program *You Are There* was launched in July 1947 and lasted on the radio network until March 1959. (Until April 1948, it was called *CBS Is There,* and then became *You Are There.*)

Created for CBS by Goodman Ace, the program was unique, combining history and fictional elements. Well-known reporters such as Richard C. Hottelet and John Daly joined actors in a retelling of episodes in world history. The reporters were present and "interviewing" the principals at Pompeii in 79 AD, the fall of the Bastille in 1789, the Battle of the Alamo in 1836, and outside Ford's Theater the night Lincoln was shot in April 1865.

At the program's outset an announcer called the audience to attention: "CBS asks you to imagine that our microphone is present at this unforgettable moment. All things are as they were then, except, *you* are there!" The program used newsmen as eyewitnesses and translators of great events happening as if they were happening in real time. *You Are There* employed interviews with the actors representing world figures and on-the-spot analysis. It gained a large and loyal weekly audience eager to bear witness to history. During the first season, the audience was there for "The Assassination of Abraham Lincoln," "The Sailing of the Mayflower," and "The Storming of the Bastille." Early in 1948, *You Are There* presented "The Burr-Hamilton Duel," "The Defeat of the Spanish Armada," and "The Signing of the Magna Carta."

In 1953, CBS took the concept for *You Are There* to television. Hosted by Walter Cronkite and directed by Sidney Lumet, the television version was modeled closely on the radio version. The television series also used real reporters and actors, among them Paul Newman, Joanne Woodward and James Dean. Meticulously researched, written and produced, the program was performed live on Sunday evenings when many movie houses were closed. Cronkite signed off with what became a familiar line: "What sort of a day was it? A day like all days, filled with those events that alter and illuminate our times, and *you* were there."

Just as on radio, the television version of *You Are There* gained a loyal following of viewers who willingly suspended belief at seeing modern reporters in historical scenes and events. As television drama and news proliferated, however, *You Are There* left the air in 1957, its four-year run suggesting that drama based on fact could succeed in this new medium.

Broadcast network television docudrama proliferated for three decades, often bringing the drama of headline news stories to viewers very soon after the actual events. Through the 1980s and 1990s, docudrama shifted from the straightforward film biography (biopic) to treatment of a broad array of social issues.

Notable in the development of the television docudrama was producer David L. Wolper (1928–). A prolific maker of theatrical docudrama films (*The Bridge at Remagen, Victory at Entebbe*) as well as made-for-television movies and more than 200 television specials, Wolper is also known as perhaps the most successful independent documentary producer in the history of television (*The Making of the President, Trial at Nuremberg*).

Because of the success of the multipart docudrama *Roots,* which Wolper produced in 1977, he is credited with helping to invent the docudrama television mini-series. *Roots* was the fact-based story of author Alex Haley's African ancestors in Africa and then in colonial America. Broadcast over an unprecedented eight days and lasting twelve hours, the series attracted two-thirds of America's television viewers and set a record for one of the most watched television programs in U.S. history. The success of the venture, considered at the time to be a risky one, signaled an untapped reservoir of interest in the docudrama among American viewers.

Docudrama Today

Although news organizations played a major part in the history of docudrama on American networks, broadcast news organizations had all but abandoned the form by the early twenty-first century. Exceptions can be found in the investigative episodes of NBC's *Dateline* and CBS's *48 Hours Mystery;* both programs are produced by network news divisions, but focus heavily on crime news. Docudrama produced by network entertainment divisions has proliferated and continues to find a receptive audience, particularly for stories inspired by tabloid headlines. One sensational example from 1993 of a story taken on by all three major networks was that of Amy Fisher, whose exploits were dramatized in *The Amy Fisher Story* on ABC; *Casualties of Love: The*

Long Island Lolita Story on CBS; and *Amy Fisher: My Story* on NBC. A U.K. television version of the story, *Lethal Lolita,* beat the American competition when it premiered on January 3, 1993.

Crime and scandal, including political scandal, have been fodder for many television docudramas. *Strange Justice* (1999) melded reenactments with footage of the Senate Judiciary Committee hearings in the nomination of Clarence Thomas for the Supreme Court. Simple human tragedy also draws audiences. *Everybody's Baby: The Rescue of Jessica McClure* (1989), based on the 58-hour rescue of a toddler from a drainpipe, drew a large audience. The docudrama was praised for its suspenseful narrative despite a known outcome. Many docudramas today are produced as regular programming on cable networks such as HBO, the History Channel, Discovery, and the Lifetime network.

Conclusion

What draws viewers to docudrama today may be what has always drawn them: the search for an answer to the question, "what really happened?" This need on the part of the viewer to know what is essentially unknowable may be at the heart of the controversy that surrounds the docudrama. Many argue that re-creations and reenactments are dangerous for their audiences. Filmmakers most often must manipulate facts, compress time, create characters and invent dialogue for dramatic effect. Those watching the "nonfiction" film may be unable to separate what is real from that which is re-created or that which is outright fiction. Filmmakers contend that facts must be manipulated in order to increase impact within a condensed timeframe. But detractors argue that docudrama filmmakers have not embraced the responsibility that goes along with their art.

Whatever the reservations about docudrama, these stories based on actual events present a deep reservoir of material not only for filmmakers but also for the multi-channel television universe, as well as a continuing source of interest—even fascination—for audiences.

Selected Film and Television Docudramas

All the President's Men (1976). A theatrical release reenacting the role of a newspaper, two reporters, and the events surrounding the Watergate scandal that ended the presidency of Richard M. Nixon.

And the Band Played On (1993). Based on the book by Randy Shilts, a television docudrama about the coming of AIDS and bitter competition between American and French researchers to identify and name the disease.

Attack on Terror: The FBI vs. The Ku Klux Klan (1975). An early dramatization of the murders of three civil rights workers in Mississippi. This subject would later be treated in a fictional film (*Mississippi Burning,* 1989), as well as a docudrama (*Murder in Mississippi,* 1990).

The Boys of St. Vincent (1992)—A controversial two-part film produced by the Canadian Broadcasting Corporation. The television docudrama deals with sexual molestation of boys under the care of priests. It was blacked out in two Canadian provinces where criminal trials of priests were underway.

Brian's Song (1971). An early U.S. television example of the genre. The docudrama is a tale of friendship between two athletes and the early death of one of them, Brian Piccolo of the Chicago Bears.

Death of a Princess (1980). This docudrama has been called the most controversial in the history of American public television. The film tells the story of a Saudi princess executed for committing adultery. It was denounced by PBS underwriter Mobil Oil and by newspapers in the United States and abroad. Because of the need for secrecy, docudrama was the only avenue open to the filmmaker, whose work exposed cultural beliefs starkly at odds with those of the Western world and vividly out of pace with modern life in Saudi Arabia. Produced two decades before 9/11, the film was controversial for its early attempt at exposing the complexities and contradictions of life in the Arab world.

Good Night and Good Luck (2005). A theatrical release mixing real footage from CBS's *See It Now* with reenactments of the showdown between Edward R. Murrow and red-baiting Senator Joseph McCarthy.

In the Name of the Father (1994). A political docudrama and theatrical release about an Irish

citizen wrongly convicted of a fatal IRA bombing in 1974.

The Path to 9/11 (2006). A two-part television miniseries based on the final report of the 9/11 Commission. Billed as "not a documentary" by the ABC network, the docudrama aired on the fifth anniversary of the 9/11 attacks without commercial interruption. It was widely criticized, most notably by officials of the Clinton administration, for implying that part of the blame for the attack was distraction on the part of the American President with the Monica Lewinsky scandal and the Republican effort to impeach him.

Quiz Show (1994). A controversial docudrama about a rigged quiz show on network television in the late 1950s. The theatrical release was criticized for taking too many liberties with a story about cheating.

Roots (1977). The docudrama that cemented the miniseries concept on American television, and still holds a record for one of the most-watched television events of all time. The story of a slave and his descendents.

Ruby and Oswald (1978). A made-for-television docudrama that re-creates the fatal meeting of Jack Ruby and Lee Harvey Oswald. Recreations are interspersed with actual footage. This docudrama was also released as *Four Days in Dallas.*

Strange Justice (1999). A made-for-television docudrama based on the Senate Judiciary Committee hearings in the nomination of Clarence Thomas for the Supreme Court. It melds video of the hearings with reenactments.

United 93 (2006). A theatrical release and real-time depiction of the flight of United Airlines 93 that crash-landed in Pennsylvania on September 11, 2001. The film, based on interviews and recordings, was praised for its realism.

Documentaries, Motion Picture

Documentary films (and more recently videos) occupy an integral role in journalistic history both here and abroad. The history of documentary films also reflects development of cinematic technology, as technological advances have had a significant impact on both the production and delivery of film.

Definitions

Documentary filmmaking is primarily an act of reporting rather than invention: real people and real events are its subject matter, rather than the imaginary characters and stories of fiction. The word documentary is derived from the Latin *docere,* which means to teach. Documentary

entered the English language even before film to describe a lesson, an admonition, or a warning. The first nonfiction films were given many titles, including actualités, topicals, interest films, educationals, travelogues, and documentaires. The earliest filmmakers, such as Auguste Lumière (1862–1954) and Louis Lumière (1864–1948) in the 1890s, sought to document scientific and cultural phenomena. However, it was primarily through the work of John Grierson (1898–1972) in Britain that documentary came to define a specific genre of nonfiction film.

Grierson was the driving force behind the emerging British documentary movement of the 1930s; he saw documentary film as an important means of informing citizenry of social issues that demanded social change. Grierson defined documentary as the "creative treatment of actuality" (Rotha 1968, 70), emphasizing that interpretation of events shapes the story told in a documentary and distinguishes it from newsreels and other nonfiction productions, such as those created by the experimental avant-garde. As a filmmaker and a theorist, Grierson had a profound influence on generations of filmmakers around the world. "Classic documentary" refers to Griersonian style, in which the film tells the viewer *about* social, political, and economic conditions that need improvement, utilizing the (usually) disembodied perspective of a commentator, referred to in filmmaking as "voice of God" narration.

Documentary filmmakers have always used a variety of styles and modes of technique and address within a single film. Film scholar Bill Nichols (1991) offers four modes or organizational structures of documentary—expository, observational, interactive, and reflexive—to help viewers appreciate the variations of form and content that abound, keeping in mind that these categorizations are understood to be flexible rather than rigid.

Expository documentary style addresses the viewer directly, emphasizes objectivity and logical narration. Observational documentary, or direct cinema, attempts to make the camera invisible and treats the filmmakers and viewers like the proverbial "fly on the wall." Generally, little or no commentary is provided, and the film's story is told by actions of and interviews with the subjects of the film, leaving to the viewer the responsibility of determining the meaning of the events observed. Interactive or participatory documentary stresses verbal exchanges both as monologues and dialogues between the subjects and the filmmaker, who may appear visually and is a prominent player in the film. In the reflexive documentary, the filmmaker engages in meta-commentary and addresses the question about how we represent the historic world and how we talk about knowledge of it. These films, then, render the practice of filmmaking and the filmmaker visible in an attempt to lead viewers to question notions of objectivity and authenticity in representational practices.

Documentary Techniques and Theoretical Debates

Documentaries vary widely. Some use narration, some do not. Some are designed for education, some are expressions of beauty and art, while others are used to evoke social action. Some use more artistic license than others. Some documentaries use reenactments and studio-created environments, yet staying true to basic tenets of the documentary genre by using such techniques to evoke the presence of historical subjects.

Formal conventions such as camera angles and movements, editing styles, sound and music, and voiceovers or dialogue, are shared by documentary and dramatic films. Both styles borrow from each other: documentaries use music scoring or artistically rendered titles resonant with fiction films. Styles most commonly identified with documentary-style footage, such as the shaky camera visuals that often result from handheld camera work, can be used to evoke the feeling of reality in a fictional narrative. As is evident in an historical look at a hundred years of documentary films, improvement of cameras, tripods, sound recording and editing equipment have had far greater impact on documentary presentation than any particular set of stylistic conventions.

Questions about representation itself have occupied filmmakers and critics since the advent of documentaries. The power of the documentary filmmaker to present the filmed world as "reality" has been subject to struggles over who can legitimately claim to speak for peoples and environments not given the means to represent themselves. Particularly since the civil rights movement of the 1960s, with the emergence of race, gender, and class-related struggles for equality as well as those

who strive to give voice to the developing world's people, filmmakers and critics have sought to understand the interactions of the film, the film's producer, its subjects, and viewers in creating a sense of reality. Nichols's framing of questions to guide theoretical considerations of documentary representation are helpful:

> Images are always of concrete, material things recorded at specific moments in time, but these images can be made to point toward more general truths or issues. To what extent can the particular serve as illustration for the general? Not only *what* general principle but *whose* general principle does the particular illustrate? To what extent are generalizations misunderstandings of the nature of the particular, the concrete, the everyday and what does this mean for historically located individuals? The body is a particularly acute reminder of specificity and the body of the filmmaker even more so. Where do filmmakers stand and how do they represent their stance? To what extent should they question their right to represent their own knowledge as situated [specific to their gender, race, class, and ethnicity] or omniscient? What are the consequences of those choices? (Nichols 1993, 176)

A chronological presentation of documentary history can suggest that documentary filmmaking has progressively evolved in a sequential fashion. This is misleading as modes of documentary filmmaking have been evident since film came into being. The sections below place documentary films in contemporary periods to suggest some of the notable films representative of diverse objectives and techniques.

Early Years (1895–1928)

Introduced in 1895, the first portable camera weighed only 11 pounds. The Louis Lumière camera was used to film short scenes of everyday life such as a train arriving at a station. While Lumière preferred to leave dramatic production for the stage, drama soon became the main staple of the film industry. The first film that moved beyond simple travelogues or narrative plots was produced by Robert Flaherty (1884–1951) over a period of nine years. Filming with a 35mm Akeley camera that was reasonably lightweight, Flaherty's groundbreaking film *Nanook of the North* (1922) followed an Eskimo hunter of the Itivimuit tribe in the frozen wastes of Hudson Bay. The film chronicled Nanook and his family as they struggled to survive in a dangerous and merciless environment. Flaherty was interested in sharing with viewers the experiences of lives lived in different cultures, and chose poetic scenes such as a walrus hunt and the building of an igloo rather than polemical scenes of the indigenous people's means of production and commerce. The film combined dramatic tension (man against nature) with people just being themselves in what some consider to be the first documentary. Yet, five major studios turned down distribution of the film, insisting that such reality projects were doomed to failure. A small French arts company, Pathé, eventually distributed *Nanook* and the film quickly became a box-office success.

The next major influence on documentary was the work of Soviet artist Dziga Vertov (1895–1954). An experienced newsreel filmmaker, Vertov expressed the conviction that dramatic fictional films were oppressive tools like religion and theater, used to keep the proletariat preoccupied and sedated. He began a project called Film Truth (*Kino-Pravda*), and created a series of films that blended newsreel style with dramatic production. Perhaps the most influential and widely recognized of these films was *The Man with the Movie Camera* (1929). The film presents a kaleidoscope of daily life in the Soviet Union with people sleeping, waking, going to work, and playing, using a range of cinematic techniques such as freeze frames, slow motion, animation, jump cuts, and split screens. Among the fast montage of images appears the camera man repeatedly reminding the viewer that they are watching film through the cameraman's eye, a device that encourages reflection on filmmaking itself and representative of Nichols category of reflective documentary mode. Vertov wrote out a long manifesto detailing his aims with Film Truth. While primarily artistic, Vertov's work was to have lasting influence, particularly on the later French movement of cinema verité.

The Documentary Takes Shape (1929–1939)

The 1930s brought the use of sound, but documentaries continued to avoid synchronous sound

recording in the filming process because of the cumbersome nature of the equipment. Sound effects and music were added to silent footage during final editing, without the filmed subjects speaking for themselves.

Inspired by the work of Flaherty and Vertov, British filmmaker John Grierson proposed a project to the British Empire Marketing Board (EMB) for a film about the herring fishing industry. Rather than a publicity film, which is what the producers wanted, Grierson directed *Drifters* (1929), which offered a narrative of a sea journey. *Drifters,* a 50-minute silent film, followed a group of herring fisherman on the North Sea as they caught a load of fish through a ferocious storm and then raced back to quayside to auction it. There were no lead roles such as appeared in *Nanook,* nor did it glamorize the industry. Initially, the producers requested certain scenes be removed because they created tension. Grierson obliged but secretly added the scenes back before it was released to the theaters. The film was well received, but rather than following up his success with more of his own productions Grierson became an organizer for the EMB. By 1939, Grierson and his British team produced over three hundred documentaries. He introduced the use of institutional sponsorship, whether public or private, as an alternative to depending on ticket sales. He also moved distribution and exhibition from theaters to schools, factories, union halls, church basements, and elsewhere, shaping the documentary movement and creating a system of filmmaking that became a model for other English-speaking countries.

The documentary was profoundly shaped in the 1930s not only by Grierson but also by government funding, which in some hands turned such films into a major medium of propaganda. Hitler used documentary to bolster support for his new government and to inspire a strong sense of nationalism in the German people. Most German propaganda films were made by Leni Riefenstahl (1902–2003), one of the first major female film directors. Her film *Triumph of the Will* (1935) is perhaps her best known; it presents a Nazi rally in Nuremburg and features no commentary except for the speeches of Hitler and other party leaders. Amid cheering crowds, a marching parade, and Hitler's passionate speeches, the film rallied many to Hitler's cause and gave him almost deity status. Many critics felt that Riefenstahl's production of this and other films was unforgivable and she found herself shunned by studios after the war.

In the United States, documentaries were also used to address social problems, particularly during President Roosevelt's New Deal of the 1930s. One of the more influential was *The River* (1937) directed by Pare Lorentz (1905–92). Funded by the Farm Security Administration, *The River* portrayed the soil erosion problem arising from drought and the need for government control over electric production along the ravaged Mississippi river. The film advocated keeping people on their land and treating the Tennessee Valley Authority as a way to make economically depressed communities viable. As filming finished, it became clear that the river was about to flood. Lorentz quickly reassembled his team to film the one-thousand mile catastrophe on the river. Picked up by Paramount Studios and released to wide success, *The River* is often credited for providing increased support for federal policies. Lorentz was able to persuade the Roosevelt administration (1933–45) to form the United States Film Service in 1938.

Wartime Documentary (1939–1945)

During World War II, hundreds of documentaries were made in the United States, Great Britain, and Germany to serve propagandistic purposes, designed to train soldiers and civilians, inspire national pride, and bolster support for the war. In the United States, documentary films were used to motivate draftees and overcome antiwar sentiments. Successful film director Frank Capra (1897–1991) was asked by the Pentagon to make films to inspire draftees and explain why they were fighting. Seven *Why We Fight* films were produced, including *The Nazi Strike* (1943) and *Your Job in Germany* (1945). They were required viewing for new recruits, and some were released to civilian and overseas audiences. The series was a compilation of emotional history lessons, with a few staged sequences, animated maps, and the robust narration of the kind then popular in movie previews. *The Battle of Britain* (1943) was widely shown in Britain, and *The Battle of Russia* (1943) became required viewing in Russia. Studies of these films suggested they had a positive effect on public opinion, helping to

end the isolationist mentality common among Americans before the war.

Failures and Triumphs (1945–1960)

The years following the war saw a sharp decline in documentary films. Documentary filmmakers found government contracts drying up and there was little interest among the major studios for nonfiction films. The introduction of television significantly revitalized the documentary tradition. Federal law mandated that "broadcasting serve "the public interest, convenience or necessity." Many of the documentaries produced during the war years were among early programs on television. *See It Now* was among the earliest regularly scheduled documentary series made for television. Produced for CBS by Fred Friendly (1915–98) and Edward R. Murrow (1908–65), *See It Now* offered a weekly 30-minute program combining the formal construction of a documentary with the news magazine. Covering everything from McCarthyism to segregation in schools, *See It Now* lasted until it was replaced in 1959 by the longer but irregularly scheduled *CBS Reports*. Also starring Murrow, one of its most influential pieces was *Harvest of Shame,* released around Thanksgiving in 1960. The film followed the plight of migrant farm workers in a small Florida city showing the poverty and detestable treatment of these mainly African American workers by white farmers. A plea to reduce poverty, *Harvest of Shame* created a furor of protests from the agricultural industry and was Murrow's last program in the series before he joined the Kennedy administration. Florida politicians pressured Murrow and the network to withhold global distribution of the program, arguing that it gave a negative view of America which could be used by the Soviet propaganda machine. Thirty years after the program originally aired, the television series *Frontline* featured a follow-up show that went back to the original Florida town featured in *Harvest of Shame*. They found that very little had changed except that the African American migrant workers had gradually been replaced by Haitians.

Documentary film also claimed an important position among art films. An acclaimed example is *Night and Fog* (1955) by Alain Resnais (1922–). The film contrasts old black-and-white footage and photos of Nazi concentration camps with color pictures of the sites ten years after they had been liberated. A first-person narrator provides a poetic reflection of the thoughts and horrors of the war to evoke powerful emotions. The film was designed to be socially stirring, aesthetically powerful, and intellectually reflective. In essence, it foreshadowed a new movement of documentary that would appear in France.

Cinema Verité and Direct Cinema (1961–1979)

Documentary filmmakers began using smaller, less expensive, and more portable 16mm cameras in the 1950s, displacing the heavier and bulkier 35mm cameras used in dramatic films. The ability to easily record synchronous sound in documentary production, however, remained elusive because the camera had to be connected to the sound recorder to maintain synchronous sound. As a consequence, filming situations that required mobility and unobtrusiveness continued to be made as silent films, with sound added in final editing. The breakthrough came in the 1960s, much of it thanks to the efforts of Robert Drew and Richard Leacock in New York City. They helped develop wireless microphones with miniature transmitters and worked with crystal-controlled camera motors that enabled synchronous sound recording without the unwieldy equipment that had impeded earlier sound documentary filming.

The streamlined technology made possible filming of real people and events in locations and situations that had earlier been difficult or impossible for low-budget documentary films. The new cameras and sound recorders required fewer people, and enabled filming to be done without studio lighting and sound recording. Drew and Leacock used the new technology to make *Primary* (1960), a film that followed then Senators John F. Kennedy and Hubert Humphrey as they campaigned for the Democratic presidential nomination. They had promised not to interfere with the action, but rather to observe it. The film was released without narrative titles and with minimal voiceover narration, and set in motion the observational, direct cinema movement to follow.

Filmmakers such as D. A. Pennebaker (1965–), Albert Maysles (1926–) and David Maysles (1931–), and Fred Wiseman (1930–) became synonymous

with this observational, "fly-on-the-wall" documentary style. Pennebaker made the profile of Bob Dylan in 1966 (*Don't Look Back*). The Maysles brothers produced *Salesman* (1968), a searing and intimate portrait of a house-to-house Bible salesman in decline, and later films such as *Gimme Shelter* (1970), on tour with the Rolling Stones and the ill-fated concert at Altamont in which a concertgoer was killed.

Public television enabled Fred Wiseman to produce some of the most intensely involving of the direct cinema productions of this period. His choice of subjects reflected his interest in institutional power reflected in the lives of people at the community level. His first film *Titicut Follies* was made in 1967 (though banned until 1991 from distribution in Massachusetts where it had been filmed). It depicted an asylum for the criminally insane, following the patients and doctors and staff in their daily routines, and culminating in the Follies, an entertainment produced for the staff using patients and staff as actors. Wiseman's style was to shoot very long takes, often one shot over an entire 400-foot roll of 16mm film (about 11 minutes), and to use no narrative commentary. The subjects told their own story. Other films followed in the same style, including *High School* (1968), *Law and Order* (1969), *Basic Training* (1971), and *Welfare* (1975). His documentary style puts the viewer in the middle of the action and, in doing so, subverts the easy attribution of stereotypes and of glibly assigned blame to one "side" or another. At the same time, Wiseman expressed ambivalence about the effect of his shooting style, calling documentaries "reality fictions" in recognition of the influence of the camera on filmed subjects, no matter how invisible the camera and filmmaker may seem to be.

Filmmakers in France also began to diverge from the Griersonian, expository mode of documentary filmmaking, but in contrast to the direct cinema practitioners whose goal was to render the filmmaker invisible, the French filmmakers wanted a more participatory role. A key film that marked this movement was *Chronique dun Eté* (*Chronicle of a Summer,* 1961) by Jean Rouche (1917–2004) and Edgar Morin (1921–). The filmmakers began by asking people on the streets of Paris whether they were happy. The goal of this experiment was to invite participation and encourage reactions from the audience. The filmmakers denied the objectivity of the camera in favor of a subjective involvement by the filmmakers, a mode of filmmaking more in line with the interactive mode named by film scholar Nichols. In homage to Vertov, Rouche called his new film style cinema verité, or cinema truth. The goal of the experiments was to evoke emotions and involvement of viewers and those involved in the filmmaking process.

The Vietnam War was an important subject for many 1970s documentary filmmakers, especially within the U.S. antiwar movement. Peter Davis's *The Selling of the Pentagon* (1971) investigated the Department of Defense's role in promoting the war, while the Academy Award–winning *Hearts and Minds* (1974), used news footage of military operations, Pentagon spokespeople, and White House administrators, and contrasted their words about the war's goals and progress with stark footage of infantry and Vietnamese citizens suffering from the war's ravages. Both documentaries were part of the effort to provide images and awareness to the American public beyond what broadcast television channels were providing. Scores of other films were produced about the Vietnam War, most protesting its continuation.

Battle of Algiers (1966) was released during this time and is regarded widely as one of the great documentary films, though it is a scripted re-creation of real world events. Directed by Gillo Pontecorvo (1919–2006), the film portrays the struggle of the Algerian people for independence from France, a multiyear uprising that succeeded in ousting the French in 1962. The film adopts the neorealistic style of post–World War II Italian filmmakers by casting nonactors in almost all the roles. The people who had lived through the ordeal of colonial occupation and risked their lives for independence from 1954 to 1962 played parts, including Yacef Saadi, a former leader of the revolutionary FLN, who played himself in the film. Pontecorvo shot it documentary-style, using a handheld camera that entered powerfully into the cause of the revolutionaries. *Battle of Algiers* continues to be cited among generations of filmmakers as a source of inspiration for both its technique and its commitment to the liberation of oppressed peoples.

Documentary Today (From the 1980s)

Deregulation of television ownership and content in the 1980s, as well as growing cable competition, led commercial networks to diminish and then drop their use of documentaries. Funding for in-depth news documentaries declined as even public broadcasting became subject to more political and ideological scrutiny and grew more cautious in its funding and programming as a result.

At the same time, technological advancements enabled greater independence in documentary filmmaking. Videotape, first introduced in the late 1950s, was evolving, and in-camera microphones for camcorders known as "portapaks" shooting half-inch videotape were invented in the 1980s. The costs of shooting and producing a video dropped significantly, as did the entry-level training required of film or videomakers. Groups such as Jon Alpert and Keiko Tsuno's Downtown Community Television Center (DCTV), originated in 1972, trained thousands of individuals and sent them out into the streets and neighborhoods as "guerrilla" filmmakers, seeking out social injustices and bringing them to public attention. The potential of video camcorders for alternative broadcasting and grassroots channels of mediated communication pointed toward greatly increasing the number and diversity of voices. As an example, Latin American videos appeared in schools, community centers, and churches, alerting developed countries to the poverty and other human and environmental miseries in developing countries that were rarely depicted on commercial networks.

One of the filmmakers who came to represent "guerrilla" filmmaking for a wide audience is Michael Moore (1954–). Moore released his first major film, *Roger & Me,* in theaters in 1989. A compilation of 16mm film, video, and archival footage, *Roger & Me* exemplifies the mode of documentary known as interactive, much like the French cinema verité of the 1960s. The film features Moore on-camera, doggedly pursuing Roger Smith, the CEO of General Motors, in order to ask him about the harm done by relocating automobile plants to foreign countries for cheaper labor. Moore interviews the people of his hometown of Flint, Michigan, tracing the gradual decay of the town after GM closed down their plant, thus taking away a major source of income for the town. Other films by Moore include *Bowling for Columbine* (2002) that looks at America's gun problems and the Academy Award–winning *Fahrenheit 9/11* (2004), which questions the Bush administration's reactions to the attacks on the World Trade Center in 2001. *Fahrenheit 9/11* broke all previous box office returns for the theatrical release of a documentary.

Although in-depth documentaries have lost much of their commercial television network support since the deregulation of the 1980s, the years since have witnessed a resurgence of interest in the form outside of commercial television. Public television garnered huge audiences in the 1990s for *The Civil War*, a series directed by Ken Burns (1953–). *Who Killed the Electric Car*? (Chris Paine, 2006) on the suppression of an alternative fuel-driven automobile, and *An Inconvenient Truth* (Davis Guggenheim, 2006) featuring former Vice President Al Gore's global campaign to awaken the public to the dangers of climate change, are twenty-first-century examples of the expository documentary mode and its contribution to investigative journalism. *March of the Penguins* (2005) by Luc Jacquet (1967–) about the emperor penguins of Antarctica, and their arduous efforts to reproduce and survive, is second only to *Fahrenheit 9/11* for box office returns and has spawned several feature-length animations.

Ross McElwee's films fall into the reflective mode of documentary that simultaneously comments on the filmmaking itself. His ironically autobiographical *Sherman's March* (1986) begins with his plan to follow General Sherman's Civil War route, but gets diverted along the way by his own past and current love interests. Subsequent films, *Time Indefinite* (1993) through *Bright Leaves* (2003), continue to intermix his deeply personal story with external encounters. In a more political vein, Trinh T. Minh-ha's *Surname Viet Given Name Nam* (1989) and Marlon Riggs's *Tongues Untied* (1990) use the reflective documentary mode to reveal the subjectivity of the point of view of the filmmaker and the need to question whose reality is being portrayed.

Another genre that offers documentary reflexivity is that of animation based on real world people and events. The filmmaker Chris Landreth, whose *Ryan* (2004) won an Academy Award, filmed in video extended interviews with Ryan Larkin, an early and highly acclaimed animator. Larkin had

stopped making art as a result of his alcoholism and drug use and was living on the streets in Canada. The documentary footage is taken by Landreth and animated using Maya animation software to portray what Landreth calls the "psycho-realism" of the subjects, a departure from the attempt of many animators to achieve photo-realism. Animation of this kind explores another avenue of documentary filmmaking, seeking to express what is often inexpressible (*A Is for Autism,* 1992) or taboo (*Daddy's Little Bit of Dresden China,* 1988, by Karen Watson on child abuse).

The Documentary Future

Digital cameras continue to improve, getting closer to the quality of film cameras and with a dramatic decrease in cost. Many cell phones come equipped with a small digital camera, and webcams allow quick recording directly into a computer. While digital cameras are only beginning to be used by major film studios, the fact that most video editing is done through computers as well as the cheap costs of digital cameras makes digital production appealing to many amateur and professional documentary filmmakers. Such devices allow for inexpensive and easily accessible filming and editing of documentary films, and the Internet offers a cheap means of distribution. YouTube and social networking spaces have become immensely popular venues for filmmakers, and may play a significant role in challenging the control media institutions have asserted over production in the past.

Documentary film has proven to be an enduring and dynamic form, one that continues to occupy an important position in media communications. The form itself has multiple modes, with a flexibility that encourages ongoing adaptation and reshaping to fit the particular objectives of the filmmaker. As a journalistic medium, documentaries blend passion, commitment, and a striving to capture reality,

Filmography

ABC Africa—Abbas Kiarostami—2001
And the Pursuit of Happiness—Louis Malle—1986
An Inconvenient Truth—David Guggenheim—2006
Battle of Algiers—Gillo Pontecorvo—1966
Bowling for Columbine—Michael Moore—2002
Chronicle of a Summer (Chronique d'un Eté)—Jean Rouch and Edgar Marin—1961
Drifters—John Grierson—1929
Empire in Africa—Phillipe Diaz—2006

Fahrenheit 9/11—Michael Moore—2004
Far From Poland—Jill Godmilow—1984
Harlan County—Barbara Kopple—1976
Harvest: 3000 Years (Mirt Sost Shi Amit)—Huile Gerima—1975
Harvest of Shame—Edward Murrow, David Lowe, and Fred Friendly—1960
Hearts and Minds—Peter Davis—1974
Kino-Eye—Dziga Vertov—1924
Law and Order—Frederick Wiseman—1980
Leonard Cohen: I'm Your Man—Lian Lunson—2005
Life Begins Tomorrow (La Vier Commence Demain)—Nicole Védrès—1949
Mad Hot Ballroom—Marilyn Agrelo—2005
Making Do the Right Thing—Claire Bourne—1989
March of the Penguins—Luc Jacquet—2005
Moana—Robert Flaherty—1926
Nanook of the North—Robert Flaherty—1922
Night and Fog—Alain Resnais—1955
Paris Is Burning—Jennie Livingston—1990
Primary—Robert Drew and Richard Leacock—1960
Roger and Me—Michael Moore—1989
Salesman—Albert and David Maysles—1969
7 UP (through *42 UP)*—Michael Apted—1963 (and every seven years)
Sherman's March—Ross McElwee—1986
Shoah—Claude Lanzmann—1986
Supersize Me—Morgan Spurlock—2004
Surname Viet Given Name Nam—Trinh T. Minh-ha—1989
The City—Willard Van Dyke and Ralph Steiner—1933
The Civil War—Ken Burns—1990
The Emperor's Naked Army Marches On (Yuki Yukite Shingun)—Kazua Hara—1987
The Lovely May (Le Joli Mai)—Chris Marker—1963
The Man with the Movie Camera—Dziga Vertov—1928
The Quiet One—Sidney Meyers—1949
The River—Para Lorentz—1937
The Selling of the Pentagon—Peter Davis—1971

Triumph of the Will (Triumph des Willens)—Leni Reifenstahl—1935
What Farocki Taught—Jill Godmilow—1997
Who Killed the Electric Car?—Chris Paine—2006
Why We Fight—Frank Capra—1943–1945

Documentaries, Television

Documentaries are nonfiction programs that convey experience, provide information, and offer analysis. Many memorable and respected programs in American television journalism were documentaries. In part, this is because documentaries offer journalists the luxury of more airtime to explore a single topic in greater depth than the shorter-format evening news or newsmagazine programs. In addition, documentarians are often freer to express their own conclusions on controversial issues than beat reporters, who are more constrained by the demands of objectivity and balance.

Although the line between documentary and docudrama is often blurry, documentaries are less likely to dramatize or reenact events. In contrast to talk shows, documentaries aim to go beyond "talking heads" offering opinions to convey the lived experience of people, places, and events. Documentary makers usually construct their programs from some combination of recordings in the field, compilations of archival materials, interviews, graphics, and animations. Many types of broadcast documentary have emerged over the years, including investigative, social, political, historical, cultural, biographical, diary, and those focused on nature.

Radio Documentary

Documentaries held a small but significant place in American radio. From the beginnings of radio broadcasting in the 1920s through the 1940s, the handful of hours per week of documentary programming on each network were really docudramas that presented reenactments of historical and current events. Yet programs such as *Great Moments in History* (NBC, 1927–28), *The March of Time* (CBS, 1931–45), and Norman Corwin's (1910–) patriotic reports on American institutions and World War II (CBS, 1941–45) helped develop some of the conventions of radio and television documentary. Such programs also offered network affiliated stations an important way to fulfill their public service programming obligations as then encouraged by the Federal Communications Commission (FCC).

Two main barriers limited development of radio documentary before the 1950s: the limits of bulky and unreliable recording equipment and the networks' reluctance to air recorded material because of poor sound quality. Advances in recording technology—including magnetic wire, discs, and,

eventually, audiotape—allowed some experimentation with recording live voices and sounds from the field. Growing interest in documenting cultural and social life during the 1930s inspired a handful of reports on folklore, folk music, and the impact of the Depression. These programs were produced by the Library of Congress, the Smithsonian Institution and other government agencies. During World War II, recorded reports from the front began to break down network resistance to airing material created outside the studio. After the war, a few programs began to weave clips of reality sound with narration, including Edward R. Murrow (1908–65) and Fred Friendly's (1915–98) *Hear It Now* (CBS, 1950–51), which quickly became the basis for their early television documentary series, *See It Now*.

However, the economics of commercial radio continued to relegate documentary to the margins from the 1950s onward. The networks' hold over radio waned with the rise of independent radio stations, television networks, and alternative program packagers. Most local stations adopted music formats with only brief breaks for news that left little room for long-form treatment of issues.

In the 1990s and 2000s, radio documentary enjoyed a small creative renaissance on the two American public radio networks: National Public Radio and Public Radio International. American RadioWorks was the largest in-house producer of public radio documentaries, while Soundprint primarily developed and distributed programs made by independent and station-based producers. Both created a steady stream of investigative, historical, and cultural documentaries told in a narrative style. The most notable of these programs, *This American Life,* introduced a new format with its 1995 debut that explored a common theme through individual stories told in the first person by those who lived them. Wry, literate narration by host Ira Glass (1959–) and the breadth of topics explored, ranging from war to summer camp, offered an innovative way to view social and political life through personal voices that created a kind of collective diary.

Television Documentary

Television documentary emerged in the 1950s, influenced by traditions inherited from radio news, photojournalism, documentary film, and movie theater newsreels. These different influences were not always easy for journalists to reconcile. Some producers saw themselves primarily as filmmakers telling stories through images and location sound recordings. In contrast, many reporters tended to favor an illustrated lecture approach in which their narration and interviews were the primary focus.

Documentaries, which were scarce on American television in the 1950s, were of two main types. The first, historical documentaries were compilation films that knitted together archival footage unified by a dominant narrator who told the story, setting the conventions for historical documentaries for years to come. Each of the major commercial networks produced a compilation series in cooperation with the military. *Victory at Sea* (NBC, 1952–53) relied on footage shot by the U.S. Navy to recount the naval battles of World War II to the dramatic musical score of Richard Rogers. *The Big Picture* (ABC, 1953–59) drew on Army footage and sources to portray military history and leaders. *Air Power* (CBS, 1956–57), produced with help from the U.S. Air Force, told the story of World War II's aircraft and decisive air battles. These series were later syndicated to stations around the country, where they were re-run for many years. *The Twentieth Century* (CBS, 1957–70), narrated by Walter Cronkite (1916–2009), depicted historical events through the biographies of key figures, often including retrospective interviews with participants. *You Are There* (CBS, 1953–56) dramatized events by placing modern reporters within recreated historical scenes.

The investigative documentary debuted in the 1950s. *See It Now* (CBS, 1951–55, then intermittently until 1958) marked the first critical journalism on television, giving birth to the second major documentary type. A team headed by reporter Edward R. Murrow and producer Fred Friendly shot their own film and conducted their own interviews rather than using reenactments. The series focused on current and controversial issues rather than major historical events or widely admired heroes. The program was more likely to question political leaders and policies than to collaborate closely with government agencies as co-producers. In its most famous reports early in 1954, *See It Now* critiqued Senator Joseph McCarthy's

anticommunist investigations, profiling some of the victims of his often unsupported accusations of communist activity. Although Congressional sentiment was already turning against McCarthy at the time of the reports, *See It Now* probably helped diminish public support as well. However, network and sponsor discomfort with the program's courting of controversy and commercial pressures to air more lucrative programming forced eventual cancellation of the series and its replacement by the occasional *CBS Reports*.

The 1960s can be seen as the golden age of television network documentary. Early in the decade, each network developed a prime-time documentary series: *CBS Reports*, *NBC White Paper*, and ABC's *Bell and Howell Close-Up!* At the high point of the documentary boom, the networks aired 447 documentaries in the 1961–62 season, over twice as many as four years earlier. The heavy investment in documentaries was the result of several factors. As public service programming, documentaries helped the networks appease angry regulators after the quiz show rigging scandals of the late 1950s. FCC Chairman Newton Minow (1926–) pressured the networks to expand informational fare to improve what he called the "vast wasteland" of commercial entertainment. The Kennedy administration hoped that documentaries might support American efforts around the world to contain communism. The networks believed that documentaries would increase the influence of American television as the networks expanded into global video markets. Television journalists hoped documentaries would help raise their prestige to the level of top print journalists, while offering citizens more thoughtful explanations of current events. By 1969, the Public Broadcasting System (PBS) began to provide a new outlet for documentary journalism that exposed social problems and critiqued American institutions.

Although the networks experimented with many different approaches to documentary in the 1960s, their most enduring contribution may have been to the development of investigative television reporting. Network journalists helped create the first sustained period of muckraking since the beginning of the twentieth century. While most scholars and journalists think print media have been primarily responsible for watchdog reporting on government and corporations, the networks created their documentary units several years before major newspapers developed permanent investigative teams. The number of investigative documentaries on television compared favorably with the number of major press exposés each year—and the documentaries reached many more Americans. In the early 1960s, about 90 percent of American households saw at least one documentary per month. By the early 1970s, a prime-time CBS documentary drew seven to 12 million viewers, while the largest urban newspapers reached fewer than a million readers each.

The most famous of these television reports were as carefully researched and argued as their print counterparts. For example, in *Harvest of Shame* (CBS, 1961), Murrow attacked the poor working and living conditions of migrant farm workers by following some of them on the east and west coasts. *The Battle of Newburgh* (NBC, 1962) criticized opponents of public support for the poor by closely examining the evidence and arguments of an antiwelfare town manager in New York state. *Hunger in America* (CBS, 1968) exposed federal food programs' failure to address widespread malnutrition among Appalachian whites, Southern blacks, Native Americans in the Southwest, and Mexican Americans in Texas. Several documentaries exposed the dark side of America's war in Vietnam through firsthand reporting. Like most investigative reporting, these documentaries often relied heavily on government sources and interest groups for their framing of the issues, yet they helped amplify those voices to a larger audience.

Journalists invented many of the conventions of television documentary in this same period. Taking advantage of newly available lightweight cameras and sound equipment, documentary producers were freed to leave the studio interview setting to offer more intimate and dynamic portraits of people and places. Robert Drew (1924–) produced path-breaking documentaries for Time-Life's television stations and then ABC in which moving cameras followed political leaders behind the scenes for the first time to record them during moments of reflection and crisis. The first of these, *Primary* (1960), followed John F. Kennedy and his opponent Hubert Humphrey in public and private for the last five days of the Wisconsin presidential primary and influenced how political campaigns

would be represented for years to come. This informal and less stagy style became known as cinema verite or direct cinema. *Biography of a Bookie Joint* (CBS, 1961) inaugurated the use of hidden cameras, which would become a staple of investigative television reporting, in this case to capture the doings in an illegal betting parlor operating with police protection in Boston. Documentaries began featuring confrontational interviews between journalists and their sources, introducing another mainstay of television reporting.

Investigative reporting, however, attracted intense opposition from government and business officials, advertisers, and nervous network executives. Complaints to the FCC about documentaries' fairness and accuracy grew. Executive branch officials and congressional committees conducted lengthy probes of television documentary practices, accusing the networks of staging events, encouraging subjects to break the law, paying participants for their stories, and reflecting political bias. Perhaps ironically, airing hard-hitting documentaries helped stimulate threats to regulate network news. When Congress investigated whether CBS journalists deceptively edited an interview with a Department of Defense official to make him sound untruthful in *The Selling of the Pentagon* (CBS, 1971), CBS President Frank Stanton (1908–2006) narrowly escaped being cited for contempt of Congress because he refused to relinquish reporters' work notes and unused footage (outtakes). While the documentary boom arose in part to assuage ire at deceptive game shows, critics accused some documentaries of being equally fraudulent.

Nowhere was this backlash against documentaries felt more directly than at PBS which depended, in part, on public funding. The noncommercial network focused heavily on informational and educational programming to fulfill its mandate. This included airing some contentious documentaries that challenged major institutions. One such report, *Banks and the Poor* (PBS, 1970), assailed banks for discriminating against low-income borrowers and Congress for failing to address the problem because of its members' financial ties to the banking industry. The program incensed bankers, some of whom sat on local public station boards of directors. President Richard Nixon's administration sought to restructure and rein in public broadcasting to limit the autonomy of program producers by trimming budgets for program production. Public affairs documentaries on PBS declined in the ensuing decade.

In the 1970s and 1980s, the documentary also began a slow decline on the commercial networks. Political and legal pressure from government and corporate targets of documentaries alienated sponsors, network executives, and affiliate stations (who refused to carry some of the programs). The rise of television newsmagazines, led by *60 Minutes* (which premiered in 1968 on CBS), demonstrated that programs with several briefer stories reported by a regular cast of celebrity journalists could attract larger audiences and more advertising dollars than long-format documentaries on a single issue. In the 1980s, the FCC dropped regulations that had spurred television stations to provide public service programming. The networks cut back unprofitable news programs because of declining audiences and advertising revenues in the face of growing competition from cable and satellite television, home video recorders, and, by the mid-1990s, the Internet. By 1984 the three commercial television networks aired just 11 documentaries between them all year.

The documentary survived in the 1990s and early 2000s, mainly on PBS and cable television networks. On PBS, the long-running *Frontline* series and the documentaries of Bill Moyers (1934–) kept the investigative tradition alive. *POV* (short for "point of view") aired more personal, independent documentaries, some of which addressed public life, often from the standpoint of unsung individuals. Ken Burns (1953–) reinvented the historical documentary, starting with his 12-hour epic *The Civil War* (PBS, 1990), by mixing imaginative use of archival photographs with contemporary cinematography, music, and actors' readings of historical documents to bring the past to life. Series such as *Nova* and *Nature* continue to introduce viewers to recent developments in human understanding of nature and science.

Cable networks offered a new home for documentaries that were less constrained than on broadcast networks. Some cable channels specialized in presenting particular types of documentary, such as The History Channel (historical documentaries) and Discovery (science and nature documentaries), while others regularly incorporated

documentaries into their entertainment schedules, such as the Independent Film Channel, the Sundance Channel, and Home Box Office (HBO). The Documentary Channel focused entirely on presenting documentaries of all types. Most of the most significant and award-winning documentaries of this period premiered on cable, such as Spike Lee's (1957–) *When the Levees Broke* (HBO, 2006), a four-part examination of human suffering in New Orleans after Hurricane Katrina and an indictment of the federal government's response to the crisis.

Conclusion

The broadcast network documentary is significant for several broader trends in American news. First, the documentary has been especially likely to provoke controversy over journalism ethics. Documentary makers have experimented with how best to tell stories and express views on public controversies. Such innovations as field recordings, hidden cameras, and combative interviews have sparked discussion over the proper balance between journalists' duties to record reality and to interpret it, or to reproduce powerful sources' views verbatim and to reveal their inconsistency and evasiveness through editing. Documentary has also been a frequent touchstone for arguments over whether journalists should pursue objective and balanced reporting of competing views or make reasoned judgments about which views are better supported or more fair-minded. Documentary producers are divided over whether they have a responsibility to go beyond exposing social problems by offering potential solutions. At the same time, reliance on reenactments (and claims that some documentaries have relied on misleadingly staged scenes) continues to provoke arguments about the responsibility of journalists to disclose their methods for constructing truth.

The documentary has often raised questions about who is a journalist and who is not. For most of their history, the main commercial networks were reluctant to air documentaries made by independent (non-network) producers. With a few exceptions, documentaries were produced by network news departments to ensure fairness in issue treatment, consistency of journalistic standards, and to promote network journalists. In contrast, PBS and cable television have relied mainly on independent producers, who often bring different perspectives to bear. Yet independent producers may identify more closely with one point of view on a topic or constituency and may prioritize journalistic values differently. Some have not been trained as journalists.

Finally, development of the television documentary illustrates both the promises and perils of the decline of network news' dominance. Forty years ago, network television journalists had bigger budgets and more production and air time to explore often controversial issues in depth than do network staffs today. During the 1960s and 1970s, documentaries could reach and influence millions of Americans. Because so many might watch, however, documentaries became a focal point for criticism of television journalism generally. Powerful forces in government and business pressured network executives to rein in documentary reports to avoid offense, lawsuits, regulatory oversight, and lost advertising dollars.

By the 1990s and 2000s, changing economics and deregulation of television fragmented the mass audience and all but erased the documentary from the commercial network schedules. Broadcast documentarians could no longer command the resources and broad public attention they had in the past. This distinction passed to documentaries first released in movie theaters, which were often buoyed by organized political campaigns, such as those of Michael Moore (1954–) (*Fahrenheit 9/11, Sicko*) and former Vice President Al Gore's (1948–) exposition of global warming, *An Inconvenient Truth*. PBS and cable channels also suffered some economic and legal pressure to quell or restrain investigative reporting. But these networks aired more documentaries produced by independent journalists for audiences more likely to tolerate journalism with a point of view.

Although documentaries have never been plentiful, they have often drawn high esteem within and beyond broadcast journalism. Because they permit journalists to tell lengthier stories and to express a point of view more clearly than other types of news, documentaries may have greater impact on public consciousness. Documentarians pioneered many techniques of television news and, in the process, prompted many recurring questions about broadcast news ethics. Not all documentary makers have identified themselves as journalists in

the traditional sense, a role that grows fuzzier as more voices produce documentaries for cable and public television. Some mourn the passing of a golden age of television documentary. But many feel that documentary makers are freer today on public broadcasting and cable networks.

Dow Jones

Dow Jones, founded in 1882 as the Dow, Jones & Company, is the world's largest provider of public financial news and information. Among other print publications, the company has produced *The Wall Street Journal* since 1889 and *Barron's Magazine* since 1921. Dow Jones also owns the Ottaway chain of local newspapers. Its holdings of overseas television business news networks include a 70 percent control of European Business News and 50 percent of Asia Business News. The Dow Jones Newswires, evolving from daily, handwritten bulletins delivered by messengers to subscribers in the Wall Street area of New York City, offers several thousand daily business news items to subscribers worldwide. The company's Financial Information Services division is the world's leading supplier of computerized real-time financial databases and analytical tools. In 2007, Dow Jones maintained 90 news bureaus across the globe and offered financial reports in 11 languages.

History

Dow Jones was formed in the autumn of 1882 by three reporters: Charles Henry Dow, Edward Jones, and Charles Bergstresser, the latter a silent partner whose savings financed the company's launch. Working from a basement office on Wall Street, Dow and Bergstresser produced financial stories and submitted these to Jones, who edited the stories and then dictated bulletins to scribes. These were compiled in handwritten reports known as "flimsies" and delivered to subscribers in the Wall Street area. In November 1883, the company began producing the *Customers' Afternoon Letter,* a printed two-page publication that summarized the bulletins dispatched that day.

The next year the company introduced the "Dow Jones Average," published in the *Afternoon Letter*. It was the precursor of the Dow Jones Industrial Average launched in May 1896, perhaps

the most famous and recognized of several stock market indices created by Charles Dow. The average consists of the adjusted value of the stock prices of the 30 largest and most widely held publicly traded companies in the United States. Regarded as the most reliable assessment of the state of the American stock market, it is reported in newspapers and broadcasts around the world.

By 1889, the company was flourishing. Two years previously, Dow Jones had joined in a news exchange agreement with Clarence Barron (1855–1928), who managed a news bureau in Boston and had been producing a financial newspaper there for several years. In July 1889, the *Afternoon Letter* was transformed into the daily *Wall Street Journal,* a four-page publication selling for two cents. The two offices, Dow Jones's in New York and Barron's in Boston, reinforced one another's coverage of American business news; in 1896, the aggressive Barron expanded coverage into Philadelphia with his *Financial Journal.* In 1898, a morning edition of *The Wall Street Journal* was launched.

In the meantime, the company founders foresaw a need for a quicker way to deliver financial news, especially about the volatile stock market. In 1897, they created the Dow Jones News Service, which provided reports over telegraph wires. Known as broadtape, the local service employed printing devices, called "tickers." The service was announced in the February 26 issue of the *Journal,* and proved a modest success. It underwent a major expansion in the mid-1920s: service was introduced in Chicago, St. Louis, and Detroit in 1925; Boston, Washington, and Richmond joined the circuit in 1927; and Los Angeles, San Francisco, and cities in Pennsylvania and Ohio followed in 1928. This news service laid the foundation for the Dow Jones Newswires.

In March 1903, Barron, along with *The Wall Street Journal*'s then-editor Thomas Woodlock, bought Dow Jones for $130,000. In 1912, with Barron's other publications no longer in print and the *Journal* floundering, Barron appointed himself president of the company and editor of its publications. Readership of *The Wall Street Journal* rose to 52,000 by 1928, and the paper grew to a daily 20 pages. Under Barron, Dow Jones and its publications became vocal defenders of Wall Street and American business practices, even against the U.S. Congress in its editorials during hearings on bills such as the Federal Home Loan Bank Act (1932), Banking Acts of 1933 and 1935, and the Securities & Exchange Act (1934) during the Depression.

Barron's National Business & Financial Weekly made its debut in 1921, with Barron himself serving as its first editor. Since its inception, it has provided a summation of the previous week's stock market activity, news reports, financial statistics, and an outlook on projected market activity for the coming week. Initially priced at 10 cents, it was an immediate success among investment and financial professionals. The magazine is known for its objective assessment of corporate prospects and is recognized for investigative reporting on stock fraud, insider trading, and overvalued companies. According to Dow Jones, *Barron's* circulation in 2004 was over 300,000. Its readership is decidedly wealthy, with an average household net worth of $1.2 million.

Barron died in 1928, leaving control of the company to Hugh Bancroft, his son-in-law, who continued Barron's plans to expand Dow Jones. The first issue of *The Wall Street Journal*'s *Pacific Coast Edition,* published in San Francisco and devoted to financial news of the West Coast, appeared just eight days before the October 1929 stock market crash. Closely tied to the fortune of the financial health of the United States, Dow Jones felt the full impact of the Depression, with declining subscriptions for its various publications and staff layoffs. The newswire "broadtape," which had been expanded to serve the Canadian market, provided the firm's major source of income during the 1930s.

With the end of the Depression and World War II, Dow Jones quickly recovered and entered a period of steady growth. By the end of the 1950s, circulation of the *Journal* was over a half-million. In 1962, the company launched the *National Observer,* its first new product since *Barron's* in 1921. A weekly that reported and interpreted national and foreign news, arts and consumer affairs, the *Observer*'s circulation rose to nearly 500 thousand before it ceased publication in 1977 when it failed to reach projected profits after 15 years. In 1967, the company's experience with its newswire led to the "Economic Report," a joint venture with the Associated Press that transmits business news to subscribers throughout the world. Meanwhile, the company that reported on the

stock market went public itself in 1963, with 110,000 shares of Dow Jones common stock sold to the public, although the Bancroft family, Barron's heirs, retained control of the company.

In 1971, Dow Jones pioneered electronic publishing; the operation, now known as the Dow Jones News/Retrieval Service, permits subscribers to search for and select items from any of the company's publications or services and bring these to their computer screen. The company expanded even more by acquiring the Ottaway group of 8 daily and 14 weekly community newspapers in seven states. Shortly thereafter, it invested in newsprint mills in Virginia and Quebec. The *Journal* launched an Asian edition in 1976, a European version in 1983, and its online edition in 1996. In 1982, the company began production of a syndicated television program on the market, and has added syndicated radio broadcasts that are aired and updated throughout the business day. Since then, Dow Jones has continued a vigorous growth, focused on three broad segments: business publishing, financial information services, and community newspapers.

At the end of 2007, *The Wall Street Journal* was purchased by Rupert Murdoch's News Corp. when Dow Jones shareholders approved the acquisition. In May 2007, News Corp. made an unsolicited bid to take over Dow Jones. The Bancroft family, which controlled more than 60 percent of the stock, at first rejected the offer, but later reconsidered. Three months later News Corp. and Dow Jones entered into a definitive merger agreement. The controversial $5 billion sale added *The Wall Street Journal* and *Barron's* to Murdoch's news empire, which already included Fox Television, the *New York Post*, and *The Times* of London. At the time, *Journal* staffers and union representatives expressed fears that the merger would impact the quality and independence of Dow Jones's news-gathering roles, while academics and others decried such major corporate consolidation of news media as dangerous to democracy and free speech.

Dow Industrial Average

Although Dow Jones produces a number of stock market and financial indices (there are, for instance, transportation and utility averages) the Dow Jones Industrial Average is the most famous and most reported. At the time of its creation, people found it difficult to understand the daily jumble of stock prices and even whether the American stock market was rising, falling or remaining even. Charles Dow compiled the index as a way to gauge the performance of the industrial component of the New York Stock Exchange. It is the oldest continuing market index, aside from the Dow Jones Railroad (now Transportation) Average, which Dow also created.

The Industrial Average (or "the Dow") first saw print in the *Afternoon Letter* in May 1896, and represented the average of 12 stocks from various American industrial sectors; of those original 12, only General Electric remains part of the average. The average is price weighted. When it was first published, the average stood at 40.94, computed by adding the stock prices and dividing by the number of stocks in the index.

For its first 25 years, the Dow Jones Industrial Average appeared only in *The Wall Street Journal*. In the economic boom of the 1920s, however, many average citizens began buying stocks and wanted an easy-to-understand method to judge the market. Newspapers began the habit of mentioning market action in the general news each day, and the Dow became the shorthand method of reporting it. Broadcast news took its cue from print media, adopting the Dow as the most understandable quantified indicator for the health of the stock market.

Over the years the number of companies increased to 30, representing the most commonly traded stocks. For the sake of continuity, changes in the companies represented are rare and are reviewed only after corporate acquisitions or other dramatic shifts. A stock is typically added only if it has an excellent reputation, has demonstrated sustained growth, and is of interest to a large number of investors. To compensate for the effects of stock splits and other corporate adjustments, the Dow is now a scaled average, not the actual average of the prices; the sum of the component prices is divided by a divisor, which changes whenever one of the component companies has a stock split or stock dividend. Since the value of the divisor is usually less than 1, the value of the index is often higher than the sum of the component prices.

Although highly regarded and reported, the Industrial Average has been criticized by some

economists who argue that it is no longer a very accurate representation of overall market performance. Being price weighted, it gives relatively higher-priced stocks more influence than lower-priced ones. Another issue with the Industrial Average is that the posted opening of the Dow is determined by the prices of those few companies that open first along with the previous day's closing price of the remaining components. On those days, according to some observers, the average may not accurately reflect the true state of the stock market. Still the average is the most widely quoted measure of Wall Street used by most news media.

The influence of the Dow Jones Industrial Average is significant and most investors and advisors rely on it to judge the market. According to some academic studies, given that most individual stock portfolios contain three to six stocks at a time, the Dow is closer to human-scale investment, and thus more understandable than indices with hundreds of stocks. It has generally proven to be in sync with other financial barometers, despite the difference in computation methods. The Dow's durability lies also in the selection of companies that make up the industrial average; collectively, these represent every important sector (no longer merely industrials as the name implies) in the stock market.

The Newswires

The Dow Jones Newswires is the world's leading independent provider of real-time business, financial, economic, and market-related political news. The Newswires includes several services, the best known among them being the Dow Jones News Service, Dow Jones Wealth Manager, Dow Jones Indexes, and Dow Jones Advantage Training Resources. VentureWire, with sector-specific news on targeted industries and trading areas, claimed more than 160,000 readers daily in 2007. The Dow Jones Newswires also include financial news networks focused on specific countries and global markets.

The newswires division of Dow Jones is also responsible for a number of specialized reports delivered online to subscribers. The Professional Investor Report provides coverage of unusual stock activity. Capital Markets Reports covers the fixed-income and futures markets, while Emerging Markets Reports follows Treasury Bills, mortgage-backed securities, corporate bonds and political events. Asian Equities Report is available in Asia and covers the equities markets there. Teleres is a commercial real-estate information service.

Taken together, the various offerings of the Dow Jones Newswires served over 420,000 subscribers in 66 countries by mid-2005. Millions of users more have access to selected content via corporate intranets and customer extranets. The Newswires produce each day over 10,000 news items covering equities, foreign exchange, energy, commodities, corporate disclosures, futures, stock markets and over 37,000 listed companies. This real-time news is also delivered via license to their own subscribers by more than 50 vendors, including Reuters, Bloomberg, Thomas Financial, and Telerate.

Dow Jones, through the high-profile *Wall Street Journal* and Dow Jones Industrial Average, is the most successful company offering financial news. Now an international conglomerate itself, it has diversified and dominates the field of business reporting. The Dow Jones Newswires span the globe. The company continues to expand its coverage and services, relying on the latest communication technology.

Editing, Newspaper

Editing involves deciding what news stories, pictures, or video to publish or broadcast and what form that material should take. The role is central across nearly all print media (on which this entry focuses), from newspapers and magazines to websites and books. Editing takes on many forms, however, and involves evaluating both big issues and small details: creating a vision for a publication; assigning articles, photographs, and graphics; evaluating articles for proper organization, tone, and readability; managing and motivating writers, photographers, and other editors; designing each issue; and correcting facts, grammar, word usage, and other mechanics of articles. While the editing process is generally invisible to readers, editors shape everything readers ultimately see.

Anyone who writes, of course, also edits, deciding which subjects and sources to pursue and which to avoid, what material to include in an article, and how that piece should be written. A true editor is an outside voice, offering a view detached from that of the writer but in tune with an audience. In that sense, editors must see a publication more broadly than other staff members, serving as gatekeepers of information and protectors of a publication's integrity through adherence to mission and to standards of ethics and quality.

Evolution of Editing

The word *editor,* first meaning the publisher of a book, originated in the 1600s and over the next 200 years took on the journalistic meaning we ascribe to it today. Editing as a profession began to take shape as the number of newspapers, magazines, and books increased, and as publications grew in both size and readership. The first editors were printers who reprinted articles from other publications (often from abroad), and sometimes added their own commentary. Printers took their role as editors seriously, however, even if they didn't call what they did *editing*. Benjamin Franklin (1706–90), for instance, published "An Apology for Printers" in his *Pennsylvania Gazette* in 1731, saying, "Printers do continually discourage the Printing of great Numbers of bad things, and stifle them in the Birth" (quoted in Pickett, 30). He asserted his right to print controversial material, though, much as editors have done in the nearly three centuries since. That function eventually became known as gatekeeping, with editors deciding what to publish or not to publish, free of government control or outside influences.

Magazine editing was primarily a part-time job until the late nineteenth century, with clergymen or professors often doing such work in addition to their primary employment. Top editors at American newspapers were often (or worked closely with) politicians or civic figures. Publications retained

their political or religious ties and editorial identities for years even as editing grew into a full-time occupation. Gradually, publications began actively reporting news rather than waiting for information to trickle in from outsiders and other publications. This broader role increased the importance of editors, who directed the coverage.

These changes took place as rising literacy rates in the nineteenth century helped create more demand for reading material, improved printing technology allowed newspapers and magazines to easily print thousands of copies, and improved transportation allowed for wider, quicker distribution. By late in the century circulations soared into the hundreds of thousands among big city newspapers and some national magazines. Many of the architects of these mass circulation publications, like Joseph Pulitzer (1847–1911) (New York *World*) and William Randolph Hearst (1863–1951) (*New York Journal*), served as both publishers and editors, guiding both the business and news operations. Others, like Cyrus H. K. Curtis (1850–1933), hired editors like Edward Bok (1863–1930) (*Ladies' Home Journal*) and George Horace Lorimer (1867–1937) (*Saturday Evening Post*) and allowed them to shape their publications as they saw fit. A gap developed, though, between editors who ran large publications and those who ran smaller ones. Those in cities saw themselves as outsiders, of sorts, observers whose detachment allowed them to get closer to the truth. Small-town editors, on the other hand, saw their role as intimates of or voices for their communities. Hodding Carter (1907–72), editor of the *Delta Democrat-Times* in Greenville, Mississippi, said in 1961 that an editor should be "the community's chronicler, commentator, and general hell-raiser," but also a citizen "participating to the fullest in the life and aspirations of his town."

Divisions of Labor

Those different approaches to editing, which still exist to a great extent today, developed not only because of the size of the communities, but also because of the growing size of the publications. At smaller publications, a single editor often does much of the work, including the writing, photography, and design. Newspapers in metropolitan areas and mass-circulation magazines contain larger volumes of information and need larger staffs, leading to increasingly specialized editing. Top editors set the direction and policy for a publication and still do hands-on work with articles. Other editors, though, oversee areas like city news, national news, financial news and entertainment news, as well as the opinion pages. Below those editors are assigning editors, who work closely with reporters and freelance writers in deciding what articles to pursue. All of these editors use their sense of audience to pare down thousands of potential topics and articles into the relatively few that make it into publication. Editing of all kinds is linked to this gatekeeping function, as all editors have at least some control over what readers see.

Many other specialty areas of editing have emerged over the last century. In fields like banking, law, and medicine, technical editors handle specialized books, journals, pamphlets, reports, and training material. Editors oversee newsletters, advertising, press releases, video scripts, product documentation, and online help pages. Nearly any type of published material moves through the hands of editors.

At newspapers, managing editors oversee newsroom operations, including staffing, budgeting, and news coverage. News editors generally oversee a publication's design and sometimes act as a surrogate for the top editor. Features editors guide the coverage of feature stories, including arts and entertainment, food, and social events. Photo editors oversee staffs of photographers much as assigning editors oversee staffs of reporters. Wire editors choose articles from the Associated Press and other wire services, which provide thousands of articles from around the world.

Another group of editors, known as copy editors or subeditors, focus on the mechanics of articles, including proper grammar, spelling, and structure. At newspapers, these editors also write headlines, design pages and see everything through to production. Copy editors are surrogates for readers, looking for problems in articles and asking questions that readers might ask. Because they usually have no part in assigning an article, they can examine the writing and reporting with a fresh eye, seeing problems that those close to the reporting may have missed. Copy editors are usually the last to look over an article before it goes to press, and they inspect the article again on a proof, or copy of a page, a process known as proofreading.

Magazines have a structure much like that of newspapers, though the duties often differ. The top editor, often called the editorial director or editor in chief, sets the overall vision for the publication, working closely with the publisher, the advertising department, and even the marketing department. A managing editor or executive editor oversees day-to-day operations, including deadlines, hiring, and production. The managing editor may also fill in for other staff members, writing, designing, and taking on any other job that needs to be done. At smaller magazines, which may have only a few staff members, the managing editor does all these things routinely. At larger magazines, many other specialized editors work beneath the managing editor, overseeing a magazine's many departments. These editors also write headlines and other display type before passing on articles to the copy desk. Magazines often have fact-checkers, as well, a job that falls to copy editors at newspapers. Some magazines also have contributing editors, who are really freelance writers with expertise in specific areas.

The editing system was set up as a means of quality control. At most publications, articles make their way through at least two editors and oftentimes more. At nearly all publications, though, an editor's duties frequently change from day to day, depending on a publication's needs. So even though editing involves many specialized skills, the best editors are generalists who can adapt easily to different tasks or different roles. Ben Hibbs (1901–75), then editor of the weekly *Saturday Evening Post,* said in 1959, "Magazine editing today has become a team job, simply because the volume of work is so vastly greater and also because no one man can even hope to possess a sufficiently all-embracing knowledge of this complex world to do the job alone." Much about editing has changed since then, but the complexity and the need for many people to create a publication persist.

A Move Toward Professionalism

Editing, like many other jobs inside and outside journalism, became increasingly professionalized at the turn of the twentieth century. Organizations like Sigma Delta Chi (now the Society of Professional Journalists), American Business Media and the Associated Press Managing Editors established professional and ethical guidelines, and industry publications like *Editor & Publisher* and *Quill* helped editors further define their mission and their responsibilities. Universities created journalism programs, helping enhance journalists' education and reinforcing the idea of editing and reporting as professions with standards of quality, ethics and judgment.

Over the last century, many other organizations have formed, allowing editors to share ideas, solve common problems and make their jobs more visible. Magazine editors, features editors, opinion page editors, photo editors, and designers have all formed organizations. More recently copy editors and metropolitan editors have formed separate groups. These organizations have focused on such issues as training, maintaining quality with smaller staffs and, increasingly, helping members adapt to the Internet. This proliferation of organizations solidified the specialized functions of editors and the roles of these editors within a hierarchy of journalism.

As part of this move toward professionalism, editors concentrated more on providing information free of the influence of advertisers, political parties, or religion. This idea of reporting and editing with a seemingly neutral viewpoint became known as objectivity. It developed in the late 1800s and grew into a central tenet of journalism, although some in the field have questioned its relevance. Even journalists who don't subscribe to the idea of true objectivity try to uphold standards of fairness and ethics, two other crucial functions of editing.

Technology and Change

Technology began to change editors' jobs enormously in the late twentieth century. Computers allowed publications to be assembled much more quickly and with fewer people. Editing that was once done with pencil and paper, scissors and paste (for moving sentences and paragraphs) could be done more easily with computers. The popularity of television led to increased emphasis on visual communication in print, attracting a new type of editor whose job focused more on creativity in design than on news and information. Pagination, the assembling of a page with a computer, increased the workload of copy editors and news editors substantially. It gave them more control over the final publication and increased the importance of

their jobs, but it also added technical work that was once handled by printers.

Editing has changed in the upper ranks, as well. Assigning editors, for instance, say they are often stuck in the neck of an hourglass, constantly moving information from above to below without time for long-term planning. Editors of all types have been forced to do more as staffs have become smaller. Top editors have had to become more involved in the business aspects of their companies, rather than focusing solely on the content of their publications. Newspapers and magazines alike have come under growing scrutiny from owners or stockholders to increase profits, even as readership has stagnated or fallen as audiences rely increasingly on broadcast or Internet resources.

Technology has brought about other changes, as well. Computers have allowed journalists to create graphics much more quickly, leading to a proliferation of charts, maps, and other types of illustrations. As a result, some publications have created the position of graphics editor, keeping in the tradition of editing as a specialized function. Other publications have created design desks, with editors who have specialized knowledge in visual communication and use of color. With the increasing importance of the Internet, publications have appointed editors to oversee web operations, while others have pushed print editors to gain skills in publishing material on the Internet.

The Challenge of the Internet

The Internet has given millions of people instant access to information they once got from newspapers, magazines, television, and radio. In a sense, that has turned readers into editors, giving them a hand in the gatekeeping function that was once the sole purview of editors. It has also pressured editors to move their publications to the Internet. Online sites provide only a fraction of the revenue of magazines and newspapers in print, however, and few publications have figured out how to make up the difference. Online journalism also forces editors to make decisions more quickly, much as a wire service does, balancing timeliness with the need to check accuracy, especially as rumors surface in blogs, e-mail, and other electronic sources. Some online content, including news stories and blogs, bypasses editors, at least initially, as news organizations rush information onto the web. Many editors have questioned the logic of that approach, arguing that it compromises the credibility and reliability that have served professional journalists well for decades.

Such changes have created much anxiety among editors, but have also created opportunity. Online readership has been rising, and many editors see the Internet as the future of journalism, with print publications still playing an important, though smaller, role. The skills of print editors transfer easily to the Internet as well. A report by the Online News Association says that word skills remain at the heart of web editing, along with news judgment, attention to detail, knowledge of style and grammar, communication skills, and the ability to work under time pressure. Online editors, sometimes called producers, need computer-related skills, as well: a grasp of web coding, audio and video, and computer programs used to create graphical elements. The author of the report, C. Max Magee, concludes that "online journalists should be prepared to be copy editors."

The importance of editing is likely to grow as the role of an editor evolves. Editors' savvy in assigning, preparing, and presenting information has for decades allowed many publications to thrive. As the Internet becomes increasingly important as a source of information, editors must adapt their skills to a multimedia world even as they maintain the core word and visual skills that have served them well for decades. As the guardians of credibility and as gatekeepers for information, editors play a role that could make or break a website. Rick Rodriguez, a former president of the American Society of Newspaper Editors, told his colleagues that in a time of great change editors "must be the guardians of the soul of newspapers," maintaining the "role of verifier and authenticator that makes us unique" and ensuring that "the ethics, values and standards that we've struggled to establish—fairness, accuracy, independence and integrity—don't get lost in the new media ethos." As editors find their way in the world of new media, editing itself is likely to remain in the background. Audiences see little of the editing process even as editors make an enormous mark on journalism.

Editing, Online and Digital

Digital technologies have been used by newspaper and magazine editors since word processors–simple computers for writing—were introduced into newsrooms in the 1970s. Since the mid-1990s, *digital editing* has referred to the practice of working with digitized source materials: text written on a computer; photographs taken with a digital camera and prepared for publication using digital video editing software; video and audio captured, stored, and edited in digital format; and graphics (such as illustrations or information graphics) created on a computer. *Online editing* refers to using digital editing procedures to prepare material for publication on the World Wide Web.

Origins

Early attempts to deliver digital news content were made in Great Britain. In 1970, one of the world's first teletext services was established. Television sets equipped with a box to decode the digital signal were used to display text and crude, low-definition graphics. Videotex soon followed, distributed by cable. In the late 1980s and early 1990s the online consumer services CompuServe, Prodigy, and America Online (AOL) contracted with news organizations to distribute content. Around 1990, some newspapers began to deliver online content using BBS (bulletin board system) technology. With these developments in distribution methods, newspaper editors began to see the potential future in paperless media.

When Mosaic, the first widely popular web browser with a graphical user interface (GUI), was released in 1993, online newspapers had the opportunity to release news material (text *and* photos) on the web before television and radio stations could air a news story. Before online publication, newspapers usually were forced to wait until the next day's news cycle—long after broadcast media had broken the story.

For traditional print media organizations, this immediacy brought new opportunities to increase readership; to expand local content to a global information market; to provide in-depth coverage, not limited by the physical size of a newsprint page; to interact with readers through e-mail, online chat, and discussion boards. Although the immediacy of online publication offered new possibilities, it also presented a new challenge for online editors. A news organization's credibility may be its most valued asset. Accuracy, assured through careful fact-checking and editing, is a key to building a media organization's credibility over time. Online content can be published for the world to see with the push of a button on an editor's keyboard, adding a new element of risk. A news media organization's credibility may be compromised with a careless key stroke. Online editors have an ethical obligation to themselves, their reporters,

their employers, and their audiences to maintain a high level of journalistic integrity by taking enough time to check facts and assure accuracy.

Hypertext, Interactivity, and Multimedia

In the mid-1990s, online editors (and reporters) were discovering the impact of technology on their daily work routines. Online editors who had been trained as print journalists were introduced to the concepts of hypertext, interactivity, and multimedia.

Online editors are aware of the differences between reading printed material and reading a computer screen. Because reading on-screen is known to be slower and more fatiguing to the eye than reading a printed page, online editors encourage reporters to write short sentences and to use frequent paragraph breaks. Bulleted lists also assist the reader, who may need to quickly scan for items of interest to hunt efficiently for specific information.

Hypertext is layered digital information. Digital files are connected by hyperlinks. For online editors, this meant the linear story—the long-established standard in print—was no longer ideal. Indeed, linear stories posted to the web without any modification were criticized as being "shovelware," meaning that the editor had simply shoveled printed material onto the web, without consideration for the differences in print and online media. By building stories with hypertext, online editors are able to allow readers to choose what to read next.

Since editors have become more sophisticated about building narrative with hypertext, stories are often "chunked"—divided into short, easy to understand units presented on separate webpages. Chunking is also referred to as "layering" a story. One challenge online editors face is establishing consistent styles for layering stories, so readers can become familiar with navigating their way through content. Navigation through a site is one important form of interactivity.

Interactivity is thought of by digital journalists as involving the online reader in seeking or sharing information. Traditional newspapers or news broadcasts usually lack any interactivity—the communication is one way. In contrast, online editors have used various strategies that involve interactivity, such as: an e-mail link at the end of a news story so readers may provide feedback; access to searchable databases; calculators created with JavaScript in stories about investment strategies for retirement or in stories about home mortgage rates; online polls; and clickable maps.

For some stories, online editors may choose to combine more than one type of digital content. The combining of text, video, audio, and animation is referred to as multimedia.

Digitized source materials stored in a central database along with software for editing, combining, and displaying content enable online editors to create news packages that go beyond traditional story structures. For example, a software bundle available in 2008 enables online editors to edit photos, produce illustrations, prepare video clips with audio, and assemble a multimedia news package for publication on the web.

Convergence

In the late 1990s, technology again influenced the daily routines of online editors when the notion of convergence became popular. In the context of journalism, convergence generally refers to the idea that historically separate technologies, content areas, or organizational structures and business models may merge or intersect in some way.

Each of these types of convergence impacts an online editor. For example, when an editor budgets for equipment or assigns a story, he or she needs to know what technologies have converged—such as a cell phone with GPS (global positioning system) capability. The editor needs to know that a reporter assigned to cover the story has been trained to use the new equipment. When the nature of a story lends itself to team coverage—convergence of print (written story) and broadcast (video and audio content)—the online editor must understand the strengths of each medium in order to convey the story in the most compelling manner. Finally, when broadcast, print, and online operations merge to follow a converged business model, the online editor must adapt to new working conditions and develop productive working relationships with new colleagues.

As newer technologies emerge in the early twenty–first century, online editors continue to adapt. Digital media recording devices are becoming more

mobile and more miniaturized. Users of such devices are the audience for digital journalism. They expect customized, personalized content to be delivered the moment it is available. Digital editing allows editors to prepare and distribute news content to a growing population that prefers mobile devices, such as cell phones, over traditional media.

Between the time the first graphics-capable web browser was introduced in 1993 and the development of video-capable handheld mobile media a decade later, digital editing techniques and online editors have adapted to technical advances, professional opportunities, and audience expectations. Online and mobile media compete with broadcast outlets for immediacy in delivery of breaking news. The limitations of paper-based newspaper delivery have been partially eliminated by the capacity to expand and enhance news coverage using nonlinear, hyperlinked, multimedia storytelling and to deliver those stories to a global audience. The role of the digital editor is to provide a wide range of content in a variety of media—text, photograph, video, audio, animation, and graphic—to online editors and digital journalists for use in convergence coverage. The online editor oversees the process of digital news production and assumes responsibility for the accuracy and perceived credibility of the journalistic product.

EDITORIALS

Editorials are articles in a newspaper or magazine (or, very rarely, stories over the air) that combine fact and opinion to interpret news and influence public opinion. They express the publisher or owner's point of view and usually address current events or public controversies. As editorials are public, mass communicated expressions of public opinion, they are probably the most widely circulated opinion statements in society, regardless of whether they are widely read. If a newspaper has a political agenda, it, more than likely, would be visible on its editorial page. The influence of editorial content often depends on their influence on political or business elites.

Even though written by a single editor (and seldom signed), editorials express the opinion of the newspaper, magazine, or (again, rarely) broadcaster. Whatever specific opinions are being formulated, they tend to be derived from social interaction with management, rather than from personal experience or opinion of the editorial writer. As such, editorials offer a prominent function in the construction and expression of public opinion and an important addition to daily or weekly news publications.

Structure of Editorials

The sociocognitive foundation of editorials is reflected in how they are structured. For example, first person pronouns and stories about personal experiences are quite rare. Editorials are impersonal.

They focus on public news events, and support general opinions focusing on social, economic, cultural, or political issues. Editorials usually take the form of an essay, using an argument to promote a specific point of view. Newspapers nearly always publish editorials in line with their publication's editorial positions. An average editorial is approximately 750 words or less and typically includes (1) an introduction, body and conclusion like other news stories; (2) a brief explanation of the issue, especially complex ones; (3) a timely news angle; (4) opinions from the opposing viewpoint that refute directly the same issues the editorial addresses; (5) the concluding opinion of the publication, delivered in a professional manner (good editorials engage issues, not personalities and usually refrain from name-calling or other petty tactics of persuasion); (6) alternative solutions to the problem or issues being criticized; and (7) a solid and concise conclusion that powerfully summarizes the publication's opinion. A good editorial expresses a clear opinion. If it is based on evidence, so much the better. It is contemporary, tackles recent events and issues, and attempts to formulate viewpoints based on objective analysis of happenings and conflicting opinions.

Types of Editorials

Although editorials generally fall into one or more of the four broad types mentioned above, not all editorials take sides on an issue. But they all serve to inform, to promote, to praise or blame, and/or to entertain. When the purpose is to inform, the editorial provides careful explanations about a complicated issue. The editorial writer fills in background information, forecasting the future and passing moral judgment. Editorials explain to their readers the importance of the day's events, telling how a certain event came to pass, what factors counted in obtaining a change in governmental policy, and in what manner a new policy will affect the social and economic life of a community. To show an event's further significance, an editorial may review its historic setting, relating to what has gone before. All editorials are designed to be persuasive—to sway readers to agree with the point of view expressed. Editorial writers often promote events, worthy causes and activities, and people, such as candidates for political office. They may praise political candidates or public servants for making good decisions or make them accountable for bad decisions and/or behavior.

Development

Through the eighteenth century, newspaper editors were primarily printers and had little time or ability to write editorial opinions. What opinions their papers carried were usually by contributors using pen names, although occasionally enterprising printer-editors would write letters to themselves, signing them "from a correspondent." Seldom did the editor or other staff members actually write the opinion of the newspaper. The owner or owners might. More frequently, a newspaper's editorials (although they were not yet called such) were contributed by writers not officially associated with the newspaper. These might include a sponsor who helped finance the paper but did not work for it. Because newspapers and pamphlets were the favored medium for writers wishing to publish their views, we can find there some of the most important opinion writing in early American history. Prime examples include such classics as John Dickinson's "Letters from a Farmer in Pennsylvania," a series of essays that were published in the *Pennsylvania Chronicle* and *Universal Advertiser* in 1767 and were instrumental in the American colonies' opposition to British parliamentary power; Thomas Paine's "Crisis" papers, published in the *Pennsylvania Journal* in 1776 and 1777 that helped rally colonists' morale during the American Revolution; and the "Federalist Papers," published in the *New York Independent Journal* in 1787–88 that argued for adoption of the Constitution.

America's first widely circulated "editorial" was also the nation's first newspaper political cartoon. An illustration of a severed snake with the caption "JOIN or DIE," is probably the most famous in American history. At the time the editorial was written in 1754, France was threatening to enlarge its territory and attacking American colonists. American printer, scientist, and writer Benjamin Franklin was considering how to rally American support. On May 9, Franklin published in his *Pennsylvania Gazette* a report of the French attack and included his views on the necessity of colonial union. To emphasize his point, he added the illustration of the divided snake. The eight parts of the snake represented the colonies.

Although numerous newspapers reprinted the editorial and accompanying cartoon, Franklin's plan for union was not accepted. During the Stamp Act crisis of 1765, many colonial newspapers reprinted the "Join or Die" snake cartoon, creating furor among British authorities. As tensions rose in later years, the cartoon reappeared. With the onset of the Revolution, Franklin's cartoon proliferated in newspapers and other publications, becoming the most popular symbol of the revolt.

The Revolutionary War brought more activity by editorial contributors who were mostly agitators and political philosophers. Their writings frequently appeared in pamphlets and were published a section at a time in successive issues of newspapers. In the decade after independence, opinion writing remained the domain primarily of contributors to pamphlets.

During the 1780s the editorial in its modern form appeared. Whereas earlier opinion had been dispersed throughout the pages of newspapers, in the 1780s some papers began to separate their opinion statements from the news and to reserve a specific place for the former. Editors such as Noah Webster and James Cheetham began publishing a separate section of short paragraphs they had written. Other editors began to place a caption over the opinion, indicating that it was the work of the editor rather than a contributor.

According to Kenneth Rystrom (1993), in almost three centuries in which editors on the North American continent have been commenting on public issues, opinion has taken different roles. For the first century or so, editorial comment was sparse and generally intermixed with (often highly personalized) accounts of news. Then, as tension mounted between the colonies and Great Britain, editors began to comment on the issues. Indeed, journals were increasingly filled with opinion.

During the presidency of George Washington there was an increase in partisan opinion, thereby causing the nature of editorializing to change. During the early republic, party leaders saw fit to establish publications to express their party's views. Few had any real expectations of earning money. But they stood to gain social prestige, literary reputation, and political influence, especially if their party won. The function of editorials, which began appearing during this era on designated editorial pages, was to argue the party line as forcefully as possible for the party faithful. The stronger and more emotional the tone of an editorial, the more likely it was to please the reader.

By the early 1800s, the editorial had an established position in many newspapers, but its effectiveness as a literary form was handicapped by several characteristics such as writers who abused institutions and people with whom they disagreed, and domination by politics. On the other hand, partisan editorial writers exhibited a number of viable strengths. Many held key positions in local, state, or national politics and therefore possessed an intimate knowledge of current issues. Some historians argue that because newspapers and politics were so closely connected, at no other time in the history of editorial writing was the newspaper's editorial role of such critical importance in the nation's political system. Rystrom's history of the editorial page notes that Horace Greeley, whose *New York Tribune* was founded in 1841, made the editorial page a significant and respectable portion of the daily newspaper. *Tribune* editorials were written in a variety of different styles but mostly in the traditional literary format. They covered numerous topics and generally followed a consistent editorial policy. Many writers contributed to the thinking behind the editorials and the writing, although readers typically thought of the *Tribune's* editorial page as the product of one man, Greeley. Subscribers read the paper to see what Greeley thought. In the course of his journalistic career, Greeley espoused many liberal causes, including the abolition of slavery and capital punishment, communitarianism, socialism, improvement of working conditions, and free-soil homesteading.

In the two decades leading up to the Civil War, major issues got highly emotional and personalized in editorial columns. However, the Civil War brought new interest in news, and personalized editorial began to wane. A few voices still spoke out. Writers such as Charles Dana, E. L. Godkin and notable newspapermen like William Randolph Hearst, and Joseph Pulitzer editorialized strongly in the 1890s and early twentieth century. But the trend was clear: Editorial writers were retreating into anonymity at conservative newspapers increasingly owned by corporations. As the nation approached both world wars, few editorial writers expressed enthusiasm for getting involved, but as

soon as war was declared lost no time in volunteering their enthusiastic support.

By the early 1900s, the papers with the most popular and respected editorial pages were *The New York Times, Chicago Tribune,* and *The Boston Globe*. However, faced with harsh economic revolution, newspaper readers demanded more news than opinions and insights and most of the nation's anonymous editorial writers were unwilling or incapable of providing readers what they wanted. Consequently there was a sudden growth in byline columnists who were hired by newspapers and syndicated services to explain to readers what was going on, especially in the nation's capital. The columns were mostly interpretative in nature but more lively and informative than the unsigned editorials that represented the views of corporate newspapers.

By the late nineteenth century, newspaper writers and editors—notably William Randolph Heart and Joseph Pulitzer—spoke out strongly for going to war with Spain, but most editors let the war zone issues go to the so-called muckrakers for magazines. Equally noteworthy, editorial writers continued their political endorsements of candidates, mostly Republicans. By the 1950s and 1960s, most newspapers had begun to disassociate with one political party although they continued to lean toward Republican candidates and agendas. In 1964, for the first time in the twentieth century, more newspapers supported a Democrat for President, Lyndon B. Johnson. In the aftermath of the assassinations of President John F. Kennedy, Dr. Martin Luther King Jr., and Robert Kennedy, editorial writers also tended to support civil rights and social legislations passed during the Johnson administration.

The last decades of the twentieth century were characterized by some aggressiveness as well as passivity in editorial leadership. For example, the Vietnam War did not produce excitement in editorial pages, although Robert Lasch of the *St. Louis* (Missouri) *Post-Dispatch* won the Pulitzer Prize for several editorials written in 1965 questioning the U.S. role in Vietnam. During the Civil Rights Movement in America, editorial pages were not aggressive in their support or endorsements of civil rights issues. However, between 1957 and 1964, six Pulitzer Prizes were awarded for editorials on school desegregation or other civil rights issues. These prizes went to the *Tuscaloosa* (Alabama) *News, Arkansas Gazette* in Little Rock, *the Atlanta Constitution* (Georgia), the *Virginian–Pilot* in Norfolk, *Pascagoula Chronicle* (Mississippi), and the *Lexington Advertiser* (Mississippi).

Between 1969 and 1972, Pulitzer Prizes were awarded to three newspapers for editorials on civil rights issues: the *Pine Bluff Commercial* (Arkansas), the *Gainesville Sun* (Florida) and the *Bethlehem Globe-Times* (Pennsylvania).

By the late sixties, editorial writers returned to supporting Republican candidates and agendas, generally preferring Richard Nixon over Democratic candidate, Hubert Humphrey. The Watergate scandal eventually emerged, leading Nixon to resign from the presidency nearly two years following the break-in at the Watergate complex. A few newspapers, most notably *The Washington Post, Chicago Tribune,* and *The New York Times* earned much credit for keeping the public centered on these events; however, it was done primarily through their news coverage rather than through their editorial leadership.

From the Reagan administration (1981–89) through the Bush administration (1989–93), neither news coverage of the press nor its editorial pages took a leadership role in crusading for national or international causes.

Recent Trends and Challenges

Recent years have been marked by increasing concentration of ownership by fewer groups and by the challenges of the Internet. In 2008 the *Chicago Tribune* became the first major newspaper in recent years to declare bankruptcy. In 2009, the *Christian Science Monitor* became the first nationally circulated newspaper to replace its daily print edition with online-only access. Print journalism has declined in recent years due to a contracting economy and the growth and popularity of the Internet, especially among young people who turn to it not only for their news but also for opinion.

The Internet has become an integral part of life in the twenty-first century and has certainly changed the face of journalism, with numerous applications, including news websites, such as Newsvine, Mixx, and C2NN, among numerous others. As a result,

newspaper publishers are watching sales steadily decline as they continue to struggle to attract readers with different innovations such as online polls, web versions of the paper, audio and video, and the "comment" function that encourages web users to submit opinions about particular stories or blog entries. The Pew Internet and American Life Project Survey conducted in 2008 indicated that 70 percent of Internet users get their news from news websites. The web's unique combination of characteristics, such as space capacity, flexibility, permanence, immediacy, and interactivity, make it a powerful medium for the practice of journalism.

Conclusion

The editorial page is the intellectual focal point of any newspaper. Editorials serve to provoke, debate, set agendas, crusade for change, persuade, and often challenge. While they express the opinion of media owners, editorial writers serve as keepers of the public conscience. The chief duty of its practitioners is to provide the information and guidance toward sound judgments that are essential to the healthy functioning of a democracy. Therefore, the editorial writer is challenged to draw fair conclusions from stated facts, basing them on the weight of the evidence and the publication's concept of the public good.

According to a study, "The Newsroom Barometer," conducted by Zogby International in 2008, about 85 percent of editors surveyed are optimistic about the future of newspapers. Forty percent of the editors believe online will be the most common way to read the news ten years from now, while 35 percent believe that print will reign supreme. The survey also found that two-thirds of the editors polled believe that opinion and analysis pages will grow in importance, but half believe that shareholders and advertisers present threats to editorial independence.

Although challenged by a declining economy and the popularity of the Internet, the newspaper editorial still has value due to its gatekeeping role, which is a challenge to maintain in an online environment where opinions are many and trust in the establishment news media is decreasing. Even as they migrate online, newspaper editorials can continue to hold a significant place in the media landscape by bringing readers strong, well-argued editorials reflecting solid research as well as maintaining the delicate balance between what readers need to know and want they want to read about.

Editors

The title of editor is conferred on a wide variety of individuals who determine what appears in

newspapers and magazines. The term *editor* today can refer to a newspaper's top executive or a lowly copy editor. Every news department, such as those responsible for a newspaper's sports, features, or business sections, usually has its own editor to assign or approve stories and manage reporters.

By the early nineteenth century, the editor was the most important (and often the best known) figure at a publication. He (most were men) often combined several roles that were "editorial" in quite different senses of the word. A traditional editor was the paper's opinion-leader, executive, spokesman, literary stylist, and on occasion the publisher or owner. Such were the eclectic pioneers of the mid-nineteenth-century penny press, notably James Gordon Bennett Sr. at the *New York Herald* and Horace Greeley at the *New York Tribune*. Starting around the time of the Civil War, editorial functions began to be divided up; a publisher would hire an editor-in-chief, while the daily management of a newsroom would fall to a managing editor. A century later, the various jobs of the old-fashioned full-service editor had been further split and downgraded into specialties within a corporate structure.

Still, a publication's top editor was its public face. As late as the 1980s, executive editors such as Ben Bradlee at *The Washington Post* and Abe Rosenthal at *The New York Times* could attain a certain nationwide fame, even though they did not determine the editorial position or business side of their publications. But the next generation of executive editors, in an era of falling circulation and media-industry consolidation, had little fame and that only among journalism insiders. Top newspaper editors of the early twenty-first century were typically corporate functionaries or, at best, fighters of a losing cause for professional autonomy and higher newsroom budgets. Many lost their jobs to that cause. In the heyday of mass-circulation magazines, meanwhile, the personality of a single editor often stamped the character of such periodicals as *The New Yorker* (under Harold Ross, then William Shawn), the original *Vanity Fair* of the 1920s and 1930s (under Frank Crowninshield), *Time* (under Henry Luce, then T. S. Matthews), and *The Saturday Evening Post* (under George H. Lorimer). Since then, the age of the titan magazine editor has passed.

Origins

The earliest definition of "editor," a word derived from the Latin verb *ēdo* (to bring forth into the world), applied to the publisher of a literary work. An editor as "one who conducts a newspaper or periodical publication" began to appear in 1803, according to the *Oxford English Dictionary*. This was when the older archetype of printer-proprietor was being replaced by a new type of newspaper chief. In colonial America, the men and women who published the first newspapers and magazines were called printers. With the proliferation of printing presses, heads of newspapers took on more literary status and the new title of "editor."

John Fenno, a Bostonian, became the first editor of the *Gazette of the United States,* the mouthpiece of the new Federalist government and, in particular, of Treasury Secretary Alexander Hamilton. To advance an opposition party, James Madison, a key author of the Constitution, along with then–Secretary of State Thomas Jefferson, sought an editor to create an anti-Federalist newspaper, the *National Gazette*. They installed Philip Freneau, a patriot-poet who had been Madison's college roommate. Fenno and Freneau were editors of the new style rather than printers who happened to own the mechanical means of communication.

The 1790s and the next three decades, which have been called "the dark ages of the partisan press," continued to produce editors under the sway of political interests and patronage. But political spoils and control by factions did not dampen the individuality of editors from this era, most notably *Aurora* editors Benjamin Franklin Bache and William Duane, English gadfly William Cobbett, *Wasp* editor Harry Croswell, *American Mercury* editor Noah Webster, and *Columbian Centinel* editor Benjamin Russell. Each of these editors tended to be colorful, vitriolic, and abusive in a tradition of personal and partisan journalism that would continue throughout the nineteenth century.

In the 1830s, editors of several big city newspapers embraced innovations that greatly increased circulation and revenue. They severed ties with political parties, added amusing human interest stories of crime and sports aimed at working-class readers, dropped their daily price from six cents to a penny, and charged advertisers more as circulation grew. The leaders of this "penny press" revolution

were founders, owners, and publishers of their own newspapers, but also proudly bore the title of editor. They did not renounce traditions of violence or partisan politics. Bennett deliberately provoked rival editor James Watson Webb to assault him twice in the streets of New York, which Bennett, as victim, gleefully reported in his paper. Greeley, founding editor of the *New York Tribune,* embraced some political agendas with a childlike fervor. But these editors largely relied on advertisers, not political machines, as their chief patrons. They were careful to appear neutral in covering politics, at least in their paper's news reports, and sought entertaining news for the masses as well as timely information for the elite. The modern editor was henceforth to be a guardian of journalistic independence and an authority on developing content with mass appeal.

As with newspapers, American magazines have often mirrored the personalities of their editors. In Victorian America, editors such as poet James Russell Lowell and novelist William Dean Howells at the *Atlantic Monthly* helped set the intellectual agenda of the cultural elite, while female editors such as Sarah Josepha Hale (who got Thanksgiving to be a national holiday and wrote "Mary Had a Little Lamb") at *Godey's Lady's Book* and Miriam Folline Squier at *Frank Leslie's Lady's Magazine* (who took the name of her husband, Frank Leslie, after he died) constructed America's culture of the "domestic sphere." The editors of successful magazines in the first half of the twentieth century, especially editors who launched new titles or built huge circulations, tended to be unusually competitive and innovative in their market strategies and graphic design, but also culturally conservative and attuned to the values of the American heartland.

The modernization of newspapers after 1900 saw editors-in-chief diminished in number and in importance. Publishers consolidated newspapers into chains; reformers emphasized schooling and professional standards, thus reducing the importance of editors as on-the-job trainers. After World War II, newsrooms of metropolitan newspapers achieved their greatest energy, size, and professional standards. Editors of various ranks now ran the show. *Late City Edition,* a 1947 book by editors at the *New York Herald Tribune,* describes the three main news desks controlled by editors: local or city desk, national or "telegraph," and foreign or "cable." It was an all-male club until well into the 1970s. "The best editor is the man with an insatiable desire to know the facts of a matter, and an instinctive tendency to be interested in the matters his readers care about," the *Herald Tribune*'s city editor wrote in the book. Most major newspapers by this time had separated the function of editorial page editor from that of news editor, generally called managing editor or "M.E." Under the managing editor came department editors responsible for particular topics—arts, women, sports and business, for example. These editors were usually anonymous to the reader, yet influenced the paper by hiring staff and shaping the news, from story assignment to copy editing and headline-writing.

The skills of a good editor are distinct from those of a reporter or writer, yet successful newspaper editors invariably emerge from the ranks of news reporters with little or no formal training to be an editor. Even heirs of newspaper-owning families who are being groomed for editorships take a turn as cub reporters. Jonathan Daniels, for example, was a Washington correspondent for the Raleigh, North Carolina, newspaper his father owned, *The News & Observer,* before the younger Daniels became editor in 1933. Daniels served as editor in two stints for a total of 29 years, writing editorials and overseeing news while his two brothers managed the business side. Management skills, increasingly important for any newspaper editor, sometimes pushed a good editor into the job of publisher or company president. Lee Hills, for instance, markedly modernized the *Miami Herald* as its managing editor, then executive editor, from 1942 to 1966, systematizing recruitment, bringing colorful design to the paper, and sharpening its news writing. For the next 16 years, he was a publisher or president within the paper's chain, Knight Ridder. His ideas gradually permeated the chain through the many editors who followed in his footsteps.

In contrast to the inventive and eccentric editors of the nineteenth century, however, successful newspaper editors of the twentieth century fit comfortably into the conventions of newspaper production and management. Few editors tried to invent anything as new as the penny press. Ralph Ingersoll, who had been an editor at *The New Yorker* and *Fortune,* attempted a radical experiment in newspapering with *PM,* an afternoon tabloid that relied on wealthy patrons instead of advertisers. Ingersoll's

PM, which accepted but did not solicit advertisements, was greatly admired for its coverage of modern cultural topics, its quality art and photography, and its literary writers. But it never gained the circulation or influence Ingersoll had sought, and folded after eight years, in 1948.

Some Notable Newspaper Editors

James Gordon Bennett Sr. (1795–1872)

Bennett launched the *New York Morning Herald* as a penny paper in 1835, and during the next 37 years as its star reporter, top editor, and irrepressible salesman, helped to invent the modern concept of "news." With an entertainer's flair for writing and a cynic's understanding of public appetites, Bennett changed American journalism by his example, showing how newspapers could be far more democratic, sensationalistic, and profitable. Rivals waged a "moral war" against him, and the diarist George Templeton Strong summed up the elite view of Bennett when he wrote that no one had more debased American journalism. Yet Bennett was hailed as a genius of the profession he helped create. A gangly, cross-eyed Scottish immigrant, Bennett learned editing at the *Charleston* (South Carolina) *Courier,* the *New York Enquirer,* and the *New York Courier.* After many business failures of his own, he threw everything into his vision of a paper that cost a penny, like Benjamin Day's *New York Sun,* but outdid all its competition with a frenzy of news for every class of citizen. Bennett turned over management to James Bennett Jr. in 1866.

Benjamin C. Bradlee (1921–)

Bradlee was a high-profile editor who ran *The Washington Post* during the heady years when the paper exposed the Watergate scandals of the Nixon Administration from 1972 to 1974. A prep-school and Harvard graduate from Boston, Bradlee began reporting for the *Post* in 1948. Later, as *Newsweek* magazine's Washington bureau chief, he and the magazine's business editor, Osborn Elliott (soon to be the magazine's editor for more than a decade), convinced *Post* publisher Philip Graham to buy *Newsweek* in 1961. Bradlee, a friend and neighbor of Senator John F. Kennedy, enjoyed being at the center of Washington's social life from the time Kennedy became President. Named managing editor of the *Post* in 1965, then executive editor in 1968, Bradlee flourished with the support of Katharine Meyer Graham, the publisher after her husband's death. Bradlee led the paper's aggressive coverage during the Pentagon Papers case of 1971 and the Watergate years. His reputation was damaged by the fabricated "Jimmy's World" feature story about an eight-year-old heroin addict by staff reporter Janet Cooke, for which a 1981 Pulitzer Prize was retracted when Cooke confessed that she had concocted the story's main character. Bradlee was the last of the flamboyant big-city newspaper editors. When he retired in 1991, editorial writer Meg Greenfield complimented him as one who had "made the *Post* dangerous to people in government."

Arthur Brisbane (1864–1936)

Brisbane was the highest-paid and most widely read editor under yellow-journalism publisher William Randolph Hearst. The European-educated son of a wealthy Buffalo, New York, family, Brisbane became the chief advisor and front man for Hearst. He had proved himself a facile writer for Charles Dana at the *New York Sun* and then for Joseph Pulitzer at the New York *World* before becoming editor of Hearst's *Journal* in 1897. There, he was the first newspaper editor to reach a circulation of 1 million. He also wrote articles for Hearst's *Cosmopolitan* magazine and penned a popular editorial column, syndicated as "Today" in Hearst's papers and hundreds of others, giving him an estimated readership of 30 million. Critics derided his columns for their banal wisdom, but his concise style made a rising new middle class "think they think," as he once described the goal of an editorial.

Turner Catledge (1901–83)

Catledge was a Mississippi-raised journalist who worked at *The New York Times* for nearly forty years, half of that as managing editor, executive editor, or vice president. He retired in 1970, moved to New Orleans, and wrote a memoir, *My Life and The Times.* Catledge expanded the *Times*' cultural and national coverage, giving attention to the South and the issue of civil rights before any other national news publication did so. He was the most influential of a series of top editors at the *Times* from the South, such as Edwin James, Clifton Daniel, and Howell Raines, reflecting the Southern origins of the patriarch of the *Times*' dynasty since 1896, Adolph Ochs.

Charles A. Dana (1819–97)

Dana enjoyed a long and influential career as a gifted newspaper editor, first at Horace Greeley's *New York Tribune* from 1847 to 1862, and later as editor of the *New York Sun* from 1868 until his death in 1897. His interest in radical politics led him to join the New England Transcendentalists at Brook Farm, where he edited *The Harbinger,* and to cover the revolutions of 1848 in Europe, where he recruited Karl Marx as the London correspondent for Greeley. Dana also played a key role in the Lincoln administration during the Civil War, as assistant secretary of war. But his great talent was not his political vision, which was spotty and often vindictive. Rather, Dana raised the quality of newspaper writing, making the *Sun* one of the best of the major papers of the period. He virtually invented the "human interest story." Dana, who was the first managing editor ever, believed that "the invariable law of the newspaper was to be interesting."

Horace Greeley (1811–72)

Greeley was the founding editor of the *New York Tribune,* his national "pulpit" from which he crusaded for various reforms and rebuked the other penny papers for their money-grubbing sensationalism. The *Tribune,* he announced when it started in 1841, would advance the interests of "the People" and avoid the "immoral and degrading Police Reports, Advertisements and other matter which have been allowed to disgrace the columns of our leading Penny Papers" (Stoddard, 61). He crusaded for temperance, workers' rights, an early form of socialism, and an end to slavery. Raised poor in New England, Greeley failed to make a profit from *The New Yorker,* a weekly literary magazine he ran for seven years in the 1830s, or from the *Log Cabin,* a propaganda sheet he edited for his Whig Party mentors Thurlow Weed and William H. Seward. He ran the *Tribune* with an energy, eccentricity, and idealism all his own, "no man's man," and it flourished in that spirit. He was the first editor to allow by lines, and his published interview with Mormon leader Brigham Young is considered a breakthrough in reporting. Other editors of renown began their careers under Greeley at the *Tribune,* such as Charles N. Dana (later editor of the *Sun*) and Henry J. Raymond (who launched *The New York Times* in 1851). Other notable correspondents for Greeley's *Tribune* were Karl Marx, in London, and feminist Margaret Fuller.

Ralph McGill (1898–1969)

McGill was called the "conscience of the South" as editor, columnist, and publisher at the *Atlanta Constitution* from 1938 through the years of the civil rights movement. A former college football tackle and Marine from Tennessee, McGill was sports editor at the *Constitution* in the 1930s. Doing feature stories on his own time for the newspaper, he witnessed the sad waste of rural poverty and racial hatred in the South during the Depression. He traveled to Europe on a Rosenwald fellowship in 1937, seeing firsthand the relationship between an un-free press and the rise of Nazism. His page-one columns in the *Constitution*—more than 10,000 were published by the time he died at age 70—drew on his love of rural culture but also applied an almost religious morality to race questions that few others would write about. In the old style of Southern editors, he was at once the paper's public face, political captain, and literary voice. His criticism of white bigotry and his eventual support of the civil rights movement brought local hate mail, but national fame. He won a Pulitzer Prize in 1959 for editorial writing and published a historical memoir in 1963, *The South and the Southerner.*

Carr van Anda (1864–1945)

Van Anda was managing editor of *The New York Times* during the formative period of 1904–32, when his mathematical and scientific intellect helped make it the most respected newspaper in the world. Van Anda, a child prodigy, had dropped out of Ohio University and abandoned his plans to become a professor of physics or Greek to work on the mechanical side of several Ohio newspapers. He then switched to reporting, in which he excelled by his detective-minded diligence. But it was as night editor at the *Baltimore Sun* and the *New York Sun* where his energy and news sense achieved the most. Later, as managing editor of *The New York Times,* he kept a night-editor's hours, scooping other papers and catching last-minute errors. Adolph Ochs, who had bought the *Times* in 1896 with the goal of rejecting sensationalism for "all the news that's fit to print," found in van Anda his ideal of an independent, intellectual news chief. Ochs gave van Anda a good salary and a free hand. Van Anda is credited with

making the *Times* the admired newspaper of record it became.

Henry Watterson (1840–1921)

Watterson was editor of the *Louisville Courier-Journal* for a half century after the Civil War. He was a "Kentucky colonel"–style orator with a message of reconciliation he called the "New Departure." His message was like Henry Grady's editorial campaign for a New South, but more partisan, less visionary, and drawn out over a much longer career. As the son of a Tennessee congressman, Watterson learned to love politics and the Democratic Party as a child who literally played in the halls of the U.S. Capitol. His service in the Confederate army was desultory but placed him in the company of legendary generals Leonidas Polk, Nathan Bedford Forrest, and Albert Sidney Johnston. He developed an extravagant writing style as editor of a Confederate propaganda organ called the *Rebel,* followed by stints as editor of a Cincinnati newspaper and an editorial-opinion writer at the *Nashville Banner*. In partnership with Walter N. Halderman, he helped merge Louisville's *Courier* and *Journal* and made the combined paper one of the best and largest in the South. He viewed the editorial page as the heart of any newspaper, and had as many as ten editorial writers on staff. He and his partners sold their stock in the *Courier-Journal* to Robert Worth Bingham in 1919.

William Allen White (1868–1944)

White became nationally known as a prototype of the kind of editor most likely to remain unknown beyond the county line—the proprietor-editor of a small-town newspaper in the American heartland. For nearly 50 years he ran and wrote for the *Emporia* (Kansas) *Daily and Weekly Gazette,* with a circulation of less than 8,000, but achieved fame by having his editorials reprinted throughout the country. White's columns appealed to a wide audience because of their earthy, clear style and his wholesome-seeming political values. After an apprenticeship under William Rockhill Nelson at the *Kansas City Star,* White made a name for himself in 1896 with a widely reprinted editorial called "What's the Matter with Kansas?" It was a sarcastic attack on the Populist revolt against industrialism in farm states like Kansas. Under the later influence of reform-minded President Theodore Roosevelt, White turned more progressive in his politics. But he remained a loyal, active Republican most of his life.

Some Notable Magazine Editors

Edward W. Bok (1863–1930)

Bok edited the *Ladies Home Journal* from 1889 until 1919, during which time it became the best-selling magazine in history. He filled it with functional advice in home management and cheery fiction by celebrated writers. Born in Holland and raised in New York, Bok left school at age 12 to hustle his way, Horatio Alger style, from stenographer to writer to editor at various enterprises. In the *Journal,* as in such books as his Pulitzer Prize–winning memoir, *The Americanization of Edward Bok* (1920), he preached a sunny philosophy that treated poverty as a spur to character building and embraced mild reforms, such as an anti-billboard campaign, that rarely challenged the status quo.

Helen Gurley Brown (1922–)

Gurley Brown was the editor of *Cosmopolitan* for 32 years, turning a failed old general-interest magazine in 1965 into an ad-thick, self-help monthly for sexually liberated young females. Her *Cosmo,* which she called "feminist" and not a woman's answer to *Playboy,* was focused mainly on how to win male attention in any way that felt good. Without nudity, it developed a sex-manual style that a Tom Wolfe novel later satirized as "some sort of pornographic parody of *Cosmopolitan*." The daughter of a poor Ozark couple, Helen Gurley succeeded by her wits and charm as an unmarried secretary and advertising copywriter in Los Angeles. She argued for such feminine self-reliance in her 1962 best-selling book, *Sex and the Single Girl.* By then, she was happily married to Hollywood producer David Brown, who helped her seek ways to repeat the book's success. The Hearst Corporation rejected their proposal for a new magazine, but let her revamp and edit *Cosmopolitan.* The female consumer she targeted and influenced was the type she described in *Sex and the Single Girl* as economically "a dream," because this individual was not a "parasite" in a family but living alone and supporting herself. "You need an apartment alone even if it's over a garage," she advised in her 1962 book.

Norman Cousins (1915–90)

Cousins was editor-in-chief of the *Saturday Review,* a national weekly literary review that grew from a circulation of 20,000 when he began there in 1940 to 650,000 when he fell out with new owners in 1971. Cousins, an irrepressible optimist, returned in 1973 as owner and editor to revive the bankrupt magazine as a biweekly focusing on science and education. It suspended publication in 1982, except for a brief revival in 1986. The *Saturday Review* had started in 1924 as a continuation of the New York *Evening Post*'s literary supplement after the newspaper shut down the supplement. But it flourished only under the sway of Cousins's boyish faith in well-educated magazine readers who were not of any intellectual clique but simply loved discussing ideas. Cousins later applied his intellectual optimism to the idea that a sick patient's attitude could contribute to self-healing. He experienced this personally in overcoming a potentially deadly form of arthritis, and promoted the idea in several popular books and as an adjunct professor of biobehavioral science at the University of California, Los Angeles.

Clay Felker (1925–2008)

Felker was a magazine editor credited with inspiring national and city magazines with his 1960s-style creativity in graphic design, New Journalism, sophisticated satire, and service coverage of where to eat, shop, and live. With designer Milton Glaser, Felker exerted this influence mostly as editor of *New York,* a slick weekly he launched in 1968 as a stand-alone version of the *New York Herald-Tribune*'s earlier Sunday supplement. He lost the magazine to media mogul Rupert Murdoch in 1977, but went on to edit other magazines. Felker, the son of two newspaper editors from St. Louis, Missouri, had been a reporter for *Life,* worked on the 1954 creation of *Sports Illustrated,* and edited features at *Esquire* before becoming editor of the *Herald-Tribune* supplement in 1963. His brash style, on paper and in person, both inspired and intimidated. One former employee said Felker grew bored faster than anyone she ever met, forcing staffers to make their ideas seem interesting within ten seconds. Projecting an in-your-face elitism in print was his great insight into how magazines could survive in the age of television. Print, he said, had become a niche product for well-educated, affluent people with elitist attitudes.

Henry R. Luce (1898–1967)

Luce, the founding editor-in-chief of Time, Inc., created three or four of the most influential magazines of "the American century," a phrase he coined that expressed his somewhat imperialistic view of the twentieth century. Born and raised in the isolated American culture of a Presbyterian mission in China, Luce started *Time* magazine in 1923 with his friend from prep school and the *Yale Daily News* staff, Briton Hadden. The success of this news weekly, the first of its kind, made both men millionaires before they were 30. After Hadden's untimely death from a strep infection in 1929, Luce launched *Fortune* magazine and established "experimental" departments to investigate other innovations in magazine forms. *Fortune,* a pro-business magazine paradoxically flourishing in the Depression, published high quality profiles of businesses with artful photography. Luce launched *Life* in 1936, buying the name from a former humor magazine, and *Sports Illustrated* in 1954, proving that excellent writing and photography could appeal to sports fans even if it covered many sports those readers didn't care about. Luce also created "The March of Time," a radio and newsreel dramatization of the news that ran from 1931 until 1951, and subsidized a commission chaired by Robert Hutchins to study threats to freedom of the press. Luce retired as editor-in-chief at Time, Inc. in 1965, after it had become the largest magazine publishing company in the United States.

S. S. McClure (1857–1949)

McClure created and edited *McClure's Magazine,* a ten-cent monthly that introduced the reform-minded journalism of the early twentieth century known as "muckraking." He claimed that the alignment of powerful exposés of political corruption and industrial exploitation by Ida Tarbell, Ray Stannard Baker, Lincoln Steffens, and others in *McClure's,* starting around 1903, was an unplanned "coincidence." But it was really the result of his long preparation. McClure's energy, gut instinct for new markets, and good relations with literary journalists put him at the center of this progressive movement of the press. Although McClure struggled financially, his talent for publishing good writers in new forms changed magazine journalism. Samuel Sidney McClure emigrated from Ireland at age nine after the death of his father. He graduated from Knox College, where he met friends and lifelong

business partners. In 1882, he launched what was probably the first quality niche magazine, a periodical for the new outdoor activity of bicycling called the *Wheelman*. He created a syndicate to sell short fiction and nonfiction by big-name writers to American newspapers. He launched *McClure's* in 1893, and edited it until forced out by a reorganization in 1911, though he remained active in journalism for another 20 years.

Conclusion

Changes brought by the Internet and digital communications reshaped the various roles of editor. Magazine editors were able to take advantage of the web as a free advertisement, or tease, to draw new subscribers to their print product, which had more sensual appeal in its images and text than either newspapers or the Internet. But for the three major types of newspaper editor—corporate executive, news editor, and opinion writer—the first decade of the twenty-first century presented difficult challenges.

As an executive of a large news operation, a newspaper's top editor was deeply involved in seeking a new business model for sustainable revenue. Executive editors had to invent—and often upgrade—newspaper websites to serve both readers and advertisers. Working out the relationship between the printed and electronic versions of the paper became a central function of senior editors. Web revenue for newspaper companies seemed to be quite limited—about 10 percent of the industry's advertising income in 2006, with the rapid early growth showing signs of slowing. By 2008, a weakening overall economy forced many executive editors into the bleak role of overseeing major staff cuts.

News editors face an equally difficult task of finding a balance between the traditional daily news cycle of their newspaper and the instant-update pace of their webpages. Webpages can be updated with an immediacy and ease that newspapers and TV news can't match. But filing and editing stories for the web takes time away from in-depth reporting for the newspaper. Furthermore, with staff cuts, the additional work has to be done with fewer workers. One editorial response is to equip reporters with video and audio recording equipment to make them more flexible in their work, with less editorial intervention. Another response has been to separate "content"—journalistic coverage of the news—from its delivery or "platform." This further divided news editors into "news and information" managers on the one hand and digital, audio-visual, or print editors, on the other.

In complex ways, the digital age has loosened the grip that editors traditionally had on their readers, their advertisers, and their reporters. But the flexibility and speed of evolving digital technology also gave new importance to news managers—editors—who could navigate the changes and meet the needs of consumers for information and storytelling.

Editors' Organizations

Editors of newspapers, magazines, and (increasingly) online services have a variety of associations

to serve their needs. As with so many journalism organizations, these groups are heavily alike in make-up and function. They focus on specified types of editors, hold annual conventions, give awards for high-quality accomplishment, and support various educational endeavors. Their prime purpose is to provide an effective means for exchanging mutually useful idea exchanges. Less often, they may become involved in lobbying efforts for matters of concern. Several have developed codes of ethics. Some of the groups have active local chapters. At least two are co-located with academic journalism programs.

Journalists are joiners and that is one reason there are so many such organizations. Networking also comes naturally to journalists in their daily work. Editors are concerned, of course, with the overall daily operation of the editorial side of their publications or electronic news operations, and that focus is evident in each of the groups discussed below. As the economic outlook for newspapers has darkened in the early twenty-first century, however, many of these groups have focused more and more on ensuring the basic survival of their business. That may eventually mean a near-total migration from printed periodicals to online and other electronic forms—and these groups may follow suit in their own operations.

Just how to treat online-only journalists has been a divisive issue for most of these groups. While virtually all periodicals now have an online presence, the rise of independent websites and blogs (among other sources) have stretched the definition of just who is an "editor," and thus eligible for membership in these associations. This is far more than a matter of technology, for many of the "nonmainstream" people who consider themselves journalists are not so viewed by the legacy media. They are often one-person operations run by those with little journalistic training or experience. Some have very decided political or social views to advance, rather than a more objective reporting role. Each of the associations listed here deals with this central matter of editorial identity differently, the overall trend being to open membership to those who appear to have the *intent* to be journalistic editors.

This entry is one of several that briefly describe different types of selected journalism organizations (there are too many to include all, and they come and go over time), so readers should also check additional entries noted at the end of this entry. The information below is drawn largely from the associations' websites, which often detail their background, structure, awards and educational programs, and member benefits.

Selected Journalism Organizations

American Association of Sunday and Feature Editors

The American Association of Sunday and Feature Editors (AASFE, http://www.aasfe.org) started in 1947 when 17 Sunday editors (all of them men) had just finished a two-week seminar at the American Press Institute and agreed to meet again the following year. The AASFE early annual meetings alternated between API offices in New York City and elsewhere around the United States, where they were hosted by the local newspapers. In 1956, the host-paper practice became the norm. Membership ceilings kept the meetings small until the 1970s, when the AASFE began to grow. Membership first exceeded 200 in the 1990s. Its conferences and meetings compare ideas on how best to prepare and present feature material, which is often found in Sunday editions of newspapers.

American Copy Editors Society

The American Copy Editors Society (ACES, http://www.copydesk.org) is a professional organization working toward the advancement of copy editors in newspapers, magazines, websites, and other journalistic endeavors. ACES's aim is to provide solutions to copy desk problems and to improve the job situation for its members. It is not a union, per se, but rather provides networking opportunities for the often thankless job of copy-editing, a role which is often reduced as newspaper and magazine revenues decline.

American Society of Business Publication Editors

Founded in 1964, the American Society of Business Publication Editors (ASBPE, http://www.asbpe.org) is the professional association for full-time and freelance editors and writers employed in the business, trade, and specialty press. They edit magazines (usually) aimed at those in a given business or trade. ASBPE offers annual Awards of Excellence which recognize the best in editorial, design, and online achievement. It also holds an annual ASBPE National Editorial Conference which highlights recent trends and problem areas. The

organization has local chapters in 14 cities. ASBPE has developed a Code of Preferred Editorial Practices in which it recommends careful guidelines for dealing with advertisers and sales departments to keep their concerns separate from a paper or magazine's editorial efforts.

American Society of Magazine Editors

Formed in 1963, the American Society of Magazine Editors (ASME, http://www.magazine.org/Editorial) developed out of the editorial committee of the Magazine Publishers of America. It is the primary professional organization for editors of American consumer magazines and business publications Thus it includes editors of virtually all of the high-circulation titles. As with other editorial groups, ASME provides an opportunity for magazine editors to exchange information. Since 1966 it has sponsored the National Magazine Awards. ASME also works to defend editors against external pressures and to speak out on public policy issues, particularly those pertaining to the First Amendment. ASME now has more than 850 members who, despite their small number, wield considerable influence over the nation's periodical press.

American Society of Newspaper Editors

The American Society of Newspaper Editors (ASNE, http://www.asne.org) was founded in 1922 amid a period of political attacks on newspapers and their editors. It is made up of directing editors (meaning the top editor, regardless of actual title) of daily newspapers, as well as people who serve the editorial needs of daily newspapers, who come together to share ideas at the annual convention, which is usually held in Washington, D.C. Among its primary projects are in the areas of diversity (of both content and employment), publication credibility, and readership. Additional projects include a High School Journalism Project to assist in secondary education programs, the Institute for Journalism Excellence, and an International Journalism Exchange, which brings foreign (typically Third World) editors to the United States for tours and conferences.

Associated Press Managing Editors

The Associated Press Managing Editors (APME, http://www.apme.com) is an association of editors at both United States and Canadian newspapers. As the name suggests, it works closely with The Associated Press news agency to foster journalism excellence and to support a national network for the training and further development of editors who are already running multimedia newsrooms. APME has held a multiday annual conference since 1933 in various cities. It provides subscriber feedback to the news agency directly and through the Sounding Board. Any person who is an editor, executive editor or managing editor, or holds any other title that provides for senior responsibilities for the news, online, or editorial staffs of a member newspaper is eligible for membership.

Associated Press Sports Editors

Formed in 1974, the Associated Press Sports Editors (APSE, http://aspe.dallasnews.com) was initially concerned with the expense and slow reporting of sports news and scores by the AP news agency. Since then, ethical issues and professional team locker room access by reporters have been among the issues touted by APSE. There have also been conflicts with some sports writers organizations, on ethical grounds, among others. Membership is open to all daily newspaper administrative sports department executives, their supervisors, and their assistants, regardless of whether those papers are subscribing members of the Associated Press. The organization is headquartered at the *Dallas Morning News*.

Association of Opinion Page Editors

The Association of Opinion Page Editors (AOPE, http://www.comm.psu.edu/aope) describes itself as "a blissfully unbureaucratic group" which charges no dues and operates no central office. Concerned with the improvement of op-ed page operations, AOPE has only four officers and operates a website and a listserv hosted by the College of Communications at Pennsylvania State University. It exists primarily to organize its annual conference. Penn State sponsors and coordinates the annual AOPE contest, where the best op-ed pages submitted by any print media are recognized for design, editing, and writing.

Education, Coverage of

Media coverage of education largely revolves around a broad swath of K–12 issues related to students and teachers, and to a lesser extent higher education. Coverage generally focuses on curriculum, test scores, teacher competency, and graduation rates at the public school level. Higher education coverage centers on the cost of and accessibility to colleges and universities by middle-class and minority students.

Much of the coverage since the 1960s has largely been framed by policies and regulations issued by the U.S. Department of Education, which became an independent cabinet-level agency in 1979 during the administration of President Jimmy Carter (1977–81) after decades of operating as part of the former U.S. Department of Health, Education and Welfare. Education's new department status gave federal education policy more gravitas, with federal regulations and laws increasingly anchoring coverage of schools. National media often emphasize federal policy issues, while smaller media outlets tend to devote more coverage to school boards and the politics that often engulf them. Since the 1980s, however, the trend toward broader coverage of schools and the issues that affect them, like poverty or homelessness, has appeared prominently in all media outlets, as K–12 issues and access to higher education are increasingly framed as significant domestic issues.

Early Education Coverage

At the turn of the last century, coverage was sporadic, with schools rarely providing the anchor for stories about education. Coverage instead focused on issues affecting children more generally, such as child labor, a significant issue of the day. Only occasionally did journalists address the impact of lost educational opportunities for working children and youth. A leading voice in the campaign to halt child labor—and to expand a child's educational opportunities—belonged to a New York City schoolteacher, Lewis Wickes Hine. In an article representative of the era's cover, with education as a secondary theme, a 1911 report in the *San Francisco Call* bemoaned the thousands of children and young people roaming the streets, as child-labor laws resulting from Hine's campaign barred children from working. The pursuit of education is rarely mentioned, but the heightened attention to issues affecting children did ultimately result in school reform. The high levels of truancy, and coverage of the problem in newspapers and magazines, prompted many states to pass compulsory school laws and forced states with such laws to enforce them more vigorously.

In the years that followed, education news was often absent from newspapers, magazines, and radio. But in 1944, *The New York Times* established a standard for education coverage with its Pulitzer Prize–winning series by Benjamin Fine, who reported that high school and college students did not know basic facts about U.S. history. The *Times*' series was the first notable reportage examining the quality of education in American classrooms, and it prompted a campaign by schools, colleges, and universities to upgrade instruction. In 1947, the National Education Writers Association was established by Fine and other journalists from the *Christian Science Monitor* and *The New York World-Herald,* among other publications, to improve the quality of education reporting by emphasizing news from inside the classroom.

Despite the success of the *Times* in making education a relevant subject of news coverage and the

creation of the education writers' group, coverage of schools was inconsistent through much of the mid-twentieth century. Journalists often wrote about schools only after being prodded by events outside the classroom. A case in point is the landmark U.S. Supreme Court decision in *Brown v. Topeka Board of Education* (1954) overturning the "separate but equal" doctrine that had kept schools segregated by race. The volume of education coverage improved significantly in the years before, during, and immediately after the *Brown* decision, and journalists applied broad strokes as never before in reporting the case, explaining that single-race schools were often the result of segregated neighborhoods created by discriminatory deed restrictions and redlining that kept whites and blacks in separate communities. But the coverage was largely framed by discussions about race, not schools. The broader reporting provided context, but it also served to consistently cast education as a secondary theme in subsequent coverage, like the 1957 launch of the Soviet Union's (and the world's) first satellite, *Sputnik*. That event generated hundreds of stories about the nascent space race between the United States and the Soviet Union. Journalists wrote about national defense and the United States' own aspirations about space exploration before coverage eventually settled on the need to beef up public education in training future scientists and engineers.

Journalists criticized schools and teachers for providing weak instruction in science, math, and other core subject areas. At the center of most news coverage about education during this era were teachers themselves. Often praised by news media as community servants at the turn of the twentieth century, educators by the 1950s, particularly after *Sputnik*'s success, were increasingly portrayed as weak links in the education process. Teacher training at colleges and universities was eventually scrutinized by journalists and universities themselves, which linked the poor caliber of teachers not only to deficient college training but also to low pay that prompted young people to seek employment in more lucrative fields.

Growing Federal Role

During the Lyndon Johnson administration (1963–69), the U.S. Department of Health, Education, and Welfare (HEW) provided a steady source of education news. Journalists covered schools and education with more balance, providing deeper explanations about how race and class affected urban schools with schools themselves the anchor for coverage. President Johnson's collection of education programs through his Great Society and War on Poverty initiatives provided a strong framework that helped focus and sustain news coverage. Early childhood education, for example, became a staple of education news for the first time as a result of Head Start, one of the Johnson administration's programs for disadvantaged preschool children.

In 1979, President Carter created the U.S. Department of Education, and a year later the department opened for operation. In 1983, the department's seminal report, *A Nation at Risk: The Imperative for Educational Reform,* provided an expansive yet focused frame for education coverage, much like Johnson's education programs supplied two decades earlier. The more focused coverage of educational issues in the 1980s produced the first sustained examinations in the widening gap in academic achievement between whites in their affluent suburban schools and minorities in the poorly financed urban schools they attended. The department also increasingly serves as a clearinghouse through its National Center for Education Statistics for a variety of education data gathered annually, and these data have helped inject more uniformity and precision in education coverage in areas of student learning and achievement, teacher certification, and dropout rates.

While the department often provides the impetus for stories, it is also often the object of criticism. The 2001 No Child Left Behind (NCLB) Act, proposed by the department as the central domestic program of President George W. Bush's administration (2001–09) and later approved by Congress, is widely disparaged by education reporters as deeply flawed legislation that places unrealistic expectations on public schools and their teachers. Investigative reports into NCLB found its flagship reading program ineffective. The Bush administration vigorously defended its $1 billion a year "Reading First" curriculum designed to enhance skills of elementary school students against critical media reports, but the program was eventually also deemed ineffective by a study conducted by the education department itself.

Complaints About Coverage

Despite the tighter framing for education news supplied by the Department of Education, coverage of schools over the years often has been criticized as simplistic and incomplete. The uneven quality can be explained in part on the stature of education reporters themselves. In many newsrooms, the education "beat" is considered the domain of beginning journalists. But critics maintain that the growing complexity of the topic requires journalists to cover test scores, school finance cases, collective bargaining negotiations, agreements between school boards and teachers, and curriculum issues, all topics critics and studies assert are covered unevenly. The most seasoned journalists, critics argue, should cover schools as lawmakers and the judiciary depend on media coverage to help guide them in their decisions.

In news coverage of *Rodriguez v. San Antonio Independent School District* (1973), for example, plaintiffs in the Texas case over inequities in state funding of public schools complained that journalists offered inaccurate and unsophisticated analysis of how the funding disparity created inequities in the quality of public schools. It is unclear whether stronger reporting would have made a difference in the Supreme Court's 5–4 decision against the parents who brought the suit. But their complaints about education coverage are not uncommon.

Unlike the experienced Washington press corps, or the foreign reporting staffs of elite news organizations, the nation's education reporters exhibit a range of experience, and they serve disparate audiences. Smaller media organizations, such as community dailies or weeklies or small radio stations, tend to cover school board meetings much more closely than do larger outlets. They typically report every vote in stories that often run on the front page. Because school districts are one of the largest employers in smaller communities, education is also covered as a business by smaller media outlets, with the annual school budget and school taxes demanding much attention. By comparison, the larger news organizations write more extensively about education as federal policy, report more often about trends in the classrooms, and interpret the gains and declines of test scores.

And in both large and small media outlets, education stories often are positioned as political stories, with fights over control of school boards between conservative interests and more liberal ones. Critics have bemoaned the framing of education stories as mere meeting coverage, or business or political stories, all of which they say ignore substantive stories about learning and teaching. But in recent years, reporting has once again shifted to more stories on more significant issues. Sophisticated examinations of school violence, and its root causes, for example, have become more commonplace, as experienced journalists assume the education beat, even at smaller media outlets. Of the 1,500 members of the Education Writers Association, only a third in 2006 were considered beginning journalists (those with five years on the job or less) a number that has declined over the last several years.

Trends in Education Reporting

The evolution in education reporting is widely evident in the early twenty-first century. Broad, contextual reporting, once the domain of publications like *The New York Times, The Washington Post,* and *Time* magazine, is now present more often in regional and smaller media outlets. Despite continuing criticism about uneven coverage, education reporters have produced stories on a wider variety of societal issues and their relationship to and impact on education, with schools consistently serving as the central subject in stories.

The broad sweep and scope increasingly applied to education coverage reflects a growing acknowledgement by editors, producers, and reporters that to write about education in the twenty-first century also means writing about homelessness, poverty, crime, violence, hunger, and other social ills that have long affected schools but have consistently been, until recently, absent from the coverage. In 2005, for example, *The Dallas Morning News* produced a multipart series about South Dallas, a collection of largely minority neighborhoods in decline for decades. Central to the series was an examination of the area's failing schools, but the series also explained how the low achievement of students was the result of the area's low tax base, the thin employment market, and poverty and high crime. In subsequent months, the newspaper has returned to South Dallas to offer readers updates about reforms and improvements in schools and the neighborhoods that support them.

Investigative and computer-assisted reporting also play a more prominent role in contemporary coverage of schools. In 2008, the *Los Angeles Times* examined plans by the Los Angeles Unified School District to build dozens of new schools across the city. The newspaper, however, reported that many schools were operating at levels well below enrollment caps and that enrollment declines were expected to continue. Because of criticisms by taxpayers in response to the story, the district cancelled some building plans but planned to continue the construction of some new schools, arguing that the projects were too far along the planning stages.

In recent years, coverage of both higher education and primary and secondary education also has embraced more of a consumer bent. Media outlets increasingly offer readers, listeners, and viewers news about the best colleges and universities for the money, how to finance a college education, and how to apply for college. In an example of how coverage is more consumer oriented, *The Boston Globe* offered readers in a prominently displayed Sunday article how to shop for a quality preschool and how to determine whether the curriculum is effective.

Higher Education

Coverage of colleges and universities has long been overshadowed by K–12 news. In 2008, the *Chronicle of Higher Education* bemoaned the lack of coverage given to higher education by the news media, and the implication of that missing news for readers. While sporadic in nature, the caliber of higher education coverage, when offered, has often been more substantive than that of public schools. In the 1990s, media coverage analyzed tuition rate increases that outstripped the rate of inflation at both public and private colleges and universities; in many cases, journalists reported that proceeds from the tuition increases often supported expanding salaries of university presidents and their administrations instead of funding more scholarships to improve access. Journalists also applied investigative resources in examining shoddy accounting practices by colleges and universities in administering millions of dollars in federal research grants. The controversies prompted Harvard Medical School, among other institutions, to return grant money to the government and resulted in the resignation of Stanford University's president.

In the first decade of the twenty-first century, coverage has focused on access to colleges and universities by minority students and increasingly by those from the middle class. In an example of coverage that explores historical reasons for lack of representation by students of color but that also offers success stories, the *Los Angeles Times* in 2008 produced a report about African American students from disadvantaged backgrounds that graduated from college; the report demonstrated one increasingly common element of coverage: use of the Internet's multimedia platform, which allowed the news paper to produce a slideshow that featured the students graduating from Grinnell College.

The Internet

The advent of the Internet has helped improve coverage at media outlets of every size. More media outlets post test scores of public schools, helping parents select the best school for their children, while other publications and broadcast outlets list tuition rates at colleges and universities in their states; meanwhile, colleges and universities, as required by federal law, post campus crime reports on their webpages, helping consumer-savvy parents and their children make more informed decisions about selecting a college.

As newspapers and magazines have shrunk in size, the result of declining advertising revenue, journalists have turned to the Internet to write more extensively about local, state, and national education issues in blogs, allowing readers to react more easily by posting comments. The Internet also allows journalists to report a range of continuing challenges surrounding schools with a fresh eye, using slideshows, video, and interactive graphics to frame stories in more compelling ways. Stories about drive-by shootings and murders in urban neighborhoods and the impact on schools and students, for example, took on new meaning in award-winning coverage by *The Philadelphia Inquirer* in 2005 when the newspaper videotaped middle school students' talking about their experiences in witnessing and experiencing death.

Though still criticized as incomplete, and often providing uneven coverage of important issues such as immigrants' impact on public schools,

contemporary coverage of education is much improved compared with previous decades, offering consumers important information on which to base a variety of decisions about education from K–12 to higher education.

Education, Journalism

Some 400 American colleges and universities offer programs of journalism education, mostly at the undergraduate level. Many others provide courses or programs in electronic media, film, or media studies. Fewer provide graduate—usually master's—degree opportunities as well. Journalism and media studies are thriving academic fields of study in the early twenty-first century, but it took some time to attain that status.

Origins

For decades, the idea of formal education for journalism struck many publishers and editors as both unnecessary and perhaps even harmful. The best place to learn journalism, they argued, was in a newsroom. Broad knowledge, an ability to write, and a willingness to work long hours was required—not hours in a classroom studying theory. On the other side of the desk, many faculty argued just as strongly that "trade school" training was not what higher education should provide. It took some time and effort to overcome these feelings—and neither has entirely disappeared.

The first individual journalism courses were offered by a few different schools in the late nineteenth century but the first organized program sequences, let alone degree programs, only appeared in the early twentieth century. The University of Illinois began a four-year program in 1904, and Wisconsin began providing a journalism sequence two years later. The first journalism school was formed with a vocationally modeled curriculum at the University of Missouri in Columbia in 1908, followed four years later by the Pulitzer-supported journalism school at Columbia University in New York (it became graduate-only in 1935). By 1910 the University of Washington and New York University had begun journalism programs as well. All of these programs centered on practical courses in reporting, writing, and editing and some had close ties with campus newspapers. A few offered courses in the history of journalism as well. Some—Wisconsin was a pioneering example—held journalism-centered classes to no more than a quarter of total college credits, encouraging if not requiring a broad liberal arts (especially social sciences) immersion as well.

As the first attempt to organize an association of college journalism teachers took place in 1912, there were 32 schools offering courses; seven of these had departments while three (Marquette University followed the University of Missouri and Columbia University) had formed schools of journalism. Five years later, the first organization of journalism program and school directors was created.

Publications began to define the boundaries of the developing academic field. The first issue of the *Journalism Bulletin* (later *Journalism Quarterly*) appeared in 1924. Over the next decade it would become a peer-reviewed scholarly publication. Willard G. Bleyer of Wisconsin published his *Main Currents in the History of American Journalism* in 1927, providing a historical basis for more systematic academic courses across the country. As with most journalism histories into the 1960s, Bleyer utilized a "great man" approach, centering on important publishers and editors. A very different landmark came a decade later with Alfred M. Lee's *The Daily Newspaper in America* (1937), which for the first time focused the economics and social impact of the news medium, broadening the horizon of what could and should be learned. Annual conventions of journalism teachers slowly grew larger and showcased an expanding variety of both applied and academic research efforts, including work in public relations and advertising, as well as radio broadcasting.

The first college courses in radio appeared in the 1930s, leading to the first master's program at Wisconsin in 1931, and the first PhD specializations at Wisconsin and Iowa in 1939. Some of these developed within journalism, but many were formed within departments of speech or English and emphasized radio speaking and performance, radio drama (then of importance commercially), and studio production. The first books of radio research appeared in the mid-1930s, but most textbooks focused on practical aspects as had journalism earlier. Serious academic study of radio program trends and audience impact began with the Office of Radio Research at Princeton (later moved to Columbia University), which applied to radio research methods from psychology, sociology and other fields. During the 1940s it combined the efforts of, among others, CBS research director (later president) Frank Stanton and respected sociologist Paul Lazarsfeld, and several books (one 1940 title compared *Radio and the Printed Page*) resulted from their collaboration.

European journalism education patterns varied from the American model. Newspapers were the first medium of academic study after the World War I in Germany and elsewhere, building upon traditional study in such fields as history, law, and political economy. Vocational and trade aspects were not thought proper for a university surrounding. Major expansion of media studies in Europe (as in the United States) would come after World War II. On the eve of the war, more than 400 American colleges and universities provided at least some courses, and many offered degrees in journalism. Yet the old tensions remained—in 1938, the University of Chicago's respected chancellor, Robert Hutchins, called journalism programs "the shadiest educational ventures under respectable auspices."

Postwar Expansion

The real growth in journalism and media education came after World War II. After years of disagreement, a process of academic accreditation for professionally oriented journalism programs (and thus covering only some of the programs) began in 1946. The emphasis on research grew in most academic programs (thereby helping their acceptance by other academic fields) and curricula broadened to include radio (and soon television) journalism, media effects, press law, trade and technical journalism, and often media studies even more generally. Growing as they did out of the experience of both world wars, propaganda and its effects were a topic of major concern and interest. The earliest moves to develop programs (later schools) built around graduate study of broader communication interests developed at the Universities of Iowa and Illinois (and later Stanford) around the efforts of Wilbur Schramm, a seminal thinker in the field. These sought to integrate further study of all mass media as well as aspects of interpersonal communication. What would later become the International Communication Association developed in 1950, and its quarterly *Journal of Communication* began a year later.

By this time, nearly 75 universities were offering degree programs emphasizing broadcasting, though most remained moored in radio. Many schools operated educational FM stations, useful for in-house training, though run on a more professional basis as time went on. Broadcast educators sought an accrediting process but failed to achieve one. As television assumed greater importance in the mid-1950s, broadcast education was expanding from

its original vocational emphasis to include the study of broadcasting history, economics, audience research, and policy aspects. This was prompted by two publications, both appearing in 1956. Sydney W. Head's *Broadcasting in America* played a landmark role similar to Lee's 1937 journalism text, opening the curricular eyes of programs across the country and creating a more critical approach to broadcasting education. And the first issue of *The Journal of Broadcasting* appeared, offering a quarterly outlet for expanding academic and industry research efforts, and it became a peer-reviewed scholarly journal within a few years. By 1960 nearly 90 schools provided bachelor's programs in what was then often called radio-television-film, 45 provided master's degrees, and there were 16 doctoral programs. A decade later all those numbers were higher as the appeal of such study (increasingly in separate communications or media departments) continued to grow alongside more traditional journalism programs. Indeed, enrollment at undergraduate and graduate levels grew fourfold in the 1960s alone.

Behind all this growth, considerable ferment was brewing. Journalism and media studies continued to operate on the lower rungs of academic respectability at most schools, though individual researchers and some departments excelled. "Underwater finger painting" was one derisory term applied to those studying communications. Battles over technical and practical training courses versus broader media education incorporating such traditional fields as political science, psychology, sociology, economics, and history tore many academic units. So did squabbles among media professionals who came to academe versus research-trained academics who never worked in the media. Some critics saw journalism schools as academic outliers of the publishing or media businesses. Yet many of their faculty became staunch critics of those same media. Fiefdoms appeared and were often fiercely protected; some focused on journalism, while others on the same campus might study many of the same topics, but within a context of electronic media or media studies. New subfields—such as political communications—grew up at the intersection of journalism and other academic fields (in this case, political science). As one indication of broadening research interests and intent, journalism as a field became increasingly known as journalism and mass communications—still a widely used term.

Despite the academic infighting, enrollments continued to expand through the last decades of the century. This was partly due to the apparent glamour of investigative reporters like Bob Woodward and Carl Bernstein of *The Washington Post* who from 1972 to 1974 helped expose the Watergate scandal and bring down a President. Every time another major investigative news story or scandal broke, applications for admission to journalism programs seemed to rise. Broader and often separate communication or media studies programs also thrived, many of them building on the growing popularity and academic respectability of film studies. By the turn of the century, it seemed every English and language program (among others) offered its own film courses and the publication of film books accumulated in a vast and continuing flood.

Continuing Issues

By the turn of the twenty-first century, journalism and media education more generally was well established in hundreds of American colleges and universities, though few Ivy League schools offered degrees in the field. Enrollments held steady or expanded, despite the steady decline in the economic fortunes of legacy media (newspapers and over-the-air broadcasters) in the face of competition from other news sources, chiefly the online world. The study of technologic "convergence" and growing application of digital methods became increasingly central to media programs. Growing rigor in journalism and mass communication research as well as the more effective application of a broad menu of social science methods led, in turn, to an increase in the number of media research journals. More interest in and focus upon ethical issues and problems was evident in journalism and mass communications programs across the country.

At least three overall trends are readily visible in early-twenty-first-century journalism and mass communication education. First is the increasing specialization of both teaching and research, sometimes within one medium, but often across multiple media. Following the specialization trend evident in other academic fields, interest here focused on such issues as media ownership and

control, management studies, research into news media audience impact, historical studies, journalism law and policy, ethical concerns (often using case studies of which there were, sadly, many at hand), or social sciences-driven theoretical approaches to the study of media in general. Among several schools of thought, critical studies researchers (following the lead of such scholars as Dallas Smythe, Herbert Schiller, and Vincent Mosco) made great headway in the late twentieth century, melding aspects of Marxist political economy thinking with a healthy skepticism about the media industry as it then operated.

Second is growing interest and participation in global journalism. The publication of *Four Theories of the Press* by Fred Siebert, Theodore Peterson, and Wilbur Schramm in 1956 was another landmark study that for several decades provided a widely used approach to studying and contrasting different systems of news media. A half century later, American thinking no longer dominates media fields and the institutional, regulatory, and content variation in print and other media overseas can, among other things, suggest possible change in our own systems. The role of media in national development (both of the one-time Third World and of the former communist-nations of Eastern Europe, for example) has been one consuming interest as has concern for the imbalance in news "flow" between the developed and developing world. Comparative systems analysis—whether of whole media systems or specific aspects such as media policy—is of growing interest.

And third has been a concentration on increasing gender and ethnic diversity—in teaching methods and content, of student enrollments, of academic hiring, and within the news industries themselves. This began with a concern for the role of women in journalism and mass communication in the mid-twentieth century and slowly expanded (paralleling the civil rights push of the 1960s and after) to include various ethnic minority groups, most recently for immigrants. An indication of how seriously this priority is taken is its inclusion as one of the standards required for professional program's accreditation.

Election Coverage

Election coverage refers to news media reports about candidates, parties, voters, and issues defining the selection of government representatives or referenda. While regular, competitive elections are considered a hallmark of democracy, they depend upon the voters' ability to be informed accurately and thoroughly in making their decisions. News coverage is one of the most important ways citizens gain such knowledge, and a free news media system is considered an essential requirement of a representative democracy. As the number and type of news media have expanded over time, contemporary election coverage has come to embody the treatment of the electoral process by the printed press, radio, television (including cable), and the Internet.

Development of Election Coverage

From the colonial period through 1824, election campaigns in the United States were different from their current operation in U.S. civil society. Voting itself was limited to a select group of the male

population, and newspapers reported candidate announcements, endorsement letters, and ideological tracts in line with the partisan views of the editor or publisher. Time and distance imposed considerable limitations on timely news distribution.

As voting rights were expanded in the early nineteenth century, more Americans began participating in the process. Nonetheless, there was very little electioneering for the press to cover as the candidates relied on their reputations and associations to attract voters. The election of 1828 between incumbent President John Quincy Adams (1825–29) and his Democratic challenger (and the ultimate victor) Andrew Jackson is considered the origin of presidential campaigning. Money, organization, rallies, parades, hard liquor, and vicious personal attacks became routine elements of this and later campaigns. The presidential election of 1848 between President Zachary Taylor (1849–50), a Whig, and Lewis Cass, a Democrat, was the first to be held nationwide on the same day with the results transmitted over telegraph wires. Through the latter half of the 19th century, newspapers became more entrenched in their partisan relationships.

Whistle-stop train tours, the traveling Lincoln/Douglas debates of the 1850s, and the pursuit of votes from the common people all combined to give rise to pack journalism campaign coverage by 1896. Democratic candidate William Jennings Bryan traveled over 18,000 miles delivering up to 20 speeches a day, and he was accompanied by a pack of journalists requiring something new to report on a daily basis. By contrast, William McKinley conducted his managed campaign from the front porch of his home in Canton, Ohio. While the campaigns were becoming professional mass marketing affairs and politicians more adept at managing their public images, reporters had grown weary of repeatedly attending the same stump speeches day in and day out. The formation of the Associated Press with its exclusive rights to the Western Union telegraph wires also encouraged a more objective approach to reporting so as not to offend any of its thousands of patrons. Continuing as partisan mouthpieces was deemed beneath the dignity of most journalists by the late nineteenth century, and the standard of objective reporting parallel to paid partisan political advertising was born.

Pre-election polls became a staple of newspaper campaign reporting in the early twentieth century. Newspapers (and others) began conducting, publishing, and analyzing public opinion polls. Although seldom scientific in terms of sampling, these weekly and sometimes daily newspaper polls became a staple of election coverage.

Radio Election Broadcasting

Only in the mid-1920s did radio become a widely adopted medium of political communication. The ability to report breaking news over the radio slowly began to jeopardize newspaper superiority by the late 1930s. By 1924, Calvin Coolidge was the first to use this new medium as an effective campaign tool. Radio further developed politically in the 1928 election between Republican Herbert Hoover and Democrat Al Smith. With both major candidates actively campaigning on radio stations across the country, plus the introduction of campaign commercials and sound newsreels, the 1928 campaign may well be considered the first presidential race contested on the air.

The master of the radio campaigners, Franklin Delano Roosevelt, waged his first presidential campaign in 1932. While the press appeared to stay neutral in reporting both the good and the bad aspects of the campaigns, much of the newspaper coverage was framed in terms of the developing horse race. By 1933 radio stations were linked by telephone lines and both NBC and CBS began to form news departments.

Polls and surveys remained extremely popular with the general public, the candidates, and the media. Armed with a means of reporting not just what was happening, but also what the public was thinking, newspapers were permanently hooked on publishing poll results. During the 1948 election cycle, Ted Gallup alone was providing four polls a week to 126 newspapers with 20 million readers.

Television began to claim a spotlight in the coverage of the 1948 election campaign between Democrat and incumbent President Harry Truman, Republican Thomas Dewey, and Dixiecrat Strom Thurmond. The Republican convention that year was the first to be widely aired on television, and an Oregon primary debate between

William H. Taft's successful presidential campaign of 1909 utilized the whistle-stop train tour tactic that had already helped give rise to pack journalism campaign coverage by the turn of the century.

Source: Library of Congress.

Republican candidates Dewey and Harold Stassen was the first to be broadcast over national radio. Newspapers and their pollsters such as Gallup were convinced of a Dewey win in the general election. Many reporters filed their stories assuming that Dewey had been elected President; among them was a now famous *Chicago Tribune* headline "Dewey Defeats Truman" that President Truman gleefully held high the next day.

Election night 1948 was the first big made-for-television news story. From Edward R. Murrow at CBS to Ted Gallup on ABC and H. V. Kaltenborn over at NBC, networks all reported the incoming results which began with a Truman lead that he never lost. Contrary to the predictions of pollsters and news media, the Democrats retained the White House with Harry Truman's triumph.

Televised Election Coverage

The 1952 presidential election between Dwight Eisenhower and Adlai Stevenson was the first in which television coverage played a pivotal role. Network news crews lugged their cumbersome analog black-and-white equipment from campaign stop to campaign stop recording events which were then broadcast from their headquarters in New York. The 1960 campaign cemented television's superiority as an election coverage

medium. In addition to general coverage, the campaign is famous for the introduction of the televised debate into presidential politics. A series of four such encounters between Kennedy and Nixon provided enhanced visibility and opportunity for the young, little known, but telegenic Massachusetts senator.

The first debate was seen by an estimated 100 million viewers, and subsequent reports labeled Kennedy the perceived winner, although many of the 15 million radio listeners thought that Nixon had won the debate. To this day, political analysts credit these televised encounters and perceptions of Kennedy's superior performance with catapulting his campaign to a close win. An estimated 90% of American television sets tuned into the election return coverage and watched as the lead shifted from Kennedy to Nixon throughout the night. Forced to declare a winner and vacate the NBC studio for the *Today* show, anchors Chet Huntley and David Brinkley declared Kennedy the winner at 7:25 a.m. and, indeed, Nixon conceded several hours later.

Since the 1960 campaign, television has been the increasingly dominant medium for election coverage. By 1963, television outstripped newspapers as the public's number-one source of information about national politics and elections for the first time. By the 1964 presidential campaign, most political candidates were planning their delivery of campaign messages for a television-based audience. Newspapers and radio remained important for coverage of state and local election campaigns.

Television has been alternately credited with or blamed for a host of changes in modern campaigning. Candidate selection and nomination processes have been affected as political parties have altered and changed the timing and procedures of their primary and caucus proceedings to take advantage of media coverage. The national party conventions, once carried gavel-to-gavel by national networks, have evolved to take advantage of decreasing coverage and heavy competition for audiences in prime-time. Election night reporting and forecasting, particularly the use of exit polling and other sampling that may have contributed to the presidential election-night reporting debacle in Florida in 2000 (when Democrat Al Gore was initially declared as the winner, only to have that pronouncement retracted and replaced by a declaration of victory for Republican George W. Bush, which was also subsequently rendered uncertain), have also led to controversies. The reporting of projected winners before polls have closed (as in states in western time zones) is also a continuing concern as television engaged in this practice starting in the late 1960s (though networks have often withheld making projections of winners until local polls close).

Legal Environment for Election Coverage

When newspapers were the major American medium for election coverage, the primary legal concerns were embodied in the Constitution's guarantee of free expression and particularly a free press. Since partisan ownership of newspapers was common, the expression of political views, including editorial endorsements by newspapers, was a common and accepted norm. Radio and television raised different issues. The spectrum with which radio and television stations transmit their signals belonged, the government decreed, to the public. Thus, the Communications Act of 1934 imposed special obligations on broadcast station owners as preconditions for acquiring a license. Stations must program in line with the "public interest, convenience and necessity."

The most important of these obligations related to elections was in Section 315 of the act, which assigned the Federal Communications Commission (FCC) to administer its provisions. In Section 315, the law decreed that stations must provide "equal" access (or allow the purchase of time for access) to all legally qualified candidates for a given elective office. Approximately equal "opportunities" must be provided to candidates, such as the purchase of airtime at the "lowest unit rate" available to other advertisers. This requirement came to be known as Equal Time. It was strengthened with amendment of Section 312 in 1971, which essentially required that stations grant federal candidates (those running for Congress, President, or Vice President) access to broadcast time.

While the application of Equal Time does not apply to the coverage of bona fide news events, documentaries, and newscasts, and thus does not require stations to adhere to strict equal time allocations when covering political campaigns, the underlying intent is clear. A station must be careful

not to give or provide special time slots to one candidate that it does not make available to all others competing for the same office.

News media are subject to civil libel laws. While the standards for proving libel are tough and precise, a newspaper can be found guilty of libel and required to pay damages if they print material that is knowingly false and malicious. Broadcast stations may not censor political candidates using their facilities (because of Section 315), and are thus immune from libel suits based on such broadcasts.

Election Coverage Issues

With television dominating election coverage over the last several decades, a number of issues about that coverage have been raised. Among the most important concerns have been the nature and content of the general campaign coverage, coverage of presidential debates, and the potential political bias in election coverage.

Nature and Content of Campaign Coverage

Classic democratic theory suggests that citizens need solid, accurate information about issues in order to make informed voting decisions. The operation of the democratic system places in the hands of journalists a responsibility to assist voters by providing the necessary information to meet this goal. Accordingly, many political observers are critical of the way journalists cover political campaigns, arguing that they fail to focus their coverage on the public policy and issue information voters need.

Research has shown this criticism has some justification. Coverage of elections seems to be characterized by the typical news values of personalization (a focus on candidates, not issues), an attraction to drama and conflict, highlighting of specific events, and an interest in deviance or novelty. In fact, most studies of campaign coverage over the past several decades have shown that both newspaper and electronic journalists focus their election reporting more on the campaign "horserace," than on the policy issues facing the country. Stories proceed from a "who's ahead, who's behind" perspective. Sometimes this style of reporting is called a "game frame," suggesting that the campaign is presented as a game between players who are alternately winning or losing points much like in a sporting event.

Of course, the reporting of polling results remains a mainstay of "horse race" framing in all election coverage. Some news organizations are careful to maintain rigorous scientific standards in their polling and properly report sample sizes, error rates, and other relevant data for judging a poll's merit. Other reports are less meticulous, leaving the public ill-informed at best, and misinformed at worst. When news organizations turn to such completely unscientific methods of gathering public opinion as call-in or text-messaging polls, without proper qualifications of scientific deficiencies, an even greater disservice is perpetrated.

Another disturbing characteristic of modern election coverage has been an increase in the amount of meta-communication. Increasingly, news reporters seem fixated on recounting their own opinions and feelings, or reflecting on the importance of the media themselves. As a result, election stories become less about the candidates' issue stance and more about the news-gathering process. One result of this meta-coverage trend has been the "shrinking sound bite." Over the past several decades, the amount of time that an average campaign news story on television devotes to broadcasting a candidate speaking has decreased from around 40 seconds in the 1960s to less than 8 seconds through 2008. The rest of the story is composed of what the reporter or others have to say, rather than on what the candidate is trying to convey to voters.

Research about campaign coverage also notes that a high percentage of all campaign coverage is negative news. That is, the coverage has a negative, pessimistic or cynical, often disbelieving tone. The effects of such stories are likewise generally considered to be negative.

Coverage of Presidential Debates

The 1960 debates were the first televised encounters between the two major party presidential candidates, and they are considered decisive, landmark events. However, in order to hold the debates, which were organized and sponsored by the television networks, Congress had to suspend the Equal Time provision of the 1934 Communications Act. Otherwise, every candidate, however unknown and

unlikely, would have been legally entitled to equal time from all the networks. This issue did not arise again until 1976 because in the 1964, 1968, and 1972 campaigns, Presidents Lyndon Johnson (1963–69) and Nixon (1969–74) were unwilling to engage in televised debates. In 1975, the FCC reinterpreted the rule, allowing such debates to be considered "bona fide news events" when sponsored by another entity (not the parties or networks) and simply covered by the news media. This paved the way for future debates sponsored by the League of Women Voters through 1988, and then subsequently by the Commission on Presidential Debates. Consequently, since 1976 there have been one or more presidential debates between major party nominees in every presidential election. Further, since the 1980s there have also been an increasing plethora of primary and caucus debates. During the general election, such debates remain the single most-viewed event in the election cycle.

These debates have all been covered live by the major television networks, providing the public with unprecedented opportunities to see the candidates answer questions in a variety of configurations. The formats have ranged from repetitions or variations of the format with a panel of questioning reporters used in the 1960 Kennedy–Nixon debates, to a single moderator arrangement, to a "town hall format" where questions are posed by members of a live audience. At least three phases of media coverage of these events have yielded important campaign content: the anticipation phase, the telecast itself, and the postdebate news analysis.

In the anticipation phase, media coverage focuses on negotiation of the debate format and its preconditions. In many cases, a great deal of strategy is involved and analyzed as candidates jockey for position and negotiate on timing, layout, staging, audience, location, and other logistics of the debate. The campaigns, of course, also find it advantageous to engage in media speculation about the debate, trying to manage expectations about how well their candidate will perform, and to frame the encounter in ways that are beneficial to their side.

The debate itself often yields important future sound bites, sometimes favorable and sometimes not, that can be replayed later by the media and the opposition. For example, President Jimmy Carter (1977–81) was ridiculed for implying in the 1980 debate with Ronald Reagan that he consulted his young daughter Amy on issues of nuclear policy. Additionally, the media portrayed Michael Dukakis as a "cold fish" due to his passionless response to a question about the hypothetical rape and murder of his wife, Kitty. On the other hand President Reagan (1981–89) masterfully used humor to turn around a critical question about the impairments of his age by saying that he would not exploit for political purposes the youth and inexperience of his opponent (Walter Mondale) in 1984.

Postdebate commentary is perhaps the most important aspect of the media's role in debates. Even those who do not see a debate often hear or see media commentary and analysis following the event. Research has shown that media commentary can influence how the public judges the candidates and their performance in the debates. The most famous example occurred in the second 1976 debate between President Gerald Ford (1974–77) and challenger Jimmy Carter. In response to a question about Eastern Europe, President Ford replied that he did not accept that Eastern Europe was dominated by the Soviet Union and "never would be under a Ford administration." At the time he made the comment, most viewers apparently thought they understood what Ford meant and did not consider it a gaffe. Postdebate polls showed that most viewers thought Ford had won the debate. However, in subsequent commentary the news media characterized the statement by Ford as a "gaffe," declaring that he must be confused if he didn't know that the Soviets dominated Eastern Europe. Later polls, after the media commentary, revealed a reversal of perceptions and viewers switched to thinking that Carter had won the debate.

Research on debate coverage has shown that the media treat debates much like other aspects of the campaign. That is, they focus more on the candidate performances and on the horserace than on the issues discussed in the debate. Generally, newspaper journalists have done a better job than television reporters of conveying the substantive issues of the debates.

Political Bias in Election Coverage

Because of the obligation to broadcast in the "public interest, convenience, and necessity," the possible political bias of television election

coverage has been of concern in the United States. In the early days of television, there was little scientific research on possible bias in television coverage, and it was presumed to be neutral and objective. After the 1968 campaign, however, public awareness of the issue became more acute. One reason for rising concern was the accusations by the Nixon administration of biased coverage. Vice President Spiro Agnew in 1969 began a public campaign of speeches in which he denounced television's political bias. Broadcast media, Agnew claimed, frequently engaged in "instant analysis" after presidential speeches, telling the public what they wanted them to think, not what the President had said. Furthermore, he said, news media exercised great power in selecting what to emphasize and what to ignore. In their constantly negative characterizations of things, he famously labeled the media as "nattering nabobs of negativism." Agnew's particular tirades were cut short by his own failings that later forced his resignation as Vice President, but similar allegations continue.

The flame of media bias was further fueled by Edith Ephron's book *The News Twisters,* which accused the media of biased coverage of the 1968 presidential campaign. This book raised the salience of the bias accusations, and in the 1972 campaign several scholars undertook well-developed studies of media bias using rigorous, scientific methodologies. However, these early studies did not find any definitive political bias. Researchers identified some differences in coverage patterns among the networks and print media, but differences seemed more related to other variables than to political bias. For instance, one study showed that in 1972 George McGovern had received more close-ups and favorable footage of him smiling and meeting people while campaigning than did President Nixon. However, Nixon was the incumbent and had pursued a "Rose Garden Strategy," portraying himself as a working President, doing his job (sitting for photo-ops signing bills in the White House Rose Garden and less often going to campaign rallies) in 1972. This analysis suggested that the media were simply covering the two different styles of campaign, not favoring one candidate over the other due to political basis.

Beginning in 1988, however, network coverage of presidential campaigns has been subject to more possible bias. Scientific content analysis studies have shown that since 1980 most presidential candidates, regardless of party, have received negative overall coverage. Exceptions (those who got favorable coverage) were Mondale in 1984, Bill Clinton in 1992 and 1996, and John Kerry in 2004. Overall, Democratic Presidents and presidential nominees have gotten more favorable (and less negative) media coverage than have Republican candidates.

The increase in the number of media outlets for campaign coverage has changed the political news environment in recent campaigns. While there is still only limited research available on such cable news channels as CNN, MSNBC, and Fox News, there is some evidence that these outlets have broadened the spectrum of views available on news events; providing, respectively, a more liberal and a more conservative interpretation.

The Internet has also pushed election coverage to new heights of availability with unlimited space for alternative viewpoints. Most major news outlets (television, radio, newspapers, and news magazines) have constantly updated web news sites that provide supplementary election information to news consumers. Social networking sites and blogs are also contributing to election coverage in this news environment such that many consumers experience a kind of election overload long before voting.

Conclusion

While election coverage continues to expand and evolve through modern media technology, the elements of conflict and strategy in the horse race continue to captivate both the media and the public. Although most newspapers were once aligned with political parties and their coverage of elections was largely partisan, advancement of mass production and dissemination capabilities in the early twentieth century encouraged a more objective approach to reporting so as not to alienate consumers or advertisers.

Television has long dominated election coverage, focusing campaign stories in personal or candidate-focused terms, while heightening dramatic conflict through a strategic game-playing frame. Further, as the number of news outlets has increased through cable and the Internet, there is an increasing trend toward meta-coverage. Candidates are shown speaking in shorter sound bites while reporters provide

interpretation and analysis frequently more related to the news-gathering process than to issue coverage. While coverage of political debates is considered a valuable service, most election coverage is negative or cynical of the process and may lead to voter alienation. As democracy demands citizen participation, such trends in election coverage are considered damaging to the system. The journalist is entrusted with the responsibility to provide for an informed electorate in a free society, but contemporary election coverage in the United States is subject to considerable and continuing criticism.

Electronic Media Organizations

As with almost any business or industrial sector in the United States, there are many trade or business organizations that serve and represent the interests of various electronic media. "Represent" nearly always means both lobbying (chiefly in Washington, D.C.) and providing a public face for the sector to the general public. This last function includes providing positive press releases, promotion, and often career and internship guides. Virtually all of these organizations present annual awards to recognize especially worthy members—some maintain halls of fame to remember the past. Many of these groups maintain separate educational foundations that help support closely related worthy causes, including scholarships.

On the other hand, few such organizations provide the plethora of free information to nonmembers that they once did. A growing number restrict access to their best material for members. Many operate online stores making information available at a cost. They remain useful information sources, if nothing else, on the official position of this business sector on major media issues of the day. Virtually all of these organizations are non-profit in their operation (though their executives and some senior staff may be very well paid) and many are registered as lobbyists.

The brief descriptive information provided here is drawn largely from the respective organizations' own websites.

Key Electronic Media Organizations

Academy of Television Arts and Sciences

As its website URL indicates (http://www.emmys.tv), this is the organization that awards television's Emmy honor each year. Syd Cassyd formed the Television Academy in Los Angeles on November 14, 1946, long before most homes

owned a television set. The first Emmy Awards, which were devoted solely to local Los Angeles programming, were held on January 25, 1949. Spurred by the success of the Emmys, columnist and television host Ed Sullivan organized a group of East Coast television professionals and established a New York–based Television Academy in 1955. Two years later, the Los Angeles and New York groups united to form a new entity, the National Academy of Television Arts and Sciences. After two decades of growing tension, and much legal wrangling, however, the two groups agreed to divide again in 1977. Both retained "national" status, with the group in Los Angeles retaining its original name, the Academy of Television Arts and Sciences, and the New York body retaining the name of National Academy of Television Arts and Sciences. The latter retained the Emmy awards given for the news, documentary and sports program categories, as well as jurisdiction over the 19 American chapters that produce their own local Emmy events.

Association of Maximum Service Television

MSTV (http://www.mstv.org) was launched in 1956 with a stated mission to "assist the appropriate government authorities in assuring the maximum television service for the people of the United States." In practice that has meant protecting the concerns (especially freedom from interference) of full-power commercial television stations, often to the detriment of potential competitors such as low power television outlets or other services whose transmissions might interfere with broadcast signals. For the past decade AMST has been an industry advocate for initiating over-the-air digital television in the United States.

Association of Public Television Stations

In 1980, public television station managers created the Association of Public Television Stations (APTS, http://www.apts.org) as their premier advocate in Washington. The goal of APTS is to secure federal funding for public television and to help define policies to help public outlets serve their local communities. To those ends, APTS provides advocacy for public television interests before Congress and the FCC, as well as assistance in marshaling grassroots and congressional support for its member stations.

Cabletelevision Advertising Bureau

Founded in 1980, the CAB (http://www.onetvworld.org/main/index.shtml) provides advertisers and agencies with the cable television information they need to make buying decisions on the national and local levels. It is designed to answer questions concerning cable television's attributes compared with competing television options. It publishes the useful *TV Facts Book* and makes it available online.

Community Broadcasters Association

Formed in 1984, the CBA (http://www.dtvnow.org/links.php?major=Inside) focuses on the needs of low power television (LPTV) stations, which transmit using as little as 100 and 1,000 watts, providing coverage over a very limited area. This is unfortunately one of the more difficult media association sites to navigate, though it appears to cover many industry issues.

Consumer Electronics Association

More than 2,200 companies involved with the manufacturing of audio and video devices make up CEA's (http://ce.org) membership. Nearly all do their actual manufacturing overseas, chiefly in Asia. CEA provides current news about consumer trends, technology-related public policy, sales statistics, and market research surveys. With more than 70 technical standards committees and working groups, the CEA is also a technical standards making body accredited by the American National Standards Institute (ANSI).

Corporation for Public Broadcasting

Created by Congress with the Public Broadcasting Act of 1967, CPB (http://www.cpb.org) is a private organization (though with a board partially appointed by the President with the advice and consent of the Senate) that promotes public broadcasting and online services for Americans. With money granted annually by Congress, CPB invests in more than 1,000 local radio and television stations that collectively can reach most households in the country. Most CPB-funded television programs are distributed through the Public Broadcasting Service (PBS) that CPB formed in 1969. CPB-funded radio programs are distributed primarily through National Public Radio (NPR), created by CPB in 1970, as well as by American Public Media, and Public Radio International (PRI).

National Association of Broadcasters

The National Association of Broadcasters (NAB, http://www.nab.org) was formed in 1922 initially to counter royalty demands made by the American Society of Composers, Authors and Publishers (ASCAP) for music that broadcasters play over the air. In working out relations with ASCAP, and later with other licensing organizations, the NAB became the chief business representative as well as the governmental lobby representing radio and later the television broadcasting industry. NAB lobbies on behalf of more than 900 television and about 5,000 radio stations. Its annual convention, held in the spring in Las Vegas, is one of the industry's largest gatherings. There are related organizations in most states.

National Association of Television Program Executives

Encouraged by syndicated program salesmen, 64 television station program directors organized the National Association of Television Program Executives (http://www.natpe.org) in May 1964 in New York. NATPE's membership grew to 210 by 1970; 1,206 in 1980; 1,818 in 1990 and 3,812 by 2000. Its annual conference, where many program syndication sales are made, has been held in a variety of cities, each winter. The event added exhibition suites in 1980 and an exhibit floor in 1981. The organization's focus is on syndicated programming (including *Entertainment Tonight* and other public affairs and sports programs) provided by most stations early in the evening (if they are network affiliates) or at any time if they are independents.

National Cable and Telecommunications Association

Founded in 1952, NCTA's (http://www.ncta.com) primary mission is to provide its members with a unified voice on issues affecting the cable industry. NCTA represents cable operators serving more than 90 percent of the nation's cable television households and more than 200 cable program networks, as well as equipment suppliers and providers of other services to the cable industry. Its website provides the annual *Cable Developments* statistical overview.

National Federation of Community Broadcasters

In 1975, a group of 25 counterculture mavens gathered in Madison, Wisconsin, to ponder the future of community-based (largely FM) radio. The National Alternative Radio Konvention, or NARK, resolved to develop a national organization representing community broadcasters, and the National Federation of Community Broadcasters (NFCB, http://www.nfcb.org/index.jsp) was founded shortly thereafter. Its initial mission was to develop training manuals for station staff, help station applicants obtain FCC licenses, and to operate a program exchange to facilitate sharing tapes among stations. NFCB relocated to San Francisco from Washington, D.C., in July 1995 and shares space with Western Public Radio, a nonprofit radio training and production facility. NFCB offers a voice at congressional hearings on CPB funding, and plays a role in partnering with other organizations on public broadcasting.

National Religious Broadcasters

(NRB http://www.nrb.org) is an international association of largely protestant Christian radio stations with over 1,400 members. As a lobbying and advocacy group, the association represents broadcasters' right to communicate religious views over the air and helps members network over programming and operational issues.

North American Broadcasters Association

NABA (http://www.nabanet.com/nabaweb/about/about.asp) is an association of broadcasting organizations in the United States, Mexico, and Canada committed to advancing the interests of broadcasters at home and internationally. As a member of the World Broadcasting Union, NABA provides representation for North American broadcasters in global forums on topics including protection of content, spectrum related concerns, the territorial integrity of broadcasters' signals, and digital transition issues.

Public Radio News Directors Incorporated

PRNDI (http://www.prndi.org/index.html) is a national service organization that encourages the professional development and training of public radio journalists. The organization began in mid-July 1985, when 45 public radio news directors gathered in Chicago for the first meeting of what became PRNDI. One of the organization's initial goals was to improve the working relationship

between NPR and its member stations. PRNDI has since established working relationships with NPR, the BBC, Public Radio Program Directors, and many other groups.

Radio Advertising Bureau

RAB (http://www.rab.com) is the sales and marketing arm of the radio industry. Founded in 1951, it adopted its present name in 1955. Long based in New York, it moved to Dallas in the 1990s and now serves some 6,000 stations in the United States, and over 1,000 associate members including networks, station representative firms, and sales and international organizations. A useful *Radio Marketing Guide and Factbook* is regularly updated online.

