision: measures to Hellenize the Jews—a fatal provocation. Hadrian was accompanied not only by Sabina but by a young Bithynian, Antinous: his passion for the youth, embarrassing to many Romans, was a manifestation of his *Hellenism. After inspections of *Pompey's and *Alexander the Great's tombs, debates in the Museum, and hunting in the desert, a voyage on the Nile ended in tragedy: Antinous was drowned. Hadrian's extreme grief was only assuaged by declaring his beloved a god (duly worshipped all over the empire) and naming a new city on the Nile (perhaps already planned) Antinoöpolis. Hadrian went from Egypt to Lycia; by the winter of 131–2 he was back at Athens, to inaugurate the Olympieum and found the Panhellenion, the culmination of his philhellenism.

In 132 the Jews rebelled under Bar Kokhba, rapidly gaining control of considerable territory. Hadrian was briefly in Judaea, summoning his foremost general, Sextus Iulius Severus, from Britain to crush the revolt. It lasted until 135; by then Hadrian had been back at Rome for a year, worn out and ill, staying mostly at his Tibur (Tivoli) villa. In 136 he turned his mind to the succession. The aged Servianus and his grandson Fuscus had aspirations; but Hadrian hated both and forced them to suicide. To universal surprise, he adopted one of the consuls of 136, as Lucius Aelius Caesar. It may have been remorse for the killing of Nigrinus, Aelius' stepfather, in 118. But Aelius died suddenly on 1 January 138. Hadrian now chose Aelius Antoninus (Pius) and ensured the succession far ahead by causing him to adopt in turn his nephew Marcus (= Marcus *Aurelius) and Aelius' young son Lucius (= Lucius Verus). Marcus, a favourite of Hadrian and

grandson of Annius Verus, had been betrothed to Aelius' daughter. Hadrian died (10 July 138) with a quizzical verse address to his restless soul. He was buried in his new mausoleum (Castel Sant'Angelo) and deified by a reluctant senate. An intellectual and reformer (the Perpetual Edict, codified by Salvius Iulianus, and the extension of Latin rights (*see* CITIZENSHIP, ROMAN) were major measures), by his provincial tours, amply commemorated on the coins, by his frontier policy, and promotion of Hellenism, he made a deep impact on the empire. ARBi

Hadrian's Wall *See* WALL OF HADRIAN.

Hannibal (*see following page*)

Hector, in mythology son of Priam and Hecuba, husband of Andromache and father of Astyanax (*Il.* 6. 394 ff.), and the greatest of the Trojan champions. In *Homer's *Iliad* he first appears leading the Trojans out to battle (2. 807 ff.); he reproaches Paris for avoiding Menelaus (3. 38 ff.), and arranges the truce and the single combat between the two (85 ff.). He takes a prominent part in the fighting of books 5 and 6, but in the latter goes back to the city for a while to arrange for offerings to be made to the gods. He thus meets Andromache and Astyanax on the city walls in one of the best-known scenes of the *Iliad*, then returns with Paris to the battle. In book 7 he challenges any Greek hero to single combat, and is met by the greater *Aias, who has rather the better of the encounter; they part with an exchange of gifts. In book 8 he drives the Greeks back to their camp and bivouacs on the plain. In the long battle of books 11–17 he takes a prominent part, leading the main attack on the fortifications of the Greek camp which nearly succeeds in burning the Greek ships. During the battle he is struck down with a stone thrown by Aias (14. 409 ff.), but restored to strength by *Apollo at the command of Zeus (15. 239 ff.). He kills Patroclus (16. 818 ff.), and strips him of his arms despite the efforts of the Greeks. After the appearance of *Achilles at the trench, full of rage at Patroclus' death, Hector again bivouacs on the plain, against the advice of Polydamas (18. 249 ff.). After the Trojan rout on the following day, he alone refuses to enter Troy, but stands his ground and waits for Achilles despite the entreaties of his parents (22. 35 ff.). At Achilles' approach he flees, but after a long chase halts, deceived by Athena into thinking that Deiphobus has come to his aid. In the subsequent fight he is killed, and with his dying words begs Achilles to return his body to Priam, then predicts Achilles' own death (22. 337 ff.). But Achilles, still overcome with rage and hatred, drags Hector's body behind his chariot, though the gods keep it safe from harm. Finally, when Priam comes by night to the Greek camp to beg for the return of his son

(24. 189 ff.), Achilles' anger is eased and replaced by pity. The body is ransomed, an eleven-day truce is agreed, and the *Iliad* ends with Hector's funeral. Later poets add nothing of importance to Homer's account.

Hector is depicted in art from the 7th cent. BC on, setting out for battle, fighting Aias or some other hero, meeting his death at Achilles' hands, and his body being dragged and ransomed: *see* O. Touchefeu, *LIMC* 4. 1 (1988), 482–98; Gantz, *EGM* 612–21. HJR/JRM

Helena Augusta, mother of *Constantine I. Born of humble origins at Drepanum in Bithynia, she became c.AD 270 the first wife (or perhaps concubine) of the future emperor Constantius I. On Constantius' later dynastic marriage to Theodora, Helena lapsed into obscurity, returning to prominence after her son's elevation as emperor in 306; she followed Constantine in adopting Christianity. In 324 she was given the title *Augusta*, and c.327 made a celebrated imperial progress through the eastern provinces as far as Jerusalem, where she engaged in charitable activities and was associated with the building of Constantine's new churches at the holy places. In Christian tradition her journey became a model of Holy Land pilgrimage, and by the later 4th cent. she was believed to have discovered relics of the True Cross. EDH

Helios, the sun. In early Greece Helios was always treated with reverence but received little actual cult. Anaxagoras' announcement that the 'sun was a red-hot mass' caused outrage (*DL* 2. 12, etc.) and it was not uncommon to salute and even pray to the sun at its rising and setting (*Pl. Symp.* 220d, *Leg.* 887e, cf. *Hes. Op.* 339, and for respect *Pl. Ap.* 26c), but *Aristophanes can treat the practice of sacrificing to sun and moon as one that distinguishes *barbarians from Greeks (*Pax* 406). Hence evidence for actual cults is scarce and usually cannot be shown to be ancient (*Farnell, Cults* 5. 419 f.; but for Athens in the 3rd cent. BC *see* now *SEG* 33. 115. 12). The exception was *Rhodes, where Helios—subject in fact of the original 'colossus of Rhodes'—was the leading god and had an important festival, the Halieia (*Nilsson, Feste*, 427); the myth explaining this prominence is told in *Pindar, Ol.* 7. 54 ff. In Homer he is invoked and receives an offering as witness to an oath (*Il.* 3. 277), and his all-seeing, all-nurturing power is often stressed in poetry (*see* *Aesch. Cho.* 984–6 with A. F. Garvie's note).

His most important myth concerned his son Phaethon (too weak to manage the immortal horses, and likely to ignite the world as a result, Phaethon was struck down by Zeus). He is regularly conceived as a charioteer, who drives daily from east to west across the sky (a conception with both Indo-European and near eastern parallels). His journey back each night in a cup is already attested in

[continued on p. 359]

HANNIBAL

Hannibal, Carthaginian general. He was born in 247 BC, the eldest son of Hamilcar Barca. After making Hannibal swear an oath never to be a friend of Rome, Hamilcar took him to Spain in 237, where he stayed during the commands of both his father and his brother-in-law Hasdrubal, marrying a Spaniard from Castulo. In 221 he assumed the supreme command in Spain on the death of Hasdrubal (confirmed by the popular assembly at Carthage) and reverted to his father's policy by attacking the Olcades, who lived on the upper Anas (Guadiana). In 220 he advanced beyond the Tagus (Tajo) as far as the Durus (Duero), defeating the Vaccaei and the Carpetani. Regarding Rome's alliance with Saguntum (Sagunto) as a threat to Carthage's position in Spain, he decided to defy her, and put pressure on Saguntum. He rejected a Roman protest, and after consulting Carthage began the siege of Saguntum in spring 219, knowing that war with Rome would result, and took the city eight months later.

Hannibal had decided, without waiting for a Roman declaration of war, to take the initiative by invading Italy; probably less with the object of destroying Rome than of detaching her allies (an expectation warranted by Carthage's experience in her wars with the Greeks) and so weakening her that she would give up Sicily, Sardinia, and Corsica, and undertake not to molest Carthage's North African and Spanish empire. He left his capital, Carthago Nova (mod. Cartagena), in May 218, with a professional army of 90,000 infantry and 12,000 cavalry (Iberians, Libyans, and Numidians) and elephants, leaving his brother Hasdrubal to hold Spain; and subdued, regardless of cost, the area between the Ebro and the Pyrenees. He remained there until September, presumably in the expectation of meeting and destroying the army of the consul Publius Cornelius Scipio before invading Italy. Then, with 50,000 infantry, 9,000 cavalry, and 37 elephants, he marched to the Rhône, avoided battle with Scipio (belatedly *en route* to Spain), and continued towards the Alps, which he crossed in about fifteen days, with great difficulty and enormous loss of life. The route he took remains a matter for conjecture: he seems to have marched up the valley of the Isère, past Grenoble, and then perhaps took the difficult Col du Clapier pass, having missed the easier Mt. Cenis pass. He arrived in the area of Turin about the end of October, defeated Publius Cornelius Scipio (who had returned to Italy) in a cavalry skirmish at the Ticinus (Ticino) near Pavia, and then, having been joined by many Gauls, won the first major battle of the war at the Treb(b)ia, a little to the west of Placentia (Piacenza), against the combined forces of Scipio and Tiberius Sempronius Longus (end of December). In May 217 Hannibal crossed the Apennines (losing an eye in the passage of the Arno), ravaged Etruria, and with the help of early-morning fog, trapped the consul Gaius Flaminius in an ambush at Lake Trasimene. Flaminius and 15,000 men were killed and 10,000 captured. Hannibal proceeded to Apulia, and thence to Samnium and Campania, while the dictator Quintus *Fabius Maximus Verrucosus embarked on his strategy of following Hannibal but avoiding a pitched battle. Hannibal returned to Apulia (eluding Fabius) for the winter. In 216 he inflicted a devastating defeat on both consuls, who commanded over-strength armies, at Cannae; only 14,500 Romans and allies escaped death or captivity. After each battle he dismissed the Italian prisoners to their homes while holding the Romans (see e.g. Livy 22. 58).

Cannae led to the defection of southern Italy, including Capua (S. Maria Capua Vetere), the second city in Italy, and part of Samnium; but central Italy and all the Latin colonies remained loyal to Rome, and with Roman commanders avoiding another pitched battle, Hannibal achieved little in the following three years (215–213), although he concluded an alliance with Philip V of Macedon (215), and helped to bring about the revolt of *Syracuse (214). He received no assistance from Spain, where Hasdrubal was on the defensive, and little from Carthage. He failed to gain control of a port, despite attacks on Cumae, Neapolis (Naples), Puteoli (Pozzuoli) and Tarentum (Taranto), and his persistent assaults on Nola were repulsed; several towns were recaptured by Rome, notably Casilinum (Capua) and Arpi (near Foggia). In 212, however, he captured Tarentum by stealth, although the citadel remained in Roman control, and this was followed by the defection of three neighbouring Greek cities. In 211, in an attempt to relieve the siege of Capua (begun the previous year), Hannibal marched on Rome itself but failed to force the Romans to withdraw troops from Capua, and returned to the south; soon afterwards Capua fell, its fall being preceded by that of Syracuse. Hannibal was now being pressed ever further south—from 212–11 onwards, with one possible exception, he spent every winter in the extreme south of Italy—and suffered a further blow in 209 when Fabius recaptured Tarentum. In 208, however, he caught both consuls in an ambush in Lucania; one, Marcus Claudius Marcellus, was killed immediately, his colleague fatally wounded. In Spain, *Scipio Africanus had captured Carthago Nova (209) and defeated Hasdrubal at Baecula (Bailen) (208). Hasdrubal slipped out of Spain, but in 207 his defeat and death on the Metaurus (Metauro) dashed

Hannibal's hopes of receiving reinforcements. Hannibal was now confined to Bruttium, where he stayed until 203—in 205 he could not prevent Scipio recapturing Locri Epizephyrri—when he was recalled to Africa to defend Carthage. After abortive peace negotiations with Scipio, he was decisively defeated at Zama (202), and successfully urged his countrymen to make peace on Rome's terms.

Hannibal now involved himself in domestic affairs; as suffete (chief magistrate) in 196 he introduced constitutional reforms to weaken the power of the oligarchs, and reorganized the state's finances so that the war indemnity could be paid to Rome without levying additional taxes. His enemies reacted by alleging to Rome that Hannibal was intriguing with *Antiochus III of Syria. When a Roman commission of inquiry arrived, Hannibal fled, ultimately reaching Antiochus (195). He urged Antiochus to go to war with Rome; he asked for a fleet and an army with which to stir Carthage to revolt, or, failing that, to land in Italy. He accompanied Antiochus to Greece in 192, and advised him to bring Philip V into the war and invade Italy. In 190, bringing a fleet from Syria to the Aegean, he was defeated by the Rhodians off Side. The peace agreed between Rome and Antiochus provided for his surrender; he fled to Crete and then to Prusias I of Bithynia, whom he supported in his war with Eumenes II of Pergamum. In 183 or 182 *Flaminius persuaded Prusias to surrender Hannibal, a fate which he preempted by taking poison.

Hannibal has been widely acknowledged, in both antiquity and modern times, as one of the greatest generals in history. He brought to perfection the art of combining infantry and cavalry, he understood the importance of military intelligence and reconnaissance, and he commanded the unflinching loyalty of his troops. But he failed against Rome because all the assumptions upon which his policy and his strategy were based—that huge numbers of Gauls would follow him to Italy, that Carthage would recover the command of the sea and reinforce him from Africa and that Hasdrubal would bring him reinforcements from Spain, and, above all, that Rome's confederation would break up following Rome's defeat in the field—proved fallacious. Roman propaganda accused Hannibal of perfidy and cruelty; as far as the latter charge is concerned, although he could be chivalrous at times, his attitude to those who resisted him was uncompromising. But the record of Rome's treatment of defectors makes far grimmer reading. BMC

Mimnermus fr. 12 West (for many further early poetic references, see Ath. 469c ff.)

The identification of the Sun with *Apollo was familiar in the 5th cent. BC but did not become canonical until much later (doubts still in Callim. *Hecale* fr. 103 Hollis): *Aeschylus in *Bassarides* probably associated it with *Orpheus, the religious innovator (M. L. West, *Studies in Aeschylus*, (1990), 38–42), and a passage in *Euripides (*Phaethon* 225 Diggle) where it appears unambiguously for the first time also mentions (whether for this reason or another is unclear) 'those who know the secret names of the gods'. (The identification is also attested for the scientists Parmenides and Empedocles: DK 28 A 20, 31 A 23). The 'visible gods' of heaven acquired new prominence in the astral religion of *Plato, and Cleanthes the Stoic named the sun the 'leading principle' (*hēgemonikon*) of the world (*SVF* 1. 499). Through indirect influence from philosophy, worship of Helios probably became more common in the late Hellenistic period and after. But it was not until the later Roman empire that Helios/Sol grew into a figure of central importance in actual cult. RCTP

Hellenism, Hellenization, Greek culture and the diffusion of that culture, a process usually seen as active. The relation between the two modern words is controversial: should the longer word be avoided (see ORIENTALISM)

because of its suggestion of cultural imperialism? (Cf. G. W. Bowersock, *Hellenism in Late Antiquity* (1990) xi: 'Hellenization is... a modern idea, reflecting modern forms of cultural domination'.)

The ancient terminology is interesting but treacherous. The earliest use of the verb 'Hellenize' (Gk. ἐλληνίζειν) is in a linguistic context: Thucydides 2. 68 says the Amphilochean Argives were 'Hellenized as to their present language' by the Ambraciots. But the extra words 'as to... language' perhaps (though see *CR* 1984, 246) indicate that the word normally had a wider, cultural sense. Nevertheless, 'Hellenism' in the Classical period is not quite on all fours with *Medism*, which has a political tinge. The asymmetry is interesting because it underlines the absence, in the evidence which has come down to us, of a non-Greek point of view from which political sympathy with Greece could be expressed.

But the most famous use of 'Hellenism' is at 2 Maccabees 4: 13, cf. Acts of the Apostles 6: 1; 9: 29 for 'Hellenists'. Here too it seems that more is meant than just speaking Greek. *How* much more, is disputed.

In modern times the 19th-cent. historian J. G. Droysen, taking his cue above all from the Maccabees and Acts passages, gave 'Hellenismus' (the German is best not translated) a powerful and extended sense, not just 'correct Greek' but 'fusion of Greek and non-Greek'. Droysen

associated the word with a particular period, that between *Alexander the Great and the victory of Octavian (later *Augustus) at *Actium. It was in this period, the 'Hellenistic Age', that Greek culture was most intensely diffused; this diffusion was seen as a success story, not least because it made possible the eventual rise and spread of *Christianity.

The post-colonial, late 20th cent. has reacted against such a simple picture. In the Droysenian and post-Droysenian view of the ancient world there was arguably (cf. M. Bernal, *Black Athena* (1987–2006)) some neglect of the non-Greek, especially the Semitic, contribution to Greek achievements. Even in the study of the religion and art of the Archaic period (see GREECE (HISTORY)) the near eastern element has recently (W. Burkert, *The Orientalizing Revolution* (1992)) been stressed.

'Hellenization or Hellenism?' is a question best approached by considering the main alleged agents of the process of Hellenization (alternatively phrased, 'the main vehicles of Hellenism').

Conventionally, Hellenization has in modern times been associated with the post-Alexander period, so that as we have seen the word 'Hellenistic' was (and is) regularly confined to the centuries 323–31 BC. But inscriptional evidence, above all that collected and edited by the great French epigraphist Louis Robert, has shown that in the Persian Empire of the Achaemenids (5th and 4th cents. BC), Greek language and even constitutional forms were adopted by dynasts in Lycia like Pericles of Limyra and by Mausolus and his family. Such adoption was perfectly compatible with anti-Greek political behaviour, as the career of Mausolus himself demonstrates. (There is a parallel here with the ambiguities of *philhellenism in the Roman period.) And rulers like Mausolus did strange things with the Greek governmental apparatus they copied: Greek eyebrows would lift at the sight of a decree like that (RO 55) by which Mausolus and Artemisia conferred block proxeny (essentially an individual honour, see GREECE (HISTORY)) on the citizens of Cnossus, in a decree which opens 'it seemed good to Mausolus and Artemisia', just like a two-person *polis. And Mausolus avoided the great Panhellenic sanctuaries, preferring the local Carian shrines like Sinuri and Labraunda: this is a sort of 'Carianization' alongside the more obvious, and surely real, Hellenization. See ASIA MINOR.

Such patriotic retention or reinvention of local culture goes right through the history of post-Classical Asia Minor. It is true that places like Aspendus or Side 'discovered' their Greek origins in the early Hellenistic period when it was convenient to do so (see e.g. SEG 34. 282, Argos/Aspendus link); Greeks expressed this sort of thing in terms of '*kinship', *syngeneia*; that is, the relation

between mētropolis and daughter-city. (The idea is not just Hellenistic, note already Thuc. 1. 95. 1, the justification for the *Delian League in terms of kinship between Ionians.) Fictitious descents and *genealogies were popular, especially Argive (*Philip II and Alexander the Great themselves claimed Argive descent; cf. Hdt. 5. 22 and Thuc. 5. 80; see KINSHIP). But against such assertions of Greekness, real, exaggerated, or imagined, must be set the survival (or artificial resurrection?) of Iranian and other indigenous proper names into the Roman imperial period, and ambiguous cultural behaviour like that of Mausolus, already considered.

