Tuning in to news on the radio and/or television is a staple of the morning routine for millions of people across the United States. From minute-long headline briefs to four-hour blocks, morning news on broadcast, cable, and satellite outlets provides a wide range of news and information, traffic, weather, and entertainment. Most morning news on radio and television is rigidly formatted to time, so viewers and listeners not only get the information but can gauge whether they are running ahead or behind in their morning schedule. More than any other news program, morning news is focused on the things the audience needs to know immediately to progress with their day—that is, "Do I need a coat or umbrella?" "Is there an accident on my driving route?" "Is the kids' school delayed or closed by weather?" "What was the score of the game last night?" "What hot stories will everyone be talking about over coffee this morning?" Over time the role of news in the morning has grown on radio and television to the point where both local and network broadcasts offer up to four or more hours of morning news programming starting as early as 4:30 a.m.

Before detailing the history and current status of radio and television morning news, it is important to understand the difference between local and network programming. In the United States, broadcast stations are licensed by the government to broadcast in local communities. Those stations produce some of their own programming locally, especially news. Television stations usually affiliate with networks (a few radio stations still do as well) that provide programming to many stations across the country. In news, networks typically cover the world and national stories that local stations do not have the resources to cover on their own. So in the morning, an all-news radio station in Columbus, Ohio, might do local news, traffic and weather, and then air *CBS Radio World News Roundup* or CBS Radio newscasts on the hour. A television station in Columbus might air local news from 5:00 to 7:00 a.m., followed by the networks' the *Today* show or *Good Morning America* from 7:00 to 11:00 a.m.

Radio

Local Radio

The Scripps family (founder of the Scripps-Howard media dynasty) lays claim to the first radio news program on its unlicensed Detroit station 8MK (now WWJ-AM), August 31, 1920. But there were several experimental amateur stations "broadcasting" weather reports, news, and music for other amateur receivers from 1907 through 1917 when the government shut down all amateur radio stations because of wartime restrictions. The first commercially licensed radio station was KDKA-AM in Pittsburgh, which started broadcasting November 2, 1920, with election returns from the Harding versus Cox presidential race. Both 8MK (WWJ) and KDKA went on the air initially with a mix of programming, but ended up decades later with news/talk formats (WWJ in 1973 and KDKA in 1990). Ironically both were bought by CBS Radio (WWJ in 1989 and KDKA in 1996) and the former rivals for "firsts" in radio entered the twenty-first century airing similar morning news programming.

These two stations were fairly typical in their early local programming, especially in the morning, and serve as a good example of the development of local radio morning news. While there was little news or any other programming in morning hours at first, by the 1930s through the 1950s, news coverage was more event-driven than regularly scheduled. Indeed, newspapers were quick to point out that radio was not a good medium for news because, editors argued, it was too fleeting, and events were presented live with no context or "reporting." In 1932 KDKA-AM started a morning show that would run for more than three

decades, the *Uncle Ed Schaughency Show* (though it lasted to1980, it shifted to an afternoon slot in 1954). As was then typical of local radio programming, it offered a mix of popular big band and jazz music, some news, and when warranted, live event coverage, such as the 1936 St. Patrick's Day flood that drowned downtown Pittsburgh under several feet of water. In 1941 KDKA added the *Farm Hour* (1941–59) in the mornings, which again mixed entertainment and news. The newsy farm reports were accompanied by country music from a local band that became the top country music act in Pittsburgh. In 1954 KDKA pioneered the modern "morning team" radio format with *Cordic & Company,* which featured less music and more comedic banter and skits, supported with plentiful advertising. Short newscasts were interspersed at regular time slots, but news was not the focus of the "morning mayhem." This is still a very popular format for morning "drive time" (typically defined as 6:00 to 10:00 a.m.) radio, and the newscaster is typically expected to join in the banter. Many such newscasts mix local, world, and national news, and end on a lighter story to facilitate that cross-talk with the hosts. Traffic and weather reports are usually also a part of the morning mix on these more entertainment-based local radio shows.

Radio stations did not seem to get serious about producing their own local news in the morning until the early 1960s, when the first All News and News/Talk format stations went on the air. KFAX-AM in San Francisco was reportedly the first to try changing from a music format to all news in 1960, but the experiment failed when lack of advertising support cost the station a quarter of a million dollars in just the first four months. So the credit for the first successful 24-hour all news station goes to Arthur Arundel, who began programming in 1961 on his Washington, D.C., station, WAVA-FM. The success of news programming in Washington was due in large part to a capitol city audience hungry for political and other local news. The modern all-news radio format can be traced to innovative radio programmer Gordon McLendon, who also created the popular "Top 40" and "Beautiful Music" (the radio designation for "elevator music") formats. His all-news format started each half hour with world and national news, usually from a radio network (CBS, NBC, or ABC), then extended local news, and closed the half-hour with sports, business news, and features. It was first broadcast in the early 1960s on XETRA, a Tijuana, Mexico, station that reached Los Angeles listeners, and then on WNUS in Chicago. This format with the addition of weather and traffic is still used today by many all-news radio stations in the morning.

Network Radio

The growing world tensions in the years just before World War II jump-started radio news at the network level sooner than at stations. As CBS and NBC (ABC was not created until 1943 when the FCC forced NBC to sell one of its two networks) battled competitively in the late 1930s for the strongest coverage of European news, the first broadcast news "stars" were born. Edward R. Murrow, William Shirer, Robert Trout, and Eric Sevareid dominated CBS Radio coverage of the war in Europe after 1939 and started the longest running radio news broadcast, the *CBS Radio World News Roundup*. CBS maintains the *World News Roundup* started March 13, 1938, with Edward R. Murrow's first broadcast from Europe that utilized short wave to link reporters from several European capitols with an anchor (though he wasn't called by that title then) in New York. But historians point out that the March 1938 broadcast was a one-time report with no title. It was CBS's answer to the competitive frustration caused by NBC's Max Jordan, who was reporting live from Vienna during the Austrian crisis with incredible access; a strong, clear signal; and ongoing scoops. And even though Jordan and NBC had tried a similar report, linking reporters from multiple European capitals in 1936, CBS got the credit and publicity for doing it first with the 1938 broadcast. CBS's sporadic "Tour of European Capitals" reports continued with Murrow's and Shirer's fame increasing, and quickly eclipsing Max Jordan and his crew despite their regular scoops of major developments in Europe during the late 1930s. It was the strong voices and dramatic writing of the "Murrow Boys," as they became known, that overshadowed the work of NBC and dominated radio news in the early years.

In September 1939, as war began, the *CBS Radio World News Roundup* developed into a daily news program airing from 6:45 to 7:00 p.m. At the same time CBS started a morning version of the *World News Roundup* that aired from 8:00 to

8:15 a.m., starting the longest running morning news program on radio or television. In 2008 the *World News Roundup* celebrated its seventieth anniversary, as a ten-minute news program airing at 7:00 a.m. and 7:00 p.m. EST, Monday through Friday, on more than 1,500 CBS-affiliated radio stations. The format includes world and national news reported by CBS reporters from overseas and in New York. Many local stations air the first eight minutes, and then take the option CBS offers to cut away and provide two minutes of local news.

If CBS's *World Roundup* is the oldest national network radio morning news show (and as with any such claim of a "first" there is controversy here), then the most popular in the early 2000s is National Public Radio's *Morning Edition*. National Public Radio (NPR) was a latecomer to the radio networks, created in 1970 from federal legislation that instituted and partially funded the Corporation for Public Broadcasting. In November 1979 NPR started *Morning Edition,* which is broadcast live from 5:00 to 7:00 a.m. EST, and then is repeated with updates as needed until noon. Local public radio stations typically air two to four hours of *Morning Edition*. The program in 2008 averaged 13 million listeners a week from more than 800 local public radio stations across the country and was the second highest rated national radio program of any type.

Morning Edition is a combination of short newscasts on the half-hour, longer (up to six or seven minutes) reports providing in-depth coverage of national and world news, interesting profiles, and feature reports, plus interviews and commentary. Local public stations can break in after the newscasts with two to four minutes of local news and get two additional cut-ins per hour for weather and/or traffic, community calendar events, and promotion for upcoming programming.

As with most morning news programs, *Morning Edition* follows a rigid time schedule. Looking at the program format broken down by timing provides a good example of how network morning news formats work, allowing local stations to integrate their own news and information with the national programming. The format is the same for each hour: (as of 2008)

5:00:00–:01:00	Headlines promoting upcoming stories, an anniversary, or a birthday
5:01:00–:06:00	National and world news newscast
5:06:00–:09:30	Continued national and world news newscast—local stations often cut away and do local news and weather/traffic during this time
5:09:30–:10:00	30-second signature music bridge
5:10:00–:19:00	Segment A: two to three long stories on the big news of the day
5:19:00–:21:00	Local station break for weather, traffic, community events, promotion
5:21:00–:28:50	Segment B: long feature stories, interviews, and commentary
5:28:50–:29:30	Sponsorships and funding credit
5:29:30–:30:00	Local station break for identification
5:30:00–:30:30	Humorous news item called a "return"
5:30:30–:35:30	National and world news newscast (local stations may cover the last two minutes for local news, sports, and/or feature stories)
5:35:30–:39:30	Segment C: Three- to four-minute cultural or news feature story (local stations often cover this segment too and do a longer local newscast, with sports, weather, traffic, or a single longer news or feature story)
5:39:30–:40:00	30-second signature music bridge
5:40:00–:49:00	Segment D: two to three longer stories on health/consumer news, international stories, or updates on national stories
5:49:00–:51:00	Local station break for weather, traffic, community events, promotion
5:51:00–:58:20	Segment E: business stories (in the second hour this segment is usually a feature story)
5:58:20–6:00:00	Closing music bed—local stations may cover some part of this time for station identification

CBS, NBC, ABC, NPR, and CNN Radio Networks also offer hourly news broadcasts to which local stations can subscribe. They may be as short as one minute and update the top world and national stories with a mix of reporters, and short (10–15 seconds) interview segments (sound bites) from newsmakers.

In the first decade of the 2000s, radio morning news is the dominant choice for news and information for morning commuters on their way to work or school. But for those at home during the mornings, television news was the dominant source for American news consumers.

Television

Local Television

Morning programming on television began at the local level, but would not develop fully until the 1970s and 1980s. The first television morning program appears to have been *Three to Get Ready,* produced by WPTZ-TV in Philadelphia from 1950 to 1952. The program aired from 7:00 to 9:00 a.m. and was primarily entertainment-oriented, though it also included news and weather segments. It also provided the television debut of comedian Ernie Kovacs and was so successful in a time period when few thought people would watch television that it led NBC to develop the first network morning program, the *Today* show, in 1952.

One of the most successful and long-running local morning news programs was *The Morning Exchange,* which aired on WEWS-TV in Cleveland for more than 25 years, from 1972 to 1999. During the 1970s, on any given morning from 7:00 to 9:00 a.m., more than two-thirds of the Cleveland audience was tuned in to *The Morning Exchange,* or *MX*. *MX* broke new ground in several ways. It was the first morning show to move from a "news desk" to a living room set, and it created the now popular format for all the network morning programs, of news and weather on the half-hour and then a mix of discussion and interviews on various topics of general interest and entertainment (dealing with career choices, relationships, death, sexuality, etc.). Morning news pioneers like longtime *MX* host Fred Griffith laid the groundwork for ABC's *Good Morning America,* which first aired in 1975. Ironically ABC's success with *Good Morning America* led the network to pressure WEWS-TV to replace *MX* with the network feed. The station pushed back *Morning Exchange* to later morning hours and in 1999 canceled it.

Until the late 1970s, few local television stations were doing anything as ambitious (or expensive) in the morning. The typical station morning news was a 15-minute or half-hour segment that led into the network morning shows. The ABC, NBC, and CBS morning news programs also allowed time for stations to insert brief local news and weather segments at the end of each half hour. But changing life schedules brought new demands and opportunities for more content in the morning. People started getting up earlier to head to work, and subsequently went to bed earlier, many times before the late news, which had been the big station program for audience and profitability. Stations slowly started expanding their morning news, first to an hour and then 90 minutes, and then two hours. By the 2000s some local stations started their local newscasts at 4:30 a.m.

As station morning newscasts expanded, they also changed to more closely match what radio news had long been doing in the morning. In fact some news consultants encouraged television stations to basically "do radio" in the morning. The formats stuck to a rigid time schedule, similar to the one presented above for NPR's *Morning Edition,* and assumed that most viewers watched for a maximum of 45 minutes, but more likely only 20 to 30 minutes. That meant short news blocks, regular traffic and weather reports, and features or sports at the end of the half-hour. In the early 1990s several stations adopted a format that put traffic and weather reports together, airing every ten minutes. This format was regularly branded using the station's channel number, for example "Traffic and weather together on the 5s" for Channel 5, or "Traffic and weather every ten minutes on the 8s" for Channel 8.

In addition to format changes for television morning news, the new longer morning news blocks also changed content. With longer newscasts and more viewers, resources also came to local morning news, often including one or two reporters who would be out reporting live during the morning, and overnight videographers to shoot fresh video news for the morning programs. The modern format for local morning news does not just recap the stories from late news the night

before, it provides fresh stories. Much of the content looks forward to what is ahead for the day. There is also more health, consumer, and business news. All the content is neatly packaged in a strict time format bracketed by traffic and weather. Despite schedule rigidity, morning news anchors actually have more flexibility in their presentation than do their evening counterparts. There is more room for personality among television morning news talent, and usually more time for "chat" among the news, weather, and traffic presenters. If sports is included in local television morning programming, it is rarely live. Typically the sports anchor from the late news records a two- to three-minute sports segment that is played back on tape during the morning program.

In the 1990s, many stations expanded their morning news to weekends, replacing what had traditionally been children's programming. These weekend morning programs range from an hour to as long as four hours. The weekend content typically has no traffic reports, and more feature segments such as cooking or gardening, mixed in with the news and weather segments. The weekend morning news programs also might rebroadcast special health or consumer reports, as well as investigative reports from weekday evening newscasts.

As morning television news expanded, it stole much of the in-home audience from all-news and news/talk radio stations. This trend accelerated as stations' technology allowed them to focus on providing information such as school closings and delays in bad weather, and very specific traffic information. While radio morning news still dominates during the actual "drive time" for people, until they get in their cars to head to work or school, they "listen" to television morning news. Unlike the evening television newscasts, most morning news producers assume their viewers are really listeners while they go through their morning routine, so they produce programming that is more for "the ear" than for "the eye" than is traditionally the case for television news.

Television Networks

The most popular television morning news programs, NBC's *Today* show, ABC's *Good Morning America,* and CBS's *The Early Show,* got their start by copying local morning news success stories. The oldest of network television morning news programs is NBC's *Today* show. It was first broadcast January 14, 1952, and since that time has been consistently dominant with viewers, except for a period in the late 1980s when ABC's *Good Morning America* grabbed the most viewers for a few years. But *Today* rebounded and has been the ratings winner every week since 1995.

The original *Today* show was hosted by easygoing Dave Garroway and blended national news headlines and in-depth newsmaker interviews, with lifestyle features and entertainment gimmicks such as the *Today* mascot, a chimpanzee named J. Fred Muggs. From the very beginning, the *Today* show also offered local stations time for short local news and weather updates. *Today* started as a two-hour program that NBC affiliated stations aired from 7:00 a.m. to 9:00 a.m. It was live on the east coast, and tape delayed in other time zones. The program experimented with five hours of live broadcast in 1956, so as to be live for all time zones, but in 1958 the network switched back to tape-delayed broadcasts for all time zones except the Eastern. In 2000 *Today* expanded to three hours, broadcasting until 10:00 a.m. and in 2007 a fourth hour was added. Not all stations air the additional two hours, as some produce their own late-morning programs.

Garroway hosted the *Today* show for nearly 10 years, during which time NBC had only token morning competition from ABC and CBS. When Garroway left, host or anchor duties fell primarily to news people and became a launching pad for careers at NBC news including those of John Chancellor, Hugh Downs, Barbara Walters, Tom Brokaw, Jane Pauley, Bryant Gumbel, and Katie Couric. While the program was originally produced in a functional newsroom within a studio, eventually the "news gathering set" was replaced by a more informal scene. An early version featured a large streetside window, so people could "look in" while the program was on the air. In 2006 *Today* returned to those roots with a new set that included an outside venue.

While the hosts and sets have changed, the basic idea of the *Today* show has remained remarkably the same. It still provides a mix of news headlines and newsmaker interviews, with lifestyle and entertainment features, weather, and local news cut-ins before the top and bottom of the hour.

During the first two hours, the program follows the same time format as local television and radio morning news, giving viewers those time benchmarks to support their morning routine, but the additional two hours tend to be more flexible, and the interviews and longer stories become lighter and more feature-oriented as the program moves through its final two hours. The *Today* show also expanded to weekends, adding a Sunday morning program (from 8:00 to 9:00 a.m.) in 1987 and a Saturday morning version (from 7:00 to 9:00 a.m.) in 1992. NBC also produces a business and news morning program, *Early Today,* which some stations air for 30 minutes or an hour before their morning news programs.

ABC only entered the network morning news race, more than 20 years after NBC, on January 6, 1975, with *AM America,* which aired from 7:00 to 9:00 am. But NBC's *Today* show was so well established that the new addition to network television morning news was no competition. So ABC sought a different format and style, and, as mentioned previously, found a local morning program on one of its affiliate stations that was wildly successful against the *Today* show. WEWS-TV's *The Morning Exchange* had a more relaxed approach, offering hard news and weather updates only at the top and bottom of the half-hours, and in between offering discussion and interviews on high-interest feature and entertainment topics. The program put together a group of regular guests who were experts in a variety of areas such as health, consumer news, travel, entertainment, and personal relationships. The program was broadcast from a set that looked more like a suburban living room than a newsroom. Using an episode of *The Morning Exchange* as a pilot program, ABC debuted its revamped *Good Morning America* (*GMA*) in November 1975 with David Hartman and actress/singer Nancy Dussault as co-hosts.

Good Morning America enjoyed a slow but steady climb in viewership during the 1980s, especially as the *Today* show lost some of its top talent, including Barbara Walters and Tom Brokaw. *GMA* really gained in popularity when co-host Joan Lunden was paired with Charlie Gibson in February 1987 after Hartman retired. For the first time *GMA* regularly beat *Today* in the audience ratings. But when Lunden and Gibson left *GMA* in the mid-1990s, viewers switched back to *Today* and remained there well into the 2000s. Despite talent changes, *GMA* has remained steady with its format of news and weather updates at the top and bottom of the hour, feature stories and interviews in between using expert guests, and local news updates at 25 and 55 minutes after the hour. *GMA* also introduced a weekend edition on Sundays that aired from 1993 to 1999, and was brought back both Saturdays and Sundays in 2004 as an hour-long program airing on ABC affiliate stations from 8:00 to 9:00 a.m.

CBS has experienced the most difficulty establishing a successful morning news program. The latest version, *The Early Show,* debuted in November 1999, airing in the traditional morning news period of 7:00 to 9:00 a.m. CBS's first venture into morning programming, *The Morning Show,* started in 1954, just two years after the debut of NBC's *Today*. The original host was Walter Cronkite, but in its two-year run other hosts included Jack Paar, Dick Van Dyke, and Will Rogers Jr. The program, which started out as two hours, was shortened to an hour in 1955 to make way for the children's show, *Captain Kangaroo*. When *The Morning Show* failed to gain an audience, it was finally dropped in 1956 in favor of a 15-minute news update called the *CBS Morning News,* which aired before the popular children's show.

CBS would not try another serious attempt at a full-length morning news program until 1963, when a revamped *CBS Morning News* went on the air as a half-hour, hard news newscast airing at 10:00 a.m. CBS moved the program to 7:00 am and expanded it to an hour in 1965 after realizing the 10:00 a.m. slot was not really a "news" time slot. The program was still a traditional newscast similar to the evening network newscasts. CBS finally gave up the pure news format in 1979 and reformatted the program to resemble its popular *CBS Sunday Morning* program with Charles Kuralt, who took over as host of the weekday as well as his Sunday morning program in 1980. Despite critical acclaim, CBS's morning news program remained dead last in viewership. Through the 1980s and 1990s, CBS changed program names, formats, and talent multiple times, trying to find a mix that would be competitive with *Today* and *Good Morning America,* but nothing worked.

The most recent version debuted in November 1999 as *The Early Show*. CBS recruited *Today* host

Bryant Gumbel and teamed him with newcomer Jane Clayson, but still the ratings did not improve, so the team was replaced, bringing back longtime CBS morning news host Harry Smith and adding three co-hosts instead of just one, plus a news anchor and weather person. Into the 2000s *The Early Show* remained third in the ratings behind the ABC and NBC programs.

The Fox network does not produce a daily morning news show for its affiliates but does produce the Sunday morning *Fox News Sunday*. The 24-hour cable networks also offer news in the morning—*American Morning* on CNN, *Fox and Friends* on Fox News Channel, and *Morning Joe* (named for host Joe Scarborough) on MSNBC—but those programs tend to be more focused on news and are less likely to have human interest or feature segments.

Conclusion

Morning news on radio and then television has expanded steadily since its early years on the air. The programs combine local, national, and world news updates with traffic, weather, and features presented in a "news you can use" type format that helps viewers and listeners prepare for their day. Usually the later in the morning, the more likely it is that the content will be lighter, and more feature-oriented, than the hard news-centered early morning hours. The programs combine short news briefs with longer stories and interviews to give more depth on various topics. Their hosts and anchors are given more flexibility to share their personalities with the audience than evening news anchors. No matter what the content, however, most morning news shows are rigidly formatted to time to ensure the viewer or listener knows how well they are staying on schedule. While many other news programs on network and local radio and television were losing audience into the 2000s, the morning news programs have remained steady or gained viewers and listeners, becoming an important part of America's morning routine.

Motion Pictures, Journalism in

Stories about journalists and journalism have been a Hollywood staple since the silent era. The movies have addressed tensions and contradictions long at journalism's core while expressing a pronounced ambivalence toward the press. By

continually focusing attention on journalism, however, films have helped underscore that news media play a central role in democratic society.

Prototypes

Cinematic depictions of journalism grew out of similar depictions in fiction and on stage, many written by journalists themselves. Novels in the early twentieth century told stories of idealistic young reporters confronting hardboiled editors in big-city newsrooms. The neophytes either proved their mettle by getting a big story or were broken by the newsroom's unrelenting cynicism. Plays such as Maurine Watkins' *Chicago,* produced in 1926, continued the theme of wisecracking reporters covering urban crime and corruption. Silent movies exploited that theme as well.

Ben Hecht and Charles MacArthur's *The Front Page* (1931) proved the most influential work of this type; indeed, its influence is felt to the present day. The authors were onetime Chicago reporters, and they drew upon their experiences in writing their play that premiered on Broadway in 1928. *The Front Page* tells of reporter Hildy Johnson's desperate attempts to escape his Chicago newspaper and his tyrannical editor Walter Burns for a supposedly better life as a newlywed and New York City advertising executive. The scoop of a lifetime disrupts Hildy's plans as a convict escapes from jail on the eve of his scheduled hanging. At the end, it is unclear whether Hildy ever will successfully leave journalism or whether he would be better off if he does. *The Front Page* in many ways paints a damning picture of journalism; Walter and Hildy hide the escaped convict for the sake of an exclusive and reporters hound a woman to the point that she jumps out a window. Nevertheless, Hecht and MacArthur said they wrote their play as a fond remembrance of their reporting days, and they made the frenetic excitement of the newsroom outshine the dreary alternative of matrimony and the business world.

Scores of movies of the era seized upon the big-city journalistic archetypes. Some, such as 1931's *Five Star Final* (itself drawn from a Broadway play), explicitly attacked the tabloid news ethos; the movie depicts an editor's growing pangs of conscience as his newspaper publishes a series on a woman's sordid past and eventually drives her and her husband to suicide. Others such as *Picture Snatcher* (1933) were more cavalier toward questions of journalistic ethics while reveling in the breathless fun of scooping the competition.

Prewar Movies

Screwball comedies of the 1930s and 1940s presented tales of romantic couples who expressed their mutual attraction by exchanging witty insults while enmeshed in an outlandish plot based upon lies and misunderstanding. Again, the journalism world offered a fruitful backdrop for such films. In *Libeled Lady* (1936), a newspaper hires a man to frame a wealthy woman who is suing the paper for sullying her name; the man and woman (William Powell and Myrna Loy) fall in love. In *Nothing Sacred* (1937), written by Ben Hecht, a newspaper turns the phony story of a young woman allegedly dying of radium poisoning into a media frenzy. The paper's star reporter falls for the young woman, which does not prevent him from slugging her in the jaw and her knocking him out in return. *His Girl Friday* (1940) remade *The Front Page*, turning Hildy into a woman. In casting Cary Grant as Walter and Rosalind Russell as Hildy, the movie made journalistic sensationalism seem powerfully romantic and the female reporter look exceptionally sharp and capable.

Director Frank Capra (who with 1934's *It Happened One Night* had himself made a pioneering screwball comedy featuring a journalist) was more skeptical toward strong female reporters and the urban tabloid press. *Mr. Deeds Goes to Town* (1936) depicts a journalist posing as an impoverished young woman to get the inside story of a simple small-town man who has inherited a fortune; after falling in love with him, she recants her lies and quits her job. *Meet John Doe* (1941) shows a female journalist writing a phony column about "John Doe" who purportedly will commit suicide to protest social conditions. The woman's newspaper hires a man to play the part of Doe. A nationwide Doe movement is born promoting neighborliness and self-sufficiency, only to be coopted by the fascistic publisher of the paper. Once more, the woman journalist confesses her sins and devotes herself to the man playing Doe, with the publisher's evil schemes apparently thwarted.

Orson Welles's celebrated *Citizen Kane* (1941) incorporated some of screwball's farcical elements

along with a more pointed press critique in telling of a William Randolph Hearst–like publisher whose youthful idealism gives way to megalomania and defeat. The movie shows up the press's glib attempts at trying to reveal the ultimate truth about a man's life as well as its vulnerability to manipulation and demagoguery. At the same time, in portraying Kane's wit and savoir-faire, it indicates that it can "be fun to run a newspaper," as Kane himself says in the film. Despite attempts by Hearst to suppress the film, and initial poor box office, this movie is often seen as one of Hollywood's best ever.

Wartime Movies and Film Noir

Responding in part to pressure from press associations for more positive portrayals of journalism, wartime movies typically presented journalists as patriots backing the war effort. Examples included *Objective, Burma!* (1945) and *The Story of G.I. Joe* (1945), the latter of which dramatized war correspondent Ernie Pyle's dispatches from the front. Some films immediately after the war continued the theme of the journalist as a conscientious professional; *Gentleman's Agreement* (1947) showed a magazine writer exposing anti-Semitism, whereas *Call Northside 777* (1948) drew upon a real-life incident in which a reporter fought to exonerate a man wrongfully imprisoned for the murder of a Chicago police officer.

Call Northside 777 is considered an example of postwar film noir, which stylistically and thematically presented dark tales of alienation and corruption. Movies of this type that targeted journalism's seamy underbelly included *Ace in the Hole* (1951), in which an utterly amoral reporter keeps a man trapped in a cave for the sake of an exclusive with fatal consequences, and *Sweet Smell of Success* (1957), in which a Walter Winchell–like columnist destroys the lives and careers of all who cross him. *Deadline, USA* (1952) deals with similar themes of violence and vice, but is much loved by journalists for Humphrey Bogart's portrayal of an upstanding editor who stops at nothing to expose a murderous gangster. The movie does not escape the darkness entirely, however; at the end, the editor's paper is sold and closed.

Conspiracy Pictures

Journalism movies of the 1960s tended to be either froth, such as the sex farce *Sex and the Single Girl* (1964), or cult pictures such as Samuel Fuller's *Shock Corridor* (1963), in which a reporter goes undercover at an insane asylum only to go mad himself. By the end of the decade, *Medium Cool* (1969) was directly addressing the social turmoil of the times while exploring the hazy line between reality and illusion. Haskell Wexler's film combined documentary footage of the 1968 Democratic national convention with a fictional story of a television photographer who finds his professional detachment increasingly challenged by the tumult surrounding him.

The long Vietnam and bitter Watergate crises helped give rise to what have been described as conspiracy films, in which individuals confronted vast conspiracies enmeshed in menacing bureaucracies. Two such films from 1976 that seemed diametrically opposed in their depictions of journalism were *Network,* a bitter satire, and *All the President's Men,* a more traditional drama. In *Network,* a television news anchor takes to the airwaves to decry the madness and decay in American society and television itself, imploring his viewers to proclaim, "I'm as mad as hell, and I'm not going to take it anymore!" When he threatens the network's financial interests, its executives coolly have him assassinated on the air.

In contrast, *All the President's Men* functions as a heroic tale how young reporters Bob Woodward and Carl Bernstein and *The Washington Post* overcame steep odds in uncovering the Watergate scandal. The movie has been criticized for exaggerating the press's role in the downfall of President Richard Nixon. Regardless, it as much as any other movie espoused the ideal that the press could and should expose abuses of power and serve as the people's guardian. As editor Ben Bradlee (played by Jason Robards) tells Woodward (Robert Redford) and Bernstein (Dustin Hoffman) in the film, "Nothing's riding on this except the First Amendment to the Constitution, freedom of the press, and maybe the future of the country."

Post-1980 Movies

Films in the post-Watergate era continued to present a mixed portrait of the press while recycling many of the storylines of previous years. Depictions of newspaper journalists included *Absence of Malice* (1981), in which a reporter writes a story falsely

implying that a man is a murder suspect and then writes another story that makes the man's best friend kill herself. In *Street Smart* (1987), a magazine writer's fabricated story about a Times Square pimp leads to bloodshed. However, in *The Paper* (1994) and *True Crime* (1999), print journalists successfully help free people who have been jailed for murders they did not commit.

Television journalists were the subject of savage satire in *To Die For* (1995), in which a young woman's hunger for TV stardom prompts her to seduce a teenage boy into murdering her husband whom she sees as standing in her way, whereas in the romantic comedy *Broadcast News* (1987), a newscaster fakes tears on camera to make himself seem more empathetic and hence advance his career. On the other hand, *Up Close and Personal* (1996) transformed the lurid real-life story of television anchor Jessica Savitch (who fell prey to drugs and domestic violence before dying in a car accident) into a slick romance featuring a jaded male journalist being redeemed by the love of his younger female protégé. In *The Insider* (1999), a television news producer sticks by his whistleblower source in the face of corporate threats and coercion.

Several films depicted the trials of Western correspondents covering overseas conflicts, often with a cynical reporter gradually being converted to a person or cause. Among those pictures were *The Year of Living Dangerously* (1983), in which a radio journalist's pursuit of an exclusive threatens to bring harm to the woman he loves; *Under Fire* (1983), which shows a photojournalist faking a photo to help the rebels in the Nicaraguan civil war; *The Killing Fields* (1984), which relates the true story of the friendship between *New York Times* reporter Sydney Schanberg and his Cambodian assistant Dith Pran; and *Welcome to Sarajevo* (1997), which tells of a broadcast reporter rescuing a young girl from the bloodshed in Bosnia.

Films of the early twenty-first century carried on these familiar themes. There were more war correspondent movies such as *Live from Baghdad* (2002) and *Blood Diamond* (2006). There were tales of journalistic malfeasance such as *Shattered Glass* (2003), which told of young writer Stephen Glass's deceptions at *The New Republic,* and *Capote* (2005) and *Infamous* (2006), both of which depicted Truman Capote exploiting a convicted killer while writing his book *In Cold Blood*. Finally, there were stories of heroism such as *Good Night, and Good Luck* (2005), which told of television journalist Edward R. Murrow and producer Fred Friendly's early 1950s crusade against McCarthyism.