Radio and Television News Directors Association

RTNDA (http://rtnda.org) is the world's largest professional organization exclusively serving the electronic news profession, consisting of more than 3,000 news professionals, educators, and students. Founded as a grassroots organization in 1946, the association is dedicated to setting standards for news gathering and reporting. Members include news directors, producers, reporters, anchors, general managers, professors, students, industry suppliers, operations managers, and digital content managers. RTNDA has a Code of Professional Ethics and Conduct and its website includes research on the status of electronic media news.

Satellite Broadcasting and Communications Association of America

SBCA (http://www.sbca.com/index.asp) is the national trade organization representing all segments of the commercial communications satellite industry. It was founded in 1986 through the merger of the Society for Private and Commercial Earth Stations and the Direct Broadcast Satellite Association. SBCA is committed to expanding the utilization of satellite technology for the broadcast delivery of video, audio, data, music, voice, interactive, and broadband services. SBCA is composed of direct broadcast satellite (DBS), C-band, broadband, satellite radio, and other satellite service providers, content providers, equipment manufacturers, distributors, retailers, encryption vendors, and national and regional distribution companies that make up the satellite services industry.

Television Bureau of Advertising

The Television Bureau of Advertising (TVB, http://www.tvb.org/nav/build_frameset.asp), founded in 1954, is the not-for-profit trade association of America's commercial broadcast television industry. Its members include television broadcast groups, advertising sales reps, syndicators, international broadcasters, associate members, and over 600 individual television stations. TVB promotes the benefits of local broadcast television to the advertising community to develop advertising revenue for U.S. television stations.

Electronic News Gathering

Electronic news gathering (ENG) originally meant combining portable video cameras, video recording, and microwave links to allow onsite coverage of breaking news stories. By the early twenty-first century, ENG includes information delivered via satellite, cable television, and the Internet.

ENG technology further enhances electronic media attributes of conveying a sense of proximity and participation because journalists can take viewers to places where news is happening. Coverage of live events plus the reporting of stories using both sound and pictures conveys the facts and, often, the

emotions of news stories to audiences. In addition, electronic media's ability to "go live, 24/7" through technological melding of microwave and satellite links, computers, and increasingly digital equipment gives electronic journalism advantages of immediacy and intimacy that print media do not share. Such innovations allow local television affiliates to supplement their networks' news bureaus and directly access national and international news stories that have a local connection.

Origins

When networks and local stations began covering news regularly in the 1930s, news reports were often "rip and read" from newspaper and wire service stories. As recording and remote technology improved through World War II, radio stories expanded to include news actualities, recorded on site with "portable" audio wire or tape decks that could weigh 40 pounds or more. By the time local television news began in the late 1940s, newscasts containing news, weather, and sports segments had evolved on radio. This three-part emphasis continued in television.

Both network and station ability to cover such events for television evolved slowly as technological advances enabled them to move out of studios and into the field. At first, photographs and footage purchased from newsreel companies comprised the visuals presented during newscasts, but soon the advent of 16-mm film sound cameras enabled network reporters to cover events such as the 1960 presidential political campaign between Republican Richard Nixon and Democrat John Kennedy. Throughout the 1960s network coverage of such stories as the civil rights movement and the Vietnam War relied on film shot, developed, and edited into news packages. This processing took hours and could expand into days if stories had to be sent from faraway places. Stories shot in Vietnam, for example, were flown to Tokyo for processing and then those images were either flown or transmitted via undersea cable to the United States for editing into news packages. In the 1970s, satellite technology and the development of "electronic news gathering" (ENG), melding videotape, portable video cameras, and microwave links began changing the face of both network and local station news.

ENG cameras and recorders allowed television news operations to expand their news-gathering operations through the 1980s. This newer, portable technology eliminated the need to process film and allowed news events to be transmitted more rapidly to viewers, especially if microwave links were used to send stories from the field back to the studio. In the early 1980s microwaving stories from remote locations for use either as taped stories or live shots in newscasts became commonplace, often eliminating a time lag between coverage and broadcast. In the 1990s smaller, lighter and more portable equipment combined the separate camera and recorder equipment into various versions of camcorders, the most popular of which was the Sony Betacam.

At the same time satellite technology had expanded the reach of both networks and stations. Satellite news gathering (SNG) allowed even individual stations to cover national and international stories, and many—especially multiple stations under the same owner—began to form satellite cooperatives to share stories relevant to all participating stations. Contributors uplinked their stories for use by consortium participants. Trucks equipped with both satellite and microwave technology joined the rest of the digital news revolution during the 1990s. While expensive to buy and operate, they hugely increased the flexibility of television news operations.

ENG live trucks can cost up to $250,000, while SNG trucks cost twice that. ENG trucks need a clear line of site from live shot to microwave tower, so hills, tall buildings, and other obstructions limit ENG use. SNG can go live from virtually anywhere so long as weather does not disrupt the signal (called "rain fade") and nothing blocks signals from the truck's dish to the satellite. While nearly all stations use ENG, networks and the top 50 markets use SNG technology more widely than the other 150-plus markets because of the expense.

While improving technology transformed the collection, distribution, and receipt of news, it also modified the concept of what constituted news. With newer technology, news became more visual and stories became shorter. In the 1960s stories typically ran around two minutes, sometimes more, but by 1990 a story which ran one-and-one-half minutes was considered long. Over the same period, the length of news sound bites dropped from 25 to 30 seconds in the 1960s to around seven seconds in the 1990s. With these changes in length of stories came less emphasis on "readers," news stories which could not be easily visualized

or too complex to cover in a few short minutes. Local newscasts especially became more sensationalized as they focused on celebrity, crime, fires and accidents.

Simultaneous with this transformation in the concept of news came longer newscasts. In the 1950s network newscasts ran 15 minutes with local news running between 15 and 30 minutes in time slots of noon, early evening (around 6 p.m.), and late night (either 10 or 11 p.m., depending on the time zone). During the 1960s most of these newscasts became 30 minutes long with six to eight minutes of commercials and production elements, such as show open and closing credits, and 22 to 24 minutes of news, weather and sports. By the 1990s many local stations supplemented these more traditional half-hour newscasts with expanded noon and early evening newscasts. Other stations added early morning and midday programs, so by the mid-1990s most large and middle market stations were producing six or more hours of news daily.

Until the 1980s the traditional television networks held a virtual monopoly on national and international news reporting. That changed in June 1980, when the Cable News Network (CNN) began its 24-hour, seven-days-per-week news coverage. CNN launched companion services Headline News in 1981 and CNN International in 1985. Its first major news "coup" came during its live coverage of the launch and subsequent explosion of the *Challenger* space shuttle (the broadcast networks no longer covered space shots live). During the late 1980s CNN's in-depth news coverage expanded, especially overseas, soon joined by other 24-hour news operations, including MSNBC and Fox News Channel. All of them made widespread use of ENG techniques to fill their news schedules.

In the 1990s the Internet joined electronic journalism outlets with various bloggers presenting their own version of news—a wholly new sense of what ENG might accomplish. Audiences increasingly turn to the Internet as a primary source for news and information. In January 2008, nearly one-fourth of Americans said they regularly learned something new about the current political campaigns through the Internet.

No matter what delivery forms news media use in the future, electronic news-gathering techniques will remain central to the reporting process. The quest for live or near-live audio and video coverage will continue to define news competition. Broadcast, cable, and Internet services all apply ENG methods to varying degrees and the underlying technology will continue to improve in capability and ease of use.

Embedded Reporters

Embedded reporters refer to journalists being officially placed within active-duty military units—especially American and British forces—in the Iraq war starting in 2003. Such a reporting tactic has also been used in some other conflicts, including continuing operations in Afghanistan. Embedded reporters operate as nonfighting members of the unit, traveling, living, and even going into battle with them. Embedding represented a new phase in military-media relations, one characterized by closer contact and a mutual understanding of the roles and needs of fighting

personnel and journalists in wartime. The process is subject to considerable controversy.

Background: Back to the Future?

Embedding arose out of an atmosphere of mistrust on the part of both the media and the military following the Vietnam War. As the United States was officially there "by invitation" of the South Vietnamese, journalists had relatively free reign to do their jobs. The conventional wisdom amongst government and military leaders was that uncontrolled access and uncensored reports from journalists had contributed to both battlefield difficulties and decline in public support for the war effort, which led the Pentagon to take a more heavy-handed approach to news media in subsequent conflicts. Supposedly learning from the British experience in the 1982 Falklands War, the U.S. military, citing national security and safety of the armed forces, greatly limited media access to military operations. For example, journalists were effectively kept at bay until two days after the U.S.-led invasion of the island of Grenada in 1983. A new pool system—where select journalists were allowed on the scene, and to file reports back to others not so selected—was first used during the U.S. invasion of Panama in 1989. In practice, it effectively prevented journalist access to the battlefield until much of the conflict was over. The system was more comprehensively and successfully implemented during the 1990–91 Gulf War against Iraq, during which the U.S. military and "host" governments in the Middle East strictly limited where and when journalists could go and what they could report from the front.

Journalists bristled at these limitations arguing that they unduly restricted freedom of the press and their ability to inform the public independent of government spin. Some attempted with limited success to work for a compromise between greater media access and legitimate government restrictions on information to protect the mission and safety of the troops. After the Gulf War, Pete Williams, assistant secretary of defense for public affairs (and later an NBC news reporter) and his staff met with members of the press to develop new guidelines for coverage of operations that emphasized the role of independent reporting and access so as to avoid journalistic "sharing" of information, which was a major complaint about pools. Some of these policies were rendered moot by better transportation and communications abilities of media organizations. This was shown by coverage of Operation Restore Hope in Somalia in 1992–93, where in one instance journalists were already on the beaches covering a U.S. amphibious landing as it happened, leading to more resentment by some in the military. Nevertheless, members of the military began to argue for commanders taking a more active approach to media relations by preparing for military operations with the media in mind and seeking constructive engagement with the media rather than defensive avoidance or conflict.

In the early days of the Afghanistan campaign of 2002 serious constraints were placed on journalist access to the action, due to transport difficulties and the nature of the new "war on terror." However, the ability of their opponents—the Taliban regime and terrorist organization Al Qaeda—to use media technology for propaganda purposes led to growing understanding on the part of the Pentagon of the value of journalism's independent "watchdog" role, demonstrating the American commitment to openness and democratic values.

Rising tension with Iraq in 2002–03 provided an opportunity for reassessing the role of news media during wartime. Improvements in video, satellite, computer, and telecommunications meant that journalists now had the capacity to capture any war story "beyond the front lines"—almost anywhere and at any time. The Pentagon was concerned about the lack of its official perspective within news coverage while recognizing the journalistic drive to capture the war story as it happened. The military realized the media had the technological means to more effectively cover the war in real time with or without them. Civilian and military leaders, freed from the perceptions of Vietnam, recognized the importance of good media relations for publicizing the war.

The Pentagon's official rationale for embedding journalists was "to tell the factual story—good or bad—before others seed the media with disinformation or distortions" (Brandenburg 2005, 230). Similarly, journalists sought greater access to the troops and battlefield that cooperation would bring. Thus, the policy of embedding was promulgated as meeting both military and journalistic needs.

As reporters had been accompanying troops into battle at least since the U.S. Civil War, embedding in some ways was a return to earlier practice. The modern notion of "embedding" was first proposed in 1996 by the Clinton Administration Defense Department, though the idea was more public relations-driven: having journalists spend a few days or a week with a unit and then do a story. The design and scope of embedding for the Iraq war—placing reporters with all major branches of the military for extended periods—was clearly an expansion of an earlier idea to improve war journalism.

Embeds in Practice

Embedding began before the beginning of combat operations in March 2003. The Defense Department issued a call for news media to send prospective embed personnel to training camps. The military made a conscious decision to offer embedding opportunities to news *organizations,* not individual journalists. It was thought this would provide a better way to hold journalists accountable for following the ground rules to "balance the need for media access with operational security" (Department of Defense 2003) including limitations on the broadcasting of troop locations or future plans, releasing the names and profiles of casualties before next of kin were notified, and allowing commanders discretion to limit media access as they saw fit.

Once accepted, prospective embeds were sent to formal military training—a "mini-boot camp" of sorts. This was to both train them how to work with and not inhibit the military forces to which they would be assigned as well as to provide them a better sense of military life. They were required to sign a waiver absolving the military from any harm to the journalist. They also had to agree that the government could, at any time and for any reason, cancel the embedding assignment and remove the journalist.

U.S. military forces limited the number of embedded journalists for logistical and security reasons. At the height of the program, 775 journalists were embedded with American forces, and 128 British reporters joined UK forces. Foreign journalists, including those from Middle Eastern news outlets like Al-Jazeera, were given some of the slots. After Baghdad fell, most embeds left the program; only 185 remained one month later, with numbers continuing to decline as the war drug on. In November 2006, CBS News reported the number of embeds assigned to units in Iraq had fallen to below two dozen.

The U.S. military provided considerable direct support to embedded reporters. In addition to the pre-war training, they also provided transportation, lodging, food, protection, and other logistical assistance; in a sense, it was as if reporters were actually members of the unit they were covering, somewhat like an additional public information officer. Other journalists, who were either not embedded or voluntarily chose to go it alone for other reasons, were officially known as "unilaterals." While not prevented from access to the areas of operation or beyond, they were not aided nor directly protected, and the military did not go out of its way to do so. Indeed, official policy noted that if encountered, they would be treated "as any other civilian."

By the nature of their being on the scene, embedded reporters were able to show a grassroots, "view from the ground" perspective. In some cases, reports filed by embeds directly contradicted the official line from Central Command, or at times showed events the government would have preferred kept secret. Yet embeds were dependent upon the military—they had little independence, no vehicles or way to move on their own, and were subject to various reporting restrictions. While most followed the guidelines and acted responsibly, there were notable exceptions. Over thirty journalists were expelled from the theater for transgressions, including Fox News's Geraldo Rivera, who foolishly drew a map in the ground describing his location while on-camera.

Being an embedded reporter is still not without its dangers, including the real possibility of ending up in an active war zone. For example, acclaimed print journalist Michael Kelly, editor of *Atlantic Monthly,* was killed in combat while embedded in 2003. In 2006, ABC News anchor Bob Woodruff and cameraman Doug Vogt were both seriously injured by a roadside bomb. Nevertheless, embedded reporters are relatively safer than those outside of the program. According to the Society for the Protection of Journalists, as of October 2008, 135 reporters had been killed in Iraq in five and a

half years of conflict; yet of these, only seven (or 5 percent) were embedded; the other 128 were "unilaterals."

Embedded Evaluation

The embedding of reporters, as ground-breaking as it may have been, proved to be a contentious policy. Some critics charged that embeds might endanger troops or the mission. Others were concerned that journalists would become "too close" to those they covered, and naturally identify more directly with those with whom they lived and were protected by, losing their objectivity. This phenomenon was likened to the so-called Stockholm Syndrome where hostages come to empathize with their captors.

Nevertheless, advocates of embedding argue it has several advantages. It provides an "up close and personal" view and allows journalists to experience war as the troops do, so that they can portray the efforts of those doing the fighting. It provides direct access to the battlefield and the war's events in ways not otherwise possible. The live footage and "real time" reporting provide a realistic "first cut of history" and document the war as it happens.

On the other hand, detractors point out that embedded reports provided a fragmented, "soda straw" view of the war that lacks a larger perspective. What embeds see and report is only a small slice, and may in fact be inaccurate or distorted. Some reports were later rebutted by broader evidence. Akin to the Stockholm Syndrome problem, some argued reporters may become tools of propaganda. Because of their proximity, they may essentially become "part of the home team" using words like "we," "us," and "our side," and in related fashion want to downplay the negative so as to not make their comrades-in-arms look bad. Finally, the focus on action, weapons, and exciting visuals inherent in the embedded context provides little substantive analysis.

The experience of journalists in the field and evaluations of the coverage itself was more complicated. More specifically, a study reviewing the content of embedded reports in one week of the war by the Project for Excellence in Journalism made several observations. The overwhelming majority (94 percent) of stories were factual rather than interpretive; 60 percent were live and unedited; most stories had reporters, rather than soldiers or other sources, as main actors; and stories avoided graphic scenes, and where weapons were shown they were passive and didn't directly show people being hit. The report described coverage as having "all the virtues and vices of reporting only what you see" (quoted in Seib 2004, 55).

One examination of television network news found that stories produced by embeds were *not* more likely to have a positive tone toward the U.S. war effort, and in fact were slightly more descriptive than those by other reporters. It did find, however, that embedded journalists were more likely to quote or focus on individual American soldiers and were less likely to depict Iraqi soldiers, civilians, and civilian casualties than "unilaterals." Conversely, another study of major U.S. newspapers found that coverage by embeds during the invasion and the occupation was significantly more positive toward the military than were reports by nonembedded journalists. Embeds also were more likely to use "episodic" (fragmented, event-driven) frames rather than thematic (interpretive and contextual) ones and to appear more authoritative.

Indeed, from interviews with embeds themselves, there was a clear understanding that on the one hand, they and the soldiers they worked with were both well aware that their job as reporters was to report what they observed—good, bad, or otherwise. But at the same time, it was also clear that embeds did come to identify with their unit and to empathize with them. Or, as journalism researchers Howard Tumber and Jerry Palmer put it in a 2004 critique, "Their professional requirement to cover a story in a detached way was slowly being swamped by the very real, human need to belong, to be safe."

Finally, a study by the RAND Corporation based on a review of news stories about the program and interviews with journalists and policymakers, concluded embedding was a success at balancing the competing needs of the media, military, and the public, and did encourage live, unscripted, and unedited coverage with all its strengths and weaknesses. It also argued the practice may have erased the Vietnam-era mindset of suspicion among the military.

In many senses, then, one could argue that the policy of embedded reporters has proved both its

supporters and its critics correct in different ways. As journalism professor Philip Seib wrote in 2004, embedding demonstrates the "basic tradeoff between access and independence."

Future Embedding

Despite its problems, both the military (and for that matter, other members of the government) and the media felt that the experiment with embedded reporters overall was a great success. Surveys of journalists from the United States and other countries found that they overwhelmingly approved of embedding and believed it an improvement over past practices.

Furthermore, the excitement and intimacy of journalists being directly among the fighting men and women creates a dramatic and human-interest angle that few media organizations can resist. New developments in both media and military technology may well alter the media–military relationship in other ways, but it seems likely that some kind of embedded journalism will be part of the media mix in covering wars to come.

Émigré News Media

News gathering and distribution are key functions of media which are further intensified in the course of migration, as immigrants reach an unfamiliar environment. While information about the host country flows regularly from media in the local language, most immigrants cannot avail themselves of such services because they have not mastered this language. They therefore require their own news sources.

This need for émigré news media was revealed almost a century ago when a groundbreaking study by Robert E. Park (1922) indicated that immigrant newspapers in the United States served as a principal source of information about their new environment for immigrants who had yet to acquire the English language. This environmental surveillance function is often carried out through reports on immigration laws, taxes, legal matters, economics, etiquette and other issues, satisfying the newcomers' basic need for orientation regarding important host society events and thus helping them adjust to their new environment.

The language barrier is not the only reason for immigrants' need for news in their own language. Another factor derives from the tendency among mainstream news media to ignore topics that may interest immigrants or at best to provide partial and

distorted coverage of these events. Yet news from or about one's homeland is of special status and value among immigrant populations, who require updated and diverse information about events "over there," no matter how much experience they have acquired in their new home country.

Furthermore, according to Wan-Ying Lin and Hayeon Song (2006), émigré news media frequently blur the distinction among host, homeland and community news, melding culturally relevant and locally oriented news concerning immigrants in the host society. On the one hand, such stories are ethnically or culturally relevant to a particular immigrant group and, on the other, they are geographically bounded and relate primarily to events in the local immigrant community. As such, news media with geo-ethnic storytelling practices may report home country stories in the same manner as most ethnic media, but go beyond that to make their stories relevant to the local audience. Similarly, news about current events in the host country may be framed to render them more relevant to immigrants: For example, a general announcement of upcoming local elections would not be considered a geo-ethnic news item unless it included information concerning polling sites offering linguistic assistance.

Dual Role of Émigré News Media

One frequently investigated topic concerning immigrant media in general and émigré news media in particular is the opposing effects they exert on their audience, both fostering and retarding immigrants' social and cultural adaptation. The more likely these media are to facilitate and accelerate adjustment to the new society, serve immigrants as a compass therein, and accord them orientation and a source of information and learning, the more they are liable to perpetuate existing national and cultural identities, slow down integration in the new society, and nurture cultural and primarily ethnic enclaves. Thus far, research into immigrant media cannot decide between these two alternatives, as the context and timing of research exert a considerable effect on conclusions.

Early studies of émigré news media, conducted within the "melting pot" paradigm, tended to focus on the assimilative function of such media, seeing them as a kind of interim situation. Some estimated that the success of immigrant media is indicated by their disappearance: The more they succeed at their social mission of fostering immigrants' orientation and adjustment, the less their audience needs news in its mother tongue.

By contrast, cultural and political changes during the second half of the twentieth century altered criteria for the success of émigré news media. As immigration became a permanent phenomenon and immigrants began to constitute bona fide minority groups rather than ephemeral ones, attitudes toward their media changed as well—they are no longer slated for extinction but rather recognized as an alternative source of information unavailable through mainstream media and an essential component of the immigrants' cultural capital and their political resources.

Émigré News Media Content

One highly extensive study investigating émigré news media content, conducted by Kasisomayajula Viswanath and Pamela Arora (2000), examined newspapers established by immigrants from India in the United States. By analyzing different items published in these papers, the researchers identified five functions fulfilled by émigré news media that might influence immigrants' acculturation or maintenance of their original ethnic identity and ties with their native homeland:

1. *Transmission of the homeland culture*—a function fulfilled by covering news of immigrant community events, such as reports about cultural and religious celebrations, communal meetings or visits of politicians, artists and other prominent figures from the homeland.
2. *Informational function*—given the limited coverage of international news in the mainstream media, the émigré news media fill the gap by providing information about events occurring in the immigrants' native homeland or in communities of their co-ethnics dispersed all over the globe.
3. *Community sentinel*—as immigrants are potentially vulnerable to discrimination from the majority group, the watchdog role becomes important for émigré news media, as fulfilled by covering stories on immigrants' civil rights

violations, changes in immigration laws, crime against immigrants etc.

4. *Community booster*—covering news that present the immigrant community in a positive light, projecting an image of success, achievement and contribution to the host society or to the native land.
5. *Assimilatory function*—covering stories such as immigrants' involvement in local politics, promotion of positive feelings between the homeland and their host country and demonstration of local patriotism by immigrant community members.

Émigré News Media Audiences

Immigrants seek news extensively and exhibit a high rate of news media consumption, desire for more news about their native homeland than can be found in mainstream media and a critical stance toward such news coverage for its failure to provide more varied and pluralistic viewpoints. Nearly all immigrants examined use émigré news media regularly and were likely to trust those media more than mainstream media for news about their native countries.

Immigrants also seek news addressing their immigrant experience in the host country. As such features are rare and often biased and distorted in mainstream media, immigrants see themselves as excluded from the flow of national news. This situation often leads to the proliferation of émigré news media aimed at compensating their immigrant audience for the perceived injustice. Émigré news media are thus a means of self-expression and alternative representation, voicing immigrants' concerns from their own perspectives and in their own way.

Studies reveal a positive correlation between consumption of news oriented toward the host country and the newcomers' social and cultural adjustment. For example, Min Zhou and Guoxuan Cai's (2002) study of Chinese immigrants in the United States showed that respondents who did not know English but were heavy consumers of Chinese-language newspapers oriented toward American current events demonstrated a marked inclination toward the U.S. political agenda and strong identification with the host society, whereas consumption of news originating in China reinforced readers' affinity with their native homeland.

On the other hand, although émigré news media initially facilitate immigrants' assimilation, they may exert a damaging impact on integration if immigrants depend on news sources in their mother tongue for too long. Similarly, overemphasis of home country news at the expense of local news also tends to jeopardize the integration role of émigré news media. Preoccupation with the home country undermines immigrants' ties to the local community, impeding adaptation to the host society. Accordingly, if émigré news media maintain a balance between news stories about "here" and "there," they will not only encourage first-generation immigrants' adaptation but also appeal to second and third generations concerned more about local events than news from their parents' homeland.

Differentiating between the assimilative and segregative roles of the émigré news media, it is important to distinguish between media *for* immigrants (that is, media established and owned by the host institutions) versus media initiated and owned *by* the immigrants themselves. Although both use the immigrants' mother tongues, they have different objectives and serve different interests. For example, media for immigrants tends to focus on helping readers adjust to their new societies, while media by immigrants aims at helping readers preserve ties with their homelands.

Émigré News Media Practices and Working Conditions

Émigré news media production employees face several predicaments. First and foremost, these media largely rely on an extremely weak financial infrastructure that dictates their modest professional standards, poorly qualified personnel, low wages, small staffs and poor working conditions. Limited finances and training opportunities often preclude long-term goals, engender understaffing and mandate extensive volunteer work. The smaller dimensions of émigré media, in turn, entail low differentiation, less division of labor and consequent imposition of diverse functions on each employee.

The combination of staff shortages and a heavy load of journalistic duties typical of émigré news

Table 1 Media for Émigrés Versus Media by Émigrés

	Media-for	*Media-by*
Principal objective	Mostly to help immigrants adjust to the host society	Mostly to help immigrants preserve their original identity and ties with the homeland
Immigrants access to the medium	Controlled and limited towards immigrants	Relatively free towards immigrants but limited towards majority
Agenda	Discrepancy between agendas of media and immigrant community; attempt to dictate community agenda	Compatibility between agendas of media and immigrant community; attempt to reflect community agenda
Homeland News Coverage	Limited and usually critical	Extensive and generally supportive
Host Society News Coverage	Extensive and generally supportive	Limited and usually critical

Source: Caspi and Elias, 2008, p. 100.

media can also result in low professional standards, as journalists are mostly tied to the newsroom or studio and use the telephone and Internet rather than engaging in investigative field reporting. Similarly, financial considerations render it difficult for these media to establish their own information gathering sources. Hence there is a clear preference for recycled information acquired from the mainstream media and news agencies, even at the expense of timeliness or commitment to immigrant issues.

Furthermore, immigrant reporters often lack professional journalism training while many of the professional ones lack proficiency in the host language. The former shortcoming may affect quality of reporting adversely, while the latter engenders an apparent problem with host-to-mother tongue translation and local production. Personnel recruitment trends at émigré news media hinder development of higher professional standards, as journalists are offered only minimum-wage salaries or employed as freelancers and paid according to output.

Finally, the position of immigrant journalists within their own community may be precarious. Although émigré media derive their strength from close contact with their own—often small—communities, their professional ethics may be compromised by flawed sources, poor division between professional norms of balance and objectivity and low professional status. Thus, in terms of journalistic routines and practices, émigré news media journalists may be compared with those of local or regional media: All work within their respective communities, often with limited resources and an uncertain future.

EMPLOYMENT

Among the activities that make up the work of journalists is information gathering, and the assembly and packaging of that information into reports. The terms most commonly used to refer to these activities are reporting, writing and editing. Also included are the making of photographs and of audio and video recordings; the production of graphic images; and the design of news products, such as newspapers, newscasts, and webpages. Journalists also express their opinions in columns, editorials, and cartoons. All of this activity is what is usually meant by news work.

The Jobs Journalists Do

In a newsroom, the work of the journalists is differentiated into distinct jobs. Reporters generate story ideas, gather information, and write or produce reports. Photographers or videographers produce still or moving images. Editors and producers package the materials into a webpage, a newscast, a magazine, or a newspaper. Editorial writers and cartoonists produce specialized sections of the newspaper or newscast that reflect opinions of the organization. Columnists are assigned to produce commentary under their own name. Managers are in charge of supervision and policy. In a newspaper or a magazine, the managers have titles such as managing editor, executive editor, or editor in chief. In radio and television, the manager is called the news director. The size of the organization determines the degree of job specialization. In a small radio newsroom, the editor may also be the only reporter. By contrast, in a large newspaper, the editor in chief may do no writing or actual editing and focus solely on newsroom management.

Story ideation is the first step in making news. Reporters produce ideas that become news in a number of ways, some structured and some haphazard. The ideas can come from something the reporter saw on the way to the office, from a tip from a friend, and from reading or listening to another newscast. If the reporter is a specialist, the ideas may come from the persons the reporter meets while covering that specialty.

In newspapers, specialists are assigned to a *beat*, the term possibly derived from police work, where officers patrol a geographic area. Many beats in the newspaper business originally were organized geographically as well. Journalists covered city hall, or the county courthouse, or the statehouse. Or a journalist could cover the suburban beat. Over time, beats also were organized around particular topic areas. A journalist may be assigned to the environmental or the healthcare beat. Radio and television newsrooms are less frequently organized into formal beat systems. More often, in these newsrooms, the journalists are general assignment reporters, meaning they cover whatever is needed. Some specialization exists in broadcast newsrooms as well. The same person does the weather part of the newscast each day, and sports is usually handled by a specialist. At some stations, journalists are given special areas of responsibility. Health care is a common assignment of this type. These journalists are expected to produce stories in these areas each day or on some regular basis, and the newscast is structured to include these materials routinely.

The work of the reporters is coordinated by an editor, or, in the case of broadcasting, an assignment editor. These managers can assign a still photographer or a videographer to accompany the journalist on the story. Increasingly, journalists are expected to have the ability to shoot stills and video themselves, and the manager may simply assign the equipment to the reporter.

Much reporting is done outside the newsroom, with the writing done in the newsroom. In print, the written story is processed by an editor or team of editors concerned with the style, the content, and, ultimately, the display or presentation of the story. Photographs are handled by specialty photographic editors, who pass their product electronically to the display editors. The reporter for a small broadcast newsroom would be expected to edit the video and write the story once back in the newsroom. At a larger station, that might be handled by a producer, whose job it is to put the pieces together into a story and the completed story into the newscast.

The work of all of these journalists is managed by higher-level editors, in the case of print, or news directors, in the case of broadcasting. In large organizations, these managers would have little direct involvement in story ideation and production, though in smaller organizations, they would have considerable input.

Communication Occupations

Journalists are part of a larger set of occupations, all of which focus around the communication process. Other examples of communication occupations include public relations practitioners, advertising workers, and various types of entertainment workers. Depending on how broadly one defines communication, the list of occupations that are included can become quite large. Clearly, however, public relations, advertising, and producers of entertainment material (such as writers and television program producers), are part of the set.

Historically, there has been a strong connection between journalism and public relations work. In fact, many journalists move to public relations as a second stage of their careers. Generally, pay and working conditions are better in public relations. The work of public relations practitioners has been divided into two types. The first is largely concerned with the production of messages sent out for initial consumption by the news media and then passed on to the general public. Such a worker generates ideas, gathers information, and writes news releases, much as the journalist does. Another variant involves the production of materials directed not at the general public but rather at some internal audience, such as a newsletter for employees or some other target group. This involves developing story ideas, gathering information and packaging it into a newsletter or web product. The public relations practitioner must be adept at all the techniques of journalists, including production of still and video images and layout and design.

The second type of public relations practitioner has managerial responsibilities. The manager advises others on broader communication issues, such as how to develop a campaign to create a brand identity for a company or how to manage a communication crisis. For example, airlines have staff prepared to handle the media in instances of breakdown in service or disasters. Major companies teach top managers how to answer questions from the media and how to speak in a way that makes it most likely that the desired message will be incorporated into a news story.

In the past, when television and radio stations produced both news and other local programming, the person who produced news (those who directed and assembled the newscast, as well as the videographers who recorded it), also worked on other, nonnews productions. The skill sets required for the different jobs overlap, and these would be viewed as the same occupation. As organizations increased in size, specialization took hold, and a news producer was seen as occupationally distinct from an entertainment producer. Today, few stations produce local programming other than news, and most production personnel work in news alone.

Career Patterns

No systematic study has been undertaken of workers as they entered the field and then moved through it to retirement. However, researchers David Weaver, G. Cleveland Wilhoit, and colleagues have conducted studies of U.S. journalists in roughly ten-year intervals since the 1980s and have found that between 10 and 20 percent predict that they will leave journalism within the relatively short period of five years. As would be expected, more senior journalists said they were less likely to stay in their jobs than their junior colleagues. The data are consistent with the idea that many journalists leave their careers for jobs with better pay, more flexible or attractive hours, or less stress.

Recent research has documented that, in the U.S. newspaper industry at least, journalists usually start their careers with small newspapers, move next up to larger ones, and reach the pinnacle of their careers at metropolitan dailies. Less systematic evidence suggests this hierarchical feature is replicated in television as well. In both industries, career progression means moving from smaller media markets to larger ones.

Of course, a journalist can move back down the career ladder to a smaller media organization to take a job that is more prestigious or involves more responsibility. For example, a reporter for a larger newspaper might move down to a smaller one to obtain a more prestigious beat assignment or an editor's post. Similarly, a reporter at a large television station might move to a smaller one to become an assistant news director. The move from reporter or a production position to a managerial post is a natural part of career development.

Concentration of media ownership has an effect on journalists' career trajectories as well. One consequence is that consolidated organizations can hire journalists for smaller media properties and then move them up through their careers without their ever leaving the parent company. This can be thought of as a way of creating an extended internal labor market. The advantage for the employee is that she or he does not have to leave to advance their career. The advantage for the company is that their investment in the training and career development of the journalist is retained. In addition, this internal labor market protects the organization from the competition and uncertainty of dealing with the labor market outside the organization.

Countries with more centralized media systems than the United States, such as Britain and Germany, distinguish between the national and regional press, and to a lesser extent, between national and regional broadcasters. The likely consequence is a system of career movement similar to what has been described above. Journalists working for a newspaper or broadcast station in Mainz or Wiesbaden would see it as a promotion to move to nearby Frankfurt or Berlin with their national and even international distribution systems.

Training

Journalists enter the occupation in different ways, though specialized university training in journalism seems to be developing as the norm. Historically, preparation nearly everywhere was via on-the-job training. In the United States, formal university training took root in the late nineteenth and early twentieth centuries. Even in Britain, where on-the-job training remains the norm, universities increasingly are offering journalism training programs as an alternative. Hybrid systems exist in Germany, France and elsewhere. In Germany, where labor laws are restrictive and it is difficult to terminate an employment contract, journalists enter specialized training programs operated by media companies, usually after completing university training in another field, and get work contracts only after completing one- or two-year programs in which their performance is closely monitored.

The United States, with the long tradition of journalism education at universities, has the most elaborate system. About 1,200 universities offer

some sort of program that educates students for careers in mass communication occupations. Of those, about 450 have journalism training as a core component, and about 110 are nationally accredited for their emphasis on professional journalism education. American university journalism programs initially were designed to prepare graduates for careers in the newspaper industry, but as radio and television developed, those curricula generally were expanded to include them. Over the last 40 years, these programs have further diversified their offerings to include other occupations, especially public relations and advertising.

In the United States, most journalists begin their careers after completing one of these journalism programs. At daily newspapers, about 80 percent of new journalists have a university journalism degree; in television newsrooms, the ratio is more than 90 percent as television journalists require more technical training and are more likely to have it if they have completed a broadcast journalism degree.

Most journalism students complete internships at local newspapers and television stations. They may practice their skills by working for a newspaper, or a radio or television news program operating at the university. Such experience predicts success in finding employment upon graduation.

Some nations, especially in the developing world, license journalists. Italy, among western democracies, also licenses journalists. Such licensing can be a prerequisite for employment.

Occupational Values

One useful way of classifying occupations is in terms of professionalism. Professions rely on research and systematic theory to support their activities, specify a client/worker relationship in which the worker has authority over the client, operate with sanctions such as licensing, have a code of ethics, and enjoy a culture that includes training standards, associations, habits, language, and other features that separate members from outsiders. Much has been written about journalism as a profession, with the consensus being that it lacks many of the required features. Anyone can be a journalist; no licensing system is in place in most countries. Journalism codes of ethics are not enforced strictly, and there is even quite a bit of disagreement on their key features. At the same time, most countries do offer formal training programs for journalists, and journalists do enjoy a certain amount of prestige, have associations and a language that separate them from others in society, and do claim at least a worker/client relationship. When journalists are challenged about a story they frequently claim that their expertise as journalists allow them to decide what is and what is not news.

Comparative research on journalistic values suggests mixed evidence that a common set of values is emerging. Journalists generally desire freedom to operate. And there is evidence that most agree that transmitting information quickly is one of their key roles. On the other hand, there is less agreement on how important it is for journalists to investigate and challenge government claims—or play what is often called the watchdog role. The research also shows that the value assigned to reporting accurately and objectively varies around the world.

Occupational Setting

Journalistic work traditionally has most often taken place within an organizational setting. The reason for this is simple. The costs and complexity of news gathering, preparation and distribution are high and require the work of many people. A journalist who does not work for a news organization on a permanent basis is referred to as a freelancer. Some journalists who work under contract for one media organization sometimes do work for another, particularly if the second does not compete with the first. A journalist for a media organization in a setting where conflict or war breaks out might send reports to media organizations outside that zone on a temporary basis. Across time, the relationship might be maintained, and the journalist would then be referred to as a stringer for the remote organization. Freelance journalists also often work as stringers for noncompeting media organizations. For example, a freelance journalist might send reports to newspapers in Japan and also to newspapers in the Netherlands, serving as a stringer in both cases. The Japanese and Dutch newspapers are not competing, so there is no conflict in the work arrangement. The important limitation of freelance and stringer work, of course, is

that these journalists are dependent on those who own and operate news media for distribution of their reports.

Employers and the Nature of Employment

All journalists are part of a labor market where the key transaction concerns the services of the worker. These services are not bought or sold, however, as the services journalists provide cannot be separated from their persons. As a result, their services can only be rented. The employer agrees to make use of—rents—the services of the journalist through some contract.

The contract can be short term, as with the freelance journalist, longer lasting, as with the stringer, or more permanent, as with the regular employee. A major determinant of that contract, however, is the general labor law of the country where it is written. German freelance journalists, as one example, receive benefits similar to those of regular employees once their freelance relationship persists over a prescribed period of time. American journalists generally can be terminated from their "permanent" employment on very short notice—usually two weeks—while journalists in many European countries can be terminated only after protracted negotiations involving government labor boards.

Because journalism services are only rented, not actually bought and sold, price is not always the key factor of the transaction. In addition to wages, employees desire favorable working conditions, benefits such as health and life insurance, flexibility in scheduling, accommodation for the demands of parenting and care of family members, and social prestige.

The news work environment usually is hectic because journalists are constantly under pressure to produce stories for deadlines. Journalists often have to work in uncomfortable and even dangerous environments. News occurs at all times of the day and night, and work and travel schedules can be irregular as a result. Newsrooms in the United States are often open spaces with lots of noise and little privacy, though in other countries work settings can be more favorable. Certainly in emerging media markets, however, quarters are often cramped, equipment must be shared, and even the air can be smoky and unhealthy.

Under these circumstances, it might be expected that the pay of journalists would be quite good and other benefits lavishly provided. That does not seem to be the case in most countries, in large part because labor markets follow whims of supply and demand. Enough people seem to be willing to take the jobs, even at low pay and with poor working conditions, to keep the level of compensation relatively low. The media are a central part of modern society, and media jobs are attractive in part because of this.

In the United States, a graduate with a journalism degree generally earns less in the first job than a graduate with a comparable degree in the liberal arts and much less than a graduate with a degree in business or computer science. Among journalism graduates, those who take a job with a daily newspaper earn more than those who work at a weekly but about the same as a graduate in radio. Graduates working in the magazine industry generally are paid better than journalists in daily newspapers. Graduates who take a job in television earn much less than those with newspapers or even in radio. This is consistent with the argument that supply determines salary, as research has shown that the ratio of job seekers to jobs is higher in television than in print. Overall the best salaries are earned by graduates who take jobs in advertising and public relations.

In the United States, a very small percentage of journalism jobs are with media organizations that have union contracts. Journalism graduates who work with a union contract do earn more than those who work in a nonunion newsroom. In other countries, however, journalism labor unions have successfully negotiated for high salaries and for other benefits. In Denmark, for example, journalists are entitled to postemployment training as part of their contracts. In the United States, where postemployment training (often mislabeled mid-career training) is widely available, journalists often have to seek such training on their own time. Oftentimes, they have to quit their jobs in order to participate in programs that stretch over a month or more.

The Future of Journalistic Work

Journalistic work is not static. As recently as the 1970s, an editor working for a daily newspaper was in charge of the design and layout of the paper,

sketched out the layout of the next day's edition on a sheet of paper, and passed it to the composing room, which converted that sketch into what the reader saw the next day. As computer technology took over, those individuals in the composing room were phased out, and much of the actual work of laying out the newspaper was shifted to the editor, who worked with page layout software to produce the next day's pages. Similarly, television reporters who worked with a videographer in the 1980s were shooting their own video two decades later.

These technological changes were minor compared to the changes brought about by the Internet. The Internet provided an alternative delivery system for news that gave consumers the ability to select and create their own news products at any time. It also meant that news work, previously tied to the cycle of broadcast or printing schedules, became even more hectic. In addition, journalists had to learn new tools, such as web design, database creation and management, and web searching. At the same time, journalists who worked for print suddenly found that they also had to know how to shoot video and capture audio messages. They had to know how to edit these files and upload them, along with their texts. They also needed to produce and upload still photographs, graphic enhancements, and databases. The technologies that once differentiated the work of journalists by industry type had converged.

In many ways, however, these were the simple changes in the world of news work. More complex, and more challenging, were the changes in the very definition of news—and the work that creates it. News had once been what news organizations such as newspapers, newsmagazines, radio, and television produced. News work was what journalists in those organizations did. Suddenly, news work was decoupled from these organizations. If anyone can distribute a news report on the Internet via a blog or a podcast or send a mobile text message, then everyone is potentially a journalist. News is no longer simply what a journalist produces. News is what anyone claiming to produce news produces. News work is no longer only what a journalist does, it is what people claiming to produce news do. For better or worse, every person has the opportunity to be a citizen journalist.

The advent of Internet-based citizen journalists certainly has had an impact on the work of journalists in the traditional media, though the full dimensions of that impact are not yet known. Citizen journalists have challenged those working for the traditional media by presenting additional or even contradictory information. Traditional journalists must monitor the work of the new journalists for these reasons as well as to generate story ideas themselves. In all cases, the Internet has become a routine part of newsgathering and checking.

English Roots of the Free Press

The origins of journalism are similar across Europe. The newspaper grows out of the time-honored

twin impulses to report significant political and economic events or sensational, curious (often trivial) ones. These impulses long pre-date the introduction of moveable type so the arrival of the printing press in the mid-fifteenth century was not in itself a necessary cause for the development of the modern newspaper.

European Background

The printed newspaper, in the form of an unbound, sequentially issued, independently edited publication using the same title but differentially dated does not appear until about a century and a half after European printing began—in other words, around 1600. During that delay, intermittently printed prose news-books on major individual events, as well as occasional digests of news, would be produced featuring stories real or imagined (e.g., battles and royal progresses as well as miracles, disasters, crimes, and celestial phenomena). The fictional as well as the factual would all be sold as "true." These proto-news journals—referred to as *mercuries, relations, gazettes,* or *avisos*—were of a piece with the printers' other ephemera, such as woodcuts or ballads on contemporary topics, both serious and sensational.

The most economically and politically significant news enterprise was the regular exchange of information between kingdoms through their ambassadorial system or by merchants at periodic great fairs or in reports from their factors in distant cities. These communications, however, did not appear in print. They remained handwritten and secret as they had always been throughout the middle ages. Some were regular enough to be "newsletters" issued to limited readership (a bank's main clients, for example) in multiple handwritten copies. They continued to be produced by hand well into the seventeenth century. The news they contained was seen as potentially damaging if published because it could be revealing of state secrets or could possibly jeopardize commercial advantage.

Making this information—known as "intelligences"—more public was a fraught enterprise. Medieval merchants had not much desire to share market intelligence at all. Authorities were also fearful but were more confused as to how to deal with the issue of press control. The problem was that, from the time of the introduction of the press, they had sought to exploit print's potential as a means of information dissemination for their own purposes. Yet they felt threatened by private presses. In response, states and the church licensed the physical machines and organized printers into monopolistic guilds. They proscribed works and authors, vetted proposals, registered titles and, as a last resort, banned any work that got through the net; but printing itself remained a necessity. The result was a censorship regime less effective than it might have been. Policing was rudimentary. Authorities were willing to license publications (inflammatory blasphemous pamphlets, for example) for export which they would not countenance for domestic distribution. Ownership and operation of presses was difficult to control because they were small enough to be loaded on a handcart or concealed in any room.

Despite this somewhat confused official approach, what emerged in the sixteenth century was an ever-increasing need to distribute commercial intelligence. During the long period of print media incubation, feudalism was collapsing and mercantile capitalism was emerging as the basis of economic organization. To work, the new system needed not secrecy but informed participation. It is this realization that finally "caused" independent printed news in its modern form to emerge, despite its destabilizing potential as far as the authorities were concerned. By the start of the seventeenth century, the pressure mercantilists brought to bear—because they needed a constant flow of information to conduct their businesses—had transformed the role of the press. No longer was knowledge deemed to be only of value to princes or banking houses. Couple this development to the established popular taste for the sensational and the foundation of modern journalism was laid. As the towns of Europe grew, so did the merchant class and the numbers of those who wrote, printed, and published news-books and a range of news-sheets.

Especially in the German-speaking cities, printers (*mercurists* rather than *journalists* at this stage) were licensed to produce regular *corantos,* instead of occasional news-books and mercuries. In 1605, Abraham Verhoeven started a coranto, *Nieuwe Tydinghe,* in the Netherlands. By 1617 he was publishing weekly and eventually, in the 1620s, these *New Tidings* came out as often as three times a week. By then journalism had one very big, and

long running, story to cover. What was to become the Thirty Years' War—a paroxysm more than a century in the making as the tensions produced by the Protestant Reformation were transformed into a bloody and interminable conflict—had begun in 1618. Nearly a third of the population of the German-speaking lands was to die in these decades mainly by disease and famine as the Catholic Church fought Protestant princes.

Censorship in the Netherlands, a republic established in provinces recently independent of Spain, was less draconian than elsewhere. Dutch printers, taking advantage of this, published in many languages including English.

English Press Controls

English printers were less fortunate than their Dutch counterparts, and strict controls via a licensing system were exercised though the Stationers' Company. Originally a medieval guild of those responsible for the production of manuscript editions, the Company had been given a monopoly over print as well. In sixteenth-century England, the printing of news took the same form as on the Continent with the appearance of occasional newsbooks. Sensation, however, sold as well as politics and was less liable to cause offense so English printers did not include the political content that the Dutch and German corantos did in the early 1600s. Nevertheless, in 1620, the first coranto written and printed in English was imported from the Netherlands without official action being taken against it. Essentially, the English authorities were permissive because the news it contained focused on the Continental war. However, in August 1621, when a London printer, Thomas Archer, started his own publication with the same Continental focus—but unlicensed by the Stationers' Company—he was quickly imprisoned.

The authorities did allow two other printers, Nathaniel Bourne and Nathaniel Butter, to emulate Archer the next month. Butter had been a freeman (member) of the Stationers' Company since 1604 so their *Corante, or, Newes from Italy, Germany, Hungarie, Spaine and France . . . Out of the Hie Dutch Coppy printed at Franckford . . .* was licensed and therefore allowed. The countries named in the title changed with each edition, functioning much like a headline. Bourne and Butter sought no news of their own but merely translated and reprinted coverage of the Continental conflict from Dutch and German corantos. They were, therefore, dependant on the flow of publications across the English Channel and their printing schedule was dictated by the arrival of the packet boats. Sometimes *The Courante,* which settled as a quarto publication of between 8 and 24 pages, failed to appear for more than a week; at others, three editions might be printed within a seven-day period.

Their success was emulated by other licensed publications; but all the printers knew that their situation was fraught with potential danger and by the early 1630s even reporting the European war was getting more difficult. Any coverage of domestic English events, of course, was avoided as it would bring instant sanctions. Despite this caution taken by printers, in 1632, the king's Court of the Star Chamber banned the corantos. England and Scotland, recently united under a single crown but uninvolved in the Continental fighting, were Protestant realms fearful of Catholic intrigues and interventions. The protracted conflict had simply become too sensitive a political topic for public debate. That Bourne and Butter alone printed 500 copies of every coranto they issued was no recommendation in the eyes of the authorities. The printers did not, though, willingly forego this business and, in 1638, they successfully petitioned to have the publication licensed again, now to be sold under the learned name of *Mecurius Britannicus*.

English Civil War and the Press

The *Mecurius* continued as before with its diet of Continental news but soon a bigger story would sweep away the ban on domestic coverage. As the King and Parliament headed toward armed confrontation, the Star Chamber, the main organ of overt press suppression, was abolished by Parliament in June 1641. A new form of journal, the weekly *diurnal* appeared: *The Diurnall: Or, The Heads of All the Proceedings in Parliament* began that December. Parliament tried to maintain the old licensing system by banning unlicensed news publications but, with the distractions of the coming conflict, this had little effect, and the diurnals proliferated. In August 1642, the first fighting in the English Civil War began. The war was to act

as midwife to what was to become and remain Europe's most outspoken press.

In the fog of war, English printers made a breakthrough that was to condition all subsequent developments. Throughout the long period of press incubation on the Continent, there had been a flood of pamphlets arguing, more often than not hysterically, either the Protestant or Catholic cause. These organs formed a tradition of propaganda and opinion quite distinct from that of news publications. However sensational and mendacious these last were on occasion, they were "true" in ways that the pamphlets were not. These two journalistic streams come together for the first time in the English news publications of the Civil War period (the 1640s).

Early News

On the one hand was the sobriety of the diurnals. Take this report of the most traumatic event of the war:

> Tuesday January 30. This day the king was beheaded, over against the Banquetting house by White-Hall. The manner of Execution, and what passed before his death take thus. He was brought from Saint James about ten in the morning. . . . After which the King, stooping down, laid his necke upon the blocke, and after a very little pause, stretching forth his hands, the executioner at one blow severed his head from his body.

This is on page three (because it was a Tuesday and the publication began with the events of the Sunday) of Samuel Pecke's *A Perfect Diurnall of the Passages in Parliament* for the first week of February 1649. Pecke, despite a refusal to sensationalize his reports, was printing 3,000 copies a week.

On the other hand, Marchmont Nedham—the Parliament's and later the republican leader Oliver Cromwell's main apologist—and his Royalist rival, Sir John Birkenhead, inserted into their mercuries a tone which had only previously been found in pamphlets. Take one example from the *Mercurius Britannicus, Communicating the affaires of Great Britaine for the better Information of the People: From Monday the 28. Of July, to Monday the 4. Of August, 1645*. Nedham wrote:

> Where is King Charles? What's become of him? … If any man can bring tale or tiding of a wilfull King, which hath gone astray these foure years from his Parliament, with a guilty Conscience, bloody Hands, a Heart full of broken Vowes and Protestations. . . . Then give notice to Britannicus, and you shall be well paid for your paines: So God save the Parliament. (quoted in Clarke, 21)

This enthusiasm, partisanship and wit came to condition the English newspaper: a unique mix of the coranto's sober reporting tradition and the argumentative dynamism of the pamphlet.

Journalism in England was now infected with a different spirit from that on the Continent. Dr. Théophraste Renaudot, Marchmont Nedham's French counterpart, who started the *Gazette de France* for Louis XIV, wrote: "Was it for me to examine the deeds of the government? My pen was only the grafting tool." Nedham's position was very different: "I tooke up my pen for disabusing his Majesty, and for disbishoping and dispoping his good subjects, and for taking off vizards and vailes and disguises . . ." (quoted in Smith, 130). Crucially, of course, Louis's position was very different from Charles'. He had defeated a revolt of his nobles while Charles lost his head.

In the midst of this social upheaval, the English press became a veritable engine of liberty. When in August 1643, the poet John Milton published an unlicensed anonymous pamphlet in favor of divorce, then an illegal proceeding, he was summoned before Parliament. His defense there not only provided the burgeoning news publications with a theoretical basis for the exercise of a free press but it also produced, the following year, in the (again, deliberately) unlicensed form of a pamphlet, a first, great printed public affirmation of that principle in English. He called the pamphlet *Areopagitica,* after the hill where the ancient Athenian high court met. It was subtitled "A speech of Mr. John Milton for the Liberty of VNLICENC'D PRINTING, to the PARLIAMENT OF ENGLAND": "Give me the liberty to know to utter, and to argue freely according to conscience above all liberties." It was, he claimed, "as good almost kill a man as kill a good book."

In one sense Milton was merely extending a concept that lay at the heart of Protestantism itself—liberty of conscience—to embrace the secular world of politics as well. His liberality, though, should not be overstated. He wrote the divorce pamphlet because his own marriage was in ruins

and his concept of unlicensed printing did not in fact run to allowing Catholic texts, for example. In fact, for a time he was to act as Cromwell's censor. Nevertheless, there was something new and crucial in his stand, a *de facto* justification of Nedham's and Birkenhead's feisty editorial attitudes. Libel, blasphemy, and sedition would still constrain publication but the fail-safe position, as it were, was that publication should be unlicensed; and therefore, at least in theory, free.

The Restoration Press

This move toward press freedom would have counted for little, however, if, after the Restoration of the crown in 1660, the old controls had been effectively reimposed; but, despite what was to become centuries of effort on the part of British authorities, they never quite were. In 1662, Charles II had passed a new act for the licensing of the press but the crown's power was now so weakened that it was only a temporary measure. In 1695, this Printing Act was again up for renewal when Edward Clarke, a member of Parliament, successfully persuaded the House of Commons that the weight of existing laws "makes this or any other Act for the restraint of printing very needless" (quoted in Sutherland, 25). The act was not renewed. Clarke was influenced by his friend, the philosopher John Locke, who had argued that, contrary to the assumptions of a divine right of kings, there was a right of resistance if the crown forfeited through its actions a claim on the loyalty of its subjects. Nedham, according to Locke's argument, had a right to write as he did. Religious reform and political theory had joined hands in arguing for a level of personal freedom which would slowly embrace, with struggle, the concept of a free press.

Yet 1695 cannot be said to mark the start of this freedom any more than did the *Areopagitica*. The existing laws were still vigorously applied, backed by a special police force known as the Kings' Messengers, who had the powers of a "General Warrant"—that is, one with no persons named as was usually required—to search any premises for unlicensed presses; and soon, special taxes on newspapers (a term that had first appeared in the 1670s) were imposed. Nevertheless, as a consequence of the Civil War and English radical thinking, the English newspaper flourished.

The English now caught up with the one Continental development they had ignored—the daily newspaper, which had first appeared in Leipzig in 1650. In 1702, Samuel Buckley brought out the London *Daily Courant,* a single sheet printed on one side but very much, as its name suggests, an echo of the old corantos; that is, a digest of translated foreign news.

The Eighteenth-Century Press

Despite the taxes and authorities being ever quick to bring offending journalists to court—even to the gallows if accused of treason and sedition—the early-eighteenth-century London press attracted "giants to write for it" including Daniel Defoe, Jonathan Swift, Joseph Addison, and Richard Steele. Journalism flourished during this time. The state was now, in effect, constrained by an assumption that the British people and their growing newspapers were free and therefore free to impart and receive information. The idea of a free press could not be extirpated: "Freedom of speech" wrote the London journalists John Trenchard and Thomas Gordon under the pen-name "Cato" in 1720, "is the right of everyman, as far as by it he does not hurt or control the right of another; and this is the only check which it ought to suffer, the only bounds it ought to know." By the 1760s, this was assumed to be the Common Law. William Blackstone, the great jurist whose *Commentaries on the Laws of England* was in the baggage of every English lawyer emigrating to the American colonies in the late eighteenth century, held that "The liberty of the press is indeed essential to the nature of a free state; but this consists in laying no previous restraints on publications, and not in freedom from censure for criminal matter when published." The press was not to be above the law but neither could it be censored—controlled by prior restraint. This was not quite the positive "liberty . . . to utter" for which Milton and the other radicals had argued; but it was a "right to hear."

In 1763, as Blackstone was formulating this concept of "no prior constraint." a famous radical and rake, the member of Parliament John Wilkes, was charged with publishing, in his paper *The North Briton,* an "infamous and seditious libel tending to influence the minds and alienate the affections of the people from His Majesty and to excite them to traitorous insurrections against his Government." Wilkes was just being rude about a

political opponent whom he accused of prostituting the crown. He, of course, claimed Parliamentary immunity and Chief Justice Parry agreed; but what was important was that Parry also held that the General Warrant under which Wilkes had been arrested, a hangover from the seventeenth century, was now illegal under English Common Law.

All that remained of the old censorship apparatus was the unique rule that in press libel cases juries only determined the fact of "publication," not of the libel itself, as the latter was the judge's determination to make. In 1769, in another case involving an anonymous journalist, "Junius" (who has never been identified), the judge upheld the libel but the jury, absurdly, held it had not been "published" despite being printed and the known publishers (now named in ordinary warrants) being before the court. The law, in other words, had been made a fool of. With this precedent, it was to become increasingly difficult to prosecute newspapers. Juries would not convict, often against the background noise of public protests outside the courthouse.

Elsewhere the positive principle of "the right . . . to utter" (not merely the concession of "no prior constraint") was incorporated into statute for the first time, albeit on what turned out to be a temporary basis, in Denmark (1761) and in Sweden (1776) and, for a few weeks short of three years, in revolutionary France starting in 1789. Press freedom had become one of the Enlightenment's *Droits de l'homme*: "The free communication of thoughts and opinions is one of the most precious of the rights of man." Two years after this Article XI of the French revolutionary constitution, the first U.S. Congress caught up with the French (and the constitutions of some American states) to pass the most long-lived of these eighteenth-century statutes, the First Amendment. But in Great Britain, homeland of the concept, the slow erosion of formal state controls continued without any enactment of a free press right.

Direct attack on the press via the law, though, was no longer a possibility. To control the press, the British state had only the tools of taxation and bribery. Robert Walpole, the first man who could be said to hold the post of Prime Minister, was accused of spending 50,007 pounds of public money, some of which had been obviously raised by the taxes on print and the bribing of newswriters, printers, and publishers in the 1730s. The last recorded governmental bribe occurred in 1820.

The Stamp Act, a tax levied on all newspaper copies, persisted but also became increasingly difficult to sustain. In 1822, Home Secretary Sir Robert Peel ordered that tax-dodging publishers should not be prosecuted as this too often led to public disorder; however the lowly distributors, often women, remained at some risk. A decade later the unstamped press was estimated as having a readership of 2 million, more than did the legally stamped papers. A campaign for the brilliantly branded "Repeal of the Taxes on Knowledge" eventually resulted in a series of abolitions—of the duties on advertisements in 1853, on newspapers in 1855 and, finally, on newsprint itself in 1861.

The press at last was "free" but there was still no statutory "liberty . . . to utter." It was not until the Human Rights Act of 1998 that the "freedom to hold opinions and to receive and impart information and ideas without interference by public authority" became part of British statutory law. By then, however, the time was long past when a radical newswriter could sell discombobulating journalism printed on a little flatbed press. Newspapers were big business. The British press was "free," but it was also, perhaps more importantly, "safe."

Entertainment Journalism

As new forms and delivery systems for arts and entertainment proliferated, interest in news and comment on all aspects of entertainment and its creators reached new heights in the early twenty-first century. The rise of blogs and other Internet-based avenues for sharing information helped democratize entertainment journalism by throwing it open to amateurs and semi-professionals. At the same time, serious criticism by trained professionals seemed in decline, resulting in a trivia-obsessed public and a reduced market for serious reviews of traditional art forms.

At a time when hard news has softened into what could be termed a 24-hour song and dance, parameters of entertainment journalism can be difficult to identify. Journalism *about* entertainers can lose definition when many journalists appear to have *become* entertainers. Meanwhile, infotainment is offered alongside self-avowed "fake news" comedy venues like *The Daily Show* and *The Onion*—which, in turn, is where increasing numbers of citizens say they get their news (and, according to some research, are better informed than those who stick to more traditional sources). Infotainment—the practice of mixing news with entertainment—is not new; it dates at least as far back as the medieval period, when traveling troubadours and theater troupes in a pre-literate age shared gossip and events from towns they had recently visited. But such light content has increasingly dominated what is being called a post-literate age.

When Neil Postman wrote his landmark treatise *Amusing Ourselves to Death* in 1985—before the rise of the Internet and its incarnations of news lite—he was primarily concerned with the dumbing down of both America and the world in a post-literate age. He saw this phenomenon as the result of people gorging on the eye candy of television in preference to the more intellectually demanding medium of print. Postman had no objection to entertainment, even of the mindless variety; what he feared was a citizenry that could no longer tell the difference.

Fewer Professionals, More Amateurs

The landscape of entertainment journalism at the end of the first decade of the twenty-first century is marked by a growing conundrum: We have fewer critics of the arts than we did 100 years ago. Yet at the same time, we have far *more* of them.

A century earlier, when magazines were our only national medium and newspapers were at their most plentiful, a major city like Chicago would have roughly a dozen daily newspapers, each with its own theater, music, and art critics. A hundred years later, Chicago had a few suburban papers and two major downtown dailies, only one of which, the *Tribune,* dominated those zip codes that were home to most patrons of the arts. Other cities followed the same pattern. So while the proliferation of blogs and websites has increased the raw number of critics writing, most communities find that for a play or exhibit to succeed financially—to draw enough customers to support the organization that produced it—it must gain a positive review from the critic who works for the dominant (or, in an increasing number of venues, the *only*) newspaper.

This proved true even in New York, widely acknowledged to be the cultural capital of the United States. Although the city supported three viable newspapers into the twenty-first century, *The New York Times* had an outsized influence on the success or failure of performing arts organizations. It was a rare show that could succeed without a positive review from the *Times.* When it came to books, that influence was nationally felt: "Get" the *Times,* and your book was made.

Media mergers, even when they did not result in a reduction of the number of newspapers, sometimes led to a reduction in force of arts and entertainment journalists. For example, various San Francisco Bay area newspapers that merged under the umbrella of the *San Jose Mercury News* saw replacement of separate arts critics with one critic whose reviews and features appeared in multiple papers. Thus the nation's traditional arts establishment found itself in an environment where a hundred blogs by unknown writers could not counteract the influence of the one remaining (and thus more powerful) newspaper critic.

These developments affected the performing arts (theater, dance, and live music including opera and symphonies as well as rock and roll and other popular genres) and museum arts (painting, sculpture, and performance art) more profoundly than they did recorded and broadcast arts such as motion pictures, recorded music, music videos, and video games. But even these electronic arts were affected: fewer newspapers meant fewer critics. As remaining newspapers felt the pinch of decreased revenue, they often dropped critics of non-local art forms. It became an unnecessary luxury to carry a local movie critic when reviews were available from syndicated sources and readers could access reviews in national publications online.

Changes in Reviewing

In the early twentieth century, when a dozen local critics would review the same performance, a public that bought more than one newspaper might take disagreements among critics as a cue to apply their own critical thinking to any given work of art. A review might be seen as less a verdict and more an invitation to consider and discuss the meanings and artistry of the work in question. A hundred years later, the critic for *The New York Times*—or the critic for any city's dominant newspaper—could not help but feel the weight of his or her review. Given the increasing price of performing arts events—even after accounting for inflation—the main function of each review seemed to have devolved into a monetary one: Should the reader buy this product or pass it by? The arts had always been subject to commercialization. Now they had fallen under the spell of *commodification,* the idea that as the monetary value of something increased, its intrinsic value decreased.

That trend was exacerbated by the transformation of culture from something that occurred live and in person to something that was recorded, reproduced, and distributed on disks or downloaded on personal computers, MP3 players, or cell phones. As art became a slickly packaged product to hold in one's hand, journalism about art increasingly took on the mantle of consumer guide. The essential question for the arts journalist shifted from "Is it good art?" to "Is it worth the price?"

In some ways the rise of the Internet hurried these trends. For example, websites like craigslist seriously undercut newspapers' ability to make money with classified advertising, leading to cost cutting on the editorial side. And the Internet itself became a one-stop marketplace where one could sample, share, pay for, and consume free snippets and full-length downloads of artistic products. Art became increasingly impersonal, consumable, disposable—and forgettable.

Web 2.0 Reviewing

On the other hand, the Internet also carried the possibility of counteracting some of these trends. The popular movie website Rotten Tomatoes collects a wide array of reviews for every new film, allowing readers to compare views as well as the differing aesthetic stances of a wide variety of critics. Some may use this as a way to comparison shop, but others might be drawn into a deeper consideration of film as an art form—and may feel compelled to post their own views. That is both the danger and the promise of the Internet, which can be tawdry and anonymous and obsessed with surface values but can also become the venue for the creation of a community of dedicated art lovers who share personal views and even art itself. Online communication is as honest and serious and deep as its users choose to make it.

If, as Marshall McLuhan famously wrote in the 1960s, "The medium is the message," there is some evidence that attention spans are dwindling as a result of the nature of the Internet itself: shimmering pixels on a screen loaded with hyperlinks that invite split focus and rapid-fire clicking from one source of stimulation to another. "Is Google Making Us Stoopid" (sic) was the title of a 2008 *Atlantic* cover story by Nicholas Carr, who observed that his own patience with long-form writing had diminished. When attention spans shrink, so does the ability to consider complex ideas and sophisticated art forms.

That said, historians caution that the penchant for short bursts of entertainment pre-dated the Internet. The late oral historian Studs Terkel observed that the practice of channel surfing—rapidly clicking from one television program to another—was a throwback to the age of vaudeville, when one frenetic act after another would enter stage right, perform hurriedly for two or three minutes, and then exit stage left to make room for the next dog-and-pony act or juggler or singer entering stage right.

Obsession With Celebrities

Celebrity journalism has never been more popular, but, as with infotainment, it is not an entirely new development. Marie Antoinette was nothing if not a celebrity in France's era of self-published pamphlets (a precursor to our blog culture). Pamphleteers speculated endlessly about what was or was not going on in the bed of the young queen and King Louis XVI. In the United States, celebrities were among the most popular subjects for the new field of photography in the late nineteenth century; Napoleon Sarony built his career photographing leading actors of the day. As attention turned from stage actors to film stars, the celebrity business kept pace, building cult followings for figures like Rudolph Valentino in the early 1920s.

That trend grew with new media products, from the oversized photo magazines like *Life* and *Look* in the late 1930s through the phenomenally successful launch of *People* magazine in 1974 and into the spawning of a seemingly infinite number of websites devoted to film stars, hip hop phenoms, and figures such as Paris Hilton who seem to be famous simply for being famous.

Painter Andy Warhol observed that everyone would be famous for 15 minutes. The Internet seemed to provide the tool for such fame, with sites like Facebook and YouTube allowing anyone with a personal computer to upload photos and videos of themselves, their neighbors, and their pets—a more democratic but less organized version of the television show *America's Funniest Home Videos*.

Amateur Hour

Just as the line was blurring between professional and amateur entertainment journalists, increasing opportunities developed for amateur performers to make a splash, and sometimes a killing. A century after vaudeville had discovered up-and-coming talent during regularly schedule amateur nights, television turned to its audience to cast performers as either legitimate talents or laughably inept wannabes. *American Idol* was a phenomenally successful "reality" television program, based on a British precursor, which in turn appeared to have its roots in an earlier American free-for-all called *The Gong Show,* in which performers kept going until a gong let them know they had worn out their welcome. The *Idol* shows invited audience members to text message their votes to help determine whether a given performer should continue on to the next round of competition. *Dancing with the Stars* followed a similar format, but

paired stars not known for their dancing ability with hitherto unknown professional dancers in ballroom competition. The third component of both these shows was a panel of judges, each of whom would give critical comments and cast votes themselves. The winners and even the runners-up in *American Idol* sometimes received lucrative recording contracts.

These programs raise difficult questions for entertainment journalism. Were these celebrity judges—noted more for their personalities than for their learned comment—functioning as legitimate critics? Had art been reduced to a commercial contest? Yet the weekly results of each of these network programs were widely reported as news in the media.

Serious Criticism in Decline

In such an environment, one might expect professional entertainment critics to be growing superfluous and perhaps disappearing entirely. Indeed, serious arts criticism, which never had commanded much airtime, appeared to be in further decline on television in the early twenty-first century. Newspapers, city and national magazines, and a few public radio stations continued to offer news and reviews of the fine and popular arts, as did a number of websites. Several awards promoted recognition of the best critics and criticism each year: the George Jean Nathan award recognized excellence in dramatic criticism. The Pulitzers, the National Magazine Awards, and the City and Regional Magazine Association's annual awards each included categories for arts criticism. They had no lack of worthy nominees. The most severe long-term threat to the careers of critics, however, was the aging of audiences for fine art forms like dance and opera. Dwindling coverage led to dwindling support, in a vicious cycle.

The more serious arts each had respected publications with smaller circulations, whose topic was easily identifiable by the magazine's title: *Dance, American Theatre, Art in America,* and *Opera News,* to name a few. Just as serious book publishing houses were in disarray amidst multiple mergers, the few newspapers that provided them were cutting back on their book review supplements. Graphically, the few surviving Sunday book sections made up the one area of American newspapers that had changed the least since the Civil War, back when America was a nation of book readers. Although the number and size of these sections had dwindled, their content was remarkably similar. They mixed reviews of new books with excerpts and profiles of authors. The questionable practice continued of having reviews of new books often written by authors of similar books. The balance shifted over a century and a half from dominance by fiction to nonfiction. And a number of magazines maintained book review sections. The talk-show host Oprah Winfrey encouraged reading by recommending books on her television show and in her magazine.

Beyond the more serious magazines stood a number of middle-brow national magazines devoted to popular arts. *Entertainment Weekly* was one of very few that covered the variety of popular entertainment in America. Most limited themselves by art form. The largest number focused on music, which was in turn subdivided by musical genre: *Rolling Stone* and *Spin* covered rock music fairly broadly, while other magazines carved up other formats, including country, hip hop, heavy metal, and so forth. A growing trend by 2008 was magazines that combined a musical genre with a complementary lifestyle. At the same time, movie fan magazines, once dominant in entertainment journalism, were in decline.

The Business Press on Show Business

The most thorough reporting on show business appeared in the relevant trade press. Magazines like *Variety, Billboard, Publisher's Weekly* and *The Hollywood Reporter* followed both the big picture of company mergers and acquisitions as well as the endless statistics of box office receipts and record sales. Perhaps the best gauge over time of the many changes in the entertainment industry could be found in *Variety*. When it began publication in New York in 1905, it was but one of dozens of magazines covering variety entertainment (which included vaudeville, burlesque and circuses) in the United States and England (where variety was called "music hall"). All of the English magazines lived and died with the art form. *Variety* survived, largely because it followed its professional readers into new worlds of musical recording, motion pictures, radio, television, and, eventually, video games and the Internet. The DNA of changing

American popular culture can be read in the small print of *Variety*'s back pages.

Similarly, there was a business-to-business magazine for virtually every type of entertainment worker. For example, the creators of postproduction special effects in movies could read the trade secrets of the latest outer space war epic in their own magazine called *millimeter*.

Opportunity for Abuse, Reason for Hope

Just as entertainment found new forms in the early twenty-first century, so too was entertainment journalism in flux. The prospects for serious critics and reporters seemed hazy at best while the opportunity for abuse was great. In the mid-nineteenth century, when the average working critic was not given a byline, there is evidence that many were open to bribes of money and food. Some theatrical producers went so far as to send in positive reviews they had written on their own presentations—and some newspapers, desperate for copy, ran them as is. A similar crisis of trust faced the public 150 years later as bloggers stepped out from under the umbrella of publications with established reputations to preserve and began to self-publish. A Google search for reviews of a DVD or live performance might turn up an undifferentiated mass of writing by unknown authors of unknown affiliations. Optimists saw the democratizing of a once elitist field. Others feared that the average reader could not tell when he or she was being sold a bill of goods—and in an era of diminished critical thinking, might not even care. There certainly was a lot of entertainment journalism out there. But how much of it was any good, and how much could be trusted?

Environmental Journalism

The creation and rise of the environmental beat in journalism since 1960 has coincided with the increased public and government interest in the environment. Beginning in the 1960s, society determined that it could no longer accept the environmental harm that in the past had been an accepted cost with an industrialized world. Journalists responded with such stories as how automobile exhaust was choking the air of cities and describing water pollution so foul that a river could catch fire. As the beat matured, so did the reporting, and journalists needed to delve into increasingly complicated issues such as whether chemicals were threatening human health and whether the world's temperature was rising. While the number of reporters grew over the years it has fluctuated with the public's varying degree of interest in environmental news. By the end of the first decade of the twenty-first century, rising fuel prices and interest in global warming were peaking interest in the environment and producing more environmental news.

Origins

Among the first true writers about the environment were the geographers or explorers who at the completion of their journeys described what they had

seen. But as journalism developed in the nineteenth century it was slow to embrace environmental coverage. An exception was William Cullen Bryant, editor of the *New York Evening Post,* who led a movement to establish a public park and is credited with writing editorials in 1844 that led to the creation of New York's Central Park. Beginning in 1876, George Bird Grinnell championed the establishment of both the national park system and the national forests in *Field and Stream.* Nature writer John Muir and Robert Underwood Johnson, editor of *The Century Magazine,* led campaigns to preserve such national treasures as the Yosemite Valley in California. The muckrakers of the early twentieth century at times touched on environmental issues. Lincoln Steffens, writing for *McClure's* and *American Magazine,* exposed timber frauds in the Pacific Northwest forests. Ida Tarbell uncovered the ruthless practices of the Standard Oil Company and John D. Rockefeller. Still, the first major journalism award for an environmental story did not occur until 1941 when the *St. Louis Post-Dispatch* led an editorial campaign against industrial soot and smoke that was so thick that it could turn day into night. The newspaper won a Pulitzer Prize, and the air grew cleaner.

Rachel Carson's *Silent Spring,* published in 1962, helped change society's thinking about the environment. A biologist, Carson criticized the widespread use of DDT, an insecticide that had wiped out malaria in the developed world and drastically reduced it globally. DDT was so popular that in the 1950s American communities were using it to spray entire neighbourhoods to kill unwanted pests. The problem was that it also killed wildlife, including birds ranging from robins to eagles. Carson called the use of such chemicals a sinister force that could not only wipe out many species but also threaten humans. The chemical industry responded with a major marketing campaign questioning the book's premise. Yet *Silent Spring* became a best-seller and prompted the U.S. government to review and eventually ban the use of DDT. Carson set the stage for a new era by encouraging readers to question, rather than to accept, what industry was doing to the environment and to human health.

The Beat Develops

By April 1970 when the first Earth Day was held, it drew millions of participants who did not want to live in a world wasted by pollution. The federal government responded by enacting a series of far-reaching environmental laws, including creating the Environmental Protection Agency. News organizations added to their focus, devoting new resources to the environment. The weeklies *Time* and *Saturday Review* started regular sections on the environment, *Life* increased its coverage, and *Look* and the monthly *National Geographic* produced special reports. In 1973 *Editor & Publisher* listed 95 newspaper reporters who identified themselves as specialists covering the environment.

One of the biggest stories of the 1970s came out of Niagara Falls, New York, when a local reporter, Michael Brown, wrote about how the Hooker Chemical Company had buried hazardous chemicals beneath a residential neighborhood. Love Canal became the poster child for the hazards of toxic chemicals. It also led to the creation of the federal Super Fund that spent billions of dollars cleaning up the nation's old waste sites. Love Canal catapulted to fame a 27-year-old homemaker named Lois Gibbs whose chief aim initially was to find out why her two children kept getting mysterious ailments. She became a community organizer who helped initiate an unprecedented evacuation of the Love Canal neighborhood that cost $17 million. Eventually Gibbs moved to Washington, D.C., and helped organize other local activists. Supporters said her action gave credence to grassroots efforts. Critics argued it was an expression of social selfishness.

Many stories in the 1970s and 1980s were shaped by a simplified white-hat-black-hat environmental view. Reporters too often seemed to rely on interviewing government officials, environmental activists, and business groups while ignoring scientists. Evident in their stories was confusion about when a story was environmentally oriented as opposed to politically driven.

Sometimes big events helped shape what journalists needed to cover. The nuclear power plant accidents in March 1979 at Three Mile Island in Pennsylvania and in April 1986 at Chernobyl in the Soviet Union prompted journalists to spend more time examining the safety of nuclear energy. The 1984 chemical spill in Bhopal, India, that killed hundreds drew renewed interest in the chemical industry. The oil industry also faced greater scrutiny after the 1989 oil spill from the tanker the Exxon *Valdez* off the coast of Alaska.

Complex Issues

By the beginning of the 1990s, environmental coverage had grown significantly not only in print but also in broadcast journalism. CNN was devoting a regular weekly news program to the environment and such programs as *Nova, Nature, National Geographic,* and Mutual of Omaha's *Wild Kingdom* were appearing. Most major daily newspapers and many smaller publications had assigned reporters to the beat and *Time* magazine was calling the endangered Earth the "Planet of the Year." By the end of the first decade of the twenty-first century the Society of Environmental Journalists, itself a creation of the new interest in the beat, reported that 1,400 journalists covered the environment either full-time for a news organization or as a freelancer.

The types of environmental stories being reported were increasingly complex, often rooted in science but having public policy implications. For instance, as the population grew in the country's Sunbelt, the pressures of development clashed with the region's diminishing water resources, creating environmental policy challenges. Efforts to control floods and provide water in places such as Louisiana and Florida were found to be destroying wetlands and making some coastal areas more prone to flooding. Human development was creating a range of biodiversity issues, from vanishing wildlife species to new invasive plants and insects.

Many stories were also taking on global dimensions. Perhaps the biggest story, and one fumbled at times by the press, dealt with whether human activity was causing the world to get hotter. Scientists began warning in the late 1980s that gases, including carbon dioxide from human sources, were building in the upper atmosphere, creating a greenhouse effect that was warming the planet. The Intergovernmental Panel on Climate Change, created by the United Nations and composed of the world's pre-eminent climate scientists, issued reports beginning in 1989 warning that these emissions needed to be sharply reduced in the near future. Otherwise, said the IPCC, sea levels would rise, droughts would increase, there would be more frequent and violent storms, and ecosystems would undergo massive changes. The political response was weak, especially from U.S. government and industry. Journalists have been accused of not understanding the science and of putting too much emphasis on stories about the uncertainties of global warming. News story standards called for fairness, which meant including comments from all sides of an issue. That practice allowed global warming skeptics to get what sometimes amounted to equal play on an issue that most scientists felt was no longer a matter of scientific question.

Finding the Right Sources

As reporters delved into these complex issues, it became apparent that they needed a stronger background in and understanding of science. Unfortunately, the journalism and science communities have a history of distrust, wariness, and sometimes outright hostility. There are several reasons for this. One is that reporters and scientists approach language differently. Scientists need to be specific and precise while journalists need to write broadly and generally to a wide audience. Those differences in language and approach can lead to communication complications. For instance, take the word *theory*. The public associates the word with an opinion or concept. Scientists see it as a set of facts that when accepted make a theory very similar to a law. Another problem is that science often works slowly; journalists seem always on a deadline. The very nature of science has been to take enough time to adequately assess a concept, even if it takes years or even decades.

The issue of balance, as journalists discovered on the climate change story, does not always work when writing about science. Scientists dislike self-promoters who stray from professionally recognized boundaries and show up in the press. Such professional reluctance only has complicated the reporting process for environmental reporters. But of all of the impediments, the possibility of journalists not getting the story right may be the greatest. Too often scientists complain that journalists simply do not get their facts correct. Journalists agree that accuracy is paramount but that some errors are inevitable in their fast-paced culture aiming reports at a general audience.

In recent years, some scientists and environmental reporters have been working to repair their

relationships. Along with seeking to better understand science, some journalists have gone a step further by directing or doing scientific research themselves. They have hired epidemiologists to find cancer clusters, conducted their own air tests for pollution and drawn their own blood to test it for the presence of potentially dangerous chemicals. The results—and their news reports—have sometimes been startling. For instance, a reporter for the *St. Petersburg Times* in 2001 tested the soil in local playgrounds containing lumber that was pressure-treated with arsenic. The tests in five counties found arsenic in the soil at levels up to 13 times higher than the level at which the state would require implementation of a toxic waste cleanup.

Environmental issues begin in science but eventually become public policy. That means that environmental journalists must also understand the roles of government, economics, and business. Authority to regulate environmental issues is spread between a multitude of federal, state, and local agencies as well as some regional and even international organizations. While the Environmental Protection Agency is perhaps the best-known environmental agency in the country, it is often small, local agencies that are the first line of protection in providing clean water, and sewage and waste disposal. Cleaning the environment is costly and a variety of players have developed to help influence government. The National Center for Charitable Statistics reported in 2006 that nearly 15,000 nonprofit environmental groups shared annual gross receipts approaching $7 billion. The range of approaches they employed was vast. One of the largest, the Nature Conservancy, was dedicated to buying and preserving land. Another large, global group, Greenpeace, embraced nonviolent, social protest as a tool for change. Many were small grassroots organizations focused on local issues. Business and industry groups were also active in promoting their approach to the environment. They often retained public relations consultants and spokespeople to get their side of the story out. Public relations consultants call such environmental campaigns "green p.r." while critics use the phrase "greenwashing." Sometimes such efforts have successfully bridged the gap between environmental advocates and business and caused the two sides to work together. Environmental journalists use all of these as sources, seeking to balance spin from reality.

Understanding Advocacy

What is sometimes misunderstood, even by journalists, is whether reporters who write about the environment are (or should be) pro-environment. After all, how can anyone be against a cleaner environment? Some have argued that environmental journalists pick sides and present a biased story in order to advocate for a better environment. Only a small percentage of environmental journalists embrace this concept of advocacy journalism. According to recent surveys, environmental journalists believe that they need to be as fair and objective as other journalists.

Accusations of bias can target stories and reporters who are considered both too favorable to environmental organizations and their aims and others who generally oppose government and regulatory controls of the environment. In 2001, Bill Moyers hosted a two-hour Public Broadcasting System documentary reporting that the chemical industry produced products from the 1950s into the 1970s that it knew could harm human health and the environment. Moyers was accused of producing a pro-environment story, because he did not give industry enough time to respond. Moyers admitted he had trouble tracking down industry sources but he also said that if he made too strong of an effort that the industry's powerful public relations specialist would have distorted the message. During the same period John Stossel of ABC News was repeatedly criticized for producing stories on the other side of the issue from Moyers'. Once a respected consumer and environmental reporter, Stossel said he had an awakening and realized that some of those stories had been overly alarmist. He then began producing stories that he said compensated for his earlier leanings by openly accusing environmental activists as fringe radicals and environmental regulations as needlessly costly to society.

As the environmental beat is complex and involves huge sums of money, reporters must deal with rabid advocates on each side. Most environmental journalists recognize that they must

provide perspective, fairness, and at times interpretation based on scientific facts.

Conclusion

Dramatic stories such as oil spills and nuclear accidents first drew attention to the environmental beat and big disasters such as Hurricane Katrina in 2005 have helped propel it. But most environmental stories lack drama. Rather than striking with a fury, some ooze, seep, or bubble silently and are often unseen. A story, such as the disappearance of another animal or plant species, might change so imperceptibly as to be nearly invisible. The challenge in the future will be to find those stories and then explain them in ways that relate to readers and viewers. Journalists have better tools and understanding of these issues. Acting on them will be critically important for future generations.

Equal Opportunity

See Diversity: Content; Diversity: Employment; Diversity: Policy

Equal Time

Equal time is a widely used shorthand term referring to fairly complex federal requirements concerning American political candidate purchase or other use of radio or television air time. The phrase "equal opportunities" better incorporates the many relevant facets of the requirements. The basic intent of the law and related regulations is to enhance and provide more balanced access to competing candidates for broadcast air time during election campaigns. However, these regulations have not balanced the disparity in funds among candidates, allowing a wealthy or well-supported candidate to purchase more air time more often.

The First Amendment's clear prohibition against federal interference with the press has meant that there has never been a similar political access requirement for print media. Yet because spectrum frequencies are limited and thus stations must be licensed, courts have held that broadcasting is subject to more limited First Amendment rights. Broadcasters have argued for decades that this creates an unfair situation, but except for a brief experiment in 1960, the "equal time" law has remained in force since 1927, though modified in detail through court cases and administrative agency reconsideration.

Origins

U.S. political broadcasting regulation began with the Radio Act of 1927, which required (in Section 18) that

> if any licensee shall permit any person who is a legally qualified candidate for any public office to use a broadcasting station, he shall afford equal opportunities to all other such candidates for that office in the use of such broadcasting station; provided that such licensee shall have no power of

> censorship over the material broadcast under the provisions of this section. No obligation is imposed under this subsection upon any licensee to allow the use of its station by any such candidate. . . .

Further, stations could not censor anything a candidate said on the air. Until a Supreme Court case in 1959, broadcast stations were caught in a legal wringer as they could be, and were, held liable for what a candidate might say, even though the station could not, under the law, censor the candidate's words.

In drafting this provision, members of the House and Senate (by definition, candidates in periodic elections) feared either being denied access to radio at all, or of having their words censored as they tried to reach voters during campaigns. Defining exactly what the law means, however, has occupied countless regulators, attorneys, and judges in the 80 years since as the requirement was carried over verbatim to the Communications Act of 1934 (as section 315). The Federal Communications Commission (FCC) was constantly called upon to define what "equal opportunities" were in specific situations. Generally, the commission held that *any* use of air time by a political candidate was subject to the provisions of law and regulations. Nothing, however, prevented stations from staying away from controversy altogether by refusing to provide time to any candidate. Despite the lost revenue, many stations did just that.

Until 1959, the political broadcasting law remained essentially unchanged. With the impending 1960 election, however, came the first substantial update. What received all the attention that year was Congress's decision to suspend Section 315's equal opportunity requirement just for the 1960 election—as a test to see how broadcasters would act. Results from that campaign suggested little real change on the equal opportunities front, though some third and lesser party candidates complained of being mistreated. Still, Congress never again suspended the law.

Far more important and lasting that year was the congressional decision (after years of lobbying by the broadcast industry) to amend the statute to exempt four types of news programs from candidate requests for "equal time." There had been countless cases of fringe or third party candidates demanding broadcast time after a mayor or congressman against whom they were running was covered in a newscast or interview program. The new exemptions included newscasts, interview programs, news documentaries, and on-the-spot coverage of news events. To qualify for the exemption, however, the FCC determined over the years that such programs, to be bona fide exemptions, must be under the control of a network or station (not a candidate or political party), be regularly scheduled (not just airing during a campaign), and a candidate's appearance was merely incidental to the program. If a station covered the incumbent mayor undertaking some function of his office, for example, that would now be seen as news coverage and thus not a "use" triggering the equal opportunities provision of the law.

In 1971 came a further change. Congress amended section 312 (a) (7) of the Communications Act to read that a station could lose its license to broadcast "for willful or repeated failure to allow reasonable access to or permit purchase of reasonable amounts of time for the use of a broadcasting station by a legally qualified candidate for federal elective office on behalf of his candidacy." In other words, a station could no longer deny a candidate for the House or Senate, presidency, or vice presidency, access for campaigning. Stations could (and still can) reject air time requests by state and local candidates.

One final change came that same year—and this one hit broadcasters in the pocketbook. For years stations had often increased their rates for political candidates, charging whatever the market would bear. Given that candidates sought a lot of air time over a relatively brief period, the "market" was one controlled by broadcasters—and they priced their time accordingly. They argued the income was needed to compensate for extensive record-keeping required by the FCC, as well as various "equal time" legal challenges by candidates and others. In 1971 Congress mandated (in section 315 [b] [1]) that stations could only levy their "lowest unit charge" for political ads sold in the 45 days before a primary election and 60 days before a general election. At other times, stations could only charge "comparable" (rather than higher) rates to those charged to their commercial advertisers. While FCC implementation of this provision became very involved, the gist of the requirement is that political candidates (at all

levels, not just for federal office) are entitled to lower rather than higher charges during campaigns. Given the growing dominance of radio and (especially) television in modern political campaigning, this provision has been vital to candidates, though despite it, the proportion of total campaign expenditure devoted to broadcasting continues to rise each election year.

As cable television developed into an important medium in the early 1980s, the political broadcasting law and regulations were applied to that service as well. Any cable system that provides time to candidates (as they must if candidates for federal office so request) is subject to the same rules that bind radio and television stations. Broadcast satellite services are also subject to these rules.

Shifting Definitions

Every even-numbered (i.e., federal election) year, the FCC is called upon by stations and candidates to render judgment about how the equal opportunities and lowest unit charge provisions of the law apply. This has become almost a game of shifting definitions. The FCC's decisions have to be rendered quickly, while a campaign is still underway, so that any finding of unfairness can be rectified before voters reach the polls. Many more complaints become legal cases, decided long after the voters have had their say.

For example, the definition of a "qualified candidate" would seem fairly straightforward. But in fact, over the years, the FCC has had to determine that this (usually) means a person who has publicly announced an intention to run for a given office and can actually be voted for depending on applicable state or local law. Write-in candidates are generally "legally qualified" if local law allows for write-ins, for example. The commission has held that a presidential candidate fits the "qualified" definition if he or she is qualified by state laws to run in at least 10 states. The burden of proof in determining qualification is always on the candidate requesting air time.

More controversial has been that little word "use." Here the definitions have changed substantially over the years. Generally speaking, the commission long held that *any* appearance (other than the four program exceptions noted earlier) constituted a use and thus triggered the provisions of the law for competing candidates. But this has been modified in the more recent era of negative ad campaigns to mean any use *authorized by the candidate*. Thus while old Ronald Reagan movies were banned by FCC rules from airing on television while he was a candidate for California governor in the 1960s, such a ban was later found unnecessary since Reagan's appearance as an actor in a movie was clearly not an "authorized" use by Reagan as a political candidate. The Federal Election Commission took this one step further by the 2004 election, requiring candidates to appear at the end of their ads and saying that they had authorized what was said or shown.

A good example of shifting definitions is the broadcast political debate. With the so-called Great Debates between John Kennedy and Richard Nixon during the 1960 campaign, the larger controversy over televised debates began. The 1960 face-off of four "debates" was not a debate in the generally recognized manner of two opponents directly addressing each other. Rather, each candidate answered reporter questions and could then comment upon the other's answer, without, as a rule speaking directly to each other. For the next several presidential races, similar "interview-debates" were allowed by the FCC only if sponsored by something other than candidates *or* broadcasters. This was important because otherwise dozens of minority candidates could seek time equal to that granted the major party candidates. For several presidential face-offs, the League of Women Voters became the sponsoring group. In the early 1990s, however, the FCC changed its policy, allowing networks and stations to directly sponsor candidate debates.

The phrase "equal opportunities" means more than just the amount of time provided. The "quality" of that time needs to be comparable as well (e.g., prime time or drive time as opposed to the middle of the night or crack of dawn). Candidates may request (but not demand) exactly the same time slot as their opponents. Stations have a fair bit of flexibility in how they meet such requests, though they are more restricted in dealing with candidates for federal office. Stations cannot, for example, insist on live-only use of air time. Candidates must be charged equally for the same quality of time (such as prime time on television, or drive time on radio), have equal use of station

facilities (such as for making spot ads), and the many other things that can reflect on campaigns. If a station requires an advance copy of a political ad's script from one candidate, it must treat others the same way. Finally, stations must keep quite detailed records of all requests for time (and how they were acted upon) for a period of two years after any election. As a result of these various provisions, stations rarely give time to any candidate: if they did so, opposing candidates could demand free time as well.

And What Is *Not* Equal

Candidates are often surprised at what the so-called equal opportunities law does *not* provide for. If candidate A has lots of money and purchases considerable time, candidate B can request "equal" time—but will only receive it if she or he can also pay for it. Thus a rich candidate can purchase many appearance times knowing that a poorer candidate cannot match his access. In effect, the law is financially blind and presumes all competing candidates have access to equal cash—which is rarely the case.

Candidates in states bordering Mexico or Canada face another issue—the FCC has no control over political time sold by stations in those nations, even though such border stations may well beam programs to listeners in the United States. Indeed, purchases of political time on foreign stations has proven important in a number of races in the Southwest.

More central to fairness and equity are some recent developments. Many political groups regularly purchase time on the air to debate issues rather than candidates. Such issue advertising is not subject to any equal opportunities requirement, since the "equal time" requirements apply only to candidates. Similarly, air time purchased by so-called 527 groups (named after a provision of the U.S. tax code) falls outside the requirements since these purchasers are tax-exempt entities formed to work in favor of or against issues—and only indirectly for individual candidates. As these groups are not under the control of a candidate (or are at least presumed not to be: 527 groups are not supposed to "coordinate" their efforts with a candidate's campaign), Section 315 equal opportunity requirements do not apply to them. Such groups played a substantial part in the 2004 presidential election and appear to be growing in election importance.

While commercial stations may editorialize in favor of or against political candidates (though in practice, few do for fear of offending advertisers or their audiences), noncommercial educational stations are not allowed to support or oppose any candidate for public office. The reasoning behind the ban is that noncommercial stations usually receive some public funding. A candidate may purchase time on a noncommercial station, though payment must only cover actual station costs.

Conclusion

The substance of American political broadcasting regulations dates back eight decades. While often amended, the basic requirements have long required equal treatment of opposing candidates with the important exception of how well those candidates may be financed. The many provisions do little for a candidate with insufficient funds to purchase broadcast time, equal or otherwise. In a sense, the law and regulations presume candidates are equally funded, which is rarely the case. Thus the "equal time" laws do little to regulate broadcast campaigning, other than to avoid the most blatant bias on the part of broadcasters. And perhaps that is exactly what the congressional authors of the law back in 1927 had in mind.

Ethics

Journalism ethics is a branch of professional ethics. Recognizing the power of communication technologies worldwide today, occupations in the media are now included with such professions as medicine, law, business, and engineering under the purview of applied ethics. Although journalists have been roundly criticized for more than a century, the exponential growth in media ethics did not occur until it began rising in parallel during the 1980s with the growth of professional ethics as a whole. The challenge at present is whether journalism ethics can contribute to applied ethics as a field, while making significant progress on its own complicated agenda.

History

Concerns over the press' weaknesses are at least as old as the country. Abuses of the press were first explicitly linked to ethical principles at the end of the nineteenth century. During the 1890s a transition occurred from everyday commentary to a more reflective period, with criticism of various kinds growing into a systematic collection of ethical precepts and several examples from this decade can be listed. Sensationalism had always been criticized through the century, but it took serious institutional form in the late 1890s during the circulation battles between *New York Journal*'s William Randolph Hearst and the New York *World*'s Joseph Pulitzer before and during the Spanish-American War. As telegraph and then telephone services were established, privacy became an urgent issue as sensitive diplomatic, military, and business information crossed multiple borders, especially in Europe. Gifts to journalists and free travel to sports events and meetings (freebies and junkets, as they were called) scourged by media critics since 1870, were now treated more systematically in the context of individual accountability. The groundwork was laid for the free press/fair trial debate.

The elementary work of the 1890s evolved into a more comprehensive effort during the 1920s as journalism education was established within university liberal arts programs. Four important textbooks in journalism ethics appeared in this period: Nelson Crawford's *Ethics of Journalism* (1924), Leon Flint's *The Conscience of the Newspaper* (1925), William Gibbons' *Newspaper Ethics* (1926), and Albert Henning's *Ethics and Practices of Journalism* (1932). They were similar in the topics they considered central: reporters and sources, economic temptations and conflicts of interest, national security, free press/fair trial, deception, fairness, accuracy, sensationalism, and protection of privacy.

However, the flurry of journalism scholarship in the 1920s, the growth of professional societies with codes of ethics, and individual journalists who made ethics a priority—even together these trends could not prevent the demise of ethics in the face of an antithetical worldview called scientific naturalism. After Crawford's 1932 book, the term "ethics" and its cognates disappeared from mass communications book titles for forty years in North America. Instead of ethics, advances in the physical sciences became the ideal as academics—including those in communications—promoted its methods and principles. Lawrence Murphy in 1924, for example, saw the scientific approach to news as the only safeguard against bias and amateurishness. Centered on human rationality and armed with the scientific method, the facts in news were said to mirror reality. The period from the 1930s is typically described as the social scientific phase of communications study, and objectivity was a quasi-scientific method appropriate to it. Objectivity in journalism helped give the press legitimate status alongside the older and more prestigious professions of medicine and law.

Under the umbrella of scientific naturalism, journalistic morality became equivalent to unbiased reporting of neutral information. Presenting unvarnished facts was heralded as the standard of good performance, with readers and viewers presumably deciding for themselves what the facts meant. As given definitive book-length treatment by Stephen Ward (2004), objective reporting, in its history and practice, was both a methodology and a moral standard.

Concern for ethics during the 1930s through the 1960s arose only on isolated occasions. The *Report of the Commission on Freedom of the Press* in 1947 advancing social responsibility was the most famous counterstatement of this period. Occasionally there were pockets of resistance in

journalism's intellectual and vocational life, but the neutrality model dominated nonetheless. A preoccupation with that value-centered enterprise called ethics seemed out of place in an academic and professional environment committed to the scientific worldview.

Two events in 1980 stimulated a renewal of journalism ethics, the "MacBride Report" issued by the United Nations Educational, Scientific and Cultural Organization (UNESCO) and *The Teaching of Ethics in Higher Education,* both published after struggles with ethical issues in North American and international news media since the mid-1970s.

Sean MacBride, Ireland's ambassador to the United Nations, chaired an International Commission for UNESCO on communication and human rights, and the state of professional journalism around the world. The Commission's report, *Many Voices, One World: Towards a New More Just and More Efficient World Information and Communication Order* (1980), helped define debates over the economic concentration of communication industries, the possibilities for democratic politics through the news media, and the free trade of communications products and services. *Many Voices, One World* recommended establishing quality journalism education in every country of the developing world.

A decisive American media ethics event revolved around the Hastings Center of New York. From 1978 to 1980, it carried out the most extensive study ever done of professional ethics in American higher education. Funded by the Carnegie Foundation, the results were published in 1980 in a series of volumes and monographs that established the field of applied and professional ethics (for the volume on journalism ethics, see Christians and Covert 1980). Occupations in the media were included along with such professions as medicine, law, business, and engineering under the purview of applied ethics. The Hastings project made recommendations about course goals, evaluation, indoctrination, and teacher preparation. It established the baseline statistical measures that are used today to teach journalism ethics.

In line with other professional fields, more monographs on media ethics were published during the 1980s than had appeared since the beginning of the twentieth century. In a critical period, between 1983 and 1993, the number of freestanding media ethics courses in American higher education increased by nearly 100 percent. The most influential contribution to media ethics education—the Gannett-sponsored National Workshop on the Teaching of Ethics in Journalism and Mass Communications directed by Edmund Lambeth—began its 20-year career in 1984.

Scholarly study of media ethics has established itself over the last three decades as a subset of professional ethics with its own subject matter. The bellwether of the field's development, the *Journal of Mass Media Ethics,* began publication in 1985. An "ethics summit" on the state of media ethics was convened in Boston in 1987, with Emerson College as a result originating in 1990 the biannual *Media Ethics Magazine,* which anchors a worldwide network of proceedings, teaching, and scholarship in ethics. Demonstrating the growth of the field, a second journal was initiated in England in 2004, *Ethical Space: The International Journal of Communication Ethics.*

Applied and practical ethics dominate academe. And the trappings of this new field are everywhere outside the classroom too. The Association for Practical and Professional Ethics began in 1991. Journals such as *The International Journal of Applied Philosophy, Ethical Perspectives* (from the European Ethical Network), and *Professional Ethics* deal with generic issues, while virtually all the professions now have their own journals, books, and courses on ethics as well. The reissuing a century after its original publication of Henry Sidgwick's *Practical Ethics* (1898/1998) signals this trend toward professional ethics as a field of philosophy with its own identity.

For journalism ethics, there have been some important intellectual gains. We understand more sharply promise keeping and contractual obligation, paternalism and client autonomy, indoctrination, reform of institutional structures, and the difference between a journalist's behavior and the need for institutional reform. Important advances have been made on the ethics of privacy, confidentiality, and deception. But many of the crucial issues (justice), diversity in popular culture, digital manipulation, and conflict of interest) are still underdeveloped. Even the ethics of truth-telling—central to news as its basic norm—has been neglected.

Issues

Media Technology

Over the history of journalism ethics, a decisive change has occurred in media technology and another shift is underway. When modern journalism ethics study began in 1980, broadcast technology dominated our media systems; while today the important ethical concerns focus on digital manipulation. The study and understanding of journalism ethics, as it took hold with MacBride and the Hastings-Carnegie studies, was rooted in print technology. Most of the heavyweights in media ethics were preoccupied with news in its literary rather than broadcast form. Nearly all the dominant issues received their sharpest focus in a print context—invasion of privacy, sensationalism, confidentiality of sources, and stereotyping. As television became the primary arbiter of news by the early 1990s (if not before), principles of truthfulness from print set its standard.

In the ongoing digital era, the challenge for ethics is to establish an agenda in terms of the distinctive properties of this new technological system. An early version of this task was a special issue of the *Journal of Mass Media Ethics* (1998) devoted to new media technologies. A double issue of the same journal five years later, focused on "Virtual Reality and Communication Ethics," developed the idea that the virtual world as the innovative edge of online technologies is the most advanced context for coming to grips with ethics. Communications researcher David Gunkel's *Thinking Otherwise: Philosophy, Communication, Technology* (2007) centers on ethics throughout, philosophical ethics and media ethics both. He develops a model of moral responsibility within the context of the newest innovations in information technology. Journalist and educator Michael Bugeja's *Living Ethics Across Media Platforms* (2008) identifies moral issues that converge across media technologies.

Based on this scholarship to date, the ethics agenda needs to be more fully developed for the digital world of search engines, online networking, and computer databases. Some issues are new, some amplify or transform ethic concerns of the past, and others create new levels of complexity heretofore unknown. Of the latter, cyberwarfare and cyberterrorism have been given special urgency since September 11, 2001. Long-standing issues have taken on a new complexity or orientation, such as web-based hate speech with violence, surveillance, and deception. The ethics of representation now has a different orientation, identifying how gender, race, and religion are represented in anonymous cyberspace. Equitable allocation of information technologies is another moral problem of justice, confronting as it does the injustice of the digital divide between the information rich and poor.

Other problems are rooted in computer technology itself, such as the ethics of blogging and online journalism. Blogging is only possible in an age of sophisticated technology. As a digital revolution at home and at work, it requires special emphasis in developing ethical principles that are appropriate. A code of blogging ethics developed by media law researcher Martin Kuhn and the Association for Education in Journalism and Mass Communication, considers the character of blogging interaction and the struggle to build human relationships and communities in cyberspace to be the core duties that the code of ethics must address. Together these dramatic technological applications offer an obvious challenge for developing appropriate ethical principles.

Truth

The press' obligation to truth is standard in journalism ethics. Truth telling is the generally accepted norm of the media professions, and credible language is pivotal to journalism's very existence. But living up to this ideal has proved nearly impossible. Budget constraints, deadlines, competitive pressures, and self-serving sources complicate the production of truth in news writing. Sophisticated technology accommodates almost unlimited news copy but still requires that difficult choices be made without the opportunity to sift through the intricacies of telling the truth.

The prevailing view of truth as accurate information is too simplistic for today's social and political complexities, though objectivity remains entrenched in daily practices of news production and dissemination. The dominant scheme committed to facts is under duress and philosophical work is critical for transforming the concept of truth

intellectually. A more sophisticated concept of truth is disclosure, getting to the heart of the matter. Even 60 years ago, the famous Hutchins Commission Report on *A Free and Responsible Press* called for this alternative. It advocated a deeper definition of the press' mission as "a truthful, comprehensive and intelligent account of the day's events in a context which gives them meaning." Dietrich Bonhoeffer contends correctly in his *Ethics* (1995) that a truthful account includes the context, motives and presuppositions involved. Truth means, as former UPI reporter and journalism researcher Wesley Pippert wrote in 1989, to strike gold, to get at "the core, the essence, the nub, the heart of the matter."

Forsaking the quest for precision journalism does not mean imprecision but more precision in disclosure and authenticity. The best journalists understand from the inside the attitudes, culture, and language of the persons and events that enter news reporting. In the process of weaving a tapestry of truth, reporters' disclosures will be true on two levels: they will be theoretically credible and they will be realistic to those being covered. Rather than reducing social issues to the financial and administrative problems that politicians define, the truth principle requires that the news media disclose the depth and nuance that enable readers and viewers to identify the fundamental issues themselves.

Diversity

Another urgent issue for present-day journalism ethics is not merely the obligation to treat ethnic differences fairly, but how to recognize the identity of various cultural groups that together make up a society. Native languages and ethnicity have come into their own. Sects and religious fundamentalists insist on recognition. Culture is more salient for many than their country. In the United States, for instance, rather than the "melting pot" Americanization of the past century, immigrants now insist on maintaining their cultures, religions, and languages. In fact, since the cold war, identity politics has become dominant in world affairs. As a result, news media are challenged to help develop a healthy ethnic self-consciousness rather than reinforce a strident tribalism.

Obviously news cannot be ethical unless the challenge of cultural diversity is met, and this requires a fundamental shift from pushing homogeneity to recognition of differences. The basic issue is whether democratic societies are discriminating against their citizens in an unethical manner when institutions fail to account for the identity of their members. In what sense should the specific cultural and social features of Puerto Ricans, Native Americans, Buddhists, Jews, the physically disabled or children publicly matter? Should not government institutions insure only that citizens share an equal right to political liberties and due process without regard to race, gender, or religion? Beneath the rhetoric is a fundamental dispute that Charles Taylor calls the "politics of recognition." This foundational issue regarding the character of ethnic identity must be resolved for diversity to come into its own.

The flourishing of particular cultures, religions, and ethnic groups is the substantive goal to which news professionals are generally committed, but it needs deeper application. Paul Lester's *Images That Injure* has become a staple of instruction toward that goal. Media researchers John Downing and Charles Husband help fulfill this agenda as well with their literature review of three decades of racial stereotyping as background for proposing a new "multi-ethnic public sphere" model for representing race. And communication researchers Robert Entman and Andrew Rojecki illustrate a deep application to race in the twenty-first century United States. Their research indicates a broad array of white racial sentiments toward African Americans as a group. They emphasize not the minority of outright racists but the perplexed majority. On a continuum from comity (acceptance) to ambivalence to animosity and then racism, a complex ambivalence most frequently characterizes the majority. Ambivalence means that the majority of whites do not necessarily harbor deep-seated fears or resentment, but become conflicted about the best strategies and sometimes lose their patience with the slow progress.

Correcting white ignorance and dealing with ambiguities hold the most promise for the news media. The reality is, however, that the media serve as resources for pushing ambivalence into animosity. There is little evidence that television or other popular media pull their viewers toward comity. The media are not enhancing racial understanding among the ambivalent majority most open to it.

Unfortunately, the news media do not serve this important swing group for moving forward and changing policy and institutions toward cultural pluralism. For journalism ethics, ethnic identity is not trivial. The media as public communicators are a crucial arena through which ethnic identity is shaped.

Privacy

Public opinion polls indicate that invasion of privacy is a premier issue in media ethics, at least in western cultures. Intruding on privacy creates resentment and damages the news media's credibility. But for all the technical gains in privacy case law and tort law, ethicists consider legal definitions an inadequate foundation. How can the legally crucial difference between newsworthy material and gossip or voyeurism be reasonably determined?

Therefore, while acknowledging legal distinctions and boundaries, the ethics of privacy is constructed from such moral principles as the dignity of persons and the redeeming social value of the information disclosed. Journalism ethics researcher Louis Hodges establishes the issues for the print and broadcast eras, and communications researcher Thomas Cooper (1998) adds the new challenges to privacy with computer-based technologies. Privacy is a moral good since it is a condition for developing a healthy sense of personal identity. Violating it, therefore, harms human dignity. But privacy cannot be made absolute because we are cultural beings with responsibility in the public arena. We are individual beings, therefore we need privacy; yet because we are also social beings, we need public information about one another. These conflicts lead to the formal criterion that the intimate life space of individuals cannot be invaded without permission unless the revelation averts a public crisis or is of overriding public significance and all other means have been exhausted.

From an ethical perspective, a fundamental media issue is the relationship between self and society. A legal right to privacy presumes a sharp line dividing an individual's zone from the collective. An ethics of privacy prefers the richer connections between public and private advocated by social theorists since Alexis de Tocqueville who have centered their analysis on a viable public life. While participating in this important debate about the social order, media ethics has been applying moral principles to three specific areas: (1) the reporting of personal data on various social groups from innocent victims of tragedy to public officials to criminals; (2) protecting confidential information stored in computer data banks—medical, financial, library, educational, and personal records; and (3) ubiquitous advertising that intrudes on our everyday activities.

Democracies insist on individual privacy as a boundary against intrusion by the state. In this sense, the USA PATRIOT (Uniting and Strengthening America by Providing Tools Required to Intercept and Obstruct Terrorism) Act has special significance. This legislation, first signed into law six weeks after September 11, 2001, shifts the Department of Justice from prosecuting terrorists to preventing terrorism. Among its controversial provisions dealing with privacy, it grants to the FBI what its critics call overbroad access to the confidential records of citizens if needed for the clandestine intelligence of suspected terrorism. The news media should be vitally involved in creating awareness of these privacy issues as they intersect with the operation of a democratic state in a complicated world.

Internationalization

Media ethics in the 1990s shifted its emphasis from local and isolated concerns to the international arena. Back in the late 1970s, the world agenda was only occasionally included. Dutch communication researcher Anne van der Meiden of Utrecht published a reader in 1980, and international conferences on media ethics were held that same year in Norway and Germany. The Gregorian University sponsored a series of colloquia in the 1980s with scholars from several continents; one in 1985 focused on ethics and another in 1987 focused on moral development. Media ethics researcher Kaarle Nordenstreng's *The Mass Media Declaration of UNESCO* in 1984 was a pathbreaker in international codes of ethics.

These efforts and others have culminated in a methodical, cross-cultural approach to journalism ethics. The first comprehensive treatment by an

international network of scholars, *Communication Ethics and Global Change,* appeared in 1989 edited by Thomas Cooper. Surveys of media ethics from 13 countries were included and integrative chapters emphasized three major areas of worldwide concern: truth, responsibility, and free expression. Throughout the 1990s, the Professional Education section of the International Association of Media Communication Research has given mass media ethics a strong emphasis. The University of Paris convened a European/North American conference on ethics in 1993, and the University of Tampere also hosted an international conference in 1993. Francis Kasoma edited a volume of ten theoretical and practical essays on *Journalism Ethics in Africa* which appeared in 1994. Pedro G. Gomes grounded his ethical model in social communication and liberation theology. John Hurst and Sally White use local examples and examine Australian attempts to develop principles and monitor policies through press councils and codes of ethics.

These are only illustrative. Already in 1991, a special issue of *Communication Research Trends* had identified academics interested in ethics in 40 countries. The Silha Center bibliography (*Books in Media Ethics*) includes entries from ten countries. Barrie MacDonald and Michel Petheram's *Key Guide to Information Sources in Media Ethics* (1998) is a reference handbook detailing extensive work in media ethics around the world.

Mass communication ethics in terms of issues, participation, and setting has achieved a level of maturity and acceptance in academe, if less so in the media themselves. One major challenge as a result is to replace the Eurocentric axis of communication ethics with a model that is genuinely comparative. The first systematic attempt at developing a comparative model across 13 countries (India, Nigeria, Brazil, Japan, Taiwan, Poland, South Africa, Germany, Venezuela, Colombia, United Arab Emirates, for example) was done by media ethics researchers Clifford Christians and Michael Traber in 1997 and identified the sacredness of life as a universal protonorm which yields three ethical principles across cultures: human dignity, truth-telling, and nonviolence. In the same comparative spirit, communication theorist Fred Casmir has developed a "third-culture model" of communication ethics. Thomas Cooper is seeking principles underlying cultural diversity by studying indigenous groups. And other recent attempts at transnational ethics in various countries have shown the significant potential of this perspective.

Conclusion

Applied ethics is taking on a life of its own. Within philosophical ethics, academics increasingly recognize applied ethics—often labeled professional ethics as well—as a legitimate domain in itself. Traditionally it has been dismissed as busy work; that is, limited to applying ethical principles to particular cases. But applied ethics is now gaining legitimacy as a scholarly enterprise with its own subject matter and logic.

In practical terms, the question is whether journalism ethics will be able to contribute significantly to applied ethics as a whole. Can it be done with such penetration that it simultaneously shapes professional ethics generally? The issues addressed in journalism ethics are often problematic across several professions—employee loyalty, distributive justice, deception, conflict of interest, and digital technology, for instance.

Communication ethics cut loose from the general morality becomes self-serving and racked by a double standard in which the press criticizes others without questioning its own failures. Unless it can be integrated into the large arena of applied ethics, we tend to rationalize our weaknesses too easily. The relentless demands on reporters and media professionals generally is to trick us into excuses or exceptions for ourselves that we would never tolerate in others. In an ironic twist on conventional skepticism, normative claims are not a medieval remnant but the catalyst for innovation.

Ethnicity

See Race and Ethnicity, Coverage of

Ethnic Minority Networks

When radio networks first appeared in the early 1920s, ethnic minorities were invisible elements in majority societies, and in many cases were under pressure to abandon their traditions and conform to mainstream culture. If those minorities spoke "foreign" languages (such as those spoken by indigenous peoples including the Maori in New Zealand), their languages might be expected to die off in due time, and in many cases their usage was actively discouraged by educational and religious institutions. While their speakers might be welcome guests permitted to sing or speak in their own tongues, mainstream media would decide when to issue such invitations.

The modest sizes of many minority populations, coupled with their frequent economic weakness and the long prevalence of mainstream assimilationist policies, have meant that minority-operated electronic media outlets have emerged slowly and tentatively, with minority networks lagging even farther behind. That situation still largely prevails, even as civil rights movements, an opening up of the frequency spectrum for both radio and television, the falling cost of broadcast equipment and a greater acceptance of minority presence in many countries have led to increased minority stations and networks, by and large they continue to lack the resources available to their mainstream counterparts.

Development

By the late 1920s, a few American radio stations were carrying scheduled ethnic minority broadcasts, usually for an hour or less per day. Other countries took similarly cautious approaches. The New Zealand Broadcasting Service first offered continuously scheduled programming in Maori only in 1942: a newscast once a week for five minutes. Norway's NRK began scheduled broadcasts in Sami in 1946. Minority networks did not

emerge until the 1960s, and then only gradually: a few to several hours of programming per day, and often for less than the full week. If the networks were part of a larger national public service broadcaster (PSB)—the BBC's Asian Network, for example—they sometimes lacked such support as proportional budgets, "good" broadcast frequencies and sufficient transmitter power, full access to production facilities, or "status" among their mainstream peers. If the networks were commercial services, as with the U.S. Spanish language television networks *Univision* and *Telemundo,* finances tended to be tight and network-originated programming limited. (Both of those networks still rely predominantly on material produced in Latin America for Latin American audiences.)

Whether commercial or public, ethnic/linguistic networks have suffered from a paucity of local outlets through which to disseminate programs, but also from which to *receive* program material. They have created programming, but have done little to encourage local outlets to produce programs that could be carried by the networks, which has limited the degree to which networks reflect local ethnic communities. A few networks have assisted growth of local stations and carried their programming, as has happened with Inuit radio in Canada starting in 1970 with the foundation of the CBC Northern Service. More often, they were highly centralized, as was the U.S. Black Entertainment Television (BET, founded in 1980) network. BET did little to support the establishment and growth of black-owned and -operated local TV stations, (they numbered 24 in 1991, dropping to 22 by 2006) or to receive material from them.

Since most ethnic minority populations are small and often economically disadvantaged, their networks are not attractive to the financial community as business ventures, and few operate commercially. If those networks are financed through annual audience license fees or government appropriations, the relatively small size of the populations they serve may mean that their fee shares or appropriations are modest. Indeed, governmental appropriations may be cut off altogether, as was Canada's Native Communications Program in 1990.

Despite these obstacles, many ethnic and linguistic minorities now have networks or network-like services. Australia, three Andean countries (Bolivia, Ecuador, and Peru), Canada, three Nordic nations (Finland, Norway, and Sweden), France, New Zealand, and the United States all feature one or more ethnic minority networks. The following selective examples, listed alphabetically, present their origins and the approaches they have taken to serving the informational needs of their audiences.

PSB and State-Supported Ethnic Minority Networks

Australia

Indigenous (Aboriginal) radio services in Australia emerged on a piecemeal basis, often supported by hard-won government funding administered by the Department of Aboriginal Affairs. Community radio obtained legal status in the mid-1970s, and Indigenous groups soon began to participate. The advent in 1978 of the Special Broadcasting Service (SBS), a multilingual radio and television service, soon led to development of an indigenous information program, though not a full-fledged newscast. The creation in 1987 of the Broadcasting for Remote Aboriginal Communities Scheme (BRACS) gradually resulted in the installation across Australia of over a hundred ground stations with modest studios and equipment, as well as satellite uplinks and downlinks.

The BRACS stations helped stimulate development of a national network. The National Indigenous Radio Service (NIRS), founded in 1996, serves as a program exchange and distribution service for the BRACS stations as well as for the many community radio stations carrying indigenous programs. The NIRS also originates several newscasts per day, often featuring items supplied by some of the 130 BRACS operations and 23 indigenous radio stations, as well as stringers, and indigenous media centers. It also provides a daily national indigenous talk show, *Let's Talk,* hosted by Tiga Bayles, one of indigenous radio's best-known figures. NIRS is supported primarily through annual government appropriations. Support levels for the BRACS stations are low to nonexistent, which impedes many from creating programs.

Australia's indigenous television networks began with Imparja in 1996, which started broadcasting from Alice Springs after a group of indigenous individuals competed for and received a commercial

TV narrowcast license valid for satellite broadcasting to eastern and central Australia. Imparja provides a daily 30-minute newscast, which often contains items submitted by the same sources as those featured on NIRS. It also broadcasts occasional documentaries. The weekday children's show *Yamba the Honey Ant* includes informational segments, often in the form of music such as "The Healthy Body Song." Starting in the late 1990s, Imparja also operated Indigenous Community Television, a service featuring videos made by and for Australia's indigenous population. That service was superceded in 2007 by National Indigenous Television (NITV). NITV introduced a five minute national newscast in 2008, and intends to expand it. Both Imparja and NITV are supported through Australian government appropriations as well as payments for carrying government announcements of training programs and other information directed to indigenous audience members. Commercial advertising accounts for only a minor portion of Imparja's annual budget.

Canada

The Canadian Broadcasting Corporation (CBC) Northern Service began in 1958, in part because of pressure from Inuit ("Eskimo") listeners impatient at being ignored. The Northern Service catered to both Inuit and non-Inuit populations of northern Canada through shortwave transmissions in English. It introduced Inuktitut language broadcasts in 1960, produced in Montreal and elsewhere in northern Canada. There were a few local terrestrial radio stations in the region, so the broadcasts did provide a network of sorts, which, in the words of the manager of the CBC service in Iqaluit, Nunavut, "enabled Inuit communities, separated by vast distances, to communicate with one another" (quoted in Molnar and Meadows). Following a lengthy series of campaigns conducted by Inuit, Native Americans, and white supporters, local Native American and Inuit stations began to emerge across Canada in the early 1970s. Many were supported through Native Communications Societies (media centers), and after 1983 through funding from the Canadian Government's Northern Native Broadcast Access Project (NNBAP).

The Inuit Broadcasting Corporation's television service developed from several experimental projects in the 1970s, broadcasting its first regular program in 1982. It was dependent on CBC transmission facilities, which could be used only late at night. After considerable lobbying, the Inuit Broadcasting Corporation received a dedicated satellite transmitter, which enabled an expanded service, Television Northern Canada (TVNC), to come on air in 1992. That service broadened its scope in 1998 by embracing television programming for Native Americans and Inuit throughout Canada in a renamed Aboriginal People's Television Network (APTN).

TVNC and APTN both have drawn heavily upon productions from several native communications societies, which provide opportunities for Native Americans and Inuit to produce material for print and broadcast media. Such productions enable the exchange of information through daily newscasts—APTN began a national newscast in 2000—as well as call-in current affairs shows such as *Contact* and frequent documentaries, in both English and tribal languages. APTN has the additional advantage of having been declared a national service, which ensures its availability through cable TV in Canada, thus making it accessible to most households. This also provides APTN with its major source of income through a share of cable and satellite subscriber fees—roughly C$30 million in 2007.

New Zealand

Maori radio stations in New Zealand (or *Aotearoa*, in Maori) developed first at the local (*iwi,* or tribe) level starting in the late 1980s, following a protracted struggle with the national government over broadcast licensing rights and funding. The stations all produce local news programs, and some create current affairs, discussion and call-in talk programs. Some of the programming is in Maori, some in English. Radio Waatea in Auckland is under contract to produce and relay a national Maori newscast in both Maori and English several times daily to the *iwi* stations. Radio Waatea also produces daily and weekly current affairs programs, including a weekly phone-in talk show. For all of those productions, Radio Waatea works closely with the 21 *iwi* stations, which are themselves interlinked through an online network, and with stringers living in cities and

towns lacking such stations. The stations receive most of their financial support through a government-supported Maori funding agency, *Te Mangai Paho,* with further assistance for specific series and one-time programs through another government agency, NZ on Air.

Maori Television made its debut as a distinct service in the mid-1990s. The existing Public Service Broadcasting (PSB) channels had carried Maori language newscasts and a few discussion and cultural programs starting in the early 1980s). It obtained its own channel in 2004, which broadcasts Maori news twice per day and also offers two weekly current affairs programs and numerous documentaries (the latter often originating from other minority stations around the world), interview-based programs, and discussions. While there are no purely local Maori television stations, Maori Television has numerous stringers as well as a few full-time reporters around the country. It also provides a video booth at its Auckland headquarters, where anyone may enter and make a brief statement about anything whatsoever. Occasionally this material is incorporated with regularly scheduled informational programs. Funding for Maori Television comes largely through *Te Mangai Paho,* with further support through the NZ on Air agency.

The Nordic Nations

Sami radio in the Nordic nations developed in part because the Sami peoples' campaigns for a voice of their own helped to convince top-level administrators of the national public broadcasting services in Norway and Finland in particular (Sweden was less supportive) that their demands were justified: Sami paid annual broadcast license fees just as did the majority population. Sami stations exist in all three countries as part of the national public service broadcaster, for example Norway's NRK-TV. In 1965, the stations began to operate as a transnational network in part because the Sami are spread across northern Finland, Sweden, Norway, and Russia, number less than 50,000, and fear the loss of their language, so the sharing of responsibility for programming made sense. A share of the broadcast license fees provides major support for the three stations.

The joint program schedule (about six hours per weekday, two on weekends with each station also providing programming for its own national population) offers a mix of information and entertainment, with several newscasts per day, various interview and discussion programs, occasional documentaries, and coverage of such events as meetings of the Sami Parliament. There is as yet no Sami television service, but since the early 1990s the radio stations have produced a number of TV documentaries each year, as well as a weekly children's television program, all of which are broadcast through Nordic PSB television services such as NRK-TV.

United Kingdom

As the South Asian and black populations of Britain pressed for greater rights and better working conditions in the 1970s, some of the newly authorized BBC and Independent Broadcasting Authority local radio stations began to offer programs produced by them. A network of sorts was created in 1989 when BBC local radio stations in Leicester and Birmingham, soon joined by BBC CWR (Coventry and Warwickshire), began to share such productions and to use the title "Asian Network." Proposals for a nationwide network led to the expansion of that network in 1996 and its carriage on the Sky satellite (and later on the Virgin and Fairview satellites as well as Digital Audio Broadcast, or DAB). Programming now includes news and public affairs, with a 30 minute weekday newscast and news inserts, and is produced primarily in London, Leicester, and Birmingham. Most of the material is in English, with several hours per day of programs in South Asian languages. The BBC also has an Afro-Caribbean-British 24-hour radio service, 1Xtra, based in Birmingham. It carries brief daily newscasts and a weekday two-hour news block (TXU), with some attention to blacks and their activities in the United Kingdom. It, too, is carried on several satellites as well as DAB.

United States

U.S. Native American radio stations first appeared when KYUK in Barrow, Alaska, made its debut in 1973. There was a considerable growth spurt through the early 1980s, fueled in part by civil rights protests and demands for self-representation

among Native Americans. By 2008 there were 33 Native American and Inuit radio stations, not including commercial or web-based services. English is the usual broadcast language, and only a few of the stations offer news and current affairs programming in the tribal languages. Although there was some exchange of taped material starting in the 1980s, nothing resembling a full-fledged network appeared until 1994, when American Indian Radio on Satellite (AIROS) was created. AIROS plays several important networking roles: as transmitter of several five minute newscasts per day, the one hour Monday through Friday call-in talk show *Native America Calling*, the radio magazine *AlterNative Voices*, and *Voices From the Circle*, a mixed news/music/current affairs/storytelling program. Funding comes primarily through government appropriations, including annual support by the Corporation for Public Broadcasting (CPB).

Native American television lacks a network service, but there are several sources of independent programs, many distributed through the Native American Public Telecommunications (NAPT) VisionMaker Video Service, established in 1997 and aired through public television stations. Most of the videos deal with current issues (for example, child abuse or alcoholism) and cultural life in Native American communities. In addition to CPB and other government funding, NAPT receives support through the Ford Foundation.

Radio Bilingue in Fresno, California, came on air as a community radio service in 1980, but gradually grew to become a six-station network with satellite transmission to several dozen more stations. It broadcasts in Spanish and in a few other Mexican and Central American languages such as Mixtec, as well as offering occasional programming in Hmong and in some South Pacific Islander languages. It provides a national newscast, *Noticiero Latino,* as well as a weekday call-in program, *Linea Abierta,* which covers topics of particular importance to Latinos, such as immigration reform.

Notable Commercial Minority Networks

Commercial ethnic/linguistic minority television networks that carry newscasts are uncommon, and most are in the United States. Where they do exist, substantial increases in the size of the relevant populations and availability of satellites led to the creation of these networks.

France

One of the few minority commercial radio networks outside the United States is Radio Beur, founded in 1990 to serve a largely North African Arab population in Paris which soon established outlets in several other French cities. In addition to providing a daily 30-minute newscast that uses some material from those outlets, the station has a one hour talk show, *Question de Tout,* on Saturdays and Sundays. Many of the topics deal with sensitive issues such as AIDS, the "correct" way to observe the holy month of Ramadan, and anti-Arab prejudice in France. Most broadcasts are in French and Arabic.

United Kingdom

When the BBC's monopoly on radio broadcasting was broken with the initiation of Independent Local Radio (ILR) commercial services in 1973, some of the ILR stations began to offer small segments of airtime to South Asian and Afro-Caribbean-British groups, sometimes on a group's request, sometimes on their own initiative. The BBC local radio stations had not been particularly active in that sphere, which provided the ILR stations with a way to distinguish themselves. However, a nationally distributed commercial Asian radio service did not emerge until 1991, when West London–based Sunrise Radio first aired on the Astra satellite. It offers informational material emphasizing South Asia life within the United Kingdom, and has a four person news staff as well as a number of stringers and other informants around the country, but does not have a regularly scheduled newscast. Instead, brief news inserts are included with some of the entertainment programs, especially the morning talk shows. At least one local station, Sunrise Radio Yorkshire, offers a local newscast.

United States

There are two U.S. black commercial radio networks. Radio One, founded in 1980 and based in Lanham, Maryland, owns 54 stations in 17 cities.

However, it does not provide national newscasts, nor do many of its local stations have newscasts. It provides a separate web service, Black America Web, which offers news and commentary emphasizing subject matter of particular interest to black audiences such as Barack Obama's 2008 presidential campaign. The American Urban Radio Networks (AURN) is a set of four differentiated outlets, and was created from the merger of the Sheridan Broadcasting Network and the Mutual Black Network in December 1991. AURN's Pinnacle and Renaissance Networks originate daily newscasts. Renaissance also offers a daily *White House Report*, a nightly talk show dealing with such issues as prostitution and child abuse, and a daily *Health Watch*. The third network, STRZ Weekend Entertainment, and the fourth network, Sheridan Gospel Network, do not originate news and public affairs programming.

The U.S. Black Entertainment Television network (BET) has been moderately successful financially, albeit primarily as a provider of light entertainment rather than news. From its inception in 1980 BET provided two minute news briefs embedded in the program *Video Soul* but did not initiate weekday newscasts (*Black Nightly News*) until 2001. It dropped these newscasts in 2005 in favor of "news briefs" throughout the day. TVOne, a black-owned cable and satellite network founded in 2004, does not offer newscasts, but does provide three weekly talk shows and brief news analyses. The Black Family Channel (BFC), founded in 1999 as MBC (Major Broadcasting Network), has struggled financially because of a relative lack of success in securing channels on local cable systems, and it dropped cable distribution entirely in mid-2007 in preparation for moving to broadband in 2008. BFC has not offered a newscast, but it has aired several informational programs dealing with health and personal finances, both of which are slated to reappear when BFC moves to broadband. A 24-hour all-news service, The Black Television News Channel, was announced in April 2008 for launch in 2009.

Univision Radio provides daily newscasts and talk shows to a 70 station network of Spanish language radio stations located in most of the major U.S. Latino population centers. The corporation did not offer a radio service until 2003, when it acquired the Hispanic Broadcasting Corporation. It has correspondents in many U.S. cities and in a number of Latin American capitals. Its two major rivals, the Latino Broadcasting Company, founded in 1996, and the Spanish Broadcasting System, founded in 1983, are less active in news and public affairs programs, but SBS began a 60-minute weekly network news program in May 2008.

Two U.S. Hispanic/Latino/Chicano TV networks offer 30-minute Spanish-language newscasts. Univision began as the Spanish International Network in 1962, and its rival Telemundo began network operations in 1987. A portion of each newscast covers events taking place within the United States, some of them involving Hispanic/Latino/Chicano events. Telemundo's commitment to newscasts decreased in 2006, when the network's owner, NBC, dropped local newscasts on six of Telemundo's principal affiliates in Texas, Arizona, and California, and replaced them with a regional newscast. Univision also provides a two-hour morning program along the lines of ABC's *Good Morning America* or NBC's *Today,* with news briefs every half hour, and a daily magazine show (*Primer Impacto*) containing newscasts. Documentaries are rare on both networks.

Programming

It is not always easy to differentiate between informational and entertainment programming where ethnic/linguistic minority networks are concerned. For example, many of these networks produce children's programs that are replete with informational material such as tribal history, vignettes of outstanding minority group members, histories of words and proverbs, and, in a few cases such as Australia's NIRS, brief newscasts produced specifically for young viewers. Where the more or less traditional information formats such as news, live coverage of major events, commentary, documentaries, interview-based shows, and talk shows are concerned, most networks offer examples of each. The manner of presentation of these programs, however, often differs from majority models in their slower pace, more respectful tone, and general absence of confrontational behavior.

Most network-originated newscasts include national and international news, particularly when the items contain material of specific interest to a given minority group, such as a U.S. Supreme

Court decision upholding the basic right of Native American tribes to establish casinos. They also are likely to contain items about local and regional events and activities, which often are reported by local minority stations or by stringers. Reporting about minorities done by minority networks generally tends to accent the positive; when negative items such as minority-committed crime are reported, often there will be material giving some minority context to the story, for example, explaining that a particular crime is also punishable under tribal law and perhaps detailing that punishment.

Interview-based programs also are a common feature of minority networks and often take the form of talk shows, where audience members will be encouraged to join in. As a rule, interviews are conducted in a spirit of respect rather than opposition, and callers are treated collegially rather than adverserially. In many of the indigenous cultures (Sami, Native American, Maori), there will be longer pauses between questions and answers than is usual with most majority services. This protracted silence is a sign of respect. Topics vary widely, but for many minority groups, health care, high incarceration rates, respect for and rights of women, proper child care, and minority political activities appear frequently. AIROS' *Native America Calling* has been particularly successful in generating discussion on such topics as family violence, casino and fishing rights, incarceration, health care, and assisting returning Native American veterans who suffer from posttraumatic stress syndrome.

Program-length discussion shows are relatively rare, but Maori TV's weekly program *Ask Your Auntie*, popular with Maori and *pakeha* ("whites") alike, illustrates the potential utility of such a format. Four Maori women of differing ages and backgrounds respond to viewers' inquiries, ranging from personal matters such as whether to date a pakeha to current issues in society such as how to deal with alcoholism among Maori. While much of what they cover could be regarded as advice, they also provide specific information about issues as well as where to obtain further information. The women move back and forth between speaking in Maori and in English, making the program more widely accessible. Native America Calling provides a daily forum for listener and "expert" discussion of such topics as Christianity's influence on U.S. Indian law and helping returning Native American combat veterans to readjust to civilian life. It regularly invites listeners to submit their own suggestions for topics.

Documentaries are fairly common in many minority TV network program schedules, and a few networks, notably Canada's APTN, carry them often. In APTN's case, many documentaries are produced by the aforementioned Native Communications Societies but also by independent ethnic minority producers in Canada and other countries, especially Australia, New Zealand, and countries in Latin America. Topics include those already listed for discussions, but also feature portrayals of "traditional" cultural activities such as woodworking or dancing and their present-day equivalents such as Maori song contests.

The production of cultural documentaries can be a sensitive matter, due to fear over the loss of local identity. That is a particularly delicate issue for certain forms of knowledge (usually religious or cultural) that may be seen as privileged, so that only certain individuals, families, and community groups (women, for example) are allowed to use and share them, while still retaining ownership. Some documentarians have developed codes of practice emphasizing the importance of sensitivity to such concerns. That includes the need for an interviewee to understand that, because many different kinds of audiences are likely to hear or view the program, and because those audiences may not understand the concept of story ownership, they may feel free to repeat what they hear and see without acknowledging ownership. Hosts of interview-based shows often observe the same caution.

Live coverage of events tends to emphasize minority cultural activities such as athletic, poetry, singing and other contests, but demonstrations, major political gatherings, and commemorations, particularly when they involve minorities, also receive attention. The funeral of the Maori queen late in 2006 drew continuous coverage from both Maori radio and TV, and was considered by Maori broadcasters as a major contribution to increasing a sense of national unity among the Maori tribes. National election campaigning and the tallying of votes also frequently attract minority network coverage, particularly where minorities are running for office.

There are associations for minority journalists in a number of countries, such as those for African

American, Asian American, Native American, and Hispanic/Latino/Chicano journalists in the United States; for Native American and Inuit journalists in Canada; for Maori journalists in New Zealand; and for Australian Indigenous journalists. These associations' annual meetings emphasize employment issues, usually with respect to mainstream broadcasting, but they also include discussion of ways to effectively and respectfully represent the cultural, political, and economic activities of the minorities they serve.

Networks and "Localism"

Ethnic and linguistic minorities appear to regard networks serving their communities as a mixed blessing. Those who feel that there is strength in numbers realize that having their own networks can increase minority and mainstream public awareness of minority grievances, problems, and accomplishments. These networks also make it easier to mobilize minority and majority public opinion around such pressing issues as high minority incarceration rates; chronic health problems; issues of land ownership; cultural, economic and educational achievements; and the importance of one's own language and religious practices.

Others worry about a possible loss of local identity, which in some ethnic and linguistic minority populations is connected with the unique language usage and cultural practices of a particular region. Broadcast networks, they fear, may lack the sensitivity to respond to these localized concerns. The centralized, top-down nature of most networks also may act to diminish the importance of local radio and television where such services exist. Networks' command of greater material resources, moreover, and their tendency to follow professional production practices, may make the local services appear amateurish.

Because some of the networks—Maori TV, Sami, Inuit, and Radio Waatea—broadcast largely or exclusively in an ethnic tongue, the homogenizing effect that such services can have on regional and local accents and word usage is also a matter of concern in terms of maintaining a sense of place and community. Further, a network news service often deals with a range of scientific, political, public health, and other issues, for example, AIDS and counterterrorism, thus requiring terms of reference that do not exist in many of the minority languages. While the users of some languages—Maori is a notable example—have been resourceful in creating linguistically appropriate terms using words from the native lexicon, others have taken the less labor-intensive approach of using the majority term or modifying it with their own language's prefixes and suffixes. This adaptation of the language can lead some to feel that the essence of the minority language is being compromised.

Changing Technology

As minority networks evolve, they become more adept at using new technologies such as the Internet and satellites to expand their reach and enhance their effectiveness. Where journalism is concerned, many minority media operations have yet to employ satellites in ways that will bring the voices and images of local populations into network-produced and -distributed news and public affairs programs. (Popular music is a very different story, and there are many MTV-like services such as Desi TV for South Asian viewers around the world.) However, there are some already-noted examples of such efforts, such as the AIROS satellite service's *Native America Calling,* APTN's *Contact,* Radio Bilingue's *Linea Abierta* and NIRS's *Let's Talk*. Because each of the host nations is vast and features indigenous populations that are widely scattered, the satellite is the only technology that enables real-time participation for a sizable share of the target audience. Satellites have also been crucial to the development of national audiences for the BBC Asian Network, Sunshine Radio, Radio Beur in France, and others. They even have made possible the development of mini-networks for specific groups, such as a three-station "network" (Little Saigon Radio) that offers daily newscasts containing items on Vietnamese American life from each of the stations.

Network websites increasingly feature interactivity. Australia's NIRS, for example, solicits contributions of news items from listeners through the Internet. The Internet and satellites also may hold the key to the creation of a long-awaited international network linking ethnic and linguistic minority broadcast services around the world. Sami Radio in Norway is coordinating the effort to involve as many groups as possible. It remains to

be seen what sorts of services minority networks may make available for users of iPods and similar mobile devices, although several of them, such as NIRS, are already offering podcasts and other downloadable audio and video material.

Notwithstanding the present and potential obstacles minority networks face—budgetary, but also the need to make themselves visible in a rapidly expanding media universe—they appear destined to grow in numbers and in reach thanks to the greater availability and affordability of newer communication technologies, satellites and the Internet in particular. As one example, the Latin American Indigenous Broadcast Network Red Quiechua Satelital uses a combination of e-mail, web radio, and satellite transmission to link 28 Quechua/Quichua language media services, which provide news and radio magazines to some 12 million of their speakers in Ecuador, Bolivia, and Peru. Given the mountainous areas in which that population lives, it would have been impossible to develop a terrestrial network to reach it. Whether the possible loss of local dialects, privileged knowledge, or purity of language is offset by possible gains in the strengthening of the larger community through such networks is a question that can only by answered by those ethnic and linguistic minority communities that are directly affected by such developments.

EuroNews

EuroNews is a multilingual television news channel that strives to cover world events "from a European perspective." Founded on January 1, 1993, the Lyon, France–based EuroNews is broadcast in 121 countries, via terrestrial channels, cable, and digital satellite. It is operated by SOCEMIE, a company whose shareholders are comprised of 21 public service broadcasters from Europe and North Africa, and it receives regular subsidies from various pan-European institutions. EuroNews broadcasts simultaneously in eight languages (Arabic, English, French, German, Italian, Portuguese, Russian, and Spanish) and follows a "rolling news" format, with news headlines broadcast every half an hour. Its professed goal—to present primarily "European news" devoid of any national bias while employing an international staff of journalists who work with footage in large part provided by national broadcasters—has forced EuroNews to develop a different model of television journalism.

History

The idea of creating a genuinely pan-European television channel that would not be identified

with any country in particular but rather with "Europe" itself is considerably older than the EuroNews project. During the early 1980s, the European Community (the precursor to today's European Union) was in the midst of a series of wide-ranging transformations (e.g., addition of new members, elimination of passport controls between some members), and audiovisual policy was perceived as an important vehicle for a durable "European integration."

Against this background, the European Broadcasting Union (EBU, a federation of national public service broadcasters) created in 1982 an experimental closed-circuit television channel called Eurikon, which aired news, documentaries, and some entertainment programs. The experiment did not enjoy much success with audience panels due to its perceived inability to provide programming relevant to local communities while also somehow maintaining its pan-European mission. As a result, Eurikon was soon scrapped. In 1985, Europa TV began operating with the support of five European public service broadcasters. The channel was explicitly set up to reflect and contribute to an (ill-defined) "European culture." Simultaneous translations and subtitles were also provided to the highly heterogeneous European audience. While many of the innovations brought about by Europa TV were sound enough to be used later by EuroNews, this experiment in pan-European TV also soon failed due to policy and financial disagreements among the stakeholders. In 1993 the EBU tried its hand again at establishing a viable transnational, multilingual television channel that could provide "European news."

Ownership

The new channel was not spared the financial and administrative nightmares that then characterized not only Europe's various audiovisual policies but also its wider political and economic integration efforts. The saga of EuroNews' ownership aptly reflects the transformations pan-European institutions have experienced during the past two decades. The initial backers of the EuroNews project were 11 European public service broadcasters (all members of EBU) who pledged to provide some 55 percent of the channel's operating cost. The rest of the money was to be provided by advertisers, various pan-European bodies (such as the European Parliament) and the French city of Lyons, where EuroNews's headquarters were established. The channel was operated by SOCEMIE, a company currently owned by EuroNews's 11 founders, plus 10 other European and North African public broadcasters. (Confusingly enough, the broadcasters actually own SOCEMIE through an intermediary company, whose acronym is SECEMIE). SOCEMIE stands for "Société Opératrice de la Chaîne Européenne Multilingue d'Information EuroNews" ("The Operating Society of the European Multilingual Information Network EuroNews"), while SECEMIE stands for "Société Editrice de la Chaîne Européenne Multilingue d'Information EuroNews" ("The Editing Society of the European Multilingual Information Network EuroNews").

The first two years of EuroNews' operation were extremely difficult, as the channel constantly faced bankruptcy. The contributing national broadcasters were going through financial problems of their own, while some of the funds promised by the European Union and France failed to materialize. Thus, in 1995, the French company Alcatel Alsthom purchased 49 percent of EuroNews. The company guaranteed editorial freedom and attempted to turn the channel's financial situation around. Two years later, however, Alcatel sold its shares to the British news broadcaster ITN, who agreed to provide some of EuroNews's content and took over the company's management. ITN, too, would eventually tire of EuroNews and sell its participation back to SECEMIE. To make matters even more complicated, the ownership arrangements within SECEMIE itself have changed over time as well. Perhaps the most notable such change came in 2004, when Russian broadcaster VGTRK increased its EuroNews shares from less than two percent (acquired in 2001) to 16 percent. The other major shareholders within SECEMIE are public service broadcasters from France, Spain, and Italy. The most notable absentee on the shareholders list is Britain's BBC, which prefers to focus on operating its own 24-hour news channel. Various pan-European institutions continue to provide money to EuroNews, through direct subsidies (the EU contributes 5 million euro annually), and advertising deals.

Audience Reach and Content

According to EuroNews's own data, in 2007 the channel reached nearly 190 million households in 121 countries and its programming is viewed by 8 million people daily. Thirty-three national TV channels also broadcast some EuroNews content. The channel's main competitors are CNN International, BBC World, France 24, and DW-World. EuroNews employs close to 200 journalists representing various European countries and languages. All programming, whether by EuroNews' own staff or contributed by the partner national broadcasters, is translated into the seven languages (with Turkish a potential eighth). Because of this policy of multilingualism, EuroNews does not have screen presenters (since it would be impossible for them to speak in more than one language at a time), and relies on voice-over narration accompanying visual footage. The programming design is minimalist. News headlines appear every 30 minutes. Each current affairs story is 60 to 90 seconds long, and is repeated for several news cycles until it is changed to accommodate new information or is displaced by fresh news items.

Between the half-hour news cycles, EuroNews presents a variety of staple programming (such as *Economia, Europa, Sport, Meteo, Press Review, Markets,* and *Cinema*) and the occasional live broadcast of notable European events. The programming sometimes also includes a "Debates" segment, which features European decision-makers discussing newsworthy issues either with each other (predictably enough, in a debating format) or with members of the European media, civil society, or citizenry. In keeping with its pan-European mandate, EuroNews covers events and issues pertaining to the various European institutions in the "Pass" program. "Europeans" switches the perspective from institutions to "regular" European citizens. Finally, "No Comment" features the day's most striking footage devoid of any voice-over narration. All of these programs are transmitted over multimedia platforms, including asymmetric digital subscriber lines (also known as DSL), the Internet, personal digital assistants, and mobile phones.

Issues

EuroNews came into being as a result of the belief on the part of many decision-makers in various pan-European institutions that television is the most effective means of rallying a heterogeneous group of people (the "Europeans") around a common ("European") cultural identity. By distancing itself from a national point of view, EuroNews journalism was intended to prove that "Europeanness" is a feasible alternative to parochial, often conflict-prone, "national interests." The proven resilience of those "national interests," however, has caused EuroNews to "downgrade" its mission to a more manageable effort to "promote cultural diversity" and inform its audience on pan-European affairs. The channel's supporters have repeatedly pointed out that national broadcasters tend to avoid covering pan-European events (mainly due to the complexity of European law and administration and the lack of dramatic—and, thus, broadcast-worthy—European press conferences and committee meetings), making EuroNews virtually the only media outlet that devotes considerable efforts to understanding and explaining pan-European policies. Some EuroNews backers, notably those in France, often extend EuroNews's mandate to providing a counterbalance to American dominance of world and European news media markets.

EuroNews professes to be independent of pressure emanating from national and EU institutions. Due to its multinational and multilingual nature, it has embraced a policy of strict impartiality in all matters regarding conflicting national interests. In practice, however, absolute neutrality is extremely hard to implement on a daily basis, and EuroNews is walking a tightrope, perpetually fielding allegations of favoritism from one interest group or another. The most common charge leveled at the channel is that of being a "propaganda arm" of either the European Union (perceived by some as a huge politicoeconomic interest group that only caters to a small transnational elite) or of France (which hosts EuroNews and provides it with a significant amount of money and staff). Moreover, perhaps precisely because of its insistence on reporting "European affairs," EuroNews has been accused, since its inception, of producing a journalistic product that is tame, repetitive, and altogether boring.

Conclusion

More than a decade after it first aired, EuroNews remains an experiment in transnational television.

Unlike its main competitors, the pan-European channel maintains a highly diverse staff of journalists, broadcasts in a steadily increasing number of languages, and maintains tight, mutually beneficial connections with national public service and private broadcasters in dozens of countries in Europe and beyond. EuroNews's continued survival is by no means a foregone conclusion, however: in a European media market rapidly drifting toward American-style corporate consolidation, an ownership scheme as complicated—and unstable—as that of EuroNews is seen by many to be a significant liability.

Europe

The European media are a hodgepodge of rapidly transforming institutions, journalistic styles, structures of ownership, and politicoeconomic priorities, born of centuries of conflicting values, traditions, rules, and ambitions. (This entry covers European countries other than France, Germany, Russia, and Scandinavia, which are treated elsewhere in this encyclopedia.) No viable analysis of "European" anything can be undertaken without some degree of generalization and categorization; the most useful theoretical distinction to make is that between "Western" and "Eastern" European societies. While this distinction is not without obvious problems (such as its tendency to operate as a self-fulfilling prophecy), it is relatively easy to justify, given the two regions' differing economic, political, and ideological coordinates for at least the past century.

Due to their prominent position in countries across Europe, national newspapers have always shaped their goals, standards, and practices in close alignment with the host country's politico-economic system. Since Western and Eastern European countries can be said to have run themselves according to different ideologies, their media also presented significant differences. On top of the East-West binary, this entry adds another, historical, duality: the cold war period between the end of World War II and about 1990 versus the more recent era.

Transition From Cold War Media

In the period between World War II and 1990, the two halves of Europe were locked in an ideological conflict, pitting Western Europe's liberal democratic system against Eastern Europe's Communist/popular democratic system. At least theoretically, Western European countries believed in a democratic system based on freedom of speech. Journalists were not only allowed to speak their mind, but were expected to play a societal "watchdog" role, investigating potential wrongdoing by those in power. Economic power (such as ownership of a newspaper) was not supposed to be concentrated in the hands of those who already possessed political power, and the economy was, in large measure, market-based, thus encouraging competition among product/service providers (such as newspaper publishers).

By contrast, Eastern Europe's domination by the Soviet Union led to the complete subordination of the media and other forms of cultural production to the interests of the political elite. The journalists' priority, therefore, was not to be "objective," but rather "educative," meaning they were responsible for communicating to the citizens the decisions reached by the leaders, and for rallying the

populace around various "national objectives" (such as producing more iron in the next five years, or increasing the country's population). Unlike in the West, where the media were mostly privately owned and lived off advertising revenue, in the Communist East all media were owned by the state, which appointed editors and directors, and subsidized newspapers and television stations. During the cold war period, therefore, Eastern and Western European media differed drastically in ownership patterns, perceived societal roles, and day-to-day journalistic practices.

The last months of 1989 saw monumental changes in Eastern Europe, as the Communist regimes toppled one after the other. The breakdown of the political establishment had multiple repercussions: the dictatorial Communist parties gave way to a myriad of parties competing for citizen votes, and state assets such as factories and newspapers were privatized. Communist ideology was officially denounced as both tyrannical and inefficient, and was replaced with a "wild" version of liberalism and capitalism that was also quickly denounced by many in Europe. The predictable vacuum in the political and economic arenas was filled by unsavory characters—in many cases former Communist decision-makers who had "reinvented" themselves into seeming businessmen and patriots. The media industry was not spared from these transformations. A large variety of privately owned newspapers and television stations mushroomed in every Eastern European country, and quickly became a battleground for competing economic, political, and ideological interests. In many cases, entities associated with the reformed Communist Party (now usually called the Social-Democrat or Socialist Party) owned a newspaper that espoused left-wing ideology (such as the Bulgarian *Duma*), while the opposition forces controlled a corresponding publication (in the Bulgarian case, the *Demokracia* newspaper linked to the Union of Democratic Forces). Toward the mid-1990s, large international corporations began investing in Eastern European media, achieving, in many cases, near dominance of the local market while also introducing new journalistic standards. The Eastern European media had traveled a long way to a chaotic yet immensely popular mix of "professionalism" (i.e., striving to abide by the Western media standards of "objectivity" and "freedom of speech") and "hitman journalism" (i.e., selling its influential voice to the highest bidder).

Although they did not experience the powerful earthquakes that shook Eastern Europe's political and economic establishments in the late 1980s, Western European countries did go through and accelerated integration of states into the powerful politicoeconomic European Community (later the European Union). The 1980s saw the addition of three of Western Europe's poorest countries—Greece, Spain, and Portugal—to the nine-strong EC membership. The shift from manufacturing to service economies required the liberalization of national telecommunication systems. The Irish Broadcasting Act of 1988, for example, ended state-owned RTE's legal monopoly over the radio market in that country, and encouraged competition from other broadcasters. In Italy, the newspaper industry flourished due to developments in advertising and marketing, reaching a daily press circulation of 7 million copies in 1989. Deregulation, liberalization, and diversification made up the new economic creed of "neoliberalism" that was sweeping Western Europe into the 1990s.

Ownership

Since the 1990s, Eastern European media have adopted many characteristics of the Western media model, making it possible to speak of a "European" media, with distinctions for individual countries rather than for regional blocs. Both Eastern and Western European media industries, for example, are based on the competitive market model, with various outlets fighting for audience and advertising shares. The European electronic landscape is characterized by a mixture of public service and private broadcasters, albeit with significant country differences. (The Norwegian public service broadcaster NRK, for example, is a major player, while in Greece, the public Hellenic Broadcasting Corporation has been badly affected by private television.) While virtually no European state has been able—or willing—to maintain a media monopoly, private near-monopolies have emerged throughout the continent, as international corporations have purchased popular media outlets, including the newly privatized or newly established Eastern European newspapers and television channels. Perhaps the most famous such media empire

in Europe belongs to Silvio Berlusconi, one of Italy's richest people and two-time Prime Minister, whose television holdings have a conservatively estimated national audience share of 40 percent. (Berlusconi also controls the AC Milan soccer club, dozens of magazines, several national newspapers, a film distribution network, and various publishing and advertising companies, as well as Spain's Telecinco TV station). Other European media empires include Bertelsmann AG, whose subsidiary RTL Group is Europe's largest broadcaster with broadcast channels in ten countries; Rupert Murdoch's News Corporation, which dominates the British television and newspaper market, and is also involved in broadcasting in eight European countries; and the U.S. company Central European Media Enterprises, which has broadcast holdings in six countries. Ownership concentration in the media industry has had many direct and indirect consequences for Europe's economies (where media corporations are major taxpayers and employers), political landscapes (where power and influence are often proportionate to one's ability to get one's message into the media), and ideological battlefields (as television is perceived to be one of the main shapers and carriers of national identity).

Policy

All European states recognize that news media play a special role in a democratic society: while the vast majority of media outlets are commercial and therefore have a legitimate interest in making money, as a whole, the democratic press must provide people with accurate, timely, and relevant information. In order to safeguard this process, each European state has put into place a system of media accountability. Most countries have rules—some more "official" than others—about television portrayals of violence and sex, and all regulate advertising on TV. (Sweden bans all forms of advertising directed at children.) Another area susceptible to controls is ownership, as some European states have passed laws trying to prevent (often unsuccessfully) corporations from establishing monopoly-like dominance of a country's media industry. Everywhere on the continent, however, those who would impose strict controls on the media are battling not only individuals and organizations dedicated to maximizing freedom of speech in their society, but also the profit-seeking media industry, which is often under the protection of powerful political forces.

European mechanisms of media accountability vary from country to country. While virtually all states have some kind of media laws (albeit, in some cases, those laws are minimal or are seldom enforced), some states have set up either government-controlled (Estonia) or autonomous institutions (Denmark) which have media regulation responsibilities. The duties and prerogatives of these institutions range from simply monitoring the national media landscape, to enforcing media laws by issuing warnings to transgressors, instituting fines, and even revoking a private broadcaster's license. Other (mostly nongovernmental) bodies designed to hold the media accountable on behalf of media audiences are review boards (Ireland), ombudsman (Sweden), industry-consumer councils that meet regularly (Denmark), and self-regulatory institutions built by the media industry itself (the Netherlands, Belgium). There is no consensus on which system serves the citizens the best; many media activists simply focus on making sure that whatever media rules do exist in a country are actually observed by everybody involved: government agencies, media companies, consumer and professional organizations, labor unions, and so forth. (Italy and Greece are two notorious examples of theoretically decent accountability systems that are seldom properly enforced.)

Emergence of pan-European institutions has constituted a strong impetus toward the harmonization of national accountability and regulation systems. The 1989 "Television without Frontiers" European directive provides television channels broadcasting on the continent with a general framework of responsibilities. The directive goals are "to ensure the free movement of broadcasting services within the internal [European] market and at the same time to preserve certain public interest objectives, such as cultural diversity, the right of reply, consumer protection and the protection of minors." In the early 2000s, however, the European Union did not have the institutional muscle to enforce these requirements in its member countries. What the EU can provide, however, is various official avenues for petition and redress to all *consumers* who take legal action against a product

or service provider (such as a broadcaster). EU citizens, thus, have the right to petition the European Parliament, to complain officially to the European Commission, and to make claims to the Court of Justice and the Court of Human Rights.

Media Systems Variations

As mentioned, the European media systems vary considerably in terms of their structure, business and editorial models, and relationship with their audiences. Nevertheless, perhaps the most important of pan-European trends is the concentration of media ownership in the hands of fewer and fewer corporations. Within this trend, the most relevant distinction for media analysts concerns the national identity of the owner. In countries such as the Czech Republic and Hungary, most of the media, print and broadcast alike, are owned by foreign companies (Switzerland's *Ringier* and Germany's *Bertelsmann* are major players). On the other side of the spectrum, in countries such as Greece, Ireland, Italy, the Netherlands, Portugal, and Slovenia, media outlets are mostly owned by local companies, with little financial involvement from foreign institutions. There are several countries, however, such as Poland and Spain, whose national media systems sport an eclectic mix of national and foreign media owners.

The picture is considerably more muddled when it comes to the national print media, as virtually every individual newspaper and magazine market features some unique characteristics. Some national markets are dominated by one newspaper, as is the case with Austria, where *Neue Kronen-Zeitung* accounts for 43 percent of all newspaper circulation. Other markets are a genuine battlefield for several daily newspapers (as is the case of Hungary, which has twelve national dailies fighting for a piece of the pie). In Greece and the Czech Republic, the main newspapers are aligned with various political-ideological camps. In the Netherlands, on the other hand, newspapers which maintain a neutral tone of reporting have recently been gaining ground to the detriment of partisan newspapers. Spain possesses a strong regional press, while its neighbor, Portugal, has a weak regional press. Tabloids have considerable audiences in the Czech Republic, but are not widely read in Italy. Due to a peculiar system of taxation, British newspapers are cheaper in Ireland than Irish newspapers and enjoy significant popularity.

Conclusion

In keeping with their different historical traditions, the countries of Europe have significantly different media systems. Some countries have moved to liberalize their national media market, while others have clung until recently to state monopolies, particularly in broadcasting. The degree to which states have regulated their media varies considerably, as do their accountability systems. The drive to harmonize and integrate their systems, however, was picking up at the beginning of the twenty-first century, in large measure due to the centripetal effect of the European Union and other pan-European institutions, and a growing fear of the influence that American culture—carried to Europe by highly popular American broadcasting programming—is thought to have on the social and ideological make-up of the continent. The rapid development of multimedia platforms is also contributing to the integration of various formerly "national" media outlets, which have increasingly found it necessary to establish partnerships with each other. In an age of informational revolution and globalization, the media in the countries of "both Europes" are nowhere close to settling into a pattern, be it economic, institutional, or ideological.

Evening News, Television

World War II was raging when, by some lights, the age of network evening television newscasts haltingly got under way. In April 1944 an NBC series of short war-news programs, already tried out briefly on New York City viewers, shifted to a three-city network (New York City; Schenectady, New York; and Philadelphia) and began providing a quarter-hour of information "regularly" but on a frequently shifting schedule. These reports were mere snippets of news by modern standards but could later be seen as a milestone in broadcast journalism as television began developing into the dominant cultural medium it would become.

Over the next two decades, television news from the "Big Three" networks (ABC, CBS, and NBC) would coalesce into a daily wave of information reports surging across the United States. On couches or at dinner tables, tens of millions of Americans from the late 1950s forward would turn each evening toward their receivers to learn of what had happened to whom and where. Even as television stimulated national discussions of domestic issues raised by comedy shows and dramas, the architects of the networks' evening newscasts would lure viewers to consume common images and narratives of national and world affairs.

Roots

Newscasts are not definitive reports, only rough summaries of daily developments likely to affect or at least interest large numbers of people. CBS anchorman Walter Cronkite and other leading journalists have characterized these programs as providing a "headline service" abstracting world and national developments that viewers can explore more deeply elsewhere, especially in newspapers (and more recently on cable channels and the Internet). The newscasts present news constructed around topics and in styles meant to reflect the problems and interests of "ordinary people." Topics come to the attention of news organizations in public ways—in rallies, releases of surveys, crime waves, and shopping stampedes—or less conspicuously through editors' intuitions and the networks' audience research. However producers defined their raw materials, the American "dinnertime" television programs emerging in the years following World War II came to wield unique power to attract national audiences to news and to help determine the agenda for public consideration of important issues.

The slow birth of network evening newscasts provided few indicators of a future of national influence. By the early 1940s, CBS and NBC were managing to televise special news events to very limited audiences. The pioneering NBC program launched in 1944 and aptly named *The War as It Happens* could be seen (by those few owning receivers) only in New York City and in two other communities electronically linked by NBC: Schenectady, New York, and Philadelphia. This three-city "network" reached only hundreds of television sets. A mass audience for TV news would take years to build, depending on development of hundreds of affiliated stations that could deliver programs around the country.

Radio had helped to demonstrate that a truly national audience for television was a future (if distant) certainty. Even before Japan's December 1941 attack on Pearl Harbor drew the United States into a widened war, the voices of CBS reporter Edward R. Murrow, his corps of "Murrow boys," and other unseen radio journalists brought home to Americans the drama, gravity, and damage of the growing conflict. Film of the great drama also played in newsreels on theater screens across the country, bringing even rural Americans glimpses of international conflict accompanied by ominous narration, dramatic music and aerial views of bombs dropping. Newsreels intensified emotions across the home front as only vivid moving pictures could.

The success of radio and newsreels stimulated network interest in covering news visually on a regular basis. But such development would have to wait because the war diverted industrial resources to the military effort and virtually shut down television's development. No network could yet employ enough trained journalists to cover the world for television, with its tough technical and logistical demands, and, moreover, the audience was not yet large enough to warrant the expense. Nor were the networks always sure of what to do with the few news programs they created. NBC's *The War as It Happens* appeared only once a week, with constantly changing broadcast times and days.

The narrator or announcer of these earliest evening newscasts—the term *anchor* had not yet arrived—had few dramatic images to support his words until newsreel producers and the government began providing film to the program. Even then, based on radio experience, the temptation was to fill the screen with "talking heads," one-time radio newscasters simply reading the news as they might have done for radio. But some of these performers were awkward on camera and less compelling than when merely heard.

Technology also lagged behind journalistic ambitions: Film of important but distant news had to be shipped or carried to New York, so important stories often aired two or three days "late." Newscasts typically were shot live in the studios and included simple graphics and photos placed on easels. Viewers who could afford costly sets did begin to follow news on television, but only a few thousand sets were in use when the war ended in 1945. Besides New York's three TV stations, only six more in Chicago, Los Angeles, and the Northeast were on the air. Sales of television sets were unlikely to skyrocket until more stations—outlets for network as well as local news—sprouted across the land. In the meantime, building on the model radio had created, selling time to advertisers grew as the financial lifeline for all programming, including television newscasts.

Events that drew national attention, such as the funeral of President Franklin D. Roosevelt in April 1945, continued to assemble most people around their radios. Television promised a startlingly different experience, its visuals adding a visceral punch to the sound radio used to project its news stories. Indeed, even before wide-ranging, heavily staffed newscasts could be launched, the new medium was putting newsmakers on the air and pumping their pictures into people's living rooms. The balance of stories was routinely limited by the visuals available, but news deemed important enough made air even if only film of a news conference, a still photograph, or a "talking head" interview was available. During the 1940s, the main attraction to viewers was the novelty of having moving images in the home—if one owned a TV set to receive them.

Postwar prosperity and expansion supported a population explosion, a boom in local-station licensing and, not incidentally, an upsurge in consumption of all goods and services by growing families. NBC continued airing its evening newscasts once or twice a week, and CBS, ABC, and even the short-lived DuMont network (1945–55) made forays into frequent or regular newscasts—but not every weeknight. The networks mostly kept their newscasts away from "prime time" (after 8 p.m.), when entertainment shows could draw big audiences and high advertising revenue. Most evening newscasts got on and off the air by 7:30 p.m., although NBC experimented through the 1940s with newscasts that were broadcast up until shortly after 9 p.m.

Growing audiences and advertising revenue fueled this experimentation, and this was the age of the single sponsor: NBC was noted for naming its early Monday-through-Friday newscasts after Camel cigarettes; less well known is that in 1946 the network had begun showing a filmed report called *The Esso Newsreel,* sponsored by the oil company, three nights a week. Sometimes the fledgling network news operations were selling advertisers more than commercial slots and naming rights; a sponsor's contributions to the bottom line were often granted in return for some influence over how the program looked, who appeared in it, and even what news it covered.

Acceleration

In 1948, the three national networks made dramatic moves to install their newscasts in U.S. homes on a nightly basis. In February NBC launched a five-weeknight newscast that at first was named *Camel Newsreel Theatre,* after its sponsoring cigarette company, and later was recast as *Camel News Caravan.* A similar program from

NBC's main rival, *The CBS-TV News,* went on the air in April. These two oldest networks learned much about putting news on the air from covering that year's national political conventions. ABC, the youngest network and last to gain multiple-city status, began broadcasting its *News and Views* six nights a week in August.

It also was in 1948 that a new kind of television star began to appear via the newscasts. Even as comedian Milton Berle's arrival was stoking NBC's entertainment profits, its newsreaders were being introduced as "anchors." (The metaphor reportedly referred not to a dead weight under a boat but to the last-lap runner crucial to a relay team.) The anchor would start every newscast, frame its stories, and wrap it up at the end. Former news narrator John Cameron Swayze (anointed by his sponsor, Reynolds tobacco) moved in front of the NBC cameras. New York local-news front man and radio announcer Douglas Edwards took over the CBS newscast, of which he would remain anchor for more than a dozen years, during which it became *Douglas Edwards with the News*. The team of Jim Gibbons and H. R. Baukhage was named to handle *Issues and Answers,* ABC's nightly news entry. Each of these ran for 15 minutes nightly.

By April 1950, more than a hundred television stations were delivering television shows to 5 million sets—and more than 8 million receivers were in use by October. NBC was setting up affiliates in the Midwest and West, with CBS lagging behind and ABC a distant third; through their affiliates, programming by all three would penetrate more major cities over the next decade. Amid domestic growth and relative global peace (save for the Korean conflict of 1950–53), the decade of the 1950s witnessed the development of network television news.

Big events and trends helped make this development happen. The national political conventions of 1948 had been televised, but only to audiences in the few networked (Eastern) cities—and with *Life* magazine sponsoring NBC's news work and directing some of it. As the 1952 conventions approached, however, the networks were ready for all-out coverage, having extended their reach to nearly 40 states. Politicians vying for coverage at the conventions rushed to the cameras in moments of high drama and controversy, and the result was a powerful, weeks-long national story.

Television began to mint major journalism stars during this time. The 1952 conventions helped establish the on-screen reputation of 45-year-old Walter Cronkite, one-time reporter for the United Press. His solid, take-charge leadership in CBS's convention booth made him nationally known. The 1950s also witnessed some of the most spectacular achievements of CBS journalist Edward R. Murrow. He reported and fronted documentaries and "specials" that touched nerves and consciences, exposing abuses including those of Communist-hunting Senator Joseph McCarthy. The work of journalists such as Cronkite and Murrow, seen night after night in the networks' evening newscasts, further elevated interest in and respect for television reporting.

On the strength of their success leading coverage of the 1956 political conventions, newsmen Chet Huntley, then 44, and 36-year-old David Brinkley became co-anchors of *NBC Nightly News*. This single move stoked a competition that demonstrated network television newscasts as a rapidly growing phenomenon. *The CBS Evening News* succeeded that network's existing program in 1962, and the following year found Cronkite replacing Douglas Edwards as anchor.

Network news decisions were driven in part by their advertisers, but mostly by their growing number of affiliate stations. A typical local station was owned independently but was contractually "affiliated" with one of the three networks. Such an arrangement exposed local viewers to the network's entertainment and newscasts while the station gained the prestige of carrying the network's entertainment and news programs as well as a little time for local ads within the national evening newscasts. This helped stations, but sometimes not enough; network newscasts often were less popular among local viewers than its stations' local reports were, so network news didn't add much to their drawing power. Still, thanks to its prime-time entertainment, the affiliated network was what distinguished a station, so the networks' newscasts aired everywhere and their logos (NBC's multicolored peacock, CBS's eye) appeared in stations' promotions and signs.

Power rising

On September 2, 1963, CBS expanded its evening newscast to 30 minutes, a statement of optimism

for the role of evening newscasts in American homes. A week later, NBC also expanded its evening program to half an hour. (Financially weaker ABC wouldn't switch to 30-minute newscasts until January 1967.) With the expansion of program time, network newscasts were also maturing, and none too soon, given that the 1960s threatened to overwhelm broadcast journalists with big stories to cover. These stories included the November 1963 assassination of President John F. Kennedy, whose death Cronkite broke into regular programming to announce, with visible emotion. African Americans increasingly demanded equal rights as the tumultuous civil rights movement took hold, prompted and aided by television coverage. The 1968 assassination of Martin Luther King Jr. led to days of urban riots vividly covered by network news.

Increasingly, these domestic events played out against the chaotic background of the 1959–75 Vietnam War, which would kill more than 58,000 U.S. troops and perhaps more than 2 million Vietnamese. Every year, as politicians' ability either to win or shut down the war slowly slipped away, thousands of war protesters poured onto American campuses (fueled by the draft) and streets. Evening newscasts brought all of this home, literally, and Cronkite returned from a war-zone tour in early 1968 to tell his audience—one of every five TV households in the country—that it was "more certain than ever that the bloody experience of Vietnam is to end in a stalemate." President Lyndon Johnson (1963–69) memorably exclaimed that if he'd lost Cronkite he'd lost Middle America and he soon resigned. By war's end in 1975, a decade and a half of wrenching quandaries and pain had divided Americans along many fault lines, even as it united most of them around "the tube" at news time every evening.