Alexander's own aims in this department have not escaped the re-examination to which the rest of his behaviour and career have been exposed in the years since the Second World War. *Plutarch's enthusiastic view of Alexander the Hellenizer was always suspect, and the opposite, modern, view—Hellenization as an instrument of oppression—was never wholly convincing. P. Briant (see his entry COLONIZATION, HELLENISTIC in this work) now offers a subtler conception: the indigenous populations were neither marginalized on the one hand, nor subjected to enforced Hellenization on the other. Whatever Alexander's intentions, exciting new evidence like that from Kandahar in Afghanistan shows that the Greek culture introduced by him flourished thousands of miles from the old Greek centres (see also AI KHANOUK; and note SEG 20. 326, a bilingual (Greek and Aramaic) Buddhist text from 3rd-cent. BC Kandahar).

Similar, though worse, problems of understanding arise with the *Seleucids. Their foundation of enduring Greek *poleis* (see POLIS) has long been reckoned as an impressive Hellenizing achievement, and here too (see ICAROS, mod. Failaka) epigraphic evidence speaks eloquently about geographical areas on which the literary sources are silent. But recent work (A. Kuhrt and S. M. Sherwin-White, *Hellenism in the East* (1987) and Sherwin-White and Kuhrt, *From Samarkhand to Sardis* (1993)) has tended to emphasize the continuity between Achaemenid Persian and Babylonian structures (see SELEUCIDS). Traditionalists will however still wish (see esp. F. Walbank, *LCM* 13 (1988), 108 ff.) to protest that the Seleucids never forgot that they were a Graeco-Macedonian dynasty; and it has been convincingly shown (C. Habicht, *The Hellenistic Monarchies* (2006), ch. 3 and p. 290, replying to critics) that the number of indigenous personnel employed by the Seleucids was very small. In one troubled area of policy, Seleucid treatment of the *Jews, the modern debate has been specially lively (M. Hengel, *Judaism and Hellenism* (1974); Millar, *Journal of Jewish Studies* 1978, 1 ff.). How far are early 2nd-cent. developments (see MACCABEES) to be attributed to a 'Hellenizing

Hellenism, Hellenization This life-size marble statue of a charioteer, carved c.460 BC, was found in 1979 at Motya, one of the great military and commercial strongholds of *Carthage in *Sicily. Undoubtedly carved by a Greek hand, it exemplifies the Hellenic cultural influence to which this Carthaginian enclave was open. Both views Whitaker Museum, Motya. Regione Siciliana Assessorato dei Beni Culturali e dell'Identità Siciliana, Soprintendenza Beni Culturali ed Ambientali U.O.VIII per I Beni Archeologici, Trapani

party' in Judaea itself and how much to Seleucid insistence?

At Rome too, the acceptance or rejection of cultural Hellenism remained an issue (see PHILHELLENISM; CATO (THE ELDER)) even after the possibility of Greek or Macedonian military or political victories over Rome had evaporated.

The Greek *polis* and its culture not only survived into the Roman period; the introduction of the *polis* was the normal method by which Romans imposed their own authority in the Greek east (though 'polis' by that time did not quite mean the same as in the days of the Delian League; see further ROMANIZATION (In the east), and F. Millar in M. H. Hansen (ed.), *The Ancient Greek City State* (1993)). There is plenty of evidence, especially epigraphic, for élite acceptance of this long-lasting blend of Greek and Roman values. But inscriptions and literary texts are never the whole story; and in Asia Minor, in particular, the attachment to cultural systems other than those of Hellenism continues to be traceable until very late dates. Large allowance must, then, be made both for the tastes of groups other than the élites whom alone our evidence allows us to see, and for the assertive awareness, by the élites themselves, of the non-Greek dimension to their own past. This is particularly true of Asia Minor. Nevertheless it is remarkable that highly traditional Greek forms of discourse should have been used to negotiate a relationship with non-Greek culture in the Hellenistic period proper (Parsons). It is also remarkable that these same traditional literary forms (including and especially *rhetoric and *epigram), and also that traditional pagan Greek *religion (including and especially *oracles (see R. Lane Fox, *Pagans and Christians* (1986))), should have propelled Hellenism as far into late antiquity as they did. Even in Byzantine antiquity, Christian epigrammatists catch perfectly the idioms of pagan Hellenism. See also GREEK LANGUAGE; JULIAN. SH

Hellenistic philosophy While the history of Greco-Roman philosophy is essentially continuous, it has long been customary to recognize distinct periods, each with its own characteristics. 'Hellenistic philosophy' is one such period, beginning with the foundation of several new philosophical schools and movements in the late 4th cent. BC, after *Alexander the Great's conquests and the consequent dramatic expansion of the Greek cultural zone. The end of the period is more controversial, with some leading specialists arguing for a date around 100 BC and others preferring the date of the battle of *Actium (31 BC), when Roman political influence in the eastern Mediterranean was consolidated. A case has also been made for 86 BC, the date of the sack of *Athens by the Roman

general *Sulla as result of the Mithradatic wars (see MITHRADATES VI). Regardless of the terminus chosen, the key political and social development relevant to the end of the period is the rise to dominance of Roman power in the area of the Hellenistic kingdoms; philosophically, the most significant markers of the change were the decline or closure of important schools in Athens, the beginnings of commentarial study of the texts of *Plato and *Aristotle, and the abandonment of scepticism within the *Academy. All of these developments unfolded during the 1st cent. BC.

The school whose foundation marks the beginning of the period was *Epicurus' Garden. An Athenian citizen, Epicurus (342/1–271/0) first taught at Mytilene and Lampsacus and founded his own school in Athens in 305/4. He and his early followers (including his successor as head of the school, Hermarchus of Mytilene) established a doctrine based on a version of *atomism, an empiricist theory of knowledge, an ascetic form of hedonism in ethics, and a political theory characterized by a form of contractarianism. The school was known for loyalty to the founder and relatively stable doctrines over time. Epicureanism spread throughout the Mediterranean world, especially Anatolia and central Italy, where it flourished among the Roman élite in the 1st cent. BC; it lasted long after the Hellenistic period ended.

The other major school whose foundation marks the Hellenistic era is *Stoicism. Zeno, from Citium on *Cyprus, was probably born in 334/3 BC and founded his school in Athens c.300. He led the school until his death in 262/1, by which point it had become a dynamic and growing philosophical movement characterized by vigorous internal debate among philosophers such as Cleanthes of Assos (his successor), Ariston of Chios, Herillus of Carthage, and Dionysius of Heraclea Pontica, on the shores of the Black Sea. Unified by a variety of Socratic commitments (see SOCRATES) and influenced by *Cynic philosophers among others, Stoicism reacted against Platonic and Academic philosophy both in metaphysics and in epistemology, but tended to share its commitment to providential teleology in cosmology. The most influential Stoic of the Hellenistic period was the third leader, Chrysippus of Soli, whose career spanned the 3rd cent. BC and whose students dominated the school for the next two generations. Towards the end of the Hellenistic period some Stoics took a renewed interest in Plato and Aristotle, though the school remained distinct and independent in doctrines until well into the Roman imperial period.

The Academy predates the Hellenistic period; its fourth leader, Polemon, was reputed to have taught Zeno of Citium and so influenced early Stoic philosophy. The

characteristically Hellenistic phase of the Academy, though, began with Arcesilaus (who became sixth scholarch in the 260s). His turn to scepticism changed the focus of Plato's school for generations. Arcesilaus and later Carneades in the 2nd cent. BC opposed Stoic dogmatism in many areas and these inter-school debates grew to be characteristic of the Hellenistic era. At the end of the period, the Academy gradually returned to a more dogmatic form of Platonic philosophy; as it did so, scepticism was championed by Aenesidemus, who founded (or revived) Pyrrhonism.

Cynic philosophy continued to flourish throughout the Hellenistic period, as did the Cyrenaic school and several minor movements. The Peripatetic school founded by Aristotle's successor Theophrastus (also known as the Lyceum) continued to be a powerful philosophical force, especially in physics and the sciences; in the conventional historiography of ancient philosophy its importance is often and unjustifiably slighted during the Hellenistic period, but the impact of Peripatetics in the 2nd and 1st cents. BC was considerable, especially in ethics and physics.

BI

Hephaestus Greek god of fire, of blacksmiths, and of artisans (see ARTISANS AND CRAFTSMEN). The name, of uncertain etymology, has no certain attestation in Linear B, though there is the possibility of reading a theophoric name in Minoan Cnossus. See MINOAN CIVILIZATION.

In *Homer, Hephaestus is so closely connected with fire that earlier scholars felt tempted to derive the god from the element: he owns the fire (e.g. *Il.* 9. 468) and helps fight Scamander with it (*Il.* 21. 328–82); in a formula, his name is metonymically used for fire (*Il.* 2. 426 etc.). On the other hand, he is the divine master-artisan who fabricates *Achilles' shield and miraculous automata, self-moving tripods (*Il.* 18. 373–9), golden servant maidens (ibid. 417–21), or watchdogs for king Alcinoos (*Od.* 7. 91–4, after oriental models). In the divine society of Homer, he is an outsider: he works, even sweats (*Il.* 18. 372); he is laughed at when he tries to replace Ganymedes (*Il.* 1. 571–600); he is married to *Aphrodite but cuckolded (*Od.* 8. 267–366); his feet are crippled (in Archaic iconography they are turned backwards): the outsider even lacks divine bodily perfection. His mother *Hera had conceived him without a male partner (Hes. *Theog.* 927; *Zeus as father *Il.* 1. 578, 14. 338; *Od.* 8. 312), as Gaia had done with some monsters; seeing the crippled offspring, she cast him out of Olympus, and he grew up with the sea goddesses Eurynome and Thetis (*Il.* 18. 395–405); or Zeus had thrown him out because he had sided with Hera, and he had landed on Lemnos where the indigenous Sinties tended him (*Il.* 1. 590–4). But he is not to

be underestimated: his works evoke wonder; when serving the gods he intentionally provokes laughter; and he takes his cunning revenge on *Ares and Aphrodite and on Hera, and is brought back into Olympus (Alc. 349 LP). Thus, the Homeric picture preserves among an aristocratic society the physiognomy of a cunning blacksmith whose professional skills are highly admired and secretly feared, and whose social skills should not be underrated. It is very much the position blacksmiths have in Archaic societies. With the exception of Athens (see below), later mythology continues without fundamentally new concepts. His workshop was located beneath active volcanoes, especially Aetna, and the Cyclopes were assigned to him as his workmen; he was also connected with natural fires, like the one on Lycian Olympus (Sen. *Ep.* 79. 3). That he had created mankind (Lucian, *Hermot.* 20) is but a witty extrapolation from his role in the creation of Pandora (Hes. *Op.* 70 f.).

Foremost among his cult places is the island of Lemnos where he landed when thrown out from Olympus. One of its two towns is called Hephaestia, with a sanctuary whose priest was eponymous. He is connected with the mysteries of the Cabiri whose father he was (Hdt. 3. 37; Samothracian mythology according to Strabo 10. 3. 20 f., 472 C) and whose ritual structure may derive from secret societies of blacksmiths. The Homeric Sinties were regarded as pre-Greek Thracians (Stephanus of Byzantium entry under *Lēmnos*) or *Etruscans (*Tyršēnoi*, schol. Ap. Rhod. 1. 608), and the cult in the Lemnian sanctuary of the Cabiri begins before the Greek settlement; thus, non-Greek elements play a role in this cult, reinforcing the marginality of Hephaestus.

Better known is the Athenian cult where he is connected with Athena, the goddess of cunning intelligence. In his sanctuary above the Agora ('Theseion'), which was built after 450 BC, there stood a group of Hephaestus and Athena Hephaestia, set up in 421/0 by Alcámenes (Cic. *Nat. D.* 1. 83). At the same time, the festival Hephaestia in honour of Hephaestus and Athena was reorganized as a *pentetēris* (festival celebrated every fifth year) with a splendid torch-race and lavish sacrifices (LSCG 13): the splendour of the festival reflects the position of artisans in the Athenian state. The same holds true for the Chalkeia on the last day of Pyanopsion, a festival dedicated to Athena and Hephaestus when the artisans went in procession through the town (Soph. fr. 844 Radt). The god was also important in the Apaturia when the participants in their best robes and with torch in hand offered a hymn and a sacrifice to the god (Harp. entry under *lampas*). Here and in the Hephaestia, the torch alludes to the theme of new fire (which is also present in the Lemnian cult). Athenian mythology tells of Hephaestus'

abortive attempt to rape *Athena; from his spilled semen grew Erichthonius, the ancestor of the autochthonous Athenians—the myth explains Hephaestus' role in the Apaturia and the theme of (new) beginnings.

He was very early identified with Roman *Vulcan (F. Coarelli, *Il foro romano: periodo arcaico* (1983), 177) and with Etruscan Sethlans.

In Archaic iconography, Hephaestus appears especially in the scene of his return to Olympus under the guidance of *Dionysus. He is also shown helping Zeus to give birth to Athena (east pediment of the Parthenon) and in the assembly of the gods. The statue of a standing Hephaestus by Alcamenes with a discreet indication of his limp was famous (Cic. *Nat. D.* 1. 83). FG

Hera This major figure in the pantheon, daughter of Cronus and wife of *Zeus, is already attested by name on two Mycenaean tablets, one from Thebes (TH Of 28), the other from Pylos (PY Tn 316), where she appears together with Zeus. In continental Greece, the *Peloponnese is the region where the cult of Hera is most prevalent. According to Homer (*Il.* 4. 51–2), Hera's favourite cities were Argos, *Sparta, and Mycenae; several cults are actually attested at Sparta, and her most famous sanctuary was on the hill dominating the Argive plain, where there was a temple perhaps from the 8th cent. BC. Sanctuaries with buildings at least as ancient are known at Perachora, Tiryns (on the site of the megaron of the Mycenaean palace), and *Olympia. Of island sites, the best known is the sanctuary on *Samos, where the main building, rebuilt in the 6th cent. BC, was mentioned by Herodotus, who comments on its magnificence (3. 60). Thus, as Burkert observes (*GR* 131), the most ancient and important temples were those of Hera. Her cults also spread at an early date to the colonies of the west, where later she became identified with the Roman *Juno. Her sanctuaries on the Lacinian promontory (near Croton) and at the mouth of the Sele (near Paestum) were much frequented.

In the Classical period, Hera's distinguishing feature compared with other goddesses is her double connection with royalty and marriage. In this way she is closely associated with Zeus, who made her 'last of all, his flourishing wife' (Hes. *Theog.* 921). Her queenliness and noble beauty are abundantly stressed in her epithets and in artistic representations. The ancient formula *potnia Herē* is succeeded by that of *basileia*, 'queen'. She is described as 'golden-throned', and is often thus represented, sometimes seeming to surpass her husband in importance: at Olympia, an Archaic statue showed Zeus standing beside Hera enthroned, while in the Argive Heraion the famous chryselephantine statue by Polyclethus showed

her holding a sceptre with Zeus in the form of a cuckoo perched on it—in her other hand she held a pomegranate; and on her head-dress were figures of the Charites and the Horae (Paus. 2. 17. 3–4). One of Plato's myths (*Phdr.* 253b) clearly underlines her royal qualities: according to this the followers of Hera are those who seek in love a 'kingly nature'.

Marriage is stressed constantly in Hera's myths and cults. It is attested by epithets such as Gamelia, Gamostolos, Syzygia, Zeuxidia, and especially Teleia, sometimes in connection with Zeus Teleios. Rituals in her honour connected with a sacred marriage are recorded in various places, notably in Athens, where this marriage served as a social and institutional paradigm: at the festival of Theogamia, celebrated in Gamelion, the divine couple were given the title of *prytaneis tōn gamōn*, 'magistrates of marriages' (schol. on Ar. *Thesm.* 973–6). In Crete, the marriage was re-enacted annually at the river Theren 'in imitation of weddings' (Diod. Sic. 5. 72. 4). But Hera was not only the patron of marriages; she was often given the title of *Parthenos*, 'girl', and associated with prenuptial rites, including sometimes the lying together of the two sexes (Callim. fr 75 Pf.; cf. Hom., *Il.* 14. 295 with scholia). At Stymphalus, Hera was called simultaneously *Pais* 'child', *Teleia* 'wife', and *Chēra* 'widow' or 'separated', thus covering the whole life of women, with its turning-points. A similar idea was connected to an Argive spring, where every year, Hera was thought to restore her virginity (Paus. 2. 38. 2).

Motherhood, though part of Hera's personality, is little stressed, particularly in cult. Her children are Ares, Hebe, and Eileithyia, goddess of childbirth, whose name she bears at Argos; in her sanctuary at Paestum, she is sometimes shown as a *kourotrophos* ('child-nurturer'). She suckled *Heracles, a scene often shown on Etruscan mirrors, but her relationship with the hero, whose name could be taken to mean 'glory of Hera', is ambivalent. She acted as nurse to monsters born to Earth, the Lernaean Hydra and the Nemean lion; in addition she was the sole parent of the monster Typhon and also, according to Hesiod (*Theog.* 927–8), *Hephaestus, whom she produced in anger, to defy her husband. But these episodes by their exceptional nature in fact illustrate Hera's close links with the marriage bond, which she herself protects and guarantees.

The marriage of Zeus and Hera is part of a complex symbolism including the natural world of plants and animals. This is shown by Hera's oldest sanctuaries, which are often situated in fertile plains away from urban settlements. The statue of Polyclethus mentioned above is relevant here. The divine union described by Homer (*Il.* 14. 346–51), despite the alterations due to epic, still bears

traces of this natural symbolism, and we also find mentioned the flourishing garden at the edge of the Ocean, which served as marriage-bed for the two deities (e.g. Eur. *Hipp.* 748–51). We can see a relationship between the goddess called Boöpis (‘ox-eyed’) and herds of cows, and also with horses, especially in connection with a sacred marriage. Io, changed into a heifer by Zeus in bull form, was the priestess of Hera at Argos, where Hera’s rule extended over the animal herds of the plain. At *Olympia, where Hera Hippiā (‘of horses’) was worshipped alongside *Poseidon Hippios, contests among girls had been established in honour of the goddess by Hippodamia in thanks for her marriage to Pelops. These facts may be linked with two other chthonian features, isolated as they are: the oracles of Hera, at Perachora and Cumae, and the funerary cult given to *Medea’s children in one of Hera’s sanctuaries at Corinth.

Hera was also worshipped as protector of cities and other social groups, especially at Argos and on Samos. It is in this context that she is sometimes shown armed. At Argos the prize at the games held during the Heraia festival was a shield. Despite this protecting function, it is noteworthy that literary presentations, from the *Il.* onwards, tend to stress the destructive and capricious side of Hera’s nature.