Conclusion

Through their stock characters and situations, journalism movies constitute their own distinct genre, and like other movie genres they address enduring cultural conflicts. In journalism films, those include clashes between home and work, cynicism and idealism, objectivity and subjectivity, the public interest and institutional interests, and the press's interest and individuals' interests.

Regarding home versus work, the movies indicate that it is difficult if not impossible to enjoy both a happy personal life and a satisfying professional life, with female journalists particularly at a disadvantage. If that implies that journalism is not for normal people, it also suggests that it is a uniquely exciting and challenging occupation. As for cynicism versus idealism, films depict journalists as a street-smart lot who see through the sordidness and sanctimony surrounding them. However, their cynicism can become debilitating when they stop believing in the ideals of their profession and the ability of the individual to make a difference in the world; in such cases, the journalists are either made to rediscover their idealism or suffer the consequences for failing to do so.

Objectivity has long been a principle of professional journalism, but in journalism movies, the model of scientific, impartial reporting often does not work. Although journalists' painstaking investigations occasionally do reveal truth (as in *All the President's Men*), other times their efforts lead nowhere; sometimes they are taken in by fakes or they make up stories entirely. Furthermore, their recurring propensity for falling in love with their sources mocks their supposed ability to remain detached.

The press's attempts in movies to serve the public interest regularly butt up against the interests of government (again, as in *All the President's Men*) and of big business. In particular, media owners are often seen trying to pressure journalists into

dumbing down or sleazing up the news or into suppressing the truth altogether. The press's interest in breaking big stories and peddling product also can make it run roughshod over the interests of innocent individuals, as in films dating back to 1931's *Five Star Final*.

Such depictions long have triggered complaints from real-life journalists, who say the movies grossly exaggerate their shortcomings and give the public a distorted view of how they really work. They express the fear that public confidence in the press may be undermined. At the same time, a number of journalists have confessed that they joined the profession precisely because of the picture of the press offered by the movies. Whatever criticism can be leveled at these depictions of journalism, they cannot be accused of being dull. On screen, the press is always at the heart of things and always makes a difference for better or for worse. As such, movies secure journalism's place in the public imagination.

Muckrakers

Muckraker is a somewhat pejorative term for an investigative reporter: someone who digs up dirt or rakes muck. It is associated with a period of crusading American journalism—called muckraking—during the first dozen years of the twentieth century, although the phrase can also be used to refer to investigative reporting in general.

Origin of the Term

The word *muckraker* was first coined by President Theodore Roosevelt in a speech on March 17, 1906. Roosevelt was angered by a recent political exposé published by his enemy William Randolph Hearst in *Cosmopolitan* magazine. In an address to the Washington Gridiron Club, Roosevelt complained about a dangerous new breed of journalist whose inflammatory writings were sweeping America. "The man with the Muck-rake," Roosevelt said derisively, "the man who could look no way but downward with the muck-rake in his hands" only wanted "to rake to himself the filth on the floor" and "consistently refuses to see aught that is lofty, and fixes his eyes with solemn intentness only on that which is vile and debasing." Such a journalist, the President said, "speedily becomes, not a help to society, not an incitement to good, but one of the most potent forces of evil" (Weinberg and Weinberg 2001, 58–59).

Although Roosevelt's use of the word *muckraker* was negative, the muckrakers themselves embraced the insult as a badge of honor. The term stuck and would thereafter be used to refer not only to the crusading journalists of Roosevelt's time but to later investigative reporters as well. In fact, Roosevelt's denunciation was surprising in some ways because he was personally sympathetic to the muckrakers' reform agenda and because his political career had been helped tremendously by positive publicity from muckrakers, some of whom he befriended. But the muckrakers' targets also included some of Roosevelt's fellow Republican politicians whom the President tried to appease with his attack on these journalists.

Rise of Muckraking Journalism

Prior to 1900, investigative reporting in America was rare and mostly local in nature. By the beginning

of the twentieth century, however, muckraking became national in scope and seemed to flower everywhere in the United States almost at once. The decade between 1902 and 1912 is generally regarded as the heyday of muckraking, the "golden age of public service journalism" (Protess 1998, 35). In general, the muckrakers targeted corporate wrongdoing, government misbehavior, and social injustice; they viewed all three as interconnected to each other and to systemic problems spawned by the U.S. industrial revolution of their time.

The muckrakers were a uniquely homegrown American phenomenon, championing optimism, personal responsibility, individualism, and the inherent goodness of man. For the most part, the muckrakers were white, middle class, and Protestant, and their writings bore an unmistakable religious influence. Earnest and righteous, they viewed their work as a moral crusade. They believed in equality of opportunity, certain that truth would prevail if given a fair chance in the marketplace of ideas. They focused on domestic, usually urban, issues, tinged with a hint of American nationalism. Their solution for the many abuses they uncovered was a simple one: the Golden Rule. "Their criticisms of American society were, in their utmost reaches, very searching and radical," Historian Richard Hofstadter noted, "but they were themselves moderate men who intended to propose no radical remedies. From the beginning, then, they were limited by the disparity between the boldness of their means and the tameness of their ends" (Hofstadter 1955, 196).

Historians have traditionally linked muckraking to the politics of the Progressive Era. "To an extraordinary degree, the work of the Progressive movement rested upon its journalism," Hofstadter wrote. "The fundamental critical achievement of American Progressivism was the business of exposure, and journalism was the chief occupational source of its creative writers." The "Progressive mind," Hofstadter continued, "was characteristically a journalistic mind and . . . its characteristic contribution was that of the socially responsible reporter-reformer" (Hofstadter 1955, 186).

Supply and demand helped spur muckraking, too. "The historical pendulum swung toward muckraking as two mutually reinforcing phenomena converged," one researcher observed: "the demand for information about societal ills from an alienated, literate population of consumers; and a fiercely competitive national media that sought to supply it" (Protess 1991, 36).

In particular, the transcontinental railroad began supplying national distribution and marketing channels, which in turn created nationwide advertising and the first mass-circulation national news magazines. Technological improvements—linotype, telegraph, illustrations, and mass production—also increased the supply of this media while decreasing the price of production. *McClure's* and other magazines became especially popular because of their unprecedented ability to reproduce arresting photographs. Total circulation climbed into the millions as these new, slick national publications became the primary delivery system for the muckrakers.

Demand for muckraking articles was also fueled by the many abuses stemming from the industrial revolution: sweatshop labor, slum tenements, and rapid urbanization, as well as increased immigration. At the same time, rising literacy rates created more readers. Journalistic exposés proved popular with consumers, and aggressive publishers began catering to the new demand for sensational scandal coverage. Moreover, political reform groups discovered that muckrakers could be valuable allies, since reformers had no political machine of their own to spread their message. Ironically, this proliferation of investigative reporting was made possible by the very industrialized capitalism that the muckrakers exposed.

Demise

The celebrated golden age of muckraking came to an end by the time the United States entered World War I in 1917. There were many reasons for the demise of muckraking: The reforms they brought about had curbed the worst excesses of the industrial revolution, reducing the need for such journalism. The decline of Progressive politics also hurt muckraking because the two were so closely tied together. In addition, World War I turned the public's focus abroad and increased public deference to authority at home. Many muckrakers simply grew tired of such confrontational journalism and turned to other careers. For its part, the public seemed to grow weary of the negativity of muckraking, in part because some irresponsible reporting discredited the muckraking movement.

At the same time, some of the muckrakers' powerful targets exerted pressure on national magazines to get rid of such crusading reporting. The consolidation of corporate-owned media also eliminated some of the magazine outlets that had once published the muckrakers. This proved to be the beginning of a century-long evolution toward media monopolies. In the words of one researcher, "as technology widened the reach of communications, increasing costs of acquiring and starting media enterprises and expanding the potential profits, the news business in the twentieth-century followed some of the same tendencies toward greater consolidation that [could] be seen in other major industries, such as automobile and oil" (Hess 1996, 7). The creation of such media monopolies was an ironic conclusion to an era that began with the muckrakers' exposés of similarly rapacious monopolies such as John D. Rockefeller's Standard Oil.

Historical Legacy

In the century since the muckrakers' heyday, historians have debated their political and journalistic legacy. The earliest scholarly interpretations were mostly positive, linking the muckrakers to important Progressive-era reforms: the Pure Food and Drug Act, child labor laws, federal income taxes, the direct election of senators, and the antitrust prosecution of Standard Oil, among others. Later historians, writing in the middle of the twentieth century, criticized the muckrakers for racism and viewed them as elitists who wanted to preserve the status quo and their own social position from assault by industrialization and ethnic immigrants. By century's end, historians reached a position somewhere in the middle, noting the limits of muckraking while praising its "exposure of the underside of American capitalism" (Shapiro 1968, 29–33).

By and large, the muckrakers were reformers, not radicals. Ida Tarbell, for example, focused on how Standard Oil's ruthless tactics against competitors led to higher prices for the consumer, largely ignoring the corporation's exploitation of workers or proposals to nationalize the giant company. Although some of the muckrakers became socialists—most famously, Upton Sinclair—most of them believed in reforming capitalism, which they realized had not only spawned the many injustices that they decried but also the reform journalism that made it profitable to document these abuses in the first place.

Noted American Muckrakers

Ray Stannard Baker (1870–1946)

Baker was one of the few muckrakers to write about racism against African Americans. His 1908 book *Following the Color Line* and subsequent articles made him the first prominent white journalist to expose lynching and Jim Crow segregation in mainstream nationwide publications. In addition, Baker's exposés of railroad corruption for *McClure's* magazine were credited with passage of federal laws to regulate the industry through creation of the Interstate Commerce Commission. Baker's support for presidential candidate Woodrow Wilson in 1912 led him to join Wilson's administration as a press secretary. In 1940, Baker won the Pulitzer Prize for his writing on Wilson's presidency.

Samuel McClure (1857–1949)

Samuel McClure, better known as S. S. McClure, was the founder and publisher of the most important muckraking magazine in the United States, *McClure*'s *Magazine,* which dominated American publishing from 1893 to 1911. McClure hired Lincoln Steffens, Ida Tarbell, Ray Stannard Baker, and other talented journalists, paid them well, and gave them the time and resources to dig up compelling stories of wrongdoing that created a national following. He also published high-quality fiction by Willa Cather, Rudyard Kipling, Jack London, and other writers. In addition, in 1884 McClure created the McClure Syndicate, which distributed material to newspapers.

David Graham Phillips (1867–1911)

Phillips was the journalist whose sensationalistic exposés of Senate corruption in 1906 led to the invention of the word "muckraker" by an angry President Theodore Roosevelt, who was defending Phillips' target, Senator Chauncy Depew, like Roosevelt a Republican politician from New York. Afterwards, Phillips compiled his collection of congressional exposés into a book, *The Treason of the Senate,* which was

laced with purple prose. "Treason is a strong word," Phillips declared, "but not too strong, rather too weak, to characterize the situation in which the Senate is the eager, resourceful, indefatigable agent of interests as hostile to the American people as any invading army could be, and vastly more dangerous" (Serrin 2002, 106). Phillips also wrote numerous novels until he was murdered by a man who claimed that Phillips had libeled his family.

Jacob Riis (1849–1914)

Riss pioneered the use of photography to expose the plight of the urban poor. A Danish American immigrant, his 1889 depictions of Manhattan slums in *Scribner's Magazine* came to the attention of then–police commissioner Theodore Roosevelt, and the two men became lifelong friends. The next year, Riis published his collection of poverty photos in the book for which he would become famous, *How the Other Half Lives*. Riis was unusual for his time in viewing poverty as caused by social conditions rather than defective character. His work helped spur laws against child labor and create urban playgrounds, settlement houses, and improved public schools.

Upton Sinclair (1878–1968)

Sinclair was probably the most famous of the muckrakers. His 1906 novel, *The Jungle,* based on Sinclair's previous undercover reporting, denounced unsanitary conditions in Chicago meat-packing plants. The book became an international best-seller and with the backing of President Theodore Roosevelt helped lead to passage of the 1906 Pure Food and Drug Act, which established federal inspections to protect the public from tainted food and unsafe patent medicines. Sinclair was invited to the White House, where the Republican President solicited his advice and, while disagreeing with the muckraker's socialist politics, admitted that "radical action" was necessary to combat "arrogant and selfish greed on the part of the capitalist." Sinclair continued writing provocative novels and turned to politics, repeatedly but unsuccessfully running for public office. In 1934, in the midst of the Great Depression, he was nearly elected governor of California on a socialist platform. By the time of his death at the age of 90, he had published nearly 100 books and won the Pulitzer Prize for his fiction.

Lincoln Steffens (1866–1936)

Steffens was the foremost muckraker of the early twentieth century. The affluent son of a California businessman, he began his career as a crime reporter for the *New York Post,* where he befriended an up-and-coming police commissioner named Theodore Roosevelt. But it was at *McClure's* magazine that Steffens truly blossomed, uncovering municipal corruption in cities throughout America: Chicago, Philadelphia, St. Louis, Minneapolis, Pittsburgh, and New York City. "[B]ribery is no ordinary felony," he declared in his 1904 book *The Shame of the Cities,* "but treason," so widespread as "to change the form of our government from one that is representative of the people to an oligarchy, representative of special interests" (Steffens 1957, 17). Two years later, his exposés of corrupt state governments were published as a book in *The Struggle for Self-Government*. In 1906, Steffens and other muckrakers founded their own short-lived muckraking periodical called *American Magazine*. But he soon despaired that reform journalism was not enough and that more radical steps were necessary to stop the excesses of capitalism. He moved further to the left politically after covering the 1910 Mexican Revolution, which he supported. In 1921, Steffens traveled to the Soviet Union and proclaimed of the new Communist government there: "I have seen the future and it works." But he grew disillusioned with Communism as well, as recounted in his 1931 autobiography, and died five years later.

Ida Tarbell (1857–1944)

Tarbell was the leading female muckraker of her day whose detailed exposés of John D. Rockefeller's Standard Oil helped lead to the passage of anti-trust legislation and the break-up of Rockefeller's powerful oil monopoly in 1911. Tarbell grew up in western Pennsylvania when oil fields were first developed there by Standard Oil; her father was one of the many early victims of Rockefeller's ruthless rise. In 1902, Tarbell began a series of 19 crusading articles in *McClure's* magazine documenting the predatory practices of Rockefeller's empire and two years later combined her findings into a

devastating book-length indictment, *The History of Standard Oil*. So tarnished was Rockefeller by Tarbell's exposé that he hired one of the first public relations consultants in American history and began handing out dimes to schoolchildren in a largely unsuccessful effort to improve his image. Tarbell continued writing and lecturing on other subjects in subsequent decades but she disliked being held up as a female role model and rejected women's suffrage out of the belief that early feminists belittled the role of homemakers.

Mutual Broadcasting System

The Mutual Broadcasting System was an American commercial radio network for 65 years, operating from 1934 until 1999. Strongest in rural areas, it began as a cooperative venture and provided some competition for the more established national networks.

Origins

On September 29, 1934, four AM radio stations—WXYZ in Detroit, WGN in Chicago, WOR in New York, and WLW in Cincinnati—agreed to form a cooperative program sharing radio network. WGN and WOR controlled the operation (at first dubbed the Quality Group) and contracted with AT&T for telephone lines to link Chicago and New York, with all four stations agreeing to share the costs. The Mutual Broadcasting System was incorporated in Illinois a month later. When WXYZ (which had contributed the popular western adventure program *The Lone Ranger* to begin the network) withdrew to join the NBC network, Canadian station CKLW in Windsor, Ontario (serving the Detroit market), replaced it. *The Lone Ranger* remained on Mutual until 1942.

After a year on the air, the new network carried 40 hours of sustaining (nonadvertiser supported) programs and 20 hours of commercial programming per week. The first coast-to-coast Mutual broadcast came in September 1936, and by 1940 the network served 160 stations, about 20 percent of those then on the air, though some were also served by other networks. Most of Mutual's stations were in rural areas and had less power than the affiliates of the older national networks. Indeed, many held primary affiliations with CBS or NBC and only a secondary relationship with Mutual. Still, Mutual had more affiliates than any other network—a record it held into the 1980s, long after the demise of most network programming.

When Mutual won the rights to carry the 1938 and 1939 baseball World Series broadcasts, CBS and NBC would not allow their affiliate stations to contract with Mutual for the popular sportscasts. Mutual's competitive problems and complaints to the Federal Communications Commission (FCC) contributed to the latter's investigation of "chain"

or network radio from 1938 to 1941. The FCC's new network rules were upheld in a landmark 1943 Supreme Court decision, helping to even the playing field for Mutual.

Mutual was the first national network to include FM stations as affiliates after World War II, by which time the network reached nearly 85 percent of the nation's homes. Yet it still operated as a cooperative, without a keystone station or headquarters in New York as the other networks featured. Most programs were produced by WOR or WGN.

Mutual News

Mutual began to carry more news as the European political crisis worsened in the late 1930s. Listeners heard correspondents via shortwave during the Munich Crisis of 1938, including London representative John Steele and Berlin correspondent Sigrid Schultz (who may have been the first woman to serve as an overseas radio news correspondent). Mutual also picked up reports from various news agency stringers including Walter Kerr of United Press.

Mutual took advantage of a cost-saving technique when, beginning in early 1938, WOR recorded English-language news broadcasts transmitted by European shortwave stations (especially the BBC Empire Service), and Mutual rebroadcast them unedited, often juxtaposing opposing sides. This technique drew considerable praise from radio critics as a way of allowing listeners to hear all the points of view on the news of the day, and enabling them to judge the propaganda for themselves without the commentary offered on CBS and NBC.

Yet Mutual also presented some very high-quality news analysts, including Raymond Gram Swing and Quincy Howe. Mutual affiliate WOL provided many of Mutual's public affairs and commentary programs, including that of conservative commentator Fulton Lewis Jr., the public affairs panel *American Forum of the Air,* and similar offerings. Mutual soon became known for controversial news commentators, including columnist Drew Pearson, Gabriel Heatter (who covered the trial and execution of the kidnapper of the Lindbergh baby in the mid-1930s), and Raymond Clapper (who replaced Swing). Pickups from other Mutual stations were usually confined to special events. The local affiliate was expected to feed any major event to the whole network. Mutual was the first on the air with the news of the 1941 bombing of Pearl Harbor by the Japanese, six minutes ahead of CBS and NBC. By 1945, Mutual's newscasts were a 24-hour operation.

By the mid-1940s, Mutual was also offering more sportscasts, including boxing matches, the World Series, the Cotton Bowl, and many other football contests. Sports continued to be a Mutual mainstay for decades. By the 1970s, Mutual had radio rights for several golf tournaments as well as tennis. By the mid-1980s the network carried five weekday sportscasts plus nearly 40 weekend reports.

In 1978, interviewer Larry King inherited the nightly Mutual talk show slot that had been pioneered by Herb Jepko and taken over by "Long John" Nebel until his death. King was on for 90 minutes and listeners could call in for another 90. The program ran until 1994, airing in the afternoon for its final years. Jim Bohannan, who had worked for Mutual's WCFL in Chicago in the early 1980s, filled in for King on occasion. When King's show shifted to daytime, the nighttime show became Bohannan's.

Decline

Mutual ended its cooperative operation in 1952 when the network was purchased by General Tire and set up in New York. In the late 1950s, network ownership changed several times, often within months. On at least two occasions, a shortage of funds threatened to close network operations (it did file for bankruptcy once) and the number of employees dropped to only 50 compared to 350 at its peak in the 1940s. A scandal ensued when it turned out one short-term owner had secretly accepted money from a Caribbean nation in return for favorable comment on the air. None of the several owners had sufficient funding to move Mutual (which had about 500 affiliates in the 1950s and 1960s) into television.

Ownership changes continued as the network shifted its headquarters from New York to Washington in 1971 (the New York news bureau closed three years later). In 1972, Mutual began special network feeds to black and Spanish-programmed stations with news and sportscasts.

In 1977, then-owner Amway bought Mutual's first station—WCFL in Chicago—and soon thereafter bought a New York station, the network's first owned-and-operated outlets.

In 1977, Mutual signed a contract with Western Union to use its satellite facilities, the first radio network to employ satellite distribution. Aided by its satellite network, Mutual served 950 affiliates by 1979 but the number declined slowly from then on. Its Operation Newsline provided close-circuit feeds of news and features to affiliates.

Mutual was purchased by Westwood One in 1985. In its last 15 years, Mutual largely produced newscasts, eventually from its headquarters in Crystal City, Virginia, just south of Washington, D.C. Westwood closed Mutual on Sunday, April 18, 1999, and its newscasts continued under the marketing name of CNN Radio.

Narrative Journalism

See Literary Journalism; News as Narrative

National Public Radio

National Public Radio (NPR) is an American noncommercial radio network that produces and distributes news and cultural programming through its member (affiliate) stations around the country. Its flagship newsmagazine programs *All Things Considered* and *Morning Edition* reach an estimated audience of 20 million listeners a week who are characterized as highly educated and socially conscious. With close to 40 news bureaus in the United States and overseas, NPR has an extensive news-gathering operation that provides in-depth news and analysis that have helped establish it as a dominant player in the field of journalism.

Origins

NPR originated out of a view of radio as having an educational and cultural purpose. Following the early 1967 recommendations of the Carnegie Commission, which was appointed by President Lyndon Johnson (1963–69) to examine the future of educational broadcasting, Congress passed the Public Broadcasting Act in October 1967 that created the Corporation for Public Broadcasting (CPB). The term *public* was coined by the Carnegie group and the new law to stress the role of public participation in the developing noncommercial broadcasting system. Over the next year or so, CPB would, in turn, create and oversee both NPR and the Public Broadcasting Service (PBS). Although the radio did not appear in the original Carnegie recommendations, the concerted efforts of advocates of noncommercial radio helped get radio included in the act.

NPR was formed in 1970 to improve the quality of public radio by improving programming and strengthening local public radio stations known as affiliates. A mission statement written by William Siemering, NPR's first head of programming operations, said that NPR would "serve the individual" and celebrate the varied nature of the human experience, thus offering an alternative to what was available on commercial radio.

The first NPR news program to air was *All Things Considered* (*ATC*), a 90-minute news magazine that was heard on over 80 member stations around the country at 5 p.m. (EST) May 3, 1971. This first broadcast included a lengthy report on the May Day protests against the ongoing Vietnam War by college students and veterans, a piece on a heroin-addicted nurse, and a story from the Canadian Broadcasting Corporation that combined antiwar poetry with songs and sounds of battle from World War I.

In its early days, *ATC* exhibited little structure and varied from day to day depending on what staff members offered to fill the time slot. When Jack Mitchell became the show's producer in 1972, he imposed a more conventional journalistic

format on the program, placing a newscast at the top of each hour, with stories ordered based on their newsworthiness. He also added a co-host when he hired Susan Stamberg, who would become the voice of *ATC* for the next 15 years.

The 1970s were a period of dramatic growth and program development at NPR. The opening of a London bureau was a signal that the network was serious about covering international news. Because NPR had limited resources, the program emphasized analysis and interpretation over breaking news coverage. Jack Mitchell says, "the reports gave listeners background, viewpoints and perspectives" from a variety of sources—academics, journalists and the common man (Mitchell 2005, 72). Over the years this was to change as the network added more reporters like Robert Zelnick, Linda Wertheimer, Cokie Roberts, and Nina Totenberg to cover the White House, Capitol Hill, and the Supreme Court, beats that were essential to a mainstream news organization.

When Frank Mankiewicz took over as CEO in 1977 his goal was to make NPR better known to both listeners and policy makers. To this end he arranged for live coverage of debates over control of the Panama Canal in the U.S. Senate. The gavel-to-gavel coverage—over 37 days—raised the profile of NPR and became a precedent for future broadcast coverage of both Senate and House hearings. Mankiewicz also negotiated an increase in federal funding for public radio and put in place a satellite distribution system that improved the technical quality of its national programming, which made it possible for programs to be distributed from various places in the country, not just Washington, D.C.

NPR took another important step towards becoming a major player in radio with the launch of a matching morning news magazine, *Morning Edition*. The program made its debut at 5 a.m. on November 5, 1979, with Bob Edwards as its host and aimed at attracting listeners during morning "drive time" when radio audiences are at their peak. Although they had needed some convincing initially, within a week of the new program going on the air, half of NPR's 222 member stations decided to carry the program (or portions of it). Within a year, 90 percent of NPR stations were airing some or all of the program and finding that their audiences were growing as a result.

Funding

From the outset, funding was a challenge for the organization. Federal funds for public broadcasting were given to CPB, which allocated these between public television and NPR. In the early years NPR's share was between 17 and 20 percent of the CPB budget; under Mankiewicz this increased to 25 percent, which led to an increase in staff, more programming, and more affiliate stations.

In 1982 a 25 percent cut in the CPB's federal fund allocation by the Reagan administration combined with a series of business ventures that required cash investments but which did not quickly yield returns, led to a debt crisis at NPR that brought the network to the verge of bankruptcy. By mid-1983 the projected budget deficit was $9 million. NPR was saved by a series of loans from the CPB that were guaranteed by some affiliate stations—and Mankiewitz departed.

The debt crisis resulted in a change in the financial structure of public radio. Officials realized that federal funding would always be uncertain and that NPR needed to raise funds from other sources such as corporations, foundations, and directly from listeners. Under the new funding plan launched in 1985, the CPB would provide the funds earmarked for radio directly to local stations, which would in turn pay NPR for whatever of its programming that they aired. The stations wanted NPR to unbundle its programming so that they could select programs piecemeal. This last request was not part of the new NPR business plan but was eventually incorporated into its business model. The new business plan also included a Radio Program Fund that would provide seed money and expansion money to local stations to develop promising programs. The restructuring plan helped put NPR's financial house in order so that it was able to retire its debt in 1988.

Building a News Focus

In the post–debt crisis years, NPR moved away from the vision many had for it at its inception. Bill Siemering's vision for NPR, articulated in the mission statement he wrote, was of a service that would "enhance intellectual development, expand knowledge," and in so doing make listeners "more responsive human beings and intelligent responsible

citizens of their communities and the world." His hope was that NPR would serve audiences from varied backgrounds, religions, races, and with varying levels of education.

Instead, during the 1990s, NPR focused on growing its overall audience, as there was a recognition that it would have to focus its appeal if it was to develop a loyal following. NPR increasingly focused on news and began to take on mainstream commercial stations in terms of the news stories it covered, with an increasing emphasis on covering breaking news and analysis rather than relying on analysis as had been its hallmark. NPR programs also gradually changed their style of reporting. In its early years, news and feature stories on NPR had been distinctive in their use of natural sound as an integral part of the story and in the way sound and words combined to create vivid radio pictures. As NPR moved to become a major player in radio news, it moved toward a more hard news approach with sound as a supplement rather than central part of the story.

With stations now helping cover NPR's costs, there was a greater need to pay attention to what stations said their audiences wanted. Stations also began focusing on increasing contributions from nongovernment sources—from their listeners and from corporations which could not advertise but which could underwrite the costs of a program in return for a brief on-air mention. In the opinion of some NPR staffers, this meant providing radio programming that was bland and safe rather than innovative and cutting edge.

As the network moved toward financial stability two more programs were added—*Weekend Edition* Saturday (in 1985) hosted by Scott Simon and a year later *Weekend Edition* Sunday hosted by Susan Stamberg. In the realm of cultural programming, NPR created *Performance Today* to showcase classical music performances recorded by member stations combined with reviews, interviews, and features covering all of the arts. NPR also began to distribute programs produced by its affiliates. The most popular among these are *Fresh Air, This American Life,* and *Wait, Wait . . . Don't Tell Me.*

During the Gulf War of 1990–91, NPR sent more reporters to cover it than any other radio news organization in the world. Some saw this as a mark of NPR's stature as a broadcaster. But there were those who felt that such expensive coverage was not in keeping with NPR's mission, and rather than competing with other news organizations, it should focus on fostering public debate and offering its listeners analysis and a context for understanding these and other news events. *Talk of the Nation,* a call-in program started during this period to offer such an opportunity for debate, eventually became another staple of NPR's programming.

Despite efforts to cut federal funding for public radio by some Republican lawmakers in the mid-1990s, NPR news programming continued to grow though half of its cultural programs were dropped in response to anticipated funding cuts. Increasingly, its news programming defined the network's identity with more news bureaus being opened at a time when commercial broadcasters were closing theirs. Audiences began to expect that NPR would be there to cover breaking news whether it was happening in China or the Middle East or New York City. When two terrorist-piloted passenger jets crashed into New York's Twin Towers on September 11, 2001, NPR expanded the hours of *Morning Edition, Talk of the Nation,* and *All Things Considered* to cover the crisis continuously for the next two and a half days.

A Changing Network

The new century has brought further changes at NPR. Both of its long-running news programs have seen a change in hosts. In 2001 *All Things Considered* initiated a slate of three hosts—Melissa Block, Michelle Norris, and Robert Seigel—who would rotate studio assignments with more reports from different locations. Bob Edwards, host of *Morning Edition* for nearly 25 years, was replaced in 2004 by Steve Inskeep and Renee Montagne in the hope that a two-host approach might allow for better coverage of breaking news. While Inskeep broadcasts from NPR's studio in the Washington, D.C., headquarters, Montagne is located at NPR's studios in Culver City, California, known as "NPR West." Established in 2002, NPR West is the network's first major production center outside Washington and allows the network to cover more stories that originate west of the Mississippi and to add more diverse sources and perspectives in its reporting.

In 2002 a bequest of over $225 million by Joan Kroc, heiress to the McDonald's fast-food fortune,

gave NPR a huge boost in revenues. While $190 million was to be placed in its endowment fund, part of the remaining money was used to expand news operations, including opening new bureaus and training investigative journalists. This financial security has also made it possible for NPR to embrace the potential of digital media, making it the biggest organization in the audio download business. It has also established a presence on satellite radio with two satellite channels, *NPR Now* and *NPR Talk*.

One of the challenges facing NPR is attracting younger audiences as most of its programs skew toward older listeners. The median age for *All Things Considered* and for *Morning Edition* is 49. In recent years, NPR has undertaken a number of initiatives to draw in both younger and more diverse audiences. The *Tavis Smiley Radio Show* first aired in 2002 as a collaboration between NPR and a consortium of African American public radio stations. With an audience including nearly 30 percent African American listeners, it had a more diverse audience than other NPR programs. Despite this, in 2004 host Tavis Smiley decided to end his program claiming that the organization was "not aggressive enough in courting minority listeners." NPR has continued to try and reach out to blacks, Hispanics, and others who have been underrepresented in its audience. In April 2007 it launched an hour-long show, *Tell Me More,* that focuses primarily on issues facing African Americans and other minorities and on international stories.

Another initiative, *The Bryant Park Project,* launched in October 2007, is a new two-hour morning news program targeted to people in their 20s and 30s. It takes a more conversational approach to news and continues through the day on the website, on podcasts, and on blogs. By making listener commentary a crucial part of the program and creating a less studied and more informal sound, the network hopes to appeal to a post-boomer audience. The *All Songs Considered* online multimedia program, as well as the song-of-the-day and live concert downloads on the website, are also indicative of a concerted effort on the part of NPR to draw in younger listeners, especially since the bands covered are generally college radio favorites.

NPR's audience profile is the envy of many commercial broadcasters. An audience study concluded in 2003 that a college education is the best predictor of whether someone will listen to public radio. Fully 60 percent of the public radio audience holds a college degree, and listeners are four times more likely to have a graduate degree than the average American. Some 27 percent hold professional jobs (compared to 10 percent in the general population). As to income, 17 percent have a household income between $75,000 and $100,000 per year, 13 percent above $150,000 and they are more likely to read prestige magazines like *The New Yorker* or the *Atlantic Monthly*. The typical audience member for NPR programming is described in an NPR audience study, *Profile 2004,* as someone with an active lifestyle and a take-charge attitude who is receptive to new ideas and technologies and is involved in civic and political life.