A Very Big Story

Newscast producers sometimes have chosen saturation coverage of the day's "top" story, downgrading other topics. (Usual motivators: available visuals and the freshest information.) In spring of 1972, President Nixon was headed for a second term despite the roiling Watergate scandal and the lethal persistence of the Vietnam War. Which ongoing story should dominate a newscast? On Thursday, May 11, 1972, ABC's evening news rundown looked like this:

1. *Vietnam/Blockade—Mines:* Lethal mines airdropped by U.S. aircraft are keeping war-supply ships out of North Vietnam's harbors. (30 seconds used for anchor voice-over)
2. *Vietnam/Blockade—Russian reaction:*
   - The Soviet Union, defending its ally North Vietnam, denounces U.S. blockade;
   - Russian delegation visits United States despite fears that mine blockade would endanger upcoming summit talks in Moscow. (3 minutes 20 seconds, filmed stories from two field reporters)

(*Commercials*)

3. *Vietnam/Blockade—North Vietnam reaction:*
   - French report says North Vietnamese are preparing to clear U.S. mines from ports;
   - U.S. ships will warn vessels of harbor mines; defense secretary vows to keep supplies out of enemy hands. (1 minute 50 seconds, anchor report and filmed story from field reporter)
4. *Vietnam/United States bombing:* North Vietnam claims U.S. planes have struck civilian areas; film shows alleged destruction of schools and hospitals hit by U.S. bombs. (1 minute 30 seconds, anchor summary and filmed story from field reporter)
5. *Vietnam/Blockade—Chinese reaction:* Communist China denounces U.S. moves to sever water and land routes to North Vietnam. (30 seconds, anchor summary)

(Continued)

(Continued)

(*Commercials*)

6. *Vietnam/Blockade—Student reaction:* 500 arrests reported as protests against new U.S. Vietnam policy continue; demonstrators chain selves to seats at United Nations; protesters crowd Capitol steps; lawmakers oppose Nixon policy, other lawmakers support it. (2 minutes 30 seconds, anchor report and filmed story from field reporter)

(*Commercials*)

7. *Vietnam/Casualties:* 19 U.S. combat deaths reported for week in Vietnam. (30 seconds, anchor summary)
8. *Vietnam/Offensive:*
   - One highway now is known as "slaughter alley"; U.S. planes bomb positions of North Vietnamese attacking U.S. troops;
   - Defense Department film shows North Vietnam trucks being shot at night by U.S. planes;
   - Big Communist attack on Hue expected on Ho Chi Minh's birthday, the day before Nixon trip to Russia;
   - Enemy already infiltrating area around Hue; 100 killed trying to blow up a base; North Vietna mines roads. (4 minutes 40 seconds, 3 filmed stories from field and one anchor summary)

(*Commercials*)

9. *Chicago 7:* Court overturns sentences of radicals charged after demonstrations at 1968 Democratic national convention. (40 seconds, anchor voice-over)
10. *Idaho mine fire:* 14 more bodies recovered after fire; death toll is 65; 26 still missing. (10 seconds, anchor summary)
11. *Army headquarters bombed in Germany:* Five bombs kill U.S. colonel; believed to be protest of U.S. Vietnam policy. (20 seconds, anchor voice-over)
12. *Alaskan oil line:* Interior secretary to authorize 800-mile oil pipeline across Alaska; project stalled by environmentalists' court action. (20 seconds, anchor summary)
13. *Minimum wage:* House approves raising minimum wage to $2 per hour; lower rates set for teens and farm workers. (20 seconds, anchor summary)
14. *Willie Mays:*
   - Baseball star just traded at age 41 by Giants to New York Mets; moved with Giants from New York to San Francisco in 1967;
   - Mets chairman says trade will succeed financially, but purpose was to get help on the field for Giants. (2 minutes, anchor voice-over and reporter field story)

(*Commercials*)

15. *Commentary—Vietnam War:* Says war is drawing to close; protests idea that North Vietnam is winning because it is superior society; attributes success to terror tactics. (1 minute 40 seconds for studio commentary by co-anchor)

News in a Newer Age

On Thursday, May 10, 2007—almost exactly 25 years after the newscast profiled earlier—the same network presented a very different sort of evening roundup. Again the United States was locked in a long-lasting war, this time with Iraq; but war did not dominate the entire newscast, or even lead it, as ABC summarized the news day:

1. *Drug fraud:* Drug company's admission it lied about addictiveness while promoting pain-killer Oxycontin draws closer investigative look; users comment on drug habits; coverage of company's expressed attitude, details of legal penalties. (2 minutes 50 seconds, anchor introduction and reporter in studio)
2. *Iraq war/funding compromise:*
   - Political debate examined; details of House funding bill; pro & con interviews on bill's prospective passage.
   - Discussion of President Bush's strategy, role of general's earlier report on Iraq situation.
   - Army will send more mine-resistant, ambush-protected combat vehicles to Iraq. (4 minutes 40 seconds; field report, anchor/Washington bureau chief discussion, brief anchor report)
3. *Britain/Blair:* British Prime Minister Tony Blair to step down June 27; details of his earlier reaction to death of Princes s Diana; British view of Blair role in Iraq war. (1 minute 50 second, field report)

(*Commercials*)

4. *Retail sales:* Report on weak retail sales nationally and on the stock market. (20 seconds, anchor summary)
5. *Starbucks:* Company's cultural role and insights into American psyche; details of U.S./world proliferation of Starbucks stores. (3 minutes 10 seconds, field report)

(*Commercials*)

6. *Wildfires:* Updates on Florida & Georgia fires. (20 seconds, anchor voice-over)
7. *Flooding:* Update on Midwest flooding of Missouri River, damage. (20 seconds, anchor voice-over)
8. *Basketball/Fisher:* Profile of pro basketball star Derek Fisher and family, including baby with eye cancer. (1 minute 50 seconds, field report)
9. *Auto racing/Earnhardt:* Report that NASCAR driver Dale Earnhardt Jr., has announced he is leaving team-racing team owned by his stepmother. (10 seconds, anchor summary)

(*Commercials*)

10. *Mother's Day/kiwi bird:* Feature on pregnant kiwi in National Zoo; X-ray of huge egg inside small bird. (2 minutes 20 seconds, field report)

Even in the 1960s and 1970s, when robust political and social upheaval gave network newscasts virtually a clear field to cultural power, audiences inevitably grew restless. With ad revenues of millions of dollars a year depending on the success of newscasts, networks responded partly by tinkering with the "look" and casting of the evening programs. It had long been established that anchors were crucial to the success of a newscast; after all, viewers who watched the news every night were inviting the same personalities into their home nightly as well. President Kennedy's assassination and state funeral in 1963 had made clear how crucial the emotional connections between anchors and viewers could be in grave national moments. What was not certain was whether a single formula for strong anchor selection could be found.

In 1969 ABC put in a dual anchor team (Frank Reynolds and Howard K. Smith) and in 1975 bumped it up to three anchors (Reynolds, Max Robinson—the first African American network news anchor—and Peter Jennings) broadcasting live from three major cities (Washington, D.C., Chicago, and London, respectively); and, in 1978, having earlier wooed Barbara Walters from NBC (for a first-ever million-dollar salary), added her as a contributor to the newscast. At NBC, Chet Huntley's retirement was followed by a multi-anchor phase and then the 1971 arrival of John Chancellor at the helm of *NBC Nightly News*.

Changing the Game

Some of the most significant changes on the evening news programs came not from anchor shuffles or format redesigns, but from one canny television producer's bright idea. Don Hewitt had been on Edward R. Murrow's CBS team producing the history-making documentary series *See It Now* in the 1950s. In the late 1960s Hewitt sold executives on something new: an hour-long weekly news magazine show that would cover only a few stories per broadcast, but in great depth. Mike Wallace and Harry Reasoner anchored the 1968 debut of *60 Minutes,* and its time slot varied until the program settled in at 7 p.m. Sundays in 1975. It became the highest-rated program in all of television, making a lot of money on the highest-rated viewing night of the week. No news program had ever done that, and this development put a gleam of fresh hope in the eyes of network executives—while at the same time demonstrating to network officials that news could make money. Soon the networks were requiring their news divisions to make money routinely, on evening newscasts and other news programming. This seemed better than losing money routinely, as in the public service–oriented years when competition for newscast audiences and advertising dollars had been much less intense. The news units responded with new programs including more "magazine" shows in prime time, and with large-scale breaking-news coverage that showed the unique power of experienced network teams. The latter factor could "drive" viewers toward a particular evening newscast, no matter when news broke.

William Wheatley was producer of *NBC Nightly News with Tom Brokaw* in January 1986 when the *Challenger* space shuttle blew up right after launch, killing seven astronauts. The network interrupted regular programming in order to cover the disaster. "We started with an advantage," Wheatley later recalled in an interview with the author, "because Brokaw had closely followed the space program and so had several of our other correspondents. We were first to cover the story, and later we were first to report the suspected cause of the explosion . . . we were all over that story, it was really important news, and soon after that we went to first place [in the ratings]."

Wheatley said having expert journalists available to guarantee strong reporting in the opening hard-news minutes of a newscast often gave him time to focus on the softer "back" of the show, where a producer could choose among a wide field of stories. Through much of the 1980s, at least two of every three U.S. television viewers reportedly watched one of the three big-budget evening newscasts every night. Every small judgment could be important, however, because competition—not just among network newscasts, but from their new rivals—was growing.

Technology and ingenuity were at the core of that widening of viewer choices. Networks already paid to develop and then showcase the use of satellites to relay reports from around the globe. They also had pioneered high-tech news graphics that aided storytelling. But in 1980, well-funded innovator Ted Turner and his Cable News Network (CNN) began providing escape from the

"appointment viewing" of network news by filling a 24-hour schedule with various types of news and features. Busy viewers could use videotape to switch their television consumption away from the dinner hour—and thus away from the network newscasts. CNN as well as other cable news channels could be viewed not just at home but, in the years ahead, also at the office, gym, or other venues. Added to this was the appeal of local newscasts on network-affiliated stations, which in some large cities rolled like a train through late afternoon and early evening, carrying world and national, as well as local news. Meanwhile, independent stations and even affiliates could ignore networks' video "feeds" and then compete with them by acquiring news material from CNN and other sources.

In the 1980s, new owners of the three networks pushed network news hard toward standard business models, which tended to mean getting more done with fewer dollars and personnel. Major layoffs and buyouts resulted, as did shutdowns of most foreign bureaus (the networks relied on the Associated Press and reporters from other media).

These actions tended to weaken all network news programs, especially the flagship newscasts. For decades, most TV viewers had relied almost exclusively on those programs for national and world news. Now these newscasts sometimes lost competitive luster, as when, during the 1990–91 Gulf War, a CNN correspondent stayed in Iraq as other Western journalists left and wound up sending exclusive reports from Baghdad.

The Nineties brought other trends to network news: dramas around celebrities, including the murder trial of ex-football star O. J. Simpson, sometimes crowded out more substantive coverage. Network newscasts made room for "news you can use," light features and even interesting local crime cases as producers sought to keep fidgety viewers from tuning out. But many did so—some of them particularly attracted by a powerful new medium called the Internet, which was winning over younger viewers before they could form networking news viewing habits.

Prospects

Early in the twenty-first century, network newscasts occupy a greatly reduced position compared with their brightest days in the 1970s. Evening news still enjoys the loyalty of tens of millions of viewers—enough to keep bringing in strong advertising revenues. However, the Project for Excellence in Journalism reported that the audience had slipped from 26 million in 2006 to only 23 million in 2007—shrinking by more than ten percent in a single year. Moreover, by 2007 the average age of those remaining loyal viewers was about 61.

A 2008 survey by the Pew Research Center for the People & the Press found most (72 percent) national journalists predicted that network evening newscasts would disappear within 20 years. More than half of that group believed the newscast era would end in half that time. Some of society's most avid news-seekers were less than half the age of typical newscast viewers and saw little reason not to move on.

The Project for Excellence in Journalism has characterized the trend toward acquisition of news from the Internet as threatening "old" media in general: "News is shifting from being a product—today's newspaper, website or newscast—to becoming a service—how can you help me, even empower me?" This change endangers the classic role of the network anchor—wise, authoritative, reassuring in a national crisis. With digital communications available "24/7," daily appointments with mature anchors, however distinguished, might appeal to aging viewers but probably not to younger ones essential to future network success.

Network news divisions are working to survive—shifting more effort to the online universe and adapting the lessons of more than half a century of television news to the fast-changing landscape of multi-source digital information. Their newscasts still bristle with commercials—now mostly medical ads aimed at older viewers—and still receive big money from advertisers. Amid continuing and unpredictable media change, however, there is a real risk that the traditional nightly newscasts will soon fade to black. In the meantime, they may be transformed in fundamental—once unimaginable—ways.

F

Facsimile

Facsimile, or the wired or wireless transmission of text, graphics, and photographs, has developed over more than a century into the office machines widely used by the 1970s. For a time before and after World War II, publishing newspapers with facsimile technology was a subject of extensive interest and many experiments. By the early twenty-first century, "fax" machines were in widespread office (and some home) use but were increasingly being supplanted by Internet-based services.

Origins

The basic notion of sending graphic material long distance is as old as the telegraph. In the early 1840s, Scottish physicist Alexander Bain introduced the first primitive facsimile machine and patented it in 1843. Frederick Bakewell, an English physicist, was the first actually to demonstrate facsimile transmission, in 1851 at the London exposition. His system differed from Bain's in that images were received and printed on cylinders (a method commonly used as late as the 1960s). In 1865, Italian physics professor Giovanni Caselli established the first commercial fax system linking Paris with several other French cities, using his Pantèlègraphe, a further modification of Bain's original idea. He transmitted nearly 5,000 faxes in the first year and the service operated until 1870. Early in the twentieth century, Germany's Dr. Arthur Korn developed a system of photoelectric scanning to allow transmission over distances of photographs. By 1910 his system connected Berlin, London, and Paris. A year earlier, *Colliers Weekly* tested facsimile service between New York and Washington, D.C.

In 1922 Korn's system was used to transmit, by radio, a photograph of Pope Pius XI from Rome to Bar Harbor, Maine. The picture was published the same day in the New York *World,* a major feat in an era when news pictures usually crossed the ocean by ship. After experiments dating back several years, the first transatlantic facsimile service, which could transmit a photo across the Atlantic in six minutes, was inaugurated by RCA in 1926. AT&T opened its telephoto system commercially the same year. Several firms soon developed "high-speed" fax systems. Early users of facsimile included newspapers to transmit and receive photos and weather services, which by 1930 could transmit weather maps.

Facsimile and Journalism

While there were numerous experiments with facsimile at both radio stations and newspapers in the 1920s, the service became the focus of serious development only in the 1930s. In 1934 the Associated Press, using AT&T technology, began its commercial wirephoto service. United Press soon followed suit. By 1937, several experimental newspapers had been transmitted using radio station facilities. In 1939 the first daily newspaper was published by radio facsimile. More than 1,000 households were equipped with experimental facsimile receivers that could print a brief newspaper overnight.

World War II interrupted further development until 1948 when the Federal Communications Commission authorized commercial use of the technology using FM frequencies. Western Union used thousands of its Deskfax machines to send telegrams between customer and Western Union offices. The *Miami Herald, Chicago Tribune, Philadelphia Inquirer,* and *New York Times* all broadcast experimental newspapers using their FM stations. The *Herald* transmitted five editions a day for a time. For a brief time it looked as though facsimile newspapers might become common. But the receivers were too expensive for widespread adoption, and the experiments were soon wound up.

Still, facsimile remained essential to newspapers. By the 1970s, both AP and UPI were transmitting hundreds of photos to subscribing papers each day. Within a decade virtually every newspaper and broadcast station was equipped with at least one fax machine for business purposes.

Widespread Fax

The modern era of fax communications—as a means of interoffice communication—began with the approval in 1966 of the American—and in 1968 of the first international—technical standard for fax transmission and machines. The analog systems that used dial-up telephone links slowly improved in definition and speed. The first phone-based fax machines in the 1980s took about six minutes to transmit one page of information printed on special paper. In 1987 Canon introduced the first plain-paper fax machine; a color fax standard followed in 1995. Digital fax machines making use of modern transmission compression technologies could transmit one mid-resolution page in less than ten seconds by the turn of the twenty-first century when some 14 million generally inexpensive fax machines were annually sold worldwide. But with the ease of transmission and dropping cost of the technology came junk fax—the hard copy equivalent of computer spam.

When the commercial Internet appeared in 1995, however, facsimile began to give way to expanding web capabilities—including the transmission of fax messages from personal computers. From 1998 to 2000 the number of transmitted pages worldwide fell by more than half—to about 170 million. But the date-stamping of fax messages—and the option that they can be signed—has continued their use in business, including news media operations. Indeed, combination fax machines and computer printers are now a common technology. Digital scanning combined with the web and e-mail continues to encroach on the facsimile business.

Feature Syndicates

A feature syndicate is a supplier offering an often quite considerable menu of comics, editorial cartoons, columns, and other features for newspapers across the country. Papers pay a subscription fee for what they select to use, the fee varying by the size of the market and circulation of the subscribing paper. Feature syndicates help broaden the non-news content offerings of newspapers, especially those in smaller communities, by providing national markets for print and graphic material.

Feature syndication in the American press has a long history—back to before the Revolution in one case, though really starting a century later with pre-printed features distributed to rural nineteenth-century weekly newspapers. Modern syndicates serving the daily press developed early in the twentieth century around popular comic strips, political columnists, and other features.

Origins

The first informally syndicated feature in American journalism appears to have been "Journal of Occurrences," a propaganda column written in Boston in 1768. It appeared weekly in three papers for just under a year, letting readers in other colonies know what was happening under British military occupation of Boston. But the column was "informally" carried by many other papers as well.

Ansel Kellogg founded a ready-print service in Chicago during the Civil War (1861–65). It provided such features as columns, poems, sometimes serialized fiction, and other entertainment-based material and display advertising for inside pages of newspapers, leaving the front and back page open for the local paper to fill with stories and advertisements. This process became known as "patented insides," for the patent medicine advertising they carried. Until the 1890s, lack of effective copyright protection made metropolitan newspapers widespread users of British literary and dramatic works as filler, often published in serial form.

Development of the stereotyping process provided a technology boost to syndication. Light stereotype molds (dubbed "boiler plate") could be readily shipped or mailed to subscribing papers. Soon the business of providing these got organized with formation of the Western Newspaper Union in Des Moines, Iowa, in 1872. Other firms developed as syndication took hold, but Western grew to dominate the field by 1917, serving some 7,000 papers (many of them weeklies serving small communities) at its peak. This approach gave way in turn (it ended entirely in 1952) to yet another syndication idea.

The rise and expansion of both daily and Sunday newspapers (the latter's longer formats called for more content, and thus demand for syndicated graphic and text material increased) helped create a new form of syndication late in the nineteenth century. C. A. Dana's *New York Sun* syndicated use of stories by Bret Harte and Henry James to a limited number of other papers. Using stereotype and electrotyping technology, the American Press Association began to serve daily papers in 1882. Irving Bacheller (1859–1950), a journalist and writer who created the first newspaper feature syndicate, focused on syndicating material to daily papers beginning a year later and was within a few years serving more than 150 of them in cities across the nation. Publisher S. S. McClure joined the growing number of syndicators in 1884, often using content from his magazine *McClure's* by such authors as Jack London, Robert Lewis Stevenson, and William Dean Howells. He was soon providing up to 30,000 words a week to subscribers.

Development of electrotyping technology in the mid-1890s made wide distribution of color graphic material possible. Paced by the means to print them, demand for comic strips soon drove the syndication business.

Growing out of E. W. Scripps' syndication activity in the 1880s, and his Newspaper Enterprise Association of 1902 (which at first supplied only the Scripps-run papers), the United Feature Syndicate was founded two decades later with nearly 400 newspaper clients, and syndicated such literary names as Carl Sandburg, Ernest Hemingway, and Ring Lardner. Eleanor Roosevelt later wrote her "My Day" column for United (from 1936 until 1962), becoming the first (and only) First Lady to write a newspaper column.

After a careful analysis of potential newspaper demand, and its own initial syndication efforts, the Hearst chain began its Newspaper Feature Service in 1913, which soon expanded into the King

Feature Syndicate in late 1915. King focused heavily on comic strips and illustrated features to attract readers; he placed artists on a salary and took control of characters to further its control of the content syndicated. By the mid-1930s, it was operating a number of syndication services to a huge list of client newspapers, along with pre-printed weekly (Sunday) magazine and comic publications.

Larger metropolitan dailies in cities such as New York, Chicago, and Los Angeles began to syndicate their own columns and other features. The *Chicago Tribune* began this in 1910, the *New York Tribune* in 1914, and *The New York Times* much later in 1960. So did the major news agencies such as the Associated Press and United Press. By the mid-1920s, there were easily 100 or more feature syndicates of all kinds operating (with 2,000 different and continuing features on offer)—they formed their own trade association in 1926. The number varied during and after the Depression, but was similar by the eve of World War II. By 1960 there were nearly 200 operating syndicates large and small.

Syndicated Content

The variety of content provided by the major syndicates in the early 2000s included a wide breadth of options for newspapers to select from. United Features, for example, provided some 50 daily comic strips, the work of ten editorial cartoonists, and a whole menu of columns including advice (3), commentary (15), consumer and finance (8), entertainment (7), food (3), health (2), horoscopes (3), home and garden (4), sports (3), and others. The service also offered nearly 20 different puzzles and games. Several other syndicates offered at least as much.

Comic Strips

Comics, and especially Sunday strips printed in color, formed the core of modern syndication efforts. The "Katzenjammer Kids," which began in 1897 (based on an earlier German comic strip), remains the oldest comic strip still in syndication. The King syndicate offered several dozen comic strips by the 1920s, and more all the time. In the bottom of the Depression in the early 1930s, some of the most popular syndicated strips brought their creators weekly salaries of more than a thousand dollars. United's comics included (by 1950) the hugely popular "Peanuts," for which the syndicate selected the name, though cartoonist Charles Schulz never liked it. With its affiliated syndicates, King Features distributed (by the early 2000s) three times as many comic features as its next-largest competitor.

Editorial Cartoons

The early 1900s marked the height of editorial cartooning syndication as few smaller papers could develop and produce their own. Syndication added greatly to the impact of individual political cartoonists, carrying their images far beyond their "home" newspaper to a wider audience. Sometimes only occasional cartoons were carried in weekly "round-ups" of the best images of that week or concerning a specific event, but some were regularly displayed in a variety of newspapers.

Political Commentary

Political column syndication began with David Lawrence (in 1916) and Mark Sullivan (three years later) being offered to other newspapers around the country. Walter Lippmann joined the growing number of political writers in 1931 and was carried in 165 major papers a decade later—with a large salary to match his growing impact. He had become the widely respected and influential dean of the genre on his retirement in the early 1960s. Drew Pearson began his "Washington Merry Go Round" of political gossip in 1932 and it quickly became a huge and lasting success (continued by Jack Anderson well into the 1990s). Britain's Winston Churchill survived economically on his syndicated writings in the 1930s, many carried in American papers. The new Gallup poll provided features about what people thought about major issues and trends by 1935, an early example of public opinion polling. By the late 1930s and increasingly in later years, many political columns took strong political stances to the right or left.

Gossip and Show Business

Society gossip content in a few metropolitan newspapers dated at least to the 1820s and appeared continually thereafter. National syndication was slower to develop. By 1924, Walter Winchell was reporting on Broadway for New York tabloid papers, soon joined by Hollywood

columnists Louella Parsons and Hedda Hopper. All three were widely syndicated and thus held considerable power in the show-business world into the 1950s. Many others centered on stage, motion pictures, radio, and eventually television. To some extent, the latter began to siphon off some of the genre by the late twentieth century—as when Broadway columnist Ed Sullivan hosted a CBS television variety program for two decades.

Modern Living and Advice

Dorothy Dix began to write a women's column in 1896 and kept it up for four decades. Later examples were the long-lived "Ann Landers" and "Dear Abby" columns, written by two sisters, and running nearly as long as Dix's effort. Numerous fashion and sports columns and illustrations were being syndicated by the late nineteenth century. Religion was an early and steady feature—in 1934, for example, King ran a 40-installment version of the Bible. Humor was always an appealing feature of syndication—Will Rogers wrote a daily column from 1922 until his death in 1935, eventually reaching 400 newspapers. Many others would follow in his footsteps.

The parlous state of many newspaper balance sheets by the early 2000s made syndication more important as the shared cost basis of the system was seen as an efficient and attractive means to display nationally known columns, features, and comics in small as well as metropolitan papers.

Feature syndicates play a newspaper role somewhat analogous to broadcast or cable networks, contributing to similar content across the country.

Federal Communications Commission (FCC)

The Federal Communications Commission (FCC) is an independent American regulatory body created by an act of Congress on June 19, 1934. The FCC replaced the earlier Federal Radio Commission (1927–34) and expanded its authority to include wired communication. Today the FCC's role includes the licensing of all services that utilize spectrum. It reports directly to Congress, which supplies its budget. In the early 2000s, the commission had about 2,000 employees and a projected annual budget approaching $320 million. While the cost of administration is on the rise, the agency typically offsets its operational cost by charging application processing fees.

The 1934 Communications Act has been amended many times since its passage, though its

2. Total gross budgetary authority, congressional budget.

basic core requirement—that services (including broadcasting) operate as public trustees (of their spectrum channels) in "the public convenience, necessity or convenience"—remains. Many of the alterations have been in response to the many technical changes in communications, including the introduction of television, satellite and microwave communications, cable television, cellular telephone, the Internet, digital broadcasting, and PCS (personal communications) services. For example, the Cable Act of 1992 and the Telecommunications Act of 1996 both amended the 1934 act. But the flexibility incorporated into the original provisions has allowed the law and agency to survive.

Organization

The Communications Act describes the administration, formation, and powers of the commission. Five regulatory commissioners are appointed by the President and confirmed by the Senate. Each commissioner serves a five-year term except for when an appointee is filling an unexpired term. The only qualifications are that commissioners must be citizens and no more than three can be members of the same political party. One commissioner is appointed chair and is responsible for setting the commission's agenda. The commissioners (and increasingly this means the chairman's office) supervise all FCC activities, delegating responsibilities to various bureaus and offices.

In 2002, FCC bureaus and offices were reorganized by function. Responsibility for oversight of electronic media (radio, television, satellite, and cable services) is concentrated in the Media Bureau. Other bureaus include the Wireless, International, Enforcement, and Wireline Competition. After the terrorist attacks in September 2001, a new bureau responsible for public safety, disaster management, and homeland security was created. Most of the day-to-day regulatory work of the commission is done by civil servants at the bureau level.

Congress wrote the 1934 act in broad terms and provided the commission with the ability to promulgate rules and regulations as a means of administering communication policy. The commission's rules and regulations sometimes reflect the intentions of Congress but may also be initiated to solve problems that develop as technology advances or when user needs warrant changes to existing policy. Regulations adopted by the commission have the same force as law (though Congress can override them) and are subject to judicial review. Decisions may be overturned in whole or in part by federal courts or remanded (sent back) to the commission for reevaluation.

FCC Media Concerns

While the commission concerns itself with many technologies related to communications, the Media Bureau seems to gain the most attention from the press and the public. The bureau focuses on facility licensing and engineering and technical considerations. While it is charged with regulation of broadcast media, section 326 of the act bars it from censoring programming. Congress can stipulate that the FCC enforce specific policies, such as regulations concerning indecency and obscenity that are part of the U.S. Code. The boundaries as to what may or may not be broadcast are variable since the courts have ruled that cable (and satellite services) has greater programming leeway because it is not a licensed broadcast service—and its subscribers must make an overt decision to subscribe and pay for its reception in their homes. Thus cable programming is not required to meet the same standards as over-the-air broadcasting. This disparity between the two services has caused confusion with the viewing public and difficulties for the FCC as it tries to apply equitable standards. In recent years, the number of complaints regarding indecent programming has spiraled as watchdog groups have used the Internet to educate the general public and to complain to the commission.

The FCC does not specifically regulate broadcast journalism. During the early days of radio, publishers threatened to support antibroadcasting legislation and convinced the news agencies to withhold news from the radio industry. That so-called Press-Radio War lasted only a few years. By the time television began to grow in the 1950s, the FCC decided, in a policy known as the Fairness Doctrine, that news coverage of local and controversial public issues was an important part of a licensee's responsibility. Given the trend to deregulation over the past three decades, including the demise of the Fairness Doctrine, however, the FCC rarely comments upon any station's news programs—or lack of same.

Frequently news and issue-oriented programming on cable will take a particular slant as a way to energize debate among viewers while broadcast

networks usually try to maintain balance in their presentations. Talk shows on radio and national cable networks often take strong sides on political and social issues. The FCC plays virtually no role in any of that. The FCC can only review licensees (whose licenses normally run for eight years and are routinely renewed) though it may fine stations for knowingly broadcasting false information. Cable and Internet news coverage, however, is generally exempt from FCC supervision as those services do not need one of the limited number of broadcast channels for distribution.

While viewer complaints to the commission are fairly common and often concern the failure of a station to cover certain events, complaints about slanted or even ignored stories are generally considered more serious. The FCC almost never interferes with the right of broadcasters to make editorial judgments regarding how stories should be covered, but it can focus its attention on rigging or slanting news and penalize stations when they have knowingly broadcast false information.

In its 75-year history, the FCC has changed many of its regulatory policies as the electronic media news and entertainment business has grown from radio to include television, cable, and now satellite communications. Early commission policy tended to be proscriptive, spelling out detailed rules about station performance, record-keeping requirements, and license renewal procedures. Though the Communications Act required that broadcasters serve in the "public interest, convenience or necessity," it does not define what these requirements entail. That definition has come from decades of FCC decision-making and judicial review—and it changes over time. Among early commission concerns were issues of fairness and balance in programming, overcommercialization, and abuse by networks over their affiliates. During the golden age of radio, the commission promulgated rules that specifically spelled out the interrelations between networks and their affiliates. In the now-famous *National Broadcasting Co. v. United States* case [319 U.S. 190 (1943)], the Supreme Court upheld the FCC's ability to specify the nature of licenses and competition within the industry. As television service expanded, the commission developed rules to encourage the use of UHF as well as VHF channels and stressed the importance of developing a local public service presence in the community of license. Over time, the commission required substantial filings requirements for broadcast licenses and asked broadcasters to investigate the needs of their community of license through a complex ascertainment process. Most of that has been swept away by deregulation.

News and content fairness has been a concern of the commission and a source of frustration for broadcasters, journalists, and the public alike. Congress mandated political candidates' access to broadcasting in sections 312 and 315 of the act but did not specify how broadcasters should report on controversial issues. Early on the FCC insisted that because of "scarcity" (the presence of more applicants for each available license than can be accommodated), a licensee must operate in the public interest rather than promote only one point of view. Initially the FCC frowned on stations developing editorial policy but later reversed itself in 1949 by adopting the Fairness Doctrine, which strongly encouraged stations to (a) cover controversial issues of public importance and (b) entertain a variety of points of view. The constitutionality of the Fairness Doctrine was upheld by the Court in *Red Lion Broadcasting Co. v. FCC* [395 U.S. 367 (1969)]. Broadcasters complained that the doctrine produced a "chilling effect" on speech (in that to avoid controversy offending advertisers or audiences, stations would avoid complex issues entirely) and cited the possibility of fighting protracted legal battles over Fairness Doctrine challenges. In reality, though, the FCC determined station "fairness" based on the overall programming record, not individual programs. The Court reaffirmed the notion that licensees were not obligated to sell or give time to specific opposing groups to meet Fairness Doctrine requirements as long as the licensee met its general public trustee obligations. Similarly, the court demonstrated support for FCC regulation based on the theory that broadcasting has a "special impact" in *CBS v. Democratic National Committee* 412 U.S. 94 (1973)]. As commissioners embraced deregulation during the 1980s, however, they began looking for ways to eliminate the Fairness Doctrine. In its *1985 Fairness Report,* the FCC concluded that scarcity was no longer a valid argument given the growth of multiple news and public affairs sources, and that the Fairness Doctrine inhibited broadcasters from airing more controversial material. In 1987, the FCC repealed the doctrine (Congress tried to reinstate it the next year, but President Reagan vetoed the bill), and in 2000, a federal

court ordered the FCC to rescind its long-standing personal attack and political editorializing rules. Periodically, members of Congress announce support of legislation that would reinstate the doctrine, often citing one-sided conservative radio talk shows as a problem. But a renewed Fairness Doctrine seems very unlikely.

The terrorist attacks of 2001 highlight the role of television during times of national crisis. Its coverage provides millions of viewers with information in a fashion that cannot be matched by newspapers, though cable and online sources often beat broadcast television. Their continuing ability to reach mass audiences gives broadcast television news greater significance and some call for more regulation as a result of this special impact. While the Gore Commission issued its 1998 report on the public interest obligations of digital television broadcasters, there was no consensus on adopting new regulations for broadcasting. In recent years, some FCC commissioners have argued that cable should be regulated much like broadcast licensees but these ideas have met with little acceptance by the industry and Congress.

Deregulation of Broadcasting

In the mid-1970s and reflecting the changing political atmosphere, the commission began to change direction and adopted a deregulatory stance, increasingly using "marketplace competition" as an alternative model to rule-based regulation. Many of those rules had first been adopted when radio broadcasting was far more limited—a few hundred stations. By the early 2000s, the number of radio and television licenses had multiplied to more than 18,000 broadcasting stations. With that number of stations, most cities have a choice between as many as 25 different radio channels and five or more television channels—not to mention a growing number of satellite and cable services and the Internet.

With the increase in the numbers of broadcast stations and competition in the entertainment industry spawning numerous new technology alternatives for consumers, some critics argue that the importance of individual broadcast stations as sources of news and public affairs has decreased. Early commission policy had stressed the importance of "localism"—reflecting the local community in programming—as a goal for individual licensees. Over the last three decades, however, radio stations have become highly formulaic (often using automated services and totally dropping any news or public affairs), while many television stations have become outlets for national network and syndicated programming and have turned away from developing costly local content. Over the last two decades, the commission instituted a new classification of broadcasters, low-power television (and more recently a limited low-power FM radio) service, created to reinvigorate localism and to help rural areas that could not get adequate TV service.

When Congress passed the Telecommunications Act of 1996, it substantially redirected communication policy toward a converging marketplace of telecommunications services. While major provisions of the Act made changes in wireless and wireline telecommunication, it also made substantial changes in broadcast licensing and ownership rules. The radio business quickly consolidated into a few large group owners controlling the most powerful stations in the country. Television ownership was also relaxed, with a cap (eventually 39% of the national television audience) that could be reached by the stations of any single owner. Interested in maintaining the momentum of change, Congress directed the FCC to re-evaluate commission rules bi-annually, encouraging elimination of unneeded regulatory policies. Over the past few years, the FCC has taken steps to further loosen requirements for broadcast license ownership as well as limits on cross-media (print-broadcast in the same market) consolidation. These policy initiatives have been met with court rulings that have directed the commission to re-examine its proposals.

Technology continues to drive change in the communications and entertainment industries and the FCC must develop policies (and speedier processes) that will ensure regulation can keep up with those changes. The FCC has adopted several strategic goals designed to accelerate the acceptance of digital television (Congress established an early 2009 deadline) and radio (no deadline exists yet) as well as broadband information services in the United States. Rapid changes in communications technology continue to place burdens on the commission's already stretched resources. Despite the need for quicker action, according to FCC records, the time necessary to complete rulemaking has increased while the number of completed proceedings has decreased over recent years. Whether the

Federal Communications Commission can adapt its procedures to meet the exigencies of the future remains to be seen.

Feminist News Media

Feminist news media are best understood within the framework of the movements that shaped them. Feminism in the United States came in three phases or waves, each with its own feminist news media.

The first wave started with the 1848 women's rights conference in Seneca Falls, New York, and encompassed the suffrage movement of the late nineteenth and early twentieth centuries. First-wave feminists focused on personal rights of interest to middle-class women, education, property, employment, and the right to vote. These feminists developed their own newspapers and magazines.

The second wave began in the early 1960s when feminism reawakened in America, Europe, and England. Second-wave feminism split into two branches—the more conservative faction that focused on legal reforms through organizations such as the National Organization for Women and the more radical "women's liberation" branch that became known for its public protests and consciousness raising. Believing "the personal is political," second wave feminists emphasized the need for greater reproductive rights, sexual freedom, and workplace advances. Second-wave feminist news media reflected the deep divisions within the movement.

Third-wave feminism developed in the late 1980s, as young feminists began to question the racism, classism, and heterosexism of the second wave. This new wave of feminists saw themselves as having different goals, strategies, and alliances. They also crafted a new style of journalism, designed to tell their story with new technology to a new audience.

First-Wave Feminist News Media (1848–1920)

Women committed to improving their gender's legal, political, social, and economic status in America in the nineteenth century faced formidable obstacles. Under the English common law principle of *femme coverte,* upon marriage women suffered a legal death. Wives had no right to own property, sign contracts, or retain custody of their children in the event of a legal separation. Divorces were rarely granted. Social customs also placed women at a disadvantage. Under the cult of domesticity that developed in the early nineteenth century, women and men occupied different spheres—men within business/industry and women within the home. Nonetheless, certain women were involved in the temperance and abolitionist reform movements of the antebellum period. It was at the World Anti-Slavery Convention in London in 1840 that the seeds of America's women's rights movement were sown. The American delegation to the convention included women, yet only men were seated. Women delegates and witnesses sat in the galleries; among them were

activists Lucretia Mott and Elizabeth Cady Stanton, who would organize the first women's rights convention in Seneca Falls, New York, in 1848. The two would also play a role in developing the feminist news media of the first wave.

All reform organizations need communication vehicles to update members and to foster a sense of community. The first wave of the feminist (women's rights) movement in America was no exception. Like many other reforms of the time, women's rights advocates relied on conventions as their primary organizational, informational, and support structure. Letter writing also served as an important means of communication. However, these two methods reached a relatively small number of women's rights supporters. How to reach other supporters became a key question for the women's rights movement during the antebellum period.

Feminists could not rely on general circulation newspapers to cover their concerns. In general, these dailies were antagonistic toward women's rights. For example, the *Oneida* (New York) *Whig* (August 1, 1848) even referred to the Seneca Falls convention as "the most shocking and unnatural incident ever recorded in the history of womanity."

Feminist news media developed in two ways in antebellum America—as part of publications launched to support other reforms and as a distinct voice of feminism. The best known of the former group were Jane Grey Swisshelm's *Pittsburgh Saturday Visitor,* a newspaper launched to support abolitionism; and Amelia Bloomer's *The Lily,* a monthly located initially in Seneca Falls, New York, which was committed to temperance. In both of these publications, feminist news, essays, and poetry were part of the editorial mix. Paulina Wright Davis' *Una* introduced a new model of feminist news media—a publication committed solely to women, their emancipation, and feminist news.

Swisshelm's weekly, *Pittsburgh Saturday Visitor,* began as an antislavery voice for the city in 1847, but the paper also covered (and editorially supported) the women's rights movement. Swisshelm's newspaper, however, was not just a voice of and for Pittsburgh. Indeed, the editor admitted that the largest number of subscribers lived outside the city. That fact explained how the newspaper covered the women's rights movement. Swisshelm's *Visitor* reported on events that impacted the women's rights movement, whether they took place in Pennsylvania or elsewhere. For seven long years, Swisshelm editorially supported equal education and a woman's right to own property even after marriage in her newspaper known for conservative feminism.

Bloomer's *Lily* sought to emancipate women from "Intemperance, Injustice, Prejudice, and Bigotry." That motto illustrated the *Lily*'s twofold reform emphasis: temperance and women's rights. Elizabeth Cady Stanton, often writing under the pen name "Sun Flower," was a frequent contributor, endorsing suffrage, opposing laws that put women at a disadvantage, and proposing a kind of easy-to-obtain, no-fault divorce. But Bloomer's *Lily* is best remembered for dress reform. Bloomer and her *Lily* promoted a "scandalous" form of female apparel: "bloomers," a shorter skirt with "Turkish" trousers underneath, a "healthier" alternative to the constrictive, heavy garb that most women of the day wore. Bloomer was also a great supporter of what twentieth-century feminists would call "sisterhood," supporting young women reformers and writers as they began their careers.

However, the title of first "feminist" newspaper belongs to the *Una,* the monthly publication of Paula Kellogg Wright Davis, in Providence, Rhode Island. Launched in 1853 and lasting almost three years, the *Una* had a host of feminist readers, including Lucy Stone, Lucretia Mott, Susan B. Anthony, Elizabeth Cady Stanton, Elizabeth Blackwell, and Frances Gage. Davis and the *Una* covered the standard fare of news of the movement—such as calls for women's rights conventions, essays on the need for better education for women, and letters from readers—but also venturing into new areas and expanding the feminist debate. The *Una* carried essays on domestic abuse, child labor, and poverty. Thus, the publication began to break down some of the class and cultural barriers that were so problematic in the first (and subsequent) waves of the feminist movement.

Much of the feminist debate was silenced during the Civil War. Only the *Sibyl,* the dress reform/abolitionist/temperance reform publication edited by Lydia Sayer Hasbrouck in Middletown, New York, continued to appear until 1864. The newspaper was the only forum dedicated to a feminist perspective on the war.

After the Civil War, the women's rights movement re-emerged and with it a whole new generation of publications materialized. Between 1870 and 1890, 33 feminist publications debuted. Feminist newspapers were published primarily

in the North—in large cities such as New York, San Francisco, Portland, and Denver; in small towns such as Lafayette, Indiana, and Beatrice, Nebraska; and in religious centers such as Salt Lake City. Editors included the notorious free love advocates Victoria Woodhull and Tennessee Claflin as well as the more conservative Mary Livermore, a well-known editor and one of the organizers of the Sanitary Commission during the Civil War. Some publications were committed to more liberal, even radical, positions such as divorce reform and abortion rights; others embraced more conservative stances such as suffrage through state action and educational, legal, and political equality.

The two publications that made the greatest mark on this time period—for quite different reasons—were *The Revolution,* the voice of Elizabeth Cady Stanton and Susan B. Anthony, and the *Woman's Journal.* These weeklies not only redefined feminist news but also illustrated the deep divisions in the post–Civil War women's rights movement over strategies and philosophies.

As the name implies, *The Revolution* was the more radical of the two. Started in 1868 and bankrolled by George Francis Train, a controversial businessman and pro-slavery Democrat, *The Revolution* was committed to "The true republic.—Men, their rights and nothing more; women, their rights and nothing less." *The Revolution* was affiliated with the National Woman Suffrage Association, the arm of the suffrage movement that sought the vote via a federal amendment, as opposed to the state-by-state strategy endorsed by the more conservative American Woman Suffrage Association. Like the *Una, The Revolution* expanded the feminist debate to include divorce, domestic abuse, and abortion. Essays, editorials, and news stories kept the readers up to date on suffrage progress in the states and territories. In addition, *The Revolution* also addressed (and editorially supported) more radical issues, including the right to abortion, and both divorce and prison reform.

The Woman's Journal was Lucy Stone and Henry Blackwell's response to *The Revolution.* Launched in Boston in 1870, the *Journal* was edited by the experienced, Chicago-based journalist Mary Ashton Livermore. At the time Livermore took over the *Journal,* she already edited her own suffrage publication, the *Agitator,* which was folded into the new periodical. With Livermore at the helm, the *Journal* debuted as the key national voice of conservative feminism. Livermore was astute, well connected, and respected nationally. She was supported by a powerful editorial board, which included women's rights activist Lucy Stone, abolitionist editor William Lloyd Garrison, writer/lecturer/composer Julia Ward Howe, and abolitionist clergyman Thomas Wentworth Higginson.

The weekly reflected the middle-class roots of its founders. The *Journal* was committed to the "interests of Woman, to her educational, industrial, legal and political equality and especially to her right of suffrage," as it explained in the January 8, 1870, issue (quoted in Hudson 1873). From its start, the *Journal* served as the clearinghouse for suffrage news from around the country. Clubwomen, members of the American Woman Suffrage Association, and professional writers kept the *Journal* informed of what was happening in their communities. With this network of correspondents, Livermore and the *Journal*'s subsequent editors Lucy Stone and Alice Blackwell were always able to provide readers with up-to-date information and the best essays. By 1915, the *Journal* was circulated in every state and 39 countries. Woman suffrage leader Carrie Chapman Catt once observed that the *Journal* was pivotal to the success of the women's rights movement.

The *Woman's Journal* stood apart from every other feminist publication of the nineteenth century. It was the most widely circulated and probably the most influential of the feminist publications of its age. It also lived the longest. The weekly started in 1870 and continued until it merged with two other suffrage publications to form the *Woman Citizen* in 1917, just a few years short of the passage and ratification on the Nineteenth Amendment. No other feminist publication—past or present—has equaled the *Journal*'s long life.

Second-Wave Feminist News Media (1960s and 1970s)

After winning suffrage, the feminist movement seemed to founder. Feminist Alice Paul, her National Woman's Party, and its periodical *Equal Rights* pushed hard for another amendment that would afford women equal rights. That proposal, variously called the Lucretia Mott amendment, the Alice Paul amendment, and the Equal Rights Amendment, was introduced into every session of Congress from 1923 until it was finally passed (though not ratified) in 1972.

PRINCIPLE, NOT POLICY—INDIVIDUAL RIGHTS AND RESPONSIBILITIES.

THE REVOLUTION WILL ADVOCATE:

1. IN POLITICS—Educated Suffrage, Irrespective of Sex or Color; Equal Pay to Women for Equal Work; Eight Hours Labor; Abolition of Standing Armies and Party Despotisms. Down with Politicians—Up with the People!

2. IN RELIGION—Deeper Thought; Broader Idea; Science not Superstition; Personal Purity; Love to Man as well as God.

3. IN SOCIAL LIFE.—Morality and Reform; Practical Education, not Theoretical; Facts not Fiction; Virtue not Vice; Cold Water not Alcoholic Drinks or Medicines. It will indulge in no Gross Personalities and insert no Quack or Immoral Advertisements, so common even in Religious Newspapers.

4. THE REVOLUTION proposes a new Commercial and Financial Policy. America no longer led by Europe. Gold like our Cotton and Corn for sale. Greenbacks for money. An American System of Finance. American Products and Labor Free. Foreign Manufactures Prohibited. Open doors to Artisans and Immigrants. Atlantic and Pacific Oceans for American Steamships and Shipping; or American goods in American bottoms. New York the Financial Centre of the World. Wall Street emancipated from Bank of England, or American Cash for American Bills. The Credit Foncier and Credit Mobilier System, or Capital Mobilized to Resuscitate the South and our Mining Interests, and to People the Country from Ocean to Ocean, from Omaha to San Francisco. More organized Labor, more Cotton, more Gold and Silver Bullion to sell foreigners at the highest prices. Ten millions of Naturalized Citizens DEMAND A PENNY OCEAN POSTAGE, to Strengthen the Brotherhood of Labor; and if Congress Vote One Hundred and Twenty-five Millions for a Standing Army and Freedman's Bureau, cannot they spare One Million to Educate Europe and to keep bright the chain of acquaintance and friendship between those millions and their fatherland?

Send in your Subscription. THE REVOLUTION, published weekly, will be the Great Organ of the Age.

TERMS.—Two dollars a year, in advance. Ten names ($20) entitle the sender to one copy free.

To whom address all business letters.

KANSAS.

THE question of the enfranchisement of woman has already passed the court of moral discussion, and is now fairly ushered into the arena of politics, where it must remain a fixed element of debate, until party necessity shall compel its success.

With 9,000 votes in Kansas, one-third the entire vote, every politician must see that the friends of "woman's suffrage" hold the balance of power in that State to-day. And those 9,000 votes represent a principle deep in the hearts of the people, for this triumph was secured without money, without a press, without a party. With these instrumentalities now fast coming to us on all sides, the victory in Kansas is but the herald of greater victories in every State of the Union. Kansas already leads the world in her legislation for woman on questions of property, education, wages, marriage and divorce. Her best universities are open alike to boys and girls. In fact woman has a voice in the legislation of that State. She votes on all school questions and is eligible to the office of trustee. She has a voice in temperance too; no license is granted without the consent of a majority of the adult citizens, male and female, black and white. The consequence is, stone school houses are voted up in every part of the State, and rum voted down. Many of the ablest men in that State are champions of woman's cause. Governors, judges, lawyers and clergymen. Two-thirds of the press and pulpits advocate the idea, in spite of the opposition of politicians. The first Governor of Kansas, twice chosen to that office, Charles Robinson, went all through the State, speaking every day for two months in favor of woman's suffrage. In the organization of the State government, he proposed that the words "white male" should not be inserted in the Kansas constitution. All this shows that giving political rights to women is no new idea in that State. Who that has listened with tearful eyes to the deep experiences of those Kansas women, through the darkest hours of their history, does not feel that such bravery and self denial as they have shown alike in war and peace, have richly earned for them the crown of citizenship.

Opposed to this moral sentiment of the liberal minds of the State, many adverse influences were brought to bear through the entire campaign.

The action of the New York Constitutional Convention; the silence of eastern journals on the question; the opposition of abolitionists lest a demand for woman's suffrage should defeat negro suffrage; the hostility everywhere of black men themselves; some even stumping the State against woman's suffrage; the official action of both the leading parties in their conventions in Leavensworth against the proposition, with every organized Republican influence outside as well as inside the State, all combined might have made our vote comparatively a small one, had not George Francis Train gone into the State two weeks before the election and galvanized the Democrats into their duty, thus securing 9,000 votes for woman's suffrage. Some claim that we are indebted to the Republicans for this vote; but the fact that the most radical republican district, Douglass County, gave the largest vote against woman's suffrage, while Leavenworth, the Democratic district, gave the largest vote for it, fully settles that question.

In saying that Mr. Train helped to swell our vote takes nothing from the credit due all those who labored faithfully for months in that State. All praise to Olympia Brown, Lucy Stone, Susan B. Anthony, Henry B. Blackwell, and Judge Wood, who welcomed, for an idea, the hardships of travelling in a new State, fording streams, scaling rocky brinks, sleeping on the ground and eating hard tack, with the fatigue of constant speaking, in school-houses, barns, mills, depots and the open air; and especially, all praise to the glorious Hutchinson family—John, his son Henry and daughter, Viola—who, with their own horses and carriage, made the entire circuit of the state, singing Woman's Suffrage into souls that logic could never penetrate. Having shared with them the hardships, with them I rejoice in our success.

E. C. S.

THE BALLOT—BREAD, VIRTUE, POWER.

THE REVOLUTION will contain a series of articles, beginning next week, to prove the power of the ballot in elevating the character and condition of woman. We shall show that the ballot will secure for woman equal place and equal wages in the world of work; that it will open to her the schools, colleges, professions and all the opportunities and advantages of life; that in her hand it will be a moral power to stay the tide of vice and crime and misery on every side. In the words of Bishop Simpson—

"We believe that the great vices in our large cities will never be conquered until the ballot is put in the hands of women. If the question of the danger of their sons being drawn away into drinking saloons was brought up, if the mothers had the power, they would close them; if the sisters had the power, and they saw their brothers going away to haunts of infamy, they would close those places. You may get men to trifle with purity, with virtue, with righteousness; but, thank God, the hearts of the women of our land—the mothers, wives and daughters—are too pure to make a compromise either with intemperance or licentiousness."

Thus, too, shall we purge our constitutions and statute laws from all invidious distinctions among the citizens of the States, and secure the same civil and moral code for man and woman. We will show the hundred thousand female teachers, and the millions of laboring women, that their complaints, petitions, strikes and protective unions are of no avail until they hold the ballot in their own hands; for it is the first step toward social, religious and political equality.

The January 8, 1868, inaugural issue of Elizabeth Cady Stanton and Susan B. Anthony's feminist newspaper, The Revolution.
Source: Library of Congress.

It was not until the early 1960s that feminism re-emerged as a new, distinct wave. Several unrelated events explain the reawakening of feminism. In 1961, President John F. Kennedy created the Commission on the Status of Women under former First Lady Eleanor Roosevelt. In 1963, that commission released a report that documented the discrimination women faced in almost every part of American life. That same year, Betty Friedan's book, *The Feminine Mystique,* chronicled what the author called "the problem with no name," the dissatisfaction among middle-class, educated women, and the role of mainstream (primarily male-edited) women's magazines in creating unrealistic expectations. It became a bestseller. The next year, the Civil Rights Act was passed. Under Title VII, employment discrimination "based on race, color, religion, sex and national origin" was prohibited. In 1966, liberal feminists organized the National Organization for Women (NOW).

Second-wave feminists had many ills to correct—legal, social, economic, and media policies had long put women in a second-class position. Like feminists of the nineteenth century, second-wave feminists split over policies, goals, and strategies. Many liberal feminists aligned with NOW, Women's Equity Action League, and other organizations that focused on legal reforms. The younger, more radical wing wished to address the larger social issues that oppressed women and adopted different goals, strategies, and forms of journalism.

In her 1988 dissertation on feminist publications of the second wave, Martha Allen identified eight characteristics that marked this form of journalism: women speaking for themselves; preference for the collective structure; a noncompetitive, sharing perspective; analysis of the media's role toward women and their media; a nonattack approach; an "open forum" emphasis; inclusion of information not related in other media; and an activist orientation.

Both wings of second-wave feminism issued publications. Most chapters of the National Organization for Women published their own newsletters. Large NOW branches in major metropolitan areas issued the best known of these newsletters. Thus, the Washington, D.C., and Chicago chapters issued separate newsletters called *Do It NOW;* the Los Angeles branch offered *NOW Times,* and New York City had *The New Feminist*. NOW newsletters shared certain characteristics. They kept readers up to date on what the organization was doing in their city and nationally, reported on local policies that discriminated against women and programs that afforded opportunities, and served as communication vehicles for the chapter's members as well as tools for recruitment. This decentralized approach meant that each NOW newsletter carried a distinct flavor of the local community, even as it offered the news of the national organization. These NOW newsletters represented a large portion of the feminist publications issued during the 1960s and 1970s.

The "women's liberation" wing of the feminist movement—the younger, more radical women—was not without a voice. Indeed, this wing of the feminist movement had many voices—and the voices reflected the rich diversity of viewpoint and strategy that marked this movement.

Any discussion of this feminist news media must begin with the *Voice of the Women's Liberation Movement* (*VWLM*), the periodical that named the movement. Edited by Joreen (Jo Freeman), *VWLM* was the first national feminist newsletter of the second wave. It represented the thoughts of the women associated with the Chicago Westside Group, which included Freeman, Naomi Weisstein, Shulamith Firestone, and Amy Kesselman. Premiering with the March 1968 issue, *VWLM* appeared on an irregular cycle—as time, material, and money allowed—and died after the June 1969 issue.

The *VWLM* was a forum for feminist news, essays, and creative expression. The first issue asked the question, "What in the Hell Is Women's Liberation Anyway?" named the "Male Chauvinist of the Month" (Warren Hinckle, editor of *Ramparts,* a political and literary magazine), provided a chapter report of the Women's Radical Action Project of the University of Chicago, offered advice on what to do at the Democratic Convention in Chicago that year, called for a spring conference, published a cartoon, and invited "unsolicited manuscripts and news stories."

Over its seven issues, the newsletter offered news reports of activities by the "women's liberation" wing of the feminist movement from Seattle to New York City, from UCLA to Boston. Some reports included long, first-person accounts, such as the coverage of the 1968 demonstration at the Miss America pageant ("WLM vs. Miss America").

Not only did the author, Judith Duffett of New York, explain what happened in the October 1968 issue of *VWLM* but she also offered a rationale for the action: "Our purpose was not to put down Miss America but to attack the male chauvinism, commercialization of beauty, racism and oppression of women symbolized by the pageant."

VWLM created an editorial package that influenced the newsletters, newspapers, and magazines of the radical wing. News was only one part of the package. Editorial comment and creative expression were also important elements of many of these publications. Thus, many of these periodicals included drawings, cartoons, photography, and poetry from contributors.

No one knows precisely how many "women's liberation" publications were issued in the late 1960s and the 1970s. Most were underfinanced, relatively short lived, had small circulations, and reflected the views of the group issuing the publication. Thus, the militant separatist organization Cell 16 of Boston issued *No More Fun and Games*; New York's early women's group, New York Radical Women, offered *Notes from the First Year*; the socialist/communist-leaning Red Women's Detachment (New York) published *Red Star*.

Few publications of these early days have survived. The periodical *off our backs* (*oob*) is a notable exception; it is the longest running feminist periodical issued in the United States today. Premiering in Washington, D.C., in 1970, the newspaper was the product of small collective that included Marilyn Webb, Marlene Wicks, Heidi and Nan Steffens, Norma Lesser, and Nancy Ferro. Since its founding, the publication has been issued by a collective, the membership of which has changed over time. *oob* has published some of the key documents of second-wave feminism—the unedited "C.L.I.T." (Collective Lesbian International Terrorist) papers, the Redstockings' charges that feminist editor Gloria Steinem had ties to the CIA—and her response—and reports of problems within the Women's National Abortion Action Coalition. That type of coverage caused the *Woman's Survival Sourcebook* to criticize *oob* for its coverage of factionalism within the movement. Notwithstanding that criticism, *oob* is considered one of the most highly regarded of the radical feminist periodicals in the 1970s.

The 1980s were particularly difficult for *oob*. Politically and socially, the decade was more conservative. Moreover, the periodical faced economic jeopardy, when a collective member embezzled funds. Other collective members lent the publication money so the newspaper could continue its coverage of politics, policies that oppressed women, academic and activist conferences, and news from industrialized and Third World nations.

During the 1990s, when much of the second-wave feminism languished, *off our backs* was reenergized when new members joined the collective. *off our backs* is one of the few publications that has been able to bridge the second and third "waves" of feminism. In its special issues, the publication—in the early twenty-first century issued as a quarterly—offers news, essays, and creative expression on everything from alternatives to patriarchy to military power, from censorship to body image, from the media to money and class; each story is told from a radical feminist perspective. Its editorial mission, which is published in the organization's website (www.offourbacks.org), is something with which feminists from the second and third wave can agree:

> to provide news and information about women's lives and feminist activism; to educate the public about the status of women around the world; to serve as a forum of feminist ideas and theory; to be an information resources on feminist, women's and lesbian culture; and to seek social justice and equality for women worldwide.

While *oob* has remained true to its radical roots, *Ms. Magazine,* another remnant of second-wave feminism, has had an uneven life as a voice of American feminism. Premiering as an insert in *New York* magazine in 1971, *Ms.*—as a distinct magazine—debuted as a monthly in 1972. Soon the magazine reached a circulation of 395,000. At its best, *Ms.* provided thoughtful first-person comment from readers; reported on sexual harassment, domestic violence, body image, women's health issues, and the status of women internationally; editorially supported the repeal of laws that put women at a disadvantage; rated presidential candidates on women's issues; issued a "No Comment" section that highlighted advertising that was insulting and degrading to women; and offered a range of creative content from poetry to illustrations and photography. Not all feminists admired *Ms.* or its editorial direction—*oob*

and *No More Fun and Games,* both radical voices, saw the magazine as a sellout.

Like *oob, Ms.* faced an uncertain future in the 1980s. Sold by the Ms. Foundation to an Australian conglomerate and then resold, the magazine shifted its editorial focus to become a general interest news magazine for women, with celebrity covers featuring singer Cher, actors Meryl Streep and Bette Midler, television host Oprah Winfrey, and athlete Florence Griffith Joyner; increased political reporting; and expanded coverage to such subjects as child care, hair coloring, and cooking. The 1990s saw *Ms.* return to its feminist roots in an ad-free format. In 2001 the Feminist Majority Foundation acquired the magazine. Since then, *Ms.* has published stories that specifically are designed to appeal to feminists whatever the wave.

Third-Wave Feminist News Media (Late 1980s–Present)

Young feminists of the third wave questioned the racism, classism, and heterosexism of the second wave. In its "Blueprint for the Future," the Third Wave Foundation pointed out how the second wave had failed young women. Earlier feminists had been too insulated and too limited in their vision, especially in overemphasizing abortion. Their outmoded messages did not relate to the young. Moreover, by excluding men, the second-wave feminists had limited the movement's growth. Researchers Charlotte Krolokke and Anne Scott Sorensen emphasized the complexity of third-wave feminism to include those who flaunted their femininity and sought to reclaim derogatory terms such as *bitch*.

Third-wave feminism has many voices. Its adherents can be heard on the radio and occasionally television. But feminist news media of the third wave are found primarily in print and on the Internet. The two best-known voices are *Bust* and *Bitch,* two print magazines circulated nationwide. Of the two, *Bitch* has the most in common with the editorial traditions of feminism of earlier waves. *Bitch* provides news, editorials, first-person essays, and art coverage; all content is designed to be a "feminist response to pop culture" and is presented in an edgy format, avoiding the objective, inverted pyramid-style of traditional journalism. Premiering in 1996 as a "Xerox-and-staple 'zine" in the San Francisco Bay Area, *Bitch* has grown into what has been called an "underground media phenomenon" with more than 150,000 readers. Founded by Lisa Jervis and Andi Zeisler, the magazine zeroed in on popular culture as its focus.

Bitch is a "girl-friendly" place where many points of view find a home. Each issue has a special theme, which is announced beforehand so young feminists can submit essays. The result is an irreverent editorial mix that touches on everything from superheroines to lipstick, from breastfeeding to breasts, from fashion to music. Even the magazine's title is in keeping with the third-wave feminism's attempt to reclaim pejorative terms.

In contrast, *Bust,* the other most frequently cited voice of the third wave, looks more like a mainstream consumer publication; it is a slick bimonthly lifestyle magazine, with content designed to appeal to the varied interests of young educated women: articles on fashion, media, makeup, sex, and travel, as well as profiles of young women making a difference in their field, all find a place in the magazine's editorial mix. The magazine is edited by Debbie Stoller, who is also known for the *Stitch 'N Bitch* series of books that has helped spawn a whole handicraft movement among third-wave feminists. *Bust* offers both news that isn't likely to be found in mainstream publications—such as a calendar of feminist events and woman-focused international news—and stories that could easily appear in any women's magazine, including recipes, craft projects, and new products, albeit from a hipper, younger perspective.

However, the largest number of third-wave feminist news voices is found online. According to one estimate, the Internet is now the home of at least 240,000 feminist blogs. These serve a range of functions. Some are merely personal perspectives; others serve as a kind of cyber consciousness-raising; a number are designed to deliver news from a feminist perspective.

The best of the feminist blogs provide perspectives from many. Feminist blogs (feministblogs.org) and feministing (www.feministing.com) offer information and commentary posted many times a day. At feminist blogs, contributors offer their perspectives on everything from politics to international women's issues, from media to education. Edited by Jessica Valenti, feministing is more news-based, offering interviews with notable women (including the commander of the all-female United Nations peacekeeping force) and

stories on politics, international events, the media, and fashion. Both blogs carry video.

The feminist blogs represent yet another phase of the feminist news media. Activist women are using new technology to offer news and opinion from their perspective, to showcase their creativity, and to build a feminist community. Those aims are not so different from the nineteenth-century women's rights activists who launched the *Lily,* the *Una,* and the *Revolution,* and they are the same goals of the twentieth-century feminists who started *Voice of the Women's Liberation Movement, off our backs,* and *Ms.* The third-wave feminist news media employ the new technology but seek to accomplish many of the same goals.

Film in Television News

Until the American commercial television networks introduced videotape recording in 1956, they produced news only live or on film. They aired live, film, and videotape news reports until 1978, when film was dropped.

Development

Televised film news first appeared in late 1936 in England with the launching of the BBC's London Television Service. Three years later, in 1939, NBC/RCA introduced U.S. television at the New York World's Fair. After World War II, in 1946, four networks (ABC, CBS, DuMont, and NBC) began broadcasting daily 15-minute filmed news magazine programs from their New York flagship stations. Coverage of political party conventions and presidential elections followed in 1948.

To capture televised images on film, 16mm and 35mm kinescope cameras especially designed for

the purpose were aimed at video monitors carrying studio or remote transmissions. Only in the late 1950s were film reels and cameras gradually replaced by erasable, two-inch magnetic videotape and the Ampex-developed transverse video recorder. Throughout the more than two decades of airing filmed news, competitive and convergent shifts occurred within and between the U.S. television and motion picture industries that affected which news formats were widely distributed and which were not.

Formats for filmed news began to proliferate after World War I. In the new Soviet Union, director Dziga Vertov (1896–1954) and the Moscow Cinema Committee experimented with free weekly newsreels screened at train stops and on barges. His collective soon switched to longer, monthly *Film-Truth* programs of "action caught on the run, from any revealing vantage." Later Soviet newsreels captured unstaged dramas he called "the prose of life." During the Depression, Frontier Films, which was affiliated with the U.S. National Film and Photo League, began producing American newsreels and documentaries that influenced the 30-minute *March of Time* series that ran from 1935 to 1951. Other U.S. independents also began producing newsreels for women, children, African Americans, and urban locales.

By 1925 an average of 40 million American moviegoers a week watched filmed newsreels in most of the nation's 18,000 theaters. Between 1931 and 1935, this total rose to 69 million. In 1929, Fox Movietone News opened its first newsreel theater on Broadway. Newsreel theaters began opening in England and Europe. The Trans Lux Corporation launched a luxury newsreel chain in New York, and Embassy newsreel theaters opened in other cities. Trans Lux theaters' ultra-modern black-and-silver look designed by Loew theater architect Thomas Lamb charged 25 cents to watch and discuss an hour of news, day or night. Downtown news houses decorated with huge globes opened in Los Angeles, Oakland, and Arizona. One was designed entirely of glass, so passersby could stop and watch. In 1938, the Telenews Theatre Corporation formed a 13-theater chain run by managers who spliced together their own newsreels from the six newsreel majors to offer a "continuous flow of news just off the wire." Also in the late 1930s, neighborhood cinemas featured locally produced newsreels. The *Home News Parade* by Castle Films even targeted the 2 million home movie market. In wartime, when movie audiences jumped to 85 million, newsreels were promoted as *the* news that brought world events home and kept communities together.

After the oligopoly of Fox Movietone, Pathe, Hearst, Universal, Paramount, and Kinograms added sound by the early 1930s and expanded their international coverage, the newsreel format had changed, though not enough for critics, who complained it was poorly ordered, blandly shot, and lacking in news value. Newsreel producers, who always viewed newsreels as entertainment, now classified news as either sudden, impending, or scheduled. Company heads hired radio industry narrators, movie cinematographers, and newspaper assignment editors. Camera people competed and collaborated with radio and print reporters, and editors further speeded up production. Content values, however, remained much the same: violence, speed, action, disasters, and assassinations. Self-censorship of shocking, morbid, and controversial content became more explicit. (As more serious critics of the 1930s and 1940s deplored the cutting out of serious, unpleasant footage unless it contained sensational violence, they also blamed the smoother, studio-produced sound newsreels for being less immediate and believable.) Cinematographers, who doubled as reporters, lagged behind their Hollywood peers. As demand for news increased, newsreel producers should have adapted (says Raymond Fielding, author of *The American Newsreel*) by shifting to bigger stories with beginnings, middles, and ends.

Dziga Vertov and Soviet film director and editor Esfir Shub (1894–1959) introduced two additional news formats that later influenced television news: the compilation newsreel and the long compilation news documentary. Both mixed archival with live footage and added voice-over commentary, and, during World War II and the early days of television, compilation newsreels with voice-over commentary became a common format. Government units in England, Germany, and the United States adopted variations of it—for widely varying purposes. *March of Time* synthesized aspects of these earlier formats. Imitated in the film *Citizen Kane,* its 30-minute newsreels spliced actuality with reenactment sequences. Stage actors impersonated

prominent newsmakers. Voice-over narration "interpreted" each story's importance.

During the 1930s and during World War II, other countries competed internationally with U.S. newsreels, so that by the time the war ended in 1945, the first television journalists could avail themselves of several new filmed-news formats. Independent newsreel companies had formed international networks to share news footage. Governmental and commercial newsreel companies like Japan's Prokino circulated their military footage. England's General Post Office unit released medium-length voice-over documentaries with actuality footage intended to provoke social change. These were so well received in England that unit head John Grierson (1898–1972) was sent to set up similar units in Canada, Australia, and New Zealand. Wartime news producers around the world began what Erik Barnouw called a "documentary war." The U.S. War Department film unit remastered footage from Europe, Japan, and the Soviet Union to produce the "Why We Fight" series of documentaries, which were used to train recruits and were also screened in studio-owned theaters. Forty-minute weekly German newsreels featured animated maps, voice-over propaganda, and music, as well as actual and staged battle footage. In U.S. theaters, war messages now changed every 30 minutes. Within the Telenews Corporation, which was dedicated to communal news-sharing, Allied and Axis countries sent government-funded news films units to military fronts and exported their news programming to neutral countries. England's Crown Film Unit documented changes in the English population; Soviet feature-film directors shot winter footage in Stalingrad, Moscow, and Leningrad; and German filmmakers dropped by parachute into the invasion of Poland.

From 1944 to 1947, the NBC network aired one of the first series in a long-form documentary format, *The Voice of Firestone Televue,* which featured serious groups such as the 4-H and the United Nations, but the first prevalent filmed news format was a 15-minute news magazine similar to the Hollywood newsreel. However, broadcasting's leaders intentionally slowed down the development of network television programming. They foresaw that, without competition, radio would earn millions in advertising, stock prices, and celebrity contracts. The war interrupted FCC and other regulation, giving network heads time to plan, publicize wartime electronics contributions, spell out merits of commercial broadcasting, and persuade the U.S. government to restrict its oversight. Only after a battle between NBC-RCA and CBS ended in 1946 with licensing restricted to the VHF spectrum did issuing of station licenses and sale of receivers begin to climb.

For a brief period from 1946 to 1955, television-produced filmed news and Hollywood newsreels directly competed for theatrical markets. It was not yet clear television would be a solely home innovation; Hollywood tried to introduce it into theaters. After 1949 newsreel production rose on a floodtide of movie-goers, who climbed from 39 million in 1951 to 49 million in 1955. Television producers introduced programming to movie theaters, while Hollywood released more "telefilms." Theater architects drew up plans for large-screen television lounges, as well as for television news theaters. By 1950, some movie theaters were replacing newsreels with regular closed-circuit television programming, as well as special televised events. The Telenews chain's newsreel production unit created daily newsreels, a weekly two-reel news review, and a separate sports edition, and delivered these products to independent movie theaters and television stations. One theater even cut out wartime newsreel frames so audiences could take home pictures of loved ones. In the early 1950s, Telenews also sold its news to both CBS and theaters in Brazil, Cuba, and Mexico. However, these efforts ended in 1954 when Hearst Metrotone News purchased Telenews. At the same time, television receiver set sales jumped to a saturation level of 36 million in the United States in 1955, and even abroad sales topped 10.5 million in 1956. Home access to free television news programming had won the competition with theatrical news.

When the four networks settled on broadcasting nightly news magazines in the late 1940s, NBC's *Camel News Caravan* combined filmed newsreel footage with narrated wire service print stories, but soon more thorough news formats emerged from a group of good, studio-based journalists. Former radio journalists Edward R. Murrow (1908–65) and Fred Friendly (1915–98) sought to tell news more visually on their *See It*

Now Series through filmed footage illustrating Murrow's voice-over narrative, and long takes of Murrow's interpretive commentaries. Murrow's powerful position at CBS, earned in part by heroic wartime radio reporting, also led *See It Now* to enter the nation's most polarizing controversy over Senator Joseph McCarthy's witchhunt for communists. During 1952 and 1953, Murrow and Friendly produced and narrated two anti-McCarthy documentaries, whose high ratings influenced ABC to air the Army–McCarthy hearings. Together, these three television news events caused McCarthy and McCarthyism to lose credibility and elevated the status of television news.

Within a few years, however, several factors influenced networks to shift away from live and filmed news programming. For one thing, videotape technology permitted reruns and franchises. For another, studies suggested that programs had little impact on overall viewing levels. Network executives began to fill prime-time with feature films and Hollywood-produced filmed series. That shift caused FCC Chairman Newton Minow to condemn television in mid-1961 as a cultural "wasteland."

Golden Age: The 1960s

In response to regulator concern about the late 1950s' quiz show scandals, the networks turned to more public service programming. Teams of journalists and documentary filmmakers like the Robert Drew Associates adapted portable sync-sound film technology to introduce on-the-spot "fly-on-the-wall" documentaries. In just the years 1961 to 1963, the networks aired 1,600 news documentaries, largely using film. Later filmed documentaries shaped television viewers' opinions about the Vietnam War, civil rights, the de-colonized Third World, and countercultures. At the same time, network journalists' uncensored nightly war coverage turned television into what Friendly called "the electronic hearth . . . where history was being made, and this country will never be the same again" (quoted in Winship 1988, 218). As Vertov had done with his news collectives, American documentary makers of the 1960s and 1970s taught generations of television journalists and film students to believe in the truth of unscripted, close shooting of "unmanipulated," unfolding events. This tradition continues today in cable television's cinema verite documentaries.

By the end of the 1960s, however, network news content was under constant criticism from liberals and conservatives alike. News documentaries were expensive and controversial, and their number began to decline. Network television reduced the airing of filmed news documentaries, especially after intense controversies provoked by CBS's *The Selling of the Pentagon,* which exposed the U.S. military's deceptive public relations efforts, and CBS's *Hunger in America,* whose report on 250 "hungry counties" nationalized food stamps. In 1980, CNN began its 24-hour, satellite-relayed, electronic news coverage. The 1980s also saw creation of documentary-centered cable networks such as the Discovery Channel and the History Channel. The one-time broadcast format shifted to the growing number of cable services.

Of interest is Fielding's argument that issues and problems in newsreel production were "substantially" the same as those of television news. Both formats were "too important a matter to leave entirely to newsmen and women—at least in a free society." The ethical issue of fakery, for example, plagued newsreels from the time they were imported from France in 1909. Fielding classifies four types: theatrical restagings not likely to fool audiences, realistically staged re-creations intended to deceive, approximate re-creations intended to deceive, and outright false news also intended to deceive. In later decades, he says, nearly 50 percent of all newsreel content was "manufactured." By the mid-1920, critical audiences deplored newsreels' fragmentation, brevity, superficiality, repetitiousness, and trivialization, much as today's viewers of network and cable television news complain about similar shortcomings of contemporary televised news. Filmed newsreel content-values of strong action and sensationalism remained constant until newsreels ended in the late 1960s, and these were carried over into television values of feeling, action, energetic presentation, and the three C's of crisis, catastrophe, and conflict.

First Amendment

In only 45 words, the First Amendment to the United States Constitution, ratified in 1791 along with the rest of the Bill of Rights, guarantees the American people a free press, as well as freedom of speech, assembly, religion, and the right to petition the government. It reads,

> Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

Although written in absolute terms ("Congress shall make no law"), the Supreme Court of the United States has never interpreted the First Amendment to prohibit every kind of government regulation of news media. Nevertheless, it has recognized a strong presumption against government attempts to restrict the exercise of any First Amendment right. This means that the government bears the burden of justifying any news media controls.

Origins

The concept of freedom of the press in the United States began well before the First Amendment. Prior to the American Revolution, newspaper publishers in the British colonies in North America were subject to laws and licensing requirements passed by Parliament. In the seventeenth and early eighteenth centuries, printers could be jailed, and their publications burned, if they published without official permission. Publishers of articles or books that criticized the government could be prosecuted and jailed, even if their statements were true.

In 1734, a New York printer named John Peter Zenger was charged with seditious libel (criticizing the government or government officials) after he printed anonymous criticism of the colonial governor general in his newspaper, the *Weekly Journal*. After spending nearly a year in prison, Zenger was acquitted when a jury refused to follow the judge's instructions and convict him—an early example of "jury nullification" in what was to become the United States. Although the outcome of the case created no binding legal precedent, it established the principle that truth would be considered a defense in similar cases in the colonies.

By the 1760s, English jurist William Blackstone, in his *Commentaries on the Laws of England,* had declared that, under British common law, "liberty of the press is indeed essential to the nature of a free state," and that "previous restraints" upon publication were incompatible with the concept of freedom of expression. However, Blackstone also made clear that writers and publishers could be held legally responsible, and punished *after* the fact, for speech that was "blasphemous, immoral, treasonable, schismatical, seditious," or libelous. In other words, the government could not stop a publisher from printing anything he chose, but could hold him legally responsible if the material published violated the law.

The men who would become known as the Founding Fathers, including Thomas Jefferson and James Madison, all students of the philosophers of the Enlightenment, were strongly influenced by Blackstone's principles, as well as by the concept of a truth defense as recognized in the Zenger trial. They regarded freedom of the press as an essential human right. But the early document that attempted to create a new nation in 1783, the Articles of the Confederation, did not mention freedom of the press. Nor did the Constitution of 1787, which created the tripartite government that exists in the country today, include a Bill of Rights. Federalists such as Alexander Hamilton believed a Bill of Rights was unnecessary, arguing that any attempt to define freedom of the press would necessarily result in limiting it. In addition, many of the states' constitutions already included provisions protecting citizens' expressive rights, which were seen as adequate protection by the Federalists. But others, particularly members of the Anti-Federalist party, feared that the new central government would muzzle citizens' rights to criticize it, and cited the lack of a Bill of Rights as the basis for opposing the Constitution. Although 13 states ratified the Constitution, nearly half either recommended, or insisted, that a Bill of Rights be appended to it.

James Madison undertook the task of drafting the twelve proposals that would be the basis for what eventually would become the Bill of Rights, submitting them to Congress in 1789. The third proposal, as originally submitted, would have protected freedom of the press from infringement by the states, and was approved by the House of Representatives. But the Senate revised that provision, resulting in the language that was adopted in 1791 (after the original first two amendments failed), following ratification by three-fourths of the states, and survives as the First Amendment.

First Amendment Theories

Legal scholars have developed a variety of theories to explain the basis and need for freedom of the press or news media more generally. These theories are important because they influence the way judges interpret the First Amendment when deciding legal disputes involving news media.

Among the most prominent of these theories are the following:

Natural law—articulated first by seventeenth-century English philosopher John Locke, the belief that freedoms of expression and of the press are natural rights that government has no power to curtail.

Self-fulfillment—the argument that free speech is an essential component of human dignity and autonomy, and cannot be subject to regulation by the state.

Marketplace—derived from John Milton's *Areopagitica* (1644), the contention that public debate is the best way to determine truth. The "marketplace of ideas" theory was refined by John Stuart Mill in the nineteenth century, who argued that society cannot function without the freedom to freely exchange viewpoints without fear of retribution from the state.

Self-governance—the theory espoused by philosophy Professor Alexander Meiklejohn, among others, that free speech is an essential component of self-government. Under this theory, free speech permits citizens to participate fully in the political system by discovering truth, reaching consensus, thwarting tyranny, and providing stability. Related concepts include the "safety valve" theory, which contends that free expression is essential to diffuse violent dissent, the "checking" function, which holds government accountable to the electorate, and the "watchdog" function, which considers the press to have a unique role as the primary guardian of the public's interest.

Right to know—the presumption that there is a constitutionally based right to know what the government is up to, and that the primary function of news media is to be a conduit of information to the public. Justice William O. Douglas, who served on the Supreme Court from 1939 to 1975, argued in *Branzburg v. Hayes* (1972) that "The press has a preferred position in our constitutional scheme . . . to bring fulfillment to the public's right to know."

Absolutism—a literal reading of the language of the First Amendment, advocated by, among others, Justice Hugo Black, who served on the Supreme Court from 1937 to 1971. In *Beauharnais v. Illinois* (1952), Black wrote that "Congress shall make no law" means just that, "without any 'ifs' or 'buts' or 'whereases.'" This view, although shared by Justice Douglas, has never enjoyed support by a majority of the Court.

Balancing—a process, widely utilized by U.S. courts, by which government weighs the value of free speech against competing social values, thereby determining whether the speech is worthy of legal protection. Under a "hierarchical approach," different types of speech enjoy different degrees of protection depending upon their "value," with political speech enjoying the most favored position, and pornography or hate speech the least. Under a "categorical approach," certain types of speech, such as obscenity, are excluded entirely from First Amendment protection.

Early Interpretations of Free Press Clause

Just seven years after the First Amendment was adopted, the Federalist Party passed the Sedition Act of 1798. This law made it a crime to print any false, scandalous, or malicious writings about the President, the Congress, or the federal government. It was used to indict and convict the editors of several Republican newspapers that supported the candidacy of Thomas Jefferson for President. When Jefferson won the election, he allowed the act to expire. Although the Supreme Court never ruled on the constitutionality of this statute, both Jefferson and Madison used it as a vehicle to renew debate over the power of the federal government to silence its critics.

Well into the nineteenth century, judicial interpretation of the free press clause was limited, in large part because it applied only to the actions of the federal government. State governments in the South that censored abolitionist materials, for example, were not then subject to the First Amendment. Not until 1868, when the adoption of the Fourteenth Amendment prohibited the states from making or enforcing laws that abrogate rights protected by the Constitution, could it be argued that the provisions of the Bill of Rights would also apply to the states. In 1925, in *Gitlow v. New York,* the Supreme Court explicitly held that the states were bound by the First Amendment's prohibition on abridging freedom of expression.

The Presumption of Unconstitutionality: *Near v. Minnesota* and the Pentagon Papers

As we have seen, the idea that prior restraints on publication are incompatible with press freedom, as championed by Blackstone, predated the adoption of the First Amendment. But although prior restraints might be unconstitutional, postpublication sanctions were not. For example, in 1907 in *Patterson v. Colorado,* the Supreme Court upheld a fine imposed on a Colorado publisher who had been found in contempt for criticizing state judges. The opinion by Justice Oliver Wendell Holmes held that because there had been no prior restraint, the fine did not violate the Constitution, noting that "the subsequent punishment may extend as well to the true as to the false."

In 1931, however, the high court invalidated a Minnesota statute that permitted officials to stop publication of "malicious, scandalous and defamatory" newspapers and periodicals, and to require publishers who had been enjoined to submit their copy to a judge for review before publication could resume. Jay Near, publisher of *The Saturday Press,* had been ordered to stop publishing his newspaper, which accused local officials of having ties to "Jewish gangsters" who were involved in gambling and bootlegging operations. His challenge to the statute led to a 5–4 decision in his favor by the Supreme Court. Although not adopting Blackstone's absolutist language, the ruling established the principle that a prior restraint on the press would be presumed to be unconstitutional. In other words, the government, not the press, would have to justify its actions.

The high court provided some examples of the types of "exceptional cases" in which prior

restraints would be permissible: obstruction of military recruiting, or publishing the details of troop movements in wartime; obscenity; incitement to violence or the violent overthrow of government; and so-called fighting words. But none of these exceptions applied in Near's case, the court found. Although acknowledging that *The Saturday Press* used language that some might find offensive to make its charges about government officials, the opinion by Chief Justice Charles Evans Hughes observed that the "abuse" of press freedom by some did not "make any the less necessary the immunity of the press from previous restraint when dealing with official misconduct."

The "national security" exception recognized in *Near* was tested 40 years later. During the war in Vietnam, *The New York Times* was leaked a copy of a classified multivolume government report on U.S. involvement in Vietnam known informally as the Pentagon Papers. The day after the paper began publishing material from the report, Attorney General John Mitchell sent a telegram to the *Times,* "respectfully request[ing]" that the newspaper cease publication of the documents. After the *Times* refused to comply, the Justice Department sought federal district court orders to enjoin it, and, in a separate action, *The Washington Post* from further publication. When the two federal circuit courts that reviewed the lower courts' decisions came to different conclusions—the appeals court in New York ruled in favor of the government, but the District of Columbia federal court sided with *The Washington Post*—the Supreme Court agreed to review the case on an expedited basis. Only 17 days after the first installment of the Pentagon Papers had appeared in the *Times,* the high court, in a terse *per curiam* (unsigned) opinion, ruled in *New York Times Co. v. United States* that the government had failed to meet its burden to demonstrate that a serious threat to national security would be posed by publication of the Pentagon Papers.

Although the *per curiam* opinion of the Court provided little insight into the justices' reasoning, each member of the Court also wrote separately. Absolutists Black and Douglas believed that the First Amendment barred any prior restraints, and would have vacated the orders without even a hearing. Justice William Brennan argued that the government's failure to do more than speculate about the harm that would result was insufficient to prove that this was an example of the "extremely narrow class of cases" in which a prior restraint would be constitutional. Justices Thurgood Marshall, Potter Stewart, and Byron White contended that, absent explicit authorization by Congress, the Executive branch had no authority to ask the judiciary to enjoin publication.

By contrast, the dissenters—Chief Justice Warren Burger and Justices John Marshall Harlan and Harry Blackmun—decried what Harlan called "the frenzied train of events" and pleaded for more time to sort out the competing interests at stake. And a majority of the justices appeared open to the possibility that the newspapers might face postpublication sanctions, including prosecution for espionage, if Congress authorized it. But the Pentagon Papers case established an almost insurmountable standard for the government to meet, and, in fact, the high court has never upheld a prior restraint on news media on the grounds of national security since that ruling.

Constitutionalization of Libel Law: *New York Times Co. v. Sullivan*

In common law, libel and slander—the publication of false and defamatory statements about an individual—were "strict liability" torts, which meant that the plaintiff was not required to show that the publisher had been in any way at fault before liability could be imposed by a court. Until the mid-1960s, libelous speech was considered to be outside the protections of the First Amendment.

But in 1964, during the height of the civil rights movement, the Supreme Court established in *New York Times Co. v. Sullivan* that criticism of public officials deserved constitutional protection. In an opinion by Justice William Brennan, the high court overturned a state court decision, and ruled that an Alabama police commissioner could not successfully sue *The New York Times* for libel based on an "advertorial" that had appeared in the paper four years earlier unless he could prove that the newspaper had published false statements about him with "actual malice"—knowledge that the statements were false, or with reckless disregard of whether they were false or not.

Brennan's opinion noted that "erroneous statement[s are] inevitable in free debate," and that in order to encourage robust debate about public

officials, as well as citizen participation in the governmental process, neither factual error, nor defamatory content, in themselves should remove speech from First Amendment protection. Although agreeing with the result in this case, concurring opinions by absolutists Justices Black, Douglas, and Arthur Goldberg would have gone further, granting complete protection for criticism of the official conduct of public officials. Perhaps surprisingly, however, in *Garrison v. Louisiana* (1965) the Supreme Court declined to strike down state criminal libel statutes outright, but nevertheless required that they meet the constitutional standard of a "high degree of awareness of their probable falsity," effectively eliminating any possibility of a prosecution for seditious libel based on a truthful statement.

In subsequent cases, the high court extended the same First Amendment protection to libelous speech about public *figures*. But in 1974, it ruled that the actual malice standard would not apply in situations where the news subject was a purely private individual, even if that person was involved in matters of public concern. The Supreme Court, in *Gertz v. Robert Welch, Inc.*, said that all the Constitution would require would be a showing of some degree of fault on the part of the publisher. It left it to the individual states to decide whether the standard of fault would be negligence, actual malice, or something in between—unless the plaintiff wanted to recover punitive damages. All those seeking punitive damages, which are designed to "punish reprehensible conduct and to deter its future occurrence," would be required to prove actual malice as well.

Protecting "Pernicious Opinions": *Hustler Magazine, Inc. v. Falwell*

An additional important aspect of the *Gertz* case was the observation in Justice Powell's opinion that "however pernicious an opinion may seem, we depend for its correction not on the conscience of judges and juries but on the competition of other ideas." The idea that pure opinion—statements that can be proven neither true nor false—should enjoy absolute protection under the First Amendment marketplace of ideas theory faced one of its most severe challenges in a case arising from a satirical advertisement parody that appeared in *Hustler* magazine in 1983.

The parody, which was clearly labeled as such, lampooned the prominent minister the Rev. Jerry Falwell, suggesting that he had committed incest with his mother in an outhouse when both were intoxicated. Falwell sued, claiming libel, invasion of privacy, and intentional infliction of emotional distress. Two of his claims were thrown out at trial, but Falwell initially prevailed on the emotional distress claim.

On appeal, the Supreme Court in *Hustler Magazine, Inc. v. Falwell* (1988) ruled that, as a public figure, Falwell would have to prove actual malice in order to successfully sue the magazine for damages. The unanimous opinion by Chief Justice William Rehnquist recognized "the fundamental importance of the free flow of ideas on matters of public interest and concerns," citing the colorful history of "caustic" political commentary in the United States as an important attribute of individual liberty and the free trade in ideas. Although acknowledging that the *Hustler* parody was "at best a distant cousin" of the classic political cartoons by artists such as Thomas Nast, it would be impossible, Rehnquist wrote, for the Court to set down an "outrageousness" standard that would permit recovery of damages based on the emotional impact on the audience, or the subject, at least when that subject was a public figure who was the object of "vehement, caustic, and sometimes unpleasantly sharp attacks."

The "Right to Know" and Rights of Access

As noted above, Justice Douglas argued that the "preferred position" of the press was predicated on its role in fulfilling the public's "right to know." However, although the high court has acknowledged that news gathering enjoys some First Amendment protection, it has been reluctant to recognize special access privileges for the press. Indeed, the Court—in *Bartnicki v. Vopper* (2001), for example—has made clear that journalists are subject to laws of "general applicability" when gathering news, as long as those laws do not unconstitutionally infringe upon the ability of news media to do their job.

This reluctance to grant special privileges is based, at least in part, on an unwillingness to attempt to define who "the press" or news media may be, out of concern that this would signal a

return to the licensing prohibited by the First Amendment. As a consequence, the Supreme Court has ruled that the First Amendment does not grant journalists a privilege to avoid compelled disclosure of confidential sources and information about criminal activities before a grand jury. It has also declined to recognize special protection—beyond the Fourth Amendment rights that extend to any citizen—from law enforcement searches of newsrooms.

Similarly, journalists enjoy no greater First Amendment right of access to government installations and activities than any other person. Even news media access to criminal court proceedings—a right seemingly guaranteed by the First Amendment—is only coextensive with the right of the general public to observe the judicial process. However, the high court has acknowledged that news media, acting as the public's surrogate, do fulfill a distinct structural role in fulfilling the historical need for citizen oversight. And gag orders on news reports of trials and other judicial proceedings—which are ostensibly designed to protect an accused person's constitutional right to a fair trial—are subject to strict limitations reminiscent of those constitutionally imposed on other types of prior restraints.

Licensing to Promote First Amendment Rights

Despite the Supreme Court's rejection of press licensing, it upheld the Federal Communications Commission's authority to compel broadcast licensees, who enjoy diminished First Amendment protection, to air programming concerning controversial issues of public importance and to provide equal opportunities for those who disagreed to express their views (the so-called Fairness Doctrine). This was based on the idea that the broadcast spectrum is a scarce public resource, and must be utilized in a way to encourage the free exchange of competing ideas and to protect the First Amendment rights of the listeners and viewers to receive information. The FCC itself chose to repeal the Fairness Doctrine in 1987, but it was not compelled to do so on First Amendment grounds.

By contrast, in *Miami Herald Publishing Co. v. Tornillo* (1974) the high court struck down a Florida statute that compelled newspapers to publish replies by politicians whom they had "attacked" in their "news columns" on pain of criminal prosecution. Although acknowledging that the statute might encourage news media to provide a forum for competing viewpoints, the opinion by Chief Justice Burger observed that "a responsible press is an undoubtedly desirable goal, but press responsibility is not mandated by the Constitution, and like many other virtues cannot be legislated."

Conclusion

The First Amendment remains unique in the world, both on its face and in its interpretation. Although the Supreme Court of the United States has never accepted the idea that "no law means no law" in Justice Black's absolute terms, it has embraced the notion that free news media are essential to a democratic society. Government attempts to regulate and control news media are subject to close scrutiny by the courts. In most cases, particularly in situations that amount to a classic "previous restraint" on publication (or broadcast), the burden is on the government to justify the restriction, not the other way around. The presumption that news media free of government control enjoy a fundamental and essential right was not invented by the Founding Fathers. But it is fair to say that the United States has come closer to realizing it than any other country in modern times. The First Amendment will continue to face challenges as new media permit individuals to participate in gathering and publishing news to a degree never imagined by James Madison and Thomas Jefferson. The Supreme Court has made clear that advances in technology will not alter the core principles that have shaped First Amendment jurisprudence. Rejecting the idea that the Internet, a new medium whose content "is as diverse as human thought," should be subject to government control, Justice John Paul Stevens wrote in *Reno v. American Civil Liberties Union* (1997)—the first case the Supreme Court considered that involved congressional attempts to regulate sexually explicit Internet content on the grounds that it was too easily accessible to vulnerable minors—

> As a matter of constitutional tradition . . . we presume that governmental regulation of the content of speech is more likely to interfere with the free exchange of ideas than to encourage it. The

interest in encouraging freedom of expression in a democratic society outweighs any theoretical but unproven benefit of censorship.

Food Journalism

Starting in the 1980s, leisure interest in food flourished across America as more people began treating cooking and dining as a pastime akin to attending the theater or cinema. The number and variety of restaurants, gourmet shops, specialty kitchen shops, cooking classes, international culinary tours, and other food related enterprises proliferated.

As culinary consumer culture grew, so did consumer interest in food writing, a category of journalism defined by its subject that takes many forms, including reviews, essays, memoirs, feature stories, and hard news. As food journalism became more lucrative (attracting both readers and advertisers), many newspapers developed their food columns into stand-alone sections, new glossy food and lifestyle magazines appeared, the cable Food Network was launched, blogs and other online publications devoted to the culinary arts exploded, and publishing houses sought book-length manuscripts from journalists who took food as their primary beat.

The best food journalists and periodicals also received recognition for their work in the form of professional awards including the National Magazine Award, The Guild of Food Writers Award, The James Beard Foundation Awards, the M.F.K. Fisher Distinguished Writing Award—even the Pulitzer Prize, which was awarded for the first time to a restaurant critic in 2007. In bestowing this award, the Pulitzer Prize committee recognized food writing as an important cultural beat worthy of professional recognition and respect—and conferred upon food journalists a status that had eluded them since they first began writing in the early days of American newspapers.

Development

Food writing appeared in the women's pages of American newspapers as early as the 1840s and by the 1880s was a staple of newspapers and magazines. From the beginning, food writers offered much more than simple guides for making the best plum puddings. They served an ideological function as well, giving women advice on how to comport themselves and manage their homes so that they lived up to the image of the proper, white, middle-class, Christian home that became the cornerstone of the nineteenth-century American "cult of domesticity." Food, its preparation, and its consumption played a central role, and food writers advised women on how to prepare, for their husbands and children, economical and nutritious meals in an efficiently designed and managed kitchen, and how to serve and consume these meals at a well-ordered table that allowed for genteel conversation. These domestic duties, women were told, would ensure a morally and physically robust family, which in turn would ensure the health and vitality of the Republic.

In addition to preserving the moral and physical health of the country, food writers in the late nineteenth century and early twentieth century also advised women to ensure its economic health by instructing them on how to become good "consumers" at a time when production of goods was shifting from the home to the factory, and people began buying rather than growing, raising, or making their own food. During the Civil War, canned and other packaged goods appeared in the markets and by 1897, Joseph Campbell had figured out how to can and condense soup. By the turn of the century, canned and other processed foods of all kinds—packaged dry cereals, pancake mixes, crackers, canned hams, and bottled corned beef—had become common in the American diet. Magazines and newspapers wrote about and accepted advertising for these goods, and taught women how to use them in their own cooking.

Periodicals also taught women from the late 1800s up through the 1920s and 1930s how to use the mechanical and electrical appliances being invented and manufactured. For example, as electricity became more widely available women had to be convinced that it was safe—and that the new kitchen appliances it powered were worth buying. These appliances were promoted in the popular press as the solution to women's drudgery in the home. In the process, a new image of the American housewife took shape, one suitable for an age of invention and consumption: an ideal wife and mother, who wisely bought and used the modern conveniences of appliances and processed foods to alleviate her toil, allowing her to always dress nicely, smell good, and be ready to meet her husband's needs when he came home at the end of the day.

Food journalism contributed to this household consumer revolution and ideological instruction through the many stories, columns, and advertisements promoting kitchen appliances and the use of processed foods that appeared regularly in local and national newspapers and magazines. Thus the often symbiotic relationship between food writing, advertising, and the various food industries that continues to influence food journalism in the twenty-first century was established early on.

Postwar Expansion

Food writing remained largely the province of the women's pages and advice columns through the 1940s. In the prosperity that followed World War II, however, interest in food and food writing began to breech its domestic confines. New York writers documented the coming of French haute cuisine to the United States in the person of Henri Soule, a French chef who opened New York's premier French Restaurant, Le Pavillon, in 1941. It soon became the training ground for a generation of chefs who went on to open their own restaurants. Other writers, notably Mary Frances Kennedy (M. F. K.) Fisher and Clementine Paddleford, traveled around the country discovering humble regional cuisines and sharing their discoveries with their readers.

As an increasing number of Americans enjoyed more leisure time and disposable income after 1945, they began to eat out more regularly and to take an interest in food that went beyond the moralistic advice columns of how to prepare efficient, nutritious meals for the young generation of citizens, or how to buy and use new consumer goods. These early columns were slowly supplanted by stories that intertwined recipes with personal experience, culinary history, and journalistic descriptions of people and places. While advice did not

disappear from food writing, it changed with the times. Women, some of whom had returned from war service overseas or in the nation's factories, were encouraged to stay home and learn how to cook delicious, fun meals for their hard-working husbands and growing children; and men were taught that home cooking was no longer for women alone: that the backyards in the new suburbs were perfect for weekend barbeques, where they could grill robust steaks and burgers in their outdoor "kitchens" without compromising their masculinity. Some food writing thus continued its ideological function, teaching Americans how to conform to accepted gender roles and other norms of the white, Christian, middle-class home—and continued to teach Americans how to be "good" consumers of the new food products and appliances continually flooding the markets.

By the 1940s and 1950s the first well-known food writers that would form the foundation of the canon of American culinary journalism emerged. One of the most influential and prolific was M. F. K. Fisher, a writer who continues to exert tremendous influence on culinary journalists. Fisher loved reading magazines from an early age because they served as her source of escape and emulation, and this love influenced her preference for short narrative forms (Reardon 2006, xii). Fisher introduced a style of food writing that soon became popular: integrating recipes into personal stories that chronicled her travels and impressions of the places she visited and lived in. She shied away from writing about food analytically, as an amalgam of ingredients and nutrients. Nor did she treat food and its preparation as a civic or domestic duty. Instead, she wrote about food as a pleasure to be enjoyed alone or in the company of family and friends. Fisher published more than 25 books and contributed regularly to such magazines as *Gourmet, The New Yorker, The Atlantic Monthly,* and *Vogue*.

As Fisher traveled the United States and Europe gathering material for her work, other writers were describing American regional cuisines for readers of newspapers and magazines. One of the most popular of these was Clementine Paddleford, who worked as the food editor for the *New York Herald Tribune* from 1933 to 1966, and contributed regularly to other newspapers and magazines, including *Gourmet,* which had been launched in 1941 as a magazine for stylish living.

In 1951, Paddleford learned to pilot a plane so she could fly around the country discovering local dishes, which she shared with her readers. Like Fisher, Paddleford gave readers not only recipes but also vivid descriptions of the people, places, and traditions she had discovered, broadening her own and her readers' culinary knowledge and experience. She also redefined the target audience for food writing, believing that although most men might not be interested in reading recipes or suggestions for setting a festive table, they would be interested in reading stories about specific foods and the people and places in which they were produced, prepared, and consumed.

From 1948 to 1967, Paddleford traveled more than 50,000 miles a year documenting local cuisines. By 1953, she had become so popular that *Time* magazine declared her the "best known food editor in the United States." Her collection of regional recipes joined other early books that treated American cooking seriously, including the works of Sheila Hibbens, who wrote the food column "Markets & Menus" for *The New Yorker* magazine and served as a consultant for White House menus under Eleanor Roosevelt.

Although the number of food journalists writing in mid-century was small, those who did take food as their beat began treating it as more than an opportunity for sharing recipes and advice, seeing it as an occasion for telling stories. Interest in food as a leisure and educational activity grew and the nation's first food television programs were broadcast. Food, in certain contexts such as the backyard barbeque or the professional kitchen, also became an increasingly acceptable passion for men. For example, in the 1930s a radio cooking show called *The Mystery Chef* was hosted by a man named John MacPherson, who concealed his identity to protect his mother who "found the idea of her son doing such a feminine thing as cooking disturbing" (Iness 2001, 94). But by 1946 when the National Broadcasting Company (NBC) invited celebrated chef and cookbook author James Beard to host a short cooking segment on the variety show "Elsie Presents," the network and its audiences were ready to tentatively accept the authority of a man in the kitchen.

Even though the concept of men-in-the-kitchen was gaining popular acceptance, it took a bit longer to take hold in the nation's premier newspaper, *The*

New York Times. When Craig Claiborne applied for the job of the paper's food editor in 1957 to replace retiring editor Jane Nickerson, he was met with skepticism. It was only after intense lobbying that the *Times* agreed to hire him as the first male food editor of a major American newspaper.

During his tenure at the *Times,* Claiborne changed the way food journalism was practiced, treating it as a "bona fide arm of journalism" (Kamp 2006, xv). Kamp argues that while writers such as A. J. Liebling and Joseph Wechsberg wrote about food in a memoirist vein, Claiborne "treated food as a journalistic beat, a daily responsibility to sniff out what was going on in America's more creative kitchens" (2006, 70). Claiborne found creative kitchens in professional restaurants and culinary schools, as well as private kitchens, and he wrote avidly about both professional and amateur cooks that he found newsworthy. Claiborne also instituted the restaurant review and in 1963 his reviews became a regular feature of the Friday paper. That same year, he introduced the system of rating restaurants by awarding them one, two, or three stars.

Claiborne became a food editor at a time when Americans were increasingly open to unfamiliar cuisines. Julia Child, one of the nation's first celebrity chefs, introduced Americans to French cooking through her best-selling book, *Mastering the Art of French Cooking* (1961), and through her popular television program *The French Chef,* which was first produced by Boston public television and then broadcast across the country. Claiborne also did a great deal to broaden his readers' appreciation for the foods of the world. Thus, food writers stimulated interest in international cuisines and guided readers in how to buy and use the latest ingredients and kitchen wares coming in from abroad.

By the 1960s, Julia Child, James Beard, and Craig Claiborne had become so popular and powerful that they formed the triumvirate of an emerging "food elite," which included a "small group of New York-based sophisticates who, via newspaper columns, magazine work and cookbooks, had national and even international reach" (Kamp 2006, 57).

From Counterculture to "Lifestyle" Nation

The 1960s and early 1970s counterculture challenged the way food was produced, distributed, and consumed in the United States, and encouraged Americans to engage in food practices that were ecologically sustainable, democratic, and humane. "Buy local" became the buzzword and food cooperatives, farmers markets, and organic farms sprung up across the country, making it possible for Americans to bring fresh, organically grown produce and humanely raised, hormone- and antibiotic-free meat to their tables. Alternative markets specializing in natural foods became profitable, as did vegetarian restaurants, demonstrating that it was possible to prepare food using fresh, local, seasonal ingredients without sacrificing taste.

The excitement buzzing through the food world affected food writing as well. Numerous alternative newspapers published food columns for the revolution, including Alice Water's "Alice's Restaurant" in the *San Francisco Express Times, Good Times*' "Eat and Enjoy," the *Quicksilver Time*'s "Food and Fun," the *Fifth Estate*'s "Eat It!," *Kaleidoscope*'s "Politix of Garbage," and the syndicated "Grub Bag," among others.

More mainstream publications also participated in the democratization of food culture: *New York* magazine, for example, ran a column entitled "The Underground Gourmet" by Milton Glaser and Jerome Snyder, both of whom were tired of the relentless focus of major publications on fine dining and set out to review the city's abundant ethnic restaurants and shops. Clay Felker, the editor of *New York,* hired Gael Greene who wrote about food as a pop-culture phenomenon in a sexy, hip, and highly personal style; and Nora Ephron, who wrote a landmark essay for the magazine in 1968 in which she coined the term the "Food Establishment."

In the three decades following 1980, culinary journalism developed alongside restaurants, gourmet shops, boutiques specializing in imported kitchenware, and other markings of a "lifestyle" culture. Indeed, as the concept of "lifestyle" permeated popular discourse, engaging in the culinary arts by eating out, taking cooking classes, participating in wine tastings, buying high-priced kitchen accoutrements, touring exotic locales that promised intensely local and still-authentic cuisines, spending small fortunes on designer kitchens, seeking out organic produce and grass-fed beef, and reading the latest of the hottest food writers became a powerful marker of status and sophistication. But, as the popularity of the international

Slow Food Movement and the work of writers passionate about food suggest, engagement in the culinary arts also satisfied an elemental need to participate in a sustainable way of living that celebrated the leisurely sharing of good food with family and friends, and that nurtured individual creativity in professional and home kitchens.

Where fewer than 20 food magazines were published in the United States in the 1950s, a half century later there were approximately 145 of them, plus quarterlies and newsletters, and the Food Network claimed 78 million viewers. Opportunities for food journalists were never greater. Food journalists, like the chefs they cover, were also gaining power and celebrity status, exemplified by the success of Ruth Reichl, Alan Richman, Jeffrey Steingarten, Molly O'Neill, Mimi Sheraton, Calvin Trillin, and others. Interest in the work of food writers from the past has also been rekindled, and a number of retrospective anthologies are appearing.

Foreign Correspondents, Electronic

Several historians declare that the foreign correspondent—the reporter covering events outside the country—is an endangered species. This description applies to traditional electronic media correspondents in particular. Since 1980, American networks closed most of their overseas bureaus and have decreased their international news coverage. Neither the terrorism of September 11, 2001, nor the war in Iraq has reversed these trends. In a review of the year 2007, for example, the *Tyndall Report* (which monitors network television news) found that while the war in Iraq was the story of the year by a wide margin, the networks' foreign bureaus had their lightest workload since 2001. Economic pressures, global interdependence, and technological innovations—and a perception of public disinterest—have changed the way foreign news is reported and consumed. At the same time, international news is appearing in new and less traditional packaging, which suggests species development more than extinction. Cable television, countless blogs, news websites and YouTube videos offer the near equivalent of a multimedia wire service, albeit lacking the credibility and professional rigor of traditional media. In a fragmented media landscape, Americans who seek international news can find more of it, while those who lack interest can avoid it.

Radio Correspondents

By the late 1930s a new breed of network foreign correspondents helped to transform radio into a pervasive news influence in American life. David Hosley (1984, xi) describes the summer of 1940 as a time when journalists, medium, and moment made a perfect combination. American radio commentators broke rules, innovated, and competed for exclusivity. There was little precedent, so they had room to create tradition.

While the major radio networks began experimenting with broadcasts from abroad in the 1930s, the few items aired usually consisted of musical programs or cultural curiosities, almost never breaking news.

NBC's correspondent in Europe, Max Jordan (1895–1977), let his sources believe that his network was *the* "national" network, which made them more eager to work with it. This gave it an early edge. CBS, however, soon caught up. Its correspondent Hans von Kaltenborn (1878–1965) won a prestigious award for his live broadcasts during the Spanish Civil War and then for translating and analyzing broadcasts from Europe during the month-long Munich crisis of late 1938. When Edward R. Murrow (1908–65) was sent to Europe as the new "European director" of CBS in 1937, he lacked any journalism experience. At the time, the networks thought of radio more as an entertainment than a news medium. The August 1940 German bombing of London prompted Murrow's series of "This is London" broadcasts, in which he showed his narrative genius. Murrow became a legend. His understated and steady live broadcasts, even in the midst of chaos, used human interest to get people involved in the tragic stories of war. Similar salutations—"This is Berlin," "This is Rome," "This is Paris"—were soon uttered by the talented correspondents Murrow recruited and molded for CBS. Overall, the CBS News staff grew from 4 in 1939 to more than 60 by 1941.

The first journalist recruited by Murrow was out-of-work reporter William L. Shirer (1904–93). While the Spanish Civil War and the 1936 abdication of King Edward VIII of Great Britain were the first European events to receive elaborate coverage from the three American networks, it was the reporting of the March 1938 *Anschluss,* Hitler's annexing of Austria, that altered the character of radio foreign correspondence. Shirer was in Vienna when German troops rolled in on March 12, 1938. German soldiers occupied his studio before he had a chance to contact CBS. So he flew to London and delivered his chilling story of the events he had just witnessed. CBS news director Paul White developed a new broadcasting technique, the "European News Roundup." Correspondents (many of them part-time print journalists) stood by microphones in several European capitals to provide their live perspective on changing events from their vantage points. Newsman Bob Trout in the New York CBS studio coordinated 16 such roundups during the *Anschluss* period, being in simultaneous telephone contact with Pierre Huss in Berlin, Edgar Mowrer in Paris, William Shirer or Edward R. Murrow in London, and Frank Gervassi in Rome. The *Anschluss* broadcasts were possible because seasoned newspaper correspondents helped with the coverage and shortwave radio made possible the live transmissions over such a distance.

"Murrow's Boys" (a group that included a woman) grew with the addition of Eric Sevareid, Tom Grandin, Larry LeSueur, Charles Collingwood, Howard K. Smith, Winston Burdett, Bill Downs, Mary Marvin Breckinridge, Cecil Brown, and Richard C. Hottelet. Many of these correspondents became everyday household names. As just an example, Collingwood's (1917–85) scoops of war news in North Africa resulted in newspaper correspondents increasingly quoting his on-the-spot reports.

During the 18-day Munich Crisis, prompted by Germany's territorial demands in the Czech Sudetenland in September 1938, CBS provided complete coverage, bringing the American public up-to-date news as it occurred. NBC mounted a

similar effort, augmenting its personnel in London, Paris, and Geneva. Throughout the month, CBS carried 151 broadcasts and NBC 147, from a total of 70 correspondents. Although the Mutual network (MBS) did not possess a newsgathering service comparable to CBS and NBC, it did have its own correspondents in London. To reduce the high costs of maintaining transoceanic phone communications, MBS correspondents often telegraphed their copy to New York, where an announcer would read it.

To a considerable degree, radio reporting through its speed, dramatic appeal, and sense of participation displaced the newspaper as the dominant source of foreign news. Moreover, the Munich Crisis made it clear that war was imminent in Europe, which pushed networks to perfect their means of reporting from abroad. When the conflict broke out in September 1939, the American networks benefited from enlarged European staffs, better equipped newsrooms, and improved transmitters that helped the correspondents relay dramatic broadcasts.

While NBC and to a lesser extent Mutual had many of their own glory news reports during the war, CBS was widely recognized as having done the best overall job. Some 600 radio editors voted that CBS had done the "best news job in radio" in its coverage of V-E Day and the final Japanese surrender.

After the war, CBS's bureaus around the world, staffed by journalists with education and skill, rivaled the foreign services of the great newspapers. Murrow and his correspondents were the standard against which excellence in foreign broadcast reporting was measured. NBC as well as CBS continued to broadcast highly informative radio programs on foreign affairs into the early 1950s, and occasionally thereafter. National Public Radio provided excellent international news reports by the 1990s, but it was the exception as the rest of the radio business focused on music and talk shows.

The Television Foreign Correspondents

Most correspondents, drawn from radio at first, doubted the journalistic potential of the upstart medium of television. After all, the need for make-up and bright lighting had little to do with news substance. They didn't like all the equipment or having to take instructions from a director or cameraman. The president of CBS, Frank Stanton (1908–2006), had to beg Murrow and Erik Sevareid to appear on television reports during the 1948 political conventions. "I wish God dammed television had never been invented," Murrow complained (Mickelson 1988, 124).

Even Murrow and his "boys" could resist only so long. In 1951 Murrow's *Hear It Now* radio program morphed into *See It Now,* a weekly television news documentary program. CBS overseas correspondents begrudgingly mixed television with radio work until 1954. The nightly 15-minute newscast on CBS television was soon drawing a bigger audience than the network's most popular radio programs. Television was clearly going to be American's primary source of news.

Several factors gave continuing weight to foreign news on television well into the 1970s: the quality of the correspondents, the long cold war, and the shorter but hotter Vietnam conflict, which kept foreign policy in a crisis mode; Federal Communications Commission regulations that made local station licenses contingent on public interest broadcasting; and, perhaps, the momentum from World War II coverage. Both CBS and NBC expanded their 15-minute evening newscasts to a half hour in 1963 (ABC followed four years later), which meant more airtime to fill.

The Vietnam War, called "the living-room war" because of nightly coverage on television, was a high point in television foreign reporting. The first network correspondent to open a full-time bureau was Garrick Utley of NBC in 1965. Soon Saigon was the largest overseas bureau for each network. Some reporting, vivified by the television images, became iconic. In August 1965, CBS's Morley Safer filmed Marines setting the village of Cam Ne ablaze with cigarette lighters, painting one of the first bleak pictures of the Vietnam War—and noting the irony of having to destroy the village "in order to save it." In 1967 Frank McGee of NBC examined the contribution of black troops to the war in the documentary program *Same Mud, Same Blood.* The surprise Tet Offensive by the North Vietnamese and Vietcong guerillas in January 1968 shocked Americans. Unlike most previous combat, which took place in small skirmishes at night, this fighting occurred in daylight, where television cameras could capture it. In a memorable scene in news history, an

NBC camera caught a South Vietnamese general shooting a captured Vietcong fighter.

Pentagon officials complained that television was running too many confusing battle scenes and presenting dour reports, which they thought eroded public support. In fact, television journalists supported the war effort for a long time, only showing overt skepticism after the Tet Offensive. Emblematic of this change was CBS anchorman Walter Cronkite (1916–2009), who traveled to Vietnam to see for himself. Distressed by what he saw, Cronkite ended his February 28, 1968, documentary on the trip with an editorial comment that the war could not be won. Cronkite's comment followed a wave of similar newspaper reports. His comments also agreed with sentiment among a growing majority of Americans.

Into the early 1980s, the networks continued to operate bureaus in cities around the world. Along with CNN (Cable News Network), they provided outstanding crisis reporting from 1989 to 1991—the Tiananmen protests, the fall of the Berlin Wall, the toppling of Communist regimes in Romania and Czechoslovakia, the dissolution of the Soviet Union, and the first Iraq war.

When CNN started its 24-hour cable news operation in 1980, it was heralded for its considerable foreign news. CNN established a large network of bureaus (10 domestic and 26 international as of 2008) and several regional and foreign-language networks around the world. CNN led in providing live coverage abroad by making use of new, lightweight equipment. Live foreign news came to be available the way local news was. Coverage of the first Gulf War and other crises of the early 1990s led many to assess the so-called CNN effect, the perceived impact of real-time, 24-hour news coverage on U.S. diplomacy and foreign policy.

From its beginnings, television struggled to speed up reporting. Speeds of news transmission quickened in a succession of phases: replacement of motion picture film with portable video in the 1970s; satellites with portable uplinks for live coverage in the 1980s; digital technology that facilitated rapid editing on computers and the creation of engaging graphics in the 1990s. In 1989, correspondents had to carry 800 pounds of equipment. It took between five and seven hours to set everything up and make a live feed to the United States. By 2003, for reports from Iran, all the equipment fit in two cases, for a total of 140 pounds, which looked just like large luggage to Iranian airport customs and the border guards. It took one technician just about 20 minutes to set it up.

By 2005, the development of small digital equipment made it possible for Kevin Sites, formerly war correspondent for CNN and NBC, to become a one-person television crew who reported, edited, and transmitted stories for Yahoo! News while on the run all over the world. He spent one year traveling to 22 war zones, reporting on victims in conflict for the website Kevin Sites in the Hot Zone. He helped pioneer the so-called video journalism or solo journalism ("SoJo"), a practice employed extensively by the BBC.

Television abroad took an upswing with the invasion of Iraq, which correspondents covered at considerable peril. ABC's new anchor Bob Woodruff (1961–) followed in the Cronkite tradition of anchors traveling abroad and visited Iraq in 2006. He was severely injured by a roadside bomb. But by 2006, the number of broadcast foreign correspondents stationed abroad had fallen by about 50 percent. For almost a year in the mid-1990s, ABC's Jim Bittermann (1947–) found himself "the only full-time, on-air correspondent for ABC News based between London and Antarctica" (Foote 1998, 74).

Meanwhile, modern communications technology has transformed coverage in ways that can be described as both good and bad. New technology has made it easier to travel, even for local stations, which can do occasional reporting abroad because of lower costs and ease of travel. Technology has transformed the idea of bureaus. Now when news breaks in a remote corner of the world, correspondents can fly in and report live. The downside is that they have less time for gathering facts, working under the imperative to go live, which is much less expensive than highly edited and produced programming. Correspondents spend less time crafting scripts and more time speaking extemporaneously. "Lost is the editorial process of balance, thought, structure, and confirmation of facts," said broadcaster Garrick Utley, who worked as correspondent for three networks. Technology favors live coverage, which, Utley argued, is more appropriate for sports events than serious news. Also, as they get parachuted in on a needs basis, correspondents have less expertise in that specific region than in the days when a reporter was stationed in one place for years.

One sign of the lessening attention to foreign news over television is that each generation of anchors has less experience abroad than the one before. CBS anchor Walter Cronkite was a United Press war correspondent in Europe and after the war the UP bureau chief in Amsterdam and Moscow. His successor, Dan Rather (1931–), took a break from being White House correspondent in 1965 to report from London, where he jumped off to cover other stories, and subsequently Vietnam. In London he broadcast from Murrow's old studio. Rather was followed by Katie Couric (1957–), who had been a host on the entertainment-heavy NBC *Today* show. Her major foreign experience, some years earlier, had been a short-term assignment to cover the Iraq invasion of Kuwait. NBC anchor John Chancellor (1927–96) was a correspondent in Vienna, London, Moscow, Brussels, and Berlin before becoming the network's anchor. Thomas Brokaw (1940–), never a foreign correspondent, came after him. Brokaw made his name as White House correspondent and, like Couric, as a *Today* show host. Brokaw's successor Brian Williams (1959–), who came from an anchor job on the cable channel MSNBC, had only episodic overseas experience.

Peter Jennings (1938–2005) was an exception in terms of foreign experience. He won the ABC anchor seat in his 20s. Realizing he was not ready for the job, he asked to go abroad instead. In addition to postings elsewhere, Jennings was for seven years the bureau chief in Beirut at the first American television news bureau in the Arab world. In 1983, with his authority very much established, he became the anchor and senior editor of *World News Tonight*. Foreign correspondents, Peter Jennings commented not long before he died in 2005, are "very hard to recruit. They are told, first of all, it's not the hottest thing. It's not the way to get to the top." With decline in network interest in foreign coverage, would-be anchors find it better to establish their credentials at home.

Changing Correspondents

Thirty years ago the three major networks were the exclusive source of broadcast images from abroad. Today images stream into living rooms from a wide variety of electronic sources, some of which are versions of print outlets. The modern audience—more fragmented and active—is far better able to choose and even shape the news it wants to see and hear.

Consumers of Internet news are taking on functions once the prerogative of editors. Internet users can be much more specific about the international news that they want to read, view, or listen to. MSNBC's website allows consumers to personalize the type of international news by region, as print has morphed into electronic media. *The New York Times*' news tracker allows people to create a subject or keyword-based filter alerting them when an article is published with those words. Or audience members can surf for their own news. Immigrants or Americans with a particular interest in another part of the world can read foreign newspapers online, a process that creates another new variety of foreign correspondent: the "foreign national correspondent," who may be a reporter in India writing for an Indian daily, whose work is read over the Internet by a resident of Indianapolis. That same reader also can access specialized websites run by nonjournalists or freelancers. For example, freelance reporter Christopher Allbritton successfully set up a personal website and asked readers to make online donations to finance his travels to Iraq. The so-called PayPal journalist was then able to tell the story directly to his paid readers rather than adopt an editor's focus or bias. On his site, *Back to Iraq* (http://back-to-iraq.com), Allbritton calls his work "pure, individual journalism using a laptop and a satellite phone, done without the protection of the Department of Defense embedding program or a bulletproof vest." With the support of more than 1 million readers, he raised in 2003 almost $20,000. By May 2004, daily readership was almost 50,000 people.

With groups and individuals able to post information on websites, anyone now can be an amateur foreign correspondent. On September 11, 2001, nearly one-half of Internet users looked for news about the terrorist attacks, marking a trend where people increasingly rely on online news sources during crises. The images that defined the media coverage of the July 7, 2005, London terrorist bombings, which claimed more than 50 lives, came not from professional news crews but from everyday people. Commuters caught in the attacks used camera phones to take images that were relayed across the world, providing hundreds of eyewitness pictures. It was a first for such a major breaking news story,

followed by similar correspondences when Hurricane Katrina hit in late August 2005, when several tsunamis shook the Indian Ocean, and when war broke in Lebanon in July 2006.

Filling the increasing void in foreign correspondents, so-called parachute journalists have become the alternative of choice for large media organizations when they are obligated to cover a foreign story. When a story happens—like the most recent war in Iraq—reporters are sent in to cover events in the region temporarily. NBC foreign correspondent John Chancellor (1927–96) expressed concern in the 1990s about how the networks were closing foreign bureaus and replacing "veteran journalists, bureau chiefs who had lived in their areas of coverage and who spoke the languages . . . with parachute reporters, just off the jet, there for a day or two, who knew little about the territory and the people involved." Nonetheless, as the national media use this technique to render foreign news more economical, local news outlets that previously had no foreign reporting have also employed parachute journalism. Therefore, contrary to the view that parachute journalism is bad, this type of correspondence can increase and broaden foreign coverage.

Technology has other tradeoffs when it comes to foreign correspondence. There are fewer bureaus overseas, but stories arrive home faster and more reliably. Speed, on the other hand, means more pressing deadlines, hence less time for reporting and reflection. Moreover, with the help of a phone connected to a satellite link, editors can better direct their distant reporters' work, which means less freedom and autonomy for correspondents, but better editing and coordination. While Internet foreign news can be a source of error, rumor, or propaganda, especially that provided by do-it-yourself journalists, it also offers valuable perspectives on the news often missed by traditional media, especially when the number of traditional foreign correspondents is in decline. Moreover, the ability of the public to get foreign news for itself may offer one of the best solutions to dwindling foreign reporting by traditional media.

Notable Foreign Correspondents

Christiane Amanpour (1958–)

Amanpour is probably the best-known foreign correspondent of our times. Amanpour grew up in Iran and England and moved to Rhode Island to study journalism. After graduation in 1983, she landed an assistant's job on CNN's international desk in Atlanta. She was transferred to Eastern Europe in 1986, just prior to the fall of Communism. Amanpour was elevated to CNN foreign correspondent in 1989, when she reported on democratic revolutions in Eastern Europe. She first attained widespread acclaim for her coverage of the Persian Gulf War in 1990, followed by award-winning reporting of the conflicts in Bosnia and Rwanda. Based in London, she has reported from war zones in Africa and the Middle East and exhibits a talent for securing exclusive interviews with political leaders.

Jim Bittermann (1947–)

Bittermann worked as a European correspondent for NBC News from 1978 to 1990. Stationed in Rome and then Paris, he covered two Papal transitions and many of the decade's major international stories in Eastern Europe, Northern and Western Africa, the Middle East, the Philippines, Japan, and the Soviet Union. As an ABC Paris correspondent until 1996, he reported on the dissolution of the Soviet Union, the Gulf War and the Middle East peace process, and U.S. deployment in Somalia. He has been the CNN Paris correspondent since 1996. He received a National News Emmy for his coverage of the 1988 Sudan famine.

Tom Fenton (1930–)

After working as a foreign correspondent for the *Baltimore Sun,* Fenton joined CBS News as a Rome-based correspondent in 1970 and conducted the first interview with hostages taken that year by the Palestine Liberation Organization. When Ayatollah Khomeini overthrew the Shah of Iran in 1979, Fenton was the first western journalist to interview Iran's new leader. He later covered the Iran hostage crisis, the first Gulf War, the fall of the Soviet Union, and the violence in the Middle East and Africa.

Max Jordan (1895–1977)

In 1934, German-born Jordan became NBC's full-time European Representative, based in Switzerland. "Ubiquitous Max," as he was known, had worked for Hearst newspapers in the United

States and abroad before joining NBC. He had lived more than 20 years in Britain. Besides on-the-spot reporting, he arranged special broadcasts and talks by prominent Europeans, securing NBC an initial edge in foreign news. In 1934 he reported from Vienna the assassination of Austrian chancellor Engelbert Dollfuss. Among his many scoops, Jordan was the first American to broadcast from the Zeppelin *Hindenburg* over the Atlantic, from Munich during the 1938 crisis, and from German-occupied Paris in 1940.

Edward R. Murrow (1908–65)

Murrow started his career at CBS in 1935, and he became its European director in 1937. His background was in public speaking and drama. He understood the difference between broadcasting and the printed word, and his broadcasts from Vienna and London made him a household name, as familiar as those of Churchill and Roosevelt. His great, baritone voice and sense of how to speak placed him ahead of all radio newscasters. During the bombing of London in August 1940, Murrow showed his narrative genius and also risked his life to tell his (partisan) stories of British heroism. After the war, he broadcast *Edward R. Murrow with the News* nightly at 7:45 p.m. on the CBS radio network until 1959.

William L. Shirer (1904–93)

Shirer had worked as a correspondent in the Paris office of the *Chicago Tribune* and the *New York Herald* before becoming a "Murrow boy" in 1937. During the annexation of Austria, he had to leave his Vienna office, which was occupied by the Nazis. At the start of World War II he reported from Berlin, where he remained until his return to the United States in December 1940. Shirer worked for Mutual from 1947 to 1949. His intimate involvement with Hitler's Germany made him a foremost U.S. authority on the Nazi era, and his expertise led to several decades of book writing and lecturing.

Hans von Kaltenborn (1878–1965)

Radio's first regular news commentator, von Kaltenborn became a celebrity after his around-the-clock Munich crisis commentaries for CBS, when he made 102 broadcasts in 18 days, many of which were extemporaneous. He had extensive overseas experience as a former newspaper foreign correspondent. His talent in securing interviews with heads of state around the world and his precise, somewhat unnatural diction made him sound serious and authoritative, although he wasn't always consistent in his commentaries. Politicians accused him of exciting listeners' emotions about the war and of openly expressing his pro-British and pro-involvement stance, while those who tuned in loved his emotional outbursts. On November 2, 1941, he actually called for a declaration of war against Germany, after being equally outspoken about Japan—well before Pearl Harbor.

Garrick Utley (1939–)

Utley the son of an NBC commentator, was the first full-time correspondent to cover the Vietnam War from Saigon. He then served as NBC's correspondent in Berlin and in Paris. Utley was the Senior European Correspondent for NBC News, based in London, from 1973 to 1979. Utley anchored several of the weekend editions of NBC *Nightly News* from 1971 to 1973, and again from 1988 to 1993. From 1993 to 1996, Utley returned to London as Chief Foreign Correspondent for ABC News. He joined CNN in 1997 after 30 years of covering more than 70 countries for NBC and ABC.

Conclusion

Because of the nature of foreign news, the evolution of correspondence has been shaped as much by technology advances as by news executives and economic pressures. Also, the peak in audiences that National Public Radio reached in 2007 (26.5 million per week) is notable in light of general declines in audience for commercial radio, television news, and newspapers, showing that sizeable audiences are still interested in serious international news.

Foreign Correspondents, Print

In 1928, the *Chicago Tribune*'s *Pictured Encyclopedia of the World's Greatest Newspaper* defined foreign news in romantic terms, arguing that, at the mere mention of the words "we catch visions of a pith-helmeted correspondent dashing into the Sahara on camelback after a flying column of the Foreign Legion; we see another seated at a desk in some battlemented European castle, interviewing a statesman who holds the destiny of a nation in his hands; we envisage voyages on Chinese junks, airplane flights over the Holy Land, and all the color and lure of seeing distant countries and reporting international affairs."

In a time when foreign newsgathering is more than ever a matter of national security, these descriptions are only partially true. Traditional print correspondents are still an elite (upper middle class, according to media researcher Stephen Hess). But since the early 1990s their numbers have been shrinking. Three-quarters of the nation's largest 100 newspapers have no foreign correspondents (*The New York Times* had the most in 1992: 37). The Associated Press, with many bureaus overseas, services 97 percent of the 1,600 U.S. dailies. At the same time, it is now rare for a reporter to be stationed abroad for years to develop expertise in a country or region's foreign affairs. Most come home after assignments of a few years. Nor is it only the traditional foreign correspondent who is reporting from abroad. That work is increasing accomplished by a variety of new types of journalists, in some cases local newspaper reporters who can travel abroad on short-term assignments, in others by non-journalists who report what they see and experience online over blogs—some of which ends up in traditional news stories.

Media ownership, advances in technology, America's involvement in world affairs, and the evolution of correspondents' roles and routines have shaped foreign correspondence ever since its early days in the eighteenth century.

First Foreign Correspondents, 1700–1840

America's first newspapers did not have reporters at home, let alone abroad. In the colonial period, editors thought of themselves as printers, publishing newspapers typically as a mere sideline. The newspapers were largely passive and opportunistic in terms of newsgathering. Publishers collected information simply by sitting in their offices waiting for people to drop off letters or strolling down to the port to greet incoming ships. After the Revolution, political parties financially supported newspapers that sided with them. None of these newspapers had reporters, either, much less correspondents as we know them today. The first "foreign correspondents" were travelers to London or Paris who wrote letters home as well as passengers and crew who hove into port with newspapers from abroad and their own stories to tell. European newspapers and journals delivered by sailing ships were the equivalent of today's overseas wire services. Early American newspapers freely reprinted official government pronouncements and other

news found in those foreign journals. Benjamin Franklin's *Pennsylvania Gazette,* for example, lifted more than four-fifths of its news about the British Isles directly from other newspapers. But that "news" arrived no faster than a ship could carry it. This meant well over a month could pass before a story reached the United States from Europe. News dried up when harsh winter weather disrupted shipping or someone lost precious printed cargo.

During the eighteenth century, foreign affairs held considerable interest for the colonists, who had strong ties to the Old World, especially to England, which dominated most foreign news. Those ties were practical as well as emotional. Economic and political policy made in London, Paris, Vienna, and Madrid eventually materialized in the Americas. The Seven Years War in Europe (1756–63) spilled over to the colonies in the form of the French and Indian War. British newspapers provided extensive coverage of foreign affairs for much the same reason American newspapers did: readers saw foreign news as relevant.

The Popular Press Correspondents, 1840–1900

The advent of the penny press and commercial newspapers in the 1840s led to the development of special correspondents who filed from abroad. In the beginning, when the role of reporter was still ill defined, these foreign correspondents were often part-timers with other jobs. Many were still volunteers. James Gordon Bennett (1795–1872), the most successful of the early popular press editors, had special correspondents ("specials") in Glasgow, Berlin, Brussels, London, Paris, Rome, Jamaica, Liverpool, Le Havre, and elsewhere for his *New York Herald*. Full-time reporters later traveled abroad for their publishers. Some of these were highly entrepreneurial in their newsgathering. One example is Henry Morton Stanley (1841–1904), who famously set out in 1871 to find "missing" missionary/explorer David Livingstone in Africa for the *Herald,* then run by Bennett's son. In 1874 the *New York Herald,* in partnership with Britain's *Daily Telegraph,* then financed Stanley on another expedition to the African continent, where he solved the last great mystery of African exploration by tracing the course of the River Congo to the sea.

Journalism was no longer a side trade or a politically subsidized enterprise. It had developed into a substantial business, focused on making a profit. The publisher's business model sought to run reports of lively local news that attracted the great mass of readers local advertisers wanted to reach. Although this model introduced the idea of original reporting, it led to a decrease in the amount of foreign news, not only because of the local emphasis with a strong appeal to urban readers, but also the high cost of newsgathering abroad. Hereafter, foreign news would form but a small part of the average newspaper except during wars and other crises. The few newspapers that did emphasize foreign news were prestige publications that sought to extend their readership to elites.

Beginning in this era, with improved communications and transport, editors began to talk about "the annihilation" of time and space. In the case of urgent news, editors became particularly inventive. When the Mexican War broke out, the New Orleans *Daily Picayune* created a relay system to get news from the battlefields. Riders carried dispatches to the Mexican coast. Regular mail boats carried the news onward to New Orleans. To beat competitors, the *Picayune* sent a small, fast steamer fitted out with typesetting equipment to meet the mail boat. To help reduce the costs of foreign newsgathering, newspapers pooled resources to transmit distant news gathered by others abroad. This became the basis for the Associated Press (AP), organized by a number of newspapers in 1846. At the turn of the century, the AP began a concerted effort to open its own bureaus overseas.

The prospect of getting news faster on a routine basis came with the completion in 1858 of the first transatlantic telegraph cable, which sadly failed within a few weeks. But in 1866, the first lasting "ocean greyhound" cable hummed with foreign news, which then flew across the country by telegraph. Cables were laid between Java and Port Darwin in Australia in 1873 and between Europe and Brazil the following year.

The first modern foreign correspondents were not American.

William Howard Russell (1821–1907)

Russell was an Irish reporter for *The Times,* the British publication that pioneered the practice of sending correspondents to cover certain conflicts in the world. Russell spent two years covering the

Crimean War (1853–56). For the first time the public could read about the reality of warfare, and his dispatches did not shy away from criticizing the suffering that the soldiers had to endure. His attacks on the British military leadership affected the reputation of both the army and the government and led to changes in the treatment of troops. Russell went on to cover conflicts in India (1857) and the Franco-Prussian War (1870–71) as well as in the United States during the Civil War (1861–18).

Given their small numbers and the importance of their jobs, correspondents began to be seen as a professional elite, who operated fairly autonomously from the home office. "The special correspondent must be 'to the manor born,'" observed Julian Ralph in 1893. "He must be as sanguine as a songbird, and as strong and willing as a race horse."

George Washburn Smalley (1833–1916)

Smalley, a correspondent for the New York *Tribune,* was such one elite correspondent. During the 1866 Austro-Prussian War, his first overseas assignment, Smalley displayed characteristic enterprise by obtaining a rare interview with German Chancellor Bismarck. The story caused a sensation in the United States. From his permanent base in London, he acquired deep knowledge about foreign affairs. He was efficient at organizing the flow of European news around special events, whether the Franco-Prussian War of 1870–71 or the Oxford-Harvard boat race of 1869. He functioned almost as an ambassador in Anglo-American relations. Besides covering politics, he wrote widely admired personality profiles of politicians, explorers, clergymen, educators, and artists, actors, and musicians.

Richard Harding Davis (1864–1916)

The first American correspondent to be lionized on the scale of Britain's William Howard Russell, Davis worked as a reporter for the New York *Herald, The New York Times,* and *Scribner's Magazine*. He became famous for his coverage of the Spanish-American War (1898), the Second Boer War in South Africa (1899–1902), and the early part of the World War I (1914–18). His first trip abroad was in Central America in 1895 and resulted in a book as well as magazine articles. He elevated his status further by writing about the glamour and romance of being a correspondent. While covering the early stages of World War I, German soldiers apprehended Davis, thinking he was a British spy. He convinced them he wasn't by showing the label in his hat, "Knox, New York." The story became the basis for an advertisement for Knox, which further enhanced Davis's celebrity. When Davis died of a heart attack in 1916 at the relatively young age of 51, he had established himself as the yardstick by which correspondents' fame would be measured.

Organized Foreign Correspondents, 1900–1920

The beginning of the twentieth century saw a more systematic approach to the news, in which individual correspondents became part of a larger network of news gatherers.

Victor Lawson (1876–1925)

The epitome of organization in newsgathering was Lawson owner and editor of the *Chicago Daily News*. The paper's foreign service was the first thoroughly professional corps of American correspondents abroad and their reporting was eventually syndicated widely. Lawson mixed profit motives with a sense of public responsibility. He favored American reporters reporting for American readers. He believed these journalists needed to go beyond the common practice of combing foreign publications for the news and gather it themselves. He also left correspondents in the field for years to gain expertise.

Paul Scott Mowrer (1887–1971)

Mowrer was Lawson's most famous correspondent. In 1929 Mowrer won the first Pulitzer Prize given for the category of "correspondence." His diplomatic reports from Europe, the jurors said, "most closely approximate the ideals expressed in the award criteria: fair, judicious, well-balanced and well-informed interpretive writing, which shall make clear the significance of the subject covered in the correspondence or which shall promote international understanding and appreciation."

Following the *Chicago Daily News,* other publications began their own foreign services in due course: the *Christian Science Monitor,* which began in 1908 as a Christian Science project against yellow

journalism; the *Philadelphia Public Ledger;* the *New York Evening Post;* the *New York Herald Tribune;* the New York *World;* and the *Chicago Tribune*. The most prominent was *The New York Times,* which was to consistently win Pulitzer prizes for its work abroad in the 1930s and after.

The reports of correspondents benefited from undersea cables and telegraph lines. But technology was expensive to use, and many newspapers focused on less time-sensitive, in-depth reporting that could be sent through the mail. Because it was still not possible for editors to talk to their correspondents directly, overseas reporters still enjoyed a high degree of independence.

The Golden-Age Correspondents, 1920–1970

The two decades between the two world wars, a period when memoir writing by foreign correspondents excelled, is commonly dubbed the golden age of foreign correspondence. Foreign correspondence reached a high point in terms of professionalism, competence, and news quality. Moreover, with their names on books and greater use of bylines in newspapers—all against the backdrop of dramatic international issues—correspondents achieved enormous celebrity. This contributed to their autonomy and, because many were still allowed to stay abroad for long periods, their expertise. As a relatively small group with direct links to the American public, correspondents were treated with deference by the foreigners they covered as well.

Vincent Sheean (1899–1975)

Sheean epitomized the dashing, "I was right there on the spot" school of foreign correspondents. Sheean's biggest break came when he was sent by the *Chicago Tribune* to report on the Riffian revolt in Morocco in 1924. Riff rebel leader Abd el-Krim was willing to talk to any correspondents who managed to make the hazardous trip across Spanish or French lines to reach him. Donning a turban and a loose-fitting robe, Sheean finagled passage through the French lines. A petty tribal chief ambushed him. When orders for his release arrived from Abd el-Krim, the chief relieved Sheean of his money and other valuables. After Sheean interviewed the rebel leader, he was given a tour of Abd el-Krim's dominion. He returned to Tangier in February under a hail of Spanish bullets. Rumors that Sheean had been killed in the Riff improved the story. Building on his budding fame, he struck out as a freelance journalist, traveling to news spots wherever his fancy took him. His reputation was assured with his book *Personal History* (1935), a combination of autobiography and political commentary, which led the way for a number of other best-selling memoirs by foreign correspondents. Those memoirs, which were really extended reports of what correspondents were seeing on the ground, warned of the coming global conflict. Many possessed literary quality.

This "golden age" resulted not simply because correspondents of the time were blessed with talent. The real difference was the conditions in which those correspondents worked, very different than those of the early twenty-first century. For instance, *The Saturday Evening Post, Collier's, Look, Liberty, Life,* and many other popular weekly magazines fielded their own overseas reporters and made extensive use of freelancers like Sheean. Likewise, the North American News Alliance and the Consolidated Press, two specialized news services at the time, flourished. Those media, many of which have since disappeared, paid correspondents well and let them write at length. By the mid-1930s, a growing number of foreign correspondents also worked on radio, using shortwave links to get their reports back to the United States.

Surely helpful to these correspondents was the fact that Americans were well liked abroad and could live well in many countries on even modest incomes. Because of their dramatic and immediate nature, radio and, increasingly after 1950, television replaced print media as the main news source for American audiences. Major daily newspapers and some magazines continued to play an important role, however, because of their in-depth coverage and analysis from celebrity correspondents like the ones noted here.

Dorothy Thompson (1893–1961)

Star correspondents in this era included some of the first great female reporters, notably Thompson. Women were still rare in foreign correspondence during this time. (By the 1970s, about 16 percent of the corps of correspondents were women, a figure that doubled in the 1980s and remained about the

same in the 1990s.) Thompson went to Europe in 1920 where she established herself as a journalist. Upon arriving in London, she received assignments from the International News Service, which was heavily dependent on freelance material, and began selling stories directly to the *Christian Science Monitor, Outlook,* and other publications. By 1925, she headed the Berlin joint bureau of the *New York Post* and the Philadelphia *Public Ledger*. In his 1990 biography of Thompson, Peter Kurth described her as "Richard Harding Davis in an evening gown. Nothing prosaic ever happened to her." She was expelled from Nazi Germany for her negative, belittling reporting of Hitler in 1934, which instantly transformed her into a heroine. In her "I Saw Hitler!" piece published in *Cosmopolitan* in March 1932, she wrote that Hitler "is formless, almost faceless; a man whose countenance is a caricature; a man whose framework seems cartilaginous, without bones. He is inconsequent and voluble, ill-poised, insecure—the very prototype of the Little Man."

John Gunther (1901–70)

Gunter, a friend of Thompson, became famous shortly after her for his *Inside* series of books. Although full of facts and figures, which Gunther collected through prodigious research, these books focused on personalities. The heart of *Inside Europe* (1936) was in its profiles of Hitler, Stalin, and Mussolini. The book reached the best-seller lists in the United States and Britain and made Gunther a national figure. Five more editions appeared in the next four years, and he extended his *Inside* formula to other parts of the planet. To support himself while researching books, which typically took months of travel, he wrote magazine articles while on the road. Whereas most reporters struggled to secure interviews with heads of state, leaders courted Gunther. In the Philippines, while working on *Inside Asia,* he and his wife were entertained on the private yacht of President Manuel Quezon and his wife. China's General Chiang Kai-shek gave him a rare interview. Gunther's books were enormous in breadth and length (*Inside Africa* and *Inside U.S.A.* ran nearly 1,000 pages), and timely, which secured him a popularity that lasted long after Sheean and other foreign correspondents dropped off the best-seller lists after World War II.

Homer Bigart (1907–91)

Bigart is regarded as one of America's most accomplished war correspondents. A two-time Pulitzer Prize winner, he covered World War II and the Korean War for the *New York Herald Tribune,* and later spent six months in Vietnam for *The New York Times*. In 1943 Bigart was one of the few privileged reporters permitted to fly on some of the first daytime bombing raids over Germany, a time when up to 25 percent of the aircraft could be lost. Bigart received his first Pulitzer Prize in 1946 in recognition of his foreign correspondence in the Pacific. He won his second in 1951 for his work in Korea, this one shared by Marguerite Higgins (1920–66), a longtime colleague and rival. Higgins's determination prompted the lifting of the ban on women foreign correspondents in Korea in 1950. She went on to cover the Soviet Union during the cold war and then Vietnam, where she contracted a tropical disease that proved fatal. Her journeys became the basis for several best-selling books.

Harrison Salisbury (1908–93)

Salisbury, who began with the United Press news agency in World War II, served as *The New York Times*' foreign correspondent in the Soviet Union for five years starting in 1949. In 1955 he won the Pulitzer Prize for international reporting, and soon became one of the nation's most respected journalists. Known among his peers for his high journalistic standards, he was named assistant managing editor of the *Times* in 1964. In December 1966, Salisbury was the only Western journalist granted access in Hanoi, North Vietnam. His dispatches, heavily criticized by the administration and other prowar mainstream media, highlighted civilian deaths and injuries and damage to nonmilitary structures by American bombing. Salisbury's reports contradicted the administration's communiqués that the air force and navy pilots hit only military targets with surgical precision. Accusations of relying on North Vietnamese propaganda cost Salisbury a Pulitzer Prize. CIA analyses and historical research later showed that Salisbury, "the teller of unpopular truths" as his obituary in *The Guardian* described him, was accurate in his reporting. He wrote 29 books based on his research and correspondence experience.

For media organizations, foreign newsgathering and elite status were mutually reinforcing during this period. The best organizations gathered news abroad and thereby affirmed their excellence. A similar reinforcing process existed for individual correspondents. They were sent abroad because of their skills or set out on their own because of their ambition. Once overseas, they enjoyed special privileges and trappings that enhanced their status.

During this period a substantial foreign press corps took shape in the United States, according to media scholar Hess, as reporters from all over the world arrived in 1946 to cover the newly founded United Nations. Based largely in New York, they came predominantly from Western Europe and Asia, with Japan and Germany having the largest numbers of correspondents. From 616 correspondents in 1964, the foreign press corps grew to more than three times that number in 2000. As of 2005, 15 percent of the full-timers, those who usually work for the major foreign news outlets, are American citizens. This use of locals as correspondents is a trend that marks American foreign correspondence as well.

The Corporate Correspondents, 1970–2000

In this period, foreign correspondents were far less free-wheeling, less likely to spend decades overseas. The *Saturday Evening Post* and other general interest magazines with an interest in foreign affairs, as well as the *Chicago Daily News,* disappeared. Newspapers also began to eliminate their foreign services, among them the *Baltimore Sun, Newsday,* and *The Boston Globe.*

But there were positive developments as well. A key factor in this change was the nature of media ownership. Growing corporate control and a resulting concern for greater profit combined with concerns about the viability of their product. Foreign news, the most expensive kind, was not the best way to reach and hold newspaper readers, who were slipping away in large numbers. Radio was no longer a central news medium, and television often lacked the time for effective foreign coverage. As media companies grew larger and more diversified, in some cases becoming but a part of general conglomerates, news executives sought to trim costs.

Technology has been one important factor in these changes. Reporters can now travel farther and faster to get to stories. The time between witnessing a story and writing about it has been reduced to basically no time at all. Most newspapers have created a parallel online presence, where news can be published instantly, without waiting for the ink-on-paper version to reach readers. Instant communication has made it possible for the home office to closely coordinate the work of correspondents. In the early twenty-first century, major media that once assigned correspondents abroad permanently rely more on "parachute" reporting by home-based celebrity anchors as a way to cut corners. The term *parachute foreign correspondent* typically is a pejorative. It describes a cost-cutting ploy through which a major news organization reduces the size of its staff of permanent foreign correspondents and instead covers foreign news only when a big story comes along by flying ill-equipped reporters to the scene. This critique overlooks the way parachute journalism adds to coverage. Advances in modern air travel, which make it possible for journalists to go abroad quickly and at lower cost, enable smaller, local newspapers that never had permanent foreign correspondents before to send journalists on special assignments, often to trace local stories abroad. In addition, traditional foreign correspondents are to some degree parachutists. Henry Morton Stanley was a parachutist when he found Dr. Livingston in 1871. Even with the development of modern bureaus, it is not unusual for modern correspondents to travel half the time or more. In 2004, the *Los Angeles Times* had roughly 30 foreign correspondents, one of the largest corps of any metropolitan newspaper, but its Jakarta correspondent covered virtually the whole of Southeast Asia. Assignments became particularly flexible after 2001, with many correspondents leaving faraway posts to cover the fighting in Iraq and Afghanistan.

In the current media climate, it is much harder to be an independent freelance correspondent for either print or broadcast media. Living abroad is no longer cheap for American journalists, and the attraction of a full-time job is much more powerful because of the need for benefits such as health insurance. Nor, sadly, are Americans as admired as they once were.

In this environment, correspondents also are far less often eccentric or flamboyant. "It's a corporation,

and it's a business; it's a brand," said a *USA Today* world editor in a March 2005 interview, "and there is less tolerance for the kind of eccentricities that you used to always see in our profession." The newspaper has a written Overseas Journalist Safety Policy that says, "You must obtain permission from your editors before entering a hostile environment.... You must routinely advise your editors of your movements" (interview with J. M. Hamilton, *Journalism's Roving Eye: A History of American Foreign Reporting,* forthcoming).

Despite this more straight-laced approach to foreign reporting, some correspondents excelled in their courage and insights.

John Burns (1944–)

Burns, with *The New York Times* since 1975, won two Pulitzer Prizes in five years. In 1993 he distinguished himself through his coverage of the destruction of Sarajevo and the barbarous killings in the war in Bosnia-Herzegovina. In 1997 he won the prize for his reporting of the harrowing regime imposed on Afghanistan by the Taliban. After covering Africa, China, Russia, and Iraq, Burns became the paper's London bureau chief in 2007.

Thomas Friedman (1953–)

Similarly, Friedman won two Pulitzer Prizes in 1983 and 1988, respectively. The *New York Times* correspondent, who, like Salisbury, began with United Press International upon graduating, won his first Pulitzer for his coverage of the 1982 Israeli invasion of Lebanon, and particularly the Sabra and Shatila massacre against Palestinian refugee camps in Beirut, in September 1982. Assigned to Jerusalem from 1984 to 1988, Friedman received a second Pulitzer Prize for his coverage of the First Palestinian *Intifada* (uprising against Israeli military occupation). His subsequent book, *From Beirut to Jerusalem* (1989), described his experiences in the Middle East. As of 2008, he was a foreign affairs columnist with the *Times*.

Trends in the Early Twenty-First Century

While serious foreign newsgathering by *The New York Times* and other prestige newspapers and magazines continues, new forms of foreign correspondence have emerged and flourished by taking advantage of new technologies. The overall result is a broader, more variegated class of foreign correspondents that, if still imperfect, ensures continued foreign news flow and forms a basis for improvement.

Print and broadcast news have blended online, sometimes in specialized services. The outstanding example of this is Bloomberg News, which has 1,250 reporters outside of the United States in about 80 bureaus. It provides news to clients on special computer terminals, but Bloomberg reports are also syndicated in 500 publications, including *The New York Times*. Also, the Internet allows news consumers to access newspapers online around the world, virtually making them their own foreign correspondents, especially if they can read more than one language.

Conclusion

Even in the great days of foreign correspondence, readership of international news was problematic. Foreign reporting, Sheean complained, was substantially useless because the forces of public opinion and of official power paid so little attention. In this light, the best hope for improved coverage of foreign affairs lies in new approaches, creating partnerships, making more and better use of indigenous journalists abroad, and constantly applying changing technology. While newspapers cut down on international news (with the notable exceptions of *The New York Times,* the *Los Angeles Times, The Washington Post,* or *The Wall Street Journal,* each of which maintain substantial foreign staffs and produce first-rate reports), the claim that readers don't want foreign news doesn't bear out. They do in times of crisis. On a more routine basis, foreign news readership is on par with that of Washington politics (17 percent), and ahead of consumer news (12 percent) and the entertainment (12 percent) coverage that is heavily produced nowadays, according to a 2006 report by the Pew Research Center for the People & the Press. These internationally aware news consumers will, as they have since the nineteenth century, have to rely on prestige or specialized media to stay informed about our increasingly interdependent planet.

Foundations, Research Centers, and Institutes

Journalism is served by a plethora of foundations, institutes, and research centers, virtually all of them dedicated to improving the news media and their products. Some are tied to academic institutions and based on their campuses (usually as an integral part of their journalism programs), though many were at least initially funded by endowments or other gifts from wealthy individuals, some of them journalists themselves.

Most tend to focus on a specific aspect of the news media, and some espouse specific viewpoints. A number offer scholarships and fellowships or annual awards that are detailed elsewhere. Not noted here are the many media industry individual company or trade organization educational foundations that many news media groups operate. These generally focus on training and scholarships, seeking to provide support for those seeking careers.

The very number of such organizations is surely one indication of the importance of journalism in society—but can also be a source of confusion. While some have quite specific functions, others are wide ranging, and the overlap is obvious. Some are fairly "quiet," centering on training and other background functions, while others are far more active in participating in the public debate about the changes in journalism, how to improve its performance, or expressing concern about a lack of objectivity or coverage of some aspect of daily life.

What follows is a partial directory of those entities operating at the time this project went to press, with descriptions drawn largely from the organizations' own websites.

Key Organizations

American Press Institute

Founded by newspaper publishers in 1946, the American Press Institute (API, http://www

.americanpressinstitute.org) is the oldest and largest center focused upon training and professional development for both news practitioners and journalism educators. API conducts more than 30 residential seminars a year for journalists and sales, marketing, and management professionals in print, broadcast, cable, and digital media companies. API offers "tracks" of programs that focus upon key parts of news organizations: advertising, circulation, the editorial function, general management, marketing, and the special issues of weekly newspapers, all building on what has been learned from its ongoing Newspaper Next project. API also develops customized training seminars on news content, journalism values, and effective leadership and management, and continues to design educational programs for news people and organizations in other parts of the world.

Casey Journalism Center for Children and Families

The Casey Journalism Center (CJC, http://www.journalismcenter.org/index.cfm) was created to teach about and recognize exemplary reporting concerning children and families. Since 1993, thousands of print and electronic journalists have attended its training programs and relied on CJC for information about children and family life. CJC is a nonprofit program of the Philip Merrill College of Journalism at the University of Maryland. Its two- and five-day fellowships, news summaries about children and family concerns, and other programs are funded by foundations and individual donors.

Center for Media and Public Affairs

Formed in 1985 by Robert and Linda Lichter (the latter died early in 2009), the Center for Media and Public Affairs (CMPA, http://www.cmpa.com) has been a nonpartisan research and educational organization that conducts research on both news and entertainment media. CMPA election studies have played a part in the ongoing debate over improving the election process. They also analyze late night television program political jokes, the important role media play in communicating information about health risks and scientific issues, and the gap between academic research and the broader domains of media policy. The CMPA's stated goal is to provide an empirical basis for debates over media fairness through studies of media content.

Dart Center for Journalism and Trauma

The Dart Center for Journalism and Trauma (DCJT, http://www.dartcenter.org) was established in 1999 at the University of Washington's Department of Communications as an interdisciplinary clearing house to encourage reporting about victims of trauma. With continuing support from the Dart Foundation, DCJT is responsible for annual Dart Awards and numerous projects linking working journalists, mental health professionals, researchers, and journalism teachers. These programs combine two related goals: educating journalists to report effectively and ethically about victims of violence and tragedy; and encouraging awareness of the psychological impact of such reporting on journalists themselves. Related Dart centers operate in Europe and Australia.

The First Amendment Center

Based at Vanderbilt University in Nashville, Tennessee (with an office in Arlington, Virginia), the First Amendment Center (http://www.firstamendmentcenter.org/default.aspx) was founded in 1991 to work to preserve First Amendment freedoms through information and education. Now a part of the Freedom Forum (see next paragraph), the center studies free-expression issues, including freedom of speech, the press, and religion, and the rights to assemble and to petition the government—the four central tenants of the First Amendment. It has issued an annual report on the state of the First Amendment since 1997 and conducts educational programs.

The Freedom Forum

The Freedom Forum (http://www.freedomforum.org) is a nonpartisan foundation dedicated to free press and free speech. It focuses on three priorities: funding operations for the interactive Newseum in Washington, D.C., supporting the First Amendment, and expanding newsroom diversity. Its First Amendment Center and the

Diversity Institute are housed in the John Seigenthaler Center at Vanderbilt University in Nashville, Tennessee. The Freedom Forum was renamed in 1991 as the successor to the Gannett Foundation started in 1935 by newspaper publisher Frank E. Gannett. It is not affiliated with Gannett as it receives support from an endowment of diversified assets.

Freedom of Information Center

The Freedom of Information Center (FOIC, http://www.nfoic.org/foi-center) is a reference and research library at the school of journalism on the campus of the University of Missouri. Established in 1958, the FOI Center helped support the effort to enact a national Freedom of Information Act. The center operates the most comprehensive library focused on freedom of information concerns—a collection of more than 1 million articles and documents about access to information at the local, state, and federal levels. The closely related National Freedom of Information Coalition (NFOIC), supported by the Knight Foundation, issues grants to support state-level action. Both entities also work abroad.

Freedom of Information Clearinghouse

The Freedom of Information Clearinghouse (http://www.citizen.org/litigation/free_info) is a joint project of Public Citizen Litigation Group and Ralph Nader's Center for Study of Responsive Law. It provides technical and legal assistance to individuals, public interest groups, and news media who seek access to information held by government agencies. It also offers extensive information on filing FOI requests to all levels of government.

Independent Media Institute

The Independent Media Institute (IMI, http://www.alternet.org/about/imi.html) is a nonprofit organization designed to assist people with independent news resources and media tools about social issues. More specifically, it is dedicated to strengthening independent journalism, and to improving public access to such sources. IMI supports AlterNet, a monthly web magazine created in 1998 that focuses on issues of environment, human rights and civil liberties, social justice, media, and health care.

Institute for Justice and Journalism

Founded with the support of the Ford Foundation in 2000 at the University of Southern California's Annenberg School of Communication in Los Angeles, the Institute for Justice and Journalism (IJJ, http://www.justicejournalism.org/index.html) seeks to strengthen news media coverage about the legal system, justice, and injustice. IJJ activities include professional fellowships; direct support and grants for journalists; web-based resources for journalists, journalism educators, and students; and conferences, forums, and collaborative projects.

J-Lab: The Institute for Interactive Journalism

A late 2002 spinoff of the Pew Center for Civic Journalism (see below), the J-Lab (http://www.j-lab.org) is an incubator for innovative news experiments that use changing technologies to better engage people and media in critical public issues. J-Lab's core mission is to improve public life by transforming journalism. It provides seed money to news organizations that propose interactive news ideas, linking them with computer experts to build software and means of navigating it. It is supported by the Knight Foundation (see next entry).

John S. and James L. Knight Foundation

Two brothers established the Knight Memorial Education Fund in 1940 to provide financial aid to college students from the Akron, Ohio, area where they published the local paper. In 1950 its assets were transferred to the more broadly conceived Knight Foundation (http://www.knightfoundation.org). Independent of Knight business interests, the foundation was intended to make small grants to local educational, cultural, and social service institutions as well as to a few journalism-related causes. A turning point came in 1972 when its assets rose to more than $24 million and it initiated an expanded grant program focused on the growing number of cities where the Knights published newspapers. The education of journalists became a more pronounced funding interest. The foundation grew

exponentially with proceeds from the estate of Jack Knight 15 years later, and in 1990 it moved to Miami. By June 2006, total foundation grants surpassed the $1 billion mark since its founding, many of them in the 26 markets where the brothers had operated newspapers. With assets of $2.4 billion, it is one of the largest supporters of centers and institutes and other programs concerned with journalism.

Knight Center for Environmental Journalism

The Environmental Journalism program at Michigan State University's school of journalism (http://www.environmental.jrn.msu.edu/institute.html) was founded in 1994 to train students and journalists to research, report, and write about environmental issues. The center conducts research in environmental and science journalism; provides research assistance to scholars; organizes training institutes; produces educational materials; and houses the Meeman Archive, a collection of award-winning environmental journalism reports in print and electronic form.

Knight Center for Specialized Journalism

Formed in 1987, this Knight-funded center in College Park, Maryland (http://www.knightcenter.umd.edu/index.htm), is a national program providing seminars for print, broadcast and online reporters, editors, and editorial writers. Journalists receive training in such subjects as law, health, science, society, demographics, and national and international affairs. Knight Fellows gain new sources, new reference materials, and further story ideas. More than 2,700 fellowships have been awarded to journalists from more than 460 news organizations.

Markle Foundation

The John and Mary R. Markle Foundation, Inc. (http://www.markle.org) was established in 1927 "to promote the advancement and diffusion of knowledge . . . and the general good of mankind." The first foundation to name both husband and wife in its title, it began with an initial endowment of $3 million. Having worked in other areas, in 1969 the foundation began to refocus on the various roles of masscommunications in a democratic society. The program subsequently expanded to include information technology, focusing in three areas: media and political participation, interactive technologies, and communications policy. Three decades later, the focus changed again, centering on policy for a networked society, health care, and interactive media for children. In the new century it has focused on modernization of the nation's healthcare system and strengthening the country's security against terrorism.

The Robert C. Maynard Institute for Journalism Education

In 1979, Maynard took over as editor of *The Oakland Tribune*, purchasing the paper in 1983, in the first management-leveraged buyout in U.S. newspaper history. By doing so, he became the first African American to own a major metropoli tan newspaper. The foundation (http://www.maynardije.org), which took Maynard's name on his death in 1993, was begun in 1977, dedicated to preparing news professionals of all ethnicities to operate more effectively in the modern but changing multicultural, multimedia marketplace.

National Center on Disability and Journalism

National Center on Disability and Journalism (NCDJ, http://www.ncdj.org/index.php) grew from a need for journalists and educators to better understand the diversity of disability reporting issues. Freelance photographer Suzanne C. Levine founded the Disability Media Project in 1998. The name changed to NCDJ in November 2000; in 2002, it moved into its own office in San Francisco but shifted to Boston in mid-2004. NCDJ offers educational and resource materials for journalists and educators to use in the media, schools, and college and university classrooms.

National Institute for Computer-Assisted Reporting

The National Institute for Computer-Assisted Reporting (NICAR, http://www.nicar.org) is a program of Investigative Reporters and Editors, Inc. and the Missouri School of Journalism. Founded in 1989, NICAR has trained thousands

of journalists in the practical skills of finding and analyzing electronic information on a variety of news topics.

National Press Foundation

With the support of some 80 organizations since 1975, the National Press Foundation (http://www.nationalpress.org) has provided professional development opportunities to more than 5,000 editors, producers, and reporters (some 300 per year), helping them better explain the impact of public policy to its readers and viewers. One and multiday seminars held in Washington and elsewhere bring journalists together with subject experts to discuss significant issues ranging from agriculture to zoology.

The Nieman Foundation for Journalism at Harvard University

The Nieman Fellowships http://www.nieman.harvard.edu) were established in 1938 and are the oldest mid-career program for working journalists. An unexpected gift of $1 million to Harvard in 1937 came with a mandate "To promote and elevate the standards of journalism in the United States and educate persons deemed specially qualified for journalism." The benefactress was Agnes Wahl Nieman, who bequeathed the money to Harvard in memory of her husband, Lucius W. Nieman, the founder and publisher of *The Milwaukee Journal.* Nieman Fellowships are awarded to any type of journalist (print, broadcast, and online reporters, editors, photographers, producers, editorial writers, and cartoonists) with at least five years of full-time, professional experience.

The Alicia Patterson Foundation

The Alicia Patterson Foundation Program (http://www.aliciapatterson.org) was established in 1965 in memory of the longtime editor and publisher of *Newsday*. One-year and six-month grants are awarded to working journalists to pursue independent research and to write articles based on their investigations for *The APF Reporter,* a quarterly magazine published by the foundation (and available on the web).

Pew Center for Civic Journalism

The Pew Center (http://www.pewcenter.org) is an incubator for experiments in civic journalism that help print and broadcast news organizations find ways to engage citizens in dialogue and problem solving. The center shares results from its civic journalism experiments with other journalists through workshops, publications, videos, and outreach programs. Since the center was created, more than 3,500 journalists have attended workshops, and about 226 news organizations have participated in 121 civic journalism initiatives.

Pew Research Center for the People & the Press

The Pew Research Center (http://people-press.org) is an independent opinion research group that studies attitudes toward the press, politics, and public policy issues. It is best known for regular national surveys that measure public attentiveness to major news stories, and for our polling that charts trends in values and fundamental political and social attitudes. Originally the Times Mirror Center (1990–95), it is now sponsored by The Pew Charitable Trusts. The center's purpose is to serve as a forum for media and public policy issues through public opinion research. The research program (with results available on the center website) includes regular reports about people and the press; the people, press, and politics; news interest; and media usage.

The Poynter Institute

Publisher Nelson Poynter founded the Modern Media Institute in 1975 as a nonprofit school for journalists as well as journalism teachers and students. On his death in 1978, it became the Poynter Institute for Media Studies (http://www.poynter.org), focused on improving standards of journalism through training and research. It continues to own and operate the *St. Petersburg Times* as well as *Congressional Quarterly, Governing,* and *Florida Trend* magazines. Among its activities, Poynter conducts seminars and workshops on broadcast/online communications, journalism education, ethics and diversity, leadership and management,

reporting and editing, and visual aspects of the news (including their design and use of graphics and photos).

Project for Excellence in Journalism

Founded in 1997, for nine years, the project (now PEJ, http://www.journalism.org) was affiliated with the Columbia University's Graduate School of Journalism and had a twin mission of evaluating the press and helping journalists clarify their professional principles. In mid-2006, PEJ joined the Pew Research Center, doubled its staff, and significantly expanded its research activities. Its wider research agenda now includes continuing content studies of the nation's news agenda, plus tracking of key industry trends, and analyzing that trend data. PEJ continues existing research, publishing *The State of the News Media* annual report on American journalism (2009 marked the sixth edition), conducting content studies of key event coverage, offering occasional analysis of press behavior, and issuing an online *Daily Briefing* of media news.

Public Journalism Network

The Public Journalism Network (PJNet, http://pjnet.org), founded in 2003, is a global online linking of journalists and educators interested in strengthening the relationship between journalism and democracy. PJNet has evolved from a public journalism site to more of an informational clearinghouse for both public and citizen journalism.

The Schuster Institute for Investigative Journalism

Founded in 2004 and based at Brandeis University in Waltham, Massachusetts, the Schuster Center (http://www.brandeis.edu/investigate) was created to help improve public interest and investigative journalism—and to counter the increasing corporate control of what Americans read, see, and hear. Its goals include to investigate significant social and political problems, and uncover corporate and government abuses of power. It offers grants and seminars concerning three major projects concerning political and social justice, the Justice Brandeis Innocence Project; and a gender and justice project. Media criticism is another part of the institute's work.

The Joan Shorenstein Center on the Press, Politics, and Public Policy

The Shorenstein Center (http://www.ksg.harvard.edu/presspol) is a Harvard University research center founded in 1986 to explore the intersection of press, politics, and public policy in theory and practice. The center is designed to bridge gaps among journalists, scholars, and the public. The center operates through teaching and research at the Kennedy School of Government and its program of visiting fellows, conferences, and other initiatives.

The World Security Institute's Pulitzer Center on Crisis Reporting

The center (http://www.pulitzercenter.org), established in 2006 in Washington, D.C., seeks to increase independent (freelance) foreign affairs reporting that media organizations are increasingly less willing to undertake on their own. By funding travel and other needs, the center's goal is to raise the standard of coverage of global affairs to engage both the public and policy makers. Funding comes principally from several members of the Pulitzer family.

Fox News

The Fox News Channel is a 24-hour cable and satellite news channel based in the United States. Fox News has become an influential player in global information since its launch in October 1996. Most of Fox News's 16 hours of live programming on weekdays, and 27 hours on weekends, are produced at its New York City headquarters. As of January 2009, Fox News is available in roughly 90 million U.S. homes, and in more than 50 countries. Competitors include CNN and MSNBC.

Fox News is often at the top of many cable news ratings categories, making it the most successful U.S. cable news operation in terms of domestic audience size and loyalty. At the same time, Fox News is arguably the most conservative and controversial cable news organization. Many critics suggest Fox News is tailor-made for Republican audiences and that its journalists are anything but objective. Regardless, the channel's opinionated programs have changed the very definition of news in the twenty-first century.

Origin and Key Executives

Fox News is a subsidiary of Fox Entertainment Group, which is owned by News Corporation, one of the world's largest media conglomerates. Its stable of media properties includes businesses in film production and distribution, book publishing, cable and satellite services, television, and Internet. News Corp. owns at least two dozen newspapers in Britain, Australia, and the United States. In 2007, News Corp. acquired American journalism institution *The Wall Street Journal* through its $5 billion purchase of Dow Jones & Company, Inc.

Rupert Murdoch (1931–)

Murdoch is chairman of News Corp. Murdoch began to build a global media empire in the 1960s when he bought the British tabloid *News of the World* and London's *Sun* newspaper. In 1979, Murdoch formed News Corp. in Australia. News organizations have been at the heart of Australian American Rupert Murdoch's acquisition and expansion strategy for decades. Fox Broadcasting was created in 1986 when News Corp. purchased six U.S. television stations as the first step in developing the fourth national television network over the next several years. News Corp. launched the Fox News Channel on October 7, 1996, as an alternative to CNN, the leading cable news provider at the time. Fox News has since expanded its reach from 10 million U.S. homes to more than 90 million. The organization oversees numerous websites tied to its programs; Fox Radio News, a 24-hour radio news service; and its sister channel Fox Business Network, which was launched in 2007.

Roger Ailes (1940–)

Ailes is chairman of Fox News, chairman of Fox Television Group, and a senior advisor to Murdoch. Ailes began his broadcast news career in the 1960s in Cleveland, Ohio. A 1967 meeting with Richard Nixon while Ailes was executive producer of *The Mike Douglas Show* led to a successful political consulting career that spanned the 1960s, 1970s, and 1980s. His most notable clients include Republican Presidents Richard Nixon, Ronald Reagan, and George Bush Sr.

In 1996, Murdoch hired Ailes to run Fox News. Ailes is often credited for the channel's aggressive expansion and unconventional, conservative editorial direction. *Broadcasting & Cable* referred to Ailes as the "proudly capitalistic mastermind" behind Fox News. Author Scott Collins argues that Ailes's personality-driven, patriotic approach to news has revolutionized journalism.

Fox News Formula

Fox News turned television news into a multimedia, manic storyteller with its use of dynamic graphics and sound effects. Fox News innovations include the scrolling ticker at the bottom of the screen to update viewers on breaking news, half-screen and bottom-of-the-screen graphics to help orientate viewers to a segment's subject as well as multimedia visuals and sound effects used to introduce Fox News programs and "Breaking News" segments. Rivals CNN and MSNBC were quick to follow Fox News's graphically enhanced format. While the flashy Fox style modified industry standards, the substance of its programs has also been both influential and controversial.

Characteristics of Fox's personality news programming include a blend of headlines with opinions, interviews, and true-crime or celebrity stories. Many of the network's longest-running programs fall into this category including *The O'Reilly Factor* (1996), *Hannity & Colmes* (1996), and *On the Record with Greta Van Susteren* (2002). With their melding of opinion and personality, Fox News's primetime programs consistently top Nielsen's list of cable news programs.

There is little demographic difference between viewers of Fox News and those of its chief competitors, CNN and MSNBC. The typical cable news viewer is likely a suburb-dwelling, married, middle-aged man with a median income of $62,000, according to the Pew Research Center for the People & the Press. The key difference is ideology. The average Fox News viewer describes himself as conservative. Indeed, a third of Republicans report they regularly watch Fox News. Republicans also tend to believe the network is more credible than its rivals, according to the Pew data.

Key Fox News Programs and Personalities

Bill O'Reilly (1949–)

O'Reilly is host of the most watched U.S. cable news program, *The O'Reilly Factor*. The program debuted in 1996 as Fox News was launched. It includes discussions, debates, commentary, arguments, and interviews about current events, politics, and celebrities. Occasionally, it offers analysis of newsmaker body language. At the heart of the program is opinion—O'Reilly's and those of his guests. He is known to tell those who disagree with him to "shut up" and/or call them "pinheads." O'Reilly's legendary on-air arguments often turn into shouting matches. He admits he likes to "joust" and the verbal warfare between him and many of his guests is the main reason people watch the program. In 2008, O'Reilly renewed his contract with Fox News for four years for reportedly $10 million a year.

Sean Hannity (1961–)

Hannity is another popular, highly opinionated, and highly argumentative Fox News personality who has been with the organization since 1996. For more than a decade, he co-hosted the second most watched news program on cable, *Hannity & Colmes* (behind *The O'Reilly Factor*). Hannity presented the conservative side of an issue, while his co-host Alan Colmes offered the liberal point of view. In late 2008, the liberal-leaning Colmes left the network. Hannity remained as the sole host and the program was aptly renamed *Hannity*. Hannity also hosts *Hannity's America,* a weekly hour-long program that includes investigative stories such as a November 2008 piece that "exposes the liberal lies permeating classrooms across the country." Fox News senior vice president of programming said Hannity is a "die-hard conservative and he believes what he says." In 2008, Hannity renewed his contract with Fox News through 2012. No figure was released; however, reports indicate he earns more than $20 million a year for his nationally syndicated radio talk show heard on more than 500 stations with roughly 13 million listeners.

Greta Van Susteren (1954–)

Van Susteren joined CNN as a legal analyst in 1991. She rose to fame for her gavel-to-gavel commentary during the O. J. Simpson trial in 1995. The former criminal defense and civil trial lawyer then co-hosted CNN's daily legal affairs program before hosting her own CNN program. In 2002, she joined Fox News as host of *On the Record with Greta Van Susteren,* which focuses on true crime and celebrity scandals. It is consistently among the top five highest rated cable news programs.

Fox Controversies

One of the most persistent criticisms of Fox News is that its programs are not news at all, but rather commentary. This stems from the usual professional and cultural expectation that journalists should refrain from offering personal opinion and remain independent, neutral observers. Fox News has pushed the boundaries of conventional "objective" journalism by embedding and rewarding opinion in its news programming. Fox News personalities O'Reilly, Hannity, and Van Susteren have built their careers on their opinions; at the same time, they call themselves journalists and in many ways what they do often appears to be journalism.

They gather, interpret, and present information; they work for an organization that has "news" built into its brand; and they interview the world's top news makers. The merging of such "acts" of journalism as information gathering, reporting, and interviewing with opinion programming may harken what author Farhad Manjoo called the "twilight of objectivity" in journalism.