As with most of the Greek pantheon, Hera’s origins are unclear. There is no certain etymology for her name; if the modern consensus sees Linear B *Era* as the feminine of *hērōs*, this itself has given rise to differing interpretations. The supporters of an Indo-European origin from the root **yer* explain the name variously as meaning ‘heifer’, ‘the goddess of the year’, or ‘a girl of marriageable age’. Others incline towards a pre-Greek origin for both Mycenaean words. But a solution to the problem of the name would not explain the whole issue of Hera’s origin. Associated as she is with Zeus from the Mycenaean period onwards, it is clear that Hera preserves certain characteristics of an Indo-European divine couple; but searching for the origin of Greek gods is not a simple task and, even though this might be possible for Hera, we would not necessarily better understand her functions in the Greek pantheon. AMOT/VP-D

Heracles, the greatest of Greek heroes. His name is that of a mortal (compare Diocles), and has been interpreted as ‘Glorious through *Hera’. In this case, the bearer is taken as being—or so his parents would hope—within the protection of the goddess. This is at odds with the predominant tradition (see below), wherein Heracles was harassed rather than protected by the goddess: perhaps the hostility was against worshippers of Heracles who rejected allegiance to the worshippers of Hera on

whom the hero depended. This could have happened when Argos had established control over the Heraion (a temple to Hera, some distance from Argos itself) and Tiryns (possibly reflected in an apparent falling-off of settlement at Tiryns late in the 9th cent. BC: A. Foley, *The Argolid 800–600 BC* (1988) 40–2). Some of the inhabitants of Tiryns might have emigrated to Thebes, taking their hero with them. Traditionally Heracles’ mother and her husband (Alcmene and Amphitryon) were obliged to move from Tiryns to Thebes, where Heracles was conceived and born (*LIMC* 1/1. 735). However, there is no agreement over the etymology of the name, an alternative version deriving its first element from ‘Hero’.

Heracles shared the characteristics of, on the one hand, a hero (both cultic and epic), on the other, a god. As a hero, he was mortal, and like many other heroes, born to a human mother and a god (Alcmene and *Zeus; Amphitryon was father of Iphicles, Heracles’ twin: the bare bones of the story already in Homer, *Il.* 14. 323–4). Legends arose early of his epic feats, and they were added to constantly throughout antiquity. These stories may have played a part in the transformation of Heracles from hero (i.e. a deity of mortal origin, who, after death, exercised power over a limited geographical area, his influence residing in his mortal remains) to god (a deity, immortal, whose power is not limited geographically).

Outside the cycle of the Labours (see below), the chief events of Heracles’ life were as follows: Hera pursued him with implacable enmity from before his birth, which she managed to delay until after that of Eurystheus. She then sent serpents to Thebes to attack Heracles in his cradle, but the infant strangled them. Later, she drove him mad and caused him to murder his Theban wife, Megara, and their children (there are different versions). In his youth, Heracles led the Thebans in their successful revolt against Minyan Orchomenus. He also took part in an expedition against Troy and sacked Oechalia (*LIMC* 5/1. 111–13), accompanied the Argonauts (113–14), founded the *games at *Olympia, and ultimately died by burning on Mt. Oeta (128–9: death came as a relief from the poison given him inadvertently by his wife Deianira, who had hoped to regain his love thereby: the dying *Centaur Nessus, from whom Heracles rescued his wife, had given her the poison as a love potion. She used it when Heracles took Iole home).

The Labours themselves (twelve is the canonical number, but there is little agreement on the full complement) support, by their geographical distribution, the contention that, however popular Heracles became in other parts of the ancient world, his origins were in the *Peloponnese, and more specifically in the Argolid. He was sent to perform them by Eurystheus of Argos, to

Heracles An Athenian vase (c.490 BC) shows the conventional image of Heracles in Greek art as a bearded, athletic male in his prime, carrying his club and lion-skin cape. Here he defends his seizure of the Delphic tripod. © Martin von Wagner Museum, University of Würzburg. Photo: K. Oehrlein

whom he was bound in vassalage. Six belong to the northern part of the Peloponnese, and might be taken to represent either a gradual spread of Argive ambitions in that region, or, with equal likelihood, the growing popularity of Heracles over a steadily widening area. These tasks were to deal with (1) the Nemean lion (northern border of the Argolid); (2) the Lernaean Hydra (SW Argolid); (3) the Erymanthian boar (NW Arcadia); (4) the hind of Ceryneia (Achaëa); (5) the Stymphalian birds (NE Arcadia); (6) the stables of Augeas (Elis). The other Labours are situated at the ends of the habitable world or beyond: the Cretan bull to the south, the horses of the Thracian Diomedes to the north, the quest for the belt of the *Amazons queen to the east, the search for the cattle of Geryon to the west, the apples of the Hesperides at the edge of the world, and Cerberus in the world of the dead. Many but not all of the Labours are already depicted in Greek art of the geometric and early Archaic periods (*LIMC* 5/1. 5–111 and 187). Also early to appear are two feats outside the canon, a fight against Centaurs (187), and a struggle with *Apollo for the Delphic tripod (133–43 and 187). The encounters with Centaurs take place in Arcadia and Thessaly; the fight with Apollo might reflect a struggle for political control over *Delphi between its inhabitants and those of Malis (Trachis and Mt. Oeta). A good survey of Heracles' Labours (*Praxeis*) and *Parerga* (incidental labours) in art is given by T. H. Carpenter, *Art and Myth in Ancient Greece* (1991), 117–34.

The iconography of Heracles was firmly established by the Archaic period, but even before then it is possible to identify him from the subject-matter. The major identifying symbols were the lion-skin cape and hood (flayed from the Nemean lion), his club, and his bow and arrows (*LIMC* 5/1. 183–6).

Throughout his life and many adventures, Heracles was guided closely by *Athena (*LIMC* 5/1. 143–54), by whom he was introduced to Olympus after his death (122–8). The apotheosis of Heracles was represented in literature and art by giving him—after his death—a wife in the person of Hebe, i.e. 'youth', or rather the embodiment of the prime of life, for it is the permanent possession of this boon which most distinguishes gods from men. The story is attested definitely by the 6th cent. BC (121–2 and 160–5). In popular cult, Heracles was recognized and invoked as a god from at least late in the 6th cent. (e.g. the inscription *CEG* 1. 309 = *IG* 1². 825 = *IG* 1³. 1017 from Phaleron). *Herodotus (2. 44. 5) writes approvingly of those Hellenes who worshipped Heracles both as an immortal Olympian and as a hero. The practice must have been common, if not widespread (cf. Pind. *Nem.* 3. 22: Heracles a 'hero god').

As in the case of Apollo, his divine rival for the Delphic tripod, the cult of Heracles spread at least partly through the absorption of local cult figures—in Heracles' case, mostly heroic—of similar nature. Individuals adopted Heracles as a more or less personal patron; at the communal level, he presided over ephebes (young men in military training) as their ideal in warfare and their patron in military training, whence his patronage of the *gymnasium (a role often shared with Hermes), and over the young in general (Kearns 35–6). He was primarily associated with the activities of men rather than women, which may explain the regulations barring women from his rites or even his sanctuaries, e.g. *LSS* 63 (Thasos), *LSAM* 42 (Miletus). Occasionally, however, the character of the local hero whom Heracles had deposited might override the general practice, as in the case of the western Boeotian Charops Heracles, who was served by a priestess.

The geographical distribution of his cults is, as one might expect, as wide as that of his legends. Interestingly, evidence from Tiryns and Argos, although early in the former, is sparse (Tiryns: *SEG* 30. 380. 15a, first half of the 6th cent.; Argos: his name scratched on two fragments of an Attic crater of the fourth quarter of the 5th cent., *SEG* 49.367). That he was established at Thebes by the Homeric period cannot be doubted, although the earliest contemporary evidence for cult occurs at Thebes in the late Archaic period and the 5th cent. (*Arch. Rep. for 2004–2005*, 47–8; for 2005–2006, 55). He was worshipped fairly widely throughout Boeotia, and neighbouring Attica.

One of the earliest places to produce archaeological evidence for a cult of Heracles is the sanctuary on Mt. Oeta, site of his immolation (Béquignon 206–15). Another important early site is at Thasos, where evidence extends from soon after the foundation of the colony. The Thasian cult exemplifies several features of the worship of Heracles: first, his treatment as a god; second, his function as *promachos*, champion or protector, of the community (particularly its urban centre); third, the tendency to syncretize Heracles with other deities, local or otherwise, in the case of Thasos, the other being Melqart of Tyre.

The sanctuary at Thasos, which may be typical, included not only a sacrificial area, but also a temple and extensive dining facilities (the last often illustrated in vase-painting and so probably typical); descriptions of other Herakleia (e.g. at Thebes: Paus. 9. 11. 4–7) would lead us to expect the existence of extensive athletic facilities as part of the complex. All of this public devotion to bodily well-being would have helped to produce the impression of Heracles as a boisterous glutton.

As noted above, Heracles was adopted by individuals or states as a symbol or protecting deity, to which

numerous towns named after him bear eloquent testimony. Boeotian Thebes used Heracles as its symbol from at least the second half of the 5th cent. BC, if not earlier. In the preceding century *Pisistratus of Athens made Heracles his personal divine protector and legitimator of his actions (but see IMAGERY; PROPAGANDA). The Macedonian royal family ('Argeads') claimed lineal descent from Heracles for similar motives (see HELLENISM; KINSHIP). Most notoriously, however, the Dorian rulers of the Peloponnese sought to legitimate their claims to sovereignty by tracing their descent to Heracles through his sons, the Heraclidae, who, as the tale was told, 'returned' to the Peloponnese from the north to claim their inheritance. ASCH

Herculaneum (see ◀Map 3, Bc▶) Roman *municipium* on a spur of Vesuvius commanding the coast-road, 8 km. (5 mi.) south-east of Naples (Strabo 5. 4. 8). An independent member of the Samnite league centred on Nuceria in the 4th cent. BC and subsequently allied to Rome, it joined the allied cause in the Social War of 91–89 (see ROME (HISTORY) §1.5): Oscan civic institutions were replaced by Roman ones in 89 BC. Its origins are still obscure, though the regular street-plan and the name suggest that it may have been a dependency of the Greek *apoikia* (colonial settlement) at Naples (perhaps of the 6th or 5th cent.).

Recent discoveries have made its municipal life seem comparably vigorous with its neighbours', but restricted hinterland, limited communications, and a small harbour denied it much economic opportunity. On present evidence, the streets (whose plan is more regular than that of *Pompeii) show little sign of heavy traffic (nor are there stepping-stones for pedestrians); shops and workshops are unobtrusive. As the centre of a resort-coast, however, renowned for its beauty and salubrious climate, and close enough to Naples to be a kind of luxury suburb, the town benefited from the wealth of local proprietors (including Roman senators). The grandest property (known from its rifling in 1750–61), the Villa of the Papyri, north-west of the town, on terraces overlooking the sea, was embellished with gardens, waterworks, and statues and inspired the mod. Getty Museum, Malibu (USA). The name derives from the 1785 papyrus scrolls found there. Though carbonized, these can be painstakingly unrolled: Epicurean in taste (see EPICURUS), they include many of the works of Philodemus of Gadara. Many of the town houses were also expensively equipped. See HOUSES, ITALIAN.

The town was damaged by the *earthquake of AD 63 and obliterated by the eruption of AD 79. Deeply buried by ash which solidified to form a tufaceous rock, the

remains (especially organic material such as wood or papyrus) are better preserved, but much more difficult to excavate, than those of Pompeii. The first explorations, using tunnels, date from the early 18th cent.; some 5 ha. (12 acres) have since been completely uncovered (representing only about a quarter of the urban core and inner suburbs). The houses appear less atrium-centred and generally more varied in plan than those of Pompeii; they preserve considerable evidence of the upper stories (e.g. the Casa a Graticcio, built of rubble in a timber frame). Public buildings, mostly dating from the Julio-Claudian period, are much less well attested (a theatre and basilica were recorded by the first excavators: a modest forum, essentially the widening of the Decumanus Maximus, and a large palaestra lie on the edge of the existing site). On the ancient coast are important baths (the 'Terme Suburbane'), and recent work has uncovered the skeletal remains of many dozens of the inhabitants killed at the harbour while attempting to escape the eruption. NP

heresy The Greek word *hairesis*, 'choice' or 'option', was used for a school of thought in philosophy or medicine. Followers of one school often disagreed with the beliefs of other schools, but Christian authors are especially fierce in denouncing 'heresy'. For them, *hairesis* is false belief about human beings in relation to God: it endangers the soul by departing from *orthodoxia*, 'right thinking', and it must be inspired by human arrogance or by demonic deception. Most information on heresies comes from opponents who listed and attacked them. *Eusebius (*Hist. eccl.*) presented heretics as an internal threat to the church, more dangerous than persecution. This influential model of orthodoxy resisting attack from heresies has been challenged, both by the rival suggestion that orthodoxy developed in response to heresies, and by efforts to reconstruct and reassess the arguments of heretics, helped especially by new discoveries of Gnostic and Manichaean texts.

Bishops could excommunicate heretics (i.e. exclude them from communion). Heresy became political when *Constantine I intervened to prevent disputes among Christians. He set a precedent by exiling, then recalling, the Alexandrian priest Arius; but his son Constantius II favoured Arian theology and its supporters. Laws of the 4th and 5th cents. (collected in *C.Th.* 16.5) imposed fines and loss of privileges on heretics, and banned them from teaching and assembly. These were probably responses to complaints, not a campaign of repression, but pressure on heretics became more intense as divisions persisted and theology became a marker of group identity. EGC

Hermes Already attested among the Mycenaean pantheon (tablets from Cnossus in *Crete, Pylos, and

Thebes), the god has no original connection with the *herma* or cairn of stones, as was once thought. Myths about Hermes are mostly concerned with his childhood, told in the *Homeric Hymn to Hermes* (last third of the 6th cent. BC). He was the son of *Zeus and the nymph Maia, born on Mt. Cyllene in Arcadia. On the day of his birth, he left his cradle, found a tortoise which he made into a lyre, then went to Pieria where he stole 50 cows belonging to *Apollo, which he led backwards to a cave where he sacrificed two and hid the others, before returning to Cyllene; finally he made up the quarrel with Apollo. Later, he invented the syrinx (pipe) and was taught divination by Apollo. Apart from these stories of his childhood, Hermes plays only a secondary part in other myths. He has no recognized wife, but two sons, Eudorus and *Pan, are attributed to him. He is characterized by a great variety of functions. Above all, he is a messenger god, who carries out the orders of Zeus with due respect. In this capacity, he appears as a subordinate deity, giving the ultimatum of Zeus to Prometheus, for instance, or acting as his go-between when he is enamoured of Ganymedes. He is generally well disposed, and negotiates the ransom of *Hector with pleasantness and good humour. His titles stress his speed and beneficence. He is also the god who guides: he shows transhumant shepherds the way and leads teams of animals; he guides people, especially travellers, for whom he marks out the route in the form of a pillar or herm (see below). He takes divine children to safety (thus he gives *Dionysus to the Nymphs of Nysa, as depicted in the famous statue by Praxiteles, and Arcas to Maia, and is generally a patron of children (*Heracles, *Achilles); he also helps heroes such as Perseus, for whom he obtains the bronze sickle used by the hero to decapitate Medusa, and Heracles. He leads *Hera, *Aphrodite, and *Athena to Paris, the judge in their beauty contest. As god of movement, he is leader of the Nymphs and the Charites. Finally as *psychopompos* (one who escorts *souls), he leads the dead to *Hades, summoning them to the journey beyond, taking them by the hand and accompanying them on to Charon's boat.

Another aspect of Hermes is that of a god of abundance, fertility, and prosperity (*Hym. Hom. Merc.* 529). He is the patron of herdsmen and of the fruitfulness of herds and flocks; he is himself a cowherd and shepherd (*ibid.* 491–4). This form of Hermes is called Nomios, 'pastoral' and Epimelios, 'presiding over sheep', and is often shown in art as Hermes *kriophoros* ('ram-bearing'), especially in Arcadia and Boeotia. He is also sometimes a 'lord of animals', of horses in particular. More generally, he is the god of every kind of prosperity. The herm, a quadrangular pillar topped with a head, with tenons on its sides and a phallus on the front, was very popular from the end of the

Hermes: Four-cornered pillars called 'herms', featuring a bust of Hermes and an erect phallus (symbolizing masculine strength), were set up in public and at private doorways as protectors of houses and cities. This 6th-cent. BC example comes from the Aegean island of Siphnos. Photo: Hermann Wagner, DAI Athens, neg. no. D-DAI-ATH-NM 4072. All rights reserved

6th cent. onwards, and not only recalls Hermes' powers of fertility but, as an apotropaic talisman, also guarantees the success of all sorts of undertakings. It is found in towns both at the threshold of houses and inside them, and became a sort of mascot bringing luck both to cities and to individuals (the mutilation of the herms at Athens was perceived as a bad omen on the eve of the Sicilian expedition: Thuc. 6. 27. 3). In the same context, Hermes is also the god of trade (on Delian seals of the Hellenistic age he appears holding a purse).

Hermes is an ingenious god, expert in both technology and magic. From his birth onwards, he was skilled in trickery and deception, and in the *Homeric Hymn* (292) he is 'prince of thieves'. Even in cult, he is attested as tricker and thief (Hermes Dolios at Pellene in Achaëa and Hermes Kleptes in Chios). But most often he uses his power in mischief, illusion, and mystery. He creates a lyre out of the shell of a tortoise, he puts on his feet sandals which erase footprints. He is an expert in knots and chains. Like a magician he knows how to put the enemy camp to sleep (*Il.* 24) and to call up the dead. As a corollary, this god of *mētis* (prudence, cunning) and of meditation (see L. Kahn, *Hermès passe ou les ambiguïtés de la communication* (1978)), has no part in violence. He is the least warlike of the gods; he is dragged into the battle with the *Giants, and linked with murder only in the story of the monster Argus. He prefers persuasion to weapons, and appears frequently as patron of orators. He can also be a musician: he is the inventor of the syrinx, and accompanies the dances of the Nymphs and the Charites. Only in a late period, as Trismegistus ('thrice-greatest'), does he come to preside over mystical revelations, as the successor to the Egyptian god Thoth and god of the 'hermetic'. A final function of Hermes, attested above all from the 4th cent. BC, is that of god of athletes—one linked, no doubt, to the youthful appearance and charm which the god assumed for seduction (*Il.* 24. 376–7, 433). See ATHLETICS. In this role he is frequently associated, particularly in the *gymnasium, with *Heracles. He even became, at a late date, the god of the school and of *education.

Hermes' main aspects are shown in his physical appearance and iconography. His attributes are the caduceus (*kērūkeion*), the herald's sign which he almost always carries, the traveller's hat (*petasos* or *pilos*), with or without wings, and the winged sandals which evoke his quality of speed. He is generally bearded in the earlier period, but an unbearded type develops from the 4th cent. onwards. He is clothed in a *chlamys* or a *chlaina*, with sometimes a furry leopard-skin. Side by side with this very frequent representation of the god of herds and flocks, the god of music, the messenger and guide, or the chthonian god (e.g. as subterranean

guide), we find the herm (see above), whose identity as Hermes is sometimes stressed by a caduceus painted on the shaft. This form, attested in sculpture as well as on vases, was very popular and could symbolize most of the functions of the god. In some cases, especially to indicate Hermes as god of the gymnasium, the pillar wears a cloak.