Almost from its inception, NPR has faced criticism from both the political right and left. Conservatives who believe in the free market are philosophically opposed to federal funding for a public radio network, arguing that if there is an audience for its offerings, then NPR should be able to find funding from private sources and its listeners. Such criticism (and the repeated threat of ending federal funding) has, in fact, pushed the network to develop alternate funding sources. Critics on the right also object to NPR's seeming liberal bias as evidenced by the opinions expressed and the people invited on the air to express those opinions.

Critics on the left believe that NPR has not lived up to its promise and has failed to program for a diverse audience because it serves only a narrow slice of the population and does not reach out to the disadvantaged. For many on the left, the pressure from market forces, as NPR increasingly relies on corporate funding, means that the network is not very different from its commercial counterparts.

While there is some validity to this criticism, the fact remains that NPR has served as a sane and increasingly valued voice in radio. Its programs cover a broader range of topics than commercial radio and better reflect the complexity of contemporary life. From its beginnings as an alternative to commercial radio, National Public Radio had moved into the mainstream. Indeed, many argue that NPR has become the dominant presence in radio news. Its newsmagazine programs are among the top three most listened to radio programs in

the country and it draws the largest audience of any program in morning "drive time." NPR is a reliable source of news that provides nuanced and unexplored perspectives as well as depth and context in its coverage of events.

Native American News Media

Native American journalism has been active on the American political and cultural landscape for more than 150 years, and current tribal and pan-tribal media efforts are fostering ever greater degrees of professionalism and influence. From newspapers and radio stations to sophisticated online multimedia packages, Native media outlets continue to play both a watchdog role at home and an advocacy role throughout the world.

The realm of Native media has consistently been dominated by newspapers. Hundreds of tribal publications provide local and tribal information to their readers, and new newspapers sprout up as quickly as old ones fade away. A few pan-tribal newspapers offer information of Native interest to readers throughout the United States.

Development

The *Cherokee Phoenix* remains among the largest and best known of the tribal papers. It was founded in New Echota, Georgia, in 1828, at a time when the federal government was working hard to expel all Native people from the eastern part of the country. The founding editor of the *Phoenix*, Elias Boudinot (1800–39), launched the newspaper by raising funds during a speaking tour of New England. He delivered rousing orations to church groups and other organizations, urging them to support the creation of a tribal newspaper that would allow the Cherokee nation to demonstrate its ability to function in an increasingly information-oriented world.

The creation of the newspaper also was made possible through the efforts and vision of Sequoyah, the man who invented the Cherokee syllabary (a form of writing that uses one symbol per syllable, as opposed to alphabets that use one symbol per sound). Sequoyah (ca. 1776–1843)—also known as George Guess, Guest, or Gist—had noted the advantages that a system of writing gave to the white settlers and soldiers in Georgia, and he worked to develop a method of capturing the oral Cherokee language on paper. He tried several approaches before developing a syllabary that is simple and easy to learn. Within months of its invention, the percentage of Cherokee people who could read began to rise, and growing literacy made the creation of a newspaper feasible.

The *Phoenix* was founded initially to fight federal efforts to force the Cherokee off their land in Georgia. Over time, however, Boudinot became convinced that the removal of the Cherokee Nation to Oklahoma was inevitable, and he began to argue that a smooth and peaceful relocation offered the best hope for the future of the nation. That change of position incensed many members of the Cherokee nation and its government, and amid the clamor, Boudinot submitted his resignation from the

Phoenix on August 11, 1832. He eventually moved to Oklahoma to build a new life for the Cherokee, but many people considered him at least partly responsible for the disastrous Trail of Tears; in that slow, undersupplied march from Georgia to the area now known as Oklahoma, 4,000 Cherokee died and thousands more suffered horrific misery. Boudinot was stabbed to death in 1839. Back at New Echota, the newspaper was destroyed by the Georgia Guard.

The Cherokee revived the *Phoenix* once they were settled in Oklahoma. The paper has been forced to suspend publication at times since then, and it has gone through a few name changes before returning to the original—but it survives to this day. Previously a quarterly publication, it is now published monthly in Tahlequah, Oklahoma, and boasts a circulation of 67,000 in Oklahoma and 106,000 worldwide.

Another prominent Native newspaper, the *Navajo Times,* was founded as a newsletter in 1959 and published its first issue as a newspaper in 1960. Publishing weekly, the newspaper covers the entire 27,000-square-mile reservation and includes national and world news of interest to Navajo readers. The paper is based in Window Rock, Arizona, and serves a paid circulation of 22,500.

Numerous other tribal newspapers populate the American mediascape. The *Sho-Ban News,* for example, publishes on the Shoshone-Bannock reservation in Idaho. *Smoke Signals* is the newspaper for the Grand Ronde Tribe in Oregon. *One Feather* is published by the Eastern Band of the Cherokee. The *Pequot Times* covers the Mashantucket Pequot Tribe. Alaska Newspapers, Inc., publishes six weekly papers and a statewide magazine, in addition to other more targeted publications. And there are numerous other Native newspapers throughout North America, most of them published and overseen by tribal governments, but some operating on an independent status.

Newer Media

Radio stations are second in number to Native newspapers. They are relatively inexpensive to develop and operate, and they are highly effective at transmitting information and entertainment over a relatively large area. Approximately 40 tribes have at least one radio station; these stations are for the most part small, low-budget, noncommercial FM operations that function with funding from the tribal governments. In addition, some Native programs are syndicated to multiple stations. *Native America Calling,* for example, is broadcast by 52 stations throughout the United States and Canada, and it is carried on the web as well. It reaches a half million listeners each week.

Newspapers and radio stations are the biggest segments of the Native news world, but online journalism is growing rapidly in Indian Country. Many tribes have at least a static website that offers information and links for tribal members, and some offer additional background information and news to outsiders. Some tribes, however, have elaborate and highly informative websites that present the news, history, culture, and philosophy of the tribe. The Navajo (www.navajo.org) and Cherokee (www.cherokee.org) websites, for example, convey a great deal of information and are updated often.

Some of the websites function beyond the borders of individual nations. *Native Youth Magazine,* for example, offers a website focused on young Natives throughout the country. The magazine offers news, profiles, and other features of interest to Native teens regardless of tribal affiliation.

Lagging behind newspapers, radio stations, and websites are media forms that require more money for creation and distribution. Only a few Native print magazines, for example, exist in the country, and many are recent start-ups. One of the most respected and longest-running Native magazines, *Akwesasne Notes,* was published by the Mohawk nation at the Akwesasne reservation in upstate New York and Ontario. In the late 1990s, the magazine suspended publication for financial reasons, and plans for its revival are uncertain.

Very few tribes own and operate television stations as the cost of television operation and programming prevents all but the most wealthy tribes from venturing into TV broadcasting. Still, some tribes—including the Seminole Nation in Florida—have television stations that broadcast both original and purchased programming. Four reservations in the Seminole Tribe of Florida operate closed-circuit broadcasting systems to households in their jurisdictions. In addition, the Alaska Native Media Company operates a statewide television network and a website to facilitate the broadcast of programming helpful to

Inuit and other Native groups in Alaska. Beyond specific television stations and networks, the Native American Public Telecommunications (NAPT) organization funds the formation and distribution of Native-made documentaries; NAPT also provides training for Native producers and works to heighten awareness of Native media nationwide. NAPT's VisionMaker service offers Native videos and DVDs for sale to individuals and educational organizations.

Some Native journalism outlets are merging media to deliver messages to multiple audiences. In the Oneida Nation in New York state, for example, Four Directions Media (FDM) publishes *Indian Country Today,* a weekly newspaper of interest to Natives throughout the United States. In addition, FDM publishes a quarterly magazine, with each issue devoted to one of four themes: Pow Wow (which offers information about pow wow schedules, history, and news), Destinations, Education, and Business. FDM also publishes a website—indiancountry.com—and podcasts, e-mail news alerts, and RSS news feeds.

In addition, Native American Television offers an online information service that features news, commentary, and history from a Native perspective. Founded in 1990 by Native and non-Native broadcasters in the Washington, D.C., area, NATV offers a television/radio/web/podcast multimedia site (www.natv.org) that reports on national issues that affect Native peoples throughout the United States.

Challenges

The greatest struggle facing Native media outlets is the constant concern over finances. This concern takes several forms, depending on the relationship of the outlet to its audience and to tribal governments.

The vast majority of Native media outlets are owned by tribal governments. In most of these cases, the newspaper functions as part of the tribal government's overall public-information effort; the paper is used to get important news and information out to the members of the tribe. This ownership also offers the advantage of at least partial financial stability. Governmental ownership is essential in most cases because the circulation of the paper, coupled with the demographics of the readership, usually makes the publication unattractive to major advertisers. Many Native communities are among the poorest in the nation, and that poverty conspires with the low and scattered populations to make it difficult to attract advertisers.

With tribal ownership, however, comes tribal control. Countless Native editors have been fired or laid off because their positions were "redefined," when their coverage of tribal leaders and activities became too critical. In 1987, for example, the entire *Navajo Times* staff was dismissed—and the newspaper closed for two months—because the Navajo administration was unhappy with its critical coverage. In 1997, *Times* editor Tom Arviso Jr. was threatened with dismissal again for publishing articles that accused Navajo President Albert Hale of mismanagement and an illicit affair with his press secretary. Also in 1997, Dan Agent, the editor of the *Cherokee Advocate* (later reverted to its previous name, the *Cherokee Phoenix and Indian Advocate*), was fired for publishing articles that alleged misconduct by Cherokee Principal Chief Joe Byrd.

In both of those cases, the editor was reinstated. Ultimately, Arviso became the publisher of the *Navajo Times,* and the newspaper began operation under a constitutional guarantee of press freedom. (In October 2003, it also achieved some built-in financial distance between itself and the tribal government, making it one of the very few tribal newspapers to function with both constitutional and financial independence.) And in 2001, Dan Agent once again became the editor of the *Cherokee Phoenix,* which is owned by the tribal government but enjoys a model degree of protection in the Cherokee constitution.

Tribal media outlets of all kinds struggle to balance two roles: the objective reporting of news and advocacy for their tribe and its heritage. On one hand, most tribal newspapers strive to maintain credibility and authority by offering factual, substantiated information that impacts the lives of their readers. On the other hand, most also try to defend against the continuous erosion of their culture, history, and heritage as a result of the racism, misunderstanding, benign neglect, and occasional malice that they experience from the dominant society around them. That defense often requires a degree of boosterism that classic, "neutral" journalism typically avoids. But Native news outlets

function in two worlds, and they often must embrace both roles in their effort to serve their readers and nations.

Within that struggle lies the ongoing challenge that all Native nations face. In non-Native media outlets—movies, books, magazines, newspapers, television shows, radio programs—American Indians are often seen as trapped in the past, like an insect ensconced in amber. They are shown wearing buckskins and feathers, living in tipis, riding horses, hunting game, and launching raids against the encroaching white settlements. Few media show American Indians in modern settings: going to school, working at jobs, driving Toyotas, watching satellite television. In their advocacy role, many Native news outlets strive to show the rest of the United States that American Indians have a present and a future, not just a past. That goal pulls them closer to the advocacy end of the spectrum, but it is a mission that many Native journalists embrace.

Another challenge that Native journalism faces involves language. On one hand, editors want large readerships, and many Native languages are dying out. That logic dictates publication in English. On the other hand, however, English is the language of the dominant society that has done so much damage in Native communities and to Native peoples. In addition, newspapers are often seen as a tool through which the decline of Native languages can at least be slowed, if not reversed. That logic dictates publication in the Native language. But much of the material published or broadcast in Native media appears in English. Some tribal publications offer articles in both English and the Native language, though some articles appear in both languages, and others are printed in whichever language the editors feel is most appropriate for the topic and readership. Publications written entirely in the Native language are rare.

The Road Ahead

Native news operations continue to function in a state of flux. Chronic problems—tight budgets, changing governmental priorities on both the federal and tribal level, low salaries that result in high turnover of personnel, minimal opportunities for journalism education, and others—present daunting challenges to Native media. On the bright side, several changes are bringing about new opportunities for Native journalists in both Native and mainstream outlets.

The Internet offers numerous opportunities for Native media. Online publications cost dramatically less to create and distribute than do their paper-based counterparts, and that lower cost can mean greater odds of survival for small-circulation Native news outlets. Hampering that progress, of course, is the ongoing difficulty of extending easy Internet access to small and often financially strapped communities. The news outlets can produce and distribute material more freely on the web, but their target audience often cannot access it. As costs continue to drop and as the network of fiber-optic cables continues to expand, this situation is slowly improving—although some parts of Indian Country will not see handy Internet access for years to come. The advent of satellite links for Internet access eliminates the need for physical linkage to the cluster of computers that form the Internet, but prohibitive costs and ongoing maintenance challenges still thwart many attempts to link remote communities to the Internet.

The web presents other opportunities as well. For example, *Reznet* is an online news and opinion publication created by and for Native students. Headquartered at the University of Montana School of Journalism, *Reznet* hires about thirty Native college students as writers and photographers and accepts freelance material from Native students throughout the country. Founded in 2003 by former *Washington Post* foreign-affairs editor Dennis McAuliffe (Osage), *Reznet* is well known among Native students coast to coast.

Another opportunity for student journalists is the Freedom Forum's American Indian Journalism Institute. Held for three weeks each summer at the Al Neuharth Media Center on the University of South Dakota's Vermillion campus, the institute gives Native college students an opportunity to learn journalism skills in a classroom setting. The best graduates of the program are given six-week internships at daily newspapers and the Associated Press. The Freedom Forum also sponsors the annual Native American Journalism Career Conference at the Crazy Horse Memorial in South Dakota; the workshop gives high school and college students interested in journalism a chance to learn more about their potential careers.

And the Native American Journalists Association (NAJA) is working to improve tribal journalism and increase the number of Native journalists in the mainstream media. With an enrollment of more than 600 individual and institutional members, NAJA hosts an annual convention of Native journalists and offers several awards for outstanding journalism in tribal media. Based at the University of Oklahoma in Norman, the organization also offers workshops to both established journalists and to journalism students.

American Indian journalism has gone through several expansions and contractions since the *Cherokee Phoenix* first distributed its inaugural issue. With the advent of the World Wide Web and the independence of increasing numbers of Native outlets, the future looks promising—but difficult and deep-seated challenges will remain for a long time to come. Financing will persist as a challenge for Native American news media, and press freedoms will continue to be debated and negotiated. With such organizations as the Native American Journalists Association and the increasing number of workshops and programs aimed at training future generations of Native journalists, however, the impact of Native media is likely to grow well into the future.

Natural Disasters, Coverage of

Disasters are catastrophic events that share five characteristics: they involve the destruction of property, injury and/or loss of life; they adversely affect a large number of people; they have identifiable beginnings and endings; they are relatively sudden; and they receive extensive news media coverage. Frequently a distinction is made between "natural" and "man-made" disasters with "natural" disasters attributed to climatological phenomena (e.g., hurricanes, floods, fires, and earthquakes) and the cause for "man-made" disasters attributed to human error (e.g., nuclear power plant explosions and chemical spills). This distinction, however, is sometimes hazy. Consider, for example, Hurricane Katrina in 2005, which resulted in the displacement of more than 500,000 families. The hurricane was natural, but the hurricane's effects were aggravated by human errors that allowed floods to submerge nearly 80 percent of the city after Katrina made landfall.

News media play a pivotal role in preparing the public for disasters and assisting the response to them. News media are the public's primary and often only source for important disaster messages. Before a disaster occurs, news reports help the public determine whether the disaster will directly affect them and what they should do to prepare for it. After a disaster occurs, news media inform the public about the extent of damage caused and provide critical recovery information (e.g., shelter locations, financial aid opportunities, and donation/volunteer opportunities). Essentially, journalism serves as an interpreter of disasters, helping the

Images such as this of the destruction caused by Hurricane Katrina in 2005 were common on many media outlets during and after the disaster; without a single person in the frame of the shot, it evokes the emotional context of much of the coverage.

public make sense of what would otherwise seem incomprehensible. In this interpretation role, news media face several unique challenges, including (a) providing accurate and timely information in chaotic environments, (b) selecting reliable sources, (c) assigning disaster responsibility, (d) balancing the government watchdog role with reasonable expectations of authorities, and (e) balancing their function as journalists with their possible role as disaster survivors.

Providing accurate and timely information is by far the journalist's largest challenge in covering disasters. There is huge demand for information after disasters because they so adversely affect many people. Those directly affected need to know first where they can find shelter, food, and water, and later who will help them rebuild their lives. Even those not directly involved want to know about those affected, the extent of the damage, methods to locate and contact loved ones, and actions they can take to aid disaster victims. Given the high demand for timely information, journalists feel pressure to provide information about disaster effects during and immediately after disasters. For example, when in October 2007 wildfires rapidly spread across Southern California, resulting in the evacuation of a million people, news agencies filed stories within hours of the first fires being reported. Quick packaging and dispersal of news content can give rise to problems when journalists allow demand for information, rather than facts, to guide their reporting.

Journalists often rely on a predetermined set of disaster "myths" (often made operational through a series of news routines) as they report disasters and their aftermath. Common disaster myths

(which are often true) include panic and looting, disaster shock, mass shelter utilization, mass evacuation, emerging heroes, and victim helplessness. While these myths are useful frameworks for quickly telling disaster stories, they nearly always fail to adequately portray the real complexity of events. At worst, they can misrepresent disaster impact. For example, media outlets reported "widespread" looting in New Orleans immediately after Katrina made landfall. In fact, the level of looting after Katrina was low during the first week after landfall and that which did take place was associated with necessities (e.g., food and water) rather than the luxury items as reported. After a massive 2004 Asian tsunami, Western media emphasized the victim helplessness motif by covering displaced children, when the reality was that orphans were taken care of by the community and few were placed in orphanages. Therefore, when meeting voracious demand for disaster information, journalists need to avoid the temptation to apply stereotype disaster myths as a basis of reporting.

Time constraints often make it difficult for reporters to utilize a variety of disaster story topics. As only limited information is initially available, there is a tendency to repeat that information which is on hand. After the 2001 terrorist attack on the World Trade Center in New York City, broadcast media replayed the collapse of the Center's twin towers for more than 24 hours. This repetition of story types and information has several negative consequences. Constant repetition of disaster images can compound the stress experienced by disaster victims and often leads to disaster fatigue. Such fatigue is especially detrimental for widespread disasters in which continual public interest is vital to long-term recovery. Just weeks after Hurricane Katrina, the American public had lost interest in media stories about survivors' struggles to recover. Yet more than two years later, nearly 275,000 survivors were still living in temporary shelters.

Another challenge created by the demand for timely disaster information is that journalists may be pressured to report news before they have adequately checked their facts, resulting in erroneous reporting. This is most common when journalists report statistics about damage caused by disasters such as the number of fatalities, injuries, and displaced disaster victims. For example, after a Bangladesh cyclone in 2007, media outlets first reported 1,000 fatalities, but later reported that between 5,000 and 10,000 could be dead. When reporting statistics about damage, journalists should use cautionary statements (e.g., *early reports indicate* that *as many as* 1,000 people *may* have died).

Selecting reliable sources poses a second challenge for news media covering disasters. Typically journalists obtain information from emergency operation centers, where government officials place their command and communication posts. By relying on official government sources, including police and fire personnel, reporters may ignore other important sources such as volunteers, community coalitions and neighborhood response teams. These nongovernment sources typically are not part of the "beat" system of journalistic coverage. Yet journalists need to seek information from a variety of nonofficial sources to help portray a more complete disaster picture.

Assigning disaster responsibility is a third challenge that journalists face. After the initial shock wears off, the public demands to know what "caused" the disaster and who is "responsible." It is tempting for journalists to meet this demand as soon as possible, especially since stories about blame attract readers and viewers. Such stories also fit into existing journalistic storytelling norms by answering the questions of who, what, when, where, why, and how. But journalists also have a responsibility to not prematurely assign causes and blame, especially since the true story is often not immediately apparent. In the days after wildfires erupted across southern California in 2007, journalists first blamed government for not being prepared for the disaster, partly because too many resources were diverted to the Iraq war. In fact, arson was the cause of the largest fire. Yet only two of the 148 television reports logged in the first four days of the wildfires even addressed arson.

Balancing the watchdog role with reasonable expectations of authorities constitutes a fourth challenge for journalists. One primary function of American news media is to monitor government decisions and activities. During disasters, this is amplified as reporters scrutinize every decision made by the government: Did the government wait too long to respond? Was the government prepared for the disaster? How effective is

government assistance to disaster survivors? This scrutiny goes hand in hand with assigning blame and responsibility for disasters, and, as with that challenge, journalists should not overplay their watchdog role. It may not be reasonable to expect government to answer all the media's questions immediately after a disaster occurs. Government officials may prioritize providing assistance to disaster survivors over responding to media requests for information. However, after the immediate response phase is over—typically a couple of days to a week—journalists should expect, and even demand, answers to their questions, expecting officials to be transparent and honest. Misleading acts—such as a faked news conference a FEMA official held to publicize the agency's response to the 2007 California wildfires—are fortunately rare.

Balancing reporter and potential disaster survivor roles is a final challenge journalists must confront. Media management must be cognizant of the fact that journalists from local media outlets are likely to also be disaster survivors. And just like other disaster victims, reporters need to deal with practical issues like finding food and shelter, recovering damaged items, and locating loved ones. Reporters covering disasters may experience emotional and psychological trauma, especially reporters who are survivors. Therefore, management should closely monitor reporters' mental health for signs of extreme stress and trauma, such as intense and unpredictable feelings, difficulty concentrating, and increased interpersonal conflicts. Management also should try to keep reporters' families informed of their safety, especially when journalists report from dangerous disaster zones where they may have limited access to communication links.

Finally, management should consider that reporters who are disaster survivors may inadvertently introduce bias into their coverage. It may be harder for journalists to remain objective after they have been directly affected by disaster. Disaster stories may need to be more carefully reviewed and edited for bias. After Hurricane Katrina, New Orleans's daily newspaper, the *Times-Picayune*, instigated a more rigorous process for evaluating evidence of bias when the paper carefully matched reporters' skills with the most appropriate stories and had editors check other editors.

In conclusion, disasters pose many journalism challenges though they may also see rewards. Disasters are one of the few instances when the information journalists report immediately influences the well-being of a mass public. Without news media, the public often does not know how to prepare for, respond to, and recover from disasters. Disasters provide a rare opportunity for journalists to captivate a wide national, and often international, audience, but with this power, comes the obligation to responsibly cover disaster stories.

NBC News

The National Broadcasting Company (NBC), since 1985 a subsidiary of General Electric, is one of four U.S. national television broadcasting networks. It began as the first American radio network in 1926, has played an important role in the development of both radio and then television journalism, and more recently has become involved in various cable and Internet ventures.

Radio Origins

The formation of NBC was formally announced by its then owner, the Radio Corporation of America (RCA) in September 1926 as the first national radio network in the country. By early 1927, NBC was operating two "chains" or networks of stations, dubbed Red and Blue. Each covered most of the country by contracting with independent stations to act as local affiliates. It took years for programming to fill much of the day and early evening. Much of the network's eventual public affairs programming aired on the Blue network and lacked advertiser support. But news was not initially a part of NBC's programming strategy, which developed only slowly.

Honors for the first daily network newscast belong to journalist and adventurer Floyd Gibbons (1887–1939), whose *The Headline Hunter* half-hour program began on NBC in 1929 on a sustaining (no advertising support) basis, then moved to six nights a week in a 15-minute format sponsored by General Electric. *Lowell Thomas and the News* began on September 29, 1930, with NBC carrying it in the East, and CBS in the West (it soon reverted to NBC exclusively until 1947). The newscast by Thomas (1892–1981) would become one of the longest running radio programs, lasting into the 1970s on CBS.

A. A. "Abe" Schecter (1907–89) brought his print journalism background to NBC in 1932, first as a publicity agent, and starting in 1938 he directed the nascent news operation until departing in 1941. Under him, NBC News began to develop, though at first it was heavily reliant on feature stories that often were more entertainment than news. Virtually all of the broadcasts from overseas, carried by shortwave, were of educational or cultural interest rather than breaking news. There were no network foreign correspondents.

One early NBC hire was Max Jordan (1895–1977), who joined NBC part-time in 1931, serving as the network's representative in Europe, and becoming a full-time employee in 1934. Born in Germany, Jordan used his language abilities and widespread contacts to provide on-the-spot coverage of Germany's merger with Austria in 1936, and the Munich Crisis two years later. At 7:45 on the evening of September 29, 1938, NBC interrupted regular programming on its two networks, and Jordan provided the first report of the agreement between German, Britain, and France that dismembered Czechoslovakia. Other NBC reporters or stringers broke the early war news of the December 1939 sinking of the German battleship *Graf Spee* off Montevideo and the May 1940 German invasion of the Netherlands.

With growing military tension in Europe and in the Pacific, radio commentators came into their own. Listeners could tune to NBC to hear Hans von Kaltenborn (1878–1965) offering commentary five nights a week in prime time as of early 1939, sponsored by Pure Oil, or the conservative Upton Close (1894–1960), who broadcast from San Francisco during the early 1940s. At the end of the war, Max Jordan again achieved a major scoop when on the afternoon of August 14, 1945, he broadcast the first word that the Japanese had accepted the Allied surrender terms. The news was unofficial and would not be confirmed for three hours, but NBC's Jordan aired the first announcement. He went on to head the network's religious programming before becoming a Catholic monk in his final years.

During the war, NBC news programming would more than double from about 1,300 hours a year on both of its networks to 2,800 hours by 1944.

While the total amount of news dropped off during and after 1945, the tradition of network news was well established by wartime reporting, and regular newscasts as well as special radio feature programming continued into the early 1950s. Most radio journalists initially ignored television as mere show business that would take years to develop given its high costs.

Turning to Television

America's first television newscast was aired by NBC on February 21, 1940, anchored by long time radio newsman Lowell Thomas and airing on week nights at 6:45 p.m. This was seen by only a few in New York City some 18 months before the inception of regular commercial television service. In 1949, the *Camel News Caravan* anchored by John Cameron Swayze (1906–95) began its weeknight network broadcasts, continuing until 1956. Swayze, an announcer with only limited reporting experience, had a breezy style of narrating the combination of news film and live coverage of personalities and events that made up the 15-minute broadcast. When the program was first telecast in color in 1954, viewers discovered his trademark lapel carnation was red. Swayze later served for two decades as a pitchman for Timex watches.

In November 1947, NBC began offering weekly television broadcasts of its long-running news and interview program *Meet the Press*. It had begun on the Mutual radio network two years earlier as *American Mercury Presents: Meet the Press,* and was produced by Lawrence E. Spivak (1900–94), who would serve as an interviewer into the 1970s. The first television host was Martha Rountree (1911–99), in an era when few female journalists were seen on television or heard on radio. Each Sunday morning program featured reporters quizzing a political figure in the news. The other networks developed their own similar programs which often created headlines in Washington. By the early 2000s, *Meet the Press* was television's longest-running program. (Tim Russert [1950–2008] became host in 1991 and the program expanded to an hour a year later.)

During the 1950s, several NBC news innovations were credited to Sylvester "Pat" Weaver (1908–2002), who served as the network's chief programmer from 1949 to 1953 and as president for two more years. Weaver expanded the network's television schedule into early morning by introducing *Today* in 1952. Still on the air 55 years later, the program has grown to four hours, offering a combination of news, interviews, and features.

For the radio network, Weaver's team created *Monitor,* a weekend-long program with free-flowing news, features, entertainment segments, humor, and bits and pieces broadcast live from all over the world. *Monitor* was scheduled from 8 a.m. on Saturday morning to midnight on Sunday (it first aired on June 12, 1955, and lasted until 1975), offering a meld of content in an attempt to lure listeners and advertisers to moribund network radio. Following a unique sound beacon indicating its start each week, it originated from a new "Radio Central" facility in the RCA building in New York City.

Former ABC president Robert Kintner (1909–80) took over NBC's programming in 1956 (and served as network president from 1958 to 1965). It was on his watch that expansion of NBC news began. Noticing how well they had covered the 1956 political conventions (then aired for hours a day), Kintner decided to pair journalists Chet Huntley (1911–74) and David Brinkley (1920–2003) to anchor the network's evening news program. Within a few years, Kintner had also launched an extensive network documentary presence, in part because of government dissatisfaction with the networks in the aftermath of a quiz show–rigging scandal late in the 1950s. The expanded news offerings became part of the widely promoted identity of NBC. And for the first time, the notion that network news might make money became apparent, thanks chiefly to the popularity of the nightly news.

News Documentaries

NBC's first venture into news documentary didn't come from the news division, but from a producer who had been a classmate of NBC film programming chief Robert Sarnoff (not coincidentally the son of parent firm RCA's chairman David Sarnoff). What became *Victory at Sea* was broadcast in 26 half-hour shows on Sunday afternoons during the 1952–53 season, and featured music by Richard

Rogers. Using official film of the naval war, producer Henry Salomon Jr. (1917–58) sought to avoid any strong point of view, hewing to a dramatic narrative stressing the role of individuals to retain audience interest. Despite strong network efforts, no advertising support was forthcoming, ironic given how successful the series was in syndication and in recorded form over the half century after the initial run. Indeed, it became one of the most widely broadcast programs in early television history.

Growing out of the success of *Victory at Sea,* Salomon stayed with NBC News and created the *Project XX* series, which began airing a wide variety of occasional documentary programs in 1954 and continued for two decades. The second program, for example, "Nightmare in Red," told the story of communism's rise in Russia and created considerable ratings and critical interest. Donald Hyatt continued producing the series after Salomon's death and

> sought to combine commercial viability, high-toned rhetoric as to its mission, and avoidance of contemporary controversy. Its methods included the compilation of previously-created visual material, a reliance on fast-paced editing and a musical score to convey mood, an omniscient narrator and absence of interviews, and a concentration on public affairs and public life. (Marcus 1997)

The series emphasized the past and thus avoided most potential controversy as it appealed to advertisers and critics—and viewers. Later programs used historical photos and developed the process of "moving" about such images. Most programs were repeated and a considerable aftermarket in Europe and on the educational market helped bring in revenues. In their content and promotion, the programs emphasized entertainment angles as well as their serious content.

Another major series of documentaries ran under the title of *NBC White Paper,* many of them produced by Fred Freed (1920–74) who joined NBC from rival CBS in 1955, departed briefly, and returned in 1961. Programs dealt with Joseph Stalin, Khruschev's Russia, Castro's Cuba, organized crime, summer race riots in large cities, pollution, the decision to drop the atomic bomb on Japan in 1945, and the developing war in Vietnam. The list of topics underlined the era's cold war fears, which underlay many of the programs. Others took a lighter note—such as a study of comedian Shelly Berman at work. Freed's programs won numerous prestigious awards, including several Peabodys and Emmys. But the pressure to produce them, pulling together the many strands of people, research, film, and narrative, led to his early death of a heart attack.

Evening News

The News Department's "bread and butter" program was the 15-minute weekday evening news program, which enjoyed a wide following. After Swayze's departure, from 1956 through 1970, NBC's *Huntley-Brinkley Report* was anchored by the team of Chet Huntley broadcasting from New York and David Brinkley in Washington. Its audience soon exceeded that of chief rival CBS News. The pair's nightly sign-off of "Good night, Chet; good night, David" became a national catchphrase. It had been the brainstorm of producer Reuven Frank (1920–2006), who had joined the network in 1950. He helped shape the early *Huntley-Brinkley Report* and produced NBC's extensive coverage of many political conventions. He eventually rose to head NBC News twice—from 1968 to 1973, and again in 1982 to 1984.

The Huntley-Brinkley coverage of the exciting 1960 national political conventions (that selected John F. Kennedy and Richard M. Nixon) attracted half the television audience and reflected their appeal. Huntley appeared serious and avuncular, rarely smiling, while Brinkley could be counted on to find some interesting tidbit or comment that would brighten the moment. The two balanced each other perfectly as they sat in the network booth perched high above the convention floor, pulling in various reporters for reports from state delegations or candidates. It often made for gripping television.