Many journalism critics (and most Democrats) complain Fox News coverage and commentary flagrantly favors right-wing and Republican positions. Some critics have gone as far as to say that Fox News's conservative "bias" is the result of editorial intervention in the newsroom by executives at the highest levels in the organization, including Ailes and Murdoch. The concern for many is that Fox News reporters, producers, and hosts exercise political considerations when assessing the newsworthiness of a story, instead of sound, fair, and balanced news judgment.

Fox News registered "Fair and Balanced" for trademark in 1998 and has heavily integrated the slogan into its programming and marketing materials ever since. In 2004, liberal Internet advocacy group Moveon.org and the nonpartisan organization Common Cause filed a complaint against Fox News with the Federal Trade Commission, the government agency responsible for assessing and regulating unfair and deceptive business practices. The groups claimed Fox News's persistent use of "Fair and Balanced" equated to deceptive advertising and Fox News reports were "deliberately and consistently distorted and twisted to promote the Republican party of the United States and an extreme rightwing viewpoint." The FTC rejected the complaint, citing First Amendment freedom of speech and press guarantees.

Conclusion

From a business perspective, the Fox News strategy of building a brand based on personality and opinion has proven to be brilliant. Ailes and his management team have demonstrated the "fair and balanced" formula of Fox News not only attracts audiences in an increasingly fragmented media environment, but those audiences remain loyal to the channel and its programs. From a journalistic perspective, Fox News's apparent conservative bias and opinionated programs clash with traditional principles of objectivity and neutrality. If imitation is the sincerest form of flattery, the impact of Fox News on journalism is clear. Most cable news channels in the United States and abroad have to some degree copied Fox News's opinionated, personality-driven programming format.

Framing

Framing is a concept that refers to the selection of words, topics, and ideas in communication and the effects of these selections on public opinion. The term itself is a metaphor, suggesting that media messages, such as news stories, are bounded by practices of inclusion (what's inside the frame) and exclusion (that which we do not see). Communications researcher Robert Entman wrote in 1993 that "[t]o frame is to select some aspects of a perceived reality and make them more salient in a communication text, in such a way as to

promote a particular problem definition, causal interpretation moral evaluation and/or treatment recommendation." This straightforward definition locates the act of framing in the newsroom, but the theory of framing is also rooted in psychology, where the focus of study is on how individuals interpret reality differently, in part as a result of media frames. Framing research therefore spans several disciplines such as communication research, psychology, sociology, and political science. This entry discusses several of the theoretical approaches to framing, illustrates their applications, and considers the importance of framing for journalism practice and criticism.

Framing as Practice

Framing practices are observed by studying the social organization of the news and by analyzing the linguistic and rhetorical organization of journalistic texts. The underlying implication of the *frame* concept is that a story has more than one way of being told and that editorial decisions affect the way reality is transferred from its actual occurrence to its symbolic representation in the news. Journalists collect a body of facts relating to an event or a series of events, such as the mayor's visit to a local school or a presidential election campaign. They are then required to digest considerable factual information and incorporate it into fairly short news stories by choosing which elements to tell and deciding how to tell them. Reducing news occurrences into narrow frames allows journalists to deliver the news efficiently to their audience. The efficiency of framing has to do with brevity but also with the use of words and concepts that are already familiar to the audience and established in use. Otherwise, journalists would have to introduce and explain each occurrence they report, without assuming prior knowledge by their audience. As a result, journalists are less likely to frame the news in a manner that challenges their audience's pre-existing beliefs.

The news media frame news by stressing certain aspects of issues or people on which they report while de-emphasizing others. They may choose to cover a new presidential initiative by emphasizing its merits and shortcomings, or discussing it as an election gimmick. Either approach may be justified, but the way in which the story is told (the policy-frame or the gimmick-frame) becomes socially important, since it can affect the way the public will consider this policy.

Framing as Effect

The expectation for framing effects is premised on the notion that frames are likely to shape the way people think about issues, persons, and events. This effect can be driven at times by choices of particular words, which activate distinct and predictable ways of thinking. The workings of this process are best understood through psychological studies, dating to the 1970s, which are the foundation for the study of framing effects. Economists Daniel Kahneman and Amos Tversky observed how seemingly minor changes in wording impact people's support for policy choices. Famously, they found that people would prefer a program where 200 out of 600 people might be saved as opposed to one in which there is a one-third probability that all 600 will live but a two-thirds probability that no one will be saved. Even though the prospects for lives saved were mathematically identical, the way in which the options were worded, emphasizing risk or gain, activated biases that are inherent to human nature. In this case, the bias was against risk. Since people are, by and large, risk averse, they will likely oppose political candidates that are framed as more risky, even where the facts may not back this estimate of risk. Along the same lines, health information can affect behaviors differently when it centers on avoiding loss rather than on possible gains as well. For example, young women exposed to information about breast cancer were found more likely to conduct breast self-examinations when provided with negatively framed information, which emphasized the risks of not doing so, than when presented with the benefits of such action.

At the receiving end of the framing effect is the individual exposed to the news media message. For the effect to take place, the media frame needs to activate pre-existing mental "nodes," or pre-existing frames, through which the person receiving the message might think about the world, such as risk and gain. Such pre-existing frames of thought are called "schemas." Media frames make certain schemas more accessible to the receiver, which means the way the story is told becomes the way in which the individual thinks about the issue

discussed. Thinking again about a presidential health initiative, if it is discussed by news media as a gimmick, the audience is likely to perceive this initiative as a political ploy. Once this skeptical schema has been activated, future initiatives are also likely to be regarded as political ploys. When frames are fresh in people's minds and when they are often repeated, their effect extends beyond single instances of attitude-formation and into their broader outlooks on the world.

The evidence for framing indicates that editorial decisions about which terms to use in a news story, which attributes of a person or an issue to highlight, and what social values to invoke can impact the audience's opinions. These decisions are not necessarily deliberate, but they can be of great consequence. The notion of framing effects covers a variety of topics and a multitude of ways in which "frames" appear in news stories. The examples below illustrate some of the types of framing effects that have been studied in recent years.

Types of Frames

Value Framing

Media coverage can affect the types of moral, religious, or social values that people apply when processing a news story. When news reports stress values such as honesty or discuss which candidate can be an agent of change, they are also framing these criteria as central to the audience. Framing occurs through the salience afforded to different values and by subtle linguistic differences that favor one value or another. Consider, for example, the terms *partial-birth abortion* and *late-term abortion,* both of which refer to the same medical procedure. The first term stresses birth and would more likely lead people to consider abortion as it relates to the unborn fetus. *Late-term abortion* frames the abortion issue in the context of the pregnancy and perhaps the mother and her well-being. Such terms could trigger different sets of emotions and values that can be tied to the abortion issue. However, in order to maintain journalistic efficiency, reporting of the abortion debate often turns to just one of these terms, which can direct the audience's thoughts about the issue in different directions.

Value-framing research often finds that framing is contingent on individuals' predispositions, suggesting that framing is not inevitable. One experiment found that people's support for national security policies is affected differently when the story's wording centers on individuals impacted by the policy than when it focused on groups. Media framing in this case affected the type of values (national security or individual rights) activated by the individuals in conjunction with their own ideological leanings. Liberals were more likely to be affected by the individual rights frame than conservatives, while the national security frame affected conservatives more than liberals.

Attribute Framing

The study of attribute framing (sometimes called "second-level agenda setting") demonstrates how news media emphasis on particular characteristics of an issue or a person can affect attitudes. When a desirable attribute of an object is stressed it will lead people to think about it more positively than when an undesirable feature is emphasized. Therefore, it should not come as a surprise that research has found that people prefer beef that is 75 percent lean to that which is 25 percent fat, even though it is exactly the same product. Simply put, the label attached to an object, meaning whether it is "good" or "bad," affects the way people think about it, no matter what its actual qualities are. In electoral campaigns, attribute framing refers to those characteristics of public figures that are made salient for prospective voters. For example, the coverage of Al Gore during the 2000 presidential campaign centered on his perceived tendency to exaggerate. This became the frame through which the public came to view him. To the extent that this was perceived as a negative attribute, voters were less likely to support him. In this manner, the news media can frame candidates by the emphases they put on candidate traits. Since political reporting tends to center on candidates' shortcomings, attribute framing can affect not only the way people think about particular candidates; persistent framing of negative attributes can foster negative outlooks on political life as a whole.

Responsibility Framing

A long-standing body of research illustrates how the framing of news stories affects the way people attribute responsibility for various social

problems. Consider two ways of discussing a problem such as homelessness. Stories may provide straightforward facts and figures as to the underlying cause of this problem, such as an economic downturn. Or news organizations may choose to personalize a story, as they often do, by centering on the individuals affected by homelessness in order to illustrate the issue. Political communication researcher Shanto Iyengar's experiments found that viewers exposed to a problem through the travails of particular victims ("episodic framing") are more likely to attribute responsibility to dispositional or individualist factors, while stories that focus on the problem itself ("thematic framing") are more likely to lead viewers to fault systemic factors and ultimately the government. As a result, this difference in media framing has undeniable political implications.

Strategy and Issue Framing

In the course of political campaigns, candidates make countless speeches, issue numerous position statements, and offer a set of policies and promises for the voters. Political news coverage, however, often seems more interested in "horse race" matters such as poll standings and tactical maneuvering by the candidates. Communications researchers Joseph Cappella and Kathleen Hall Jamieson studied the effects of these two types of frames ("issue" and "strategy") on people's sense of political trust. Experiments they conducted reveal that when people watch politics discussed through the strategy frame they express higher levels of political cynicism, or distrust, than when the campaign is discussed by focusing on the issues at hand.

Framing and Individual Factors

While framing research has been able to produce significant results in several research traditions, some studies have lacked necessary explication of the conditions attenuating the effect or eliminating it altogether. People tend to process information in accordance with their pre-existing outlooks, rather than by invariably reacting to new information as it is transmitted to them. At times, individuals may resist or ignore this new information and they will tend to see, understand, and remember things as they always have. Therefore, media effects, such as framing, may be conditional on the extent to which a frame is compatible with individuals' pre-existing knowledge structures and with the prevailing beliefs in a given culture. Some frames may simply not register with their audience. The less congruent the media frame is with an individual's schemas, the lesser the likelihood of frame transfer.

Framing research does not assume automatic frame transfer. This is evident in a study that exposed participants to political messages that were focused on either candidate traits or the issues. As framing theory would predict, those in the trait-frame condition expressed more thoughts about candidate traits than those in the issue-frame condition and vice versa. However, the effects were particularly strong for those who were more likely to think that way to begin with: people who thought traits were most important ("trait schematics") in politics were more affected by the trait frame than the issue schematics, while those who considered issues most important were more affected by the issue frame than the trait schematics. In this way, framing reinforces existing conceptions.

Most of the research on framing discussed above took place in lab settings that do not amount to an exact replication of the way people actually receive media messages. Some scholars have demonstrated that framing effects are short lived and may dissipate quickly, especially if people discuss the media messages with others, who may have different viewpoints.

The fact that framing may be conditioned by individual factors as well as by the setting in which the message is received should not, however, diminish framing's importance. There is an overwhelming body of evidence that indicates that how a story is told can have a significant effect on how broader social concepts and central political figures are considered by the public. In some cases, the way news media frame a story can affect not only opinions but also actions and behaviors.

Conclusion

While somewhat context- and person-dependent, the evidence for the effects of framing poses a challenge to news reporting. Many journalists still aim to provide an impartial account of an actual reality. But the process of reporting the news involves a series of decisions as to which attributes

of an occurrence or person are brought to the forefront and which are to be excluded. Each one of these decisions can affect the type of concepts activated in the minds of news consumers, which, in turn, affect public perceptions about issues and persons and could perhaps transform general outlooks on policies or social institutions. With this in mind, media framing should be considered as one of the most important sources for media-driven cognitive effects, bearing individual and social consequences.

France

France's importance as a world cultural and political power has been evident for centuries. The nation has also played an important role in the history of journalism. French newspapers appeared as early as the mid-1600s. Newspapers in France have been credited with both helping bolster government legitimacy and helping push forward social movements.

Origins

There is some debate among historians as to what were the first publications in France. Most believe that the first regularly printed publication was Paris's *Cy est le Compost et Kalendrier des Bergiers* in 1491. Between then and the 1630s, the bulk of publications produced were calendars and almanacs. While weekly newspapers were being imported into France from Amsterdam as early as 1620, the first French newspaper appeared in 1631. The *Gazette de France* remained almost unchanged in format until the French Revolution in 1789. Most periodicals' format between 1631 and 1789 resembled those of small books—columns of dense type with little illustration. Business and political events made up most content in newssheets prior to 1750.

For more than a hundred years after the first newspaper was produced in France, newspapers were a resource for the privileged. Under the monarchy during the 1700s, newspapers were more closely linked with literature than business. Literary critics and writers (who by definition were members of the aristocracy because literacy was almost solely limited to the aristocracy) would gather in "literary salons" discussing new works. The ideas of this aristocratic clientele were then printed in newspapers. Thus, both the readers and writers of newspapers were members of the aristocracy and essentially extensions of the state, and journalistic content remained primarily literary in focus. Given the high cost of printing and distribution, individuals would pass on handwritten copies to others.

The rapid spread of news created by these networks strengthened the market for more newspapers.

The number of French language periodicals slowly grew worldwide, from 40 in 1700 to 277 in 1780. As in most countries, the press in France experienced periods of rigid censorship versus greater freedom depending on the nation's changing political climate. The Revolution of 1789 resulted in increased public and institutional freedoms. Prior to the Revolution, only *Le Gazette* (*Gazette de France*) was allowed to report political news. Subsequently, the press won the right to report on Parliamentary proceedings. Despite this newfound freedom, however, presentation of political news continued to lag behind arts, sciences, religion, and philosophy.

Claude Chappe helped bring France to the forefront of media development in the eighteenth century with his pioneering work in semaphore telegraphy. In 1793, the French National Assembly voted to have Chappe expand his invention, a semaphore telegraph, and build a state semaphore telegraph system from Paris to Lille.

The chaos of the French Revolution into the 1790s prompted a period of increased newspaper development, especially in Paris. The Declaration of the Rights of Man and the Citizen (1789), the first step in constructing a new constitution, set the stage for press freedom. The Declaration states that "All citizens, being equal in the eyes of the law, are equally admissible to all public dignities, places, and employments, according to their capacity and without distinction other than that of their virtues and of their talents." The Declaration also defined freedom of speech, stating: "The free communication of thoughts and opinions is one of the most precious human rights: hence every citizen may speak, write, print with freedom, but shall be responsible for such abuses of this freedom as shall be determined by the Law." Newspapers started to appear in public places, quickly expanding readership beyond the bourgeoisie. Indeed, during the post-Revolution period, newspaper circulation in France became the highest in the world. Estimates put the peak circulation at 300,000 a day, about all the limited technology of the time could produce. By 1802, with greater social calm, Parisian newspaper circulation had fallen to 33,000.

Napoleon Bonaparte took control of the Republic in 1799 as First Consul and later Emperor from 1804 until 1814. Regardless of the freedoms granted to the press in 1789, upon his ascension to power, and as a result of his belief in the power of the press over public opinion, Napoleon was able to skillfully suppress the political press through his sense of news management. By 1811, only four Parisian dailies remained (*Le Moniteur, La Gazette de France, Le Journal de l'Empire,* and *Le Journal de Paris*).

After his defeat in 1815, the monarchy was restored with constitutional limitations. However, Charles X placed limitations on the press; in 1830 journalists led a revolution that helped bring him down. In the years that followed, improvements in printing capabilities (steam and rotary-action presses) increased the numbers of dailies produced and the simultaneously lower subscription costs resulted in growing circulation.

Development

Print

Growing revolutionary developments in thought and demand for freedoms they incited led to reinstatement of press freedoms in a July 1881 press law. The press enjoyed these freedoms until World War I (a period often called "the Golden Age" of the French press), when press cooperation in state propaganda bruised public opinion of press services. Instrumental to growing readership was the expansion of public education, which made French literacy the highest in Europe and encouraged appearance of commercial newspapers resembling the American penny press. By 1914, *Le Peit Parisien* became the largest-selling newspaper in the world with a circulation over 2 million. The rate of French circulation was 244 papers sold per 1,000 people, rivaling that of the United States (255 per 1,000) and overshadowing that of Britain (160 per 1,000). Despite the success of commercial papers that claimed no political bias, many political opinion-based papers remained. In fact, 80 percent of Paris papers in 1914 were small-circulation opinion papers, insignificant compared to the huge commercial papers. Yet despite the success of French commercial newspapers during this "Golden Age," they failed to develop into a sustained industry, in part because profits were lower than those of their British and American counterparts.

By 1914, more than 300 dailies were being published in France, the most copies per capita in Europe.

During World War I, circulation declined, but photojournalism became increasingly popular. *Paris-Soir* was notably one of the few dailies to successfully survive this period through its inclusion of pictures and other more modern editorial techniques.

By 1936, French papers earned but one sixth to one eighth the advertising dollars of newspapers in Britain or the United States due to the inter-war economic depression experienced throughout Europe, but exaggerated by the French government's pro–laissez-faire response (which meant no direct government economic stimulation). The financial strain placed on newspapers by these low advertising revenues was exploited by the government's "buying" off of corrupt journalists and newspapers in return for favorable government coverage. Thus the 1930s saw a significant decline in the newspaper industry, both in terms of production and circulation. Adding to the decline was the nation's growing news focus on radio and early television experiments.

In 1940, the government established a Ministry of Information to centralize control over the press. During the German occupation (1940–44), forced cooperation of the newspaper industry intensified to the point that after liberation in 1945, only some newspapers were resuscitated.

After the war, political papers surged in popularity. There was also considerable concern over corruption in the press. The political left pushed for (and were somewhat successful in) advancing a broader public service system. The French Press Federation declared in 1945 that "the press is not a means of commercial profit. It is free only when it is not dependent on either the government or the money powers, but only on the conscience of its journalists and readers." Despite this argument, however, no such system developed, and both commercial and political powers retained close ties to the press. Most newspaper ownership was concentrated in corporate hands, though some industrialists with political aspirations sought to retain political influence. One example is Robert Hersant, a member of the National Assembly for two decades (1956–78), who owned many media outlets including the Paris dailies *Le Figaro* and *France Soir*. In the mid-1980s, a dozen National Assembly members worked for Hersant.

By 1947, the largest-selling paper in France was the Communist Party's *L'Humanite*. Even in the twenty-first century, there is a strong cultural desire to ensure the survival of these ideological newspapers, including those connected to religious institutions, especially the Catholic Church. These collectively make up 70 percent of circulation in the early twenty-first century. The largest-selling paper in the country is a provincial daily, *Ouest France,* founded in 1944, with a circulation of around 700,000.

Broadcasting

Regular radio broadcasting began in Paris in 1921 with transmission of Radio-Tour Eiffel from the Tower, and slowly expanded. Radio was perceived as a means of reinforcing national identities. A 1923 law made broadcasting a state monopoly (although some private stations were allowed if they did not interfere with state programming transmissions). License fees on receivers provided financial support starting in 1933 as radio expanded into a mass medium. Radio news was initially politically neutral, but that did not last long. In 1932 radio was first used in an election campaign. Political riots in February 1934 increased the importance of radio news reporting. By 1935 there were 1.3 million radio receivers in France; just three years later, there were over 4 million.

President Charles de Gaulle instituted a true "government model" system in broadcasting. He believed that control of the country's television was required for effective government. Until 1964, top executives of Radio Television France (RTF) were appointed by the Minister of Information. Changes in government were directly reflected in public broadcasting personnel and policies into the 1970s.

Immediately following the political crisis of May 1968, a "rule of thirds" was established to ensure diversity of political opinion on television both public and commercial. During election campaigns, television airtime must be divided equally between the government, the parliamentary majority, and the opposition. This rule was renewed in 2000 and provisions made to ensure minority parties received some airtime. During campaigns, paid political advertisements are prohibited and the week prior to voting, televised poll results are prohibited. The Conseil Superieur de L'Audiovisuel (CSA) is the government body responsible for issuing broadcasting licenses to stations and seeing these rules are enforced.

During the 1980s, the nation's broadcast system was threatened by expanding cable and satellite television. The number of available television channels increased to over 200 channels plus seven terrestrial channels compared to only three in 1980. Credited for this increase was the end of the government's media monopoly by the late 1980s.

Government Versus Market Control

As a result of the new competition, privatization was introduced. In 1986 the government privatized the TF1 channel, though the government still exercised control over private networks. For example, during the shift to privatization in the 1980s, government networks were sold to political "friends" of the administration.

The second half of the twentieth century also saw a move toward market-oriented print media, including efforts to mix traditional political stories with more human interest, features, and elaborate graphics. The increasing importance placed on regional media helped feed the public perception of media as social actors because of their vast diversity and pluralism. This was especially evident in May 1968 as student protests against the de Gaulle government focused upon replacing the old conservative cultural morality with a more liberal morality stressing human rights and equality. The French government is protected against "offenses to the chief of state" and can seize any publications in the interest of national order. During the turbulent times of Charles de Gaulle's administration of 1966–73, the law was exercised over 300 times.

The Law of 29 July 1982 guaranteed the commercial media's independence from political powers and placed all television and radio stations (which had been controlled by a state monopoly for nearly five decades) under the regulation of an independent government entity, which was later modified in 1989 to become the Conseil Superieur de l'Audiovisuel (CSA). One result was a sharp increase in the number of radio stations, especially on FM channels, and a more decentralized and pluralistic system. In 1984, some stations began using satellite links. Two years after the Law of 1982 guaranteed media independence, the French Constitutional Council acknowledged the constitutional importance of press freedom and the necessity of such freedom to democracy.

To protect media from political influence, a law in 1986 extended protections to all modes of communication. The Freedom of Communication article included in this act does have numerous limitations, however. It states that "this freedom may be limited only, to the extent required, for the respect of human dignity, freedom and property of other people, the pluralistic nature of the expression of ideas and opinions and, for the protection of children and adolescents, safeguarding of law and order, for national defense, public service reasons," and so on.

One exception to the country's low level of journalistic autonomy is the newspaper *Le Monde*. Control of that paper is held by its journalists through the Societe des Redacteurs (Society of Editors) whereby journalists elect a director who is then financially supported by a Corporation of Readers (a group of small investors), who do not have voting rights. Over the years, the paper took steps to insulate its reporting from outside influence by limiting its revenue obtained through advertising. Journalists retained control over the paper's director into the twenty-first century.

During the first decade of the twenty-first century, French papers enjoyed higher circulation rates than other Mediterranean countries but lagged behind the rest of Western Europe.

Modern News Media

Journalists are typically members of the elite; most come from the upper middle class, are educated at elite institutions (especially at Institut des Etudes Politiques in Paris) that also turn out the country's economic and political leaders, and are thus often close friends with or even married to political and economic leaders. However, development of new media has begun to unravel this tight relationship between the state and media. Cable and satellite television have made available many more news sources and the Internet has reduced the ability to control news institutions.

French journalism has traditionally focused on political commentary, placing high value on discussion and interpretation of events and ideas. It is common for the press to interject judgments on policy and political action. At the same time, information-oriented journalism became more common as investigative reporting grew in popularity and frequency.

Yet there is little journalistic autonomy in France. For example, there are many laws and self-regulatory codes within news organizations that protect journalists. In 1935, a law included an individual conscience clause, which made it easier for journalists to leave their paper after an ownership change if the ideological or political stand of the publication shifts. Conflict over the political stance of newspapers continued into the early twenty-first century.

Trade unions in France are closely affiliated with political parties. A formal governmental authorized organization, Commission de la Carte, regulates wages as well as journalist credentials and benefits.

Newspapers

Though the number of French newspapers increased in 2004, circulation and revenue declined between 1990 and 2005. By 2008, France produced 75 national newspapers: 10 dailies, 26 weeklies, 22 monthlies, and 17 quarterlies. Eight of the ten national dailies are owned by media conglomerates that own many various media outlets across many different media platforms (broadcast, print, etc.); the other two (*Le Monde* and *Liberation*) are owned by financial organizations. France has long enjoyed a culture of sharing copies of newspapers. Evidence of this appears in the 2008 circulation and readership rates of national daily papers: 1.2 million copies, but a total readership of 8.3 million. The yearly circulation of dailies was 611 million copies, of which 449 million were continuing subscriptions, reaching over 70% of the population. Nearly half of all revenue originated from advertising (409 million euros).

Newspaper circulation declined during the late twentieth century. In 1961 *France Soir* sold more than a million copies a day; by 2005 daily sales had dropped to 50,000, leading to considerable financial losses. Regional papers followed similar trends initially, but by 2008 their circulation appeared to be increasing. In 2008, national dailies accounted for 14 percent of total media publication circulation, and only 2 percent of the published titles. As was happening elsewhere, audiences and advertisers were shifting allegiance to electronic news sources, both broadcast and Internet.

Free papers have become hugely popular, with total circulation of 291 million copies. There are three "freesheet" networks: *Metro, 20 Minutes,* and a group of city-edited factsheets. *Metro* is owned by the Swedish Metro press group of which TF1 French television is a major shareholder. *20 Minutes* is owned by Shibsted (a Norwegian firm) and Ouest France (regional). The third group is owned by Groupe Hersant, Socpresse, Hachette group, and Sud-Ouest group and includes the public service television channel *France Cinq*.

Magazines

Modern French readers tend to rely less on national dailies as sources of information and more on magazines and local newspapers. Nearly 40 percent of France's print media circulation (and titles) is represented by magazines. By the first decade of the twenty-first century, French magazine yearly production totaled 111 million copies. Similar to newspapers, almost half of magazine revenue came from advertisements (113 million euros), the remainder from subscriptions or single-copy sales. French magazines have also experienced a slow decline in readership since 2002.

Television

The French government has always controlled broadcasters. Most major channels are publicly owned and have been occasionally subject to censorship. Despite provisions made to legally protect expression and encourage opinion pluralism, relationships between television executives, their journalists, and government officials remain close. Indeed, many powerful government officials are married to journalists. Allegations frequently arise that the French government (through the CSA) makes public television appointments based on a journalist's political persuasion.

There is a long-standing news culture of protecting the privacy of government officials and not delving into their private lives. This has been encouraged because French law typically sides with the government in libel cases. However, this culture is beginning to shift, although heavy personal criticism of public officials remains largely absent in the mainstream media. For example, President Nicolas Sarkozy divorced his wife and then dated and married the pop singer and former model Carla Bruni, all within his first year in office, and mainstream media coverage was similar

to that given to a celebrity; however, the President was not generally criticized.

In mid-2000 the government established the France Televisions holding company to take control of the three public television companies (France 2, France 3, and La Cinquieme). The firm determines these companies' strategies, development, and program policies within their public mission.

Viewers pay an annual audiovisual licensing fee, which finances public television. Seventy-six percent of the sector is financed by the state (funded largely by the licensing fee), and the rest by advertising. However, advertising has been perceived as a threat to public television stations. As success of the newly privatized TF1 forced the public channels France 2 and 3 to compete for ratings, the public channels were forced to accept advertising. Subsequently, they have been criticized for behaving as private channels. However, the same law that created France Televisions also reduced the amount of advertising time on France 2 and 3 because they are public channels. The state subsidizes some of the lost advertising revenue in order to help the channels compete, because while they must compete commercially with TF1, they are also bound to limit advertising time in compliance with their "public" status.

There are five national public channels (France 2 through 5, the latter an educational channel, and France ô-, a multicultural channel); three national privately held channels (TF1, M6, and Canal Plus); and more than 20 national and local cable channels. The 24-hour news channels in France include France 24 (international news and current affairs), BFM, and iTele. However, although they are on the air 24 hours a day, often their programming is pre-recorded. A substantial portion of the country still watches televised news at 8 p.m. on weekday evenings.

Radio

By 2008 some 1,200 different broadcasters were on the air, reaching better than 80 percent of the population aged 15 years and older. Radio station ownership is often concentrated through co-owned networks, affiliated stations, programming franchises, or advertising networks. There are also a number of state-owned public radio stations operating as Radio France (which is a network of 53 radio stations). Radio France is a parent umbrella media company composed of major national stations such as France Inter, France Info (a 24-hour news station), France Culture, France Bleu, France Musiques, and FIP (music and traffic information station).

Newer Media

French Telecom formed Minitel, a pioneering (and for a time quite successful) teletext system in 1981. Minitel is an Internet-like system, in which users can access the Minitel network via simple terminals that were connected to the telephone system. Users could look up phone numbers, buy train tickets and other items, and even purchase stocks via Minitel. The company gave away the terminals for free, creating a large network of users, thus saving money on printed telephone books, among other services.

But despite widespread publicity, Minitel was doomed in the face of the more useful Internet and World Wide Web. By 1997, French Prime Minister Lionel Jospin argued that continuing Minitel was holding France back from fully entering the information age. In 2001, Minitel users totaled 16 million compared to half as many Internet users, though the latter expanded rapidly over the next few years as Minitel was largely phased out.

By 2008 nearly 60 percent of the country's population could access the Internet and nearly all French newspapers offered online editions including daily news, files, record, chats, and blogs. Many radio and television stations were also offering at least some online content.

Media Organizations

There are numerous trade unions and associations serving the country's journalists and press. The most influential is the Federation Nationale de la Presse Francaise (FNPF), which studies issues related to the industry and the profession, represents the collective interest of the press in legal events, and represents the press to governmental and para-governmental entities. The FNPF also represents the profession to interprofessional groups including the organization responsible for issuing journalist ID cards (the CCIJP or Commission de la Carte d'Identite des Journalistes Professionnels).

There are 40 journalist syndicates ranging from those focused on broad interests to those specializing in religion, politics, or professional interests. In 1918 the Syndicat National des Journalistes was created (and fully established in 1938) to create a moral code for journalists similar to that of lawyers. Professional training of journalists is controlled by the Union Syndicale de Journalistes CFDT (created 1992) in an attempt to create common understanding among all French journalists.

Professional associations exist for nearly every communications job at both the regional and national level as well as journalism specialties (such as Internet journalism). Many individuals who work in public relations and communications, such as press attaches, or for corporate publications belong to Information, Presse et Communication. Internet and multimedia journalists often belong to the Association des Journalistes Professionnels des Technologies de l'Information (AJPTI). In general, the various associations offer professional resources and networks for their specific members.

Print Media Policy

Press freedom of expression was first protected by law with an act in July 1881. The legislation sought a balance between freedom of expression, protection of citizens, and maintaining law and order. Over a century later, similar protection was extended to television and radio. Despite these freedoms, however, France employs strong "hate speech" regulations. It is prohibited to either write or deliver a speech that incites religious, racial, or gender orientation hatred (added 2003), denies the Holocaust (1990), or presents illegal drugs or their use in a positive light (1970). Violations of these rules are pursued in the courts after the fact, rather than using prior restraint.

In 2000, the 1986 act on media freedom was extended to include amendments created for greater audiovisual diversity through the introduction of digital terrestrial television and establishment of local stations.

As of 2008 the French government provided the highest press subsidies in Europe, estimated at 12 to 15 percent of total press revenues. Commonly, funds in the form of grants go toward helping maintain party and ideological papers in the spirit of political pluralism. Subsidies also come in such forms as lower tax or utility rates. The government provides similar subsidies to individual journalists in the form of up to 30 percent reduction in their taxes. (This is not uncommon in France; the government provides similar subsidies in other industries, such as to farmers and agricultural companies.) Given these financial benefits, along with the close relationship between the media and politicians, vigorous privacy protections, tight control of official information, and the centralized form of state administration, media organizations tend to take care not to embarrass state representatives. However, when scandals occur, the media take a more independent stance and are often highly critical.

Electronic Media Policy

In 1989 the Conseil Superieur de l'Audiovisuel (CSA) was formed as the chief government policy agency for electronic services. The CSA holds the rights to chair appointments within public television and radio (which in practice means that programming can be indirectly influenced by the government), as well as frequency distribution and licensing, and acts as the administrator of broadcast laws, particularly those protecting authors' rights and guaranteeing representation of a diversity of opinions. The president of the National Assembly, the Senate, and the Republic each appoint three CSA members (for a total of nine), who serve six-year terms. Each set of appointments is staggered so a third of the council is replaced every two years. The country's President appoints the CSA chair.

In an attempt to protect French culture, in 1994 popular music stations were required to devote at least 40 percent of their music to French language songs, an obligation that remains in force. As with television, the CSA controls transmission and distributes frequencies.

In 1996, the French government set up a commission to explore Internet policies, resulting in a set of recommendations to increase French cultural presence and language. Named after the Minister of Telecommunications at the time, the Fillon amendment was enacted by the National Assembly to regulate the Internet. Under it, Internet providers do not have to abide by codes of conduct set forth by the CST (Conseil Superieur de la Telematique), but those who do are absolved of any legal liability for content (text, documents, or images) they transmit.

There has been some criticism that CST censoring of the Internet is unconstitutional.

In 2008, President Sarkozy, in response to the struggling survival of cultural identity in media, proposed to increase government control of publicly owned television and radio, removing all advertising. Through his proposal, private broadcasters would be taxed on advertising revenues and new media (Internet service providers and mobile phones) would be taxed on revenues as well to subsidize the more cultural public television and radio. (The idea is that this new subsidy and elimination of advertising pressures would rejuvenate public broadcasting that has been hurt by the decline of more traditional audiences.) His proposal was met with great criticism. On February 13, 2008, around a dozen public television and radio stations, employing about 150,000 workers, went on a 24-hour strike. Radio stations stopped broadcasting news and only played music, and television stations ran a banner at the bottom of the screen explaining the strike. (This strike was reportedly the largest strike in the audiovisual sector since 1974 when President Chirac announced that the Office de la Radio et de la Television Francaise [ORTF] was to be split into seven independent companies that included what became the France Televisions and Radio France.)

Summary

France has been a leader in driving media development across Europe and the world. The country was one of the first to experiment with television, and its media have a long history of fighting for free expression. Although new media usage is often slower to develop, France continues to utilize new media platforms as they appear. Like print media elsewhere, France has experienced declines in newspaper and magazine circulation. There remains, however, a strong sense of national pride in its journalistic professionalism. Despite this, the country has experienced a growing amount of "soft" news such as celebrity gossip and tabloid features.

Freedom of Information Act (FOIA)

The Freedom of Information Act (FOIA) is an information disclosure statute that provides the principal means of access to records of the executive branch of the United States federal government. The FOIA, codified at 5 U.S.C. section 552, was enacted in 1966 and has been amended several times since, significantly by the Electronic FOIA Amendments of 1996.

History

The FOIA was necessitated in large measure by the dramatic growth of the federal government in the mid-twentieth century, though a confluence of circumstances brought open-government legislative efforts to fruition in 1966. The U.S. Constitution does not provide a right of public access to inspect or copy government records. The first statute to provide a comprehensive right of access was the Administrative Procedure Act of 1946 (APA), of which the FOIA today is a part. The APA was initially limited, vesting broad discretion in agencies and permitting access only to "persons properly and directly concerned" with records. Abuses of government secrecy were well publicized in subsequent years and frustrated Congress, journalists, and the general public. Attorney Harold Cross documented government secrecy in a report to the American Society of Newspaper Editors, published in an influential 1953 book, *The People's Right to Know*.

Responding to this frustration, Congressman John Moss, a Democrat from California, began in 1955 to press for access reform and to hold

hearings on government secrecy. Legislation to expand access under the APA access was introduced in Congress as early as 1957, though no bill gained traction until the APA came under review in 1963. Moss found long-sought bipartisan support for a bill in 1965. Federal agencies unanimously testified against the proposed legislation, and the Department of Justice doubted its constitutionality. Nevertheless, owing in significant part to press editorial pressure, the FOIA passed the Senate, and passed the House unanimously, in 1966. President Lyndon Johnson (1963–69) signed the bill into law without ceremony at his Texas ranch on Independence Day, July 4, 1966. The holiday was likely a coincidence, as the President was unenthusiastic about the law. He issued a signing statement asserting that the FOIA "in no way impairs the President's power under our Constitution to provide for confidentiality when the national interest so requires."

FOIA Today

The FOIA applies to the executive branch of the federal government, including independent agencies, the military, and the Executive Office of the President, but excluding the President and Vice President, and their immediate staffs. The FOIA does not apply to Congress, to the courts, to nongovernmental recipients of public funding, the District of Columbia, or to state governments. As a general matter, the FOIA provides that when any person requests access to the records of a public agency, the agency must provide them unless they come within one of the nine FOIA exemptions. The FOIA also requires that agencies provide information and indexes for public guidance.

Pursuant to the FOIA, "any person" (not just journalists) may request records from a public agency. The agency must fulfill a request that "reasonably describes" the records sought. Records are defined broadly to include not only documents, but video and audio recordings, and data stored in electronic media. An agency must undertake "reasonable efforts to search for" requested records, including automated searching, but need not create new records. Records must be produced in the form requested as long as the records are "readily reproducible" in that form. An agency may charge a "reasonable" fee for searching, reviewing, and duplicating records, but noncommercial and news-media requesters may not be charged for searching and reviewing. A waiver of search and copying fees is available for requests "in the public interest." Agencies are compelled to respond to requests within 20 working days (four weeks), absent "unusual circumstances" warranting extension. However, as a matter of practice, some federal agencies (such as the FBI) are renowned for backlogs running from weeks to years. An agency must offer expedited processing for the requester who "demonstrates a compelling need," and when news-gathering has been held to constitute such a need.

Exempt from mandatory disclosure under the FOIA are

1. classified national security records;
2. records of "internal personnel rules and practices";
3. material specifically made exempt from disclosure according to a statute other than the FOIA;
4. confidential "trade secrets and commercial or financial information";
5. agency memoranda and letters that would be privileged in litigation (sometimes termed "working papers" or "pre-decisional" records);
6. personnel, medical, and other records "the disclosure of which would constitute a clearly unwarranted invasion of personal privacy";
7. certain law enforcement records, including those which "could reasonably be expected to interfere with enforcement proceedings" and those which "could reasonably be expected to constitute an unwarranted invasion of personal privacy";
8. reports generated in the supervision of financial institutions; and
9. geological information about oil and gas wells.

The scope of some exemptions is controversial and subject to perpetual litigation. Records must be redacted of exempt information before their release. When an agency claims an exemption to support denial of access to records, the agency may produce (indeed, may be compelled by a court to produce) an itemized inventory of undisclosed records and claimed exemptions, termed a "*Vaughn* Index" after a 1973 federal court case.

The FOIA requires that agencies publish in the *Federal Register* rules, procedures, and FOIA forms as well as a description of its organization. Agencies also must publish online their final orders and opinions; policies and interpretations; staff manuals and instructions, such as they affect the public; annual FOIA compliance reports; and records previously produced under the FOIA that are likely to be requested again. The FOIA authorizes agencies to promulgate and enforce their own internal FOIA policies and procedures, as long as they do not contravene the law. The online publication requirements added by 1996 amendment have led agencies to create "electronic reading rooms," websites where agencies post information as required by the FOIA and provide additional guidance to FOIA requesters about the agency's own policies and procedures.

Every federal agency must designate an official to receive FOIA requests. If a requester does not receive a response to a request or believes the agency has improperly claimed exemption, the FOIA requires that the agency provide a process of administrative appeal. For the requester who is dissatisfied with the outcome of an administrative appeal, the FOIA authorizes suit against the agency in federal district court. If a court determines that FOIA non-compliance was "arbitrary and capricious," disciplinary action may be taken against responsible federal employees.

Interpreting the Law

Influential in interpretation of the FOIA are executive orders of the President, memoranda and policies of the attorney general and Department of Justice, and the body of federal case law that has arisen from more than four decades of FOIA litigation.

Executive discretion has vacillated between greater and lesser disclosure, as illustrated by executive orders concerning the national security exemption. In a 1982 executive order, President Ronald Reagan (1981–88) created a detailed classification system that weighted agency analysis in favor of classification. In a 1995 order, President Bill Clinton (1993–2001) revamped the system, instituting a presumption in favor of disclosure absent a demonstrable threat to national security. In a 2003 executive order, President George W. Bush (2001–09) eliminated the access-friendly presumption.

Attorneys general too have struggled over FOIA interpretation. In a 1993 memorandum, Attorney General Janet Reno directed agencies to favor disclosure when FOIA exemptions, such as those concerning agency memoranda, are discretionary, rather than mandatory, unless the agency could foresee harm resulting from disclosure. In October 2001, after the terrorist attacks of September 11, Attorney General John Ashcroft revoked the Reno memorandum and told agencies instead that the Justice Department would defend any non-disclosure decision rested upon "a sound legal basis."

The federal courts have developed a voluminous body of case law interpreting the FOIA. A key U.S. Supreme Court decision involved journalists' FOIA requests for access to "rap sheets," or criminal information histories, maintained by the Federal Bureau of Investigation. In *Department of Justice v. Reporters Committee for Freedom of the Press* (1989), the Court stated that the "central purpose," or "core purpose," of the FOIA is to inform people about "what their government is up to." The rap sheets revealed information about private individuals, not about the government, the Court reasoned, so access was properly denied. Though the case ostensibly involved only a question under the law enforcement–personal privacy exemption, the "central purpose test" has been more broadly influential in lower court interpretation of the FOIA, affecting a limit on disclosure.

The *Reporters Committee* decision was also an important interpretation of the FOIA privacy exemptions because the Supreme Court accepted an argument predicated on "practical obscurity." The federal rap sheets contained information aggregated from the records of state and local law enforcement agencies, and the information generally was available to the public from those underlying sources. That availability did not preclude application of the federal privacy exemptions, the Court decided, because the geographic dispersion of the source data rendered it practically obscure.

Journalists and the FOIA

Because journalists historically have advocated vigorously for open government, the FOIA is commonly regarded as a law for journalists. But studies of FOIA usage show otherwise. Though precise numbers are difficult to ascertain, journalists'

access requests account for only about five percent of the millions of FOIA requests made annually. Most FOIA requests come from commercial entities, such as private businesses seeking information about government contracts, and information brokers mining information to repackage and sell. Journalist requests are also far outpaced by requests from individual citizens, including researchers, historians, and the simply curious.

The FOIA is arguably ineffective for many journalists. They complain that the FOIA process is too slow for timely newsgathering because of agency resistance to disclosure, the 20-day time frame, agency processing backlogs, the sluggishness of the federal courts, and a weak enforcement process. Important stories such as the Pentagon Papers in 1971 and the Iran Contra Affair in 1986 were based upon government leaks or investigative reporting, not upon voluntary government disclosures. Critics therefore charge that the FOIA is only as useful as the government is cooperative.

Nevertheless, the FOIA has made countless news stories possible and remains an important tool, especially in historical research and long-term investigative projects. For example, records disclosed under the FOIA brought to public attention the health consequences of dioxin exposure resulting from use of the "Agent Orange" defoliant in the Vietnam War. Public record disclosures were also instrumental in exposing programs of domestic government spying on civil rights activists in the 1960s and 1970s. Access advocate and journalism professor Jane Kirtley has asserted that the FOIA is important to journalists even if they do not invoke it formally, because the threat of its use is sufficient to ensure public officials' compliance with journalists' informal requests for information.

Influence

Most states had open records laws before the FOIA was enacted in 1966. Nevertheless, the federal FOIA was influential in bringing about open records laws in the remaining states, and federal court interpretation of the FOIA has been influential in state court interpretation of open records laws. Though the FOIA was not the first such law in the world—it had antecedents in Sweden and Finland—it has been influential in the creation of statutory access regimes in more than 60 countries. Though access to government records remains a subject of law around the world, access is becoming an international norm of democratic governance. International nongovernmental organizations advocating public access have proliferated, and in a 2006 case about the environmental impact of development in Chile, the Inter-American Court of Human Rights construed the American Convention on Human Rights—not binding in this respect on the United States—to provide a "right of access to State-held information."

Related Laws

Several federal disclosure laws complement the FOIA. The Privacy Act of 1974 permits individuals access to public records about the requesters themselves. The Presidential Records Act of 1978 governs access to, and the retention of, records of the President and Vice President and their immediate staffs. Public access to meetings in the federal government is provided in limited fashion by the Government in the Sunshine Act of 1976 and by the Federal Advisory Committee Act of 1972.

Conclusion

Despite its shortcomings, the FOIA plays a critical role as an instrument for both the public in general and journalists in particular to ensure government accountability in the United States. As a corollary to the freedom of speech and press embodied in the United States in the First Amendment, the right of access is coming to be recognized as an essential component of democracy in the modern era of expansive government. The FOIA is therefore unusual among U.S. statutes in that it plays a role in American law and journalism that is akin to the fundamental constitutional freedom of expression.

Free Expression, History of

In early modern Europe and North America, many conflicts over freedom of expression occurred, occasioned by the development of the printing press, on the one hand, and democratic theory on the other. By the twentieth century, a standard history of these struggles had become canonical for political theorists as well as for the occupations that are most invested in freedom of expression—lawyers, publishers, librarians, academics, religious activists—and journalists.

Journalism as a practice and an institution has been fundamentally shaped by these struggles. Positioning itself as the gateway between governments and their publics, journalism has defined itself in part as the instrument people rely on to acquire the information they need to protect themselves from and to participate in government; journalism also has thought of itself as representing the voice of the people. The culture of journalism pivots on struggles over government control of information and expression. Journalism's identity relies on a collective memory about its role in continually expanding the area of free expression.

Conceptualizing the Notion

Several different approaches to the history of freedom of expression are common. The oldest and best established is a liberal approach, sometimes called the "Whig theory of history." This theory begins with the premise that power, including the power of government, is always hostile to individual liberty. In the Whig theory, history is the story of the continual advance of liberty. This viewpoint is rooted in liberal political philosophy, which holds that liberty advances because people are free by nature, and "ideas want to be free" as well.

One variant of the liberal approach was put forward by the 1956 book *Four Theories of the Press* by Siebert, Peterson, and Schramm. It identifies a "libertarian" theory of the press, which has confidence in the rationality of free individuals and proposes that minimal government interference will be the best policy for a media system. It contrasts the libertarian theory with the "authoritarian" theory on the right and the "Soviet communist" theory on the left, which both call for massive oversight and leadership of the media system. The *Four Theories* model is somewhat different from the "Whig" model, though, in that it sees the rise of the mass media requiring a modification of "libertarian" theory into a fourth theory, the "social responsibility theory," which distinguishes between the freedom of expression of *persons* and the freedom of the *media,* and concludes that the latter is derived from and justified only to serve the former.

On the opposite end of the political spectrum there is a series of critical—as opposed to liberal—approaches to the question of freedom of expression. These approaches dispute a key point shared by liberal theories: that the realm of ideas and expression is relatively autonomous from the realm of material wealth and power. The classic expression of this position comes from German social scientists Karl Marx and Friedrich Engels, who declare in the *German Ideology* that the ruling ideas

of any age are the ideas of the ruling class, who own the mental as well as material means of production. A similar position is taken by feminist critics and some proponents of critical race theory, who understand public discourse as a "zero-sum" game, in which more speech for some means less speech for others. From a critical perspective, the history of freedom of expression can be understood only as a feature of a larger history of political struggle among groups identified by race, class, and gender.

A third approach, emphasizing the historical development of the "public sphere," mediates between liberal and critical approaches. Inspired by the work of German sociologist and philosopher Jürgen Habermas, thinkers who use the concept of the public sphere to talk about freedom of expression emphasize the importance of the development of a space of public deliberation. Like critical scholars, they point to the importance of economic development, social classes, material struggles over political power, and the material development of media forms as factors in the creation of a public sphere and the norms of public communication that govern it. Like liberal scholars, on the other hand, they point to the importance of free expression and rational deliberation within the public sphere.

Each of these approaches projects a different historical view. But any account of what we now call freedom of expression muddles the distinctions on which these approaches pivot. This is because freedom of expression is itself a constructed object. The term *freedom of expression* is a relatively recent invention. But with its construction came a kind of obligation to create a lineage for it.

Development

One might usefully begin the history of freedom of expression with the European struggles over control of information at the end of the medieval period. John Milton's *Areopagitica* (1644), one of the first arguments in English for freedom of the press, begins with a history of censorship, which, after touching on and then dismissing incidents in the ancient and medieval worlds, argues that the true origin of censorship came with the Roman Catholic office of the Inquisition. Milton's history is disingenuous, of course. His rhetorical purpose was to identify censorship with an institution that his target audience would loathe; he tried to deflect attention away from the fact that all European governing institutions also constructed systems of press regulation around the same time.

The European invention of the printing press in 1450 seems to have been the cause for the invention of press regulation. Printing was immediately understood to be a technology with deep implications for the flow of ideas and information. Historian Elizabeth Eisenstein has argued influentially that the printing press was an "agent of change," altering the cultural environment by introducing "fixity," her term for the permanence and standardization associated with printed work, multiplying the number of texts that any individual could conveniently encounter, and thereby producing a tremendous cross-fertilization that in turn nurtured the Renaissance and Reformation, the scientific revolution, the growth of the nation-state, and the crystallization of vernacular languages. Other scholars have challenged Eisenstein. Historian Adrian Johns, for instance, argues that rather than fixity, printing's first effect was to multiply forgeries and piracies. According to Johns, only when a regime of copyright law stabilized the print marketplace did fixity occur.

For the history of freedom of expression, it's not the printing revolution per se that's important, but the conflict between printing and the law. Established authorities perceived printing as potentially threatening and tried to construct webs of control. The regime of copyright law that Johns cites was a strand within one such web. In England, the larger web combined elements of church, state, and the private sector. Beginning with the Tudor monarchs in the sixteenth century, and formalized in the Star Chamber decree of 1586, England controlled printing through pre-publication licensing by officials operating under the Crown's Privy Council and the Church of England. The Crown also granted a monopoly to the Stationers' Company, the trade organization of printers and booksellers. The Stationers' Company in turn policed its membership, taking care not to alienate the authorities. Other nations achieved a different balance of mechanisms of control, but all pursued a system of prepublication censorship.

Nevertheless, these systems of press control proved ineffective in times of strain. Printing was

too mobile a technology for Europe, with its competing jurisdictions and geopolitical and religious divisions. Cultural historian Robert Darnton has documented the network of print distribution that allowed Swiss publishers to produce Enlightenment works for the French market. Earlier, printers in Amsterdam had produced English-language newsbooks for the public in England. Moreover, within any particular country, patrons with means could find sympathetic or ambitious printers willing to produce contraband publications.

So regulation was unable to prevent movements from finding expression in print. The Reformation and the seventeenth- and eighteenth-century revolutions all featured bursts of publication activity; in some cases activists in these movements made freedom of expression a cause in itself. In England, the period of revolution that began in 1640 saw the collapse virtually overnight of the complicated Tudor and Stuart system of regulation and an explosion of discordant newspapers and pamphlets. When the revolutionary Parliament moved in 1642 to create its own system of licensing, John Milton responded with *Areopagitica,* which argued against prepublication licensing, although it allowed that the state had a legitimate right to burn publications that advocated "Popery, and open superstition." This outburst of relatively uncontrolled publication proved temporary, and after the Stuart monarchy was restored in 1660 firmer regulations were put in place. But these also eventually fell. The creation in practice of freedom of political expression often resulted from accidental political events. In England, the failure in 1695 of competing parties in Parliament to negotiate a renewal of the Printing Act produced de facto freedom of the press. The parties, however, remained suspicious of the value of free public discussion of politics, and in 1712 adopted a stamp tax that in effect doubled the price of newspapers, substituting economic regulation for content regulation.

In many western European countries, it proved difficult to silence empowered groups. As new bourgeois classes appeared, they asserted their rights to freedom of conscience, political participation, and, therefore, free expression. Alongside the achievement of enfranchisement, universalistic explanations developed to legitimate these liberal policies.

Some of these explanations appealed to natural rights. Philosophers such as John Locke argued that the rights to "life, liberty, and estate" were rooted in natural law. In essence, men owned themselves, and by extension their labor and their thoughts, and had the right to do with them what they will. This naturalistic argument paralleled the religious argument that humans were endowed by nature with the capacity and the duty to make moral choices, and that governments should not interfere in the exercise of individual moral decisions.

In addition to these "metaphysical" justifications, liberals asserted that freedom of expression would also have practical effects. One recurring motif was that free discussion would lead toward progress because truth would prevail over falsehood in any fair contest. Another common assertion was that freedom of expression was necessary to maintain the vigor of beliefs in the face of a tendency toward bland conformity. This social need for lively belief also, it was argued, required toleration of unorthodox positions, especially religious ones. For the most part, early liberals presumed that there would be limits to free expression. For the most part, they presumed that non-Christians, nonwhites, women, and the poor would not participate in public discourse. They also assumed that there would be a certain etiquette to the public sphere marked by an appeal to disinterested reason.

Transformations

The public sphere, according to Habermas, came into existence in early modern Europe as the realm of private life/civil society separated itself from the state, which was in the process of transforming itself from the person and household of the monarch to a permanent bureaucratic structure. This space between civil society and the state was to work as both a steering mechanism for the state and a buffer zone protecting private rights. It could work as a steering mechanism because it allowed citizens to communicate freely on matters of common concern. It could work as a buffer zone because it kept the government under public supervision. In this liberal model of the public sphere, any empowered individual could enter public space, but only as a "citizen." Because a separation of civil society from the state was constitutional to the public sphere, citizens were expected to repress

or "negate" their purely personal interests when entering it: they were to speak as "no one," or as "anyone." And they were to assume that everyone was watching. So the norms of public discourse assumed that public speech was by no one for everyone. This style of speech is exemplified by the Federalist papers, for instance—anonymously authored by "Publius," published in New York newspapers with the expectation of republication throughout the nation, and composed in calm lawyerly language.

One particular area in which freedom of expression was jealously guarded was legislative privilege. It was a traditional right of legislatures like the House of Commons to enjoy freedom from prosecution in their deliberations. Ironically, this right meant also freedom from public supervision, and was interpreted to prevent all but authorized publications of proceedings. The eighteenth century saw continual maneuverings to publish legislative proceedings, with legislatures attempting to muzzle news outlets in the name of freedom of expression.

The bourgeois revolutions of the eighteenth century yielded an embodied philosophy of free expression in the form of bills and declarations of rights. The United States protected religion, speech, press, assembly, and petition in the first amendment to its constitution (1791). The French Declaration of the Rights of Man (1789) includes the following protections:

> No one shall be disquieted on account of his opinions, including his religious views, provided their manifestation does not disturb the public order established by law.
>
> The free communication of ideas and opinions is one of the most precious of the rights of man. Every citizen may, accordingly, speak, write, and print with freedom, but shall be responsible for such abuses of this freedom as shall be defined by law.

Such catalogs typically asserted that these rights were natural or divinely ordained. But the logic of the Enlightenment also included an impulse toward empiricism that worked to undermine the notion of natural rights. Arguing that the book of nature could be understood without the assistance of divine revelation, the scientific revolution that accompanied the political revolutions in the western world called into question all notions of divine order.

Utilitarian Notions and Tyranny of the Majority

If rights could not be justified by an appeal to the natural order, then more utilitarian notions of the grounding of rights were called for. In England, philosophers James Mill and his son John Stuart Mill articulated such notions, arguing that acknowledging a right to free expression had the practical effect of promoting the discovery of new truths and prolonging the liveliness of existing truths, resulting in a more dynamic social order and a more equitable political order. But utilitarian justifications could always be falsified by experience. One could argue that a panoptic society was more functional than a libertarian one. Likewise, in utilitarian or consequentialist notions of free expression, there would always be a question of balance. Free expression would be just one among a host of other goods, like the right to privacy or property rights.

A utilitarian justification of free expression was falsifiable by practice. In the wake of the eighteenth-century establishment of freedom of expression, as well as other individual rights of private security and political participation, a series of observers described shortcomings in the practice of free democratic societies. The most famous of these observations are Alexis de Tocqueville's *Democracy in America* and John Stuart Mill's *On Liberty*. De Tocqueville noted that freedom of the press had produced explosive growth in the number of newspapers in the United States, but that this had resulted in a general lowering of the quality of journalism. Any individual newspaper or journalist had little authority, but cumulatively the press was very powerful indeed. Its power was the power of democracy, a system in which a raw majority of the people could exercise power in every realm of social, cultural, and political life. Mill echoed de Tocqueville's alarm over the potential "tyranny of the majority." Repeating his father James Mill's arguments about the importance of free expression for the continual progress toward truth in a dynamic society, Mill pointed out that a "tyranny of custom" had appeared in Victorian England, and that this threatened the independence of the strong individuals on the

creative periphery of the society necessary to drive continued development.

The rights talk of the bourgeois revolutions had been majoritarian. The point of protecting free expression was to allow the majority to deliberate, to form public opinion, and to assert it in the face of constituted authority. Constitutional law professor Akhil Reed Amar has convincingly argued that the U.S. Bill of Rights (1791) was a majoritarian document. It was this that alarmed de Tocqueville and Mill. Though neither proposed restricting freedom of expression, their critiques implied that there should be policies aimed at countering majority impulses.

By the end of the nineteenth century, the industrial west had developed a minoritarian agenda for freedom of expression. Movements and groups outside the mainstream used the notion of freedom of expression as a political tool to protect core beliefs, practices, or identities from majority pressure. Sometimes these actors concentrated on concerns that might be considered private—sex and religion were frequent flashpoints. Sometimes the stakes were political or cultural. In many cases in Britain and the United States, the key issue was class power. In Britain, property restrictions on voting and the stamp tax on publications gave a class edge to questions of equal rights. In the United States, attempts to limit the labor movement's exercise of free expression defined the issue at century's turn. Arguably, the twentieth-century notion of freedom of expression was invented by these outsider groups. At the same time, some of these struggles generated antiliberal notions of free expression.

In the United States, the World War I era marked a climax in the development of thinking about freedom of expression. In the background were fears about the tyranny of the majority—always also a fear of domination by the lower classes—intensified by new, more sensual media, especially motion pictures and recorded music, which seemed to undermine cultural authority by directly entering the eyes and ears of morally, culturally, and socially vulnerable populations—women, children, exhausted workers. Against this background appeared all the abuses of political communication associated with a new age of total war—propaganda in every form, and official and informal repression of dissidents. In the wake of World War I, a civil liberties coalition emerged, consisting of lawyers, academics, librarians, artists, and journalists. This coalition aimed to protect individual expression. At the same time, the experience of the propaganda effort and the failure of the news media to counter it produced a new sense of apprehension about the power of the media. Thinkers such as journalist and political commentator Walter Lippmann called for some institutional corrective for commercial media—in Lippmann's case, expert intelligence bureaus that would provide authoritative information to decision makers.

Libertarian and Public Service Models

These quite different legacies of World War I inspired two very different liberal traditions of addressing the problem of free expression. The civil liberties movement inspired a libertarian approach. Emphasizing the protection of individual freedom from government interference, this approach predicted that allowing the broadest exploitation of free expression to every conceivable actor, including both nonmainstream voices and the emerging corporate media industries, would produce a healthy and diverse realm of public discourse.

But the suspicion of the power of the media produced a very different approach. If media were becoming larger, more monopolistic, and more powerful, as the new terms *mass media* and *mass communications* suggested, then competition in the marketplace could no longer be counted upon to provide a healthy realm of public discourse. Instead, media outlets had to be tasked with the responsibility to provide a virtual marketplace, or *marketplace of ideas*, also a novel term in the middle third of the twentieth century. This approach to free expression viewed individual freedom as requiring media stewardship, and amounted to a public service or social democratic vision of media freedom.

The public service model of free expression seemed in the ascendant at the end of World War II. In the United States, practical moves like the breakup of the Hollywood studio system in the late 1940s and publication of the FCC's 1946 "Blue Book" setting standards for broadcast licensees gave concrete form to the abstract articulation of "social responsibility theory" by, among others, the Hutchins Commission, whose 1947 report, *A Free and Responsible Press,* is credited with crystallizing this approach. Internationally, similar developments

in European countries, which had already instituted a public service regime for telecommunications and were more advanced in developing media professionalism, suggested ways of fulfilling the "right to communicate" set forth in the United Nations' Universal Declaration of Human Rights (1948).

The UN Declaration's wording was designed to embrace more than these two liberal traditions, however. It also suggested a different approach to free expression coming from the Marxist tradition. Marxism rejected the assertion in liberalism that the realm of ideas operates by different rules than the material realm. In the material realm, goods are distributed in roughly a zero-sum fashion—more oil or gold for you is less for me. Liberals asserted that more speech for you is more speech for me and for everyone else as well, and that the solution to any equity problem in communication is simply more speech. Marxists pointed out that liberalism's notion of protecting freedom from government interference translated into a preservation of inequality in the private realm—more speech for the rich is less speech for the poor. So Marxists called for a redistribution of communicative resources.

Such a redistribution, while elegant in theory, was difficult to implement. In nations governed by Marxist authorities, like the Soviet Union and the People's Republic of China, Marxist theory translated into a combination of party control of media systems coupled with a kind of professionalization of media work with the agenda of creating a realm of correct political discourse. By the 1930s in the Soviet Union and by the 1960s in the People's Republic of China, apparently seamless systems of state-controlled media operation were in operation. These systems were supposed to be transitional, pending maturation of communist society. Few Marxists claim these systems to be appropriate embodiments of Marxist principles, which would require a less alienated body of media workers and a more responsive, less centrally controlled, and more open news and media culture. Into the twenty-first century, no mature Marxist national media system offered itself as a paradigm.

Global Free Expression, the MacBride Commission, and Right to Recognition

By the second half of the twentieth century, however, the language of freedom of expression, like the language of democratic governance, had become the default language of the international community. As the Universal Declaration attests, a global consensus endorsed something called free expression, even though many different conceptualizations of it existed. The tension between these conceptualizations played out in the 1970s and 1980s in the United Nations Educational, Scientific, and Cultural Organization, or UNESCO.

Calls for a "New World Information and Communication Order" led UNESCO to create a commission, headed by Sean MacBride. Formally called the International Commission for the Study of Communication Problems (and informally the MacBride Commission), it issued its report, *Many Voices, One World,* in 1980. The report acknowledged a series of imbalances in communication that paralleled imbalances in wealth, with the north controlling international wire services, international markets in film and broadcast entertainment, and consequently the flow of images and information. The report responded to the principle of the free flow of information with a plea for a "free and balanced" flow and suggested a variety of principles and mechanisms to promote it. Critics, usually speaking from liberal principles, seizing on the human rights records of some proponents and on the commission's recommendations for licensing newsworkers and for "right of reply," depicted the movement as a concealed attempt at endorsing censorship. The controversy contributed to the withdrawal from UNESCO of both the United States and Great Britain. In the decade that followed, the debate over the international communication and information order shifted from UNESCO to the World Trade Organization as protecting intellectual property became the key site of struggle.

A continual erosion of the public service model in western countries accompanied this shift. In the 1980s and 1990s, national telecommunications authorities were either dismantled and privatized or supplemented by privately owned commercial broadcasting and cable or satellite television and radio. The collapse of the Soviet bloc after 1989 opened a new territory to commercial media development. In some countries, media entrepreneurs acquired tremendous political influence. The rise to political power of media magnate Silvio Berlusconi in Italy marked the emergence of a new kind of "media politics."

The MacBride Commission report and the controversy it incited showed the difficulty liberalism as an ideology experiences when the subject of free expression is shifted from the individual to the community. In the MacBride Commission, which took its initial charge from the Universal Declaration, reference was made to the "right to *communicate*." Liberals note that this is different from the right to free *expression*. Expression doesn't require that anyone else pay attention, and is in fact freest when no one does. Communication, on the other hand, only exists with some reciprocal action. So a right to communicate entails the imposition of a duty to be communicated with.

Within liberal societies, the parallel frontier involves the right to recognition. Nonmainstream and subaltern groups claim a right to recognition of their identity and culture by the general public or the national government, arguing that otherwise their members are denied full equality under the law. Liberals are unaccustomed to thinking of groups as rights-bearing, however. Corporations, for instance, are rights-bearing only because liberalism treats them legally as "fictitious persons"—General Motors has the same First Amendment rights as any citizen. It makes no sense to think of the Quebecois as a fictitious person, however. So on what basis can liberalism require the acknowledgment of Quebec or Canadian francophone culture?

This dilemma has been keenly felt in multicultural nations, particularly those with competing religious communities. The reception of Salman Rushdie's 1988 novel *Satanic Verses* in India and the Muslim world was one such spectacular case. In 2006, the Danish newspaper *Jyllands-Posten* published caricatures of the Prophet Mohammed that were condemned by Muslims as blasphemous and rioting followed in numerous countries. In both cases, Muslims claimed a kind of right to recognition; liberals responded by claiming the issue to be the individual right to free expression.

Such controversies became framed by the larger question of freedom and policing in the post-9/11 age of the Global War on Terror. Although the implications have been most visible in the realms of surveillance and procedural rights, the GWOT has also marked the return of the World War I dynamic, as propaganda has been matched by formal and informal attempts to oversee and curtail certain forms of expression, especially in combat zones. In the United States, "embedding" reporters, covertly funding "expert" sources for cable news shows, planting news in Iraqi media, restricting use of cell phones and blogs by military personnel, wiretapping electronic communication, and surveilling antiwar protesters have awakened traditional civil liberties concerns.

So the beginning of the twentieth century saw conflicting trends in the realm of free expression. On the one hand, the reappearance of patterns of state control and interference looks back to earlier generations of struggle and reenergizes older civil liberties organizations. On the other, technological change and neoliberalization promise a new era of channel abundance that makes older forms of control, including journalistic professionalization, seem superfluous.

Free Flow of Information

Toward the end of World War II (1939–45), the expression "free flow of information" and the ideas that it encapsulates began appearing in national and international documents. Briefly, the expression is meant to convey the open passage of print and electronic media across borders and among nations. Important examples include (as "free flow of ideas by word and image") the constitution of the United Nations Educational, Scientific and Cultural Organization (UNESCO, 1945) and (as "freedom of opinion and expression") the UN Declaration of Human Rights (1948). The UN Economic and Social Council (ECOSOC) established the Subcommission on Freedom of Information and of the Press in the early 1950s. ECOSOC addressed the problem of a global imbalance of information structure as early as 1961, as did the United Nations General Assembly in deliberations in 1952 and again a decade later.

The intellectual currency of "free flow" has demonstrated durability and adaptability over time, appearing, for example, in the 1966 UN International Covenant on Civil and Political Rights (as "freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media"), and in the 1972 General Conference of UNESCO's Declaration of Guiding Principles on the Use of Satellite Broadcasting for the Free Flow of Information, the Spread of Education and Greater Cultural Exchange.

Yet not long after the end of World War II it also became apparent that the principle of "free flow" of information might potentially clash with both *equity* among nations in their levels of technological and economic development, and with their *national sovereignty*. Transnational delivery of television signals by satellite, first accomplished in the early 1960s with *Telstar,* was predicted by some critics to pose a severe threat to national cultural sovereignty (although by the 1990s, it seemed that satellite had greater significance at local, national, and regional than at global levels). The "free flow" principle was broadened to a "free and *balanced* flow of information" in UNESCO's 1978 "Declaration of Fundamental Principles Concerning the Contribution of the Mass Media to Strengthening Peace and International Understanding, the Promotion of Human Rights information and to Countering Racialism, Apartheid and Incitement to War." This long-titled document called for "greater reciprocity" of information, and for a "free flow and better balanced dissemination of information"—reformulations that were reiterated in the 1980 MacBride Commission report to UNESCO. The MacBride report was the culmination of a series of debates at conferences hosted principally by UNESCO and by countries of the Non-Aligned Movement, that sought to encourage a proposed "New World Information and Communication Order" (NWICO) as a necessary sequel to an earlier New World Economic Order (NWEO). The story of the NWICO debates and their conflicting philosophical foundations has been recounted in many sources, including Mehra's 1986 book, *The Free Flow of Information: A New Paradigm.*

The spirit of NWICO was first reflected in global telecommunications when in 1973 the International Telecommunication Union (ITU) eliminated its colonial system of voting whereby nations voted according to the number of colonies they administered. In 1982, the ITU expanded its mandate to address particular needs of developing countries. Both the NWICO and the 1980 MacBride Commission report to UNESCO met with a sustained Western media attack, spearheaded by the

United States (including 1982 congressional measures against UNESCO, and strong lobbying of the newspaper-backed World Press Freedom Committee) and Britain. Their reaction expressed a fear that UNESCO might endorse restrictions on "free flow" imposed by undemocratic governments. It was also argued that these might require government licensing of journalists (although UNESCO itself never supported this concept). Western negative reaction can also be seen as one reflection of an evolving postcolonial world in which the UN was no longer as compliant with Western foreign policy as it had been earlier.

The United States (in 1985) and Britain (a year later) withdrew from UNESCO, prompting conciliatory changes in UNESCO structure and policy. Both nations returned to membership two decades later, by which time UNESCO had ceased to aggressively promote the ideas of the MacBride Commission. Through its International Program for the Development of Communication (IPDC) UNESCO concentrated instead on technical assistance, often in bilateral contexts. Discourse about "free flow" lost popularity for some years following MacBride, which exposed the concept as an ideological tool wielded mainly by America and its allies. Those responsible for such exposure were roundly condemned by Western governments and mainstream media. Inspired by the work of Manuel Castells and his disciples, some academics later abandoned the metaphor of "flow." Instead they favored the concept of "network" and other alternatives that better visualized the complex interrelationships between digital communication, space, and time. Critics wondered whether the newer language subtly distracted attention from continuing concerns about media power, gate keeping, and control.

Indeed, UNESCO found it useful to revive the language of "flow." "Promoting the free flow of information and the development of communication" appeared as a component of UNESCO's strategy for 1996 to 2001, as adopted at its General Conference in 1995. The report of the UN World Summit on the Information Society (WSIS), held in Tunis a decade later, saw 170 governments recognize "that freedom of expression and the free flow of information, ideas, and knowledge are essential for the Information Society and beneficial to development," a very different text than the MacBride report a quarter of a century earlier. WSIS had a strong government, corporate, and technocratic character, focusing principally on computing, the new media, and the Internet. Its patrons worked hard, though not altogether successfully, to avoid ideological and political controversy.

Benign Implications

The earliest uses of "free flow of information" had broadly benign meaning. Later attacks on the concept generally targeted particular uses to which the expression was applied, rather than the inherent ideals that it was intended to represent. The word *flow* is associated with fluidity (whether of liquid or electricity), and the notion of a "free flow" of information is suggestive of a forceful, self-sustaining, and unrestrained movement of ideas. Yet limits of this positive interpretation are suggested by unidirectional flows of both fluid and electricity. These, in turn, are evident to critics who maintain that the term is ideologically loaded.

The specific reference to "information" is sometimes deemed a poor term to cover the full range of human communicative activity, seemingly confining the notion to knowledge of a neutral descriptive or scientific character. Still, "free flow" has acquired value as shorthand for the open movement of information and ideas and the creative expression within and, especially, *between* societies. It acquired considerable purchase during the twentieth century, especially in democratic societies in which processes of decision-making were said to be based upon interchange of rational argument among different interests, so that important ideas and information were widely articulated by well-developed media networks. Indeed, a close symbiosis between democracy and media has often been postulated. The historical context of World War II and its immediate aftermath was especially receptive to the idea of "free flow of information," as the Western allies recovered from the threats of fascist authoritarianism, threats that many believed were revived in a different guise by Soviet communism.

As Tool of Ideology

The deconstruction of what he called the "free flow" doctrine was perhaps most eloquently

undertaken by Dr. Herbert Schiller, a professor at the University of California, San Diego, notably in his 1976 book *Communication and Cultural Domination*. His second chapter, "The Diplomacy of Cultural Domination and the Free Flow of Information," recounts the intensive diplomatic efforts by the United States, in partnership with influential U.S. publishers, associations, and the Associated Press, to promote the "free flow" concept. In a 1986 book, Achal Mehra noted congressional resolutions in 1944 that called for "world-wide right of interchange of news . . . without discrimination . . . protected by international compact." Schiller recalled a 1944 resolution of directors of the American Society of Newspaper Editors in support of "world freedom of information and unrestricted communications for news throughout the world," a sentiment that had the support of both major political parties and congress. The doctrine was also espoused by the Inter-American conference on problems of War and Peace convened in Mexico City in 1945 and embedded in the earliest drafts of the constitution and organizational structure of UNESCO, not to mention during the outset of the UN itself, including the foundation of the UN Commission on Human Rights in 1946 and the 1948 UN Conference on Freedom of Information.

Writing in 1997 for the *Le Monde Diplomatique,* Schiller recalled U.S. Secretary of State John Foster Dulles as saying in the 1950s that "free flow" was the most important issue in American foreign policy. In 1946, Assistant Secretary of State William Benton had said much the same thing: "Freedom of the press—and freedom of exchange of information generally—is an integral part of our foreign policy." In his article, Schiller referred to American delegates at the UN and UNESCO pressing "relentlessly" for free flow of information. Financial incentives were later added to ideological appeals. The Marshall Plan, for example, tied dollar grants to a recipient's willingness to open its market to American cultural exports, including film. Schiller noted the "enormous significance" of U.S.-funded research and development for such things as computer and surveillance technologies. Communications satellites were designed, he argued, to purposefully "wrest global information control from Great Britain, which at that time exercised worldwide domination of underseas cable."

In his 1976 book, Schiller linked all of this to the American experience preceding World War II, and in particular to the long period during which the leading U.S. news agency, Associated Press, was subservient to the British-based news agency, Reuters, in a world news cartel. An influential polemic, *Barriers Down,* written by AP Managing Director Kent Cooper in 1942, described his own campaign over many years to liberate AP from the cartel, something his agency had largely accomplished by 1933. His book became an influential source for "free flow" enthusiasts. It chronicled how the United States had been disadvantaged by cartel restrictions on AP's news coverage, subjecting American readers to news written through the biased lenses of foreign journalists, and subjecting foreign readers to American news written by foreign journalists.

Schiller's attack on the free flow doctrine revealed the extent to which use of the term had been put to ideological work on behalf of the United States taking over from Britain the role of world superpower, and the interest of American publishers, movie makers, and broadcasters in securing unfettered access to global markets at the very time when many nations (such as those emerging from war-devastated Europe) might have much preferred measures of market protection on behalf of nascent or recovering local industries. Yet, as Dwayne Winseck has noted, the "free flow of information" doctrine largely wiped out the rights of states in important areas of communications policy.

Skepticism of what Schiller labeled the "free flow doctrine" was reinforced by a 1970s series of UNESCO-sponsored conferences and debates about the New World Information and Communication Order (NWICO). Schiller's deconstruction of the term exercised a powerful influence on many of those active in those debates, and the UNESCO-commissioned MacBride report of 1980.

At the start of this period, a development in Helsinki struck a discordant tone, temporarily dislodging political discourse from uncritical acceptance of "free flow." Accounts have been offered by both Schiller in his 1976 volume and, in 1995, by Kaarle Nordenstreng, a Finnish communications researcher who participated in the 1975 conference that led to the signing of the Helsinki Accords. The leaders of 35 nations, including the United States and the Soviet Union, signed a document calling for increased international cooperation in practically

all fields, including culture and communication. In an address to the conference, Finnish President Urho Kekkonen critiqued the concepts of "freedom of speech" and "free flow of information," arguing that these were not unalloyed benefits in circumstances of severe inequality of access to the means of communication. Could it be, he wondered, "that the prophets who preach unhindered communication are not concerned with equality between nations, but are on the side of the stronger and wealthier?" (quoted by Nordenstreng 1995).

Resuscitation of the Concept

Use and significance of the "free flow" term, therefore, has been ambivalent. In use, it has too often glided over the issue of *whose* freedom. Freedom of media owners, or of media consumers? of senders or receivers? Is there reciprocity of communication between parties to the communication? Ambivalence cloaks the play of *power* in situations where some communicating parties control far more capital, equipment, know-how, technology, and talent. Where there are wide discrepancies of power between the parties, any communication is much less likely. Additionally, the term "information" seems to many critics of "free flow" doctrine too narrow a concept to embrace such a vast array of publishing, educational, entertainment, and cultural products and activities that are disseminated in many complex ways. Such a restriction may mostly serve the interests of those who stand to gain by the reduction and commodification of this vast array into marketable bytes.

In its use, finally, the term often seems to assume that the primary enemies of "free flow" are governments, whereas increasingly those enemies are found to be private enterprise. Initiatives to stimulate privatization of previously government-owned or controlled media form part of the bundle of trends that accompany policies of media "deregulation." Their impact is to enhance the likelihood that private interests may reduce "free flow." This happens principally through the political power accumulated by giant communications conglomerates whose emergence has been greatly facilitated by deregulation policies. How such conglomerates choose to exercise their power in lobbying politicians, and how they shape their news and entertainment practices, will continue to affect "free flow" within an ongoing deregulation environment.

These problems notwithstanding, the term remains durable, as in the case of UN debate over the World Information Society. Dwayne Winseck in 1997 argued that "free flow" had been resuscitated through the "trade in services" regimes of the North Atlantic Free Trade Area, the World Trade Organization with their promotion of media deregulation as a condition for membership of the emerging global economic order. Features of media deregulation as advanced by the United States and Britain (such as removal of regulations that restrict foreign investment in domestic communications, cross-ownership between newspapers and broadcasters, or the share of national audience a single broadcasters might reach) also promote the corporatization of media and reduce the potential for public access to media and decisions about media content. "Free flow of information" applied to such trends cloaks implications for growing corporate control of communications under the supreme "purr" word *freedom*.

In a final example of its rhetorical durability, a "free flow of information act" was proposed by U.S. Attorney Chuck Rosenberg and others in 2005 as a measure to limit the circumstances and manner in which reporters might be compelled to reveal sources in court. While out of line with uses of the term in the international realm, this instance begs the question, once again, of *whose* freedom—the freedom of courts to subpoena media as witnesses, or freedom of the media to protect sources in the interests of gathering information? We can conclude that despite its demonstrated lack of intellectual precision, the term "free flow of information" remains a valid tool in debates about the proper role of media.

Freelance Writers and Stringers

Freelancing for media outlets—working on a short-term, temporary, or contract basis rather than as a salaried staff employee—used to be seen as a tenuous but promising route to full-time employment in journalism. By the early twenty-first century, that was no longer the case. As demand for diverse media content has grown while conventional media job opportunities have shrunk, the corps of freelance writers, photographers, broadcast journalists, web scribes, and others working assignment-to-assignment has expanded. Likewise, "stringing" for particular outlets, once seen as a foot in the door, has become a decidedly transitory arrangement rather than a portal to permanent work.

Definitions and Evolution

The *Oxford English Dictionary* online traces the word *freelance* to the Middle Ages, when it designated "a type of military adventurer . . . who offered his services to states or individuals for payment, or with a view to plunder; a mercenary soldier." In modern times, to freelance means to works as an independent contractor, fulfilling assignments for different clients.

A *stringer* is a subcategory of freelancer who supplies content on a regular basis for a specific client. The designation originated in newspaper work, with nonstaff correspondents paid according to column inches published; an untraceable urban legend has it that such writers used string to measure and bill for their accumulated work, while the online *Oxford English Dictionary* attributes the term to the figurative saying "one who strings words together." The usage grew in the 1950s, especially as applied to photographers and foreign correspondents, and thanks largely to the expansion of Time Life magazine operations, which claimed 435 correspondents, stringers, and writers reporting from 33 locations around the world by 1958. By the 1960s to 1970s, TV news relied increasingly on worldwide stringers as well.

During this same postwar period, the proliferation of niche magazines and trade journals along with the growth of advertising, marketing, and public relations industries created additional demands for writers, editors, designers, illustrators, photographers, and others with relevant media skills. Over time, the burgeoning availability of work without corresponding provision of permanent salaried positions gave rise to a notion of freelancing as a career in itself. An accompanying genre of instruction emerged in the form of books, magazines, marketing directories, and writers' courses aimed at individuals seeking income from media piecework.

In the Internet age, the downsizing of conventional print and broadcast staffs, the continued vitality of niche and trade publications, and the boundless appetites of the web only accentuated these trends. While extending infinite opportunities for mostly unpaid expression, the Internet also furthered the idea of content creation for money, seen in the profusion of self-help websites for would-be freelancers. Meanwhile, celebrity journalism across all media continued to build upon and sustain another brand of freelancer—the paparazzi, glad to sell photos or stories to the highest bidder.

International Reporting

As major news organizations closed or consolidated foreign bureaus and cut back on permanent staffing abroad, overseas stringers became even more crucial to international coverage. Young freelancers willing to travel to dangerous hot spots provided much of the reporting on Latin American

upheavals in the 1970s to 1980s, and stringers were conduits for much of the news of the brutal Balkan civil wars in the early 1990s.

Increasingly, however, hard news from areas wracked by violence and conflict depended on unsalaried, uninsured, and often politically vulnerable stringers who were nationals of the countries affected. This became particularly evident amid the civil strife of the Iraq war (2003–), when Western news outlets came to depend on Iraqi stringers risking their lives to get first-hand information—a situation one reporter quoted by *Slate* media columnist Jack Shafer likened to "journalism by remote control."

At the same time, the expanding international operations of business news services such as Bloomberg, Dow Jones, and Reuters (Thomson Reuters by 2008) created new prospects for Western freelancers abroad. Even as locals stepped into situations too dangerous for outsiders, the outsiders were stepping into safer and more lucrative jobs.

These varied trajectories in freelance journalism have their counterparts in popular culture. The footloose reporter easily becomes the intrepid seeker of truth, as in the 1986 Oliver Stone movie *Salvador,* about a freewheeling U.S. journalist covering El Salvador's guerilla insurgency against a right-wing military dictatorship. The notion of the freelancer as mercenary also lives on, however, as in the more obscure 1999 film *Stringer,* whose protagonist is expected to be first on the scene, videocamera rolling, at accidents, fires, rapes, and robberies.

Two reporters who freelanced from abroad, David Bank and Peter Leyden, found the reality less dramatic, writing in 1991: "Ultimately stringers are trapped in a caste system that leaves them little chance for advancement. Few stringers make the jump to staff positions as foreign correspondents. Like migrant farm workers, stringers are dependent for their living on the crop of news coming out of a country. When the story dries up, the stringers must move on. Nobody looks out for their welfare."

Varieties and Rationales

Any type of writing for hire can come under the rubric of freelance writing—be it sports reports, advertising copy, promotional brochures, or greeting card verses. Most freelance writing advice is geared toward production of articles for magazines, newspapers, and online publications, but money-making freelance jobs can range from recording statistics at baseball games to compiling technical manuals.

Proponents of freelance writing for a living note the virtues of a flexible work schedule, the ability to work from home (or, thanks to the Internet, from just about anywhere), the prerogative to accept or decline jobs, and other liberties that come with being self-employed. Indeed, notions of independence and freedom are central to the ideology of freelancing not just as a career, but as a lifestyle choice—sometimes deemed especially suitable for mothers of small children. As one web enthusiast, Rachel Pickett, puts it: freelancing means "you work when you want, for who [sic] you want, and for the amount of time you want."

Realistically, however, those who seek a livelihood through freelancing seldom control the volume, terms, or conditions of their work. Most freelance jobs are unglamorous. The workload fluctuates, the pay is often low, and publication usually is not assured. Freelancers don't get benefits like health insurance and paid vacations; at best, a project might provide for expenses. Freelancers are eminently expendable, because potential replacements abound.

The U.S. Bureau of Labor Statistics' (BLS) overview of the job category "Writers and Editors" observes: "While many freelance writers enjoy running their own businesses and the advantages of working flexible hours, most routinely face the pressures of juggling multiple projects with competing demands and the continual need to find new work. Deadline pressures and long, erratic work hours—often part of the daily routine in these jobs—may cause stress, fatigue, or burnout. In addition, the use of computers for extended periods may cause some individuals to experience back pain, eyestrain, or fatigue."

Reliable statistics on numbers of media freelancers are hard to come by for numerous reasons, including the fact that many freelancers make their main living at other jobs. The BLS reports that writers and editors held some 306,000 jobs in 2006 (subcategories of "writers and authors" accounted for about 135,000 jobs, "editors" about 122,000, and "technical writers" about 49,000), with more than one-third self-employed. But the

numbers of individuals who write or edit on a freelance basis without claiming this as their main occupation is surely far larger.

Information on freelancers' incomes is similarly elusive. The BLS put median annual earnings for salaried writers and authors at $48,640 in May 2006, but comparable information for freelancers is not available. Magazines like *The Writer* or *Writer's Digest* and websites for writers such as writers weekly.com and worldwidefreelance.com suggest that six-figure incomes are well within freelancers' reach, but other evidence belies such claims. Internet discussions of pay rates suggest tremendous variation from region to region as well as among individuals, with some commentators commanding hourly rates of $35 or $50 and others settling for little more than minimum wage. In any case, comparisons with the salaried workforce are impossible, since freelancers carry their own overhead.

Freelance journalist Doresa Banning's web survey of U.S. freelance journalists conducted in the fall of 2004 found that nearly three-fourths of the 473 respondents were female, the majority were middle-aged and well educated, and they were concentrated in large cities. Most respondents said they freelance from choice, because they like being their own boss. Nearly 70 percent reported an annual gross income of less than $50,000 from freelancing, while another 24 percent grossed $50,000 to $99,000 annually. Five people, the top one percent, said they earned between $200,000 and $250,000.

Information and Advocacy

The expansion of freelancing since World War II has been accompanied by the growth of organizations devoted to protecting and promoting the rights and interests of self-employed media workers, and such advocacy groups constitute another sort of resource for freelancers.

The leading trade association for photographers, for example, is the American Society of Media (formerly Magazine) Photographers, founded in 1944 and one of the earliest advocates for fair pay and copyright protection for freelancers. The most active writers' associations are the Authors Guild, with some 8,000 members, founded in 1912; the American Society of Journalists and Authors, founded in 1948, with about 1,100 members; and the newer and more militant National Writers Union (NWU), founded in 1981 and affiliated with the United Auto Workers, with a membership of some 3,400. On its website, the NWU describes its emphasis as improving income, contracts, and working conditions for all freelance writers, "including journalists, book authors, business and technical writers, essayists, poets, playwrights, script writers, writers for the web, and campus writers. . . ."

Under U.S. labor law, freelancers are considered as "independent contractors," rather than employees. As such, they are not entitled to any employee benefits; nor do wage and hour laws apply to them. Publishers make no deductions from payments to freelancers for tax purposes; freelancers are responsible for paying their own taxes, keeping their own place of business, and supplying required tools and skills. Freelancers by nature bargain from the weaker position, and policing the use and reuse of their work is an unending challenge.

The advent of newer media formats, particularly online publication using digital technologies to disseminate text, pictures, audio, and video on the Internet, greatly expanded opportunities for expropriation of content without compensation, and the 1990s brought additional battles over electronic publication. Among the most important was a class action lawsuit filed on behalf of thousands of freelance writers whose stories had been republished in online databases without their consent. The defendants—large publishers and database companies that included *The New York Times,* Time Warner, *The Wall Street Journal,* Dow Jones Interactive, Knight-Ridder, Lexis-Nexis, Proquest, and the West Group—argued that they were merely facilitating access to information, akin to making newspapers available on microfilm. The plaintiffs maintained that in repackaging content in new formats, the publishers were obliged to obtain copyright permissions anew. The case *Tasini v. The New York Times* reached the U.S. Supreme Court and culminated in an important victory for freelancers. The court's 2001 ruling established that principles of copyright developed for print also apply online, and that editorial content cannot be distributed electronically without the creators' permission.

As a result of this ruling, the NWU and other authors' organizations reached an $18 million settlement agreement with the companies involved, setting payments of up to $1,500 to writers who

had obtained copyright registration and up to $60 per article for writers who had failed to register their copyrights. The results remained in limbo, however, after a group of freelance writers seeking better compensation for the unregistered works challenged the settlement. As of mid-2008, no resolution had been reached, nor any payments made to claimants.

Similarly, freelance photographers brought battles over rights into the electronic sphere in the 1990s, notably in a challenge to *National Geographic*'s 1997 release of a 30-CD set of the magazine's 108 years of content to that point. The set included countless images taken by freelancers who claimed the copyrights to their own work—unlike staff photographers or writers, for whose work the employer held the copyright. Some 2,000 affected photographers learned of the upcoming product in a company letter informing them that they would not be paid for the use of their material. Numerous lawsuits followed, with two federal appeals courts making opposite rulings and the Supreme Court declining to resolve the conflict. Ultimately, one of the photographers, Jerry Greenberg, won $400,000 after eight years of litigation.

As wrangling over rights continues, many publishers have formulated "work-for-hire" contracts that require freelancers to sign over all rights ahead of time. Major newspapers commonly ask regular contributors to sign blanket agreements relinquishing all rights in all mediums to past, present, and future works, and refuse to work with freelancers who balk. Advocacy organizations have challenged such sweeping provisions with additional lawsuits, including a class action suit filed in 2000 by freelance writers, illustrators, and photographers against *The Boston Globe*. Freelancers are advised to avoid work-for-hire arrangements, but unless they are well-established writers with leverage to negotiate better terms, this often means forgoing the work.

Against the backdrop of these enduring controversies, a myriad of other organizations, publications, and websites offer admonitions, encouragement, and guidance for breaking into freelancing, getting and fulfilling assignments, dealing with editors, running a home office, and collecting payment. (As a practical matter, for many freelancers the problem of nonpayment often looms larger than the issue of rights.)

Some of the providers of information and resources for freelancers are disinterested nonprofit groups; some are entrepreneurial freelance endeavors themselves; and some are large corporate ventures. Among the latter, F & W Publications, Inc., based in Cincinnati, Ohio, publishes one of the most successful freelance-oriented magazines, *Writer's Digest*, a monthly with a circulation of about 200,000. F & W also puts out the best-known handbook for freelancers hoping to publish books or magazine articles, *Writer's Market*. The website WritersMarket.com complements an annual directory published since 1921, providing contact information for thousands of consumer and trade magazines and publishing houses, along with guidance for preparing manuscripts and approaching editors and agents.

Websites aimed at freelancers often host job listings along with tips, cautionary tales, and plentiful moral support. Blogs offer "Top 10" or "Top 100" lists of writing tips, story ideas, freelance markets, or best sites for freelancers in categories ranging from writing, design, and photography to programming and web development. The Society of Professional Journalists sponsors a blog for freelancers called "The Independent Journalist."

Financial support for unaffiliated journalists wishing to pursue independent projects is rare, but a few key sources exist. The Alicia Patterson Foundation fellowship program, with an annual awards program begun in 1965, has a laudable track record of supporting freelancers engaged in serious public affairs journalism. In 2008, the organization Investigative Reporters & Editors announced the creation of a new $80,000 endowed fund to support freelance journalists doing investigative projects.

The realities of the media marketplace in the early twenty-first century continue to drive the growth of freelancing. From the perspective of employers, the relative economies of hiring part-timers and stringers on a contract or piecework basis ensure the endurance of such arrangements. From the perspective of enterprising journalists, getting a start by freelancing or stringing can open the door to more stable employment. And as a chosen career path, freelancing can offer a flexible and independent, if often tenuous, livelihood.

Free Newspapers

Free newspapers are dailies that are given away free of charge to readers, typically Monday through Friday. Often quite thin and tabloid in physical format, free newspapers usually feature shorter news stories, employ news agency copy, and emphasize lifestyle and entertainment coverage. In the first decade of the twenty-first century, free newspapers began proliferating around the world with the Metro International chain leading the way.

This growing trend impacted the news industry in several ways. First, free newspapers sought to capture a younger, nontraditional demographic that was increasingly ignoring daily newspaper reading. Second, the business model for free newspapers—reliant upon advertising income alone—represented a bold departure from the strategy of subscription revenue. Third, free newspapers became indelibly linked with urban public transit systems where they are often given away and designed to be read during brief commutes. Lastly, their often bare-bones mastheads signal a potential shift toward reporting and editing with fewer, more versatile journalists and leaner institutional operations. Although their lasting impact on the news industry remains as yet unclear—particularly whether they complement or cannibalize the existing market for mainstream dailies—some preliminary conclusions already seem to be emerging.

Origin

Various claims are made about the origin of the free daily newspaper. One source traces the format back to Australia at the turn of the twentieth century; another points to *Contra Costa Times,* founding publisher Dean Lesher's experiment with free newspapers in California during the early 1960s, as the progenitor. According to the California Newspaper Hall of Fame, Lesher's model delivered the paper to reader's homes for free but sought "voluntary" subscriptions to support the service. The *Colorado Daily,* a newspaper based in Boulder, whose own free format dates from the early 1970s, also claims to be one of the first outlets to publish under the advertising-only model. The more recent geographic expansion and readership growth of free newspapers was born of a gambit by Swedish publishers in 1995. Launched in Stockholm, *Metro* sought success based on the premise that subway riders would enjoy a free newspaper to accompany their daily commute; the approach was groundbreaking for integrating free distribution with mass transit structure. The paper achieved notable inroads with the youthful readers so desired by advertisers, saw broader growth that doubled the size of the still-comparatively slim publication, and posted an industry-leading $11 million in earnings within a decade. As one Swedish media analyst told *Time* magazine in 2000, "Metro has changed the newspaper reading patterns for Swedes.…It is all the young people read."

The concept proliferated swiftly across Europe and more slowly elsewhere. Metro International introduced free daily newspapers in the late 1990s in Prague, Helsinki, Budapest, and Amsterdam. From their modern incarnation in 1995 with a circulation of 200,000, free newspapers grew to distribute more than 40 million copies daily by the middle of the first decade of the twenty-first century, according to industry expert Piet Bakker. Although the format has taken hold in cities from

Baltimore to Buenos Aires and Seoul to Singapore, Europe continues to be the region where most of the papers are located—Spain in particular has had a large concentration of free dailies. Metro International, based in Luxembourg, continues to dominate the bulk of the market as the world's largest publisher of free dailies. By 2008, the chain that distributes to New York, Boston, and Philadelphia in the United States claimed a daily circulation of 23 million copies in 23 countries around the globe. Traditional (paid) daily newspapers responded to the format upstart with several business and legal strategies. Free newspapers challenged their existing institutional model and raised concerns about eroding habitual readership and advertisers, though claims were often made (and some evidence found) that the free dailies capture a younger readership that was not using the more venerable outlets. Faced with potential competition nonetheless, the established market players could opt for confrontation, competition, or co-existence.

Clashes and Criticism

Paid newspapers around the world have pursued lawsuits against free dailies for a host of reasons—frequently challenging the exclusive distribution deals the giveaways cut with public transportation systems. In Philadelphia, the daily *Inquirer,* in conjunction with legal counsel from *The New York Times* and *USA Today,* tried unsuccessfully to block what they argued was an unconstitutional alliance between *Metro* and the local transit authority—claiming that the agreement violated First Amendment principles by its exclusive nature. Another obstructionist strategy is to prevent free newspapers and their journalists from joining publishing associations and press clubs. In France, for example, when *Metro* entered the market without obliging printing and distribution agreements already in place, union workers destroyed its debut editions and attacked those handing them out. Alternately, traditional newspapers can choose to enter the market themselves with a free daily. In the United States—perhaps in response to steadily declining readership (youth in particular)—the parent organizations of *The New York Times, The Washington Post, Chicago Tribune, Chicago Sun-Times, The Dallas Morning News,* and *Newsday* have all introduced free off-shoots at one time or another. London-based Associated Newspapers, for example, uses its free daily (which also happens to be called *Metro*) as a means of promoting the sale of sister newspapers, *The Evening Standard* and *The Daily Mail*—particularly on weekends, when most free dailies are not distributed. Market impact of free dailies on paid circulation and advertising revenue appears to be relatively mild; some cite estimates of 1–2 percent reader losses for traditional newspapers.

Free dailies have been criticized on a number of fronts. In their effort to attract younger readers, the publications have been designed for shorter attention spans and with a limited commute window in mind. Stories rarely provide the depth of information and context found in traditional newspapers and most can be read in their entirety in 15 minutes. Their flashy style and lighter fare extends many of the often-maligned techniques pioneered by *USA Today*—indeed, one journalism scholar told *American Journalism Review* in 2005 that the rise of the free mini-daily newspaper is the most important trend in the newspaper industry since the advent of *USA Today*. As such, free dailies often have faced condescension at being "fast food journalism." Jack Shafer, an influential press critic for the online magazine *Slate,* lodged an emblematic complaint against the Chicago free dailies: "As 'remedial' newspapers, designed to lure young readers back into the newspaper habits and then graduate them to the flagship product, they're a bust. . . . The market is already saturated with journalism by people who can't write for people who can't read." Others protest that free dailies view the reader more as consumer than citizen (with content heavy on entertainment and gossip and light on political or investigative reporting) and, in so doing, abdicate journalism's role as responsible protector of democracy propagating an informed audience.

Other concerns about free dailies have been raised during their decade-long rise to notability. To hold down costs, the giveaways often outsource printing press work and expect their spare-yet-versatile staffs to multitask journalistic roles like reporting, photography, page design, and editing. This also means that free newspapers spend comparatively less on journalistic overhead—by one 2006 estimate, one-half to one-quarter less than conventional newspapers. Some have also

grown concerned about the environmental impact of free newspapers—with many potentially littering the streets as trash. Despite these criticisms, free dailies continued to grow through the first decade of the twenty-first century, suggesting that the concept was, indeed, filling a niche. Defenders of the genre add that young audiences reading an abridged newspaper is an improvement on young audiences reading no newspaper at all. Moreover, the explosion of free online news sites may increasingly cultivate a reader mindset that eschews paying for content—in that sense, proponents of free dailies argue, their format is ahead of the curve.

All of this suggests that, while still a nascent trend, free newspapers seem sure to leave some mark on journalism as a whole. At a content level, they signal an extension—in even more bite-sized form—of many of the patterns *USA Today* first developed in the 1980s. The reliance on very short stories both caters to short attention spans and potentially encourages them—which, some fear, could further endanger journalism's capacity for depth. Their target demographic—18- to 30-year-olds—is an elusive audience for the news media, but early signs point to free newspapers' success reaching them (though it remains unclear if these readers will feed into the paying audience). The impact on industrial patterns of the free newspaper business model—dependent on advertising alone and a skeletal staff—is, as yet, uncertain.

Free Press and Fair Trial

Two cherished U.S. traditions guaranteed by the Bill of Rights are a free press and the right to a fair trial. Although independent media coverage can, and often does, enhance public oversight of the administration of justice, untrammeled reporting of information by the news media prior to and during criminal trials has the potential to undermine the integrity of the proceedings as well as the Sixth Amendment right to a "speedy and public trial, by an impartial jury of the state and district wherein the crime shall have been committed."

Courts have struggled to reconcile the competing constitutional rights implicated by robust news reporting about criminal cases. The Supreme Court has made clear that neither the Sixth nor the First Amendment invariably prevails in a clash between these two competing values. At best, trial courts must strike an uneasy balance in an attempt to further the public interest.

Although the perceived conflict between a criminal defendant's right to a fair trial and the public's right to know has been exacerbated since the advent of electronic communication, the issues raised by media coverage of crimes are not new. For example, at the beginning of the nineteenth century, when Aaron Burr was facing charges of treason, Chief Justice John Marshall ruled that despite the pervasive publicity that had surrounded his arrest and indictment, Burr could still be assured of a fair trial as long as the jurors could base their decisions solely on the evidence presented in the courtroom (*United States v. Burr,* 25 Fed.Cas. 49, No. 14692G [1807]).

It was not until the 1960s that the Supreme Court specifically ruled that media coverage of criminal defendants' confessions by the news media had resulted in such "deep and bitter prejudice" that the accused's rights to a fair trial had been violated, necessitating the reversal of their convictions and new trials (*Irvin v. Dowd,* 366 U.S. 717 [1971]; *Rideau v. Louisiana,* 373 U.S. 723 [1963]). In 1966, the Court went further, excoriating a trial judge for failing to control the "carnival atmosphere" in the courtroom during a high-profile murder trial, as well as neglecting his responsibility to restrict media reports of information deemed prejudicial to the defense during the course of the trial. Although acknowledging that the news media were free to report what transpired in the courtroom, the high court made clear that the trial judge must take appropriate steps to protect the defendant's Sixth Amendment rights, including such options as instructing lawyers, witnesses, and government officials not to talk to the press; postponing the case until the publicity died down; transferring the case to another location; or sequestering the jury to prevent their exposure to information that would not be admissible at trial (*Sheppard v. Maxwell,* 384 U.S. 333 [1966]).

In the wake of *Sheppard,* the American Bar Association convened the "Reardon Committee" to propose a set of principles designed to govern conduct for attorneys to minimize the potential for prejudicing a defendant's Sixth Amendment rights. These served as a model for voluntary bench-bar-press guidelines for coverage of criminal cases that were adopted in many states.

Ten years after *Sheppard,* however, the Supreme Court was forced to confront the issues again. The murder of six family members in a small town in Nebraska attracted immediate and widespread media coverage. A suspect was arraigned the day after the murders, and two days later, both the prosecution and defense attorneys asked the trial judge to issue gag orders to prohibit anyone from disseminating testimony or evidence in the case, and requiring the news media to adhere to the "voluntary" Nebraska Bar-Press Guidelines. After representatives of the press protested, the judge modified the order to limit the reporting restrictions to five specific subjects that the court found to be particularly likely to be prejudicial, but also continuing to mandate compliance with the Nebraska Bar-Press Guidelines. The order also prohibited the press from reporting about the exact nature of the gag order itself.

On appeal, the Supreme Court reversed. Although acknowledging that its prior precedent required judges to take "strong measures" to protect Sixth Amendment rights, it concluded that the gag orders on the press in this case were contrary to the First Amendment. Prior restraints on reports and commentary on news and current events constitute serious infringements on constitutional rights, Chief Justice Warren Burger wrote, and can only be justified in cases where pervasive prejudicial publicity could not be mitigated by less restrictive measures, and where the gag orders demonstrably would prevent the harm to the defendants' rights. In this case, the Court found, the trial judge had failed to adequately consider alternative means, including extensive pretrial examination of potential jurors. In addition, there was no evidence that the gag orders would in fact be effective, especially in light of the wide-ranging gossip and rumors that had already spread throughout the rural community (*Nebraska Press Association v. Stuart,* 427 U.S. 539 [1976]).

But although the high court rejected the idea that restrictions on media reporting of legally obtained information would be an acceptable way to protect a criminal defendant's rights, it nevertheless continued to uphold court rules and state bar canons of legal ethics, as well as gag orders that restrict commentary by lawyers, litigants, and others involved in the case. And although it recognized that the First and Fourteenth Amendments guarantee both the press and the public a constitutional right of access to criminal

proceedings, that right is not absolute, and must be balanced against competing interests, including the defendant's right to a fair trial (*Richmond Newspapers, Inc. v. Virginia,* 448 U.S. 555 [1980]). As a consequence, narrowly tailored restrictions, particularly on access to pretrial proceedings such as suppression hearings, have been upheld in situations where an overriding public interest trumps the presumption of openness, where other alternatives will not adequately address the threat, and when it is clear that the closure will avert the harm.

Perhaps not surprisingly, the use of newer technology such as cameras and audio recording devices to cover the courts has been particularly vulnerable to judicial restrictions. Although the Supreme Court explicitly rejected the idea that the presence of a camera over the objections of a criminal defendant would, in itself, result in an unfair trial, it has never affirmatively recognized that the electronic media have the same rights of access to court proceedings enjoyed by their print colleagues (*Chandler v. Florida,* 449 U.S. 560 [1981]). Although the states generally permit "cameras in the courts" in at least some types of criminal proceedings, electronic coverage has never been allowed in federal criminal trials. An experiment launched in 1991 to test audiovisual coverage in federal civil proceedings, regarded as a necessary precursor to expanding the right of access to federal criminal trials, was received favorably by many judges. But the experiment suffered a massive setback in the wake of the media frenzy surrounding the murder trial of athlete and actor O. J. Simpson in 1995. Much of the blame for the extensive and often sensational coverage was directed, arguably unfairly, at the presence of the cameras in the California state courtroom during the trial.

But many other factors, including the relentless use of selective leaks as well as repeated press conferences and public statements on the courthouse steps by both the prosecution and the defense, fed and contributed to the "carnival atmosphere." Some of these activities clearly fell within the control of presiding Judge Lance Ito under the *Nebraska Press* standards, but for whatever reason, Ito declined to exercise his inherent authority to control the trial participants. Of course, as it turned out, Simpson was acquitted of the murder charges, so the issue of whether the media coverage had undermined his Sixth Amendment rights never reached a court for adjudication.

The conflict between free press and fair trial continues. Other high-profile cases, including the 2004 trial of entrepreneur Martha Stewart for insider trading, as well as that of Lewis "Scooter" Libby Jr., former Vice President Dick Cheney's chief of staff, who was convicted in 2007 of perjury and obstruction of justice in connection with the investigation into the leak of the identity of CIA operative Valerie Plame, raise significant questions about the impact of saturation media coverage on the ability to impanel and maintain jurors who are untainted by prejudicial pretrial publicity. Certainly the United States is unique among the common law countries, including the United Kingdom and Canada, in continuing to uphold the presumptive rights of the press to report information about ongoing criminal investigations both prior to and during a trial. The Supreme Court has not retreated from the standards articulated in its precedents from the 1970s and the 1980s, recognizing that the First and Sixth Amendments each protect interests that are vital to preserving democratic values.

Gag Orders

The term *gag order*—also known as an *injunction, restraining order, restrictive order,* or *protective order*—refers to a form of prior restraint which prohibits an individual or institution from disseminating information to those not authorized to receive it. Although the term is usually applied to orders issued by a judge in the context of an ongoing legal proceeding such as a trial, it can also include statutory or regulatory provisions promulgated by the legislative or executive branches.

As a general proposition, prior restraints are presumed to violate the First Amendment rights to freedom of speech and press, and are therefore unconstitutional. However, the Supreme Court has recognized that this presumption is not absolute, and can be overcome when a competing and overriding public interest requires protection (*Near v. Minnesota,* 283 U.S. 697 [1931]).

"Classic" Gag Orders

A typical gag order is issued by a trial judge during the pretrial stages of a criminal prosecution. It restricts trial participants, such as attorneys, law enforcement officials, or witnesses, from disclosing information which could be deemed prejudicial to the Sixth Amendment right of the defendant to a fair trial by undermining the ability of the court to impanel an impartial jury. This could include, for example, investigatory details such as the contents of wiretap transcripts or the fruits of a search that have not yet been admitted into evidence; the defendant's confession; the fact that a lie detector test has been taken (or refused) and its outcome; or the defendant's previous criminal record.

In 1966, in the wake of a notorious murder trial, the Supreme Court reversed Dr. Sam Sheppard's conviction, placing the responsibility for controlling prejudicial publicity squarely on the shoulders of the presiding judge. In addition to maintaining the dignity of the courtroom by controlling media conduct during the proceedings themselves, the high court also recommended that trial judges consider issuing orders proscribing extrajudicial statements by lawyers, parties, witnesses and court officials (*Sheppard v. Maxwell,* 384 U.S. 333 [1966]).

Controls on trial participants' speech, however, did not solve the perceived problem as long as the news media were free to report information that was leaked to them. Ten years after *Sheppard,* the Supreme Court considered the question of whether direct restraints on the press could be constitutional after a trial judge in Nebraska had ordered the news media to refrain from publishing specific details considered "strongly implicative" of the guilt of the individual accused of murdering six family members in a small rural community, including the confession of the prime suspect which had been introduced in open court during his arraignment. The high court found that the order was vague and overbroad and that it violated settled principles protecting the rights of the press to report events that transpire in a public hearing. Publication of information obtained

legally from other sources, the Supreme Court found, could be restrained only if it posed a clear and present danger to the defendant's rights; if no alternative measure such as change of venue or extensive questioning of the jurors could avert the potential danger; and if the gag order demonstrably would protect the defendant's Sixth Amendment rights. Given the pervasive gossip that had already saturated the small community, the high court was skeptical that any restrictions on the news media would be effective (*Nebraska Press Association v. Stuart,* 427 U.S. 539 [1976]).

The principle that the news media could not be restrained from publishing truthful, accurate information obtained in an open judicial proceeding was reiterated shortly thereafter when the Supreme Court struck down an injunction prohibiting the press from publishing the name or photograph of an 11-year-old boy whose identity was disclosed during a hearing that was open to the public after no objection was made to the media's presence (*Oklahoma Publishing Co. v. District Court,* 430 U.S. 308 [1977]).

Gags on Lawyers

As officers of the court, attorneys are considered to have diminished free speech rights in the context of ongoing criminal proceedings. Most state bar associations have promulgated mandatory ethics rules that proscribe statements by participating attorneys if they could be prejudicial to ongoing proceedings.

In 1991, the Supreme Court considered whether these rules are constitutional. Nevada attorney Dominic P. Gentile held a press conference the day after his client was indicted in a high-profile case involving the theft of money and drugs. Gentile stated that his client was innocent, and suggested that police corruption was implicated in the case. His client was acquitted, but the state bar's disciplinary board reprimanded Gentile for violating a rule prohibiting lawyers from making statements to the press which they knew would have a "substantial likelihood of materially prejudicing a proceeding." The Nevada Supreme Court upheld the reprimand, but the U.S. Supreme Court reversed on the ground that the language in the ethics rule was unconstitutionally vague. However, a separate opinion by Chief Justice William Rehnquist (1924–2005) made clear that attorney speech could be regulated by a standard less exacting than the *Nebraska Press* test because statements by lawyers pose a particular threat to fair trials and impartial jurors because they are likely to be perceived as "especially authoritative" (*Gentile v. State Bar of Nevada,* 501 U.S. 1030 [1991]).

Two years later, the U.S. Court of Appeals for the Second Circuit struck down an order forbidding prosecution and defense attorneys from making any extrajudicial comment in the case arising from the 1993 bombing of the World Trade Center in New York, finding that the trial judge had failed to consider less restrictive alternatives (*United States v. Salameh,* 992 F.2d 445 [2d Cir. 1993]). But the same circuit upheld a finding of criminal contempt against Bruce Cutler, an attorney representing crime boss John Gotti, for willfully violating a local court rule prohibiting public statements by lawyers if there is a "reasonable likelihood" that the statements would interfere with a fair trial (*United States v. Cutler,* 58 F.3d 825 [2d Cir. 1995]).

Gags on Jurors and Grand Jury Proceedings

Juries, including grand juries, are supposed to deliberate in secret. Although court rules generally govern jury secrecy, it is not uncommon for judges to direct jurors that they have no obligation to speak to the news media at the conclusion of their service, and, in some cases, to issue specific gag orders to prevent them from doing so. For example, the Fifth Circuit upheld a trial judge's instruction that jurors could not be interviewed about their deliberations without an order from the court. The appeals court found that the limiting language of the order, referring to discussions within the jury room but not the jurors' personal reactions to the trial, was narrowly tailored to protect the sanctity of candid juror deliberations from posttrial interviews (*United States v. Cleveland,* 128 F.3d 267 [5th Cir. 1997]). But in another case, a trial judge's order that jurors should not discuss their verdict with anyone was struck down by the Tenth Circuit because it contained no limitations on time or scope. Although it would have been permissible for the judge to have told the jurors not to discuss specific votes, for example, the appeals court held that he could not prohibit any contact

between the press and the jurors "without a compelling reason" (*Journal Publishing Co. v. Mechem,* 801 F.2d 122 [10th Cir. 1986]).

One unusual case involving a journalist who was called before a grand jury as a witness came before the Supreme Court in 1990. Michael Smith (dates unknown) had written a series of stories for his Florida newspaper which led to a special grand jury investigation about corruption in the local state attorney's and sheriff's offices. He was advised by the special prosecutor that if he wrote anything about his appearance before the grand jury, he would violate a state statute making it a misdemeanor to disclose witness testimony. His suit challenging the statute reached the high court, which ruled unanimously that the statute violated his constitutional rights to the extent that it would punish him for revealing matters he had learned prior to his grand jury appearance, even if he testified about them there. Although acknowledging the strong state interest in preserving the integrity of the grand jury proceedings and protecting the privacy of those not yet indicted, the Court ruled that those interests did not overcome Smith's First Amendment right to disclose truthful information he had previously obtained by lawful means. However, a concurring opinion by Justice Antonin Scalia (1936–) suggested that it might be permissible to punish Smith if he disclosed procedural details, such as questions he was asked or comments made by participants, that he learned during his grand jury appearance (*Butterworth v. Smith,* 494 U.S. 624 [1990]).

Gags on Litigants

Based on the Supreme Court's mandate in *Sheppard,* trial judges have authority to issue restrictive orders governing extrajudicial comment by criminal trial participants—including, it would seem, the defendant. The Fifth Circuit upheld a gag order imposed on all trial participants by the trial judge in the corruption trial of former Louisiana Governor Edwin Edwards. Edwards himself claimed that the order violated his First Amendment rights, but the appeals court found a "substantial likelihood" that publicity could undermine the conduct of the trial, despite the fact that the trial judge had not considered less restrictive alternatives (*United States v. Brown,* 218 F.3d 415 [5th Cir. 2000]).

Protective orders are frequently sought by litigants in civil litigation as part of the discovery process, where a condition of parties agreeing to exchange information prior to trial is conditioned on an undertaking to keep the information confidential. Although the news media are not bound by these orders if they are not participants in the trial, and may in some cases have standing to challenge them, a different situation arises when the press is the plaintiff or defendant in the case.

The *Seattle Times* was sued for libel and during the course of pretrial discovery asked for the membership lists and names of contributors to the plaintiff foundation. The plaintiff initially refused to disclose the material but was ordered to do so by the trial judge. However, the judge also issued a gag order prohibiting the newspaper from publishing or otherwise disseminating the information obtained through discovery. On appeal, the Supreme Court upheld the order, ruling that it did not constitute a classic prior restraint because it was limited only to material that the newspaper obtained through compelled pretrial discovery, which the state Supreme Court had found might embarrass or otherwise harm the libel plaintiff if disclosed. The newspaper would be free, Justice Lewis Powell (1907–98) wrote, to publish identical information as long as it obtained it "through means independent of the court's processes," but its First Amendment rights were not violated by enforcement of the protective order as to pretrial discovery information (*Seattle Times Co. v. Rhinehart,* 467 U.S. 20 [1984]).

News Media Challenges to Gag Orders on Others

A number of courts have held that news media have the right to contest gag orders issued to lawyers, even though the press is not directly restrained by them. For example, the Second Circuit permitted Dow Jones, publisher of *The Wall Street Journal,* to challenge an order silencing prosecution and defense counsel in the 1987 Wedtech contracting scandal. Although the court did not regard the order as "prior restraint" on the press, it nevertheless

acknowledged that the media had a right to receive information and therefore had standing to litigate the issue. It did uphold the order, however, finding that there was a "reasonable likelihood" that the defendants' Sixth Amendment rights would be prejudiced by pretrial publicity (*Application of Dow Jones & Co.,* 843 F.2d 603 [2d Cir. 1988]). This "reasonable likelihood" test has been also been adopted by the Ninth Circuit (*Radio & Television News Association v. U.S. District Court,* 781 F.2d 1443 [9th Cir. 1986]). However, the Sixth Circuit has utilized a "clear and present danger" test (*CBS Inc. v. Young,* 522 F.2d 234 [6th Cir. 1975]). Although the U.S. Supreme Court did not grant the newspaper's petition for certiorari, three of the then-justices of the U.S. Supreme Court would have accepted the *Dow Jones* case in order to resolve the conflict.

Similarly, the Tenth Circuit has held that a newspaper has standing to challenge gag orders imposed on jurors. Again, the appeals court found that the trial court's order "impeded [the newspaper's] ability to gather news" (*Journal Publishing Co. v. Mechem,* 801 F.2d 1233 [9th Cir. 1986]). On the other hand, the Third Circuit has ruled that the news media may challenge such orders only "when there is reason to believe that the individual subject to the gag order is willing to speak" (*FOCUS v. Allegheny County Court,* 75 F.3d 834 [3d Cir. 1996]).

News Media Challenges to Gag Orders on the Press

Gag orders on the media are rarely upheld, but they have survived judicial scrutiny in a few cases. In 1990, Cable News Network (CNN) obtained tape recordings allegedly made by prison officials of telephone conversations between former Panamanian General Manuel Noriega and his attorneys while he was being held in federal custody. Noriega's lawyers obtained a temporary restraining order to prohibit the network from airing the tapes until it was determined whether they contained material protected by the attorney–client privilege. CNN refused to surrender the tapes for review, asserting its constitutional right to air the tapes. It unsuccessfully appealed to the Eleventh Circuit and to the U.S. Supreme Court, which refused to review the lower courts' orders over the dissent of two justices, and was held in contempt of court for airing one of the tapes, even though the lower court eventually lifted its order. CNN avoided paying a fine by issuing an apology and paying $85,000 to cover the government's costs (*Cable News Network v. Noriega,* 498 U.S. 976 [1990]).

Similarly, the U.S. Supreme Court declined to disturb a trial judge's order prohibiting Colorado news organizations from disseminating transcripts from closed hearings in the rape case brought against athlete Kobe Bryant which had been sent to them electronically in error. Even though the information was truthful and had been legally obtained, the trial court concluded that the compelling state interest in protecting the privacy of alleged sexual assault victims outweighed the First Amendment interests of the press (*Colorado v. Bryant,* 94 P.3d 624 [Colo. 2004]).

In civil cases, however, where constitutional issues are less clearly implicated, restraining orders on nonparty press are more likely to be viewed as "transparently invalid." The Sixth Circuit ruled that a trial judge had improperly ordered *Business Week* magazine to refrain from publishing sealed documents provided to its reporter, finding that the litigants' interest "in protecting their vanity or their commercial self-interest" was not sufficient to outweigh the First Amendment rights of the press (*Procter & Gamble Co. v. Bankers Trust Co.,* 89 F.3d 219 [6th Cir. 1996]).

The Constitutional Right to Defy a Gag Order

A lingering question that the Supreme Court has yet to resolve is whether a news organization may violate an unconstitutional gag order with impunity. The Fifth Circuit has held that even an unconstitutional order must be obeyed by the press until it has been overturned on appeal (*United States v. Dickinson,* 465 F.2d 496 [5th Cir. 1972]). The First Circuit, on the other hand, has ruled that a news organization may publish material in violation of a "transparently invalid" gag order "[i]f timely access to the appellate court is not available or if a timely decision is not forthcoming" (*In re Providence Journal,* 820 F.2d 1354 [1st Cir. 1987] [en banc]).

Conclusion

The strong presumption that prior restraints violate the First Amendment means that the courts rarely uphold gag orders against the press. Nevertheless, restraining orders that prohibit sources, such as lawyers, litigants and jurors, from speaking to the news media pose a significant obstacle to news gathering. The news media have enjoyed some success in challenging these orders. In order to avoid further erosion of their rights to report on the judicial system and to preserve the public's right to know, it is essential that they continue to do so.

Gang Journalism

See Bandwagon Journalism

Gannett

Frank Gannett and his associates founded Gannett Company in 1906 when they bought a half interest in the *Elmira* (New York) *Gazette*. More than a century later, the company's media holdings in the United States include 85 daily newspapers, among them *USA Today,* and another thousand nondaily periodicals. By early 2008, Gannett newspapers reached a combined audience of 7.2 million, led by *USA Today*'s circulation of roughly 2.3 million. Additionally, Gannett publishes 17 daily newspapers and 300 nondaily papers in the United Kingdom under its Newsquest brand, with a circulation of more than 600,000.

Gannett also operates 23 television stations in the United States, which reach more than 20 million households, and operates many online news and advertising operations, which in 2007 had more than 23 million unique visitors. In addition to its print and broadcast holdings, the company is investing in online advertising and other Internet services.

History

After purchasing the *Elmira Gazette* in 1906, Frank Gannett and his associates slowly expanded their holdings, first by buying another paper in Elmira, New York, and merging the two to form the *Star-Gazette,* and later buying *The Ithaca* (New York) *Journal*. They then purchased two papers in Rochester, New York, and in 1923, formed Gannett Co., Inc., with holdings of six newspapers all in upstate New York. Gannett appointed Frank Tripp as the general manager of the company.

Gannett believed in the power of the press and saw the media as a force for public good. He said that newspapers had a responsibility to be honest and fair and to always fight injustice, arguing that "A newspaper's power for good is unlimited," because "newspapers can create public opinion. There is no limit to what public opinion can do" (quoted in Newton 1999).

The company gradually expanded its holdings throughout the northeastern United States and in 1943 created Gannett National Service—now Gannett News Service—to provide the group's papers with national news coverage from Washington, D.C., as well as regional coverage from a number of news bureaus across the country. By the 1960s, Gannett had become a national rather than regional newspaper group, and in 1967 the company went public. Gannett has long been at the forefront of technology, with Frank Gannett investing in the development of the typesetter in the late 1920s and later equipping newsrooms with shortwave radios to improve the speed of reporting from distances.

Perhaps one of the company's biggest gambles was the creation of *USA Today,* a national general-interest daily newspaper, in 1982, after two years of research on what readers and advertisers wanted. The new paper, originally sold out of white vending boxes designed to resemble television receivers in order to appeal to a generation raised on television, made heavy use of color and graphics and avoided page jumps for continuing stories. Critics of *USA Today* chided the publication for its short stories that they said gave scant attention to significant news and took to calling it "McPaper." The paper was known for its stand-alone charts that sized up the latest trends and for its reliance on news briefs. But it had a daily circulation of 1.3 million by the end of 1983—it only publishes five days a week—and it ushered in design changes and the wide use of color (especially in weather pages) in newspapers across the country. Richard Perez-Pena, writing for *The New York Times* in September 2007, concluded that *USA Today* encouraged "many drab dailies to print shorter articles, switch to color, devote more space to sports and use more pictures and graphics."

Perez-Pena also notes that despite the paper's success today, it lost nearly $1 billion in its first ten years of operation. But he argues that *USA Today,* which was designed for a more mobile society—half of its 2.3 million copies are distributed through hotels—is well situated to adapt to a changing and challenging environment for print newspapers. The paper's website, for example, was drawing more than 9 million unique visitors each month in the fall of 2007. And its mission, editor Ken Paulson told Perez-Pena, is to "run stories that nobody else has, where we're driving the conversation."

The success of *USA Today* led Gannett to move its headquarters from Rochester, New York, to Arlington, Virginia, in 1986 so that executives were closer to the organization's flagship newspaper. In 2001, the company moved to a newly built headquarters in McLean, Virginia. As of early 2008, Gannett had more than 49,000 full- and part-time employees worldwide, and it posted revenues of $8 billion in 2006. More than 45 percent of the company's U.S. employees are women, and roughly 25 percent are minorities.

Gannett in the Media Market

News organizations in the United States—and especially newspapers—continue to face tough economic times as they try to adjust to the challenges posed by declining readership and free content on the web. The result of these challenges is shrinking advertising revenue, which accounts for roughly 80 percent of newspaper revenue. It's no different for Gannett, which had a 21 percent operating profit margin in 2007, but a 10 percent decline in the dollar amount of that margin and a 5 percent drop in advertising revenue.

As a result, newspapers are looking for more innovation online, even adopting many of the traits of new media, from blogging to citizen-generated content. The top newspaper website, NYTimes.com, gets nearly 15 million visitors a month; *USA Today* has close to 10 million monthly visitors.

Gannett is responding to the new media market on several fronts. In 2006, the company, through the *Tallahassee Democrat* that it already owned, started reaching out directly to a younger generation of potential readers by purchasing its first collegiate newspaper, the *FSView & Florida Flambeau,* published for the students, faculty, and staff at Florida State University. The paper has a circulation of about 25,000. And the company approached the *Rocky Mountain Collegian* at Colorado State University with a proposal to purchase the student paper through *The Coloradoan,* the local paper that Gannett owns in Fort Collins. University officials and Gannett executives could not reach an agreement on the proposal, however, and the deal fell through early in the spring of 2008.

The company's news outlets also have started "crowd sourcing" their newsgathering, which emphasizes local over national news; the publication of user-generated content; the primacy of the web over print versions of newspapers; and using readers to help research in-depth and investigative pieces. While other news organizations are looking to user-generated content to increase their audiences, Gannett outlets are outsourcing some traditional reporting roles by encouraging citizens do the investigative legwork. In Fort Myers, Florida, for instance, *The News-Press* asked readers to help them find out why costs to connect new homes to water and sewer lines were so high. According to *Wired* reporter Jeff Howe (2006), "Readers spontaneously organized their own investigations: Retired engineers analyzed blueprints, accountants pored over balance sheets, and an inside whistle-blower leaked documents showing evidence of bid-rigging." But the experiment also has led to more speculation being included in some stories, and Howe notes that reporters and editors are concerned that despite the cost savings, the expectation among the public is that information that appears on a news organizations website has been as carefully scrutinized as information that appears in print or on the air. That, however, isn't typically the case.

Still, Gannett views the web as the venue for future growth and, according to the Project for Excellence in Journalism's "State of the News Media 2008" report, the company's newsrooms are becoming "'platform agnostic,' meaning news would be delivered from any medium." The company also is focusing on multimedia news-gathering techniques, ranging from photos and video to use of graphics to podcasting. Additionally, Gannett is doing more to involve readers in the process through crowd sourcing, by which the company's news organizations solicit advice from readers on stories.

Despite these efforts, Gannett—like most media companies—was struggling in 2008. In June 2008, the company, which was ranked tenth in the world among media businesses according to ZenithOptimedia, announced that it was going to write down its assets by up to $3 billion because of the declining value of is operations. According to an article that ran in the Green Bay (Wisconsin) *Post-Gazette,* a Gannett newspaper, Gannett's net income for the first six months of 2008 was $424.5 million, compared with $500.5 million for the first six months of 2007. As a result, Gannett announced in August 2008 that it was cutting 1,000 jobs from newspapers throughout the United States and laying off 600 employees. Similar cuts were being announced at other news organizations throughout the country, mostly due to falling advertising revenue.

GATEKEEPING

A classic piece of research published more than a half century ago contributed the concept of "gatekeeping" to the understanding of decision making in journalism. For news communication, a gatekeeper is anyone who makes editorial decisions on what news should be published or broadcast to the public. There are usually multiple gatekeepers in all but the smallest news organizations. Gatekeeping decisions help determine the news agenda and thus play a role in agenda setting for news consumers.

The term *gatekeeping* appears to have first been used by social psychologist Kurt Lewin in 1947 research that determined that wives or mothers were the usual decision makers (or gatekeepers) on what made up their families' meals. Three years later, David Manning White published a seminal paper in 1950 applying the concept to journalism. Based on his observation of a newspaper wire service editor (whom he dubbed "Mr. Gates"), White saw that the role entailed constant decision making about what stories to distribute versus the many more that for one reason or another were not used. White's pioneering study, and the many replications in the decades that followed, helped identify the many subjective factors that help define an editor in his gatekeeping function

Several issues are central to the gatekeeper concept, chief among them who the gatekeepers are, how they came by that role, what training and biases they bring to the role, how much decision-making freedom they have, and the breadth of their potential impact—do their gatekeeping decisions affect only one local daily, or *The New York Times* where any news story decision will contribute to the news agenda for other media?

The factors that have impact on gatekeeper decision making must also be considered. What is it that makes one news story sufficiently interesting or important that it passes through an editorial "gate" to the next step (gate) in the process—perhaps eventually to reach the pages of the newspaper, and thus its readers? The relevant decision factors could be similar across different editors at different papers—or broadcast news departments, for that matter—or they could vary widely in application. Through the 1950s and 1960s, further research began to answer some of these questions while often posing others.

The gatekeeping process begins with the professional norms in defining news and the gatekeeper's personal knowledge and biases (whether recognized or not). Next comes the menu of choices presented to any editor/gatekeeper at a given time or day. Gatekeepers at a news agency (the Associated Press, for example) have already made choices on what news to place on the wire for local subscribers to choose among. That creates part of the menu of choices for local editors—the rest are locally reported stories. The latter nearly always take priority: the paper or station has expended effort and money to obtain that local story (and has already made a decision that the story is important enough to cover) whereas a news agency story, though it costs little to use, is almost surely of less local relevance.

Local relevance is almost always a vital gatekeeping factor in deciding which news stories will appear in a newspaper or on the air. And any way that a story from outside the local area (even one from overseas) can be "made" local—perhaps by highlighting a role played by a local resident—will increase that story's chances of being used. National stories that have general impact on readers and viewers—such as those about the state of the housing market, rising gasoline prices, or concern about business failures across the country—are more likely to be used, but other factors are important as well in gatekeeping decisions. These include the timeliness of an event (how recently it occurred), its impact (how many people—particularly local people—are affected), how much controversy or conflict is involved, the simplicity or complexity of a story, how prominent the newsmakers involved are, the public's perceived interest in the story, how visual the story is (especially for television), and what other stories are happening that day that are competing for attention.

Always important to the gatekeeping process are the location and characteristics of the individual news market. Access to and cost of water is of vital concern in the Southwest. The Middle West is more worried about crop or livestock prices. Floridians and those along the Gulf of Mexico need to know about incoming tropical storms. Bigger markets have more interest in business and market news. Small towns could be devastated by reports of the departure of a key employer or the end of local airline service.

Changing technology, particularly the explosion of news sources on the Internet, is diminishing the role of traditional gatekeepers. The tech-savvy individual can now fence in or fence out information—choosing what stories to pay attention to (often those that reinforce already held beliefs) and completely ignoring others—in a phenomenon some scholars have called the "Daily Me." This customization of news feeds has been welcomed as democratization of news or bemoaned as the self-selection of news that reinforces existing convictions. New information gatekeepers have also been

introduced in the form of bloggers and "citizen journalists" who often lack their traditional predecessor's training. At the same time, financial pressures on news organizations, particularly newspapers, has prompted many to cut back on editing staffs and to rethink the role of the editorial gatekeeper in the twenty-first century.

Gay and Lesbian Journalism

News coverage of the lesbian, gay, bisexual, and transgender community has been guided by changes in social tolerance, legal proscriptions against homosexual acts, and the desire of gays to hide their sexual orientation to avoid the social stigma attached to homosexuality. Until the mid-twentieth century, the term *homosexual* was considered obscene, and mainstream newspapers shunned the topic for fear of offending readers and alienating advertisers. In rare instances when the importance of a story overrode these concerns, newspapers couched any reference to homosexuality in obscure terms that eluded the average reader. When Oscar Wilde was put on trial for "gross indecency" in 1895, he offered the first public defense of homosexuality in England, but *The New York Times,* for example, never expressly stated the playwright's offense. By the 1940s, newspapers and magazines highlighted the military's efforts to weed out homosexuals and other "undesirables" from the armed forces. The Washington, D.C., *Evening Star* celebrated the policy in a 1943 feature article headlined "How the Navy's Mind Detectives Seek Men of Sound Nerve for Warfare." *Newsweek* explained in 1947 that military psychiatrists detected homosexuals by their effeminate looks or behavior and by "repeating certain words from the homosexual vocabulary and watching for signs of recognition." However, many other publications continued to avoid the subject. In 1948, the *Raleigh Times* for example, refused to print a wire service report on Alfred Kinsey's *Sexual Behavior in the Human Male,* although they did inform readers that the story could be ordered by mail.

Depictions of homosexuality grew even darker in the 1950s, as newspapers relegated homosexuals to the crime pages. A string of articles in the *Miami Herald,* for example, described a crackdown on undesirables along a strip of beach. One official explained that the area had acquired a reputation as a "congregating place for males who try hard to look and act like women." Similar stories were seen in New York City; Atlanta; Denver; Dayton, Ohio; and Washington, D.C., to name a few.

Homosexuals garnered greater negative attention as they became easy prey for Senator Joseph McCarthy and other politicians who were eager to capitalize on the nation's postwar paranoia. "Perverts Called Government Peril" blared a *New York Times* article that described concerns that homosexuals had infiltrated the federal workforce. In a similar fashion, a Washington *Times-Herald*

article told readers: "Reds Entice Women Here in Sex Orgies." Despite the sinister tone, the article was one of the few that acknowledged the existence of lesbians.

Slowly Changing Times

Network television first tackled the subject in a 1967 documentary, *CBS Reports: The Homosexuals*, hosted by correspondent Mike Wallace. "The average homosexual, if there be such, is promiscuous," he said. "He is not interested in nor capable of a lasting relationship like that of a heterosexual marriage. . . . The pickup—the one night stand—these are characteristics of the homosexual relationship." Such characterizations were widespread among broadcasters and the print media, such as a 1966 *Chicago Tribune* feature headlined "The Homosexuals—A Growing Problem." Although the media did not create the sinister image surrounding gays in the 1960s, they reinforced the negative stereotypes promoted by police, clergy, and antigay psychiatrists. Newspapers readily publicized bar raids and arrests, but they were reticent about mentioning homosexuals in any other context. Chicago newspapers routinely rejected any press materials, even including advertisements, sent to them by Mattachine Midwest, a gay rights group in the city. In September 1966 a small group of gays responded by picketing both the *Chicago Tribune* and the *Sun-Times*.

In the summer of 1969, gay activism became more vocal as gays clashed with police outside the Stonewall bar in New York City. After a *Village Voice* account referred to the rioters as the "forces of faggotry," gays picketed the newspaper's editorial offices, pointing out that while the paper refused to print an ad from the Gay Liberation Front, it permitted landlords to specify "no gays" in apartment rental ads. The publisher agreed to change the advertising policy but vowed to retain the right to call gays whatever his writers pleased.

Heartened by their success—and by a 1973 decision by the American Psychological Association to drop homosexuality from its list of mental illnesses—gay activists organized protests against *Time, Harper's,* the *San Francisco Examiner,* the *Los Angeles Times,* the *New York Daily News,* and ABC Television, and the media began to listen to their complaints. But by the late 1970s, successes of the Gay Rights Movement touched off an antigay backlash. Pop singer–turned–antigay-activist Anita Bryant sparked a rash of negative publicity nationwide in her campaign against gay teachers in Florida public schools. Although coverage remained spotty and uneven through the late 1970s and the early 1980s, as gays fought for legal protections, news coverage increasingly reflected who gays were and what they wanted from the rest of society. Gays lobbied *The New York Times* for eight years before the newspaper relented and permitted its staff to use the term "gay" as a synonym for "homosexual."

In 1974, David Goodstein, a former Wall Street financial whiz, bought *The Los Angeles Advocate* which was the first true newspaper aimed at gay readers. Goodstein renamed it *The Advocate* and transformed it into a glossy magazine that departed from the strict political radicalism that had gripped other gay publications after 1969. *The Advocate* helped introduce a new degree of professionalism by shifting from advocacy journalism to the practice of objective journalism found among the mainstream press.

The AIDS Tragedy

News coverage again darkened with the onset of AIDS in the early 1980s. Some outlets ignored the epidemic because they did not consider the death of homosexuals relevant to their largely heterosexual audiences. Those outlets that did address the epidemic tended to define everything about the gay community in terms of death and disease. Extreme antigay voices also got a hearing on the issue: *National Review* publisher William F. Buckley Jr. urged a government crackdown on people with AIDS that included mandatory tattooing. Gay and lesbian activists again confronted the media and in 1985 created the Gay and Lesbian Alliance Against Defamation, the first organization exclusively dedicated to challenging negative media depictions of gays. The organization also became a resource for journalists and a clearinghouse that strove to guide the press toward gay men and lesbians who exemplified issues facing the gay community.

The case for fair and accurate coverage was also being made by an increasing number of open gay and lesbian journalists. Randy Shilts became the

first open gay reporter at a major mainstream American newspaper when he was hired by the *San Francisco Chronicle* in 1981. After *New York Times* deputy national editor Jeffrey Schmalz contracted AIDS and revealed his homosexuality to his colleagues, he became the highest-ranking openly gay editor in American journalism. Similarly, Linda Villarosa at *Essence* and Andrew Sullivan at the *New Republic* rose quickly through the ranks after making their sexual orientation known. In increasing numbers, gay and lesbian journalists were willing to make their sexuality known within their newsrooms and to serve as resources on stories about the gay community. In 1992, former *Washington Post* editor Leroy Aarons formed the National Lesbian and Gay Journalists Association (NLGJA). Within three years, its membership rolls had swelled to more than one thousand. Gays who would have been considered too biased to write on the subject in an earlier era were routinely reporting on their own community, sometimes from their own personal experience. "It is a history of seismic change in the way American Journalism treats gay subjects and in the openness so many of us now enjoy in our newsrooms," Aarons told the NLGJA's fifth annual convention in 1996.

Throughout the 1980s and 1990s, court cases, legislative proposals, and protests fueled a seemingly endless flow of coverage of issues related to gays and lesbians. A national gay march on Washington in 1987 helped focus media attention on gay parenting. The presidential campaign and another national march on Washington in 1993 generated another surge in coverage, particularly discrimination against gays by the military. Similarly, widespread coverage of the gruesome murder of a Wyoming college student, Matthew Shepard, in 1998 focused public attention on homophobia.

The Turn of the Twenty-First Century

By the late 1990s, news outlets routinely approached sexual orientation in ways that were unimaginable forty years earlier. Editorials could be seen in both *The New York Times* and *The Boston Globe* attacking the homophobia after Matthew Shepard's death. The *Times* endorsed antigay discrimination legislation on both the city and the state level and argued for inclusion of transgendered people under the state's antidiscrimination bill. The *Globe* editorialized in favor of domestic-partner benefits, as well as endorsing Massachusetts's Safe School initiative, which supported the rights and safety of gay kids and students.

The changes that had taken place at some of the nation's most prestigious and most influential newspapers became models for newspapers in smaller cities and towns across the country. By 2002, the pattern reversed as smaller newspapers became trendsetters when they began carrying announcements for gay unions. Such papers as the *Sun Journal* of Lewiston, Maine; the *Sunday Citizen* of New Hampshire; the *Fayetteville Observer* of North Carolina; and local Massachusetts community weeklies, such as the *Melrose Free Press,* the *Somerville Journal,* and the *Cambridge Chronicle,* began carrying such announcements before major newspapers. *The New York Times* changed its policy in August 2002, and *The Washington Post* followed six months later. On the other hand, as increased coverage by the mainstream press produced greater visibility for the GLBT community, it brought a crisis to some gay publications that no longer held a monopoly on news about gays and were increasingly seen as anachronisms of a bygone era. The shifting financial landscape prompted unprofitable publications to close in the early 1990s but also produced a variety of publications aimed at marketing niches that had developed within the gay community, such as magazines aimed at gay parents and gay vacationers.

In another trend, mainstream media increasingly shifted from treating gay men, lesbians, bisexuals, and transgendered people as novelties and began to incorporate them into articles on the nation's broader social and political fabric, including them in stories about family life, parenting and adoptions, home ownership, and employment issues, to name a few. Some outlets discovered, however, that the new approach to gay-related issues could carry a price. After the *Roanoke Times* ran a four-part series on "Gay Living" in 2001, for example, more than 400 readers canceled their subscriptions. At the same time, gays and lesbians increasingly became the subjects of features and entertainment rather than hard news. Some activists questioned whether the media's focus on only a segment of the gay community fostered public understanding of what it is like to

be gay or obscured it. "Sure it is exciting to see gay issues in the media, but where is the more complicated content, the deeper analysis?" wrote Michael Bronski in a 2003 *Newsday* article. "[Journalists] need to ask the same hard questions they do about energy or the budget or Iraq."

Gay and Lesbian News Media

From their humble beginnings in the 1920s, the gay and lesbian press have played a critical role for the gay and lesbian community in a fashion similar to that performed by media for other minorities. They have provided a platform where gays could their share their common struggles, define themselves as a social minority, and identify their political and social goals.

The earliest gay forays into journalism were short-lived. The Society for Human Rights in Chicago, the nation's first gay rights organization, launched *Friendship and Freedom* in 1924. The initial issue contained an article on "self-control," a poem by gay journalist-poet Walt Whitman, and an essay concerning the gay playwright Oscar Wilde. They published only two issues before the wife of one of the founders became suspicious and called the police, who quickly shut down the organization and its newspaper.

A lesbian in Los Angeles, using the pseudonym Lisa Ben, an anagram for "lesbian," established a social club for women in 1947 and began publishing *Vice Versa,* a pamphlet that contained short stories, poems, and personal essays. A secretary at the RKO film studios, she published the newsletter by hand, typing each issue several times using carbon paper to generate copies to distribute to lesbians bars. Although her rudimentary publishing process generated only a few copies, her readership grew as readers passed them from one to another for years. She published nine issues before the task became too arduous to continue.

Six years later, a group of Los Angeles gay men began publishing *ONE,* a pamphlet-size, professionally printed magazine that marked the first time gays in America had written about their concerns in a publication intended for mass distribution. Beginning in January 1953, *ONE* typically consisted of 20 to 25 pages of poetry, original fiction, essays, and scientific articles, much of it promoting assimilation of homosexuals into the greater society. The small staff wrote both under their own names and under pseudonyms, a practice that made their numbers appear larger than the reality. A few Los Angeles newsstands sold copies openly, but others refused to carry it. Even so, monthly sales climbed to 16,000 within a year, most of them distributed through the mail. The success of *ONE* attracted the attention of Los Angeles postal officials who refused to accept the October 1954 issue, claiming it was obscene. The publishers slapped the postmaster with a lawsuit

citing constitutional protections of free press and free speech and touched off a legal tug-of-war that lasted for several years.

In 1958, the postal case against *ONE* landed in the U.S. Supreme and resulted in a landmark decision for gay journalism as the Court unanimously reversed a lower court ruling that banned the publication. The decision set a major precedent that effectively sanctioned public discussion of homosexuality and cleared the way for the emergence of a sustainable gay press in the United States. It wasn't until the late 1960s, however, that gays began to cover their own community and to reach well beyond organizational newsletters and small-circulation magazines. The publications of the "homophile movement" of the 1950s had been an essential platform for homosexuals in that era but infighting undermined *ONE* and it collapsed in 1967

In the meantime, the Mattachine Society, a Los Angeles–based organization for gay and lesbian rights, began publishing the *Mattachine Review* in 1955. The following year, the Daughters of Bilitis, formed by lesbians in San Francisco, began *The Ladder*. Both contained news of the fledgling gay and lesbian community and served as a lifeline for chapters that sprung up in Los Angeles, Long Beach, Chicago, and San Francisco. Declining membership in the Mattachine Society forced the *Mattachine Review* to shut down in 1958. Although *The Ladder* continued to be an important publication for women, its emphasis shifted to embrace the broader feminist movement.

The first true newspaper aimed at gays appeared in 1967 when two men first published *The Los Angeles Advocate* with an all-news format. Publisher Dick Michaels had a personal interest in sounding an alarm over illegal police activities, having been arrested several years earlier in a bar raid. His partner, Bill Rand, became the editor and printed the first editions in the basement of his office at the ABC Television studios. After distributors refused to touch the publication, the founders created a crude sales network through gay bars, which explained why much of the content focused on gay men and excluded lesbians since they were less inclined to frequent the bar scene as gay men did.

In June 1969, New York City police raided the tiny Stonewall Inn, a popular gay bar located in Greenwich Village, touching off three nights of rioting. The riots marked a shift in the tenor of the fledgling gay rights movement from polite discussions to militant demands. The shift also brought changes in gay journalism as pacifist publications like *ONE* gave way to a new generation of more forceful publications that included the *Gay Blade* later renamed the *Washington Blade, Gay Community News* in Boston, *NewsWest* in Los Angeles, *Gay News* in Pittsburgh, and *Gay Life* in Chicago. Unlike their predecessors, which stressed identity and cooperation, this second generation concentrated almost solely on political change and resistance.

In 1974, Michaels and Rand sold *The Los Angeles Advocate* to David Goodstein, a former Wall Street financial whiz who had been fired from the investment department of a large bank when his superiors realized he was gay. Goodstein renamed the newspaper *The Advocate* and transformed it into a glossy magazine that departed from the strict political radicalism that had gripped other gay publications after 1969. Under Goodstein's leadership, the magazine explored topics that ranged from gay sensibility in art and literature to women's music, lesbian motherhood, and the popularity of gay bathhouses and discotheques. At the same time, *The Advocate* helped introduce a new degree of professionalism by shifting from advocacy journalism to objective journalism. Articles began to reflect the journalistic convention of balancing gay perspectives with antigay comments on issues.

In the early 1980s, a new disease mysteriously began to devour gay men at an alarming rate. Gay publications such as the *San Francisco Sentinel,* the *Bay Area Reporter,* and *The Advocate* failed to sound an alarm about the incipient AIDS crisis. Such publications were reluctant to oppose actions that had traditionally been a large part of defining gay liberation. Moreover, they avoided stories that placed some of their biggest advertisers in a negative light, such as gay bathhouses. On the other hand, the *New York Native* and the *Washington Blade* distinguished themselves by crusading against the disease, often reporting medical developments before mainstream news organizations that had far greater resources.

By the late 1980s, the epidemic propelled the lesbian and gay community into a new culture of radicalism which spawned a new genre of publications. *OutWeek,* a New York–based weekly

magazine burst into the national spotlight when it began to "out" men and women who were closeted and silent on the AIDS crisis, such as publishing tycoon Malcolm Forbes. The confrontational tactics of ACT UP and Queer Nation sought money to support AIDS research and treatment, as well as an end to second-class citizenship for gay people. These campaigns set an important editorial tone for much of the gay press.

Increased visibility and the simultaneous increase in public acceptance produced a variety of forms of gay journalism in the early 1990. The most prominent, *Out,* was a glossy, New York–based lifestyle magazine that reflected a sophisticated design and a desire not to offend the political or social sensitivities of its politically diverse gay and lesbian readership. *Out* and publications modeled after it succeeded in attracting a large number of mainstream advertisers with large advertising budgets and the business model began to supplant the advocacy model among the gay press.

At the same time, gays began to pay greater attention to opportunities in broadcasting. In 1992, John Scagliotti, an openly gay New York television producer, launched *In the Life,* the nation's first nationally distributed, gay-oriented television show. The monthly program, funded by foundations and loyal viewers, focused on such diverse topics as youth and education, health and AIDS, arts and culture, workplace, and relationships and family. By 2006, the program aired on more than 200 public television stations nationwide, reaching 70 million households.

Gays also ventured into the Internet as it surged in popularity in the mid-1990s. Tom Rielly, an openly gay entrepreneur, established PlanetOut .com, one of several portals serving the gay and lesbian community. Not only did the site offer gay men, lesbians, transgender, and bisexual people a way of meeting others, it also provided an efficient delivery system for news of interest to online readers. As the American social climate became increasingly tolerant, the gay and lesbian press produced a string of specialty publications. *Gay Parent,* for example, became a 16- to 24-page bound newsprint magazine featuring personal stories of gay, lesbian, bisexual and transgender (LGBT) parents from across the country and around the world. It concentrated on readers in the New York tri-state area (New York, New Jersey, and Connecticut). Articles included international and domestic adoption, foster care, donor insemination, using a surrogate and what it is like to raise their children throughout the world. By 2001, there were more than 200 publications in North America serving LGBT readers.

In 2005, the gay and lesbian market became increasingly attractive to cable broadcasters as narrow casting became financially sustainable. Viacom's MTV Networks launched Logo, the first the first national cable network devoted to LGBT programming. Programming on the advertiser-supported network included a mix of original and acquired programming. MTV and Showtime announced a groundbreaking joint venture to develop the first national cable channel devoted to gay and lesbian programming.

Despite the successes of gay media outlets, the gay press faced similar pressures as their mainstream counterparts, and adopted similar solutions. Not only were they competing for advertisers among themselves, they also began to compete with mainstream publications that discovered a lucrative gay market and began to carry similar content aimed at gays. A few smaller gay publications went out of business while some others began to consolidate under a single publisher. PlanetOut Inc., for example, acquired the majority of the assets of the publisher of *The Advocate* and *Out,* which had become the two largest circulation LGBT magazines in the United States. Much had changed since the days when the biggest problem facing the gay press was censorship. The gay and lesbian press has played a critical role in the growing gay movement since the 1950s and developed a genre of its own by creating an alternative form of journalism on which gays came to depend.

Germany

Located in the center of the European continent, Germany is the largest state west of Russia on the continent in terms of population and economic strength. As of 2007, about 82.3 million people live in Germany in 39 million households, of which 98 percent have at least one television set. About 9 percent of the population are foreign or have roots outside of Germany. The common language is German and, together with Austria and the German-speaking part of Switzerland, about 100 million people make up a German-language area, constituting a rather large media market.

Development

Germany has a long history of journalism. After a phase of sporadic nonprofessional dissemination of news until the middle of the 1600s, a sort of correspondence journalism developed until the middle of the 1700s, while a mixture of writers and opinion-arguing journalists was predominant until the mid-1800s. Since then, the modern appearance of journalists as part of a newsroom developed, followed, since the middle of the 1970s, by a sort of newsroom-technical journalism in which present forms of online journalism can be included. Attitudes to and standards of journalism have changed dramatically during these phases.

German journalism in the twenty-first century is strongly affected by conditions of the postwar era after 1945: by the efforts of the Allies to create a new media elite, which was to be democratic and free of contamination by the old Nazi ideology; by the emergence of a democratic press, which endorsed critical reporting as a part of developing a better future; and by the early commercialization of the press, which began with the reappointment by the Allied military administration of the former (anti-Nazi) editors to leading positions.

A sensationalistic journalism developed in the 1950s and 1960s (in the tabloid newspapers operated by Axel Springer of a Hamburg-based editor family, among others), while in the newly built system of public service broadcasting the ideal of a journalism oriented towards a democratic mission was promoted.

With the inception of commercial broadcasting in 1984 in West Germany (in East Germany the media were state owned and nearly completely under the control of the ruling communist party) and the competition that resulted from this so-called dual system, another important sphere of public communication yielded to commercialization. This commercialization has its effects on journalism as a whole. Deregulation and competition give the advertising industry more weight, so that journalism is increasingly orientated to advertiser interests and becomes more market driven.

The end of Soviet-controlled East Germany (German Democratic Republic, GDR) and the reunification of East and West Germany in 1990 brought about a new situation: the two different models of journalism had to merge. The media system of the former GDR was highly centralized under the control of the Communist Party. In consequence of the merging, the attitudes and self-perception of journalists became an important research topic for media and communication scholars, which also provided answers to earlier criticism that German journalism in West Germany before unification had been too removed from the political opinions of the majority of the population and too left wing.

By the mid-1980s, criticism of journalism was fuelled by several media scandals during which coverage of crimes and catastrophes did not live up to the expectation of the audiences. A famous example is the taking of a hostage after a bank robbery in 1988, where the reporter of a Cologne-based tabloid joined the criminal in his car for an interview, even as the police were hunting the thug. The expanding critique was included in a report initiated by the President of Germany in 1994 that bemoaned the many aberrations of political reporting and the

decreasing credibility of the media. Sensationalism, negativism, scandalization, and ritualized presentations of politics were the main points of critique in this report. The heavy competition resulting from commercialization and concentration of media created many problems for journalism in Germany.

German Journalism in the Twenty-First Century

By the early twenty-first century, some 48,000 people in Germany work as journalists (earn more than the half of their income or spend more than half of their working time in journalism). Not included are those journalists who are working part-time and who are earning their living from other activities, mostly within public relations or related fields. Some authors describe a three-class system of journalism in Germany, where the first includes famous star journalists with high incomes who are influential in both media and in the political field; the second includes the majority of full-time journalists who mainly work in regional and local newspapers; and the third includes part-time journalists or 'professional amateurs,' who experience difficulties making a living from their journalistic activities.

Most regular journalists are predominantly male (63 percent), average 41 years of age, emanate from the middle class, are living in a permanent partnership (whether married or not, 71 percent), lack children (57 percent), have a university degree (69 percent), and have completed (usually) two years of an editorial department traineeship (which is still the dominant way to become a journalist in Germany aside from university-based and industry-owned journalism schools). The majority (63 percent) is working in a print medium and earn roughly 2,300 euros net per month ($44,000 a year).

The number of professional journalists declined by about 6,000 people between 1993 and 2005. This is mainly due to the shrinking number of freelance journalists able to earn their living from journalism. The number of professional journalists within newsrooms has been relatively stable, although a significant amount of new online facilities and special interest and trade magazines have been founded. This indicates that fewer staff are working for more media. With journalistic talent spread so thin, academic and journalistic observers fear that accuracy and diligence will suffer and mistakes may increase. The fact that fewer journalists can live on journalism incomes and seek additional income from public-relation activities is a danger for the professionalism of journalism, since conflicting interests may undermine journalistic independence.

The survey also shows more women in journalism: the percentage of women increased from 31 percent in 1993 to 37 percent by 2005. While women have been entering traditionally "male" field such as politics or economics, their share in leading positions (22 percent) is still far from equal, although they generally have more formal education than their male counterparts.

Most German journalists feel obliged to meet the standard of presenting information in an unbiased fashion, explaining complex issues, and breaking stories rapidly. The one-time complaint that German journalists were "missionaries" trying to influence public opinion, is no longer applicable. German journalists are generally quite cautious and do not practice risky and unethical methods of investigation, such as door-stepping (recording an interview with a person for broadcast without having made a prior arrangement with the interviewee), undercover reporting, or checkbook journalism.

Regulation

Fundamental to journalistic freedom are the guarantees of article 5 of the German constitution, which ensures freedom of opinion and information and the freedom of press, broadcasting, and film. Article 18 prevents misuse of these freedoms, Article 75 provides framing directives for press and media law, and Article 30 protects the prerogatives of the states (*Länder*) within the federalist system. Within criminal and civil law, there are several restrictions to news media freedoms, namely the protection of human dignity, as conveyed in Article 1 of the Basic Law, and the protection of youth. There is nothing similar to the First Amendment of the U.S. Constitution.

The main ethical norms for journalism are found in the constitutions of the states, which stipulate requirements concerning the public mission of the press, due diligence, and accuracy. Similar prescriptions for broadcast journalism are

laid down within laws for public service and commercial radio-television of the states; these are similar to state press laws.

Legal provisions protecting journalists as the bearers of press freedom include the right to keep confidential sources secret, the right to refuse to give evidence to police and the courts, and the freedom of information act, introduced in 2005, which gives all citizens the right to have access to information of public administration.

Normative claims for journalism which do not have legal backing are laid down within the German Press Code, published in 1973 by the German Press Council in West Germany (in East Germany a similar institution did not exist). This self-regulatory body was formed in 1956 with ten representatives each from journalists' and publishers' organizations. Members of the general public may appeal press concerns directly to the Council and if the Council supports the complaint, the respective newspaper is expected to publish the Council's ruling. Claims are decided based on the Press Codex, which is regularly renewed according to developments in journalism. The effect of this self-regulation is limited, however, especially in relation to the practices of the "boulevard" (tabloid) press. Discussion has emerged on how the German Press Council could work more openly with the public, but there are no media ombudspersons in Germany.

A developing, though still weak, area of media accountability is the trend of media organizations, especially newspapers, having special media sections or slots of air time that offer more transparency about the making of media content and explanations of behind-the-scene decision making for audiences, but offer little criticism. Journalists' organizations such as *Netzwerk Recherche* (network for investigative journalism) are trying to improve news reporting quality.

Print Media

German print media include a large number of titles, a strong local and regional newspaper market, a few national newspapers, many magazines, a dependency on advertising income, and considerable economic concentration.

In 2007 the number of "independent editorial units" (i.e., full publishing entities that produce all parts of a newspaper) for daily newspapers in Germany was 136, with more than 350 newspapers overall. If local editions of all papers are included, there are 1,524 different newspapers. Since the early 1990s, the number and circulation of newspapers in Germany have declined. Penetration of daily newspapers fell from 75 percent in 2005 to 73 percent in 2007. Most major media production centers are located in the western half of the country, and newspapers of the former GDR are usually controlled by western publishers.

Circulation figures show that the local and regional press is very important in Germany. Ninety-seven percent of the subscription press claims to be local, which means a circulation of 14.6 million. On first view, the German press appears to be highly diversified and local, but, in fact, much newspaper content is produced by central offices. The *Heimatpresse* (local press) is in many cases only legally independent. Because of concentration and economics local papers work closely with larger newspapers or other local and regional newspapers.

In terms of circulation figures, German national newspapers account for 1.6 million (without the biggest tabloid, *BILD*), and 4.6 million papers are sold on the street. The top-selling German tabloid paper is *BILD Zeitung*, with a circulation of 3.3 million. With the buying up of the publishing house *Berliner Zeitung* (and, later, other papers) by British investor David Montgomery, the first takeover of a German newspaper by a foreign owner took place. Daily newspapers control just over a quarter of national advertising expenditure.

The German magazine sector is extremely buoyant with some 884 general magazines and 1,081 specialized periodicals on the market. *Der Spiegel* (The Mirror), a weekly news magazine modeled after the American *Time* magazine has long held a virtual monopoly of its market. With its investigative style of journalism, it represents the most influential political publication in Germany. The market for general interest magazines is also quite lively. Best known for its liberal and investigative format, and with a nearly 20 percent share of advertising, *Der Stern* (The Star) is the best known although its circulation is dropping The weekly newspaper, which presents less news and more analysis and background information, became popular after 1945. The most successful and important is *Die Zeit* (The Times), a liberal and

independent paper. Free newspapers only started publishing in the beginning of the twenty-first century, but have not gained any importance.

The Broadcasting Market

The main characteristics of German radio and television include a "dual system" of both public and commercial broadcasting, federalism, and a strong role for the Länder in public broadcasting. The supervisory councils have an important role in both the public and private sector. Penetration of cable television is substantial. Two groups, ProSiebenSAT.1Media AG and the RTL Group, control commercial TV. Digitization of the terrestrial TV is ongoing, and governmental policy is active in developing infrastructures for digital services. While there is a lack of innovative services and programs, public service broadcasters play an active role in developing digital services and maintaining quality journalism.

The traditional public service broadcaster is an independent and noncommercial organization, financed primarily by licence fees. The public service broadcasting organization (*Anstalt*) in Germany roughly resembles the BBC system in the United Kingdom. The typical *Anstalt* provides a region, usually a *Land,* with public service radio and television service. Together the regional corporations founded the ARD (*Arbeitsgemeinschaft der Rundfunkanstalten Deutschlands*) in 1950, and contribute content (according to their size) to the first TV channel which is in the responsibility of the ARD. In addition, the regional corporations independently organize a third channel, broadcast only in the Länder, that offers regional news and more culturally and educationally oriented programming. The second German television channel, ZDF (*Zweites Deutsches Fernsehen*), is based on collaboration by all Länder channels (via the ZDF-Interstate treaty) and is located in Mainz. ZDF offers one national television service, but also maintains offices in different parts of the country. All Länder broadcasters offer three to five different radio channels in their own region, some of them localized.

German commercial television is controlled by two media groups calling themselves "sender families." One, formerly led by Leo Kirch, is ProSiebenSAT.1Media AG and consists of Sat.1, Pro 7, N24, Kabel 1, and 9live; the RTL Group is owned by Bertelsmann and the Luxembourg-based CLT (which also owns RTL II, Super RTL, VOX, and n-tv). N24 and n-tv are all-news channels. Many more specialized programs are offered. In large cities such as Berlin and Hamburg, regional commercial TV has also been established.

The combined market share of all public service television broadcasters is 43 percent, of which ARD has a market share of 13 percent, ZDF 13 per cent, and the third channels 14 percent. Among the private channels RTL (12 percent), SAT1 (1 percent) and ProSieben (7 percent) have the biggest audience shares. Television enjoys a share of 42 percent and radio advertising a share of 6 percent of the overall advertising market.

Online Market

Among Internet media, T-Online and AOL provide the most popular websites, and many new online media are generated by the traditional media such as the above mentioned channels, magazines, and national newspapers. In 2008 about 66 percent of all Germans used online services. The Internet is an established medium and is especially popular among young people; 96 percent of those aged 14 to 19 use it daily. About half of all Internet users report that they use the web for up-to-date information.

News Agencies

There is one dominating, internationally active German news agency and seven small specialized agencies, and competition among them is fierce. The leading agency, dpa (*Deutsche Presseagentur*), also is very strong in the international market and has a cooperative structure; approximately 200 newspapers, magazines, and broadcasting stations participate. As nearly every newspaper is a subscriber, dpa can be regarded as the primary source, whereas the other news agencies are complementary sources. The second largest agency is ddp (*Deutscher Depeschendienst*), which reports German national and regional policies, and because of its former GDR heritage includes a strong representation of correspondents in the new Länder. Other players in the global news market are active in Germany as well. The

Associated Press (AP), the German Reuters (rtr, a subsidiary company of Thomson-Reuters), and Agence France-Presse (AFP) rank second, third, and fourth in the German market.

Journalism's Future

Journalism in Germany is both a strong provider of public communication as well as a highly competitive business. Transformations resulting from deregulation and commercialization of the media system have changed journalism to such a degree that it might be in danger of not fulfilling its democratic tasks. De-professionalization and an increasing degree of self-referentiality are the most obvious signs of trouble. On the other hand, new forms of journalism, including blogs, phlogs (photoblogs), wikis, and other forms of web 2.0 online communications, may challenge the traditional monopolistic situation of journalism as responsible and competent providers of news and reports. To survive in the future, German journalism has to prove that it fulfills those tasks and values that a democratic society requires. It is an open question, however, under which business model the funding of such journalism can be maintained.

Globalization, Coverage of

Globalization is the process of increasing communication interconnectivity between geographically distant and diverse populations, cultures, and economies. This is usually, though not always, brought about by technological advances in transportation and communications and through the creation of virtual interactions. With regard to journalism, globalization can mean both the process of this interconnection and reporting about the end results. Two resulting phenomena are particular noteworthy. The first is the public's expectation of instant international news as part of the now standard 24-hour news cycle. The second is the expectation of ongoing cultural exchange between previously separated and diverse groups of people. Of this increased cultural exchange, some scholars see increased diversity and hybridization of cultures (pluralism), while others see an extension of Anglo-American corporate hegemony (cultural imperialism). Paradoxically, evidence for both outcomes abound.

History and Development

Integral to both of these globalization phenomena is continuing improvement of technologies of transport, distribution, and communications. Globalization is a longer running trend than many perceive—it began with the industrial revolution in the mid-nineteenth century and continues into the early twenty-first century. Many antecedents of contemporary globalization can be found, including such early trade routes as the Silk Road in Eurasia and the Incense Route in Africa and Arabia, and the religious institutions which spread with empires, most notably the Roman Catholic Church and the Islamic Caliphates. These global religions created and continue the process of

globalization through complex ecclesiastical hierarchies, traveling missionaries, and pilgrimages. By the late Middle Ages, trade and craft guilds had established systems for traveling journeymen and craft masters which increased the exchange of knowledge and ideas. Through these proto-globalizing trends, information was collected by travelers and conglomerated into central locations for use by ruling elites, merchants, and religious officials. As such, journalism and news gathering evolved together with travel and nascent globalism.

The rise of nationalism worked against globalism for a number of centuries as newly formed nations established national or ethnic identities by defining what they excluded. However, the rise of the nation-state was partially due to the rise of the printing presses and the cultural consciousness of nationhood brought about by growing distribution of printed material. Establishment of an educated merchant class, usually in coastal city-states, required information to facilitate trade. City-states evolved into larger nation-states. Due to the cultural nature of globalization and its foundation in multilingual communication, it has been inextricably linked to forms of cultural information exchange, including journalism.

The character of globalization changed drastically with the beginning of the industrial revolution. Some technologies, for example steamships, allowed for faster travel and as a result more rapid global interconnections. However, it was the development of telegraphy in the 1840s that most radically encouraged globalization. Telegraphs were first used by Great Britain and the United States. The development of undersea telegraph cables in the 1860s, and wireless telegraphy at the turn of the twentieth century, dramatically speeded up cross-border communication. Although early telegraphy allowed for faster news gathering and the development of international news (or "wire") services, it was the application of wireless technology for radio broadcasting by the 1920s, which allowed for large groups of geographically and culturally diverse populations to be seen as one single audience. Point-to-point and broadcast radio expanded alongside each other and were used to form the first broadcast networks. These involved (by the late 1930s) a central news collection organization linked to dozens of affiliate stations. While the network itself used point-to-point wired communications to link affiliates, the stations used broadcast technology to reach their audiences.

Expansion of Global Communications

Truly rapid global communications began with undersea telegraph cables in the 1860s and expanded with the adoption of shortwave broadcasting in the 1920s and 1930s. Unlike medium-wave radio broadcasting, shortwave signals are bounced along the ionosphere and reflected back to the earth's surface thousands of miles from their broadcast source. This technology allowed a few, usually government-controlled, broadcasters to reach audiences around the world. The most notable drawback to shortwave radio is limited bandwidth. Thus, shortwave broadcasts are heavily regulated by international treaties and often exclude smaller broadcasters. This perceived notion of exclusion lead initially to many "pirate" broadcast stations that operated in international waters (Radio Caroline, broadcast from ships anchored off Britain), across international borders (Radio Luxembourg, which broadcast to Western Europe and especially Britain), or in areas with little government oversight (Radio Swan near Cuba). The rise of satellite distribution in the 1980s and Internet audio streaming radio early in the twenty-first century has diminished the role of pirate radio.

The growing number of broadcast, cable, and satellite-based electronic media systems has led to the (thus far) ultimate network of networks, the Internet and the World Wide Web. While the Internet was created in the late 1960s by an agency of the U.S. government, it was used for academic, military, and government communications nearly exclusively until the wide-scale proliferation of personal computers and a standardized Internet protocol (IP) for the graphic display of information. The resulting system is now called the World Wide Web, which uses the infrastructure of the Internet for commercial, journalistic, and entertainment purposes. The system of the World Wide Web and the Internet form a good metaphor for globalization in media, with the Internet's basic infrastructure created in the United States in the late 1960s and early 1970s, while the World Wide Web backbone and protocols were designed in Europe in the early 1990s.

Looking at the explosive growth of communications technology in the mid-twentieth century, media researcher Marshall McLuhan made the now famous observation that humanity will soon be living in a "global village." Many of the cultural assumptions that McLuhan had based his global village model upon were flawed and vague—for example, the idea that some media were "hot," and gave much information and required less sensation—such as radio and newspapers—and other media were "cool," giving less information but inviting more participation—such as television and film. His ideas gained acceptance and are still widely used when discussing global media and globalization. Proponents of McLuhan's vision point to the growth of the World Wide Web and mobile communications devices as examples of the continuing relevance of McLuhan's model. Detractors believe that the model does not take into consideration large-scale media conglomerates and the effect of governments on mass media.

Globalization and Mass Media

In 1956 communications researchers Fred Siebert, Theodore Peterson, and Wilbur Schramm posited four types of media organizations around the world: authoritarian, libertarian, Soviet/Communist, and social responsibility. Criticized even at their introduction as too simplistic, these four cold war categories still have some relevance in the twenty-first century. Despite the technological movement toward digital global corporate culture, individual nation-states and regions maintain unique journalistic media.

Through the expansion of communications technologies and global media, there had been a sliding scale of media freedom from state-controlled media (as in the People's Republic of China) and state-funded media with some level of autonomy (Britain's BBC) through commercial satellite and cable networks (BskyB, CNN) to the apparent anarchy of online media (YouTube, P2P filesharing). Digital technologies can most readily permeate national borders and allow for journalism to cross borders with decreasing government control. The rise of transnational media corporations has greatly aided and speeded this process. One of the best-known examples, Rupert Murdoch's News Corporation, holds newspapers (*The Times, The Wall Street Journal*); broadcast, cable and satellite networks (Fox Television Network, BSkyB); film studios (20th Century Fox); and Internet sites/services (MySpace, Photobucket). Other examples of transnational media corporations include Bertlesman, Sony, Vivendi, Disney, and Time Warner.

International organizations and trade agreements have been created around the complex issues surrounding globalization and mass media. During the 1970s the United Nations Educational, Scientific and Cultural Organization (UNESCO) attempted to establish news guidelines called the New World Information and Communication Order (NWICO). These guidelines were intended to equalize treatment and coverage of developing and industrialized nations. The establishment of the NWICO became overtly political during the cold war struggle, and it was ultimately derailed in the mid-1980s. This was superseded by a series of trade negotiations from the 1940s through 1994 called the General Agreement on Tariffs and Trade (GATT). In 1995 the World Trade Organization (WTO) was formed to institutionalize international agreements on trade. Within the WTO, the General Agreement on Trade in Services (GATS) is an evolving framework of treaties that includes global entertainment and worldwide news distribution.

Growing international trade and corporate ownership of technologies for communication have moved most nation states toward the social responsibility and libertarian models originally proposed by Siebert, Peterson, and Schramm. Proponents of globalization in media production and news gathering/distribution favor the model of an open "marketplace of ideas." Opponents of this form of globalization counter that it places profitability ahead of media access.

Marshall McLuhan, Jacques Ellul, Niel Postman, Walter Lippmann, Edward Bernays, and Daniel Borstin all contributed to thinking about global media culture in the twentieth century. Contemporary media critics and philosophers include Robert McChesney, Ben Bagdikan, and Noam Chomsky.

Noam Chomsky began is career as an academic linguist who applied ideas of language to mass media. He gained notoriety by being a fierce critic of U.S. foreign policy and by making the connection between government/military aggression and corporate ownership and control of mass media

and news gathering. In his book *Manufacturing Consent: The Political Economy of the Mass Media,* Chomsky popularized the idea that corporate-owned journalism operates under the same profit-driven model as that of other businesses, and will rarely engage in anti-authoritarian criticism and self-censor much of its content to appease business interests.

New thinkers on this subject include Naomi Klein, Henry Jenkins, and Lawrence Lessig. Lessig was trained as a copyright and intellectual property lawyer who argued several cases before the U.S. Supreme Court. He was one of the leading members of the open-source movement, which has evolved around free, editable software, such as Linux, but has grown to encompass scientific research, music, photography, and online collaborations, such as Wikipedia. As a practicing attorney, Lessig has also worked to design legal methods where copyright protection could be extended across global borders.

Globalization and Journalism

Many of the changing social trends in news gathering and reporting can be linked to emerging globalization of mass media. The spread of both Western consumerism and laissez-faire democracy throughout the world has changed how audiences interact with their news sources. Both increased democratic participation and intrusive corporate marketing make new demands on and new models for journalism in a globalized world. Older models for journalism took a mass-production approach to mass media and continue to privilege journalistic objectivity, the use of public intellectuals and experts, tight scripting formats, and an attempt to give neutral facts to an audience. Newer models take a niche-market approach to mass media and tend to embrace (or at least admit) a political or cultural point of view, more frequently assess and interpret facts for an audience, rely more on public opinion and vox-populi (or man-on-the-street) interviews, and openly criticize or advocate political parties or regimes. Some examples include newer organizations such as *The Weekly Standard* and *The Independent Media Center*; however, older examples include *The Economist* and *The Nation* as well as other practitioners of "Advocacy Journalism." While becoming increasingly commercialized, newer models of journalism in a digital, globalized world focus on putting individual stories in a context for their audience. This is thought to be a reaction to the 24-hour news cycle and information overload that can be created by the news industry itself.