The cult of Hermes is particularly widely diffused in the Peloponnese, where Pausanias mentions numerous myths, rituals, cults, and herms. Passing over the more ordinary examples (Pellene, Pheneos, and Mt. Cyllene, Megalopolis, Tegea, Corinth, Argos), we may point out the oracular ritual in front of a pillar of Hermes at Pharaë in Achaëa (Paus. 7. 22. 2). In Athens, Hermes had a very ancient cult (cf. the *xoanon* or ancient statue dedicated on the Acropolis by Cecrops), and in the form of the herm he was present everywhere in the city. The Hermaia, a young boys' festival, were celebrated in his honour. His cult is also attested in Boeotia (Tanagra) and in the Cyclades: at *Delos he is the god of the gymnasium. At Cydonia in Crete, the Hermaia were a popular festival where slaves took the part of their masters. Hermes was not a major divinity, but because he was essentially kindly, he was one of the most familiar gods in the daily lives of the Greeks. MJ

Herodotus (*see following page*)

Hesiod, one of the oldest known Greek poets, often coupled or contrasted with *Homer as the other main representative of early epic. Which was the older of the two was much disputed from the 5th cent. BC on (Xenophanes in Gell. *NA* 3. 11. 2; Hdt. 2. 53; *Ephorus, *FGrH* 70 F 101, etc.): Homer's priority was carefully argued by Aristarchus, and generally accepted in later antiquity. Hesiod's absolute date is now agreed to fall not far before or after 700 BC. Of his life he tells us something himself: that his father had given up a life of unprofitable sea-trading and moved from Aeolian Cyme to Ascrea in Boeotia (*Op.* 633–40); that he, as he tended sheep on Mt. Helicon, had heard the *Muses calling him to sing of the gods (*Theog.* 22–35, a celebrated passage); and that he once won a tripod for a song at a funeral contest at Chalcis (*Op.* 650–60). For his dispute with Perses see below (2). He is said to have died in Hesperian (Ozolian) Locris (Thuc. 3. 96, etc.), but his tomb was shown at Orchomenus (Arist. fr. 565 Rose, *Certamen* 14, Paus. 9. 38. 3). For the story of his meeting and contest with Homer see *Certamen Homeri et Hesiodi* (A. Rzach, Teubner ed. *Hesiod*³ (1913), 237ff.). The poems anciently attributed to him are as follows (only the first three have survived complete, and only the first two have a good claim to be authentic):

[continued on p. 374]

HERODOTUS

Herodotus, of Halicarnassus (now Bodrum on the Aegean coast of Turkey), historian.

1. 'Herodotus' is (in Greek) the first word of a long historical narrative, the earliest we possess. It looks back to the fall of the Lydian kingdom in western Turkey in 545 BC and forwards to events in the early 420s, during the great war between Athens and Sparta, but it has as its principal focus (proem) and *raison d'être* (1.1) the 'war between Greeks and non-Greeks', which we call the Persian Wars. We do not know exactly when it was written but some think that *Aristophanes parodied its opening chapters in one of his plays (*Ach.* 515 ff.): if so, it was known in Athens in 425 BC. We know very little about the life of its author: he nowhere claims to have been an eyewitness or participant in any of the major events or battles that he describes (unlike *Aeschylus), but records conversations with those who were (8. 65, 9. 16) and with the grandsons of those involved in events of the late 6th cent. (3. 54; cf. 3. 160, 4. 43 where Herodotus' informant may well be the exiled grandson of the Persian Zopyrus, referred to in 3. 160). This fits with the dating of his birth traditional in antiquity ('a little before the Persian Wars', Dion. Hal. *Thuc.*, 5; '484 BC', Gell. *NA* 15. 23). But the latter date is suspicious: it is 40 years before the foundation of the Athenian colony at Thurii in southern Italy in which Herodotus is said to have taken part and where he is said to have spent the rest of his life and died (Steph. Byz., entry under *Thourioi*: his grave was shown there; Aristotle, *Rh.* 3. 9, already refers to him as 'Herodotus of Thurii'); 40 years is an ancient biographer's formula for his subject's age at a turning-point in his life and the whole chronology may be imaginary. His birthplace, Halicarnassus in Caria, was a Greek city, founded some 500 years earlier, but by Herodotus' time it was subject to Persian control; it lay on the extreme western edge of the great empire that had its administrative centre three months' journey (5. 50) to the east, in Iran. Inter-marriage with the neighbouring non-Greek population, who were Carians, was widespread (ML 32) and Herodotus was a cousin or nephew of the Halicarnassian epic poet Panyassis, who had a Carian name. He seems to have taken part in political struggles against the Persian-nominated tyrant Lygdamis, grandson of the Artemisia who figures prominently in his narrative (7. 99; 8. 68–9, 87–8, 93, 101–3); these struggles ended in Panyassis' death and Herodotus' exile. Most of what he tells us about himself concerns his travels and inquiries (see (3) below). He is likely to have died where his allusions to later events themselves end, in the 420s; he may well have been less than 60 when he died.

2. Herodotus' narrative is built from smaller narratives and from summaries of events that are peripheral to his main concern. These smaller narratives, often told in rich detail and equipped with verbatim reports of many conversations, are sometimes told in Herodotus' own person; sometimes in the special syntax which ancient Greek reserves for things reported on another's authority. They are generally linked by chronological succession (particularly, at the beginning, the succession of eastern kings), and as cause and effect; but sometimes they go temporarily backwards (effect is followed by its explanatory cause in another story) or move sideways, to take in events elsewhere which throw light on something in the main line of the story. Their starting-point is in answer to the question with which Herodotus ends his first sentence: 'What caused Greeks and non-Greeks to go to war?'. After surveying traditions (Persian and Phoenician, according to Herodotus) which traced the origin of the conflict to the reciprocal abduction of legendary princesses (Io, Europa, *Medea, Helen: 1. 1–5), Herodotus declares his own view that the story cannot reliably be taken back beyond the reign of the Lydian king Croesus (1. 5), who began the process of absorbing the Greek communities of the Aegean coast into his kingdom and whose fall brought the power of Persia into contact with these communities, which were promptly forced into submission. The first book explains how these events occurred, deals with the Persian conquest of the Median kingdom which embroiled Lydia and led to its annexation by Persia, and continues the expansionist reign of the Persian king *Cyrus the Great to his death in battle in 530 BC. Book 2 takes the form of a massive excursus on the geography, customs, and history of *Egypt, which was the next target of Persian expansionism, under Cyrus' son and successor, Cambyses. Book 3 continues the reign of Cambyses down to his death in 522 BC, after a failed attempt to invade Ethiopia; it goes on to describe the turmoil that followed and the eventual emergence of *Darius I as the new king of Persia, and deals with his administrative settlement of the empire (3. 88–97). Book 4 covers Darius' abortive attempt to subdue the nomadic Scythian tribes who lived to the north and east of the Danube and across southern Russia, and deals also with Persian expansion along the North African coast. Book 5 traces further Persian expansion, into northern Greece and the southern Balkans, and narrates the unsuccessful attempt of the Aegean Greek communities to free themselves from Persian control (the so-called *Ionian Revolt: 5. 28–38, 98–6. 42): Herodotus signals, ominously, the fatal support that Athens gave to that revolt (5. 97). Book 6 begins the story that runs continuously to the end of Herodotus' narrative in book 9: the Persian determination to have

revenge for Athenian interference in the affairs of its empire and the first seaborne attack on mainland Greece, which was defeated at Marathon in 490 BC. Books 7–9 embrace the huge expedition mounted in 480–479 by Darius' son and successor, *Xerxes, and the Greek response to that threat; the opening engagements, at sea off Artemisium and on land at Thermopylae; the climactic battles of Salamis and Plataea, which forced the Persian army and navy to withdraw to the north; and the carrying of the war back across the Aegean, ending in the battle of Mycale, on the Turkish coast opposite *Samos. At various points, episodes in the history of Greek communities not at first directly in contact with Persian power, such as *Sparta, *Athens, Corinth, and Samos, are interleaved, often at length, with the main narrative of Persian expansion as they explain how these communities became involved or failed for a time to be involved, until all are seamlessly joined together in books 7–9.

3. The stories from which Herodotus' narrative is built derive sometimes (as we have seen) from distinguished individuals, sometimes from 'collective' informants ('the Corinthians say...'; 'we Spartans have a story...'; 'I heard the story in Proconessus and Cyzicus...'). Occasionally his source may have been a document (for example, his description of the satrapy system set up by Darius to administer the Persian empire). But the overwhelming mass of his material must derive from oral tradition and that tradition will always have been local, even familial. Thus the overall conception of a narrative that would draw on these local traditions but would connect them so as to span more than 70 years and take in much of the known world was Herodotus' own, and it is his most brilliant and original achievement. Herodotus did not speak any language other than Greek but he writes of interpreters in Egypt (2. 154) and at the Persian court (3. 38, 140), where also there were Greek officials in high places. He writes repeatedly of what was told to him in an astonishing range of places: where he could, he preferred to trust what he could see for himself (2. 99; cf. 2. 147, 4. 81, 5. 59) and could inquire into (Herodotus' word for 'inquiry' is *historiē*, which brought the word 'history' into the languages of Europe). Where he could not, he listened (*see* ORALITY). He writes of inquiries made in the northern Aegean, in southern Italy, round the shores of the Black (Euxine) Sea, in Egypt (where he travelled as far up the Nile as Elephantine: 2. 29), at Dodona in NW Greece, and at *Cyrene in Libya; of things seen on the Dnieper in southern Russia; in Babylon on the Euphrates; at Tyre in Lebanon; of talking to Carthaginians (*see* CARTHAGE) and to the inhabitants of *Delphi. He is familiar with the geography of Samos, of Attica, and of the Nile delta, which he compares to the mouth of the Achelous river in NW Greece, as well as to the coast of Turkey from Troy south to the Maeander. He takes for granted a detailed knowledge of the topography of *Delos, of the Athenian Acropolis, and of Delphi. Everywhere he writes of what was said to him by 'the locals'. It is of the essence of Herodotus' method of *historiē* that he builds the process of inquiry into his narrative: he writes not only of his sources, their agreements and disagreements, but also of his own belief and disbelief at what he is told (he is, he writes, under an obligation to report what was said to him, but under no obligation to believe it: 7. 152. 3); sometimes too he records his inability to decide, or the impossibility of arriving at an answer to some question he is inquiring into (sometimes because it is beyond the reach of human memory; sometimes because it lies too far away, too far beyond the limits of his travels). Unlike *Thucydides, he does not present his account of the past as smoothly authoritative, the result of work not to be done again (Thuc. 1. 23) but as one man's struggle, not always successful, to discover and record what heroic men, non-Greek as well as Greek, have achieved, before those achievements are obliterated by time (1. 1).

4. It is not merely Herodotus' travels that cover an astonishing range but also his understanding of the variety of human experience. He does not disguise the fact that the Greek-speaking world was the cultural as well as the geographical centre of his perceptions. But he writes, almost always open-mindedly, of the differences that distinguish Persians from Scythians, Babylonians, Indians, and Egyptians, as well as from Greeks. For Egypt, he has a model to help him understand the way their world works: it is simply the world of other men upside down; the Egyptians do the opposite of what is universal elsewhere, just as the Nile behaves in a way that inverts the behaviour of all other rivers by flooding in high summer (2. 35). He is less sure of what makes Persian culture cohere but describes what seem to him its distinctive features (the features, that is, that make the Persians un-Greek: 1. 131–40). He is relatively unsuccessful too in grasping the 'ideologies' that made one religion different from another. That is hardly surprising: he records religious practice everywhere with precision, but he has nothing to teach him the 'meaning' of *ritual, as he has for Greek religion in the epic poems of *Homer and *Hesiod (2. 53). He is sure that for all men, however much they know of other cultures, their own culture is superior (3. 38). But when he is faced with something totally alien to his experience and to Greek experience generally, such as the culture of the Scythian nomads, who have no aspect of permanence to their lives (no statues, altars, or temples, except to *Ares, the god of war; no agriculture, no buildings, no walls or settlements even), though he can admire their ability to escape Persian domination by never staying to confront the enemy, 'for the rest', he writes, 'I do not like them' (4. 46). They offer him no point of resemblance and they do not fit. None the less, he describes their culture also dispassionately. For Herodotus it is important that things

should fit: he is at home with symmetries. He is persuaded of the truth of a story of young Nasamonian tribesmen wandering across the Sahara and finding a great river flowing west–east, because the river they found must have been the Nile. Its identity is guaranteed by the symmetry of its course with that of the Danube, which flows west–east from the Pyrenees and then turns south, as the Nile turns north, to flow out ‘opposite the Nile’ (2. 32–3)! But such a priori geography exists alongside acute empirical observation of the world around him, as in his defence of the proposition that the land of Lower Egypt is the product of the Nile’s silting over ten or twenty thousand years (2. 11–12).

5. Herodotus’ vast narrative coheres because it is strung on two lines of connection which pass through time. The first is kinship; the second *reciprocity. Reciprocity is the demand that all men respond to what is done to them with like for like (‘equals for equals’, in Herodotus’ own phrase: 1. 2): with good for good and with hurt for hurt. The demands of reciprocity are absolute, admit of no exceptions and, Herodotus believes, are common to all men. They also outlive time, since they are inherited. The principle of reciprocity is essential to Herodotus’ writing: to answer the question ‘why did this happen?’ it is necessary to ask the further question: ‘to what previous act was this act a response?’. The chain of reciprocity may reach far back and encompass many people. Thus the search for a ‘beginning’ is common to all narrative and it is no surprise that, faced with the question ‘why did non-Greeks and Greeks go to war [in the 5th cent. BC]’, Herodotus finds an answer in events far distant in space and more than three generations in the past, with Croesus of Lydia and his ‘beginning of wrongful acts against Greeks’ (1. 5). It is the logic of reciprocity that explains not only the two Persian invasions of Greece but also, for example, the bitter hostility between Athens and Aegina, which lasted from the mid-6th cent. until the Athenians expelled the Aeginetans from their island in 431 BC (5. 82–7: Herodotus describes it as ‘owed from before’) and the complex of obligations which tied Persia, Sparta, Corinth, and Corcyra together in their several relationships with Samos over more than a generation (3. 44–53, 139–40). For the most part, the question ‘why?’ is not a problem for Herodotus. Events that are too uncanny, shocking, or momentous for merely human explanation call into play the actions of divinity which are assumed also to be determined by the logic of reciprocity (1. 90–1, 6. 75, 82, 7. 133–7). He seems too to be at ease with the question of the ‘meaning’ of events. Both in his own person and also in the person of various ‘warners’ who appear in his narrative (men such as *Solon; the Egyptian pharaoh Amasis; Xerxes’ uncle, the Persian Artabanus, and Croesus, after his downfall), the thread of events seems to be illuminated by general statements: ‘human success stays nowhere in the same place’, Herodotus (1. 5); ‘divinity is jealous and disruptive’, ‘man is the creature of chance’, and ‘in everything one must look to the end’, ‘Solon’ (1. 32); ‘there is a cycle of human experience: as it revolves, it does not allow the same men always to succeed’, ‘Croesus’ (1. 207). These look to add up to what D. Lateiner (*The Historical Method of Herodotus* (1989)) has called Herodotus’ ‘historical philosophy’. But they do not in reality fit together; rather they are what ancient Greeks called *gnōmai* (maxims or aphorisms) and their function is closer to that of the proverb than to any ‘law’ of historical process: they are not discountenanced by contradiction. Nor do references to ‘what was going to be’, to notions of a man’s ‘portion’, or ‘what is assigned’ make Herodotus a historical determinist. Rather they represent the storyteller’s sense of the shape of his story. Closer perhaps to the heart of Herodotus’ sense of things are ‘wonder’ (a very Herodotean word) at human achievement, the ‘great and wonderful deeds of men’ (1. 1) and the emotional undercurrent to events that so often gives his narrative a tragic colour: two compelling and haunting examples are the story of the deadly quarrel between Periander, the tyrant of Corinth, and his own son (3. 49–53: characteristically, the story is introduced to explain another event, Corinthian and Corcyrean involvement in the affairs of Samos), and the astonishing moment at Abydos when Xerxes, in the act of mounting his great invasion of Greece and engaged in reviewing his vast invasion force, bursts into tears on reflecting that in a hundred years not one of these splendid warriors would be living (7. 45–7: his uncle, Darius’ brother Artabanus, replies that more painful still is the fact that in so short a life there was not one who would not, again and again, wish himself dead to escape the distress of living).

6. The singularity of Herodotus’ methods and achievement has always meant that he was problematic to his readers. He has been read with most enthusiasm and greatest understanding in periods of the rapid expansion of men’s horizons, such as the Hellenistic period of *Alexander the Great’s eastern conquests and in the Age of Discovery. But two adverse responses constantly recur: the first that he is a mere storyteller, charming perhaps but not a serious historian (that view, without the acknowledgement of charm, goes back to Thucydides (1. 21–2; cf. Aristotle, *Gen. an.* 3. 5)); the other view is that he is a liar. This view also has ancient supporters (especially *Plutarch in his bizarre essay *On the Malice of Herodotus*: Plutarch’s beloved Thebes does not emerge very well from Herodotus’ account of events). But it was revived at the end of the last century by Sayce and is currently championed by Fehling and Armayor: D. Fehling’s view (*Herodotus and his ‘Sources’* (Eng. trans. 1989)) would make the untravelled Herodotus the inventor of plausible-sounding encounters with ‘those who should know’ about the fantastic events he wishes to pass off as veracious. There are problems, certainly, about believing everything that Herodotus says he saw or was told but they are not so great as the problem of recognizing Fehling’s Herodotus in the text that we have.

1. The *Theogony* (*Theogonia*). The main part of the poem, which is prefaced by a hymn to the Muses (1–104; cf. the *Homeric Hymns*), deals with the origin and genealogies of the gods (including the divine world-masses Earth, Sea, Sky, etc.), and the events that led to the kingship of *Zeus: the castration of Uranus by Cronus, and the overthrow of Cronus and the Titans, the ‘former gods’ (424), by the Olympians. This ‘Succession Myth’ has striking parallels in Akkadian and Hittite texts, and seems originally to have come from the near east. Hesiod’s version shows some stylistic awkwardness and inconcinnity, but is not without power. Interlaced with it are the genealogies, which run smoother. The first powers born are Chaos, Earth, and (significantly) *Eros (116–22). From Chaos and Earth, in two separate lines, some 300 gods descend; they include personified abstracts, whose family relationships are clearly meaningful. There is an interesting passage in praise of the un-Homeric goddess Hecate (411–52), further myths, notably the aetiological tale of Prometheus (521–616), and a detailed description of Tartarus (720–819). The poem ends with the marriages of Zeus and the other Olympians, and a list of goddesses who lay with mortal men. This last section, which refers to Latinus (1013) and led on to the *Catalogue* (below, 4), is agreed to be post-Hesiodic, though opinions vary as to where the authentic part ends.