The two anchors also offered insightful coverage of the growing number of American-manned space missions in the successive Mercury, Gemini, and Apollo programs in the 1960s and early 1970s, when space missions rated continuous network coverage. Indeed, the entire Studio 8H was configured for this coverage, complete with models and

mockups of rockets and spacecraft, maps of the earth and moon to show orbital trackage, and stages on which animated figures were used to depict movements of astronauts before on-board spacecraft television cameras were feasible.

Sponsors flocked to the popular newscasts, special coverage, and documentary programs, and the news division generated profits. The early evening newscast expanded to a half hour in late 1963 and extended to seven nights a week in 1970. Attempts to expand it to an hour failed at NBC and the other networks as local stations wanted to keep control of the time for their own news offerings. NBC's evening news ratings lead began to slip after 1967, and fell sharply when Chet Huntley retired in 1970. His loss, along with a reluctance by the network to fund the network's news effort at a level to match that of CBS, left the NBC operation drifting for several years. The network first tried a platoon of different anchors but nothing seemed to click with audiences.

Despite the efforts of the lead anchor from 1970 through 1982, the articulate and slightly professorial John Chancellor (1927–96), NBC News would not recover its earlier high viewing levels for two more decades. Even perennially third-place ABC News would soon have as many viewers as NBC. Chancellor had joined the network's Chicago station in the late 1940s and after joining the network news department in 1950, worked a variety of reporting jobs, including early civil rights conflicts in the 1950s. He served overseas in Vienna and Moscow, and was named in 1961 to host *Today*. Just a year later he was back on NBC's reporting circuit, including the tumultuous Republican national convention of 1964. Arrested for blocking the aisles on the floor (but more because he was seen as representing a "liberal" network by the conservative backers of nominee Barry Goldwater), he was televised being taken away, saying "This is John Chancellor, somewhere in custody." He served as the director of Voice of America before returning to NBC in 1967.

It was only when Tom Brokaw (1940–) was shifted from the morning *Today* program (the same post Chancellor had once occupied) to become anchor in 1983, a decision championed by news head Reuven Frank, that things began to improve for what was now called the *NBC Nightly News*. Audiences slowly grew so that the network again won the Nielsen ratings race in 1995, the first time in 25 years that an NBC newscast had done so well. But behind the scenes, things were changing. As news audiences stagnated or diminished, the network was saving money by closing many foreign bureaus and reducing the number of foreign correspondents, some of whom had been at their posts for years and had a deep knowledge about the parts of the world they covered. The total number of correspondents for the evening news also declined over the two decades of the Brokaw program, which slowly became more feature laden (and, some argued, devoted to softer personality-driven news) as viewers now typically already knew the major news stories from cable networks or the Internet. Put another way, *NBC Nightly News* was by the late 1990s serving an aging audience (the medical advertisements in the program underlined that fact) with softer feature news.

When Brokaw decided to retire after more than two decades in the anchor chair, NBC was faced with a host of possible replacements. While the networks' evening news programs no longer reach the sizable audiences they once commanded (thanks to competition from cable and the Internet), the anchor decision was important given its headline role in shaping the public view of the news division if not the network itself. The choice turned out to be Brian Williams (1959–) who had often substituted for Brokaw. The transition was a smooth one, and the network retained its strong ratings position. As anchor, Williams soon made a name for himself in covering the disaster of Hurricane Katrina, which smashed into Louisiana and Mississippi Gulf Coast communities—including New Orleans—at the end of August 2005. His anger at the initial fumbled federal response to help the victims of the tragedy was palpable.

Other News Programs

While they declined in number by the 1990s, news specials, sometimes built around breaking events, were another aspect of the network's efforts. Unpredictable by their nature, and thus hard to budget for, the news special allowed the news department to showcase its on-air talent, technical abilities, and overseas personnel. They also provided a throwback to the days of live television—as, to use one example, when reporter

Edwin E. Newman (1919–) could not understand an off-camera signal and stopped his presentation momentarily to have it restated.

Early in 1969, NBC News developed its first news "magazine" program to parallel CBS's *60 Minutes*. Dubbed *First Tuesday,* it ran for two hours on (as its title indicated) the first Tuesday of each month. Made up of several stories running anywhere from 15 to 40 minutes, each reported by a different NBC correspondent, the program became *Chronolog* two years later, though retaining much the same format. It tended to mix hard and soft news segments. Renamed *Special Edition* (and by 1974 *Weekend*) it failed to find a steady place on the schedule or with viewers.

The weekly *Dateline NBC* began in 1992, with Stone Phillips (1954–) and Jane Pauley (1950–) as anchors. The program's mix of investigative journalism, with an emphasis on crime, and human interest stories sometimes got it into trouble. Just a year later, under strong competition to hold its audience, *Dateline* broadcast a sensational investigative report suggesting General Motors (GM) trucks were unsafe. GM discovered the tests shown in the broadcast had been rigged by adding explosive incendiary devices attached to the truck gas tanks and by use of improper sealants for those tanks. The truck maker filed suit against NBC, which publicly admitted the tests had been rigged and settled out of court. Four *Dateline* producers were fired, and NBC news chief Michael Gartner resigned under pressure. Later, in a cost-cutting move, Phillips's contract was not renewed in 2007.

Changing Technologies

NBC news, like the other networks, employed steadily improving technology in its broadcast journalism. For example, it experimented with wire and then tape recording by journalists during the final years of World War II. Early television programs were broadcast live, with occasional inserts of film made for television. Only the development of video tape in 1956 allowed some of the pressure to recede as programs could be taped for later broadcast (though most documentary series did not make the shift for years). NBC News was a pioneer in using color television (as network owner RCA was a primary manufacturer of the receivers), although regular color news programming developed only by the late 1960s. Coverage of the country's quadrennial national political conventions often featured the latest portable camera equipment in reporting from the floor—bulky and clumsy in the early 1950s and progressively smaller and streamlined over the next two decades.

As the technology became available, NBC News made extensive use of electronic and satellite news gathering. Computers became increasingly important in controlling production. Graphics improved as digital methods allowed greater flexibility and a faster response to news deadlines.

By the late 1980s, competition developed from new quarters. Cable television had spawned new networks, chiefly CNN, which bled off broadcast viewers. The Fox Network appeared, and by the late 1990s had added a news operation many considered a conservative mouthpiece. No matter, it attracted many viewers. The growing competition had several effects. NBC largely closed down the production of news documentaries, arguing relatively few people watched them and sponsors were often hard to find for programs with controversial topics. A number of reporters were let go. NBC "joined" its competition by forming two cable networks of its own. The first, the Consumer News and Business Channel (CNBC), began in 1989, growing out of several earlier news networks. MSNBC was inaugurated in mid-1996 as a cooperative venture with Microsoft, and continues to provide a general news service competing especially with CNN.

Finally, NBC News makes increasing use of a variety of websites, often promoting their extended content during broadcast programs. The broadcast network and MSNBC combine efforts on the main news website. Anchor Brian Williams provides a regular blog providing a bit of insight into how the evening program and some specials are put together.

New China (Xinhua) News Agency

From its tentative beginnings in 1931 as the propaganda voice of the fledgling Chinese Communist Party to its status as the world's largest news agency by the early twenty-first century, the Xinhua News Agency has grown in importance along with the expanding global role of the People's Republic of China. From the very beginning, Xinhua has always been directed by the party—and later government—leadership.

Origins

Originally known as the Red China News Service, the news agency was formed in November 1931 in the eastern province of Jaingxi. Most of its early news consisted of documents of the growing communist party movement and information about the areas controlled by its developing Red army. News was received and transmitted on equipment belonging to the army. The agency continued to receive but could not transmit news during the Long March of 1934–35. After the communists agreed to join the central (Chiang Kai-shek) government to fight Japanese invading forces, the title of the news agency was changed to that still used today. By 1937, Xinhua was establishing branch offices in various cities and transmitting news (about five thousand words a day) across the country. By 1942 the agency had also taken control of a growing network of radio stations operating in unoccupied China. The first external broadcasts in English began in 1944.

During the post–World War II struggle for power in China (1945–49), Xinhua established more branch offices in Chinese cities. Its reporters followed units of the Red army as fighting broke out in mid-1946, though agency headquarters had to shift locations as the fighting ebbed and flowed. By 1948, even as fighting continued, Xinhua

established its first overseas bureaus in London and Prague. The agency moved its headquarters to Beijing in March 1949, about six months before the end of the civil war.

With the formation of the People's Republic of China in October 1949, Xinhua became the nation's official news agency and a formal agency of government. Its employees were all government workers and the agency was given monopoly control of news distribution within the country. Slowly it began to modernize—a year later it formed a photography section and began to prepare Chinese domestic news for foreign distribution. News was transmitted in Chinese and English (and soon other languages) by shortwave radio. By 1952 Xinhua had established additional bureaus in Moscow and Hong Kong. Most foreign news carried within China was supplied by the Soviet TASS news agency with which an exchange agreement had been signed in 1950.

For the next several decades, Xinhua is hard to find in analyses of Chinese, Asian, or world journalism. China turned inward, greatly restricted communications, and passed through a series of upheavals such as massive starvation in the 1950s, and the "Great Leap Forward" of the 1960s that devastated the economy and people. During this time the government tightly controlled Xinhua reporting to match official government positions on what was happening. Natural disasters (such as weather or floods) might be covered, but political crises only rarely. Only with the 1976 death of Mao Zedong, Chairman of the Chinese Communist Party, and the slow development of the next generation of political leadership did the news agency begin to expand its role both within and outside of China. The uprising of university students in Tiananmen Square in Beijing in mid-1989 saw extensive coverage by Xinhua and world media—until the army was ordered in—and then the story was hushed up and remained so for the next two decades. The news agency had few offices outside China in this period, focusing largely on internal news and retransmitting news obtained from TASS and other sources.

Operations

By the middle of the twenty-first century's first decade, Xinhua employed more than 8,500 people, by far more than any other news agency. It operated branch offices in more than 50 Chinese cities including the former colonies of Macao and Hong Kong. And it operated in more than 100 countries with major editorial centers in New York, Mexico City, Cairo, Nairobi, Paris, Moscow, Hong Kong (where until 1997 the bureau represented Chinese government affairs in the then-British colony), and Rio de Janeiro. All of these units come under the central control of the government's publicity (formerly propaganda) department in Beijing.

New Xinhua employees are recruited from the country's major universities, selected by a combination of examination and interview, and subjected to weeks of journalism and ideological training. Those who are chosen for two-year overseas assignments (after two years of domestic reporting) are often interviewed in English. Estimates suggest that up to 80 percent of Xinhua journalists are members of the ruling Chinese Communist Party. Xinhua issues two very different news feeds—those intended for domestic media (and tightly controlled), and those for international media (and somewhat more loosely controlled).

Priority is given to positive reports of party political news and the activities of the country's leadership. Only recently has realistic reporting of natural disasters crept into the national news agenda, and news of protests or riots is still suppressed while being communicated to party and government leaders (as "internal reference" reports). Despite having its own foreign bureaus, most international news supplied to domestic media by Xinhua comes from one of the other world agencies—typically Agence France-Presse or Reuters—or one of the many national news agencies in developing nations, and is then translated (and often heavily rewritten) for domestic consumption, though unedited material may well go to party and government leaders. Indeed, the foreign bureaus are used less for actual initiative reporting and more for receiving domestic news agency reports to transmit back to China. While reports of foreigners that are critical of China may go to the political leadership, almost none appears in Xinhua's domestic news feeds.

Xinhua stories often feature more use of background and analysis than the more usual fact-based hard news approach of Western news agencies. This is true of both domestic and international feeds, though Xinhua does provide more coverage of developing nations than is found in other

agencies. Stories about China are overwhelmingly positive—80 percent according to one content analysis done in the middle of the twenty-first century's first decade. Outright criticism of government officials or decisions is rare.

Xinhua is more than a traditional news agency—it publishes a number of newspapers and magazines, predominantly in Chinese. These are partly operated as revenue sources, as government funding for agency operations has been dropping in recent years. Somewhat less than 40 percent of its budget is met by government funds. This has delayed some technology upgrades. For example, the news agency began to provide Internet connections to its foreign news offices only in 2003, odd in that Xinhua first offered service on the web in 1997 as Xinhuanet. By the early 2000s, the web service was feeding six languages: Chinese, English (as chinaview.cn), Spanish, French, Russian, and Arabic to more than 200 countries and regions, and achieving about 80 million page views per day.

The primary way that the Chinese news agency differs from its western compatriots is in its fundamental view of the function of journalism. News is not seen as a product or commodity, but rather as a vital means of educating (and persuading) the people. News should help the country develop and promote both individual and institutional success stories and governmental policies.

The difference between propaganda and journalism—a stark one in the West—is nowhere near as sharp within the Xinhua context.

New Journalism

"New Journalism" refers to a literary movement in the 1960s and 1970s that tried to expand the definition of journalism by arguing that feature writers could use the same techniques to write stories about real-life events that novelists used to write about imaginary worlds. Writers like Tom Wolfe, Truman Capote, and Gay Talese, often credited with launching this movement, immersed themselves in their subjects, at times spending months in the field gathering facts through research, interviews and observation. But when they sat down to write, they produced something very different from the feature stories typically published in newspapers and magazines of the time. Instead of forcing their story into a traditional formulaic structure and institutional voice, they constructed well-developed characters, sustained dialogue, vivid scenes, and strong plot lines marked with dramatic tension. They also wrote in a voice that was distinctly their own. Their writing style, and the time and money that their in-depth research and long stories required, did not fit the needs or budgets of most newspapers (a notable exception was the *New York Herald Tribune*), although the editors of *Esquire, The New Yorker, New York,* and other prominent magazines sought out these writers and published their work with great commercial success. Many of these writers went on to publish their stories in anthologies or to write what became known as "nonfiction novels," and many of these works became best sellers.

Fact and Fiction

The New Journalists expanded the definition of what types of stories counted as "journalism," and what reporting and writing techniques journalists could legitimately use. They also associated journalism with fiction when they used phrases

like "nonfiction novel" and "narrative techniques of fiction" in describing their work. In so doing, they ignited a debate over how much like a novel or short story a journalistic piece could be before it began violating journalism's commitment to truth and facts.

Critics praised the New Journalists for writing well-crafted, complex, and compelling stories that revitalized readers' interest in journalism and the topics covered, as well as inspiring other writers to join the profession. Other critics, however, worried that the New Journalists were tempting reporters to stray from the facts in order to write more dramatic stories; tempting them, for example, to create composite characters (melding several real people into one fictional character), compress dialogue, rearrange events, and even fabricate details. Some New Journalists freely admitted to using these techniques, arguing that they made their stories readable and publishable without sacrificing the essential truthfulness of the tale; others adamantly opposed their use, arguing that any departure from facts, however minor, discredited a story and moved it away from journalism toward fiction. As John Hersey (1914–93), the reporter who became famous for his 1946 nonfiction work *Hiroshima,* said in his widely quoted statement in the *Yale Review:* "There is one sacred rule of journalism. The writer must not invent. The legend on the license must read: NONE OF THIS WAS MADE UP."

Challenging Objectivity

In engaging in this debate over what counts as truth in journalism, the New Journalists were contributing to widespread discussion over the nature of "truth" and our ability to know and represent it objectively in stories, paintings, photographs and other representational arts. The New Journalists engaged in this larger debate by writing stories that challenged the ideology of "objectivity" and its related practices that had come to govern the profession. Some journalists and cultural critics worried that the New Journalists, by writing in a personal voice with a strong point of view and becoming immersed in their subjects, were replacing objectivity with a dangerous subjectivity that threatened to undermine the credibility of all journalism, including the heart of the profession, daily news. But the New Journalists argued that objectivity did not guarantee truth, and that objective stories could be more misleading than stories told from a clearly presented personal point of view.

The New Journalists were not alone in challenging objectivity. Similar challenges were being mounted by scientists, historians, and anthropologists who were also struggling with the philosophical and practical limitations of objectivity, and experimenting with new narrative forms for their nonfiction works. Mainstream news reporters also echoed the New Journalists' arguments as they began doubting the ability of "objective" journalism to arrive at truth—especially after objective reporting failed to convey the complex truth of events such as McCarthyism (1950s), the Vietnam War (1960s and 1970s), and the Watergate scandal (mid-1970s). By 1996, objectivity had been so crippled as a guiding principle that the Society of Professional Journalists dropped it from its ethics code, replacing it with other principles such as fairness and accuracy.

Roots of the New Journalism

The New Journalists of the 1960s were not the first reporters in the history of American journalism to advocate for a more literary approach to writing about contemporary events—nor were they the first to call themselves "new." Journalism historian Michael Schudson argues that as early as the 1880s, two stereotypes of reporters had emerged: the newspaper reporter who churned out facts in a formulaic account, and the "new journalist": an educated "man of letters" who could write stories that "sparkled" and had the same literary power to draw readers in as did the best-written novels. Some journalists of the time, such as Lincoln Steffens (1866–1936), believed that this power had a moral dimension. Reporters were morally obligated to write stories that were true, well-crafted and rhetorically persuasive because only these stories (as opposed to dry, factual reports) could lead readers to empathize with others and spur them to take action against social injustice and abuses of power. Steffens and other like-minded journalists—Ida Tarbell (1857–1944), Ray Stannard Baker (1870–1946), David Graham Phillips (1867–1911), among others—wrote investigative magazine

stories that President Theodore Roosevelt (1858–1919) derisively called "muckraking" and they wrote about society's "muck" in a literary, rhetorically persuasive way. The social and literary ambitions of these first "new journalists" had a lasting impact on journalism, providing a foundation for generations of investigative and literary reporters and editors who believed in factual, socially committed journalism that "sparkled"—including the New Journalists of the 1960s.

The Writers

Since the beginning of American commercial journalism in the 1830s, reporters with literary ambitions have been writing stories about real-life events using characters, scenes, dialogue, action, plot—all the devices that in later times became associated more with fiction than with journalism. Their work has been published in newspapers, magazines, books and, more recently, online publications. There are too many major writers to name. That said, those wishing to learn about the New Journalism could begin by reading the work of three foundational writers: Tom Wolfe, Gay Talese, and Truman Capote. They could also expand their reading by turning to a number of anthologies that include the work of influential nonfiction writers such as Joseph Mitchell (1908–1996), John McPhee (1931–), Tracy Kidder (1945–), John Hersey (1914–93), Joan Didion (1934–), Hunter S. Thompson (1937–2005), Michael Herr (1940–), Annie Dillard (1945–), Ted Conover (1958–), Richard Ben Cramer (1950–), Jane Kramer (1938–), Susan Orlean (1955–), Calvin Trillin (1935–), Lillian Ross (1927–), Norman Mailer (1923–), A. J. Liebling (1904–63), Martha Gellhorn (1908–98), Jimmy Breslin (1930–), and many more. Finally, those wishing to understand how the New Journalism has influenced new generations of writers can read the journal edited by Lee Gutkind (1945–), *Creative Nonfiction.*

Tom Wolfe (1931–)

Journalism critics and historians identify Tom Wolfe as one of the most influential promoters of the New Journalism. Wolfe graduated from Yale University with a Ph.D. in American Studies and then took his first newspaper job in 1956. He worked for *The Washington Post* and later for the *New York Herald Tribune* where, he says, he met writers like Jimmy Breslin, who showed him that journalism could be creative and exciting. In 1963, when a newspaper strike in New York City left Wolfe temporarily without work, he turned to his editor at *Esquire Magazine* with an idea: he wanted to fly to California to write about a custom car show and the hot-rod culture. The result was Wolfe's now-famous "Kandy-Kolored Tangerine-Flake Streamline Baby," an energetic piece marked with his personality that has become a model of what the New Journalism could achieve. The article later became the title piece of Wolfe's first book, a collection of 22 magazine and newspaper pieces, published in 1965. In 1973, Wolfe published *The New Journalism,* in which he explicated the features of the genre. He went on to write several successful books in the style of the New Journalism, including *The Right Stuff,* a story about the Mercury 7 astronauts that was adapted in 1983 for the Oscar-winning film of the same name; *Bonfire of the Vanities,* a satire of 1980s status-conscious New York; and *From Bauhaus to Our House,* a biting history of modern architecture. Wolfe is still credited with helping to establish The New Journalism as a literary movement, although he gave that credit to another writer, Gay Talese.

Gay Talese (1932–)

Talese was born in 1932 in Ocean City, New Jersey. As he writes in "Origins of a Nonfiction Writer," he grew up in his mother's dress shop, listening to the stories the white-gloved ladies who frequented the shop told about their private lives and about their friends and neighbors, and watching as his mother encouraged the tales with unobtrusive questions. As he listened and watched, he learned "much that would be useful" to him years later when he began interviewing people for articles and books. Talese started working as a reporter in high school, writing more than 300 stories for the *Ocean City Sentinel Ledger*. He continued writing in college and then after graduation he headed for New York City where he found work as a copyboy for *The New York Times*. In his spare time, he wrote stories about the ordinary people and places that didn't interest

most reporters—and he quietly offered them to the editors of the *Times,* who were impressed with his work. In 1953, Talese, who had graduated college as an army officer, was commissioned and sent to Fort Knox. He kept in touch with the *Times* by writing stories during his military service. In 1956 when his tour of duty ended, the *Times* invited him to return to the paper, this time not as a copyboy but as a sports reporter. He continued to work for the *Times* for ten years, developing the style that earned him a place in the history of New Journalism. Talese also wrote for *Esquire,* producing his most influential stories for that magazine. His two arguably most famous pieces, a profile of Joe DiMaggio titled "The Silent Season of a Hero" and his profile of Frank Sinatra titled "Frank Sinatra Has a Cold," were anthologized along with his other most popular *Esquire* pieces in the collection *Fame and Obscurity* (1970).

Talese also used his skills as a literary journalist to write internationally best-selling books, including *The Kingdom and the Power* (1969), an inside look at *The New York Times; Honor Thy Father* (1971), about the rise and fall of the notorious Bonanno crime family of New York; *Thy Neighbor's Wife* (1981) about the hidden and changing sex lives of Americans; and *Unto the Sons* (1992), about his own family's emigration from Italy to the United States in the years before World War II.

Although Tom Wolfe gave Talese credit for developing the distinctive style and reporting methods of the New Journalism, Talese never considered himself a New Journalist. He thought of himself as a very traditional writer who wanted to "do something that would hold up over time, something that could get old and still have the same resonance." He also came to associate the New Journalism with journalists who are more interested in being celebrity writers than in doing the hard legwork required of good reporters—in cultivating a flashy, easy style designed to get attention rather than hold up over time. Yet Talese admired the work of Tom Wolfe and Norman Mailer, New Journalists who, he said, achieved "remarkable things" through diligent reporting. Although Talese did not call himself a New Journalist, he influenced many writers who did, and he continues to influence literary journalists writing today.

Truman Capote (1924–84)

Unlike Wolfe and Talese, Truman Capote was not a journalist but a playwright and a novelist. However, he became a central figure in the New Journalism in 1965 when *The New Yorker* magazine serialized what Capote called his nonfiction novel, *In Cold Blood*. The novel told the story of a family of four in Holcomb, Kansas, who had been murdered in their beds. Capote spent six years reporting and writing the piece. As he told a reporter for *Life* magazine, he wanted to see if he could write a true story about real life events that had the dramatic power, excitement, and intricate structure of a novel. Capote, who by this time had become a celebrity among New York's social elite, was interviewed extensively about his work. As he described what he did and how he did it to reporters from major national media, he introduced the idea of the "nonfiction novel" into popular discourse. He also triggered controversy as skeptical reporters, wary of his attempts to combine fiction and journalism, tried to discredit his claims to accuracy and questioned his assertion that a responsible journalist could write a true story that read like a novel.

Conclusion: The *New* New Journalists

Today, the term "New Journalism" is most often associated with the writers of the 1960s and 1970s who stretched the boundaries of legitimate journalism by challenging the ideal of objectivity and advocating the use by journalists of narrative techniques used by fiction writers. Their ideas of "good journalism" continue to be explored and refined by new generations of reporters and editors who believe that it is possible to write creative, literary nonfiction that is factually true. In the early 1990s, the spirit of the New Journalists was reincarnated in yet another literary movement called "Creative Nonfiction." This movement gained momentum under Lee Gutkind, who organized an annual creative nonfiction writing workshop at Goucher College in Baltimore, helped establish one of the nation's first degree programs in creative nonfiction, founded the journal *Creative Nonfiction,* and published several anthologies. In the editorial rooms of newspapers and magazines, in professional journalism organizations, and in

creative writing workshops across the country, writers and editors continue to take inspiration from the New Journalists, experimenting with forms, styles and practices that can work for and give credence to a genre that tries to be simultaneously creative, personal and "true."

News Aggregators

News aggregators combine computer software and journalistic practices to enable online computer users to collect news stories and other information as that information is published and to organize the information in a specific, personalized manner. This is accomplished in several ways, but the most common is the use of HTML (hypertext mark-up language) coding on the websites of news-gathering organizations to create RSS (really simple syndication) feeds and other public notifications of instant updates to news content. News aggregators programs are installed on the computers of individual users. These programs regularly search for updated information from news-gathering organizations and compile it for later use. The term news aggregators can also refer to intermediate websites that republish RSS feeds and information from other primary news sources.

News aggregation is based on the concept of content syndication, where content created by one or more news-gathering organizations is distributed through a different organization. Historically, syndication involved republication of both hard and soft news content by newspapers in different locations. These newspapers paid the initial publishing source (often a metropolitan daily) for the limited right to reprint the stories. The nature of syndication has changed as technological advances allow far more information to travel much greater distances. Online journalism allows for more and different types of syndication, particularly the syndication of headlines and breaking news scoops. Most news aggregators are web based: they deliver RSS feeds and other content using web browsers. However, other aggregators use stand-alone software that connects to the Internet to deliver RSS feeds and other content. Well-known news aggregators include Google News and My Yahoo. Other news aggregators have been designed to display news feeds as scrolling screensavers or to send news feeds directly to an end user as a daily e-mail digest. (Due to the fluid nature of the World Wide Web, any listing of news aggregators would quickly become obsolete. Please refer to the more frequently updated websites in the Further Readings section.)

Syndication and the Evolution of Aggregators

While web-based news aggregators are a relatively recent phenomenon, they have their roots in news agency reports carried in local newspapers, which attempted to provide a local angle on stories for their readership. This practice developed into the familiar newspaper sections still in use today, such as the front page, editorial page, international section, sports section, and so on. In the late twentieth century, most major metropolitan daily newspapers began to publish zoned editions, which carried both

the main sections of the newspaper, plus an added section (or sections) of news specific to a subregion within the metropolitan area. While this practice of audience segmentation was common in newspapers, it was less common in local broadcast journalism as there was no ready way to focus stories for only part of a region. Before the rise of online journalism and news gathering beginning in the 1990s, feature syndication had become a widely accepted news practice. Importantly, however, it was still practiced under the control of traditional news editors.

When newspapers began publishing on the Internet, they extended these practices into the online space: sections of printed newspapers usually became separate sections within the overall websites. Since online versions of newspapers required no printing and distribution costs, the number of local editions could be expanded, increasing geographic customization and demographic personalization. Stories could be expanded and more photos—or even video—provided. The rise of independent intermediate websites that collect and republish headlines and hyperlinks began to erode the impact of traditional news editors. The social and political effects of a 24-hour news cycle in journalism (begun with cable news services and greatly expanded online) began to create expectations that print and broadcast news editors should to provide near-constant updates and headlines.

RSS, or Really Simple Syndication (or Rich Site Summary), is the standardized software protocol that news websites use to publish updated headlines onto the World Wide Web through publication of data and meta-data tags on their websites. But RSS is not the same as web-based broadcasting. RSS Feeds are effectively passive and must be constantly searched for, although this searching can be, and almost always is, automated. Further complicating this process, the intermediate sites that collect and republish RSS feeds are often called news aggregators. Such naming is misleading because it confuses individual practitioners with the overall practice. The news-gathering organization, intermediate websites, and end users all engage in the same process of acting as news aggregators, and increasingly the distinctions between them are disappearing.

Using these RSS feeds, intermediate sites collect new information, and end users can select and compile information based on their particular needs and interests. This developing feature of journalism allows for very personalized editorial control and will likely change the way in which individual audience members interact with their news. The upsides to the growing use of news aggregators include the increased relevance of selected news to the end user, faster access to breaking news, advertising that is more targeted, and an increased personal agency for an audience that had been passive. Among the downsides to the growing use of news aggregators are the increased pressure on journalists for speed and scoops, the erosion of the distinction between news gathering and republication, intrusive generalized advertising, and lack of any professional editorial role.

Contemporary Media Theory

Media theorists and technology pundits have made many predictions regarding the effects of online publication of newspapers and the rise of news aggregators. The balance of increased personal agency and decreased professional editorialism were popular topics of speculation and research even before the technologies had been fully developed. As early as the 1960s, Marshall McLuhan had predicted an anarchic computer web and expected that some form of personal organization would be necessary. In the mid-1990s, Nicholas Negroponte coined the term "the Daily Me" to describe the interface with which end users would receive, customize and manipulate information. Negroponte envisioned a prototype "digital newspaper," either in the form of an on-screen interface or a portable device, that would receive information constantly and arrange it in a personalized format.

Open-source movements have actively lobbied to keep standards open and to mitigate the effects of corporate ownership of media. These advocates have pushed for open web standards like XML and the Atom syndication format for the publication of news feeds, as well as free open-source software for stand-alone news aggregators. In theory, these open source aggregators allow for both commercial content and advertising while preserving the prerogative of intermediate websites and end users to copy and republish RSS feeds. More recently, media theorists such as Henry Jenkins and Cass Sunstien have stressed the complex interactions between existing corporate structures of news

gathering, evolving technologies for cataloging and moving information and an active audience that self-organizes around emerging dynamic demographics or specific points of view.

Probably the most notable feature of the effect of online news aggregators on journalism is that of homophilly. Homophilly, literally "love of sameness," is a sociological theory that similar individuals will move toward each other, and act in a similar manner. Coined in 1954 by social scientists Paul Lazarsfeld and Robert Merton, the idea of homophilly has been expanded by evolving media technologies, enabling demographically or politically similar individuals to seek out news sources that agree with their preconceived views. But homophilly also describes the likelihood that users will thus exclude news sources that challenge or disagree with those preexisting views. News aggregators can create hyper homophilly by allowing an end user to maximize exposure to agreeable news while minimizing exposure to new and conflicting information and create an "echo-chamber effect" of personal information feedback.

Continuing Changes

In the same manner that text and image content has been published using news aggregators, multimedia content and full-motion video are also published and distributed using news aggregators. The majority of video and multimedia aggregators are stand-alone software, such as iTunes and Miro. Web-based multimedia aggregators, such as YouTube and Blipp.tv, are limited by the architecture of web browsers. Digital television hardware, such as TiVo and DirecTV, can also function as content aggregators, digitally recording content as it is broadcast and cataloging it for later viewing. (Due to the evolving nature of digital media delivery, any listing of multimedia aggregators would also quickly become obsolete. Please refer to the more frequently updated websites listed in the Further Readings section.)

Despite the erosion of control of traditional news editors, much of the audience of news websites and newspapers still prefer professional editorial oversight, design and content selection. These readers use a mixture of information from news aggregators and from more traditional, edited sources. The continuing use of news aggregators has not displaced traditional news publications, but it has altered how news is written and distributed. The automated nature of RSS feeds is balanced by the introduction of new levels of ad hoc editorialism that continues to evolve around Internet book marking and hyperlinks, which are integral parts of the flow of news through aggregators. Delivery of news to networked mobile computing devices, such as mobile phones, will further change how audiences interact with both news content and the news aggregators.