Other emerging trends in journalism that may be changing globalization are the adoption of a global form of English for news coverage along with the rise of multiple-language reporting by large news-gathering organizations. Community-based journalism and other forms of user-generated content, such as YouTube and Fark .com, increasingly become the story leads for professional journalists. For example, both CNN and the BBC include viewer-submitted stories on their websites. Thus, stories that previously would not have been reported upon due to distance, lack of field reporters, or political pressures can move easily from very small news organizations to a large global conglomerate in a short time.

In the future, globalization will continue, as the many underlying "causes" of it are highly unlikely to reverse course. The "marketplace of ideas" model, argues that it is possible that global communications may become more balanced as digital technologies become the norm. Specific examples of globalism likely to continue are hybrid cultures, particularly in music and independent film; the continued rise of viral marketing and memetics; and the expansion of user-generated content and citizen journalists. Other events likely to effect media globalization are the continued decline of both state-funded media and funding through tax-incentives and technological accessibility to a global audience through crank radios, mobile phones, and inexpensive notebook computers.

There is an essential paradox of globalization in the production and distribution of global journalism. Along with the greater bandwidth and the number of media outlets within new media overall, there is a simultaneous conglomeration of both ownership and content. In the twenty-first century, globalization presents the question "are there mainstream media, or is that concept an illusion?" From this paradoxical question, there is an evolution within media and journalism; the meaning of "broadcasting" is changing as individual media users customize their experience as readers and audience members. This is done first in multichannel satellite news networks and with the

widespread adoption of news aggregators and social networks for vetting a large amount of broadcast news and information. In the same fashion that journalism grew and changed with improvements in transport, communication technology, and growing industrialization, it will continue to be a leading part of globalization.

Government, Federal, Coverage of

Media coverage of the federal government entails both news gathering to monitor the actions of government agencies and officials, as well as news about national politics and policy. Both kinds of coverage predate the formal formation of government itself. As just one example, *The Federalist,* a collection of commentaries arguing for the reorganization of the United States into its present form, appeared in several New York newspapers following the 1787 Constitutional Convention.

The federal government's myriad activities continue to provide an indispensable set of topics for U.S. news media. The government's importance to journalism is underscored by the vast assembly of correspondents, editors, and analysts dispatched to or based in Washington, D.C. According to *The Washington Post,* almost 70 correspondents from 40 news organizations cover the President as part of the White House press corps. This is only one fraction of the Washington press establishment: According to the Labor Department's Bureau of Labor Statistics, nearly 2,000 reporters and correspondents lived in the District of Columbia in 2006. Their work is integral to the functioning of American democracy as it provides necessary links between voters and officials, even in the face of concerns about government co-option, the representativeness of the press corps, and the influence of media.

Origin of the Washington Press Corps

In the late eighteenth century, press coverage of national politics was dominated by news organizations sponsored by government officials and financially subsidized by federal agencies (see Cook 1998). Federalist newspapers like *The Gazette of the United States* and its rival *National Gazette*

were published by partisans supported by government printing contracts and political patronage jobs. The President designated an official administration newspaper, such as the *National Intelligencer,* which provided President Jefferson (1801–09) with a mouthpiece for official news as well as information not attributed directly to him. When reporters sought to cover the proceedings of the House of Representatives, their access was granted on an individual basis and could be revoked as political revenge. The Senate, members of which were (until 1913) appointed by state legislatures, made no provision for reporters in its chamber until 1802.

The Washington press corps began to take a more recognizable shape in the mid-nineteenth century, with the expansion of the penny press and its dependence on a mass audience, rather than narrower partisan audiences. The federal government established the Government Printing Office in 1860, reducing patronage opportunities for partisan printers. During the Civil War, news content shifted from terse reports and ideological arguments to expanded coverage of specific events, delivering what mass communications researcher Timothy E. Cook calls "the coup de grâce to the old partisan system."

In the late nineteenth century, "Newspaper Row" developed along 14th Street between F Street and Pennsylvania Avenue, allowing the press corps to establish a stronger sense of internal camaraderie. The interactions among reporters and officials also became more institutional with these changes, with both sides developing a clearer set of routines and establishing a set of Washington newsbeats. Rather than initiating sporadic and ad hoc interviews with officials, specialized reporters began covering the various branches and agencies of government.

By the time of Leo Rosten's sociological investigation of *The Washington Correspondents* (1937), there were at least 127 reporters covering the New Deal federal government. Rosten documented a press corps quite similar to its contemporary counterpart, a cadre of news professionals socially integrated into the Washington establishment and often friendly with officials. He discussed familiar efforts on the part of government officials to shape coverage, including "the handout" or press release from a government agency.

Trends in Federal Coverage

In the 1960s and 1970s, Herbert J. Gans found that almost three-fourths of domestic television news stories and an even larger percentage of newsmagazine columns addressed the activities of government and officials in some way. These stories were diverse, including coverage of scandals and investigations, conflicts among officials, policy proposals and decisions, information about the officials themselves, and occasional protests against government actions.

In recent decades, however, federal government coverage appears to be on the decline. According to the Policy Agendas Project at University of Washington, using *The New York Times* as its principal indictor, news media are devoting less coverage to governmental issues than they did in the mid-twentieth century. In the most recent decennial national survey of journalists, 40 percent said discussing national policy is an extremely important role for journalism. Yet three decades earlier, 55 percent of journalists said focusing on national policy was an extremely important role for journalists (Weaver et al. 2007, 104). Nonetheless, coverage of the federal government and its activities remains on the front page of daily newspapers nationwide and often leads nightly network newscasts.

News from Washington increasingly revolves around the presidency. The President is especially important because news values privilege officials as a function of their position in hierarchies: as sociologist Herbert J. Gans writes, "the higher an actor is in the governmental hierarchy, the more his or her activities are of importance." To that end, presidential administrations invest substantial resources in providing facilities for journalists, and in generating newsworthy events that allow the White House to control the story, with structured public addresses, as well as foreign and domestic travel. The White House has institutionalized its efforts to spin the media with its Office of Communication.

Members of Congress also devote resources to garnering press attention, with specific personnel designated in congressional offices to handle press inquiries and generate interest in what the member is doing. Coverage of the legislative process tends to focus on party and committee leaders as a function of their perceived institutional importance. In 2004 Arnold analyzed coverage of Congress in a

sample of 25 newspapers across the country and found that the median newspaper covered its local representative in one article every two days. The range of this coverage was quite large, from only six stories per month to nearly one story per day.

Much coverage of Congress also involves the President. Coverage of these officials, when not focused on structured photo opportunities, tends to adopt what authors Joseph Capella and Kathleen Jameson call a "strategic frame," advancing a narrative for news focused on conflict and how actors play at politics with each other. This strategic frame lends itself quite well to the independence and objectivity norms of journalists. Covering politics as a game of strategy allows reporters to give voice to at least two sides of any given debate.

Knowledge of these news values has given rise to the particular media strategy of members of the U.S. Supreme Court. Justices do not necessarily seek press coverage for their own political ends, but are interested in promoting knowledge of and compliance with majority opinions. Thus, they tend to focus their news releases and comments on specific opinions, rather than their own personalities. This results in less, but perhaps better, coverage for the Court and less attention to its internal conflicts.

Reporters and Officials

Washington correspondents and federal officials have a relationship which is, at best, reciprocal. Reporters need to produce news stories and officials, elected officials in particular, often need attention in the form of news coverage. However, there is a great deal of tension in this relationship; reporters—and many observers—fear that journalists are ultimately too close to the officials they cover, while at the same time needing to cultivate those relationships to get stories. According to sociologist Michael Schudson, journalists individually distrust government, particularly in the post-Watergate era, but there "is always a tendency for journalists to revert to the comfort of being friendly insiders."

Most Washington journalists collect news through their assignment to a continuing newsbeat, such as the White House. This allows reporters to develop deep, long-term contacts in the institutions they cover and helps them cultivate better stories about the inner workings of these institutions. But access to high-level government officials is a scarce resource that is necessary for journalistic success. This level of familiarity and dependence, according to Gans, also draws the beat reporter's attention to "stories that please their sources, since angering them may endanger closeness or rapport . . . beat reporters are drawn into a symbiotic relationship of mutual obligations with their sources."

According to political scientist and communications researcher W. Lance Bennett, the nature of the relationship between reporters and officials has led some observers to reject the ideal that journalists serve as an independent monitor, claiming that news media have been co-opted to "generate support, compliance, and just plain confusion among the public."

Many are particularly critical of the job journalists did in covering the George W. Bush administration's (2001–09) foreign policy prior to the 2003 invasion of Iraq. In September 2002, *New York Times* reporters cited unnamed sources in the Bush administration asserting that Iraq had intensified its quest for nuclear weapons. It was one of several stories later criticized as factually inaccurate and which caused the newspaper to admit, in a 2004 editorial, that its reporting on preinvasion Iraq and U.S. policy was "not as rigorous as it should have been." This is just one example of news produced by an establishment of correspondents considered by many to be too cozy with governmental officials.

Charges of Bias

In addition to charges of being too close to its government sources, the Washington press corps is often criticized for being insufficiently representative of the varied perspectives and political views of Americans. The loudest of these criticisms come from activists, pundits, and some scholars asserting that the press corps contains a higher proportion of people with left-leaning political ideologies than the nation as a whole. Others reject these claims out of hand, noting that even if reporters as a group lean leftward, the owners of news organizations and affluent editorial leaders lean to the right. The substance of this controversy is reflected in quite similar terms in Rosten's 1937 study—claims and counterclaims of ideological bias are old news.

A more substantively important source of potential bias in the Washington press corps is the racial and ethnic makeup of news bureau staffs. A 2004

report from UNITY, an organization promoting newsroom diversity, found that the Washington press corps dramatically underrepresents persons of color. While more than 30 percent of the U.S. population is nonwhite, less than 10.5 percent of the Washington reporters, correspondents, and others staffing bureaus are from historically underrepresented groups. Among the few minority reporters in the Washington press corps, only a fraction (13 percent) thought the press corps does a good job covering racial issues—none of the journalists responding to their survey thought the press corps does an excellent or even very good job with race-related topics. More than 80 percent thought expanded racial diversity in Washington bureaus would improve coverage.

Media Effects

Concerns about ideological and descriptive representation not only involve judgments about fairness, but also embody concerns that the media's priorities reflect those of the country rather than skew in an unrepresentative direction. This is particularly important given the influence of the news media in setting the national political agenda. News stories about potential issues worthy of government attention can affect their inclusion on the government's agenda. This affects actions of elected officials as well as bureaucrats. For example, in 2002, political scientist Daniel Carpenter showed that the Food and Drug Administration approves a drug more quickly if there is sustained media coverage of the disease associated with it.

Another salient example of how federal government coverage can effect the actions of officials is the so-called CNN effect, a product of visually compelling coverage provided by 24-hour news channels. The CNN effect appears to be pronounced particularly among foreign policy and national security officials presented with images of humanitarian crises and late-breaking events across the globe brought to American homes. The CNN effect can shorten the amount of time available to consider policy alternatives, as well as affect military priorities.

Yet the influence of news coverage on the public is conditional at most, and has even been described as minimal. Members of media audiences have a well-documented resistance to persuasion—they are selectively attentive to news and media messages and selectively receptive to the information received from them. But variation in news media attention can influence what issues people find important, how they define issues under debate, and how they evaluate public figure performance on those issues.

News media may also have the effect of increasing public cynicism. Cappella and Jamieson find that by focusing on strategy and conflict, news media coverage of government may have the unintended consequence of creating more suspicion of government officials and thus contributing to a potentially self-destructive crisis of legitimacy for American government. How this balances allegations that coverage of the federal government tends to produce support for and compliance with government action is difficult to assess.

Conclusion

The Washington press corps is reliant on informational subsidies (e.g., access to officials) that call into question its incentives to act as an independent monitor of those officials. The practice of newsgathering and the content of federal government coverage are criticized because of the importance of that coverage to the functioning of American democracy. Critics who are watching the watchdogs may help serve the public interest as long as their goal is to improve rather than impede federal government coverage. The federal government remains newsworthy due to its importance to the daily lives of U.S. residents. Given that the structure of how the federal government distributes power makes it difficult to assign responsibility for government action, the process of holding officials accountable is made all the more difficult. Citizens require effective information about how officials act in order to have any hope of holding them accountable.

Government, State and Local, Coverage of

American news media have traditionally invested considerable time, space, and expense to cover local and state-level news. Such coverage can be dynamic and have considerable effect on public affairs, or be more passive, uninteresting, and even ineffective. The most popular media for coverage of state and local issues are newspapers and broadcast (usually television) news, and increasingly some online services. Research demonstrates that people rely more on newspapers than television for local political and governmental news—raising concerns given both the changing content of "local" television news, and the continuing decline in newspaper readership. Nor do newer media offer much promise as blogs present individual points of view and mainstream media closely control what "citizen journalism" appears on their pages or in their broadcasts. These media serve more as alternative outlets for citizens to voice their opinions rather than gather objective news.

Local Media and the Democratic Process

State and local governments provide greater and more direct interaction with constituents than is the case with national politics. Politicians on the local or state level are more closely aligned with community issues, requiring greater public interaction. However, direct politician-to-citizen communication remains a challenge given constraints of time, cost, and sometimes distance. Local media are instrumental in this interchange because they serve as the primary mode of communication among officials, business, citizen action groups, and the general public. According to a survey by the Pew Research Center for the People & the Press, 40 percent of people involved in local print media maintain that journalism does very well as a public service for providing information to the public, as compared to only 28 percent of people involved in national print media.

Given this role, local media can and often do help foster democratic processes. By covering local and state governments (including such vital functions as education, transportation, and health), media inform citizens of what these governments are doing. With such coverage, media serve as "watchdogs" on government, increasing transparency through occasional use of investigative journalism and by holding officials accountable for their actions. This watchdog role is thought to be more effective in local than in national media

coverage: approximately 39 percent of people from local print media that responded to the Pew survey stated that journalism does very well as a political watchdog, as opposed to 31 percent of respondents from national print media. At the same time, media channel citizen wants and needs to government. For example, letters to the editor, e-mail messages to stations, and blogs help to make clear where some members of the public stand on controversial concerns.

Local and state governments are primarily concerned with public issues such as health and safety, welfare, transportation, education, and agriculture. Thus, media coverage of state and local government fluctuates with local elections, whether the state legislature is in session, or whether a function of the government is under scrutiny. Usually based on legislative action (or threatened action), hot-button issues like political scandals, gun control, how schools should (or should not) teach evolution, consolidating public schools, or government cutbacks due to budget shortfalls will feature prominently in coverage of state and local affairs.

Agenda Setting

Agenda setting is evident when news media report to their audiences about current issues. The very choices of news items made by newspapers, television, and other media contribute to the public agenda by their selection, and how the stories are treated and for how long. A one-shot story has limited effect, while a string of stories over time is far more likely to have lasting impact on reader or viewer thinking. Yet such follow-up news is becoming increasingly rare (unless it is a specialized news program such as *60 Minutes* or *20/20*) in the news media quest for audiences, attracted by the latest scandal or disaster. Thus, news media have the ability to tell the public what issues to think *about*.

The more people are exposed to news about government, the more they may pay attention to what government is doing. Indeed, the public will seldom consider an issue significant if they do not hear about it in mainstream media. Therefore, if media do not report on local and state government activities, then the public will not view those functions as an important subject. This raises obvious questions about what drives news media choices among the influx of stories to cover. Will an issue receive coverage because it will attract viewers or readers? That is surely a vital factor that explains the widespread media fascination with local crime and scandal stories, as well as those of accidents, fires or other local disasters which may provide dramatic pictures of flames, rescue, and traffic jams. A plane crash—even one involving only a handful of people—will always get more coverage than a story on state finances that lacks dramatic pictures, yet actually affects far more people. Local and state-level coverage, like other news, is often defined by available pictures, dramatic narrative about events, or the importance of the people involved.

Local Coverage and Civic Journalism

Media coverage of local government and politics is often enhanced by civic, or public, journalism. Civic journalism refers to news media efforts to engage citizens regarding community issues. While maintaining traditional journalism values such as objectivity and accuracy, civic journalism aims to foster discussion about local issues, serving as forums for community discussion and empowering people with information essential to involve them in the political process. The resulting relationship between government and civic journalism is therefore symbiotic: Effective civic journalism can increase public involvement in local and state politics, and a vibrant local or state government will ideally seek greater citizen involvement. News media are in the middle of such a relationship.

The Pew Center for Civic Journalism argues that civic journalism can best foster democracy by subscribing to the following guidelines on local government election coverage:

- Avoid focusing local election coverage on "horse-race" news about which candidate is ahead in the polls, as such reporting may increase voter apathy by depicting the outcome as a foregone conclusion.
- Instead, focus on the issues directly concerning local voters to further engage the public in local elections.
- Frame local election stories as a "hiring" process by inviting readers or viewers to ask which candidate would best run local government, and then provide thorough information and a forum to discuss issues with others

The Binghamton, New York, "Facing Our Future" project is an example of the symbiotic relationship between civic journalism and local government. Defense contractor cutbacks in the late 1980s resulted in a loss of over 14,000 manufacturing jobs in the upstate city of 53,000 people. In 1996, several local media outlets—the *Press & Sun-Bulletin,* the WSKG public television and radio station, and the WBNG-TV CBS affiliate—partnered with the State University of New York at Binghamton to create the civic journalism project. The aim of the project was to foster community discussion about the resulting economic crisis and promote solutions.

The project organized multiple activities to align the public with local government through political dialogue and informed action. The *Press & Sun-Bulletin* and local television stations produced multipart series about employment and economic revitalization; WSKG offered online discussion forums for elementary and high school students to better relate to their community; the newspaper published questions that young people could ask government officials; and project partners hosted a televised town meeting that rallied over 300 citizens to participate in action teams. For five months, these teams communicated through the media to brainstorm community revitalization recommendations that were ultimately presented at an open forum. This became a continuous dialogue with local businesses to create tangible economic development initiatives. The "Facing Our Future" media project was buttressed by outspoken support from the mayor. Local Binghamton media not only informed the public of political challenges facing their community but also encouraged direct involvement with the government in finding ways out of the employment drop.

State Government

News media also engage readers and viewers in broader state issues. States hold primary responsibility, for example, for public education, through relevant taxes and statewide boards of education. States often determine standards for local school boards. All of this is germane for print and broadcast media, especially when controversies about the teaching of evolution or the topic of school lunch programs arise. What occurs on the state level often defines what local school boards can accomplish, a topic most people learn about through media coverage.

Further, every state has a highway, public works, or transportation department responsible for building and maintaining freeways. Especially in congested urban areas with long commute times, transportation decisions can make compelling news coverage. When states are considering, for example, whether or not to build highways or develop new light-rail or subway systems, local news media will provide coverage. Indeed even mundane daily traffic reports have become a staple of daily news coverage. State and local news media coverage also includes activities of state police forces, crimes and trends in crime, disaster updates and response, creation and maintenance of parks, and encouraging growth of businesses and employment. How such stories are presented makes a significant difference in viewer or reader involvement. Pictures always attract attention, as do stories that feature important decision makers and their concerns, as opposed to bland descriptions of events.

However, both state and local levels of government have always suffered a lack of visibility. Research has found that there is less public awareness of state and local government than there is of the national political scene. A research study conducted at the University of Pennsylvania found that residents in and near Virginia's capital city of Richmond were significantly more knowledgeable about state politics than those living elsewhere in the state. Proximity to where decisions are made increases the likelihood that local and state-level news will be covered. Even in capital cities such as Richmond where the state capital is a relatively small market (Northern Virginia, for instance, is the far more important economic and population center of the state), local news media can and often do play a considerable role in framing issues of governance.

Electronic Media

Coverage of any story, let alone those concerning state and local government, depends on the availability of qualified reporters and, ideally, graphics or video with which to illustrate the story and attract viewers. The same is true for the relatively few local cable channel news reports. The ability

to obtain video is central to television or cable news—and many government-related stories do not readily lend themselves to visual presentation. For example—economic news, such as layoffs or budget cuts, are hard to visualize without falling into clichés. Lack of video or photos often means that a news outlet is less likely to cover a story.

A larger trend is also evident here. "Local" television news is increasingly anything but that. As programs' popularity with viewers and advertisers increases, they become longer and include more national and even international coverage rather than their one-time focus on local or state-level stories. Indeed, the once distinctly different content displayed by local station and network news programs is increasingly blurred. Every national or international story takes away time that might otherwise be devoted to detailing or following up on local stories. The trend is due in considerable part to economics—simply picking up ready-made network or syndicated national or global material is quicker and cheaper than sending out one or more reporters to dig into local stories. The weakening economy at the end of the first decade of the twenty-first century simply exacerbated this trend. Stations trimmed local news staff and other resources and turned increasingly to network and news agency services.

What the public wants—as measured by broadcast ratings and readership studies—also plays an important role in determining this changing news content. However, whether the lack of public interest leads to this declining local coverage, or if minimal coverage lowers public interest remains unresolved. What is clear is that there is a declining amount of local and especially statewide news coverage on television.

An exception is with public radio stations, many of which broadcast a mixture of national and locally produced news programs. Programming, often in the form of call-in or panel discussions, allows coverage of local interest issues. But state and local government support of public radio has been decreasing steadily. This forces stations to rely more on private donations, charitable foundations and corporations to support their costs. Some of that support is local and helps encourage local and state-level reporting. Wisconsin, for example, with an extensive state-operated public network of FM outlets (it opened in the late 1940s and has been greatly expanded in the decades since), provides regular coverage of statewide news that reaches most listeners.

Unlike public stations, commercial operations are far less likely to report news, especially at the state or local level. News gathering is costly and radio has steadily declined as a serious news medium in many markets. Most outlets rely on music and if they feature news at all, it will focus on national stories from a news agency (such as AP), all too often centering on entertainment and human interest stories rather than local or state government.

Newspapers

In the early twenty-first century, newspapers remain the main source for detailed coverage of local government and political news. Newspapers have the editorial space, the staff (though they, too, are shrinking) and the "watchdog" reputation to garner public respect and attention. There are many examples of award-winning newspaper investigative stories into local and state-level government and other news events. Furthermore, such newspaper attention often attracts follow-up television or radio attention.

Yet breaking news of crime, deaths, or disasters tend to take priority over incremental, probing stories because of their immediate concern or interest to readers, and often provide striking visuals. The probing stories take more time and money, both less available as newspaper circulations decline. As a result, investigative reporting of local government stories usually receives only a small portion of a newspaper's limited budget. Aggressive watchdog journalism is especially costly for resource-starved newspapers already inundated with the conflicting demands of daily reporting by a limited staff.

Conclusion

Coverage of state and local governments is essential to the democratic process because it fulfills the watchdog role better and fosters more direct communication between politicians and constituents than is possible with coverage of national politics. All too often, however, coverage of state and local government news is neither as good nor

as extensive as coverage of national government. When state and local government *is* covered, stories tend to focus on controversies in education, politics, public safety, or transportation that directly affect citizens' lives. Few readers or viewers get a continuous sense of what their local or state governments are actually doing. As a result, very few can name any of their local government officials. Fewer still go to the polls when only state or local candidates or issues are on the ballot. It would take a broader and deeper menu of media coverage to reverse those dismal facts.

GRAPHICS

Graphics, also referred to as infographics, are visual elements used to explain information (as in a news story) in a way that text, photos, or video alone would not be able to do. Graphics present information in a more concise, succinct way. In 2001, Edward Tufte, an authority on graphics history, estimated that between 900 billion and 2 trillion graphics were printed worldwide annually. With the launch of *USA Today* in 1981 and the development of the Internet after 1995, graphics have become a vital part of news presentation.

Graphics should be easy to understand. The best graphics do not call attention to themselves, but rather become an integral part of the story they support. Those looking at a graphic should not worry about how it was put together, but focus on the information it provides. While some interpret graphics in print media to include photographs, most media organizations make a clear distinction between the two, often having separate departments for each. Collaboration between the two is common and stories often contain both graphics and photos.

Graphics may accompany a story, or they may stand alone. Reporters and/or editors usually play a key role in developing graphics, since they provide the needed information. They also decide when a story needs a graphic. Information for the graphic is rarely repeated in a story to save space. Most media companies hire specialists not involved in the layout or editing of a story to create graphics on a regular basis. Since graphics are supposed to replace text, most present information in a visually creative way, rather than relying on extensive use of text.

Knowing the purpose of any graphic is central, as is the data on which it is based. While illustrations can be humorous, they still need to fulfill a specific informational goal.

Although most graphics are created in-house, news agencies and other syndication sources also provide news graphics.

Computer technology has provided a huge boost to the use of graphics in journalism, by making their creation easier, quicker, and less expensive. Adobe's Illustrator and Photoshop programs are examples of commercial programs that are widely used.

Common Elements in News Graphics

Most effective graphics share five basic elements:

1. The ***headline,*** or ***title,*** should provide a short, clear introduction to the graphic, calling people to read it. Too often headlines in graphics can be confusing calling for further explanation in the graphic itself.
2. The ***chatter,*** or ***briefer,*** presents additional information explaining the graphic or its reason to be. It may serve as a complement to the headline.
3. ***Art*** is the visual core of any graphic. It may include a pie chart, map, one or more photos, or a meld of photos and graphic features.
4. The ***source*** explains where the information contained in the graphic was originally acquired. This may be the name of an organization, the title of an article or book, or other sources.
5. The ***credit*** lists the artist and/or publication that created the graphic.

Types of Graphics

Graphics can be categorized into six main types: maps, tables, charts, timelines, illustrations, and breakout boxes.

1. *Maps* are the most common type of journalism graphic. They help answer questions about the location of places cited in stories; the distance between places; or the geography, typography, or other spatial relationships. Maps may focus on specific subjects, such as weather or population information.

2. *Tables* provide information usually displayed in columns and rows, with headings usually running horizontally across the top, and the categories listed vertically on the left side. Tables allow readers to compare two or more subjects, and can sometimes include much text. Tables may also include photos or drawings, to help illustrate the different categories or subjects.

3. *Charts* are, in a sense, graphic tables. There are three common types of charts: fever or line, bar, and pie charts.

A fever or line chart shows one or more continuous lines connecting several points on a grid. This helps illustrate changes in quantity or amount over time. A fever chart can contain multiple lines comparing elements over time. Stock market trends are often presented using a fever chart.

Bar charts, as the name suggests, present information by using bars to compare two or more items. All bars in a graphic extend in the same direction (either vertically or horizontally) and follow the same scale, allowing ready comparison of the measures illustrated.

Pie charts demonstrate all of a given category, as well as how different subcategories make up the whole. Each subcategory is represented by a "slice" of the pie, usually separated from others by lines and the use of different colors or markings.

4. *Timelines* illustrate how a trend of events developed over time. They nearly always include some measurement of time from moments to weeks or years. Timelines are especially useful in tracing developing events and are essentially graphic chronologies.

5. *Illustrations* or drawn pictures help add information to a story in a clearer fashion than text or photographs. Cartoonists use their illustrations to make comments by enhancing a person's physical features to playfully poke fun at—or strongly satirize—their subjects. During the 2008 presidential elections, for example, illustrations often showed Barack Obama with large ears.

6. *Breakout boxes* present information by highlighting parts of the text in an attention-grabbing way. These may include highlighted quotes, a list of questions and answers; a fact box, listing an

event's time and location; a brief biography of a person; or checklists. Page designers often create breakout boxes as they lay out a publication, with the input of editors and reporters.

Development

In modern history, many consider Williams Playfair the father of graphics. A Scottish engineer and political economist who lived most of his life in London, Playfair created three of the most common graphics still used to this day: the line graph, and the bar and pie chart formats. Another pioneer was Joseph Priestley who created the first timeline.

The first journalism graphics appeared in the early 1800s. *The Times* of London used maps to explain how a murder took place in a victim's mansion in 1806, marking the beginning of graphics in news media. In the United States, the first newspaper maps appeared in the 1860s, to clarify important battles during the Civil War. Graphics also appeared in a growing number of American magazines. In similar fashion, maps were widely used during both the First and Second World Wars, to clearly show where battles took place in areas far from the United States.

The *Chicago Tribune* was the first newspaper to create a graphics department, in 1974. With the new department, it also created the position of graphics editor to be in charge of graphics for the entire newspaper, helping to identify the importance of graphics in American newspapers.

USA Today

The best-selling newspaper in the country, *USA Today,* brought with it a revolution in the use of graphics right from its first issue in 1982. A committee was assembled in 1980 to design prototypes for the newspaper—then code-named "NN," for "Nation's Newspaper." It included Gannett CEO Al Neuharth; Ron Martin, then editor of the *News American;* future deputy managing editor of design J. Ford Huffman; and designer George Rorick, among many others. Around 30 people worked in assembling prototypes for what would become *USA Today*.

Four prototypes were presented between 1981 and 1982. When the *USA Today* was launched on September 15, 1982, it introduced several new graphic elements that American newspaper readers had not previously seen.

Perhaps the most famous was the color weather map. The idea was simple: run a wide map across the page and put weather patterns in it. Artist Ray Stanczak, editor John Bodette, and J. Ford Huffman did the first *USA Today* map in 1981. Originally, the map was presented on an inside page, in black and white. Ultimately, it was displayed in color, on the back of the first section, where it remains.

Aside from the color-coded section labels, another element soon made famous by *USA Today* was the "snapshot"—a small, easy to read graphic illustrating a current trend. Ron Martin is usually credited with creating the snapshot idea and George Edmonson was an early snapshot editor who directed a team of researchers to produce them. Originally, the paper was to have just one snapshot. At the last minute, Neuharth decided to have snapshots in each section's front page. When *USA Today* was launched, it would take four hours to create the graphic for a single snapshot, not counting the research involved. By late 2008, the newspaper had produced some 28,000 snapshots, and they remain one of the most valued bits of information for the paper's readers.

Internet Influence on Graphics

Since it became a commercial medium in 1995 the Internet has changed how graphics are used in news media. From static images and numbers on the printed page, graphics have become animated, with sound, video and interactive capabilities. Technology now allows graphic artists to easily transform a print graphic into a lively moving online graphic.

The *South Florida Sun-Sentinel* was one of the first newspapers to present graphics online. Leavett Biles, graphics director at the paper, created the first multimedia graphics department. The newspaper's approach at the time was "Nobody does [know how online graphics are supposed to work]. We're going to invent it." The department launched the first animated graphic online in late 1996. It was a Christmas project for the Science page of the online edition of the newspaper, created using the Macromedia

Director and Shockwave programs and is still available online. While many viewed the graphics, at first, it could take up to a half hour to download the necessary software to see them. Soon after, Macromedia released Flash, and many other media organizations started adding animated and/or interactive graphics to their sites. With faster connections and cheaper computers and connection costs, online graphics have rapidly become an important tool for news media.

As the technology advances, the media are expected to not only enhance their graphics in print—by using, for example, more powerful 3-D software—but also online. Some have started integrating video with their online, and new approaches are continuously being developed to present news and graphics in more interesting and attractive ways.

H

Hard Versus Soft News

While the terms *hard* and *soft* news are somewhat loaded, they represent the extreme ends of a continuum of standards in news value. Broadly speaking, most news stories can be separated into two types: the immediate and serious, and the less immediate and often less serious. Of course, there are nuances within each category, and the terms *hard* and *soft*, as well as *serious* and *less serious*, carry with them a wealth of value judgments about the legitimacy of journalistic efforts in relation to various subjects.

"Hard" news is the embodiment of the "watchdog" or observational role of journalism. Typically, hard news includes coverage of political, economic, or military significance, or social issues with political, economic, or military implications (such as crime coverage and stories about political demonstrations). Hard news stories also carry temporal imperatives—hard news indicates events that are current and time-sensitive.

"Soft" news, then, is everything else. The term *soft news* can be (and has been) applied to human interest stories, arts and entertainment, sports, celebrity gossip, society pages, and similar topics. In general, soft news stories are seen as less time-sensitive and covering topics that are not viewed as seriously or as having as great a societal impact as hard news coverage. Another way to think of soft news is as feature material. If the conventional wisdom about hard news is that its major purpose is to inform, then it follows that the major purpose of soft news must be something else—to entertain, perhaps, as well as to inform. In the words of journalism historian Frank Luther Mott, a hard news story is "interesting to human beings," while a soft news story is "interesting because it deals with the life of human beings."

The Rise of "Soft News"

With the public inundated with news from a vast array of venues and media, from newspapers to television to the Internet, consumers often turn away from news entirely. Beginning in the 1950s but sharply escalating in the late 1970s, in order to offset the loss of readers and viewers, news organizations sought to increase the amount of entertaining, human interest stories they presented—and the manner in which those stories were presented. Dramatic content, faster presentation, shorter stories, and more happy endings became commonplace in the 1980s. Especially in cable news, in which demands of the 24-hour news cycle dominates the information landscape, more sensationalistic and "softer" news items are included, not only to attract and retain viewers, but simply to fill the hours of the day.

Sensationalism is often linked with soft news, although certainly not all soft news is sensationalistic, and there is ample opportunity for hard news to be sensationalized. Media outlets do not have to simply focus on shock value, name recognition, or human interest to be sensationalistic—hard news stories can be sensationalized by focusing on emotional or dramatic elements of a story at the expense of context, background, or other information that may be more relevant to the public at large.

However, while this trend increased significantly as media venues proliferated toward the end of the twentieth century, tabloid media and their sensationalistic leanings found roots as early as 1919. Published by Joseph Patterson and Robert McCormick, *The New York Daily News* focused primarily on scandals—the sexual peccadilloes of local well-knowns, violent crime stories, and the like. Its major rival, *The New York Post,* has taken the *News*'s sensationalistic, soft news–prominent approach and amplified the shock value with garish headlines and questionable photo doctoring. Then again, the *News'* influence is not simply limited to other tabloids; many of the particular stylings of *The New York Daily News,* such as the prominence of photography in its layout and extensive gossip and entertainment sections, have been adopted by major daily newspapers across the country such as *USA Today*.

To be fair, soft news does, in fact, attract viewers who might not normally take notice of daily events. However, the rise in soft news has also had significant impact on the public's perception of the quality and importance of news coverage overall. Despite efforts to attract more consumers, overall consumption of news (through almost all venues) is down and declining compared to years past. According to a 2008 Pew poll, newspaper readership declined from 58 percent of Americans to 34 percent between 1993 and 2008; radio news listenership suffered a similar loss, from 47 percent in 1993 to just 35 percent in 2008. Additionally, local television news viewing decreased, from 77 percent in 1993 to 52 percent in 2008. The largest blow, though, has been struck to network nightly television news, which decreased from 60 percent viewership in 1993 to a paltry 29 percent in 2008. Whether it is because there are simply too many news outlets and it all becomes white noise, or because media critic Neil Postman was correct when he stated we are "amusing ourselves to death," public consumption of news as a whole is in rapid decline.

The format of presenting hard news is changing as well. Conventionally, hard news newspaper articles follow the "inverted pyramid" format of information structuring. That is, the journalist places the most important and interesting portions of the story near the beginning, with the less critical information coming at the end of the story. In this manner, a reader can be sure he or she has most of the pertinent information in just the first paragraph or two of the story. However, as soft news styling has slowly crept into nearly every corner of journalism, the traditional inverted pyramid is being replaced by more narrative forms. Compared to the newspapers from as recent as the 1980s, nearly the entire contemporary newspaper is significantly softer than before.

As hard news reporting changes, so too does the nature of a great deal of soft news. Sports coverage is the most visible of the "serious" soft news genre, with its entrenchment in both print and broadcast news sources. The advent of EPSN, *The Sporting News,* and other completely sports-related media outlets lends credibility and a hard news–type focus to the presentation of sports information. While entertainment news continues to maintain a softer approach, the legitimacy of celebrity happenings, movie openings, record deals, and the like (as featured on programs such as *Entertainment Tonight*) have markedly increased in prominence with the expansion of entertainment coverage by many newspapers and entire networks devoted to entertainment news.

Coverage of the mid-2009 death of pop music star Michael Jackson provides an example of "gang" journalism—mobs of reporters and 24/7, often breathless, continuing coverage of every possible angle of the story, repeated endlessly. Where hard news was not available, speculation often filled in—or "person-on-the-street" interviews—to provide a measure of what viewers think. The Jackson story led evening network newscasts for several days, and again at the time of his funeral, and filled countless newspaper columns and even more cable news hours, blogs, podcasts, and Twitters. The story was almost impossible to avoid and, argued some critics, crowded out other (often more important) stories.

Journalism has appreciably blurred the distinction between hard and soft news. The Pulitzer Prize has been awarded far more often in recent years not to breaking news presented in the traditional inverted pyramid format, but to the real stories of people's lives as events unfold around them. Even in the wake of national disasters and tragedies, such as Hurricane Katrina (2005) or the 2007 shooting of more than 30 people at Virginia Tech University, it is not the traditionally structured, "just the facts" approach that has been rewarded by the Pulitzer committee but the stories told through people's faces, in their own words, that have impressed and moved the award body.

For example, the Pulitzer for National Reporting was given in 1948 to the *Minneapolis Tribune* for stories on the Truman administration's plan to "impose secrecy about the ordinary affairs of federal civilian agencies in peacetime"; in 2001, *The New York Times* received the same award "for its compelling and memorable series exploring racial experiences and attitudes across contemporary America." In 1998, the *Los Angeles Times* received the Pulitzer for Breaking News Reporting for its coverage of a bank robbery that led to a police shootout; in 2005, the award was given to the *Star-Ledger* for its coverage of the New Jersey governor's announcement that he is gay and had an affair with a male lover.

Criticizing Terminology

The terms *hard news* and *soft news* are fraught with issues of vagueness and value relativity. One of the major criticisms of a distinction between the two is that, in the age of increasing media intrusion into the private lives of public figures and widespread access to media-producing technology, the line between what is public and private has blurred significantly in contemporary society. For example, a story regarding an uncovered tryst between a political figure and a prostitute would be hard news, as it may lead to the political figure's resignation and possible prosecution. If the tryst was a legal one involving, say, the politician's secretary, however, the story drifts into "soft" territory. In either case, the affair may constitute both political and social discussion.

The distinction between time-sensitive and -insensitive news is also not universal. For example, while sports are considered soft news, the reporting of breaking scores or player news often requires timeliness. A review of the weekend's latest Hollywood release is sure to appear in the arts and entertainment section of major metropolitan dailies. Conversely, not all hard news stories require immediate distribution. An analysis of a candidate's political platform, the reporting of this year's crime statistics, or an article on the development of a particular technology may not need to be reported immediately. Soft news sometimes means feature or "evergreen" material that can run on slow news days. One manner in which researchers attempt to distinguish between hard and soft news is by examining the tone and style in which stories are delivered in an effort to discern if the intent is to inform or entertain—or, as is increasingly the case, both.

Finally, different news organizations make different judgments about what constitutes serious or timely news. There is no universal standard that signifies a clear distinction between hard and soft news. For example, if a major player in the National Football League is sentenced to prison, it would seem this would be a hard news report on the outcome of a criminal investigation. However, it could also be considered soft news, as the loss of a star player impacts the team's ability to compete. This, in turn, becomes an economic issue, because the loss of the player could harm team revenue, making the story, once again, hard news. The conviction of the player has legal, social, and business ramifications, which places it somewhere between the hard and soft labels.

Conclusion

The lines between "hard" news and "soft" news are not nearly as clear as they once were. There is a rapidly growing middle ground in which even hard news has adopted a more entertaining, human-interest oriented style, and in which some soft news has taken on a more serious, information-oriented tone. As the chasm between hard and soft news shrinks, and the narrative blends in with the inverted pyramid approach to form a combined or melded category, the terms *hard* and *soft news* may slowly disappear altogether.

Havas

Havas was the world's first news agency, and after a century of operation, formed the core of the present Agence France-Presse.

Origins

Charles-Lewis Havas (1783–1858), a Frenchman of Hungarian background, began to develop an informal network of European reporters (today they would be called stringers) in 1825 to report about European financial and political events for French businesses, banks, and a few newspapers. Havas himself initially acted as translator. In 1832 he created L'Bureau Havas in Paris, with an office located not far from the main post office, the French stock exchange, and several newspaper offices. A growing staff (which briefly included Bernhard Wolff and Julius Reuter, both of whom would go on to form their own news agencies) assembled financial news from other European capitals (some transmitted by semaphore telegraphs), translated it, and distributed it by messenger or mail to client newspapers in France and elsewhere.

Havas soon took over two small competing news bureaus. With some 200 client newspapers and a subsidy from the government, in 1835 the growing operation became known as the L'Agence Havas, usually recognized as the inception of the world's first news agency. By 1840 it was sending and receiving some news reports by pigeon, enabling same-day news from London and Brussels to appear in major Paris newspapers.

By 1845, Havas operated as an effective monopoly in France and began to utilize the electric telegraph, initially with a line newly installed between Paris and Rouen. The founder retired a year later and his son Auguste-Jean took over direction of the expanding operation. In 1852, Havas took over a budding advertising agency, allowing the merged entity to provide both news and advertising to client papers and spreading the cost of operation. For many years, the advertising side of Havas helped to support the expense of news gathering.

Beginning in 1860, Havas began to report news from and to South America, and to much of Europe over the 1870s. In 1879 family control ended with sale of the growing news and advertising agency to a Paris banker.

News Cartel

As early as 1856, Havas, Reuter in Britain, and Wolff in Germany signed an exchange agreement to share financial news from their own countries. It soon expanded to more general news, and in 1859 to an agreement to create joint offices in different cities, subject at different times to the imperialist moves by the countries' respective governments.

By 1870, the three agencies established a cooperative news cartel, soon dubbed "The Ring," each agency taking responsibility for part of the world (Havas took the French colonies plus news of Spain and Portugal, Italy, and all of South America where no national agencies developed until after 1900), thus eliminating overlapping reporting and their related costs. All three made effective use of the growing web of undersea cables as well as land telegraphy and were accordingly often called "wire" services. With some changes, the cartel agreement was renewed in 1890 and again in 1914.

By World War I, Havas occupied a semi-official role in France. While the agency was a primary source of wartime news, it could issue only those stories approved by the French military command. Havas also refused to carry German military communiqués. Havas faced growing competition from new national news agencies after World War I.

A multiple address radio system was introduced in 1931 (thanks in part to government financial aid), allowing Havas news to be more efficiently (and far less expensively) distributed across both Latin America and Asia. By 1933 a dedicated short-wave transmitter near Paris carried the

service to some 2,000 newspapers worldwide, using automatic teleprinters. Such services could theoretically, of course, be used by any recipient, not just those with Havas subscriptions. But with them, Havas was able to compete for a time with American news agencies in Latin America.

Teleprinters were also used by newspapers and radio stations within France (which relied almost totally on Havas for their international news), keyed to an extensive network of dedicated telegraph lines. Within the capital city, messengers and telephone links were used to distribute news. Havas controlled the national agencies in Spain and Italy until the mid-1920s. It received government financial support through the budgets of several ministries.

Demise5

With the occupation of much of France by the German army in June 1940, however, Havas, cut off from many of its usual sources and clients, and operating from a country (and its colonies) in disarray, largely closed down. Indeed, many of its personnel became part of the French Resistance. News from Paris was controlled by Germany until 1944.

In August 1944, as Allied forces cleared Paris of the occupying German forces, the remains of Havas gave way to form the core of a new publically owned Agence France-Presse.

Health and Medicine Journalism

Health journalism provides news about issues of personal and public health. Magazines, newspapers, broadcast and cable channels, and websites frequently run news and advice about health matters directed to a lay audience. Indeed, health stories are some of the most prevalent and popular stories that run in consumer media. Such stories are also referred to as medical journalism, health reporting/writing, and medical/health news.

A Distinct Field

Health journalism is not a recent phenomenon. In fact, two prominent examples from the turn of the last century show just how enduring the fixation on health maintenance has been. Luther H. Gulick wrote for magazines (such as *Good Housekeeping*) and authored a 1907 book, *The Efficient Life*. Gulick obsessively outlined how to live a more vital, healthy life through good personal habits and mental attitude; he advised on how to battle common ailments; and he deemed prevention to be the "distinctively modern attitude toward disease." Another was Bernarr Macfadden, a crusader for wellness and health, who wrote more than 100 health books and published a magazine called *Physical Culture* (founded in 1899) that included articles about nutrition, vitamins, fitness, and natural foods (decrying the "white bread curse"), remarkably similar to contemporary prevention coverage. A focus on personal health was further entrenched by the birth of the "therapeutic society" in the 1930s, which appealed to a generally healthy, middle-class audience. Interest in health, especially from the historically therapeutic audience, has only continued to grow.

While health journalism in some cases grew under the umbrella of science writing and faces similar challenges, it is now largely considered to be its own field of news reporting. Although

information in science news is often relevant to health stories, the distinction is that science events have less direct bearing on individual action and thus are not given service-oriented treatment. For that reason, science writers have observed that consumer-focused health reporting is edging out science coverage at newspapers. Immediate impact on the daily lives of readers and viewers is what sets health journalism apart from science.

Health journalism is a primary source for consumers to learn about personal health as well as medical developments and new research. Medical personnel, who also follow health journalism, often deal with patients' questions and attitudes that are direct results of their exposure to mass-mediated health information (not to mention "ask your doctor" prescription advertising). Policymakers also rely on journalistic accounts of health to inform their decisions on laws and regulations. Because health journalism can have an impact on so many consumers, physicians, and legislators, media and medicine scholars analyze many facets of the field.

Health journalism is also a magnet for pharmaceutical and health care industry advertising dollars. The FDA's relaxing of the regulations on direct-to-consumer (DTC) advertising in the late 1990s and early 2000s led to immense growth in DTC advertising. Reader interest in health, compounded by manufacturer desire to reach those readers through aggressive marketing, brought about an increase in editorial health content.

How It Is Produced

Health journalists' primary function is to translate often technical medical information into lay language. Although some health journalists have a specialized background in medicine (as a physician or a registered nurse, for example), many health journalists have not practiced medicine. Other health journalists may have an educational background in health, having obtained a degree in public health or biology. Still, many health journalists don't have a background in science or medicine and come to the topic through other journalistic endeavors. Organizations to which people who produce health journalism belong include the Association of Health Care Journalists, the American Medical Writers Association, and the European Medical Writers Association.

Some research has investigated how health journalists do their work. Though many journalists lack specialized training in covering health news, they learn much of what they do on the job. Many health journalists consider the absence of a medical background a boon to their ability to present information in an understandable way. Rewording medical jargon, interpreting statistics, and extracting meaning from medical studies are some of the skills that constitute their work as translators.

In order to explain health information, journalists use many tools. Media often stand in as the public's only contact with people working in technical fields, and the presence of medical researchers and specialty physicians in journalistic health articles is no exception. Journalists often interview "experts" to help explain information in a clear, credible, and quotable manner. Depending on the subject, such authorities can include physicians, lead investigators for a medical study, nurses, trainers, malpractice attorneys, policymakers, psychologists, authors, nutritionists, spokespeople for pharmaceutical companies, social workers, and hospital administrators. Another approach that health journalists use to present a story is interviewing "real" people to provide more of a "human element." Such people are experts in their own right, considering they have often suffered from a certain disease, faced a problem with the health care system, or participated in a clinical trial, among other experiences. Journalists often introduce a story with what is called an anecdotal lead (or lede) to hook the audience with a personal account or question and then get to the more complicated details later in the story. Journalists often find that these narratives give readers or viewers a way to identify with the issue and possibly diminish any stigma associated with it.

Data and statistics from medical research, which help impart credibility and explain risk factors, often surface in health stories. To help audiences understand data or other complicated medical ideas, stories will also include infographics or other visually informative elements (e.g., photos, graphs, charts, tables, illustrations). Journalists also try to reword or define technical terms and often use metaphors or analogies to get across a concept that may otherwise be difficult to grasp.

Many health journalism stories include mobilizing information, another term for the "how-to"

advice that offers directions for behavior or resources for additional information. The perception is that consumers want useful, practical tips they can use to take action. At times, health stories can be so condensed that the main focus is the "take-away" information as opposed to the background information. For example, text might read: "Drink tea—Recent research shows that drinking black tea on a regular basis can lower stress hormones." This kind of advice is focused on the take-away information and includes only a nod to the fact that research supports it.

Where journalists get their story ideas and what they choose to cover is a central factor in their work. They often locate story ideas in recent medical journals, news releases from the federal government (such as the Centers for Disease Control or the National Cancer Institute), newly published books, reader or viewer feedback, announcements from non-profit advocacy organizations, press releases from universities, and other media outlets. Some story ideas stem from recurring annual events (such as Breast Cancer Awareness Month). Health promoters have also found success in utilizing media outlets to advance certain health campaigns (such as smoking cessation). Pharmaceutical companies and for-profit health care organizations also jockey for coveted editorial space and airtime through publicists who seek source-initiated news coverage. Sifting the good science from the bad is a challenge for health journalists in that they receive constant appeals for coverage from so many types of sources.

Health journalists cover topics that range from the hard-hitting, such as fraud in medicine or hospital mortality rates, to the more personal, such as deciphering nutrition labels and recommended screenings for cancer. Medical information is continually evolving as new research emerges; therefore, potential story topics are nearly infinite. These topics include, but are not limited to, research findings, health care policy, wellness/prevention, patient care, diseases, public health, infrastructure, malpractice, pharmaceuticals, diet, and exercise.

How Health Journalism Is Consumed

Health journalism is a form of health communication to the public. Although early definitions of health communication restricted it to medical settings (doctor–patient communication) or public health campaigns, the focus has broadened to include mass-mediated health journalism messages.

What readers and viewers do with the information that health journalism provides is of paramount importance. Scholarship on how the audience evaluates and uses health reporting, however, is notably lacking. The extant research has shown that health journalism likely has its main impact in alerting readers to the existence of a health problem. It is much less likely that readers will make a health behavioral change based only on information they learn about through health journalism. Readers often don't fully recall health information they consume through news media and what they do recall and attend to is filtered through how it relates to them and whether it has a high level of sensation. Before making a behavior change, readers often seek more information and consult with an interpersonal source, such as friends, family, or a medical practitioner. In a 2002 Gallup poll, nearly half the respondents said they asked their physicians about subjects stemming from information garnered from media outlets. About the same percentage said they had asked medical personnel about information they found online in the National Cancer Institute's 2005 Health Information National Trends Survey (HINTS). The idea that health journalism could be a "magic bullet" for changing people's health behaviors is largely a myth, though it plays a cognitive role in supporting the decision-making process. The availability of substantial amounts of health information is not proof that readers or viewers actually act on it.

As in other fields, there has been a surge in web use for learning about health. The widespread use of the Internet has prompted new paradigms in health communication and information seeking. Most web health sources are not affiliated with journalistic outlets. This is a logical extension of the fact that many people who search online are motivated by a particular query, while those who read or see health journalism are often not seeking health information. People's individual health needs are too specific and time-dependent to coincide perfectly with a health journalism piece, which is one reason why most stories appeal to a general audience seeking prevention or wellness information.

Considering how health journalism is disseminated, electronic media excel at covering event-driven health news, while print may be better for

interpretations or more in-depth health information. That said, research has found that magazines tend to avoid controversial health information, both because of publishing lag time (research could change before publication) and because it prevents them from providing the bottom line on behavior due to a lack of consensus on the research (for example, recommendations about mammogram screenings have been controversial). A 2002 Gallup poll attempted to determine where Americans adults get their medical and health information. While most respondents said that television was their most frequent media source for health information, television and the Internet were then seen as less trustworthy than magazines and newspapers. The 2005 HINTS data show that trust in Internet health sources fell from 2003.

Challenges

There are several critics of health journalism who offer valuable comment about both process and product. Physicians and scientists have criticized journalists for misleading the public with incomplete, incorrect, oversimplified, or premature medical coverage. Some researchers believe that poor health reporting constitutes a public health threat. Many of the problems that are commonly cited, such as simplification, polarities of opinion, sensationalism, and lack of time, space, and scientific knowledge, exist because health stories appear in media that must abide by traditional news values, such as the rituals of objectivity. One reason why people heavily criticize health journalism is because the stakes are assumed to be higher with such reporting than with most other subjects. Inaccurate medical reporting can cause panic, cultivate false hopes, or profoundly affect an individual's health decisions.

Several studies have examined the quality of health journalism. Content analyses of accuracy, scientific evidence, and representations of risk have found health journalism to be lacking on each measure. The crux of the critique from those who seek to accurately present scientific findings is that health journalism is oversimplified. Original medical research is so attenuated by the time it reaches readers or viewers as to be often erroneous or misleading. Any caveats or expressions of uncertainty are downplayed or removed. Furthermore, because evidence of medical research rarely appears in full, consumers cannot weigh the quality of the information. This, however, presumes a reader or viewer who has a high level of health literacy, which might not be representative of much of the general public. A concept of health literacy, or a person's ability to obtain, understand, and act on health information, is percolating among health journalists whose ideas of the consumer are factored into nearly every level of reporting. Using the lens of a moderately health-literate reader, a health journalist would likely deliberately simplify health information to make it comprehensible.

Scholars have also argued that most commercial media outlets cannot adequately respond to public health problems for two reasons. For one, informing people about health problems is not the panacea that many idealize it to be; information alone cannot change issues of access and informing the public does not ensure attitude or behavior change. Also many health problems cannot be solved by individual action because they are related to socioeconomic status and environmental factors.

Essentially, there is a gulf between the democratic function of making medical information understandable and the scientific function of advancing knowledge. This gulf for some is surmountable, as researchers have shown much health journalism to provide accurate and reliable health information. Thus for many, journalism outlets are valuable vehicles for health communication.

Several attempts to address these critiques have been made. From summits on health journalism (such as the Mayo Clinic's National Conference on Medicine and the Media in 2002) to journalism courses on science and health writing, to ongoing workshops for professionals, to published field guides, there are numerous endeavors underway for improving health journalism.

Conclusion

Critiques help make clear why studying the production and consumption of health journalism is important to understanding the communication of complex issues. Sometimes derisively referred to as "soft news," it is clear health journalism should not be so easily dismissed. Another reason why health journalism is important is that some audience members do act on the behavioral advice they encounter. This possibility is part of what drives health journalists

to provide accurate information, and it also intensifies the significance of their work.

Health journalism, along with information received from family, friends, physicians, and other mediated sources, helps shape an individual's perceptions about what is normal and what is healthy. It also helps to cultivate social constructions of good and bad health behavior that can have immeasurable impact.

History of Journalism: Before 1861

During the 400 years between the introduction of Johann Gutenberg's moveable type printing press around 1455 and the beginning of the American Civil War in 1861, news reporting experienced significant philosophical, legal, and technical changes that set the stage for the practice of modern journalism. Although written and printed communication did not originate in Western Europe, most American journalism scholars begin their discussion of journalism history with Gutenberg because of the United States' origin as a British colony. Gutenberg's press was brought to England in 1476 by Englishman William Caxton, who proceeded to publish the first book printed in English, a history of Troy. Caxton's other printed English works helped unify England under a common language. As a British colony, Americans were subject to English law, which included the licensing of publishers and charges of seditious libel whenever someone criticized the crown or royally appointed officials. These legal restraints on freedom of the press and speech paved the way for the establishment of the First Amendment in 1791, the lively political debates that ensued during the party press of the 1820s, the sensational news stories of the penny press beginning in the 1830s, and the barely cloaked sectional hostility of the antebellum press leading to the Civil War.

Western European Heritage, 1455–1630

The process of moving from very ornate, hand-lettered and illustrated books to newsletters and then moveable type printing presses in fifteenth-century Europe slowly revolutionized life by making printed information available to more readers. Eventual results of the introduction of moveable type printing included growing education and thus a rise in literacy rates, the scientific revolution, and the Protestant Reformation and Renaissance. Before the printing press, information was primarily exchanged orally or in the written form of personal letters, and only the very wealthy or the clergy had access to (or could read) the elaborately handcrafted illustrated books. In 1568, the Fugger German banking family hired correspondents to gather and report political and economic news from across the continent in the form of handwritten newsletters. These "Fugger newsletters" became the leading news source across Europe through the late 1500s. Early forms of the modern newspaper appeared in Holland in the 1620s and were known as Corantos,

which translates as "currents of news." These were published irregularly in different cities and featured very little of timely news value.

British Journalism, 1509–1702

King Henry VIII in the early 1500s instituted a system of licensing printers that lasted until 1695. To publish legally in England, one had to have a license from the crown, and only those who published information favorable to the crown were granted licenses, making licensing an early form of censorship. Henry VIII used the Court of the Star Chamber to prosecute those who published without a license or published information deemed inappropriate. Taken together, licensing and the Star Chamber formed the basis of governmental prior restraint (control prior to publication), the first press philosophy practiced in England.

Mary I and Elizabeth I continued their father's practice. During her 45-year reign, Elizabeth controlled the press via the Stationer's Company, which had originated in the 1400s as a guild for printers, booksellers, and publishers. Under Elizabeth's control, Stationer's Company members had the power to search and seize all unauthorized publications, and the Star Chamber court enforced laws against such publications. Penalties were severe and could include torture, maiming, imprisonment, or execution.

Throughout the 1600s, the monarchy and Parliament struggled for control of the government, and typically some form of press control as well. In 1641 the Court of the Star Chamber was abolished by the Puritan-controlled Parliament, and three years later poet John Milton issued his call for the end of licensing through his seminal essay, *Areopagitica,* a call that failed. The first English semi-weekly newspaper (printed on both sides of one sheet) appeared in 1665 in Oxford, when printer Henry Muddiman founded the *Oxford* (later the London) *Gazette.* It was little more than a propaganda sheet for the government, as it was the only newspaper allowed to publish while the Licensing Act was in place. Illegal publications existed in pamphlets, broadsides, and books, but publishers of such materials lived in fear of search and seizure by members of the Stationer's Company. Licensing of printing and publishing finally ended in 1695.

Publication of the first English daily newspaper in the modern sense is credited to Elizabeth Mallett, who in 1702 began the *Daily Courant.* Samuel Buckley took over the paper two weeks after Mallett started it, and the paper lasted 33 years. It is historically important in that it established several practices still used by journalists today: the use of a dateline to indicate the location of a news story, and the separation of opinion from advertising, among other things.

American Colonial Press to 1765

The first printing press arrived in colonial America in 1638 and was installed at Harvard College, founded in Cambridge, Massachusetts, just two years earlier. Licensing was still practiced at this time, however, and the first colonial newspaper, *Publick Occurrences, Both Foreign and Domestick,* immediately fell victim to the law. Printer Benjamin Harris published his first issue in Boston on September 25, 1690, but it was immediately banned because it was published without permission of the royal governor and contained two stories critical of the governor. The first continuous newspaper published in the colonies was Boston postmaster John Campbell's *Boston News-Letter,* which appeared April 24, 1704, and because it was published with authority, or government approval (as prominently stated on the masthead), it lasted 72 years. It emphasized foreign news and regularly contained stories copied from other newspapers, but it too functioned primarily as a government mouthpiece. Typical of most newspapers published from this period through the penny press era, content was text-driven—woodcut illustrations were used sparingly and photography had yet to be invented.

Of the other newspapers to publish in colonial America, none was more challenging of English rule than James Franklin's *New-England Courant,* first published in 1721. It covered foreign and domestic news, but added editorials, and in June 1772 Franklin criticized the government for not doing more to stop pirates in the area from preying on commercial ships. He was jailed for three weeks but quickly returned to his criticisms of the government upon his release. This time, government officials ordered him to cease publication, so he arranged for his younger brother, Benjamin, to be listed as publisher of the *Courant* while James

continued secretly to run it. Benjamin Franklin soon moved to Pennsylvania, where he started his own paper, the *Pennsylvania Gazette*. James's paper folded three years after Benjamin's departure, having made its mark in colonial newspaper history as a controversial paper that drew readers to its focus on local issues.

The most important newspaper in colonial America appeared November 5, 1733. German immigrant John Peter Zenger was hired by a group of wealthy New Yorkers to establish the colonies' first paper started for overtly political reasons, the *New-York Weekly Journal*. It gave voice to the many citizens who were unhappy with the rule of New York's royal governor. Lawyer James Alexander wrote most of the paper's articles using pen names, but as Zenger was listed as publisher, he was imprisoned by the New York authorities on the charge of seditious libel (criticism of the government). Zenger's case was brought to trial, and under British common law, the more accurate the criticisms of the government were, the graver the libel. But Alexander hired famous Philadelphia attorney Andrew Hamilton to defend Zenger, and Hamilton argued that truth should be a defense against libel. A runaway jury broke with the law of the time and acquitted Zenger, and though his case did not legally make truth a defense for libel, it did send a message to royal governors that the charge of seditious libel could no longer control criticism of government.

Revolutionary Press, 1765–1783

Perhaps the most important role journalism played during the Revolutionary era was one of consolidation. Newspapers and many pamphlets urged independence from or loyalty to England, depending on the publisher's political beliefs. One catalyst for independence lay in the Stamp Act of 1765, where Parliament required colonial newspaper publishers to print only on stamped paper (a kind of tax) and to pay a further tax on each advertisement printed. These taxes meant many editors would make little if any profit. Many newspapers stopped publishing as a result, but vigorously protested the Act, as did lawyers who were equally affected by the law's requirement to print legal documents on stamped paper. Protests were so successful that Parliament repealed the Act the following year. Encouraged by the success of their protests, and angry over England's acts of "taxation without representation," some colonists began to clamor for independent rule. Three of the most prolific writers in support of independence were Samuel Dickinson, whose 12 "Letters from a Farmer in Pennsylvania" earned him the nickname of the penman of the revolution; Samuel Adams, a prolific writer who used at least 25 different pen names when signing his essays on independence to keep British authorities guessing as to his identity; and Thomas Paine, whose 1776 pamphlet "Common Sense" became one of the most widely read essays on the need for independence.

Once the Revolution began in 1775, newspaper editors took sides, becoming either Patriots, who supported independence, or Loyalists. Neutrality was not an option. Radical patriot groups regularly practiced mob censorship, or the destroying of printing presses and offices of any newspaper editor who took the British side. One such editor was James Rivington, who in 1773 began publishing the *New York Gazetteer*. At first he published both Patriot and Loyalist pieces, but because he dared print Loyalist views, critics hanged him in effigy and damaged his print shop. After that his paper became a staunch supporter of the Loyalist cause, even going so far as to print a letter critical of George Washington. The most prominent Patriot editor of the Revolutionary period was Isaiah Thomas, who on November 14, 1771, began publishing his incendiary *Massachusetts Spy*. He revived the "Join or Die" woodcut editorial cartoon first fashioned by Benjamin Franklin during the French and Indian War in the 1760s and used it as a symbol of the need for colonists to unite in their fight for independence. After the revolution, Thomas became a successful printer and author of the first history of printing in the colonies.

Party Press, 1783–1833

Given the system of licensing they had long suffered, Americans were more than ready to guarantee their freedom of expression with the First Amendment in 1791. The newly independent American press was partisan in its presentation of news, and played an important role in influencing the decision to adopt a strong central government in the Constitution as opposed to strong states' rights and a weak central government as advocated

by Thomas Jefferson's Republican Party. Stirring debates on the merits of the proposed Constitution were widely printed in American newspapers, as were essays against a strong central government. Historians recognize that the most influential essays supporting adoption of the Constitution were the series of "Federalist Papers," written by Alexander Hamilton (leader of the Federalist party), James Madison, and John Jay, under the common pseudonym of "Publius." These 85 essays, which appeared in the *New York Independent Journal* from October 1787 to April 1788, and were widely reprinted elsewhere, explained the political philosophy behind the Constitution and are considered among the most important contributions to American government ever published.

But the debate surrounding the adoption of the Constitution and the formation of the new government was complex. The leaders of both the Republican and Federalist groups recognized that they needed dedicated political organs to express the party line, and thus each began its own newspaper. The first was the Federalists' *Gazette of the United States,* originally published by John Fenno in 1789. The Republican's leading political machine was *The National Gazette,* which debuted in 1791, edited by Frenchman Philip Freneau. Other newspapers supported specific party allegiances during the crucial Constitutional debates, but Fenno and Freneau were the first editors tapped to lead official party organs.

In addition to the partisan debate, another type of discourse was common in newspapers during this period: the abusive personal attack. Two editors stand as examples of the personal attacks practiced: Federalist William Cobbett of *Porcupine's Gazette and Daily Advertiser,* and Republican Benjamin Franklin Bache, who was Ben Franklin's grandson and published the *General Advertiser* or the *Aurora*. The two battled over whether the country needed the Constitution, whether George Washington was a good leader, and whether the United States should support France during its own revolution. They attacked each other, trading insults about personal attributes such as appearance and honor, which eventually led to a street fight.

The second party era began in 1816 following the demise of the Federalist Party. Membership of the remaining Republican Party began splitting into factions. By 1828 there were two recognizable parties, the Jacksonian Democrats, which appealed to the masses, and the Whigs, which were typically former members of the Federalist Party and hard-line Republicans. Just as in the first party system, members of each group established official party newspapers to express the party line. For the Whigs, that paper was the *Evening Journal,* begun in 1830 by editor Thurlow Weed. The Jacksonian Democrats' official party paper was the *Argus of Western America,* published by Amos Kendall from 1824 to 1829. While each party utilized other newspapers, these two are recognized as the first political organs patronized by party leaders to build support among their few readers.

Editors of the Party Press era also witnessed the first major technological development in printing since the Gutenberg press: the rotary press, also known as the Hoe cylinder press. In the early 1820s Richard Hoe devised a machine that used a curved cylinder rather than a flat bed to print on continuous roles of paper, a process that significantly increased the number of pages one could print per hour.

Penny Press, 1833–1861

Starting in the 1830s, newspapers were sold on the streets for a penny a copy, which made their purchase possible for more Americans. With their sensational stories written in everyday language and printed in great numbers, circulation figures grew from hundreds into thousands of copies. The first successful penny paper was the *New York Sun,* published by Benjamin Day starting September 3, 1833. Day's paper was far cheaper than the existing business and political papers that sold for six cents a copy, and with its new emphasis on local, police, sports, and society news (and occasional made up stories designed to spike circulation), Day's paper quickly became the best-selling newspaper of the time.

Day's success was followed by James Gordon Bennett's *New York Herald,* which debuted May 6, 1835. The *Herald*'s straightforward language shocked and titillated many readers, as did its detailed coverage of crime and the courts. Bennett instigated many of modern journalism's topics and techniques, including coverage of Wall Street and religion, personals columns, and his emphasis on getting timely information published. Bennett also

made extensive use of domestic and foreign news correspondents, and pioneered coverage of sports and society. He hired Jane Cunningham Croly, who published under the pen name of Jenny June, to write about fashion, social gatherings, and beauty. Unfortunately, a number of readers did not care for Bennett's use of frank language and sensational news topics, and in 1840 a "Moral War" against his publication began. Other New York editors attacked Bennett's *Herald* and urged their readers to withdraw business from the paper. While the "War" did cause the *Herald* to lose some of its circulation, and Bennett to reign in some of his worst excesses, his publication remained the second most successful paper of the period.

The third important editor of this period was Horace Greeley, who on April 10, 1841, began publishing the *New York Tribune*. At this time there were already a dozen daily newspapers publishing in New York City, and Greeley decided there was room for a cheap, politically oriented paper. He hired Charles Dana as his city editor and Margaret Fuller to work as America's first female news correspondent. Greeley published a little of everything, including poetry, book reviews, and lectures, but he refused to cover police courts, murder trials, or the theater, which earned his newspaper the nickname the "Great Moral Organ." Also contributing to that nickname was Greeley's heavy use of the editorial to support his personal political positions. He was a strong supporter of prohibition, socialism, abolition, labor unions, and westward expansion and an equally ardent opponent of capital punishment.

In 1851, Henry Raymond, who had worked for Greeley during the first two years of the *New York Tribune*'s existence, decided the readers of New York needed a middle-of-the-road paper that provided fair and accurate reporting of foreign and domestic news (unlike Bennett and Day's papers) without overpowering readers with opinion (like Greeley's paper). His approach worked, and by 1860 *The New York Times*' circulation made it the fourth largest of the penny press era.

One other important development of this period was the illustrated weekly, a tabloid-sized newspaper that made liberal use of illustrations and sparing use of text. *Frank Leslie's Illustrated Weekly* (debuting December 15, 1855) and *Harper's Weekly* (January 3, 1857) are two of the more famous of these papers that used extensive woodcut illustrations based on drawings and, during the American Civil War, photographs, to tell "pictoral" stories.

Antebellum Press, 1820–1861

Cries for the end of slavery began appearing in American newspapers as early as 1817 and were especially pronounced in those of Benjamin Lundy and William Lloyd Garrison, two editors who advocated tirelessly for abolition. Lundy began publishing the *Genius of Universal Emancipation* in 1821, now recognized as one of the most influential early abolitionist papers. He traveled most northern states, carrying his newspaper equipment on his back, lecturing about the evils of slavery, and producing an issue of his newspaper whenever local printers would share their facilities. He would then mail the completed issue to subscribers. Eventually, he found that he needed a home office for regular publication and hired William Lloyd Garrison to be his editor. Although both were ardent supporters of abolition, they differed in their opinions on how to achieve this goal and eventually parted ways.

Garrison started his own abolition paper, the *Liberator,* which first appeared January 31, 1831, in Boston. He was a radical, supporting immediate emancipation for all slaves and their enfranchisement, positions which earned him numerous enemies. In 1835, a Boston mob attacked Garrison and he was jailed for his own protection, but despite threats to his paper and his life, Garrison continued to print the *Liberator* for 35 years, making it one of the most influential newspapers of its time.

The earliest black newspapers also sought to bring about the end of slavery. Two of the most influential black editors were Samuel Cornish and John Russwurm, who together in 1827 began publishing *Freedom's Journal.* Cornish was a Presbyterian minister and Russwurm was one of the first blacks to earn a college degree in America. Together the two committed to publishing a newspaper that would give blacks a voice in the debate over slavery. Unfortunately, like Lundy and Garrison, Cornish and Russwurm disagreed over how to bring about the end of slave holding and in 1829 parted ways. Cornish renamed the paper *Rights of All* and continued to publish it until 1830 when financial troubles caused its closure.

Perhaps the most influential black editor was Frederick Douglass, a runaway slave who started his work as a journalist with Garrison and later published his own newspaper. Douglass escaped slavery in 1838, traveling to relative safety in Massachusetts where he began to lecture about his experiences as a slave and to publish accounts of his experiences in Garrison's *Liberator*. In 1845, afraid his fame would lead to his recapture and return to slavery, Douglass fled to Great Britain where he spent two years traveling and speaking until supporters raised enough money to buy his freedom. Upon his return to the United States as a free black, Douglass began publishing the *North Star* on November 1, 1847. Four years later he merged his paper with another under the new title of *Frederick Douglass' Paper,* which continued publication until 1860 and the eve of the Civil War.

As dedicated as these and other abolitionist editors were to their cause of ending slavery, so were southern newspaper editors dedicated to the cause of maintaining the southern way of life, including slavery. One of the most influential southern editors was "Fire-Eater" Robert Barnwell Rhett, who owned the *Charleston Mercury* and forcefully advocated slavery and secession in his news pages. James DeBow, founder of *DeBow's Review,* and Ethelbert Barksdale, editor of the *Weekly Mississippian* in Jackson, vigorously defended slavery on moral grounds. Other influential southern newspapers of the time included the New Orleans *Picayune,* the *Nashville Republican Banner,* and the *Louisville Journal.*

The American Civil War was also known as the first visual war, meaning that images of soldiers, camp life, battles, and their aftermath were made available to the average citizen for the first time through the use of printed illustrations based on sketches of war scenes and engravings of photographs. Photography was in its infancy at this time, and the newspaper industry had not yet developed the technology necessary to reproduce photographs. One new technology that newspapers made extensive use of before and during the Civil War was the telegraph, which was patented by Samuel F. B. Morse in 1844 and used electricity to send signals over wires. Using the telegraph, reporters covering far-off battles could send stories back to their editors in mere minutes, as opposed to the days or even weeks it had taken to get news back to their editors in the past, a development that made news timelier for readers.

Conclusion

In the year before the start of the American Civil War, the newspaper industry was thriving. There were 3,725 newspapers being published, a 60 percent increase from just 20 years earlier. Of those, 387 were daily publications. Overall, daily and weekly newspapers combined had a total annual circulation of more than 885 million among a population of 31.4 million Americans, which translated into 28.2 annual newspaper copies per capita.

By the start of the Civil War in April 1861, American journalism had instituted a number of practices still associated with modern journalism: the use of domestic and foreign news correspondents; an emphasis on timeliness as an important news value (greatly aided by the appearance of the electric telegraph in the 1840s); coverage of business, sports, and society news; detailed coverage of crime, the courts, and religion; and a wider variety of advertising messages to support continued publication. By 1861, newspaper publishing was widespread and hotly competitive (major cities had numerous dailies), serving a growing readership. The Associated Press was pioneering the syndication of national and regional news for local papers. Newspapers were on the front line of growing North–South tensions over states, rights. They also backed the expansion of railways and other technology, encouraged business, and supported expanding education and other social change. But the most important contribution by the early American press to the modern practice of the journalism is our legal expectation of freedom of the press and speech, as guaranteed in the First Amendment.

History of Journalism: 1861–1930

Between the Civil War and those years marking the height of the Great Depression, every aspect of American life, including its news media, were transformed by dramatic change. From a nation loosely tied by slow travel, magazines, and newspapers, the country by the 1920s had developed telephones, globe-circling news agencies, radio broadcasting, and rapid urban transit as well as long-distance rail lines.

A Changing Country

Between the Civil War and the turn of the century, every aspect of American life, including its media, was transformed. Continuing trends of urbanization and industrialization were at the center of this transformation. In 1850, the country was largely rural, no cities had achieved a population of a million, and only two, New York and Philadelphia, had more than half a million. As a result of the Civil War (1861–65) and postwar industrialization, however, populations began to cluster in a growing number of cities. Starting in the 1890s, an immigrant wave pushed the nation's population to 76 million by 1900. Many of these newcomers lived in the teeming cities.

Modern America rose directly from the foundations laid by such moguls as Andrew Carnegie, an immigrant from Scotland who at the age of 13 was earning $4.80 a month as a bobbin boy in a Pittsburgh textile mill. By 1901 his steel empire assured him of a guaranteed retirement income of a million dollars a month for life. Oil baron John D. Rockefeller organized a second industry, the oil business. In the middle of the Civil War, he formed a partnership that would produce 3,000 barrels of oil a day, a tenth of the industry's output. Within a decade, his Standard Oil Company controlled nine-tenths of the nation's oil-refining capacity.

However, many Americans lived in urban squalor. Most obvious among the oppressed were immigrants, southern freedmen and blacks in the North, women and child workers, and mine and factory workers. Many families were able to survive only because their children could earn money in sweat shops, businesses with inferior wages and working conditions. Child labor and similar iniquities slowly disappeared from the American scene in the twentieth century, though only after organized labor became strong enough to push political and social reforms.

Political corruption was notorious in Washington and much of the country in the post–Civil War era, and particularly flourished during the administration of Ulysses S. Grant (1869–77). City political machines became instruments to bilk the public coffers and line the pockets of those in charge. None was more notorious than William M. Tweed, whose Tammany Hall controlled New York City during and after the Civil War. Indeed, his power soon extended to the state legislature and the governor.

A new crop of writers, the muckrakers, would expose these injustices, writing primarily in the nation's first national medium, magazines. Meanwhile, newspapers reflected the urban trends of American life and the problems—especially government inefficiency and crime—of urban America. Increases in literate populations allowed urban newspapers to flourish. By the end of the century about 1,600 newspapers were published in the afternoon and nearly 600 in the morning. Joseph Pulitzer, one of the many immigrants who helped to build the new America of the post–Civil War period, and his rival, William Randolph Hearst, would capitalize on problems of the period as circulation builders, culminating in the creation of a "new journalism."

At the turn of the century, America became the "can-do" nation. The dream that riches would reward hard work flowered in the United States and abroad as evidenced by the rising number of immigrants, nearly 9 million, who arrived in the first ten years of the twentieth century. With the era's wealth came leisure time, a new aspect of life that would have profound impact on consumption of media.

Love of gimmickry matched by inventive genius produced a welter of labor-saving devices and novelties, including the personal camera, motion-picture projector, and after 1920, radio broadcasting. By 1900 some 1.25 million telephones buzzed with business and social talk; 20 million incandescent lamps glowed; skyscraper buildings and their elevators rose to increasingly giddy heights.

Civil War Journalism

On the eve of the Civil War in April 1861, about 2,500 newspapers (only a minority of them dailies) were operating. Of these, nearly 300 dailies were in the North and 80 in the South. New York City alone had 17 dailies. The typical paper contained four or eight pages and offered few illustrations. Circulations were small, rarely exceeding a few thousand copies in most communities. Wartime reporting introduced the development of the "special correspondent" and widespread journalistic use of the telegraph to speed news transmission. These special correspondents could be sent anywhere at any time by their editors to gather and report war news in a timely and readable—but not necessarily accurate—fashion. The speed of their reporting was greatly aided by extensive railway networks, especially in the North.

Essential to effective wartime journalism was the electric telegraph. Some 50,000 miles of telegraph line, belonging to a half dozen companies, crisscrossed the country between the eastern border of Kansas and the Atlantic Coast by 1860. While it allowed rapid transmission of news, the telegraph was expensive. For example, a 2,000-word story transmitted from Washington, D.C., to New York cost about $100 (easily 20 times that in monetary values of 2009). That same story transmitted from New Orleans might cost $450, a hefty sum when one considers that a reporter likely earned less than $10 a week.

Some 350 correspondents accompanied the Northern armies to cover one bloody battle after another. These newspapermen were rough, rowdy, courageous, and hotly competitive. Correspondents were equipped with their standard tools—a revolver, field glasses, notebooks, blanket, a sack for provisions, and a good horse. They included some not-so-famous poets, preachers, school teachers, lawyers, and eventually famous celebrities such as Henry M. Stanley, a young Bavarian immigrant who after the war would be assigned by the *New York Herald* to search for missionary David Livingston in Africa. *The New York Times* publisher Henry Raymond assigned himself to cover the war, and his speed and accuracy in reporting stories became legendary.

In the South, about 10 percent of newspapers were dailies. The typical four-page papers, which varied from four to eight columns in width, were rarely profitable. As with the northern press, many of the papers were highly partisan, surviving solely because of party subsidies. The Southern press witnessed a shortage of ink and paper. Of the 555 paper factories in the United States reported by the census of 1860, only 24 were in the South. Meanwhile, blockades prevented paper shipments from the North. The result was that many of the weeklies reduced the size of their newspapers.

The Civil War had a tremendous impact on the nation's press. First, newspapers became big business. This was precipitated by improved methods of printing, with the introduction of stereotyping making it possible for the first time to create a printing plate the size of an entire page, curved to fit the cylinder, which sped production. Before stereotyping, pages were made up of individual lines of lead type strapped in a wooden box and printed one page at a time. Second, Sunday editions were inaugurated and with the practice of issuing afternoon "extras" (which many critics said were issued to contradict the lies that newspapers told in the morning). Third, news agencies, especially the Associated Press, developed. They provided war and other news, saving newspapers from having to pay for their own war correspondents. Fourth, the newspaper syndicate developed, distributing preprinted news and feature material on a subscription basis to smaller newspapers. Finally, the high cost of telegraphic news reports forced a more concise reporting style—the "inverted pyramid,"

in which the most important information was placed first.

Postwar "New" Journalism

The technological, social, political, and economic changes resulting from the Civil War brought about a different society and different media. Publishers and editors now saw their newspapers as public defenders, as watchdogs over government and business. They became more impartial in their coverage of news stories and more interested in investigative reporting, rooting out corruption in city politics and industry. Joseph Pulitzer exemplified this new journalism. In 1883, Pulitzer acquired the New York *World* and soon instituted dramatic changes, including a new concept of news that included widespread use of illustrations, sensational treatment, and news reporting as a social crusade.

His chief contribution to the business was the invention of the formula that rival publisher William Randolph Hearst later took up and made famous in his *New York Journal*—sex on the front page but an editorial page that demanded morality from politicians and businessmen. This approach took the form of an exaggerated sensationalism in news stories along with a steady self-advertisement of the newspaper and its latest deeds. Soon dubbed "yellow" journalism (so named over a cartoon character), techniques included use of provocative illustrations, larger and darker headlines, and incessant promotions of exclusive features. *The World*'s news columns also were peppered with illustrations, which were by the 1890s enhanced by color printing and the use of half-tone photographs. The cartoon would become a daily fixture in larger newspapers by 1890.

Pulitzer also created news—or stunts, as some critics called them. These were often entertaining, sometimes educational, and always attracted readers. His most ambitious was sending reporter Elizabeth Cochran ("Nellie Bly")—who in an earlier undercover exposé had exposed the horrors of an asylum at Blackwell's Island—on a world voyage in an effort to beat the record of Phileas Fogg, the hero of Jules Verne's popular novel, *Around the World in Eighty Days*.

Nellie Bly's 1890 reception in Jersey City upon completion of her 72-day, six-hour journey around the world, which she documented for Pulitzer's The World.

Source: Library of Congress.

Though he didn't invent the journalistic crusade, Pulitzer stimulated circulation by constant stunts designed to involve readers in social change. His most famous crusade was to collect funds to build a pedestal for the new Statute of Liberty after Congress refused to appropriate funds and a citizens' committee failed in the same task.

Hearst wanted to share the New York newspaper stage with Pulitzer. After he made the *San Francisco Examiner* one of the most profitable newspapers on the West Coast, the ambitious Hearst in 1895 moved to New York and initiated a hot circulation war with Pulitzer. The Hearst formula was simple. He adopted Pulitzer's ideas wholesale, having admired them from the beginning, and then carried them a step further in both extravagance and boldness. He could do this successfully because of his virtually unlimited resources and because he had a better sense of the mass mind than did Pulitzer. The collision of Pulitzer and Hearst brought about one of the most fascinating, if unseemly, periods in American journalism.

The crucial test of the new mass-circulation newspaper power came when the Pulitzer/Hearst struggle coincided with the tensions between the United States and Spain that in 1898 led to war. Hearst's coverage of the war exhibited his usual audacious style. He chartered a tramp steamer, installed a printing press and a small composing room big enough to lay out an edition of the *Journal,* and set sail for Cuba along with a crew of reporters and photographers.

In an era of widespread illiteracy, political cartoons grew to importance. New York City–based Thomas Nast was one of the first and most important figures, helping to pillory and finally drive from office the Tammany Hall machine of William Marcy Tweed, which had bilked the city for years. As Tweed himself acknowledged, "them damn pictures"—which caricatured his large nose, unkempt beard, and giant frame—were what did him in, far more than pages of angry newspaper stories. Nast went on to create the Republican elephant and Democratic donkey symbols still in use 125 years later.

Magazines and Muckraking

The Pulitzer-Hearst brand of journalism evolved by the early 1900s into a related and more useful but distinct form of reporting called muckraking. "Muckrakers"—nicknamed by President Theodore Roosevelt for their crusading style of journalism—were writers active during America's progressive era, the first decade of the twentieth century. Their investigations into corrupt businesses and governments shocked readers, who demanded reform in politics and industry. Their usual targets were leaders in business and finance—often tagged as "robber barons"—who controlled the nation's wealth and bought and influenced state legislatures and some U.S. senators as well.

Muckrakers sought to clean house by naming names, pointing to sore spots in business and politics. They investigated and wrote extensively about crooked politicians; criminal police; exploitation of children in mills, mines, factories, and sweatshops; malefactions of capitalists, such as John D. Rockefeller; food adulteration; fraudulent claims for patents; prostitution across state lines; and other unscrupulous business practices.

What distinguished the Progressive-era muckrakers was their reach; they commanded attention nationwide, thanks to the growing role of the first national medium—weekly and monthly popular magazines. The emergence of the ten-cent periodical as a powerful social force began with the founding of *McClure's* in June 1893. A flood of cheap periodicals followed, until publisher Frank Munsey estimated in 1903 that they comprised about 85 percent of the total circulation of magazines in America. Besides his own (*Munsey's,* naturally), Munsey guessed correctly that the biggest moneymakers were *Argosy, Cosmopolitan,* and *McClure's.*

The basis of the ten-cent magazine's popular appeal was its liveliness and variety, its many well-printed illustrations, and its coverage of world events. These magazines were quite a contrast from the traditional literary or political magazines that were genteel and sedate enterprises selling at 35 cents a copy. Publishers of such magazines as *Atlantic, Harper's,* the *Century,* and *Scribner's* were literary men who believed that magazines were really books in periodical form. While their circulations were far smaller than the popular muckraking titles, they reached the political and business opinion leaders of their time.

Film and Radio

This buoyant era of technology produced a welter of media innovations, including the camera,

In a cartoon by Thomas Nast, William "Boss" Tweed ("Reform Tweed") is depicted as a policeman wearing a prison uniform and threatening two boys in the July 1, 1876, issue of Harper's Weekly.

motion-picture projector, radio, and (by mid-century) television. Despite the popularity of early silent black-and-white motion pictures, they took a backseat to newspapers when it came to First Amendment protections. Moral guardians saw film as a new enemy of social mores and demanded legislation to control the medium. Ohio authorities, for example, censored a film and then won the Supreme Court's blessing in 1915. In *Mutual Film Corp. v. Industrial Commission of Ohio*, the Court

set a precedent that stood for 37 years—movies were not protected by the First Amendment. Simply, the court dismissed them as frivolous entertainment and not a vehicle for significant ideas. Only in 1951 did the court have a change of heart, ruling in the case of *Burstyn v. Wilson* that films could be a vehicle for important ideas and affording them First Amendment protection.

During the first unhappy years of the Great Depression, the public sought recognizable images of their own problems on the screen—or, at the other end of the spectrum, total musical escapism. The popularity of Warner Brothers' *Little Caesar* sent the message that the public enjoyed a hard-hitting, naturalistic form of drama that took its themes from the headlines of the day. They got it in *The Front Page, The Public Enemy,* and *The Secret Six*. Some films even brought reforms. After the appearance of *I Am a Fugitive from a Chain Gang,* based on an actual case, public clamor forced changes in the chain-gang system.

Radio would have a more profound impact on the nation, though it took some time to become apparent. Unlike other media, radio's history is a complex web of technological and scientific achievements that had to be tied together. Most of these achievements were not accomplished by scientists in corporate laboratories. Instead, individual inventors, or hobbyists, tinkering in their garages or basements, helped bring about radio's development, often ignorant of what others were doing.

Four ingredients were needed for radio's development. Samuel Morse, a painter of some renown, succeeded in developing the first ingredient in the 1840s—an electromagnetic telegraph. Practical applications of electricity (chiefly the light bulb, early recordings, and practical movies) developed by Thomas Edison in the late nineteenth century made up the second ingredient. In the late 1870s, Alexander Graham Bell developed the third ingredient—telephony—allowing transmission of the voice over copper wires. Finally, the fourth and most important ingredient was provided by Italian innovator Guglielmo Marconi, who perfected wireless telegraphy at the turn of the twentieth century.

By 1921, one-time Marconi employee David Sarnoff became general manager of the new Radio Corporation of America. He played a central role in shaping radio broadcasting as an industry. Through a series of negotiations, he founded the National Broadcasting Company (NBC, 1926) that would be responsible for national programming. He would soon be challenged by William Paley, who invested in the Columbia Broadcasting System (CBS). By 1928 he became president of the company and brought in the Paramount movie studio as a partner. The network lost more than $300,000 the year he took over, but under his shrewd management, CBS would soon overtake NBC in profits.

Sarnoff and Paley helped introduce America to radio drama, soap operas, situation comedies, talk shows, and variety and specialty shows. Many colleges experimented with educational programs. Political broadcasts had been a staple of radio since KDKA broadcast results of the 1920 Harding-Cox presidential election. Hans von Kaltenborn was the first to offer weekly radio commentaries, in 1923, at WEAF, the station that a year earlier had introduced the principle of radio advertising as a revenue source. In 1930 Lowell Thomas introduced his first daily 15-minute newscast on NBC.

President Franklin D. Roosevelt initiated the effective use of radio as a political instrument and probably best understood its potential and power, even though others had used it before him. During the Depression, Roosevelt's "Fireside Chats" soothed an often desperate nation. Approximately 50 million Americans tuned in to his first chat on March 12, 1933, when he attempted to stop a run on American banks. By then, radio had become an accepted part of America's media landscape, though regular news broadcasts were still to come.

Conclusion

From 1850 to 1930, newspapers and magazines proved powerful entities that contributed to the social and political fabric of the nation. The American newspaper was at the pinnacle of its influence: New York had no fewer than 15 dailies and more than twice as many weeklies, but even a town as small as Emporia, Kansas, had two dailies. The New York *World* was selling 374,000 newspapers in morning and evening editions. By the end of the century, technological achievements in printing and stereotyping helped spur newspaper competition.

Early in the twentieth century Americans had come to appreciate the writers known as muckrakers, who described the dangers of unrestrained

industrial capitalism. These writers of exposure were fueled by magazines, such as *Munsey's, Cosmopolitan,* and *McClure's,* with national circulations and huge resources, which exploited such innovations as printed photos and color illustrations. They also laid the foundation for the weekly news magazine, of which the first was *Time,* founded in 1923, by Henry Luce and Britton Hadden.

Over this 80-year period, newspapers and magazines became important and powerful media for the dissemination of news and entertainment. The telegraph and telephone also became important means of communications as America moved from an agrarian to an industrial nation. In the 1920s, radio was suggesting a journalistic promise that would grow in relevance in the coming decades.

Massive newspaper circulations pushed technological progress with the invention of improved presses, distribution syndicates, news agencies, and often aggressive news coverage. Growth in advertising, which supported the press and began to support radio, made publishers rich and their powerful newspapers provided them a platform in which to debate the most important issues of the day. By 1930, news media played a substantial role in setting both national and local agendas of political and social issues.

History of Journalism: 1930–1995

Development of journalism in the six decades from 1930 to 1995 saw the decline of newspapers and rise of radio and then television as the dominant purveyor of news. The 1930s began in the depths of the Depression when newspapers were the primary means of communicating news to most Americans. As it would all too soon become clear, economic reassurance from Washington would not be enough to protect journalism from the Depression's effects. After overall newspaper circulation dipped early in the 1930s, it remained fairly level through the rest of the decade. But an indicator of deeper problems was evident when, early in 1931, the owners of the New York *World* were forced by hard times to sell the paper for a mere $5 million to the Scripps-Howard chain. *Editor & Publisher,* the industry's trade journal, devoted six pages of its late February issue to the event, which threw hundreds out of work.

Such economic hard times led a group of reporters and editors in 1933 to establish the American Newspaper Guild, the first successful attempt to organize the nontechnical side of newspaper production. Three years later the guild affiliated with the American Federation of Labor. One of the nation's first white-collar unions, it sought to protect job security of members while agitating for higher wages and better working conditions. The rise of the guild was highly controversial and was accompanied by conservative charges that it was part of a communist conspiracy seeking to take over the nation's press. By the end of the decade,

however, the guild had become a permanent feature within at least major urban newspapers.

Minority Papers

The Depression was an especially difficult period for publishers of America's foreign-language press, as well as for newspapers devoted to concerns of African Americans and other minorities whose concerns were largely neglected by mainstream papers. The need for foreign-language newspapers declined as their readers were absorbed into American life and restrictive policies arrested the flow of immigration. By 1960, the number of foreign-language periodicals published in America had dropped to half those of 1914.

African American newspapers provided their readers with indispensable news and editorial commentary. One of the most widely distributed, the *Pittsburgh Courier* (1911–2002), reached its peak in the 1930s. A conservative voice, the *Courier* challenged misrepresentation of blacks in national media and advocated social reforms to advance the cause of civil rights. In the 1940s, the *New York Amsterdam News* (1922–93) reached the height of its influence. During World War II, its writers strongly advocated for desegregation of American military forces. In addition, its writers also covered the historically important Harlem Renaissance. The *Los Angeles Sentinel* (1934–2005) became the largest African American–owned paper in the west and eventually in the country. The *Chicago Defender* (1909–75) was another important black newspaper, with more than two-thirds of its readership outside Chicago.

Many smaller African American newspapers also published, although economic circumstances made their tenuous situations even more difficult. In Kansas, for example, more than 80 African American newspapers have appeared since the first one in 1876. Some lasted but a single issue. Among those whose publishers were more successful were the *People's Elevator* (1937–40), in Kansas City; the *Kansas Whip* (1934–55), in Topeka; and *The Negro Star* (1922–52), in Wichita.

At the same time, Franklin D. Roosevelt's 1932 election led to exciting times for journalists. His administration's New Deal recovery program precipitated tremendous debate through the 1930s, as did growing tension with totalitarianism regimes in Europe and the Pacific. All this helped strengthen newspapers as a center for political debate, and the burgeoning role of the Washington columnist underlined this. Before the early 1930s, newspapers' editorial pages largely excluded writers whose views differed from those of their publishers. Given Depression pressures, however, the writings of journalists with opposing views were increasingly featured. One of the earliest and eventually most influential was Walter Lippmann, whose *New York Herald Tribune* column "Today and Tomorrow" was eventually syndicated to hundreds of newspapers across the country.

Rise of Radio and the War Correspondent

Long-held competition between newspaper and radio owners came to a head. After the first commercial stations went on the air in the early 1920s, radio gradually cultivated huge audiences for its fare, which consisted largely of entertainment and advertising. The newspaper industry reacted with hostility, such as in 1922 when the Associated Press wire service issued a notice to subscribers that its news copy was not to be used for broadcasting, but as time went by, radio became so successful that even some newspaper owners started investing in stations. By the early 1930s, the economic threat posed by radio was so intense that the Associated Press (AP) and American Newspaper Publishers Association (ANPA) sought to restrict news availability to its owners. The April 1933 Biltmore Agreement was crafted by members of the leadership of the AP and ANPA to, among other things, require newspaper owners of radio stations to limit news broadcasts to twice-daily, unsponsored, short newscasts made up of 30-word stories. But these restrictive policies lasted only a few years before United Press and International News Service broke ranks to sell news to radio, and by 1940 the AP capitulated as well.

Despite these threats, radio experienced a golden era during the 1930s and 1940s, and part of its appeal grew from its expanding journalistic voice. In 1930, Lowell Thomas began a nightly news program for CBS. Thomas traveled the world to bring news to his listeners, who were captivated by the sense of adventure his broadcasts inspired. As other talented journalists, such as Hans von Kaltenborn of the *Brooklyn Eagle,*

joined Thomas on the air in the 1930s, radio's voices became etched in listeners' minds.

Beginning with the Spanish Civil War and Japanese incursions into China in 1936, journalists covered wars almost continuously throughout the last half of the twentieth century. By the time World War II ended in 1945, print and radio news media had reported an unprecedented amount of information from the battlefield. While advances in technology reduced the amount of time it took news to travel to the home front, governments attempted to control the flow of information, though generally working with media rather than mandating censorship.

World War II elevated the status of all foreign and military correspondents, although some stood out. One of the war's famous reporters was Ernie Pyle, a roving correspondent for the Scripps Howard chain until he was killed in action in 1945. The "Murrow Boys," CBS radio news correspondents who broadcast memorable stories from across Britain and Europe, all but created radio's journalistic status. Led by the iconic Edward R. Murrow, these reporters set high standards for later radio and television journalism.

Television

Though television had a limited start in 1941 in the United States (the BBC began regular telecasts in 1936 but stopped when the war began), the medium expanded only after World War II. The networks began service in the fall of 1948, and both CBS and NBC provided newsreel-like brief newscasts weekday nights for the few with television receivers. Television raided radio of its celebrities, including journalists. Edward R. Murrow, Fred Friendly, Douglas Edwards, and others began to utilize television, though many considered video but a passing fad and not "serious" in its intent. By the mid-1950s, radio began to transform from a network-dominated into a more local medium, including dissemination of local news.

While some of the 1950 to 1953 Korean War was seen on film in television newscasts, only with the 1960s' Vietnam War did war-related television coverage come into its own. Satellite and other technologies began to make it possible to transmit news more quickly over long distances than had been the case before. These reports and the general lack of censorship over the long conflict led to dissemination of stories that eventually helped precipitate a groundswell of public opinion against the war. By 1975, when the American role in the long war ended, the term "Living Room War" carried a somewhat pejorative connotation.

The half-century-long cold war after 1945 featured an intense rivalry between the Soviet Union and the United States that was readily evident on television with reporting about espionage, propaganda, weapons development, and technological competition such as the "space race." A pivotal event in this process was television's highly inflammatory live coverage of the Cuban Missile Crisis in October 1962. President John Kennedy's announcement of a naval quarantine of Cuba made for gripping television—as did the subsequent Soviet withdrawal of its missiles that had initiated the crisis. Just over a year later, television pulled the nation together in the aftermath of Kennedy's assassination in Dallas. Four days of coverage (and the elimination of all advertising) solidified the medium's coming of age as a national news service.

Television became a vital means of covering the growing movement to achieve civil rights for African Americans. Journalistic coverage of such struggles climaxed in the years between the Supreme Court's school desegregation ruling in *Brown v. Board of Education* in 1954 and the assassination of civil rights leader Martin Luther King Jr. a dozen years later.

The 1970s saw a rise in the impact of televised international news coverage. In August 1970, coverage of thousands of women marching in U.S. cities to dramatize feminist concerns found its way to Europe. In solidarity, French and Dutch women staged their own marches. Television news also entered the world of global diplomacy. In 1977, CBS anchor Walter Cronkite used satellite technology to conduct interviews with Egypt's President, Anwar Sadat, and the Israeli Prime Minister, Menachem Begin. The result of this event was a breakthrough in Israeli-Egyptian relations.

In 1991, the continuing importance of television in world affairs was epitomized by the joint appearance by Soviet Premier Mikhail Gorbachev and Russian President Boris Yeltsin on an ABC-sponsored town hall meeting that took place on September 7. Their appearances occurred in the midst of the disintegration of the Soviet Union and

the Communist system. Admitting the failure of the system, Russian television began its newscast with: "Today, September 5, 1991, we all began living in a new country: The Soviet Union is no more." After the fall of the Soviet Union, international terrorism replaced the cold war as the primary international topic covered by Western news outlets.

Magazines and Newsreels

Magazines were also popular disseminators of news during these years. A milestone in news magazines took place on November 23, 1936, when Time, Inc. published the first issue of *Life* magazine, a photojournalistic weekly that covered a wide range of topics. Publisher Henry Luce told readers in the magazine's first issue that he wanted them "to see life; to see the world; to witness great events; to watch the faces of the poor and the gestures of the proud; to see strange things" (quoted in Stephens 1998, 75).

Luce kept his promise by hiring a stable of talented photojournalists. Among those who rose to prominence at *Life* was Margaret Bourke White, the magazine's first woman photographer. Her photograph of Montana's Fort Peck Dam provided the cover of *Life*'s first issue. During the war, Bourke-White served as a war correspondent, working for both *Life* and the Army. She survived a torpedo attack while on a ship to North Africa and was with U.S. troops when they reached the Buchenwald concentration camp in April 1945.

The popularity of the weeklies *Time* and *Life* encouraged others to compete in the same market. Thomas J. C. Martyn first published *Newsweek* and David Lawrence began *U.S. News* in 1933. Notable for its thorough coverage of Washington, the latter often carried complete texts of speeches and documents. In 1945, Lawrence established *World Report* to cover international news, and in 1948, merged them to create *U.S. News and World Report,* which published until 2008. Gardner Cowles Jr. established the pictorial *Look* magazine in 1937.

One popular venue for news well into the 1950s was the neighborhood movie theater. Movies were so loved that people frequently went more than once a week. Among the shorter features shown were newsreels covering the previous week's events. Five newsreel companies predominated: Fox Movietone, Paramount, Universal, Warner-Pathé (owned by Radio-Keith-Orpheum [RKO] after 1931), and Hearst Metrotone. Each month, a newsreel titled *March of Time,* a program that resembled a news magazine, supplemented these. Newsreels remained a regular feature in American movie theaters until television squeezed them out in the late 1960s.

Issues

Women in Journalism

Newspapers discriminated against women who sought to become general news or political reporters. It would take World War II's demand for men in other posts for the newspaper industry to welcome women into journalistic positions previously earmarked for men. Before then, women were largely confined to writing "Women's Pages." A few managed to capture other positions, such as Lorena Hickok, who quickly tired of her society page position at the *Milwaukee Sentinel* and was able to shift to the city desk. In 1928, the Associated Press hired her to write feature stories for its wire service. During the 1930s and 1940s, Hickok's close ties to Eleanor Roosevelt provided her with a rare journalistic platform. During the war, she advised Mrs. Roosevelt to hold press conferences with only women reporters and encouraged her to resume her writing, most notably her monthly column "Mrs. Roosevelt's Page" and her daily newspaper column "My Day."

One northern Minnesota newspaper hired an all-woman newsroom staff for the duration of the war. As the war ended, however, a call went out for them to give up their positions to the returning vets. While some were glad to do so, others remained in journalism.

Radio was also largely a man's world into the 1960s. Men reigned supreme since the industry's leaders considered women's voices unsuitable for the medium. Despite this, a few women managed to break through. Indeed, many had worked behind the scenes for years. One of America's first female radio newsreaders, Fran Harris, started broadcasting news for Detroit's WWJ in 1943. Dorothy Thompson and Sigrid Schultz, among others, gained popularity through their reporting and commentary from Europe before and during World War II.

Changing Technology

Rapid technological change marked news reporting during and after the 1950s. Development of

videotape was an especially appealing tool for television news producers. Its first use for television news came in 1956, on Douglas Edwards's evening news program on CBS. Development of portable video cameras a dozen years later was another important milestone. Color transmission was increasingly common by the late 1960s. Communication satellites allowed for almost instant communication from anywhere on the globe. The first experimental satellites appeared in the mid-1960s, and regular use was common by the 1970s. In mid-1969, *Apollo 11* transmitted live pictures from man's first landing on the surface of the Moon.

Television enjoyed its dominance in national news for several decades. In control of the field of television news in the United States from the 1950s until the 1980s were the "big three": ABC, NBC, and CBS. During these decades, the popularity of newscasters Edward R. Murrow, Walter Cronkite, Chet Huntley, David Brinkley, and Douglas Edwards turned them into legends. In 1968, CBS aired *60 Minutes,* an investigative journalism television news magazine, for the first time. The news magazine became so popular that other networks launched clones, such as ABC's *20/20*. By the 1990s, critics of television news decried what they saw as the tabloidization of the field.

In June 1980, Ted Turner's Cable News Network (CNN) became the first 24/7 news channel, suggesting the competition to come. CNN served the growing number of cable systems in the United States, making clear cable's potential role as a journalism heavyweight. Eventually, Turner's CNN (ridiculed at first, in part because it was based in Atlanta, far from the traditional New York national news outlets) became so lucrative that many others invested in other cable news, weather, and sports channels. CNN's global reach was epitomized in its coverage of the 1991 Gulf War, when for the first time television broadcast live around the world from a war zone as bombs fell.

By the 1980s, newspaper owners were forced to adapt not only to the popularity of television news but also to competition from within the newspaper industry itself. Al Neuharth's 1982 launch of the controversial *USA Today,* with its color, graphics, and innovative layouts and headlines, shook the field. Many publishers responded by investing in color printing technologies, although some refused, largely because of the costs involved. By 1997, *The Wall Street Journal* and *The Washington Post* were the only major dailies without color on their front pages. Computer-assisted reporting was another technological innovation adopted by newspaper publishers. In a 1973 book on the use of computers in journalism, University of North Carolina professor Philip Meyer stated that computers were enabling journalists to become more scientific.

Ethics

Critics of American journalism questioned its owners' commitment to the nation's needs. A landmark in such criticism took the form of a 1947 report, *A Free and Responsible Press*. The so-called Hutchins Report was created by the Commission on Freedom of the Press and it charged publishers and broadcasters with five responsibilities:

1. Provide a truthful, comprehensive and intelligent account of the day's events in a context that gives them meaning.
2. Provide a forum for the exchange of comment and criticism.
3. Project a representative picture of the constituent groups of society.
4. Present and clarify the goals and values of society.
5. Provide full access to the day's intelligence.

The press, however, was largely unreceptive to these recommendations. Preoccupied with fixing other problems, publishers largely neglected to look at their responsibilities to their readers and the general public.

In the 1970s, the ethical standards of professional journalists were also on the minds of a group of reformers who established news councils made up of both news people and others. Designed to investigate complaints about lapses in journalism ethics, organizers of news councils held hearings where complaining parties could air their concerns about specific cases of journalistic inaccuracy or bias. The most successful of the councils was established in Minnesota in 1970 and still operates today. By the mid-1990s, five news councils were still operating in the United States, while dozens remained active around the globe. The National News Council, established in 1973, however, closed in 1983 after a

decade of struggling to unsuccessfully develop a base of support among journalism's leaders.

New Styles of Journalism

Following the tradition of earlier muckraking journalists, late twentieth-century investigative journalists exposed illegal and unethical conduct of government officials and business leaders. Among the most famous investigative journalists from this period were Bob Woodward and Carl Bernstein, who led *The Washington Post* in its 1972 to 1974 breaking of stories related to the Watergate political scandal that led to the first resignation of a sitting President.

A development in journalistic writing style—dubbed the "New Journalism"—emerged in both magazines and newspapers during the 1960s and 1970s. Those who wrote in this fashion applied fiction-writing techniques to news. The "new" style provoked intense criticism within the profession. Among early proponents were Tom Wolfe, whose first book, *The Kandy-Kolored Tangerine-Flake Streamlined Baby* (1964), demonstrated the style's techniques, and Truman Copote, whose chilling narrative of a murder case in *In Cold Blood* is considered a classic in this genre.

Another part of the movement to make journalism more accountable was the establishment of magazines devoted to responsible journalism. Notable examples include the *Columbia Journalism Review,* launched in 1971 by the Columbia University Graduate School of Journalism; the *Chicago Journalism Review,* started after the 1968 Chicago Democratic National Convention to counter the negative effects of local journalists' overly cozy relationships with city officials; and the *American Journalism Review,* which began in 1977 as the *Washington Journalism Review*. These magazines cover issues of interest not only to news publishers, but also to members of the public with an interest in journalism.

By the early 1990s, another new form of journalism—public or civic journalism—began to develop. At the heart of the movement was a belief that journalists have an obligation to public life that goes beyond disseminating news and editorial opinion. Leaders include David Mathews, president of the Kettering Foundation; Jay Rosen, a journalism professor at New York University; and W. Davis Merritt, a former editor of the *Wichita Eagle*. This movement represented a departure from the trajectory of the "detached objective journalist," which the field of mainstream journalism had been on for nearly a century. Those who practiced public journalism treated readers and community members as participants in the process of journalism.

Conclusion

The period 1930 to 1995 was one filled with many challenges and changes for those in the field of journalism. The Great Depression and World War II tested the resilience of all producers of news during the period's first two decades. The popularity of first radio and later television threatened the health of the newspaper and news magazine industry, while rendering movie-theater newsreels extinct. Newspapers and news magazines maintained an important place in the overall news business throughout the period, but to do so, publishers were forced to adapt to hold on to their advertisers and readers. To appeal to consumers of news, publishers, among other things, created new types of newspapers, increased their attention to the concerns of women and minority groups, invented new styles of journalism, and invested in improved printing presses and other new technologies. Wars and global economic problems confronted news producers throughout the period, but the adoption of satellites for broadcasting starting in the 1960s made television journalism even more globally relevant. Ironically, at the end of the 1990s, the world's providers of news were once again poised on the threshold of a new technological challenge—the World Wide Web.

History of Journalism: 1995 to Present

Since 1995, a complex mix of social, economic, political, and technological changes have combined to substantially reshape journalism. Several trends are of particular significance during this period: changes in broadcast industries, the acceleration of the decline of printed news, the emergence of the World Wide Web, developments in political news, and the events of 9/11 and the international battle against terrorism.

Broadcast Industry Transformations

Until the 1990s, CBS, NBC, and ABC largely predominated in the broadcast television business in the United States. But in 1985, their power began to wane when Rupert Murdoch started the Fox network. Over the next decade, Fox slowly developed a group of affiliates and debuted prime-time programming. In 1996, Fox's parent company got into the news business when it started Fox News Channel. Fox News grew slowly after its mid-90s debut, but by 2007 it was rated as the cable news network with the largest number of regular viewers.

Critics of Fox News accused it of being biased toward the political right and Republican ideologies at the expense of neutrality. Murdoch and his associates disagreed. Selecting "Fair and Balanced" as Fox's trademarked slogan, Murdoch claimed the channel's news and opinion were more balanced than those of its competitors.

Like the broadcast television industry, after 1995, radio was likewise forced to adjust to technological innovation. Emerging technologies allowed radio station owners to cut back on the number of people they employed, and much of the news aired on commercial radio was purchased rather than produced locally. AM radio grew in popularity among listeners eager to hear from conservative talk show hosts such as Rush Limbaugh and Don Imus. Public radio news programs remained popular among many Americans looking for fuller treatments of the events of the day.

With its 1997 decision to license satellite radio, new opportunities for radio news journalists were born. The first satellite radio leaders, XM and Sirius, started transmitting music, news, sports, and other content across the globe to its subscribers in late 2001 and early 2002. In 2004, XM began offering radio channels featuring local weather and traffic reports. The two companies merged in 2008 after the U.S. Department of Justice and Federal Communications Commission approved their request.

Web Revolution

The relationship between journalism and newer technologies starts long before 1995. During the 1980s, the development of many new media, including the Internet, accelerated thanks to computers and modes of transmission that increased speed, lowered cost, and expanded capacity.

By the mid-1990s, almost all aspects of newsroom operation, including production, layout, composition, circulation, and the newspaper archives, were computerized; and the potential of computer networking for journalism was increasingly recognized. In the 1980s, a handful of newspaper and broadcast journalists started dial-up bulletin board systems on the Internet. Most resulted from partnerships with budding dial-up platforms such as America Online, Prodigy, and CompuServe.

Standard journalistic fare on such bulletin boards included classified ads, business and entertainment listings, and a few headlines. In 1991, the Chicago Tribune Company invested in America Online. A year later, it launched Chicago Online on AOL with localized stories and other content.

Since the mid-1990s, the ability to transmit mail electronically has greatly aided reporters and editors in their reporting and fact-checking activities. While there are some drawbacks to using e-mail as an interview tool, such as the criticism that they are lulling journalists into laziness and susceptibility to hoaxes, there are many virtues. E-mail provides an electronic record that allows both reporters and sources to keep track of what has been said and written.

Surely the most dramatic technical development of the mid-1990s was the appearance of the World Wide Web, which is essentially a system of interlinked hypertext documents that can be accessed via the Internet. With a web browser, journalists can view pages that may contain text, images, and other multimedia and navigate among them using hyperlinks. The basic idea was developed in 1989 by Tim Berners-Lee, and first made available on the Internet in 1991. As use of the web expanded journalists became cyberjournalists.

The first online newspapers were usually digital versions of the printed publication. Better understanding of the web's unlimited capacity led publishers to include more information and visual material in expanded online editions of their newspapers. Over time, they began experimenting with design as they added hypertext and links. An early example was the 1993–94 appearance of the *Nando Times,* companion to Raleigh, North Carolina's *News & Observer*. The online edition quickly attracted attention as the first 'round-the-clock, regularly updated news and sports online venue. Initially its staff did some original news reporting, but soon settled into primary roles as news aggregators and enhancers.

While online newspapers offered more news and other content than did their print counterparts, publishers had difficulty selling online advertising or otherwise generating revenue. Only *The Wall Street Journal* developed a successful subscription model in the web world that most users presumed was a source of free information.

The late 1990s saw tremendous growth in online journalism. The National Newspaper Association noted that during 1996, the number of online newspapers nearly doubled; by July 1999, only 2 of the 100 largest dailies did not have online editions. Site traffic grew accordingly. From 1995 to 1998, in a growing number of cases, the number of users accessing online editions of newspapers began to rival their print circulations.

Advertising first appeared in online news operations in 1994. Over the next dozen years, as advertising on the web grew exponentially, solutions were developed for many problems, including pricing; creation of means of measuring effectiveness; and developing linkages to other media, both online and traditional.

By the end of the first decade of the twenty-first century, most newspapers and broadcast organizations were firmly established in cyberspace. According to the authors of the Internet Society, the web had become "at once a world-wide broadcasting capability, a mechanism for information dissemination, and a medium for collaborations and interaction between individuals and their computers without regard for geographic location."

Web 2.0, the Blogosphere, and Citizen Journalism

One of the new century's most notable Internet developments was the emergence of blogs and the blogosphere. Blogs are websites maintained by individuals who regularly post entries of commentary, descriptions of events, or other content such as graphics or video. Since blogs are easy to create and cost little, if anything, to maintain, they have encouraged people without formal journalistic training to start publishing news and analysis. Called citizen journalists, such writers' forays into traditional professional journalism territory have touched off a storm of controversy.

Blogs are one of a cluster of new web tools made possible by the development of web 2.0 applications. Such tools offer users opportunities to pull information from multiple sites and deliver it on their own to achieve new purposes. In a web 2.0 world, streaming audio and video, podcasting, and the downloading and uploading of digital images proliferate. Within just a few years after free blogger software became available in 1999, the number of weblogs exploded. Numerous web 2.0 sites provide users with easy-to-use downloadable free software.

Regardless of bloggers' positive contributions, in the movement's early years, some news publishers forbade their staff from blogging, concerned that their blogs would expose them to potential lawsuits. Indeed, it would take some time for the courts to render decisions that would reveal whether they would afford bloggers the same First Amendment freedoms as traditional journalists.

Over time, more newspapers added blogs to their online editions. Meanwhile, television and radio news operations also moved into the blogosphere. One of the leaders is MSNBC, the 24-hour cable news channel launched in 1996 by NBC and Microsoft. The channel's online site, MSNBC.com, has become one of America's most popular web news providers. In 2002, the site operated seven blogs; by early 2006, the number was up to 21. Other news organizations similarly began to enlist the help of citizen journalists in news gathering.

Not long after blogging became popular, people began experimenting with blogs where video was the main component. The rise of interest in videoblogging, or vlogging, was linked with the launching of YouTube, a video-sharing website where users can upload, view, and share video clips. Vlogs are part of the open sourcing trend that has recently become an important component of citizen media and journalism. Operators of open-source journalistic media ask audiences to produce and upload content, including digital photos, audio, and video.

The first open-source all-podcast radio station was started in San Francisco in 2005 by Infinity Broadcasting, Viacom's radio division. Television was not far behind. ABC began offering a weekly 15-minute podcast titled *ABC News Shuffle* in mid-2005. By early 2006, many local television stations were also distributing podcasts and asking their users to upload their own content. Called crowdsourcing, the practice of accepting video or other content from the public became increasingly popular during this period. An offshoot of this is crowdfunding, where people pool their resources via the Internet to support projects initiated by people or organizations not connected to the mainstream journalism industry. A San Francisco website named Spot.us is testing journalistic crowdfunding at the local level. The site allows freelance journalists to suggest stories and get funding from the public in the Bay Area. Other citizen-initiated journalistic websites, such as Pro Publica, are funded largely through foundations.

Many say that the web, and web 2.0, are changing the face of journalism. The mixing of formats is becoming an increasingly popular journalistic practice, and some argue that multimedia journalism has greater impact on the public than either print or broadcast formats. Others contend that there are downsides to multimedia approaches—for example, users sometimes have problems using the complex features of news sites.

Decline of Newspapers

The appearance of web options accelerated problems of newspapers and magazines. Compared to broadcast news, print newspapers and magazines had some built-in advantages. Most newspapers were produced in their readers' communities, meaning their contents were closely related to local interests. In an attempt to compete with the visual appeal of television, print publishers spent huge amounts to purchase printing equipment that could provide more color and graphics. But other problems persisted, including rising labor, paper, and energy costs, and the appearance of web software that enables anyone to start publishing news. As blog publishing systems such as Blogger.com gained popularity, news blogs like Blogger News Network, which started on February 1, 2005, added to the problems experienced by print news publishers.

By 2008, some were suggesting that printed newspapers had entered their final stage. In the first quarter of 2008, print advertising sales fell by 14 percent, adding to losses of the previous eight years. Newsroom staffing levels were slashed at most major newspapers, including the country's largest. Plunging advertising revenues and other financial difficulties led the Tribune Co., owner of the *Los Angeles Times* and other media, to file for bankruptcy protection from its creditors in late 2008. And the media consolidation trend started much earlier in the history of American journalism continued unabated. Knight Ridder, one of America's largest news media companies and itself a product of media consolidation, was purchased by the McClatchy Company in 2006. And the *Christian Science Monitor* announced it would publish only an online addition starting in February 2009, presaging a move other papers were at least

considering. In 2009, the world's unfolding economic recession, the effects of which were noticeable in 2008, continued to pose problems for not only newspaper publishers but also all journalistic institutions.

Political News and Electoral Campaigns

The field of American political communication adapted to cyberspace as web-based news venues and eventually blogs proliferated after the turn of the twenty-first century. According to a 2006 report published by the Pew Research Center, the number of Americans turning to the Internet for news or other information related to politics had increased from 21 million to 26 million people per day. Responding to this trend, news organizations increasingly used the Internet and other new media tools in ways that they hoped would effectively engage audiences.

Political campaigners also turned to the new media for tools they hoped would attract supporters. Howard Dean's unsuccessful bid for the 2004 Democratic Party presidential nomination is notable for his unprecedented use of the web. Four years later, Barack Obama's use of instant text messaging, Facebook and MySpace, and other new technologies was touted as a watershed in American political history.

9/11 and Battling Terror

The attack on the United States by terrorists on September 11, 2001, had a lasting impact on journalism. Some researchers suggest that a new kind of journalism emerged in the post-9/11 world that is less frivolous and more connected to the serious concerns of people living in a complex and dangerous world. At the same time, however, critics decried the patriotic tone of much American and British news coverage, which was accused of credulously publishing prowar propaganda for their governments.

One major concern among journalists has been the chilling effect the U.S. government's post-9/11 antiterrorism strategies have had on free speech and privacy rights. Government threats concerning the shut down of some websites, like one in Virginia that posted unedited video of journalist Daniel Pearl's execution, and even Internet service providers, such as their shutdown of the nation of Somalia's only Internet service provider in 2001; removal of once-available information from government websites; and the closure of once available government documents and meetings were among the changes. In addition, pre-9/11 rules that limited use of electronic surveillance strategies such as wiretapping by government authorities have been abandoned in the fight against terror. Concerned about the chilling effect such surveillance was having on journalism, in 2008, the American Civil Liberties Union filed a lawsuit against the federal government to stop it from conducting unchecked tapping of international e-mails and telephone calls.

Conclusion

Journalism underwent a series of profound changes after 1995 as it was forced to adapt to new technologies, economic forces, and global political events. Already challenged by CNN, ABC, NBC, and CBS's news operations faced further competition when Rupert Murdoch launched his Fox News in 1996. The decline of large metropolitan newspapers continued unabated, as their publishers struggled to adjust to rising prices in a time of declining advertising revenue and the global economic recession that began to unfold in 2008. Web-related innovations, particularly blogging, had a profound impact on journalism by opening up the field to nonprofessionals with a penchant for news writing and videography. New media likewise affected the political world, as journalists and political candidates increasingly used blogs, social networks, and cell phones, among other things, to disseminate information during electoral campaigns. al-Qaeda's 9/11 attack on America was followed by a wave of patriotic journalism that lasted until the Bush administration's retaliatory War on Terror seemed to many to be lasting too long. The 9/11 attack on America also ushered in governmental antiterrorism security measures that have troubled journalists and civil liberties advocates ever since.

Much as it has since it first emerged in history, journalism will survive in coming generations as it continues to adapt to the changes that take place in society that are outside its control. In the near future, however, the decline of the large

metropolitan newspapers will continue—as will shifts in the field of journalism ushered in by new web tools and economics—and political campaigns will progress further in their web-and-other-technological transformations.

Hoaxes

Media hoaxes have existed as long as media have served the public. Hoaxes are generally intended to fool and to entertain. Many are parodies of some occurrence or play upon topics that are currently newsworthy. As such, their creators realize that the public will likely catch on to the joke as it unfolds, or they will reveal the fabrication in a subsequent story. Hoaxes of this type are not considered to be dishonest news reporting by those who create them since the entire scenario has been created purely as entertainment and is usually acknowledged. Other hoaxes, however, are intended to deceive the audience into believing what they read, hear, or see is factual.

Origins

The nature of information dispersal and news gathering that dominated media from the 1600s through most of the 1800s made the creation and dissemination of hoaxes relatively easy. In most cases, information was presented without comment. Readers were left to determine validity on what seemed plausible to them based on conventional wisdom, religious beliefs, or scientific discovery. Much of what was known scientifically, however, was built upon speculation, not upon scientific inquiry. As a result, what might be considered hoaxes based on present understanding was simply the passing on of information. When Benjamin Franklin, for example, reported in the October 17, 1745, *Pennsylvania Gazette* that a medicine made from a substance called "Chinese Stones" could cure rabies, cancer, and a host of other ailments, verification of the medicine's potency was based on personal testimony. A letter to the *Gazette* the next week, however, revealed that the stones were made from deer antlers and contained as much medicinal value as a tobacco pipe. Similar hoaxes passed regularly as news stories or in advertising for patent medicine until the creation of the Food and Drug Administration curtailed many of them in the early twentieth century.

Author Jonathan Swift used hoaxes to tell stories. *Travels into Several Remote Nations of the World* (1726), more commonly known as *Gulliver's Travel*s, purported to be the true story

of the travels of Lemuel Gulliver. In 1708, Swift predicted the death of a famous astrologer in an almanac using the fictitious name Isaac Bickerstaff. On the appointed day, Swift printed a black-bordered elegy to the astronomer. Two days later, he published a pamphlet extolling the prediction. The news spread through London. People who saw the astrologer that day thought he bore a striking resemblance to the deceased astrologer. Swift later said that he created the hoax to discredit the man's astrological predictions. Swift's hoax was set to coincide with April Fool's Day, and media have regularly created fictitious, nonharmful hoaxes for the day ever since.

Stories of human abnormalities and oddities regularly appeared in the news in the eighteenth and nineteenth centuries. In 1765, a story that swept Britain and then America declared that "the Existence of Giants is proved." Examined by scientists, the story as it appeared in the *Maryland Gazette* of March 14 told of a tomb in France that contained "a human Skeleton entire, 25 Feet and a Half long, 10 Feet wide across the Shoulders, and 5 Feet deep from the Breast Bone to the Back."

Writers such as Edgar Allan Poe often employed the hoax as a tool for storytelling. When Poe became editor of the *Southern Literary Messenger* in Richmond, Virginia, in 1835, he used the magazine to publish the first of his several hoaxes, "The Unparalleled Adventures of One Hans Pfaall." In the story, which Poe presented as a news account, Pfaall flew in a hot-air balloon to the moon, stayed there for five years, and sent a "lunarian" back to Earth to announce life on the moon and Pfaall's impending return. On April 13, 1844, Poe created another hoax concerning balloons when the *New York Sun* printed the astounding news that a balloon had crossed the Atlantic in 75 hours.

The bases for creating hoaxes grew tremendously in the first half of the nineteenth century as Poe's stories demonstrate. In the eighteenth century, only two scientific societies existed in the United States. By the 1820s, dozens operated, 26 in New York City alone. These societies turned to the press to announce their discoveries. Twenty-four different societies regularly published findings in journals by the mid-1820s, and a number of these articles appeared in newspapers, too. Poe's balloon stories, for example, were supported by other news reports about balloons, one saying that a Philadelphia man had ascended 35,000 feet over the city.

Subject to widespread hoax treatment were astronomical "discoveries." In the 1780s, William Herschel discovered a new planet beyond Saturn. Over the next four decades, Herschel released accounts of further discoveries. Although what Herschel had to say cannot be classified as hoax, it was certainly misinformation. He announced that he had observed continents, islands, oceans, and volcanoes on the lunar surface. By 1793, Herschel guaranteed that life existed on the moon. Only time and further scanning of the satellite with Herschel's powerful telescopes were needed. Although Herschel never actually saw creatures on the moon, his son John would in one of the more cleverly crafted media hoaxes.

On August 21, 1835, a blurb on page two of the *New York Sun* remarked that "some astronomical discoveries of the most wonderful description" had been uncovered by Herschel with his 20-foot telescope. The British astronomer had taken it to the Cape of Good Hope in order to gain a better glimpse of Halley's Comet, which was set for its 77-year return to visibility. A *Sun* reporter cited Herschel as the authority in his hoax, reporting that Hershel had viewed all sorts of life on the moon, including winged human creatures about four feet tall, covered with short and glossy copper-colored hair.

The Moon Hoax was initially widely believed, according to New York newspaper the *Daily Advertiser*. It was the perfect hoax, as it was based in certain truthful elements—John Herschel and the *Edinburgh Journal of Science,* even though the journal had ceased publication six months earlier. The science of the day assured that extraterrestrial life existed; life on the moon was taken for granted by everyone. All major religious leaders accepted human life on other planets. For example, the president of Yale University said in a series of sermons that God had created many worlds inhabited by intelligent creatures throughout the universe.

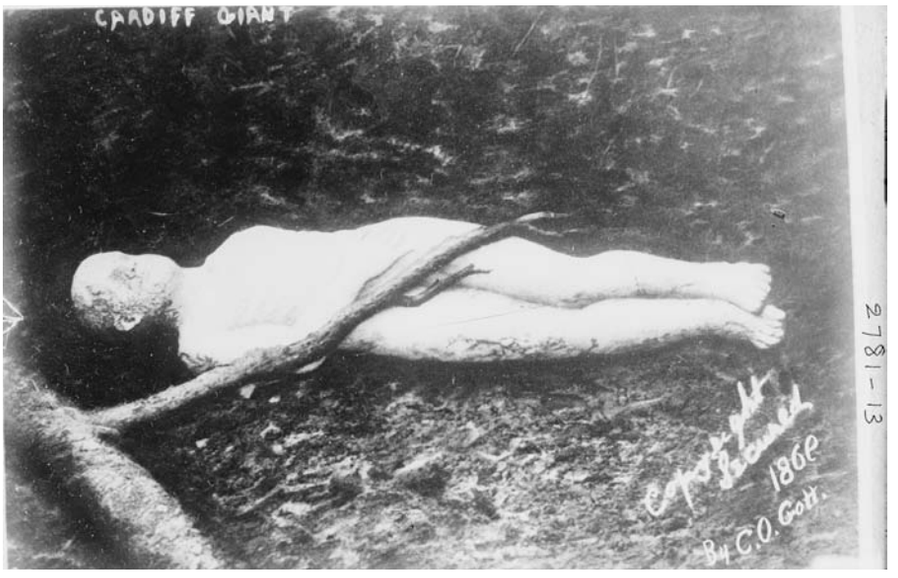
The moon life hoax was perfect in another way: it harmed no one. It was uncovered before it finished running in the *Sun* because its writer, out drinking with a reporter from another paper, told his compatriot not to write anything about the amazing discoveries yet because he had not finished writing it. Once the secret was out, people blasted

the *Sun* and its owner, Benjamin Day, for the elaborate hoax. Neither Day nor the *Sun* ever admitted that the story was fabrication, however. Indeed, Day published illustrated pamphlets on the topic a couple of months after the story first appeared.

Poe, who had written a similar account about Hans Pfaall, claimed that Richard Adams Locke, an acquaintance of Poe's, had plagiarized the concept from the *Southern Literary Messenger,* but no one bought Poe's charges. Later (in the October 1846 issue of *Godey's Lady's Book*), Poe would call the Moon Hoax "the greatest *hit* in the way of *sensation*—of merely popular sensation—ever made by any similar fiction either in America or in Europe."

Perhaps the greatest hoax in terms of human discovery occurred in 1869 with the unearthing of the Cardiff Giant in upstate New York. Reports described the Cardiff Giant as a complete man, "A human form of huge proportions, entirely petrified." The figure was 10 feet, 2½ inches tall, according to a story in the *Daily National Intelligencer and Washington* (D.C.) *Press* of October 22, 1869. In reality, the giant was the creation of George Hull. The story was, in part, an outgrowth of the growing debate on biblical literalism versus the evolutionary concepts introduced by Charles Darwin in *The Origin of Species,* published in 1859. The discovery, news reports said, proved Genesis 6:4, which said that at one time "the Nephilim (giants) were on earth." Hull sold his giant to a group of entrepreneurs who put it on public display. Scientists studied the remains, and many determined that it was made of limestone or some other soft stone. When the Cardiff Giant's owners displayed it in New York City, the hoax was revealed because P. T. Barnum had created his own version of the Cardiff Giant. With both giants on display in the same city, the owners of the original Cardiff Giant sued Barnum. In court, Hull admitted that he had created the giant in Iowa and had it buried on his cousin's farm in Cardiff. Thanks to the massive interest in the "discovery," the Cardiff Giant has been dubbed the greatest hoax in newspaper history. "All other attempts at humbugging sink into insignificance by the side of the 'Cardiff Giant.' Richard Adams Locke's moon hoax and Poe's story, 'Hans Phaall,' are simply moonshine when compared with the cool effrontery of this Cardiff hoax," opined the *Daily Cleveland* (Ohio) *Herald* on October 27, 1869.

Not all nineteenth-century hoaxes were harmless. On November 19, 1874, James Gordon Bennett Jr. ran a story on the front page of the *New York Herald* saying that animals had escaped from the city's zoo and had killed 27 people and injured hundreds. Most readers never finished the



An undated photo of the so-called Cardiff Giant, the subject of one of the greatest journalistic hoaxes in American history.

Source: Library of Congress.

story, which stated at the end that it was "pure fabrication." Instead, people ran into the streets with guns or fired them randomly from windows.

Nineteenth-century advertising created some of the most elaborate hoaxes, and most of them were the work of Phineas T. Barnum. When Barnum was 25, he purchased a slave named Joice Heth and promoted her as the 161-year-old nurse of George Washington. In 1842, Barnum presented the Feejee Mermaid by tricking dozens of papers to run stories about it simultaneously. In reality, the mermaid had been created by sewing the tail of a fish to a monkey's body. The stories tripled the number of people who paid to visit Barnum's New York City "Hippodrome."

Early in 1860, Barnum created another elaborate hoax, this one based in current events. Just months after the release of Darwin's *The Origin of Species,* Barnum introduced "What Is It?" Promoted as the missing link between ape and man, the exhibit really featured one William Henry Johnson, a native of Bound Brook, New Jersey. This so-called evolutionary missing link became a tool in the 1860 election with editorial cartoons claiming that the election of Abraham Lincoln would ensure that an African American would soon become President.

Advertising use of false images and statements received judicial support in 1946 in the case *Carlay. v. FTC.* The case centered on Ayds candy, which could help its eaters lose weight, according to Carlay's advertising. The Supreme Court ruled that the use of puffery in advertising was acceptable since people knew (or should know) that eating candy would not cause weight loss.

Media outlets have also used hoaxes in order to expose rivals who copy them. During the Spanish American War, William Randolph Hearst's *Journal* fabricated a story about the death of a famous soldier in Cuba, Colonel Reflipe W. Thenuz. Joseph Pulitzer's *The World* ran the story the next day. Hearst sued the embarrassed Pulitzer, pointing out that the name backwards created "We pilfer the news."

Broadcast hoaxes have been less common than those in print. In late October 1938 Orson Welles fooled many Americans with his fabricated radio news report about a Martian invasion. Even though *The Mercury Theatre of the Air* announced several times that the broadcast was a drama, Welles knew that people might be listening to a popular program on NBC and not tune in to his CBS program until a commercial break. By that point, Welles had Martians attack Grover's Mill, New Jersey, not far from Princeton. Later estimates suggested at least a million people believed the radio news reports were real. That the broadcast followed by a month the real Munich Crisis and radio reports about European diplomacy may also have contributed to audience belief in the realistic "news reports" of rampant Martians.

The rush to break important information, however, ensures that some hoaxes will be broadcast. On November 5, 1991, ABC Television's *World News Tonight with Peter Jennings* reported the impending sale of Lenin's corpse in a Russian effort to raise money. *USA Today* also ran the story, which was later discounted.

Internet hoaxes are easier to create than those on traditional media as anyone can create a webpage or post information to blogs. The rise in use of the online encyclopedia Wikipedia is one example. Even though much of the information on it is accurate, a February 2007 *New York Times* story stressed that misinformation can and is regularly posted there, sometimes intentionally, to misinform or fool readers. Countless posts on the Internet and sent via e-mail have carried inaccurate news stories and columns, let alone purposeful hoaxes.

David A. Copeland

Hoaxes Versus Fraud

Over the last century, however, most "hoaxes" have been created by people other than journalists to fool the press and its audiences. General use of the term "hoax" has been so nonspecific and inclusive that it includes what more rightly are frauds, although frauds with varying motivations. Widely published photographs or stories of the Loch Ness monster in Scotland, the oft-sighted "Big Foot" in the Pacific Northwest, strange crop circles in the Midwest, flying saucers, alien abductions, and ghosts have been called "hoaxes" even though the intent of many perpetrators was not to be discovered as faking it. People, including reporters, who truly believe these claims further complicate matters by offering support for and writing about them. In England in 1917, for example, Sir Arthur Conan Doyle, author of the Sherlock Holmes stories, obtained pictures of two girls playing with fairies

and wrote persuasively about them as proof of a spirit world. The photos were debated for decades until the two cousins admitted they faked them to avoid punishment for getting their dresses dirty. Many people adamantly believed the Piltdown Man, the widely publicized "missing link" discovered in 1912 in a Sussex quarry, was real until the fraud or "hoax" was revealed 40 years later.

In something of a throwback to the more traditional media hoax, Alan Abel and Joey Skaggs, called "professional media hoaxers," have since the late 1950s perpetrated hoaxes on the media as detailed on their websites. They demonstrate that news media remain easy to fool in their quest for sensational and unusual stories. As in traditional media-originated hoaxes, both men eventually reveal their hoaxes as untrue and, at the same time, claim some higher purpose—demonstrating media and audience gullibility or drawing attention to some cause. Abel achieved news coverage of events he created involving an organization protesting animal nudity, former Junior League women who provided sex to help rehabilitate inmates, a man (Abel) with the world's smallest penis, and Citizens Against Breastfeeding proclaiming the practice immoral and perverted. "Multimedia artist" Skaggs excited the press with his "Cathouse for Dogs," which offered one-night stands for pets; a sperm bank auctioning off rock star sperm; a wonder drug made from cockroach hormones; and a Korean company offering to buy dogs from U.S. shelters to feed to Asians.

More recent "hoaxes" come from journalists less concerned with amusement or higher purposes than with creating "better" stories—and perhaps making their own reputations. Although they are often referred to as "hoaxes," because the reporters had no intent to reveal their stories as untrue, these should be considered fraud rather than hoax. More widely known examples come from reporters Janet Cooke of *The Washington Post,* Jayson Blair of *The New York Times,* Steven Glass of *The New Republic,* and Patricia Smith of *The Boston Globe,* all of whom embellished or created stories they passed off as real. Cook won the 1981 Pulitzer, later withdrawn, for "Jimmy's World," a purported investigative story about an eight-year-old heroin addict with "sandy hair, velvety brown eyes and needle marks freckling the baby-smooth skin of his arms." Cooke apparently combined elements of truth in her compelling story and resisted admitting her actions for some time. Blair wrote more than 35 stories, including about Iraq war veteran Private Jessica Lynch, in which he fabricated quotes and descriptions. Glass made up quotes, people, organizations, and stories in a number of publications and Smith also made up quotes, people, events, and stories. In the online publication *Slate* (June 2007), freelance writer Jay Forman wrote that Florida Keys "fishermen" took him to an island inhabited by monkeys that a cosmetics company used for testing. Keeping their boats offshore and baiting hooks with fruit, they cast lines to the island and hooked monkeys, even yanked them from trees, and eventually cut lines to free them. People immediately questioned the story, but *Slate* insisted its "Monkey Fishing" story was accurate, only to find months later that most of it was fiction.

In February 2008, the press was fooled by a Nevada high school football player who faked his own recruitment and signing ceremony to play football at a major university. Widely covered in the region, the player admitted after a week that he made up everything, because he wanted so much to play Division I football. For promotion or propaganda purposes, the U.S. military released a story about the fighting, capture, and rescue of Private Lynch (who had figured in Blair's faked stories) that was far more compelling than other versions, including Lynch's own.

In the late 1950s, *Twenty-One* television quiz show contestant Charles Van Doren, a Columbia University instructor, won money week after week, gaining enormous popularity until NBC admitted that he was provided with answers in advance. Several other quiz shows suffered the same fate—and all quickly disappeared from prime time.

In the current media climate, in which there is so much information, skepticism, and difficulty in determining what is true and what is not, the traditional media hoax seems almost quaint. Its ability to amuse having been diminished in a world of "reality" television, fake or fraudulent news, disinformation, and the Internet, the modern "hoax" appears motivated more by political, personal, or economic intentions. Many perpetrators aren't hoaxers at all, as their intent is neither to reveal their untruths nor to get caught.

Hong Kong

Hong Kong, an economically developed Chinese coastal city with 7 million residents, has a vibrant and well-developed modern media system, in which journalism plays a core part. A British colony from the 1840s to 1997, the city was returned to China as a Special Administrative Region (SAR) governed under the formula of "one country, two systems." This formula was originally designed to stress that the capitalist system of Hong Kong shall remain unchanged until 2047. These days, the formula is often used more broadly to refer to Hong Kong's "right" to remain different from China in its political, economic, social, and legal systems.

The News Media Scene

According to the government's record, by the end of 2006 there were 22 Chinese-language daily newspapers, 14 in English, 8 bilingual newspapers (Chinese and English), and 5 in Japanese. However, some of these newspapers serve very small and specific minority groups, and a few focus solely on horse-racing (one of the most popular sporting and, more importantly, gambling events in the city). Excluding these, 18 dailies (16 in Chinese and 2 in English) can be considered as the major sources of social, economic, and political news for Hong Kong's residents.

As of 2008 there are three radio and two television broadcasters, and three pay television services in operation. All produce their own newscasts. The Hong Kong public is also served by numerous local gossipy infotainment magazines, regional satellite broadcasters, and the full range of news outlets in the online world. It is particularly worth noting that Hong Kong has one of the highest Internet penetration rates in Asia. According to a government survey in 2007, 70.1 percent of Hong Kong households had Internet access.

Nevertheless, local newspapers and local television broadcasters remain the most important news sources for the citizens. The four most widely circulated Chinese-language newspapers—*Oriental Daily, Apple Daily,* the *Sun,* and *Ming Pao Daily*—have a combined daily circulation of about 1 million copies. The main evening newscasts of the two television broadcasters—*Television Broadcasting Ltd.* (TVB) and *Asia Television* (ATV)—have an audience of about or more than 1 million people each. Moreover, since the middle part of the first decade of the 2000s the city also witnessed the emergence of three free daily newspapers distributed through key locations such as Metro stations. It is estimated that the three dailies have a combined circulation of about 1 million copies.

All Hong Kong newspapers are commercial operations, although the three leftist newspapers (*Wen Wei Pao, Ta Kung Pao,* and *Hong Kong Commercial Daily*) are also financially supported by the Chinese government. The co-existence of a large number of newspapers in one city means that survival can by no means be taken for granted. One result is the competitive phenomenon of tabloidization, discussed below.

Besides commercialism, the press in Hong Kong is also marked by a significant degree of political parallelism, that is, different newspapers support different political stances, and the spectrum of viewpoints largely corresponds to that existing in society. The nature of this political parallelism has changed historically. From the 1960s to 1980s, many newspapers in Hong Kong could be classified as either "rightist" or "leftist." The former supported the regime in Taiwan, and the latter supported the Communist regime in Beijing. Into the 1980s and 1990s, the rightist papers declined as they faced both financial and political difficulties in a city preparing to return to Chinese control. Currently, the surviving newspapers can be roughly located on a continuum, anchored by the *Apple Daily* on the pro-democracy side and the three leftist papers on the pro-China side.

Television broadcasters, in contrast, have long provided the impression of being professional and objective in reporting news. The television broadcasters in Hong Kong are also commercial operations. Radio Television Hong Kong (RTHK), the city's public broadcaster, has a division that produces public affairs programs to be aired by the commercial television broadcasters as it lacks its own television channel. It does not produce newscasts.

Historically, television journalism in Hong Kong did not exhibit any substantial degree of sensationalism or political bias. However, the situation may be changing. Commercially, the rise of pay television since the 1990s and its subsequent expansion have led to increased market competition, which may have implications on how television broadcasters approach news work. Politically, it is questionable whether television broadcasters can maintain their independence and professionalism in the face of Beijing's political pressure since 1997.

Professional journalists in Hong Kong are highly educated. According to a representative survey in 2006, more than 90 percent of Hong Kong news personnel have at least some college education, while 70 percent have formal university training. More than half (57 percent) majored in journalism or communication. However, journalists in Hong Kong are also relatively young and inexperienced. In the 2006 survey, 36 percent of Hong Kong journalists had been in the field for fewer than five years, and another 24 percent for up to ten years. The high turnover rate can be partly attributed to low pay, long working hours, and other unsatisfactory aspects of the job.

Politics and Press Freedom

Press freedom has been a serious concern for the Hong Kong media throughout the past two decades. In the transition period (1984–97), despite its colonial status Hong Kong's media enjoyed a high degree of press freedom due to the balance of power between the British administration and the Chinese government. Since 1997, China has been the sole power center, and the media have faced heightened political pressure.

Press freedom did not suffer an immediate decline, however. Constrained by the promise of "one country, two systems," the Chinese government did not impose the Mainland's prepublication censorship system in Hong Kong. Instead of direct and formal control, the Chinese government influences Hong Kong media through several indirect methods. First, it has defined a few areas as basic taboos for the Hong Kong press: there should be no personal attack on China's national leaders, and there can be no advocacy for Taiwan/Tibet

independence. Second, Chinese officials issue occasional criticisms of the Hong Kong press when they perceive news media as engaging in "politically incorrect" coverage.

Moreover, the Chinese government co-opted the Hong Kong media owners by distributing political appointments and presumably economic rewards to them. With very few exceptions (such as the *Apple Daily*), news organizations in Hong Kong are either wholly or partly owned by Mainland capitalists (such as ATV), are owned by Hong Kong capitalists who have formal political appointments in China (Charles Ho, owner of the *Sing Tao Daily,* is a member of China's Political Consultative Committee), or are owned by Hong Kong or regional tycoons with huge business interests in China (Malaysian tycoon Robert Kuok, whose Shangri-la Hotels and Resorts will operate 32 hotels in Mainland China by 2011, is the owner of the English-language *South China Morning Post*). Although the owners may not exercise direct control of daily news operations, the personnel and resource allocation decisions they make, coupled with the processes of newsroom socialization, can be effective in generating self-censorship and political conformity.

By the tenth anniversary of the Hong Kong handover, in 2007, most observers agreed that press freedom in Hong Kong had declined and that media self-censorship is a growing problem. A survey by the Hong Kong Journalists Association in January 2007 had 58.5 percent of the responding professional journalists regarding self-censorship as a more serious problem in 2007 than in 1997. However, many commentators also agreed that the decline in press freedom has not been straightforward or abrupt. Countervailing forces have prevented journalists from succumbing completely to political pressure. The most important such forces include professionalism, commercialism, and the journalists' own political beliefs. Professionally, Hong Kong journalists have largely taken up the liberal ideal of the press. They see themselves as independent actors in the political communication process and regard monitoring and criticizing holders of political and economic power as an important role. Commercially, many newspapers try their best not to give readers the impression that they are self-censoring, for otherwise they will lose credibility in the market. Politically, liberty, democracy, and the rule of law are presented as being among the "core values" of Hong Kong, and survey research has shown that many Hong Kong journalists indeed share those values.

The counteracting forces of professionalism, commercialism, and a liberal political culture are at their strongest when media have to cover issues which touch upon the concrete interests of Hong Kong society and people. On such issues, professional, commercial, and liberal considerations compel Hong Kong news media to stand by local interests, even if it means they have to criticize China (as happened during the outbreak of the severe acute respiratory syndrome [SARS] in 2003).

Tabloidization and Journalism Ethics

While commercialism prevents Hong Kong media from becoming the mere mouthpiece of the government, it also leads to the problematic phenomena of tabloidization, sensationalism, and trivialization of news contents.

"Yellow journalism" has existed in Hong Kong since at least the late 1960s. In fact, *Ming Pao,* which is currently the most widely circulated elite-oriented newspaper in the city, was a mass-oriented paper in its early years. Soft pornographic novels and photographs were also published in the feature sections of many Chinese daily newspapers throughout the 1980s. However, tabloidization and sensational news reporting became a prominent industry and public concern only since the mid-1990s, especially after the publication of *Apple Daily*. Besides adopting a critical and pro-democracy political stance, *Apple Daily* also adopted a highly market-oriented approach to news reporting, most conspicuously by its use of color printing, large and occasionally gory photographs, catchy headlines, and computer-generated graphics. It also had no qualms about putting celebrity-related news on the front page as headline social news, and it pushed newspaper soft-porn's challenge to social morality to a new level—by offering "guides to prostitute services" in one of its feature sections.

The success of *Apple Daily* forced many newspapers, including the elite-oriented ones, to adopt at least some of its methods of news reporting and presentation. The elite-oriented newspapers also seem to have their news agenda occasionally affected by that of the mass-oriented press.

The situation was exacerbated by the emergence of gossipy infotainment magazines. Besides their usual focus on entertainment celebrities, the magazines also covered public affairs while turning many of these stories into juicy scandals. Most notoriously, the infotainment magazines send out teams of reporters to follow and cover the private lives of celebrities. This has led to the term "doggy team" (*gou jai dui*) in local parlance, essentially the Cantonese phrase for paparazzi.

One result of the trend toward tabloidization is strong public discontent toward news media performance and ethics. University-conducted opinion polls since 1997 have consistently shown that between 60 percent and 70 percent of Hong Kong people believe the media have abused their freedom. The public is particularly concerned with how some media organizations encroach upon people's privacy in their news coverage.

In light of this public dissatisfaction with the press, in 1999 the Hong Kong government proposed the establishment of an official press council to regulate media ethics. Opinion polls showed majority support for the proposal. Predictably, the idea met strong resistance from both media organizations and professional journalists, including the Hong Kong Journalists Association, who argued that the official press council might morph into a political organ to curb press freedom.

In the end, an unofficial press council was formed in March 2000. It is made up of journalists, academics, and other social elites. It receives complaints from members of the public, conducts investigations, and issues reports and "orders" for the accused media organizations to follow. Unfortunately, without official power, the press council's capability in promoting changes remains limited. The paradox is that those news organizations that are willing to cooperate with the press council are not the main sources of media ethical problems to begin with, and those that are the sources of ethical problems are not likely to cooperate with the council. In fact, in 2007, 63 percent of the complaints received by the council were directed at newspapers that were not members. Journalism ethics thus remains a troublesome issue for the city's news media.

In sum, situated within a society that has a free market and a significant degree of civil liberties, and yet no fully developed democratic system, journalism in Hong Kong has been largely driven by the complex interplay between political pressures and economic forces. These forces work sometimes with and sometimes against each other, constricting or expanding the room for press freedom. This complex interplay will continue to shape the development of the Hong Kong press in the future.

Houston

Houston, the largest city in Texas and the fourth largest in the United States, was incorporated in 1837. The city's future was assured when oil was discovered at nearby Spindletop in 1901; dredging of Houston's deepwater port was completed in 1914; and air-conditioning came to the Gulf Coast in the 1950s. The petrochemical industry is still strong in Houston, but today's economy includes aerospace, medical, biotechnology, technology, and transportation industries.

Print Media

Houston was served for more than a century by two dailies, the *Post* and the *Chronicle,* although

several dailies, most notably Scripps Howard's colorful and feisty *Press,* came and went. The *Press* stopped publishing in 1964, when its assets were acquired by the *Chronicle*.

The *Post* was published from 1880 to 1883, and then reappeared in 1885. It was purchased by William P. Hobby in 1939 and became the only Houston newspaper to win a Pulitzer Prize. It was sold in 1983 to the Toronto *Sun* and again four years later to Dean Singleton's MediaNews Group. The competition for readers and advertisers was strong during the 1980s and early 1990s. The *Post* and *Chronicle* competed aggressively for news, according to journalists at both papers, and both became more interesting and contemporary in appearance. Singleton sold the newspaper's assets in 1995 to the Hearst Corporation, already publisher of the *Chronicle,* and Houston became a one-daily town. Competition for news was greatly diminished following the *Post*'s demise. Some critics blamed the *Sun*'s stewardship and Singleton for running the *Post* into the ground, while others said if they gave the *Post* a dozen years, it would not have been otherwise.

The *Houston Chronicle* was born in 1901 when news reporter Marcellus E. Foster combined his own $5,000 with another $20,000 from investors to start the paper. Jesse H. Jones bought a share of the paper in 1908 and became the *Chronicle*'s sole owner in 1926. Jones left the paper to the Houston Endowment when he died in 1956. Hearst purchased the *Chronicle* in 1987.

Unlike many of America's biggest dailies, the *Chronicle* has never won a Pulitzer Prize. The newspaper flubbed perhaps its best opportunity when Enron, a global firm based in Houston and America's seventh largest company at the time, went belly-up. The *Chronicle* missed "a lot of red flags" signaling that Enron was in trouble, then managing editor Tommy Miller told the *Columbia Journalism Review*.

Chronicle management, probably under pressure from Hearst, has tried in recent years to maximize profit at the expense of quality journalism. Editors have published increasing numbers of soft features, sports stories, and promotions on a front page that once contained only hard news, and the editorial page has drastically reduced the space for op-ed contributions by non-syndicated writers.

Space for news in Section A, the *Chronicle*'s primary news section, also has been shrinking. The *Chronicle* devoted 106 pages in the third week (weekdays and Saturday) of November 2007 to Section A, compared to 124 pages during the same period just two years earlier. An average of three more pages were published each day during that 2005 week, and the percentage of space devoted to news in Section A pages did not expand appreciably in 2007.

When management announced in October 2007 a 5 percent cut in the workforce, publisher Jack Sweeney said in a memo that more resources would be dedicated to new technology and product development and that he would institute a "position elimination program." The *Chronicle* has devoted more resources to its website in a gamble the results of which may not be known for years.

The Houston *Press,* part of Village Voice Media, is the only other newspaper that has wide distribution (with a circulation of 300,000) in the city. The *Press* (not related to the Scripps Howard *Press*) is an alternative weekly that focuses mainly on Houston's cultural scene. It features entertainment news with occasional investigative stories about politics, government, and education. Suburban communities are served by Houston Community Newspapers, a group owned by ASP Westward LP. The group publishes 33 weeklies and two dailies (the Pasadena *Citizen* and *The Courier* of Montgomery County), all of which focus almost exclusively on local news. Baytown, with the *Sun,* is served by its own daily.

Broadcasting

Radio arrived in Houston in 1925 when the Hobby family established KPRC-AM. More than two dozen Houston stations broadcast today and more than twice that number broadcast from the suburbs into Houston. The program mix includes music, Christian, sports, news/talk, and Spanish stations—most of which do little quality news reporting. Even KTRH, 740 AM, once a solid all-news station, became a shadow of its former self when it was absorbed by the conservative Clear Channel Communications. KTRH reduced the time devoted to news and started filling the air with the opinions of conservative commentators such as Sean Hannity and Rush Limbaugh. News and alternative views

are available primarily on KPFT, 90.1 FM—one of the five Pacifica Network noncommercial stations—and KUHF, 88.7 FM—Houston's primary public radio station.

Houston is served by several major television stations, but the quality of local television news is uneven. Network affiliate Channels 11 and 13 typically produce the most highly rated newscasts, with Channels 2 and 26 trailing.

KHOU-TV, Channel 11 (CBS) started broadcasting from a Houston studio in 1958. KHOU was sold in 1984 to A. H. Belo Corporation. KHOU's investigative reports have won many national awards, including an Alfred I. duPont–Columbia University Award. The station's stories about problems with Firestone's radial 500 tire resulted in the recall of 6.5 million tires in 2000. Its stories about the flawed handling of DNA evidence by the Houston Police Department's crime lab in 2002 led to the release of individuals falsely convicted of crimes—and to changes in lab procedures and personnel.

KTRK-TV, Channel 13 (ABC) began broadcasting in 1955. Capital Cities Communications bought it in 1967 and KTRK became an ABC-owned station when Capital Cities bought the ABC network in 1986. Disney acquired Capital Cities/ABC through a merger in 1996. KTRK has an experienced staff, with several reporters and anchors boasting more than 20 years with the station. It also has a strong investigative team, which has garnered awards from the Associated Press, Investigative Reporters and Editors, the Academy of Television Arts & Sciences, and others.

KPRC-TV, Channel 2 (NBC) was purchased by the Hobby family, who owned the Houston *Post,* in 1950. It was one of NBC's first affiliate television stations. The Hobby family owned the station until 1994, when KPRC was sold to the Washington *Post.* Despite that ownership, KPRC is an also-ran among the big-three in local news. Even with strong anchors who are active in the community, its emphasis on sensational sex and violence stories has helped diminish its role in Houston.

KRIV-TV, Fox 26, first broadcast in 1971 as KVRL. The call letters were changed to KRIV in 1978 when Metromedia purchased the station. Media magnate Rupert Murdoch purchased Metromedia in 1986 and KRIV became part of the Fox television network. KRIV's evening newscast begins at 9 p.m., a disadvantage since it pits the newscast against popular prime-time programming on other channels. While KRIV occasionally passes KPRC in some ratings, it does not challenge KHOU or KTRK.

The University of Houston is the site of the nation's first public television station—KUHT-TV, Channel 8—which began broadcasting in 1953. KUHT was an early member of National Educational Television and helped form the Corporation for Public Broadcasting. KUHT has long provided access to lectures and other educational programming as well as nationally syndicated programs such as *Masterpiece Theatre, Sesame Street, Nature,* and the *NewsHour with Jim Lehrer.* Channel 8 airs stories about local events and people, but it does not offer comprehensive coverage of local news.

Houstonians have access to the usual array of Internet, satellite, and cable television services found in any major city. Time Warner Cable dominated Houston's cable industry until 2007, when Comcast Corporation assumed daily operations. Residents also can subscribe to services such as Dish Network, DirecTV, or AT&T's U-verse, which bundles Internet, television, and telephone services. Cable companies have provided some channels for local programming, but most have a troubled history. Houston MediaSource, for example, the nonprofit that runs the public access channel, lost most of its public funding after nudity and profanity were broadcast on some shows.

Key Figures

Jesse Jones and the Hobby family, both active in journalism and politics, are the major figures in Houston journalism, particularly in the 1950s and early 1960s when local journalism was feisty and aggressive.

The patriarch of the Hobby family was William P. Hobby, who served as a circulation clerk, city editor, and managing editor at the Houston *Post* before he purchased the paper. He also served as lieutenant governor and governor of Texas. Hobby's second wife, Oveta Culp Hobby (1905–95), commanded the Women's Army Auxiliary Corps (1942–19); served as the first secretary of the U.S. Department of Health, Education, and Welfare (1953–55); and was editor and publisher of the *Post* for many years. William P. Hobby (1932–), son of Oveta and William, was president

of the *Post* for two decades before it was sold in 1983. He chaired the board of H&C Communications until retiring in 1996. He was elected lieutenant governor of Texas in 1972.

Jesse H. Jones purchased a share in the *Houston Chronicle* in 1908 and became the sole owner in 1926. Jones, appointed by Woodrow Wilson to head military relief for the American Red Cross (1914–19), was a board member and then chair of the powerful Reconstruction Finance Corp., the United States' primary economic investor. Named RFC chairman in 1933, he became one of the most powerful men in America. He was named to head the Federal Loan Agency in 1939 and served concurrently as Secretary of Commerce (1940–45).

Journalistic Importance

Houston journalism is not as influential nationally—or even in Texas—as one might expect given the role of oil in the economy and the size of the market. One reason is that the news media are parts of media conglomerates that appear to value profit over good journalism. Early-twenty-first-century cutbacks at the *Chronicle,* for example, have produced the inevitable reduction in quality and the emphasis in local television news is still on sex, violence, and tragedy.

Despite this, local news media maintain some distance from government, education, and business leaders. If journalists stumble over a story that will affect a local company or city department negatively, they will go with it—and probably do a decent job. The Houston Police Department, the Houston Independent School District, and other public and private organizations have been the targets of investigative stories. Such stories are rare, however, for a city of Houston's size and economic importance.

Human Interest Journalism

The term *human interest* often appears on lists of news values—along with such criteria as impact, timeliness, prominence, and proximity—that ostensibly guide journalists in their decisions about news selection. Narrowly construed, human interest refers to an attribute of an event, issue, or topic that helps make that story deserving of news coverage. Stories involving cute children or animals, for instance, may be judged newsworthy primarily for their inherent appeal to human emotions. The attribute of human interest, on its own or in combination with other characteristics, often provides sufficient reason for journalistic attention.

From a broader perspective, human interest journalism may be seen as a genre in its own right.

Stories attempting to humanize subject matter that ordinarily seems dry or impersonal—for instance, an article that addresses problems of cost and access to medical care by relating the tale of an ill individual lacking health insurance—incorporate human interest not as an innate trait of what is covered but, rather, as an approach to coverage. In this more expansive view, the term refers not to specific subject matter but to how subjects are represented in the news. Human interest journalism is a mode of reporting that may be applied to a wide variety of news content.

Examples of human interest, as both distinct value and general approach, are not hard to find in news accounts across media, from print to broadcast to web outlets. A clear definition is harder to come by. However, most discussions of the concept—as value or genre or both—highlight several interrelated aspects. These include the commercial origins and impetus of human interest news; an emphasis on factors that accentuate audience appeal, whether in the service of entertainment for its own sake or for purposes of information and knowledge; personalization through a focus on individuals, who may be "ordinary" people, experts, or celebrities; and the blurring of public and private spheres.

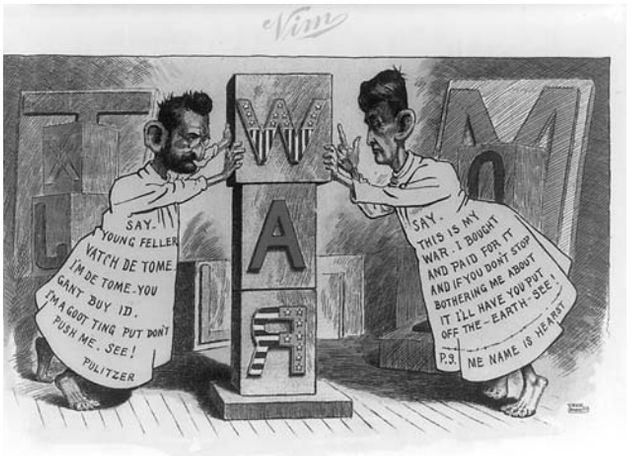
Development

Scholars trace the origins of human interest reporting to newspapers and magazines of the nineteenth century. The phenomenon, which emerged with the birth of the "penny press" in the 1830s and gathered steam in the "yellow journalism" of the 1890s, was part of a journalistic formula that emphasized entertainment, crime, sports, and other content catering to a mass readership in urban centers. The newly personalized approach to news, revolving around individuals, also provided opportunities for stylish writing that offered pictorial details of people's lives, appearances, feelings, and ideas in a conversational, even intimate tone. Improving technologies that facilitated use of illustrations and photography complemented this trend toward pictorial writing.

Another related development was the appearance of signed opinion and gossip columns that turned some journalists into personalities themselves. The human interest tradition also figures in the development of investigative and depth journalism, from emotion and vivid storytelling found in the work of the early-twentieth-century "muckrakers" to the sophisticated use of character, plot, and other narrative techniques of the "new journalists" in the 1960s.

Sociologist Helen McGill Hughes, whose 1940 book remains the definitive study, traces the specific origins of human interest journalism to the innovations of printer Benjamin Day, who founded the *New York Sun* in 1833 as a vehicle for "personal gossip, anecdotes, animal stories, and news of the police courts," preoccupations that proved an immediate success in the marketplace. The actual term *human interest* was first used at the *Sun* in the mid-1800s, Hughes says, in reference to "chatty little reports of tragic or comic incidents in the lives of the people." James Gordon Bennett followed suit with his *New York Herald,* founded in 1835, aiming to extend the news to additional "areas of life not hitherto reported."

Priced initially at a penny, such papers found a ready general audience; to cover costs, however, publishers were compelled to seek advertising, which required continued emphasis on stories with mass appeal. Publishing magnates Joseph Pulitzer, who purchased the New York *World* in 1883, and William Randoph Hearst, who bought the *New*



THE BIG TYPE WAR OF THE YELLOW KIDS.

Publishing magnates Joseph Pulitzer and William Randolph Hearst, depicted here as rival sensationalizing "yellow kids" in an 1898 cartoon by Leon Barritt, helped pioneer the use of the "human interest" angle to bring in readers to their newspapers.

York Journal in 1895, took the trend further with sensational stunts, campaigns, and crusades that drove newspaper circulation to new heights. Their brand of journalism consolidated the notion of news as a commodity, responsive first and foremost to its market, with human interest a central marketing device.

Although human interest journalism originated from presumptions about what common people share and are thus interested in, it also had a formative influence on celebrity journalism. In his 2002 scholarly study of the rise of the notion of celebrity from the 1890s to the 1940s, media studies researcher Charles Ponce de Leon shows how human interest reportage about movie stars, politicians, business titans, and athletes helped shape American thinking about public figures. Celebrity journalism incorporated democratic and individualistic values of the time, he says, to demonstrate the ways famous people were ordinary and flawed as well as outstanding, with the "master plot" about achievement of success and fame through talent and hard work foremost among the narratives arising from symbiotic interaction between journalists and celebrities after 1890.

Definitions and Variations

Although Hughes provides no single definition of human interest journalism, she describes it as "true stories of personal vicissitudes told with the exhaustive detail peculiar to gossip" and likens it to a "literature for the populace." Human interest stories are designed to provide diversion and generate excitement, she says; and their execution hinges on journalists' ability to capture ordinary people's experiences and resonate with readers' understandings of the world. Furthermore, she suggests, human interest stories are marginal to what might be considered serious or consequential news. Their news value lies not in any relevance to important public affairs or genuinely critical "interests" of citizens, but rather, in their ability to attract the largest audience of consumers.

Media researchers Gary Fine and Ryan White, in their study of how media covered the rescue of a man trapped in a cave in 1925, emphasize this quality of nonimportance, at least in the sense of bearing on specific public issues. In their definition, human interest stories "focus on the predicaments and circumstances of particular, but previously unknown, individuals in which the events are presented as irrelevant to public policy." They add that, although human interest may enter into any domain of reporting, from international relations to sports, "the archetypal human interest story involves an individual or group previously unknown to the media audience who must face adversity."

Hughes identifies a roster of "perennial stories" with human interest at the core, including "life's little ironies," hinging on quixotic and often amusing anecdotes; "changes of fortune," whether for good or ill; "the lost child," a particularly familiar trope that takes what once belonged solely to the domestic sphere into the public arena; "romantic adventure," with thrills and vicissitudes; stories about mysterious, unknown, uncontrollable, or unexplained phenomena; animal stories, ranging from the adorable to the amazing; and a fairly amorphous category she calls "the human side of the news," touching on experiences or emotions common to human beings generally.

Fine and White offer the motif of "entrapment stories"—be it a child trapped in a well, miners trapped in a cave-in, or beached whales—and explain the enduring appeal of such stories in terms that also help illuminate Hughes's categories. Such stories, first, evoke psychological fears or archetypes that are recognizable to a collective audience. Second, these stories offer a sequence of events and time duration that tend to accord with typical news cycles, thus matching the logistical needs of media outlets. Finally, entrapment stories, because they generally involve rescue efforts, respond to human hopes that actions can be taken to solve problems.

Another common story line is that of individuals struck by random forces—natural disaster, accident, illness, or other afflictions they cannot control. These human interest stories may revolve around victims, or around the heroic deeds of rescuers, or both. They often have trajectories of action that pose a clear moral duality between good and bad. Human interest stories have strong affective dimensions designed to provoke empathy and identification, even when the people in the stories are caught up in unlikely events.

Developing Human Interest News

In the space of a century, the human interest approach, with detailed characterization and

compelling storytelling aimed at producing an emotional response and a satisfying aesthetic experience, became widespread. What was once a journalistic novelty is now well established in print and electronic media. And the advent of "citizen journalism" on the Internet, which provides opportunities for individuals to share personal and community stories, has added new dimensions to the genre.

Books, periodicals, and websites offering advice for writers commonly identify human interest as a marketable category, distinguished by poignant narratives that tug at the heartstrings about subjects that readers are assumed to relate to. A typical theme is facing and overcoming adversity, as in stories of raising a physically or mentally challenged child, coping with cancer, or managing divorce. Stories of crisis and disaster in which ordinary people rise to the occasion are standard, as are stories in which famous people appear down-to-earth. The advent of *People* magazine in 1974, with contents centering on famous people in ordinary circumstances and ordinary people in extraordinary circumstances, stretched contemporary applications of human interest in both these directions.

A prime exemplar of the human interest formula's enduring power is the long run of *Reader's Digest,* which has specialized in real-life dramas and people-centered narratives since its inception in 1922, and by its one thousandth issue in 2005, had 48 different foreign language editions reaching a worldwide readership of 41 million. Categories enumerated on the publication's website exemplify stock story lines—Action Stories, Inspiring Stories, Survival Stories, and Amazing People. A section devoted to "Heroes and Stories of Bravery" celebrates "everyday heroes who risk their lives to help others…without expectation of accolades or even a thank-you." The heroes can range from people helping inner-city kids develop job skills to escape gang life to environmental activists cleaning up coastlines, and from parents who bust cyberspace porn rings to mugging victims who confront and overpower their attackers. Sometimes the heroes are pets that thwart burglars, rescue children from house fires, or save their owners from drowning.

Meanwhile, human interest strategies have become engrained in broadcasting as well as all varieties of print. On television, human interest is the premise for the light, fluffy pieces that appear as kickers in local newscasts; a key dimension of the softer, longer-form journalism in TV news magazines; and a driver of the popularity of "tabloid TV," including true-crime and other reality programming. Melodramas of everyday life have also become staples of talk shows such as *The Oprah Winfrey Show* that probe what once were invisible, private matters such as domestic abuse and drug addiction and give them quite public visibility.

Interpretations

Journalism scholars and critics agree that modern media are saturated with human interest accounts, and also agree that the phenomenon arises from commercial imperatives that may conflict with higher journalism ideals. In the U.S. context, journalism claims to perform the important political function of providing people with information they need to operate as citizens in a democracy. At the same time, journalism as a commercial proposition must address people in their roles as consumers. The extent to which human interest promotes one or the other objective is a matter of continuing debate.

Hughes portrays human interest in journalism primarily as a distraction from matters of public consequence. Fine and White, however, believe that human interest stories that might seem trivial actually can have far-reaching public import because they create a basis for public discourse. In particular, they argue, developing coverage of a human interest story over time can help forge a sense of community among audience members attending to and discussing the story.

Other analysts regard human interest as a double-edged sword that can either dilute or strengthen attention to consequential issues: At one extreme, when employed with the motivation of audience expansion—as seen, for instance, in the proliferation of reality crime shows that invite uncritical vicarious participation in police raids and other strong-arm activities—human interest journalism becomes gratuitous sensationalism, pandering to the most voyeuristic propensities of media consumers. On the other hand, when employed to expand on hard news or complex topics—seen in compassionate immersion coverage of AIDS patients and caregivers, for instance—a human interest strategy can enhance understanding and concern for widespread issues and problems by getting

readers, listeners, and viewers more fully engrossed, and thus empower them as citizens.

In a 2001 book, Committee of Concerned Journalists members Bill Kovach and Tom Rosenstiel suggest that human interest can function as a point of articulation that simultaneously addresses consumer desires and citizen needs. In advocating a list of essential "elements of journalism," they include the necessity of striving to make "significant" stories "interesting and relevant"—in other words, even serious news must be presented in a manner that avoids boring or alienating audiences. In their formulation, human interest journalism is an integral part of the tool kit of public interest journalism.

Conclusion

Communications researcher Ib Bondebjerg, in a 1996 study of the human interest properties of tabloid television, analyzes how private life stories increasingly have moved into the public sphere in a process that has changed established forms of journalism. He offers mixed reviews of what he calls the "hybridization of public and private discourse," seeing these new hybrids as positive in the sense that they enlarge space and legitimacy granted to "common knowledge and everyday experience"; but he is also dubious about the development, since making all kinds of private fodder for public discussion doesn't necessarily foster more sophisticated understanding and critical perspectives on the world.

Clearly, the human interest rationale has illuminated many topics that used to be off-limits to mass media, from intimate traumas faced by ordinary people to personal peccadilloes committed by politicians and other celebrities. The fundamental issue may be whether human interest journalism has enhanced or attenuated journalism's public interest role. At its crassest, human interest treatment of grave issues such as crime, political corruption, poverty, unemployment, drug and alcohol abuse, domestic violence, or child abuse may merely simplify and stereotype social distress. At its best, however, human interest journalism can generate awareness of important social issues and problems, bring valuable new voices into crucial public debates, and promote popular involvement in civic affairs.

Images, Ownership of

Ownership of a photograph is vested with the owner of the photo's copyright, which may be the photographer, his designated agent or an employer. Under American federal copyright law, an image receives copyright protection from the moment it is "fixed in a tangible medium of expression" and as long as it possesses sufficient originality. Since the advent of digital technology, federal courts have ruled that for the purposes of copyright, a digital image file constitutes a tangible medium of expression, and copyright law generally acknowledges digital works as copyrightable. According to *Nimmer on Copyright,* the authoritative legal treatise on copyright law, most photographs also contain sufficient originality—in legal terms—to support a claim of copyright.