2. The *Works and Days* (*Erga kai Hēmerai*), abbr. ‘Op.’ This poem, apparently composed after the *Theogony* (cf. 11–24 with *Theogonia* 225), would be more aptly entitled ‘the Wisdom of Hesiod’. It gives advice for living a life of honest work. Hesiod inveighs against dishonesty and idleness by turns, using myths (Prometheus again, with the famous story of Pandora, 42–105; the five World Ages, 106–201), parable (202–12), allegory (286–92), proverbial maxims, direct exhortation, and threats of divine anger. The sermon is ostensibly directed at a brother Perses, who has bribed the ‘kings’ and taken more than his share of his inheritance (37–9); but Perses’ failings seem to change with the context (cf. 28 ff., 275, 396), and it is impossible to reconstruct a single basic situation. Besides moral advice, Hesiod gives much practical instruction, especially on agriculture (381–617, the year’s ‘Works’), seafaring (618–94), and social and religious conduct (336–80, 695–764). There is a fine descriptive passage on the rigours of winter (504–35). The final section, sometimes regarded as a later addition, is the ‘Days’ (765–828), an almanac of days in the month that are favourable or unfavourable for different operations. Some ancient copies continued with an *Ornithomanteia*, a section on bird omens. The poem as a whole is a unique source for social conditions in early Archaic Greece. It has closer parallels in near eastern literatures than in

Greek, and seems to represent an old traditional type. (*Virgil’s *Georgics*, though much influenced by Hesiod, are shaped by the Hellenistic tradition of systematic treatment of a single theme.)

It has always been the most read of Hesiodic poems. There was even a ‘tradition’ that it was Hesiod’s only genuine work (Paus. 9. 31. 4); but he names himself in *Theog.* 22, and links of style and thought between the two poems confirm identity of authorship. Both bear the marks of a distinct personality: a surly, conservative countryman, given to reflection, no lover of women or of life, who felt the gods’ presence heavy about him.

3. The *Shield* (*Aspis*), abbr. ‘Sc’, is a short narrative poem on Heracles’ fight with Cycnus, prefaced by an excerpt from the fourth book of the *Catalogue* giving the story of Heracles’ birth (1–56). It takes its title from the disproportionately long description of Heracles’ shield (139–320), which is based partly on the shield of Achilles (*Il.* 18. 478–609), partly on the art of the period c.580–570 (R. M. Cook, *CQ* 1937, 204 ff.; this proves that Aristophanes of Byzantium was right in denying the poem to Hesiod). Disproportion is characteristic of the work; the Homeric apparatus of arming, divine machination, brave speeches, and long similes is lavished on an encounter in which two blows are struck in all. Parts of the description of the shield betray a taste for the macabre.

4. The *Catalogue of Women* (*Gunaikōn Katalogos*) or *Ehoiai* (*Ēhoiai*) was a continuation of the *Theogony* in five books, containing comprehensive heroic *genealogies with many narrative annotations. Numerous citations and extensive papyrus fragments survive. The poem was accepted as Hesiod’s in antiquity, but various indications point to the period 580–520 BC.

5. Other lost poems. (a) Narrative: *Greater Ehoiai* (genealogical); *Melampodia* (at least three books; stories of famous seers); *Wedding of Ceyx*; *Idaeon Dactyls*; *Aegimius* (at least two books; alternatively ascribed to Cercops of Miletus or Clinias of Carystus). (b) Didactic: *Precepts of Chiron* (addressed to *Achilles; see CENTAURS); *Astronomy* (risings and settings—and myths?—of principal stars); *Greater Works*. A few fragments of most of these poems survive. MLW

heterosexuality and *homosexuality are not strictly applicable to the Graeco-Roman world (this remains controversial). Discussions of sex could focus on either pleasure or procreation. Pleasures were categorized and valued on the distinction between active (penetrating an orifice with a penis) and passive. Heterosexual acts (not people) were distinguished from homosexual not as radically differing pleasures but primarily on the basis of social consequence: only the former produce children.

What was most important in heterosexual acts was the status of the woman and the man's degree of responsibility towards her and her offspring: wife, concubine, hetaira (courtesan), prostitute, slave ([Dem.] 59. 112, 122). The purpose of wives was to produce legitimate children (Xen. *Mem.* 2. 2. 4; Men. *Dys.* 842; *FIRA* 3. 17). Marriage was primarily a nexus of social and economic exchange (see MARRIAGE LAW). Love between husband and wife was neither necessary nor expected (Lucr. 4. 1278–87; but contrast Cimon and Isodice, Sulla and Valeria). However, mutual respect, affection, passion, and love could and did arise (*IG* 2². 12067, Dem. 40. 27, Plin. *Ep.* 7. 5, Mart. 10. 38). Expressions of wives' love for husbands are common, seldom the reverse (*IG* 22 6288; *ILS* 7472). Wives were expected to be modest even during sex (Plaut. *Amph.* 839–42; Lucr. 4. 1268–77; Plut. *Praec. coniug.* 16–18). Later marriage contracts specify sexual responsibilities for both partners (*PEleph.* 1; cf. Plut. *Sol.* 20). A strict double standard was enforced. Men had recourse to hetairai for love affairs and sophisticated entertainment, or to prostitutes for quick relief (see PROSTITUTION, SECULAR). Slaves, male or female, could be routinely used for sex (Muson. 12). Concubinage offered a stable, legal (sometimes contractual) status to those for whom marriage was impossible or undesirable.

Control of wives' sexuality (virginity, *adultery) was important to assure the legitimacy of the children (Lys. 1. 33–5; [Dem.] 59. 112–13) and so social stability. Athenian fathers could sell their corrupted unmarried daughters into slavery (Hyp. *Lyc.* 1. 12–13; Plut. *Sol.* 23; no known cases). Tests (if ever applied) for virginity were mostly magical: the hymen was not fully recognized even by anatomists.

Adultery meant intercourse with a married woman; she was the object of adulteration. The offence was against her husband and a matter of 'self-help' justice until the *lex Iulia*. A man caught in the act (seduction or rape) with another's wife, mother, sister, daughter, or concubine, could be killed, sexually abused, or fined. Cuckoldry, however, was less of an obsession than in later 'Mediterranean' societies. Adulterous wives must be divorced ([Dem.] 59. 85–8; *Dig.* 48. 5. 2. 2) and were barred from public ceremonies. Roman law permitted fathers to kill adulterous daughters (*Dig.* 48. 5. 23–4). Rape of a free male or female was subject to monetary fine; half for a slave (Lys. 1. 32; Plut. *Sol.* 23).

Female orgasm is acknowledged (Hippoc. *De genitura* 4; Ar. *Lys.* 163–6; Lucr. 4. 1192–1207; Ov. *Ars am.* 2. 682–4) but largely ignored by the (male) sources. At the same time women were thought to be sexually voracious ([Hes.] fr. 275M–W). Roman (and to a lesser extent Greek) sources illustrate a marked scale of pleasure for

the actor and humiliation for the object: vagina, anus, mouth. Anal intercourse, considered a Spartan proclivity (Ath. 13. 602a; Ar. *Lys.* 1148–74), was also practised as a form of birth control (Hdt. 1. 61) and perhaps as a substitute for defloration early in marriage (for Rome, *Priapea* ed. A. Baehrens, *PLM* 3. 7–8; Sen. *Controv.* 1. 2. 22; Mart. 11. 78). Receiving fellatio was especially prized (Mart. 9. 67) but also presented as more necessary to older men (Suet. *Tib.* 44–45; Mart. 3. 75, 4. 50) and a speciality of older women (Hor. *Epod.* 8.19–20; *Anth. Pal.* 5.38). Cunnilingus was most vile and degrading to the giver (Ar. *Eq.* 1280–9, *Vesp.* 1280–3; Gal. 12. 249 Kühn; Mart. 11. 61).

Reproduction was controlled through infant exposure, contraception, and *abortion. Most forms of *contraception were useless but some barriers (wool and wax pessaries) or mild spermicides (e.g. cedar oil) may have been intermittently successful. Coitus interruptus is almost never attested (Archil. 196a West ?). Surgical abortion was dangerous and avoided by the doctors (Sor. *Gyn.* 1. 65; Ov. *Am.* 2. 13–14); oral or vaginal drugs were largely ineffective.

Vase-painting (c.575–450 BC) and other artistic (e.g. mirrors) and literary sources illustrate a wide variety of postures for intercourse. Black-figure favours standing rear-entry; red-figure shows greater use of couches. Intercrural sex with women seems unknown. Though the man is always the dominant partner, the positions seem to have few symbolic overtones. Sexual violence, group sex, as well as occasional scenes of tenderness (kisses, caresses, eye-contact) are shown. Sex reappears in Hellenistic and Roman decorative arts, depicting primarily heterosexual intercourse of individual couples in domestic rather than symposiastic settings (see SYMPOSIUM).

Love as a theme in literature shows a marked periodicity. The personal celebrations of the lyric poets largely disappeared in the Classical age. Love re-emerged in New Comedy (see COMEDY (GREEK), NEW) and the *novel (adumbrated in *Aristophanes' *Lysistrata*) in a predominantly social, domestic, and hence heterosexual form. Hellenistic poetry focused on forbidden and pathological love (Ap. *Rhod.* 3; Theoc. 2). *Epigram worked conceits on pleasure and pain with both women and boys. Roman comedy transmitted some of this to Latin poetry. *Catullus made romantic love in our sense central to his life and poetry. The theme of erotic passion was continued by the elegists, parodied by *Ovid, and largely disappeared from the western tradition until its rediscovery in Courtly Love. See EROS; PORNOGRAPHY. HNP

Hieronymus of Cardia historian and statesman, was in the entourage of his fellow Cardian (and relative?) Eumenes, acting as his emissary at the siege of Nora

(319/8 BC) and passing to the court of Antigonos the One-eyed (Monophthalmus) after Eumenes' death at Gabiene (316). He served with Antigonos in Syria (312/1) and at Ipsus (301), and under Demetrius Poliorcetes ('the Besieger') governed Thebes after its revolt in 293. He ended his days with *Antigonos Gonatas. His great history spanned the period from *Alexander the Great's death (323) to at least the death of *Pyrrhus (272). It was *Diodorus Siculus' authority for Greek affairs in bks. 18–20, and was used extensively by *Plutarch, *Arrian, and Justin. The extant fragments only hint at its dimensions and content. The main evidence is Diodorus' digest of his work, which in bks. 18–20 abruptly rises to a quality not found elsewhere in the *Bibliothēkē*. Excellently informed (see, for instance, the description of the battle lines at Paraetacene and Gabiene, which Hieronymus witnessed), he supplied documentation such as the texts of Alexander's Exiles' Decree and Polyperchon's *diagramma* (edict) of 319/18, and carefully explained the motives of the various protagonists (particularly Eumenes and Antigonos the One-eyed). The lively and lucid narrative was varied by pertinent digressions like the descriptions of Alexander's funeral car and the Indian practice of suttee. He was not without bias, understandably favourable to Eumenes and Antigonos Gonatas, and markedly unsympathetic to Athenian democracy, but there is nothing to equal the sustained prejudice of *Polybius, his only Hellenistic rival in 'pragmatic history'. (For this term see POLYBIUS.)

Hippocrates, Hippocratic corpus See MEDICINE §4.

historiography, Greek That Greeks invented history-writing is not certain: the Jewish 'Succession Narrative' in the books of Samuel and Kings antedates every Greek claimant to be the first historian. But direct Jewish influence on Greece is unlikely, and much biblical narration is driven by divine not humanly contingent causal forces.

*Homer is not historiography and is slippery ground for the historian. But his characters show awareness of the past, and are impelled by an urge to leave glory to posterity; thus *Achilles sings of the famous deeds of men and Helen weaves into a web the story of the sufferings she has herself brought about. The poet himself speaks of 'men who exist nowadays' by contrast with inhabitants of the world he describes. *Genealogies, of the sort that feature in Homeric battle-challenges, are essential to a historical perspective on human events, and they form the link between Homer and Hecataeus of Miletus, the first true Greek historian: he wrote a prose work on genealogy, as well as a description of the world known to him, and a work on mythology. His younger critic and improver was *Herodotus: the urge to correct and improve on a

predecessor is one of the main dynamics of Greek historiography. But the prose of Hecataeus was not Herodotus' only stimulus: Herodotus' nine-book work may owe at least as much to poets who (unlike Homer) did treat historical events in verse. Elegiac poets (see ELEGIAC POETRY, GREEK) like Mimnermus wrote about the military struggles which accompanied *colonization, and can thus be seen as 'ancestors of historiography' (E. Bowie); and it is now known that *Simonides handled the Persian War in detail and compared it explicitly to the Trojan War (*POxy* 3965).

Herodotus' repudiation of myth was less explicit and famous than that of *Thucydides, but equally or (because earlier) more important: Herodotus restricts himself to historical time and to information he can check. How far he did check that information has been controversial since antiquity, but the sceptical case has not been made out. On the contrary Herodotus' work shows many authentic traces of the oral tradition (see ORALITY) on which its author drew.

Thucydides knew and reacted against Herodotus' work and there are obvious differences, above all a more linear narrative which concerned itself more narrowly with male activities like war and politics. But there are similarities too; thus Homeric influence is detectable in detail not just on Herodotus but on Thucydides also, who has a rhetoric of his own and should not be crudely opposed to Herodotus as *literacy is opposed to orality: Thucydides' famous preface declares his work to be *not so much* a prize composition (a word which hints at the displays of the *sophists) as a possession for ever. This formulation does not exclude recitation of sections in high finish, or even performance of debates and dialogue. By including (i.e. inventing) speeches at all, both historians were copying Homer, and Thucydides' very difficult speeches resemble Homer's in that their style is different from the narrative.

Western Greece, i.e. Italy and Sicily, developed its own historiography, which however borrowed from and interacted with that of old Greece. Thus Antiochus of Syracuse may have written his account to supplement Herodotus' gappy treatment of the west; but Antiochus was in his turn drawn on by Thucydides; who was then a close model for Philistus, who straddles the 5th and 4th cents.

Much ancient Greek historiography was always 'local history' of *poleis* and areas (see next entry below). Antiochus and Philistus were in effect local historians, though Sicily is a big place and they were hardly parochial figures. Similarly, local historians studied the great states of old Greece, producing above all the *Atthides* or histories of Athens. The first Atthidographer was, however, not an

Athenian at all, Hellenicus of Mytilene on Lesbos. But the great 4th- and 3rd-cent. Attidographers, Androtion and Philochorus, were Athenians who used their literary works to express definite political viewpoints.

The main stream of historiography after Thucydides was, however, navigated, as so often in the ancient world, by more cosmopolitan and restless writers, like the exiled Athenian *Xenophon. His preoccupation in the *Hellenica* with the Peloponnese is marked but his perspective is just too wide for this work to be called local history. He takes his chronological starting-point and some other obvious external features from Thucydides, but his religious values and his use of the illuminating digression are more reminiscent of Herodotus. His *Anabasis* is a snapshot of Persian Anatolia which reveals his gifts as a social historian and is a prime source for modern students of religion and warfare.

Thucydides never ceased to have influence even in the 4th cent. when to find him cited by name is rare, though another and more hard-headed continuator of Thucydides than Xenophon, the Oxyrhynchus historian, does mention him. *Aeneas Tacticus, not an intellectual, shows knowledge both of Thucydides' narrative and his speeches, and Thucydides' remarks on speeches were discussed by Callisthenes, whose *Hellenica* (used by *Ephorus later in the 4th cent. and thus at one remove by *Diodorus Siculus) faintly transmits an important alternative tradition to that of Xenophon. 'Faintly', because Callisthenes resembles other big names of 4th-cent. Greek historiography in that he survives only in 'fragments' or quotations. The same is true of Ephorus, whose universal history, enormously popular in antiquity, drew on Thucydides for the 5th cent., then on the Oxyrhynchus historian (late 5th and early 4th), then on Callisthenes (? from the King's Peace of 386 BC onwards). But Ephorus also comes down to us mediated by Diodorus. The sources of Diodorus' Persian material for the 4th cent. (Ctesias? Dinon?) are disputed, even more so his Sicilian material. Ephorus was one 'Sicilian' source but it is hard to know how much to attribute to *Timaeus, a major figure in Greek understanding of the west.

Another Thucydidean continuator and partial imitator (he echoes the Thucydidean Funeral Speech) was *Theopompus, who wrote about *Philip II of Macedon in a way which may owe something to Thucydides' fascination with the individual *Alcibiades. But the great individual of the age was *Alexander the Great, whose 'Deeds' were reported by Callisthenes, by Dinon's son Cleitarchus (the source of Diodorus book 17 and of the vulgate tradition about Alexander generally), and by *Arrian's sources *Ptolemy I and Aristobulus. Alexander, the new *Achilles as his historians presented him or as he presented him-

self, and his glorious Deeds take us back to Homer, where this survey began. SH

historiography, Hellenistic In an age that witnessed the conquests by *Alexander the Great and his Successors and then the Roman succession to virtually all that had been theirs, Greeks substantially expanded history-writing to include new themes, styles, and genres. In the 1st cent., BC *Dionysius of Halicarnassus claimed that the day was not long enough for him to recite the names of all the historians (*Comp.* 4. 30). The increase in history-writing was due to the necessity to explain new events, lands, and peoples. It was nurtured by the patronage of Hellenistic monarchs and Roman aristocrats and by the growth of *libraries and centres of scholarship, most notably in *Alexandria and *Pergamum, and finally in Rome.

Most of that rich and diverse writing is lost. Substantial parts of *Polybius, *Diodorus Siculus, and Dionysius of Halicarnassus survive, as do some of the works of *Appian, *Arrian, *Cassius Dio, Herodian, and *Plutarch from the Roman period. Fragments from the lost works of nearly a thousand historians, preserved by later authors as quotations or paraphrases, are collected in F. Jacoby's *Die Fragmente der griechischen Historiker* (FGH). Although still incomplete, it is a treasure trove of information and, arranged by genre, presents an organizational scheme which helps make sense of the complex subject. Work on it has (1994) been resumed by an international team.

Spanning centuries and continents, Hellenistic historiography, however, defies categorization. The ancients themselves did not submit history to the same rigours or canons as they did philosophy, rhetoric, and science; nor was history part of the educational curriculum. Rhetoricians, apparently far more often than historians themselves, commented on the principles of history writing, usually by evaluating historical narrative for style. Hellenistic history never developed acknowledged classics. Egyptian papyri, as well as literary references, suggest that *Herodotus, *Thucydides, and *Xenophon (followed by *Theopompus and *Ephorus) continued throughout antiquity to be the best-known historians. Polybius, the most renowned Hellenistic historian, was not read closely a century after he wrote (so Dionysius of Halicarnassus). The Attic revival made these Classical writers better objects of rhetorical imitation.

Rhetoric played an important role in the development of narrative. Historians had, since Thucydides, added speeches for variety, colour, and dramatic tension. *Isocrates, a practitioner of the epideictic style of oratory, influenced Theopompus and Ephorus to include also character assessments in passing moral and practical

judgements on their subjects. Perhaps related is the development of so-called tragic history. The invocation of highly emotive scenes lent drama to the narrative and entertained the reader. Although Polybius, in choosing a more utilitarian approach, inveighed against the use of tragic history as counterfactual (he attacked especially Phylarchus), a few episodes in his surviving narrative also bear its influence.

Local chronicles—important in the development of Classical historiography—continued to be produced in abundance in the Hellenistic period (see Chaniotis, *Historiker*; and K. Clarke 2008, as in previous entry). But other genres emerged. Biography developed fully, with its Hellenistic emphasis on individual characterization and character type. Satyrus and Cornelius Nepos were precursors of Plutarch, *Suetonius, Philostratus, Eunapius, and other pagan and Christian hagiographers. Ethnographies became important for explaining the new lands under Greek and then Roman control, and even traditional narratives contained much ethnographic material, leading to amalgams such as the works of *Strabo and *Pausanias. Indeed, the novel emerged from the same spirit of discovery, with many of the romances situated in exotic lands and the main characters ‘historical’ figures, such as Alexander the Great, Ninus, and Semiramis. Despite their interest in ethnography, Hellenistic historians rarely learned local languages and frequently forced their interpretations of foreign cultures into categories familiar to Greek audiences. Megasthenes idealized the social structure of India in Greek philosophical constructions, as did Hecataeus of Abdera in his analysis of Egypt; Polybius, who spent two decades in Italy, presented a description of Roman political institutions (book 6) based on an Aristotelian model of government (see ARISTOTLE) and marred by an inability to understand Romans on their own terms.