Faster movement of information is a continuing trend in journalism. However, audience demand for meaningful selection of information by professional news editors, will balance the increasing use of news aggregators online. End users will exercise increasing control over their content selection, but some will likely continue to use trusted news sources regardless of media or delivery method.

News as Narrative

Storytelling is a central mode of human communication and journalists can be viewed as the primary narrators of public events in contemporary societies. News stories—the product of journalism—constitute a distinct, nonfictional narrative genre. They share with other types of narrative a reliance on storytelling devices as a means of making sense of the world, but differ in their structure, cultural authority, social roles, and relation to reality.

Influenced by what came to be called the "narrative turn" in human and social sciences, scholarly inquiries into narrative qualities of news emerged in the mid-1970s, gained considerable momentum by the early 1990s, and continued to flourish into the new century. Underlying these investigations was a growing recognition of the significance of narrative in understanding news. However, different academic traditions emphasize different dimensions of the relationship between news and narrative. From a literary or linguistic perspective, emphasis is on narrative *forms* and *styles,* while assuming that only part of news stories are structured as narratives or have narrative qualities. From a philosophical perspective, the emphasis is on the epistemological status of *all* news stories as *constructions* rather than objective representations of reality. From a cultural or folkloric perspective, emphasis is on roles played by news stories in expressing and reaffirming prevailing values, beliefs, and ideologies, particularly through creation and retelling of cultural myths. These three different perspectives are reviewed in turn.

News and Narrative Forms

As a particular news form or writing style, narrative news stories are often described as standing in opposition to the inverted pyramid style (where facts are presented in a descending order of importance), simple chronicles, or the more general "information model" of journalism, which emphasizes factuality over aesthetics or emotion. The information model, which developed towards the end of the nineteenth century and gained prominence in the twentieth, marginalized the once-prevalent narrative style in favor of a fact-centered, "hard news" style. However, narrative journalism has gained renewed popularity in the early twenty-first century, where traditional news outlets are looking for strategies to combat declining readership, and provide added value to available online information. Narrative journalism, which goes beyond a mere rendering of facts, is one such strategy.

A narrow definition of narrative news stories refers to texts that begin with an anecdote rather than a summary lead and proceed to describe events in sequential order rather than presenting information in a descending order of importance. A broader view of narrative forms in news suggests that news stories incorporate narrative devices as wide-ranging as temporal structure, setting, point of view, characterization, personalization, conflict, dialogue, suspense, climax, metaphors, or irony. These varied narrative strategies can be found in different combinations and to different degrees in print or broadcast news texts. They also serve multiple aims, from capturing readers'/viewers' attention through ideological framing, to establishing journalistic authority. News texts are thus seen as having different degrees of narrativity rather than being narratives or not. Similarly, while narrative style is often associated with soft news, human interest stories, magazine journalism, tabloids, or "new journalism," researchers have widely demonstrated the presence of narrative elements in hard news and mainstream journalism, including bastions of "information journalism" like *The New York Times*. One can therefore see different journalistic modes—such as soft versus hard news or tabloids versus broadsheets—as different positions on a "storytelling continuum."

The narrative work of news is driven by conflicting impulses, analogous to the literary tension between attaining closure and sustaining readers' interest, or between short stories and novels/serials. On one hand, news is commonly seen as composed of autonomous narrative units—each with a beginning, middle, and end—aimed at uncovering the whole truth and imposing closure on our understanding of depicted events. In this sense, a good news story leaves no loose ends, and news stories can be seen as an incarnation of the short story, though usually offering closure at the beginning of the text—most often in the headline. On the other hand, few news stories start and end within the framework of one news item. In these

continuous stories, each news item can be viewed as a chapter in a novel or an episode in a television series. Continuous news stories can be divided into two primary types: those that focus on the question of "what happened?" and those that focus on the question of "what *will* happen?" While the former deal with revelations about the past, like corruption scandals or unresolved crimes, the latter report about events unfolding in the present, like elections or wars. In both cases, journalists need to employ narrative devices such as suspense, flashbacks, and multiple points of view in order to sustain readers' interest in the story and achieve narrative coherence.

Unlike authors or screenwriters, journalists rarely withhold information in order to maintain tension, and unlike fictional texts, news stories are shaped by an external reality that helps determine their beginning and end points. Yet some stories are buried by news media before they are fully resolved in the "real world" (such as crimes, disappearances, or injustice stories), while other stories continue to produce headlines long after they were seemingly resolved, including the deaths of John F. Kennedy and Princess Diana, or even the sinking of the *Titanic*. Sustained coverage of such stories relies on diverse narrative devices, employed to different ends. Thus, for example, in the case of the 1963 Kennedy assassination, the tabloids kept the story open through soap-opera plot devices, like resuscitating the slain character (the Kennedy-is-alive theme) and conspiracy narratives, whereas retellings of the assassination in the mainstream press relied on narrative strategies that helped assert journalists' authority as preferred narrators of the story and repair possible failures in the initial coverage. For example, by focusing on their own experiences during the assassination weekend and inserting themselves as major characters in the story, journalists established their presence at the events, although most journalists did not witness the shooting itself.

News and the Construction of Reality

From a philosophical perspective, news as narrative refers to a particular relationship between a news story and the external reality to which it points. Here, news as narrative is not necessarily associated with certain writing styles or literary devices but offers an alternative to the conception of news as a reflection, mirror, or objective representation of reality.

According to the narrative view, facts do not speak for themselves and reporting news necessarily involves selection processes: deciding which information to include in the available time or space, how to present it, in which order, under which headline, and where to position the story in a newscast, newspaper, or webpage. These multiple selections render news inevitably partial, with each story being one among many possible narratives of the depicted events. Similarly, each newscast, newspaper, or webpage offers one among numerous possible narratives about the world on a given day. Proponents of the narrative view of news also argue that these selections are inescapably dependent on the perspective or biases of reporters and editors, who are positioned as narrators with particular voices and points of view, rather than as objective observers of an immutable reality awaiting to be discovered.

In its extreme version, a narrative view of news can blur the distinction between fiction and nonfiction, arguing that all representations of reality are narrative constructions of equal epistemological status. However, while one may accept the assumptions that there is always more than one valid way to tell a news story and that there is no *one* true story that needs to be discovered, it does not follow that there is an infinite number of possible narratives or that all narratives are equally valid. News narratives, unlike fictional narratives, can still be seen as constrained by facts and by the actual events, and can still be judged as more or less faithful to an external reality. Yet, even in its softer versions, the notion of news as narrative is in tension with accepted views of journalism and journalism's own sense of self. Interestingly, while journalists commonly refer to news as *stories,* they tend to vehemently reject the suggestion that they themselves are storytellers or that their stories are anything but a reflection of reality.

Finally, philosophical debates over news as narrative relate to questions of form and style discussed earlier. The inverted pyramid style, for example, is historically associated with notions of factuality and objectivity, whereas proponents of narrative journalism reject "informational" styles not only as less aesthetically pleasing but also as obscuring the particular point of view from which all news stories are ultimately written.

News and Myth

From a cultural perspective, news media do not merely convey information but also participate in the construction, maintenance, and dissemination of cultural myths. Myths are defined in this context as culturally significant narratives that express foundational values, beliefs, and ideologies. A myth, in this sense, is not a false story or the opposite of truth, but a story that represents a given culture's view of the world. This view is produced and reinforced daily by news media.

Some mythic archetypes—like the hero myth—are particularly prevalent in news coverage. The myth of the hero follows a recurrent pattern, in which the hero, who is usually born into humble circumstances, embarks on a difficult journey, encounters great challenges, wins a decisive victory, and returns home triumphant. Sport heroes are one popular subgenre of the hero myth in contemporary news media. For example, the story about the triumphant journey of swimmer Michael Phelps in the 2008 Olympic Games captured front pages of U.S. newspapers for over a week. Captivity and rescue narratives are another prominent subcategory of the hero myth in the news, such as the much-disputed story of the capture and rescue of Pfc. Jessica Lynch in Iraq in 2003 (a story which later turned out to be less heroic than was initially portrayed by the press), or the heroic Vietnam War captivity story of John McCain, the 2008 Republican presidential nominee. The 2008 presidential campaign also demonstrated the mutability of cultural myths, and the role played by news media in expressing and shaping these changes. Thus, the narrative created for Democratic candidate Barack Obama was also based on a heroic journey of a gifted individual, but his triumph was not that of a war hero. Rather, the mythic narrative emphasized Obama's success in overcoming racial barriers and renewing hope, thereby reflecting shifting definitions of heroism and the qualities and tests required for the presidency.

Mythic qualities of news have been explored extensively. Some researchers have focused on news as a particular kind of symbolic system, arguing that when viewed from a narrative-mythic perspective, what readers/viewers learn from news is not necessarily facts of a particular story, but the larger symbolic system into which facts and details fit. For example, audiences rarely remember the details of specific crime stories, but each story fits into a larger narrative about good, evil, deviance, and underlying cultural norms and values. Others have focused on particular news stories with mythic elements, arguing that journalists regularly invoke mythic archetypes in formulating current news stories (like the hero archetype, or the use of the flood myth in news coverage of hurricanes), or that certain culturally important stories (such as the Kennedy example above) are mythologized and "kept alive" by journalists.

There is a fundamental tension between notions of news and myth. In order to attain and retain status as a cultural myth, stories should be told and retold, whereas news deals with new and different events. Fitting new stories into a broader symbolic system, invoking mythic archetypes in contemporary stories, or keeping stories "open" and unresolved, can all be seen as strategies of mitigating this inherent tension. They all allow journalists to retell a culture's foundational stories through a framework of newsworthy stories.

Conclusion

A narrative view of news greatly enriches our understanding of journalism's different forms and styles, its commonalities with other cultural storytellers, its relationship with the broader cultural system, and its social roles beyond information transmission. However, when taken to an extreme, this approach can also obscure differences between journalism and other modes of cultural production, and in particular journalism's unique relation to truth and facts. Attending to narrative qualities of news does not necessarily negate the value of facts and truth in journalistic practices, theories, and ideals. The challenge is to find ways of accounting for the complexity and countervailing impulses of journalism, without treating it as either the same as or completely different from other storytelling modes.

News Audiences, Decline of

As readers of print news and viewers and listeners of broadcast news erode, traditional media have a more difficult time remaining financially viable. Of even greater concern is the cuts being made to the news gathering staff as fewer reporters translate to lower-quality news products. This entry explores the reasons for declines in American news consumption over recent decades—and whether audiences for news in traditional print and broadcast formats have shifted to the web—also describes a few of the strategies news media executives have taken to try to stem the tide and assesses the prospects for a successful recovery.

Early Audiences

Lacking an audience to read and view their work, journalists have no reason to produce news content. For each mass medium, the news-consuming audience has declined since reaching a peak sometime in the twentieth century. According to the annual reports by the Project for Excellence in Journalism, the percentage of Americans reading newspapers began to decline in the 1940s, but circulation continued to rise until 1984 due to the increases in U.S. population. For television network news viewing, the peak came in 1969 when the combined audience for NBC, ABC, and CBS was about 52 million. Since then, the audience has steadily declined to about half that number. Cable news audiences, measured by the mean number of people watching over the course of a given day, rose steadily until 2003, when they too began to trend downward. Radio news is lumped in with talk show and information program listening by researchers. This audience, though harder to accurately measure, has remained relatively stable since 2000 according to Arbitron, the radio audience research company, as reported by the Project for Excellence in Journalism. As with other news media, the largest part of that audience is made up by those in the 55 to 64 and over 65 years old categories. Weekly news magazines such as *Time, Newsweek,* and *U.S. News and World Report* have experienced major circulation losses that threaten their very survival.

Historically, as each new medium developed, it took a bite out of the audience for earlier media. Radio, for example, was perceived in the 1930s as a threat to newspapers as it could offer current news more frequently. Newspapers, meanwhile, were stuck with their once-a-day news cycle unless something extremely newsworthy occurred, in which case the paper might publish a special edition—an "extra." Over time, the two media settled into comfortable niches, with newspapers focusing on more in-depth news and analysis, and radio providing more condensed versions of the news, offered more frequently. Serious news consumers might choose to listen to radio reports and to follow up with reading the more analytical version in the newspapers. Others in the audience might choose one version or the other, thus fragmenting the audience for each medium. Television, in turn, challenged radio and newspapers since its onset in 1948, while the latest and most intense challenge has come from the Internet, starting from the mid-1990s when newspapers began to appear on line in large numbers.

Changing Habits

Media competition-driven fragmentation is not the only reason for declines in audience. Societal changes have also contributed to the process. One major change in the United States is the increase in numbers of women in the work force. In 1920, before the advent of radio, only a fifth of women over the age of 16 were employed, but by early in the twenty-first century, that figure reached around 60 percent. When women began to work outside the home in greater numbers, they devoted less time to the media and other family members took on greater responsibilities in the household. Increased variety of leisure time activities also competed with media for audience attention. When the Pew Research Center for the People and the Press asked people in 2006 why they do not read newspapers, 23 percent cited a lack of time.

Young people are particularly poor news consumers. The same 2006 Pew survey found that only about a quarter of 18- to 29-year-olds said that on the previous day they had gotten news from a newspaper, the radio, or the Internet. About half of them said they watched news on television. Other activities occupy more of their time—use of the Internet for other purposes (62 percent) and watching television for entertainment (61 percent). Journalists are concerned about people not developing a habit for consuming news when they are young, as history demonstrates that few people adopt regular newspaper reading later in life. Pew documented a shift in young people's interest in news in about 1990 (and summarized in 1995), saying that they were experiencing the "age of indifference," a trend Pew researchers had noticed as beginning after the Vietnam War. *The Wall Street Journal* reported in 2006 that only 35 percent of young people aged 18 to 34 read a daily newspaper, half the percentage that were readers in the 1970s. Whatever the reason, the lack of exposure to news by young people has led to a lack of knowledge about current affairs and politics.

Declining news audiences are not just an American phenomenon. This trend is occurring in most parts of the world. An indication of reduced interest in traditional news media comes from a 2007 Harris Poll for the World Association of Newspapers. The survey, conducted in five European countries as well as Australia and the United States, found that television news is the primary source of information in five European countries and that reliance on newspapers ranged from 16 percent of respondents in France to 23 percent of those in Australia. Most people in six of the seven countries reported that a lack of time prevents them from reading newspapers but that the convenience of online sources drove them to the Internet for news. The poll predicted major losses in television news audiences and newspaper readers in the near future and increased dependence on online news and information.

Both technological changes and lifestyle changes help explain why people spend less time with the news. Diffusion of the Internet, especially when delivered by broadband services, has made it both easier and faster for people to obtain news. Traditional media have delivered online versions of their products at no cost to the users to establish an Internet presence. News media also hoped that young people would take up the news reading habit on the web given they were already online for other reasons. Newspapers, fearing competition to their classified advertising base, figured it made sense to offer their products online. Newspaper websites obtain about 78 percent of their revenues from online classifieds. But craigslist, Monster.com, cars.com, and even Google Base have been successfully competing with newspapers for this business. A recent entrant into the free classifieds market segment is the social networking site Facebook, launched in 2004, boasted a membership of 54.5 million monthly unique viewers by 2008. Newspapers have fought back by teaming up with Yahoo for job classifieds. But unless newspapers are able to raise income from other sources, they will not be able to afford to offer online news. Results of the Inland Cost and Revenue Study in 2007 show that newspaper websites only generate about $5 to $10 for each visitor per year while they generate between $500 and $900 for each subscriber per year. So as fewer people read the print versions of newspapers, the online versions will also struggle to survive.

It is hard to document exactly how much time people in the twenty-first century spend getting their news, as technology has made news ubiquitous. News pops up all over the Internet, in e-mail messages, and even on cell phones. Most people grab their news in quick snatches from many

sources. The primary news source for non-Internet users is local television. As more people migrate from dial-up to broadband Internet connections, however, they also shift their news consumption from print and broadcast to online. However, according to Pew surveys conducted in 2005, local television edged out the Internet as the first choice, but most all respondents to the study—whether Internet users or not—obtained news from multiple sources. In the 2006 Pew survey, respondents who said they got their news from the Internet reported spending less time with online news (about a half hour) than those who said they got their news from print or broadcast sources (an average of 45 minutes to an hour).

It is also difficult to tell what people mean when they say they "read" the news. Hitwise, a company that researches online information consumption, reported in March 2007 that in the previous year the amount of traffic that leaves news and media websites and diverts to such entertainment-multimedia locations as YouTube had grown by nearly 200 percent. At the same time, the company found that the number of visits to the ten leading news and media web sites had declined by nearly 4 percent in the same period. The report concludes that news consumption is fragmenting as the audience is going to nontraditional locations such as celebrity gossip blogs and some news aggregators. In fact, most visits to mainstream news and media web locations are by people who click through from search engines, portals, and news aggregators. Readers who access news through large portals, reported Steven Rattner of *The Wall Street Journal,* "are mostly consuming a bland porridge of wire service stories" (2007, A19).

Others seeking news may gravitate toward blogs, alternative media that advocate a particular point of view, and citizen-produced news locations on the web. Although the news (as defined by mainstream media) offered from these sources may not be written in a traditional news style and may not always contain the level of accuracy editors would like, audiences may prefer this approach to that of *The New York Times* or CNN. Some news consumers may reject information produced by corporate-owned news media, and others may prefer information that is presented from a particular political perspective. It is possible that in the range of choices of news and information offered on the Internet people are selecting different venues, and still becoming informed about the important issues of the day.

Several analysts have proposed that newspapers and television news must transform themselves to being even more local and leave national and international news gathering to a few major companies. *New York Times* journalist Jacques Steinberg in 2007 described the success of a 24-hour cable news channel in New York that reports only on Westchester County and several sister stations covering other parts of New York and the boroughs. When Nielsen Media Research asked more than 1,000 people in the metropolitan New York area where they would turn for news about a major event occurring in their own area, more than a third said they would choose one of these local stations. Should this approach be taken in print and broadcast news across the nation, the country might witness a revival in news consumption.

There is also some good news about the online news audience. The Newspaper Association of America, working with Nielsen/Net Ratings, has found that online news consumers should be increasingly attractive to advertisers because the newspaper website visitors spend more time online, are better educated, have higher incomes, are more likely to hold professional or managerial jobs, and purchase online more often than other Internet users. This upscale profile could lead to pricing advertising on newspaper sites at high enough rates that might ensure the economic future of the newspaper.

On the other hand, by late 2008, the country's general economic downturn had begun to impact news media as well. In fall 2008 the century-old *Christian Science Monitor* announced it would cease daily publication early in 2009, relying instead on a weekly magazine and its website. Most large news organizations announced continuing cuts in their staffs, often several hundred or even thousand at a time, and often more than once a year. Time Inc., part of Time Warner, announced major streamlining, and a growing use of reporters across different magazines. The *Los Angeles Times* newsroom staff was by 2009 half the size it had been only a few years earlier. Many papers were publishing in smaller sizes, sometimes with fewer pages, and certainly with less news. Advertising revenue from car makers, financial firms, and retailers—longtime stalwarts of

newspaper revenue—was down sharply. As David Carr of *The New York Times* put it, "Clearly the sky is falling. The question is how many people will be left to cover it." The falling sky may also include *The New York Times* itself, according to Michael Hirschorn in 2006. He writes that the stock in the company had fallen so far that a buyer could take it all for about $1 billion at the end of 2008. The New York Times Company was awash in debt, and the prediction that the print version of the newspaper might actually disappear did not seem far-fetched.

Newspaper circulation has continued to decline (as it has for years), though at an accelerating pace, with some papers losing upwards of ten percent of their readers in just a year. Only the country's two national papers, *The Wall Street Journal* and *USA Today,* were holding steady. Many papers were shedding marginal subscribers and free copies at hotels. Their overall readership may be holding up, but more (and younger) readers are using online access while fewer (and older) readers still rely on a physical copy. And newspapers have yet to figure out how to monetize their online users given that people expect online sources to be free.

There will be no quick fix to reversing the overall decline, however. Audiences have turned their attention to other activities and may never become the avid news consumers of a bygone time. If print and broadcast news are to survive and if the Internet is going to continue to include high-quality news and public affairs, however, the money to pay reporters to gather that information must come from somewhere.

Newscasters, Radio

When news breaks, many hear it first on radio. Tens of thousands of New Yorkers learned of the attack on the World Trade Center on September 11, 2001, when WCBS AM traffic reporter Tom Kaminski, on what had been a routine helicopter flight, described what he'd just seen as he flew near

the twin towers. Millions of Americans learned that World War II was over when CBS radio anchor Robert Trout announced: "This, ladies and gentlemen, is the end of the Second World War." This entry provides both a brief history of American radio news and representative profiles of network broadcasters who helped create it.

Origins

In a sense, Guglielmo Marconi, one of the pioneers of broadcasting, can also be considered the medium's first "newscaster." In September 1898, he placed wireless equipment on two steamships that were part of a welcoming parade in New York harbor for American Admiral George Dewey and relayed information about the event to *The New York Herald*. It, in turn, printed a story that featured both Marconi's information and details about the remarkable way in which it had been obtained.

For our purposes, "radio newscaster" means "one who reads scripted news aloud as part of a radio broadcast." This is to differentiate the newscaster from a reporter who describes an ongoing event on the air (such as NBC's Graham McNamee describing the return of transatlantic aviator Charles Lindbergh in June 1927 or the stunning eyewitness account by WLS's Herbert Morrison of the explosion of the German dirigible *Hindenburg* over Lakehurst, New Jersey, in 1937). These were exciting examples of a practice common in the early days of radio. But regularly scheduled radio newscasts, or summaries of the day's events, were relatively rare until the 1938 broadcast of what would become the first *CBS World News Roundup,* described below in more detail.

Early station newscasts (and those only in the largest markets) were typically read by a station announcer who often lacked any training as a journalist. In the 1920s, Harold Arlin of Pittsburgh station KDKA, credited with being the first full-time professional radio announcer in America, might provide news headlines one minute, read a community service announcement the next, then broadcast a prize fight or a football game later in the day.

An important distinction (but one not often made in the early days) existed between radio commentary and news. News reporters made the phone calls, tracked down sources, and presented the facts as they found them, while commentators gave their opinions (one book on radio journalism describes them as "mellifluous posers").

Radio newscasts, as envisioned by such early practitioners as Edward R. Murrow, would instead strive for an accurate reporting of facts and a minimum of personal opinion. Radio newscasts became essential as world tensions grew toward war in the late 1930s. The radio news equivalent of "The Big Bang" came in the spring of 1938, when CBS broadcast a program featuring live reports from several European cities, ushering in an era of journalists who became among the best known in radio history.

Notable Radio Newscasters

Robert Trout (1909–2000)

Born Robert Albert Blondheim and possessor of a baritone voice that retained traces of his native North Carolina, Bob Trout can be considered radio's first real "anchorman" (Trout sometimes called himself an "emcee" or "master of ceremonies") by virtue of his having been the anchoring voice for a CBS program broadcast on March 13, 1938 (which would evolve into *The CBS World News Roundup*), when Germany annexed Austria. CBS executives decided the event warranted a complicated transatlantic, multipoint live shortwave broadcast with William Shirer in London, Ed Mowrer in Paris, Pierre Huss in Berlin, Edward R. Murrow in Vienna and Trout as the anchor in New York City, presenting the news of the day, passing the aural "baton" to Shirer and the others, then introducing a newsmaker in Washington, D.C., and finally ending with a summary of the broadcast. It was a program that was both technically remarkable for its time and journalistically influential, creating the template for future radio newscasts, that is, an anchor reading a script, introducing reporters (live or recorded), and stage-managing the broadcast from beginning to end.

Trout began his life's work by accident, hired as a handyman at a Washington, D.C.–area radio station. One day the person scheduled to air a newscast failed to show up, and Trout (who adopted his air name from a family friend) was drafted into service, beginning a broadcasting career that would last nearly seventy years.

Trout was called by some "The Iron Man of Radio" for seeming to be on the air whenever something important was taking place, no matter what time of day or night. Indeed, he slept on a cot near the CBS studios for several days toward the end of World War II so he could be on the air with late-breaking developments at a moment's notice. He also had an excellent ability to ad lib. As *The New York Times* wrote in its obituary, "His tireless ability to hold an audience when nothing was happening amazed President Franklin D. Roosevelt." (Trout is also credited with coining the phrase "fireside chats" to describe FDR's famous radio talks.) Toward the end of his life, Trout appeared on National Public Radio (NPR), offering commentary and talking about his historic broadcasts. His papers, including some of his original radio scripts, are preserved at the University of Texas at Austin.

Edward R. Murrow (1908–65)

Murrow, born Egbert Roscoe Murrow, was not a radio newscaster in the same sense as Robert Trout. He considered himself first and foremost a reporter whose medium happened to be radio, but he is perhaps the best-known American radio broadcaster because of his reporting during World War II.

He majored in speech at Washington State University in Pullman, guided by teacher Ida Lou Anderson, whose method was to have Murrow and his fellow students study a text to extract all its meanings, then read it aloud while she listened intently, asking questions and guiding the discussion. (Anderson is also responsible for suggesting to Murrow that he make the dramatic pause in his famous "This—is London" sign-on, thinking it would help the overall pacing and effectiveness of his presentation.)

Murrow became Director of Talks at CBS in 1935 and then Director of European Operations for the network in 1937, moving to London and, as fate would have it, preparing to cover the run-up to the Second World War. His reporting, along with that of the famed "Murrow Boys"—the men (and one woman) he hired to bring the news of the conflict to America—would make him a broadcasting legend.

As a radio personality, Murrow set the standard for on-air authority. He reported the facts as he could ascertain them, but often described, in personal terms, what he saw happening before him. He was a pioneer in the use of actuality (newsmaker voices) and natural sound (ambient noise from an event), at one time even hauling his bulky radio equipment to a London Tube station-turned-air-raid-shelter to let listeners hear the sound of people scurrying to safety. His first-person account of the horrors of the Buchenwald concentration camp ("As we walked out into the courtyard, a man fell dead. Two others, they must have been over 60, were crawling toward the latrine. I saw it, but will not describe it.") is a classic of radio journalism. Murrow sometimes blurred the line between objective reporting and commentary as evidenced in his on-air denunciation of anti-Communist Senator Joseph McCarthy in 1954.

Despite his great success, Murrow was never comfortable on the air. His colleague Richard C. Hottelet remembers watching Murrow at the microphone, his leg pumping nervously as he read his script, and when he had finished, his shirt soaked through with sweat. Murrow has become for many the patron saint of broadcast journalism, a title he would likely scorn, although Hottelet says Murrow "knew his worth" and used it to his advantage when required. His view was that radio (and later television) should be used to inform, challenge, and stimulate. As he said in a 1958 speech to the Radio and Television News Directors convention: "If radio news is to be regarded as a commodity, only acceptable when saleable, then I don't care what you call it—I say it isn't news."

Mary Marvin Breckinridge (Patterson) (1905–2002)

Mary Marvin Breckinridge, as she was known when hired by Edward R. Murrow, is noteworthy not only for her reports but also for being a female radio journalist at a time when most women broadcasters were relegated to hosting homemaking programs. Breckinridge reported from several European countries in the months before the Second World War began. Her pieces from Berlin are of particular interest. On the air, she sounded like the upper-class woman she was, with clear diction and an often amused tone, even while describing unsettling events. In reporting on the official Nazi newspaper in Germany, she said that its

motto was "Freedom and Bread" and noted wryly that "there is still bread," a comment that somehow escaped the Nazi censors. Her broadcasting career was short-lived. She resigned from CBS in 1940 to marry diplomat Jefferson Patterson.

Susan Stamberg (1938–) and Bob Edwards (1947–)

Although they were not the first hosts of National Public Radio's *All Things Considered,* Bob Edwards and Susan Stamberg established the program's format and put it in the forefront of radio journalism. New York City native Susan Stamberg was named co-host in 1972, becoming the first woman to anchor a national nightly news broadcast in the United States, and bringing her distinctive voice (traces of her New York accent remain) to what had been a male broadcasting bastion. Stamberg's own style was intimate—each listener could feel as if she were talking to them in a one-on-one conversation. This approach helped erase what had been the dominant style of presenting radio news, what has been described as "the voice of God" (male), presenting information in an authoritative manner. *All Things Considered*, with its mix of both hard news, feature material, and sometimes downright silliness (Stamberg regularly told listeners about her mother-in-law's recipe for cranberry relish), has broadened the scope of radio news and is one of the few news programs that can devote many minutes to one subject. Stamberg is now a special correspondent for NPR.

Bob Edwards had been a radio newscaster at the Mutual Broadcasting System before joining NPR in 1974 and becoming co-host of *All Things Considered* with Stamberg. He became the solo anchor for the new *Morning Edition* in 1979. Edwards is considered an excellent interviewer, exemplifying what has become the signature NPR sound, as described by the Peabody Committee in giving him an award in 1999: ". . . a man who embodies the essence of excellence in radio. His reassuring and authoritative voice is often the first many Americans hear each day. His is a rare radio voice: informed but never smug; intimate but never intrusive; opinionated but never dismissive. Mr. Edwards does not merely talk, he listens."

After a disagreement with NPR management over the direction of *Morning Edition,* Edwards left the network in 2004 and joined XM Satellite Radio as host of his own program. Edwards and Stamberg, along with the other NPR hosts and news anchors, established an "up-close and personal" style of broadcasting that has influenced commercial as well as public radio newscasts.

Paul Harvey (1918–2009)

Paul Harvey's work extended from the early days of radio newscasts to shortly before his death. He began his career in 1933 at KVOO in Tulsa, Oklahoma, and over the decades, his voice had become one of the most familiar on radio. His *News and Comment* program began airing on the ABC radio network in 1951 and remained a broadcasting staple for more than 50 years. Harvey's website said "News and Comment" and his feature program "The Rest of the Story" aired on more than 1,200 U.S. radio stations. Although he had worked as one, Harvey deviated from being a straightforward radio newscaster, per se. His shows were a mix of news, commentary, and commercials so tightly interwoven, it could be difficult for a listener to discern where one ends and another begins. Harvey's style was at once personal and idiosyncratic. He was considered a master story-teller, talking listeners through the details until he reached the payoff at the end. Harvey was also willing to play with the conventions of radio broadcasting, sometimes seeming ready to end his broadcast, only to return with another bit of information that added to the overall effect.

Lowell Thomas (1892–1981)

Thomas's 50-year broadcasting career began in the earliest days of radio news and ended when journalism was firmly established as part of the medium. He is noteworthy because, unlike many radio newscasters, he was primarily a reporter, having covered, for example, World War I from the frontlines. Thomas, with his avuncular tone, clear writing, and familiar greeting "Good evening, everybody," became a fixture on radios around the United States. Thomas is credited with anchoring the first experimental television news broadcast in 1930, but radio was his preference. He used it to transport listeners to the exotic places

he had visited (like the Khyber Pass and Mandalay) and the fascinating people he had met (such as Lawrence of Arabia and the Dalai Lama of Tibet). Thomas's regular radio appearances ended in 1976 after a remarkable 46-year run.

Conclusion

Despite repeated reports of its impending demise, radio survives and radio news reaches millions each day. The style of radio newscasters has changed significantly over the years—they are no longer expected to be, in the words of radio reporter Richard C. Hottelet, "trombone-voiced" announcers, but have now become much more conversational, as if an acquaintance of yours were telling you about the day's events, rather than declaiming from a stage.

With deregulation of radio, the number of stations providing news is in decline. Many stations no longer have their own news departments, opting instead—if they carry news at all—to use network or syndication services.

Radio is no longer the mass medium it once was because no one network or station can command the millions of listeners who, for example, tuned in back in 1940 to hear Edward R. Murrow from London—there are too many media choices today. But there remains a hunger for news relayed quickly and radio continues to provide that service. Despite media consolidation, economic considerations and the fact that providing news is no longer a requirement for stations, radio newscasters may be a threatened but are not yet an extinct species.