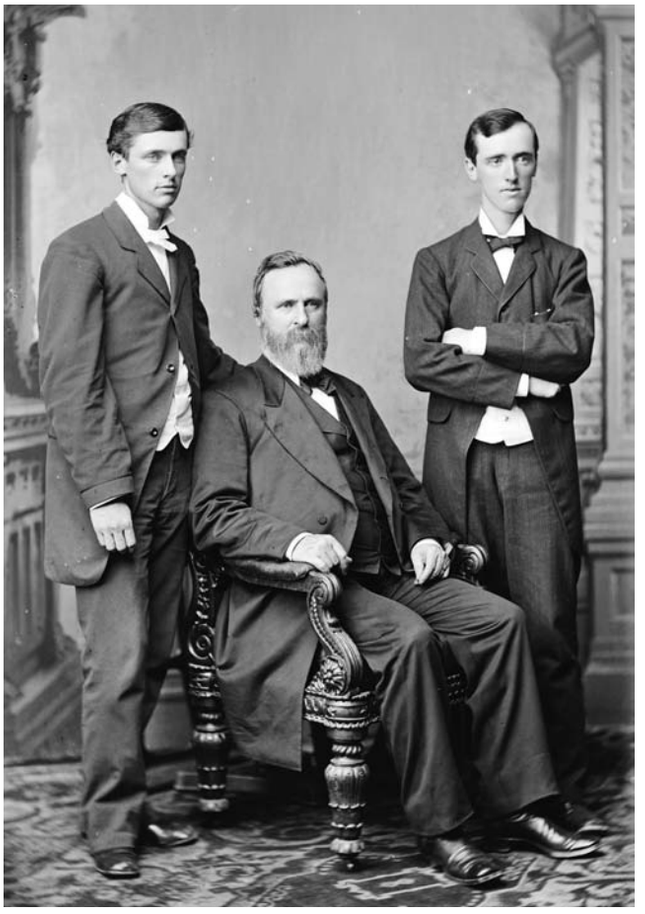
By receiving copyright protection of their images, owners of such works are entitled to all the rights awarded to other copyright holders, such as authors or composers. Those include the exclusive right to reproduction, making derivative works or copies, and performance and display of the copyrighted images. Thus, those who wish to use a copyrighted photograph must first seek permission from its owner, unless the use is a "fair use" as discussed below.

Early Photography Ownership

Claiming ownership in a photo was not always a given, particularly during the beginnings of photography in the late nineteenth century. While commercial photography existed as early as the 1830s, it wasn't until March 1865 that the U.S. Congress passed a law giving photos copyright protection. In amending the 1831 Copyright Act, Congress agreed that photographers should receive a copyright in their work "upon the same conditions as to the authors of prints and engravings."

Reasons for the delay in protecting photographs may never be fully understood. Increased post–Civil War commercial popularity of portraiture photography by suc h famous photographers as Mathew Brady (c a. 1823–96) led to widespread piracy and calls for protection. But painters and other artists criticized photography for its mimicry and inability to rise to the level of "true art." As Christine Farley noted, "at that time, the photograph was not seen as the product of an author, but rather the product of a machine. The photograph was seen as having the ability to represent nature; to produce an unmediated copy of the real world. The medium itself was transparent." Such views probably contributed to the delay. Indeed, the sense that photography merely reproduced life rather than interpreted it led some to conclude that photography lacked sufficient originality to warrant copyright protection.

Such was the heart of the dispute challenging Congress's amendment in the Supreme Court case *Burrow-Giles Lithographic Co. v. Sarony* in 1884. *Burrow-Giles* is frequently cited in copyright law for its discussion about standards of originality.



The abuse of rights to use formal portraits—such as this shot of President Rutherford B. Hayes and his two sons taken at the studios of Mathew Brady and Levin C. Handy (Brady's nephew)—encouraged the eventual congressional enactment of protections for unauthorized usage of photographs.

Source: Library of Congress.

Prominent portrait photographer Napoleon Sarony (1821–96) sued the Burrow-Giles lithographic company for violating his copyright on a photo titled "Oscar Wilde 18." While Burrow-Giles sold 85,000 copies of the photo without Sarony's permission, they argued that photographs did not deserve copyright protection because they did not involve authorship. They were, the lithographer argued, simply a result of a mechanical process: ". . . the mere mechanical reproduction of the physical features or outlines of some object, animate or inanimate, and involve no originality of thought or any novelty in the intellectual operation connected with is visible reproduction in [the] shape of a picture."

While the Court acknowledged that some photos may be so "ordinary" as not to be original, in the case of the Wilde photograph, it was a

> new, harmonious . . . and graceful picture, . . . that plaintiff made . . . entirely from his own mental conception, to which he gave visible form by posing the said Oscar Wilde in front of the camera, selecting and arranging the costume, draperies, and other various accessories in said photograph, arranging the subject so as to present graceful outlines, arranging and disposing the light and shade, suggesting and evoking the desired expression, and from such disposition, arrangement, or representation, made entirely by plaintiff, he produced the picture in suit. (111 U.S. 53, 55 [1884])

In cases since, courts have acknowledged two general principles: An author is someone who creates the work himself, and the author's work must result from creative choice, such as the selection and arrangement of lighting, costume, and other elements. Nineteen years after *Burrow-Giles,* the Court eliminated the distinction between the artistic and the ordinary in *Bleistein v. Donaldson Lithographing Co.,* finding that even a small expression of "personality always contains something unique" enough to qualify for copyright protection. The Court noted that future decisions might reject authorship in a work within "the narrowest and most obvious limits," but generally speaking, most photographs today are commonly accepted as original and creative works of expression. The Court's 1990 decision in *Feist v. Rural Publications* established that copyrighted works need only contain a "minimum level of creativity" to sustain the right.

Disputes Over Fair Use of Visual Images

While there is no single legal test for determining originality of photos, courts in cases since *Burrow-Giles* and *Bleistein* have found numerous creative elements in visual images: the arrangement of light, selected camera angles, the selection of cameras and film, the artistic talent selected and the pose struck, the timing of a photo, and the choice of subject matter, among others. Thus, in 1968, a federal district court found that Abraham Zapruder's (1905–70) film of the assassination of

President John F. Kennedy was copyrightable because Zapruder had selected the kind of camera, film, and lens, and he had selected the area and time in which the film would be taken. In 1986, a federal appeals court said the broadcast of a major league baseball game was copyrightable because of the decisions regarding camera angles, types of shots, and instant replays that went into the broadcasting of the game.

While a copyright extends to the photographer's print, it may not extend to the subject matter. For example, while a photographer's photo of a public building or a natural scene may be copyrighted, such a copyright does not prevent others from also photographing the same scene. Likewise, a telecast of a sporting or entertainment event may be owned by the organization producing the event, but the game or concert event itself cannot be copyrighted.

One exception to this principle is when a visual artist creates the scene or subject matter himself and the accused infringer re-creates that scene. Thus, in *Rogers v. Koons,* a 1992 federal court case, the court found that Jeff Koons's three-dimensional sculpture of a staged scene by photographer Art Rogers constituted copyright infringement. Koons re-created in sculpture a photo of a man and his wife holding eight puppies on a park bench. In this case, Koons not only copied the idea of a man and his wife holding puppies—which in itself was not protectible—but copied the exact expression represented in Rogers's photo. This the court found to be infringement.

Furthermore, some images may be protected by the Visual Artists Rights Act of 1990 (VARA) which gives some artists rights of attribution and integrity—essentially a moral right to their work. This right, however, is limited to paintings, drawings, prints, or sculptures, existing in a single copy, in a limited edition of up to 200 copies that are signed and consecutively numbered by the author. In the case of photos, the act applies to a still photographic image produced for exhibition purposes only, and meeting the same criteria. VARA grants several rights, including preventing the use of one's name on any work the author did not create; or on any work that has been distorted, mutilated, or modified in a way that would be prejudicial to the author's honor or reputation; and the right to prevent distortion, mutilation, or modification that would prejudice the author's honor or reputation.

An exception to the reuse of images that favors new users, however, may be found under the copyright fair use provisions. Section 107 of the Copyright Act of 1976 permits the use of copyrighted works without permission if the use has some social or public benefit. The section contains four factors for courts to weigh in a determination of a fair use, but to know for certain if a use is fair, a user must first copy the work and then seek a court's ruling. Critics of the fair use section find it highly subjective, open-ended, and difficult for users to determine in advance of a legal determination. The four fair use factors include the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes; the nature of the copyrighted work; the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and the effect of the use upon the potential market for or value of the copyrighted work. Courts must weigh each factor independently.

Much of the visual image fair use debate centers on the degree of "transformation." If, in the Supreme Court's words, the new use of the copyrighted work "adds something new, with a further purpose or different character, altering the first with new expression, meaning or message," the new work is then transformed, and deemed fair. Thus, new visual images that "transform" copyrighted images may be a fair use. For example, when artist Jeff Koons appropriated a photo for conversion to a sculpture in 2005, a federal appeals court said the new use was "transformative." In *Blanch v. Koons,* fashion photographer Andrea Blanch created a photo for a fashion magazine of a woman's lower legs and feet wearing Gucci sandals resting on a man's lap in an airplane. Koons copied the legs and feet and changed their orientation so that they pointed downward and then incorporated them into a collage with other pairs of women's feet and legs, all dangling over images of food and landscapes. In finding for Koons, the court wrote,

> Koons is, by his own undisputed description, using Blanch's image as fodder for his commentary on the social and aesthetic consequences of mass media. His stated objective is thus not to repackage . . . [the photo], but to employ it in the creation of new information, new aesthetics, new insights and understandings.

Images as Works for Hire

Authorship of images is another area in which disputes have arisen, particularly between photographers and those companies and others that have hired them as independent contractors. U.S. copyright law states that a protected work "vests initially in the author or authors of the work." But section 201(b) of the Act provides that "[i]n the case of a *work made for hire,* the employer or other person for whom the work was prepared is considered the author . . . unless the parties have expressly agreed otherwise in a written document instrument signed by them. . . . "

The work for hire doctrine is an exception to the rule that the copyright in a visual image vests with its creator. As such, according to law professors Rochelle Dreyfuss and Roberta Kwall, the United States is likely the only country that allows the employer of a work's creator to obtain authorship status. This is different from most European and Third World nations that recognize "moral rights" in a work, a doctrine that protects a creator's personal rather than economic rights in a work. Thus, U.S. owners and corporations wield significant intellectual property power in the permission scheme to reuse copyrighted works and garner significant profits, rather than the individual who necessarily created the work for the owner or corporation. U.S. copyright law defines a work made for hire as

1. a work prepared by an employee within the scope of his or her employment; or
2. a work specially ordered or commissioned for use as a contribution to a collective work, as part of a motion picture or other audiovisual work, as a translation, as a supplementary work, as a compilation, as an instructional text, as a test, as answer material for a test, or as an atlas, if the parties expressly agree in a written instrument signed by them that the work shall be considered a work for hire.

Determining whether a work is made for hire involves an examination of the relationship between the creator of the work and the entity requesting the work. Disputes arise when that relationship is not contracted, or the contract is vague, or when the nature of the creator's employment is not clearly either as a full-time employee or as an independent contractor.

In *Community for Creative Non-Violence v. Reid* (1989), the plaintiff was a nonprofit organization that sought to raise attention to homelessness by commissioning a sculpture of homeless people from artist James Earl Reid (1942–) who later claimed he owned the work, which led to the case. The Supreme Court held that to determine whether a work is made for hire, one must first determine whether the work was prepared by (1) an employee or (2) an independent contractor. If the former, the work is a work made for hire. If the latter, then the work is specially ordered or commissioned. To be a "work for hire," it must come within one of the nine categories listed in the second part of the definition above, and there must be agreement between the parties specifying that the work *is* one made for hire.

In ruling for Reid, the Court identified thirteen factors to help define the nature of the employer relationship to the creator:

> the hiring party's right to control the manner and means by which the product is accomplished . . .; the skill required; the source of the instrumentalities and tools; the location of the work; the duration of the relationship between the parties; whether the hiring party has the right to assign additional projects to the hired party; the extent of the hired party's discretion over when and how long to work; the method of payment; the hired party's role in hiring and paying assistants; whether the work is part of the regular business of the hiring party; whether the hiring party is in business; the provision of employer benefits; and the tax treatment of the hired party.

Thus, freelance photographers and other visual artists are particularly impacted by the work for hire relationship and are often advised to be clear in both their contracted relationship to the entity requesting their services and what the entity will own after the relationship is over.

This admonition has become particularly important after *New York Times Co. v. Tasini,* a 2001 U.S. Supreme Court case that ruled freelancers are entitled to negotiate the electronic rights to their work and that publishers may not assume those rights are part of the collective work of a publication for the

purposes of resale and redistribution. Prior to *Tasini,* much of the work provided by freelancers (both writers and photographers) was done on the basis of oral agreement with a publisher, and publishers mostly assumed all rights in the material once produced. Since the victory for freelancers in *Tasini,* however, the *Times* and other publishers have actively sought to retroactively license pre-*Tasini* works as well as arrange work for hire contracts with very detailed rights provisions:

> In addition to the foregoing, you hereby grant to *The Times* a perpetual, worldwide, royalty-free, paid-up non-exclusive transferable license under copyright to reproduce, distribute, display, perform, translate or otherwise publish your Prior Contributions in any form or media, whether now known or that may hereafter be developed, whether or not any such Prior Contribution may be individually accessed, perceived or retrieved from such form or media, and to authorize third parties to exercise such rights, provided that this license shall be limited to the use of Prior Contributions in forms or media that contain other articles from *The Times*.

Critics of the *Tasini* decision have argued that while winning the "war," freelancers lost the "battle" in *Tasini*. Such critics argue that, though freelancers were victorious in the Supreme Court "war," the effect was to put them into a daily "battle" with content providers, a worse position than they occupied before the case because they are forced to assign more rights than before or risk losing their freelance contracts.

Image Business Consolidation

Another factor in image ownership is the consolidation of image or photo stock houses. Several of the surviving companies have amassed image collections numbering in the millions. Many of these own rights to some of the most famous images of our time.

Until the 1990s, according to David Walker (2005), the stock photo business consisted of a series of small "mom-and-pop" agencies that published and distributed free printed catalogs to customers. Customers scanned the catalogs for photos and made requests for use by telephone. Legions of picture researchers found film negatives, reprinted the photos requested and sent the photos out by mail. Photographers sent their outtakes to stock houses from various assignments and split the proceeds 50/50 with the stock house.

The advent of digital photography and the digital darkroom drastically changed that paradigm. In the late 1980s, Microsoft CEO Bill Gates (1955–) started Corbis and envisioned it would be a "New Alexandria" (referring to the great ancient library) by collecting images that captured the entire human experience. Corbis collected and digitized 2 million images and funded photographers to take photos to add to the collection. It also struck deals with major museums such as the Hermitage in St. Petersburg and the National Gallery in London and with photographers such as Ansel Adams (1902–84) for digital distribution rights. In 1995, Corbis acquired the Bettmann Archive, an enormous collection of 16 million images, including some of the most famous news images of the twentieth century. Most of these had been acquired by Bettmann from United Press International in 1990. As the number-two player in the stock photo business, Corbis's total revenues for 2006 exceeded $251 million.

The top player in the stock photo business as of 2007 was Getty Images. Investment bankers Jonathan Klein and Mark Getty formed the company in 1995 after identifying an industry on the verge of technological change and opportunity. They first acquired Tony Stone Images, one of the largest collections of commercial stock images, and went on to acquire several other reputable stock houses including Hulton-Deutsch, Energy Film Library, The Image Bank, Visual Communications Group, and PhotoDisc (a pioneer in allowing customers to buy photos online). Getty spent tens of millions of dollars upgrading its online ordering site, and has opened it to competitors. In 2007, Getty revenues grew to $807 million just as Getty announced acquisitions of WireImage and Jupiterimages. Although Corbis and Getty focus primarily on commercial photography, they have challenged traditional journalistic outlets in editorial photography because of their size and their ability to provide so much choice so quickly to buyers.

Industry consolidation has affected the rights schema for photographers. Some photos are still sold under a "rights managed" (RM) structure,

where stock houses license use of images on a use-by-use basis and photographers and agencies both profit. Increasingly, though, more photos are being sold under a "royalty-free" (RF) structure, in which images may be used by a licensee multiple times for multiple projects without incurring additional fees. This, combined with the advent of free photo-sharing web consumer sites like Zoomr and Flickr, is impacting what additional revenue a photographer might make selling his or her photos to a stock agency. Where Getty and Corbis serve large media corporations in need of a high quality image quickly and legally, start-up sites like Zoomr and Flickr are providing more access to more photos for less money to more people and are challenging the high-cost, infrastructure-heavy business models of Getty and Corbis.

Summary

Ownership of images is intimately tied to changes in U.S. copyright law, which since 1865 has extended copyright protection to photography and later, digital images. Complicating the ownership paradigm has been whether photos are sufficiently original to qualify for copyright protection and whether some photos may be reused fairly, particularly in the age of digital manipulation. The assignment of image rights in "work for hire" relationships has also complicated the image ownership issue, and those disputes have routinely been battled out in court. Consolidation of the traditional photo stock houses has also challenged the livelihood of photographers who relied on the resale of photography for income. The ease with which photos are now uploaded to and downloaded from the World Wide Web nearly erases the search and delivery hassles of image delivery during the last century. What remains are rights clearance issues, which the photo stock houses continue to negotiate between photo taker and photo user. Ultimately, the market value of an image remains in the permission and cost to reuse it.

Immigration, Coverage of

As a nation of immigrants, the United States' relation to the many waves of newcomers is complex, and the reaction that greets the recent arrivals varies. The role of journalism as it relates to immigration is multifaceted: immigrant news outlets help orient the newcomers; mainstream news operations seek to explain to the larger society the makeup of the immigrant community, the underlying forces that pushed those newcomers out of their country, and those that drew them here. Journalists covering the topic of immigration, whether working for immigrant or mainstream media organizations, strive to explore and analyze the impact of immigrant populations.

Development

Immigration is a perpetual subject of news stories in the United States. Mainstream outlets at times have embraced newcomers, and the labor and other capital they bring, while at other times the news media have characterized immigrants as spoilers who deprive Americans of economic well-being, and threaten to erode the "American way of life." More nuanced journalistic representations, particularly since 1980, have tackled fundamental issues, including how U.S. foreign policy has contributed to the arrival of refugees and asylum-seekers, the development of immigration reform legislation, and the impact of legal and

illegal immigration on local communities and industries.

An overriding contemporary theme has been the explosion in U.S. immigration. In 2005, foreign-born residents in the United States made up 12.4 percent of the population, according to Census figures, up from 4.7 percent in 1970. University of California, Irvine, demographer Frank D. Bean estimated that in 2001, there were 7.8 million illegal immigrants in the United States and that of those, 4.5 million were from Mexico. Researchers suggest that the illegal population has continued to grow since then.

Journalists have sought to address the presence of new immigrant populations in locations in states like Idaho, North Carolina, and Nebraska. One continuing challenge for journalists is attempting to quantify the numbers of residents who did not secure proper government authorization to enter the U.S. Census figures may address only the official record, and make only a broad approximation of the invisible, undocumented immigrants. Resourceful reporters know to cross-check those numbers with input from community institutions, such as churches, social service agencies, and schools.

News coverage of immigration challenges the ethics of journalism in several ways and raises important questions about the practice of journalism. Among these questions are whether journalists are too protective of their sources when they use pseudonyms for people who may well be deported if their true name is published; when and whether it is necessary to report the actions and reactions of a small group, such as the anti-immigrant Minute Men, for the purposes of offering an "opposing viewpoint"; whether Hispanic reporters identify too strongly with Latin American immigrants; and when the fact of a person's citizenship, or residency status, is relevant to a news story.

Immigrant Ethnic News Operations

It is commonplace for news publications to emerge from immigrant communities, serving as a bridge between the newcomers and their adopted country, providing news from back home, as well as orienting them to their new country's ways. These immigrant ethnic newspapers are often initiated to fill a gap in information provided by the mainstream news outlets in the same market. At various times, these ethnic immigrant presses have served other functions as well:

- to protest discrimination;
- to serve as a historical record of the contributions and challenges of that group;
- to provide news and information that might be censored by the government back home, as was the case of the Philippino exiles in the 1970s;
- to serve as a message-exchange service;
- as a way to lift the morale and raise the aspirations of a community; and
- to maintain the ethnic culture, and in some cases, its language.

Often published or broadcast in the native language of the group, the perspective on current events involving the group may be markedly different from the mainstream news operation in the same market. Mainstream journalists may find these ethnic outlets useful in understanding and keeping abreast of an ethnic immigrant community.

Mainstream Coverage

Since its early years, the United States has experienced several waves of immigration from different racial, ethnic, linguistic, and/or religious backgrounds. Each wave has ushered in a "nativist," anti-immigrant reaction, one that has been closely linked to the mainstream news coverage of that immigrant group—a kind of warning bell of the dangers that the group represented. At various points, mainstream media have carried fiercely anti-immigrant cartoons and news stories. One matter for journalists to consider is whether, or to what degree, biased news coverage merely reflects societal rejection of the immigrant community or whether, or how much, that negative news coverage shapes harsh attitudes toward immigrants.

The Statue of Liberty in New York harbor came to symbolize, particularly in political cartoons, the huge wave of immigration, from 1870 to 1920, when over 26 million people came to the United States, largely from Italy, Austria-Hungary, and Russia. Not all came through New York's Ellis Island entry station, however: Canadians and Mexicans were also arriving over their respective borders. The bulk of newcomers in the mid-1800s

were generally less skilled and educated than the general population. With large numbers of poor people, there is generally a backlash in the news media and in public opinion.

Around 1.5 million Irish left their homeland to escape the potato famine between 1840 and 1860. The newcomers, some of whom spoke only Gaelic, took low-skilled jobs, including building the 363-mile-long Erie Canal from Albany to Buffalo, and worked for as little as 50 cents a day. Irish Catholics were often resented and characterized as lazy, ignorant drunkards in the newspapers of the day. In the 1830s, for example, a nativist philosophy underlay the publication of several anti-Catholic and anti-Irish newspapers. These newspapers, which had names like *The Protestant* and the *American Patriot,* sought to create the impression that the Catholic church was infiltrating the United States and that the Pope would instruct his flocks on how to subvert the U.S. government.

Germans were also subjected to prejudiced coverage. One example was the 1886 Haymarket Affair, a Chicago riot in which 17 were killed after a protest organized by an anarchist group. Five of the seven men accused of involvement in the incident were German immigrants. The *Albany Law Journal* described the Germans as "long-haired, wild-eyed, bad-smelling, atheistic, reckless foreign wretches, who never did an honest day's work in their lives."

Chinese came under attack on the west coast in the 1880s. The *San Francisco Chronicle* ran negative stories about the large Chinese immigrant population. Two decades later, the targets of the negative coverage were Japanese immigrants. The *Chronicle* supported a boycott of Japanese businesses. Many other West Coast papers took similar stands.

But in times when there was a need for large numbers of laborers, the news media appeared to welcome arrivals from afar. For instance, after the Civil War, as the country began to expand, there was a need for more people to populate its western frontier. Some news media painted a glowing picture of what immigrants would find in the United States and how easy it would be to attract them. An 1864 *Chicago Tribune* editorial declared that Europe would "open her gates like a conquered city. Her people will come forth to us subdued by admiration of our glory and envy of our perfect peace. On the Rocky Mountains and still over to the Pacific our mighty populations will spread.... Our thirty millions will be tripled in thirty years."

But among the newcomers were people whose political ideologies threatened American capitalism. *Harper's Weekly* cartoonist Thomas Nast in 1874 used a top-hatted skeletal figure to indicate what communism would signify for Americans.

Mainstream journalists and cartoonists also defended the immigrants. English immigrant Bernhard Gillam became an influential cartoonist who showed particular sympathy for Chinese immigrants. In one cartoon, Gillam depicted a Chinese man in pigtail, traditional trousers, and tunic top, his pointy hat on the ground, being beset by a mob of white men wielding clubs on which are written their constituents: Democrats, Republicans, Independents. The title on the cartoon: "They Are Pretty Safe There. When Politicians do Agree, their Unanimity is Wonderful." Yet in cartoons about other immigrant groups, Gillam betrays his own prejudices, skewering Irish immigrants and depicting them as apes.

This period was important for its creation of immigration law. In 1882, for instance, Congress, hard pressed by West Coast interests that were reflected in emotional press coverage, passed the Chinese Exclusion Act, suspending new immigration of Chinese laborers to the United States for ten years; the law was later extended and was the first U.S. law to ban a group of immigrants based on race or nationality.

The Spanish-American War of 1898 encouraged further immigration, as the United States took control of Cuba, the Philippines, Guam, and Puerto Rico, providing citizens of those four colonies easy entry into the U.S. mainland. Later wars effected immigration as well. After the United States left Vietnam in 1973, for example, over 700,000 Vietnamese were eventually given refugee status in the United States and news coverage of the Vietnamese refugees pointed to difficulties faced by the new arrivals. In Louisiana, news operations reported that the Vietnamese were perceived by the African American workers as competing for jobs. In the late 1970s, fishermen in Plaquemines Parish, 40 miles southeast of New Orleans, accused the Vietnamese of killing their pet dogs and cats for food and of wearing sleeping clothes as day wear—for the Vietnamese these "pajamas" were similar

to the clothes that they wore in their homeland. The media's depiction of Vietnamese integration ultimately may have overemphasized its "problems" at the expense of more positive and sympathetic stories.

Changing Policies

In modern times, mainstream journalism has generally sought to present fair coverage of immigrant issues. The National Association of Hispanic Journalists in 2006 offered guidelines to news organizations, urging them to drop the use of "illegal alien" which the NAHJ said, "dehumanize" those who arrive without legal permission. For journalists, the growing numbers of immigrants, and the varied government and private efforts to stymie the flow, has led to serious discussions about the ethics of covering those who chose to come without government authority. By 2008, it was standard practice for news operations to omit identifying characteristics of unauthorized immigrants, because to do otherwise will lead invariably to deportation. But some critics have wondered if the journalistic use of pseudonyms and otherwise protecting the identities of this vulnerable population ultimately serves to support their presence.

By the end of the twentieth century, immigration became a hot political issue, one covered at great length by the news media. Immigration also became a hot-button topic for conservative radio and television commentators who characterized the immigrant community as lawbreakers. Perhaps the most virulent to emerge was Michael Savage, who told listeners in August 2008 that "America is being overrun by an invasion force from Mexico that'll soon take over the country." Other conservative anti-immigrant commentators, including CNN's Lou Dobbs and talk radio host Rush Limbaugh, consistently denigrated immigrants as well. Audience members of anti-immigrant commentators often voice their approval of the message and register their own opinions with lawmakers, further politicizing the immigration debate. There have been some politicians who have used the immigration debate to garner media attention, energize an anti-immigrant vote and secure elections.

In 2006, after Congress attempted to pass harsh immigration restrictions, immigrants and their sympathizers held massive protest rallies across the country, coming out of the shadows in an unprecedented and astounding display of force. The rallies took place in the spring of 2006 and were largely organized by Spanish-language radio talk show hosts. Mainstream news operation managers were unaware of the buildup in the weeks before the rally until just a few days before—a fact that speaks to the disconnect between the mainstream news media and the immigrant community. The rallies themselves were page one, top-of-the-newscast events. One 40-year-old Peruvian immigrant who volunteered in the May 2006 rally in Philadelphia told the Associated Press that the protesters had succeeded in making the immigration debate—and the Latino immigrants' strong opposition to harsh measures—known to a broad audience.

Immigration has far-reaching policy implications, and several federal laws have had longstanding effects. For instance, after the 1959 takeover of Cuba by Fidel Castro's forces, Cuban immigrants became the beneficiaries of a major U.S. cold war policy shift. Cubans were dubbed "refugees" fleeing communism, and the federal government made available various programs to smooth their adjustment. Later Cuban immigrants faced resistance, in particular after the 1980 to 1981 influx of nearly 125,000 Cubans who were allowed to leave from the Port of Mariel. The American news media's characterization of the early Cuban settlers was sympathetic, and while the media was also sympathetic to the so-called Marielitos in the days following their arrival, the tone of news coverage changed when it was revealed that Castro had deported "undesirables," which included homosexuals, the mentally ill, and criminals. Researchers found that news coverage of the Marielitos turned public opinion against the newcomers.

Few immigrant communities have been as successful as the Cubans in Miami at affecting news coverage. Militant anti-Castro Cubans have been able to influence coverage by threatening journalists who are not strident enough in criticizing Fidel Castro. On January 21, 1992, Jorge Mas Canosa, who headed the Miami-based Cuban American National Foundation, told listeners of a Miami radio broadcast that the *Miami Herald* and *El Nuevo Herald* were siding with the Castro government and that the two papers were openly hostile toward Cuban exiles while simultaneously

benefiting from their support. The Foundation threatened the *Miami Herald* with boycotts and journalists received threatening phone calls. Critics of the Cuban American Foundation maintained that Mas Conosa had effectively silenced critics and declared himself and the Foundation as the only source for Cuban authorities.

In sum, immigration stories offer a rich array of story possibilities, including economics, demographics, coverage of various levels of government, the courts, and even, on occasion, sports, not to mention cultural and language concerns. Immigration experts note that as long as there is a pervasive disparity of wealth and opportunities between the United States and other countries, from faraway nations as well as immediate neighbors, immigration will continue to be an important issue for journalists to explore and explain.

Indecency and Obscenity

Who can say what about sex in print or on air is of enduring concern to journalists because every new means of communication is accompanied by some complaint about its misuse. Knowledge of the definitions of and laws governing obscene and/or indecent speech is thus fundamental to news stories about how or why any medium should be restrained. Moreover, and regardless of the mode, a familiarity with the restrictions is vital to journalists covering the entertainment industry. Rare is the occasion that some individual or group has not lodged a news-making objection to sexual content that film or television produces. But objectively reporting these stories can be challenging. Because a broad

interpretation of the First Amendment is the news industry's lodestar, the tendency is to report moral complaint as a statement of opinion or plea for censorship rather than an appeal for enforcement of existing law. Also, the jurisprudence governing sexual expression is complex, which makes the widespread circulation of speech that arguably violates the limitations all the more difficult to explain. Ironically, one of the keys to this mystery has been the consensual and long-reigning focus on preserving youth morality—a theme at the heart of obscenity and indecency law.

Obscenity

With the exception of child pornography, which is ipso facto obscene (*New York v. Ferber,* 1982), any printed or pictorial sexual expression that fails the test set by the United States Supreme Court in *Miller v. California* (1973) is not protected by the First Amendment. Sexual expression is obscene if *all* three parts of the *Miller* test are failed at once:

a. whether the average person, applying contemporary community standards, would find that the work, taken as a whole, appeals to the prurient interest;
b. whether the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by the applicable state law; and
c. whether the work, taken as a whole, lacks serious literary, artistic, political, or scientific value.

The story of how the Court arrived at this analysis begins in New York City at the twilight of the Victorian era, when trade in sex was a highly visible, lucrative industry that drew its players from all walks of life.

Enter Anthony Comstock, a Civil War veteran, determined Christian, and hardly the first one to try toppling New York City's prosperous commerce in sex. With limited housing making for expensive rents, and waves of immigrants standing in lines for low-paying jobs, prostitution evolved as a commonplace lifeline for women and children. Comstock's many reform-minded predecessors tackled the very public vice by trying to shut down brothels, concert saloons, and other venues of open assignation. The tactic failed repeatedly because the economic necessity remained. In the early 1870s, Comstock and his well-heeled benefactors at the Young Men's Christian Association (YMCA) decided on a different tack. A more effective reform, they reasoned, would be one that prohibited newspapers from running advertisements for brothel keepers and abortionists, for example, or that denied publishers the liberty to sell salaciously detailed guidebooks to houses of prostitution, like Butt Ender's (a clear nom de plume) *Prostitution Exposed.* An effective reform, in short, was one that put new teeth in the law against circulating obscene material in the United States mails and, not incidentally, appointed Comstock as Special Post Office Inspector in charge of its enforcement.

In the early hours of March 2, 1873, the U.S. Congress passed An Act for the Suppression of Trade in, and Circulation of, obscene Literature and Articles of immoral Use, which became known as the Comstock Act after its chief architect. Armed with the postal code amended to include much harsher punishment for circulation of obscene books, pamphlets, pictures, print, or other publications of a vulgar or indecent character, and the mailing of information about birth control, abortion, and other lewd or immoral literature found in newspapers, advertisements, circulars, books, or pictures, Comstock went to work. Like a modern-day undercover agent, Comstock boarded trains flashing his badge and pistol in pursuit of nefarious publishers, abortionists, madams, pimps, and gamblers—anyone, in short, who used the mails to support sexual commerce. By his account, he hauled in tons of obscene material, but not without a personal cost. According to a flattering biography, Comstock was forced to bravely withstand the bitter criticism journalists heaped upon him until his death in 1915. The New York press fomented a disdain for Comstock that survives to this day. Newspaper publishers complained bitterly at the time that the Comstock Act violated the First Amendment. They never mentioned, of course, that the new law also adversely affected their advertising revenues. In such enmity was Comstock held that the YMCA quickly disassociated itself from the reformer, founding the New York Society for the Suppression of Vice (NYSSV) and putting him in charge.

The first major test of the Comstock Act came in 1879 when a book dealer insisted he was at

liberty to circulate *Cupid's Yokes: Or, the Binding Forces of Conjugal Life,* written by Ezra Heywood, an anarchist, abolitionist, free lover, and feminist. A federal court disagreed, relying on what become known as the *Hicklin* test. The little tract was obscene, the court said, because it had the tendency to deleteriously affect the most susceptible member of the audience. It was no defense to say the material must be judged as a whole, or that a child, presumably the "most susceptible" character, could not possibly understand the complex thesis Heywood proposed (*United States v. Bennett*).

Hicklin stood for nearly 80 years but not without becoming a cumbersome roadblock for at least one of the social reforms Progressives of the early twentieth century had in mind. Excited by the promise that infant science held for society's betterment, many forward-looking Americans urged a new public discussion about sex as the means to eliminating divorce, adultery, and disease, and otherwise save the traditional family. This dialogue, which was to be based on the scientific "truth" about sex, would help adults overcome the insensible moral cant of old-world reformers like Comstock—or so the theory went. Few individuals were more enthused about the sex scientists' promises than Morris Ernst, a high-profile New York lawyer and one of the founders of the American Civil Liberties Union (ACLU). Ernst, who single-handedly convinced the ACLU to join in the obscenity fight, was sure that the rapidly developing study of sex would reveal all its mysteries, freeing everyone of the ignorant and censorial habits of Comstock, and his successor, John S. Sumner. Never mind that all the moral reformers ever talked about was what it was about sex they did not want talked about, Ernst led the charge to finally liberate a discussion about sex. And worries about children's morality could not stand in the way of this frank new dialogue, or so he urged in the defense of literary artists James Joyce, Theodore Dreiser, and Radclyffe Hall; or the scientist, Alfred C. Kinsey. *Hicklin* had to go.

When the constitutionality of the Comstock Act finally reached the Supreme Court for review in 1957, Justice William Brennan Jr. wrote for the Court that the old law remained a good one but that *Hicklin* had to fall because the burdensome analysis stifled too much socially important artistic and scientific material pertaining to sex (*Roth v. United States*). The new test for the obscene must be whether "to the average person, applying contemporary community standards, the dominant theme of the material taken as a whole appeal[ed] to prurient interest," he wrote. In other words, sexual expression could no longer be deemed obscene simply because it might corrupt youth morality, and small sections of the material could not be extracted and found obscene.

If the Warren Court believed it had dispatched the obscenity problem in *Roth,* it was sorely mistaken. The Court's docket quickly grew jammed with appeals. Citizens for Decent Literature, which was founded two years before *Roth* by Charles H. Keating Jr., vowed to file briefs in support of the government in every obscenity case at the state and federal level. Worried about this new group, the ACLU came to the defense of publishers, writers, movie makers, and others, many of whom stretched artistic and scientific credulity. What did the Court mean by "community standards?" Did it mean the standards of the entire nation; or that of the local community (*Jacobellis v. Ohio*)? Were homosexual magazines prurient simply because they were designed for a homosexual audience (*Manual Enterprises v. Day*)? Was *Fanny Hill or Memoirs of a Woman of Pleasure,* penned in 1749 as an intentionally pornographic novel, obscene? Did the book have some redeeming social value (*Memoirs v. Massachusetts*)? Did the police have the right to seize all of a bookseller's material when only a few magazines or books seemed to fall outside the *Roth* test (*Marcus v. Search Warrant*)? And was hardcore pornography protected expression (*Redrup v. New York*)? Demands that the Court clarify *Roth* seemed as endless as did headlines hailing the speech-friendly Warren Court.

To the dismay of moral groups, the Justices themselves reviewed much of the material that moralists and libertarians brought to them, often determining that the content fell within the law. Too, the Court often ruled on procedural issues, involving, for example, the way the contested speech was seized. In nearly all of the procedural appeals, the Court found the government in error. This left the impression, however incorrect, that scores of sex pulps, like William Hamling's *Wife-Swappers, Seeds of Sin,* and *No Longer a Virgin,* were reviewed and found not obscene. Moral groups complained bitterly that journalists rarely delved into the narrow

nature of many of the opinions, focusing instead on all the sexual speech the Court seemed to be liberating. Fairly or not, public displeasure with the Warren Court's views on sexual content in media grew virulent by the late 1960s.

So it is little wonder that a new moral group in New York City could easily stir up worries about children's moral welfare. It was one thing for the Court to clear *Fanny Hill* along with what seemed like an endless parade of "girlie" and "nudie" magazines for adults to read, but for children, too? By 1968, and clearly weary of what the Justices themselves referred to as the "intractable obscenity problem," the Court ruled that the state had not violated the First Amendment rights of booksellers when it prohibited the sale of certain material to children (*Ginsberg v. New York*). Operation Yorkville (later known as Morality in Media) had nurtured the case along and was, momentarily, delighted to finally have made headway in its war against sexual material it believed glorified the bacchanal.

The cost of a short-term win in a long-running battle was immediately evident. In effect, *Ginsberg* created two worlds; one for children, one for adults. Within days of the opinion, "Adults Only" signs sprang up in theaters, bookstores, and at magazine racks. The Motion Picture Association of America instituted its rating system, which meant bolder sexual portrayal in films that children were not permitted to see. The Adult Film Association of America, founded in 1969, boasted that its explicit films were intended for adults only. Although Operation Yorkville's clear intent was that of curbing the availability of certain sexual speech for adults, employing youth morality as its stalking horse paradoxically spawned the "adults only" world where the nature of sexual expression grew far more explicit, available, and arguably obscene.

Enter the new Chief Justice, Warren Burger, the purported nemesis of all civil liberties, particularly those governing expression. Charged with turning around the Warren Court's activism, his conservative supporters clearly expected him to tackle the "obscenity problem." And he tried. In 1973, the Burger Court decided *Miller v. California*. So doing, it refined *Roth* to say that the "community standards" by which the obscene was to be judged were those of the local or state, not national, community. And, it narrowed the "utterly without redeeming social value" part of the obscenity test to say that the contested material, taken as a whole, must lack serious literary, artistic, political, or scientific value. In dicta, the Chief Justice wrote that hardcore pornography, or that portraying sexual conduct in explicit terms, was the type of sexual expression the Court remained willing to review. In the early twenty-first century, *Miller* remains the law.

Free-speech-minded journalists might have characterized the Chief Justice's opinion as exceptionally speech-friendly. After all, *Miller* returned the right to talk about what constituted the obscene to thousands of little communities around the country. But *Miller* gave reporters pause. Was it a bellwether for a "no-law-means-no-law" interpretation of the First Amendment that some Justices on the Warren Court championed? While libertarians called *Miller* the Burger Court's most constitutionally restrained decision yet, moralists said they had finally won the war. Both camps were no doubt surprised by the fact that hardcore pornography, like the film, *Deep Throat,* which was wildly popular in the 1970s, became far more widespread just as obscenity prosecutions fell markedly.

Although there is no evidence that moral groups were the instigators behind the state and federal child pornography legislation that swept the nation in the late 1970s, the fact remains that *Miller* failed dismally, and to some, there seemed no other recourse but to restage the fight in the name of children's welfare. The alarm coincided with newly enacted child protection laws at the state and federal levels, measures intended to shield youth from physical abuse. The worry also came at a time when pressure on law enforcement "to do something" about sexual expression in clear violation of the law was intense, often on newspaper editorial and op-ed pages. So police in Chicago and Los Angeles asked reporters to ride with them through the homosexual haunts of their respective cities, taking note of the young boys the adult men were said to be sexually abusing. Shocking stories about child pornography subsequently made front-page stories in the *Chicago Tribune* and *Los Angeles Times* for days. Calling the reporters to testify, Congress applauded them for discovering the new multimillion-dollar child pornography business and then quickly outlawed it as a violation of allowed speech.

In 1982, the Burger Court upheld a New York law that criminalized the sexual portrayal of children as ipso facto obscene; in other words, without the benefit of *Miller* (*New York v. Ferber*). Most child pornography, which constituted only a small part of the overall market at the time, quickly disappeared. By the next decade, however, some were creating sexual images of children using technology rather than actual children. Congress acted to criminalize the expression, but the Supreme Court struck the law as overly broad, reasoning that no child was actually harmed in the construction of such graphic images (*Ashcroft v. Free Speech Coalition*). Because the material at question is contraband, in-depth coverage on, say, the nature or availability of child pornography is a risky undertaking for journalists. Some academic research shows, however, that the market for sexualized images of youth has grown tremendously, and it is traded, rather than sold, using the Internet in extremely secretive ways.

Although the war over what sexual speech the First Amendment should protect continues, it is rare that an obscenity case reaches the Supreme Court. The reasons vary. State and local prosecutors are not always well grounded in obscenity law. Mounting an obscenity case is expensive and likely to bring community rebuke if taxpayers' dollars are spent on a lost case. But the leading explanation is that those with a moral opinion about sexual speech consistently project it through the child-morality lens—a fact not lost on the "adults only" trade organizations. If reasonable steps have been taken to protect children, and purveyors of explicit sexual speech are quite fastidious on that score, the government is hesitant to stir up a case, even though the Burger Court made it exceptionally clear that "adults only" venues provided no shelter for obscene speech (*Paris Adult Theater v. Slaton*).

Indecency

Worries about children's moral welfare also characterize the evolution of indecency law. In fact, the very definition of indecent speech is language that describes—when children are likely in the audience—sexual or excretory activities and organs in ways that would patently offend the contemporary community's standard for the broadcast medium (*FCC v. Pacifica*). The broadcast industry, journalists and entertainers alike, greeted this 1978 Supreme Court opinion as if the Justices had turned the clock back to 1878 when *Hicklin* seemed to silence so much adult talk about sex. Broadcasters troubled themselves unnecessarily. As the Court would have to make clear repeatedly, *Pacifica* is an exceptionally narrow restriction.

The facts are (a) indecent speech is protected by the First Amendment as long as it reaches an adult audience, and (b) *Pacifica*'s reach extends only to the broadcast use of the public airwaves. Knowledge of these rules is useful to reporters because virtually every television season is accompanied by moral complaint about one new program or another. Radio personalities, too, often provoke protest. Knowledge of *Pacifica*'s narrow nature is valuable for journalists who report about newer communication technologies, the competition for audiences they incite, and the moral complaint about indecent speech that predictably follows.

Considering the history of broadcast law, it is not surprising that the definition of indecent speech is that likely to corrupt children's morality. While Congress debated the Communications Act of 1934, anxious parents and school administrators warned lawmakers that certain radio programs, which were very popular with children, corrupted their innocence. Legislators apparently heard the complaints. As a part of the act, Congress created the Federal Communication Commission (FCC) and charged the regulators with granting licenses to those broadcasters who promised to use the airwaves in the public interest, convenience, or necessity of everyone. The FCC was also authorized to penalize those who broadcast indecent speech. Although it would take the FCC about 40 years to exercise its power to so punish, a child's moral welfare was at the heart of the case when the constitutional question of its authority to do so reached the Supreme Court.

One afternoon in 1973, a former Central Broadcasting System (CBS) executive, John H. Douglas, accompanied by his teenage son, tuned his car radio to a station owned by the Pacifica Foundation. In the context of a program on what constituted prurient speech, WBAI played comedian George Carlin's "Seven Dirty Words You Can Never Say on Television." Douglas complained to the FCC that the words "Shit, Piss,

Fuck, Cunt, Cocksucker, Motherfucker, and Tits" were hardly in the public interest, clearly offensive to children's moral welfare, and the station should forfeit its license. Its license was not revoked, but the FCC did order the station to broadcast such speech only during a "safe harbor" period, or when children were likely asleep, soon defined to be after 10 p.m. and before 6 a.m.

The Court agreed in the landmark case that the FCC had not engaged in rulemaking; that the Communications Act of 1934 did not prohibit the FCC from reviewing expression after it aired; that the law constitutionally prohibited the broadcast of indecent language; and, because the airwaves were limited and publicly owned, broadcast speech was subject to greater regulation, or less First Amendment protection. This latter thesis was particularly so because radio and television were easily accessed by children, the majority agreed.

For years following the *Pacifica* decision, moral groups pressed lawmakers and the FCC over how big the "safe harbor" ought to be and how old one had to be to get in it. Indecent speech may be legally broadcast over the airwaves between 10 p.m. and 6 a.m. The age youth may safely enter the "safe harbor" has been defined rather arbitrarily as seventeen.

The Court has been quite unwilling to extend *Pacifica* to other media. For example, it would not uphold the Telephone Decency Act of 1988, which banned dial-a-porn in the name of children's innocence (*Sable Communications of California v. FCC*). *Pacifica* did not prohibit adults from accessing indecent expression, the Court said, reminding Congress that the telephone was not a scarce, publicly owned resource or an invasive medium. The same reasoning applied when the Court severely limited the reach of the Cable Act of 1992 (*Denver Area Educational Telecommunications Consortium v. FCC*). In 1997, the Court ruled that Congress tread upon the First Amendment rights of adults again when legislators treated the Internet as if it, too, was a limited and invasive resource (*Reno v. ACLU*). However pressing the public's interest in youth morality might be, the Court said upon reviewing the Communications Decency Act of 1996, the regulation of indecent expression must be narrowly tailored to suit that end. Congress tried two more times to regulate indecent expression on the Internet. The Child Online Protection Act (COPA) of 1998 was blocked by court order before its enforcement and later overturned. Finally, the Children's Internet Protection Act (CIPA) of 2000 was upheld by the Court in 2004.

For all the bickering, the First Amendment protects the right of telephone companies to deliver indecent expression, or dial-a-porn, at any time so long as the receiver is an adult using a credit card. Cable and satellite operators, who must provide lock boxes and other purportedly childproof devices, may deliver indecent speech regardless of the "safe harbor." Their services are perceived as different from over-the-air broadcasting because people must make a decision to subscribe to and pay for the service.

Few seem happy with this arrangement. In competition with cable and satellite concerns, network television programmers, seeking better ratings, persistently test the "safe harbor." Their ratings may rise but so do objections that indecent content is reaching the young. Unsurprisingly, Congress passed the Broadcast Decency Enforcement Act of 2005, which increased the fines the FCC may levy by tenfold (to more than $300,000 per incident). Meanwhile, some radio broadcasters, like longtime shock jock Howard Stern, took their shows off broadcast stations and into the largely unregulated (because listeners pay to subscribe) satellite arena.

India

Indian media have served the world's largest democracy as an inexorable watchdog. The country's free press has helped sustain Indian democratic traditions in sharp contrast to some neighboring nations where military dictators have stifled the press and democratic values.

India's media inform, educate, and entertain a population of 1.2 billion, which is roughly one-sixth of the world's people. More than one-third (35.2 percent, 2001 Census) of India's population cannot read or write but are avid audiences of radio, television, multimedia programs, and Internet content. India's burgeoning media landscape encompasses nearly 65,000 newspapers and periodicals in 123 languages and dialects, more than 300 national and regional television channels featuring news and entertainment programs in English and 22 national languages, nearly 300 million mobile phone subscribers and a rising number of active Internet users.

Economy Fosters Media Boom

India's expanding media have been catapulted by its growing economy, the world's fourth largest after United States, China, and Japan defined in terms of gross domestic product at purchasing power parity per capita.

Despite impressive gains steered by sweeping economic reforms (and some deregulation) since 1991 and by growing international investment, there is a wide chasm between the rich and poor. For instance, in 2007, every fourth Indian lived below the poverty line even as India was home to 36 billionaires (defining assets in U.S. dollars). India faces other problems such as overpopulation, environmental degradation, government and business corruption, an extensive underground black market economy, ethnic conflict, religious riots, terrorism, and neglect of children. These problems have long been a staple of news coverage in India.

A vibrant economy has reinvigorated Indian media with increased advertising spending, rising international investment, growing income levels, and a surge in consumer spending. India's newspaper market is among the largest in the world. More than 150 million people read a newspaper in India every day compared to 97 million Americans and 48 million Germans.

In 2002, the Indian government eased a 1955 ban on foreign investment in magazines and newspapers. By 2008, it had approved 15 foreign investment bids for news and current affairs media besides approving publication of international newspaper facsimile editions. As newspaper readership stagnates in the United States and Europe, global companies such as the U.S.-based Blackstone Group; Britain's Pearson, publisher of the *Financial Times;* and Britain's Associated Newspapers, have invested in Indian media. Newspaper circulation in India has been growing and advertising increased by 15 percent in 2007. Such double-digit growth rates are projected to continue until 2014. India's print media recorded a growth of 16 percent over 2007, at nearly $2.9 billion and estimated to double in size by 2012.

In 2005, the Indian government relaxed restrictions and has since approved 189 Indian editions of foreign specialty, technical, and scientific magazines. Such opportunities have attracted prominent global magazine publishers including Condé Nast (*Vogue* and *GQ*), Time (*People*), Meredith Corporation (*Child*), Dennis Publishing (*Maxim*), Rodale (*Prevention*), and Axel Springer (*Autobild*). Indian editions have enabled publishers to target the Indian market with indigenized innovations and online features, helped readers subscribe to international magazines at affordable prices, and opened new avenues for advertisers. With a 17 percent growth in 2008, the Indian media and entertainment industry has emerged as among the fastest growing sectors of the Indian economy. The entertainment and media industry grew cumulatively at 19 percent over 2005–08 to an estimated size of $10.9 billion. While the advertising industry increased by 22 percent in 2007, online advertising

was up nearly 70 percent in that year. The entertainment segment of the animation, gaming, and visual effects industry grew by 24 percent at nearly $3.2 billion in 2007.

Indian media's prosperous times may be attributed to several factors such as government's liberal reforms inviting foreign investment in media, a focused media fare devoid of free content online due to low Internet penetration, a rising literacy rate, sophisticated print and broadcast technologies, increased purchasing power of the middle class, rise in advertising and consumerism, growing popularity of infotainment, and round-the-clock media content on television and the Internet.

Press Development

India's first English newspaper appeared under fortuitous circumstances. By the 1760s, the Indian empire of Britain's East India Company grew to paramount power. Despite such business and imperial power, there were no newspapers in Calcutta, the seat of British colonial rule for decades and second only to London in population. In 1780, James Augustus Hicky, an expatriate Irishman, published India's first English newspaper, the *Bengal Gazette* or *the Calcutta General Advertiser*. Hicky quickly realized that truly distinguished newspapers should serve society, even at the risk of official displeasure. His newspaper made interesting reading with its ample dose of scurrilous reporting, risqué advertisements reflecting low morality in society, and scandalous accounts of the misdeeds of British administrators. In 1781, British rulers charged him with libel. He was harassed, attacked, and jailed. Undaunted, Hicky continued to edit his newspaper from prison, though his publication did not survive long and Hicky died a pauper in 1802.

The early nineteenth century saw the birth of several newspapers, both in English and regional Indian languages. In 1818, the Baptist missionaries of Serampore published a Bengali newspaper, *Samachar Darpan* (The Mirror of Truth), and the English periodical *The Friend of India,* which were self-proclaimed organs of Christian thought and doctrine. Ram Mohan Roy, the Indian leader and social reformer, published in 1821 the Bengali newspaper *Sambad Kaumudi* (Moon of Reason), which propagated the radical Western Hindu viewpoint. By 1822, there were six Bengali papers in and around the Calcutta area with circulations of 400 to 800 copies and widespread influence among readers. In 1823, when the British tried to censor the Calcutta press, Roy, as founder and editor of India's earliest newspapers, organized a protest designating freedom of speech and religion as natural rights for the people. Founded in July 1822, the Gujarati publication *Bombay Samachar* has been the oldest continuously published newspaper in India.

The newspaper emerged as a powerful social and political force during the freedom movement in India. The British rulers enacted in 1878 the Vernacular Press Act to repress "seditious propaganda" in regional language newspapers. Lord Lytton, the British viceroy, denounced vernacular newspapers as "mischievous scribblers preaching open sedition" to end the British Raj. Faced with severe criticism and protest, the British rulers repealed the act in 1882. In 1880, Bal Gangadhar Tilak, a social reformer and nationalist, founded the Marathi daily *Kesari* (Lion), which attracted widespread readership for its opposition to British rule. British officials jailed Tilak in 1897 for his writings.

Fewer than two decades later, Mahatma Gandhi, the architect of India's freedom from British rule, played a prominent role as editor of three newspapers—*Young India, Harijan* (meaning "child of God," coined as a euphemism for Untouchables by Gandhi in 1931) and *Navajivan* (New Life)—which became major vehicles for Gandhian thought and action. As an outstanding twentieth-century leader, Gandhi authored a prodigious number of words. Through his newspaper columns, he assiduously propagated his ideas as a prophet of nonviolence and *Satyagraha* (the firmness of truth). This empowered members of the meek Indian masses to fight against seemingly invincible British rule. In 1938, Gandhi's lieutenant Jawaharlal Nehru founded the English newspaper, *National Herald* and its sister Urdu publication *Qaumi Awaz* ("Voice of the Community") to uphold such national values as secularism and nonalignment. Nehru, who became the first prime minister of independent India in 1947, gained renown for his political acumen and scholarship.

Language Diversity

In the postindependence era, Indian journalism sustained its influential role on two fronts. First,

the urban elite relied on the English-language media, which was a dominant legacy of the British Raj. Second, the regional-language media played a vital role in educating and informing a significant section of Indians who prefer to read and view media in their native language.

India's language diversity extends beyond Hindi, the official language, and English, the subsidiary official language, to more than 22 officially recognized languages and hundreds of regional dialects. Such pluralism is richly represented in the print media, radio channels, news websites, blogs, wikis, and television programs that reflect multicultural heterogeneity, diverse social values, and an array of linguistic traditions. The Paris-based World Association of Newspapers' list of "World's 100 Largest Newspapers" features 17 Indian newspapers, including three English dailies, seven Hindi publications, and seven regional-language publications. Most of these newspapers publish color broadsheet editions printed simultaneously in several cities and maintain websites for their domestic and international readers.

Other media entities are also committed to language diversity. All India Radio's services cover 24 languages and 146 dialects. The Indian government plans to add 107 community radio stations to the 38 existing community radio stations to spearhead rural empowerment and dissemination of information with local language programming. India's two primary news agencies, the Press Trust of India (PTI) and the United News of India (UNI), provide news coverage and information in both English and Hindi. UNI's wire services are also available in Urdu.

The Indian government provides advertising support to regional language newspapers in Bodo, Dogri, Garhwali, Khasi, Kashmiri, Konkani, Maithili, Manipuri, Mizo, Nepali, Rajasthani, Sanskrit, Santhali, Sindhi, Urdu, and tribal languages. It extends similar concessions to newspapers published in remote hilly and border areas and in Jammu and Kashmir, Andaman Nicobar, and eight northeastern states.

News Agencies

Launched in 1961, UNI was the first Indian news agency to offer a financial service, a stock exchange service, and a national photo service. UNI also features specialized content services like Unidarshan (television news clips and features), UNIscan (news display on television sets for hotels, top government officials, and corporate clients), UNIDirect (for top executives in the government, corporate, and other sectors) and UNIgraphics (computer-designed graphics in ready-to-use form).

India's largest news agency, PTI, is a nonprofit cooperative owned by the country's newspapers. PTI subscribers include 450 newspapers in India and several media entities abroad. All major broadcast channels in India and abroad subscribe to PTI. Founded in 1949, PTI's origin dates back to 1910 when Keshab Chandra Roy, a political correspondent from India, founded the Associated Press of India in London as a news pooling arrangement with journalists. By 1919, Reuters became the sole supplier of foreign and domestic news to the government and to the newspapers of India.

PTI has collaborative arrangements with the Associated Press (AP), Agencies France Presse (AFP), and Bloomberg for distribution of their news feeds in India, and with the Associated Press for its photo service and international commercial information. PTI exchanges news with nearly 100 news agencies worldwide as part of bilateral and multilateral arrangements, including the Non-Aligned News Agencies Pool and the Organization of Asia-Pacific News Agencies.

Broadcast Media

Radio broadcasting started in India with the Radio Club of Bombay's first broadcast in 1923. This was followed by regular Broadcasting Services in 1927 with two privately owned transmitters at Bombay and Calcutta. The Indian Government took over the transmitters in 1930 under the aegis of Indian Broadcasting Service, renamed All India Radio in 1936 and *Akashvani* (meaning the "Voice from the Sky") after 1957.

Doordarshan (meaning "View from Afar"), a public service broadcaster and one of the largest terrestrial television networks in the world, started in New Delhi as an experiment in 1959 with half-hour programs on education and development. Regular television service commenced in major Indian cities such as Delhi in 1965, Mumbai (Bombay) in 1972, Kolkata (Calcutta) and Chennai (Madras) in 1975. Television services were separated from radio in

1976. India introduced color television in 1982 coinciding with the Asian Games held in New Delhi. With the advent of color television, the state-owned broadcaster Doordarshan introduced in 1982 Doordarshan National programs that ushered in a major broadcasting revolution with national telecast of government events, sports, soap operas, and other programming that attracted nationwide viewership and advertisements. India's first long running television soap opera, *Hum Log* (We People), which began in 1984, was designed to promote women's status in Indian society with messages about equal status for women, family harmony, and smaller family size. Doordarshan commissioned a television adaptation of the ancient Indian religious epics, *Ramayan* (1987–88) and *Mahabharat* (1989–90). These mythological serials became instant television hits that cut across rural-urban barriers to attract advertisers and viewers across India and abroad, allowing Doordarshan to expand its programming exponentially and develop an array of programming innovations such as Indian soap operas, comedy shows, children's programs, and crime thrillers. In response to both political protests and popular demands that the government-owned broadcasters should be autonomous like those in other countries, the All India Radio and Doordarshan were merged in 1997 under Prasar Bharati (Broadcasting Corporation of India), a regulatory agency. Television ceased to be under strict government control by 1990 when transborder satellite channels such as Star TV and CNN began beaming programs. Jaded with Doordarshan's staid programming steeped in officialdom, urban residents installed receivers to access satellite programs. Some local entrepreneurs started offering television services, albeit illegal ones, that provided access to an array of international channels. The government's economic liberalization and deregulation of the 1990s led to a proliferation of international satellite television, global television channels, and cable networks. During the late 1990s, Indian television audiences enjoyed a plethora of channel choices comprising CNN, BBC, MTV, and other global television channels. Some pan-Indian television networks featured Indian movies, music prayer services, soap operas, and news programs in English and local languages. By 1998 several international television channels adopted programs with local flavor in response to waning interest in foreign television content. Indian entertainment television channels such as Zee TV, Star Plus, and Sony Entertainment introduced shows based on sociocultural themes, pluralism of ethnic and cultural norms, local language messages, and region-specific interests to compete with pan-Indian networks in localized markets.

India's broadcast media environment offers nearly 300 channels including program choices from Doordarshan as well as from domestic and global media companies such as News Corporation, Sony Entertainment, and Walt Disney. Today, such programs also attract a global audience. India's entertainment television channels such as Star One, Bollywood 4 U, TV ASIA, Sahara TV, and MTV India repackage their media content for the global south Asian diaspora across Europe, Africa, Australia, and the Americas. Besides exerting greater cultural influence with transforming television content, these media companies have led to increased journalistic independence and greater scrutiny of the government.

Faced with competition from private channels, Doordarshan, the public broadcaster, has reconfigured its programs with sports, news, and entertainment content and introduced a satellite television service with no subscription fees. Its programs now reach 90 percent of the population through a network of nearly 1,400 terrestrial transmitters and 65 studios. Doordarshan remains the most widely available network, especially in rural areas, where a majority of the population lives.

The Indian television industry is expected to grow annually at around 22 percent from 2009 through 2012. The direct to home (DTH) satellite television and broadcasting industry is expected to grow annually at 48 percent from 2009 through 2013. While DTH homes are projected to increase 525 percent from 4 million in 2007 to 25 million in 2012, the pay television homes are projected to increase by 55 percent from 74 million in 2007 to 115 million in 2012.

India's radio industry is set to grow by 200 percent from 2009 through 2012. India's FM radio industry plans to offer services in 275 cities across the world as part of government reforms that began in 2005. The FM radio industry seeks to fund this unprecedented growth with foreign direct investment limits of 49 percent for non-news channels and 26 percent for news channels. These services will act as a useful supplement to the radio

services of All India Radio, which served 99.14 percent of the Indian population in 2008 with 229 broadcasting centers supported by 148 medium-frequency, 54 high-frequency, and 168 FM transmitters.

Journalism and Communication Education in India

India's media boom has led to rapid developments in journalism and communication education. The number of institutions for journalism and communication education has increased from six in the 1940s to more than 86 universities with curricula for journalism and communication education. In addition, more than 283 private institutions offer training programs in various aspects of the media industry. Some universities now offer graduate programs in media and communications studies in India. This has led to a multifold increase in student enrollment in journalism and communication schools and a growing demand for journalism educators and teaching resources.

India has been a major seat of higher education for several centuries and its science and technology talent pool is among the largest worldwide. However, journalism and communication education in India has faced various challenges such as inadequate funding, shortage of well-qualified educators, lack of equipment, library resources and support staff. In addition, journalism and communication education is handicapped by dearth of institutional investment in exploring research issues that integrate and inform the media scholarship with theoretical perspectives and comprehensive methods. Most journalism and communication schools in India may benefit from encouraging their faculty and students to pursue erudite research on media trends from a scholarly perspective.

Press Freedom

The Indian Constitution provides for "the right to freedom of speech and expression" but stipulates the government can restrict those rights under some circumstances, such as maintenance of public order, state security, and public morality. In 1975, under controversial circumstances of political instability, India declared a "State of Emergency" to restore the security of India. During the 21-month "State of Emergency" (1975–77), Prime Minister Indira Gandhi imposed restrictions on the media, curtailed civil liberties, suspended elections, and resorted to severe misuse of power. Opposition leaders and journalists were jailed. However, the press in India survived the "State of Emergency" to report Indira Gandhi's defeat in the 1977 general elections. Unshackled from draconian excesses of the Emergency, people called for institutional reforms and greater government accountability. This led to a quantum jump in the number of newspapers and magazines, contributing to a media boom.

International organizations rate India's press as "partly free." The U.S.-based Freedom House ranked India seventy-seventh out of 195 countries in its 2007 *Freedom of the Press*. Reporters Without Borders, a news media advocacy organization, ranked India one hundred twentieth in its 2007 Worldwide Press Freedom Index, which tracks actions against news media.

In 2005, India introduced the Right to Information Act that authorizes citizens to request information from a "public authority," which has been stipulated to reply "expeditiously or within 30 days." The act also requires public authorities to computerize their records for wide dissemination and to proactively publish certain categories of information. With the crusading zeal of a perpetual adversary, the Indian media campaigned and influenced public demands for this right with fervent calls for a free flow of information.

Internet and Emerging Technologies

In August 1995, India began full-scale Internet service for public access through the Videsh Sanchar Nigam, India's overseas communications agency. That led to rapid diffusion of Internet communication nationwide (estimated 150 million Internet users in 2009). Despite a yawning digital divide, modern communication systems in Indian cities coexist with abysmal connectivity in the remote villages, where more than 70 percent of India's population lives. Compared to traditional landline phones, mobile phones have emerged as the dominant mode for telephony in rural areas, where fewer people own phones and it is easy to link distant villages with cost-efficient installation of mobile infrastructure. Mobile

phones also provide similar flexibility and convenience to the urban consumer.

India has the world's fastest growing mobile phone market. By 2012, India plans to double its phone subscriber base to 700 million users, covering nearly 70 percent of the country's population. India's teledensity, or the number of phone users for every 100 individuals in rural areas, stands at 13 percent and 72 percent in urban areas. The national average is 32 percent. Of the 364 million telephone subscribers in October 2008, 326 million were mobile phone users. In 2009, India adopted the third-generation (3G) mobile technology that provides users access to high-end data applications, including high-speed interactive gaming and Internet access, videoconferencing, video streaming, and other multimedia features on the phone.

The recent growth of the Internet in India has led to a spurt in online journalism comprising news websites, blogs, wikis, and some crowd-sourced citizen journalism that has permeated the national consciousness. Since 2000, online journalism in India has exposed a range of issues such as political corruption, misuse of state funds, and match-fixing in professional cricket, India's national pastime. A large section of the Indian news audience regularly access websites of mainstream media, Twitter, photo and video sharing sites, wikis, and blogs for breaking news and commentary. During the November 2008 terrorist attacks in Mumbai, more than 9 million people in India and abroad accessed the website of *The Times of India,* India's largest English-language newspaper. Page views on the *Times of India* website saw a fourfold increase from 4.5 million on November 27, 2008, the day after the attacks, to more than 17 million the next day. Breaking news of the terrorist attacks featured on blogs and Twitter messages.

India's burgeoning blogging community, comprising more than 150,000 blogs, covers topics like politics, social issues, Bollywood celebrities, Indian culture, and technology trends. Mirroring the success and influence of the Indian language media, Indian bloggers represent the rich diversity of regional languages and local issues. A significant number of Indian bloggers communicate in English to reach a global audience both in India and abroad.

With the imminent convergence of information, communication, and entertainment media, India plans to implement Internet Protocol Television (IPTV), a digital television service delivered through an Internet network infrastructure. IPTV provides viewers with a new visual digital experience enhanced by myriad value-added interactive services that meld infotainment and e-commerce. Such plans may lead to an augmented demand for broadband connectivity in India.

Conclusion

Checkered circumstances have transformed media in a developing nation like India where a sizable segment of the Indian population is illiterate and impoverished. Faced with major economic and social changes, India's media reflects diversity of content and growth. Exciting changes in entertainment media, phenomenal growth in emerging technologies, a plethora of broadcast media choices, a burgeoning print media, and a steady diffusion of innovations, such as improved telephony and Internet connectivity, have reshaped India's media.

India provides a captivating context for studying the relationship between media and democracy. Indian media have broadened and deepened democracy by acting as a bridge between the government and the governed. To this end, the media have galvanized civil society to campaign more vigorously for institutional reforms and greater government accountability by melding multiple democratic roles as an inexorable watchdog of democracy. In their best role, the Indian media have acted as a reliable source for news and information; a credible critic of the government; an active adversary; an investigator of corruption; an intellectual interpreter of events; and a forum for public expression of censure and praise. Thus, the Indian media have not only influenced democracy but also helped preserve it.

INFOTAINMENT

Infotainment, formally defined by *Merriam-Webster's* dictionary as "a television program that presents information (as news) in a manner intended to be entertaining," is a neologism that refers to the blurring between information and entertainment in news and current affairs programming, whether it be in the selection of news stories (e.g., more emphasis on celebrity gossip, crime stories, and human interest pieces) or in their presentation (flashy graphics, sound effects, and sensationalism).

The media environment in the United States and around the world has undergone dramatic changes since the late 1970s and early 1980s. Not only have technological innovations changed the way citizens consume various media, but the structure of the industry has changed as well. Growing conglomerations of media companies have led to a dramatic increase not only in the amount of information available but also in competition for audiences. Newspaper readership is down as is viewership of the major network news programs. As audiences turn to Internet-based news sources, media companies are searching for ways to maintain if not expand their audience shares while increasing advertising revenues. News divisions of media companies, once treated by management as insulated from market pressures, are now considered additional sources of revenue. These economic challenges have helped blur the news-entertainment distinction as news producers rely on entertainment value to "sell" news stories.

Infotainment is a buzzword, first popularized in the 1980s, and commonly used by communications scholars and critics to describe the erosion of the line that once divided news (information) and entertainment. Historically, news organizations maintained a distinction between "hard" news and entertainment, or "soft" news, programming. Infotainment is generally used as a synonym for "soft" news, defined broadly as either

> a residual category for all news that is not 'hard,' as a particular vocabulary in presenting the news (e.g., more personal and familiar and less distant or institutional), and as a set of story characteristics, including the absence of a public policy component, sensationalized presentation, human-interest themes, and emphasis on dramatic subject matter, such as crime and disaster. (Baum 2003, 92)

So where does "soft" news, or infotainment, come from? It is often the result of standard journalistic practice combined with market influence. Researcher Doug Underwood describes five ways in which news and marketing goals interact. He argues that the "marketing and bottom-line influence" upon today's media can be seen in

> the tabloid techniques adopted by ratings-fixated local television stations and the network television newsmagazines . . . the embrace of splashy visual techniques and news-you-can-use items by newspapers desperate to stem a four decade long readership slide . . . the explosion of salacious

> copy and scandal coverage in traditional media outlets and on the Internet . . . the mixing of entertainment, crime, and gossip with the news by television organizations trying to hold onto their audience; and the 'synergy' of relentlessly expanding media conglomerates eager to treat the news as a 'product' to be recast for the publicity, promotional, and marketing purposes of their integrated media holdings. (Underwood 2001, 100)

Taken together, this mixture of market forces and journalistic practices begets infotainment.

Defined as such, infotainment includes daytime television shows such as *The Oprah Winfrey Show,* entertainment news programs like *Entertainment Tonight,* talking-head forums such as *Hannity and Colmes,* and late-night talk shows including political punchlines from late-night host David Letterman or the satirical stylings of *The Daily Show with Jon Stewart.* These types of programs convey political and public affairs information through humor, discussion panels, and feature stories, and try to do so in an entertaining, eye-catching manner. So do such news magazines as NBC's *Dateline,* which increasingly stress crime and human interest stories as opposed to hard news.

News programming and entertainment are not necessarily opposites, however. Entertainment television often has informative elements and news can often be entertaining in its presentation. It is now common for 24-hour American cable news channels and television network broadcasts to underpin stories using graphics, sound effects, and slogans. The presentation of news items in such a stylized, eye-catching manner is not new, nor is it limited to electronic media. *USA Today* has since 1981 packaged the news using graphics, charts, and flashy color photographs, putting as much or more emphasis on style than substance.

Media critics argue that by providing content in this manner, media are failing the public as a source of reliable information necessary to the democratic process. Others suggest that soft news and infotainment might actually be good for consumers. Researcher Matthew Baum claims that not only do large numbers of Americans consume soft news, but soft news programs also attract viewers normally not interested in political programming. By "piggy-backing" information about foreign policy and politics onto entertainment-oriented programs, these normally inattentive soft news consumers may actually gain information.

Media mergers promotes the atmosphere in which infotainment thrives. To take just one example, after America Online and Time Warner joined forces in 2000, the top executives at Turner Broadcasting, the parent company of CNN, were replaced by entertainment industry insiders with very little news experience. Large media conglomerates with diverse holdings including film production houses, magazines, book publishing companies, newspapers, and broadcast stations often use these outlets to promote their products. This cross-promotion of media holdings has made its way into news broadcasts. Celebrities are often interviewed by news anchors in order to promote their new films that are owned by the same parent companies.

Infotainment, while entertaining and good for the bottom line, takes up time and space that might otherwise be filled with more important ("serious," "hard") news items. Put another way, what is *not* making it on the air or into the press? One reason infotainment is so appealing to news editors is that it is unlikely to offend viewers. French sociologist Pierre Bourdieu concluded that "part of the symbolic function of television, in the case of the news, for example, is to call attention to those elements that will engage everybody—which offer something for everyone. These are things that will not shock anyone, where nothing is at stake, that do not divide, are generally agreed on, and interest everybody without touching on anything important." When viewers, and the advertising dollars they bring, matter, the temptation to air infotainment-oriented programming is heightened.

The rise of infotainment is a mainly result of market forces and pressure to constantly grab the viewer's attention and keep them tuned in. One reason for the increase in "news you can use" items, feature stories, and localized topics is the perception of news consultants and editors that this is what the public wants. CNN correspondent Christiane Amanpour once told a group of news executives,

> Think of how much more of a contribution we could make to this great society if we weren't so dependent on what I call those hocus-pocus-focus awful groups who tell us what people are not interested in.…time has proven that all the gimmicks and all the cheap journalism can only carry us so far. (quoted in Anderson 2004, 29)

Whether consultants, market researchers, and news "gatekeepers" are correct is debatable, but one result of the glut of infotainment is less coverage of government and the bureaucracy. Although their decisions may be vital to local citizens, city council or school board meetings rarely sell newspapers; scandals involving Hollywood celebrities do. If the role of the press in a free society is to give the public the information they *need* to be self-governing, in addition to the programming they may *want,* the implications of infotainment-saturated news content may be having large and lasting effects.

Innovation Journalism

Innovation journalism refers to reporting about the people, processes, practices and politics associated with innovation, be they related to computer technology trends, health and medicine, or the development of new products, markets, and industries. Other examples of innovations covered by the media include new business models, business process improvements (such as Six Sigma), and intellectual property.

It includes coverage of risks and opportunities that emerge when money and innovations cross language, national, and industry sector boundaries. Innovation journalism can be quite broad in that it covers technical, business, legal, and political aspects of innovations as well as innovation systems. An innovation system refers to the flow of technology, information, interactions, and money between people, enterprises, organizations, universities and governments focusing on new technologies, products and services, or simply new ways of doing things. These systems may be local (such as universities, research institutes, and regulatory agencies), regional (such as Silicon Valley, California, or Research Triangle Park, North Carolina), national, and even sector based (for instance, nanotechnology).

Development

In the early twenty-first century, innovation journalism covers a wide range of audiences through scientific magazines such as MIT's *Technology Review,* industry publications such as *PC Computer,* and the business/technology sections of mainstream newspapers. Many national news media, like the *Wall Street Journal,* have opened local news offices in Silicon Valley. Venture capital magazines such as *Red Herring* and *Wired* are headquartered there.

The concept of innovation journalism is not new, however; reporting on entrepreneurship, free enterprise, new technologies, and so on has been around for a long time. The convergence of business, politics, and technology with entertainment to reach wider audiences beginning with the dot-com era of the late 1990s, however, marks a change in innovation journalism. Innovation has a lot more to it than just technology; it is about management systems that drive growth, social systems and cultural trends, and government management. Consequently, traditional newsbeats, which only focus on particular aspects of innovation, treat innovation as a subtopic and miss the full story.

Innovation journalism, on the other hand, is a newer beat that spans science and technology trends, intellectual property, research funding and finance, technical standardization, industrial production processes, marketing of new technologies, business models, politics, cultural trends and social impacts, requiring a greater range of news sources.

Innovation journalism brings news of technology commercialization to a diverse audience often neglected in traditional journalism. *Competitor organizations* use innovation journalism to adjust their own product and marketing strategies. *Potential investors,* including venture capitalists, use innovation journalism to receive timely information in order to direct their capital and resource investments. *Channels of distribution* use innovation journalism to anticipate changes in technology and to influence the way those changes come to market. When innovations are of great potential value, *researchers* often work in secret; without the information that innovation journalism provides, their efforts are duplicated or they fail to learn from the trials and errors of earlier innovations or competitors. In such an environment, systems operate less efficiently.

Challenges

Innovation journalism is not without its limitations. For one, whether news stories about innovation journalism are a product of hard-news reporting or information subsidies from analysts and marketers is debatable. Recent debacles such as the dot-com collapse in the late 1990s, the Enron scandal, and the mortgage crisis of 2008 have led to criticism of the media for overly optimistic reporting. Big business has historically complained that the news media have an antibusiness bias in their reporting. This is not so with innovation journalism, which reveals a positive media bias demonstrated by a consistently optimistic tone and focus. Consider that Enron was listed among *Fortune* Magazine's Most Admired Companies for years because of its innovative practices, and described by Nieman Reports as "the business media's poster child." Yet some have argued Enron's "innovative" business model and some of its financial innovations were at the heart of its failure. The Media Tenor Institute in Bonn, Germany, reports that out of all the attributes and news topics they monitor, innovation is consistently regarded as the most positive.

The goal of innovation journalism is to enhance public debate through better common knowledge and understanding of innovation issues. As previous diffusion research has shown, individuals do not evaluate innovations based on scientific evidence. Moreover, a particular innovation's effectiveness, efficiency, or superiority is no guarantee that individuals or organizations will adopt it. Rather, adoption is based on opinions conveyed by an innovation's users or the reports published in the news media. Moreover, innovation is an attribute difficult to observe, making the news media's reporting integral in public association of "innovation" with a firm whose internal decision-making and operating processes are hidden from view.

Innovation journalism can be observed at many levels. At the individual and routines level, reporters who cover innovation must be generalists rather than specialists. They cross over the desks and beats depending on the frame they build for their stories. Nevertheless, without specialized knowledge such as how to report on the financial sector, innovation journalists may overlook key aspects of the story, a common criticism made of the news media's failure to report meaningfully on the nuts and bolts of the Enron story in 2001.

Research is lacking on training of journalists who cover innovation. At the organizational level, editors and editorial boards demonstrate a vested interest in innovation. Focused on their community, editorial boards may publish editorials designed to entice businesses to locate in their cities. At the external level, a city's commitment to economic development influences the innovation reporting in community media, providing proof of a city's status as "pro-business." At the ideological level, there are visible differences among media systems in their approach to innovation coverage. For instance, reporting on nanotechnology in the United States has focused more on its benefits, while European reporting has focused more on its costs.

Impact

Innovation journalism is not without consequences. Research has shown that the news media confer status onto new firms they cover and in

some respects enable a self-fulfilling prophecy. Consider this scenario: Firm A, a relatively unknown firm, and Firm B, equal in status to Firm A except with an observable edge in innovation, are generally not newsworthy enough to sustain regular news coverage. The local media publishes one article about Firm A—thanks to Firm A's public relations strategy—linking the firm to innovation. This article could be the only one written about either firm for months. Firm A, judged to be innovative by the media and its audience, may actually become more innovative thanks to the media-driven linking of Firm A with the idea of "innovation." Consequently, venture capital firms may direct funding toward Firm A, banks may be more willing to lend it money, and an increasing number of MBA recruits may now want to work with Firm A thanks to the "social proof" offered by media coverage that the firm is, in fact, innovative. So, in successfully attracting coverage, Firm A, originally the less innovative of the two firms, may actually become more innovative, leading Firm B to be perceived as less innovative in the absence of social proof in the media. Employees of Firm B may begin to question their identity as an innovative firm. In turn, the firm may face an exodus of talent as well as recruitment difficulties, become less innovative as a result, and eventually fail.

Outlook

While research on innovation journalism training is lacking, programs to train journalists on the skills needed to report on innovation have begun to emerge. David Nordfors, who coined the term *innovation journalism* in 2001, launched a fellowship program for working journalists at Stanford University to help journalists acquire the skills they need in these areas. Nordfors has his PhD in molecular quantum physics where he worked with the Nobel Prize winner in physics. Many countries have begun to set up initiatives for the training of their journalists, including Sweden, Finland, Germany, and Pakistan.

In the first decade of the twenty-first century, innovation journalism is expanding. The First Conference on Innovation Journalism was held at Stanford University in April 2004. The University of Jyväskylä in Finland launched the first Innovation Journalism course for university students in September 2005.

International and Comparative Journalism Law

Globalization of journalism has accelerated in recent decades thanks to borderless cyber technologies and expanding cross-border media operations. As a result, media law is no longer limited to domestic issues. International and comparative law is increasingly relevant as news media and journalists are subject to a wider range of legal and extra-legal restrictions.

In 2002, for example, the International Criminal Tribunal for the former Yugoslavia recognized the

journalistic privilege of war correspondents to protect their sources under the Universal Declaration of Human Rights. This international recognition of journalist's privilege contrasts with U.S. law in which journalistic confidentiality varies by state. The High Court of Australia in *Dow Jones & Co. v. Gutnick* (2002) held that an American newspaper publisher was subject to Australian law because a defamatory article was "published" there when it was downloaded by a user in Victoria. The Australian court rejected Dow Jones's argument that U.S. libel law should apply since the offending article was uploaded in New Jersey. The Australian decision showcases comparative media law as a topic of growing practical importance.

International Law

International law is that which governs relationships among nations. It embraces not only nations but also international organizations, multinational corporations, nongovernmental organizations, and even individuals (including those who invoke their human rights or, conversely, commit war crimes). While international law has a long history, it became increasingly important in the twentieth century. Freedom of speech and press are but one aspect of such law.

There is no unified international legal system covering journalism. International law on journalistic practices derives from several sources of modern law under the governing statute of the International Court of Justice:

- International conventions, whether general or particular establishing rules expressly recognized by the contesting states;
- International custom, as evidence of a general practice accepted as law;
- The general principles of law recognized by civilized nations; and
- Judicial decisions and the teachings of the most highly qualified legal authorities of various nations.

The United Nations provides the global framework of international law on human rights, which applies to freedom of speech and the press. The UN Universal Declaration of Human Rights, adopted in 1948, guarantees everyone the right to freedom of opinion and expression that includes "freedom to hold opinions without interference and to seek, receive and impart information and idea through any media and regardless of frontiers." Freedom of expression under the Declaration, however, is not absolute. It can be restricted to protect others' rights and freedoms and to meet "the just requirements of morality, public order and the general welfare in a democratic society."

Nor is the Declaration legally binding in and of itself. It is primarily hortatory and aspirational. Still, it is cited by many international and national courts in their decisions on freedom of the press. In a 1991 access to information case, for example, the Constitutional Court of South Korea, drawing partly upon the Declaration, stated that the public's right to know is "naturally included in the freedom of expression."

In 1976, the Declaration was made legally binding by the International Covenant on Civil and Political Rights (ICCPR), a supranational treaty. States that have ratified the ICCPR must adhere to its human rights provisions. The freedom of expression under the ICCPR is almost identical to that under the Declaration. In ruling on a possible conflict between the right of reply and freedom of the press, the Hungarian Constitutional Court in 2001 took into account the ICCPR's dictates, which allow restrictions on freedom of the press in order to protect an individual's reputation.

There are three regional human rights conventions, each significant with regard to the rights of journalists: the European Convention on Human Rights (ECHR, 1953), the American Convention on Human Rights (ACHR, 1969), and the African Charter on Human and People's Rights (1981). The ECHR, the oldest of the world's human rights treaties, recognizes freedom of the press as a right to free expression in a similar way that the Universal Declaration does. In mid-2008, the ECHR had a membership of 47 nations. The European Court of Human Rights, which interprets the ECHR, is the most respected international court. Its rulings guide various courts in construing human rights treaties and national constitutions and laws. In *Goodwin v. United Kingdom* (1996), for example, the European Court upheld the right of reporters to shield their sources. This seminal decision persuaded the International Criminal Tribunal for the

former Yugoslavia in 2002 to accept the reporter's privilege for war correspondents.

The American Convention on Human Rights, which was adopted by the nations of the Americas in Costa Rica in 1969, reflects the Universal Declaration, the ECHR, and the ICCPR. But it differs from the latter two in its explicit prohibition against prior restraint on the press by government (censorship) and indirect restriction of freedom of expression. It also allows a right of reply for anyone injured by inaccurate or offensive statements published by the "legally regulated" media. The Inter-American Court of Human Rights, established under the ACHR and located in San Juan, Costa Rica, has issued important decisions on freedom of the press. The Inter-American Court has rejected the compulsory licensing of journalists as incompatible with freedom of expression. The Court also ruled that the right to freedom of expression under the ACHR includes a right of everyone to access government records.

The African Charter on Human and People's Rights has no express provision for a right to receive ideas or to disseminate information: "The rights and freedoms of each individual shall be exercised with due regard to the rights of others, collective security, morality and common interest." Significantly, the African Charter is bereft of any explicit restrictions on the individual's rights and freedoms. Thus far, it has rarely been applied. An African Court on Human and People's Rights was established in 2004 and first met two years later.

Comparative Law

Comparative law centers on analytical comparison of different national legal systems. Modern comparative law emerged in the nineteenth century as the interaction among countries grew exponentially, thanks in part to the rise of global telegraphy. Comparative law is different from foreign law, which offers no specific comparative reflections on the foreign law.

While comparative law (that of individual nations) is different from international (or transnational) law, their interactions are substantial. The conflict of national laws as an international legal concern is a case in point. It is highlighted when U.S. courts refuse to enforce foreign judgments they consider antithetical to the First Amendment. In order to discover whether U.S. courts can accept or reject content-liability judgments from abroad, as when a New York court in the early 1990s was asked to enforce an English court's libel judgment against an American newspaper, one must conduct a comparative study of the relevant U.S. and foreign laws. The fundamental principle of comparative law is "functionality," that is, what can be compared in law is limited to provisions that fulfill the same function. Comparative law is both substantive and process oriented. That is, it deals with law as its subject and comparison as its method. Law carries little significance if it is disconnected from its sources and its interpretational methods. Comparative law is impossible without knowledge of which sources of law are recognized and which methodological approaches are used in the legal systems concerned.

Several major sources have formed the basis for comparative law. Most prominent is constitutional law. Communication technologies have enhanced access to material about foreign constitutions and court cases, providing impetus for comparison. Meanwhile, comparative lawyers have paid most of their attention to statutes and case law, and various methodological issues relating to them. Not surprisingly, comparison of media statutes has attracted more attention than other sources of law since 1941, when a U.S. media law commentator lamented that few had explored newspaper law for its comparative legislation and jurisprudence. One of the earliest comparative press law studies, Ignaz Rothenberg's 1948 book *The Newspaper,* examined press legislation in various countries to interpret and compare newspaper journalists' rights and duties.

Considering that defamation is the chief occupational hazard for journalists, libel law has been a frequent topic of comparative study. More recently, privacy, access to government information, hate speech, advertising, copyright, journalist's privilege, and broadcasting law have all been analyzed critically, which speaks to a diversity of issues facing international media.

Comparative media law focuses on comparisons of common with civil law. Anglo-American legal systems are often compared with major European countries, though few non-Anglo European systems have been assessed. This results from the Eurocentric approach of comparative law as a whole, the still formidable language barrier

and limited access to source materials, and the challenge inherent in comparing the law and methods of a Western legal system with those of a non-Western country.

Few administrative regulations concerning news media have been treated comparatively, though they significantly impact on electronic media in many countries. If the American experience with broadcasting regulation is any guide, administrative law often evolves so rapidly that it is not easy to keep up to date.

Conclusion

As journalism becomes more international, journalists will have to confront international and foreign media law issues. Although freedom of the press is accepted as a human right around the world, its status still remains the product of a nation's sociocultural, political, and legal traditions. Regional human rights conventions such as the ECHR and ACHR are of more practical value to news media.

International Herald Tribune

The International Herald Tribune (*IHT*), a Paris-based newspaper now owned by *The New York Times* but rooted in France since its founding in 1887, has often styled itself as "the world's first global newspaper." The claim has a great deal going for it. Printed, as of 2007, in 33 cities around the world and with a paid circulation of some 250,000 copies in more than 180 countries, the *IHT* is indeed a global newspaper presence. No more than 15 percent of its readership is located in any one "home" market—although roughly two-thirds of the copy sales are in Europe and the Middle East—with much of the remaining distribution coming throughout Asia.

What also makes the newspaper "global," however, is the fact that it is edited from an international perspective. Its typical reader is thought to be a "citizen of the world," a business or professional leader with broad international interests—who often reads the newspaper as a supplement to his or her own local or national press. While both news and advertising content vary to some degree from edition to edition, the *IHT*'s principle purpose is to present an international overview that will place the news of any region in a broader, global context. What this often means, of course, is that readers must turn elsewhere for deeper local coverage.

Many of the readers of the *International Herald Tribune* are international travelers or expatriate residents—with a strong command of

English—the language of globalization. But most of these readers (at least two-thirds are other than Americans) have come to regard the paper as their own "letter from home" while they live or travel abroad. The audience is affluent and well educated. Household income averages well above $150,000—and over 90 percent of the readers have a university degree. *IHT* journalists face the stimulating challenge of writing and editing for one of the world's most sophisticated, cosmopolitan audiences. Such an audience also allows the newspaper to realize a larger-than-normal portion of its revenues from circulation—most of its copies are sold on newsstands, at a price equating to more than US$2 a copy. The *IHT*'s demographics also allow the paper to charge an unusually high price to advertisers, who prize its influential readership.

At the same time, the broadly scattered nature of this audience means that distribution costs are much higher than is normally the case. This fact, combined with the often-sluggish nature of international advertising markets, has made it difficult for the newspaper to achieve dependable profits in recent years—and, in some years, has experienced substantial operating deficits—though it has been a steadily profitable enterprise at other stages in its history.

Compounding the *IHT*'s business challenges has been the growth of alternative sources of quality international news. Daily competition for readers comes principally now from the European and Asian editions of both the London-based *Financial Times* and New York's *Wall Street Journal*. At the same time, local and national newspapers have become increasingly able and inclined to present quality news coverage of the global scene. In addition, competition for large multinational advertising campaigns comes from a host of weekly and monthly magazines which now circulate aggressively across international borders.

All of these traditional publishing competitors have been joined over the past decade by new online, digital information sources—which are especially attractive and effective for the *IHT*'s sophisticated core readers. In response, the paper has been developing its own news website as an important method for serving many of its constituents.

Development

The *Herald Tribune* is building on a long history as a pioneer in applying new technologies to gathering and distributing news. The newspaper's founder, James Gordon Bennett, Jr., had been an investor in the first undersea telegraph cable project connecting the United States to Europe. Bennett was then the owner of the fabled *New York Herald*—founded by his father in 1835 and one of the country's very first widely circulated newspapers. With such a strong news institution on one end of the new cable system, Bennett thought it sensible to establish a counterpart newspaper on the other end—both as a way of distributing newly available material from the Western Hemisphere and as a collecting point for transmitting such material to America. The decision was made easier by the fact that Bennett found Europe to be a more tolerant setting for his flamboyant lifestyle—and because of his special affection for France, where he had spent a part of his childhood—and where he principally resided from the 1870s until his death in 1918.

On October 4, 1887, Bennett launched the *New York Herald*'s European edition from a small print shop in the Les Halles district of Paris—it quickly became known as "*The Paris Herald.*" At the time, it was one of many small English-language newspapers circulating in the principal cities of the Continent. But as other such efforts came and went, Bennett's persisted and grew. His enthusiasm for technology was one of the reasons. He brought to Europe new developments such as the linotype, color comic strips, and half-tone photo engravings. His newspaper was among the first to bring information into its newsroom by radio and to distribute copies by automobile and, later, by airplane.

When World War I forced some Paris newspapers to suspend publication, Bennett, then in his seventies, took personal command of his editorial staff and continued to publish. He died just as the war ended—and his company passed, through an intermediate owner, into the hands of the Reid family—who merged the *Herald* with another nineteenth-century publishing giant, the *New York Tribune,* creating, in 1924, the *New York Herald Tribune*. When the Reids bought out the *Chicago Tribune*'s storied Paris edition a decade later, the word "Tribune" also made its way onto the nameplate of the now-well-established *Paris Herald.*

The years which immediately followed marked a low point in the newspaper's history. Its New York owners gave it a long leash, and the management in Paris took a quieter attitude toward the rise of European fascism than did their State-side counterparts. This tendency was particularly clear when tourism sections about Germany were being planned—holding on to the advertising revenue they produced was something of a priority at the paper's Paris offices for a time. Nonetheless, a good deal of superb reporting continued to appear in the *Herald Tribune*'s pages—and the experience was central in the determination of the Reid family following the war to bring the Paris edition under much tighter control.

The *Paris Herald Tribune* was the last free newspaper in any language to publish in Paris before the Nazi occupation of June 1940. It then closed for four dark years. But it reopened late in 1944 with new energy and discipline and the 1950s brought a great surge of success. Its New York parent, however, fell into difficult straits with the advent of television and the growing success of its chief competitor, *The New York Times*. John Hay Whitney, then U.S. ambassador in London, bought the Herald Tribune Company in 1959—in an expensive effort to save the New York paper, but he finally gave up the project amid the 100-day New York newspaper strike of the mid-1960s.

Having closed down the New York parent, however, Whitney was determined to save the Paris child. To this end he brought, first, *The Washington Post* and then *The New York Times* into the newspaper's ownership. On May 22, 1967, the Paris paper appeared for the first time under its new name, the *International Herald Tribune*.

The new nameplate signaled a new era. Under its tripartite ownership, the publication flourished in the 1970s and 1980s, steadily improving its profit, more than doubling its circulation, expanding its advertising sales, and consistently employing to great advantage the extraordinary journalistic resources—domestic and international—of the two leading American newspapers of the era. Their far-flung networks of correspondents and contributors became the *IHT*'s networks as well, while the art of editing—sifting and winnowing, digesting and condensing, polishing and presenting incoming news—was honed into a distinctive art form by the editorial team in Paris. The paper also slowly assembled a small group of its own reporters, though this development was often a matter of some dispute among the three owning companies.

On the whole, however, the three-way ownership worked harmoniously, partly because the paper had a debt-free balance sheet—and, for a long time, did not represent any drain on the owning companies' financial resources.

Technological innovation was again an *IHT* watchword in the last third of the twentieth century. It became an early model of high-tech innovation in Europe when it computerized its editing and typesetting system in 1978. A bit earlier, in 1974, it had pioneered the electronic transmission of facsimile pages across international borders as it opened a remote printing site in London. A similar operation in Zurich followed in 1977. By the time of its worldwide centennial celebrations in 1987, the *IHT* was opening a new print site once every year on average—reaching both old and new markets earlier and a lower cost. The most dramatic of these steps came in 1980 as the paper launched a successful new Asian edition, printed in Hong Kong using page images which had been faxed via satellite from Paris. It was the first time that a daily newspaper had published simultaneously on two continents—available to readers over breakfast on opposite sides of the world.

The *International Herald Tribune*'s three-way ownership became a two-way partnership in 1991, as the Whitney interest was sold to *The New York Times* and *The Washington Post*. In the late 1990s, however, as global newspaper economics began to change, so did the owners' patience with divided control. In 2003, the *Times* purchased the *Post*'s 50 percent ownership, and became the sole proprietor. (Some at the *Post* felt that it had been forced out of the partnership by a *Times* threat to start a competing enterprise if the *Post* insisted on remaining a co-owner.)

After a period of intensive study (and anxious uncertainty) in the Paris offices, the *Times* moved to strengthen the paper on several fronts. Among other steps, a more distinctive Asian edition was created, in part through a more autonomous Hong Kong newsroom. The *IHT*'s own corps of independent reporters was expanded—writing from an *IHT* point of view on *IHT* deadlines. And a stronger business and financial report was launched, designed to meet head-on

the intensifying competition with both the *Financial Times* and *The Wall Street Journal*.

At the heart of the *IHT*'s continuing popularity, however, are the qualities which have characterized it from birth, an emphasis on credible and relevant information, skillfully reported and edited, attractively and efficiently presented. In an age of information overload, the paper's relative compactness has also remained an important asset.

But most importantly, in news environments around the world in which media traditions are often those of subjective comment and political advocacy, the *IHT*'s effort to separate news and opinion—to pursue objectivity as a professional ideal—continues to be a stimulating breath of fresh air. "I read my local paper to find out what I am supposed to think," a European reader once told a friend at the *IHT*. "And then I read the *Herald Tribune* to find out what happened."

International Journalism

International journalism refers to the production of news media around the world and reporting about foreign countries. Frequently it denotes coverage by Western correspondents of countries other than their own. This is of special concern because news travels unevenly across borders. This flow of news is dominated by large corporations and news agencies based in the United States and Europe, even as the Internet offers new opportunities for sharing and disseminating information.

Four Theories

News media operate under varied conceptual frameworks that help explain the character of journalism in different countries. One of the earliest scholarly assessments is found in the influential work of Fred Siebert, Theodore Peterson, and Wilbur Schramm in their 1956 book, *Four Theories of the Press,* which divided the world's news media into four categories: authoritarian, libertarian, social responsibility, and Soviet communist. In the half century since, their model has been criticized, expanded, and updated by others. The need for revision was clear in the face of the collapse of Soviet communism and the rapid advance of globalization. However, their fundamental research questions—"Why is the press as it is?" and "Why does it apparently serve different purposes and appear in widely different forms in different countries?"—remain fundamental. The authors' contention that "the press takes on the form and coloration of the social and political structures within which it operates" remains at the heart of international journalism.

In their pioneering formulation, the authors based their approach in the political, social, and historical development of Europe, the United States, and the Soviet Union. Writing at a time dominated by the cold war's bipolar balance of power, they applied their formula globally. Their "four theories" remain a starting point for discussion of international journalism. Under an authoritarian system, which they conceived of as the oldest and most common, media are controlled from the top and serve the state and ruling elite. The subsequent development of science, capitalism, and

Enlightenment philosophy ushered their second "theory," the libertarian. This made journalism part of a democratic process in which information was put to the test in a "marketplace of ideas." Readers and journalists were seen as rational citizens who relied on news to participate in political and social decision-making. The authors saw this system functioning most clearly in the United States where it was characterized by a laissez faire approach to media ownership and regulation.

The social responsibility theory arose in the West in response to criticisms that journalism served big business, was controlled by a single class, was not inclusive, and was often superficial. The development of broadcasting stations made regulation in the public interest necessary due to spectrum limitations. As opposed to a strictly libertarian approach in which only those with economic resources control media, in the social responsibility model, media should strive to include the greatest spectrum of views and sources. Finally, with the Soviet theory of the press, the authors saw a new variant of the authoritarian model, where the tightest control of media was applied to support an ideologically based totalitarian system.

The two root systems—authoritarian and libertarian—remain the basis for much of the discussion of international journalism, which often centers on which media are "free" or "not free." Press freedom has been an enduring focus of such international media watchdog groups as Freedom House, the Committee to Protect Journalists, the World Press Freedom Committee, and the World Free Press Institute. International press freedom also plays into U.S. foreign policy, which sees free news media as essential to democracy.

Other scholars have developed later designs to describe international news media systems. For example, William Hachten suggests the categories authoritarianism, Western, communist, revolutionary, and development. The first three owe much to the original formulation. The revolutionary concept describes a temporary cause-oriented news media. The development concept sees media as tied to national goals of economic, social, and political development. Hachten notes that friction between developmental and Western policy is crucial to debates about international journalism. Western foreign policy sees the unhindered flow of information as paramount, while developing states often feel that tighter media regulation can help nation-building and economic development.

Even when analysis remains restricted to the West, the "four theories" have been adjusted. For instance, Daniel C. Hallin and Paolo Mancini divide Europe and the United States into a polarized pluralist, democratic corporatist, and liberal models. Still, they see stable connections between political and media systems.

Cold War Patterns

Frequently the relationship between media and politics has been addressed at the level of the nation-state. However, following the reach of imperialism, the contests of the cold war, and the rapid development of globalization, attention has also focused on a global news media system.

International news is a staple of developing globalism. Indeed, the earliest American newspapers were filled with items pertaining to shipping and reprints from the London press. A capillary system of news media linked European colonies. These links were strengthened by development of undersea telegraph cables and later radio that extended the speed and reach of older communications. News agencies grew as Britain's Reuters, France's Havas, and Germany's Wolff initially dominated global news flow. Thomson Reuters retains a leading position, and the Associated Press and Agence France-Presse also play central parts. National news agencies became a mark of state legitimacy, a symbol of modernization, and a means to offset the frames presented by global news agencies.

The Soviet Union's TASS became an important distributor of news in its zone of influence and to a lesser degree globally (primarily by restricting the access of outside journalists). Soviet efforts to block news from the West by electronic jamming, among other actions, resulted in state-backed cultural and media thrusts from the West during the cold war. These efforts sought to establish the "free flow" of information and assure that Western interpretations of events and issues would be available to the East. Thus, propaganda and politics helped international broadcasting become an important part of world journalism.

During the cold war, the role of journalism was also an important and contentious subject among the nonaligned states of the so-called Third World.

Many governments in developing countries sought greater control over how they received and transmitted news. Western news values that privilege conflict and reporting patterns in which journalists descend on many locales only at times of crisis often led to a diet of news that presented much of the world as threatening and chaotic, a formula typical to this day. Critics charged that this hindered nation-building and development efforts of many newly independent states. This debate found its greatest platform at the United Nations Educational, Scientific and Cultural Organization's (UNESCO) call for a New World Information and Communication Order (NWICO), and in efforts to promote "development journalism" as the kind of reporting that responded to the unique realities and needs of developing countries.

Wilbur Schramm noted in his1964 *Mass Media and National Development* that little attention was paid to developing countries in international media. When they were covered, the news could be unflattering or misleading. In 1977, Sean MacBride, former Assistant Secretary General of the United Nations, was named to direct UNESCO's new International Commission for the Study of Communication Problems. The 16-member commission made its final report in 1980. Their report asserted that the world was divided into media rich and media poor countries, and that the latter were dependent (to their detriment) on the former. This undermined sovereignty and nation-building efforts. The MacBride report recognized an imbalance of news flow, inherent biases in Western-based international journalism, inequality in the means of media production, technological disparities, and professional difficulties in reporting. Both the United States and Britain took exception to these conclusions as threatening unhindered international news gathering and distribution and both withdrew from UNESCO membership, rejoining the international body only years later.

Post–Cold War Changes

In the debates about news flow and "media imperialism," the Soviet Union sought to diminish Western dominance in international journalism. With the demise of the USSR in 1991, however, policy debates about the issue subsided, but did not disappear. The terms of the debate shifted away from politics and ideology toward economics and the broad phenomenon of globalization.

The driver of world news is now media capitalism in an age of deregulation and conglomeration. International journalism is subsumed in what is sometimes called a global oligopoly of Western media giants purveying news and entertainment. Rupert Murdoch's News Corp. the largest media company, held assets worth $62 billion in film, television, cable, satellite, magazine, newspaper, book publishing, and other enterprises.

Extensive corporate control of news media has reignited debate about news flows, dependency, development, and cultural and media "imperialism." Journalism products tied strongly to corporate profits result in overcommercialization of news. Audiences may be treated more as consumers than citizens. News and entertainment products too often blend. Superficial and sensationalist news that sells well anywhere may supersede serious news aimed at creating an informed public. Market-driven media globalization also results in standardization of media. Western, and particularly American, professional conventions have become widespread. Critics contend that such conventions as neutrality, objectivity, and reliance on narrow sets of officials and experts, coupled with the need to sell news to large audiences for profit effectively shuts out a wide range of interpretation, critical analysis, and subject matter crucial to the functioning of civic life. They charge that the profit motive undermines the social responsibility of journalism and that this has reached global proportions.

Defenders of media globalization counter that capitalism ensures that audiences get what they want as well as what they need. If they do not, they will vote with their wallets against what they receive. Further, Western media exports carry universal values or cater to local contexts, rather than promoting alien norms. Further, only giant corporations can bear the expense of efficiently conveying news promptly and globally. They have been so successful at this that one expects to find information about any event of major significance virtually instantaneously, especially in English.

Although few argue for the creation of a New World Information and Communication Order any more, many of the continuing debates about international journalism hark back to those 1970s UNESCO debates. Whereas concerns then focused

on availability of newsprint and satellite access, recent worries center on the "digital divide" between rich and poor countries. This argument rests on the observation that while some countries are racing ahead to an era of technologically driven cornucopia of media, others are falling behind. News of the developed North continues to outweigh that of the developing South and poorer countries still get more news from the developed West than they give. Western news media continue to define the developing world as chaotic.

Twenty-First-Century Challenges

International journalism is one part of an era of media plenty in some areas. Privatization along with technological developments and diffusion in cable, satellite, and the Internet, has brought many people into contact with more and faster channels of information. For instance, Latvia, with a population of less than 3 million in 2004, had four national television channels among a mix of 28 terrestrial and 36 cable services. One could flip from local news to the BBC or MTV, then surf the web with radio playing in the background before reading a newspaper on the tram on the way to work. The increase in media abundance is uneven across countries and people. In many places literacy remains low and access to media technology is limited. Media globalization has varied in different places. Further, big Western news enterprises are cutting their international budgets and bureaus, banking on lighter, cheaper-to-produce local fare, rather than costly, challenging foreign coverage. Consequently there is concern about isolationism in media, and not only in the United States. One recent study showed that many countries devote more attention to themselves and their immediate region than distant locales. This shows a turn away from stories judged most relevant by the big news agencies even though they continue to dominate global news flow.

While international news may fall victim to profit seeking, interest in international news has not consistently diminished. A study by the Pew Research Center for the People & the Press showed that nearly as many Americans (52 percent) were interested in international news as national (55 percent) and local news (55 percent). But critics charge that audience and market research should not guide news judgments. They argue that international news is important in an interdependent global environment. This has particular relevance in the United States, which finds itself engaged in myriad international issues as the world's sole superpower. Moreover, as U.S. power is preeminent globally, how Americans understand the rest of the world may affect other countries. Therefore, U.S. foreign correspondence is important to international journalism.

Audiences are particularly dependent on news media for their understanding of places with which they have few sources of knowledge. Yet journalists and editors are often little more knowledgeable of issues, places, and context than are their audiences. Problems of language acquisition, source development and access, bias, stereotypes, deadline pressure, and financial expense compound the difficulties of foreign correspondence. Television, long the most popular news source, is problematic for international news coverage because of its dependence on captivating visuals and limited time devoted to each story. The medium is good at creating powerful and emotional imagery, but poor at conveying complexities and thoroughly exploring issues and contexts.

Most regions of the world are not reported on consistently in American media. There are fewer overseas news bureaus each year. International journalism largely follows Western news values of what gets covered and how. Conflict and "deviance" are preeminent among these values, thus the news cliché "If it bleeds, it leads." Too often foreign locations become news sites when there is unrest or discord. Journalists drop in (or "parachute") on places when conflict flares and depart as the fire dies down. Such visits do not allow reporters to become well educated about the context of a situation. They leave audiences poorly informed and with the impression that chaos and trouble is the dominant reality around the globe.

Journalists also bring their own preconceptions to their task. Foreign correspondents are usually foreigners in the lands about which they are reporting. While this may give them a certain objective detachment from the issues they cover, it also limits their framework for understanding what they learn. Western foreign correspondents frequently huddle around expatriate communities as well as form their own. They often do not know

local languages, especially when in more remote locations. Often they cultivate relationships with Westernized elites with whom they feel comfortable and whom they can more easily understand. This insularity may compound cultural biases and narrow the lens through which places and issues may be viewed. The lens is often brought from home and the foreign locale or story is measured against home-based foreign policy positions. Different social and political realities are difficult to comprehend and explain, all the more so under the conditions in which foreign correspondents frequently operate. Consequently journalists often fall back on stereotypes, simplistic labels (e.g., "tribal areas," "ethnic cleansing," "Islamic extremism," "economic transition") or simply fail to grasp or convey the complexities of places and events. Africa is one huge zone of incomprehensibility in which a picture emerges in the Western press of impenetrable confusion and often brutality. Storylines without clear good and bad guys are difficult to deliver. Without the old cold war frame that wrapped much of international news, journalists have frequently experienced difficulties delivering clear explanatory narratives. A foreign correspondent coming into unfamiliar territory must also guard against reliance on local public relations and official sources. Separating truth from spin may be more difficult than at home. It may be easier to manipulate a journalist who is just passing through and has little knowledge of the area.

The Foreign Correspondent

Despite the challenges and frequent shortcomings of international journalism, foreign correspondents are still the most prestigious positions in the profession. Therefore, understanding who foreign correspondents are is relevant to understanding international journalism. Based on research in the 1990s, Stephen Hess put together a portrait of U.S. foreign correspondents. Most often, they came from upper-middle-class families, went to selective private colleges, and commonly graduate school. They often spent periods abroad in various capacities, though less with the military. They often possessed weak foreign language skills. They were mostly men (about a third were women) and mostly white (only 8 percent were not). The foreign correspondent received good pay, particularly since many expenses were handled by the employer and some taxes could be avoided working abroad. Therefore, they are neither representative of their home population nor the populations they cover.

Stringers and freelancers make up a significant portion of foreign correspondents. Many are married journalists working abroad. Commonly such foreign correspondents keep children in tow while on assignment. Hess divided freelancers into six categories, including spouses seeking their own work while their partner was posted to a foreign bureau. Second were experts who were "wedded to a country or region rather than to journalism," who report to make use of their special interest in and knowledge of a foreign place. Third were adventurers out for the thrill of the foreign experience. Fourth came the "flinger," who with little journalistic experience goes on mini-adventures to build clips and learn the craft. Fifth was the ideologue who was seeking to get a particular interpretation of events into mass media. Last was the resident, often a native or expatriate journalist permanently living abroad.

A hierarchy exists among foreign correspondents, with reporters for elite media at the top and freelancers at the bottom. Working for *The New York Times* not only offers better working conditions and salary but also better access. Overseas reporters include experts and generalists, the latter being good at collecting information and getting a story out, but more likely to "parachute." Television journalists drop in and out of hot news spots more often than do print reporters. Media outlets vary in how they treat their foreign correspondents. Some media outlets may see the job as a journalistic specialization and circulate correspondents around the globe. Others see it as a potential rung in the ladder toward advancement in the news organization. In either case, foreign correspondence is a place of prestige in the world of journalism. Georgie Anne Geyer, a longtime foreign correspondent, quotes Ernie Pyle, a revered World War II reporter, on the point, "We correspondents could go anywhere we pleased being gifted and chosen characters." She expresses the romanticism tied up with the culture of foreign correspondence, such glory often being bound up with war reporting. International journalists often

have real war stories to tell from their work and not just around the water cooler.

Professional war reporting is often traced to British foreign correspondence during the 1850s Crimean War, although some military reporting occurred earlier. War reporting is what made stars out of Ernie Pyle, Martha Gelhorn, Edward R. Murrow, David Halberstam, and Christiane Amanpour. The detached "noncombatant" position of the foreign correspondent is anything but sacrosanct. War reporting is dangerous, difficult, and vitally important, but it also generates criticism. Critics charge that such singular devotion to conflict in foreign correspondence leaves us only partly informed and with a picture of the rest of the world in a state of barbarism. No one denies the importance of war reporting, but many warn against its exclusivity. Thus, international journalism too often becomes a prisoner of Western news judgments and cost-benefit analyses within large profit-driven companies.

The impact of Western journalism in the post–cold war era of globalization may not be limited to its influence over what gets reported as news and then circulated internationally. Journalism researcher William A. Hachten has written of the "triumph of Western journalism" claiming that its conventions have gone global. However, significant differences still exist among journalists and the news they create. Some variation is created by circumstance such as the political situation of a particular region and its effect on press freedom. There are differences based on professional values and how journalists conceive of their role in society, which affect professional practices and ethics. These differences affect whether a journalist will pay for information, whether he or she will be willing to go "undercover," whether anonymous sources can be used, and whether one can be a "watchdog" on government or business.

Differences are widespread among foreign correspondents on whether they should contribute to political agendas and lead public opinion, or be detached and neutral conveyors of dispassionate information. Some have gone so far as to call media globalization a "myth" in part because news is still largely reported from national rather than universal viewpoints. The global reach of international journalism has been intensified by technological innovation and diffusion and the rise of giant media companies, though journalism is practiced differently in different places for different aims. Debates about the intersection of politics, economics, and news gathering and the impact of news on international affairs and development continue.

International Journalism Organizations

International journalism organizations are those groups, associations, institutes, and societies concerned with journalism issues on a global or regional basis. Most are nongovernmental organizations (NGOs). They work in more than one country, often focusing on a specific region of the world (the many national groups are not covered here). Many of them promote education and training in journalism and meld efforts of academics and professionals. Such organizations include those focused on academia, print journalism, broadcast journalism, and organizations/associations with international divisions or participation.

Article 19

Article 19 (London, http://www.article19.org/index.html) is a human rights organization with a mandate to promote freedom of expression and information worldwide. It takes its name from Article 19 of the Universal Declaration of Human Rights, which states that everyone has a right to freedom of opinion and expression. Founded in 1987, it works with more than 50 national organizations in some 30 countries. Among other things, Article 19 scrutinizes threats to freedom of expression, offers legal standards to ensure free expression, and advocates for the implementation of freedom of expression. For example, following the controversy and hostility generated by the publications in Europe of cartoons depicting the Prophet Mohammed in 2006, Article 19 continues to campaign against the introduction of blasphemy laws as a justifiable answer to the problem. Moreover, as many countries implement new legislation to fight the global terrorism threats, Article 19 is continuously keeping a close watch on new occurrences and intervening, where necessary, to ensure that there is an appropriate balance between the need for security and value for freedom of expression. With its headquarters in London, Article 19 is a registered U.K. charity that is supported by contributions from individuals, foundations, and governments worldwide who are dedicated to the concept of freedom of expression.

Asia-Pacific Broadcasting Union

Asia-Pacific Broadcasting Union (ABU, Kuala Lumpur, http://www.abu.org.my/public/compiled/p657.htm) is a nonprofit, nongovernment, professional association of Asian broadcasting organizations. It was created in 1964 to assist in the growth of broadcasting in both Asia and the Pacific. It encourages regional and international cooperation between broadcasters and is the third largest of the world's eight regional broadcasting unions. It also exchanges information on the most recent developments in broadcasting with many international organizations and engages in activities that are geared towards enhancing the skills of its members. With 194 members in 57 countries, the ABU is funded primarily by annual subscriptions from its members.

Asian Media Information and Communication Centre

The Asian Media Information and Communication Centre (AMIC, Singapore, http://amic.org.sg) was established in 1971 with the support of the Government of Singapore and the Friedrich-Ebert-Stiftung foundation of Germany, to expand media and communication expertise in the Asia-Pacific region. It is a premier center for information, research, and promotion of mass communication in the region. Members include academics, practitioners, and policy makers from the Asia-Pacific region as well as other areas. AMIC's mission, according to its website, is to

"nurture and promote media and communication research, capacity building, knowledge management and dialogue among academia, industry, government and civil society." In June 2007, AMIC hosted a Journalism Education Congress in Singapore, attended by over 450 educators, journalists, and policy makers. AMIC houses a large collection of research materials in its Asia Communication Resource Centre, a comprehensive data communication service with over 65,000 books, journal articles, conference papers, and news clippings. AMIC also disseminates vast amounts of information on mass communication in the Asia-Pacific region through its newsletter, a quarterly magazine, and a biannual research journal, in addition to books and monographs.

Committee to Protect Journalists

The Committee to Protect Journalists (CPJ, New York, http://www.cpj.org), a nonprofit organization, was founded in 1981 by a group of U.S. foreign correspondents to protect the rights of threatened journalists in authoritarian regimes and elsewhere and to promote press freedom throughout the world. CPJ also shares information on breaking cases with other press freedom organizations through a global e-mail network. It is funded by contributions from individuals, corporations, and foundations.

Commonwealth Broadcasting Association

Commonwealth Broadcasting Association (CBA, London, http://www.cba.org.uk), founded in 1945 as Commonwealth Broadcasting Conference with six members, has made considerable progress over the years. It now consists of more than 100 broadcasting organizations in over 50 countries. Among other things, the mission of CBA is to advance the concept of public service broadcasting and promote freedom of expression and the right to communicate. It also provides networking facilities and training opportunities to its members. An all-Commonwealth General Conference is held in alternate years in addition to regular conferences held in different Commonwealth countries every year. CBA is funded by subscriptions from members of the major public service broadcasters of the Commonwealth.

Commonwealth Press Union

Began before World War I as the Empire Press Union, the Commonwealth Press Union (CPU, London, http://www.cpu.org.uk) has approximately 750 members in 49 countries, including numerous newspaper groups, more than 1,500 newspapers, and news agencies throughout the Commonwealth. The mission of CPU is to advocate the ideas and values of the Commonwealth, to promote understanding and goodwill among its members, and to enhance the interests and welfare of the Commonwealth press and those working within it. To support its mission, CPU has engaged in several activities over the years including the offering of legal support programming, lobbying on behalf of journalists who have been harassed or intimidated, providing regular updates on press freedom issues, and offering workshops and seminars on media law, ethics, and self-regulation.

European Broadcasting Union

The European Broadcasting Union (EBU, Brussels and Geneva, http://www.ebu.ch), founded in 1950, has 75 active members from 56 countries plus 45 associate members. It is the largest regional association of national broadcasters and works to ensure its members' participation in the global debate on media policy in addition to representing its members on European Union audiovisual policy matters. Eurovision, said by some to be the world's largest television contribution network, transmits live sports and news events, and is managed by EBU. For the news network and sports services of EBU, customers pay a fee.

Institute for War & Peace Reporting

The Institute for War & Peace Reporting (IWPR, London, http://iwpr.net/index.php), a journalist training and news media support organization, serves as a global system for media development, with not-for-profit divisions in Europe, the United States, and Africa providing training and competence programs for local journalism, including field courses in more than 24 countries. IWPR is headquartered in the United Kingdom and has offices in, among other places, the United States, South Africa, the Netherlands, Afghanistan, Central Asia, and the Middle East.

International Center for Journalists

The International Center for Journalists (ICFJ, Reston, Virginia, http://www.icfj.org/mission.html) is a nonprofit, professional organization whose mission is to promote quality journalism throughout the world in the belief that autonomous, dynamic media are critical in improving mankind. The programs of ICFJ span the globe and offer seminars and fellowships for media professionals. ICFJ has worked directly with more than 30,000 journalists from 176 countries in the past 22 years. It receives most of its funding from sponsoring foundations and agencies in the form of program grants and fees for its services.

International Consortium of Investigative Journalists

Launched in 1997 as a project of the Center for Public Integrity, the International Consortium of Investigative Journalists (ICIJ, Washington, D.C., http://www.publicintegrity.org/icij) is a Washington-based collaboration of approximately 100 renowned investigative reporters from 50 countries who generate long-term, transnational investigations. The team of ICIJ journalists investigate major global issues that affect everyone and release their findings in media around the world.

International Federation of Journalists

The world's largest journalism organization, the International Federation of Journalists (IFJ, Brussels, http://www.ifj.org) was first established in 1926, then relaunched in 1946 and again in 1952 in its present form. IFJ serves as a voice for journalists within the United Nations as well as within the international trade union movement whose primary functions are to defend, maintain, and advance (by collective bargaining) the professional, ethical, moral, and material rights of journalists. Among other things, the aims and objectives of the federation are to protect and strengthen the rights and freedoms of journalists; to respect and defend freedom of information, media freedom, and the independence of journalism; to uphold and improve professionalism and to promote high standards of journalistic education; to improve and defend the social and working conditions of all journalists; to promote and maintain editorial democracy; and to promote the social role of journalists and the profession of journalists, particularly its contribution to democracy and freedom. The federation has a half million members in more than 100 countries. It is partly supported by membership fees, collected according to the number of regular members declared by unions.

International Institute of Communications

The International Institute of Communications (IIC, London, http://www.iicom.org/frames.main.htm) is an interdisciplinary network of scholars, senior policy makers, regulators, technologists, industrialists, and content providers embracing broadcasting, telecommunications, and new media in approximately 70 countries. Among other things, the goal of IIC is to provide a global framework for dialogue about trends in communications, including the Internet, telecommunications, broadcasting, and print and new media, and their impact on society. It is a registered charity and not-for-profit membership organization whose funding comes primarily from subscriptions, donations, and projects.

International Journalists' Network

The International Journalists' Network (IJNet, Washington, D.C., http://www.ijnet.org) is an online service for journalists, media professionals/managers, educators, or anyone with an interest in news media around the world. It helps connect journalists with the opportunities and information they need to upgrade themselves and raise journalism standards to subscribers in more than 150 countries. IJNet is supported by the International Center for Journalists and various foundations.

International Press Institute

Formed in New York in 1950, the International Press Institute (IPI, Vienna, http://www.freemedia.at/cms/ipi) is made up of editors, media executives, and leading journalists. In several countries, IPI members have established National Committees that support IPI in its work to improve the situation for the media. Being the world's oldest global press freedom organization, the IPI is active in

more than 120 countries. IPI enjoys consultative status with the UN, UNESCO, the Council of Europe, and other intergovernmental organizations and can issue letters of appeal to these bodies when press freedom is threatened. IPI organizes an annual World Congress in conjunction with the annual IPI General Assembly. IPI publishes an annual *World Press Freedom Review*. In addition to these activities, IPI has two major funds that are responsible for countering threats to press freedom—the IPI Press Freedom Fund and the IPI Emergency Response Fund. Both of these funds are financed primarily through contributions from individuals, organizations, and corporations.

International Telecommunication Union

The International Telecommunications Union (ITU, Geneva, http://www.itu.int/net/home/index.aspx) is the leading United Nations specialized agency for information and communication technologies. Initially founded in Paris in 1865 as the International Telegraph Union, the ITU is the global focal point for governments and the private sector that provides efficient telecommunication services worldwide. The ITU is an intergovernmental agency, issues technical standards for telecommunications and information, and assists developing nations to improve their communications. It issues extensive publications tracing global telecommunication developments, including regulatory trends.

International Webcasting Association

The International Webcasting Association (IWA, Washington, D.C., http://www.webcasters.org) was formed in 1996 to provide a forum to promote webcasting and streaming media via teleconference calls, websites, listservs, Internet webcasts and regular meetings. Over the years, IWA has grown considerably and is now the largest worldwide nonprofit organization. Its membership includes portal websites, streaming service providers, content creators, educators, entrepreneurs, and user companies. As a service to its members regarding advice on legal and regulatory issues as well as investment strategies, IWA initiates meetings with the FCC and presents to Congress and the National Telecommunications and Information Administration. Headquartered in Chantilly, Virginia, IWA serves its members throughout the United States, Europe, Asia, Canada, and Australia.

International Women's Media Foundation

Launched in 1990, the International Women's Media Foundation (IWMF, Washington, D.C., http://www.iwmf.org/about) has built a network of more than 5,000 women journalists from approximately 130 countries, providing them an opportunity to form associations and partnerships worldwide to improve the status of women in the media. Its mission is to strengthen the role of women in the news media around the world, based on the premise that "no press is truly free unless women share an equal voice." IWMF holds numerous programs that are designed to advance women into key positions in the news media. IWMF also has an online training center that offers comprehensive training courses online to assist women journalists in honing professional skills and managerial abilities. Compiled from IWMF publications and other resources, its *Studies and Reports* document the opinions of women journalists, scrutinize how women are portrayed in the media, and gauge how many women work in the worldwide media and what types of jobs they hold. For funding, IWMF mostly relies on foundations, corporations, and individuals to carry out its programs.

Reporters Without Borders

Since its inception in 1985, Reporters Without Borders (Paris, http://www.rsf.org) has been fighting against censorship and laws that undermine press freedom and strives to improve the working conditions and safety of journalists, especially those reporting in war zones. Registered in Paris as a nonprofit organization and with a consultant status at the United Nations, Reporters Without Borders has branches in all five continents. The organization's publications are available online in Arabic, English, French, Spanish, and Farsi at its website, which keeps a daily record of journalists killed or imprisoned around the world. Its funding comes mostly from private groups, North American and governmental organizations, and from sales of photo albums, T-shirts, and other artifacts.

United Nations Educational, Scientific and Cultural Organization

UNESCO (Paris, http://portal.unesco.org) is a United Nations specialized agency formed originally in late 1945. An organization with a wide remit, its Communication and Information Sector (CI) was established in its present form in 1990. Its programs are rooted in UNESCO's Constitution, which requires the organization to promote the "free flow of ideas by word and image." Besides its staff at UNESCO headquarters, the CI Sector is represented in 27 UNESCO field offices. The three principal strategic objectives of its programs are to promote the free flow of ideas and universal access to information, to promote the expression of pluralism and cultural diversity in the media and world information networks, and to promote access for all to information and communication technologies.

World Intellectual Property Organization

World Intellectual Property Organization (WIPO, Geneva, http://www.wipo.int/portal/index.html.en) is a UN specialized agency formed in 1970 to encourage development of fair and balanced regimes of copyright, patent, and other modes of intellectual property protection. It is concerned with melding the interests of those who create (for example) media content with the demands of users and the capabilities of changing and increasingly digital technology.

World Press Freedom Committee

The World Press Freedom Committee (WPFC, Reston, Virginia, http://www.wpfc.org), formed in 1976, is an international umbrella organization that includes 45 journalistic groups—print, online and broadcast; labor and management; journalists; editors; publishers; and owners on six continents. WPFC administers the only global program for systematically monitoring press freedom issues at UNESCO, the United Nations, and other intergovernmental organizations on behalf of press freedom groups. It also set out global press freedom principles in its 1981 Declaration of Talloires, followed in 1987 by the ten-point Charter for a Free Press. WPFC provided the first analysis of post–cold war code words that can mask censorship practices and in 1985 produced the first comprehensive survey of killings, arrests, and harassment of journalists, showing that licensing would not protect journalists.

World Press Institute

The World Press Institute (St. Paul, Minnesota, http://www.worldpressinstitute.org/mission.htm), a private, nonprofit organization, is dedicated to promoting press freedom throughout the world. It is supported by numerous foundations, local and national media, individuals, and multinational U.S. corporations. Its mission is to advance, support, and fortify a free press in its role as an opponent of cruelty around the world. It works with local journalism organizations to provide training in ethics, advertising, and circulation growth techniques, and marketing and strategic planning, among other things. Every year, it brings ten foreign journalists to the United States to expose them to U.S. journalistic practices and standards through seminars, briefings, and visits to the newsrooms.

International News Service

The International News Service (INS) was an American news agency founded by newspaper publisher William Randolph Hearst in 1909 to serve his own growing chain of papers as well as other subscribers. Always a distant third to its larger rivals, the Associated Press and the United Press, INS combined with the latter in 1958 to become United Press International.

Origins

In 1903, the Hearst publishing organization leased a telegraph line from San Francisco to New York, running through Chicago to allow its expanding newspapers in the three cities to share content. Some stories were also provided to other newspapers. This process of serving both Hearst and non-Hearst newspapers (no membership was required, as with Associated Press) became the Hearst News Service in 1904. Five years later, in May 1909 (by which time he published seven morning newspapers), Hearst established the American News Service with headquarters in New York. Just a few months later, this entity was divided into two separate entities serving morning and evening newspapers, with the International News Service furnishing overnight reports for morning newspapers seven days a week. Foreign news coverage was added in August 1909.

In 1911, the morning and evening services were recombined under the INS rubric. Further changes again focused INS on serving only evening papers from 1917 to 1928, after which time it always served morning and evening. While serving as a news agency, INS was also a "news marketing and distribution arm of the Hearst combination" and was widely perceived as such (Rosewater 1930/1970, 358). It carried many features and columns, which were later spun off to a separate Hearst features syndicate.

Heyday

In an attempt to gain attention (and ideally subscriptions) from the country's more than 2,000 dailies, INS emphasized colorful writing (and sometimes seamier news stories) over careful fact checking. Indeed, the agency was accused on the eve of World War I of inventing most of its foreign correspondents, its reportage striking some as just another example of Hearst fakery. The accusation—and numerous others of the same tone—hit INS personnel hard, and from all reports, morale plummeted. Finally, in 1916, British, French and Portuguese (and later Japanese) news services denied INS exchanges of news and access to their cable links, claiming Hearst (and thus his INS) favored Germany and were distorting war news. This lockout may have been one factor that led to a landmark court case concerning news piracy.

In 1916–17, the Associated Press accused INS of stealing its early reports, rewriting them, and delivering the result to INS subscribers with no attribution to their AP origin. INS obtained the reports either by bribing AP newspaper employees for access (though some Hearst papers were AP members and therefore received AP feeds), or by simply copying early East Coast published versions. After losing at the lower court level, AP appealed to the U.S. Supreme Court which in December 1918 largely upheld AP's complaint. The court (though with three dissenting votes) concluded that while actual news events themselves could not be copyrighted, specific stories about those events most certainly could be. Put another way, there was a legal property right to news. It took INS years to recover its image.

Barry Faris became editor in 1916, serving for the next 40 years later. Moses Koenigsberg headed overall INS operations until 1931. Under his direction, starting in 1923, INS began to serve foreign papers. By the late 1920s, INS was delivering 20,000 to 30,000 words per eight-hour day to its American subscribing papers using leased telegraph lines. Some papers received "Public News Telephone" called in reports, and others got abbreviated summaries by messenger. Special sports and financial wires provided additional services. International News Photos began in 1930. Although INS joined in the press-radio "war" of 1932 that briefly denied most agency new reports to radio stations, the constant pressure for revenue quickly caused it to cave in and, in 1935, resume service to radio stations.

A number of famous reporters worked for INS over the years including adventurer Floyd Gibbons, Jack Lait, Bob Considine (later a columnist), Pierre

J. Huss, Irving R. Levine (later an NBC economics reporter), Anna Louise Strong, and Jack Singer. Lait achieved perhaps the biggest scoop in INS history. Thanks to a tip from a Chicago policeman, he was standing only a few feet away when, in the summer of 1934, FBI men shot one of their most wanted fugitives as he came out of a theater with Ana Cumpanas, later nicknamed "the lady in red," a brothel owner who fingered him for the FBI. Lait's lead was written in classic INS style: "John Dillinger, ace bad man of the world, got his last night—two slugs through his heart and one through his head. He was tough and he was shrewd, but he wasn't as tough or as shrewd as the federals. . . . Their strength came out of his weakness—a woman." Assigned to cover the Pacific war in the early 1940s, INS correspondent Richard Tregaskis spent two months (today we might say "embedded") with the U.S. Marines during their pivotal battle with the Japanese for the island of Guadalcanal. His book *Guadalcanal Diary* became a best-seller.

Despite such highlights as well as substantial investment in facilities and personnel, however, INS remained a weak third-place holder in the competition with the Associated Press and the second place United Press. INS served just over 13 percent of American dailies in 1934; that number crept up to 19 percent by 1948. But they are placed in perspective with AP's percentages for the same years (61 and 68 percent) and even those of United Press (44 and 51 percent). INS client totals ranged from about 400 at the end of World War I, rising to 600 by 1930, more than a thousand after World War II, and about 3,000 at the time of the 1958 merger with United Press.

In 1948, INS became the first American news agency to enter television when it combined efforts with Telenews Productions Inc. to provide a daily service of newsreels, still photos, and news copy. By 1952, more than 80 percent of American television markets were served, along with stations in Canada, Mexico, Cuba, and Brazil. By 1950, the main INS news feed went to more than 900 foreign clients, most of them added since 1945. By the early 1950s, INS was providing some 125,000 words of news and features daily. Radio stations were served by a script service of some 40 weekly feeds, in addition to the standard INS feed. Teletype service began in 1951.

Merger

Despite all its efforts, INS faced two problems—the poor image of the Hearst press (even after the founder died in 1951) and the dominance of news agency service by the Associated Press. The Hearst company had been in weak financial shape since at least the late 1930s. Furthermore, the number of American daily newspapers was already in slow decline by the middle of the twentieth century, making it even harder to gain clients. All of these factors squeezed the agency's budget for both technology and personnel.

As the second-place United Press was facing similar issues (though from a stronger competitive position vis-à-vis the AP), talks were initiated on a merger, and agreement was reached to create what became United Press International on May 24, 1958.

Internet Impact on Media

The Internet has had a tremendous impact on the traditional news media, especially in bringing about convergence (a blending of media forms). Virtually all news media have a web presence. Some of the key factors influencing online news media are personalization and interactivity, the reduced importance of geography, and the rise of the 24-hour news cycle, which puts pressure on all media outlets to cover breaking news.

Personalization allows users to select content that meets their interests and shifts the balance of power away from editors and reporters. Web users also have the opportunity to customize delivery of content of interest in the form of news feeds and e-mail newsletters and alerts. Interactive features such as discussion boards allow audiences an opportunity to be part of the conversation and sometimes even shape the content of news sites. In a sense, the Internet has made news media more democratic. But there is also concern that it isolates users by limiting their exposure to topics and points of view divergent from their own.

A major influence of the Internet has been to remove geographical limits on the reach of media outlets. No longer are news media restricted to one city or region; the Internet allows them to reach audiences nationwide and internationally—the online version of a local newspaper may find audiences all over the world. For example, when Hurricane Katrina hit the American Gulf Coast in 2005, online viewers could get up-to-the-minute information directly from the website of New Orleans's *Times Picayune,* which continued to publish online editions even when the hurricane made print editions impossible. This extended reach can also influence changes to news media content; editorial decisions may strive to make the content more appealing to secondary audiences, such as emigrants or members of diasporic communities.

Newspapers

Newspapers began to establish a presence online after Netscape launched its Navigator browser in 1994. By 1997, about half of the dailies in the United States had a webpage. Initial newspaper websites were rather rudimentary, served mainly to introduce the newspaper, and in many instances were not updated more than once in 24 hours. As newspaper readership among those under 30 was declining, operating a website became one way to attract younger users.

By the early twenty-first century, online newspapers had evolved into constantly updated publications that are often richer in content than the print versions. News is usually presented in a series of layered pages, with the first containing headlines and news capsules and the second and third layers offering more in-depth content. Online newspapers vary from one another in their depth of content and degree of interactivity. They also vary in presentation: some retain the look of the print edition (such as the newyorktimes.com) while others have crafted a unique web identity (like washingtonpost.com). In most cases, the general concepts of newspaper organization have not changed in the online versions, with special sections devoted to topics such as arts and sports, as well as editorial pages. Even the traditional organization of the printed front page, with the most important stories being presented "above the fold," is maintained in most website designs; however, some sites take advantage of web technology to present a series of top stories in rotation.

Online presence has enabled newspapers to become much more interactive. For example, many newspaper sites have their own blogs written by journalists on staff. Readers are invited to respond to journalists and offer feedback and express opinions about stories. This interactivity allows readers to participate in a conversation about news. Such interactivity both limits and expands the kind of reporting done by newspapers: local issues tend to get more coverage, at the cost of national or international issues.

Online newspapers also use multimedia—such as audio and video clips—to make their content livelier and less text based. As audio and video streaming technology improves and household broadband connections become more widespread, such multimedia applications will continue to expand. The blending of audio, video, and text allows for multiple levels of reporting as well as for the ability to link to original documents, which can make for greater transparency in reporting. The

use of multimedia has the potential to engage younger readers more comfortable with an audio-visual culture than a purely text-based one.

Newspaper webpages can provide greater depth of information than print, with links to original documents, related stories, and background materials. Because there is no online space constraint, newspapers can post stories and features that did not make it into the print version. The ability to search through the newspapers archives gives online readers an opportunity to trace the development of an ongoing story.

Many newspapers have developed community sites such as philly.com (*The Philadelphia Inquirer*) and mysanantonio.com (*The San Antonio Express News*) that drive traffic to their sites from those seeking information about events in the community, thus keeping visitors on their sites for a longer period. Such websites provide a portal for arts and entertainment, as well as community and neighborhood news and information. This emphasis on "local" is also part of the strategy at Cox Newspapers (publisher of the *Atlanta Journal and Constitution*) whose online newspapers target specific demographic groups like young mothers and local sports fans who may be underserved by the printed newspaper. As online newspapers recognize that web users seek news from multiple sources, they are making it possible for users to aggregate this information in one place. *The New York Times*' "My Times" feature allows readers to create a personalized page containing their favorite blogs, pictures, and headlines from multiple news outlets.

Recognizing that there is a significant online readership has led some newspapers to reorganize their newsrooms to facilitate the creation of more online content This shift has given newspapers the ability to emphasize local news and events with interactive features that are updated throughout the day while leading to a greater reliance on wire services for some content such as arts reviews, features, and sports. The Gannett newspaper group is redefining newsrooms as "local information centers" that can gather and distribute information across a variety of media outlets including handheld electronic devices and mobile phones.

As with the printed edition, the main source of revenue for online newspapers is advertising. In the mid-1990s when newspapers were first going online, some experimented with charging readers for online content, but this subscription model did not succeed, mainly because Internet users had access to many sources of free news. The only newspaper that has been successful with the paid content model is *The Wall Street Journal*. This is possible because its readership sees a tremendous value in current and deep business news and is therefore willing to pay to access this content. In 2005 *The New York Times* tried a hybrid business model with some content available free, but *Times Select,* which included a search capability as well as current commentary by editorial writers, at a cost. Two years later the *Times* reverted to providing all content free, finding that advertising revenues more than made up the loss of subscription income.

The Internet has also led to experiments with new business models such as Politico.com, which is a hybrid of a print newspaper and an online news service. Moving away from a generalized product for a mass audience, it provides specialized coverage for an audience of lawmakers, lobbyists, and strategists on Capitol Hill. The print edition of the paper has a limited print circulation of about 25,000 and is available free in the Washington, D.C., area.

Magazines

The Internet has impacted magazines in two ways—existing magazines have, like newspapers, established a presence on the Internet, while new web-only magazines like Salon.com and Slate.com have appeared.

For newsweeklies the challenge is finding a way to continue to be meaningful to readers at time when there are a plethora of more current news sources on the Internet. Known for their analysis and lifestyle pieces, magazines such as *Time* and *Newsweek* are finding themselves competing with newspapers that are increasingly offering similar content. While most magazines have websites, the key issue remains determining what they can offer on a weekly basis that remains relevant in a 24-hour news environment. Related to this is the issue of deciding how much original content to offer on the website. Most weekly and monthly magazines offer more online content while at the same time offering multimedia features.

In 2007 *Time* announced changes in the way it determined its total readership by including online readers in its totals. This was accompanied by a change in its publication day for the print edition from Monday to Friday, in recognition that it was moving away from breaking news to more review and analysis. In January 2007, the website underwent significant redesign with continuously updated news, more prominence given to blogs and interactive features and less space given over to content from the print version of the magazine. The intent was to allow *Time* to have a presence in the 24/7 news space, while distinguishing itself from news aggregators like Yahoo and Google. The magazine seeks to combine more context (rather than just headlines) by relying on a stable of high-profile writers.

In 2007, *Newsweek* was the largest newsmagazine on the web (in terms of unique web visitors to its site), providing both original content and that from its partners MSN and MSNBC.com, as well as blogs authored by its correspondents. *Newsweek*'s editors believe that the website should provide readers with a perspective on news as well as online exclusives in addition to breaking news. The magazine is in the process of trying to figure out what editor Jon Meacham in an interview with the *American Journalism Review* called the "polished narrative writing of the 21st century online." The seriousness of *Newsweek*'s investment in maximizing the interactive and visual value of the Internet is evident in the magazine's investment in a video studio so that it can create multimedia content in-house.

The smallest of the newsweeklies, *US News and World Report,* has also turned its attention to the web. USNews.com showcases the magazine's famous college and hospital rankings, as well as similar reports, keeping some of the content available on a premium paid basis. At the same time the website carries the usual breaking news and analysis. Reporters are being trained to add audio and visual elements to their web stories in a move to make the website more appealing.

An important creative way the Internet has impacted magazines is with the emergence of webzines, also known as e-zines or zines, magazines published exclusively online. Two early entrants are *Salon* and *Slate,* which began in 1995 and 1996, respectively. *Salon* was launched with seed money from Apple, while *Slate* was funded by Microsoft. Each has established a unique identity, offering both political and cultural criticism, commentary, and exposés that have been both lauded and criticized. When *Slate* was launched, then-Editor Michael Kinsley made it clear that at some point readers would have to pay and thus share the cost of producing the magazine. This point came in 1998 but lasted only a year, as it did not gain sufficient subscribers to attract advertisers. After facing a decline in advertising revenues, in 2001 *Salon* created two tiers of content, a free version that is supplemented with advertising revenue, and a premium version, available by subscription.

The Internet has saved some struggling print magazines from disappearing. Some print magazines that face difficulty earning advertising revenues have turned to the Internet to continue to reach readers but to eliminate the huge costs of printing and distribution.

Radio

Radio has been less dramatically impacted by the Internet than other media. Internet Radio station websites, webcasting (broadcasting over the Internet), and podcasting (syndication of digital files for replay on computers and portable media players) are all evident. Some stations use their websites primarily to list programs, while others offer primarily local news. Most websites offer streaming, which enables audiences to listen to the station's content online in real time.

The greatest impact of the Internet has been to remove the limits of geography that radio stations previously faced. Through webcasting, stations can reach listeners across the world. Not only have existing stations adopted webcasting, there are many web-only radio stations, whose content is almost always music. Web radio has made a much wider variety of content available to listeners, particularly for those living in rural areas. Unfortunately, problems with copyright have rendered the existence of many web radio stations precarious.

Another important development in radio's relationship to the Internet is podcasting, in which specific "shows" can be created, posted to the Internet, and downloaded for listening later. With podcasting, limits of both geography and time can be overcome. National Public Radio is the leader

among radio stations in the United States in providing podcasts of a variety of its programs.

Internationally, major radio providers like the British Broadcasting Corporation (BBC) have shifted their attention online. In 2001 BBC Radio replaced its shortwave broadcasts to the United States, Canada, Australia, and New Zealand with an online audio stream stating that in the developed world radio listening is in a decline. A few months later Deutsche Welle radio made a similar move. Early in 2008, the BBC ceased over-the-air English broadcasts to Europe, relying instead on Internet services.

Television and Cable

Network news divisions continue to explore ways of using the Internet to hold on to their audiences and attract new viewers. By establishing a presence on the Internet they hope to attract audiences to their website during the hours when they are not on the air while broadening their appeal to younger audiences. As with other media, their websites are another way to overcome limits of traditional media—in this case their evening newscast. Stories that are kept short for broadcast can be offered at greater length online and those that didn't make it to the broadcast can find an audience on the website. At the same time there is also a push to create content that is made exclusively for a web audience.

The major television networks have increased the web-only content available on their websites and also offer blogs by their correspondents and anchors. In 2005 nbc.com began posting the *Nightly News* online after it had aired on the network. CBS News also makes its newscast available online in the hope of reaching viewers who may not have access to the broadcast when it airs. ABC News produces a separate webcast called World News. This 15-minute program is distinctly different in style and content from the on-air broadcast and is meant to appeal to a younger audience demographic. All news divisions recognize the potential for a new type of storytelling and are looking for ways to make content relevant online.

The website of each news organization is rich in content with breaking news headlines accompanied by videos, photo galleries, and comments. Stories on the CBS and NBC sites are flagged as exclusive to the web. With continuing topics like "Planet Earth" and "The World," online visitors are given an opportunity to customize their news experience. Unbundling the newscast into individual stories as well as making news programming available as downloads on digital clearinghouse sites like iTunes is a another way of giving greater control to the viewer. Blogs by correspondents and anchors (in the case of NBC and CBS) occupy a prominent place on each network's website. Some of these, such as NBCnews.com's "Daily Nightly," offer a look at what goes on behind the scenes in putting together a newscast while at the same time promoting it.

The Internet was the impetus behind the formation of a hybrid news outlet, MSNBC, in 1996, the first online news outlet linking a traditional network and a software company (Microsoft) to create a cable news channel. The goal was to use NBC's news-gathering resources to attract web users to the site and to create a cable channel that harnessed the interactivity of the Internet. MSNBC's website has been very successful at incorporating elements of the new media. The "community" tag links visitors to a variety of blogs. The site makes it very easy for visitors to load and share pictures, video, and news. In 2007 MSNBC bought Newsvine.com, a website that combines traditional news content with user-ranked news stories and user-generated content, as a way to strengthen its online presence.

Cable news outlets such as CNN and Fox News have seen their round-the-clock advantage over broadcast network news erode with the availability of news on the Internet. Their websites provide breaking news, links to programs, and some ability to customize news while allowing viewers to generate content in the form of photos and videos. Both CNN and Fox allow viewers to upload unfiltered content in the form of videos that do not get evaluated by their editors. In 2008, Fox lagged behind CNN and MSNBC in terms of web viewers and announced a digital strategy that included an increase in videos and in Internet exclusive content as well as the opportunity for viewers to rate and recommend videos.

Their websites also allow them to feature content from media partners. For example, cnn.com has a link to *Time* magazine (both are owned by the same conglomerate) while MSNBC provides

links to NBC's news programs. Increasingly, these companies see themselves as news providers that use more than one platform to make their content available to PDAs, cell phones, and in the form of RSS feeds that can be picked up by news aggregators.

Blogs and Citizen Journalism

Of all that the Internet has brought about, the change that maximizes its democratic potential is the formation of weblogs, or blogs. Most observers agree blogs first appeared in 1998. By early 1999, there were 23 blogs online, the result of free software that made it possible for individuals to upload content. Since then, blogs have grown exponentially. The blog search engine Technorati estimated that there were over 100 million blogs worldwide in 2008.

Blogs have been described as diaries or journals written by individuals who want to establish an online presence. The authors of most early blogs were people who wrote highly personal material rather than news. The key characteristics of a blog include content that is updated frequently and that centers on a theme, while providing a user-friendly interface, discussion threads, and links to other webpages. This last feature—the interlinking of sites—is a distinguishing aspect of most blogs.

The huge and growing number of blogs has led to sites, such as the Huffington Post, Technorati, Slashdot, and Digg, that help users navigate the blogosphere. In addition to providing original content, Huffington Post serves as blog portal, organizing blogs by content category and providing links to the most popular ones. Technorati.com functions as a blog search tool and lists blogs in order of the attention they are getting on the web. Slashdot focuses on science and technology stories, and while the site provides links to the stories, its greatest value is in the editorial function it performs by choosing relevant material to feature. By contrast, there are no editors on Digg; users rate news stories and blog posts, and the ratings determine what appears on the home page.

One aspect of blogs many find exciting is their potential to counterbalance the power of mainstream corporate media by creating free-flowing electronic communities. The tremendous popularity of blogs suggests that news gathering and commentary can be successfully democratized. By linking to other sites, blogs demonstrated their ability to gather information from a variety of sources in order to form an opinion or reach a conclusion. Even as blogs have grown in popularity, however, there is considerable debate over whether bloggers are journalists. Many see bloggers' lack of objectivity or editing as a serious drawback.

While many in traditional media are fascinated by what blogs offer, there are others who question blog authority and credibility. But bloggers have showed their ability to go after unreported stories and make news in a number of high-profile instances. For example, bloggers focused attention on remarks made by Republican Senator Trent Lott in 2002, in which he reminisced with apparent fondness about a segregationist presidential campaign. Although traditional news media initially ignored the story, blog stories led to more widespread coverage and to Lott's ultimate resignation as Senate Majority Leader. Similarly, bloggers' questions about the authenticity of documents used by CBS news in 2004, which suggested President George W. Bush had avoided service during the Vietnam War, led to closer scrutiny of those documents and to CBS ultimately retracting the story. In a 2006 Virginia campaign for the U.S. Senate, blogging about a video of Sen. George Allen making an ethnic slur cost him an expected reelection.

Starting around 2002, traditional news media outlets began to add blogs to their sites. These blogs tackle a range of subjects and encourage ongoing dialogue to drive more traffic to news sites. Many of these blogs are written by journalists and columnists at news organizations but others are provided by freelancers and special guests.

Blogs make it possible for the average citizen to highlight issues that he or she feels are important and thus to become a part of a more widespread public debate. Blogs have transformed the news business by giving any individual the power to be a reporter, thus creating the citizen journalist. Citizen journalism aims to connect journalism directly to issues that the public is interested in debating. Citizen journalists have often played a central role in situations where professional journalists have had limited access to the news scene

(at least initially) such as in the London terrorist bombings of 2005 and in the aftermath of Hurricane Katrina in the same year.

YouTube, with its user-generated videos, has developed into a key site for citizen journalism. Videos of events that are politically significant and that document important trends contributed by citizens enter the public domain and can be accessed by the millions of users of the website. As a testament to the impact of YouTube journalism, some repressive governments have blocked access to the site. Podcasts that deal with politics and news are also a form of citizen journalism. With a minor investment in equipment anyone can create a podcast and reach a wide audience over the Internet without needing an established news outlet to carry it.

Citizen journalists have joined to form groups like ePluribus Media and the Independent Media Center (IMC or Indymedia) that aim to counter mainstream reporting and shift to a bottom up rather than top down model of news gathering and production. ePluribus is a cooperative of citizen volunteers who are interested in similar issues and who are committed to the ethical practice of journalism. Indymedia is a news collective composed of a range of independent media organizations and professional and amateur journalists who are committed to social change. Its mission statement on its website states that it is a "democratic media outlet for the creation of radical, accurate and passionate tellings of truth."

Another citizen journalist success, Korea's OhMyNews, calls on citizen journalists to provide reporting for an online newspaper that serves as an alternative to mainstream conservative media. The site has become a household name in Korea and in 2004 added an international edition in English that draws on the service of "world citizen reporters" for its content.

Conclusion

It is clear that the Internet has transformed the media while at the same time giving rise to new forms of news media. Some traditional media formats like newspapers have seen considerable alteration because of the Internet while others are only beginning to use the Internet to extend their audience and their brand. The Internet has made media producers think differently about what constitutes news and journalism and about how it can best be practiced and presented. Audiences can now access most media content irrespective of place or time and now can customize content—this has made media more democratic by giving users the opportunity to define their own news agenda and by providing content. The impact of the Internet continues to evolve as technologies develop and as legacy news media experiment with the possibilities the online world provides.

INTERVIEWERS

People are infinitely fascinated with other people, and therein lies the central appeal of being an interviewer on radio, television, or cable. Getting people to talk revealingly about themselves, their lives, interests, and motivations is the chief task facing any interviewer. Being able to accomplish that without getting a subject defensive or angry is something of an art. And doing it with important political or other news figures can be a tricky proposition.

Most of the interviewers noted here differ sharply from radio or television talk-show hosts of the present. The modern-day on-air figures take up most of their own air—they aggressively present their opinions and thoughts, rarely those of others (save for callers who usually agree)—and many go on for hours every day. The interviewers included here were far more interested in showcasing their guests, though they were often deferential and discreet in a way that would appear old-fashioned by the early twenty-first century. Still, many interviewers on commercial television appear reluctant to look or sound offensive to the viewer. That makes it harder to ask probing questions and almost impossible to demand quality responses. Insisting on specific answers to allegations makes any reporter look rude, perhaps insolent, certainly discourteous, and obviously disrespectful. Striking a balance between decorum and determination to get responses is a difficult thing to accomplish.

Most broadcast and cable interviewers tend to focus either on journalistic topics or the world of entertainment, though some meld the two. This entry emphasizes the former though many interviewers deal in both.

Radio Interviewers

In at least one way, radio has always been a natural forum for interviewing. After all, the listener's entire focus is on voices and what people say (and often how they say it), and radio delivers that well. There are no disconcerting pictures. On the other hand, for decades, radio shied away from using women on the air, let alone as interviewers. It was largely a man's medium for many years—save for Mary Margaret McBride. Only in the past few decades has that barrier slowly dissolved such that women are now some of the best-known and most effective broadcasting interviewers.

Terry Gross (1951–)

Gross has hosted *Fresh Air* for decades on National Public Radio. Born in Brooklyn, New York, Gross earned a bachelor's in English and a masters in communications from the State University of New York at Buffalo. She briefly taught school in the inner city before beginning her radio career in 1973 at Buffalo's public radio station WBFO. Two years later she moved to Philadelphia, joining WHYY-FM as producer and host of *Fresh Air*. She covers contemporary arts and issues on the weekday magazine program. According to its website, *Fresh Air* provides interviews as much time as needed and has won numerous awards for its "probing questions, revelatory interviews and unusual insights." Gross's approach to interviewing combines empathy, genuine curiosity, and sharp intelligence. Part of her technique is to ask guests to explain something they have previously said. Most times, the discussion goes well and her guest stays on for the entire interview. In a few instances, for example when Gross spoke with FOX News Channel's Bill O'Reilly in 2003, things have not gone to the guest's liking, they have and terminated the interview.

Mary Margaret McBride (1899–1976)

McBride was one of radio's most important and versatile interviewers for several decades. Born in Missouri, she graduated from the state university with a degree in journalism in 1919 at a time when women in the field were fairly rare. Through the 1920s, she worked as a writer/reporter for a series of newspapers and magazines. She broke into radio as "Martha Deane" on New York's WOR in 1934. Three years later she began her first network program with CBS, staying with the short format (15 minutes) until 1941. During the 1940s she reached her peak audiences with an early afternoon 45-minute program on NBC. She broadcast with ABC in the early 1950s, and returned to NBC from 1954 to 1960. A postwar attempt to shift her program to television, however, failed in a few months. For the rest of her life, she syndicated her program and its

interviews. She had a relaxed and homespun style (she was Mary Margaret to everyone) that encouraged informal conversation with her broad range of guests, from politicians to generals to movie stars; she never announced her guests in advance, so the audience tuned in with no idea what they would get. They often heard everyday people with interesting roles who were as likely to appear as the famous. She was one of the earliest national radio figures to include African American guests during World War II. Long before Oprah Winfrey, Mary Margaret's positive mention of a book could sell thousands of copies. She developed an advertiser policy early on of not accepting commercials unless she could attest to the product's quality or value herself. Her fifteenth anniversary of being on the air was celebrated at Yankee Stadium, which could barely hold all the attendees.

Edward R. Murrow (1908–65)

Born in North Carolina and raised in the Pacific Northwest, Murrow attended Washington State College in Pullman for his degree. After a brief period with national student organizations, he was hired by CBS radio in 1935 as their director of talks. He became a reporter starting in 1938 in Europe and was made famous by his broadcasts from London in the 1940 Blitz of the city by the Germans. While he would often interview people in his role as a foreign correspondent, Murrow's interview style came into its own after the war on both his radio broadcasts and the 1950s television documentary series *See It Now* (1951–58) and *Person to Person* (1953–61). The former often included a live or filmed interview. The latter was a light weekly informal (but well-planned) interview of two celebrities for each program, televised inside their own home. Some of these subjects were show business figures, but many were important political, cultural, or scientific people. Murrow retired from the network and headed the U.S. Information Agency under President Kennedy in the early 1960s.

Diane Rehm (1936–)

Rehm was born in Washington, D.C., and began her radio career in 1973 as a volunteer at American University's WAMU (FM). She soon became host and producer of two health-oriented programs, and (after a brief attempt at a television show plus some freelance work for AP Radio) in 1979 she returned to WAMU to host the station's morning talk show, *Kaleidoscope*. In 1984 it became *The Diane Rehm Show,* and National Public Radio began its national distribution in 1995. Three years later, however, Rehm was diagnosed with spasmodic dysphonia, a neurological condition that causes a strained and slow speech pattern. After a short time off the air for treatment (which is repeated every few months), she returned to the program which remained on the air into the early twenty-first century. Rehm interviews a wide variety of guests, ranging from political figures to authors of all kinds.

Lawrence E. Spivak (1900–94)

Born in Brooklyn, New York, Spivak's first journalism work was in print media and he became the publisher of the monthly *American Mercury,* the conservative journal created by H. L. Mencken. Intending to promote readership, he and Martha Rountree created the idea of *Meet the Press* on the Mutual network in 1945. He served as one of the journalist panelists as the program (always asking the first question) began to appear on television in 1947, becoming moderator for a decade, before retiring in 1975. Spivak sought to confront newsmaker guests on the program with straight and often provocative questions rather than expressing his own opinions. Some critics argued he was intrusive and abrasive in his questions, but as he made clear over the years, he didn't want anybody on the program who withheld information.

Television Interviewers

Interviewing on television is harder than on radio, as making "talking head" material interesting is harder without the use of supporting visuals. At the same time, television can underline the discomfort of those being interviewed—their changing expressions, nervous sweat, or shifty eyes. Eye contact becomes important to the interviewer, his or her subject, and the viewer.

William F. Buckley Jr. (1925–2008)

Born in New York, Buckley graduated from Yale into a career of conservative journalism and

commentary. He founded and long edited the *National Review* as a vehicle of sensible conservatism, and was a syndicated columnist for decades, known for his expansive use of the language. Put another way, he was a "public intellectual," a role often assigned to important academics. From 1966 to 1999, he hosted most weekly programs of the *Firing Line* series of news commentary and interview programs on public television. He demonstrated a light touch in his interviewing, often sparked with humor and insight.

David Frost (1939–)

Frost was born in England and graduated with a First (top-rated degree) in English from Cambridge University. He initially became famous as host of the satirical news program *That Was the Week That Was* on the BBC in the 1960s. Starting in the late 1960s, he became known for lengthy and often revealing political interviews on *The David Frost Show,* among other venues. Frost is said to be the only person to have interviewed all six British prime ministers serving between 1964 and 2007 and the seven U.S. presidents since 1969, including four 90-minute 1977 programs with Richard Nixon (who was paid $600,000) after he left office. He also interviewed the leading candidates on *The Next President* during the campaigns of 1968, 1988, and 1992. His approach to his political interviews is quiet in style but probing in substance.

Larry King (1933–)

King was born in Brooklyn as Lawrence Harvey Zeiger and changed his name to Larry King when he was 23 and started doing morning drive-time radio in Miami in 1957. Soon he was doing interviews from the front window of a Miami Beach restaurant. By the late 1960s, King was hosting a radio and television show, providing play-by-play for Miami Dolphins football games, and writing a column for the *Miami Herald*. By 1975, he was hosting a nightly talk show on Miami radio. And in 1978, the *Larry King Show* debuted on the Mutual Broadcasting System. Within four years, his midnight to 5:30 a.m. show was carried nationally on more than 250 radio stations. In 1985 CNN founder Ted Turner recruited King for a prime-time talk show which became *Larry King Live* and features interviews with political leaders, pop culture stars, citizens thrust unexpectedly into the spotlight, and even convicts. Leaning into the microphone, and toward the interview subject across the desk, King is easily recognizable in his large eyeglasses, colorful shirts, and suspenders. In his 1988 book *Tell It to the King,* he says that being curious, listening well, and being sincerely interested in what people have to say are qualities of good interviewers. He likes to ask short questions beginning with "why" or "how." King is generally nonconfrontational because he does not believe that a verbal attack in an interview results in anything useful. He provided extensive interview coverage of the 2000 postpresidential vote recount in Florida, the 2001 terrorist attacks on New York and Washington, the 2003 American invasion of Iraq, and Hurricane Katrina in 2005. His post-Katrina disaster programming included interviews with more than 250 guests.

Ted Koppel (1940–)

Koppel has often been considered television's best interviewer by many critics. Born in England, he moved to the U.S. in the early 1950s. After earning degrees from Syracuse and Stanford universities, and working briefly as a radio news writer, he was hired by ABC television news in 1963 as a reporter. He spent considerable time reporting from overseas and for two years in the mid-1970s anchored the network's Saturday evening news report. His interviewing skills came to the fore with the 1979–80 *America Held Hostage* nightly report on the fate of more than 100 American hostages in Iran. In March 1980, with the hostages safely home, the program became *Nightline,* which Koppel would host for more than two decades. The program would typically center on an issue or event, and would include a discussion among guests with Koppel moderating and asking probing questions. He retired from the job after 25 years, turning to hosting duties on the Discovery Channel and appearances on public television.

Brian Lamb (1941–)

Lamb was born in Indiana and graduated from Purdue University before serving with the

U.S. Navy. He then served with several federal agencies in Washington, D.C., during the Nixon administration, and as a press secretary to a U.S. senator from Colorado. In the mid-1970s, he published a media policy newsletter in Washington, D.C. He was the founder in 1977 and is still the CEO of C-SPAN, the cable industry-supported public affairs network which first aired in 1979. It is on that network that he has gained a following for his interviewing, first on *Booknotes,* with nonfiction authors, and starting in 2004 on the wider-ranging *Q&A*. He is a low-key but incisive interviewer, pulling out his subjects on their writing, careers, interests, and viewpoints. He uses a nonconfrontational style and tries not to "get in the way" of his interview subject.

Bill Moyers (1934–)

Moyers was born in Oklahoma and raised in Texas, graduating from the University of Texas in 1956. After obtaining a divinity degree and serving as a Baptist minister for two years, he found himself in the political world of Lyndon Johnson, serving on his White House staff in the mid-1960s and as his press secretary from 1965 to 1967. During the 1970s, he worked for the new Public Broadcasting Service and began *Bill Moyers' Journal,* which ran until 1981. In this and other programs, he developed his "conversations with" style that worked well across a variety of fields and guests. In 1976 he moved to CBS, where he worked with the *CBS Reports* documentary until 1980, then as senior news analyst and commentator for the evening news until 1986 (he was the last regular commentator for the network broadcast). He worked briefly for NBC, then, frustrated with the limitations of commercial television, struck out on his own, producing more than 100 syndicated programs, many featuring interviews. He eventually returned to PBS with *Bill Moyers' Journal* in 2007. His role as an interviewer (an "entrepreneur of ideas") was most evident in the *Journal* and included often quite cerebral discussions with notable intellectuals as well as political, social, or scholarly newsmakers.

Charlie Rose (1942–)

Born in North Carolina, Rose graduated with a degree in history from Duke University and went on for a law degree. After working for a time in New York banking and as a weekend reporter for a local television station, Rose was hired by Bill Moyers to work on his various public television news programs. He began doing interviews, and began *The Charlie Rose Show* on a Dallas station in the late 1970s (it was syndicated on NBC for two years). From 1984 to 1990 he anchored the CBS network late-night newscast as well as an early morning interview program, *Nightwatch*. His PBS *Charlie Rose Show* began from New York's WNET in 1991 and was carried nationally on PBS within two years.

Tim Russert (1950–2008)

Russert was born in Buffalo, New York, and attended college and law school in Cleveland, Ohio. He worked as an assistant to New York Governor Mario Cuomo and then as chief of staff for Senator Daniel Moynihan (D-NY) before shifting to journalism by joining NBC News in 1984. He moderated NBC's *Meet the Press* from 1991 until the time of his unexpected death in 2008. Prior to his death, he was senior vice president and Washington Bureau Chief of NBC News. *The Washington Post* credits him with coining the "red state" and "blue state" terms to explain the nation's political divide. And when the electoral votes were being tabulated on election night, he was known to use hand-held legal tablets and dry-erase boards to simplify and visualize the math of the projected final tallies. Russert said he tried to be objective and nonpartisan. But some said he could move quickly from objective questioner to overzealous prosecutor while he developed a reputation for penetrating questions and tough follow-ups.

Bob Schieffer (1937–)

Schieffer is a native of Austin, Texas, and grew up in Fort Worth where he graduated from Texas Christian University in 1959. After three years in the Air Force, he joined the Ft. Worth newspaper as a reporter, just in time to cover the assassination in Dallas of President John Kennedy in November 1963. Two years later he reported from the growing Vietnam War for five months. He became the evening news anchor at the local NBC affiliate, before joining CBS in 1969. He has covered the

four major beats in Washington: the White House, the Pentagon, the State Department, and Capitol Hill. He has covered presidential campaigns and been a floor reporter at the national political conventions since 1972. Schieffer has called moderating CBS's *Face the Nation,* a post he has held since 1991, the best job he's ever had because he gets to interview everyone who is anyone—and they come to him. He describes the network Sunday morning interview programs as one time on broadcast television where serious people can have serious discussions about serious things. Schieffer anchored the network's evening news from March 2005 until August 2006 and remains a regular contributor to the program.

David Susskind (1920–87)

Born in New York City and educated at the University of Wisconsin and Harvard, Susskind became a talent agent and producer after service in World War II. He began hosting *Open End* in 1958 on a New York City television station (the program began at 11 p.m. Sunday evening and lasted until topic and/or participants were tired), began to syndicate it in 1961, and rebranded it in 1967 as *The David Susskind Show*. Guests, usually several at a time, would generally focus on one topic per program and subjects varied widely. Susskind was a tough-minded interviewer and often pushed his panelists hard to get a strong give-and-take response.

Mike Wallace (1918–)

Wallace was born May 9, 1918, in Brookline, part of Boston, the son of Russian Jewish immigrants. After high school, he graduated from the University of Michigan (which now holds his papers) and began his broadcasting career at stations in Grand Rapids and in Detroit. In 1941, Wallace was hired by a Chicago station as a newscaster, but wartime service as a naval communications officer interrupted his career path. He returned to Chicago as a news reporter for station WMAQ, joined CBS in 1951, but left four years later. He first became widely known for his intense interviewing approach in the late 1950s on *Night Beat* in New York and, on ABC, *The Mike Wallace Interview*. He returned to CBS in 1963 when he was named a CBS correspondent and anchor of *The CBS Morning News* (1963–66). Wallace was political correspondent and a floor reporter at the political conventions of the 1960s and 1970s. In 1968, he was one of the original reporters on the new *60 Minutes* weekly news magazine that over the next three decades often featured his interviewing style of homing in on the key issues and staying with his questioning until he gets answers. He retired in 2006.

Barbara Walters (1931–)

Walters was born in a Boston suburb and grew up around celebrities and show people in Miami and New York as her father ran a nightclub. She studied theater and literature at Sarah Lawrence College and found work in the publicity department of WNBC-TV in New York. In 1961, she landed a job as a freelance writer for the network's morning *Today Show*. It was her work for that program in 1963, when she covered the funeral of President John F. Kennedy, that first put her in the national spotlight. By the fall of 1964, she was a program regular and had broken out of covering what were then called "women's stories." In 1971, she launched a gossipy NBC talk show called *Not for Women Only*. By 1974, Walters was co-hosting *Today* as the program's first female co-host and was becoming known for news interviews and what were then called the "Washington interviews" with key political figures. She often did interviews–with both celebrities and people in the news—on location. In 1976, third-place ABC coaxed Walters away from NBC for $1 million a year and the opportunity to co-anchor its evening newscast. Her one-hour prime-time *Barbara Walters Special,* including interviews and "chats" with celebrities, often come across as affectionate visits rather than probing journalism. The taping of her interviews may continue for five hours or more and then be edited down at her direction to a 20-minute piece.

Oprah Winfrey (1954–)

Winfrey was born in Kosciusko, Mississippi, in 1954 and grew up shuttling between her mother and father and grandmother. She was still a student at Tennessee State University when she began

anchoring news at a Nashville station from 1973 to 1976. She moved to Baltimore and did news anchoring for two more years. But her interviewing strengths of combining empathy and charisma really started to shine in 1978, as she began hosting *People Are Talking,* featuring celebrity guests, local news, and service segments. Her 1984 move to Chicago to host *AM Chicago* on WLS-TV launched her into national prominence as her interviewing skills turned that faltering local program into a success. Within a year it was renamed as *The Oprah Winfrey Show* and she signed with King World to put the program into national syndication. She owns HARPO, a production company; owns a multimillion-dollar studio; is editorial director of *O, The Oprah Magazine*; and is a partner in Oxygen Media.

Investigative Journalism

Investigative reporting is a journalistic specialty that uses fact-gathering to expose wrongdoing by powerful individuals and institutions. This form of reporting has also been called advocacy, adversarial, crusading, watchdog and public service journalism, or muckraking. Experts have offered varying definitions: some emphasize in-depth reporting that is more time-consuming than traditional daily journalism; others claim that the very phrase "investigative reporting" is redundant since all reporting involves investigation of some kind. According to the nonprofit group Investigative Reporters and Editors, America's leading organization of such journalists, it is "the reporting, through one's own work product and initiative, [of] matters of importance which some person or group want to keep secret" (Shapiro 2003, xv).

Nonetheless, despite these varying definitions, the core of investigative reporting throughout American history has been its use of evidence to challenge authority and oppose entrenched power—political, governmental, corporate, or religious—on behalf of ordinary citizens. This "journalism of outrage," as one researcher has characterized it, "is a form of storytelling that probes the boundaries of America's civic conscience" (Protess et al., 1991, 5). According to another writer, the job of investigative reporters is "to speak documented truth to lying power" (Shapiro 2003, xv).

Investigative reporting has taken place in all forms of news media: newspapers, magazines, radio, television and, most recently, online. Investigative journalists conduct research using interviews and documents, including databases

mined for hidden facts in computer-assisted or "precision" reporting that uses the rigorous techniques of social scientists. Sometimes, investigative reporters work "undercover," with or without cameras, to witness and report about abuses firsthand. Given the nature of their work, many investigative reporters have been injured or killed in pursuit of stories.

Unlike traditional journalists, investigative reporters often do not abide by the journalistic principle of objectivity; by definition, their work is frequently subjective, even moralistic. Investigative reporters are "custodians of public conscience" whose "reporting yields stories that are carefully verified and skillfully narrated accounts of special injury and injustice . . . with a meaning that always transcends the facts of the particular case. Their stories call attention to the breakdown of social systems and the disorder within public institutions that cause injury and injustice; in turn, their stories implicitly demand the response of public officials—and the public itself—to that breakdown and disorder" (Ettema and Glasser 1998, 3).

To be sure, the line between fair-minded investigative reporting and partisan witch-hunting or sensationalistic gossip-mongering can be a fine one, and that line has been repeatedly crossed over the years. Right-wing critics have complained that investigative reporting undermines authority while leftist detractors protest that such journalism reinforces the status quo. The truth is probably somewhere in between. "Investigative reporters are reformers not revolutionaries," one researcher has noted. "They seek to improve the system by pointing out its shortcomings rather than advocating its overthrow. By spotlighting specific abuses of particular policies or programs, the investigative reporter provides policy makers with the opportunity to take corrective actions without changing the distribution of power" (Protess 1991, 11).

While significant and substantive public service journalism is often high profile, even famous, it is also relatively rare. This is true in part because wrongdoing in high places is difficult to uncover. Investigative reporting can be time-consuming and expensive to produce and can generate costly lawsuits and alienate powerful authorities, from government officials to advertisers. However, by providing a check on abuses by authorities, investigative reporting is important to democracy. It helps mold public opinion, shape policy, deter wrongdoing, and reinforce society's key values.

Although only a small minority of journalists are true investigative reporters, they have been prominent—even household names—from colonial times in America to the present day. What follows is a discussion of the historical evolution of investigative reporting in the United States. For more detailed treatment of important twentieth- and twenty-first-century investigative reporters, see the entry "Investigative Reporters."

Rise of American Investigative Reporting

The amount of investigative reporting has waxed and waned in periodical cycles throughout history. The roots of such journalism are deep, going back almost to the days when the printing press was invented (1447), although it has steadily grown and evolved in style and technique.

The earliest known investigative reporting on American soil can be traced to the first colonial newspaper published in 1690. Benjamin Harris (c. 1660–1720), a London printer who was driven out of England in 1686 under threat of imprisonment for producing pamphlets that offended British authorities, produced North America's first English-language newspaper, *Publick Occurrences Both Foreign and Domestick*. The Boston newspaper was a pioneer in both the noble and lowbrow traditions that would become associated with investigative reporting in America. In his first issue, Harris exposed allegedly "barbarous" human rights abuses of prisoners-of-war and a supposed royal sex scandal in which the king of France "used to lie with" his "Sons Wife." Four days later, British authorities shut down the newspaper. The paper's first issue was also its last—an early warning of what could happen to investigative reporters who challenged authorities.

A generation later, James Franklin (1697–1735), the older brother of America's founding father Benjamin Franklin, used his Boston newspaper, the *New England Courant,* to attack the Massachusetts Bay colony's Puritan leaders for failing to put an end to piracy on the Atlantic Ocean. In retaliation, colonial authorities imprisoned Franklin and banned his newspaper. His younger brother Benjamin fled to Philadelphia, where he established his own printing press in a more hospitable

political climate. Meanwhile James Franklin, unrepentant, defended himself by quoting the Roman philosopher Cato that "exposing publick Wickedness . . . is a Duty which every Man owes to his country."