The most significant historical genre that developed in the Hellenistic period was universal history. The Roman conquest made the study of the *oikoumenē* (‘inhabited world’) a compelling topic, a subject initially treated by Polybius (although *Timaeus had been the first to cover Rome at length). The growth of universalistic philosophies, especially *Stoicism, brought another unifying theme: the power of the common good. Diodorus Siculus used the theme of individual benefactors and civilizing agents haphazardly, but Posidonius could suggest, with some ambivalence, that Roman might represented a unifying force for the common benefit of all. This notion, reinterpreted, became influential with Christian writers such as St *Augustine. But few practitioners of universal history were broadly inclusive of other ethnic groups except as they came into contact with Graeco-Roman

civilization. Universalistic historiography became truly ecumenical only when it abandoned time-bound narrative in the form of Judaeo-Christian apocalyptic and prophecy.

Just as Thucydides implicitly acknowledged and followed Herodotus, a series of later historians built their narratives on previous ones. This succession of historical works helped develop the notion of historical tradition, with historians increasingly quoting from and drawing on past works (no more evident than in the case of Plutarch). It also spawned the belief that historical narrative could be created without primary research: Diodorus Siculus and Arrian (to choose extremes in quality) compiled narratives based on accepted earlier traditions. New interpretations of past events were generally derived from rationalizing or from new perspectives, rarely from new research. The very diversity and abundance of Hellenistic history-writing assured a widespread acceptance of the principle that the past, as well as the present, needed to be recalled and reinterpreted—if not also re-investigated. It encouraged the invocation of history for justification of present policy or for *propaganda, such as occurred in the generally anti-Roman Sibylline oracles. In the Greek revival of the 2nd cent. AD (see SECOND SOPHISTIC), Arrian consciously modelled his works after Xenophon’s, as if an echo of Classical form and style would bestow legitimacy.

Greek historiography profoundly influenced its Roman counterpart (beginning with Quintus Fabius Pictor who wrote in Greek) and created the paradigms of historical investigation in other Mediterranean lands. *Maccabees II, an epitome of Jason of Cyrene’s larger work in Greek, contains episodes in the style of tragic history, and *Josephus’ *Jewish Antiquities* reflects the work of Dionysius of Halicarnassus. Manetho’s study of Egypt and Berossus’ history of Babylonia are based on Hellenistic examples of history-writing. Although early Christian historiography departs conceptually by identifying a pre-existing spirit that was to outlast all history, some books of the New Testament, especially Luke and *Acts of the Apostles, bear the influence of Hellenistic historiography and rhetorical devices. Christian hagiography develops from the Greek biographical tradition, and *Eusebius, who initiated ecclesiastical history, drew heavily on documents in a manner similar to his Greek predecessors.

See articles on individual historical writers. KSS

historiography, Roman Presentation of the Roman past was firmly rooted in the Roman present. Historians proclaimed a desire to help and inspire contemporary readers in their public life (e.g. Sall. *Iug.* 4; Livy, pref. 10;

Tac. *Ann.* 4. 32–3), and the past was often moulded to provide antecedents for contemporary events or rephrased in contemporary terms, sometimes for tendentious reasons, sometimes just to make the story more excitingly familiar. Roman writers were also more often public men than their Greek counterparts (e.g. *Cato the Elder, *Sallust, Gaius Asinius Pollio, *Tacitus), and their contemporary narrative told of events in which they had played a part: the result was an emphasis on this recent history, which usually comprised the bulk even of those works which covered Rome's history from its foundation (*ab urbe condita*).

Still, historiography was not simply a masked version of the memoir. It aspired to tell the story of the Roman state, not just of an individual's experiences. At first this usually involved an outline of Rome's history from its beginnings, with special emphasis on the inspiring foundation stories. The result was an hourglass structure, with most space given to the beginnings and the present, and a sketchier account of the period in between: that is already visible in Quintus Fabius Pictor, traditionally the earliest Roman historian, and survives in most of his *ab urbe condita* successors (including *Ennius, who did much to shape the Roman view of history). Another aspect, as Cicero (*De or.* 2. 51–3) ruefully observed, was the evocation of traditional Roman *annales*. Writers may only rarely have consulted the *annales maximi* themselves, but the texture of such material—bare lists of omens, magistrates, triumphs, etc.—was still familiar; Cato fr. 77 and Sempronius Asellio frs. 1–2 (both ed. Peter) protested at the historical inadequacy of such catalogues, but versions of these lists figured even in the developed genre, usually conferring an aura of tradition and antiquity. The annalistic structure, organizing material in a year-by-year fashion, also became regular.

Rome took her past seriously; it became part of that seriousness to insist that its history was told with suitable literary and rhetorical art (cf. Cic. *Leg.* 1. 5, *De or.* 2. 36). For Fabius Pictor and his early successors—Lucius Cincius Alimentus, Aulus Postumius Albinus, Gaius Acilius—this meant writing in Greek, thus fitting Roman history into the mainstream of Hellenistic historical literature, which greatly influenced its Roman equivalent; the use of Greek also promoted the presentation of Rome to a cultured Greek audience as Rome advanced eastwards. The Latin prose genre was pioneered by Cato, whose *Origines* extended the focus to the Italian cities, and Lucius Cassius Hemina; but the change of languages did not end the influence of Greece, nor reduce the literary pretensions. From an early stage history drew a great deal from rhetoric, including many clear boons: an eye for evidence, a nose for bias, an alertness

to arguments from probability, the capacity to impose structure on recalcitrant material. But rhetorical virtuosity also promoted the imaginative expansion of the past. Second- and 1st-cent. BC writers filled out the bare annalistic record with circumstantial narrative, sometimes creatively reconstructing what 'must have' happened, sometimes glorifying a family or providing a precedent, sometimes simply for artistic effect. The voluminous works of Gnaeus Gellius in the 2nd cent. and Valerius Antias in the 1st seem to have been particularly rich in such elaboration.

This should not obscure the commitment to discovering the truth, however much it might then be embellished and strengthened with supporting detail. Writers do discuss the reliability of questionable material, with varying critical acumen (e.g. Livy 2. 21, 6. 1, 38. 56–7; Tac. *Ann.* 4. 10–11, 13. 20); *Livy's predecessors aspired to find out new facts as well as provide a new artistic veneer (pref. 2). There was no clear distinction between antiquarianism and historiography at least in the 2nd cent. BC, and even later writers show some respect for documentary sources, e.g. Gaius Licinius Macer and Quintus Aelius Tubero with the 'linen books', and perhaps Tacitus with the senatorial acta (official record of proceedings). Still, Roman writers doubtless underestimated the sheer difficulty of discovering distant truth. Cicero (*De or.* 2. 62–3) insists on truthfulness as the first law of history, but gives most emphasis and thought to the rhetorical 'superstructure' (*exaedificatio*) built on this acknowledged 'foundation' (*fundamentum*); when *Pliny the Elder, *Ep.* 5. 8, considered writing ancient history, he considered it 'easy to find out about, but burdensome to bring together'. Writers might identify their sources' political bias; they rarely asked more searching questions about the texture and origin of their material.

Partisan bias was intensified by the struggles of the Gracchan age (see GRACCHUS, GAIUS; GRACCHUS, TIBERIUS), and these accentuated the concentration on the present. One aspect was a stepping up of the reinterpretation of the past in contemporary terms: this seems to have typified the work of Lucius Calpurnius Piso Frugi, then in the 1st cent. Gaius Licinius Macer. The more straightforward development was the tendency to omit earlier history altogether. Asellio combined this with a Polybian determination (see POLYBIUS) to emphasize important interpretative strands; he apparently began in 146 BC, perhaps deliberately beginning where Polybius stopped. A number of writers carried on this practice of continuation, self-consciously producing a serial canon of Roman history: thus, it seems, Sisenna continued Asellio, and Sallust's *Histories* continued Sisenna. A middle position, less exclusively contemporary but still

eschewing the distant past, was occupied by Quintus Claudius Quadrigarius, who apparently began with the Gallic sack (387 BC), and earlier by Lucius Coelius Antipater, whose work on the Second Punic War introduced the historical monograph to Rome. Cicero (*Leg.* 1. 6–7) stresses the stylistic advances made by Coelius and Sisenna, but he felt that Rome was still waiting for her great national historian. Cicero never wrote the work himself.

*Sallust's *Bellum Catilinae* and *Bellum Iugurthinum* abandoned annalistic form and developed the monograph, using these two episodes to illustrate themes of wider significance, especially that of moral decline. The analysis is carried through with concentration and structural deftness; and Sallust moulded an appropriate style, concise, epigrammatic, rugged, and abrupt. Meanwhile *Caesar had written a different sort of monograph in his commentaries; their form leaves them outside the mainstream, but he still adapted techniques from historiographic rhetoric to fit his insidiously persuasive plainness of manner. Gaius Asinius Pollio wrote of the Civil War (between Caesar and *Pompey) and its antecedents, beginning with 60 BC. His incisive and independent analysis influenced the later Greek versions of *Appian and *Plutarch.

Pollio was less influential in Rome itself, largely because *Livy's 142-book *ab urbe condita* came to dominate the field. The great Roman history had been written at last. Livy offered something new, with a more even treatment of past and present: the great bulk of his history was pre-contemporary, partly, as he explains in the preface, because decline was relatively recent, and the best ethical examples were to be found in the earlier centuries. His moralizing is, however, more than Roman bias; it is also a form of explanation, isolating the strengths which carried Rome to its success, and might yet prove her salvation. The preface suggests that his contemporary books may have projected a less rosy view of Rome's morality, with degeneration explaining the less happy developments of the last century.

As in other genres, an Augustan classic had a stifling effect, and Livy's bulky eminence deterred rivals. History too changed, and the early Principate shows writers balancing traditional forms with a new world where the achievements of the Roman people, with the annual rhythm of changing magistracies, no longer captured the central themes of imperial reality. *Velleius Paterculus controlled his recent narrative around leading individuals, Caesar, *Augustus, and *Tiberius, and treated his material with rhetorical exuberance. His enthusiasm for the new world contrasted with Aulus Cremutius Cordus' nostalgia for the old, and Cremutius paid with his life; the

elder Seneca dealt more safely with the transition from republic to Principate. Trogius had earlier set Roman history in its universal context; Hyginus and Valerius Maximus collected *exempla*; at some point Quintus Curtius Rufus turned to Greece, and wrote in Roman style about *Alexander the Great's heroics. A more traditional style was followed by Aufidius Bassus and his continuator *Pliny the Elder, though their general histories were complemented by detailed studies of particular wars. Marcus Servilius Nonianus, Cluvius Rufus, and Fabius Rusticus also wrote substantial works.

*Tacitus' achievement is accentuated by this background. In many ways he was highly traditional. He kept the annalistic form; he chose relatively recent events; he wrote of senate and generals, not just emperors and courts. Yet the old forms are at odds with their content, so often pointing the contrast with the republic. The annual rhythms are overridden by the impact of emperors and their changing characters; further themes cut across the years and reigns—the power of advisers and the great ladies of the court, the regrettable necessity of one-man rule in a world unfit to rule itself, the inert senators who exchange hypocrisies with their prince. Brilliant rhetorical sharpness and devastating analysis serve each other well. Livy, at least in his surviving books, was the historian of a romanticized past; Tacitus exposed dispiriting reality.

Tacitus defied imitation as much as did Livy. Imperial historiography was always in danger of collapsing into imperial biography; that had been clear since Velleius, and from the 2nd cent. AD biography dominated the field (see BIOGRAPHY, ROMAN). The classical historians stimulated epitomes (Ampelius, Justin, Eutropius, Pompeius Festus, Obsequens) or at most rhetorical reformulation (Florus, Granius Licinianus, Exsuperantius); they were not imitated until the last flowering of the genre with *Ammianus Marcellinus, who finally addressed a great theme, and was adequate to the task. CBRP

history of classical scholarship See SCHOLARSHIP, ANCIENT and SCHOLARSHIP, HISTORY OF CLASSICAL.

Homer (*see following page*)

homosexuality No Greek or Latin word corresponds to the modern term *homosexuality*, and ancient Mediterranean societies did not in practice treat homosexuality as a meaningful category of personal or public life. Sexual relations between persons of the same sex certainly did occur (they are widely attested in ancient sources), but they were not systematically distinguished or conceptualized as such, much less were they thought to represent a single, homogeneous phenomenon in contradistinction

[continued on p. 388]

HOMER

Homer The existence of a poet called Homer was accepted throughout Antiquity, but the restriction of the Homeric corpus to the *Iliad* and the *Odyssey* became acknowledged only in the 520s. Before this date, it included the *Epic Cycle*, all the *Homeric Hymns*, and two mock-epics, the *Margites* and perhaps the *Battle of Frogs and Mice* (though this last may well be later). Nothing was known of the author who makes only fleeting appearances in his own work in the form of first-person pronouns. The first mention of Homer's name is perhaps to be found in the mid-7th cent. (Callinus fr. 6 West), but the first securely datable references to him belong to the last third of the 6th cent. and coincide with the emergence of a new interest in the personality of the author. The ancient biographies of Homer were then composed several centuries later: the most detailed *Life of Homer*, wrongly attributed to *Herodotus in Antiquity, belongs to the end of the Hellenistic era at the very earliest. Our version of the *Contest between Homer and Hesiod* that goes back to the *Museum* of Alcidamas dates from the time of Hadrian. The two books reunited in *On the Life and Poetry of Homer* and attributed to *Plutarch were probably written by a grammarian at the end of the 2nd cent. AD. The other biographies are dated to the Byzantine period. We can no doubt trace their origin back to the rhapsodes, more precisely to the Homeridae from Chios, who claimed 'Homer' as their putative ancestor.

All the ancient sources except Josephus (*Ap.* 1.2) present Homer as a writer. But according to *Cicero, Aelian and the *Suda*, Homer left others to make a unified whole out of his scattered poems. In the phase of modern Homeric study that began in the late 18th cent., scholars placed a great deal of weight on these traditions and took the Homeric poems to pieces. In 1795 the German Friedrich Wolf in his *Prolegomena to Homer* opened a new chapter in the history of philology. (See SCHOLARSHIP, HISTORY OF CLASSICAL.) According to Wolf, the poems, originally transmitted by oral tradition, were first written down in Athens during the 6th cent. (under *Pisistratus or his son) in connection with the creation of the Panathenaea and were not given their definitive form until the 3rd cent. BC, by Alexandrian scholars such as Zenodotus and Aristarchus. For 150 years after Wolf scholarship was dominated by the 'Homeric question' and the fight between Analysts, who attempted to extract the original poems from the morass of later interpolations, and Unitarians, who tried to demonstrate the existence of a single author. Later on so-called Neo-analysts such as J. T. Kakridis (*Homeric Researches* (1949)) and W. Kullmann (*Die Quellen der Ilias* (1960)) maintained the unity of the poems, but explained their inconsistencies by going back to Homer's own sources preserved for us by later texts such as the poems of the Epic Cycle. A more recent strand of criticism (e.g. J. M. Foley, *Homer's Traditional Art* (1999), and B. Graziosi and J. Haubold, *Homer: the Resonance of Epic* (2005)) explores 'traditional referentiality' or 'epic resonance', finding extra suggestions in particular passages or phrases by reference to the broader oral tradition from which they come (rather in the manner of intertextuality in written texts).

The Homeric question and the polemic between Analysts and Unitarians were fundamentally altered by Milman Parry's 1928 essay on the traditional epithet in Homer (see A. Parry (ed.), *The Making of Homeric Verse* (1971), ch. 1). He identified the *Iliad* and the *Odyssey* as products of an oral tradition of hexameter poetry which had its origins long before the 7th cent., as demonstrated by the existence of some lines which do not scan properly unless pronounced as they would have been at an earlier stage of the Greek language. He demonstrated the existence of a widely extended system of formulae—that is 'expressions regularly used, under the same metrical conditions, to express an essential idea'—elaborated by a long tradition of illiterate bards and characterized by its 'economy' and 'extension'. At almost the same time as Parry, Walter Arend drew attention to the existence of 'type-scenes' in which certain actions or events (such as sacrifices, banquets, arming scenes etc.) are narrated with the same expressions used in the same order. Others have pointed out the existence of similar phenomena at different levels (e.g. repeated motifs, duplicated characters and similes constructed from identical elements). This repertoire allowed the bard to compose while he sang, as is demonstrated by a comparison first with South Slavic epic, then with a wider range of oral traditions.

It remained to explain how and when the text came to be written down. Some scholars still posit a late crystallization of the Homeric poems under the Pisistratids. But after A. Lord, most scholars, relying on various indications, have come to speak of 'oral-derived' texts and to situate the composition of the poems as well as their fixation in writing at the transition between orality and literacy around 750–700 BC. They imagine either an outstanding illiterate bard dictating his poems to an expert scribe (a phenomenon explained perhaps by the exceptional quality of the poems, perhaps also by their ideological content, which is assumed to have been particularly appealing to the aristocratic élite) or

to an oral poet who learned to write and created a poem of unrivalled scale and complexity. Even after it was fixed, the text was still subject to alterations, as demonstrated by early quotations and papyri. A stable vulgate eventually emerged under the influence of the Alexandrian grammarians.

This lengthy history has left its mark in the artificial language of the poems. It is nowadays agreed that Homeric Greek is basically the Ionic Greek which was spoken in the poet's own day, but it includes some older Achaean and Aeolic elements and some Euboean veneer as well as Atticisms introduced in the 6th cent. This poetic dialect—distant from everyday speech but still comprehensible—helped to transport the audience to the distant heroic world.

The new understanding of Homeric poems as oral-derived texts had far-reaching consequences. The Homer prisoner of tradition portrayed by the pioneers of orality has given place to the 'Homer against his tradition' of J. Russo (*Arion* (1968)). It has been convincingly shown that epithets do not simply fill out the line but are used with an eye to the context. Type-scenes show a wide range in scale and elaboration: in the *Iliad* the arming of Patroclus takes up fifteen lines, that of Achilles twenty-seven lines; in the *Odyssey*, despite their length, the four banquet scenes involving the impious suitors omit the sacrifice proper and the libations. Recent studies have also underlined the importance of choice in the treatment of similes, the use of crucial moral terms and emotionally tinted expressions in the speeches as opposed to narrative, and the exceptionality of the language of Achilles who redeploys the traditional formulas for new effect.