News Conferences

In representative governments, press conferences have become an important means for elected or appointed officials to speak to the public and respond to press queries. While elected authorities regularly give speeches, voters want to hear officials answer questions about topics they may not have otherwise addressed. News or press conferences provide one means of responding to that need. Reporters serve as surrogates for the public asking questions and their queries often probe problems, scandal, and weak points that might otherwise not come to light.

The news conferences watched most closely are those given by the President. Since Woodrow Wilson took office in March 1913, news conferences have been a regular feature of the American presidency. Presidents met with reporters from time to time for interviews and to give them information. But Theodore Roosevelt was the first President to regularly meet with reporters. These sessions were off-the-record ones with only a select group of reporters allowed in. President Wilson decided to meet reporters less frequently and to do

it in a setting where all reporters were allowed to attend. Over the years, however, there has been much variation in the ground rules observed by reporters as well as the in the form of the sessions. Naturally, Presidents want to use such conferences on their terms, setting rules as to how often they take place, how directly questions are answered, and which reporters are called on.

Few chief executives have talked about why they submit to news conferences. Most simply allude to the reasons, but Calvin Coolidge explained his reasons for doing so: "These conferences are held for the purpose of giving newspaper men just in a brief way some idea of what the President has in mind in order that they may write intelligently concerning the transaction of the business of the Government, and it is the rule that the President is not to be quoted" (press conference, June 17, 1927). On another occasion he argued that "it is important that the Presidential office should be correctly represented to the country and the attitude of the Presidential office should be accurately interpreted. . . . I regard it as rather necessary to the carrying on of our republican institution that the people should have a fairly accurate report of what the President is trying to do, and it is for that purpose of course that those intimate conferences are held" (press conference, September 14, 1926).

Initial rules governing news conferences were established in the Wilson era, including those regarding access and questioning. News conferences are open to reporters with White House credentials whether full- or part-time. Reporters decide what the questions are, not the President or his staff, although the latter can usually anticipate topics reporters will pose. Transcripts are retained of what is said. From Wilson through Harry Truman, the sessions were held on an off-the-record basis, but transcripts are available save for the sessions of President Warren Harding, whose transcripts have not surfaced though they likely were made. President Dwight Eisenhower put the sessions on-the-record where they remain today, with verbatim transcripts now found on a variety of websites. News conferences include more than one format. While most feature the President standing alone answering questions, sometimes the chief executive is accompanied by others who respond to questions with him, including foreign leaders and, less frequently, members of his cabinet. News conferences include those sessions designated by the National Archives as such in its compilations of presidential remarks.

Once presidential news conferences began, they continued fairly regularly, though Presidents have always had other less public ways of meeting with reporters. They can meet with individual reporters and with groups of them for interviews on or off the record. Even today, Presidents occasionally have off-the-record sessions when they are traveling and at other times in the family quarters of the White House.

Why Presidents Hold News Conferences

The presidential news conference sessions go directly to the basic need politicians and reporters have for each other. The President needs news organizations as vehicles to relay information to the public. Reporters need access to the President because their audiences want to know what the chief executive says.

Presidents use the sessions to make announcements about crises, policies, programs and appointments, to explain decisions, and to highlight their priorities. Chief executives also use them to gain the attention of the public and demonstrate their command of facts in responding to questions about their policies and actions. Reporters agitate for news conferences because they allow journalists get to decide the topics the President must address. Presidents may open their press conferences with statements, but the bulk of the time is spent responding to queries. While reporters control the questioning, Presidents control their own answers. A President can determine how to answer or whether to respond at all. Refusing to answer has a cost, as the public may perceive a President to be uncooperative in a setting where people expect responsiveness.

The continuum of stated reasons Presidents hold press conferences range from the most lofty (the

Table 1 Presidential News Conferences: 1913–2007

President and Term	*Total*	*Months in Office*	*Conferences per Month*	*Conferences per Year*
Wilson 1913–21	159	96	1.7	19.9
Harding 1921–23	No transcripts	29		
Coolidge 1923–29	521	67	7.8	93.3
Hoover 1929–33	268	48	5.6	67.0
Roosevelt 1933–45	1,020	145.5	7.0	84.1
Truman 1945–53	324	94.5	3.4	41.1

needs of a democracy) to the practical (reporters get restless when Presidents don't hold them). On more than one occasion, President George W. Bush referred to responding to reporters' queries as a basic element of democratic government. In one session shared with a foreign leader, he said, "We'll answer a couple of questions in the spirit of democracy" (December 6, 2004).

Presidents view news conferences as just one more persuasion tool. Early in his administration, President Bill Clinton expressed frustration at not having one of his press conferences covered by all of the television networks because he viewed such sessions as a forum where he could reach and persuade the public on the virtues of his programs. Thus, he hosted a series of roundtable interviews with reporters from different regions. In one with Texas reporters, he commented on the success he had persuading those who watched the press conference.

> So one of the things I can do to reach the whole country is to spend more time with media from many States. We're doing this with a lot of States. I will, I hope, have the chance to address the country again. But I tried to do this in a national press conference, and only CNN and one network covered it. And by the way, the research showed that the people who saw it on the network that covered it had their attitudes markedly altered about the economic plan. So I'm doing the best I can to get information out. (July 28, 1993)

News Conference Practices

Of the 16 Presidents who have held regular news conferences, all wanted to use the sessions to best serve their interests. They recognized they needed to hold them, but only those who enjoyed the give-and-take with reporters held them on a regular and frequent basis. Both Calvin Coolidge and Franklin Roosevelt held news conferences on a regular basis throughout their administrations, holding sessions twice a week with one session in the morning and the other in the late afternoon to balance the needs of morning and evening newspapers. With television not a factor until the Eisenhower administration, Presidents were covered primarily by wire service and newspaper reporters and, secondarily, by radio reporters.

Looking through press conference practices over nearly a century, a number of common characteristics and practices can be perceived. These include generation of a transcript, announcement beforehand so reporters covering the President can get to the announced location, open questioning from whomever the President chooses to recognize to speak, and flexibility in how the President answers those questions. Their differences lie in whether sessions are on or off the record, whether they are filmed or televised, and whether they are played on a delayed or live basis. If the sessions are going to be live and on the record, Presidents want to control the timing so as to avoid questions at awkward times, such as during military operations or during the early hours of a major event when the facts are unclear.

Chief executives follow remarkably similar routines in which reporters they call on. The primary television news organizations—ABC, CBS, NBC, CNN, and Fox—and the wire services—Associated Press, Reuters, and Bloomberg—today rank above all other organizations in terms of the consistency with which Presidents call on them and how early in the news conference they do so. Then national newspaper correspondents follow among them: *The New York Times, The Washington Post, The Wall Street Journal, Los Angeles Times,* and *USA Today*. From there, Presidents vary in their interest in calling on reporters representing regional, ethnic, and foreign news organizations. In 2009, President Obama first recognized a blogger—Sam Stein at The Huffington Post—at one of his early news conferences.

Two types of sessions have developed over the years: solo and joint. Solo sessions are ones where the President appears by himself to answer reporters' queries while joint sessions are those where he appears with a visiting foreign leader or, less frequently today, with one or more cabinet members. In earlier years, Presidents often brought their budget directors in to help brief reporters on their budget plans.

Table 2 Presidential News Conferences by Term: Joint and Solo Sessions 1913–2007

President	*Total*	*Solo*	*Joint*	*Joint as % Total*
Wilson 1913–21	159	159	0	0
Harding 1921–23	No transcript record			
Coolidge 1923–29	521	521	0	0
Hoover 1929–33	268	267	1	0.4
Roosevelt 1933–45	1,020	984	33	3.2

Development

The most basic breakdown of presidential press conferences has two periods, demarcated by the introduction of radio in 1953. Until that year, including the administrations of Woodrow Wilson, Warren Harding, Calvin Coolidge, and Herbert Hoover, news conferences were establishing their roots. President Wilson first met with reporters in his office on March 15, 1913, but reassembled a week later in larger quarters, the East Room of the White House. He held conferences for two years, and then they trailed off. As the United States entered World War I in April 1917, Wilson ceased holding news conferences. He did not particularly enjoy them, and the war gave him an opportunity to focus elsewhere than giving answers to reporters' queries.

As a former newspaper owner, Warren Harding enjoyed meeting with reporters regularly on Tuesdays and Fridays, as did his successor, Calvin Coolidge. Coolidge so enjoyed his sessions that he held 531, the most frequent (just over 93 a year) of any President given his time in office. The sessions were open to all who covered the President but were considered off the record. Harding, Coolidge, and Hoover all required questions be submitted in writing prior to the conference. Wilson had no such rule, and President Franklin Roosevelt abandoned it in his first press conference; it would never be reinstituted by his successors.

While President Hoover's sessions were often short and devoid of news, those of Franklin Roosevelt were comparatively long and informative. His annual press conferences explaining his budget lasted well over an hour. Roosevelt's sessions were a hot ticket in Washington with visiting officials and out-of-town press people clamoring for a place in the Oval Office to watch. The off the record sessions were full of discussion of current issues, events, and people. Roosevelt made clear in his first session that nothing he said was to be used by reporters in their copy unless Press Secretary Steve Early gave his approval. Most of his sessions were held in the Oval Office with a room full of reporters from around Washington.

President Truman continued the Roosevelt tradition except that he reduced sessions to once a week. In addition, with the increasing number of reporters covering the sessions, he moved them out of the Oval Office, to the Indian Treaty Room in the Executive Office Building next door. He, too, kept his news conferences off the record, though he allowed substantial allusion to what he said and approved some quotes. Truman also followed Roosevelt's tradition of occasionally bringing in visiting foreign leaders and administration officials to help him brief on his budget. Such joint sessions were to become even more popular as time went on.

At a time when Presidents rarely delivered public remarks as they do today, news conferences were important as a place where chief executives made news. They might announce a program initiative, an upcoming trip, or a President's intentions in dealing with members of Congress. But most of all, the sessions gave Presidents an opportunity to put into relevant context a policy issue or action. They explained their thinking and their priorities. As Presidents delivered remarks more frequently in the age of television, news conferences became less important.

In 1953 and 1955, President Eisenhower took two actions that broke with the past. He began to hold on the record sessions and allowed television to broadcast them. Though the news conference recordings were played later in the evening, they were generally played in full. Although Press Secretary James Hagerty worried about what he called a "fluff" (mistake) by Eisenhower, the films were rarely edited before they were released (Associated Press 1959). Television networks often selected highlights as did newspapers printing partial transcripts.

With news conferences going on the record, Presidents altered the frequency, regularity, and format of the sessions. President Eisenhower reduced them from Truman's twice monthly frequency down to once a month. Except for President Carter, Eisenhower's successors rarely held the sessions on a regular basis. Instead, the chief executives preferred to maintain their flexibility, hold the sessions at their convenience and not have an expected time when they had to meet the press.

Since the Eisenhower administration, news conferences have played a smaller news role because Presidents are speaking more frequently in other venues where they often answer reporters' questions. While Presidents used to avoid regularly doing interviews with individual reporters, today it is common practice. In addition, Presidents often do short question-and-answer sessions with reporters where

they respond to two or three questions from a pool of reporters, most often wire service reporters.

The balance between the various interchanges the President now has with reporters could be seen in the second Bush and the early Obama administrations. News conferences are now far outnumbered by incidental short question-and-answer sessions and interviews, often based on a specific topic. Presidents have come to prefer news conferences shared with foreign leaders, for example, as they can deliver substantial statements about their mutual discussions and then answer a limited number of questions.

After taking office in 2009, President Barack Obama followed some of Bush's news conference precedents (such as the rather imperial walk down a long red carpet to the podium to start the proceeding). Obama tended to give longer and more fulsome answers to reporter questions, demonstrating considerable knowledge about a wide range of both domestic and international issues. Given that the nation was in economic crisis, Obama appeared in several formal and informal presentations each week (almost daily, it seemed) and held a number of formal evening prime-time news conferences as well.

When viewed over the past century, presidential news conferences have proven resilient. Presidents may not control them as much as their speechmaking venues, but no matter whether they speak on the record or off, chief executives have found them to be a useful setting to explain their thinking and their policies. All the while, they have been able to shape the forum in ways that suit their needs. The sessions will almost certainly change in the years ahead but will remain a forum Presidents use to reach the public.

News Councils

A news council is a nongovernmental body formed by journalists and/or news media owners, and which usually includes nonmedia members, created to adjudicate public complaints against media misbehavior. Its only means of punishment is the voluntary publication of its judgments by news

media. Financing of council operation is normally provided by the organizers.

In 2007, the total number of national and regional councils ranged (depending on definition) between 68 active, genuine press councils—83 if African "media observatories" are included—and 89, including several similar accountability systems. (See Table 1.)

Development

The decision to establish a news council sometimes derives from the wish to enforce an accepted code of ethics. Yet relatively few news councils have been created voluntarily. Legislators first had to make threatening noises about establishing a council by law, usually under pressure from the public outraged by one or more media transgressions.

Sweden initiated the concept in 1916, though the idea took at least half a century to take off. A major step was the creation in Britain of the General Council of the Press in 1953 as a self-regulation body containing only journalists and publishers. Although it had little impact, it was copied in Germany and a decade later evolved into the Press Council which included nonmedia members. That initiated a first great wave of interest in news councils, from the mid-1960s to the mid-1970s, when the United Nations Educational, Scientific and Cultural Organization (UNESCO), the International Press Institute, the Council of Europe, and various foundations organized symposiums and experiments. Reports, articles, and books on the topic started pouring out.

A second surge occurred in the 1990s and early 2000s: almost 60 percent of existing councils have been set up since 1990, 35 percent since 2000. In 2006, for example, the Knight Foundation funded the launching of two new regional news councils in the United States. News councils have become more feasible and useful, as more nations turned democratic and restored press freedom, notably by terminating state monopolies in broadcasting. In addition, as media have grown more commercial and have alienated a large part of the public, they fear their freedom might be restricted if they do not prove accountable.

A Typology

A news council is always a nongovernmental organization (NGO). It is normally made up of journalists, media owners, and members of the public but lacks owners or journalists, provided it includes nonmedia members. Only rarely are news councils made up only of media owners and journalists, as is the case in Germany.

News councils can be created on four different levels. A local council consists of community leaders meeting with representatives of the town's media, to let them know what the public likes and dislikes. About a dozen such local news councils have become known, most of them in America in the late 1960s and early 1970s. Many others have functioned under a variety of names.

Table 1 Census of News Councils: 2007

Continent	*National*	*Regional*	*Total*
Africa	5 (+15*)		5 (20)
North America		11	11
South America/Caribbean	3		3
Asia & Near East	9		9
Europe	24 (+6**)	8	32 (38)
Pacific	6	2	8
Total	47 (+15+6)	21	68 (89)

*African "media observatories."

**Ethics commissions set up by journalists' associations.

The typical news council, however, operates on a national level, established by an association of publishers and one or more unions of journalists, primarily to adjudicate complaints from the public, and guided by a code of ethics. News councils always cover print media and about 60 percent (the more recent ones) cover broadcasting as well. They usually adopt simplified court-like procedures of open hearings and final decisions.

In large countries like Canada, the United States, or Russia, news councils usually operate at a regional level. In the English-speaking provinces of Canada, for example, the council has often been established by some of the newspapers and has dealt with complaints against those publications while trying to settle conflicts and avoid a published judgment.

Experience has shown that moral authority can be an efficient means of achieving an end, as media people hate to be accused of unethical behavior. Such reproof, however, must be fast and visible—and that requires proper funding. This can come from many sources: unions, foundations, other (nonmedia) corporations, private organizations, even government agencies—though normally most news council operating funds come from constituent media companies.

Special Cases

News councils come in various shapes and some possess special features.

In Sweden, the council has been assisted since 1969 by an "ombudsman" who resolves many cases himself. The Swedish council is the only one in the world that can fine publications. In South Africa, an ombudsman deals with all complaints but his judgments can be reviewed by an appeal body. An American National News Council was set up by the Twentieth Century Fund foundation in 1973. Although composed of eminent media and lay members, it was not representative of the industry and was thus never fully accepted. Many major publishers—including *The New York Times*—ignored it, and it only lasted for a decade. In Britain, under threat of action from the Thatcher government, publishers replaced the Press Council in 1991 with a Press Complaints Commission. It is far better financed than any other national news council (over $3 million a year) but does not contain working journalists and strictly limits its activities to mediating grievances. Conversely, Swiss journalists have refused to let publishers sit on their council, arguing their presence would prevent open discussion of issues. In Denmark, both the ethics code and a news council were included in the country's 1992 Press Law with the agreement of news media professionals. In India, journalists begged Parliament to establish a news council, but publishers stubbornly refused to cooperate. Interestingly, about half of its complaints are lodged by media professionals against government officials.

Differing from most other councils, the Peruvian *Consejo de Prensa* is made up only of publishers and editors, though its Ethics Tribunal consists entirely of important nonmedia personnel. In Estonia and Russia, competition among professional groups has resulted in two national PCs. In some nations (e.g., Slovenia, Hungary), when media owners and journalist unions could not agree on forming a news council, journalists created "ethical commissions" that play a similar role but with far less credibility if only because they do not normally include nonmedia members. Fifteen "media observatories" have recently appeared in francophone African nations under prodding from Western organizations, designed to avoid restrictive legislation by improving press ethics through monitoring, criticizing, processing complaints, and training. Their lack of funds and government intolerance, however, make it difficult for them to function.

The Record

By 2007, there were news councils in only a quarter of world's nations even though democracies were more numerous than ever. There are none in the Arab world, only two in Latin America, and only five state-level councils in the 50 United States. Almost half the nations belonging to the Council of Europe lacked a news council—including France, Greece, and Hungary.

The news council record to date is not impressive. When polled a few years ago, none of the councils felt it had clearly contributed to improvement of their media. While it is potentially the most useful "media accountability system," formation of a news council has to this point been more a sign than an agent of progress. While the British council is the best known and one of the oldest, the

country suffers from some of the most sensationalist popular newspapers in the West. Indeed, the British council played no part in the breaking of newspaper unions' power in the mid-1980s.

Obstacles and Resistance

To survive and prosper, councils require three things: a democratic environment; a liberal press regime; and privately owned media. Yet in the United States (which meets all those requirements), news councils have not multiplied, partly because they look like tribunals to media owners that fear government intervention in their affairs. Conversely, in nations with a Latin tradition, such as France or Italy, people trust the law and the courts—and distrust nongovernmental organizations.

Economic underdevelopment also impedes news council creation. A country's media need to be wealthy enough to fund formation and operation of a council. They must be staffed by educated professionals, aware of their duties, and self-confident enough to bear criticism. Furthermore, the country should not be divided into violently partisan factions, and it needs to encourage at least a minority of enlightened citizens to take the media seriously.

In some cases what shackles the council is a birth defect, as when one of the three protagonist groups has excluded the other two, as originally occurred in Switzerland where journalists wanted to operate the council on their own. Or when two excluded the third, as in Austria, whose council refused nonmedia members. In each case, the argument was that full and fair news council discussion could only proceed if the exclusions were upheld.

Sadly, news councils have met with resistance on all sides. Although none of the dangers a council has been accused of carrying (mainly its use by government to muzzle the press) ever materialized, they have aroused that fear in country after country. Undoubtedly, media owners perceive such a council as a limitation to the freedom they derive from owning media. Any news council is bound to demand, implicitly at least, that media place public service ahead of money-making. So even if they accept a council, proprietors are often reluctant to support it adequately. Working journalists also resent public meddling, which they perceive as violating the protected sanctuary in which they ply their profession. This reluctance of owners and professionals usually limits a council to examining complaints, and publishing its judgments in trade publications the general public never reads.

Left-wing observers denounce news councils as a mere public relations operation by owners designed to blunt complaints of government and the public. Councils are accused of being biased in favor of the press—and thus of having no "teeth." Most councils do not even receive the most serious cases, because complaints are made elsewhere. NCs rarely monitor media due to lack of funds, personnel, and motivation. Many critics, especially academics, dismiss councils as idealistic exercises in futility: good media do not need them and bad media will pay no attention.

Linked to the timidity or weakness of councils is their worst failure—their very obscurity. The public is often totally unaware of the existence of a news council, so it can neither use its services nor support it. Seldom does one meet even an informed media user who knows what a council is or whether one exists. That is *lethal*, for the whole point of news councils is to get the public involved in supporting the independence and improved quality of news media.

Conclusion

A news council is usually organized by media owners and/or by journalists, partly to avoid costly law suits, but primarily to avoid establishment of a governmental supervisory agency. Councils usually succeed in those two limited missions—but the media are not much improved by them. Most present-day councils are little more than complaint-processing agencies which strive to reconcile a few angry citizens and some media outlets.

An ideal news council could be so much more. It would be a permanent institution, independent, flexible, multifunctional, yet harmless, whose sole purpose is to improve media service to the public. Vitally, it would bring together and represent the people who own the news media with those with the talent to inform, and those who have the right to be informed. Hence, it could put pressure on government to avoid most media laws.

A news council can stand as a symbol of democracy. When they participate, media owners

B. Professional (Journalists-Only) Councils—8

Belgium (francophone)	1988
Czech Republic	1998
Germany	1956
Hungary	1994
Italy	1963
Macedonia	2001
Slovenia	1995
South Africa	1998

acknowledge that their employees have something to contribute in social communication. And journalists acknowledge that media users also have a right to be heard. A council publicizes the fact that the news media are listening to the public, and are ready to render accounts with them.

To "improve" media implies other tasks beyond mere processing of complaints. All news councils should have the power to initiate cases. This would require active monitoring of media in order to discover omissions and long-term distortions. Such surveillance is of greater significance than complaints since what media do wrong is so often what they fail to do: the public, unable to perceive the fault, cannot react against it.

A council should also report on the news media scene and encourage research on how the news media actually function, what real influence they have, what citizens need from them, etc. It should publish warnings on dangerous trends, and promote vocational training, including continuing education. The long-term means of curing the ills of the press lies in employing true (i.e., highly trained) professionals. But the public, too, needs to be better educated in its daily use of media. Lastly, a national news council should help develop a loose network of media accountability systems (M*A*S) to supplement its work, including other councils at regional and local level. One or even a few M*A*S cannot be expected to ensure quality news media, but creating dozens could.

News Hole

The definition of *news hole* has evolved over time. Initially the term referred to that part of a newspaper or magazine that is available for news stories, after subtracting the space taken up by advertising. Years later, with the advent of broadcast media, the meaning of the term expanded to include the amount of airtime available for news content within a news broadcast or cable news channel. Today's definition would include the effects of the Internet: offering theoretically unlimited space plus minimal production and distribution costs. In general usage, then, *news hole* refers to the editorial core of a print or electronic journalism publication or program.

The origins of the term *news hole* reflect the industrial era within which it was coined. Post-Civil War economic growth and large-scale immigration facilitated what historian Martin Sklar (1988) calls the "corporate reconstruction" of the country: This fashioned the newspaper into a more thoroughly industrial product, as pressures for capital accumulation increasingly shaped its ownership, organization, personnel, policies, and content. A newspaper's profitability depended on the ratio of advertising space to the space allocated for news and editorials—space which journalistic shorthand came to refer to as the "news hole." In a 2008 interview with this writer, longtime reporter George Gladney credited the term's origins to the process of setting type: "I suspect it comes from the forms which printers used to build pages of type. Usually the ads were placed in these forms first, literally leaving a hole for the non-advertising text."

The term is clearly an old one. It appears in a list of standard "jargon" in journalism work, in a book published in 1911. By the mid-twentieth century the term's definition had expanded to include broadcast media, more specifically the time within a designated radio or television news program that was actually available for editorial content. In a television network evening newscast, that is usually about 22 minutes of the half-hour period. By the early twenty-first century, "news hole" had even become part of public discourse: A 2008 Google search resulted in 113,000 listings. This reflects a broadening of its usage, as postmodern culture and the Internet contribute to an expansion in the varieties of journalism. The well-regarded Project for Excellence in Journalism's reports still use the term in its original meaning, even though newspapers' online editions no longer suffer space limitations driven by the cost of ink and newsprint.

Some newer applications refer to the "news hole" as if it were a physical location, a gathering place for people seeking news, much as a "watering hole" attracts people seeking drink and companionship. Hence, the online edition of Baltimore's *The City Paper* titles its news section "The News Hole." MSNBC gives the same name to its "award-winning blog from the cast and crew of the award-winning television news hour." By contrast The Huffington Post makes a pun in suggesting a gap in the mainstream U.S. news media's coverage of

some subjects; its critique's headline reads, "A Different Kind of News Hole." Clearly separated from a newspaper's physical production processes, today many bloggers use the term *news hole* simply as a generic label for their musings.

Just as the term originated with a quite specific meaning during the industrial age, so the postmodern era is infusing it with new usages and connotations which broaden its application. As it is steadily separated from its foundational meaning, it is kept in the journalistic lexicon, even as it occupies a space in public discourse. We speak of the shrinking news hole, for example, as one measure of the decline of the newspaper press and serious news and documentary in broadcast television. The important and ongoing struggle between hard and soft news is often defined in terms of how much space or time each takes from the total available news hole in a publication or broadcast. So are other comparative measures, such as how much of the news hole is taken by the political right or left, or the different sides in a specific controversy. The term is also useful (though rarely carefully enough defined) to allow for a seemingly comparable measure of print space or broadcast time over which editors and producers have control.

News Interview Programs

American news interview programs are generally of two types—the continuing series and the special one-off program built around an important person or a particular event. Essential to the success of either type is an effective interviewer and an interesting interviewee. While many interview programs center on celebrities and entertainment, the focus here is on those providing serious news journalism. Few commercial stations provide such programs and thus this entry concerns broadcast and cable network offerings.

Radio Origins

The broadcast public affairs interview format developed first in radio—indeed it probably dates to the 1920s before networking began. There was nothing simpler than having an announcer (only later was the interlocutor more often a journalist) interview somebody of importance either because of their social or political position or to cast light on recent news events or a current controversy. Many of radio's public affairs programs did not focus on interviews, but rather encouraged give-and-take among regular or guest participants, some of whom might be journalists.

America's Town Meeting of the Air

America's Town Meeting of the Air was created and moderated by George V. Denny Jr. This hour-long discussion program, broadcast from New York City's Town Hall on 43rd Street, began to air on the NBC-Blue network in May 1935. Broadcast on different evenings (usually Thursday) over the years and varying from 30 to 60 minutes, it continued on ABC after World War II and ran until July 1956. The

program featured a live studio audience—up to 1,800 attendees at a time—who could often be heard heckling, cheering, or simply commenting on what was said. It was this often very active audience participation that differentiated the program from others. The program participants could get pretty heated in their disagreements as well, and strongly held opinions were encouraged. More than a thousand listening groups and clubs were established across the country, both to listen to and continue the debates locally. Many listeners sent in questions by telegram. Hundreds and sometimes thousands of transcripts were mailed out after the programs aired and some broadcasts were published in pamphlet form. The program was broadcast on a sustaining basis (commercial-free), as Denny did not want anything to inhibit the "fire and color" he sought, though multiple advertisers did help meet some costs after 1947. On two occasions, ABC sought to simulcast the program over television (in 1948–49 as the television networks were beginning, and again in 1952), but the format did not "translate" well to the visual medium.

The American Forum of the Air

The American Forum of the Air was one of the earliest radio network panel discussion programs, first appearing on New York City station WOR in 1934. The program became *The Mutual Forum Hour* when the Mutual network was launched later that year. Produced by attorney Theodore Granik, the program moved to Washington in 1937 and took the title shown. Within a rather rigid format, opening remarks were made by two opponents on some public issue, followed by a panel discussion, and then questions from the studio audience and closing summaries. The program varied from 30 to 60 minutes, then shifted to NBC in 1949 as a half hour offering before leaving the air in March 1956. Granik kept the program participants on point (most issues were hot political or economic concerns) and off personal attacks on one another. The program was briefly carried on television in 1949.

University of Chicago Roundtable

University of Chicago Roundtable was originally broadcast on station WMAQ beginning in February 1931; it was carried on the NBC network from 1933 to mid-1955. Generally broadcast early Sunday afternoon for a half hour, it featured University of Chicago faculty members discussing important and current issues. While the academic "cast" changed each time based on the issue being discussed, the program kept things moving (a light blinked if some scholar began droning on) and for a time even issued a related magazine that included transcripts and background on the speakers. Guests from the world of politics and journalism often appeared as well.

Meet the Press

Later a staple on television, for its first several years on the air (starting in October 1945), this panel program ran on Mutual radio, moderated by Lawrence E. Spivak, editor of *American Mercury* magazine, and intended to promote that publication. Spivak partnered with Martha Rountree who produced the broadcasts, which very quickly began to create headline news. Political candidates, other politicians, and public figures faced reporters without the protection of a script. The interviewing journalists were selected to represent differing points of view to encourage sharp verbal exchanges. The program was simulcast on NBC television beginning in 1947 (see below).

Capitol Cloakroom

Capitol Cloakroom was a CBS radio network program of political analysis and interviews that ran from October 1949 through 1983. Reporter Bill Shadel was the moderator/host, and Eric Sevareid was among the journalists who appeared.

Fresh Air

Fresh Air is a public radio program based on the cultural affairs program that originated in 1975 on Philadelphia's WHYY (and is still produced there). National Public Radio began to carry the one-hour *Fresh Air* nationally in 1985. The weekday program centers on interviews by program host Terry Gross that cover contemporary arts (music, performing arts, fine arts, theater and movies) and political and cultural issues, the interviews varying in length as content requires. Indeed, its 1994 Peabody Award citation credits *Fresh Air* and Gross with "probing questions, revelatory interviews and unusual insights." The interviews are conducted in advance—sometimes by telephone—and are edited down for broadcast. Original material is broadcast Monday through

Thursday, with Friday carrying repeats of selected programs. Reviews and various types of musical performances fill out the hour as needed.

Television Interview Programs

When television picked up the radio interview format, it faced a special problem—-how to make "talking head" interviews sufficiently interesting to hold an audience. In an era when broadcast news sound bites run less than ten seconds, interview programs of 30 or 60 minutes give political leaders, military officials, authors, and other newsmakers a chance to explain their policies and thoughts in detail. They also give the interviewer/host a chance to sit competing parties across from them and side by side on the set to defend, challenge, debate, argue, and question each other. The programs are similar in many ways and sometimes newsmakers will appear on one Sunday morning interview program and show up several minutes later on another one. The comments made on these programs are often picked up in broadcast and print news stories later in the news cycle. Such programs are opportunities for politicians to frame issues for a general audience and to send messages and "trial balloons" to each other.

Bill Moyers Journal

Bill Moyers Journal began in 1972 covering a wide array of topics such as religion, history, sexuality, geography, and politics, mostly with interviews with key figures. Moyers served as host/reporter. The weekly program was produced by WNET in New York and aired until 1976 on PBS. In 1979, the program resumed for a second series, covering many more topics, and ran until 1981. *Bill Moyers Journal* returned to the air in April 2007. In each of its incarnations, the program featured numerous interviews with the important, the famous, and the interesting. Moyers took a more intellectual approach to his topics and guests than many television interview programs.

Booknotes *and* Q&A

Booknotes and *Q&A* are C-SPAN interview programs. From 1989 to 2004, Brian Lamb, head of the C-SPAN cable network, interviewed contemporary nonfiction authors for a one-hour (sometimes longer) program on Sundays in which they discussed their books, the research that went into those books, and their lives more generally. The 800 interviews, available online, make up a valuable collection of late-twentieth-century American scholarship, capturing the intellectual work of important nonfiction writers, as well as biographies and memoirs of notable political figures. It was replaced with *Q&A* on Sunday evenings, another Brian Lamb–hosted interview program with a broader writ covering people in the arts, politics, science and technology, and other fields.