In 1734, John Peter Zenger (1697–1746), the printer of the *New York Weekly Journal,* was jailed for seditious libel—criticizing the government—after he assailed the colonial governor of New York, who was alleged to have engaged in financial impropriety and abuse of power. But Zenger was freed in a landmark legal case after a jury ruled that there could be no libel if a news story was truthful. In his successful defense of Zenger, his lawyer articulated what would prove to be the investigative reporter's creed for more than two centuries afterwards: "the liberty of exposing and opposing arbitrary power . . . by speaking and writing truth."

In the 1760s and 1770s, during the years leading to the American Revolution, newspapers and pamphlets frequently challenged colonial authorities by exposing their misdeeds, although such efforts were typically accomplished through slashing partisan attacks rather than objective reporting. Samuel Adams (1722–1803) helped stir up Revolutionary sentiment in the *Boston Gazette* by exposing alleged atrocities of British soldiers. By contemporary standards, Adams was less an investigative reporter than a political activist, the leader of the Patriot faction in Massachusetts. Nonetheless, by using the press to uncover abuses of the government, he and other writers of his era helped plant the seeds of investigative reporting that would flower in future generations.

After the Revolution, exposé journalism was used largely as a partisan weapon during bitter disputes between the nation's new rival political factions, which began to fund newspapers as party organs. *The National Gazette,* the paper of Thomas Jefferson's Republican Party, exposed corruption in the office of rival Federalist leader Alexander Hamilton; as a result, several Hamilton aides at the Treasury Department were convicted for insider trading of government bonds. Benjamin Franklin Bache (1769–98), grandson of U.S. founding father Benjamin Franklin, used his newspaper, *American Aurora,* to expose secrets of Presidents George Washington and John Adams. Bache published confidential Cabinet minutes and drafts of treaties that were leaked to him, possibly by Jefferson himself, in an attempt to influence politics and government policy. In response, the Adams administration jailed Bache on sedition charges, and he died in prison from yellow fever before he could be tried. Two years later, his ally Jefferson was elected President and helped eliminate the 1798 Sedition Act that put Bache behind bars in the first place.

James Thomson Callender (1758–1803), another Jeffersonian journalist imprisoned under the Sedition Act, was America's first true political scandalmonger. A Scottish-born pamphleteer who had attacked British corruption and fled to the United States afterward, in 1797 Callender exposed Hamilton's extramarital affair with a woman who had blackmailed the Treasury Secretary to keep it secret. Callender's attacks on President John Adams led to Callender's jailing until his patron Jefferson defeated Adams for the presidency. Callender expected Jefferson to reward his loyalty with a federal job in the new administration. But Jefferson did not appoint Callender to such a position and the journalist got revenge in 1802 by writing an article in the *Richmond Recorder* exposing the President's sexual affair with his African American slave, Sally Hemmings. "By this wench Sally, our president has several children," Callender wrote. Nearly 200 years later, DNA testing would confirm the rumor.

With a few notable exceptions, early-nineteenth-century investigative reporting was generally infrequent and had little impact. The partisan nature of newspapers limited such journalism to exposés of the opposition party whereas businesses, churches, the military, and other important institutions went unexamined. Investigative reporting was further restricted by newspaper dependence on state or federal government contracts for printing as well as limited circulation due to widespread illiteracy, dispersion of the population in rural areas, and technological limits to printing. The awarding of government contracts to favored printers was a particularly potent form of political patronage in Washington, D.C., where transcribing congressional debates was so lucrative that it essentially underwrote the cost of the partisan press. Thus, most journalism in the nation's capital was from the beginning a curious blend of partisanship and stenography, a trend that would continue.

In the 1830s and 1840s, writers working for Democratic newspapers uncovered pay-offs involving the National Bank, which was supported by the rival Whig Party. Abolitionists, early union organizers, and other activists established their own crusading newspapers, although their polemical exposés were largely propagandistic in nature and their circulation and influence was minimal.

William Lloyd Garrison (1805–79) crusaded against slavery in *The Liberator,* an abolitionist newspaper that he founded in 1831. An advocate who also started the American Anti-Slavery Society, Garrison was seized by an angry white mob and led around his hometown of Boston with a noose on his neck; authorities in Georgia also offered a $5,000 reward for his arrest. Although Garrison's newspaper circulation never exceeded 3,000, he exposed the cruelty of slavery with a mix of investigative reporting and fiery rhetoric. As Garrison stated in the first issue of his newspaper, "I am aware that many object to the severity of my language: but is there not cause for severity? I will be as harsh as truth, and as uncompromising as justice. On this subject, I do not wish to think, or speak, or write with moderation. No! no! . . . I am in earnest—I will not equivocate—I will not excuse—I will not retreat a single inch—AND I WILL BE HEARD" (Serrin 2002, 174).

Elijah Lovejoy (1802–37), an abolitionist writer who crusaded against slavery and lynching in the *St. Louis Observer,* was assassinated in 1837 in retaliation for his unyielding articles. A Presbyterian minister and antislavery activist, Lovejoy saw his printing press destroyed by proslavery mobs on three separate occasions. Although he refused to temper his views, in 1836 he relocated to Alton, Illinois, where he edited the abolitionist *Alton Observer* newspaper. The next year, he was fatally shot during a riot by slaveholders who stormed his printing press and threw it in the Mississippi River. After his death, Lovejoy was lionized not only for opposing slavery but also as America's first martyr for press freedom.

After the Civil War, the practice of investigative reporting increased slowly but steadily. *The New York Times* uncovered graft by Boss Tweed in New York City's Tammany Hall in 1871, and the *New York Sun* exposed the Crédit Mobilier scandal of the Grant administration in 1872. Still, there was a distinct partisan flair to these exposés; the *Times* was a Republican newspaper targeting a Democratic machine while the *Sun* was a Democratic paper targeting Republicans.

By the late nineteenth century, most newspapers had evolved from partisan to commercial entities. Urbanization helped concentrate populations in locales where large circulation could be established. Technological improvements—linotype, telegraph, illustrations, and mass production—increased demand while decreasing the price of production. One-cent "penny newspapers" were cheap enough for large numbers of an increasingly literate population to buy. And because these new mass circulation newspapers were economically self-sustaining, they were not dependent on political parties for subsidy. In fact, since profit was tied to circulation, nonpartisanship made economic sense so as to avoid antagonizing supporters of either political party. Publishers began replacing a more narrow partisan outlook with a broader concept of social responsibility to the community at large.

Mass circulation newspapers appealed especially to immigrants and rural workers who had moved to urban areas and were trying to learn how to cope in their new environment. Journalistic exposés proved popular with these readers, and such aggressive publishers as Joseph Pulitzer (1847–1911) and William Randolph Hearst (1863–1951) began specializing in sensational scandal coverage.

Nellie Bly (1864–1922), the pen name of Elizabeth Cochrane, became famous in 1887, when she exposed mistreatment of the mentally ill for Pulitzer's New York *World* by going undercover and feigning insanity to get committed to New York's Blackwell Island asylum for women. Bly described how "nurses beat me with a broomhandle and jumped on me. . . . Then they tied my hands and feet and, throwing a sheet over my head, twisted it tightly around my throat, so I could not scream, and thus put me in a bathtub filled with cold water. They held me under until I gave up every hope and became senseless. At other times they took hold of my ears and beat my head on the floor and against the wall. Then they pulled my hair out by the roots" (Serrin 2002, 144–45). Bly's exposé led to a grand jury investigation and a cleanup of the asylum. It was the first of many stunts—including a trip around the world in less than 80 days—that made Bly the most famous of the "sob sisters" hired by competing New York

newspapers in their fierce circulation wars of the late 1800s.

Another female investigative reporter, Ida B. Wells (1862–1931), exposed lynching and other forms of racial violence in the African American press. Born into slavery in Mississippi a year before Lincoln's Emancipation Proclamation, Wells was galvanized into investigative reporting in 1892 when three black friends were lynched in Memphis, Tennessee. Wells's exposés about the murders in that city's black newspaper, *Free Speech and Headlight*, led a white mob to destroy her newsroom. She fled to Chicago, where for years she continued to expose the waves of lynching around the country, which the white news media largely ignored.

During the late 1800s, other writers exposed previously taboo subjects such as prostitution and slum tenement conditions. Political reform groups found large-circulation newspapers valuable allies, particularly since such activists had no political machine of their own to spread their message. For all its aggressiveness, however, this investigative reporting was still largely infrequent and local in scope.

Muckraking Investigative Journalism

By the beginning of the twentieth century, however, exposé journalism had become widespread and national in reach. Ironically, this proliferation of investigative reporting was made possible by the very industrialized capitalism that these journalists exposed. In particular, the transcontinental railroad led to national distribution and marketing, which in turn created a demand for nationwide advertising and thus the first mass-circulation national news publications. Newspaper chains began to reach from coast to coast, the beginning of a century-long evolution toward consolidated corporate media. National magazines started to flower, made more popular by their unprecedented ability to reproduce gripping photographs. Total circulation climbed into the tens of millions as these new, slick national publications became the primary delivery system for the muckrakers.

In 1906, President Theodore Roosevelt invented a word to describe these investigative dirt-diggers: muckrakers, journalists who raked out the muck of society.

The years between 1902 and 1912 were the glory decade for muckraking, the "golden age of public service journalism." These muckrakers soon became famous: Lincoln Steffens (1866–1936), exposing municipal corruption in *The Shame of the Cities;* Ida Tarbell (1857–1944), documenting the crimes of John D. Rockefeller's Standard Oil in *McClure's* magazine; and Upton Sinclair (1878–1968), working undercover in Chicago meat-packing plants to write his epic work *The Jungle*. In general, the muckrakers targeted corporate wrongdoing, government misbehavior, and social injustice; they viewed all three as interconnected to each other and to systemic problems spawned by the U.S. industrial revolution.

The golden age of muckraking came to an end by the time the United States entered World War I in 1917. Historians have offered various explanations for the end of the muckrakers' era: that the reforms they produced solved the industrial revolution's worst abuses and thus the need or appetite for muckraking; that the decline of the Progressive political movement inevitably meant the decline of muckraking because the two were so closely linked; that World War I turned the public's focus abroad and increased public respect for authority at home; that media consolidation eliminated magazine outlets for muckraking; that individual journalists turned inward to narrow careerism; and that irresponsible muckraking alienated the public, which had already grown weary of journalistic negativity.

The half century after the muckrakers—from World War I to the Vietnam War—was a kind of "dark age" for investigative reporting. Even the enormous public alienation from the economic and political turmoil brought on by the Great Depression in the 1930s failed to rekindle aggressive exposé journalism, although President Franklin Roosevelt's government-funded writer's project did produce some notable documentary efforts. A few journalists, mostly on the left of the political spectrum, continued the lonely crusade: socialist Upton Sinclair (1878–1968) attacked the conservative media; columnists Drew Pearson (1897–1969) and Jack Anderson (1922–2005) specialized in political corruption and scandal; George Seldes (1890–1995), I. F. Stone (1907–89), and Jessica Mitford (1917–96) challenged cold war politics; and Edward R. Murrow (1908–65) used the new medium of television to

attack Senator Joseph McCarthy's Red-baiting demagoguery. But these were aggressive exceptions to the rule of journalistic conformity. "By 1950 investigative journalism ebbed to its low point of the century," one researcher wrote. "Objectivity and deference to authority had become dominant journalistic norms" (Protess 1991, 45).

Investigative Journalism Reborn

By the 1960s, however, a new muckraking age was born as a younger generation of crusading journalists challenged segregation, the Vietnam War, political corruption, and corporate misconduct. The legal climate for aggressive journalism improved with the enactment of the Freedom of Information Act in 1966, which provided reporters with greater access to government documents, and pro-media court rulings, such as the landmark 1964 Supreme Court case, *New York Times Co. v. Sullivan,* which made libel suits from public figures harder to win. National and local investigative reporting teams sprouted around the country in alternative, mainstream, and elite publications alike. Magazines introduced a "New Journalism" with a heavy investigative emphasis while television turned muckraking into dramatic morality plays as popular programs like *60 Minutes* generated huge profits. The invention of the copying machine helped whistle-blowers leak evidence documenting wrongdoing and nonprofit organizations devoted to watchdog journalism, such as Investigative Reporters and Editors, the Center for Investigative Reporting, and the Fund for Investigative Journalism, took root.

Investigative reporting grew particularly fashionable after President Richard Nixon resigned from office in 1974. *Washington Post* reporters Bob Woodward (1943–) and Carl Bernstein (1944–) were mythologized for their work helping uncover the Watergate scandal that toppled Nixon. The 1976 Hollywood movie *All the President's Men,* with its dramatic portrayal of the young investigative reporters' mysterious source "Deep Throat," led to an upsurge in investigative reporting as well as journalism school enrollments. Other investigative reporters, such as *The New York Times*' Seymour Hersh (1937–) and CBS News's Mike Wallace (1918–), became household names as investigative reporters became American folk heroes.

The "new muckrakers" of the 1960s and 1970s resembled their predecessors of the early 1900s: educated middle-class urban professionals who believed in the importance of truth as a check on wrongdoing. Like the turn-of-the-century muckrakers, 1960s journalists believed in individualism and equality of opportunity and were instinctively critical of business, politics, and bureaucracy. Yet, they were also different in some important ways, focusing more on government misconduct than corporate misdeeds. The new muckrakers were more objective in tone, less blatant in their political advocacy. Secular careerists rather than religious crusaders, their belief in journalistic neutrality discouraged any open affiliation with political movements or leaders. These modern muckrakers were less radical than their forbearers, their indictment of society more limited and less far-reaching.

The frenzy of investigative reporting soon began to wear off. As in the Progressive era, the explanations were varied: the end of the 1960s to 1970s political turmoil, media mergers, adverse legal rulings, and public weariness. As in the last years of the muckrakers, irresponsible scandal coverage overshadowed substantive public service journalism. This trend has arguably continued into the twenty-first century, although the globalization of media and the rise of the Internet have already begun to push investigative reporting in new directions. In particular, the ability of journalists in repressive societies to avoid government censorship and spread their investigative reporting worldwide by posting their exposés online promises a new dynamic to an old tradition.

What has accounted for the waxing and waning of investigative reporting throughout history? Such journalism seems to reach a critical mass when there is a combination of two distinct trends: strong public demand, usually caused by some combination of political, economic, and social turmoil; and increased media supply, frequently the result of new technologies or journalistic competition. Otherwise, while the occasional journalistic dissident can be counted on to expose and oppose those in authority, investigative reporting is generally the exception rather than the rule. Nonetheless, substantive investigative reporting remains one of the most vital functions of a free press, a bulwark

of democracy that can bring about important and peaceful changes in society.

Investigative Journalism Organizations

Investigative journalism organizations include those that sponsor and do investigations and others that act as professional associations and train journalists in investigative techniques. Investigative journalism organizations are a relatively new phenomenon. The first one, Investigative Reporters and Editors, began in 1975, while the Center for Investigative Reporting, which does investigations itself, began in 1977. Both are nonprofit and nonpartisan institutions. Over the next three decades, associations and centers expanded in the United States and into other countries, increasing to more than three dozen. The advent of investigative journalism organizations signified the institutionalization of the practice as an integral part of everyday journalism.

The professional associations have thrived because they provide extensive training and a basis for dialogue among journalists that the news media do not. A 2002 study commissioned by the Knight Foundation found that the news media provided much less training to its employees than other businesses. Training in investigative journalism is especially necessary because it often calls for more intensive research and better interviewing, organizational, and presentation skills. The need for training increased even into the mid-1990s with creation of the World Wide Web and the need to analyze computerized databases in investigative reporting. At the same time, many investigative journalism organizations and centers produced stories filling gaps left by newspaper and broadcast newsrooms that did not have the interest, budget, or staff to carry out more substantial inquiries.

Charles Lewis, the founder of three nonprofit journalism organizations, said in a 2007 paper that the increase in investigative reporting centers is part of a larger trend toward nonprofit journalism. He argues that nonprofit centers that do public service stories or encourage investigative journalism by others are needed because market pressures are causing most news media organizations to reduce resources for investigative journalism.

Initial Investigative Associations

In the early 1970s, the only relevant organization was the Fund for Investigative Journalism, created in 1969 to support freelance journalists undertaking investigations. The fund was first widely noticed when it gave $2,250 to reporter Seymour Hersh to complete his expose on American soldiers

committing atrocities in the hamlet of My Lai during the Vietnam War. But the fund was note intended to be a membership organization or to carry out investigations itself.

In 1975, a handful of veteran investigative journalists established Investigative Reporters and Editors (IRE) with the purpose of developing a network of journalists in the United States who could assist each other on news stories. IRE also wanted to raise and maintain high standards of investigative journalism and provide conferences and seminars in which reporting and editing techniques would be taught. The organization has served as a model for associations subsequently created in other countries.

IRE grew quickly to hundreds and then thousands of members who were, or wanted to become, investigative journalists. Part of IRE's momentum was produced by the Watergate scandal, during which two young *Washington Post* reporters, Bob Woodward and Carl Bernstein, wrote a series of stories on corruption in the 1972 re-election of President Richard Nixon (1969–74). The stories helped lead to Nixon's 1974 resignation and was chronicled in their book *All the President's Men,* which inspired many students and reporters to pursue investigative journalism.

In its second year, IRE undertook a major investigation named "The Arizona Project." It was mounted in reaction to the murder of one of its members, Don Bolles, who had been working on stories in and about Arizona involving public corruption and organized crime. A team of nearly 40 reporters and editors came to the state to complete and expand on Bolles's work with the purpose of showing that murdering a reporter cannot kill a story.

The resulting 23-part report gave IRE a high national profile because at least parts of it were published throughout the country. But the series also led to numerous lawsuits, and the legal costs put IRE in serious financial straits and distracted the organization from its major goals. IRE has since assisted and sometimes financed other newsroom or freelance journalist investigations but not undertaken further investigative stories by itself.

Despite the legal battles, IRE began an annual contest for investigative reporting; formed a resource center for investigative journalists that consisted of newspaper clippings and broadcast videos of investigative stories; initiated the publication of *The IRE Journal* that published how-to articles; and started a series of regional training programs. During the 1980s, the training expanded to in-house newsroom seminars and began to attract international journalists.

By the 1990s, the organization grew to more than 4,000 members and had integrated into its curriculum training in computer-assisted reporting (which involves data analysis and the use of social science methods). The National Institute for Computer-Assisted Reporting (NICAR), a joint program of IRE and the University of Missouri School of Journalism, conducted much of the data analysis training and work for newsrooms. In the early twenty-first century, IRE and NICAR's training included seminars in more than a dozen other countries and numerous resources and tutorials on IRE's website.

The organization structure of IRE consists of an elected, volunteer board of directors that oversees a staff of professional journalists and administrative employees. The board formulates policy, standards, and educational direction, and the staff performs the necessary tasks to carry out the organization's mission.

Throughout its history, IRE has struggled to secure adequate funding for its operations. Its revenue comes from membership dues, training and research fees, and contributions limited to a restricted set of donors, and through investment income from a growing endowment fund. Although exempt from federal taxes, IRE's funds barely cover its annual operating costs.

Models for Investigative Journalism Centers

In 1997, journalists in the San Francisco Bay area formed the Center for Investigative Reporting. Its purpose was to investigate issues and institutions that news media were not covering. The center recognized that investigative journalism often requires months of work and substantial expenditures and set out to raise money in donations and fees to support such long-term in-depth investigations. The investigations were performed by the small center staff or in collaboration with freelance journalists or other news organizations. Since its inception, the center has produced hundreds of investigative reports on a wide array of issues, individuals, and institutions.

A similar investigative journalism organization, the Center for Public Integrity, began in 1989 in Washington, D.C. Again, it was formed by a small group of journalists who sought to undertake investigations overlooked by the mainstream media, particularly those focused on the federal government. Since 1990, the center has released more than 275 investigative reports and 14 books. In 1997, it created the International Consortium of Investigative Journalists, a network of more than 90 investigative reporters and editors in 48 countries. Another offshoot was the Fund for Independent Journalism, whose purpose is to provide legal defense funds and endowment support for the center and possibly for other organizations.

Given the continuing shortage of substantial investigative journalism in most news media, two more organizations formed. The World Security Institute, a nonprofit organization, established the Pulitzer Center on Crisis Reporting in 2006. The organization states on its website that its purpose is "to sponsor the independent reporting that media organizations are increasingly less willing to undertake on their own." And in 2007, a third nonprofit organization, Pro Publica, began with funding from a married couple who had made their fortune in banking. Pro Publica plans to sell long-term investigative projects on wrongdoing in government and business institutions to media newsrooms.

Recently, other centers, with the support of private donors, have sprung up at such schools as Columbia and Brandeis Universities as a way to encourage training of journalism students in investigative reporting methods through practical instruction and work on investigative projects.

International Associations and Centers

With the U.S. associations as models, journalists in other countries began to form investigative reporting organizations in the 1980s. First to appear was Föreningen Grävande Journalister in Sweden in 1989. After attending conferences in the United States, a group of Swedish journalists formed the organization (with the title translated as "digging journalists") with an elected board and staff. The organization held conferences and training seminars and began a resource center and an awards contest.

Over the next decade other IRE-like organizations formed in other European countries including Denmark, Norway, and Germany with the real growth in international investigative associations taking place since 1990.

In a 2007 study for the Center for International Media Assistance, investigative journalist David Kaplan wrote that the number of nonprofit investigative reporting groups has had increased from only three in the late 1980s to about 40 in 2007. Kaplan found, however, that while some organizations were well structured (such as the Swedish group), others had only two or three journalists trying to build an organization.

Prominent among international investigative reporting centers was the Philippine Center for Investigative Journalism, founded in 1989 and supported by donations and fees. It distinguished itself with its investigative stories on the corruption of Philippine President Joseph Estrada. That reporting in 2000, later turned into a book, *Mistresses, Mansions and Money,* detailed the wealth Estrada had accumulated by plundering public funds. The stories led to Estrada's resignation. The Philippines Center has done hundreds of stories for print and broadcast and produced documentaries and books. It has also provided extensive training to journalists—both in the Philippines and throughout Asia.

Other centers developed in Eastern Europe and the former Soviet Union despite threats and attacks against journalists. The Journalism Development Group's Center for Investigative Reporting, based in Sarajevo, Bosnia, which involves both U.S. and Eastern European journalists, conducted an award-winning investigation in 2006 along with two other regional centers into corruption involving utilities and exorbitant electricity rates.

Unlike American associations and centers, funding for European centers often came from governments, particularly the European Union and the U.S. government. The centers maintained they could keep their independence despite these grants, and in Denmark, a nonprofit organization investigating questionable farm subsidies did award-winning work on government programs. Other European centers received substantial funding from the Soros Foundation, which has supported a number of advocacy programs in addition to media centers.

In South America, a number of investigative journalism associations have formed with the encouragement and support of U.S. journalists and foundations. The first to form was Periodistas de Investigacion in Mexico City in 1996, which was supported by IRE and a grant from the McCormick Tribune Foundation. In the following decade, Brazilian journalists established Abraji (Associação Brasileira de Jornalismo Investigativo) after a leading investigative broadcaster was killed by drug lords in 2002. The journalists were helped significantly by a Knight Foundation grant. Other organizations have formed across the continent, including groups in Colombia, Chile, and Argentina.

In Africa, investigative journalism centers and associations have been established and received funding from American foundations, the U.S. and European governments, and international institutions including the World Bank. Among the associations and centers is the Forum for African Investigative Reporters, which has a part-time staff but is enabling journalists to network on their efforts of journalists through its online work and has helped organize conferences.

With the growth in investigative journalism organizations, the need to form a network of support and communication became clear. In response, the Global Investigative Journalism Network, formed in 2000, held its first conference, in Copenhagen in spring 2001. A website, www.globalinvestigativejournalism.org, helped maintain the network after the conference, and three more conferences have been held. The conferences have brought together more than 2,000 journalists from nearly 40 journalism organizations and spurred the creation of more organizations throughout the world.

Sustainability of funding for many international investigative journalism organizations continues to be a primary issue. In some cases, foundations or governments have ceased their support because the foundations have changed interests or have unrealistically expected the organizations to create a steady stream of revenues and fees. Centers cannot charge sufficient fees for their training or work because of the low pay many journalists receive in addition to the lack of media industry support for the organizations' efforts. In recent years, Periodistas de Investigacion in Mexico and the Caucasus Investigative Reporting Center have gone dormant because of the lack of support by journalists, foundations, and the news industry.

Nonetheless, major efforts are underway to coordinate funding and support for investigative journalism organizations, especially as the news industry goes through a major transformation from print and broadcast to web-oriented presentations.

Investigative Reporters

Investigative reporters are journalists who gather facts to expose wrongdoing by powerful individuals and institutions. These journalists have also been called advocacy, adversarial, crusading, and public

service reporters, or muckrakers. Like enterprise reporters, investigative journalists require more time than daily news reporters to produce their stories. But unlike enterprise journalists, the specific mission of investigative reporters is to uncover misconduct by those in authority—political, governmental, corporate, or religious.

Investigative reporters work in all forms of media: newspapers, magazines, radio, television, and online. They conduct research using interviews, documents, and personal observation, sometimes going "undercover" to witness events firsthand themselves.

Because their crusading brand of journalism can be expensive to produce and often generates costly lawsuits or angers powerful authorities from governments to advertisers, investigative reporters are relatively few in number. Yet they tend to be high-profile figures, often working in dangerous circumstances. Many investigative reporters around the world have been injured or killed in pursuit of their stories about wrongdoing. By providing a check on abuses by authorities, investigative reporters help protect democracy, mold public opinion, shape policy, deter wrongdoing, and reinforce society's key values.

The number of investigative reporters has waxed and waned over time. Exposé journalism tends to increase in periods of turmoil, such as the foment leading up to the American Revolution in the 1760s and 1770s, the industrial revolution of the late nineteenth and early twentieth centuries, and upheavals during the Vietnam War and Watergate scandal of the 1960s and 1970s. New media technologies and journalistic competition have also spurred investigative reporters, such as the development of the penny press in the 1830s, mass market national magazines in the early 1900s, and the rise of broadcasting and digital media in the late twentieth and early twenty-first centuries. Government censorship, more common in wartime, hampers investigative reporters; restrictive legislation such as the World War I Sedition Act of 1917, and its 1950 sequel during the McCarthy era, discouraged such critical journalism. In contrast, investigative reporters thrive during periods of free expression, such as that following the expansive 1964 Supreme Court ruling in the case of *New York Times Co. v. Sullivan.* The number of investigative journalists in the United States reached an all-time high in the early twenty-first century when membership in the nonprofit group Investigative Reporters and Editors neared 5,000 journalists.

The earliest investigative reporters in America were partisan advocates, financed by political parties or ideological movements such as abolition or women's suffrage. But by the early twentieth century, most investigative reporters were employed by commercial media outlets and began to adopt a more objective style of storytelling. Investigative reporting was spurred by urbanization, increased literacy, and technological improvements in production, which made newspapers and magazines affordable to average consumers. As this journalism became economically profitable, publications ran exposés to increase circulation and began developing a broader concept of social responsibility to the community at large.

But while political parties no longer dictated coverage, advertisers sometimes did. Growing corporate ownership of media outlets sometimes discouraged investigative reporting out of timidity or a bottom-line focus on profit. Still, investigative reporters are a hardy breed and have persisted even in inhospitable climates.

Although its roots go back to the earliest days of the United States, investigative reporting, properly speaking, is largely a twentieth-century practice. This entry is limited in its coverage to notable investigative reporters active in the twentieth and twenty-first centuries. For detailed coverage of the origins of American investigative reporting, including such groups as the muckrakers, see the entries "Investigative Journalism" and "Muckrakers."

Noted Investigative Reporters Since World War I

Jack Anderson (1922–2005)

Anderson is the only known investigative reporter whose assassination was plotted by White House aides. A crusading syndicated columnist in Washington, Anderson's exposés ruined numerous politicians during the second half of the twentieth century. He began as the "legman" for Drew Pearson's "Washington Merry-Go-Round" column, which he inherited upon Pearson's death in 1969. Published between 1932 and 2004, it was the longest-running and most popular syndicated column in the nation. In 1972, two of President Richard Nixon's top operatives secretly plotted to murder Anderson in retaliation for his anti-Nixon

reporting, but the plan was cancelled after the conspirators were arrested a few weeks later during their notorious break-in at Democratic Party headquarters in Washington's Watergate office complex, which led to Nixon's resignation as President two years later. Anderson's unorthodox news-gathering techniques included bugging, blackmail, and rifling through trash; but although he was often viewed with scorn by Washington officials, he was awarded the Pulitzer Prize in 1972.

Paul Y. Anderson (1897–1938)

Anderson was an investigative reporter for the *St. Louis Post-Dispatch* and was called "the last of the muckrakers" for his crusading exposés of Washington corruption during the 1920s and 1930s. He began uncovering wrongdoing in St. Louis in 1917. Two years later, he returned to his newsroom in blood-splattered clothes to report how city police were abandoning black victims to a mob of rioting whites; his stories sent 20 men to prison and received accolades from Congress. But Anderson's greatest work came in the 1920s when he helped uncover the Teapot Dome oil scandal of President Warren G. Harding's administration. Unable to get his own newspaper to cover the story, Anderson published his exposés in the New York *World, The Nation,* and *The New Republic* and maneuvered behind-the-scenes to help Senator Thomas Walsh (D-MT) investigate the scandal. Anderson's relentless probing helped send Harding's Interior Secretary, Albert Fall, to prison for bribery and also won a Pulitzer Prize. Other Anderson exclusives forced the resignation of a federal judge and led to a congressional investigation of the Ku Klux Klan. But the high-strung reporter became an alcoholic and committed suicide at the age of 45.

Scott Armstrong (1945–)

Armstrong, a *Washington Post* investigative reporter and co-author with Bob Woodward of *The Brethren,* a 1976 exposé of the Supreme Court, founded the National Security Archives, a nonprofit organization that uses lawsuits and the Freedom of Information Act to declassify government documents. A former investigator for the Senate Watergate Committee, Armstrong helped discover President Richard Nixon's secret tape recordings of Oval Office conversations that ultimately led to Nixon's resignation.

Donald L. Bartlett (1936–) and James B. Steele (1943–)

This two-man investigative team pioneered the use of social science methods, including computer-assisted reporting, in exhaustive exposés for the *Philadelphia Inquirer, Time,* and *Vanity Fair*. During more than three decades of collaborative work, the journalistic pair tackled systemic inequities in American medicine, taxes, border security, job outsourcing, and income inequality. Their work has produced two Pulitzer Prizes and five books, including *Critical Condition: How Health Care in America Became Big Business and Bad Medicine* (2004) and *America: Who Really Pays the Taxes?* (1994).

Lowell Bergman (1945–)

Bergman is one of a legion of investigative broadcast news producers who in the late twentieth century supplied the off-camera reporting for on-camera television stars and uncovered misconduct by the tobacco industry for the popular prime-time CBS newsmagazine *60 Minutes*—only to be censored by cautious network news executives. Bergman leaked his findings to other news outlets and quit CBS in protest, a drama later immortalized in the Hollywood film, *The Insider*. He later became an investigative reporter for *The New York Times* and an on-camera correspondent for the PBS series *Frontline*.

Don Bolles (1929–76)

Bolles, an investigate reporter for the *Arizona Republic,* specialized in uncovering organized crime. In June 1976, he was murdered in Phoenix when a bomb exploded underneath his automobile. Before dying, Bolles's last words included a tip about his assassins: "The Mafia." His assassination led dozens of other investigative reporters from around the country to swarm to Arizona to expose his killers. The newly created nonprofit group Investigative Reporters and Editors coordinated a year-long probe among journalists who

usually competed against each other but were now working in collaboration on behalf of their martyred colleague. The result was an exhaustive investigative series published nationwide that exposed more than 200 people throughout Arizona for their mob ties. This orchestrated response was intended not only to avenge Bolles's death but also to prevent future journalistic murders by sending a message that killing an investigative reporter would guarantee more rather than less media scrutiny.

David Burnham (1933–)

An investigative reporter from the 1960s to the early twenty-first century, Burnham first achieved fame in 1970 by exposing municipal police corruption for *The New York Times* with the help of a whistle-blowing detective source who was immortalized by actor Al Pacino in the movie *Serpico*. Burnham's stories led to the appointment of the Knapp Commission to reform New York City's police department. Another Burnham source, nuclear activist Karen Silkwood, died in a 1974 car crash while on her way to a meeting with him to provide information about faulty fuel rods manufactured by the Kerr McGee Corporation where she worked. The Hollywood movie *Silkwood* chronicled the case, including unproven allegations that Silkwood was murdered to silence her from talking to Burnham. Burnham went on to found a nonprofit investigative group called the Transactional Records Access Clearinghouse (TRAC), a data-gathering research organization affiliated with Syracuse University that mines public records to hold government agencies accountable for their performance.

Mark Dowie (1939–)

One of the earliest investigative reporters for the fledgling left-leaning *Mother Jones* magazine, Dowie exposed how Ford Motor Company's Pinto automobile exploded on impact when hit from behind. Dowie's 1977 article, based on internal company documents, revealed that 500 people had burned to death in the dangerous car and that Ford paid millions of dollars to settle lawsuits after an internal "cost-benefit analysis" found that this was cheaper than changing the design of the auto. The article led Ford to recall more than 1 million Pinto cars and helped launch *Mother Jones* as a significant muckraking magazine of the late twentieth century.

Robert W. Greene (1929–)

Greene founded the nation's first permanent newspaper investigative reporting team at *Newsday* in 1967, a lead that was followed in the next two decades by other media outlets across the United States. A one-time investigator for the Senate Rackets Committee, Greene taught other journalists how to systematically conduct reporting projects by imitating the techniques of professional criminal investigators in law enforcement—developing databases, reconstructing chronologies, and pooling information—in ways that soon became standard for large media probes. Greene's own investigative work made him the preeminent investigative reporter in New York State during the 1960s and 1970s as he exposed political corruption, organized crime, and judicial misconduct. His probe of President Richard Nixon's finances led the White House to order a tax audit on the newsman, just one of many retaliatory efforts against the media by Nixon's men. Greene also led a team of 34 journalists who descended upon Arizona after the 1976 murder of investigative reporter Don Bolles, leading to a 23-part series exposing Mafia influence in Arizona to avenge Bolles's death and discourage other mob killings of investigative reporters.

Michael Harrington (1928–89)

Harrington, a left-wing activist and onetime editor of *The Catholic Worker,* focused national attention on the plight of the poor with his 1962 best-selling book *The Other America*. The book was credited with influencing President John Kennedy and the "War on Poverty" begun by his successor, President Lyndon Johnson. A democratic socialist, Harrington was more of an activist than a journalist, a pacifist intellectual who turned from Catholicism to Marxism.

Seymour M. Hersh (1937–)

Hersh achieved national attention in 1969 when he exposed the massacre of more than 100 Vietnamese civilians by a U.S. Army unit in the

village of My Lai. The atrocities Hersh uncovered soon became a symbol of American guilt during the Vietnam War and helped hasten calls for the war's end. Hersh won the Pulitzer Prize for these revelations and was then hired by *The New York Times,* where he revealed illegal CIA spying on Americans that led to far-reaching reforms in the intelligence agency. Hersh's investigative books, *The Price of Power* (1983) and *The Dark Side of Camelot* (1997), exposed abuses of power by, respectively, Secretary of State Henry Kissinger and President John F. Kennedy. In 2004, he again uncovered U.S. atrocities in wartime, this time involving torture of Iraqi prisoners at the hands of American soldiers and government operatives at the Abu Ghraib prison in Iraq. Once more, Hersh's disclosures—this time published in *The New Yorker* magazine and accompanied by trophy photos that soldiers took of their brutality—led to criminal prosecution and hastened calls for U.S. withdrawal from its foreign war.

Michael Isikoff (1952–)

Isikoff uncovered President Bill Clinton's sexual affair with White House intern Monica Lewinsky, a scandal that eventually led to Clinton's impeachment after the President falsely denied the liaison under oath. Isikoff's 1998 scoop first appeared not in the publication for which he worked, *Newsweek* magazine, but in an online website, the *Drudge Report,* when the story was leaked to cyber gossip Matt Drudge after *Newsweek* hesitated to publish the controversial story. In 2005, Isikoff wrote that Americans interrogating suspected Muslim terrorists in Guantanamo Bay, Cuba, flushed a copy of the Koran down a toilet "in an attempt to rattle the suspects." Widespread anti-American riots in the Islamic world followed. Although the Pentagon denied Isikoff's report, its own investigators later acknowledged that the Koran had indeed been desecrated at the military prison.

Charles Lewis (1953–)

A onetime producer for ABC News and the CBS newsmagazine *60 Minutes,* Lewis founded the Center for Public Integrity, a Washington-based nonprofit investigative organization that has issued more than 300 reports and 15 books uncovering corporate and government wrongdoing since 1989. Funded by foundation grants, Lewis's center has focused on the corrupting influence of money in politics, especially in the White House, Congress, federal agencies, and state governments. Lewis also created the first global website devoted to international exposés, hiring nearly 100 of the world's top investigative reporters under the auspices of the Center for Public Integrity's International Consortium of Investigative Journalists.

Morton Mintz (1922–)

Mintz was perhaps the first reporter in the United States to investigate consumer issues. At the *Washington Post* in 1962, he exposed how the drug thalidomide caused thousands of children to be born without limbs. He also revealed safety defects in the Dalkon Shield intrauterine birth control device for women. In 1966, Mintz uncovered how auto giant General Motors was spying on a then-obscure critic named Ralph Nader, launching the young lawyer's career as a national consumer advocate. Mintz began his career as a reporter in St. Louis during the 1940s, where he wrote the first newspaper series ever on the plight of the mentally retarded for the *St. Louis Globe-Democrat* in 1955.

Jessica Mitford (1917–96)

A British aristocrat who became an American communist, Mitford exposed price gouging by the funeral industry in her tart-tongued 1963 best-seller, *The American Way of Death*. Her book led to congressional hearings and some reforms in funeral practices. Witty and irreverent, Mitford went on to critique the U.S. prison system and birth control practices in other books and articles. "You may not be able to change the world," she said of her muckraking, "but at least you can embarrass the guilty."

Clark R. Mollenhoff (1921–91)

Mollenhoff, the Washington bureau chief of the *Des Moines Register,* exposed organized crime and political corruption from the 1950s to the 1970s. "Everyone has his price," Teamsters Union boss Jimmy Hoffa told Mollenhoff. "What's yours?"

(Ritchie 2005, 224). But Mollenhoff persuaded Senator John McClellan (D-AR) to hold congressional hearings on both the Teamsters and the Mafia, and then worked behind-the-scenes with Senate counsel Robert F. Kennedy to orchestrate the probe. Mollenhoff introduced Kennedy to other journalists who investigated the mob—John Siegenthaler, Pierre Salinger, Ed Guthman—and Kennedy in turn hired them for his various senatorial and presidential campaigns. But Mollenhoff was equally aggressive when Kennedy's brother was elected President and exposed a German call girl, Ellen Rometsch, who had a sexual relationship with Kennedy. A hulking and aggressive lawyer, the argumentative Mollenhoff was told to sit down at a White House news conference by a scolding President Eisenhower. In 1969, President Richard Nixon hired Mollenhoff to be a White House ombudsman but the obstreperous reporter resigned a year later and became one of Nixon's fiercest journalistic critics. Mollenhoff's 1981 book, *Investigative Reporting: From Courthouse to White House,* was one of the first primers published on how to conduct exposé journalism.

Bill Moyers (1934–)

A one-time minister and press secretary to President Lyndon Johnson, Moyers was a television commentator for CBS and PBS from the 1980s to the early twenty-first century. His eloquent documentary broadcasts championed the plight of the poor and dispossessed, attacked corporate greed, and exposed bureaucratic indifference. Moyers's progressive views made him the target of conservative Republicans and a hero of liberal Democrats, some of whom tried unsuccessfully to persuade him to run for President.

Edward R. Murrow (1908–65)

Murrow was television's first prominent investigative journalist. He originally gained fame for his dramatic radio broadcasts from Europe during World War II, but it was as a television correspondent for CBS News in the 1950s that he introduced in-depth advocacy reporting. In early 1954, on his *See It Now* program, Murrow presented a devastating indictment of Senator Joseph McCarthy's bullying tactics, shown largely through filmed clips of the Senator's own behavior. Murrow's final CBS documentary, *Harvest of Shame* (1960), depicted the plight of migrant farm workers, giving a human face to rural poverty that was seen in living rooms across America. Murrow quarreled with network news executives who did not share his high sense of purpose and left CBS in 1961 to work for President John Kennedy's administration. For decades after his death, Murrow continued to be regarded as a broadcasting icon. The film *Good Night, and Good Luck* (2005), taking its title from Murrow's well-known closing line to each broadcast, carried his legacy into the twenty-first century.

Jack Newfield (1938–2004)

Newfield was a crusading New York City columnist and investigate reporter for the *New York Daily News, New York Post, New York Observer,* and *New York Sun* from the 1960s to the early twenty-first century. In 1964, he helped pioneer advocacy journalism at the alternative *Village Voice* newspaper, where he championed the poor, excoriated the powerful, and dismissed journalistic objectivity. The author of several investigative books, Newfield wrote his exposés with "a hammer," one colleague said, "pounding one nail at a time."

Drew Pearson (1897–1969)

A crusading liberal columnist in Washington, D.C., Pearson exposed conservative political foes ranging from Senator Richard Nixon (for financial impropriety), General George Patton (for striking soldiers) to Father Charles Coughlin (for having sex with a married woman). In 1932, Pearson began the "Washington Merry-Go-Round," which became the nation's most popular and longest-running syndicated column. A Quaker pacifist with a pugnacious sense of righteousness, Pearson was one of the few national newsmen to champion Franklin Roosevelt's New Deal during a time when most newspapers were published by conservative Republican businessmen. He frequently plotted with liberal allies in Congress and the White House, trading favorable columns for legislative votes and ghostwriting political speeches to advance his favorite causes. He was sued more than 275 times for more than $200 million but had to settle only a single case out of court; a 1934 lawsuit by

Douglas MacArthur nearly bankrupted Pearson until he acquired love letters the General wrote his teenage mistress, which the columnist used to blackmail MacArthur into withdrawing the suit. After his death, Pearson's column was taken over by his underling, Jack Anderson.

David Protess (1946–)

A journalism professor at Northwestern University, Protess began directing student investigations of wrongdoing in the Illinois criminal justice system in 1996. His classroom projects helped free innocent men who had been wrongly imprisoned for murders they did not commit. This led to a moratorium on executions and clemency for death row prisoners in the state. A former research director of Chicago's nonprofit Better Government Association, Protess co-founded the Innocence Network, a national consortium of more than 40 journalism and law schools devoted to uncovering similar miscarriages of justice across the United States.

Brian Ross (1944–)

A network television investigative correspondent, Ross began his career exposing corruption in the Teamsters Union in the 1970s. In 1980, at NBC News, he first broke the story of the FBI undercover bribery sting called "ABSCAM" that targeted members of Congress. He subsequently uncovered child labor in sweatshops and sexual crimes by United Nations peacekeepers. His 2006 stories about Congressman Mark Foley sending sexually explicit e-mails to underage Capitol Hill pages led to Foley's resignation from the House of Representatives.

Daniel Schorr (1916–)

Schorr, a correspondent for CBS News, was arrested on trumped-up charges and expelled from Moscow in 1957 after angering the Soviet Union's secret police, the KGB. He irritated President Richard Nixon in the early 1970s and was investigated by the FBI and placed on a list of White House "enemies." In 1976, Schorr made public a secret government report about CIA misconduct. Congressional hearings followed and Schorr was ordered to reveal the name of the source who leaked him the document. He refused and narrowly avoided being jailed for contempt of Congress. Schorr left CBS News in 1976 and was hired by Ted Turner in 1979 to report for his fledgling all-news cable network, CNN. He left CNN in 1985 and became a senior analyst for National Public Radio, where he broadcasts piercing radio commentaries past the age of 90.

George Seldes (1890–1995)

Seldes was a liberal gadfly whose reporting was repeatedly censored by the conservative newspapers that employed him, beginning in 1914 when he discovered sexual harassment by one the largest advertisers for the *Pittsburgh Post,* where he began his career. During World War I, U.S. Army General John Pershing killed many of Seldes's dispatches from the European front. In 1922, the Soviet Union expelled him after his stories in the *Chicago Tribune* displeased the country's Communist leaders. Seldes then traveled to Italy, where he wrote stories implicating dictator Benito Mussolini in the murder of a political rival. Seldes was soon expelled once again from his host country. In 1927, the conservative publisher of the *Chicago Tribune,* Colonel Robert McCormack, censored Seldes's articles from Mexico that criticized U.S. corporations there. The writer then turned to books and to an investigative newsletter that he started in 1940, *In Fact,* which published criticism of establishment media. Seldes's newsletter earned a sizable following for more than a decade but died after Senator Joseph McCarthy accused Seldes of Communism in 1953. The charge was false, and Seldes continued writing books and outlasted almost all of his enemies before dying at the age of 104.

Neil Sheehan (1936–)

Sheehan, an investigative reporter for *The New York Times,* obtained a classified Defense Department analysis of the secret history of America's involvement in the Vietnam War. The secret study, which became known as the Pentagon Papers, chronicled a pattern of government deceit in the conduct of the war, which the *Times* exposed in June 1971. It soon became a landmark case in both journalistic history and media law when the Nixon administration went to court to

try to prevent the *Times* from publishing additional stories about the scandal. Ultimately, the Supreme Court found that the Pentagon Papers did not endanger national security and ruled that the *Times* could publish the documents. But before the Court issued its verdict, Sheehan's source, whistleblower Daniel Ellsberg, leaked other copies of the Pentagon Papers to *The Washington Post, The Boston Globe,* and other media outlets, which began publishing the documents as well. The Nixon Justice Department brought criminal charges against Ellsberg for the leak but they were dismissed in court because of government misconduct. Sheehan's story earned *The New York Times* a Pulitzer Prize. In 1989, he won another Pulitzer for his biography of an influential Army intelligence officer in Vietnam, *A Bright Shining Lie*.

I. F. Stone (1907–89)

Born Isidor Feinstein, Stone was a radical journalist who wrote for such left-leaning publications as *The Nation, PM,* and the *New York Post* during the 1930s and 1940s. In 1953, inspired by the equally iconoclastic guerilla reporter George Seldes, Stone began his own newsletter, *I. F. Stone's Weekly,* which he published with his wife out of his home in Washington, D.C. Stone attacked racial segregation and the red-baiting of Senator Joseph McCarthy. He also pored over obscure government documents, uncovering hidden stories that other, less patient, reporters missed. In 1955, a Senate subcommittee accused Stone's newsletter of being a Communist "front," and he was frequently under surveillance by federal agents, who rifled through his trash in an effort to uncover evidence of subversion. But Stone continued publishing his newsletter, which peaked at 70,000 subscribers. Failing health forced him to close it in 1971 but he continued writing books until his death

Bob Woodward (1943–) and Carl Bernstein (1944–)

Woodward and Bernstein helped uncover the Watergate scandal of President Richard Nixon for *The Washington Post* between 1972 and 1974. Guided by a top FBI official who served as Woodward's secret source, the reporters helped keep the story in the news when the Nixon White House was trying to cover it up. Their two best-selling books about the scandal, *All the President's Men* and the *Final Days,* along with a top-rated Hollywood movie that glamorized their role, transformed them into the most famous investigative reporters in history and inspired a generation of aggressive journalists who followed in their wake. After Watergate, Woodward authored more than a dozen other books while continuing to report for *The Washington Post*. Bernstein also wrote books and reported for ABC News and *Vanity Fair* magazine.

Pam Zekman (1944–)

Zekman dominated investigative journalism in Chicago for a generation, beginning in the 1970s. In 1978, in an undercover investigation for the *Chicago Sun Times,* she helped establish a phony bar, the "Mirage Tavern," to expose systemic payoffs to city inspectors. Three years later, she moved to WBBM-TV, the CBS affiliate in Chicago, where she spent more than three decades using hidden cameras and uncovering virtually every kind of wrongdoing at the local level: police corruption; unsanitary restaurants; Medicare and Medicaid fraud; unsafe subway cars; loopholes in drunk driving laws; dangerous taxicab drivers; delays in ambulance service; and loafing by city workers. Her investigative reporting has won two DuPont-Columbia Awards, two Peabody Awards and 18 local Emmy Awards.

Israel

Israel's population in 2008 was about 7 million, some 80 percent Jews and about 20 percent Arabs and other minorities. While the official language of Israel is Hebrew, its residents speak dozens of languages. Israel is a parliamentary democracy, with elections to its parliament—the Knesset—conducted every four years. Freedom House lists Israel among nations enjoying freedom of the press.

Development

Israel's printed media date to the nineteenth century, when Palestine was part of the Ottoman Empire. The first two Hebrew newspapers, *Halevanon* (The Lebanon) and *Havatzelet* (Sand-Lily), both of them monthlies, began publication in 1863, but authorities closed them down about a year later, on the grounds that they lacked a license. The Hebrew press developed very slowly under Ottoman rule, the number of newspapers and periodicals increasing only gradually. The development of the press in Arabic was even slower, primarily due to the low level of literacy among the Arab population of Palestine. With the outbreak of World War I almost all newspapers were closed down and only resumed publication after Palestine was occupied by the British Army in 1917–18. British rule in Palestine lasted for thirty years, mostly under a mandate from the League of Nations, until the establishment of Israel on May 14, 1948.

Shortly after the occupation of Palestine, the British Army began publishing a weekly, *The Palestine News*—in Hebrew and in Arabic—whose purpose was to supply information to the local population (another edition, in English, was intended for the troops), but also supplied some of its communication needs. About a year and a half later, the military authorities decided to transfer publication to private hands, but only the Hebrew edition was revived and became a cornerstone of the Israeli media. In 1919 the Hebrew daily *Ha'aretz* (The Land) was established as the military's official periodical and continues to appear today. Privately owned, *Ha'aretz* is the newspaper of Israel's elite with a daily circulation of 65,000 copies.

Over the next few decades the number of printed media gradually increased, including daily newspapers—primarily belonging to political parties—and many journals. After World War II, the printed press flourished, and within a few years, 12 new newspapers began publication. The Jewish population of Israel at the time of independence in 1948 was only about 600,000, yet the region produced about 150 papers and periodicals of various types

and in diverse languages, including 23 dailies (16 morning and 7 evening papers). One reason for the multiplicity of the printed media lies in the waves of emigration from Europe. The Jewish immigrants, many of them Holocaust survivors, were accustomed to reading periodicals in their former countries and continued to do so in their new home. Another cause was the division of Israel's Jewish society along ideological and party lines, which meant that each political party sought a newspaper or journal of its own. The blurring of ideological differences and the subsequent decline in the power of political parties has led, as in many European countries, to the demise of party journalism. In the first decade of the twenty-first century, only the religious and ultra-Orthodox parties in Israel maintain separate newspapers.

In 1936 the British Mandate authorities established the first radio station in Palestine, called "The Voice of Jerusalem." Under government control, the station was patterned after the BBC with the help of advisers from that broadcasting system. With the establishment of Israel, the radio station (as "The Voice of Israel") was transferred to the prime minister's office, an indication of the importance attached to the medium. Under the Broadcasting Authority Law of 1965, The Voice of Israel became a public broadcasting corporation, like similar bodies in Europe, and with the establishment of Israel Television (now Channel One) in 1968, it too was subordinated to the Israel Broadcasting Authority.

Since the late 1970s there has been considerable development in printed journalism, with the first appearance of local newspapers. Within a decade or two almost every city or town in Israel had at least one. By the early twenty-first century, local newspapers number about 350, but most of those with large circulation are owned by the three leading Israeli dailies (*Yedioth Aharonot, Ma'ariv,* and *Ha'aretz*), each of which has its own network of local newspapers, nearly all distributed free of charge.

Broadcasting has also changed a good deal since the early 1990s. Privately owned cable TV networks were established; two commercial television channels (Channels Two and Ten) operated by private concessionaires joined the single publicly owned Channel One; and about 15 local and regional private radio stations, also began transmitting alongside the state-controlled Voice of Israel. Channel One's monopoly of television news came to an end when the two commercial channels were obligated to operate news broadcasts, the first (Channel Two) in 1993 and the second (Channel Ten) in 2002.

Technology and Training

Hiring of journalists without formal training was and remains a characteristic of Israeli media. Although the press nurtured the growth of many political leaders, Israel had no formal journalism education program until the early 1990s. Indeed, the academic and media worlds were often at loggerheads, expressing mutual contempt and mistrust. Only in the late 1990s and early 2000s did the first signs of change in journalist training become evident. Some colleges offered journalism studies and attempted to develop a suitable professional training curriculum, although all courses were provided under the broad umbrella of media (or communication) studies. The programs consisted of courses on essentials of field reporting, investigative reporting, news and magazine editing and writing, Internet journalism, and practical local newspaper work. Instructors were highly experienced professionals. The outcome of this training was evident: gradually recruitment began to include graduates of these programs alongside others who received their training on the job.

Israeli news media make good use of modern Internet and mobile communications technologies. As a Western state with a stable economy and a highly developed industrial infrastructure, Israel possesses a modern mass media industry equipped with modern technologies. A few of these technologies, especially in the field of computerization, were developed in Israel, which is considered a world pioneer in this sphere. Surveys indicate that Israel is also characterized by a high level—when compared with other countries—of adoption of technological advancements, including PCs, Internet, and cellular phones—all are now integral part of the journalist's tool kit.

Law and Policy

Although freedom of the press has existed since the establishment of Israel and has been affirmed by court decisions, it has not been anchored in

legislation (indeed, Israel has no written constitution). Effectively, the British Mandate left Israel with several legal legacies capable of restricting the press, such as the 1933 Press Ordinance that required a license for publication of a newspaper and accorded the Minister of the Interior the authority to close papers suspected of disrupting public order. In 1953, the nation's High Court of Justice laid the foundations that ensured freedom of the press by severely restricting the Minister's authority to close newspapers solely to cases of "proximate certainty" of a threat to public order. In succeeding years, the Court reinforced de facto freedom of the press by upholding the right of journalists not to reveal their sources. The Ministry of the Interior has largely ceased enforcement of the need to apply for a license to publish, so that many local newspapers and periodicals are published without licensing.

While there is no regulator for printed media, electronic media operate within the framework of specific laws: the Broadcasting Authority regulates public television and radio, the Second Authority for Television and Radio Law of 1990 regulates commercial television and regional radio stations, and the Communication Law of 1982 regulates cable and satellite TV broadcasts. Although the commercial outlets are obliged to provide news, there are hardly any provisions concerning news broadcasts.

Journalists Associations

Local journalists associations are active in Israel's three largest cities—Tel Aviv, Jerusalem, and Haifa—and are linked to the National Journalists Union, an umbrella organization of the press community and effectively its trade union as well.

The oldest journalists association was established in Jerusalem in 1933, with two more founded two years later in Tel Aviv and Haifa. Each has sections for journalists in specialized fields (such as military affairs, the Knesset, agriculture, economics), dealing mainly with professional issues or coverage procedures in these respective fields, as well as organization of seminars and enrichment programs.

The power of the National Journalists Union, established in 1948, was derived for decades from its status as the journalists' representative in negotiations over wage agreements, all of which were collective for national media. Over the years, the union's representative status decreased, primarily as the result of two developments: (a) changing hiring patterns and a gradual shift from collective work agreements to individual contracts, virtually eliminating the former for press employees by the late 1990s, and (b) the rise of local periodicals and alternative media, many of whose reporters are not members of press unions.

As their authority as representative professional organizations attenuated, the journalists' unions gradually turned into members' clubs, primarily concerned with cultural and social activities, speaking out only on perception of threats to freedom of the press or to the practice of journalism.

Professional Ethics

In 1957 the Journalists Association in Tel Aviv produced a draft of "Professional Ethical Regulations for Members of the Journalists Association" that was circulated among newspaper editorial boards and journalists for comment. A few months later, the association approved what was later described as the "legislative platform that journalists will observe henceforth, maintaining compatibility between professional practice and ethics" (Limor 2002).

When the Israel Press Council was established in 1963, one of its functions was to formulate ethical principles and see to their observance. These principles were based, at the explicit request of journalists, on regulations already drafted by the journalists' trade union. The code was updated several times (major revisions were made in 1973, 1986 and 1996), including the addition of many new sections, such as recommendations on how to cover war events.

The Israel Press Council is composed of three types of representative: public (40 percent of members), journalists (30 percent), and owners and editors (30 percent). The council is headed by one of the representatives of the public, generally a retired Supreme Court judge or senior attorney.

Contemporary Trends in Israeli Journalism

While journalism in Israel was initially based on the newspaper tradition of Eastern Europe, from

where the first waves of immigrants had come, the profession later adopted patterns customary in Britain such as editing or layout techniques. More recently, mainly in the 1980s and 1990s, norms of American journalism (such as the "New Journalism" style) became more dominant.

Media Market

Israel's media market is marked by two parallel processes: concentration and decentralization. While a small number of media barons control an ever-increasing number of outlets, there are always new ones (most quite small) not under their control. These have resulted from technological innovations and low production costs.

All dailies are national newspapers, though many local papers appear on a weekly or monthly basis. There are no evening papers in Israel. Evening newspapers gradually moved up the time they hit the streets during the 1980s, until they became morning papers. One reason is that the country lacks an extensive infrastructure of railroads and metros, and thus, potential readers must drive to work and therefore cannot read papers while commuting.

Free distribution, which began with local papers, has gradually entered the dailies market. Such free dailies have cut into the income of traditional dailies and pose a threat to their economic stability.

The Israeli New Agency ITIM (a Hebrew abbreviation for United Israeli Press), founded in 1950, was closed at the beginning of the twenty-first century as the daily newspapers preferred to rely on their own staff and refused to finance the agency.

Employment

For many years a characteristic of the Israeli media was low employee mobility, first and foremost because of the collective work contracts which effectually prevented payment of compensation by the employers when an employee left of his own free will. With the introduction of personal contracts in the 1980s, there has been much greater mobility as is the case in other Western countries. The media industry has slowly but surely undergone feminization. This has included the highest administrative and editorial levels. Surveys indicate that early in the twenty-first century about one-half of the employees in Israeli media are women.

Toward the end of the first decade of the twenty-first century, Israel has a variegated media: three television channels, many cable television and satellite channels, about 20 dailies, some 350 local papers of varying frequency, dozens of radio stations (about 40 of them educational stations in schools, colleges, and universities), and a very active and lively Internet. There are also hundreds of foreign journalists present in Israel at any given time. Such ongoing contact with the international media has contributed to the development of professional standards among Israeli journalists.

J

Japan

Contemporary democratic Japan enjoys a relatively high degree of free speech. Under the country's constitution, freedom of speech and press are guaranteed without censorship. However, journalistic practice and the press system are significantly different from those in the United States, reflecting Japan's historical experience and societal values and systems. Media technology has grown considerably, and Japan has become one of the world's biggest producers and consumers of media-related products.

By 2008 Japan had a population of about 127 million people living in 49 million households. Roughly 14 percent were children below the age of 15, 65 percent were between 15 and 65, and 21 percent were older than 65. In 2008, the population growth was –.14 percent, and life expectancy was approximately 82 years. The speed of aging of Japan's population was much faster than other developed countries in Western Europe or the United States.

The nation is composed of 47 prefectures, and its capital, Tokyo, the political and economic center of the country, has a population of 8,490,000. Japan is considered ethnically homogeneous since 98.5 percent is of the Japanese-Yamato race; Koreans (.5 percent) and Chinese (.4 percent) are the two largest the minority groups. The average annual household income was around $50,000. According to the United Nations, poverty is not a major issue in Japan.

Education through junior high school is compulsory for children between the ages of 6 and 15, and 97 percent of junior high school graduates go on to high school. Nearly half of high school graduates continued to college, 6 percent to junior college, and 16 percent to technical or vocational schools. The adult literacy rate in Japan is estimated to be 99 percent.

Newspapers

During the late feudal period in the nineteenth century, community newsletters were published, but the government restricted publications that offended social values derived from traditional Asiatic doctrines; therefore availability of information, especially about the West, was limited. By the mid-nineteenth century, the Meiji Restoration initiated the modernization of Japan, and new knowledge and technology from the West came to influence the growth of the country. Publications similar to contemporary newspapers soon became available. In 1871, *Yokohama Nikkan Shinbun* (Yokohama Daily Newspaper) was published near Tokyo, followed by *Tokyo Nichinichi Shinbun* (Tokyo Daily Newspaper) in 1872, *Yomiuri Shinbun* (Yomiuri Newspaper) in 1874, and *Asahi Shinbun* (Asahi Newspaper) in 1879. Under the Meiji Constitution, which did not allow freedom of either speech or the press, a Newspaper Ordinance was issued in 1875 to restrict antigovernment speech and activities. The ordinance was revised in 1909 as the Newspaper Law, which imposed prior restraint on newspaper content until 1945.

Although Japan's current population is less than half that of the United States, Japanese newspaper circulation is much larger. In 2005, total daily circulation of Japanese newspapers was nearly 53 million. Of this, 47 million were general daily newspapers, and 5 million were sports and entertainment newspapers. The total average circulation of daily newspapers per 1,000 inhabitants in 2004 was 551.2, which is second only to Iceland (551.6).

By 2006, there were 120 daily newspapers, including the five national papers: *Asahi, Yomiuri, Mainichi, Nihon Keizai,* and *Sankei.* Among these, *Asahi, Yomiuri* and *Mainichi* are considered the "Big Three," composing the world's top three largest circulations of daily newspapers. Among the "Big Three," *Yomiuri* publishes 10 million copies per month, considered to be the largest in the world, followed by 8 million of *Asahi,* and 4 million of *Mainichi* as of 2006. In addition to the national papers, there are regional newspapers called *burokku-shi.* These include such titles as *Hokkaido, Chu'nichi,* and *Nishi-nihon,* distributed throughout several prefectures (districts). Another type of regional paper is *chihou-shi,* which is circulated in only one or two prefectures. *Tokushima,* and *San'in -chuo Shinpo* are examples, providing vicinity-specific information. Some newspapers publish both morning and evening editions in large cities, such as Tokyo and Osaka, while regional newspapers often publish only in the morning.

Owners of newspapers are less active in their newspaper's content than in the United States, with the exception of Tsuneo Watanabe, the owner of *Yomiuri* Newspaper, who is known for his tyrannical personality. Watanabe, a former reporter, is also chairman of the Yomiuri Giants Baseball Team and the president of the Japan Newspaper Publishers and Editors Association. *Asahi* Newspaper is owned by two individuals, Chieko Murayama, a granddaughter of the founder of *Asahi,* and Shoichi Ueno, a son of the former owner of the newspaper, who together own half the stock in the company.

The "Big Three" are not merely newspaper publishers but also media conglomerates that have expanded their business from media into real estate and travel agencies. For instance, *Asahi* Newspaper Company has 300 branches within the country and 30 foreign offices. It also owns 15 subsidiary companies that publish specialized newspapers, including sports and English papers. *Asahi* also owns 23 printing offices and some 3,000 sales offices that employ roughly 82,000 people to deliver newspapers to individual households. The *Asahi* Fellowship Program provides scholarship support and sponsors cultural and educational groups. Among the "Big Three" newspapers, *Asahi* is seen as more liberal when compared with *Yomiuri* and *Mainichi.* While *Yomiuri* is more conservative *Mainichi's* position is more moderate. *Asahi*'s liberal journalism was targeted in 1987 by an unidentified militant group in which two reporters were shot in the newspaper's *Kansai* branch office.

The sports daily newspapers, such as *Nikkan Supotsu* (Daily Sports), *Supotsu Nippon* (Sports Japan), and *Supotsu Hochi* (Sports Hochi), are one of the most popular formats in Japan. Their focus is on sports news and entertainment gossip, featuring big and colorful banners and photos on the front page, and in some papers, centerfold photos of naked young women that make clear the papers' appeal to male readers, especially those who commute by train. Major newspaper companies, both national and regional, publish sports as well as general daily newspapers.

Magazines

Ippan Shukan-shi, weekly general interest magazines, are the most popular format, and contain a variety of articles from political news to entertainment gossip. Weekly magazines such as *Shukan Asahi* (Weekly Asahi), *Shukan Shincho* (Weekly Shincho), and *Shukan Bunshun* (Weekly Bunshun) deliver political, social, economic, and entertainment news with photographs. These occasionally provide in-depth reporting, and seek to raise awareness about political corruption and social problems. On the other hand, they have also been criticized for sensationalism and overtly sexual content. *Shukan Bunshun* has the highest weekly circulation at 80,000, followed by *Shukan Shincho* at 67,000.

Keizai-shi is a type of magazine that focuses on economic issues. The major titles in this category are *Shukan Ekonomisuto* (Weekly Economist), *Shukan Toyo Keizai* (Weekly Asian Economy), *Shukan Daiamondo* (Weekly Diamond), and

Nikkei Bijinesu (Nikkei Business). Other types of popular magazines include *Josei-shi* (women's magazines), which are published biweekly or monthly: the biweekly tabloid style magazines are priced between $2 and $3 and are aimed at housewives; the monthly fashion magazines are priced between $5 and $10 and directed toward college students and young business women.

Photojournalism

During the 1960s, three Japanese photographers received the Pulitzer Prize. In 1961, Yasushi Nagao (1930–) of the *Mainichi* newspaper was awarded the 1961 prize for his photograph showing the moment of the assassination of Inajiro Asanuma, then leader of the Japanese Socialist Party. In 1966, Kyoichi Sawada (1936–70) received the award, and Toshio Sakai (1940–99) was the recipient in 1968, both for their work in Vietnam.

In 1981, photojournalism began a new trend in Japanese print media with the publication of a weekly and trendsetting photo magazine, *Fokasu* (Focus). The magazine featured sensational photographs of current news events, candid female nudity, and collages of cultural and political satire, accompanied by brief articles. Photographs of news events sometimes included crime-scene photos, some with explicit images of violence. The success of *Focus* was followed by similar magazines, *Furaidei* (Friday), *Furasshu* (Flash), *Enma* (Emma) and *Tacchi* (Touch), creating a new approach to journalistic publication, in which photo-centered reports replaced traditional articles. The popularity of these magazines prompted criticism that sensationalism had displaced traditional serious journalism. In addition, competition among photo magazines drove them to make their content more shocking and scandalous, one result of which being that several public figures filed lawsuits charging invasion of privacy. Readers also complained that the content was becoming depraved, and the popularity of these magazines began to decline by the 1990s. While *Friday* and *Flash* were still published in 2007, *Focus, Emma,* and *Touch* had ceased to appear by 2001. Both *Friday* and *Flash* publish spin-off photo magazines, *Fraidei-Dainamaito* (Friday-Dynamite) and *Furasshu-Ekisaiteingu* (Flash-Exciting), which follow the same format but with stronger sexual content. Among these four currently available weekly photo magazines, *Flash-Exciting* circulates to almost 46,000 a week, followed by *Friday* to 40,000.

Radio and Television

There is one public broadcasting network, and five commercial television networks in Japan. These six networks each have local affiliates throughout the country. Nationwide, there are 129 television and 101 radio stations (48 AM and 53 FM).

There is one public broadcasting network, NHK (*Nippon Hoso Kyokai*), which is an influential news source for the Japanese public because of its availability and popularity. NHK is not a commercial broadcasting company but a special public corporation, or semigovernmental corporation. According to the Broadcasting Law, the objective of NHK is to contribute to the welfare of the public through the nationwide distribution of diverse and quality programming as well as the development of broadcasting technology. As a public media institution, it is considered more trustworthy than commercial broadcasters. On its television channels NHK General and NHK Educational, fully half of all programming is news. In addition, NHK also distributes programs through NHK World and World Premium for overseas television viewers via a satellite system, and NHK World Radio via shortwave in 22 languages. NHK also uses the Internet to distribute its news service.

The most watched news program on NHK is *News 7,* broadcast at 7 p.m. and *News Uocchi 9* (News Watch 9) at 9 p.m. daily, which focus on political, economic, and international news as well as information on societal issues, sports, and weather. *News 7* is followed by a reportage program, *Close-up Gendai* (Today's Close-up) on weekdays, which provides an analysis of specific political, economic, international or cultural issues. In addition to regular news programs, NHK also provides news for special audiences. For instance, *Shukan Kodomo News* (Weekly Kids' News) is aired on Saturday evenings. NHK also provides regular programming for sign language news, *Shuwa News 845* (sign language news 845) during the week, and *Shukan Shuwa News* (weekly sign language news) on Saturday evening.

While 96 percent of NHK's revenue is supported by subscription fees, NHK's annual budget

has to be ratified by the Japanese Diet (parliament), according to the Broadcasting Law. The Ministry of Internal Affairs and Communications oversees licenses for broadcasters, which are renewable every five years as long as the broadcaster does not violate criteria established by the Broadcasting Law. Because the Diet has been dominated by the Liberal Democratic Party (LDP) since 1955, a common criticism is that NHK avoids investigating the LDP's political leadership, focusing on neutral reportage in order to maintain a good relationship with the government. As a result, NHK's role to serve the public has been criticized as lacking critical reporting and political analyses. Commercial networks include TBS, Fuji-Sankei, Nippon, Asahi, and Tokyo. Each of these offers their own morning and evening news programming to attract audiences. Among those competing for the evening news, *News 23* on TBS, and *Hodo Station* (Journalism Station) on Asahi are often cited for their popularity as well as their critical tone. In general, however, commercial network news programs have been criticized for providing news programming that resembles variety shows. In addition to news, the Asahi Network airs programs of political debate including *Asa Made Nama Terebi* (Live TV Until Morning). Assigning well-known journalists as hosts, *Live TV* is a three-hour panel discussion program, in which panelists debate specific political or sociopolitical topics.

News Agencies

There are two major Japanese news agencies, *Kyodo Tsushinsha* (Kyodo News), and *Jiji Tsushin* (Jiji Press), and two specialized agencies, *Rajio Puresu* (Radio Press) and *Tokyo Nyusu Tsushinsha* (Tokyo News Agency). Kyodo is a nonprofit cooperative organization whose members include 63 newspapers and NHK, and is funded by membership fees and subscription revenues. Kyodo World Service plays a role of gatekeeper to the world since it provides links and support to foreign media that do not have correspondents in Japan or that need backup service. Compared with Kyodo News, Jiji Press focuses on delivering financial information and enjoys joint agreements with such foreign agencies as Reuters, Xinhua, and Tass.

Radio Press was originally founded by the Ministry of Foreign Affairs as an agency to collect information from overseas. In 1946, it became a foundation that monitors foreign mass media and distributes information to both government agencies and domestic media companies. Tokyo News Agency used to specialize in the distribution of information in English, but currently its service is limited to the distribution of TV and radio schedules to newspaper companies. It also publishes weekly television guide magazines.

Education and Training for Journalists

The first college department of journalism was established in 1932 at Sophia University in Tokyo. During the U.S. occupation of 1945 to 1952, journalism programs were established in various universities in Tokyo, Osaka and Kyoto with the support of the Allied Powers' General Headquarters (GHQ). Currently, Sophia University, Waseda University, Keio University, and the University of Tokyo are the most recognized universities for journalism education. In addition, Keio houses an Institute for Media and Communications Research, and the University of Tokyo includes the Interfaculty Initiative in Information Studies, in which research on journalism has been conducted from political, economic, technological, and cultural perspectives.

Legal Issues

Historically, the Japanese press has experienced a significant level of governmental censorship. The first modern constitution, issued in 1889 and in force until 1945, did not guarantee individual rights, including free speech rights. Under this constitution between the early Meiji period and the end of World War II, press restriction was exercised through both prepublication censorship and postpublication punishment. Under the Publication and Newspaper laws, publishers were required to seek permission to publish. However, a significant part of the censorship was conducted privately, through personal threats, pressure, and persuasion designed to force editors and publishers into voluntary self-censorship.

Under the occupation, Japan began enjoying freedom of speech and of the press. At the same

time, the office of the Supreme Commander for the Allied Powers (SCAP) exercised the right of censorship during the occupation. An order issued in September 1945 claimed that although there should be a minimum of restrictions upon freedom of speech, it forbid discussion of Allied troop movements. News, commentary, and informational broadcasts were limited to Radio Tokyo. If the information distributed from other radio station was false, SCAP could suspend the station. Supplementary censorship provisions further restricted who could distribute information regarding the current condition of Japan. These orders remained in effect until 1949.

The new constitution, issued in 1947, was written by the Japanese with American assistance and approval. Article 21 explicitly protects freedom of speech, but the public welfare requirement in Articles 12 and 13 allows the courts to consider individual right of speech to be applicable only when they are not abused. In other words, although the new constitution guaranteed freedom of speech, postwar courts obtained constitutional permission to restrict speech if it impinged on public welfare.

The Role of the *Kisha Kurabu*

While the Japanese press seems to enjoy considerable freedom of gathering, reporting, and disseminating information in Japan, the role of the *kisha kurabu* (press club) has been a main focus of the debate over press freedom. The press club is an association for journalists through which various kinds of press conferences are held, but it has an unchallenged monopoly on the flow of news and information within the country. The most representative press club is *Nihon Kisha Kurabu* (Japan National Press Club), located in Nagata-cho, Tokyo, the Capitol Hill of Japan, but there are more than a thousand smaller press clubs throughout Japan, providing information regarding political organizations and parties, governmental agencies, economic institutions, and the Imperial Palace.

The press club was formed in 1890 when reporters gathered to demand that the Imperial government reveal information about its activities. Although the suppression of the press before and during World War II forced the end of this club, it was refounded in 1969 by the presidents of *Nihon Shinbun Kyokai* (Japan Newspaper Publishers and Editors Association), *Nihon Minkan Hoso Renmei* (National Association of Commercial Broadcasters in Japan), and NHK. By 2007, 147 media companies and 1,644 reporters belonged to this club.

The press club in Japan allows reporters to obtain information more easily than they would be able to by conducting their own independent investigations, since the conferences at the club are intended to feed reporters the basic information they need. But it also restricts reporters from probing scandals because reporters and news sources maintain a mutual dependency whereby both benefit from obtaining and disseminating news. This dependency leads reporters and their sources into a close relationship that biases reporting. As a result, reporters may censor their own work, and the press fails to function as an effective check on government. In addition, because reporters associated with the club gather information from the same source, the diversity of news content is reduced.

In addition, there was concern regarding foreign reporters' lack of access to these press clubs, a concern addressed in October 2003 by the European Union Delegation of the European Commission in Japan in the EU Priority Proposals for Regulatory Reform in Japan. In the press club system, only reporters who are members of the club are allowed to participate in the press conferences, while nonmembers, such as foreign and freelance reporters, may be excluded. The EU's proposal requested that foreign reporters have equal access to the news source and recommended the abolition of the club system. In December 2003, Kisha Kurabu Mondai Kentou Shoiintai (the Committee of the press club problem), a subsidiary committee of the Japan Newspaper Publishers and Editors Association, responded to the EU's proposal, upholding the press club's objective to provide fair and equal access to information in order to maintain freedom of the press as well as the public's right to information. It also claimed that the EU's view of the press club system was the result of misunderstanding, bias, and, because the proposal ignored the historically developed systematic ways of practicing journalism in Japan, a factual misrepresentation of the press club system. The committee also emphasized that the press club was open to nonmembers, and the so-called lack of foreign access was merely the result of a lack of effort on

the part of foreign reporters. Within a week, the EU Commission countered the committee's response, denying that its perspective was the result of ignorance or misunderstanding, and further appealing for the abolition of the press club. In 2004, the committee issued a request that the press club make additional efforts to allow foreign reporters who possess foreign reporter ID cards issued by the Ministry of Foreign Affairs into its press conferences.

Technology

Japan has become one of the world's most technologically advanced nations. The use of electronic media by news organizations has expanded with the availability of the commercial Internet since 1995. More than 100 national and local news distributors in Japan are operating 179 websites to disseminate information.

NHK has played a large part in the development of broadcast technology. High-definition television service, first developed as an analog technology during the 1970s, has been available in Japan since 1989. In the beginning, the service was experimental, airing only a few hours per day, but since 2000, one satellite channel has been dedicated to digital high-definition system. By 2011, analogue broadcasting will end in Japan and will be replaced by digitized signals delivered to all homes and businesses.

Technology has also been applied to develop fast and accurate information distribution systems, especially when disaster strikes. The One-Seg broadcasting system inaugurated in April 2006 allows mobile phones to receive video and audio segments without distortion through the digital broadcasting system. Beginning in October 2007, One-Seg offered a service called Emergency Earthquake Warning, which reports a possible large earthquake just before it occurs. The warning will be transmitted through all NHK channels in both television and radio networks between a minute and several seconds before such an earthquake occurs.

By 2007, the number of Internet users in Japan was 88,110,000, which is approximately 70 percent of the entire population. More than 70 million users access the Internet from mobile phones. Major newspaper companies as well as broadcasting networks host websites providing constant news updates. The circulation of hard copy newspapers has been in steady decline since 1997 due to the increasing migration of newspaper readers to the (largely free) online versions.

Conclusion

While journalism in Japan has been influenced by political and historical change as well as technological development since World War II, the audience enjoys a significant free flow of information. Media literacy is not yet a widely accepted part of compulsory education. People's lack of interest in politics is quite apparent in contemporary Japan—one reason why journalism is not an important check on government. Availability of information regarding matters sensitive to the cultural identity of Japan, such as that regarding the royal family, is restricted by bureaucratic organizations. Thus, limits on the free flow of information have become increasingly evident.

Joint Operating Agreements

A joint operating agreement (JOA) in the United States is a contract that allows competing daily newspapers in the same market to share their production and distribution facilities while keeping their reportorial and editorial functions separate and independent. JOAs are designed to ensure a diversity of information and opinion by maintaining head-to-head competition between daily newspapers amid an ever-increasing number of one-newspaper towns. This stands in marked contrast with many industrialized countries in Europe and Asia, which rarely recognize such government-sanctioned arrangement for newspapers. JOAs are granted under the Newspaper Preservation Act (NPA). Since Congress passed the NPA in 1970, 28 JOAs have been approved. But JOAs have not been a success story. Each year, there are fewer JOAs and fewer cities with competing newspapers.

History

The JOA is often perceived as a relatively new development in the American newspaper industry, though it is more than 70 years old. The Depression led several newspapers to consider reducing their production costs by combining business operations with their competitors. In 1933, the *Albuquerque Journal* and the *Albuquerque Tribune* in New Mexico entered into a joint operation except in their editorial functions—this was the first JOA in the United States. Into the 1960s, newspapers in about 20 cities had agreed to operate as partners, though many critics argued this was a violation of U.S. antitrust laws.

In 1964, the U.S. Justice Department challenged the JOA between two Tucson, Arizona, newspapers as a private contract in restraint of trade. The JOA between the *Tucson Daily Citizen* and the *Arizona Daily Star* mandated price fixing, profit pooling, and market allocation. At the same time, the agreement required that the papers maintain separate news and editorial departments. The Supreme Court in *Citizen Publishing v. United States* (1969) found that the JOA of the *Citizen* and the *Star* violated the Sherman Act, the key federal antitrust law passed in 1890. The Supreme Court deemed the JOA of the Tucson newspapers a business cartel to foreclose publishing competition in their newspaper market. The Court stated that operating such a JOA enjoyed no support from the First Amendment, for it did not concern news gathering or news dissemination, but rather restraints on the newspapers' monopoly of business practices. Nonetheless, the Court did not ban the Tucson JOA altogether. Instead, it asked the JOA to be revised in such a way as to avoid violating the antitrust laws.

In defense of their JOA, the Tucson newspapers unsuccessfully invoked the "failing company" doctrine, a judicially created exemption to the Sherman Act. The doctrine authorizes an otherwise illegal merger when one of the two companies is on the verge of bankruptcy and no one is willing to acquire the failing company. The Supreme Court in *Citizen Publishing* rejected the failing company defense as there was little evidence that, when the JOA was contemplated, the *Citizen* was on the brink of collapse and that no effort had been made to sell the newspaper to any purchaser other than its sole competitor, the *Star*.

Newspaper Preservation Act

The *Citizen Publishing* decision placed all the existing 22 JOAs in jeopardy. The newspaper industry lobbied Congress for a special legislative exemption from federal antitrust regulations. To overcome the Court's holding, Congress passed the Newspaper Preservation Act (NPA) in 1970. It "grandfathered" the JOAs then in existence and authorized the creation of new ones. "In the public interest of maintaining a newspaper press editorially and reportorially independent and competitive in all parts of the United States," the NPA aimed "to preserve the publication of newspapers in any city . . . where a joint operating

arrangement has been heretofore entered into because of economic distress or is hereafter effected" under the law (15 U.S.C. § 1801).

The NPA codified, in a merger-friendly way, the failing company doctrine that the Court had found inapposite in *Citizens Publishing*. A "failing newspaper" under the NPA is a newspaper that is "in probable danger of financial failure," not necessarily one facing imminent bankruptcy. In mid-March 2009, the *Seattle Post-Intelligencer* ceased print publication and became a web-only newspaper, effectively ending the JOA.

Prior to entering a JOA, the newspapers must obtain the written approval of the U.S. Attorney General. In considering the JOA application, the Attorney General is required to determine whether one of the newspapers is in probable danger of economic failure and whether the JOA, if approved, would serve the NPA's "purpose and policy." A valid JOA under the NPA allows two newspapers to combine their business-related operations, while keeping their independent editorial functions intact.

As a statutory exemption for newspapers to antitrust regulations, the NPA protects the newspapers against price-fixing and profit-pooling restrictions. Nonetheless, the JOAs are barred from violating antitrust laws with impunity. Newspapers cannot commit predatory pricing practices that would be unlawful if engaged in by a single newspaper.

The NPA addresses few possible issues relating to termination of JOAs, whether good-faith or pernicious. It also pays little attention to what could be done to a JOA party that might violate the Act after the JOA had been approved.

JOAs Under the NPA

The passage of the NPA in 1970 did not lead to a sharp increase in the number of JOA applications. Of the eight JOA applications in the years since, the U.S. Attorney General reviewed and approved seven, and one was withdrawn. One of the more widely known JOAs under the NPA involved the financially troubled *Seattle Post-Intelligencer* (*P-I*) and the *Seattle Times*. In 1981, the two newspapers entered into a JOA, which the Attorney General approved after finding that the *P-I* was a "failing newspaper" as defined in the NPA. The 1981 JOA required the *Times* to provide the newsprint, presses, and labor and to print, sell, and distribute both newspapers. The two newspapers, however, were to maintain independent news and editorial departments. Also, they were to remain separately owned and managed.

In 1999, the two Seattle papers amended their JOA, which allowed the *Times* to change to a morning publication and to compete directly against the morning *P-I*. Also, the amended JOA contained a "loss operation" clause that permitted either party to terminate the agreement after three consecutive years of operation losses. In the early 2000s, when the *Times* tried to end the JOA, Hearst Corp., owner of the *P-I,* sued to keep the agreement in effect. In 2005, the Washington Supreme Court ruled in favor of the *Times*. In April 2007, the *Times* agreed to pay Hearst $24 million to cancel key provisions of their JOA while agreeing to continue publishing.

Judicial Interpretations

Over the years, the NPA has been challenged on constitutional grounds, but it has been upheld each time. As a federal district court held in 1972, for example, the Act did not violate the First Amendment on freedom of the press because it selectively carved out exemptions to the antitrust laws to preserve independent editorial voices. More recently, the 9th U.S. Court of Appeals *Committee for an Independent P-I v. Hearst Corp.* (9th Cir. 1983) rejected a claim that that the NPA impaired the First Amendment rights of smaller newspapers as applied. "It is obvious," the 9th Circuit reasoned, "that the Newspaper Preservation Act's antitrust exemption will not affect the *content* of speech of these smaller newspapers. The Act is an economic regulation which has the intent of promoting and aiding the press. At most, the Act *may* affect the number of 'readers' a newspaper has. But that the Act may have such an effect is not different . . . than any other economic regulation of the newspaper industry" (704 F.2d 467, 483).

JOAs Not a Viable Option

Since the early 1990s, 13 JOAs have terminated. Most recently, the JOA between the *Cincinnati Enquirer* and the *Cincinnati Post/Kentucky Post* expired at the end of 2007 with the closure of the 126-year-old *Post* papers. In March 2008, there

were still ten JOAs in force, a dozen fewer than in 1970, when Congress enacted the NPA.

According to a 2007 study of JOAs, "leading papers in these cooperative arrangements are now regularly seeking to escape their unions with secondary papers" (Picard 2007, 41). What causes the termination of JOAs? The end is often precipitated when one of the JOA parties is no longer economically viable or when one or both parties have neither a wish nor an obligation to continue with their joint operations. Further, the NPA has been of limited value to the Justice Department in that it provides for no governmental authority to investigate newspaper owners when they violate the provisions of their approved JOAs.

The fundamental problem with the JOAs lies with the shifting economic challenges facing the newspaper industry as a whole. Two-paper cities are now anomalous, and all the JOAs can do for the "failing" newspapers tends to be more cosmetic than structural. Some JOAs help weak newspapers in one way or another by prolonging their lives for a while. But metropolitan daily newspapers, whether with or without JOAs, are less likely to compete with each other, simply because fewer cities will have more than one newspaper. Hence, the death of the remaining JOAs is only a matter of time unless the NPA is substantially revised. This is all the more true, given the changing media landscape and the NPA's questionable efficacy as a mechanism to keep a newspaper press editorially independent and diverse.

Journalists' Privilege

See Shield Law

Juvenile Offenders, Coverage of

Crime news makes up a large segment of journalistic reportage. Juvenile crime is of special interest because it can affect changes in government policy and public perceptions of the nation's youth. Bundled into this issue are people's worries about their own children, generational fear and mistrust (i.e., older people are often afraid of younger people), and a tendency toward sensationalism on the part of the news media. Coverage of juvenile offenders includes broadcast and print news stories of crimes committed by minors (often defined as those 16 years of age and younger). This coverage is affected by the routines of news gathering (e.g., deadlines, reliance on sources, limited time/space), does not reflect social reality (i.e., the amount of *coverage* of juvenile crime does not reflect the actual *amount* of juvenile crime), and, according to early-twenty-first-century research, is increasingly affected by race and ethnicity.

Juvenile Offenders in the News

Little research appears to have been conducted on news coverage of juvenile offenders until the late 1990s. Research since then indicates that when youth are covered in the news it is generally in the context of violence, and particularly murder. About half of all coverage of youth is related to crime and violence, despite strong evidence that juvenile crime arrests have been stable or in decline since the 1990s. This holds true for both broadcast and print reports.

According to the Office of Juvenile Justice and Delinquency Prevention (OJJDP), part of the U.S. Department of Justice, since 1994, most arrest

rates have seen a steady decline. Murder arrest rates, for example, were 74 percent lower in 2000 than they were in 1993. About half of all juvenile arrests are made for theft (the greatest single cause), simple assault, drug abuse, disorderly conduct, and curfew violations.

Such news coverage of juvenile offenders does not reflect social reality in a number of ways. For example, media coverage of juvenile crime tends to increase as juvenile crime rates decline. A commonly noted problem with news media is that only news with blood and violence—"if it bleeds, it leads"—is covered. This trend clearly affects coverage of youth issues. Violent crime by youth in 2005 was at its lowest point in the history of the National Crime Victimization Survey (which provides statistics back to 1973) yet, according to David Doi of the Coalition for Juvenile Justice, more than two-thirds of coverage of violent crime was focused on juveniles while youth were actually responsible for less than 15 percent of the violence. Further, most youthful offenders are not violent. In 2003 the Annie E. Casey Foundation, established to foster human service reforms to meet the needs of vulnerable children and families, estimated that 77 percent of incarcerated juveniles are nonviolent offenders.

Journalists also tend to cover juvenile crime episodically. They focus on individual crimes as isolated events instead of reporting the important context of overall trends. Major events—such as shootings or other violence in public schools—tend to receive heavy coverage. So do drive-by shootings and carjacking crimes. News coverage of juvenile offenders also connects race and crime, particularly violent crime and especially on television. Pictures of African Americans or Latino youth (including reports of gang warfare) dominate portrayals of youth violence, especially broadcast or photographic visual images. These portrayals have been shown to lead many who watch and read such news to worry more about their own safety. Television coverage of African American and Hispanic youth offenders raises levels of fear among viewers, increases their support for more stringent crime policies, and promotes racial stereotyping.

Legal Issues

In the 1960s the U.S. Supreme Court decided a series of landmark cases that changed the character and procedures of the juvenile justice system. In 1966, in *Kent v. United States,* the Court listed several factors for judges to consider when deciding whether to transfer a juvenile case to adult court. This included the alleged seriousness of the offense. It was at this time that juvenile courts became more concerned for the interests of the juvenile. To this point, youth offenders were rarely afforded the legal protections usually granted to adults (such as the right to counsel). Most states limited news access to juvenile courts, largely to protect offenders from a lifelong stigma for what was often a single mistake. Limits also encouraged rehabilitation efforts. Journalists followed suit, and became less likely to run stories culled from the juvenile court system. News organizations and journalism groups counseled caution in identifying juvenile suspects of crime.

Six states enacted new laws that opened juvenile court hearings to the public in 1996–97 for specified violent or other serious crimes. At the end of the 1997 legislative session, 30 states required or permitted open juvenile court hearings of cases involving either juveniles charged with violent or other serious offenses or juveniles who were repeat offenders.

Three states passed legislation giving the general public and news media access to the names and addresses of minors convicted of specified serious or violent crimes. As of the end of the 1997 legislative session, 42 states permitted the release of a juvenile's name, address, and/or picture to the media or general public under certain conditions. Connecticut, District of Columbia, Maryland, New Mexico, New York, North Carolina, Ohio, and Virginia do not permit the release.

In states that limit access to juvenile proceedings, news media cannot be penalized for revealing a juvenile's identity if they lawfully obtained the information. When a juvenile defendant's identity has already been revealed (as in public court records or open proceedings) news media may disseminate that information.

Some recent examples of how the media has been affected by juvenile offender laws, as reported by the Reporters Committee for Freedom of the Press, include the following:

- The Mississippi Supreme Court overturned the contempt conviction of a newspaper reporter

who had written about a discussion of a criminal defendant's juvenile record that had taken place in open court.

- An Alabama state court overturned the conviction of two newscasters for violating a state law that prohibits disclosure of information in juvenile records. An anonymous source provided the name to the stations, and having received the information legally, they broadcast it.
- Illinois courts may only suppress revealing the identity of a juvenile if that information was obtained from a closed juvenile court proceeding.
- The Connecticut Supreme Court has held that statutes mandating the confidentiality of juvenile records and proceedings do not prohibit news media from disclosing information about the case but only restrict press access to proceedings and records.
- Even secret court records can be published in Maine if a reporter has lawfully obtained access to those records.
- If a news media organization learns a juvenile's name from sources outside court proceedings in Rhode Island, it may publish the name and attend the proceedings.

Given public desire for the information, journalists will continue to concentrate on juvenile offenders in their routine coverage of crime. That coverage can have an effect on public policy as well as individual perceptions of criminal reality. Journalists must know the relevant laws governing such coverage in their own state or community, however, and the laws are often changing. Further, the amount of news coverage allowed is often up to individual court or judge discretion.

K

Kansas City

The development of journalism in Kansas City parallels the development of the city itself. The first fledgling newspapers were influenced by the forces of national western expansion and the approaching Civil War. As the two Kansas Cities (Kansas and Missouri) grew in population, media consolidation occurred, and one newspaper company dominated print media by the early part of the twentieth century. With radio and television, the number of media outlets grew, but more recent events have led to nonlocal ownership and journalism that mirrors the national trends.

Origins

Situated at the confluence of the Kansas and Missouri Rivers, the twin cities of Kansas City, Kansas, and Kansas City, Missouri, grew both in population and physical size from initial settlements in the mid-nineteenth century. Early beginnings were influenced greatly by the larger context of the escalating western national expansion of the 1850s as well as the remnants of the fight over the Kansas-Nebraska Act of 1854, which opened the Kansas and Nebraska territories to statehood with an option of allowing slavery based on popular sovereignty. The term *border ruffians* was coined by newspaper editor Horace Greeley to refer to proslavery activists from Missouri who crossed the border into Kansas in an attempt to vote on the issue. While voting irregularities were common, it was skirmishes along the border between Missouri and Kansas that led to the term "Bloody Kansas."

A number of weekly newspapers began operation in the 1850s and 1860s, many of them ceasing publication within a few years; others were purchased and their names changed with new ownership. Notable among early newspapers was the *Quindaro Chin-do-Wan* (1857), a Free State publication that ceased publication during the Civil War. Another prewar newspaper, the *Wyandotte City Register* (1857) became *The Citizen,* and then *The Western Argus,* which in 1861 became *The Wyandotte Gazette. The Kansas City Enterprise* started in 1854 and survived for 88 years, although the name changed several times before ceasing operation as *The Kansas City Journal-Post.* Reportage in these very early Kansas City newspapers consisted of anecdotal renderings of a variety of topics, including chronological accounts of local occurrences, especially border skirmishes. Occasionally, even some European social events were covered. Provisions for overland trips to the west were also conspicuous in advertising.

Following the Civil War, the two cities expanded rapidly, and a manufacturing sector grew up along the river. With the added population media became more formalized, with one newspaper, *The Kansas City Star,* growing in readership, advertising, and influence.

The Kansas City Star

In 1880, William Rockhill Nelson and Samuel E. Morss sold the *Ft. Wayne New Sentinel* in Indiana

and moved to Missouri where they began publication of *The Kansas City Evening Star*. Competitors then included the *Evening Mail, Times,* and the *Journal*. Morss soon left the newspaper due to ill health and Nelson continued the business until his death in the 1915 (at which time the *Star* was operated by Nelson's wife and daughter). Within two years of the founding of the *Evening Star,* Nelson acquired the *Evening Mail* and combined it with his paper, which became *The Kansas City Star*. Nelson purchased the morning *Times* in 1901. The remaining competing daily, the *Journal,* ceased operation in 1942. Nelson's newspapers were sold to employees in 1926 upon the death of Nelson's daughter, whose husband was editor. The fortune amassed by the family was donated to create a museum of art at their grand mansion.

The Kansas City *Star* newspapers, which included the *Times* and the Sunday newspaper, together held a dominant position during their first 70 years, with circulation many times greater than that of their competition. Later ownership of WDAF radio (1922) and television (1949) broadened the company's position. But this domination of the market led to a government antitrust case in 1953. The charges involved anticompetitive practices that included combination buying where advertisers were required to purchase space or time in more than one medium to gain access to any one of them. The government claimed that predatory pricing led to the elimination of competition. The *Star* alleged that the suit, brought in the waning days of the Truman administration, was a result of the paper's questioning of Truman's association with local political boss Tom Pendergast. Pendergast had long dominated a local political machine that paved the way for Truman's winning of a county judgeship in 1922 and his election as U.S. senator in 1934. Pendergast's reign came to an end in 1939 when he was convicted of income tax evasion and several of his lieutenants were found guilty of vote fraud.

The case against the *Star* was litigated during the Eisenhower administration. Criminal charges were dropped just prior to the trial, and the civil case was settled through a consent decree that forbade certain monopolistic practices. The decree also led to sale of the *Star*'s radio and television stations.

Ernest Hemingway was a reporter for the *Star* for about six months in 1916 to 1917. He later credited the newspaper's style book for his own style: "Use short sentences. Use short first paragraphs. Use vigorous English. Be positive, not negative." *Star* reporters have won eight Pulitzer Prizes, including one in 1954 for Alvin Scott McCoy's reporting of a scandal involving the Republican National Chairman. This award was given scant attention by the newspaper itself, perhaps due to the editor's active involvement with the Republican Party.

Following a half century of employee ownership, the *Star* was purchased by Capital Cities/Disney in 1977. In 1990, the morning and evening newspapers merged to become a morning-only newspaper. The holdings were sold to Knight Ridder in 1997 and to the McClatchy Company in 2006.

The Kansas City Call

The Kansas City Call was founded in 1919 as a newspaper for and about African Americans. Its first editor and publisher, Chester Arthur Franklin, operated the newspaper until his death in 1955, at which time his widow continued to publish it in association with the newspaper's managing editor, Lucile H. Bluford. Upon the death of Mrs. Franklin in 1993, Bluford became the publisher of the newspaper. She was well known for her work in advancing integration of the University of Missouri's School of Journalism. She was admitted to the school in 1939, but was denied registration; she subsequently attempted to enter the University of Missouri several more times. A court case, *Bluford v. Missouri* found against her, citing a separate but equal logic. A half century later, the University of Missouri presented her with an honorary doctorate in the humanities in 1989. As a longtime journalist, Bluford was known for asking tough questions and for seeking the truth to tell her readers, even if it meant scolding black leaders. She also sought to build relationships between whites and blacks in the area.

Suburban Newspapers

As the two Kansas cities have grown, encompassing many smaller, once-rural areas, some of the weeklies continue to provide local news for a limited geographic area. Other newspapers have begun operation twice or more each week, either

as local news providers or shoppers. With an increasing population of Hispanic residents, at least two bilingual weekly newspapers have begun operation. Several weekly religious newspapers serve the greater Kansas City Metropolitan area.

Radio and Television

Early Kansas City radio stations included WHB, WOQ, WPE, and WDAF in the early 1920s. WHB radio, begun in 1922, was financed by an automotive and electrical school. John Schilling, who had been involved with ham radio in the teens, later serving in the radio division of the U.S. Navy, and as an engineer with de Forest Radio in New York, returned to Kansas City to partner with Sam Adair to begin broadcasting in April 1922. After obtaining a license the following month, the station became WHB and operated an extensive daytime schedule until 1948 when nighttime hours were added. In 1954, WHB was sold to Mid-Continent Broadcasting. Just a year earlier WHB joined with KMBC-AM to operate KMBC-TV. WHB purchased KMBC-AM the following year. As an early version of media convergence, a magazine called *Swing* served as an advertising tool for WHB. It contained features about entertainment and biographical sketches of Kansas Citians, as well as information about the station. It was published monthly at least through the early 1950s. In 1985, Midcontinent sold WHB to Shamrock Broadcasting, and in 1993, Kanza Inc. purchased the station.

In 2007, with a population of more than 1.7 million in the greater metropolitan area (including both Kansas and Missouri), the community is served by nine local television signals that penetrate all areas of the metropolitan Kansas City area. Most of these stations are owned by corporate entities, including Fox TV, Meredith, Hearst-Argyle, Paxson Communications and Scripps Howard, among others. Stations are affiliated with a number of networks, including ABC, CBS, CW, Fox, Ion, MyNetwork, and NBC. The cities also are served by strong PBS and independent signals. The area is served by at least 24 FM radio station signals and 27 AM radio station signals. Other signals from outlying communities serve certain parts, but not all, of the metropolitan area.

L

Labor Journalism

Over the last 200 years, the role of labor journalism has evolved with ebbs and flows of the labor movement, both in the United States and throughout the developed world. The rise of factory employment in America early in the nineteenth century resulted in class distinctions not apparent at the founding of the country late in the eighteenth century, and substandard working conditions led to discontent that needed a media outlet. Although expression of some of this discontent was reflected in coverage of the working class in the mid-nineteenth-century penny press, a ready market also existed for serious investigative journalism geared specifically for workers and their political allies.

Types

Throughout their history in the United States, three types of labor publications have predominated. The first are trade union periodicals published with union money and circulated mainly to union members. They serve as mouthpieces for union officials. Rather than independent labor publications, most labor journalism consists of magazines that individual unions publish. They serve as mouthpieces for their labor unions although they dispense information to other media that can lead to wider coverage. Among these publications are *Solidarity,* the national magazine of the United Auto Workers, *The UMW Journal,* a bimonthly publication of the United Mine Workers, and *The American Educator,* published by the American Federation of Teachers.

The second are party papers, published by political parties and intended to promote a social agenda connected with progressive politics. These publications were strongest in the early twentieth century, when political parties advocated worker reforms often influenced by world events.

The third type of publication was the independent newspaper unaffiliated with any political party and dependent on subscriptions for their survival. However, the close connection between worker rights and political activism has often blurred distinctions between the second and third types of labor publications. Today, independent labor newspapers, which rely on ideological fervor but depend on subscriptions and advertising for a profit, still survive, but not at the local level. Although they thrived for a time in the nineteenth and early twentieth centuries, these local publications eventually disappeared due to lack of advertising support and the co-optation of many of their issues by the mainstream press.

Development

Labor journalism in this country began with the rise of publications concerned with reform in working conditions that depended on subscriptions and donations for their survival. Perhaps because of this content-advertising dichotomy, many of these publications proved short-lived. During the 1820s and 1830s, some 50 labor weeklies appeared,

most of them in the rapidly industrializing northeastern United States. These not only advocated for better working conditions but also expanded to social commentary on topics such as the need for universal education. The *Mechanic's Free Press,* founded in 1828, in Philadelphia was the first labor newspaper. It folded after three years, though it did reach a circulation of 2,000. Other early papers included the *Free Enquirer,* published in New York from 1828 to 1835, and *The Working Man's Advocate,* published in New York from 1829 to 1849. The *Advocate* supported a ten-hour working day, universal suffrage, and improved public education. The paper also was critical of mainstream media, which it said had grown "fat" by oppressing the working class.

These publications emerged during the 1830s coinciding with expansion of American democracy and growth of immigration. They also served as a form of early labor solidarity. Since many workers were illiterate, they would gather on street corners to listen to others read the publications aloud.

The papers also served as a way of encouraging political activism. In 1828, *The Mechanic's Free Press* became the official organ of the Working Men's Party, which that year elected 21 candidates to public office in Philadelphia and surrounding communities. The party expanded its efforts into other areas of Pennsylvania. In New York, *The Free Enquirer* and *The Working Man's Advocate* advocated political action as well. In 1830, the entire labor ticket won in Syracuse, and all but one labor candidate was victorious in Troy and Albany. The labor political movement, supported by labor media, also gained a foothold in this period in local and state offices in Delaware, New Hampshire, and Connecticut. In the 1830s, responding to the threat by this potential national third party, the two major political parties, the Whigs and Democrats, adopted many of the suggested reforms into their party platforms.

Independent labor newspapers continued their expansion throughout the middle and latter part of the nineteenth century. In Canada, the labor press movement also thrived between 1870 and 1900 due to a perceived need to rein in unbridled capitalism. During this period, Canadian trade unionists founded more than 100 journals, mainly in Ontario and Quebec. Canadian labor journalism was hostile to both the Protestant and Catholic churches, which tended to side with capitalistic interests rather than workers. The first major Canadian labor journal, *The Ontario Workman,* published from 1872 to 1874, arose out of a dispute following a strike at the *Toronto Globe*. *The Workman* was published with financial assistance from the federal Conservative Party, which believed it to be in its own interest to harness support from the growing ranks of industrialized labor.

In the United States, relations between labor and government in the same era did not proceed quite so smoothly. The Haymarket affair (also known as the Haymarket riot or massacre) in Chicago in 1886, proved to be a temporary setback for the labor press. An unknown person threw a bomb at police as they were dispersing a labor protest. The incident led to the death of seven police officers and an unknown number of civilians and came to symbolize an anarchistic labor movement threatening American capitalism.

A New Era

Following the Haymarket affair, a new era of labor journalism emerged, with a stronger tie to political parties and worldwide working concerns. This second era came to be dominated by papers published by political parties and intended to promote a social agenda connected with progressive politics. A good example of this type of journalism were the "wobbly" papers, published by the Industrial Workers of the World (IWW) beginning in 1905. They shared disgust with the American Federation of Labor's conservative domination of trade unionism, and many saw their publications as a vanguard of a Socialist revolution. Among the Wobbly papers were *The Industrial Union Bulletin,* published in Chicago from 1907 to 1909; *The Syndicalist,* published in Lakebay, Washington, and Chicago in 1913; *The One Big Union Monthly,* published in Chicago from 1919 to 1921; *The Industrial Pioneer,* published in Chicago from 1921–1926; and *The Industrial Unionist,* published in Portland, Oregon, from 1925 to 1926.

Mainstream media also spoke with a more progressive labor voice during this same period. The New York *World* and *St. Louis Dispatch* newspaper publisher Joseph Pulitzer championed the cause of working men and women in his papers at the end of the 19th and beginning of the twentieth century. Pulitzer's New York newspaper war with

rival publisher William Randolph Hearst added to this focus on the working class reader's interests.

That era saw the emergence in mainstream journalism of Eva Valesh, a prominent turn of the twentieth-century voice of progressive labor journalism. Recruited in 1887 to write for the *St. Paul Globe,* Valesh (writing under the pseudonym Eva Gay) got herself hired as a working girl in different shops in order to illustrate an the life of the working poor. Valesh went on to become an advocate for labor rights and other Populist causes.

The early twentieth century proved a high water mark for socialist labor journalism, coinciding with muckraking journalism by reformers such as Ida Tarbell, Lincoln Steffens, and Upton Sinclair. Between 1905 and 1919, the IWW published more than 70 newspapers and periodicals. The Socialist weekly *Appeal to Reason* had more than 760,000 readers in 1913. Daily labor newspapers before World War I included the *Cleveland* (Ohio) *Citizen, The New York Call,* and *The Milwaukee* (Wisconsin) *Leader.*

Labor in the Age of Bolshevism

After 1920 came a decline in the socialist labor press, as it became identified by the American public with the rise of Bolshevism. Indeed, the Communist, Socialist, and Communist Labor parties all competed through the labor press for predominance. The intensity of this struggle was reflected in postwar journalism, when Bolsheviks seeking violent overthrow of capitalist regimes withdrew from the Socialist Party. *Class Struggle,* a left-wing socialist publication published in New York from 1917 to 1919, was a pre-Bolshevik publication that argued that socialism could not be achieved through reform or at the polls. *Class Struggle* called for the victory of the proletariat over the capitalist bourgeoisie and regularly published articles by leaders of the Russian Communist Revolution, such as Lenin and Trotsky. Other worker oriented political publications of the Bolshevik Revolution era included *The New York Communist,* published in 1919 in New York, *The Revolutionary Age,* published in Boston and New York in 1918 and 1919, *The Socialist,* published in New York in 1919, and *The New Justice,* published in Los Angeles in 1919 and 1920. Growing American anti-Red fears drove many of these papers either underground or out of business.

After the expulsion of Communists from its ranks in 1919, socialism went into a gradual decline after World War I, though the socialist movement did recover for a time during the Depression of the 1930s as new worker-oriented papers spread that served as voices for reform. Socialist publications of this period included *New Day,* published in Chicago and Milwaukee between 1920 and 1922; *Socialist World,* published in Chicago between 1920 and 1926; and *American Appeal,* published in Chicago from 1926 to 1927. Three New York–based publications of the period included *American Socialist Quarterly* (1932–35), *American Socialist Monthly* (1935–37), and *Socialist Review* (1937–40). By the 1940s, the Socialist labor press was in a weakened state, though *Challenge!*, the periodical of the Young People's Socialist League, managed to publish between 1943 and 1946 in New York. This publication had an influential role in shaping post World War II sentiment through shaping the postwar generation's attitudes toward international and social issues. The Young People's Socialist League members who read *Challenge!,* with its virulent anti-Hitlerism, its promotion of peace "strikes" on college campuses, and its support for labor demands would go on to become some of the nation's leading liberals, intellectuals, and trade union leaders. For this reason, the League was probably more influential in this period than the Socialist Party itself.

In the New Deal and World War II years, the Communist workers press also served to promote labor rights. In an era when support for the Soviet Union fit American foreign policy aims, publications such as *Communist International,* published in New York from 1919 to 1940, and *The Daily Worker,* published in Chicago and New York from 1924 to 1958, had influence in labor and left-wing political circles.

Labor Broadcasting

Organized labor's attempts to get involved directly in broadcasting during the 1920s and 1930s met with mixed results. Organized labor attempted to establish and operate radio stations but gained little headway. One exception was WLCF in Chicago, owned and operated by the Chicago Federation of Labor, which began in the 1920s and continued to operate as a voice of labor until 1979. In the 1940s and 1950s, the American Federation of Labor,

later the AFL-CIO, sponsored evening newscasts and aired public service announcements made possible by Federal Communications Commission guidelines. In the 1950s, the AFL-CIO attempted to get into television broadcasting, but high production costs thwarted these efforts.

Modern Labor Press

The independent labor newspapers that launched labor journalism early in the nineteenth century survived into the early twenty-first century, but in a much diminished state. Although they thrived from the nineteenth and, in some cases, into the middle of the twentieth century, local labor publications eventually disappeared due to lack of advertising support and the cooptation of many of their issues by the mainstream press. On the other hand, their progeny at a national level, including *The Union Democracy Review,* published since 1972, a bimonthly publication of the Association for Union Democracy; and *Labor Notes,* published since 1979, a monthly magazine published by the nonprofit organization with the same name, still promote workplace and grassroots democracy. Both publications have websites and continue to rely on contributions and subscriptions for their survival.

With the decline in the independent labor press, covering organized labor has fallen to mainstream media. While some communities with a strong union tradition (such as Detroit and Chicago) have media that incorporate labor coverage into their news agenda, this is the exception. Network television in its heyday in the 1960s and 1970s exposed few viewers to people who worked in factories, and this situation has not improved much since. Few newspapers or television stations assign reporters to a labor beat. What coverage exists tends to focus on strikes or potential strikes. Cutbacks in reporting staffs and ownership consolidation in the first decade of the twenty-first century have not improved things. However, covering labor is a matter of refocusing and filtering labor news and trends into a broader news context. As a result, each medium tends to focus on a labor union stereotypes, such as the movies' frequent focus on connections between organized crime and labor. Television, in turn, tends to portray the union bargaining goals as petty or foolish, with good local labor leaders led astray by their national unions.

The American labor movement through its history has assumed hostile coverage from print, television, and film. At best, media concerns have been peripheral to those of organized labor. As a result, however, organized labor has had to work hard through its history to get its points across, often turning to advertising and advocacy.

Although the fortunes of organized labor may appear to be waning, labor journalism has played an important role in promoting progressive change. Labor publications have championed reforms such as child labor laws, workplace safety, improved public education, and universal suffrage. To some extent, the decline of labor journalism is because organized labor, in winning many of its goals for working people, has become a victim of its own successes.

Labor Unions

Audiences for newspaper or electronic news media rarely pay attention to union organization of the people that produce and distribute that news—until a strike intervenes and stops news flow. As with other industries, news media owners nearly always hold a more negative view of labor unions than their employees. The changing national economy has led to upheaval in union organization and considerable recent consolidation. Indeed, by the last quarter of the century, membership began to decline in many newspaper and broadcast unions as the country steadily shifted from a manufacturing to a services economy.

Generally speaking, labor unionization has been a more important factor in larger markets. Closed shops (where union membership is required as a condition of employment) are common in larger newspapers and broadcast stations (and especially networks), while less restrictive situations (open shops or even a lack of unionization) are more the norm elsewhere.

Media unions tend to divide into "above the line" and "below the line" categories, using traditional theatrical terms. The "aboves" include creative and performing personnel—such as writers, newscasters, and announcers. The "belows" emphasize the technical and engineering trades so essential in getting mass news into the hands of consumers. Traditionally, the latter has been organized earlier. Such distinctions have sometimes led to protracted jurisdictional disputes over which union will represent which workers. The potential revenue and bargaining power for the winner of these battles made them especially bitter.

This entry focuses on American labor unions—there are many others in most developed—and some developing—nations.

Origins

The earliest known labor strike at a newspaper took place in Philadelphia in 1786 against a management plan to reduce printers' wages. But after succeeding in its aims to uphold existing wages, the union dissolved. Two New York attempts to organize printers around 1800 lasted for a few years in each case, as did several other false starts there and in other cities. Most efforts to organize centered on the control of wages and working conditions (including hours). Attempts to organize printers in multiple cities in the 1830s sputtered out in the face of firm publisher opposition and an economic downturn that made any job dear.

Only in 1848 did printers succeed in organizing in a lasting fashion, beginning in Boston, and create the National Typographers Union (NTU) in 1852. The NTU had 34 locals and some 3,500 members by 1860. It was one of only three unions (in any field) to survive the Civil War. By 1869, it had more than doubled in size (and changed the first word to International), one indicator of the expansion of newspapers across the country. Women were admitted as of 1870 (there had briefly been a separate union for them). Development of inexpensive stereotype plates in the 1870s marked one of the first "new" technologies that impacted printer employment and thus the role of their union. Introduction of the linotype in the late 1880s led to agreements on higher pay and shorter hours to allow the mechanization to continue. Operators of such devices usually became union members, and the ITU was one entity contributing to the American Federation of Labor on its formation in 1886.

While the ITU attempted to include other trades (even reporters), separate and more specialized unions began to develop by the late nineteenth century. Photoengravers and mailers organized in 1902. Contracts for an eight-hour workday were becoming common about the same time, though the 40-hour work week took until the 1930s to nail down. In the mid-1930s, the ITU was centrally involved in the creation of the umbrella Congress of Industrial Organizations.

In the early 1930s, pushed partly by Depression pressures, broadcasting became a new focus of union activity with both performer (and news personnel) and engineers organizing on the network and then station level. Actors Equity initially tried to organize the radio business, but gave way in 1937 to the new American Federation of Radio Artists (AFRA). News personnel and commentators were soon included among its members.

With the postwar rise of television, unions expanded their scope and membership to include that and related fields. AFRA, for example, merged with The Television Authority, the representative entity for television personnel, and formed AFTRA, which went on to engage in numerous jurisdictional battles with the Screen Actor's Guild over representation of television personnel. And political blacklisting afflicted several "above the line" unions including AFTRA, which nearly split over the issue. Additionally, some news personnel—notably Chet Huntley (who was in the late 1960s co-anchoring NBC's evening network newscast)—argued that journalists had no business organizing into unions and striking against employees.

Print Media Unions

By the early twenty-first century, there were but three surviving national newspaper unions, the result of considerable consolidation over the previous three decades. All three have been subsumed as parts of much larger unions with broader representational interests. Two of them serve the technical trades. Some markets—notably New York City—had additional separate local unions for different newspaper trades—such as printers, mailers, and newspaper delivery personnel. A massive strike by several unions against publishers of the nearly dozen New York dailies in the early 1960s led to the end of many of those newspapers—only three survive today.

Graphic Communications Conference of the International Brotherhood of Teamsters

The GCC (http://www.gciu.org/index.shtml) is the result of a 2005 merger of the formerly separate International Photo-Engravers Union (1904–64), which organized the half-tone photoengravers, the subsequent Lithographers and Photoengravers International Union (1964–72), and the Graphic Communications International Union (1983–2005). In the late twentieth century, new technical advances in printing, including offset lithography, screen printing, and (most recently) digital printing, greatly reduced the number of workers needed in newspaper composing rooms.

The many organizational changes that led to the GCC formation are an indicator of upheaval in newspaper graphics and printing. The wide-ranging council of some 60,000 members also includes magazine and book publishing personnel. An earlier merger brought the mailers (also once a part of the International Typographer's Union) into the Teamster fold as well.

The Newspaper Guild—Communication Workers of America

TNG (http://www.newsguild.org) grew out of a Depression-era struggle for recognition. There had been many attempts to organize news writers and reporters, many of whom had suffered low pay for decades. With new Depression pressure, Heywood Broun, a New York columnist, spearheaded the rise of what became the American Newspaper Guild in late 1933. The guild had its first newspaper contract the next year and initiated its first local strike. The guild had soon organized more than 60 newspapers. By 1937 it branched out to include other categories of newspaper employees, including those in advertising. Canadian and other members helped prompt dropping the "American" in the union title in the 1970s. By 1987 the guild had nearly 35,000 members, including reporters, editorial assistants, photographers, editors, paginators, editorial artists, correspondents, typographers, advertising sales and marketing people, information systems specialists, commercial artists, technicians, accountants, customer service reps, drivers, maintenance, mail room, pressroom, telephone operators, and circulation and distribution staff. The guild also includes independent translators and interpreters, nonprofit organization staff members, public relations staff, and technical workers. Members, including online writers and designers, work at news agencies, newspapers, magazines, labor information services, broadcast news outlets, public service organizations, and dot-com companies. In 1997 the guild merged with Communication Workers of America, becoming one sector of the larger union.

Printing, Publishing, and Media Workers Sector of the Communications Workers of America

PPMWS (http://www.cwa-ppmws.org) resulted from the 1986 CWA takeover of the declining International Typographers Union, the oldest newspaper union (indeed, the oldest American labor union in any field), and its 70,000 members. By the early twenty-first century, the sector represented women and men in a diverse range of occupations in daily newspapers, commercial printing and mailing operations, graphic design, specialty manufacturing, publishing, and distribution as well as employees of the U.S. Government Printing Office, the official federal government outlet.

Electronic Media Unions

Unions in the electronic media focus heavily on engineers and the technical trades that underpin broadcast and cable journalism. These organizations have seen less consolidation than those serving print journalism—only one has become part of a larger general organization. Only those unions having some impact on journalism are included here—there are several others (including both the Writers and Directors Guilds, and the Screen Actors Guild) that focus more on the entertainment side of the business. There is no broadcast journalism union per se.

American Federation of Television and Radio Artists

AFTRA (http://www.aftra.org/aftra/aftra.htm) began as the American Federation of Radio Artists in 1937. The union signed their first agreement with the NBC and CBS networks in mid-1938, representing "above the line" performers: actors, announcers, disc jockeys—and news personnel. Initial representation of television personnel fell to The Television Authority, a separate entity that merged into what then became AFTRA (adding television to the title) in 1952. The union called its first national strike in March 1967, and many well-known network television journalists disappeared from the air for 13 days. The union struck ad agencies for several days in 1978 in only its second national strike. AFTRA, though often in negotiations about a possible merger with the Screen Actors Guild, expanded to cover cable network employees in 1997. By the early 2000s, AFTRA represented some 70,000 people in broadcast, public, and cable television (news, sports, and weather; drama and comedy, soaps, talk and variety shows, documentaries, children's programming, reality and game shows); radio (news, commercials, hosted programs); sound recordings (CDs, singles, Broadway cast albums, audio books); "nonbroadcast" and industrial material as well as Internet and digital programming. (Generally speaking, those involved in entertainment television were members of the Screen Actors Guild.)

Broadcasting and Cable Television Workers Sector of the Communication Workers of America

CWA (http://www.nabetcwa.org) was created in 1994 when the National Association of Broadcast Employees and Technicians (NABET) merged into the CWA. The formation of the union began in 1934, when the Association of Technical Employees started representing employees at NBC's Red and Blue radio networks. The union became NABET in 1940. When the Blue network became ABC, NABET representation continued. The union organized members as part of the new Fox Network in the 1980s. In 1987, NABET suffered a five-month strike at NBC and lost some key bargaining ground. NABET tried a one-day strike over medical benefits at ABC—and suffered a long management lockout in 1998. Nationally, NABET represents over 10,000 workers employed in the electronic media.

International Alliance of Theatrical Stage Employees and Motion Picture Technicians, Artists and Allied Crafts

IATSE (http://www.iatse-intl.org/home.html), formed in 1893 to represent Broadway stage personnel, represents many technical workers at television stations and production houses. IATSE has had jurisdictional issues with both NABET and the International Brotherhood of Electrical Workers (IBEW) in the past—indeed, the battle over representing film production and exhibition workers continued well into the 1940s, with IATSE coming out on top. The union represents some 12,000 broadcasting technicians (including production personnel, makeup artists, set and scene designers, cameramen, sound personnel, and electricians), though less than 10 percent of television stations employ IATSE-represented personnel.

International Brotherhood of Electrical Workers

IBEW (http://www.ibew.org) began in the 1890s to represent workers in the electrical industry. IBEW tried to organize motion picture projectionists in 1914, but lost out to IATSE. The two unions continued to battle over representing the growing motion picture technical trades in the early 1920s. IBEW began to organize radio station engineers in 1931 and soon represented those at the CBS radio network. By the 1960s, the IBEW included some 12,000 broadcasting employees, largely engineers and technicians.

The technical unions active in the electronic media appeared to be losing their dominance by the late 1990s even as more cable networks (and thus employment options) appeared. Equipment automation was the key issue (as it was in print unions), as far fewer people were needed to operate increasingly computer-controlled devices. But so was the growing trend of using part-time "contingency" workers hired only when needed. Furthermore, the newer cable networks were often not unionized. Local stations were also reducing technical staffers for many of the same reasons.

Latino News Media

Latino news—journalism that is purposefully and strategically created for U.S. residents of Latin American descent—offers a distinct worldview. Whether offered in Spanish, English, or bilingually, this journalism creates a world in which Latinos are virtually everywhere: as victims, witnesses, and perpetrators of crime; at all levels of government; in the professions; and in fields and factories. Like other national and regionally distributed U.S. journalism, its ownership is concentrated, and in most cases is not owned by Latinos. Many Spanish-language media carry Mexican-produced content, but most Latino-oriented news today is produced in the United States, with ongoing contributions from Latin America. Latino news weekly tabloids proliferate at the local level, especially throughout the southwestern United States, California, Florida, and urban centers like Chicago and New York.

This type of journalism has expanded as the U.S. Latino population has grown. Latinos are the largest

ethnic group in the United States, surpassing African Americans for the first time in 2002. They are the largest minority population in Los Angeles and New York and make up the majority populations of Miami and San Antonio. The growth of the Latino populations has been attributed equally to continuing immigration from Latin America, and a slightly higher than average birth rate.

About two-thirds of Latinos trace their origins to Mexico. Fidel Castro's 1960 revolution in Cuba spurred millions to immigrate to the United States. Puerto Ricans have been U.S. citizens since the 1898 U.S. military victory in the Puerto Rican campaign of the Spanish-American War. Their immigration to the U.S. mainland increased in the 1960s and has remained a constant flow since. The Latin American civil wars of the 1980s prompted yet other flows of immigrants to the United States from El Salvador, Nicaragua, Honduras, and Guatemala. While these disparate Latino groups have distinct histories and U.S. settlement patterns, in media terms they share one key defining trait, the Spanish language.

Development

The first Latino news media were not newspapers, but an oral cultural form called *corridos*. These nineteenth-century topical ballads spread word of Mexican politics as well as the heroic exploits of men resisting U.S. law enforcement. The best known of these is the "Ballad of Gregorio Cortez." Before recordings, *corridos* were distributed by word of mouth and through community meeting places in Mexican American neighborhoods, or *barrios*.

After the United States annexed one-third of Mexican territory in 1848, dozens of Spanish language newspapers were created in the future United States. The largest number were concentrated in the southwestern region of the country, though Spanish-language newspapers were also established in New York City and in Florida in the latter decades of the nineteenth century. Most of these publications exposed atrocities of the U.S. military and demanded public services from the U.S. government, all the while urging their readers to fight back against American mistreatment of Mexicans in the United States. Readership for Spanish-language newspapers continued to grow during the latter half of the nineteenth century, as civil and political unrest escalated in Mexico and people fled in larger and larger numbers to the United States. Ultimately, more than 1 million Mexicans fled to the United States to escape the tumult caused by the Mexican revolution.

The largest of the Latino newspapers of this period, Los Angeles's *El Heraldo de Mexico* (1916–20), ran headlines such as "Exploiters Beware! Mexicans Beware!" Owned by Cesar Marburg, it regularly ran advertisements from employers throughout the southwest who were seeking laborers. Other newspapers such as *Regeneración,* also of Los Angeles, were concerned with relating the ongoing Mexican Revolution to the lives of Mexicans in the United States. For instance, the editors of *Regeneración* drew parallels between the corruption of government officials in the United States and those in Mexico.

In contrast to the working class orientation of the Los Angeles immigrant newspapers, San Antonio's *La Prensa* (1913–57) called itself an *exile* newspaper. *La Prensa*'s ownership represented a different facet of Mexican immigration resulting from the Mexican revolution, that of the privileged and the educated. When Mexican-born Ignacio Lozano founded *La Prensa,* he also created *Editorial Lozano,* a book publishing company. The newspaper published poetry and serialized novels, as well as reporting on Mexican and U.S. government affairs. While its editorial stances shifted over time, remaining constant was *La Prensa*'s commitment to being a profitable Mexican-American enterprise. It folded in 1957, when editor and publisher Lozano noticed that immigration from Mexico to the United States had shifted westward.

Beginning in the 1920s, Lozano's *La Prensa* was in great demand in Los Angeles, as that city surpassed San Antonio as the U.S. city with the largest concentration of Mexicans. He founded *La Opinion* in Los Angeles in 1926. Within two years, it was turning a profit and was distributed in Texas, New Mexico, Oregon, Kansas, Arizona, Utah, and Illinois in addition to California. While the newspaper was critical of abuses of Mexicans in the United States, overall it gave little coverage to Mexican Americans, focusing instead on Mexican news.

Early U.S. Spanish-language radio, while dominated by live musical and drama performances, also contributed to the journalism of the 1920s,

1930s, and 1940s. Emblematic of this type of service was a radio program called "Los Madrugadores" (The Early Risers), which began broadcasting from KELW in Burbank, California, in 1927. It was hosted by Mexican musician and radio producer Pedro Gonzalez and mixed live performances with information about jobs, community services, and interviews with prominent public figures like the Mexican consul general in Los Angeles. Gonzalez's program was sponsored by Folgers's coffee as well as other general market advertisers. His response to the social and political events of the 1920s and 1930s transformed him into one of the best-known Mexican American political figures of his generation.

Following World War I, growing isolationist feelings and the onset of the Great Depression in 1929, the U.S. government deported tens of thousands of Mexican immigrants. Gonzalez's popular program advised his audience, many of whom were longtime U.S. residents, as well as U.S. citizens, of their rights. He was arrested in 1934 on trumped up rape charges brought by the Los Angeles Police Department and deported. Decades later he was exonerated, and returned to the United States to resume his radio career.

Spanish-language radio, and soon television, blossomed in the latter half of the twentieth century due to the commercial acumen of the Azcárraga family of Mexico. Emilio Azcárraga created a radio network for the growing Mexican American audience. These were enormously profitable enterprises because they had no production costs. Rather, the U.S. Spanish-language networks rebroadcast what was broadcast in Mexico on Azcárraga-owned networks. This included the rebroadcast of the news. Although these stations flouted the Communications Act of 1934, which bars "any alien or any representative of any alien" from holding a U.S. broadcast license, and the Federal Communications Commission prohibition on foreign ownership of U.S. broadcast stations, they were never prosecuted.

Contemporary Latino News

The (re)discovery of the Hispanic market in the final decades of the twentieth century laid the foundation for the proliferation of Latino journalism. Once the sheer size of the Hispanic market was recognized by advertisers and marketers as a profitable sector of the U.S. media economy, Latino-focused English, Spanish, and bilingual journalism blossomed. Crucially, this created a national audience for Latino news media. Previously, the Latino audience was seen as three significant but separate audiences: following immigration and settlement patterns, these included Puerto Rican audiences in the Northeast, Cubans and Cuban American audiences in Florida, and Mexicans and Mexican American audiences in the Southwest. While these national origin distinctions have not been completely erased, as is evidenced by local and regional Latino journalism, the differences have been muted as part of the purposeful commercial construction of a national Hispanic market. Contemporary Latino news is predicated on the notion of Latino panethnicity; that is, while key differences remain, the audiences for Latino news in, say, New York and Los Angeles, have more in common than not.

The publisher and CEO of Los Angeles's *La Opinion* in the early twenty-first century is Monica Lozano, the granddaughter of the newspaper's founder. As further illustration of the maturation of the Spanish-language newspaper industry, Lozano is also the creator of Impremedia, an eight-newspaper, nationally distributed Spanish-language newspaper chain. Impremedia publishes *El Diario* and *Hoy* in New York; *El Mensajero* in San Francisco; *La Raza* in Chicago; *La Prensa* in Orlando and Tampa; *Rumbo* newspapers in Houston, San Antonio, and the Rio Grande Valley in Texas; and *Vista,* a glossy bilingual Sunday newspaper insert. The company also owns *La Vibra,* a youth-oriented, bilingual newsprint magazine distributed in six markets. Impremedia describes itself as a "Spanish language newspaper and online news publisher." The newspapers are each locally edited and supported by local as well as national advertisers. The leading Spanish-language newspapers in their respective markets, they look like traditional English-language newspapers with national and international sections, as well as local news, sports, fashion/lifestyle, and classified sections. Impremedia newspapers have a collected audited circulation of half a million readers.

The content of this journalism closely tracks the interests of its audience of recent Latin American immigrants to the United States and bilingual Latinos. These media produce extensive coverage

of Latin American governments, politics, and economies. Sports news includes coverage of World Cup soccer matches as well as U.S. major league baseball stars, many of whom are Latin American. Similarly, entertainment and cultural news, such as that covering music and film, emphasizes Spanish-language productions. This focus, however, does not exclude coverage of Hollywood cinema, which is after all a global industry.

Univision is the largest U.S. Spanish-language television network, and the parent company of the cable television Telefutura and Galavision networks. Univision owns and operates 62 television stations. In addition, it owns and operates 73 radio stations, most of which carry news and public affairs programs. *Noticias Univision* (Univision News) both the local and national programs, are regularly the highest rated in Los Angeles, San Antonio, and Miami, surpassing the English-language broadcasts in their respective cities, as measured by AC Nielsen. Telemundo, the second largest U.S. Spanish-language television network with some 20 stations, also produces local and national newscasts, talk shows, and entertainment news programs.

The format of U.S. Spanish-language television news is much like that of the general market. Reporters stand in front of iconic government buildings like the White House, a state capitol, or local city hall narrating brief sound bites of government officials. Of course, the sound bites are voiced over in Spanish. Language isn't the only difference between this journalism and that of the general market. Like their print counterparts, U.S. Spanish-language broadcast journalists offer their audiences a distinct world view and mapping of the United States.

While the U.S. general market embraces a global East-West axis, with Europe at one pole, and Asia at the other, U.S. Spanish-language journalists have a North-South orientation, with the United States at the north and Central and South America at the southern poles. Univision, for instance, has news bureaus in Mexico City and Lima, as well as Washington, D.C., and New York. International news is oriented to countries of origin of the recent immigrant audience, and the family heritage of those Latinos who are third- and fourth-generation Americans. A comparative content analysis of ABC's *World News Tonight* and *Noticiero Univision* shows that while ABC typically allots about 20 percent of its airtime to foreign news, about half of Univision's nightly newscast concerns events occurring outside the United States.

Acculturated Latinos make up a smaller part of the Hispanic market, perhaps 30 percent; they consume Latino news in English and bilingually. While smaller in number, this niche market within a niche market has more disposable income and is therefore attractive for advertisers. English-language news media targeting the Latino audience include *Latina, Hispanic,* and *Hispanic Business*. Another example is *Ciudad,* a Los Angeles glossy magazine whose target audience is young Latinos with an annual income of at least $75,000. The use of English in these magazines is proxy for economic success and stability. While Spanish-language Latino journalism typically carries advertising for Chevrolet cars and salsa, English-language Latino magazines have ads for automobiles such as the Hummer 2 and BMW and Chivas scotch. The articles range from celebrity profiles to advice on how to get a promotion, or in the case of *Latina,* how to make low-fat enchiladas.

Latino Objectivity

The vast majority of U.S. Latino journalists, whether they are employed by English, Spanish, or bilingual firms, were educated in U.S. universities and journalism schools. While they see their work as a public service to Latino communities, they are also adamant that they are not advocacy journalists but traditional U.S. journalists like any other. What distinguishes Latino news from the general market, they say, is that Latino journalism includes Latinos and Latin America in its worldview. The people of east Los Angeles or the Pilsner section of Chicago, for example, as well as Mexico City and Havana, are part of this media world. Therefore, what happens in those areas (rarely covered in general market news) is of special importance.

For example, while the English-language news networks such as CNN rarely cover Latin American news other than natural disasters and maintain only stringer reporters south of the Rio Grande, Univision has news bureaus in Mexico City and Bogota. Similarly, when doing "vox" or "man-on-the-street" interviews, *El Diario-La Prensa* reporters seek out

residents of predominantly Latino New York City neighborhoods, not only for their ability to speak the Spanish language but also because of their particular perspectives on, for example, a bill pending in city hall. Latino journalists absorb the objectivity ideal into their public service orientation.

The future of Latino news will be shaped by two interacting social dynamics: continuing large-scale immigration to the United States from Latin America and the integration—or, alternatively, the isolation—of many Latinos from mainstream U.S. society. Put another way, Latino news is specialized journalism produced for a particular segment of U.S. society, one that is regularly overlooked by much of general market, English-language journalism. As long as immigration and news media isolation continue, the demand and viability of Latino journalism will continue.

LAYOUT

Layout includes the arrangement of text and illustrations on a page, whether editorial content or advertisements. Effective layout is like a map, guiding readers through content and graphics to make stories visually clear to follow and assist readers in finding what he or she is looking for. After articles are written and edited, and necessary photographs prepared, layout is what brings all of these elements together on a page. All print publications utilize layouts in the final steps of the production process. Since the advent of movable type, designers have been challenged by the need to integrate typography and imagery into a visual product that will attract readers. Layout differs from medium to medium based on the purpose of the publication. Newspaper layout is designed to communicate visually and easily the important and current news of the day, while magazine layout, particularly on its cover, is designed to attract readers to open its magazines and subscribe to or purchase them.

Layout is expected to vary from page to page in order to give the print publication variety and diverse visual interest on each page. Graphic designers, sometimes referred to as "information managers," are typically responsible for the layout and design of pages in print publications. It is important for graphic designers and other individuals who work with layout to understand the basics of and current trends in print publications' page design. Trends tend to be driven by advancements in technology, such as laser systems for printing plates and video display terminals for layout of news.

Layout must be carefully planned. Graphic designers and art directors must first visualize the space, thinking through key elements of layout. One of these key components is proportion, which refers to the relationship of one element on a page—a block of text, a piece of art—to another or of one element to the whole. Balance is another

fundamental element of layout. Balance is achieved when the elements are in equilibrium.

Based on an items' placement on the page, its information value can be assessed. For instance, information has differing value based on whether it is placed on the right, left, or in the center of the page, as well as if it is in the upper or lower portion of the page. Therefore, it is important to realize that the different elements of layout attract the readers' attention to differing degrees through myriad means, including size, color, sharpness, placement in the foreground or background, and so on.

Development

Layout has been said to reflect the culture and society in which it is produced. As cultural shifts occur, layout and page design shift as well to accommodate the current needs of readers. One thing that always stays consistent is the public's thirst for knowledge, and newspapers, magazines, and media help fulfill that need.

The first newspaper in the American colonies was *Publick Occurrences Both Forreign and Domestick,* founded by Benjamin Harris in 1690. The colonial government cancelled it after just one issue. The first regularly published newspaper, *The Boston News-Letter,* was established by John Campbell in 1704. By 1765, the colonies had more than 30 newspapers.

Newspapers continued to develop rapidly during the 1800s—the United States had nearly 1,000 papers by 1830. In 1833, Benjamin Day started the *New York Sun,* the first penny newspaper. With a surplus of papers, the competition for readership was fierce. To stay competitive, newspapers tried to outdo each other with sensational reports of crimes, scandals, and disasters—filling the front pages with countless bold headlines and images. Two of the most sensational and successful newspapers late in the nineteenth century were William Randolph Hearst's *Journal* and Joseph Pulitzer's *World*. The number of newspapers peaked in 1909, with approximately 2,600 daily newspapers and about 14,000 weekly papers.

Early broadsheets were jammed with text-filled columns in small fonts; numerous large, bold headlines; and black-and-white illustrations. Newspapers were printed on inexpensive, off-white paper. Since the 1980s, the newspaper industry has largely moved away from lower-quality letterpress printing to higher-quality, four-color process, offset printing.

In the 1920s and 1930s, newspapers in the United States developed more modern designs than those of the previous century, transitioning from overcrowded pages to a more streamlined, structured look. Although the world was historically struggling through turbulent times due to such events as World War I and the Great Depression, a new systematic organization of the layout in American newspapers was introduced that presented readers with a sense of rational, accessible information and knowledge. Rather than overcrowded front pages packed with one sensational news story after another, newspapers began to streamline their look with fewer items on the front pages and sections to separate news into categories, such as business, lifestyle, and real estate, making its pages easier to navigate and information more readily accessible. Horizontal layouts made stories wider rather than taller. New space in newspapers came from streamlined type and upper- and lowercase headlines, whereas headlines in the nineteenth century were typically all in uppercase.

The modernization of newspapers led to significant changes in the appearance, presentation, and organization of the news. Major changes to modern layout include fewer columns, prominent illustrations, and simplified typography. To explain, primitive newspapers used myriad typefaces, or fonts, in headlines, whereas more modern newspapers use consistent typographies throughout for an easy-to-follow, streamlined look. The size and scale of images changed with the times. When first introduced, images such as photos, graphics, and maps, were a novelty and were prominently featured, often in entire-page spreads. The need for newspapers to outdo one another led them to print bigger, bolder images. However, the shift away from sensationalism and the turn toward modernization led to an increase in the number of images and a decrease in their size or scale. What made this change possible was the accessibility of and ease of reproducing images, particularly photographs. An increase in the number of photographers and advancements in photo equipment, such as digital photography, made more pictures available, easy to use, and drove costs down.

Advancements in technology have changed the look and feel of newspapers. One major advancement was in color technology that allows printing to be done in full color. This added a new dynamic to newspapers, as images could now tell a story as fully and as vibrantly as text. One popular newspaper founded in 1982 took color technology to new heights. *USA Today* became the country's most colorful newspaper, prominently featuring graphics such as large diagrams, charts, and photographs. It contrasted other relatively colorless newspapers, including *The Wall Street Journal* and *The New York Times*. *USA Today* deviates from the traditional newspaper layout in other ways as well, including using the left-hand area of each section as reefers (brief front-page synopses of stories that appear inside the paper) and employing a unique font, Gulliver, for its headlines and stories.

Newspapers

There are two formats of modern newspapers: broadsheet and tabloid. Broadsheet is the largest and most popular of the various newspaper formats, characterized by long vertical pages typically 22 inches in length and a foot or more wide. Full broadsheets are a single sheet of paper folded vertically to form four pages, or a spread, and are then folded horizontally down the center. The horizontal fold is necessary to accommodate display stands. Broadsheets must go up or down in increments of two, four, or eight pages to be published, requiring more extensive layout across broadsheets than is required in tabloids. Examples of United States newspapers that retain this format are *The Wall Street Journal* and *The New York Times*. Half broadsheets form two pages and lack a vertical fold; however, they are still folded horizontally in the center and are usually inserted within full broadsheets. The half broadsheet is usually an inside page or an advertiser's circular inserted into a newspaper. In uncommon instances, an entire newspaper, such as college publications, can be a two-page (front and back) half broadsheet.

The tabloid is a magazine-like format with a smaller spread, with typical dimension of 17 inches by 11 inches. The paper folds vertically like a book, but the paper size does not accommodate or require a horizontal fold as in the broadsheet format. The tabloid differs from a broadsheet in its front page philosophy (one feature story encompassing the entire page, use of teasers or synopses of stories rather than placement of entire copy, etc.); sectionalizing (white space and typography are used to signal a change in section); spreads (facing pages can be treated as a single unit and the gutter can be used on the spread in the middle of a section or between pages); sizing (size of photographs relative to the dimension of the overall publication, meaning photos in tabloids are larger relative to the size of the paper than those of broadsheets); typography (the display type is different because there tend to be fewer headlines per page than in a broadsheet by virtue of the smaller page size); and its limited use of "jumps," or the continuation of a story on another page (writing is typically tighter in tabloids to avoid the necessity of "jumping").

The tabloid format is popular in the United Kingdom, yet there are numerous American newspapers that use this format as well, including the *Boston Herald* and the *Chicago Sun-Times*. Tabloids are an increasingly popular format, as the size is more convenient for readers to handle and content is easier for editors to spread throughout the entire issue compared to broadsheets, which require many stories on various subjects to be placed on a single page.

There are certain consistencies in the layout of modern newspapers. For instance, in a daily newspaper, the reader will typically find the name of the publication, the date, and the page number at the top of each page, serving as a common header. Other consistencies include the use of common typography throughout rather than varied fonts that were once intended to indicate significance or catch readers' attention. Similarly, headlines in modern newspapers highlight the important points of the story to follow rather than presenting an outline of the story, as they would in primitive newspapers. Headlines also vary based on the weight or significance that editors want to give to a story. For instance, many newspapers use a bolder, larger head or different typeface on the lead story. Another way to make headlines stand out is to vary the density of the color. A bold, black headline will draw the eye more quickly than a simple gray one.

The most popular form of newspaper layout is the broadsheet, as illustrated in this image, in which the material is printed in columns on long sheets of paper. When the sheets are assembled, the newspapers are then folded horizontally for easy delivery and selling at newsstands. The tabloid format, by contrast, is narrower and shorter, allowing for the publication to open much the way a magazine does.

Source: istockphoto/narvikk.

The front page is valuable real estate—an exclusive neighborhood in a highly desirable location, and as such, modern American newspapers present the most significant news and features of the day on this page. Therefore, fewer items occupy more space, creating a hierarchy of importance that highlights the significant news of the day. However, full articles rarely appear complete on the front pages—they will reference a jump page. Successive pages typically contain full articles in one place, though jump pages can be utilized throughout the publication. For example, the *USA Today* has color-coordinated sections that organize its stories into categories such as News, Money, Sports, and Life. When their stories move onto jump pages, they typically follow on the next page within the same section.

Magazines

Unlike most newspapers, many magazines are printed in color on glossy paper. The pages are significantly smaller than the pages of a newspaper, which lead to different challenges in layout. Magazines differ from newspapers in form—for instance, they have covers and are bound by a spine—and content—they typically have less concern with daily, rapidly changing events than do newspapers. Typically printed weekly or monthly, magazines have a longer shelf-life than newspapers, and some people preserve them as they would a book, leaving them on the shelves for months or even years.

The earliest magazines developed from newspapers or from bookseller catalogs, which first

appeared in France in the 1600s. Pamphlets published in regular intervals appeared in America in the 1700s. The first magazine published in America, *American Magazine* or *A Monthly View,* was published in 1741. Today, the United States has more magazines than any other country, with more than 16,000 titles. Two of the most prominent American magazines, *The New Yorker* and *Time,* were started in the 1920s. *The New Yorker*'s signature display typeface, used for its nameplate and headlines and the masthead above *The Talk of the Town* section, is Irvin, named after Rea Irvin, the publication's creator, designer, and illustrator. *The New Yorker* is unique from other American magazines in its inclusion of short stories, literary reviews, and single-panel cartoons featured throughout the pages of each issue. These unusual elements present unique challenges to the design and layout of the publication. *Time* was the first weekly news magazine in the United States. Historically, the magazine's cover features a single person and is famous for its single red border framing the cover. In 2007, *Time* received a style overhaul. Among other changes, the magazine reduced the red cover border to promote featured stories, enlarged column titles, reduced the amount of featured stories, increased white space around articles, and accompanied opinion pieces with photographs of the writers. This shows that even the most classic, successful magazines go through redesigns to modify layouts and make their pages more current and appealing.

Some magazines, particularly large newsstand titles, redesign every three or four years. The Internet has raised the overall level of visual literacy and created an expectation for freshness and variety among readers. *Wired,* a full-color monthly American magazine that reports on technology and how it impacts culture, the economy, and politics, is an example of a modern magazine that has an innovative approach to layout—including use of fluorescent and metallic inks. Each department (or section of the magazine) in *Wired* has a logo that has the same typography to maintain consistency throughout the publication, but the logos vary in color to easily guide readers to different sections of the magazine. Each page within the publication differs in layout. Page dimension is determined first, followed by type areas (or how much space is used by the type, or margins), columns, and the depth of the column grids (total depth of the page divided up horizontally). These innovations in layout and design make *Wired* a unique magazine with a fresh approach to page presentation.

Implications and Issues

For readers, layout can tangibly affect their attention to and comprehension of the information presented. As the arrangement of articles and images naturally draws the eye to certain parts of the page over others, or asserts "visual power," it gives a certain amount of power or weight to layout decisions. Studies have shown that visual cues signaled by design and layout, such as prominent photos or graphics (diagrams, maps, charts, graphs, tables, or directories), are what guide readers' attention processes.

Redesign of newspapers and magazines continually brings new, creative ideas that change and advance layouts, driving change in the overall aesthetic of publications. Controversy arises as graphic designers push to increase the size and/or quantity of pictures within a newspaper for aesthetic reasons. In order to make space for these changes other elements must go. Therefore, the question becomes: if artists hold control of the overall design, then what will happen to the content? There needs to be a balance between editorial concerns and those of the art director and designers.

As many publications migrate to the web to supplement or supplant their printed versions, more questions are arise about how layouts will evolve and adapt the values of the print medium to the more dynamic and changeable online world. Convergence to online technology allows newspapers and magazines to be more interactive, allowing readers to easily link to other articles, post comments on message boards, or send an e-mail to an article's author. Moreover, online versions of print publications offer alternative sources of revenue and additional advertising dollars.

Conclusion

Layout—the spatial arrangement of texts, pictures, and other graphic elements—is a critical component of the publication process and of the transmission of messages to an audience. At its best, layout can bolster the written content and arrange it in a way that is visually appealing, accessible, and informative to its audiences. As the media

landscape changes, layout continues to evolve to fit the needs of the society and culture that utilizes it.

Letters to the Editor

Dating to colonial times, letters to American newspaper editors have given ordinary citizens a way to publicly express their views on issues of the day—and to offer opinions on how those issues are covered. Published letters from readers enliven and personalize the news; they are among the most-read items in newspapers. Broadcasters, too, may air letters that illustrate both the relevance of their programs and the public spiritedness of their audiences. Skilled and dedicated letter writers are so valued that some editors regularly host them at get-togethers to celebrate their contributions to public debate.

Although it may be tempting for political leaders to consider letters to the editor a rough gauge of public opinion, letters fall well short of representing any scientific measure of what a community is thinking. Some people simply are more inclined and able than others to voice their opinions to the news media, and editors may be highly subjective in choosing which letters to run. On controversial issues, for instance, audiences cannot know whether a set of published letters reflects a cross section of opinions received, or if letters were printed in any representative proportion to the views expressed. Even so, letters to the editor link the past and present in offering an enduring outlet for the first-hand expression of personal sentiments on public matters. Arguably a newspaper's letters page comes closer to providing a broad-based community forum for the civil exchange of ideas than any other readily available tool of democracy.

Letters and Their Writers

Who writes letters to the editor? Who does not? What do they illustrate about the thinking of citizens? These and other questions concern researchers who consider letters to the editor a window offering a unique view of public life. Unlike opinion polls, which ask specific questions of sample populations, letters to the editor express what individuals think is important in their own words. Editors of small newspapers may run nearly all the letters they receive. But larger outlets, including national news magazines, often must be highly selective in choosing what to use. How are letters

picked? How heavily are they edited? Are potentially offensive comments removed or published anyway? Journalistic websites such as poynter .org, run by the Poynter Institute, and trade publications such as *Masthead,* the journal of the National Conference of Editorial Writers, suggest that editors who receive and relay letters wrestle with these questions in the spirit of fostering a marketplace of ideas and civic engagement.

People who write letters to the editor tend to be older, better educated and wealthier than those who do not. People disgruntled over something are more likely to write than those who are satisfied. The views of letter-writers may be more strongly held and more extreme than those of the population as a whole. Letter-writers also may be people who, simply put, feel compelled to take some civic action. Roderick P. Hart of the University of Texas finds that people who write to editors are more likely to demonstrate what he calls "political irrepressibility." For instance, he found, letter-writers to newspapers in medium-size communities were more likely than nonwriters to offer unsolicited comments to the researchers who surveyed them, to donate to political causes, and to volunteer for political campaigns. Letter-writers also are more likely than nonwriters to be white males. Most newspapers at least since the mid-1990s have required published letters to include the real names of the authors. Some critics believe this may inhibit some women and members of minority groups from submitting letters, for fear they could be harassed by others in their communities. Political parties and other ideological beliefs do not seem to make much difference in who writes to editors.

Because mainstream journalism idealizes giving both sides of a story, editors may run letters critical of their organizations' news coverage as a matter of fairness. Other letters, however, may be published because they are concisely argued, well-written, interesting, and concern topics that are in the forefront of the local news. Rejected letters may make personal attacks that risk libel, come from outside a media outlet's circulation area, or fail to include identifying information about the author. Karin Wahl-Jorgensen of Cardiff University found that impassioned letters that convey personal stories may carry greater weight with editors than professionally written missives that advocate positions on campaigns or issues.

Letters typically are edited for length to allow space for as many letters as possible; most published letters are less than 250 words. Deciding whether a potentially offensive letter should be selected or discarded, however, can be touchy. John McClelland reports in *Masthead* that some editors will not publish bigoted letters, but others will. Many make decisions on a case-by-case basis, believing it can be valuable to relay what others are saying even if their views are disturbing.

Published letters do offer enduring and meaningful glimpses into what was said in bygone eras. Brian Thornton of Northern Illinois University has tracked the sentiments expressed in thousands of letters to the editor regarding historic events and American social changes. Although the 1950s are remembered as a tranquil time in American culture, for instance, he found that many letters to magazine editors in 1952 reflected a "simmering rage" against McCarthyism, racial inequality, and the demeaning treatment of women. Because these sentiments were expressed by letter-writers in their own words, of their own volition, they offered insights into the era that opinion polls missed.

Given that letters may be heavily edited, they perhaps don't always accurately convey the precise sentiments of their authors. Karin Raeymaeckers of Belgium's Ghent University sent 101 letters on news-related topics to Flemish newspapers, which published about 25 percent of them. Editing sometimes changed the nuance and meaning of published letters, she discovered. Words or sentences were cut even from letters that originally were very short, making them seem more radical than intended. Sometimes arguments were exaggerated by editing. Raeymaeckers suggests that more before-and-after research is needed and believes researchers should have access to the unpublished letters that editors receive to learn more about unheard opinions.

Contemporary Correspondence

In the early twenty-first century, readers typically e-mail their views to editors, rather than "snail mailing" missives via postal service as in earlier times. Online letters offer newsrooms a stream of readily formatted material, typically increasing both the volume of correspondence and the ease

with which edits can be made and details clarified with authors.

A downside of online correspondence is that mass-produced messages can be sent in sweeping Internet crusades, sometimes orchestrated by campaign websites, to multiple news outlets under the guise of individual letters. Submitting identical petitions to government that are signed by multiple authors may be a staple of democratic representation, but letters to the editor are expected to be original, individual, and authentic. Printing identical letters from different signers in different newspapers has become a professional embarrassment that the industry works to thwart, notably through a listserve sponsored by the National Conference of Editorial Writers.

Conclusion

Individual voices in letters to the editor, and the role of the letters themselves, have proved timeless since the country's earliest days. Published letters offer a forum for the rational debate that democratic theorists consider a hallmark of self-governance. They give voice to a news organization's readers. They enable an audience to criticize its news sources. They confirm that public issues, news stories, and media coverage are worthy of considered discussion and debate. Perhaps most importantly, they enhance the rhetorical power of ordinary citizens. Even after the voices of letter-writers have been stilled with the passage of time, long-ago views can be reread in news archives to ascertain how everyday people perceived the issues that they believed mattered.

Stamped envelopes and handwritten letters to newspaper editors have given way to e-mailed correspondence and website postings. Readers can leave comments on media blogs under the near-anonymity of their online screen names, a far cry from the real names required on the opinions printed on letters pages. Absent the gatekeepers who determine what is fit to print, postings on news sites may appear in raw form, perhaps artless, error-ridden, or potentially offensive. Published letters may be more civil than posted discourse, but some might argue that posted discourse is inherently more democratic than edited opinion. Media gatekeepers who screen letters for publication may enhance the quality of public debate. But perhaps they detract from its meaning. Like the topics of the letters themselves, these issues merit pondering as the Internet age advances.

Whether conveyed by pen, typewriter, or text messaging, then, the views of readers hold a firmly established place in American journalism's quest to help ensure an informed and engaged democracy. A free press is a cornerstone of American self-governance, and the words of ordinary citizens help keep it that way.

LIBEL

Defamatory statements are those which harm an individual's reputation in the eyes of the community. The law distinguishes between *slander* (spoken defamation) and *libel* (written or broadcast defamation). Libel law attempts to balance the interests of journalists and others with the rights of individuals and organizations to protect themselves against false and injurious attacks. American libel law has changed significantly since the 1960s, offering greater freedom to journalists to criticize public figures. At the same time, libel law has also become more complex, creating ongoing uncertainty about when journalists are on safe ground. Libel lawsuits are still the most common legal complaints filed against the news media. Defense against these can be time-consuming and costly; suits occasionally result in large monetary damage awards and can be abused by the powerful to divert attention from their own wrongdoing and muzzle their critics. Despite these problems, attempts to reform libel law have rarely succeeded, in part because of opposition from news organizations.

Development

Greek myths, the Bible, Shakespeare's plays, and other classic texts are filled with stories of individuals seeking to avenge their honor by violent means. The law of defamation arose in part to help individuals more calmly resolve conflicts provoked by insult to one's reputation. American libel law emerged from English Common Law, a set of customs that developed over centuries. Seditious libel concerns criticism of government or its officials.

Common Law prohibited strong criticism of government and the laws. This type of libel law has been slowly weakened, but not entirely discarded. In sixteenth-century England, the written word was thought to pose a greater threat than speech because pamphlets and newspapers could reach farther and endure longer than conversation. Therefore, English printers had to obtain licenses from the government and faced prosecution for criticism of that government. The United States inherited this tradition. Although the First Amendment to the U.S. Constitution, adopted in 1791, states that "Congress shall make no law abridging freedom of speech or of the press," the extent of journalists' right to criticize the government remained unclear. Just seven years later, amidst partisan rivalries between President John Adams' Federalist Party and Thomas Jefferson's Republican Party, the Federalist-dominated Congress passed a Sedition Act, which banned false and malicious statements against the state as well as calls to resist the laws. The act aimed in part to silence newspapers associated with Jefferson's party, which had criticized Adams and the Federalists. The law expired three years later, and Jefferson, then President, pardoned those who were convicted under it.

However, laws against seditious libel have been revived several times. In 1918 (during World War I) and 1940 (before American entry into World War II), Congress passed laws that limited criticism of government. Not until 1969, in *Brandenburg v. Ohio,* did the Supreme Court significantly restrict prosecutions for seditious libel to statements that aim to spark immediate violence against the government. The court noted that advocating the use of force against the state or breaking its laws could not be punished, "except where such advocacy is directed to inciting or producing imminent lawless action and is likely to incite or produce such actions." Yet some critics of the USA Patriot Act—an antiterrorism law passed after the attacks of September 11, 2001—saw a weakening of these free speech protections in the act's ban on any "attempt to intimidate or coerce a civilian population" or alter "the policy of the government by intimidation or coercion." Given the history of increased restrictions on speech during wartime, it is unlikely that prosecutions for seditious libel will entirely disappear in the future.

Libel is mainly a matter of civil law, in which private individuals or organizations sue for damage to their reputations, rather than criminal law, in which government prosecutes attacks on public order and well-being. Libel is also an example of tort law, which governs offenses against persons or property that do not involve contracts. For most American history, states almost entirely controlled defamation law. Important differences among state laws remain, but the Supreme Court has stepped in to standardize important elements of libel law across the country beginning with its

groundbreaking decision in 1964 in *New York Times Co. v. Sullivan*. In it, the Court determined that state laws must balance the interests in protecting individual reputations with the U.S. Constitution's free speech protections for public (or media) discussion. More particularly, media have a right to criticize how public officials conduct their official functions. As a result of this and later decisions, it has become very difficult for a public figure to successfully bring a libel case as they must prove that the media acted with "actual malice" in making derogatory remarks. This has created greater protections for the press reporting about individuals in public (government, business, entertainment) life.

Product disparagement, or trade libel, has become more important to news media. Trade libel involves comments questioning the reputation of a product rather than the individual or organization responsible for producing or selling it. In the 1990s, many states passed laws to enable banks, insurers, and food producers to defend against attacks on the quality of their products or services. Many of these laws were inspired by a 1989 story by the CBS news magazine *60 Minutes* that suggested Washington state apples were unsafe because they were treated with a chemical suspected of increasing the risk of cancer. Apple sales plunged briefly after the story aired, prompting farmers to sue CBS for $100 million in lost revenues. Similarly, in 1998 Texas cattle ranchers sued talk show host Oprah Winfrey when beef sales declined after she aired a segment in which a guest alleged that many U.S. cows were infected with mad cow disease and Winfrey responded that she planned to stop eating hamburgers. Neither the apple growers nor the beef ranchers succeeded in court because they could not prove the statements about their products were false. Product disparagement remains an area of unsettled law. Yet the high costs of these trials and potential for plaintiffs to win enormous damages have made some news organizations more cautious about criticizing the quality and safety of products.

Elements of Libel

To bring a successful libel lawsuit against a news organization, five elements must be proved by the plaintiff (one who files a suit against a defendant).

Publication

To prove that a libelous statement has been published, plaintiffs must show that at least one person besides the speaker and the plaintiff received the communication. This is fairly straightforward in cases involving news media, where it is presumed that anything in a newspaper, broadcast, or posted to the Internet has been seen by others. Both news stories and editorials can be sources of libel. In some circumstances, news organizations can be held responsible for republishing defamatory comments. Journalists are not protected simply by attributing a libelous statement to a source—if the reporter decides to include it, he or she can be held to account. News organizations can also be held liable for material supplied by an outside speaker, such as an opinion piece, letter to the editor, advertisement, blog posting, or comments made on television or radio. Even internal communications, such as company newsletters, can trigger a lawsuit.

With some exceptions, almost anyone who is involved in publishing an alleged libel may be sued, including reporters, editors, and the news organization itself. However, vendors who merely distribute copies—such as newsstands, bookstores, and libraries—are not responsible unless it can be shown that they had reason to know that they were disseminating libelous material. Similarly, Internet service providers (ISPs), such as America Online, are considered vendors of material that others post to their systems (e-mails, chat room comments, news articles, and the like), and are thus not responsible for transmitting defamation unless they do so knowingly. Because the Internet reaches beyond national borders, however, it is unclear whether U.S.-based ISPs can be sued for defamation in other countries where laws do not protect online providers as fully as in the United States.

Indeed, the increasing reach of mass media means that publication can occur across a wide range of legal jurisdictions. A plaintiff may sue in any state in which the potential libel was circulated, even if the plaintiff does not live there. Publication of stories on the Internet has subjected U.S.-based news organizations to suits in other countries where plaintiffs lived or had personal or business associates. Significant differences in libel law among states and countries allows some plaintiffs to "shop

for venues," filing a suit in a jurisdiction where law is most favorable to complainants.

Identification

Plaintiffs must also show that a libelous statement is indeed about the plaintiff. To win damages, plaintiffs need to demonstrate that a significant number of people recognize the defamatory statement as being about the plaintiff. Although the exact number of people who can identify the plaintiff from the remarks at issue is unclear, it must be more than one or two persons to show that one's reputation has been damaged in the community.

Identification does not occur only when a plaintiff is named directly in a news story. Defamatory material about a person with a similar name as the plaintiff's that creates the impression that a story is about the plaintiff may count. So might an image of the plaintiff, even if it is not accompanied by a caption naming him or her. Describing a person by their job title, such as "the city dog-catcher," is often enough. Even providing enough clues to a person's identity to allow a large number of the person's associates to identify him or her may be sufficient. For example, a story that falsely alleged that police were seeking a rape suspect described as a "middle-aged white male driving a white Dodge van with a 'Question Authority' sticker on the rear bumper" could constitute identification if the article led a man's family, neighbors, and friends to see him as the suspect. The courts have found that members of small groups may sue when the group is defamed even if its individual members are not named. Thus, if a journalist falsely claimed that "the city council has been taking bribes," each member of the council may be able to bring a libel complaint.

Defamation

Libel plaintiffs must also demonstrate that the material at issue disparages their reputations. Some statements, called libel per se, are clearly defamatory on their face, such as claims that a person is a "drunkard" or a "liar." Other claims, called libel *per quod,* are only damaging if the reader can connect them with additional information in a way that harms reputation. For example, mistakenly reporting that a famous athlete was seen on "a date" with a movie star can be considered libelous if it is widely known that the athlete is married to someone else. Courts assess whether the statements at hand would diminish the complainant's reputation in the eyes of reasonable people in their community. Changes in social values and the meaning of words are taken into account in determining whether material is defamatory. Thus, a claim that a woman wore a "short skirt, red lipstick, and a tight shirt with the words 'Hot Stuff' on the chest," which might have been considered an attack on her sexual modesty a century ago, might not be considered defamatory by today's fashion standards.

The kinds of statements that most commonly provoke libel suits involve accusations about criminal activity, sexual behavior or victimization, honesty, financial condition, health (including drug or alcohol addiction), business dealings, and professional competence.

Falsity

Libel plaintiffs who are public figures must prove that a statement about them is false, while private figures do not have to prove falsity unless the claim is about a matter of public concern. Public figures include those who have willingly thrust themselves into the public arena, such as elected officials, celebrities, leaders of campaigns to affect public policy or behavior, and highly visible leaders of major institutions (businesses, religious organizations, and so on). Because public figures may enjoy power, fame, and more access to the media to respond to allegations, they must meet higher standards of proof in libel suits. Private figures need only prove that a statement about them is false when it touches on an issue important to the public, although the courts have not defined such matters clearly. In cases involving reports on private matters of a private plaintiff, the defendant bears the burden of proving that the claim is true.

Not every word of the disputed report must be shown to be true or false, only the gist of the report that concerns potentially defamatory material. However, a story that contains no false claims still may be libelous if it creates a false view of the plaintiff by omitting key facts. For example, a story that stated that a wife "attacked her husband with

a hammer and he died six weeks later in the hospital," may be libelous if the husband in fact died of a heart attack not related to his encounter with his wife because the report falsely suggests that the wife was responsible for her husband's death.

Fault

All plaintiffs must prove that the defendant was at fault in publishing a libel, although the standards for doing so differ dramatically depending on who sues. Private figures must prove that the defendant was negligent, failing to exercise reasonable care. Public figures must meet a higher standard, showing that defendants acted with "actual malice," which means either publishing a statement despite knowing that it was false or exhibiting reckless disregard for the truth.

Negligence arises from how a reporter prepares a story. The overarching question is whether a journalist made a reasonable and competent effort to establish the truth or falsity of the report. Common causes of negligence include relying on untrustworthy sources, failing to consult obviously relevant sources (such as the subject of the disparaging story), ignoring or grossly misinterpreting evidence that would challenge the libelous statement, and careless editing (dramatic alteration of the meaning of quotes from sources, misattribution of quotes, misidentifying the subjects of photos, and so on).

Actual malice may be proved in either of two ways. Plaintiffs may demonstrate that journalists knew a claim was false but published it anyway. However, the Supreme Court has ruled that altering a source's quotes does not necessarily count, "unless the alteration results in a material change in the meaning conveyed by the statement." Plaintiffs may also show that journalists showed reckless disregard for the truth. The Supreme Court has ruled that proving such disregard involves establishing that journalists had "a high degree of awareness of probable falsity" of a claim (*New York Times Co. v. Sullivan*), or that "the defendant in fact entertained serious doubts as to the truth of his publication" (*St. Amant v. Thompson*). Courts sometimes use a three-part test devised by Supreme Court Justice John Harlan in his opinion on two 1967 cases (*Curtis Publishing Company v. Butts* and *Associated Press v. Walker*) to help assess whether reporters act with reckless disregard. The test involves asking (a) whether publication of the story was urgent or if there was sufficient time to check the facts fully, (b) how reliable was the source of the story and the journalist who produced it, (c) whether the story was probable or highly unlikely. Breaking news that relies on trusted sources reported by professional journalists that involve credible events are likely to escape findings of actual malice. Because journalists rarely admit to negligence or disregard for truth, it is difficult for plaintiffs to prove, requiring extensive examination of how a story was produced and the reporter's state of mind at the time.

Defenses

News organizations may rely on one of several defenses to seek dismissal of a libel claim.

Statute of Limitations

All states have limits on how long a plaintiff can wait to bring a libel suit. Depending on the state, a suit must be filed within one to three years of publication of the alleged defamation. However, each time a radio or television station rebroadcasts a program it is considered a fresh publication.

Truth

Defendants in cases involving private plaintiffs on matters of private interest may dismiss a libel claim by proving the truth of their statements, using similar criteria for assessing falsity discussed above. In cases regarding matters of public concern or public figures, defendants need not prove truth, but may do so in response to plaintiffs' cases.

Privilege

To protect the conditions for free and open debate in a democracy, certain kinds of communication are protected from liability for defamation, or "privileged." The comments of participants in legislative forums, judicial forums, and the administrative and executive branches of government enjoy an absolute privilege against libel claims. This immunity from libel extends to remarks by lawmakers, witnesses at public hearings and in

court, reports issued by government agencies, and other communications made in a government forum (although officials' comments outside these forums can form the basis for a libel claim).

In recognition of the news media's valuable role in disseminating news of governmental affairs, journalists have a qualified privilege when they report a fair (balanced) and accurate summary of what was said in a privileged (official) proceeding or document, even if the comments reported include libel.

Opinion

Expressions of opinion rather than fact are generally not considered defamatory. Opinion has long been a staple of journalism that contributes to public discourse about everything from politics to art to food. Another reason for exempting opinion from libel is that opinion cannot be proved false or true. If a television talk show host calls a guest "an ugly fool," there is no cause for libel because one cannot prove or disprove objectively that someone is ugly or a fool—both qualities are in the eye of the beholder. However, the host cannot claim an opinion defense if he says the guest is "an ugly fool whose wife left you because she couldn't stand the sight of you," and the guest can show that his wife did not leave him because of his looks. In this case, there may be cause for libel because the question of whether and why the wife ended the marriage is factual.

When distinguishing fact from opinion, many courts go beyond considering whether a statement can be disproved to consider other factors outlined by the U.S. Court of Appeals for the District of Columbia Circuit in *Ollman v. Evans* (1984). The *Ollman* test also includes asking about the common, ordinary meaning of the words used. Some apparent statements of fact are often used to express opinion, as when a person is accused of being "an animal," and thus should not be cause for libel. The test also inquires into the journalistic context of the statement. Claims made in places where audiences have come to expect opinion, such as the editorial page of a newspaper or a comedy program that satirizes the news, are more likely to be viewed as opinion. Finally, the test considers the social context. Coverage of remarks made in protest rallies, for example, are more likely to appear as opinion than those made at a medical conference about the findings of a recent study on the safety of a particular drug.

Similarly, hyperbole (exaggerated statements about someone or something) is also not considered libelous because reasonable people could not take such claims to be literally true. Overstatements, epithets, and satire often fall into this category. For example, a court found that television journalist Geraldo Rivera used hyperbole and so was not liable for defaming a man by calling him an accomplice to murder for creating a website that revealed the personal contact information of doctors who performed abortions—information that could be used by prolife extremists to find and kill physicians.

Other Defenses

Several other defenses have been passed down from Common Law and are therefore not recognized by all courts and less likely to be used today. The Fair Comment defense protects opinions about a matter of public interest that are based on true facts. The Consent defense absolves those who can show that the plaintiff acquiesced to publication of the statement beforehand. The Right of Reply defense, or "self-defense," protects a speaker's libelous remark made in response to an initial libel against her or him as long as the response is not more severe than the claim that provoked it.

Damages

News organizations must pay close attention to the four kinds of damages a successful plaintiff may win in a libel case because the scope of damages can threaten the organization's survival. *Actual damages* compensate victims for harms suffered as a result of the libel such as mental suffering or diminished standing in the community, which are difficult to estimate in financial terms. *Special damages* are specific monetary losses that can be precisely documented, such as wages lost by someone who is fired because of the libel. *Presumed damages* (also called general or compensatory damages) may be awarded without requiring proof of harm. *Punitive damages* are designed to punish the defendant and deter others from similar wrongdoing. Juries can sometimes make large awards of actual and punitive damages. Complaints

about excessive punitive damages awarded in some cases have convinced several states to ban them and others to consider capping them.

Libel Reform

Dissatisfaction with libel law is widespread for several reasons. First, determining libel has grown increasingly complex in the post-*Sullivan* era. Judges and jurors struggle to interpret and apply concepts such as actual malice, public versus private figures, fact versus opinion, and the array of damages that can be awarded. Mistakes by judges and juries must be reheard and corrected through appeals to higher courts.

Second, this complexity means that cases can be protracted and expensive for all involved. One cannot mount a major libel suit or defend against one without paying expert lawyers hundreds of thousands or even millions of dollars to prepare and argue these complicated cases. *Sullivan* was supposed to give journalists more room to foster criticism of public officials by requiring public figures to surmount the obstacle of proving actual malice in court. But establishing knowing or reckless disregard for truth requires extensive attention to journalists' state of mind and work process as they prepared their stories. From the plaintiff's standpoint, these costs mean that individuals and organizations with few resources are unlikely to be able to vindicate their reputations in court. Even powerful plaintiffs rarely succeed in restoring their reputations in a timely manner (the average libel suit lasts four years). From the media's point of view, important news may be squelched if media defendants fear that reporting it will spark a lawsuit from a well-heeled individual or corporation. The increasing costs to the media of defending against libel suits, of damage awards, and of libel insurance, raise concerns about chilling critical coverage of the powerful. Although media defendants succeed in getting most libel cases dismissed before they go to trial, juries are more likely than not to find the media guilty in cases that do proceed to trial, which can result in millions in damages. Small media organizations can be especially vulnerable to bankruptcy if they lose. They may avoid risky features such as police blotters, letters to the editor, or investigative reporting rather than face a crippling libel suit.

Third, libel lawsuits are sometimes abused by powerful plaintiffs who aim to silence critics. Strategic Lawsuits Against Public Participation (SLAPPs) refer to suits that have little legal merit but are brought to intimidate citizen groups to stop speaking out to government and the media against real estate developers, polluters, and others. Sometimes these suits aim at the media themselves. Even if plaintiffs rarely win these cases, and at least twenty states have passed laws against them, these costly suits can muzzle legitimate contributions to public debate.

In response to these problems, several proposals have been made to reform libel law. One reform would allow the news media to publish a retraction, acknowledging inaccuracy in a story and apologizing for it, in exchange for removing the threat of damages at trial. A majority of states have adopted laws to this effect. Although retraction laws differ, and some have been ruled unconstitutional by the courts, they typically share several features. The potential plaintiff must request a retraction from the publisher before a libel case can be filed. If the news organization complies by publishing the retraction as prominently as the libelous statement was featured, the plaintiff can only seek limited damages, or none at all, in court. Such laws aim to give the media an incentive to admit inaccuracy or negligence when they are wrong by removing the fear that the admission could be used against them later in court. Plaintiffs may be more likely to avoid going to court because they can clear their names more quickly and cheaply. Practice in many European countries suggests another model in which those who have been attacked have a right to reply in the journalism outlet that criticized them. Others have suggested moving libel out of the courts by referring cases to trained arbitrators who would focus primarily on questions of truth and falsity, such as news councils made up of journalists and citizens. But these small-scale arbitration programs have not been widespread. Some news organizations have begun to counter-sue libel plaintiffs for malicious prosecution or abuse of process, but the courts have not been receptive to these suits for fear of deterring legitimate libel plaintiffs.