A better knowledge of oral traditions and the progress of archeology has also contributed to an improved understanding of the Homeric world. Comparative evidence shows that oral traditions in general tend to update the past in accordance with a contemporary agenda. Thus Homer's portrait of the heroic age is unlikely to be a reflection of the distant bronze age: the more we know about the organization of the Mycenaean society from the Linear B documents, the more problematic its relation appears to Homer's world, and the few fossilized memories of the Mycenaean age may be explained either by an unbroken tradition dating back to this period or by a new awareness of ancient artefacts discovered in graves. The poems are no longer viewed, as by M. I. Finley in his *World of Odysseus* (1954, 2nd edn. 1977), as an accurate portrait of the social institutions of the so-called Dark Ages. Most scholars today agree that Homeric epics, like the spread of heroes' cult, reflect the great surge of interest in the past. This past purports to be real and its truth is guaranteed by its divine origin: the Muse invoked at the beginning of both poems has privileged eye-witness knowledge of all things and gives the poet the ability to make them visible to his audience. But it is in effect an imaginary construct, walled off from subsequent times (the poet prevents us from looking for its remains by stressing in the *Iliad* that the great wall built by the Achaeans was totally destroyed by *Poseidon and *Apollo after the sack of Troy). It is an idealized image more attractive and more noble than present-day reality that transports the listener into another time (hence the almost total absence of any features that were felt to be 'modern', like iron weapons). The exploits of its heroes surpass anything in the modern world. But in order to be credible, this heroic past is modelled on what the poet and his audience took for granted about the world. In fact a more careful reading of the poems, combined with a more flexible conception of the archaic Greek city-state, has revealed a whole series of elements (maritime trade, colonization, dominance of aristocracy, familiarity with Panhellenic sanctuaries) characterizing the 8th cent. BC.

Iliad

Divided into 24 books by the Alexandrian grammarians, the *Iliad* is the more ancient of the two poems, as demonstrated by the greater frequency of older forms. There is now broad agreement that we have the poem virtually as it was composed, with the exception of book 10. The *Iliad* does not deal with the whole of the Trojan War, but selects one major episode, 'the wrath of *Achilles, son of Peleus and its devastating consequences, which inflicted pains a thousandfold upon the Achaeans' (1.1–2). It is framed by careful ring composition: it begins in book 1 with a negative intervention of Apollo, the refusal of *Agamemnon to release Chryseis to his father, and two visits of Thetis first on earth when called by her son and then to *Zeus, and ends in book 24 with a positive intervention of Apollo, the return of *Hector's corpse to his father and two visits of Thetis, first to Olympus when called by Zeus and then to her son on earth. It falls into three parts:

Books 1 to 9 cover the quarrel with Agamemnon and its consequences: the withdrawal of Achilles from the battle and the plan of Zeus to avenge him by supporting the Trojans (1), the sending of a deceptive dream to Agamemnon (2), a truce and a duel between Paris and Menelaus (3), the breaking of the truce by Pandarus (4), the beginning of general fighting in the plain with the *aristeia* (an individual warrior's glorious rampage) of Diomedes (5), the visit of Hector to Troy (6), the duel between Hector and *Aias (7), the success of the Trojans (8), the sending of an embassy to appease Achilles and its failure (9).

Books 9 to 18 include, together with the Doloneia (10), the *aristeia* of Agamemnon, the casualties of the Achaean leaders and the appeal of Nestor to Patroclus (11), the success of the Trojans (12), the advance of Hector checked by Ajax

(13), the distraction of Zeus by *Hera and the defeat of the Trojans (14), the awakening of Zeus and the Trojan victory (15), the setting on fire of the first Achaean ship, the *aristeia* of Patroclus and his killing by Hector (16), the fight around the corpse of Patroclus (17), Achilles' decision to avenge him and the new armour that he gets from *Hephaestus (18).

Books 19 to 24 begin with the reconciliation between Achilles and Agamemnon (19), the beginning of the *aristeia* of Achilles (20), his fight against the Scamander and the battle of the gods (21), and concludes with the killing of Hector (22), the funerals of Patroclus and the games in his honour (23), the ransoming of Hector and his funeral (24).

As opposed to the poems of the Epic Cycle, the *Iliad* is characterized by an extraordinary concentration both in space (its action is located in four places: the city of *Troy, the Achaean camp, the plain in between, and Olympus) and time (it covers altogether a period of 53 days, but the bulk of the poem [2 to 22] covers only five days and the narrative of the central day alone occupies 8 books [11 to 18]).

But Homer manages to work the story of the entire war into the *Iliad*. Books 2 to 4 recall the beginning of the war. The catalogue of ships in book 2 takes up the traditional catalogue of the army assembling at Aulis. In book 3, the view from the wall and the single combat between the two husbands of Helen displace events which belong naturally to the first year of the war, and the actions of Paris and Helen retell the origin of the war without actually narrating it. Pandarus' breaking of the truce in book 4 is a symbolic re-enactment of the original Trojan guilt. There are also many foreshadowings of the two major events that occur after the end of the poem. Achilles' coming death is constantly lamented by Thetis, and reaffirmed in books 19 to 22 by his immortal horse, by the hero himself, and by Hector. His funeral attended by the Nereids in the *Aithiopsis* is prefigured in the *Iliad* by their participation in the mourning of Patroclus in book 18. The sack of Troy is successively evoked from books 4 to 24 by characters, omens, and comparisons. The *Iliad* looks even beyond the end of the war: for an audience well acquainted with the tradition, the wrestling match between Odysseus and Ajax points to their fatal conflict over the arms of Achilles.

The *Iliad* is a tragic epic dominated by the heroic choice of death. It is also a poem full of contrasts between gods and mortals, divine and human heroes, war and peace.

The Olympians play an important role in the plot. The action is initiated by Apollo who drives Agamemnon and Achilles into conflict. Then the plan of Zeus to damage the Achaeans, though momentarily disrupted by Hera in book 14, commands the action from book 2 to book 18 until Achilles' decision to avenge Patroclus, and his final intervention in book 24 convinces Achilles to return Hector's body to Priam.

The gods' interventions in the human world are usually based on partisan attachments. They help their children, their favourites, their priests and those who offer them lavish sacrifices, harm their enemies or those who dare to compete with them, and often punish the group for the crimes committed by one of its members: all the Trojans pay the price for Paris' crime. It is usually vain to attempt to propitiate them, as in the negative answer of *Athena to the Trojans' prayers and offerings in book 6. Gods also prevent the happening of events that would be 'beyond fate', which may mean 'before due time', such as the return of the Achaeans (2), the sack of Troy by Patroclus (16) or by Achilles (20 and 21), the killing of Sarpedon by *Odysseus (5) or the death of *Aeneas (20). Their interest in justice is also stated by the characters who invoke them as witnesses for oaths (3) and say that Zeus punishes oath-breaking (4), and is also suggested in an exceptional simile (16. 384–8) that portrays Zeus sending a storm to express his displeasure at those who pronounce crooked judgements.

As in the normal world, gods may reveal their will indirectly through omens, dreams and prophets. In the heroic world, they may also intervene physically, in the assembly (as Athena in book 1 takes Achilles by the hair to prevent him from killing Agamemnon) and on the battlefield, but miracles are few. The gods also influence mental processes, either directly or indirectly and for the better or for the worse, and thus one often sees an inseparable connection between divine and human causation.

On the one hand the supreme power of the gods throws into relief the weakness and insignificance of mankind. The encounter between Apollo and Diomedes on the battlefield (5) is emblematic of this disparity. Successively Hephaestus (1), Hera (8), Poseidon (20), and Apollo (21) point out that the gods should not quarrel or fight for the sake of mere mortals. On the other hand their 'sublime triviality', to quote K. Reinhardt, acts as a foil for the tragedy of men. Their immortality, their carefree life (their real ordeals all belong to a bygone era), and their happiness set them apart from the 'wretched mortals'. Because they ignore death, their quarrels are frivolous and end quickly: the quarrel between Zeus and Hera (1) spoils only for a while the enjoyment of the gods' feast, whereas the quarrel between Agamemnon and Achilles will provoke endless killings. Their wounds are quickly healed (5). Their battle (20), despite a grand introduction reminiscent of a Titanomachy, is ludicrous. The marvellous description of Poseidon's chariot ride over the sea (13), much admired by 'Longinus' (9.8), contrasts with the descriptions of Hector's (11) and Achilles' (20)

chariots trampling down dead men. But such an existence makes it even more striking that they may not merely watch the mortals' fighting with delight but also come to care deeply about them, feeling pity like a tragic audience: thus their presence serves as a device to heighten for us the emotional significance of terrible events.

Gods are only a background. The true protagonists of the *Iliad* are the heroes, those who, like Sarpedon, know that all men are born to die, but also that they can choose to die well and win renown (12.310–28). The crucial decisions in the poem are made by men alone: it is the wrath of Achilles that causes the plague sent by Apollo (1) and the plan of Zeus is the consequence of his appeal to his mother. Achilles' rejection of the proposals of the embassy is explained only by his own wrath (9). The hero also acts entirely on his own when he dispatches Patroclus (16) and when he decides to avenge him (18) or to reject Hector's entreaties (18). This is especially true for the two major characters of the poem, Achilles and Hector.

As a warrior, Achilles is the best of the Achaeans: after his withdrawal from the battle, the Achaeans are pinned back against their ships and when he re-enters the fight, his *aristeia* surpasses all the others. He is a very special hero through his removal from a society that deprived him of his due honour and gave the same lot to the brave and the coward (1 to 18) and through his closeness to the gods (his mother is a goddess, his horses are immortal, his arms are a gift from the gods who consistently grant him special favours). His wrath directed first against Agamemnon, then against Hector, is quasi-divine in its magnitude, as indicated by the word *mēnis* usually applied to the gods: he refuses the compromise offered to him by Agamemnon (9) and behaves with unparalleled savagery towards Hector (22); but he obeys without protest the orders of Athena (1) and Zeus (24). He is the most heroic in his willingness to look death in the face: given a choice between two fates, a return to his fatherland and a long life without glory or an immortal glory if he dies at Troy, he left for war (9), and he decides without hesitation that he will return to the fight and kill Hector, after having heard from his mother that his death will soon follow (18). This awareness allows him in front of Priam (24) to reach a heightened form of humanity and compassion based on an objective vision of the ruthlessness of life itself.

As opposed to Achilles, Hector is totally human and has only a limited perception of his circumstances. Firmly located in a family and a city, as the son of Priam, the husband of Andromache, the father of Astyanax and the leading warrior among the Trojans, this hero of *aidos* who embodies the ideal norm of Homeric society is tragically trapped in contradictory obligations to his family and to his city. But when he realizes that his time has come, his heroic decision to die 'not without glory, but after having done something great, for future generations to learn of' (22.304–5) gives precedence to the community.

The *Iliad* is neither an unqualified expression of heroic ideology nor a straightforward criticism of it. Its celebration of 'the beautiful death' does not obliterate the destructive aspect of war that pervades the whole poem. It is expressed first in regular epithets for war such as *poludakrus* ('of many tears') and in the portrait of the war-god *Ares. The scenes in Troy and the emphasis on the former wealth of this sacred city contribute to the pathos of slaughter; so do the necrologies of lesser heroes killed far from their families and their homeland, and the evocation of their bereaved parents; so does the setting of the death of Hector in a landscape reminiscent of peace and beauty. The similes that recall fertility, creative human activity, peace and innocent delight also emphasize by contrast the grimness of war. On a far larger scale the description of the shield of Achilles (18) brings into the poem aspects of life that are otherwise left out and place the battle scenes against the perspective of the world at large; its beauty contrasts with the increasingly savage fighting of the surrounding books.

Odyssey

Composed shortly after the *Iliad* and divided in 24 books, the *Odyssey* was defined as 'an epilogue' ('Longinus' 9.12) to the former poem. 'Longinus' (9.13) also considered it to be a work of Homer's old age, and some scholars still agree, given its many structural similarities with the *Iliad* and its choice of a beginning *in mediis rebus*. But many prefer to favour separate authorship, in view of the differences in subject and sensibility.

The opening invocation to the *Muses presents the *Odyssey* as the portrait of a man through the history of his wanderings, beginning 'at some point'. In fact the poem takes up Odysseus' journey at its very end, when he is stranded on Calypso's remote island, at the year that the gods, in their first assembly (1), had set for his journey home. The narrative of this return begins only in book 5, with the second assembly of the gods. It is preceded by an introduction of four books: the first two focus on the situation on Ithaca and demonstrate how much Odysseus is needed at home, whereas books 3 and 4 follow Telemachus, in his travels to Pylos and *Sparta to get news of his father. So despite his absence Odysseus is still at the centre of the narrative. Moreover, the short and painless journey of Telemachus under Athena's protection functions as a contrast to Odysseus' adventures.

At the beginning of book 5, the action starts afresh with the second assembly of the gods and the departure of Hermes to Ogygia. The story then narrates Odysseus' travel to Phaeacia at the end of book 5 and his stay among the Phaeacians up to the moment when he is put ashore on Ithaca (13.123). The unity of this first part of the *Odyssey* is strongly indicated by a ring composition and the recurrence nearly word for word at 13.90 of the formula that described Odysseus at 1.4.

Book 13, which focuses on Odysseus and takes place entirely on Ithaca, also marks the start of a complex interweaving of Odysseus' adventures with those of Telemachus in books 14 to 16 until the moment when the two narrative threads merge into one with the reunion of father and son in Eumaeus' hut at the opening of Book 16.

From Book 16 onwards, the action coincides with the new trials announced in the first lines of the epic, for Odysseus still has to wreak vengeance on the suitors. This is carried out in book 22 through the plan made together by Odysseus and Athena (13) and revealed to Telemachus (16).

The poem ends with Odysseus' recognition by Penelope (23) and Laertes (24), and his re-establishment as a king, after a reconciliation with the suitors' families. This ending parallels the *Iliad* where the death of Hector (22) is followed by the reconciliation between Achilles and Priam (24).

Like the *Iliad*, the poem covers only a short time-span (42 days) as it moves between Olympus, Ithaca, Pylos and Sparta with Telemachus, then from Ogygia to Scheria with Odysseus, and is finally set in various places of Ithaca. Moreover, some days such as the second (8.1 to 13. 17), the fourth (17. 1–20. 90), and the fifth (20. 91–23. 343) are especially developed. Again, its scope is considerably broadened by foreshadowings and, especially, flashbacks. Several allusions to events preceding Odysseus' departure for Troy are introduced as digressions by the principal narrator (the famous story of Odysseus' scar in book 19) or told by his characters. The poem also evokes the Trojan War, but besides general references to the sufferings of the Greeks, it usually refers to episodes absent from the *Iliad*. Such a systematic avoidance, far from demonstrating that the author of the *Odyssey* did not know the *Iliad*, is likely to be deliberate: the quarrel opposing Odysseus and Achilles (8) and signalling for the Achaeans the imminence of their success, looks like a refashioning of the quarrel between Achilles and Agamemnon that marked the beginning of the woes for the Achaeans in the *Iliad*. There are also many allusions in the speeches to the 'returns' of various Achaean leaders, and Odysseus himself tells lengthily to the Phaeacians the first part of his adventures (9 to 11), in the so-called *Apologoi*. But anticipations of events that fall outside the temporal framework of the poem are exceptional. The most significant of these is the prophecy of Teiresias (11) about the last trial of Odysseus and his gentle death at home. Moreover, the poet uses extended similes, but their decrease in number is striking. Given that one of the main purposes of similes is to introduce 'variety' (*poikilia*), this change is usually traced back to the diversity of the *Odyssey*. But one does not find in the *Iliad* the equivalent to the performances given by two bards at the feasts of the élite in the palaces of Odysseus and Alcinous in scenes that indirectly illuminate Homer's conception of poetry. Both Phemius and Demodocus depend, like Homer, on the Muse when they sing the fame of the heroes in such good order that Odysseus vouches for their accuracy. And the song of Ares and Aphrodite, which is the only one to be quoted, combines narration and direct speech in the manner of the *Odyssey* itself. This poetics of truth is also a poetics of pleasure that delights a fascinated audience, despite its painful content. The same enchantment is provided by Odysseus when he gives a truthful account of his adventures to the Phaeacians or invents a series of lies that are closely modelled on his actual travels but are usually more realistic.

The *Odyssey* is far more varied than the *Iliad*. One has first to distinguish between the wonderful world of the *Apologoi*, the world of the Phaeacians on the threshold of myth and reality, and the more 'real' world of Pylos, Sparta, and Ithaca.

As opposed to the main narrative told by the Muse, Odysseus' journey is narrated by the hero himself (9 to 12). However there is no doubt about the reality of an account that is echoed at several points in the main story. It begins with the Ciconians who are a real people. But after Cape Malea, the hero enters a mythical world populated by lotus-eaters, cannibals (Cyclopes and Laestrygonians), deities (Aeolus, Circe, and Calypso), immortal cattle, enchanted beasts, monsters (Charybdis and Scylla), and ghosts. These encounters help to define by contrast the meaning of human life, the importance of memory and the value of civilization. By eating the lotus fruit or listening to the song of the Sirens, men forget to return. The victory of Odysseus over the Cyclopes who ignores agriculture and navigation and lacks political institutions demonstrates the superiority of civilization over barbarity. Aeolus' island is also far removed from normal Greek society by its perpetual feasting and its practice of endogamy. Scylla and Charybdis are monsters close to the creatures of folktales. Circe, who facilitates Odysseus' return and Calypso who delays it both live in remote and strange places: Aea is inhabited by wild beasts who behave like domesticated

animals and Ogygia looks like a paradise. Odysseus' visit to Hades (11) and more precisely his dialogue with Achilles, demonstrate the priceless value of life.

Scheria is a utopian place, settled on the boundary between myth and reality. Its inhabitants are 'close to the gods' (5.35) and share their feasts. Removed from war and human pain, they have magic ships that understand men's purpose. Alcinous' miraculous orchard ignores the seasons, his palace has a divine splendour and his relations with the other 'kings' are entirely harmonious. As opposed to the Cyclops, they provide a lavish hospitality to Odysseus. But they are fated to disappear, victims of Poseidon's wrath.

The real world includes gods and heroes, but also pays attention to women, men of the people, and slaves.

The gods still play a major role: the action is initiated in book 1 by the proposal of Athena to go to Ithaca and dispatch Hermes to Calypso and concluded in book 24 by a conversation between Zeus and Athena that puts an end to the civil war at Ithaca. It has long been a commonplace of Homeric scholarship that the *Odyssey* and the *Iliad* widely differ in their presentation of the gods, but recent studies tend to tone down this opposition. Admittedly, the divine cast is less rich: besides Zeus, only Athena, Poseidon, and Hermes play an active role in the main plot, together with Calypso and Ino Leucothea in book 5. The other Olympians as well as many lesser deities only appear in secondary narratives. Moreover the gods never openly dissent: the two divine assemblies of books 1 and 5 both take place in the absence of Odysseus' principal enemy Poseidon. Even when there are direct conflicts, the gods of the *Odyssey* are careful not to encroach on others' domain: before reaching Phaeacia, Odysseus is under the power of Poseidon and Athena does not help. Conversely, Poseidon acknowledges that once Odysseus has landed in Phaeacia, he cannot harm him. Zeus has no difficulty imposing his authority: both Hermes and Calypso obey his orders without question (5) and Poseidon, in contrast with his behavior in the *Iliad*, complies with his will and even asks for his permission to punish the Phaeacians (13).

Their interventions in the human world remain usually within the same limits as in the *Iliad* since 'Gods themselves cannot ward off death' (3.236–7). The only exceptions are Menelaus who, as Zeus' son-in-law, will be sent to the Elysian fields and *Heracles who is among the immortals. The gods also broadly retain the same characteristics as in the earlier poem. However miracles are more numerous: not only in the *Apologoi* but also in the main narrative, the gods are able to transform the appearance of a human being for the better or for the worse or make a landscape look otherwise than it is. But other miraculous events are few and far between.