The Charlie Rose Show

The Charlie Rose Show began from New York's WNET in September 1991 and was carried nationally on PBS to other public television stations within two years. His studio moved to a Bloomberg facility on Park Avenue in 1994 which also provided the option of interviews using satellite links. For his late, weeknight programs, Rose interviews a wide variety of usually well-known subjects including writers, politicians, athletes, entertainers, business leaders, scientists, and other newsmakers. He sits with his guests across his trademark round table against a black background. According to the program website, only Rose and his guests are allowed in the studio during taping thanks to the use of robotic cameras. Many past interviews have been made available online.

Chronoscope

Chronoscope was a CBS interview series sponsored by the Longines-Wittnauer watch and clock company and ran from 1951 to 1955. Airing live at 11 p.m. three nights a week, the program featured host Frank Knight and a changing cast of journalists, who interviewed a specific domestic or international figure—politicians, diplomats, and leaders in many different fields—for each segment. Special attention was given to the developing cold war and the Korean War. In an era before videotape, the more than 600 programs (of which nearly 500 survive in archives today) were recorded on kinescope (film) for distribution around the country.

Face the Nation

Face the Nation was launched on CBS in 1954, adopting the same format of a panel of journalists interviewing a newsworthy figure as had been

pioneered by *Meet the Press*. Only over the years did it evolve into a panel of newsmakers discussing issues under the direction of a single moderator. Reporter George Herman acted as moderator during the 1970s, succeeded by Leslie Stahl in 1983, and veteran reporter Bob Schieffer since 1991. The hour-long program airs Sunday morning from studios in Washington, D.C.

Firing Line

Firing Line, based in New York and nationally syndicated, was hosted by William F. Buckley Jr. from 1966 to 1999. It produced some 1,500 programs over its third of a century on the air, appearing on public television after 1971. Buckley, the conservative columnist and commentator, would usually converse with one or more guests on each weekly program. Issues ranged widely but the level of conversation was intellectual in tone and often became a genteel debate. Up to 1977, a panel joined Buckley in conversation; after than point (until 1988), an "examiner" (often more liberal than the host) would provide a counterpoint of questions and comment.

Issues and Answers

Issues and Answers was introduced on ABC in November 1960 as *ABC Press Conference*. This Sunday morning program was part of the third network's attempt to compete with the larger CBS and NBC. Also originating from Washington in a half-hour format, the program featured reporter Bob Clark as a longtime panelist. The program gave way in 1981 to a new interview program featuring David Brinkley.

Larry King Live

Larry King Live is one of the nation's most watched interview programs and has aired since 1985. One of the most popular programs on CNN, it is usually originated from Los Angeles (but sometimes from New York or Washington). King defines the program as more infotainment than journalism, but presidential candidates have used his venue to announce they are running since Ross Perot did in 1992. Indeed, many other candidates appeared that year (and in subsequent elections) to respond to questions from King and viewers telephoning in. Guests sit across from King at the same table and the give-and-take can become tense depending on the subject matter.

The McLaughlin Group

The McLaughlin Group is a syndicated political talk program that began in 1982, supported initially by several conservative foundations, and was the creation of its host, John McLaughlin, a former presidential speech writer and journalist. Carried on both commercial and public television stations, it features a cast of journalists and often guests and specializes in an "in your face" aggressive style of give-and-take about current events. McLaughlin, who argued the standard network interview programs were stilted and boring, also served during the 1980s as Washington editor for the conservative *National Review*.

Meet the Press

Meet the Press is the longest-running American commercial network program series. NBC-TV launched *Meet the Press* from Washington, D.C., on November 6, 1947. As with its radio predecessor, the half-hour television program was produced by Lawrence E. Spivak, who served as a panelist and moderator before retiring in 1975. The panelists included print and broadcast journalists. Focused primarily on political figures in Washington, this was also one of the first regular programs to appear in color, starting in 1954. In 1997 it also became one of the first network programs to appear in high-definition digital television. Only in the 1960s did it settle into a Sunday morning time slot, which it still holds. In September 1992, less than a year after Tim Russert took over as moderator, *Meet the Press* expanded to an hour. He began the practice of including historical video clips. Some political figures who made for good copy were constant repeat visitors—longtime Senator Robert Dole (R-KS) had appeared more than 55 times by 2002. The program usually airs from Washington, D.C., but is often heard from other locations depending on events and guests. After Russert's death, David Gregory took over as moderator in December 2008, replacing Tom Brokaw, who served as interim moderator for six months.

Night-Beat *and* Mike Wallace Interviews

Night-Beat, later *Mike Wallace Interviews,* were two short-lived, New York–based interview programs. Television producer Ted Yates created *Night-Beat,* which brought Mike Wallace to

prominence. It began in 1956 as a live, late-night (11:30 p.m.) hour of interviews in New York in which Wallace grilled a pair of newsworthy guests every weeknight. Based on good research and using provocative questions, Wallace turned a flair for the dramatic into hard-hitting investigative reporting as *Night-Beat* quickly demonstrated a hard edge lacking in most television talk shows of the period. With a stark black backdrop and smoke from his ever-present cigarette for atmosphere, Wallace asked pointed questions (sometimes dubbed attack or sabotage journalism—usually by its victims) that often made guests squirm—readily apparent in close-up shots. The program moved to ABC and national distribution as the half-hour primetime *Mike Wallace Interviews*. Concerned with small audiences and possible legal problems, however, it lasted only through 1958, turning somewhat more intellectual in tone during its final weeks, which were sponsored by the Ford Foundation.

Nightline

Nightline began on ABC television in March 1980, having developed out of the more than 400 late-night appearances of *America Held Hostage* (concerning Americans held in Iran) over the previous year. Hosted by Ted Koppel, the new half-hour program usually focused on a single topic each evening, and included a discussion among several invited guests who might include journalists, scholars, political figures, scientists, or people from the world of movies, culture, or sports. *Nightline* programs combined elements of investigative journalism and effective interviews. With Koppel's retirement, the program changed formats to cover a number of topics nightly (many concerning popular culture rather than hard news) with three reporter/hosts (Martin Bashir, Cynthia McFadden, and Terry Moran) and less use of interviewing.

Open End *and* The David Susskind Show

Open End, later *The David Susskind Show,* began on a New York City station in 1958. For several years, the program began at 11 p.m. on Sunday evening and would continue until the topic or panelists were exhausted, hence the program name. The program was limited to two hours and entered syndication in 1961. Susskind's interview of Soviet leader Nikita Khruschev in 1960 made national headlines and greatly increased the number of stations carrying the late night program. It became *The David Susskind Show* from 1967 until it left the air two decades later. The program addressed a wide variety of both hard news and social topics, often using an aggressive style of interviewing that brought hostile reactions from its guests. More than 1,100 programs are available in archives.

60 Minutes

60 Minutes is the celebrated CBS network television weekly news magazine program, first aired in 1968. It has often included interviews among its three or four segments making up each broadcast. Often presented by Mike Wallace (before his 2006 retirement), the segments are hard-hitting and sometimes verge on the accusatory. The program has paid for some interviews, and legal actions have arisen from others over the years. Interview subjects have ranged from heroes to villains, and have included show business figures, politicians, military leaders, and the occasional author.

This Week

This Week replaced ABC's *Issues and Answers* in 1981. For two decades this program was hosted by David Brinkley, whose name formed part of the one-hour program title until his retirement. Regular journalist panelists included conservative commentator George Will, ABC's Sam Donaldson, and Cokie Roberts. Thanks to Brinkley's star power, the program quickly surged in the ratings and held a strong position among the Sunday morning talk shows.

Washington Week

Washington Week is a panel interview program that began as *Washington Week in Review* in February 1967, produced by Washington, D.C., public television station WETA. It became the first program carried by the new Public Broadcasting Service in January 1969. After a changing cast of moderators, Paul Duke served in the role for many years, succeeded by Ken Bode and, in 1999, former NBC reporter Gwen Ifill. *Washington Week* initially utilized a continuing panel of three correspondents (Peter Lisagor, Charlie Cordry, and Neil McNeil), but in 1970, the format changed to three regular reporters and a weekly guest reporter. By

the early 2000s, the program maintained a small core of regular correspondents and a larger group of occasional guests.

Conclusion

News interview programs allow listeners to hear discussion in a longer form than traditional mini sound bites provide. Because opposing parties are sometimes seated across from the interviewer at the same time, there is opportunity for them to argue and sometimes even agree on certain issues. Some programs are "must see" or "must hear" for government insiders and those interested in following particular issues and the arguments for and against them in real time. The bookers for these programs compete to find articulate guests who can discuss the "hot" topics of the week, and they're apt to choose official government, mostly senior and male, voices. These programs attract political insiders and "news junkies" worldwide.

Analyses of interview programs often criticize them for tending to exaggerate partisan differences and for drawing on too narrow a range of predictable and frequent guests, such as congressional leaders. They have also been criticized for reflecting the assumptions and priorities of whoever is in power and for presenting "establishment" viewpoints.

Newspaper Design

Newspaper design, as a specialized area of practice, is a relatively recent addition to the journalism industry. Until the 1960s, the organization of printed elements on newspaper pages depended largely on two main journalistic customs: the first being the standing or repeating elements such as the nameplate and the second being the editor's daily hierarchical decisions for newspaper elements that change according to the day's news stories. Since the nineteenth century, newspapers have divided their available space into editorial content and advertising. These two have become separate production areas, with distinct groups working independently. Newspaper design focuses on the editorial side and is often called *editorial design*.

Editorial design controls a newspaper's visual presentation. Publishers from time to time mount a redesign project either to plan a complete makeover (an unusual occurrence) or to update existing design gradually. A cadre of independent redesign consultants focuses on the newspaper industry, although publishers may instead use the internal design staff.

Editorial design also includes the daily design activity of staff members, which encompasses the changing visual treatment of news items within the relatively fixed format of a publication: the selection, edition, and organization of all visual elements in a newspaper. Although the newspaper has a set of design rules, these do not resolve the specific problems and applications to individual stories and pages.

Since the 1990s, newspapers have required designers to be visually literate and also to be able to research and write. As one result,

newspaper designers are also called visual journalists. Practitioners with both skill sets may come from art schools or from academic journalism programs.

Designers divide content between hard and soft news, distinctions that affect the formal presentation. A features designer concentrates on soft news, such as features, reviews, and other nontimely items, which are more open to variation and experimentation. A layout editor or designer concentrates on hard news production and hews more closely to overall newspaper design guidelines.

Like other areas of visual practice, newspaper graphic design has changed through a series of style developments called *movements*. Since its emergence, the first main movement in newspaper design was *modernism* (initially called *streamlining*), a mid-twentieth-century effort led by newspaper design pioneer John Allan, that removed clutter from page designs (such as, for example, headlines with many words capitalized) in favor of the easier-to-read forms (such as headlines with only the initial word and proper nouns capitalized). The second main movement in newspaper design was *functionalism,* a product of the late 1960s and early 1970s which Harold Evans of *The Times* of London led to remove the irregular shapes of story layout (such as doglegs, where one column of type extends below others from the same story) in favor of more compact forms (such as simple rectangles).

Newspapers have generally followed behind the avant-garde of other areas of design practice, such as magazine and product design. They have not, for example, so far adopted postmodern typography, which mixes home-made-looking typefaces in exaggerated sizes that push beyond standard limits of legibility.

Design Components

The graphic design of newspapers employs type, images, and charts as visual components in an overall layout.

Typography

Type is the oldest visual component of newspapers and, as the basic element of any design, includes the visual appearance of the letterforms and symbols from any specific language.

Display typography grew out of book designs. The *nameplate,* or main newspaper title (sometimes mistakenly called the *masthead,* the term for the list of editors appearing on the editorial page), may involve *blackletter* type patterned after medieval lettering to give the impression of credibility and respect for authority. Headlines became larger over time, compared to the columns of text, which grew smaller on the whole and more compact. Larger-sized headlines usually indicate more important stories (see Layout, next page).

Newspaper designers share with other typographical workers a wide (and inconsistent) vocabulary for elements on the page. Among them are terms such as *decks* (subheads), *drop caps* (a large initial letter for the first word of a paragraph), *pull quotes* (direct quotations enlarged to display size), *lifts* (bits of the story text enlarged to display size), *photo captions, refers* (text pointing to other items in the newspaper), *taglines* (writer's name, phone number or e-mail), and *jump lines* (indicators for where the story continues on another page or column), among others. These terms are mostly descriptive and may seem obvious to designers but not to most readers, and so their use helps sort insiders from outsiders in the industry. Each term, however, may have a history that reveals deeper trends in society. The *byline*, for example, emerged along with the change from old-time news hounds of the early twentieth century to the specialist reporters of late in the century, a change that followed the wider advance of professionals throughout society.

Only in the early twentieth century did newspapers focus on the ease of identifying letterforms (legibility) and the ease of understanding words (readability). In search of those qualities, editors began to make typographical decisions based on characteristics of letterforms, such as *serifs* (small feet or letter endings), which they considered easier to read.

Designers also classify type by size (measured in the point, about .35 mm), weight (from boldface to light), position (such as italics), case (capitals, lowercase, or small caps), and width (ranging from condensed to expanded). Most newspaper designers consider medium sizes, weights, and so forth more legible. Other elements affect readability, including line length (the more words in a line, the less readable), leading (space between lines), justification (ragged-right, ragged-left, centered, or justified), kerning (space between letters),

paragraph indentation, page margins, and background color. Again, the middle-range choices are usually more readable. All these classifications and their effects on legibility and readability are culturally bound. Western cultures read lowercase letters best from left to right, and so Western editorial designers rarely stack the letters of a word, unlike those in Asia.

Photography

Photographs entered newspapers generally in the early twentieth century, replacing hand engravings (drawn from photographs) and sketch art, which now tends to appear only with feature matter. News images appeared first in black and white and later in color (such as special *rotogravure* sections, named after an automated engraving process). Production of photography in newspapers has evolved dramatically from plates and flash powders, through film and paper, to digital processes.

Designers may use photos as line art (converted to pen-and-ink drawings either by hand or using software) or in halftones that reproduce a range of grays in greater detail, depending on the image resolution. The low quality of newsprint surfaces cannot achieve the high photo resolution in magazines, which use smooth, glossy paper stock.

Newspaper designers usually arrange photographs within either vertical or horizontal frames (by scaling the image). Although the photo editor may then sharpen and crop the image, any other manipulation changes the image into a photo illustration (a label that must accompany it in the printed edition).

Illustration

News illustrations started appearing regularly in newspapers in the nineteenth century, with specific techniques usually first appearing in advertisements and the editorial side adopting them later. Even so, newspapers were primarily typographical products until the rise of the illustrated press at the end of the nineteenth century. Photography took over many of the tasks of early news illustration, especially as a means to capture the reader's attention, because of the perceived realism of the imagery.

Art movements, such as Art Deco, surrealism, and pop art, have played a major role in the production of newspaper imagery. These varied styles first appeared in advertising, migrated into magazines, and finally appeared in newspapers. Newspaper illustrations now generally visualize what photography cannot capture: sensations, moods, and other intangibles.

Newspaper designers may produce illustrations by using collage, ink, gouache, watercolor, color pencils, oil, acrylics, a drawing pencil or pen, or computer software. Illustrators and designers may also create a three-dimensional composition for later photographing, resulting in a hybrid photo illustration.

Feature sections, including lifestyle, travel, health, and food, use illustrations more than do news sections, following a longstanding pattern of innovation in newspaper design. Sports and business sections use illustration rarely. When they do, they apply realist techniques to fit with the reporting mission of news. For example, they may use a drawing instead of a collage.

Editorial or opinion pages provided an early and continual location for political cartoons and other interpretative visual images. Caricatures and comics may have either satirical or entertainment purposes and appear mostly as line drawings.

Informational Graphics

Despite the common American belief that *USA Today* brought informational graphics to the daily press in 1981, graphics have been part of newspapers for much longer. Maps were the earliest newspaper graphics, appearing in the early nineteenth century. Other graphics include diagrams that explain how a system works, tables that array data and lists, and graphs. Bar graphs most often display statistical information, pie graphs represent a whole and its divided parts, and line graphs express numerical information over time. Newspaper information graphics normally include the following: a title to identify the content, a brief caption or blurb to explain it, the graphic information itself, the source of the information, and credits to identify the designer and researcher.

Layout

Traditional nineteenth-century newspaper design focused on columns of text and tended to arrange pages symmetrically. A key innovation of modernism in the first half of the twentieth century was to conceive of the larger structure of the page

(especially the front page) as conveying information through its layout or architecture. News designers have developed principles to organize elements on a page, all of which draw on modern aesthetic notions and offer guidance for organizing a composition. Some elements underlying the principles include points, lines, planes, and shapes, and each element has relative aspects, including scale (larger or smaller), color, value (dark or light), direction, and the like. Designers use these aspects to accomplish balance (so that pages are not lopsided), contrast (to highlight what is most important), harmony (so that everything belongs), rhythm (to move the reader's eye across the page), and unity (to make the page hang together), as principles of design.

Unlike printers or typographers who once decided how newspapers looked, the graphic designer sees the printed page as a canvas, which can be large or small in format (page size), most commonly broadsheet (full-sized pages) or tabloid (half-sized pages). Designers link these sizes to public perceptions of news. Historically, authoritative publications acquired larger formats, and sensationalistic news started in tabloid formats, but national press cultures differ. Although the broadsheet holds the highest status in the English-speaking world, serious newspapers elsewhere have small formats, especially in parts of Latin America, continental Europe, and Asia. Because of the cost of newsprint, newspapers have tended to become smaller in both formats.

Designers work within the image area, the space displaying everything inside the margins. They divide the area into columns, allowing for gutters (the spaces between each column). The topmost element of each page is the folio line, which contains the date, the section, and the page number.

Since the 1990s, graphic design for newspapers has become a distinct occupation, with professional publications and associations. The main organization, founded in 1979, is the Society for News Design. Practitioners attempt to give news visual meaning and bridge the gap between wordsmiths (traditional journalists) and image-smiths (graphic designers and artists).

Newspaper designers have adapted to the rise of the Internet and accompanying circulation declines in printed newspapers. At first some newspapers, such as *The New York Times,* sought to reproduce online the visual appearance of the print editions. Other newspapers began by *dumping* (through automation) the print product text into webpages with little design at all. Some web editions, such as *The Washington Post* of the 2000s, developed a separate visual identity from the print version.

To adapt, newspaper companies are hiring journalists who not only report and write but also take pictures, record audio, and shoot video. Online journalism has taken priority for disseminating news and events as they take place, while the print editions continue to develop traditional news packages. Page designers are moving to web design as well, which requires a different set of skills for storytelling and presentation.

Like other journalists, newspaper designers tend to work across platforms, and platforms also refer to each other. Some items, such as e-mail addresses and references to more information online, migrated from the web to print editions, and some online editions provide links to electronic pages of the print edition (usually only to subscribers).

Although *editorial designer* is a recent job title, newspapers have always had a visual component. Newspapers after the invention of other news media have continued to be visual products that draw on the latest thinking of designers and artists. The visual changes in the printed and online press reveal much deeper movements in how a society views itself and how journalists see themselves. Traditional newspaper design of the nineteenth century treated readers as omnivores who read everything, column by column, but twenty-first-century design treats readers as choosy consumers who jump around and browse for only those items they want.

Newspaper Preservation Act

The Newspaper Preservation Act of 1970 was passed in 1970 to allow antitrust exemptions for newspapers in the same geographic region with agreements to share business and operating expenses while maintaining separate news and editorial functions. Known as joint operating agreements, or JOAs, these were intended to connect a "failing" newspaper with a stronger one. In theory, these agreements permit competition in a newspaper market by saving the weaker paper. In practice, some critics argue, JOAs permit additional monopolization of the news product by shutting out other publications.

As of early 2009, there were ten JOAs operating in the United States: Albuquerque (*Tribune* and *News,* this was the first JOA established in 1933); Birmingham (*News* and *Post-Herald*); Charleston, West Virginia (*Gazette* and *Daily Mail*); Cincinnati (*Enquirer* and *Post*); Detroit (*Free Press* and *News*); Fort Wayne, Indiana (*News Sentinel* and *Journal Gazette*); Las Vegas (*Review-Journal* and *Sun*); Salt Lake City (*Tribune* and *Deseret News*); Tucson (*Citizen* and *Daily Star*); and York, Pennsylvania (*Daily Record* and *Dispatch*). These JOAs have varying time limits and renewal requirements; for example, the Charleston JOA is set to run through 2036, while the Cincinnati papers' agreement renewed automatically every ten years until 2007, when Gannett, owner of the *Enquirer,* chose not to renew the JOA.

Origin

The law was passed in response to a 1969 decision by the Supreme Court of the United States, *Citizen Publishing Co. v. United States* in which the Court invalidated a JOA between two Tucson newspapers, finding it in violation of antitrust laws. Justice William O. Douglas famously wrote for six members of the Court: "Freedom to publish is guaranteed by the Constitution, but freedom to combine to keep others from publishing is not."

Congress responded less than a year later, after strong lobbying from the newspaper industry, with the Failing Newspaper Act, which eventually became the Newspaper Preservation Act. The law begins with a finding that "it is hereby declared to be the public policy of the United States to preserve the publication of newspapers in any city, community, or metropolitan area where a joint operating arrangement has been heretofore entered into because of economic distress or is hereafter effected" under the act. The act grandfathered existing JOAs (including the Tucson JOA that precipitated the original lawsuit) and set parameters for the creation of new ones. The law also permits the paired newspapers to engage in activities that would otherwise be antitrust violations, such as price fixing, profit pooling, and market control. At the same time, the stated purpose of the act is to foster competing voices in communities where two newspapers may not be commercially viable.

The Justice Department opposed the law, while many newspaper owners—particularly those engaged in current JOAs—supported it. The Hearst newspaper chain sent letters to the Nixon administration and to President Nixon directly, requesting the administration's support of the act. Several critics have suggested that Nixon's favorable treatment of the act was a result of a desire for positive press coverage (indeed, the administration reversed its original opposition). The act was signed into law in July 1970, and 22 JOAs were in effect at the time.

The Act in Practice

Under the act, two newspapers may petition the attorney general for permission to create a JOA. The attorney general must determine that one of the newspapers is "failing" in order to grant the JOA. The act defines "failure" broadly, stating that a failing newspaper is one that "regardless of its ownership or affiliations, is in probable danger of financial failure." The act does not require a newspaper's status to be evaluated as to ownership or competition. There can, however, be no merger of editorial staffs, and editorial stances must be independently determined (although the meaning of "independently determined" has never been judicially interpreted). And, as noted below, what constitutes a failing newspaper is also open to interpretation, with the decision ultimately in the hands of the attorney general.

In *Michigan Citizens for Independent Press v. Thornburgh* (1989), the Supreme Court upheld by a split vote (no opinion was published) the decision of the attorney general to approve a JOA between the *Detroit News* and the *Detroit Free Press*. The two papers had engaged in fierce competition and both had been losing money, though the *News* had led the *Free Press* in most competitive measures. An administrative law judge had found that the *Free Press,* the "failing" paper, was not in real danger of failing, and in fact he did not believe that "reader and advertiser demand in Detroit is so inadequate that the market cannot sustain two profitable papers irrespective of changes in pricing policies." Therefore, because the *Free Press* was not considered to be failing, the administrative law judge said, the requirements of the act had not been met.

Attorney General Edwin Meese disagreed. He noted that the *Free Press* had suffered a decade's worth of losses and had no way to unilaterally reverse that trend, so therefore it was failing, and he granted the JOA. The citizens' interest group appealed Meese's decision to the courts. A district court upheld the attorney general's decision, and the United States Court of Appeals for the District of Columbia Circuit upheld the district court's decision. The appeals court said that while the *Free Press* was not in the traditional "downward spiral" that usually indicates a failing newspaper (decreasing circulation leading to fewer ads leading to even more decreases in circulation), it was on the brink of such a spiral down. The attorney general's interpretation, the court said, was not unreasonable or capricious, merely different than the administrative law judge's. And, said the court, Congress gave the burden to the attorney general to determine what constitutes a "failing newspaper."

The Supreme Court upheld the appeals court's decision by a split vote without opinion. *The New York Times* editorialized that Meese's decision was probably the right one under the Newspaper Preservation Act but that the act itself was problematic and should be repealed. According to *The New York Times,* the act ignores other, newer sources of competition: "Virtually every major metropolitan area has one or more substantial suburban newspapers that conceivably could gain market share if a faltering big-city newspaper were allowed to die."

Controversy

Proponents of the act and of JOA arrangements argue that the stated purpose of the act—to maintain several newspaper editorial voices in communities that cannot economically support more than one—was valuable when the act passed and continues to be so. The Newspaper Association of America, in a 2005 brief to the Antitrust Modernization Commission, recommended that the act be retained. The act, according to the association, "preserves and prolongs editorial and reportorial competition between newspapers after the economic basis for commercial competition has disappeared" (Newspaper Association of America, 9). Newspapers in JOAs maintain strong editorial voices and do not appear to become homogeneous in their coverage and content. Online and other news outlets continue to provide serious competition to newspapers, and the act provides sustenance to a newspaper that otherwise would have failed, maintaining an additional editorial stance in the community.

Opponents suggest that newspaper readership continues to decline despite the JOA exemptions to antitrust law, and that the act relies on antiquated ideas of what competition and news sources are. The unclear legal definition of "failing newspaper" results in large news organizations pitted against smaller ones. Some see the act as providing a "soft landing" for competing newspapers that might take advertising and editorial risks they would not take in the absence of the option for a JOA—in other words, knowing that the newspapers can bail each other out means that they need not be as careful with their business decisions. Business columnist Daniel Gross took an even harsher view of the act: "JOAs insulate politically connected and favored industries from the competition that would cause them to change business models or innovate, and permit them to collect diminishing profits while doing nothing to ensure long-term viability" (Gross 2003).

Newsprint

Newsprint refers to the low-quality, nonarchival type of paper normally used to publish newspapers. Made from wood pulp, it is thin enough to be economically manufactured, but thick enough to be printed on both sides. Combined with advances in the technology of printing presses, the availability of low-cost newsprint beginning in the 1840s allowed newspaper publishers to offer their product at prices affordable by the working class. The first American newspaper to be printed exclusively on newsprint was the *Boston Weekly Journal,* commencing in January 1863. The majority of people could now afford to buy a paper on a regular basis, making newspapers a true "mass medium."

Origins

Charles Fenerty of Halifax, Nova Scotia, is generally credited with making the first newsprint paper from wood fiber in 1838. He had been hired by a local paper mill to maintain an adequate supply of cotton and linen rags (then used to make paper), but could not supply enough used and discarded clothing in such a thinly populated region. Experimenting with materials, Fenerty discovered a process of grinding softwood waste from lumber mills that kept the long fibers in the wood intact. The resultant wood fiber was found to be a suitable substitute for the cotton or linen (flax) fibers previously used to make paper.

A German engineer, F. G. Keller, developed specialized mechanical pulping machinery in the 1840s. Chemical methods of extracting the wood fiber quickly followed, first with Englishman James Roth's use of sulfurous acid to break down wood, followed by Philadelphia chemist Benjamin C. Tilghman's 1867 American patent on the use of calcium bisulfate to pulp wood. Tilghman's process involved heating a mix of wood chips, water, and chemicals to separate the fibers. Almost a decade later, the first commercial sulfite pulp mill began operation in Sweden. By 1900, the chemical pulping of softwoods such as pine had become the primary method of producing newsprint, although mechanical pulping plants continued in operation.

The alternative chemical pulping approach using sodium sulfate, the kraft process, was developed by German inventor Carl Dahl in 1879 and the first kraft mill opened in 1885 in Sweden. The resulting paper pulp was much stronger and more durable than previously, and hence the process was termed "kraft" (German for "strength"). Although the kraft process creates a brown paper (used for cardboard, bags, wrapping paper, etc.), bleaching it makes newsprint. The invention of the recovery boiler in 1930 by American engineer George Tomlinson allowed kraft mills to recycle almost all of their pulping chemicals, a significant cost savings. This, along with the ability of the kraft process to treat a wider variety of wood types and produce stronger fibers, made it the dominant pulping process by the late 1940s.

Pulp used in manufacturing newsprint at the Southland Paper mill in Lufkin, Texas, around 1943.

Making Newsprint

Although simplified and improved by the coming of steam power (as early as 1857 Swedish mills were using steam-driven grinders and refiners) and later electricity (beginning in 1902 at the Hudson River Mill in New York state), Fenerty's process remains the basis for making newsprint. New-growth trees raised specifically for pulp or waste timber is debarked and ground into wood chips. These then pass through a digester (for chemical pulping) or refiner (mechanical pulping) that separates the wood fibers from the rest of the cellulose. The fibers are combined with large quantities of water, creating a pulp mixture (about the consistency of oatmeal). Passing over screens and mesh belts, water is drained away to leave a wet fiber mat. Finally, the fiber mat is fed into presses; the fibers bond as the last of the water is squeezed out. Drying is completed with steam heat, and the result is a low-grade paper suitable for a variety of uses.

The paper is then wound around rolls. A standard roll of newsprint is about 3.3 feet tall and weighs between 800 and 900 pounds and averages about 36,000 linear feet of paper. A newspaper roll's width is referred to as the "web" and is defined by how many pages can be printed on it. Faced with dwindling revenue, newspapers—particularly the traditional full-size or broadsheet publications—have begun downsizing the web used on their presses. Modern presses print broadsheet sections in multiples of eight pages (with four fronts and four backs); thus the newsprint rolls used are defined by the width necessary to print four pages across. By 2000, the broadsheet standard in the United States was the 48-inch web, which means that each page is 12 inches wide. Interest in the new standard increased when *The Wall Street Journal* announced in January 2007 that it would abandon its iconic 60-inch web (15-inch-wide format) in favor of a 12-inch-wide format.

Newsprint manufacturing underwent a technological revolution in the late 1980s when several processes for "de-inking" paper were developed. In the de-inking process, waste paper is fed into a pulper and combined with hot water and various chemicals, which vary from mill to mill. Caustic soda, soda ash, silicate of soda, phosphates, and surfactants are all used; some mills have started to use enzymes and electric fields to separate the ink from the paper. Afterward, the paper pulp is screened and rinsed to remove the dispersed ink and chemicals. Without de-inking, recycled newsprint would be coarse and grayish in color, useless for printing.

Since 1990 the recycling of newspapers has doubled. The American Forest & Paper Association reported that 71 percent of newspapers were recovered for recycling in 2004 and that more than a third of this was used to make new newsprint. The shift from "virgin fiber" in newsprint was driven by laws passed in several states, and voluntary agreements negotiated in others, requiring newsprint consumers—primarily the major market daily newspapers—to use recycled paper.

Newsprint is relatively inexpensive (compared to other grades of paper) because it is produced without the processes that can remove lignin, and other impurities such as tannin and resin, from the pulp. Lignin is a polymer in the wood fibers that makes timber stiff and allows trees to grow to significant height, and helps protect wood from insect pests and other threats. It represents about 16 to 35 percent of the impurities in softwood, depending on the type of tree. But lignin also causes newsprint to eventually turn brittle because of oxidation. Lignin molecules, when exposed to oxygen, become less stable and the fibers become more rigid. Lignin also absorbs light, which conversely makes newsprint darken, leading newspapers to "yellow" with time. Storing newspapers in a dark, stable environment of 60 to 70 degrees Fahrenheit and 40 to 50 percent humidity will slow the rate of deterioration. To make better grades of paper, the mills put the wood pulp through a chemical solvent process, which separates the lignin from the fibers, and then bleach the pulp before the water is removed. Increasingly, newsprint is made from recycled paper; in 2006, more than half of the world's newsprint production was from recycled fiber pulp.