Although many agree that some libel reform is desirable, it has not been very successful. Many news organizations oppose offering frequent

retractions, either because they believe their stories are correct or fear losing credibility. Libel lawyers have a financial stake in continuing the present system, which brings them business defending or suing the media. And no other organized constituency has stepped forward to demand change.

Conclusion

The law of defamation arose to protect public order and individual honor. Prosecutions for seditious libel—attacks on the government—are rare, but still pose a danger to vociferous critics of the state in wartime. Today, libel is mainly a civil tort used by individuals and organizations to defend themselves from assault, especially in the news media. Since 1964, the courts have recognized that protecting reputations must be weighed alongside the often conflicting interest in robust and freewheeling debate on public issues. The law has expanded journalists' freedom to publish negative information, especially about public figures. However, this freedom has come at a price. Libel lawsuits have become enormously complex, costly, and time-consuming. They can be used as weapons to deter the media from publishing valid critique of powerful people and institutions. Few small plaintiffs can command the resources needed to bring a successful lawsuit against a large media organization. Courts do not often render verdicts on the truth of an alleged libel in a timely manner, leaving the public in the dark. Yet attempts to simplify libel law in order to serve the interests of news organizations, plaintiffs, and the public have foundered because of resistance from those most involved in libel suits.

Lifestyle Journalism

Lifestyle sections generally were introduced into American daily newspapers in the 1970s and typically evolved from what had been styled as women's pages. Despite an assumption that we can all identify what "lifestyle" might mean, most newspaper definitions are still in flux as editors seek to define what it is that readers might want to read (and what advertisers will support). Some papers have lifestyle sections that could be defined as entertainment or celebrity driven—not much of a change in philosophy from the old women's/society sections which concentrated on the doings of the local rich and influential. Lifestyle sections themselves are sometimes listed separately and sometimes classified as part of feature pages. Sometimes they are not included in current staff listings at all; indeed, it is instructive to see how newspaper structure has changed by studying the listings in *Editor & Publisher Year Book*. In 1976, in the middle of the decade introducing much of the change, out of 1,325 daily newspapers listed, only 48 included features editors, and lifestyle sections were represented in just nine papers (three as lifestyle and five as life/style). In contrast, during the same year, there were 706 society editors listed and 758 women's editors.

These figures suggest that change and experimentation with the old structures were just beginning, as the names of new editor categories also illustrate: Viva, Scene, View, Today, People, Accent, and of course Style, the section at *The Washington Post* that has been credited with leading the lifestyle revolution in newspapers. That what resulted was no "revolution" is clear by looking at the

Editor & Publisher daily newspaper listings 30 years later in 2006. Even though the accepted historical view is that lifestyle sections have replaced women's and society pages, this is true only in major metropolitan areas or cities closely linked to these areas. For example, in 2006, only 152 of 1,245 dailies listed a "lifestyle" section editor, with an additional 42 listed as "living/lifestyle" editors. Two more offered the reverse "lifestyle/living," another 10 were listed as "living" editors, and 17 were listed as "life" section editors, bringing this group to a total of only 221 lifestyle-type editors. Women's and society editors show a real decline, however they are still present with 265 entries. Going back decade by decade suggests that the transition came for most papers around the turn of the century and that the real change has been in the number of features editors—from 48 in 1976 to 431 in 2006, but still not as many as the 691 women's and society editors listed in 1976.

Origins

With the exception of some lifestyle, technology, and expanded entertainment sections, the basic structure of the metropolitan daily newspaper has been in place for more than a century. Typically urban papers have had separate areas or sections for news, sports, opinion, and business. Feature material has frequently been sprinkled throughout these various sections and has only recently come to dominate its own section by name. Some shifts have come fairly recently; for example, there is increased attention to entertainment and lifestyle material and a corresponding decrease of social and local celebrity news. As is clear from reading the staff listings, each of these newspaper units typically has its own hierarchy of staff writers and editors involved in creating and presenting material for the different audiences that read the paper. Each section is supported by advertising that is related to the general section topic—and indeed, some historians have argued that it is the advertising that has driven and controlled the creation of these different sections. They point out that women as an audience became of interest to editors when more advertisers wanted to reach those women with money to spend, an argument bolstered by advertisers' general acceptance that women are the buyers for most families.

Society news offered an early addition to the broader newspaper editorial mix and was important to the development of popular mass-appeal dailies, a necessary step on the way to what is today called "lifestyle" coverage. These popular newspapers began publishing daily in the 1830s with a fuller range of stories on sports, criminal trial stories, and society news items. Social coverage had its first "on the scene" reporter when James Gordon Bennett of *The New York Herald* sent William H. Attree to a costume ball given by Mr. and Mrs. Henry Brevoort in 1840. Another early society writer was William Bininger, again for *The New York Herald*. A new interest in women readers helped open the door to women writers who were best able to write about their own lives. More than one chronicler of a newspaper's history has remarked that women were believed to be more socially adept at fitting into higher social circles. There was also a shift toward elaborate descriptions of what society matrons wore to events, and again, women were believed to be more able to provide these verbal illustrations.

Joseph Pulitzer is credited with creating the first women's page, but in 1886 it began as a special column devoted to women's interests. An issue of *The World,* May 25, 1884, page 11, shows this precursor of the woman's page—the "World of Women" column. By the 1890s, women's pages were a definite feature of larger papers, publishing information about clubs, society, and other topics of interest to women. And in 1895, a phenomenon of "women's editions" of newspapers brought something new into the mix. Around the country, community women began taking over their local newspapers for a day. The power of the popular press and the importance of women's work in the community were being paired to showcase women's talents and abilities. It was the first time many women saw their names in print, and it was the beginning of a love affair with the newspaper world for many. One of the women to get a break in one of these editions was Elizabeth Meriwether Gilmer, who was to become America's highest paid female journalists (as Dorothy Dix) by the time of her death in 1951.

By 1900, women's pages or sections with "women's" topics were part of most large metropolitan dailies, and smaller newspapers throughout the country were quick to join. For more than

a half century, the common elements of these pages were related to fashion, food, household hints, society, and advice. But not everyone was happy with the change. Women journalists wanted to write serious articles and women readers frequently discussed the women's pages as banal. One bit of evidence is that writers for the women's editions in 1895 were penning sardonic, patronizing columns "for our male readers." And as early as 1901, women and intellectuals were complaining that the women's pages were a "hopeless case," filled with useless trivia and social news, notes historian Marion Marzolf. These pages may have been hopeless, but they were money-makers and advertisements located on them commanded high prices.

Despite complaints about the "drivel" contained in women's pages, they were an institution throughout the twentieth century in most daily newspapers. The insistence of Eleanor Roosevelt to work only with women reporters was a boon to both women editors and women with aspirations for front-page reporting. Articles about serious social topics began to appear in the 1940s, as did items written by professional women. Some of these changes were bolstered by the increased professional activities of women during World War II, though the 1950s were to see a return to stories on beauty, cooking, society, and fashion. A decade later, women's pages became the center of newspaper and social change. Because the women's movement began to make news and because women began demanding rights for equal pay, child care, and so on, women's pages began to run more controversial stories and interviews. While some women's editors were pleased by the increase in "real" news, some seemed to ignore these cultural happenings. Newspapers had hired increasing numbers of women, but many of them had been placed on the women's pages. They, too, were eager to change the nature of women's news. At the same time, a few courageous women's page editors began what might be called campaigns to change their pages from predictable sections into columns of issues-centered reporting about equal rights, childcare, and spousal abuse. Conflict arose when advocates for women such as Gloria Steinem fought to keep news about the women's movement from being buried in the women's pages.

Unisex "Lifestyle" Coverage

The late 1960s and early 1970s saw the impetus for most of the dramatic changes. As Kay Mills put it, "The evolution of the women's pages marked a belated recognition that all parts of a newspaper should be prepared for all people," adding that the changes were occurring partly because of social pressures and partly because of economics. At *The Washington Post*—one of the early claimants to journalistic lifestyle development—the "Style" section, Ben Bradlee's major structural change, was introduced on January 6, 1969. The change came as longtime women's editor Marie Sauer was retiring. Instead of replacing her and continuing the women's section, Bradlee was seeking to ride the wave of social change.

Bradlee's idea was to create a section that gave cultural news and reviews a place of their own. It was to include food, fashion, fun, and culture—all directed to a unisex audience interested in an upscale lifestyle. His criticisms of women's pages mirrored those of the women in the women's movement who were trying to fight for newspaper changes. He spoke for many when he said that traditional women's news was boring and that most newspaper editors had been listening to highly intelligent women who were vocal in their criticism of women's pages with what seemed like endless information about diets, teas, and society gatherings. But the "Style" section itself was experiencing growing pains, and even when Thomas Kendrick, who became editor two years later, was able to bring order to journalistic chaos by setting editorial standards, there were problems. A memo from Bradlee underscored some of the change. Admonishing his reporters to avoid words like *pert, dimpled, cute,* or *vivacious,* he wrote that stories about the achievements of women should be written "without a trace of condescension." But the problems were still not solved. One of them resulted from a letter to publisher Katharine Graham signed by 59 women at the paper who were unhappy with what they described as discrimination at the paper. This act was quickly followed by a lawsuit in 1972 filed by the same women. In her 1998 autobiography, Graham wrote, "Since the new 'Style' section had replaced the old women's pages, women had lost four jobs." Besides Graham, Meg Greenfield was the only woman in upper management at the paper.

A few editors had applauded and supported the women's-news momentum, but they were in the minority. Although there was talk and plenty of activity at a handful of papers, rarely are the stories of women's page editors presented as part of the history of newspapers. For example, although Marjorie Paxson won the highest honor at the Penney-Missouri awards for a women's page editor while at the *St. Petersburg Times,* neither her name nor an entry for "women's pages" appears in a recent biography of Nelson Poynter and the *St. Petersburg Times*. Likewise, the story of Maggie Savoy, a leading women's page editor in the 1960s, is absent from a history of the *Arizona Republic*.

Women's Editors Oppose Changes

One of the first to pioneer change in women's news within the existing structure was Dorothy Jurney, an editor who had been encouraged to expand the coverage of women's activities at the *Miami Herald*. Like Colleen Dishon of the *Chicago Tribune,* she was an advocate for retaining women's sections and making them relevant to women's lives. Jurney, who was hired at the *Detroit Free Press* to change the women's pages and direct a "family section," has addressed what happened during the change in the late 1960s and early 1970s. Women's advocates such as Gloria Steinem, she said, "got on their soapboxes and said that women's news should not be confined to a women's section. It should be throughout the newspaper" (Jurney 1989). Applying what happened at the *Post* to newspapers throughout the country, Jurney then explained that what really happened throughout the country was that the women's editors lost their jobs to men who knew nothing about women's basic interest in social issues. Women's advocacy and news for the women's pages just disappeared.

Jurney was not the only one unhappy with a looming, much-discussed shift to lifestyle reporting from women's sections. Writing in *Editor & Publisher* in 1973, June Almquist, women's editor of the *Seattle Times,* wrote that some women's sections of the country jumped out of the window too quickly: "In their eagerness for change, they lost their identity—becoming, at best, general-feature sections and, in some cases, hodgepodge sections" (28). One trap, she noted, is that women's sections had become dumping grounds for other areas of the newspaper—bridge columns, coin-collection columns, travel stories, etc. On the opposite side of the coin were women's sections that "went overboard" on social issues such as rape, poverty, and venereal disease. But as Alquist noted, "the biggest fattest ads in the newspaper are the grocery ads, the fashion ads, the home furnishings ads. And we know full well why those advertisers want to be in the women's sections: because the major buyers of consumer goods are women" (28).

Earlier that same year, the Penney-Missouri workshop sessions at the University of Missouri tackled the problems facing women's editors at this time of change by honoring Judith Anderson of the *San Francisco Chronicle*'s "People" section with the first Paul L. Myhre Award for Excellence in Reporting. These influential Penney awards were instrumental in changing the face of women's news and inadvertently promoting the lifestyle impetus.

Lifestyle can today be defined as a universally accepted descriptive with the categories of gendered, feature, cultural, and even entertainment writing. Because it is less commonly used as an indentifying label for editors throughout the newspaper industry—only 152 lifestyle editors of 1,325 daily newspapers in 2006—it must be understood as a description of feature material that is usually gender-neutral, that is, "family" instead of "women's" articles. Even though one commonly thinks of "lifestyle" sections as having superseded women and society sections, the indications are that at some papers women's and society editors are still firmly entrenched. In fact, a recent return to women's news at the *Chicago Tribune* has been widely imitated and is still being evaluated for possible industry change by newspaper trend writers.

Literary Journalism

Scholars and observers of American journalism have spent considerable effort attempting to define a form of expression that many have come to call literary or narrative journalism. As the terms suggest, this journalistic form occupies a space between the imaginative nature of fictive literature on one hand, and the empiricism of the objective, inverted pyramid style of news report on the other. Since the New Journalism movement of the 1960s and 1970s reinvigorated an American tradition of literary journalism dating at least to the nineteenth century, the form has generated substantial professional, scholarly, and popular interest, not to mention debate. Narrative journalism can be found in magazines, books, newspapers, radio shows, broadcast news, and Internet reports. It is used to tell timely stories about actual people and events in topical areas ranging from human interest stories to business reportage to the explanation of complex medical and scientific phenomena as well as international events. Journalism schools and English departments across the United States teach courses on the form; anthologies are flourishing, as are professional and scholarly conferences attending to the form.

Historian John C. Hartsock defined "narrative literary journalism" as "those true-life stories that read like a novel or short story" while acknowledging the problematic nature of defining such an approach. Such stories, he suggested, are often allegorical, embracing the subjectivity of the author and promoting the "understanding of the social or cultural Other" (2000, 22). Thomas B. Connery preferred the term *literary journalism* to identify a kind of nonfiction writing that depends on traditional news gathering and reporting techniques, such as interviews and documentary review, at the same time that it values writing style and interpretation. At issue in the conversations over the appropriate definition and naming of the form is anxiety over what the terms *literary, narrative,* and *journalism* mean in the first place. Must all literary, or narrative, journalism use narrative techniques, such as scene setting and dialogue? Must it incorporate, as New Journalist Tom Wolfe has suggested, immersion reporting (the writer's deep, prolonged engagement in the world about which she is reporting)? Should it be called literary nonfiction, creative nonfiction, narrative nonfiction, journalistic nonfiction, the literature of fact, literary journalism, or narrative journalism? Despite the lack of consensus regarding the most appropriate term and definition to identify this particular kind of journalistic expression, literary journalism is a recognizable and robust historical tradition within the professional practice of American journalism.

Origins

American literary journalism is part of a larger Western tradition of narrative news dating back,

according to some scholars, to ancient Rome and Greece. At the very least, the tradition has roots in the literary news writing of the late seventeenth and early eighteenth centuries in England (for example, Edward Ward's narrative profiles of London in the *London Spy* and Joseph Addison and Richard Steele's more essay-like reports in the *Tatler* and the *Spectator*). In the United States, the tradition can be traced to the 1830s birth of the penny press and the resulting emergence of two distinct news styles: the objective report and the more subjective personal report. Throughout the nineteenth century, the Enlightenment ideal of progress through the accretion of scientific knowledge gained ascendancy in American social thought. In the latter part of the century, American literature turned toward realism (a representational form that assumed a one-to-one correspondence between language and the world language intended to portray). In the context of this societal transformation, the two forms of news report became more fully distinguishable and defined. By the 1890s, it was clear in American journalism that two distinct news forms existed: what sociologist Michael Schudson has called the information model (the objective report) and the story model (the narrative subjective report).

The information model emphasized the clear, hierarchical reporting of facts about current events in a neutral, detached manner. It was a form owing much to the scientific spirit of the age in which verifiable facts were valued as essential to the production of objectified knowledge. The story model, on the other hand, emphasized the use of novelistic techniques in rendering the author's subjective interpretation of such events. This journalistic story developed simultaneously with other realistic literature. An important distinction between the information and the story forms of journalism is that in the first, the reader was generally left to create meaning out of the reported facts for himself; in the latter, the writer suggested, if not conclusively, a possible range of meanings.

In the 1890s, New York newspapers like Charles Dana's *Sun,* Joseph Pulitzer's *World,* and William Randolph Hearst's *Journal* popularized the story model in what was known then as "the new journalism"—a kind of dramatic reportage that intended to entertain. In the late 1890s, *The New York Times* emerged as the model of informational, objective journalism. While these two forms peacefully coexisted then, by the early twentieth century the objective report began to gain dominance as the preferred form of news expression in American journalism. This dominance lasted into the early twenty-first century. In the wake of widespread public discomfort with the Wilson administration's World War I propaganda machine, in which many journalists participated, political commentator and theorist Walter Lippmann encouraged journalists to use a quasi-scientific, or objective, method of gathering, verifying, and reporting facts. The idea was to professionalize the work of journalists, thereby separating their effort to inform citizens so they could intelligently participate in American democracy, from the propagandists' or publicists' work of persuading readers to embrace particular ideologies or to take particular action. Lippmann's call for a professional objective journalism that separated facts from opinion, and stressed the relaying of information over persuasion and entertainment, built on and strengthened the informational model of journalism of the nineteenth century, devaluing story model.

The growth of journalism education in American universities and colleges also supported the privileging of the objective report in the news profession. Early professors tended to associate the story model with the excesses of the "new" and "yellow" journalism of the late nineteenth century—war-mongering, falsifications, sensational crime reportage, and questionable invasions of privacy. To clean up and professionalize journalism was to teach would-be reporters how to gather and report facts—that is, how to write the objective, informational report as a kind of quasi-scientific practice. Both the academy and the newsroom embraced the objective report as the ideal form of press expression.

Literary Journalism in the Twentieth Century

The story model survived, however, and from the 1890s to the present has assumed different forms in distinct periods. Over the past century, literary journalism arose, some have theorized, to fill the breach left by objective reports in their failure to provide adequate explanations and interpretations of confusing, complex social changes. The muckraking magazine article, popular from the 1890s to the 1910s, investigated and reported social injustice, political corruption, and conflicts

between capital and labor, among other topics. Notable practitioners included Ida Tarbell, who published a series of articles exposing the unethical practices of the Standard Oil Company in *McClure's Magazine* (1902–04) and then as a book, *The History of the Standard Oil Company* (1904), and Lincoln Steffens, whose articles on political machines in American cities, also published in *McClure's*, became the 1904 book *The Shame of the Cities*. The muckrakers were closely associated with the reform impulses of the Progressive movement.

Various types of documentary nonfiction and narrative magazine articles flourished during the social, economic, and political turmoil of the 1930s and 1940s. The Federal Writers' Project (FWP) of the Depression-era Works Progress Administration produced a range of documentary works, including the American Guide Series (travel and cultural guides for each of the states and many cities) and oral histories. The extent to which FWP projects can be considered "literary journalism" is an unsettled question, although Hartsock mentions favorably African American writer Zora Neale Hurston's account of her hometown in the Florida travel guide. During this period, the image became an important part of narrative reporting, particularly in the work of James Agee's and Walker Evans's *Let Us Now Praise Famous Men* (1941), an account of the lives of Alabama sharecroppers. *The New Yorker,* among other magazines, distinguished itself by publishing a narrative literary journalism for which the magazine became known. Notable *New Yorker* writers of the 1930s and 1940s include Janet Flanner, John Hersey, A. J. Liebling, and Joseph Mitchell.

Literary journalism flourished again in American journalism with the New Journalism movement of the 1960s and 1970s (not to be confused with its progenitor, the "new journalism" of the late nineteenth century). The precise origin of the term *New Journalism* to refer to this period is unclear, although it is most closely associated with Tom Wolfe and his 1973 book of republished articles by the same name. While some view 1965 as the year the New Journalism emerged, Gay Talese had been writing literary journalistic pieces for *Esquire* since 1960. That acknowledged, 1965 was a watershed year for New Journalism, ushering in a revival of the literary form. In 1965, Truman Capote famously published *In Cold Blood,* what he called the first "nonfiction novel," as a series of four articles in *The New Yorker* and then as a book. *In Cold Blood* told the harrowing story of the murder of an entire Kansas farm family. In 1965, Tom Wolfe, who had been writing for *Esquire* and the *New York Herald Tribune,* published a book of linguistically innovative articles titled *Kandy-Kolored Tangerine-Flake Streamline Baby,* which took its title from an *Esquire* piece on hot rod culture in California. The article's original title gives some sense of Wolfe's verbal inventiveness: "There Goes (Varoom! Varoom!) That Kandy-Kolored (Thphhhhhh!) Tangerine-Flake Streamline Baby (Rahghhh!) Around the Bend (Brummmmmmmmmmmmmm)…." Also in 1965, Joan Didion was publishing articles on life in California in a range of magazines, including the *Saturday Evening Post.* These articles would be collected in 1968 in *Slouching towards Bethlehem.* Other notable New Journalists include Jimmy Breslin, Norman Mailer, and Hunter S. Thompson (also known as a Gonzo journalist).

What made the New Journalism of the 1960s and early 1970s different from what came before was the self-consciousness and public awareness of the movement. It was a journalism that called into question the assumption underpinning the traditional objective report: that reality was readily knowable through the neutral reporting of facts. As traditional reporting on the cultural and social dislocations of the 1960s demonstrated—from civil rights violations to political assassinations to the Vietnam War to the drug culture—an accretion of reported facts did not always make the changing world more intelligible to readers. The subjective storytelling of the New Journalism attempted to make sense of a society in the throes of great change, not through proposing a grand, unifying narrative but largely through telling the varied stories of the lived experiences of everyday people. By the 1970s, a scholarly and professional literature on the New Journalism began to develop, and thus marked the beginning of sustained scholarly and professional interest in literary journalism.

Since the New Journalism movement, literary journalism has flowered across almost all forms of news media in America, though most has been published in magazines and books. Robert S. Boynton has called the writers of this latest period the "New New Journalists" and has suggested that

their writing, while less linguistically experimental than that of the New Journalists, has experimented more with "the *way* one gets the story" (xiii). Of particular note, he argues, is the way in which these contemporary literary journalists have so immersed themselves in the lives of their subjects that "the public/private divide [has] essentially disappeared" (xiii). They often write about race and class, focusing on telling the stories of subcultures as a means for engaging America's social and cultural problems. These contemporary practitioners include, among many others, Ted Conover, Leon Dash, Tracy Kidder, Alex Kotlowitz, Adrian Nicole LeBlanc, and Susan Orlean.

Controversies

Literary journalism has often been the subject of both professional and scholarly controversy. In a *New York Times* review of *Kandy-Kolored Tangerine-Flake Streamline Baby,* critic Dwight McDonald attacked Tom Wolfe's work as "parajournalism"—a "bastard form" appropriating the techniques of both journalism and fiction with little regard for accuracy and too much regard for entertainment. Some critics have questioned the use of interior perspectives and re-created events in certain works of literary journalism, viewing these narrative techniques as appropriate only in fictional representations. Others worry that the straightforward subjectivity of much literary journalism will open the door to partisan, ideological reporting. Still others suggest that literary journalists often arrogantly present their interpretation of reality and external events as reality rather than a point of view. A number of critics have blamed several high profile cases of journalists fabricating stories—Janet Cooke at *The Washington Post* in the early 1980s, Stephen Glass at *The New Republic* in the late 1990s, and Jayson Blair at *The New York Times* in the early 2000s—on the supposed negative influence of the New Journalism.

Apologists for literary journalism, as well as its many practitioners, tend to reject such causal arguments. Mark Kramer, former director of the Nieman Program on Narrative Journalism at Harvard and co-editor of the anthology *Literary Journalism,* has suggested that the form has developed certain identifiable conventions since the New Journalism movement. Among these, he wrote in his introduction to *Literary Journalism,* are "no composite scenes, no misstated chronology, no falsification of the discernible drift or proportion of events, no invention of quotes, no attribution of thoughts to sources unless the sources have said they'd had those very thoughts, and no unacknowledged deals with subjects involving payment or editorial control" (Kramer 1995, 25).

Conclusion

Literary, or narrative, journalism has a long and rich history as a form of expression in American journalism and literature. In the twenty-first century, the form is not nearly as controversial as it was in the past and appears to be more robust than it has ever been. It may be that news producers, consumers, and theorists have largely accepted the postmodern realization that all reports of the world are culturally conditioned. In other words, many now believe that no reporter or writer—or reader, for that matter—can entirely escape her own perspective and somehow present an entirely objective report. It is not that verifiable facts do not matter, for most would agree that they are the foundation of all journalistic reports. It is simply that many Americans have come to believe that other kinds of reports beyond the objective can present, explain, and interpret these facts and the world of human experience they represent.

Los Angeles

Situated between the Pacific Ocean and the Hollywood Hills, Los Angeles boasts a near-perfect climate, celebrity-laden streets, and palm-tree lined beaches. The self-proclaimed entertainment and creative capital of the world is the second-largest media market in the country (behind New York). The music industry, radio, television, and motion pictures all have deep roots in the greater Los Angeles area. More than a dozen major television and motion picture studios, including Paramount, Warner Brothers, Universal, Disney, Fox, and MGM, are based in the region and the city plays host to nationally broadcast performing arts awards shows such as the Emmys, Grammys, and Oscars.

Journalistically, the *Los Angeles Times* enjoys the highest circulation of any newspaper west of the Mississippi and boasts dozens of Pulitzer Prizes. The broadcast market also is strong; each major television network owns and operates affiliate stations that serve as West Coast bureaus. CNN has a presence as do numerous entertainment news programs and tabloid shows. But the glittering Southern California city is not without challenges and historic struggles.

The City of Angels, which began as a Spanish settlement in the late 1700s, has the nation's largest population of minority residents. According to 2007 census figures, 71 percent of Los Angeles County residents were nonwhite. Because of the city's proximity to Mexico, the number of Hispanic residents is higher than in any other region of the country. As a result, immigration and racial issues have dominated local politics and law enforcement. African Americans sparked racial riots in Watts during the civil rights protests in the 1960s. In the 1990s, more riots broke out after the acquittal of four white police officers who were accused of beating an innocent black man, Rodney King. The *Los Angeles Times* earned Pulitzer Prizes for its coverage of both racial uprisings.

Los Angeles also wrestles with air quality problems, traffic congestion, water shortages, fires, and the threat of earthquakes along the San Andreas fault. Still, its location, weather, and glamour make it a favorite destination for vacationers and those wanting to relocate to warmer climes.

Newspapers

Since winning the rivalry with its closest competitor, the *Herald-Examiner,* in 1989, the *Los Angeles Times* has consistently ranked among the top three largest metro daily newspapers in the country. By 2008, the *Times* had won nearly 40 Pulitzer Prize awards for international, national, and public service journalism. But the once family-owned newspaper wrestled with corporate mergers, massive staff layoffs, declining readership, and management shakeups during the first few years of the twenty-first century.

The *Times* was a relative latecomer to the American newspaper industry scene. It began publishing in 1881 as the *Los Angeles Daily Times* when the city was but 30 years old. The first newspaper, the *Los Angeles Star,* begun in 1851 as a weekly published half in Spanish and half in English under the name *La Estrella de Los Angeles.* After taking highly controversial editorial stances—such as calling for Southern California to form a separate state and heavily criticizing the federal government during the Civil War—the *Star* stopped publishing in 1879 due to financial problems.

Like many newspapers of the era, a printing company, the Mirror, ran the *Daily Times*. The paper did not do well financially, partly because of competition from other publications including the *Los Angeles Daily News*—the first daily newspaper in the city—and the *Los Angeles Herald,* which would continue to compete through most of the twentieth century. The Mirror hired former military officer Harrison Gray Otis, a silent partner, to become its editor. Otis turned the *Los Angeles Daily Times* into a success and by 1886, he had become full owner and publisher. Otis bought and formed the Times-Mirror Company in 1886 and removed the word "daily" from the paper's masthead, making it the *Los Angeles Times*.

During the first half of the twentieth century, the *Times* secured its position as the dominant newspaper in the market. In the early 1900s, at least five morning and afternoon newspapers competed in the metropolitan area. Aside from the *Herald* and *Daily News,* the *Los Angeles Examiner* appeared in 1903. San Francisco publisher William Randolph Hearst started the *Examiner* in L.A. to counter the conservative leanings of the *Times* and promote Hearst's own national political aspirations. In 1922, Hearst bought the *Herald* and merged it with the *Evening Express,* making the *Herald-Express* the largest afternoon paper. The *Times,* still competing with the *Examiner* in the morning, countered with an afternoon tabloid, the *Mirror,* which later absorbed the *Daily News*. The *Mirror* folded in 1962 after Hearst countered by merging the *Herald-Express* with the *Examiner*. The *Herald-Examiner* remained the afternoon leader while the *Times* held the morning slot. But after bitter labor disputes, the *Herald-Examiner* stopped publishing in 1989, leaving the *Times* to reign as the sole large metro daily in the region.

In the early 1900s, Harrison Otis fiercely opposed organized labor and often was accused of using his paper as a political pulpit. That stance made the *Times* the target of union terrorists who blew up the newspaper's building in 1910, killing 20 employees.

The newspaper rebuilt, and Otis remained owner and publisher until his death in 1916. Somewhat of a real estate tycoon, Otis used his newspaper to encourage the city's growth and supported expansion of the city's water supply—an effort that was fictionalized in the movie *Chinatown*. After he died, his son-in-law, Harry Chandler took over the *Times* and began hiring a strong team of investigative journalists. The Chandler family dynasty continued to control the paper with Harry passing the torch to his son Norman in 1936. Norman Chandler continued his father's more conservative editorial policy, even publicly endorsing the encampment of Asian Americans in California after the bombing of Pearl Harbor. The *Times* won its first Pulitzer in 1942—a public service medal for the newspaper's campaign to clarify first amendment rights for freedom of the press.

Norman and Dorothy's son, Otis, became the fourth and final Chandler publisher of the paper in 1960. Otis Chandler focused on diversifying the Times-Mirror company, turning it into a national media powerhouse with a more centrist editorial policy. The company already had extended into broadcasting, forming KHJ—the area's first commercial radio station—in 1922, and KTTV, a television station jointly owned with CBS, in 1948. Chandler sold KTTV in 1963 to Metromedia, however, and focused on a news service partnership with the Washington Post Company. Chandler helped the *Times* fight off an attempt by *The New York Times* in the early 1960s to start a West Coast edition.

The *Times* would continue to expand, adding Orange County and San Fernando Valley editions. By 1990, the paper was the largest metro daily in the country; two decades later, the *Times* ranked among the top five newspapers in national circulation figures and was by far the highest-selling paper on the West Coast.

Economic pressure hit the *Times* at the turn of the twenty-first century because of competition from the Internet. In 2000, the Chicago-based Tribune Company bought the *Times* as part of an $8 billion acquisition of the Times Mirror Company. After eliminating 2,500 jobs from the *Times,* the Tribune Company continued to trim staff. Chicago real estate tycoon Sam Zell took control of Tribune in late 2007—and continued the cuts in Los Angeles and his other holdings. But even Zell could not keep the Tribune Company afloat. Faced with declining advertising revenue and $13 billion in debt, the company became the first major news organization to file for bankruptcy protection. Zell told reporters that the

December 2008 filing would allow the company to restructure its debt and move forward.

Alternative Newspapers and Magazines

Because of its diverse population, an ethnic press has thrived in the greater Los Angeles area. Specialty publications include the Spanish-language *La Opinion,* once owned by the *Times,* and *Hoy,* owned by the Tribune Company. The *Jewish Journal of Los Angeles Magazine* and the *Asian Journal* are also published in Los Angeles, along with a number of other small ethnic newspapers.

Regional papers also vie for readership with the *Times,* the largest of those being the *Orange County Register, Long Beach Press-Telegram*, and *The Daily Breeze* to the south, and the *San Gabriel Valley Tribune, Pasadena Star-News,* and *Ventura County Star* to the north. Los Angeles Wave Publications target neighborhoods as well with the *L.A. Independent* covering Hollywood news; the *Wave* also prints east, west, and northeast editions and the *Culver City Star*. *City Beat,* an alternative weekly newspaper, provides news, arts, and entertainment coverage in the greater Los Angeles area.

National publications focusing on the entertainment industry include *Variety* and the *Hollywood Reporter,* while business affairs are the focus of the *Los Angeles Business Journal* and *Daily Journal.* The magazine industry is not large in Los Angeles; however, glitzy monthlies targeted to wealthier residents include *Los Angeles Magazine* and niche publications such as *Bel-Air View, Beverly Hills 90210,* and the *Santa Monica Sun,* owned by Westside Today.

Hollywood and Celebrity Journalism

In the early 1900s, the fledgling film business began to relocate from the east coast to Hollywood, an area just north of Los Angeles previously known for its deserts, tar pits, and mountain ranges. Rogue independent filmmakers helped establish the region as the film capital after leaving the control of corporate studio owners in New York. The independents wanted an area with good weather, varied scenery, and a nearby border in case they had to flee lawsuits filed by studio executives.

By 1926, those filmmakers either had formed their own studios or merged with existing corporations. Hollywood became the location for 90 percent of the country's movies, and the film industry was a growing economic force. Universal City opened the same year five miles north of Hollywood on the Los Angeles River and became a popular location for shooting movies. Later, television shows would be taped there "on location" and Universal Studios would open as a popular tourist attraction about the movie and television industry.

The free-spirited, high-partying antics of Hollywood celebrities became notorious during Prohibition (1920–33) and were not viewed kindly by the print media. When comedian Fatty Arbuckle was arrested for the mysterious death of actress Virginia Rappe in San Francisco in 1921, Hearst instructed his reporters from both his San Francisco and Los Angeles *Examiner* newspapers to play up the alleged sordid details of the crime. The *Times* covered the Arbuckle incident but did not go into as many details as the *Examiner*. Those details proved to be false, however, as Arbuckle was acquitted for the murders. Nevertheless, the hunger for celebrity and tabloid style journalism had begun and many media outlets rushed to Hollywood to provide continuing gossip about the stars.

Celebrity journalism increased steadily throughout the century, reaching frenetic proportions after the rise of television and the proliferation of cable networks in the 1980s. Stars were easy to spot in L.A., and the audience seemed insatiable for news about their lives, lifestyles, and romances. What was once considered tabloid journalism went mainstream as Los Angeles became the base for popular entertainment news shows including *Entertainment Tonight, Access Hollywood, E! Entertainment,* and *TMZ,* which claims to cover Hollywood "as it really is . . . and celebrities as they really are." Paparazzi working for print publications such as *People* magazine and *Us Weekly* jostle for position on the streets as they try to catch incriminating shots of Britney Spears, Paris Hilton, or Lindsay Lohan out on the town.

Just as the Fatty Arbuckle case made headlines, celebrity trials continue to draw hundreds

of reporters to the courthouse in downtown Los Angeles. A near-circus atmosphere surrounded the murder trials of former football player O. J. Simpson in 1995 and actor Robert Blake in 2002, who were both later acquitted of killing their spouses.

The audience shows no sign of getting tired of celebrity news online. Gossip bloggers behind PerezHilton.com and Defamer.com have huge followings—in 2006, the *Los Angeles Times* named Defamer's Mark Lisanti one of the 50 most influential people in southern California.

Radio and Television

"This is the city," intoned *Dragnet*'s Sergeant Joe Friday at the start of the popular television show in the early 1950s. *Dragnet* was one of many television shows that originated on radio in Los Angeles and then moved to television. As home to the film industry and many movie stars, Los Angeles was a natural place for radio and television to blossom. The movie studios soon spawned television sound stages; the region's architecture, mountains, and beaches provided optional scenery.

When radio began most shows aired live from New York; with television in the 1950s, many shows were filmed on location in Los Angeles. The time difference between the East and West Coasts made broadcasting national shows live from the West impractical; some shows had to be performed again until recording methods (audiotape in the 1940s and videotape a decade later) were developed.

Nearly 100 AM and FM radio stations can be found in Los Angeles—ranging from Spanish-, Korean-, and Iranian-language formats to wider-appeal rap, adult contemporary, religious programming, news, sports, and talk.

In 1922, the first radio stations in Los Angeles were KFI, KNX, and KHJ, the latter owned by Times-Mirror for five years (it is now a Spanish-language station). KNX was purchased by CBS in 1938 and became its West Coast production headquarters, forming the site of what was to become Columbia Square on Sunset Boulevard. The station debuted an all-news format in 1968 and remains known for its traffic and weather "on the fives."

Clear Channel owns many stations in Los Angeles, including three of the top stations, KIIS, KOST, and KFI-AM—now a news and talk station that airs syndicated shows.

Los Angeles is the number one market for Hispanic radio programming; KSCA and KLVE, two of the top-ten radio stations overall, are owned by Univision, the nation's largest Spanish-language broadcast company. Univision's flagship West Coast television station, KMEX, consistently ranks among the highest of all stations in the market, regardless of language. KMEX-TV premiered in 1968 and paved the way for Spanish-language programming on television and features news, talk shows, dramas, and movies. Telemundo, an NBC enterprise, also operates an affiliate in Los Angeles.

Disney-owned KABC-TV dominates the local news market. Other television network affiliates include KCBS, KNBC, and KTTV (Fox). Los Angeles is one of the few cities where locally produced newscasts have thrived on independent TV stations. KTLA, the first commercial television station licensed in the western United States, began broadcasting in 1947, then owned by Paramount Pictures.

The station changed hands several times and was sold to the Tribune Company in 1985. A year later, KTLA became part of the CW network and in 2007 received its own star on the Hollywood Walk of Fame, marking its sixtieth anniversary. KTLA news anchor Hal Fishman, known as the dean of the Los Angeles media, died in 2007 after 47 years of reporting in the market. Other popular on air personalities include KNBC-TV evening anchor Paul Moyer, who has broadcast in the city since 1972, and KABC-TV meteorologist Dallas Raines, who began forecasting Los Angeles weather in 1984.

Conclusion

Los Angeles is home to the most powerful print and electronic media outlets west of the Mississippi. The film and television industries are key contributors to the national and regional economy, but the once influential *Times* has less impact on state and local politics than in the days of Chandler family control.

Even as the Internet provides increased competition for news audiences, the Los Angeles print and broadcast media continue to dominate the western United States and play a key role on the national stage.

Magazine Design

Magazines have personalities. Like people, they can be edgy, colorful, organized, friendly, authoritative, or elegant. A magazine expresses its personality through its editorial slant—the kinds of stories it runs, the actual words these stories use—and also through its design—its use of typefaces, art, photos, colors, space, paper, and even its binding. *Vanity Fair,* with artful celebrity photos running across spreads, art deco cover type, and use of red borders, says it's sophisticated but willing to take risks. *Esquire* magazine's design says it's masculine and stylish. *People* magazine's design says it's friendly and newsy. Even magazines covering the same general subject—sports, for example—have differing personalities: *ESPN,* with its larger-than-typical size, bold type, and strong cover portraits, says it's a sports magazine with an attitude. *Sports Illustrated,* with its smaller format and mostly action-shot covers, says it's about news.

These distinctions are important because magazines want to occupy unique niches so as to appeal to readers, and design is a key way magazines distinguish themselves from each other. Even so, magazines in the early twenty-first century are designed using the same elements and many of the same techniques as they did in the 1930s. Modern magazine design—design that weaves type, art, and space—is a product of the twentieth century and advances in printing technologies. In the 1800s, magazine formats were smaller, and pages featured one- or two-column layouts with titles centered on the page and illustrations made from woodcuts—art engraved in wood and pressed onto paper. Twentieth-century printing made it easier and less expensive to reproduce color and black-and-white photos and illustrations. It also allowed two design movements that took shape in Europe to make their way to America: modernism and Dadaism.

Early Influences

Modernists created the cohesive look of magazines. They saw stories as packages inside the larger package of the magazine. They were the first to design stories across spreads of multiple pages instead of just on individual pages; they reinforced story themes with art and type, and they used different type sizes on a page to create a hierarchy that would lead readers through a story.

While the modernists advocated order in design, the Dadaists (related to the art movement of the same time: 1914–20) advocated flexible, even chaotic, uses of type and art. The Dadaists invented the use of collage and photomontage in magazine design, and they were the first to place photos in a storytelling sequence, the essence of photojournalism.

Modernism was born in the Bauhaus design school in Germany. Founded in 1919, the school preached "form follows function," which means a magazine's visual personality should grow out of its editorial purpose and audience. The Bauhaus school promoted utilitarian design that featured

only the elements necessary to tell a story. Adolf Hitler shut down the school in 1933, but not before its influence had spread beyond Germany.

Parisian designer Mehemed Agha brought modernism to the United States in the late 1920s when Condé Nast hired him to reformat his two premier fashion magazines, *Vanity Fair* and *Vogue*. Agha did more than just design magazines: he exercised editorial and artistic judgment, which, in effect, made him the first magazine art director in America. He simplified the design of *Vogue* and *Vanity Fair* to emphasize the photos, and he ran photos and designed layouts across two pages.

Agha's work inspired other magazines to hire their first-ever art directors; the two most prominent in the 1930s were T. M. Cleland at Time, Inc. and Alexey Brodovitch at Hearst Magazines. Cleland was hired to design *Fortune,* which debuted in 1930. Like Agha, Cleland promoted an aesthetic that emphasized big, dramatic photos and unadorned layouts.

Brodovitch came to Hearst to design *Harper's Bazaar,* and his work there made him perhaps the most influential art director in American history. A Russian-born Parisian designer, he pioneered the use of bleed photographs (photos that print to the edge of pages) in magazines. He encouraged his photographers, including Irving Penn and Richard Avedon, to design pages through the camera lens and to put subjects on plain backgrounds so headings and stories could be printed directly on top of photos. Brodovitch wanted his magazine designs to have a musical feel.

Mid-Century Design

Through teaching and mentoring, Brodovitch and Agha educated the most important designers in the mid-1900s. This collection of designers became known as The New York School and heralded a period that historian William Owen has called the golden era of magazine design, from about 1945 to 1968. Brodovitch's and Agha's notable heirs included Cipe Pineles, art director of *Glamour* and *Seventeen;* Bradbury Thompson, art director at *Mademoiselle;* and Henry Wolf, who served as art director of *Esquire, Harper's Bazaar,* and *Show* magazines, and Otto Storch, who redesigned *McCall's*. Designers of this era used many of the same techniques: shaping type to look like objects, merging type with image on full-bleed photography and creating visual metaphors. For example, in a 1961 *McCall's* layout for "The Forty-Winks Reducing Plan," Otto Storch placed a photo of a sleeping woman on the top of text made to look like a sagging mattress.

In the 1960s and 1970s, magazine design headed in a new, less inspired direction, particularly in the 1970s. The economy began to struggle in the early 1970s and so did magazines, as advertising and readership dropped. Magazines became more commercial, seeming to shout louder to attract newsstand buyers. They amplified their cover designs with multiple sell lines pushing different stories and clashing colors, just as companies reduced the size of magazines to make them more economical to produce.

Even so, magazine design had its bright spots in this era, among them the work of Herb Lubalin, who designed or redesigned *Reader's Digest* and the *Saturday Evening Post,* among others. He also launched a magazine, *Avant Garde,* which gave birth to a still-popular typeface of the same name. Lubalin's work reflected the modernists' use of the spread and modular layout of photos, but emphasized type design more than the modernists did. Where golden-era designers might use one typeface for an entire magazine, Lubalin would change the typeface for every story. Like many designers today, Lubalin believed type should reflect story themes.

Walter Bernard and Milton Glaser also broke new ground in 1968 with their design of *New York,* a regional weekly magazine that combined activist journalism with strong visual expression. With the Vietnam War, the civil rights and women's rights movements, and the rise of television, Americans had a lot competing for their attention in the late 1960s. Glaser said he designed *New York* for the television generation, for readers with an attention span of seven minutes, the length of commercial breaks during TV programs. He gave the magazine a more functional design, putting advertising throughout, not just in the front and back; placing a lot more text on the pages; adding more interruptions such as subheads to help cue readers; and halting the practice of jumping stories to the end of the magazine.

Another magazine making waves during the 1970s was *Rolling Stone,* a music and counterculture monthly magazine. Its content wasn't new among so-called underground magazines, but its

design departed from the psychedelic style of other underground magazines. Perhaps more than any other magazine of this era, it emphasized type design over art, an aesthetic the magazine has continued throughout its history. Other magazines in the 1970s that featured strong design included *Psychology Today; Ms.,* which served the women's movement; and *Texas Monthly,* which was designed by Fred Woodward, who later became art director of *Rolling Stone.* All of these magazines had different visual styles: *Psychology Today* was known for its use of metaphorical imagery to explain science and technology, *Ms.* for its polished design, and *Texas Monthly* for its precise typography.

During the 1980s, the magazine industry began to regain its financial and editorial balance, which helped revive good taste and experimentation in magazine design. The U.S. edition of the fashion magazine *Elle* was among the most successful and best-designed magazines in the 1980s. Modernist, like its mid-century ancestors, and colorful, it used full-bleed photography, primary colors, and only one typeface, Futura. During the late 1980s, magazines began to rebel against the modular, spare layouts of the modernists and to revive the multilayered design of the Dadaists. Magazines such as *Spy,* a humor magazine; *Egg* and *Wigwam,* culture magazines; and *Esquire, Metropolitan Home,* and *New York* were more textured in their use of both typefaces and art and photographs.

The Computer Age

The advent of computers made the experimentation going on at many magazines easier. Apple introduced its first Macintosh in 1984, and by the late 1980s, the computer had transformed the design process at most magazines, although not always for the better. The late Henry Wolf once said the computer was "a seductive piece of equipment that too easily facilitates excess" (interview with author, 1994).

Excess certainly seemed to be the prevailing design principle at many magazines in the 1990s. While mid-century art directors believed that good design was the result of editing—of subtracting elements not essential to a story—many magazines in the 1990s seemed to believe that the best way to succeed was to try to spin faster than their competition. Covers featured as many as ten sell lines (headlines designed to attract readers) and six colors on top of a photograph. Inside pages also used abundant colors, decorative borders and typefaces, overlapping titles, and photos laid out at angles.

A few magazines did make a design impact in the 1990s, and key among them was *Ray Gun,* a wildly postmodern music and culture magazine. *Ray Gun's* then–art director, David Carson, created a magazine for a video-game generation of readers that was more interested in visual stimulation than readability. Carson was a rebel. He overlapped type, ran small text over photos, put type on its side, upside down, and backwards. He made every page completely different.

With the revival of Dadaist design in magazines such as *Ray Gun* alongside the modernist bent of magazines such as *Dwell* and *Real Simple,* no particular aesthetic dominates the twenty-first century. Roger Black, a pre-eminent art director in the latter part of the twentieth century (he has designed or redesigned such varied titles as *Rolling Stone, Newsweek, Reader's Digest, The New York Times Magazine, McCall's, The New Republic, Fast Company, Foreign Affairs, Advertising Age,* and *Esquire*) has said that since the 1967 launch of *Rolling Stone,* which inspired legions of young designers, no magazine has had a major impact on design.

Celebrity Covers

What have had an impact on magazine design in the view of Roger Black are celebrities, who, since the 1990s, have replaced the models that once dominated magazine covers. In 2007, entertainment/celebrity and fashion magazines accounted for about a quarter of magazines sold in the United States, and about a third of magazines' circulation revenues came from newsstand sales. Magazine newsstand sales are dependant on covers, and no one sells a magazine more effectively than a celebrity, some much better than others—Brad Pitt and Jennifer Aniston, to name two. Their marriage and breakup dominated the covers of magazines such as *People, In Touch Weekly, Life and Style,* and *US Weekly* in the early 2000s. As of 2008, *US Weekly's* highest-selling cover in its history was the February 7, 2005, issue, titled "How Jen Found Out," that sold 1.25 million copies.

Because it sells newsstand copies, a cover is considered a magazine's most important page.

Although their designs will differ, covers of most magazines have similar time-tested formats. Typically they feature one large photograph with sell lines that promote anywhere from four to ten stories inside. Designers believe the single image attracts the shopper's attention, but sell lines are what actually get someone to buy the magazine. Magazines keep track of newsstand sales rates for different cover subjects and often test cover concepts to see which will generate the most interest. Magazines will sometimes put different covers on newsstand issues in different regions to see which attract the most sales.

While designing covers is more an art than a science, magazines have learned a lot about what appeals to newsstand shoppers. A panel of experts in 1986, which included John Mack Carter, who had been editor-in-chief of *Ladies' Home Journal* and *Good Housekeeping,* offered a list of tips for creating successful covers: photos sell better than artwork; sex sells better the politics; timeliness is critical; solutions sell better than problems; and subtlety and irony don't sell.

Magazines in the twenty-first century still follow this conventional wisdom. Contemporary techniques also include using bright colors, plus signs, and numbers ("697 ways to kick-start your style"; "27 terrific summer reads"). Numbers are a graphic device that make magazine covers stand out. Magazines have learned that big numbers sell better than small ones, and odd numbers sell better than even ones because they seem more authentic to readers.

Ultimately, a cover's design—the typefaces, kind of image used, and logo design—depends on a magazine's editorial mission. A title like *Dwell,* a modern home design magazine, would feature a picture of a home, inside or out, often with a person or people in it. *Time* or *Newsweek* would feature an image related to a key news story or feature. These images often are conceptual photographs or illustrations. Since its start in 1925, *The New Yorker* has used only graphic or cartoon illustrations on its covers. Most men's and women's magazines such as *Esquire, GQ, Good Housekeeping,* and *Marie Claire* typically feature a celebrity. When people are used as cover subjects, they are nearly always looking directly at the reader because their eye contact draws attention.

A magazine's logo is positioned at the top of the cover where it will show above other magazines on the newsstand. Most logos consist of one or two words made large enough to be visible from 10 feet. A magazine logo is a brand much like a corporate logo; as a result, magazines rarely change them, although they may touch them up—adjust the spacing between the letters or type size, for example—to keep them looking current. *The New Yorker* has precisely the same logo it started with in 1925 and *Esquire* still uses a variation of its original cursive typeface. Occasionally, a magazine may create a new logo as part of a major redesign as *BusinessWeek* did in 2007. *BusinessWeek* replaced its serif logo (serifs are the strokes that extend from the ends of a letter) with one without serifs, a significant shift from a more conservative aesthetic to a more modern one.

Redesign

While a magazine's logo is designed to stand the test of time, magazine content and layout typically get redesigned every three to five years to stay current. Some redesigns are rejuvenations and others are major overhauls. Magazines redesign to attract new readers or keep existing ones, to show advertisers that the magazine is up-to-date, and to reflect changing editorial content. Major redesigns are done from the inside out; they involve changing a magazine's editorial content such as adding or eliminating departments, as well as creating a new or refreshed format. A new format may mean changing a magazine's typefaces, the kinds of art and photos it uses, and how it uses space.

Both *Time* and *Newsweek* redesigned in 2007 for the typical reasons: Newsweeklies have been losing subscribers and advertising to the Internet. *Time* underwent an extensive change to simplify the magazine's look and organization. It broke the magazine into four identifiable sections, revived use of Franklin Gothic, a sans serif typeface the magazine featured earlier in its history, and put more space on the pages, which the magazine's editor said had become cluttered. *Newsweek,* on the other hand, added to its print version, creating more space for longer stories and more photography.

Magazines on the Web

Magazine design is to the web as print is to a computer screen: an entirely different medium.

The challenge for online magazines is differentiating themselves from each other and from other websites. Most web magazines, whether they are online-only such as Salon.com or companion sites to print magazines such as *The New Yorker,* are designed using the same format as news and information sites. They feature a logo on the top, a list of links on the left, and content in the middle and top of the page.

What differentiates these publications from each other primarily is use of colors and typefaces, which are selected to match the magazine's personality. Salon.com, for example, uses red as its signature color, with black and gray for contrast. Nerve.com, another freestanding magazine, varies its format slightly: It has an illustration of a cityscape at night framing its content, and its home page uses photos with titles on the left to link to blogs and an index of other content down the middle. Print magazines design companion sites so they will have the same brand. They will use similar fonts and colors. *The New Yorker,* for example, has the same logo, accompanied by the illustration of Eustice Tilley, the tall-hatted character featured on the magazine's first print issue in 1925. *The New Yorker* home page is white, with black type and red spot color, and has the same cultured feel as the print magazine.

A breed of fashion webzines is designed to look like their glossy print counterparts, with pages that a reader "turns" by clicking on the screen. Titles in 2008 included Luxuryculture.com, Hintmag.com, and Fashion156.com. Some of these webzines have home pages similar to other websites, but their feature stories open in separate windows that look like magazine pages. Unvogue.com opens onto what looks like a magazine spread. One key difference, though: these magazines are a multimedia experience encompassing music, still photography, and videos.

All online magazines are designed to take advantage of the web's key attribute—interactivity. A 2008 story in Smashing magazine, a blog for web developers and designers, said usability, not visual design, determines the success or failure of a website. That's why the online version of *Domino* magazine, which focuses on home décor, invites readers to submit photos of their own spaces to be featured in an ever-expanding gallery, or why *Mother Earth News* asks readers to vote on covers and articles that will appear in its print version. And it's why virtually every online magazine has chat rooms and message boards so readers can interact. Smashing magazine suggests that good website design has white space, creates a focal point, and strives for simplicity and continuity, the tenets of good magazine design, regardless of medium.

A magazine's design ultimately is about connecting with readers and creating a visual connection with its editorial content. *Dwell* magazine, for example, looks very much like the modern homes it features on its pages—cool and open—and likely matches its readers' aesthetic. *Good Housekeeping,* with its busy pages and colors and photos of families, mirrors the lives of its readers, or at least the lives readers aspire to. Successful magazines reflect the way life is and the way readers want life to be. They try to capture the zeitgeist—the spirit of the times—and seek inspiration from the past. As Estelle Ellis, who helped launch *Seventeen* in 1944 and worked as a design consultant for 50 years, once advised, "Design on the basis of what you know and understand, but don't underestimate looking back to what was great in an earlier time. You have to drive with a rearview mirror. You have to design the same way."

Carol Holstead

Maps in Journalism

Maps are important to journalism because location is a key part of many newsworthy events. Local stories on home invasions, road closures, and zoning disputes have geographic elements for which words alone are often inadequate—readers want to be able to visualize where an event occurred as well as know what happened. And for stories about natural disasters and terrorist attacks in unfamiliar locations, maps can satisfy the editor's need for an illustration as well as the reader's thirst for details. In addition to small, straightforward displays relating a single location to a geographic framework of boundaries, place names, and nearby landmarks, maps describing multiple locations can enrich feature stories covering phenomena as diverse as rare-bird sightings, contaminated wells, and school attendance zones. And in addition to decorating the page or television screen while highlighting the report, a map can reveal potentially meaningful patterns as well as help readers assess the likely effect on themselves and loved ones. The best example of this ability to engage audiences while communicating efficiently is the weather map, which has well-established roles in print and electronic journalism.

Scale, Distortion, and Generalization

Maps work by condensing information about places and distances into comparatively small, highly generalized graphic representations. The ratio of map distance to ground distance is called *scale*. Sheet maps and atlas maps typically report their scale as a ratio or fraction such as 1:24,000 or 1/24,000, which means that an inch on the map represents 24,000 inches, or 2,000 feet, on the ground. Small-scale maps, with relatively small fractions like 1/100 million, require considerable generalization to reduce a large country, a continent, or the entire world to a display less than a foot wide. By contrast, a large-scale, 1:2,000 newspaper map two columns wide can show individual land parcels on a city block. Because viewers might not readily grasp ratio scales, large- and medium-scale news maps typically state their scale graphically, with a horizontal bar perhaps a half-inch long and a label indicating the corresponding distance. Bar scales on news maps generally represent a single distance, always in miles in American newspapers.

However appropriate on maps of neighborhoods or states, bar scales are potentially misleading on small-scale maps, where scale varies significantly from place to place as well as with direction. Flattening the spherical earth is a complex process, which requires drastic distortion of distance and shape. (On a rectangular world map, with a grid of evenly spaced meridians and parallels, north-south scale is constant while east-west scale approaches infinity near the poles—stretched from mere points into lines as long as the equator.) Although stretching is unavoidable on large-scale maps of neighborhoods or counties, geometric distortion is not noticeable if the map author selects an appropriate map projection. These maps are typically framed with a *conformal* projection, the type used for topographic maps and nautical charts. Because scale at a point is the same in all directions on a conformal projection, circles and complex curves can retain their characteristic shapes. And because the area shown is not large, distances and areas are not noticeably distorted. By contrast, conformal projections like the Mercator, used for nautical charts to portray constant sailing directions as straight lines, are not recommended for small-scale maps, on which they can severely distort area. The classic example of an

inappropriate map projection is the widely used Mercator world map, which portrays Greenland as roughly the same size as South America. Numerous projections suitable for whole-world or continental maps either preserve relative area or offer an appropriate compromise between distorted areas and distorted shapes and angles.

Generalization is unavoidable because map symbols are almost always proportionately thicker than the features they represent. Exaggerated width is blatantly obvious for boundary lines, which have no measurable width, and potentially troublesome for roads and streams. On a column-width news map covering a multi-county region at a scale of 1:1 million, a reliably visible line 1/50 inch thick requires a cartographic corridor nearly a third of a mile wide. To avoid clutter and confusion, the map author must separate nearby features as well as exaggerate some kinks and eliminate others—a meandering stream must look like a meandering stream, after all, even if the mapmaker must dampen curvature and reduce the number of bends. Which features are retained depends on the map's purpose. Good design requires a geographic framework of carefully selected background features as well as a graphic hierarchy in which essential features are more visually prominent than background details. Addition of a simple *locator inset* at a smaller scale can relate the main map to a wider, more familiar geographic frame of reference. A *detail inset* at a larger scale might be added to show part of the region more precisely.

Because of space limitations and the need to highlight relevant details, news maps are simpler and more focused than conventional reference and atlas maps, and complex map keys are rare. Instead of the environmental scientist's arcane symbolic codes, significant features might be identified with text-balloons similar to those in cartoons. (A prominent text-balloon at the top of a simple locator map can even substitute for a caption or headline.) Readily interpreted symbols include miniature highway shields to mark Interstate 95 and U.S. 40, interlocking brushstrokes to suggest tree cover, and color symbols that rely on familiar associations of green with vegetation, blue with water, and red with danger. Weather maps have their own readily understood conventions—simple pictograms predict rain, snow, or cloudy conditions for selected cities while spectral hues running from cold blue to warm red describe temperatures across the country.

History

Technological impediments explain the slow development of journalistic cartography. News maps were rare until the early twentieth century, when photographic engraving provided an efficient way to combine their idiosyncratic arrangement of lines and labels with words organized in lines and columns. In contrast to commercial cartography, for which comparatively intricate maps were engraved elegantly on copper plates or lithographic stones, newspaper maps were crafted by removing the non-ink areas from smooth blocks of soft metal or dense, durable wood to leave a "type-high" printing surface. Labels were either engraved crudely, letter by letter, or composed by inserting type characters in small troughs cut into the metal or wood. Town names on the famous Gerrymander map-cartoon (see next page), used to ridicule a purposely contorted election district and published in the *Boston Gazette* on March 26, 1812, were engraved individually, as were labels on the election-district map that inspired it, published three weeks earlier in the *Boston Weekly Messenger*. During the American Civil War (1861–65), daily newspapers met the demand for timely battle reports by having multiple artisans work on separate sections of large maps.

Mass-circulation daily newspapers, which became prominent in the late nineteenth century, could afford full-time illustrators as well as photo-engraving departments adept at supplying their high-speed presses with high-contrast line images, drawn in black ink and captured on film. (Halftone photographs, pioneered in the early 1880s by the New York *Daily Graphic,* were not common until the late 1890s.) Further down the urban hierarchy, small daily and weekly newspapers relied on news syndicates for maps, cartoons, crossword puzzles, and other illustrations as well as feature articles, short stories, and mass-market advertisements. Dispatched by train from a central engraving plant, thin metal stereoplates were integrated with local material from the newspaper's own typesetter—received as "boiler plate" and "edited with a saw," this inexpensive filler encouraged an explosion of local newspapers in late nineteenth and early twentieth centuries. Some syndicates

Elkanah Tisdale's classic Gerrymander map-cartoon, a take-off on a previously published election-district map. First printed in the Boston Gazette *on March 26, 1812.*

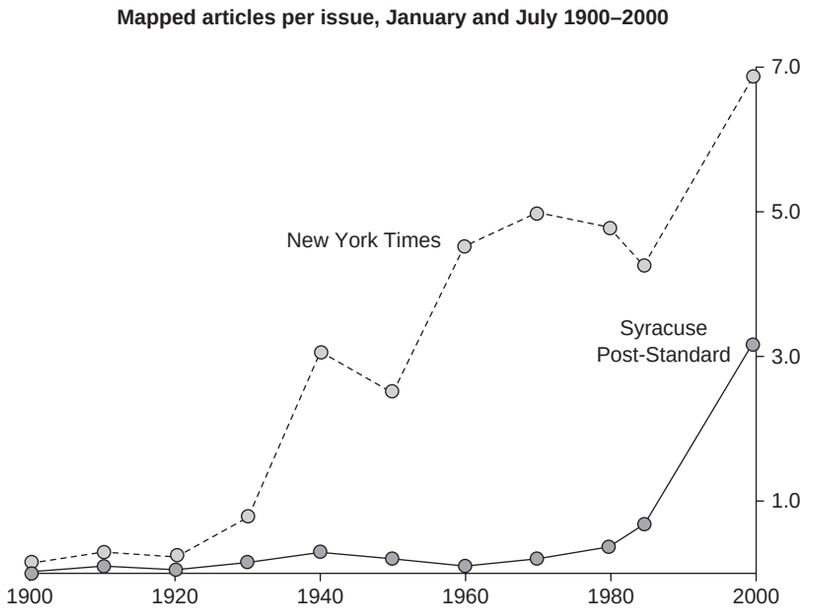
delivered features and serialized fiction, others transmitted more timely news by telegraph. News maps were infrequent, and rarely addressed local events. A feature syndicate might embellish a story about colonial activity in Africa or a forthcoming eclipse with a crude, hand-drawn map captured photographically, while an enterprising editor with a supply of stereotyped reference maps might add an X or Maltese cross to illustrate a wire report about a natural catastrophe on another continent.

In January 1935 the Associated Press launched its WirePhoto network, which opened opportunities for more timely news maps. Although the facsimile transmission system was designed for continuous-tone photographs, rather than line drawings, AP artists learned to create graphically stable labels and line symbols. Separate weather maps for morning and afternoon newspapers were among the 50 or more images transmitted daily. One of the system's first news maps focused on the Saar Basin, site of a forthcoming plebiscite. Although the map situated the Saar between France and Germany and included portions of five other countries, lack of a bar scale made it difficult to judge the area's size and proximity to Paris and Frankfort. During World War II and the Korean War wire-service maps provided eager readers with a carefully censored, at-a-glance picture of the fighting. Several AP competitors entered the facsimile-photo business in the late 1930s, but few small daily newspapers were connected to a news-photo network before the 1950s, when the Fairchild Camera and Instrument Corporation introduced a comparatively inexpensive receiver/engraver.

Competition and new technology continued to transform journalistic cartography. After television, traffic congestion, and more hectic lifestyles killed off most big-city afternoon newspapers in the 1960s and 1970s, the surviving morning dailies repackaged their content in a multitude of sections with specially designed front pages and abundant graphics. The Associated Press and United Press International encouraged this "design revolution" by increasing the amount and quality of graphic artwork offered subscribing publishers. In the 1980s smaller newspapers responded to the perceived threat of *USA Today,* a national newspaper with a brilliantly colored, full-page weather package, by investing in color presses, while larger newspapers retrofitted their letter presses for run-of-press color. Maps helped art directors enliven a section front with a controlled splash of color, but the most prominent beneficiary was the weather map. For example, at the Syracuse *Post-Standard,* a medium-size daily that replaced its presses in 1998, color enhanced only 30 percent of the 3.2 nonweather maps printed on an average day in 2000—up markedly from .7 in 1985. And at *The New York Times,* where the same rate rose from 4.3 in 1985 to 6.7 in 2000, only 13 percent of the millennial year's maps were in color (Monmonier, "Pressing Ahead"). The "Old Gray Lady" had capitulated to weekday color in 1997, largely to appease advertisers, but the most obvious cartographic impact was its delicately colored weather map.

Of the diverse factors underlying the increased prominence of newspaper maps, electronic computing was the most influential. The catalyst was the Knight-Ridder-Tribune (KRT) syndicate, which began distributing MacDraw graphics over a dedicated network in 1985, a year after Apple introduced its Macintosh computer. In 1987 the Associated Press encouraged subscribing



Mapped articles per issue

Source: Tabulated and created by author.

newspapers to download Macintosh graphics over an 800-number telephone line. Smaller newspapers that purchased a Macintosh and laser printer for downloading and customizing AP or KRT graphics quickly learned to illustrate local news with maps. Because subscriber loyalty hinges on detailed local coverage, it's hardly surprising that in the year 2000, local or regional events accounted for 87 percent of the Syracuse *Post-Standard*'s maps.

Maps in Contemporary Journalism

Driven by events, deadlines, and intense competition for readers' attention, news maps are functionally different from their counterparts in commercial and scientific cartography, and require a distinctive terminology. A key division separates *fact maps,* which include most simple location maps, from *explanatory maps,* which are inherently more complex, and might even be used (perhaps with a caption) as sidebars or self-contained, "stand-alone" graphics. *Anticipatory maps,* which address forthcoming events as diverse as local marathons or overseas invasions, enjoy a comparatively generous lead time, often reflected in engaging designs and elaborate details. Small and largely decorative maps serve as *factoids* or "fever charts" (a term coined by Nigel Holmes while art director at *Time* in the 1980s) or as "standing sigs" (signature graphics) used daily to identify regional or world news briefs. Larger, more elaborate illustrations that combine geographic information with aesthetic appeal qualify as "flavour graphics" (a term introduced by Harold Evans, who edited *U.S. News and World Report* in the late 1990s), a genre especially common in travel magazines, the Sunday travel sections of large metropolitan newspapers, and weekly news magazines.

A newspaper's cartography has a distinctive look because the design specifications that standardize its typography, headlines, and page layout include the type, symbols, and frames of its maps. Style guidelines for maps not only contribute to an integrated visual appearance but also minimize delay and confusion when breaking news requires a map. Because cartography is a prominent part of a newspaper's overall design, some art departments impose the house style on maps from syndicates and wire services like the Associated Press, which has its own distinctive cartographic style.

Despite advances in desktop mapping software, which would empower reporters as mapmakers, news publishers tend to treat maps like photographs and other images—as illustrations developed by specialists working in an art department outside the news room. Some newspapers have a

separate graphics department that is responsible for maps and other information graphics or a "graphics editor" who mediates between the news desk and the art department. Elsewhere the integration of illustrations and art relies on informal alliances—inviting the art director to the daily editorial meeting is a common concession. Because reporters and editors are rarely trained in graphic design and mapmaking, this division of labor is likely to persist. Even so, some newspapers committed to investigative reporting acquired a geographic information system and made the software available to reporters covering crime, elections, or the environment. The resulting maps are often team efforts involving reporters, editors, and graphics specialists.

Electronic journalism also uses maps. Despite poor resolution and troublesome receivers, television broadcasters had used maps sparingly since the 1950, mostly for weather reporting. Electronic graphic systems developed in the 1970s could generate simple locator maps—now in color, with improved contrast—as well as animated sequences with few labels. Dynamic cartography became the backbone of local and national weathercasts, where on-camera meteorologists interpreted an otherwise confusing mélange of animated forecast maps and Doppler radar displays. The Weather Channel, launched in 1982, combined a region-by-region canvass of weather and its effects with customized updates, advertised relentlessly as "Local on the Eights." Traffic reports and war news also benefited. Animated maps crafted with guidance from retired military officers helped network newscasters cover the run-up to the Gulf War of 1991 and the Iraq war. Google Earth, a web-based mapping tool introduced in 2005, merged fly-over animation with satellite imagery, and was quickly adopted for dramatic introductions to unfamiliar locations. Newspapers, which saw Internet distribution as essential for survival, enhanced their websites with interactive election maps and other dynamic displays.

Conclusion

News maps demonstrate that location matters. Their increased frequency and expanded role reflect changes in publishing economics and information technology as well as growing awareness of geography as news and of information graphics as visual decoration. The Internet's prowess in disseminating interactive, customized news reports has opened new opportunities for journalistic cartography.

MARKETING

Marketing is the customer-oriented process of creating, pricing, distributing, and promoting goods or services. Over the years marketing has evolved from its dedicated, process-oriented roots to become a distinct and integrated component that drives the output of every organization. The American Marketing Association defines marketing as "an organizational function and a set of

processes for creating, communicating, and delivering value to customers and for managing customer relationships in ways that benefit the organization and its stakeholders."

For news media organizations, marketing accomplishes three important and interrelated functions: (1) to identify and create, distribute, and promote their products and services to answer to the informational, educational, and entertainment needs of their audiences; (2) to market their products and services to advertisers and third parties; and (3) to increase brand awareness and develop strategies to promote organizational growth.

Both journalists and marketing practitioners use media channels to deliver information to their audiences. This proximity, combined with the need for media organizations to actively compete in the marketplace, has blurred to some extent the differences between marketing and journalism yet at the same time, has diversified and modernized both fields. The advent of new communication channels since 1990 has made it even more difficult to draw a clear distinction, at least from an applied perspective.

Marketing forces continuously shape the journalist's world as the consumer's need for news and informational channels dynamically change. Traditional print media outlets, such as newspapers and magazines, major employers of journalists, have been relatively slow in adapting to modern business models, and to recognize and accept the power of marketing. In an era of troubled media and general economics, marketing becomes even more important.

Journalism deals with information and has a duty to present accurate, factual, and balanced reporting and analysis of news events to its audience. Marketing, on the other hand, and especially the "promotion" component, deals with persuasion, with the need and duty to generate or increase brand awareness and brand recognition, increase product or service recognition and demand, and ultimately increase sales. Journalism at its roots is descriptive, marketing is persuasive. By the end of the twentieth century, information had become a commodity requiring effective packaging to be attractive to its intended audience. Today, content must resonate with audience needs and values. Given the quest for earnings, journalism cannot survive without marketing.

To complicate the picture, news media organizations make a significant portion of their revenues not only by selling information to readers (or indirectly to viewers), but by selling audiences to advertisers. Thus, as news media compete for customers for their advertising time or space, they must provide a news product which, using marketing terminology, must be tailored to the needs of the business (advertising) audience, with a competitive price structure, and adequately promoted. Thus a conflict arises between the need to be objective, tell the truth, and inform, and the need to have a profitable business model and play a part in delivering third-party marketing-driven persuasive messages to readers or viewers that seek the media product because of its perceived informational value.

Business entities, on the other hand, employ journalism techniques to enhance the appeal of their public relations releases so they are more likely to be selected for inclusion in the news. Research in 2005 estimated that about 44 percent of news editorial decisions in the United States are influenced by public relations practitioners. This is a significant figure that adds to the pressure news media get from their advertising clients. This relationship reflects the balance of power between journalism and marketing in news media organizations. According to data from a survey of marketing professionals conducted in 2008 by Millward Brown for *PRWeek,* 19 percent of senior marketers confirm their organizations have bought advertising space in media outlets in exchange for coverage in news stories; furthermore, about 10 percent of the same marketing professionals state they had a verbal agreement with reporters to buy advertising space in anticipation of positive news coverage of their company. These findings highlight another concern: the ethical dimension. As pressure on news media from market forces increases, journalists have to walk a continuously thinning line between sound journalism principles and coping with increasingly demanding organizational pressure to deliver a "sellable" product.

In order to respond to the demand of increased competition among traditional and newer news outlets, media organizations apply marketing principles not only to promote their products, but to the basic core of how news and editorial content is written and collated. The trend at the beginning of the twenty-first century is changing from "delivering information" to "making information resonate

with the audience," or packaging news to best meet the needs and values of advertisers and consumers. The change can also be seen with the increasing number of journalism schools now offering marketing courses, and teaching news and information from more of a "market oriented" perspective.

Origins

The development of marketing can be traced through two distinct dimensions, one academic and the other functional.

According to Robert Bartels (1988) the academic evolution of marketing went through eight decade-long periods, starting in 1900. The academic evolution of marketing is important as research and education provided an understanding of market forces.

The early years to 1910, or the discovery period, saw the first marketing courses in American colleges and the first published reports on price and distribution of agricultural goods, a first in utilizing the scientific method to explore the existence and interaction of market forces. The second decade of the twentieth century, or the conceptualization period, focused on researching and understanding of basic marketing processes and institutions and the role of products in the market. The period of integration in the 1920s was a time of assimilation of knowledge from sales management and advertising, thus creating the premises for further development of marketing. During the 1930s (the development period), the first comprehensive marketing theories were postulated and the *American Marketing Journal* was first published in 1934. The 1940s was a period of reappraisal, marking theoretical development, and evolution of marketing from individual processes to a more integrative and systematic approach. The following decade built upon previous development, and saw a refining of marketing knowledge with new theoretical work and development of modern marketing perspectives. The main achievements of the period of differentiation during the 1960s were the incorporation of quantitative research methods into marketing research and the extensive development of marketing models. The period after 1970 was marked by a realization that, at any societal level, interaction between organizations and their stakeholders may profit from implementation of marketing techniques; this period also witnessed development of social marketing as a distinct component.

The early twenty-first century development of communication technologies and the increased utilization of online social networks (with millions of users, no geographical boundaries, and intimate targeting potential) may mark another period in marketing's evolution. To further underline parallels between marketing and journalism, the same determinants irreversibly influence the way consumers seek information: user-generated content, almost nonexistent 15 years ago, represents over half of the media consumption of young people. Message boards, blogs, instant messaging, and the like are but a few of the new outlets where people seek news and may trigger a revision of the position of the journalist in society.

According to Robert Keith (1960) the real-life business impact of marketing can be segmented into three main periods. Some marketing scholars have questioned this historical perspective, although it is widely accepted and included in many marketing textbooks.

The first period (product oriented), triggered by the industrial revolution, extends to the beginning of the twentieth century. In an age of newly discovered mass production means and high demand, the main orientation of organizations was to design new products and make these quickly available to the market. The sales oriented period lasted from the 1920s to the early 1950s and was defined by the Depression and all the market turmoil that it generated. Diminishing purchase power and an abundance of products generated a sharp decrease in demand, forcing organizations to concentrate on sales. This is the great era of personal selling and the golden age of advertising.

The marketing oriented period of the past half century has been fueled by the realization that, in order to be successful in a market saturated with products and sales pitches, you must deliver to your customers what they want. This reorientation of the functional marketing philosophy has consumer characteristics and present and future needs as the focal point. This has, indeed, been a golden era of consumer research.

The Marketing Mix

At the core of any marketing plan resides the concept of marketing mix. This notion is as important

for a news media organization as it is for a retailer or manufacturer. Although perhaps not perceived consciously, the marketing mix is what drives how news is gathered, packaged, promoted, and distributed, thus influencing company policies and procedures, and in the end, the journalist. Postulated by Harvard Business School professor Jeremy McCarthy in the 1960s, the marketing mix comprises four elements: product, price, place, and promotion.

Product represents the actual specifications of the goods or services offered to the customer and the congruence of these specifications with the consumer's needs and values. Some of the most important variables that must be considered are brand and quality, functionality and design, packaging and warranty, and postsale service and support.

Price represents the perception of exchangeable product value for the customer and the process of determining that value, including any financial incentives that may be associated with the actual selling process. Variables that must be considered include list price, gross and point of sale (POS) discounts, financing and leasing options, and allowances.

Place denotes the process of bringing the product or service in contact with the customer, at the right time, in the best place, and in the required quantities. This component of the marketing mix is sometime called "placement" or "distribution." Variables that must be considered include locations and logistics, distribution channels, and market coverage.

Promotion refers to the process of informing, educating, and persuading selected target audiences about the organization, the product or service, and the brand. It uses a complex arsenal of research, communication tools, and strategic thinking. Some of the major variables that must be considered include message development, advertising and public relations, media plans, and media channels.

The Extended Seven P's

The development of the service industry during the final decades of the twentieth century influenced changes in the marketing mix, which needed to adapt to new market realities. A departure from the traditional four P's marketing concept is the seven P's marketing mix, which adds people, process, and physical evidence to the traditional blend.

People. This concept has dual significance. On one dimension, it stands for any representative of an organization or its affiliates, distribution chain representatives, or service personnel who comes in direct contact with the consumer and may influence the overall satisfaction or perceived value of a product or service. Additionally, it means the consumers of a product or service, for their perception of the value of their purchase may influence other potential customers. The increased use of online discussion groups during the first half of the first decade of the twenty-first century and the exponential increase in users of online social networks during the second half of the same decade underscores the power of individuals in influencing the marketing of a product or service. This is of extreme importance to the journalist. As people migrate from traditional news media, accounting for how people seek news from the multitude of available outlets influences how a journalist prepares a story and how it gets distributed. Furthermore, the explosion of user-generated content is threatening the core of the journalism profession. A strong trend of personnel downsizing at news media companies has been evident since 2004, with much of the former content being replaced by news generated freely by news consumers.

Process. This concept, specific to the service industry, addresses customer satisfaction from the perspective of the service process itself. This approach takes into account the intermediary steps needed to obtain the desired outcome, especially as customer interaction may be significant during the process. From a journalist perspective this translates into transparency and responding to consumer questions and comments.

Physical Evidence. This concept is a direct complement of the "promotion" found in the classical four P's model, and it is also particular to the service industry. Demonstrations, endorsements, testimonials, and case studies highlight the fact that a service is intangible and its value is hard to evaluate prior to its delivery. Nothing could be more relevant for a journalist, especially for stories posted online: the story has a comments and a ratings field; any reader can post a comment and leave a rating. Major news search engines may rank their stories based on user reviews; endorsement by a member of

an online social network may stimulate further distribution of the story within the network.

Integrated Marketing Communications

As noted, communication is an integrant part of marketing. Diversity of media channels and audiences and interaction between the two has created the need for organizations to present a consistent and coordinated message. Integrated marketing communications can be defined as the process of coordinating promotion with all other marketing efforts in order to deliver the maximum persuasive and informational impact on targeted audiences. Integrated marketing communications practitioners take advantage of any new medium that may enhance and/or focus the delivery of their message—such as the usage of highly targeted promotional materials via online delivery or database marketing. The overall businesses' openness to communication plus the need to interact with news outlets in a language and a format they understand has created a need for experienced journalists—many of them currently working as communication officers in businesses.

Conclusion

Marketing and journalism both serve audiences' need for information, and their strategic congruence has assisted the survival of news media organizations during economic downturn and increased competition. Perceiving the needs and values of the consumer as essential determinants for news reporting and information delivery, thus implementing modern principles of marketing in the daily activities of media organizations, has increased the quality and appeal of reporting and editorial content.

Mass Media, Decline of

The term *mass media* refers to the channels and institutions of mass communication that produce and deliver media messages to a large, heterogeneous, and scattered "mass audience." The term originated in the 1920s with the creation of countrywide radio networks, mass-circulation newspapers, and magazines. In the twenty-first century, the term *mass media* is used to describe a much broader array of both print and electronic media, including television, film, radio and sound recording, books, and magazines, as well as so-called new media, such as the Internet and video games. However, as new media proliferate, three interconnecting trends—audience fragmentation, specialized media content, and content customization—are challenging and reshaping conceptualizations of the terms *mass media* and *mass audience*.

Audience Fragmentation

Audience fragmentation is often described as the process through which large, heterogeneous audiences are divided into smaller groups who consume specialized media content from an increasing array of media outlets. Today's overall audience is not smaller but is far more divided up among a vast range of individual media, outlets, and messages. In turn, some scholars argue that the

audience is becoming less "mass." For example, prior to the onset of cable television, there were but three national networks (e.g., ABC, CBS, NBC) from which to choose. During this period—well into the 1960s at least—the term *mass audience* indicated a vast and heterogeneous group of people, consuming more or less the same television content at the same time, and thus sharing a similar viewing experience. Four decades later, however, with the growth of cable and satellite television, the number of video entertainment and news choices has skyrocketed, thereby making it increasingly difficult for any single message to capture a mass audience. Furthermore, relative to broadcast television and radio, entertainment and news content on the Internet operates in an environment that is especially conducive to audience fragmentation.

Specialized Media Content

As our media options multiply, many of them are becoming increasingly specialized in content. At the start of the twenty-first century, we are witnessing a transition where legacy broadcasting is being supplemented and may be replaced by narrowcast services, where specialized media content attracts a smaller and more specific audience demographic. For example, cable television has entertainment channels that appeal specifically to African Americans (e.g., BET), sports fans (e.g., ESPN), and preschoolers (e.g., PBS Kids Sprout), among others. Cable news service has grown increasingly specialized as well, with CNN offering 24-hour news coverage, C-SPAN covering the U.S. Congress and related hearings, and Fox News known for its more conservative coverage. The Internet, even more than cable television, provides a seemingly infinite number of media choices, both entertainment and news, targeting highly specialized audiences.

Content Customization

Perhaps more than any other mass communication technology, the Internet makes a seemingly unprecedented amount of content available to the user. At the same time, the Internet offers the user more control over both content creation and selection (let alone time of use) and typically does so at little or no cost to the average person. Thus, not only does the Internet's sheer volume of specialized online content further fragment audiences, but it also offers the user the possibility to create their own messages (via blogs, message boards, personal websites, and so on), thereby giving the user an extraordinary level of control. At the same time, the Internet and other technological advancements (e.g., iPods, heavily featured cellphones) allow for an exceptional level of user customization. The Internet, for example, affords users the ability to personalize their online news services to receive only those items that conform with their preferences. Furthermore, most online news websites include features (e.g., menu, hyperlinks to related stories, searchable archives of content) that enable users to locate further information to suit their individual needs. This huge menu of service options often renders it easier for the user to seek specific issues online than in legacy news media outlets.

Implications for News Consumption

Audience fragmentation, specialized media content, and content customization have important potential implications on general media consumption, and more specifically, news. For instance, while some media scholars celebrate audience fragmentation and specialized media content for their democratic potential (i.e., more voices, more perspectives, etc.), other critics view these trends as two of the most significant obstacles to the media's role in contributing to a national identity. In other words, as we become increasingly fragmented into smaller demographically targeted groups, what may become of our sense of national culture, society, or politics? Other critics argue that fragmented audiences are highly unlikely to consume a common intake of news content, thereby potentially leading the vast majority of the public to be underinformed about vital issues facing the country and the global community. Many critics posit that with the growth of increasingly specialized cable channels and the Internet, people will select only news content that conforms to their own specialized interests and biases; in fact, there has been some research showing evidence of this trend. In 1996, sociologist Elihu Katz argued that specialized media content and individualized use "seems to be fast displacing national comings together, and pleasure seems to be pushing public affairs even more out of sight." These trends, critics suggest, may jeopardize the

very foundation of government based on citizen awareness and political involvement.

While many online news readers welcome the once unprecedented level of news customization, many critics view this as a trend with potentially damaging consequences. Such a tool runs the risk of limiting readers to very specific points of view and makes it harder for them to discover new viewpoints or topics of interest. Such concerns are real. Research shows that college students who read customized online versions of *The New York Times* read fewer international and national political reports than readers of the traditional printed version. A leading voice in this discussion is Cass Sunstein (2001), who has suggested that Internet users' growing ability to customize their political information may have a polarizing effect, with people becoming less likely to encounter arguments and information that challenge their political opinions. Thus, much like the fears surrounding audience fragmentation and specialized media content, content customization raises concerns about the future of national culture and political awareness.

Given the growing trends of audience fragmentation, specialized media content, and content customization, some observers wonder whether these changes signal the decline of mass media. Clearly, the abundance of media options, coupled with the unique characteristics of newer services, are challenging and reshaping our conceptions of both "mass" media and "mass" audiences. Yet others steadfastly argue that the terms *mass media* and *audience* still apply on the grounds that both traditional media and newer services are reaching relatively large, heterogeneous audiences. One must consider that even a television show that "fails" in the ratings can still reach three million households. Likewise, a video posted on YouTube holds the potential to reach an unprecedented portion of the global Internet community. There are, no doubt, cases in which current events reported in the news have captured the attention of a truly mass audience. The news coverage of the terrorist attacks on September 11, 2001, is a prime example of media's ability to pull seemingly fragmented audiences together. Clearly, while the explosion of specialized content renders it increasingly difficult for any one media message to reach a sizable portion of the population, the potential still exists for a powerful message delivered by the right medium in any given context to reach a mass audience.

Media Access

See Access to Media

Media Accountability Systems

A media accountability system (M*A*S) is a relatively recent concept. It gathers a wide diversity of

existing non-governmental organizations (NGOs) whose unifying purpose is to improve news media. Among the better known variations are correction boxes, press councils, news ombudsmen, and even books attacking press misbehavior. An M*A*S can be an individual (such as a media reporter) or a structured group (like a television viewers' association). It may consist of a single document (such as a code of ethics), a critical report, or a censorious blog on the Internet. It can also be a process, either short (like an ethical audit) or long (like a university education).

Although the terminology is recent, forms of M*A*S have existed since the press was born. Why, then, pay more attention to them now? For the same reason that there are more of them: it is widely believed that news media are not yet good enough for democracy to function well, though the survival of civilization may be predicated on the extension of democracy. So a crucial issue is how to help news media to better inform the public. Both a free market and limited legislation that avoids abuse of freedom are indispensable, but neither can deliver a quality press. Worse, either one can be dangerous: consider what state tyranny did to Soviet media, and what near total deregulation has done to American media since the 1980s.

A third force is developing in journalism, called "media accountability." That concept embraces "ethics," an individual journalist's sense of right and wrong; "media ethics," guidelines drawn up by the profession in order to better serve the public; and "quality control," the techniques used by a manufacturer to satisfy and retain his customers. Media accountability involves the public and in that way is quite different from "self-regulation," which has rarely proved efficient. Media users are also voters and consumers: they can wield great influence on media but they have rarely done so.

The basic M*A*S, media codes of conduct, started being drafted at the turn of the twentieth century when "mass media" and commercialization spread. Today, probably no nation on earth is without some kind of media code. In the United States, most major newspapers have one of their own. Reading hundreds of them from around the world leads to the conclusion that they all essentially agree. With few exceptions, what is wrong and right in journalism are the same in every democracy. So the main problem is not in defining the principles or justifying the rules of journalism, but in getting media owners and journalists to respect them. And since history teaches us not to trust the government, its police, and its courts, the focus has to be on *non-governmental* means to enforce the rules—M*A*S.

The purposes of the existing M*A*S are not limited to the enforcement of code rules, however. The situation may be summarized in six points:

1. The goal is quality information, sorely needed for democracy.
2. Quality information depends largely on the quality of journalists.
3. The quality of journalists requires that they resist both political and economic pressure.
4. To resist, they need to bring two forces into play: solidarity within the profession and public support of the profession.
5. Public support will only be made available if the public feels trust and esteem toward the profession.
6. Trust and esteem require three conditions: that quality services be provided, that journalists listen to the public, and that journalists feel accountable to the public for what they do.

Many argue that journalism needs to be redefined. Input from consumers, researchers, and academics needs to correct the old-fashioned kind of news coverage still widely practiced. Those old approaches include such distorting practices as "iceberg journalism," which covers only the small visible part of reality while generally ignoring the much larger part under the surface, the quiet trends and processes that are transforming society. Another practice is "negative journalism," which focuses on the coverage of conflict, violence, failure, disaster, death, and suffering. And a third problem is the generation of "infotainment," or covering that which is interesting and ignoring what may be far more important. Law and the marketplace can do little, if anything, to correct such failings. M*A*S can.

Evaluation: Positive

While their purpose is the same, M*A*S use one or more of four approaches. Evaluation is one:

media criticism is as old as media, rarely appreciated by newspeople but indispensable just the same. Education is another, both that of the public and that of professionals. Journalists should never stop training, through courses, conferences, publications, and on the job—to become both more competent and more aware of their responsibilities toward society. Monitoring is a third approach: rank-and-file media users, independent experts, and academic researchers should provide long-term examination of media, reliable in-depth analyses, and serious studies of media effects. Last is public participation or intervention. There are many paths for this including "Letters to the Editor," an op-ed page for minority voices, online message boards annexed to published stories, meetings with professions that may conflict with the media (such as the police), and questionnaires sent to people cited in news stories.

M*A*S are amazingly diverse (see table). They can be internal to media organizations, such as an editor's memo to his staff, or external, such as a "journalism review" based on a campus (*The Columbia Journalism Review* is a renowned example), or they can involve cooperation of profession and public, such as a regularly consulted panel of readers or listeners.

One may also distinguish between M*A*S that function at local or regional or national or international level—or even on all four (as with some press councils). Or one can distinguish between those that produce an immediate effect (such as a correction box), a short-term result (like an awareness-raising session), or a long-term impact (such as higher education).

M*A*S are flexible and can easily be adapted to circumstances. Some ombudsmen, for example, write a regular column about the complaints they receive and consequent action they take, though many do not. Critical blogs come in all shapes and sizes. M*A*S complement each other: while none is sufficient alone, a few can be strikingly efficient, and all are useful. And they can function with one another, forming a vast though loose network for quality control. The best approach is not to choose among them but to incorporate all, much like weapons in a war. There is no alternative.

Last but not least, experience shows that, contrary to frequent accusations, M*A*S are

Table 1 Three Types of Media Accountability Systems

*1. Internal M*A*S*	
Correction box, column	Code of ethics
Media page/program	Ethics committee
Letter from the editor, sidebar	Disciplinary committee
Behind-the-scenes blog	Training to organize
Newsletter to subscribers	Whistle-blower
Media reporter	Newsroom committee
Consumer reporter	Media observatory
In-house critic	Order of journalists
Daily self-critical report	Company of journalists
Investigative panel	Assoc. of specialized reporters
Media weblog by journalist	Assoc. of publishers & editors
Evaluation commission	International defense org.
Filtering agency	Publishing foreign material
Internal study of issues	Foreign views on own country
Readership survey	Nonprofit newspaper
Ethical audit	[Public broadcasting]
Ethics coach	[International broadcasting]
Internal memo	[Quality service-oriented media]
Awareness program	

*2. External M*A*S*	
Media-related website	Public statement by VIP
Readers' info blogs	Higher education
Critical blogs	Required ethics course
Blog by sources	Nonprofit research
Alternative media	Opinion survey on media
Satirical news show	Media-at-school program
Daily report on media	Media literacy campaign
Journalism review	Media literacy website
"Darts and laurels"	Consumer group
Critical book/report/film	Association of militant citizens
Guides to influence	Monitors for profession. groups
Watchdog's watchdog	Media-serving NGO
Petition to pressure media	[Royal commission]
Ad hoc federation	[Indep. regulatory agency]
*3. Co-operative M*A*S*	
Letter to the editor	Citizen on board
Online message board	Club of readers/viewers
Outside media columnist	Local press council
Ombudsman	Annual conference
Complaints bureau	Seminar on media criticism
Listening session by editors	Training foreign bloggers
Accuracy & fairness question.	Yearbook on media crit.
Annual self-audit report	National press council
Grading the news	National ombudsman
Media barometer	Liaison committee
Paid advertisement	Occasional demonstration
Encounter with public	Media-related association
Website for public reaction	International cooperation
Panel of media users	Training NGO
Inviting in readers	Multipurpose center
Readers choosing Page One	Continuous education
Citizens journalism	Bridge institution
Radio clubs	Prize or other reward
Journalists' e-mail and phone

harmless—which cannot be said of the law or the marketplace. This is a crucial point.

Evaluation: Negative

In spite of these assets, M*A*S often seem to be largely ignored or rejected. Many large democracies including Brazil, France, and Japan lack a press council. Very few have journalism reviews or periodicals mainly devoted to media evaluation. Over half of all countries (Germany is but one) report "no ombudsman here." There are fewer than 300 journalism reviews for the tens of thousands of media outlets (again, Germany, for instance, has none).

Given their potential, why are there so few M*A*S? A chief obstacle is ignorance. Most people, even many inside the media, have never heard

of an M*A*S. And if they have, they may dislike them simply because they are new and seemingly offer a threat to media independence. Another problem is that M*A*S are focused upon rendering accounts to clients (the general public), which few professionals appreciate.

Generally speaking, what are M*A*S accused of? They are said to be purely cosmetic, more a matter of public relations than real effect. But if that is so, why should media decision makers be hostile to them? Paradoxically, M*A*S are also considered dangerously radical, a leftist conspiracy against freedom of expression and free enterprise. The real fear is that governments will use them to censor the news media. That has never happened. Indeed, when in 1975 Prime Minister Indira Gandhi suspended democracy in India, one of her first moves was to terminate rather than utilize the press council.

Some journalists judge M*A*S unacceptable on principle. According to the code of the International Federation of Journalists (1954), for example, "the journalist recognizes, in professional matters, the jurisdiction of his colleagues only; he excludes every kind of interference by governments *or others*" [emphasis added]. These days, however, journalists need just those "others" to help retain their independence.

A very common criticism is that M*A*S are unrealistic. It is often said that good media do not need quality control while the bad will never accept it unless government forces it upon them. Real power is in the hands of media owners for whom sales are a sufficient measure of public satisfaction. If media consumers are truly angry, let them stop reading or listening—or let them go to court. As for journalists, they cannot afford to antagonize their employers by insisting on observation of ethical rules.

Admittedly, some M*A*S are costly, though most are not. An ombudsman needs to be an experienced and respected journalist, and thus entitled to a good salary. A press council needs a sufficient budget to do its job well, fully, quickly, and visibly. While many believe it is better not to seek government funds, reporters lack money; and media owners are reluctant to pay to be criticized or even lose some of their power.

Protagonists

Ignorance about M*A*S needs to be overcome. Publishers and journalists, when told about M*A*S experiments, often react with great interest. M*A*S need to be promoted. All the protagonists in social communication should be involved. Politicians can help pressuring reluctant media owners and journalists into acting in a more ethical fashion, mainly by threatening to pass restrictive laws—which is how most press councils got created. The same result can be achieved by giving money with few or no strings attached, as the Finnish treasury did when providing the country's PC with half its budget.

What of the public? Contrary to conventional wisdom, the media user is rarely stupid or easily manipulated, but it lacks the knowledge, motivation, time, or the organization to become effectively involved—and thus feels powerless. The public needs to be informed and stimulated, mobilized, made to trust the M*A*S potential and to support the idea. The public absolutely must be involved for M*A*S to be fully effective.

Any rapid success of ethics and M*A*S is predicated on the cooperation of media owners and managers because they possess both authority and money. They can authorize, encourage, publicize, fund, and participate in many M*A*S. And they have legal, social, moral, and, most importantly, economic reasons to support such "quality control," though many may not be aware of it. Quality pays.

Lastly, journalists can benefit most directly from M*A*S, since quality public service can provide them with credibility, influence, and social prestige. Yet recent history shows that media staff is often more opposed to M*A*S than management. Professionals argue that they are not independent, hence they cannot be held responsible. Media ethics focuses on journalists since companies do not have a moral conscience. Imposing ethics can turn journalists into scapegoats, although they often commit only minor sins, while media companies commit the mortal sins. This is why media ethics and M*A*S should not seek only the improvement of media but also restoration of the bond of trust between journalists and public so that the latter will support the former in their fight for autonomy.

Conclusion

Considering the great number of M*A*S, some in operation for more than a century, their harmlessness, their diversity in meeting paramount needs of our time, one may wonder about their relative rarity.

Yet the picture is not as dark as it may seem. Many M*A*S have become such a normal part of the media environment that they are barely noticed anymore. The less spectacular, less controversial M*A*S include codes of ethics, letters to the editor, university training, required courses on media ethics, non-profit research, correction boxes, regular pages or programs devoted to media, media reporters, associations of specialized journalists, readership surveys, alternative media, and public service broadcasting.

Even though rare compared to the tens of thousands of media outlets, M*A*S are more numerous than ever. In the United States, ombudsmen serve over 40 newspapers, including *The Washington Post* and *The New York Times*. The best dailies in Britain, France, Italy, Portugal, and Spain each have one. The majority of existing press councils have appeared since 1990, more than a third since 2000. All are signs of a change of climate, but they have also played a major part in the change. Media are now far more concerned with the public than they used to be. Many better understand the need to forge closer links with their customers. Journalists understand that citizens, too, are entitled to "a voice in the product," that their support is vital.

Together with improving technology, M*A*S have thus contributed to better media, certainly not yet good enough but indisputably better than they were 50 or 100 years ago. M*A*S could have contributed more if they had been used more. What is needed at the beginning of the twenty-first century is a wider, clearer awareness of what media accountability can mean for journalists everywhere.

Media Hoaxes

See Hoaxes

Media Literacy

The term *media literacy* is drawn from an analogy with reading literacy: just as the latter refers to an ability to read, write, and understand words and phrases, the former refers to an ability to analyze, evaluate, and produce various kinds of media texts. *Media literacy* is often used interchangeably with *media education*, which technically speaking is the creation, primarily by school teachers, of the

necessary conditions for the development of media literacy. The relative uncertainty surrounding the definition of media literacy also characterizes the movement associated with it, as various media educators base their work on different theoretical perspectives. Virtually all media literacy schools of thought, however, agree that media pervade people's everyday lives, thus creating a need for an educational diet of analytical and critical thinking skills that can be specifically applied to their content. Alongside commercial messages carried by the media, news and public affairs stories receive increasing attention.

Basic Assumptions

As it is a relatively new intellectual concept, media literacy is still in the midst of developing its principles. In the past two decades, however, something akin to an action program has slowly developed around several commonly held beliefs. Arguably the most important is that all media messages are *constructed:* TV commercials, newspaper news items, captioned photographs, and billboard slogans are all created by someone working within a discernable set of social, political, historical, and economic institutions, and seeking to achieve a particular effect on the targeted audience. Assuming that most people seek exposure to at least some media messages, media educators seek to deconstruct them. The importance of this mission is underlined by the fact that mediated messages largely define people's sense of "reality."

In traditional communication theory, a mediated event (such as Joe Smith watching a newscaster on TV) has been seen to have three main components: sender (the newscaster), receiver or audience (Joe Smith), and the message (say, the latest news about the Middle East peace process). The vast majority of media researchers and teachers seek to educate the receiver/audience, but the other two elements are also included in media literacy programs. While focusing on helping people understand where (as well as how and why) media messages come from, many media literacy researchers hope to influence the process so that entertainers and journalists might modify their messages to accommodate a more informed and critical audience.

While most media literacy efforts take place in educational institutions, supporters stress the importance of other venues, such as community events and, most importantly, everyday family life. In keeping with the twin assumptions that the media have a strong (mostly negative) influence on people and that young people are most susceptible to be influenced, the most elaborate media literacy programs are centered on elementary and secondary schools. The elementary schools are receiving more attention, as it is increasingly believed that children must be familiarized with media systems as they become regular consumers of mass media. In the absence of a nationwide media literacy program, American media educators are often generalist, English, or social science teachers working at their own initiative or at the behest of individual schools.

The media examples examined in a classroom range from contemporary music and movies, to social interaction websites such as Facebook or MySpace, and the front page of *The New York Times*. Elementary school students, for example, might watch five minutes of a *Tom & Jerry* cartoon reel and count the instances of violence (such as Jerry pulling on Tom's whiskers) and note the consequences (or lack thereof). The children's observations can then be used as a springboard for a wider discussion of violence as a solution to social conflict, media representation of "reality," and so on. High school students might watch a 20-minute segment of the day's TV news and then identify how newscasters identify people in terms of ethnicity. Indeed, media representations of violence and race relations are two of the most frequent themes addressed in media literacy programs, alongside images of the "ideal" male/female body type, consumer values, and messages related to sexual and gender norms.

Different Approaches

Media literacy has its roots in British literary criticism of the 1930s and the subsequent intellectual tradition known as "cultural studies." As part of their efforts to examine relationships among various institutions of power and sociocultural products, cultural studies scholars of the 1970s began paying special attention to film and television. Britain remains a media literacy powerhouse, with the country's telecommunications regulatory body responsible for the promotion of nationwide media literacy programs. In North America, the media

literacy movement was spear-headed in Ontario, which in the late 1970s created and implemented wide-ranging media education curricula. Various American school districts followed suit throughout the 1990s. Because of the great autonomy that individual educational entities enjoy in the United States, no one media literacy program has been applied consistently across the nation.

All schools of thought agree on the necessity to assist people, especially children, in the development of analytical and critical skills to apply to any media messages. The main differences lie in how media educators use their classrooms. One of the prominent pioneers, Renée Hobbs, outlined some of these differences.

The first, and most often quoted, debate centers on the relationship between media teachers and students. American instructors tend to warn about the negative effects of prolonged media consumption (an approach often referred to as "protectionist"). In contrast, the British "cultural studies" perspective favors a companionship model, whereby students are invited to discover how media work at their own pace. Protectionist media literacy seems to assume that all young people consume media messages the same way, and therefore require the same antidotes to nefarious media influences. Such an approach has come under fire for being both elitist and clueless. The competing perspective on media literacy has had its share of criticism as well, mainly for its emphasis on the pleasure associated with media consumption, to the detriment of media criticism.

Media Production and Activism

A second important difference in media literacy approaches concerns the desirability of including a hands-on media production component. Should students be encouraged to conceive and produce such things as documentaries and websites or should they simply analyze and evaluate existing media texts? On the one hand, while ostensibly learning nothing more than how to work a camera or build a website, students run the risk of reproducing the dominant discourse that permeates their society. Such a media literacy program might easily end up reinforcing the very hegemonies it purports to fight. On the other hand, supporters of media production point to the necessity of students experiencing first-hand the processes by which media messages are crafted, if they are to genuinely appreciate their "constructed-ness."

A third point of contention among media literacy researchers centers on the nature of the media studied in the classroom. An analysis of *The New York Times*' coverage of national elections, for example, tends to be privileged over a similar analysis on a Facebook site. Granted, the reason for that may have more to do with the teacher's unfamiliarity with the component parts of sites such as Facebook, but it is often that very inability to manage the newest forms of media that leads to their ideological dismissal.

Another one of Hobbs's issues in media literacy concerns the form such learning should take within the educational system: as a stand-alone discipline akin to history or math, or as a supplemental program incorporated into the study of other disciplines? The proponents of the first option argue that media literacy programs will only be taken seriously by students if they benefit from the symbolic capital associated with an autonomous academic discipline, while the supporters of the second option argue that contemporary globalization processes absolutely require that subjects such as history, health, and English include a media literacy component, rendering a stand-alone literacy module superfluous. It is another kind of controversy, however, that has for years given rise to the most acerbic disagreements among media educators: the question of whether to promote a sociopolitical agenda as part of the media literacy program. Do the teachers have a mandate to go beyond developing their students' analytical and critical skills, or, conversely, do they have a moral obligation to stop short of imposing any one particular set of moral and ethical imperatives on their students? Will analytical and critical skills translate into a desire and an ability to change the world for the better or will minimalist media literacy simply breed smarter and more efficient bureaucrats? Unlike with some of the other controversies mentioned here, the question of activist media literacy does not look likely to be resolved in the near future.

Conclusion

Both as a concept and an educational concern, media literacy is still in its infancy. Priorities have

Table 2 Media Literacy Concepts and Questions

Five Core Media Literacy Concepts:
1. All media messages are constructed.
2. Media messages are constructed using a creative language with its own rules.
3. Different people experience the same messages differently.
4. Media have embedded values and points of view.
5. Media messages are constructed to gain profit and/or power.
Five Key Media Literacy Questions:
1. Who created this message?
2. What techniques are used to attract my attention?
3. How might different people understand this message differently from me?
4. What lifestyles, values, and points of view are represented in or omitted from this message?
5. Why was this message sent?

not been agreed upon, controversies have not been settled, and the various teaching approaches have not been harmonized. For all that, a growing number of politicians, parents groups, scholars, and young people themselves have become convinced of the need for some kind of media literacy learning.

Media Ownership

For more than a century scholars, critics, politicians, and advocacy groups have argued about the influential role that the news media owners play in determining what news the public receives. The extent of this influence, as well as the means available to owners to influence news content, has been the subject of extensive debate and inquiry. They have implications not only for understanding the role of news media in a democracy, but also for our understanding of the nature of the First Amendment, the ethical dimensions of journalistic practice, and policymaking related to the media industries. These issues become further complicated when we also consider the variety of forms and structures that the ownership of news outlets can take, and how these have changed over time.

Background

The earliest incarnations of news media in the United States were the heavily partisan newspapers of the early to mid-1800s. They were financed primarily by political parties, and thus were tightly—and publicly—associated with specific political perspectives. There were then multiple political parties that could viably influence the political process, and the newspapers controlled by these parties were an essential means of exerting that influence. These papers were overtly, and unapologetically, partisan. They practiced a style of journalism that many would argue was very different from contemporary standards, in which objectivity and balance are more often given priority. These "partisan

press" outlets were explicitly devoted to advancing the political interests of the parties that controlled them.

The newspaper business underwent a wide range of changes in the mid-1800s, including a shift from political party to advertiser support and a changing economic profile of newspaper readers. The end result was a more commercialized industry—but one that still maintained the capacity for substantial political influence. Reflecting these altered characteristics of the journalistic field and of news consumers, the nature of newspaper ownership began to change as well. Newspapers were owned and controlled by individuals primarily interested in generating profits, but also in some cases still interested in asserting a particular political agenda.

Following this change, news outlets frequently became part of family dynasties, passed down through generations. The history of the American news media is filled with well-known families who for years steered some of the country's most well-known and influential news outlets. The Ochs-Sulzberger's have for more than a century controlled *The New York Times*. The Chandler family controlled the *Los Angeles Times* for nearly as long. The Bancroft family controlled *The Wall Street Journal* for more than a century before the paper's 2007 sale to News Corp. And many smaller newspapers similarly were long associated with individual family ownership.

As the news business continued to expand in the twentieth century, first into radio and then television, the commercialization of the industry intensified. As a result, family ownership went into decline, as many news organizations become part of large, publicly traded companies eager to reap the profits associated with the various media sectors. In the early 2000s, the traditional notion of the family-owned newspaper (or broadcast station, for that matter) is disappearing, as most news media outlets—large and small; print and electronic—are becoming a part of large, publicly traded companies, with a wide range of individual and institutional stockholders. It is also important to note that these news outlets frequently have been integrated into larger corporate structures that often have little to do with journalism.

These changing patterns in news media ownership raise many concerns, some of which involve the potential tensions inherent in news outlets' twin identities as commercial business operations and as key participants in, and contributors to, the democratic process. Consequently, extensive discussion has focused on which kinds of media ownership structures best serve profits as well as public informational needs.

Ownership and News Influence

All of the ownership structures discussed above have been accompanied by questions regarding how they impact the nature of news. A variety of concerns have arisen about the "media baron"—the owner of one or more powerful media outlets who uses his/her media outlets to advance economic or political agendas. Such concerns perhaps began in the early twentieth-century days of William Randolph Hearst, and extend to the present, with concerns over the political and economic influence wielded by such well-known American media owners as Rupert Murdoch (1931–) and Ted Turner (1938–), and internationally by such controversial figures as Conrad Black (1944–) in Canada, and Silvio Berlusconi (1936–) in Italy.

Berlusconi is particularly interesting in that he was Italy's largest media magnate, who subsequently became the country's prime minister in 2001. The concern raised involved how he might utilize his vast media holdings to skew news in ways favorable to his administration. Some critics argued that this was the kind of integration of political power with media ownership that is a fundamental conflict of interest. Rupert Murdoch also frequently has been criticized for utilizing his control of a wide range of media outlets both in the United States and abroad to advance his conservative political agenda. Murdoch's Fox News cable channel has, in recent years, received much criticism for advancing his conservative agenda, and thus, for example, providing a distorted picture of the war in Iraq to foster support for the war effort.

Some researchers have suggested that such notions are exaggerated and overly simplistic. Direct ownership influence certainly undermines notions of autonomy or independence for individual journalists, and may potentially also run counter to the economic interests of the news outlet's owner, given the extent to which profitable news enterprises would presumably need to present news in ways that are appealing to a broad spectrum of

the citizenry. The contemporary media environment has conditioned news consumers to expect a level of apparent objectivity and balance in their news. This raises questions as to whether any news media owner can provide news that supports a particular political agenda without alienating a significant portion of the audience.

Questions have also been raised about the extent to which any owner can maintain firm editorial control over what have become vast organizations, with dozens or even hundreds of outlets, and thousands of widely scattered employees around the country and the world. Within organizations of such size, it would seem likely that individual journalists and editors would be able to maintain some autonomy to use their own judgments about how best to present the news. At the same time, researchers have identified a variety of indirect mechanisms allowing owners to potentially influence news content. These range from personnel hiring (seeking like-minded individuals to serve in leadership positions) to incentive systems (i.e., establishing types of behavior or professional practice that are rewarded with promotions) to the organizational culture established within news outlets (which can condition news workers to behave in particular ways).

Public Versus Private Ownership

Reflecting ownership patterns discussed above, researchers also have addressed the significance of the shift from private to public ownership, where news organizations become investment commodities traded like any other publicly held corporate entity. As the control of news outlets increasingly has fallen within large, publicly traded media corporations, some have questioned what this pattern means for journalism—is journalism helped or harmed? Perhaps the most frequent question is whether different types of ownership exhibit different priorities in balancing profits against public service.

Research supports the idea that public ownership correlates with better financial performance. However, critics contend that with public ownership comes an increased emphasis on short-term profitability and less willingness to invest the resources necessary for rigorous news gathering. A number of critics have asserted that when, in the 1980s and 1990s, the major American television networks became part of corporate conglomerates, these new owners increased emphasis on achieving profitability in the network news divisions. The result was significant budget and staff cuts and a diminished emphasis on hard and foreign news, let alone investigative reporting.

And, perhaps equally significant, several critical analyses have asserted that such ownership creates incentives for the news outlet to be less critical when covering the activities of the corporate parent. Thus, for instance, NBC News has been criticized for shying away from coverage of the wide-ranging activities of General Electric, its corporate parent. Similar criticism has argued these news outlets provide excessive coverage of stories or issues beneficial to the corporate parent. For instance, when Disney/ABC bought a stake in the Internet pet supply company Pets.com, ABC's morning news program, *Good Morning America,* and the network's evening news program, *Nightline,* subsequently ran segments featuring the sock puppet mascot used in company commercials. Examples of such "synergy bias" suggest its potentially damaging effects on journalism and help illustrate the challenges to journalism that can arise when ownership of a news outlet is integrated into a larger firm.

Critics of public ownership frequently contend that when a news outlet is publicly owned, journalistic quality and commitment suffer. That is, local owners of news outlets are more likely to be aware of, and sensitive to, the informational needs and interests of the community—and that this will be reflected in the journalism provided. From this perspective, the move toward public ownership increases the separation of news outlets from the communities they serve.

Multiple- and Cross-Ownership

A defining trend in media ownership over the past three decades is the growth of large firms that own multiple outlets, often across multiple platforms. Group ownership is common in broadcasting, where companies may own dozens of television and hundreds of radio stations while in cable television, individual firms may own hundreds of local systems and/or dozens of networks. In the newspaper industry, "chain" ownership refers to large groupings of newspapers owned and operated by companies such as Gannett, Newhouse, and Knight

Ridder. These large chains have largely replaced the family ownership that characterized news media in decades past.

Of course, these changing ownership structures raise the question of whether bigger is in fact better, whether for financial success or journalistic performance. Here again, we see widely divergent perspectives. Group or chain owners can realize economies of scale in the production and distribution of news. Some have argued that larger news organizations are more resistant to external, potentially corrupting, influences. A news outlet forming part of a larger media conglomerate may be better able to resist pressures from advertisers or special interest groups. Further, these larger organizations may be better able to devote the resources necessary for thorough news gathering, or to invest in new technologies for news gathering and distribution.

On the other hand, critics contend that exploitation of economies of scale undermines journalistic performance, as it creates incentives to "repurpose" news content across multiple news outlets and thereby reduce the amount and diversity of news received by the public. Critics further contend that allowing control of news media to reside in fewer hands is antithetical to the appropriate role of journalism in a democracy. Group or chain ownership raises concerns about the disconnect between media owners and the communities their outlets supposedly serve.

Ownership Regulation

In the United States, the Federal Communications Commission (FCC) long maintained limits on the number of broadcast outlets that could be owned by a single entity. These limits have controlled the number of radio or television stations that a single entity can own in a single market, as well as the proportion of the national audience that can be served by any owner of television stations. Similar national limits in radio station ownership were eliminated in 1996. While ownership of stations and cable systems has historically been subject to regulation at both the national and local levels (though relaxed or eliminated in recent years), newspapers are exempt from such control. Newspaper ownership has been limited only to the extent that the FCC has limited broadcast licensees from owning daily newspapers in the same market, largely out of a concern for the lack of diversity if two major news sources in a community were owned by the same entity. These "cross-ownership" rules were under reconsideration in 2007 and may be eliminated. Otherwise, large-scale concentration has taken place with individual newspapers increasingly becoming part of large chains.

Most limits on media outlet ownership have been premised in part on the notion that democracy is best served when citizens can access diverse viewpoints—a rationale that clearly relates to the production and dissemination of news. The trend over the past three decades has been to relax such ownership limits. Rules have been subject to detailed reexamination in light of the dramatically changing media environment in which new technologies provide a presumably wider range of choices than was possible when many ownership regulations were instituted. Consequently, the Telecommunications Act of 1996 directed the FCC to reassess its media ownership limits every two (now every four) years, with a presumption that most such limits may no longer be necessary in an Internet world.

Some have questioned whether differences in ownership structure have any real bearing on the quantity and quality of news provided by individual outlets. Does ownership matter? And if not, does this undermine the logic of maintaining ownership restrictions? Others argue that rules that maintain a diverse array of owners of our media outlets are a fundamental reflection of democratic principles, and thus should not even be subject to empirical assessment (Baker 2007). Under this perspective, the value of ownership diversity is self-evident in the same way that the value of freedom of speech is self-evident. These questions were being debated within the FCC, Congress, and the courts early in the twenty-first century.

Most nations have restrictions on foreign ownership of media outlets. These reflect the potential political impact of news outlets in both domestic and international affairs, and policymakers' concerns about whether foreign owners might incorporate propaganda. Australian media mogul Rupert Murdoch became a U.S. citizen in 1985 primarily to circumvent FCC restrictions on foreign ownership of broadcast licenses.

Some American media policies have sought to foster ownership of media outlets by ethnic

minorities. Women and minorities have been the focus of policies designed to bring greater diversity to the ownership of U.S. electronic media outlets under the assumption that they would likely program their stations differently, and would thus be likely to provide—in both news and entertainment—viewpoints that might not otherwise be found on the air. Here again, however, debates have focused on whether *demonstrable differences* in content can be found that justify according women and minority owners special status.

Ownership and the First Amendment

In 1960, well-known American journalist and critic A. J. Liebling (1904–63) famously stated that "Freedom of the press is guaranteed only to those who own one." His statement captures the essence of the tensions that exist between the First Amendment and media ownership. That is, concerns about the abuses of the enormous power over public opinion that owners of news outlets can wield represent a difficult challenge for policymakers or advocacy organizations concerned about such abuses—as the First Amendment traditionally has been interpreted as providing powerful protections of speech rights, regardless of whether the speaker is an individual standing on a street corner or a large multinational conglomerate.

The First Amendment has sometimes been marshaled to protect the public from private restrictions on speech. What set of speech rights should receive priority? Government controls on the number of media outlets owned by a single entity can be seen as an abridgement of that entity's free speech rights. Yet allowing concentration of media ownership undermines the First Amendment right of the public to diverse sources of information. In this argument, issues of First Amendment free speech rights become inextricably intertwined in debates about the ownership of news outlets.

Conclusion

Today's media environment is one in which questions about the ownership of media outlets are becoming increasingly complex. Some argue that, with the advent of the Internet and growth of blogs, anyone who wants to provide news can do so. From this perspective, Liebling's pessimistic statement regarding who can enjoy freedom of the press becomes obsolete. There is no longer a dividing line between us (the audience) and them (owners of news media). Others, however, argue that this represents an oversimplification and that, even with newer technologies, the actual *sources* of most news remain highly concentrated, regardless of how many different channels there are through which this information can now be received. In any case, debates over the nature of media ownership and its impact on the practice of journalism are no doubt going to continue, as the technological environment in which the news media operate continues to change and as research on the relationship between media ownership and journalistic performance continues to advance.

Mexico

Mexico's journalism, like its politics, has changed enormously since the mid-1980s. Yet as journalism and other key institutions in Mexico reform, many of their defining characteristics are rooted in the country's long period of single-party rule. Mexican politics and society are in a process of gradual transformation and journalism reflects this pattern of uneven change.

In the 2000 presidential elections, Mexicans peacefully ended 71 years of federal rule by the Institutional Revolutionary Party (PRI) during a gradual political transition that dates at least to the mid-1980s. Mexico's hegemonic party system, presidentialist governing structure, and state-led economic development model garnered decades of legitimacy for the PRI regime. Until the economic crash of 1982, the political system's legitimacy generally was premised upon appeals to the ideals of the Mexican revolution, resolution of the problem of presidential succession, corporate and clientelist control of organized groups, targeted cooptation and repression of opposition leaders, and concrete material gains for urban dwellers. Control of media messages and cooptation of media owners and journalists were also central to regime survival until the 1980s, when an expanding segment of the press interacted with civil society to push political elites toward a set of pacts that eventually led to free and fair elections in 2000. Radio in the period occasionally acted as a public plaza, airing complaints against the regime in call-in talk shows, but television changed very late in the transition, similar to what happened in Brazil with TV Globo.

Moving from a relatively uniform institution that supported a single-party state for seven decades, several models of journalism now coexist in Mexico. The country's hybrid media system includes market-driven, civic-oriented, and holdover authoritarian elements. Ethnographic research and work by journalists' organizations suggest that journalists' values, ethical orientations, and desired norms of conduct have moved furthest since the breakdown of the authoritarian government, but actual practices vary greatly across news organizations, media types, and geographic regions. Journalists' expressed values tend to reflect a civic-oriented or public-interest model, but actual news coverage mixes civic, market-driven, and authoritarian style journalism.

The distance between expressed values and actual journalistic output is the result of hierarchical power relations in news organizations. Journalists labor with relatively little autonomy over their work product. Because of that, media owners (or, alternatively, politicians' directives in the less common state-owned media sector) ultimately determine the journalism practiced by a particular news organization. The longer-term structural conditions within which journalists

operate include a semi-authoritarian legal framework that is beginning to open, growing violence against journalists, heavily concentrated broadcast ownership, the supremacy of ratings over public interest broadcast journalism, and weakness in the country's media regulation.

The legal framework has changed most since Mexico became a more competitive electoral democracy in the early 2000s. The country created Latin America's most effective federal law allowing access to government information and a federal protection of journalists' confidential sources. It also weakened federal criminal defamation charges as a way to control the press, although criminal defamation still exists in most states. On the other hand, violence against journalists, which has been increasing since the mid-1990s, partly reflects the growing influence of narcotics trafficking, but also the weakness of Mexico's judicial system and the fact that earlier means of controlling the press no longer work as well. As of mid-2007, an effort to open up broadcasting to greater competition and ownership diversity was part of the antimonopoly reforms under consideration by the new presidential administration.

Alternative Approaches

Several different models of journalism developed in the decades after the transformation of Mexico's 1910–17 Revolution into a semi-authoritarian state that lasted from 1929 until the end of the twentieth century. Today's hybrid media system has its roots in each of these journalistic models, but also expresses society's greater political pluralism, weak partisan allegiances, highly concentrated wealth, oligopolistic economy, and concentrated social power.

Despite occasional political uprisings, the PRI regime (1929–2000) co-opted dissent rather than ruled by sustained repression. This approach stemmed from legitimacy earned until the 1980s from economic growth for urban residents, political patronage that was rotated between competing factions, and control of key mass media. Rather than being only a case of corruption, where media owners and reporters traded news coverage for material benefits, Mexico's media owners and journalists considered themselves part of a legitimate governing system. The country's authoritarian media system remained intact for about five decades, from roughly the mid-1940s to the mid-1990s, and its associated behaviors, values, and ways of interpreting reality became so pervasive that they could be called an institution of similar organizations and individuals. This meant that the messages of the PRI regime were replicated without contestation across the media spectrum, as journalists typically acted more like stenographers than reporters.

The early PRI conception of journalism viewed media as a support for the state in order to promote economic growth and stability within a semi-open political regime, similar to the developmentalist model of journalism. This concept appears to have been present only briefly, however, and may never have been practiced in any sustained way, although some journalists continued to voice similar norms into the 1980s.

Instead, newspapers and radio chain ownership coalesced around elite families in the 1940s and 1950s, and Mexico's media structure took on a more oligarchic form. This served to subordinate journalism to the state, but also to the mutually beneficial agendas of media owners and politicians. The few elite families that controlled most of Mexico's broadcasting used it to further group interests by supporting the ruling PRI, with which they were allied. The country's current television giant, Televisa, is the direct descendent of these early state-granted concessions, as are some of the largest radio chains. The network's dominance in the market is one legacy of its early political connections. TV Azteca, its only national competitor, was created from the privatization of a state-owned network in 1993. Reports link the second network's sale to the brother of the sitting President, although he was a minority player. The administration of President Felipe Calderón (2006–12) announced it might create a third national commercial television network, as well as regional networks, in response to criticism about media ownership concentration and the lack of content diversity. Strategic partnerships using both foreign and national capital were expected to compete. Coupled with measures to strengthen non-commercial radio (which was left in a legal limbo while media reforms in 2006 remained under court challenge) Calderón's six-year administration could increase the diversity

of owners, perspectives, and styles of broadcast journalism.

The highest circulation newspapers in the country during the PRI era were not primarily connected to the political class by family, but by material exchange and usually by conviction. Instead of concentration, newspapers proliferated above market capacity. State support through advertising, subsidized newsprint, tax breaks, and sometimes direct payments to owners and journalists meant few newspapers actually had to survive on the market alone. Such dependency produced a stenographic form of journalism where politicians' speeches or curbside interviews were the story of the day. Criticism of the President, the Catholic church, or the military was taboo. Closely read political columnists were often paid to criticize the political opponent of a particular benefactor. Readers learned to decipher these coded messages in order to gauge the comparative power of the competing political factions known as *camarillas,* as well as the head of the *camarillas*: cabinet secretaries and ultimately the President himself.

By the early twenty-first century, many newspapers survived on shoestring budgets or were rumored to be backed by those seeking a political mouthpiece. Most newspaper readership is concentrated in just a few publications in each major city, including market powerhouses such as the *Reforma* Group, the *Milenio* Group, the *El Universal* company, Healy newspapers in Northwest Mexico, and a few other regionally strong publications. *La Jornada,* while never financially powerful, is unique because it serves a left- to center-left audience and has editions in several Mexican states. These newspapers also practice the most civic-oriented form of journalism in the country, and during the period of political liberalization from the 1980s to 2000 they reflected the increasing demands of civil society and the political opposition to press democratization.

Variants of the former authoritarian journalism still survive. Close reading of television and newspaper coverage, especially outside the capital, sometimes suggests an underlying allegiance to the oligarchic class as well as to corporate media interests. Within government-owned television, where newsroom personnel are appointed by state governors, a propagandist model often exists. Public broadcasting, in the sense of editorially and financially independent state media, does not operate, with a few partial exceptions, including the Polytechnical University's Channel 11, Radio UNAM at the National University, and the small Mexican Radio Institute, all of which transmit from Mexico City. All have small audiences that nevertheless are influential because they include the intelligentsia and more-critical members of society. In some states, governors have distanced themselves from editorial decisions of state-owned media, but only protests from journalists, opposition legislators, or media audiences might stop a future governor from again using the media for propaganda since there is no structural protection of state newsrooms.

Toward the end of the twentieth century, new forms of journalism emerged as politics opened up and the economy liberalized. Civic-oriented journalism in a growing number of newspapers became more autonomous, politically diverse, and assertive than the former passive, narrow, and subordinate style. Responding to market demand, market-driven journalism as practiced on nightly commercial network newscasts also became somewhat more diverse politically, but only to the degree that other corporate interests were not jeopardized. Reportorial assertiveness on commercial TV followed the same pattern, usually taking on tabloidized forms. Political coverage became more personalized and combative, and less issue oriented. Non–prime time political roundtables offered more analysis, although conflict also permeated many of those programs as well.

Mexican-style civic journalism offered a contrast to old-style authoritarianism in a sustained way beginning in the 1980s. Led by publishers or key editors who held new ideas about journalism, political values opposed to continued PRI rule, and decision-making power in their newsrooms, a few newspapers began to cover politics more broadly by including voices beyond state-sanctioned political and civic groups. They greatly legitimized opposition to the old regime. When Mexico's economic crises and market-based economic reforms shifted economic power from the state in the 1990s, economic incentives for media, including stronger private sector advertisers and greater public funding for political campaigns, also shifted. At the same time, political assassinations, financial scandals, and the Zapatista uprising of indigenous people

further delegitimized the state and its supporters. All of these convinced more newspapers to transform their journalism.

While the first civic-oriented newspapers arose early in the political transition, before the full onset of economic liberalization, market-driven television news only joined the democratization process later as a new generation of managers took control of the major networks. With the large national networks, this shift in the late 1990s was a double-edged sword for democracy. On the one hand, it meant that executives in Mexico City ordered subordinates to give equal time to opposition candidates across the country. On the other, an extreme form of sensationalism took hold, personalizing politics and treating social problems such as crime, poor health, and weather disasters exacerbated by unrestricted development as episodic, de-contextualized events. For a time, politicians used television to strategically leak compromising videos of opponents.

Journalists during the PRI regime had the options of following orders and working within the confines of owners' directives, or quitting. Working conditions for journalists are much the same in the early twenty-first century. Journalism as a professional career with widely accepted ethical and technical standards is in its earliest stages. In 2006, the two-year-old Quality Journalism Network (www.periodismodecalidad.org) made up of journalists' organizations, educators, and industry representatives called for creating "clauses of conscience" and independent media monitors to reinforce reporters' ability to act freely when a supervisor's order contradicts their values and ethical norms. This call to professionalization from below, instead of the organizationally dictated transition from above, will take time to develop and requires support from civil society and the steadfastness of journalist organizations and academia.

Laws, Violence, and Impunity

The legal arena for journalists in Mexico has improved since the PRI lost power in 2000, but progress is uneven and threats or attacks on journalists continue. A federal access-to-information law was enacted in 2003, the most wide-reaching democratization reform since the conservative National Action Party obtained the presidency. The law applied only to the federal executive branch, but other federal branches passed access laws, as did state and municipal governments. The federal law clearly defined limited exceptions to the presumption of access, set a mandatory deadline for response to petitions, applied sanctions for non-compliance, and created an autonomous entity to review denials of petitions for information. In its first years of operation, the Federal Access to Information Institute (IFAI) consistently ruled in favor of access. Journalists have begun to incorporate access-to-information requests into their reporting, although use remains uneven. State-level application thus far has been less successful.

Congress voted to end criminalization of defamation at the federal level in 2007, but several state-level laws remain problematic and are used to jail journalists for critical work. Politicians usually lodge the criminal complaints in these cases. In 2005, for example, a politically connected businessman conspired with the governor of Puebla state to harass and assault an investigative journalist who had been jailed. Journalist Lydia Cacho (1963–) was released after journalists' networks and media outlets quickly publicized her disappearance at the hands of state police agents. The Supreme Court threw out the case on a technicality, but also ordered an investigation into the detention. The investigative commission recommended the court urge the federal attorney general's office to press charges against public officials, but could not get a majority vote from the justices. The case seems to have ended there. In 2006, a journalist was jailed in Chiapas state under that state's criminal defamation statute and two lawmakers in Michoacán filed criminal defamation charges against a journalist.

On a more positive note, Congress also passed a federal shield law allowing journalists to protect confidential sources in 2007. Once reporters became more assertive and independent in their reporting in the 1990s, federal and state police increasingly cited journalists to testify about their stories and sources during public corruption investigations.

Threats and violence from drug traffickers, organized crime, and corrupt police remain the biggest obstacles faced by journalists in Mexico. Several media rights groups have documented wide-scale self-censorship in areas of the country where drug trafficking is prevalent. Initial attempts by news outlets to jointly investigate drug-related

attacks stalled due to fear of violent reprisal. Large swaths of the country are left without insightful coverage of this important issue, which is complicated by corruption of local public officials.

Under the Vicente Fox government (2000–06), 27 journalists were killed and three disappeared. None of the investigations into these cases were solved by 2007. A new federal prosecutor position created to investigate crimes against journalists in March 2006 never received authority to investigate crimes with drug connections, and the first prosecutor quit after less than a year in office. Journalists in smaller news organizations outside of major cities are most vulnerable.

These trends have continued under the Calderón administration. Especially outside of Mexico City, journalists who cover drug trafficking and associated corruption face legal and physical intimidation more than those in any other Latin American country except Cuba, Venezuela, and Colombia.

Because Mexico remains a transitional society, its media system continues to evolve at a more rapid pace than that of the United States and other developed countries. This offers an opportunity for consolidating a more diverse, assertive, and citizen-serving news media than elsewhere on the planet, at least in the medium term. Two steps that indicate such a media system is still possible occurred in 2007.

First, the Supreme Court threw out sections of a Televisa-backed reform of the Radio and Television Law that had the potential to shore up the current broadcasting oligopoly well into the digital age, as well as leave noncommercial media financially weak and operating in legal limbo. The "Televisa Law," as it became known to critics, had been passed one month before the opening of the presidential campaigns, when political parties were most in need of fair treatment in television news and advertising. Broadcasting giants essentially were able to undermine the state's regulatory role. The Supreme Court's action opened up the way for wholesale congressional reform of the new law.

On another plain, Mexico's elections have become some of the most expensive in the world, which belies the approximately 40 million Mexicans who live in deep poverty. A year after the 2006 presidential elections, the federal Congress and the required number of state legislatures passed an election reform requiring all electoral advertisement on broadcast media to be run during air time that by previous law is reserved for state use; in other words, for free, as currently occurs in Brazil and Chile. Hundreds of millions of dollars would be saved, and the bargaining chip of discounted advertising would be removed from commercial broadcasters as Congress re-enters the debate on how best to further broadcast reform. While some critics believe that the reform curtailed freedom of expression because wealthy individuals and lobbying organizations would no longer be able to buy political ads on broadcast media, the majority of lawmakers and independent academics thought the move would lower the exorbitant cost of elections and help raise the quality of public discourse about electoral politics. As one federal Senator said before the lopsided vote in favor of electoral reform, "Let's start thinking more about the constitution and less about television."

Miami

Miami's media landscape has undergone substantial change since 1960. For decades, the city's major media outlets were predominantly English language. But media industry development shadowed the social and demographic transformations of the city, and by the end of the twenty-first century, Miami was an international center of English- and foreign-language media catering to diverse audiences. Because of this heterogeneity, media in Miami serve many different functions beyond simply being means of disseminating information. They have served, among other roles, apparatus for cultural assimilation (helping exile groups adjust by learning more about host country characteristics), or conversely, instruments for cultural maintenance (when immigrants seek information from their home countries in order to remain distinct from host cultures); networks of communication and assistance for members of émigré communities; arenas of conflict between and within groups; and instruments for accountability for a city with historical problems of corruption and lax oversight. The transformation of Miami's population also presents compelling challenges for journalists working in the city. Media professionals in Miami must be aware of issues not only relevant to very culturally heterogeneous audiences but also of those in global news that have import for large immigrant communities.

Development

Development of Miami's modern media scene began with the incorporation of the city in 1896, pushed by growing investor interest in the then-sleepy Southern outpost. The *Miami Metropolis* (later, the *Miami Daily News* and then *The Miami News*) was founded that year. Frank Shutts, backed by railroad magnet Henry Flagler, bought the *Miami Morning-News Record* (an earlier version had been established in 1903) in 1910 and changed its name to the *Miami Herald*. Frank Stoneman became the editor, after a stint at a newspaper in Orlando. By 1913, Shutts was able to buy Flager's portion of the paper and the purchase proved to be financially fruitful, as a thriving real estate sector poured advertising dollars into the newspaper and circulation soared. Devastation wrought by a powerful hurricane in 1926 and the subsequent Great Depression curbed investor enthusiasm in the area to a certain extent. But the lure of beautiful beaches, exotic nightlife, cheap land, and little regulation continued to draw many. Indeed, Miami's later reputation as a sun-drenched Sin City had deep historical roots. Researcher Aurora Wallace (2005) characterizes Miami in the early part of the twentieth century as a glamorous tourism center lined with pristine beaches and steeped in a balmy climate, but stricken with corrupt governance, lawless behavior such as gambling, smuggling and prostitution, deep poverty, and racism.

Nevertheless, the regions' seemingly endless financial opportunities continued to beckon investors and spur industry development. A newspaperman from Ohio, John Knight, acquired the *Miami Herald* in 1937 for $2.25 million. Broadcasting began with the first radio stations in the early 1920s. Television operations first aired after World War II. WTVJ began broadcasting as a primarily CBS affiliate in 1949, the first local news station in South Florida (later becoming an NBC affiliate). South Florida's beautiful natural resources spurred

change in terms of covering the environment: Frank Stoneman's daughter, Marjory Stoneman Douglas, had begun writing for *The Herald*. In 1947, she published her famous work *The Everglades: River of Grass,* which brought much publicity to Florida's lush natural life and made Douglas famous as one of the country's most-recognized environmental journalists.

By the late 1950s, however, Miami media audiences were beginning to change. The city's proximity to Cuba and the rest of Latin America made it first a favorite vacation spot for wealthy Latin American tourists, and then a convenient destination for exiles fleeing political and economic turmoil in many of those countries. The trickle of immigrants became a flood in the coming decades, especially of Cubans seeking political asylum from Fidel Castro's revolution. Latin American banks and businesses established offices in Miami, not only to cater to the increasing number of Hispanic residents but also to take advantage of the proximity to Latin American clients. John Sinclair (2003) describes many of the economic, political, and cultural advantages Miami afforded to Latin American businesses including geographical location, cold war politics, low cost of labor, lax government oversight, tax breaks, relative economic and political stability, and cultural networks and ready-made markets afforded by earlier waves of migrants.

Miami's demographics began to shift from what had originally been a primarily Anglo population with a small black minority, to predominantly Hispanic with smaller white and black populations. The magnitude and speed of the changes are impressive. According to the U.S. Census, in 1960 the population of Miami-Dade County was approximately 5 percent Hispanic, 15 percent black, and 80 percent white non-Hispanic. By 2000, Miami was 57 percent Hispanic, 19 percent black, and 24 percent white non-Hispanic.

Media Melting Pot

The composition of Miami's Hispanic population is different from other cities with large Hispanic populations. While Mexican Americans and Puerto Ricans form the largest slices of the Hispanic populations in other regions, Miami features more diverse subgroups. As of 2000, Cuban Americans were the majority in Miami-Dade County, but there are growing communities from Argentina, Colombia, Ecuador, El Salvador, Honduras, Nicaragua, Peru, and Venezuela. Haitians and Brazilians have also established substantial communities in Miami.

Therefore, foreign-language media, once a minimal presence, became major players, and Miami evolved into a hub not only for Hispanic media but also an important destination for international media groups interested in reaching audiences throughout the Western Hemisphere. From humble beginnings in the late 1960s—Humberto Delgado and Lorna Veraldi describe the "surprise" that met a local channel that was considering broadcasting a weeknight newscast in Spanish—Spanish-language television expanded in Miami from the 1970s. Univisión, Telefutura, and Galavisión have units in Miami; Telemundo and its cable channel, mun2, are headquartered in South Florida. Various other Spanish-language broadcast and cable channels, distribution companies for Spanish-language programs, and many Hispanic media advertising companies and marketing also operate in the area, creating incentives for Latino creative talent, news professionals, and media managers in Miami.

As Miami's Hispanics live in an increasingly bilingual environment, programming that mixes English and Spanish is also on the rise. Sinclair (2003) discusses the advent of "Spanglish" and bilingual programming aimed at younger Hispanics on Galavisión and mun2, in particular.

Creole- and French-language media reflect growth in the city's Haitian American population in recent decades, particularly in radio. As Haitian immigrants poured into Miami to escape political and economic turmoil since the 1970s, numerous Creole-language radio shows have started offering information to their growing audiences.

Spanish-language print media has also found a receptive home in Miami. Among the area's first was *Diario las Américas,* begun in 1953. Many Spanish-language magazines are headquartered in Miami and cater to both local and international publics. In 1987, Knight-Ridder began carrying an independent "sister" publication to *The Herald, El Nuevo Herald,* in order to reach the city's Cuban population, who had traditionally not been consumers of English-language print media.

Cultural Tensions

However, relations between exile communities and the Miami English-language press have been contentious at times. Emigré communities often have very different ideas of the role of media than has been traditionally espoused elsewhere in the United States. Some Latin American exile communities, as researcher Gonzolo Soruco (1996) discusses, brought with them the idea that responsible journalism can or should be openly partisan or supportive of ideals or perspectives that the community holds in high regard, as is accepted for various Latin American and European media. This differs from the traditional U.S. norm of an objective, neutral, information-oriented press. This schism is illustrated in the tensions among various communities and the Miami press over what responsible journalists should do.

For example, the *Miami Herald* and the Cuban American community have clashed over the paper's coverage of American actions in Central and South America such as CIA involvement during the 1970s and 1980s; crime in Miami following the 1980 Mariel boatlift; or cases of corruption involving Hispanic officials. In 2007, *El Nuevo Herald* fired several journalists for accepting payments from the U.S. government to appear on state-sponsored radio programs that had a decided bias against Castro's regime. The firings provoked anger in the Cuban exile community, many of whom saw the move as unfair and harsh. Eventually, citing an ambiguously worded code of ethics, the publisher of the paper resigned and offered to rehire the fired journalists, as debate raged in the newsroom regarding ethical conflicts of interest.

Media and Accountability

Local media have also played a role with accountability in governance in a city historically associated with weak oversight and enforcement, particularly in terms of bringing attention to instances of official corruption. In 2007, journalists at *The Miami Herald* won a Pulitzer (the paper has 19 as of early 2008) for their investigation of egregious mismanagement of taxpayer funds supposed to have gone to build affordable housing for the area's poorest residents. The series of articles resulted in the resignations and firings of officials, arrests of several developers, as well as the scrutiny of many other public and private entities involved. Eight years earlier, the paper won another Pulitzer for its investigation into voter fraud in a city mayoral election. According to their reports, thousands of illegal absentee ballots had been included in the election.

Military and the Media

The armed forces and the news media always have been crucial to American democracy. The Constitution's Preamble underscores the importance of a strong military by declaring the need to secure liberty and provide for defense. The First Amendment enshrines free speech and free press as cornerstones of a representative government. Other than ensuring civilian control of the armed forces, however, the Constitution leaves unspecified how

to resolve conflicts between the military and media. Conflicts spring mainly from the public's need for security versus its need for information. Secrecy protects against enemies. News that compromises wartime security risks death and destruction, or threatens democratic government by turning the tide of war. It is no surprise, then, that government and military officials have often pushed for restrictions on the news media since 1798, when Congress passed the Alien and Sedition Act to curb the open expression of public opinion during a time of international tension. On the other hand, restrictions on the media's ability to report on military action, as well as on the larger reasons to declare and end war, limit the robust debate required for civilian control. Military affairs unchecked by public scrutiny raise the likelihood that incompetence, waste, recklessness, and a host of other abuses pass unnoticed. These tensions between the military and the media range back more than 200 years.

The Nineteenth Century

Journalism posed little threat to American troops during the Mexican-American War (1846–48), the first U.S. military action covered by full-time correspondents. Handwritten dispatches describing the combat traveled by ship, train, and horse, with some completing their journey home via the newly installed telegraph service along the Eastern Seaboard. Most took days or weeks to reach the offices of American publications, the only forms of mass communication. Delays provided little chance for a carelessly written item to undermine operational security. Visual reportage also began during the invasion of Mexico but had virtually no impact on public opinion. Photographers made only a handful of daguerreotype images, which measured a few inches square and could not be reproduced.

When the American Civil War (1861–65) began, however, much had changed. The telegraph had spread across a 50,000-mile network of lines. Telegraphy allowed eyewitnesses to send battle news across the country at high speed. Furthermore, the handful of combat journalists active during the Mexican-American War had expanded to about 500 by the 1860s. They generally moved easily among the troops, although some officers, including Union General William Tecumseh Sherman, complained about their presence as a security threat. The news they sent home affected morale on both sides, in turn prompting the first widespread wartime censorship in American history when the Union War Department cracked down on military reports filed by telegraph. In order to help shape public opinion, Secretary of War Edwin Stanton censored and delayed publications and briefly jailed journalists who displeased him. The Union army also temporarily shuttered some newspapers.

By the end of the nineteenth century, professional American war correspondents had emerged. Foremost was Richard Harding Davis (1864–1916). He and others considered the late 1890s to be a golden era for wartime journalists as they had great freedom to observe and write, with minimal military restriction. They produced compelling stories that newspapers ran under large headlines. Davis's account of Theodore Roosevelt leading a charge in Cuba during the Spanish-American War (1898) is credited with cementing Roosevelt's image as a man of action and helping launch him toward the White House.

Early Twentieth Century

Unfettered war reporting ended in 1904 when fighting between Japan and Russia broke out in the Far East. The Japanese army expected the war to be difficult and instituted a broad range of information controls to soften public reaction at home. Although the Japanese routed the Russians, the restrictions remained in place until war's end in 1905. They included accreditation, a sort of contract between journalists and military commands; battlefield chaperones, which required Western journalists to have Japanese military escorts if they left their press compound; news conferences that revealed little of value; mandatory military censorship; and press pools, in which one journalist collected officially sanctioned news and shared it. Combined with upbeat reports issued by the army and government, the rules allowed Japan to produce war news for public consumption as it saw fit. Other nations realized that just as war news could affect the home front, so too could an orchestrated information campaign of censorship and propaganda.

The Allies instituted a Japanese-style model of military-press relations early in World War I

(1914–18). This was the first total war, involving millions of citizen-soldiers and civilians, mobilization of industry, and widespread information controls. Britain and France severely restricted civilian journalists in 1914 and 1915, when both nations suffered a string of defeats. At one point in 1915, Britain accredited five British and only one American reporter for the entire Western Front. The accredited American, Frederick Palmer (1873–1958), submitted his dispatches to military censors, who then sent them to the three main American news agencies. Thus American media relied on one journalist for news of the biggest war in history to that time, until protests by journalists and politicians loosened the restrictions. After the United States entered the war in 1917, the number of accredited Americans rose to 31. Hundreds more stayed near military headquarters and cities near battle zones, seeking news. Despite their increase in number, journalists did little to crack the official silence about the horrors of trench warfare. Censors eliminated unpleasant details or inspired journalists to censor themselves, resulting in a blackout on photographs of dead American soldiers—not one appeared in print during the war. Nor did journalists puncture the official propaganda of belligerent governments. Disillusion over news management in World War I led to widespread skepticism when initial reports of atrocities in Nazi Germany appeared two decades later.

On the home front, George Creel's (1876–1953) Committee on Public Information (CPI), which opened in the spring of 1917, sought to increase support for the war through publicity and propaganda, as well as control news through a voluntary code of censorship. Through censorship and widespread distribution of propaganda, including much that targeted citizens directly, the CPI attempted to weaken the news media's ability to challenge the ways in which the military and government shaped perceptions of the war. The federal office distributed thousands of speeches, booklets, and press releases to newspapers and magazines as well as citizen groups. In order to avoid a showdown over the First Amendment, it also sent out lists of sensitive war news topics and asked journalists to avoid them. These rules proved effective, as most newspapers joined the information campaign supporting the war.

World War II

World War II (1939–45) witnessed the largest bureaucracy of information control in American history. President Franklin Delano Roosevelt, who had served as assistant secretary of the navy in World War I, moved away from a single, centralized office and decided to separate censorship from publicity and propaganda.

The Office of Censorship, led by former Associated Press Executive Editor Byron Price, supervised domestic news censorship. Like the earlier CPI, the Office of Censorship distributed lists of war news topics, such as troop movements and location of war factories, and asked journalists to avoid publicizing them. According to Price, journalists knew that some form of compulsory censorship would arise if voluntary censorship failed. The system worked. During the entire war, only one journalist deliberately violated Price's "Code of Wartime Practices." That journalist, a radio station manager in New Mexico, briefly fought the request to monitor foreign-language programs. Major secrets kept by journalists during World War II included the program to develop an atomic bomb, which investigative reporter Andrew Russell "Drew" Pearson (1897–1969) uncovered months before the first atomic test at Alamogordo, New Mexico.

The Office of War Information (OWI), headed by radio commentator Elmer Davis (1890–1958), coordinated the release of war news and supervised propaganda directed at most other countries. The OWI struggled with the reluctance of military officers to release complete, accurate, and timely information. In particular, Davis fought with Chief of Naval Operations Ernest Joseph King, who suppressed news of losses in the Pacific early in the war. The OWI also suffered from internal and external differences of opinion on what information it should publicize overseas. Congress slashed its budget over concerns that the OWI had become politically partisan.

In the combat zones, some 1,650 accredited American journalists roamed almost at will along the front lines. Their reports and photographs received lighter censorship than they had in World War I. Novelist John Steinbeck, who covered the war in Europe for the *New York Herald Tribune,* explained, "We edited ourselves much more than

we were edited." He said that journalists bought into "a huge and gassy thing called the War Effort" (Steinbeck 1958, xvii, xi). Self-censorship stretched to include photography and radio broadcasts. War photographers avoided shooting much of the worst violence, knowing it would never clear military censorship. Photos of American combat deaths submitted to military censorship were routed to a Pentagon file known as the "Chamber of Horrors." The federal government did not release any such photos until the fall of 1943, when the war turned in the Allies' favor and OWI and military decided that such images might bolster public support. Radio broadcasters who first covered combat during the Spanish Civil War (1936–39) faced stricter military censorship because of the medium's immediate, widespread distribution. However, radio journalists demonstrated sympathies similar to their print colleagues. "I pray you to believe what I have said about Buchenwald," CBS reporter Edward R. Murrow (1908–65) told his listeners after visiting the liberated concentration camp. "I reported what I saw and heard, but only part of it. For most of it, I have no words" (quoted in Persico 1988, 229).

Korea and Vietnam

In the Korean (1950–53) and Vietnam (1959–75) wars, journalists again got close to the action. In Korea, press–military relations followed the pattern of World War II, with journalists reporting from front-line units. Combat journalists avoided outright military restrictions on news except for a few weeks after the Chinese intervened in Korea late in 1950. The journalism of the Korean War, while full of grim realities, continued a measure of self-censorship. For example, journalists knew of the massacre of South Korean civilians at No Gun Ri but either ignored it or treated it as insignificant. While tensions between journalists and the military increased during the Korean War, the press mostly remained supportive—in part because the conflict began with a communist invasion at the height of the cold war, and ended only three years later.

Coverage expanded to include starker images and stories during the longer Vietnam War, especially after the advent of daily television coverage. Official censorship would have been difficult, if not impossible, to impose in Vietnam. America fought without a formal declaration of war, and initially under the pretense of merely advising South Vietnamese troops. Any formal censorship would have required the approval and participation of South Vietnamese officials, but American advisers opposed allowing the notoriously heavy-handed Saigon government to shape the news. Furthermore, according to Vietnam War historian Clarence R. Wyatt, formal censorship would have had political repercussions in America. In addition, attempting to keep journalists from seeing the realities of war, or to force them to submit their dispatches and photos to military review, would have proved impractical in a largely guerrilla conflict scattered over a wide area. The military did provide transportation to combat zones, but correspondents found it easy to hitch rides without formal permission. Still, the American government quietly attempted to restrict journalists' movements. Cable 1006, a 1962 State Department communiqué to the American ambassador in Saigon, urged downplaying the limited American role in the war and not taking correspondents "on missions whose nature [is] such that undesirable dispatches would be highly probable" (quoted in Wyatt 1993, 92). Candor increased in the mid-1960s as America's military role expanded and its confidence briefly rose. However, coverage of the enemy's massive Tet offensive of 1968, which starkly conflicted with public pronouncements of success, damaged hopes that the war could be easily won. In response to the Tet offensive, *CBS Evening News* anchorman Walter Cronkite (1916–2009), one of the most influential journalists in America, broadcast in an editorial that he foresaw no future but stalemate in South Vietnam. Cronkite's conclusion added to the growing doubts of President Lyndon B. Johnson (1963–69), who announced five weeks later that he would not seek re-election.

Television news crews filmed close-up views of Americans in combat for the first time during the Vietnam War. To save costs, most TV crews sent their film by plane to the United States instead of transmitting it by satellite. Thus, most televised coverage depicted events that had occurred days earlier. Nevertheless, news broadcasts supplied the most powerful images of the war. These images included fighting during the Tet offensive, the street execution of a guerrilla, and the burning of civilian villages by American forces. Such televised images

brought home the chaos and violence more poignantly than words or still pictures ever could. Together with information gathered in the field by determined print journalists, TV images undermined the military's professed optimism. Journalists came to distrust daily American military briefings, which they called "The Five o'Clock Follies." What they saw and heard in the field often conflicted with what both government and military leaders told them, leading to a "credibility gap." After war's end, an article in the army's *Military Review* suggested that the power of television's undeniable images shifted American public opinion against the Vietnam War. Other historians, such as William M. Hammond, blamed flawed strategy and body counts more than adverse press coverage.

Gulf and Iraq Wars

During and after the Vietnam War, military officers, particularly those who sparred with skeptical journalists, came to distrust the press, and television in particular. At the same time, many journalists grew increasingly leery of government and military pronouncements. They learned a greater appreciation for verifying information independently. Thus, the military and media relationship became more fractious. When the military could impose control of battle zones (for example, during minor invasions of Grenada and Panama in the 1980s and during the Gulf War in 1990–91), it often severely limited news media access.

American military planners took their cue from the brief British war with Argentina over the Falkland Islands in 1982. The Royal Navy controlled access to the islands as well as the transmission of stories and photos, which underwent censorship and thus delay. An American naval lieutenant commander, Arthur A. Humphries, applauded the British approach. In order to get what he called "favorable objectivity" in news coverage, Humphries called for controlled access to future battle zones, strict censorship, the exclusion of unsupportive journalists, and a flood of prowar publicity.

American armed forces employed something similar to Humphries' vision during two brief conflicts, the 1983 invasion of the island of Grenada and the 1989 invasion of Panama. In both cases, the military prevented journalists from witnessing significant combat. The military instituted an even broader and more bureaucratic system of information control during the 1990 to 1991 Gulf War to liberate Kuwait from Iraq. Rules governing press access to the war zone came from the top military command. Within weeks of Iraq's invasion of Kuwait in the summer of 1990, rules known as "Annex Foxtrot" required military escorts for all journalists accompanying troops into battle. Pools and military censorship also were instituted, bringing the American military back to the 1904 Japanese model of press control. Of 1,200 journalists in the Persian Gulf when fighting began, only 130 initially received pool membership. Those pool reporters, whose numbers later grew to 192, said they sometimes found their military escorts, or "minders," intimidating soldiers during interviews. Pool reports also commonly suffered delays before being released. Given the controls placed on correspondents accompanying American troops, it is small wonder that the war's most memorable—and controversial—reporting came from a CNN team operating without censorship from Baghdad.

Between the end of hostilities in the Persian Gulf War and America's invasion of Iraq in 2003, both military and civilian communication technology made huge leaps. Correspondents used Internet connections and satellite uplinks to report live back to the United States. No longer could the military impose total control over the channels of communication from the front lines to the rear, and to the home front, making World War II–style censorship obsolete. Replacing it was a largely voluntary system of self-censorship, coupled with the "embedding" of accredited journalists in military units, which was a form of controlled access. Embedding, one of the most important developments in the long history of the relationship between military and media, required journalists to stay with their units until they opted out. It minimized the risk of compromising operational security since any breach would put a journalist's own unit at risk.

The decision to embed 600 journalists as part of the 2003 invasion arose out of both military and media frustrations with the reporting of the Persian Gulf War. Independent news coverage from embedded, front-line reporters was expected to accurately portray combat, support America's claims that Iraq possessed weapons of mass destruction, and counter any claims the Iraqi government might make

about American military abuses. Some of those roles were not realized. The invading forces found no weapons of mass destruction, and what arguably were the most significant abuses, at the Abu Ghraib prison where captured Iraqis were tortured and humiliated, came to light through American sources. However, embedding did meet expectations through expanded coverage, as journalists let Americans see war in real time. Embedding had its critics. "The most common criticism of the embedded reports is that they are only isolated pieces of a larger mosaic, and that relying too heavily on them would thus skew the picture viewers get," concluded the Project for Excellence in Journalism (Project for Excellence in Journalism 2003, 11). Observers also suggested that the close reporter/soldier relationships promoted by embedding served to bias news reports in favor of the military. Some 2,100 unembedded journalists, known as unilaterals, maintained their independence. They wandered through Iraq without accreditation until guerrilla violence made their reporting activities too risky.

Conclusion

Throughout history, the military and the media have sought balance between the people's right to know and the armed forces' need for security. This balance has shifted in response to changes in communication technology, public opinion, and the vulnerability of troops in the field. The military always will require some measure of wartime secrecy. Experience has demonstrated, however, that extreme secrecy affects public opinion and thus civilian oversight.

Faced with the power of ubiquitous, rapid modes of communication that journalists can carry into battle zones, the military opted in 2003 to reenergize the World War II system of putting correspondents in front-line units. The embedding program modified the old system by requiring journalists to stay with their units for the duration of combat, instead of wandering nearly at will. Embedding generally was well received. Journalists achieved access on par with coverage of the Civil War or World War II. The military, in turn, received generally positive coverage that did not compromise security. Nevertheless, the military and media are likely to continue to face challenges concerning appropriate levels of news coverage, particularly as communication technology becomes even more powerful and as warfare continues to evolve from conventional combat to more guerilla and terrorist forms.

Milwaukee

Wisconsin's largest city (more than 600,000 people in the early 2000s) and the country's 33rd-ranked market by the early 2000s, has long been dominated by one media company, which includes holdings in print, radio, and television. But neither the city nor company started out that way.

Milwaukee's first newspaper appeared with the 1837 birth of the weekly *Sentinel,* published by Solomon Juneau, a one-time fur-trader, successful businessman, and later mayor. It became a daily in the mid-1840s, about the time the city of Milwaukee was formally incorporated. The city expanded rapidly, drawing many European immigrants to its nascent manufacturing and brewing industries. It soon had a heavily German population and an active political scene.

Newspapers

When Lucius Nieman, who had become managing editor of the *Sentinel,* decided he wanted a paper of his own, he purchased the three-week-old *Daily Journal* in 1882. He faced competition from four other English-language dailies, plus four German- and two Polish-language dailies. One indicator of the vibrant competitive newspaper market the city had become is that the Milwaukee Press Club was formed in 1885 (and is now the oldest continuously operating such group in the country). Soon renamed *The Milwaukee Journal,* in 1891 Nieman's newspaper became the first to use "run-of-paper" color when it printed red and blue stripes across its first page to mark the inauguration of a governor.

The *Journal* covered a city dominated by an active Socialist Party (which controlled the mayor's office for most years through 1960). Throughout Nieman's long editorship he maintained a generally liberal but independent stance for the newspaper, sometimes supporting Republicans, but more usually Democrats. It won its first Pulitzer in 1919. By this time, most of the foreign-language papers had closed down. Two years after his 1935 death, a small bloc of *Journal* stock was given to Harvard by his widow; this endowment initiated funding for their Nieman Fellowship program for promising journalists.

Following several owners, the *Sentinel* was sold to the Hearst Corporation in 1924. Operations were joined to Hearst's afternoon paper, the *Wisconsin News,* and a joint Sunday edition was published as the *Sunday Telegram*. The *News* closed in 1939, leaving the morning market to the *Sentinel.*

In 1937, Journal Company president Harry Grant assured a stable future for the firm he had

just taken over by creating an employee-ownership plan. Employees purchased a one-quarter interest in the company (a proportion that expanded over the years to come). Any sale of the publisher would require approval from two-thirds of the stock voted by active employees (those who retired had to sell their stock back to the employee pool). The rules also allowed any who opposed a buyout the first right to buy the stock of those seeking the sale—and at a "formula" price, not that offered by the buyer. (As Journal Co. stock was not then publicly traded, it was priced according to a formula that took account of company assets and earnings over the previous five years.) Grant's descendants still owned 10 percent of the company 70 years later.

The *Journal* demonstrated considerable independence in the early 1950s when it opposed Wisconsin's red-baiting junior senator, Joseph McCarthy, though he enjoyed considerable support across the state. Following a long and costly strike, in 1962 Hearst announced the closing of the *Sentinel,* which had lost money for years. The Journal Company, then at the peak of its circulation (about 400,000 weekdays and half again more on Sundays) and concerned about how its dominance of the Milwaukee media market might look to policymakers, agreed to buy the *Sentinel* name and subscription list, with Hearst retaining ownership of its broadcast stations (WISN-TV remains with Hearst-Argyle, while the radio station by the early 2000s was owned by Clear Channel). The *Sentinel* became a Monday-through-Saturday paper, leaving the Sunday market to the parent *Milwaukee Journal.*

During the 1960s, the *Journal* won two Pulitzer prizes and modernized its content and appearance. It also began its first expanded metropolitan coverage through zoned editions that offered news and features for specific areas of the city and suburbs. After running both papers as separate publications for three decades, the Journal Co. merged them in 1995.

A decade later, the combined newspaper had the 35th largest circulation in the country, just under a quarter million daily and 430,000 on Sundays. The Journal Communications company continued to expand. By the mid-2000s, it owned over 90 community newspapers and shoppers in eight states, 38 radio stations and seven television stations in 11 states, a regional fiber optic network in the upper Midwest providing integrated data communications, and commercial printing and direct marketing services. The more than 14 million shares outstanding in the mid-1990s were controlled by some 2,600 shareholders. In 2003, the company made the first public offering of part of its stock.

Radio

The first radio stations aired in the city in the early 1920s, and as elsewhere, many were short-lived as there was little economic stability in the business. The Hearst operation purchased a radio station in 1927, calling it WISN (after their newspaper) several months later. In 1955 the Hearst company purchased a local television station and it became WISN-TV (Channel 12).

The Journal Company also branched into broadcasting, after sponsoring programs on other stations starting in 1922. In 1927 it purchased a station that became WTMJ (the letters standing for the owner). A middle-of-the-road station for decades, and by far the most popular AM radio station in the city, it began broadcasting 24 hours a day in 1974, and was by the early 2000s known as "Newsradio 620." It competes with several other news-talk stations including WISN.

In 1940, the Journal Company's W9XAO (later W55M and WTMJ-FM) became the first FM station to air west of the Alleghenies. Broadcast operations were consolidated in the handsome Art Deco "Radio City" on East Capital Drive in 1942, a building designed with future television operations in mind and said to be the first such purpose-built radio-TV facility in the country. The FM was taken off the air (the transmitter given to the University of Illinois) when the medium appeared to be fading. In 1958, WTMJ-FM returned to the air. The AM outlet has long been a news/talk operation while the FM station became WKTI in 1974 and has moved through different musical formats.

Most of the other FM operations in the city broadcast some type of music—including one largely devoted to polkas, a reminder of the city's German heritage. By the early 2000s, thanks to radio ownership consolidation, Clear Channel owned six radio outlets in Milwaukee, and Entercom three more including all sports WSSP, the station long known as WEMP. Public radio outlets were long operated by Marquette University,

the state educational network (since the late 1940s), and since 1964 by the University of Wisconsin–Milwaukee's WUWM.

Television

The Journal Co. broadcast technicians experimented with television beginning in 1929 and lasting to 1938. The company applied for a commercial license in 1941, but construction was delayed by the war. In 1947, WTMJ-TV signed on the air as the state's first (and until 1953, only) television station—and only the eleventh station in the country. Originally on Channel 3 (shifted to Channel 4 in 1953), the NBC affiliate was an immediate financial winner and was the only station serving the city until 1952.

By the early 2000s, there were nine other commercial outlets in the market (including six affiliates of national television networks), including two stressing religious programs. Two public television stations are operated by the city's vocational school (the first aired in 1957) and there are several others, including one operated by the state network.

Minneapolis–St. Paul

Minneapolis and St. Paul have always been disparate sibling rivals—as have their media. St. Paul and its newspapers came first, capturing the state capitol and early lead in communications, but Minneapolis and its newer media soon surpassed its sister city in size and prestige. By the early twenty-first century, the Twin Cities metropolitan area had 3 million people, making it the sixteenth largest U.S. media market, and it was resurgent St. Paul that could claim safer streets, more recent Pulitzer Prizes, and many of the nation's leading public broadcast personalities.

Newspapers

Minnesota's mass media history began in St. Paul on April 28, 1849, when James Madison Goodhue published the first issue of the *Minnesota Pioneer* weekly. He had taken the first steamer up the Mississippi as soon as word came from Washington that Congress had established the Minnesota Territory. Statehood was still nine years away.

In January 1851, Goodhue got into a duel over some of his editorials against Whig Party territorial officials; he often accused the "recumbents" of drunkenness, graft, and incompetence. Goodhue used his pistol to wound Joseph Cooper, whose brother David was running for territorial chief justice, but Cooper stabbed him twice with a bowie knife. Blood flowed liberally, but both men survived.

As St. Paul's population grew, Minnesota's first four daily newspapers all began publication in May 1854: the *Daily Minnesota Pioneer* on May 1, the *St. Paul Daily Democrat* that same evening, the *Daily Minnesotian* on May 11 and the *St. Paul Daily Times* on May 15. A year later, the *St. Paul Daily Free Press* became the city's fifth daily—even though the telegraph didn't make it to St. Paul until 1860 and the railroad didn't arrive until 1862. The *St. Anthony Express* weekly had begun publication in 1851 in what was to become Minneapolis, but the younger twin city didn't have a daily newspaper until the *Minneapolis Tribune* launched on May 25, 1867.

On April 11, 1875, the *St. Paul Press* took over the *Pioneer,* giving the city one powerful morning

paper. The *Pioneer Press*' main competition was a Democratic afternoon daily begun in 1868, the *St. Paul Dispatch*. In 1876, the *Minneapolis Tribune* suffered the ignominy of being bought by the *St. Paul Pioneer Press*. But in a matter of months, a dozen prominent Minneapolitans bought back the *Tribune* to be an evening paper, which became the *Minneapolis Journal* after they relaunched the morning *Minneapolis Tribune* in May 1880. In March 1891, William J. Murphy bought the *Tribune* for $450,000. By 1895, its circulation reached 37,453, while Minneapolis had a population of 200,000, many of whom still read the area's Swedish-, Norwegian-, or German-language newspapers.

In St. Paul, the evening *Dispatch*'s circulation passed the morning *Pioneer Press'* in 1906, and the *Dispatch* bought its last St. Paul rival three years later. In 1927, the *St. Paul Pioneer Press-Dispatch* became the first acquisition in what would be a coast-to-coast chain of papers owned by the Ridder brothers: Bernard, Joseph, and Victor. The Ridders would run St. Paul's paper and own at least half of it for the next 80 years.

Meanwhile at the *Minneapolis Tribune,* Murphy died of pneumonia in October 1918. Having fancied himself the Pulitzer of the Midwest, Murphy bequeathed $350,000 to establish the University of Minnesota's school of journalism, which has resided in Murphy Hall since 1940. Murphy's younger brother, Frederick, became publisher of the *Tribune* on September 1, 1921, after working his way up through the paper for 28 years. Under him, the *Tribune* continued to champion agriculture and Republicans. North Dakota farm advocates started the evening *Minneapolis Star* in 1920, but their brand of socialism did not catch on, and they sold out four years later. The new managing editor, the ironically nicknamed Basil "Stuffy" Walters, deployed sensational headlines and circus layouts to capture the city's largest evening circulation. What really sent shockwaves through the Twin Cities journalism scene came in June 1935, when *Des Moines Register* owners Gardner and John Cowles bought the *Minneapolis Star* and instituted the same nonpartisan editorial policy and distribution excellence that made the *Register* a lucrative award winner.

The *Star* bought out the evening *Journal* in 1939. Frederick Murphy, the *Tribune*'s publisher, died in 1940. And Minneapolis' newspaper circulation wars ended on May 1, 1941, when the Cowles bought their once-dominant morning rival and formed the Minneapolis Star Tribune Co.

Cowles and his top executives became intricately involved in Minneapolis civic affairs, serving in more than 100 organizations and fulfilling more than 300 speaking engagements a year. But at the same time as they were pursuing parochial interests, John Cowles and his successor, John Cowles Jr., expanded their readers' worldview by opening one-man bureaus in London, Beirut, Hong Kong, and Rio de Janiero. The Cowles' Washington correspondents won Pulitzer Prizes in 1947, 1954, and 1957, followed by a Pulitzer for a *Star* photographer in 1958. In 1961, a *Saturday Review* survey of journalism professors rated the *Tribune* one of the nation's top 15 papers, and in 1964, *Time* magazine put it among the top 10. But then as in many cities, the evening paper's circulation began to drop, and in 1982, the papers merged into the morning *Star Tribune,* forcing painful layoffs and reorganizations. The *Star Tribune* won its most recent Pulitzer in 1990, but the Cowles era of expansive budgets and civic involvement ended in 1998, when Sacramento, California–based McClatchy Co. bought the *Star Tribune* for $1.2 billion. In an attempt to stave off further readership and revenue losses to new media competition, McClatchy launched *startribune.com,* which quickly became one of the highest penetration and most award-winning newspaper sites on the web.

Across the river, the *St. Paul Pioneer Press and Dispatch* thrived throughout the 1940s through the 1960s by forging a gentlemen's agreement with the *Star* and *Tribune* to not solicit advertising, news, or readers from Minneapolis. But a third generation of Ridders forced Ridder Publications Inc. to go public with its stock in 1969 and to merge with Knight Newspapers Inc. in 1974, giving Knight-Ridder the largest daily collective circulation of any newspaper group in the nation.

At first, the stock offerings and merger yielded more resources for the St. Paul newsroom, especially after it dropped the *Dispatch*'s evening editions in the mid-1970s. The *Pioneer Press* won Pulitzer Prizes in 1986, 1988, and 2000. But readership losses also hit that paper, forcing the St. Paul and Minneapolis papers to compete—with each other and with other media—for advertising, news, and audiences.

The unthinkable for Twin Cities journalists, the ownership merger of the Minneapolis and St. Paul newspapers, happened again in 2006, but it was short-lived as in 1876. McClatchy Co. bought Knight-Ridder, but to ease antitrust concerns, it quickly sold the *Pioneer Press* to Dean Singleton and his Denver-based MediaNews Group. Then on December 26, 2006, McClatchy decided to pay off its capital gains tax bill by selling the *Star Tribune* to Avista Capital Partners in a leveraged buyout valued at $530 million. Almost immediately, MediaNews and Avista offered buyouts that cut the newsroom staffs in St. Paul and Minneapolis by almost 20 percent, following patterns seen in other cities.

Broadcasting

By 2008 there were nearly 50 radio stations in the Twin Cities market, but throughout the twentieth century, one station dominated: WCCO-AM, the self-styled "Good Neighbor to the Northwest." In fall 1962, for instance, WCCO had a 68.1 percent share of Twin Cities area listeners—twice the audience of all the other stations combined. In 1966, its morning audience was larger than any Twin Cities TV station's prime-time audience. In 1973, *The Wall Street Journal* proclaimed that WCCO commanded its listening area like no other station in the nation. WCCO remained the top-rated AM station in the Twin Cities, but by 2006, some of the music-dominated FM stations were matching its share of the market.

The station began as WLAG, going on the air from downtown Minneapolis on September 4, 1922, a few months after the University of Minnesota's WLB became the state's first radio station. WLAG died in less than two years. Just six weeks later, however, the Washburn Crosby Co. revived it as a marketing tool in its flour milling war with Pillsbury and renamed it after itself, WCCO. In 1928, a group of St. Paul businessmen banded to counter WCCO's gambit in Minneapolis, and they formed KSTP. They appointed Stanley E. Hubbard to run KSTP, and he eventually bought them out before going on to found KSTP-FM and KSTP-TV along with his son, Stanley M. Hubbard.

Just before the stock market crash of 1929, CBS founder William Paley paid $150,000 for a one-third interest in WCCO. Radio's emergence as a news source in the 1930s led the *Minneapolis Tribune* and *St. Paul Pioneer Press-Dispatch* into a rare cooperative venture whereby they bought a radio station in 1934 and named it WTCN, which stood for Twin Cities Newspapers. The papers also owned WTCN-TV when it took to the air in 1948. CBS bought WCCO-TV and radio from the newspapers in 1992.

WCCO-TV has won seven Peabody Awards for news excellence, while WCCO radio has won six, compared to two for KSTP-AM, one for KSTP-TV—and six for Minnesota Public Radio, plus two for Minnesota Public Television. KARE-TV, an ABC affiliate that Gannett owns, has not won a Peabody, but the National Press Photographers Association named it national station of the year six times between 1985 and 2008. KARE also remained the ratings leader for most of the 2000s. For example, its 10 p.m. news held a 21 percent share of the audience in mid-2008, compared to a 13.7 share for the runner-up, WCCO-TV.

In 2007, St. Paul–based KSTP-AM reignited its rivalry with Minneapolis-based WCCO by outbidding it for the rights to broadcast the Minnesota Twins games—a contract WCCO had held for 45 years.

Conclusion

By 2008, the Twin Cities journalism industry had hit a new low. WCCO-TV shed its high-paid meteorologist, Paul Douglas, and asked the rest of its anchors to take a 10 percent pay cut in order to stanch layoffs. The *Star Tribune* sought another 25 buyouts from the newsroom at year's end, missed its payments to creditors, and filed for Chapter 11 bankruptcy protection in January 2009. The *Pioneer Press*'s circulation was holding steady, but its owners were strapped for cash and credit, too. A return to 1876 and the unpopular merger of the Minneapolis and St. Paul newspapers seemed economically inevitable, but journalists held out hope that wealthy local patrons would buy the papers, keep them competing, and lead them into a new era of profitable multimedia convergence.