Gods have also the same selfish motivations: they want to help their human favourites or their family and to punish those who do them no honour, slaughter their cattle, dare to challenge them or fail to sacrifice. As in the *Iliad*, the gods punish the group for the crimes committed by one of its members, as demonstrated by the returns of the Achaeans and the death of all the suitors, including the 'good' ones, and attempts to soften their wrath are still bound to fail. Still, it is widely believed that the *Odyssey* differs from the *Iliad* with regard to divine justice: the bulk of evidence for the gods' interest in morality in the *Odyssey* comes from the plot itself that shows justice in action and from opinions expressed by men. Yet even in book 1 the speech in which Zeus makes the mortals responsible for the sorrows 'beyond their fate' does not represent a radical shift. One can also draw a parallel between the disobedience of Aegisthus who was warned by Hermes not to kill Agamemnon and the Iliadic Patroclus who would have escaped death if only he had listened to the warning of Achilles (16). The change between the two epics is really limited to a more frequent and sharper distinction of the two spheres human and divine (significantly in the battle of book 22 Athena turns the battle in the favour of Odysseus and his son only after she made a trial of their courage), and to a clearer opposition between two sorts of ills, those that mortals bring upon themselves by their crimes and those that they were always destined to suffer.

Scenes among the Olympians are rarer. The only illustration of their inconsequential lightness is to be found in the song of Ares and Aphrodite that has justly been defined as a 'sophisticated pastiche of Iliadic motifs'. With the exception of this episode, the gods are no longer portrayed as detached spectators. When they look at mortals, it is to gaze upon their sin and their righteousness (17. 485–7).

Even more than in the *Iliad*, men are the true protagonists of the *Odyssey*. Its hero, Odysseus, is the man par excellence: he refuses the immortality offered to him by Calypso and heroically chooses to endure human trials and gain the fame attached to them. He is a complex character, a complexity doubtless explained by the interaction of several different traditions. Like Achilles, he is a warrior: he destroyed the holy city of Ilion (1.2) and fights victoriously against the suitors (22) and their relatives (24). But in contrast to Achilles, he is also a mere human who cannot forget the needs of his belly, a son, a father and husband who longs for home, a leader who cares for his companions, and a king 'who was kind like a father' (four times). He is also cautious, and on several occasions—for instance in front of

Scylla (12)—it is possible to see a conflict between heroism and caution. Moreover Odysseus is an embodiment of curiosity, cunning and skill, a man who knows how to tell stories that suit his listeners, as emphasized by a series of epithets. Last but not least he stands out for his ability to endure the hardships on sea and for his self-control in front of the insults of the suitors. These qualities are made conspicuous in the narrative of his travels through the contrast with his companions who perish when they fail to listen to him, and even more through his behaviour when he reaches Ithaca. The 'shrewd' Telemachus is his worthy son, and his father Laertes first embodies the disastrous consequences of his absence and becomes at the end, with the help of Athena, the warrior he was before. Their foils, the suitors, are like them members of the élite. But their actions are in stark contrast to their appearance and their glowing reputation. They are consistently criticized for their breaking of all the rules of decent behaviour. Their villainy is thrown into sharp relief by the presence among them of two just men, Amphinomus and Leiodes.

The world of the humble subordinates is also prominent in the *Odyssey*. They are shaped according to the poem's ideological biases. The 'good' ones, like Eumaeus and Philoetius or Eurycleia and Eurynome, retain their affection for Odysseus and his family and care for his possessions. The bad ones, Melanthios and his sister Melantho, side with the suitors and show no consideration to Telemachus, his mother, and his guests.

The importance of female figures is also characteristic of the *Odyssey*. Much critical attention has been given recently to the female elements, especially to Penelope. But her sphere of activity is quite limited. Significantly she is defined through her male relatives: she is the worthy wife of Odysseus, the daughter of Icarius, and the mother of Telemachus. Her excellence mostly consists in a conjugal fidelity. From books 1 to 16 her heroism is mostly passive (her only trick belongs to the past). In Books 17 to 21, by contrast, Penelope is at the origin of two actions that have a considerable impact on the way events unfold, as she appears to the suitors and instigates the contest of the bow. But the origin of her decisions is left opaque by the poet. It is only in book 23 that she becomes a match for her husband by testing him.

As it is, the *Odyssey* is certainly not a tragedy. It has often been defined as a romance. But it may also be read as 'a kind of comedy of manners' (Longinus' 9.15) and a collection of examples illustrating how to act and not to act in relation to others.

Reception

Many books and papers have been devoted recently to Homer's ancient readers and Homeric reception. A complete overview would require writing a history of Greek and Latin literature, as well as of philosophy and art history from the perspective of Homeric influence, an influence linked to the place of the 'poet par excellence' in the school curriculum, its status as a foundation of the Greek cultural identity, and its major impact on the Romans. It explains why the Trojan War soon became the war against which all the others were measured and why its heroes served as authoritative paradigms over centuries. Homer was first explicitly quoted by *Simonides of Ceos and indirectly by *Stesichorus' *Palinode*, which is an implicit criticism of Homer. His artificial language became the basis of all subsequent hexameter and elegiac poetry. All the epic poems, from the Hellenistic *Argonautica* of *Apollonius of Rhodes and the miniature epics of Callimachus and *Theocritus to the *Aeneid* of *Virgil, and the late productions of Triphiodorus, Quintus Smyrnaeus, and Nonnus are to be understood as a creative refashioning of Homer, greatly influenced by the interpretation given by the Homeric scholia. Homer was also the 'father' of many subsequent literary genres. According to Aeschylus quoted by Athenaeus, his own plays were only 'slices from the banquet of Homer' and Sophocles was labelled 'the most Homeric' of the tragedians. Conversely the scholia, following the lead of Plato and Aristotle, regarded Homer as the first of the tragedians and modern scholars justly defined tragedy as 'an exploration of the significance of the Homeric heritage'. Historiography inherited from Homer not only its purpose but also its form, notably the insertion of speeches into the narrative; and its interest in causation (see EXPLANATION, HISTORICAL). Sophists and orators like *Aeschines or *Isocrates or much later Libanius relied heavily on Homeric quotations and used his characters as models. The *Odyssey* became also a founding text for the new genre of the *novel and its influence is most visible in the first (Chariton's *Callirhoe*) and the last (Heliodorus' *Ethiopian Story*) illustrations of the genre. Beginning with the *Presocratic philosophers and *Plato, *philosophers attempted to debunk Homer's authority or used etymology or moral and physical allegory to defend him. Under the Empire, *Dio of Prusa devoted three speeches (35, 35, 53) to Homer, portrayed Homeric heroes such as Nestor (57), Achilles (58), and Chryseis (61), and attempted to refute Homer by Homer in his *Trojan discourse* (11) as did Philostratus in his *Heroicus*. Last but not least Jewish writers such as Philo and many Christian writers, notably Clemens of Alexandria, Origen, and Basil, quoted the Homeric poems lavishly and made them into a 'propaedeutic' teaching. ss

to sexual relations between persons of different sexes. That is because the ancients did not classify kinds of sexual desire or behaviour according to the sameness or difference of the sexes of the persons who engaged in a sexual act; rather, they evaluated sexual acts according to the degree to which such acts either violated or conformed to norms of conduct deemed appropriate to individual sexual actors by reason of their gender, age, and social status. It is therefore impossible to speak in general terms about ancient attitudes to 'homosexuality', or about the degree of its acceptance or toleration by particular communities, because any such statement would, in effect, lump together various behaviours which the ancients themselves kept rigorously distinct and to which they attached radically divergent meanings and values. (Exactly the same things could be said, of course, and with equal justification, about *heterosexuality.)

It is not illegitimate to employ modern sexual terms and concepts when interrogating the ancient record, but particular caution must be exercised in order not to import modern sexual categories and ideologies into the interpretation of the ancient evidence. Hence, students of classical antiquity need to be clear about when they intend the term 'homosexual' descriptively—i.e. to denote nothing more than same-sex sexual relations—and when they intend it substantively or normatively—i.e. to denominate a discrete kind of sexual psychology or behaviour, a positive species of sexual being, or a basic component of 'human sexuality'. The application of 'homosexuality' (and 'heterosexuality') in a substantive or normative sense to sexual expression in classical antiquity is not advised.

Greek and Roman men (whose sexual subjectivity receives vastly greater attention in the extant sources than does women's) generally understood sex to be defined in terms of sexual penetration and phallic pleasure, whether the sexual partners were two males, two females, or one male and one female. Although lovemaking could be spoken of as 'mingling', the physical act of sex was thought to involve a polarization of the partners into contrasting categories of penetrator and penetrated as well as a corresponding polarization of sexual roles into 'active' and 'passive'. Those roles in turn were correlated with superordinate and subordinate social status, with masculine and feminine gender styles, and (in the case of males, at least) with adulthood and adolescence. Phallic insertion functioned as a marker of male precedence; it also expressed social dominance and seniority. The isomorphism of sexual, social, gender, and age roles made the distinction between 'activity' and 'passivity' paramount for categorizing sexual acts and actors of either gender; the distinction between homosexual and hetero-

sexual contacts could still be invoked for certain purposes (e.g. *Ov. Ars am.* 2. 682–4; *Achilles Tattius* 2. 33–8), but it remained of comparatively minor significance for the classification and moral evaluation of sexual behaviour. Exclusive preferences on the part of men for male or female partners, on the rare occasions when they are voiced, are treated by our sources not as deep psychological orientations of sexual desire but as extreme, amusing, and faintly absurd expressions of sexual partisanship (*Pl. Symp.* 189C–193D, ps.-*Luc. Amat.*).

Any sexual relation that involved the penetration of a social inferior (whether inferior in age, gender, or status) qualified as sexually normal for a male, irrespective of the penetrated person's anatomical sex, whereas to be sexually penetrated was always potentially shaming, especially for a free male of citizen status (e.g. *Tac. Ann.* 11. 36). Roman custom accordingly placed the sons of Roman citizens off limits to men. In Classical Athens, by contrast, free boys could be openly courted, but a series of elaborate protocols served to shield them from the shame associated with bodily penetration, thereby enabling them to gratify their male suitors without compromising their future status as socially dominant adult men.

Pederasty

'*Paidierastia*' is the word that the Greeks themselves employed to refer to the sexual pursuit of 'boys' (*paides* or *paidika*; Lat. *pueri*) by 'men' (*andres*; *viri*). The conventional use of the term 'boy' to designate a male in his capacity as an object of male desire is somewhat misleading, because males were customarily supposed to be sexually desirable to other males mostly in the period of life that extended from around the start of puberty to the arrival of the full beard (see AGE); the first appearance of down on a boy's cheeks represented to some the peak of his sexual attractiveness, to others the sad end of his youthful bloom (*hōra*), while the presence of more fully developed hair on the male face, buttocks, and thighs typically aroused in men intense sexual distaste. Since puberty probably began quite late in the ancient Mediterranean world, some youths may have been pursued by older males while still sexually immature. Still, the ancients designated by 'boy' what we would call an adolescent rather than a child. Moreover, 'man' and 'boy' can refer in both Greek and Latin to the senior and junior partners in a pederastic relationship, or to those who play the respective sexual roles appropriate to each, regardless of their actual ages. A boy on the threshold of manhood might assume the sexual role of a boy in relation to a man as well as the sexual role of a man in relation to another boy (e.g. *Xen. Symp.* 8. 2), but he might not play both roles in relation to the same person. Although some

Athenian men may have entertained high-minded intentions towards the boys they courted, it would be hazardous to infer from their occasional efforts at self-promotion (Pl. *Symp.* 184c–185b; Aeschin. *In Tim.* 132–40) that Greek pederasty aimed chiefly at the education and moral improvement of boys instead of at adult sexual pleasure: the market for male prostitutes and handsome slaves indicates that male same-sex desire often had a purely sexual motive.

Sexual relationships between women are occasionally described by male authors in the vocabulary used to articulate distinctions of age and sexual role in pederasty (e.g. Plut. *Lyc.* 18. 4, *Amat.* 763a), but solid evidence for a comparable polarization of sexual roles in female same-sex sexual relations is lacking.

Periodization

The most remarkable feature of ancient ‘homosexuality’ is the longevity of the age-structured, role-specific, hierarchical pattern that governed all of the respectable and most of the recorded sexual relationships between males in classical antiquity. There is evidence for the existence of such a pattern as early as Minoan times and as late as the end of the Roman empire in the west. *Homer, to be sure, did not portray *Achilles and Patroclus as sexual partners (although some Classical Athenians thought he implied as much (Aesch. frs. 135, 136 Radt; Pl. *Symp.* 179e–180b; Aeschin. *In Tim.* 133, 141–50)), but he also did little to rule out such an interpretation, and he was perhaps less ignorant of pederasty than is sometimes alleged: he remarks that Ganymedes was carried off to be the gods’ cupbearer because of his beauty (*Il.* 20. 232–5) and he singles out for special mention the man who was—with the exception of Achilles—the most beautiful man in the Greek host (*Il.* 2. 673–4). (Male beauty contests are well documented in the Greek world from Hellenistic times; they may have been institutionalized earlier: Ath. 13.565F; Paus. 7.24.4.)

Sexual relations between males at Rome conformed closely to the age-differentiated, role-specific pattern documented for Greece. The traditional belief that Roman men regarded ‘homosexuality’ with repugnance and that its presence at Rome was the result of Greek influence is mistaken. To be sure, sexually receptive or effeminate males were harshly ridiculed, and the public courtship of free boys (which the Romans thought of as ‘Greek love’) was discountenanced as severely as was the seduction of free girls; however, the sexual penetration of male prostitutes or slaves by conventionally masculine élite men, who might purchase slaves expressly for that purpose, was not considered morally problematic. We do hear a good deal more from Roman sources about adult

pathics (Sen. *QNat.* 1. 16. 1–3; Petron. *Sat.* 92. 7–9, 105. 9; Juv. *Sat.* 9) and about the sexual pursuit by adult males of male beloveds who had passed beyond the stage of boyhood (Suet. *Galb.* 22). None the less, as in Greece so in Rome did masculinity consist not in the refusal of all sexual contact with males but in the retention of an insertive sexual role and in the preservation of bodily (particularly anal) inviolability. In neither society did sexual relations between males necessarily indicate an exclusive sexual preference on the part of the participants or an inaptitude for sexual relations with women.

‘Greek Love’

The fullest testimony for Greek pederastic norms and practices derives from Classical Athens, but surviving evidence from elsewhere in the Greek world largely accords with the Athenian model. Greek custom carefully differentiated the sexual roles assigned to men and to boys in their erotic relations with one another. Good-looking boys supposedly exerted a powerful sexual appeal that men, even when good-looking, did not. Accordingly, men were assumed to be motivated in their pursuit of boys by a passionate sexual desire (*erōs*) which the boys who were the targets of that desire did not conventionally share, whence the Greek habit of referring to the senior partner in a pederastic love-affair as a *subject* of desire, or ‘lover’ (*erastēs*), and the junior partner as an *object* of desire, or ‘beloved’ (*erōmenos*). Those terms did not necessarily imply a sexual relationship: they could equally be used to denote a relation of unconsummated desire—even of distant (though passionate) admiration—indicating courtship or bedazzlement rather than physical sex.

A boy who chose to ‘gratify’ (*charizesthai*) the passion of his lover might be actuated by a variety of motives, including (on the baser end of the scale) material gain or social climbing and (on the higher end) affection, esteem, respect, and non-passionate, non-romantic love (*philia*), but—although a man might stimulate a boy sexually—neither sexual desire nor sexual pleasure represented an acceptable motive for a boy’s compliance with the sexual demands of his lover. Even pederastic relationships characterized by mutual love and tenderness retained an irreducible element of emotional and erotic asymmetry, as is indicated by the consistent distinction which the Greeks drew in such contexts between the lover’s *erōs* (passionate desire or ‘being in love’) and the beloved’s *philia* (non-erotic, non-passionate love). By contrast, women were believed capable of returning their male lovers’ sexual passion, and so could be spoken of as ‘loving them back’, as exhibiting *anterōs* (‘counter-desire’)—a term never applied in an erotic sense in the

Classical period to boys, except by *Plato in a highly tentative philosophical context (*Phdr.* 255c–e).

The asymmetries structuring pederastic relationships reflected the underlying division of sexual labour. Whereas a boy, lacking his lover's erotic motivation, was not expected to play what the Greeks considered an 'active' sexual role—he was not expected, that is, to seek a sexual climax by inserting his penis into an orifice in his lover's body—a man was expected to do just that, either by thrusting his penis between the boy's thighs (which was considered the most respectful method, because it did not violate the boy's bodily integrity) or by inserting it into his rectum. Respectable erotic relations between men and boys preserved the social fiction, to which some honourable lovers may even have adhered in actual practice, that sexual penetration of the boy took place only between the legs (the so-called intercrural position), never in the anus or—what was even worse—in the mouth. It was not a question of what people actually did in bed (the boy was conventionally assumed to be anally receptive to his older lover) so much as how they behaved and talked when they were out of bed. Hence the story about Periander, the 6th-cent. BC tyrant of Ambracia, who asked his boy, 'Aren't you pregnant yet?': the boy, who had apparently raised no objection to being anally penetrated on repeated occasions, was sufficiently outraged by this question when it was put to him aloud—and doubtless in the presence of witnesses—that he responded by killing the tyrant in order to recover his masculine honour (*Plut. Mor.* 768 f).

The Greek insistence on drawing a clear distinction between the beloved's *philia* and the lover's *erōs* reveals its purpose in this context. Whatever a boy might do in bed, it was crucial that he not seem to be motivated by passionate sexual desire for his lover, because sexual desire for an adult man signified the desire to be penetrated, to be subordinate—to be like a woman, whose pleasure in sexual submissiveness disqualified her from assuming a position of social and political mastery. A boy who indicated that he derived any enjoyment from being anally receptive risked identifying himself as a *kinaidos*, a pathic, a catamite: no modern English word can convey the full force of the ancient stigma attached to this now-defunct identity. Similarly, a man who retained as his beloved a boy on the threshold of manhood thereby cast doubt on his own masculinity, for if the grown boy was not himself a *kinaidos*, then the man who continued to love him must be (cf. *Aeschin. In Ctes.* 162; *Anth. Pal.* 12.4.7–8; *Sen. Ep.* 47.7). And since both Greek men and Greek women (if we credit the desires imputed to the latter by male authors) liked males who looked young, any man who

either did look or who tried to look younger than his years exposed himself to the suspicion of harbouring pathic desires or adulterous intentions.

A rare pictorial representation of *kinaidoi* can be found on one of the so-called Homeric vases, a 'Megarian' bowl decorated in relief, extant in two copies, the better preserved of which, from Thebes, is now in the Louvre (C. A. 936). It probably dates from the Hellenistic period and portrays a group of *kinaidoi* attacking a flour-mill, no doubt a scene from a mime (Rostovtzeff, *AJArch.* 41 (1937), 86 ff.).

Origins and causes

Scholars have speculated about the factors responsible for the visibility and cultural prestige accorded to pederasty in Greek culture. Among the explanations commonly advanced are: (1) Greek males were driven to seek romance and sexual gratification with other males, *faute de mieux*, by the seclusion and enforced intellectual impoverishment of *women; (2) pederasty was a vestige of earlier male *initiation rituals which featured sexual contact between men and boys; (3) the Greeks inherited pederasty from their Indo-European ancestors.