Recycling

However, challenges remain for recycling newsprint. Local governments across North America are turning increasingly to a "single stream" method of collecting residential and commercial recyclables. This allows people to throw all recyclables—bottles, cans, plastics and paper—into a single recycling container. The materials are then sorted out at "materials resource facilities." Newsprint mills have found that this contaminates and stains the newspapers, which leads to difficulties in recovering useable pulp fiber.

In addition, there are discrepancies in the meaning of "recycled content" in newsprint. In its 1988 Comprehensive Purchasing Guidelines, the U.S. Environmental Protection Agency (EPA) required a minimum of 40 percent of used, or "postconsumer," fiber in newsprint, consistent with several state's recycling laws or agreements at the time. But in the 1995 revisions to the guidelines, EPA dropped its minimum to 20 percent. Meanwhile, a number of states, notably California, contributed to the confusion by passing laws requiring newspapers to buy recycled newsprint with increasing amounts of postconsumer fiber, but these laws defined "postconsumer" differently. Some limited the term to materials that had been used and discarded by readers; California's newsprint law, passed in 1991 (and revised in 2002), included printers' scraps, undistributed newspapers, and mill waste in its definition of "postconsumer." The distinction may be unimportant, however, as a 2006 survey by the Institute of Scrap Recycling Industries found that most newsprint mills were not, in fact, tracking postconsumer content at all.

Global production of newsprint in 2006 was 175 million tons, with Canada being the largest producer at 21 percent of the total followed by the United States with 16 percent. Sweden, Japan, China, and Russia are also major sources of newsprint. Chemical pulping accounted for 93 percent of the world's newsprint. Although considerable quantities of newsprint in Canadian and Scandinavian mills continue to be produced from virgin fiber (mostly softwoods), the worldwide recycling rate of newsprint was nearly 60 percent in 2006.

Almost 80 percent of newsprint production in North America is consumed by daily newspapers. Because of this, major publishers such as *The Washington Post* and News Corp. own equity interest in paper mills or own a specific paper machine in a mill. This relationship was more common in the past as newspapers tried to secure a reliable and cost-effective source of newsprint, but in recent years many have divested themselves of newsprint mills. In April 2008, for instance, the Times Mirror Company, publisher of the *Los Angeles Times,* began seeking a buyer for two mills in Oregon, after having sold another in 1985; earlier in the year, the New York Times Company announced that it had reached an agreement to sell its joint interest in the Spruce Falls Power & Paper Company, a Canadian paper mill. Most daily newspapers are instead establishing direct purchasing agreements with newsprint mills or through broker arrangements.

For the balance of newsprint users—publishers of weekly newspapers, advertising inserts and flyers, campus newspapers, shoppers guides, telephone books, and others—the paper is obtained through commercial printers or through broker arrangements if the quantity is large. The federal government uses newsprint for printing its daily periodicals, *Federal Register* and *Congressional Record,* and a number of other publications; it obtains the paper from commercial mills operating under government contract. Large commercial printers with web presses usually stock newsprint as a standard item for customers.

Despite demand and technological advances, newsprint production has been declining. According to the annual report of the Pulp and Paper Products Council, production of newsprint in North America dropped nearly 5 percent in 2007. Observers of the industry blame this, in large part, on surplus manufacturing capacity at a time of declining domestic demand as the readership of daily newspapers continues to drop. Although export of Canadian and American newsprint to developing markets around the globe has helped, prices for newsprint have been increasing since 2006, reaching an average American price of $675 per ton as of January 2008. (The record price of $743 per ton [in 2008 dollars] in the American market was reached in September 1995.)

While the advent of broadcast and online news has decreased the public's reliance on newspapers, according to the Earth Works Group at Portland State University, Americans throw away the equivalent of 30 million trees in newsprint each year. Even with improved papermaking technology, a higher recycling rate, and more efficient replanting, it takes about 17 pulpwood market-sized trees to make a ton of newsprint. Bearing these figures in mind, the international pulpwood industry is developing methods to improve its sustainability through better forest management and harvesting; among the leading nations in this effort are Indonesia, Finland, and Australia, which all boast totally sustainable pulp production. The American Forest and Paper Association has committed its member companies "to sustain and expand a renewable resource that will meet future consumer demand at competitive prices."

Although some newspapers use higher quality paper—such as "improved newsprint," glossy or

coated paper, or directory paper—most newspaper publishers continue to rely on traditional newsprint. Manufactured in bulk on rolls compatible with web presses, newsprint has been essential to bringing the news to the public at an affordable price since the days of the penny press. Despite declines in production and increasing prices of pulpwood, the U.S. Office of Industries consumption reports predict an average rate of increase of two percent per year for newsprint and kraft paper for the foreseeable future. Until society is truly paperless, there will be newsprint.

Newsreels

For the first half of the twentieth century, long before television broadcasting existed, motion pictures of newsworthy events were shown in theaters around the world. These were called newsreels and were released serially, with two different issues a week, into more than 15,000 theaters in the United States alone and tens of thousands more abroad. They appeared in American theaters from 1911 to 1967 and for a few years thereafter in some other countries.

Each motion picture newsreel issue ran eight to ten minutes in length and contained seven or eight unrelated stories, each separated from the others by a newspaper-type headline. The subject matter was as diverse as could be found in a daily newspaper, and included politics, war, technology, celebrities, crime, disasters, the arts, parades, celebrations, sports, fashion, feature stories, and novelties.

Origins

Before there were newsreels, there were *news films*—individual motion picture records of newsworthy events, presented in theaters as isolated attractions whenever opportunity allowed. Among the many individual stories covered by the early news films were sports events in 1894, the Boer War in 1899, the funeral of Queen Victoria in 1901, and the San Francisco earthquake and fire in 1906.

In 1909 the French firm of Pathé combined several news film stories into single issues, released serially. Titled the *Pathé Journal,* it was a regularly released collection of timely and newsworthy scenes, with weekly changes in content. Pathé's newsreel was introduced in France in 1909 and in England in 1910. On August 8, 1911, Pathé introduced an American version under the title *Pathé Weekly.* Ten days later, an indigenously produced series was introduced in America by the Vitagraph Company, titled *The Vitagraph Weekly of Current Events.* In the years that followed, more than 50 different newsreels went in and out of business in the United States alone, on national, regional, or local levels. Only a handful survived for long.

Economics

The newsreel was part of a package of two or three short subjects that accompanied feature films, furnished at low cost by major film distributors to their exhibitors. Short subjects included newsreels, comedies, travelogues, cartoons, informational films, and sports events, each running about ten minutes and presented between the screenings of the feature film(s). Whatever a

particular package of short subjects might include, it always contained a newsreel, the screening of which became a permanent part of the motion picture exhibition business into the 1950s before declining and disappearing by the mid 1960s.

By the early 1930s, five major motion picture companies monopolized the American film industry: Paramount, Metro-Goldwyn-Mayer, Warner Bros., RKO Radio Pictures, and Twentieth Century Fox. Exhibitors (theaters) were obliged to contract for a block of feature films in advance of exhibition, without the opportunity of viewing them and sometimes before the films were even produced. To some extent, this monopolistic influence extended abroad as well. World War I had destroyed much of the European film industry, leaving an economic vacuum into which American studios and their films soon moved. For decades thereafter, the American film industry achieved preeminence worldwide, both artistically and financially.

By the time sound motion pictures had been successfully introduced, beginning in the late 1920s, five American newsreels dominated the American market and much of the foreign market as well, each of them owned by one of the large American film companies: Paramount News, Fox Movietone News, Universal News, Pathé News (later, RKO Pathé and then Warner-Pathé) and Hearst Metrotone News (later News of the Day, released by Metro-Goldwyn-Mayer). So popular were newsreels with audiences that from the late 1920s through the late 1940s specialized theaters operated in many cities throughout the world that displayed only newsreels, information films, and related short subjects.

Despite their popularity with audiences, however, short subjects, including newsreels, were of little financial importance to the film industry. By far the largest portion of revenues were derived from feature films. With rare exceptions, short subjects never made a profit for their studios and were provided at low cost as a service to exhibitors to round out their programs. As such, although domestic American newsreels and their foreign versions were seen throughout the world, they enjoyed very little respect from their owners and were frequently criticized by print journalists, who ridiculed their simplistic coverage, sometimes gee-whiz tone, and sophomoric humor. They were often filled with thrills and laughter, but often little real news substance. Even so, for the first half of the twentieth century, before the introduction of commercial television, the newsreel was the only form of moving image journalism that existed in the world, and depending upon its subject matter, the newsreel sometimes competed effectively with the photojournalistic coverage of newspapers and magazines.

American newsreel companies set up foreign news bureaus with scores of staff and freelance cameramen who shipped millions of feet of film each year to New York City, where all five companies operated their headquarters. Fox Movietone News, the largest and best financed of the American newsreels, had cameramen in 51 countries. Foreign-language versions of American newsreels were released abroad where they were seen by millions of spectators. Fox Movietone alone was reported to exhibit its semi-weekly newsreel in 47 foreign countries in more than a dozen languages.

At the height of their popularity, newsreels reached an enormous weekly audience of 40 million people in the United States alone, while the potential annual international audience for newsreels of both American and foreign production was estimated by a 1952 UNESCO study to number more than 215 million people (Baechlin 1952). Whatever its journalistic inadequacies, the newsreel had a profound influence in providing the imagery with which, for a few decades, audiences visualized and interpreted the world's events, personalities, and distant locales, all of which were inaccessible at first hand to most citizens. As one historian of the medium has observed, "It was often shallow, trivial and even fraudulent. But sometimes it was wonderful—filled with vivid, unforgettable pictures and sounds of the people, events, wonders and horrors which the free people of this century did their best to understand and confront" (Fielding 1972).

Censorship

Newsreels were often censored by governments. During the 1930s, American newsreels were banned outright in the Soviet Union, Nazi Germany, and the fascist states of Italy, Spain, and Japan—each of which often provided its own newsreels for domestic use. They were also sometimes censored in democratic countries such as England, France, Canada, and Australia and were even censored occasionally in the United States.

Newsreel coverage of World War II was extensive. Most of the footage was photographed by combat cameramen in the armed forces and made available to newsreel companies for inclusion in their films. Content was closely controlled by military authorities, however. Shocking scenes of the destruction of the Pacific fleet at Pearl Harbor were withheld for nearly a year, while scenes of dead and wounded American soldiers were rarely shown.

Content

The newsreel was a fundamentally visual medium, dependent on high-quality, complete, well-edited moving picture images to tell its story in a very short time. As with today's television or cable news services, without pictures there was not much of a story. With eight or nine sequences running less than a minute each, the newsreel thrived on subjects having high-velocity, recognizable visual action. The medium was unsuited for the investigation and analysis of abstract ideas, complicated political events, or economic or social trends. It could illustrate the consequences of an economic depression with images of bread lines, soup kitchens, political confrontations, and labor-management violence, but it was ill equipped to analyze the causes and theoretical remedies for such events.

Throughout the course of the form's popularity, newsreel content, although influenced by shifting domestic and international events, remained fairly predictable. Researcher Leo Handel conducted a content analysis in 1950 that reported that in the wartime year of 1943, 74 percent of all newsreel footage released was devoted to a combination of (a) government news, (b) national-defense news, (c) news of war in Europe, and (d) news of war in the Pacific. Sports news dropped from 26 percent in 1939 to 9 percent in 1943 (Fielding 1972).

Political Bias

Newsreels were occasionally accused of political propagandizing. In some countries, such as Nazi Germany and the Soviet Union, indigenously produced newsreels were plainly operated as propaganda outlets in the service of the state. In the United States, the *Hearst Metrotone Newsreel* (*News of the Day*) was most frequently criticized for presenting a conservative point of view, while the *Pathé News* was charged with a liberal bias. For the most part, however, American newsreels sought to avoid upsetting its audiences with controversial subject matter. Trade paper editorials within the film industry cautioned newsreel producers to avoid compromising audiences' impression of the motion picture theater as an escape from the bitter realities of life.

The exhibitor's point of view was clearly stated in 1937 by Martin Quigley, owner and editor-in-chief of the influential trade paper, *Motion Picture Herald:* "[N]ewsreels have no social obligation beyond those of the amusement industry and theatres they are supposed to serve. Newsreels have an obligation, if they are to be purveyed as entertainment in theatres, to be entertaining. They have no obligation to be important [or] informative. They can successfully present neither one side, both sides, nor the middle of any social condition or issue" (Fielding 1972).

The March of Time

In 1935, a radically different kind of motion picture news feature appeared in both American and foreign theaters. It was a quasi-newsreel, titled *The March of Time,* and was produced by the publishers of *Time* and *Fortune* magazines. Running a full 20 minutes, it explored political, economic, cultural, technological, racial social, public health, and military issues, often in considerable detail. Its most unusual feature was its combining authentic newsreel footage with staged scenes of events that had actually occurred but which had not been photographed by newsreel cameras.

The March of Time producers used both professional and amateur actors and re-created sets of various locales. The series soon became so popular that celebrities portrayed themselves on film, re-creating events in which they had participated. The technique was similar to that employed years later in the production of television docudramas, except that *The March of Time* did not identify its footage as having been re-created with impersonators.

Unusually bold for its time, it attacked political nostrums, ridiculed pomposity in public figures, and made pungent, oftentimes hilarious comments on current events. Illuminating the twilight zone between journalism and propaganda, *The March of Time* was consistently antifascist at a time when cautious motion picture producers generally avoided controversial subject matter. Miraculously,

it survived in theaters for 16 years, from 1935 to 1951, the only regularly released commercial motion picture series to consistently present controversial subject matter.

Decline and Disappearance

In the years immediately following World War II, the American motion picture industry suffered a sudden and precipitous decline in revenues as people found themselves able to enjoy other recreations and entertainments unavailable during the war. Many motion picture theaters closed their doors and studios looked for ways to cut production costs. Newsreels, never having made a penny for their owners, were among the first to go. Further, with each passing year it became apparent that newsreels could not compete successfully with the much more rapid and thorough coverage of the broadcast news media, especially via the relatively new medium of television.

One by one, each of the great American newsreel companies closed down. The last of these to go in the United States was Universal News, which ceased production in December 1967. That was the end of the American newsreel, perhaps the only major medium of communication that ever closed is doors and went completely out of business.

Archival Value

Although the newsreel has disappeared, at least in the form of semiweekly issues released for showing in motion picture theaters, a good deal of an estimated half billion feet of film photographed by American cameramen alone survives in archives throughout the world. Scorned by print journalists and depreciated by its owners during its lifetime, the newsreel has, following its operational demise, become a valuable resource for the historical study of the twentieth century. It has also acquired considerable economic value as the raw material out of which new documentary features can be fashioned for television. Some of the most interesting of such footage consists of "outtakes"—scenes which were photographed by cameramen but which, for one reason or another, did not find their way into finished newsreel releases.

Regrettably, a somewhat cavalier attitude is frequently taken by documentary editors in selecting newsreel footage to illustrate points being made by the narrator and to bridge gaps in the film's continuity: historical accuracy is often skewed through the editing and positioning of particular shots and scenes. As a consequence, historians have grown more cautious in recent years in their examination of so-called archival documentaries and the newsreel materials from which they are made.

Newsroom Culture

Newsroom culture refers to the assimilation of unwritten workplace rules and shared assumptions regarding values, beliefs and practices. Unlike climate, which can vary between organizations and change with each leader, newsroom culture is embedded into the customs and mores of the profession and evolves gradually. Culture is a sociological feature of all workplaces, a function of human interaction.

What makes newsroom culture significant is its influence on how news is defined and reported. Journalists have norms that govern behavior, such as acceptance of minor deceptions to obtain a story or uneven treatment of presidential candidates

during primary elections based on who is deemed to have a chance of getting elected. Because these foundational beliefs are seldom articulated, journalists rarely discuss newsroom culture or acknowledge its influence on their everyday routines. Therefore, most writing about newsroom culture comes not from journalists, but from sociologists and academics studying workplace behavior, and analyzing the tension between autonomy and conformity.

The primary hallmarks of newsroom culture are competition and a situational ethic that justifies getting the story. Newsroom morale depends on competition. Television journalists measure their effectiveness by Nielsen ratings and celebrate the "get," an exclusive interview. Long before websites and portable satellite uplinks enabled 24/7 news operations, journalists chased after breaking news and strove to beat competitors by minutes. Getting stories first also justifies inaccuracies; newsrooms generally believe it is better to report the story in a timely manner and get a few details wrong than it is to ensure every detail is accurate and get beaten. Competition also exists within organizations. Television's pay scales encourage an up-or-out career path in which journalists expect to stay at a station for no more than a year or two, build a demo tape and jump to a larger market—a competition that creates a newsroom culture with shallow geographic roots. Some newspapers pit starting journalists against each other in undesirable beats or less prestigious departments to see who will sink or swim. Such competitions reinforce the other enduring facet of newsroom culture, that the story trumps most other considerations. Journalists may debate the ethical ramifications of practices such as hidden cameras and weigh the potential harmful effects of a story, but they ultimately give the story itself preeminence, a thumb on the scales in favor of publication or broadcast. If the story is important, journalists feel little compunction about using stolen or leaked documents such as the Pentagon Papers, and so long as they themselves did not commit theft to get the documents. Newsrooms are factories designed to supply news for the next news show or edition and thus have an incentive to place the story ahead of other considerations.

Development

Newsroom culture has evolved as a result of media economics, the professionalism of journalism, and social forces. Newspapers, which began as one-person operations, continued to reflect their owners even when they became larger operations as advances in machinery and the urbanization of America made large-circulation papers feasible. The press lords of the nineteenth century, such as James Gordon Bennett (1795–1872). William Randolph Hearst (1863–1951), and Joseph Pulitzer (1847–1911), molded their newspapers in their images. Even in the twentieth century, a Hearst newspaper had a different feel than one run by Col. Robert McCormick (1880–1955) in Chicago (*Chicago Tribune*), Harry Chandler (1864–1944) in Los Angeles (*Los Angeles Times*) or John S. Knight (1894–1981) in Detroit (*Detroit Free Press*). In some cases, editors imbued their newspapers with unusual climates, such as when Barney Kilgore (1908–67) built *The Wall Street Journal* into a national force or Gene Roberts (1932–) transformed the *Philadelphia Inquirer* from a second-tier newspaper in its own town into one of the nation's top five dailies, according to a *Time* magazine ranking, by instilling a risk-taking culture that embraced pranks like bringing a camel into the newsroom.

In some cases, systems have lasted over time. For example, *The New York Times,* which for years has invested a fair amount of authority in its editing "bullpen," is regarded as an editor's newspaper, while *The Washington Post* bestows more authority to individual reporters and grants editors less leverage. But while the locus of power may last several decades, and although the impact of individual editors, news directors, and producers is undeniable, these distinctive characteristics may not be durable. The more pervasive and ubiquitous nature of newsroom culture evolves more slowly, and primarily from economics, education, and society.

The strength of press lords and other powerful figures waned into the twentieth century because of inheritance taxes and the inevitable thinning of family bloodlines. Families such as the Ochs-Sulzberger line that has guided *The New York Times* since 1896 are rare; more common are the Knights, Chandlers, and Bancrofts that relinquished control to Wall Street or sold outright. At the start of the twentieth century, the ratio between family and corporate ownership was about four-to-one; by the end of the century, that relationship had been reversed. As newspapers turned into public companies, they increasingly were run by

professional managers with marginal journalistic credentials, and Al Neuharth (1924–) of media company Gannett exemplified a push to raise operating margins and quarterly earnings to boost stock prices. These economic emphases changed newsroom culture from one dominated by the eccentricities of its owners to one standardized by group ownership while embracing marketing techniques such as audience surveys and business terminology like "return on investment." Newspaper chains valued having publishers and editors who could move between newspapers every three to five years, rather than stay at one location for decades, which in turn produced a uniformity in newsroom culture.

This economic-induced homogenization paralleled rising professionalism. The American Society of Newspaper Editors was formed in 1922 partly to establish ethical standards for newspaper journalism and thus imbue newsroom culture with a sense of craft. Journalism turned away from the excesses of sensationalism that marked the end of the nineteenth century by emphasizing the training and development of journalists, including the first collegiate program (at the University of Missouri) in 1908. The rough-and-tumble era exemplified by the play and movie *The Front Page* was being replaced by a white-collar mentality. The audience was becoming more educated, too. A public that once saw newspapers as primarily entertainment vehicles, embracing moon hoax stories and lurid tales of debauchery, expected its newspapers to supply serious and truthful accounts of an increasingly complex world. In turn, newspapers, led by *The New York Times,* began to transfer power from the publisher to the reporter. No longer could a publisher's parochial or partisan vision be sufficient to meet the expectations of the audience; newspapers needed educated and capable reporters to summarize events and challenge official pronouncements. Thus, the newsroom culture was changed from one that reflected its owner to one that prized independence and autonomy. Rather than take its cues from the owner's preferences, the newsroom saw itself as a profession defined by peers.

The situation was different for television, which from its inception was controlled by networks dependent on advertising. Even CBS broadcaster Edward R. Murrow (1908–65), who set the standards for the new medium, allowed a show's sponsor to dictate the choice of broadcaster host, though not the content. Further, the ability of television to reach vast numbers of people, and to stir emotions in a way no printed product could, gave it so much power that broadcasters were more cautious than they had been on radio. As author David Halberstam noted in *The Powers That Be* (1997), television networks, from their inception, decided unconsciously that they would be judicious in their use of power and limit the autonomy of news programs—so much so that Lyndon Johnson once observed that Walter Cronkite (1916–2009) would have been the most powerful person in America if he would have said on television what he said on radio. Television's power limited the autonomy of its practitioners.

A third factor affecting newsroom culture has been social change precipitated by the civil rights movement, which in turn spawned the second wave of feminism. After race riots broke out in dozens of U.S. cities, the Kerner Commission in 1968 scolded the news media, with its lily-white newsrooms, for providing a distorted picture of life in America. The situation was equally dire when viewed through the lens of gender: females were relegated to women's sections in newspapers and were virtually nonexistent in television. Antidiscrimination laws and regulations, enforced by the Federal Communications Commission for broadcasters, and a consensus that newsroom employment should reflect the communities they serve, gradually resulted in more diverse newsrooms. Women moved into the city room and assumed decision-making positions; his-and-her anchors became the norm in local television. However, social change did not completely transform the newsroom, even into the twenty-first century. Television prefers women who are young and attractive, and daily newspaper employment has never approached gender parity. Religion is often a blind spot in U.S. newsrooms, exemplified by *The Washington Post*'s 1993 front-page description of evangelical Christians as "largely poor, uneducated and easy to command," a pejorative phrase that should have triggered alarms during the editing process. Some critics such as Bernard Goldberg in *Bias* and William McGowan in *Coloring the News* have argued that journalism's embrace of diversity has been selective and resulted in errors born from a liberal bias. While most journalists have rejected those criticisms, they are more than three times more likely to have a college degree than the audiences

they serve and, especially in urban markets, are often paid more than the median per-capita wage. In short, newsrooms tend to be more elite than their communities, validating the Kerner Commission critique.

Autonomy and Conformity

Throughout its evolution, newsroom culture has been the product of two seemingly contradictory ideas: autonomy and conformity. A hallmark of any profession is the autonomy granted practitioners. For journalists, that autonomy is seen as a necessary check on the influence of advertisers and the powerful. Yet journalism is also practiced in social settings in which peers guide behavior—not only because human beings are socialized creatures but also because journalists depend on consensus to define news and set ethical boundaries. Competing television networks, for example, scrutinize each other's evening newscasts, wanting to stand out from the others but not by much; they need their coverage decisions and priorities to be similar enough to affirm their definitions of news. The tension between autonomy and conformity is heightened in the United States by the fact that the news reporting system is privately owned. Journalists serve a business purpose, to create and hold audiences, even as they assert they have a church–state relationship with the business side of the operation.

Starting in the 1950s, sociologists such as Warren Breed, Gaye Tuchman, and Herbert Gans identified the mix of autonomy and conformity in newsroom culture by observing journalists at work for extended periods. They found that even new staffers were attuned to the preferences of management, writing their stories to match whatever appeared in print and avoiding subjects that appeared to be taboo. Newsrooms are often run on a star system, and those afforded such status are granted much greater autonomy; in television stations, anchors—often referred to as "talent"—wield enormous authority to define and prioritize news. Gans, who studied CBS, NBC, *Time,* and *Newsweek* in the 1970s, was struck by how much those journalists relied on each day's *New York Times* to define news, even as they insisted they made news judgments independently; they seemed oblivious to the conformity encouraged by the news bureaucracy. Tuchman found that newsrooms valued collegiality so highly that decision makers consciously apportioned prized front-page space fairly evenly among various sections rather than by merit. Several studies have shown that newsroom culture crosses organizational lines, such that competing city hall reporters share coverage ideas and story framing in a self-reinforcing mechanism to define news.

Journalistic core ideologies affirm the value of autonomy. Two of the *Elements of Journalism* identified by Kovach and Rosenstiel in their widely embraced 2001 book involve autonomy: independence from sources and freedom to exercise personal conscience. Journalists often view the mid-1970s' Watergate scandal as an exemplar of the value of autonomy: unheralded *Washington Post* reporters Carl Bernstein (1944–) and Bob Woodward (1943–) doggedly pursuing a story that few at their own newspaper and even fewer in a city teeming with journalists thought worth chasing. Yet journalists rarely acknowledge that conformity constrains autonomy. As President, Franklin Roosevelt adroitly used peer pressure to shape what the White House reporters covered. The FBI sought to discredit Martin Luther King Jr. in the 1960s by showing journalists evidence of King's extramarital dalliances, and many journalists knew that President Kennedy had paramours in the White House. No journalist chose to print or air those stories because newsroom culture at the time deemed the private lives of public individuals to not be newsworthy. That would change dramatically just a few years later, when the indiscretions of U.S. Representative Wilbur Mills and presidential candidate Gary Hart became major news stories. As *Rolling Stone* reporter Timothy Crouse documented in *The Boys on the Bus,* a behind-the-scenes look at reporters covering the 1972 presidential election, editors expected their political reporters to follow similar angles on stories and expressed concern if their reporter's version of a campaign event was markedly different than that of the wire services.

Conclusion

Journalists rarely discuss newsroom culture or acknowledge its existence because most of culture is implicit in newswork routines, yet it shapes how news is defined and pursued. At its core, newsroom

culture is a product of tension between autonomy and conformity, between the independence granted individual practitioners and journalism's need for consensus in determining what news is. As journalism enters a new era in which traditional boundaries between mediums are blurred by online convergence, newsroom culture may evolve further but will continue to be marked by an emphasis on competition and the supremacy of the story.

News Syndication

News syndicates license content for use in newspapers and on websites. Separate companies syndicate programming for broadcasters. Wire services, which focus on breaking news, have traditionally been treated as a separate industry from news syndication. However, the consolidating environment of recent decades has seen growing overlap between the two. The industry's leading syndication firms in the twenty-first century included the Associated Press (AP), Tribune Media Services (TMS), New York Times Syndicate, Washington Post Writers Group, Creators Syndicate, King Features, and Universal Press Syndicate.

Syndicator products include news, opinion pieces, reviews, advice columns, crosswords, comics, and nearly anything else that can fill a news hole. Syndicates allow their clients to offer an array of content and spread the cost of expensive features across a large number of subscribers. Syndicated material can detract from a media outlet's communal qualities, however, when nationally homogenized content is substituted for locally distinct material. Indeed, news syndicates—which furnish everything from political opinion to horoscopes—have been more responsible than any other source for giving newspapers their character. The popular orientation of much syndicated fare—whether through bridge columns in the 1920s or adventure travel columns today—serves to enmesh news outlets within the broader cultural fabric of their times.

Early Development

While today's new syndicates are institutionally rooted in three distinct branches of the nineteenth-century news business—the wire services, stereotype-plate sales firms, and feature syndicates—the general idea of sharing news content goes back to the start of periodical publishing in seventeenth-century Europe. Throughout the late eighteenth and nineteenth centuries, newspaper publishers shared stories by mailing issues to one another. One of the Post Office's founding mandates was to facilitate this practice through subsidies and extensive network of routes. The Postal Act of 1792 set newspaper mailing rates at a fraction of what it cost to send personal correspondence.

The 1840s were a pivotal decade in the development of news sharing practices. Heightened competition among the "penny press" dailies spurred publishers to seek out faster ways of procuring more news. They commissioned pony and railroad express services to rush home the European intelligence washing into Northeastern ports, plus political news from Washington, D.C. These businessmen almost immediately recognized the utility of the telegraph for sending news at lightning

speeds. As wires were strung across the eastern states in the mid-1840s, a group of New York papers consolidated their express and telegraph activities as a cost-saving measure. This group, dubbed the Associated Press (AP), soon realized that the same wires that brought the news to New York could also be used to disseminate news back out into the hinterlands. The AP began packaging news from abroad with rewritten items from newspapers across the United States and selling it as a package to clients.

The cooperative's power grew over the next three decades as it forged a close partnership with telegraph giant Western Union and monopolized journalistic use of the new transatlantic cables. Similar agencies emerged overseas, as Reuters (Britain), Havas (France), and Wolff (Germany) formed a cartel to control news-gathering activities across Europe and colonial Asia and Africa. While the wire services would become their own industry, they sped the move toward newspaper content as a commodity that could be formulaically packaged and distributed.

Amidst this entrepreneurial climate, a number of publishers began experimenting with selling readymade news content in the form of printed inserts and stereotypes. *New York Sun* publisher Moses Yale Beach printed copies of the President's 1841 State of the Union address for smaller papers in the region, swapping out the masthead for each of his clients. In 1847, Vermont publisher Edgar Kimball commissioned a paper in Boston to print copies of the President's address on one side of a broadsheet. Upon receiving the copies, he printed his own news and advertisements on the other side. The practice spread west over the next two decades as frontier publishers looked to larger neighbors for printed news pages—usually placed inside the paper. A group of Wisconsin publishers, led by Ansel Nash Kellogg, started a booming trade in advertising-laden news pages called "readyprint," collecting revenue from small-town publishers hungry for content and businesses eager to reach a larger, more geographically dispersed, public.

Kellogg broke away after the Civil War and moved to Chicago to find his own business—A. N. Kellogg Newspaper Company—specializing in readyprint. Kellogg's pages, which featured fiction and novelty items, were designed to appeal to a wide audience and avoid the pitfalls of timeliness. By 1870, the company supplied nearly two hundred newspapers, and Kellogg had exchanged its one-size-fits-all model for more customized pages that could reflect a subscriber's political leanings. The industry expanded rapidly over the next decade. Kellogg, and chief competitor Chicago Newspaper Union, hired editorial staffs to write both national and local news. The syndicates also struck deals with popular writers to serialize their new works and experimented with images. The two companies also launched aggressive industry consolidation campaigns, buying up regional competitors in the East, Midwest, and South to push their subscription lists into the thousands. A third industry giant, the Western Newspaper Union, expanded rapidly in that direction as settlers pushed toward the Pacific.

As the syndication businesses grew, a prejudice formed against readyprint. Critics saw something sinister in papers that were supposedly expressions of a local community but were in actuality products of distant regional hubs. They worried that the practice would lead to a national network of homogenized papers. The Chicago Fire of 1871 focused national attention on the issue as towns across the Midwest went without newspapers when pages intended for them went up in flames. Congress came close the following year to reclassifying the readyprint newspapers so as to revoke their postal subsidies. The syndicates were able to fight off the challenge, but the stigma against readyprint remained a formidable barrier to greater industry growth.

Introduction of Features

The introduction of stereotype sales in the 1870s helped erode that barrier. Syndicates upgraded their facilities to churn out mass-produced plates bearing serials, children's stories, recipes, gossip columns, and other features that were common to urban papers but, until then, too expensive for the country press. Publishers that spurned readyprint were more open to stereotyped features that they could seamlessly work into their own layouts. William Allen White, for instance, regularly purchased plates from A. N. Kellogg to keep typesetting costs down and offer a wider variety of content in his western Kansas *Emporia Gazette*. Syndicates like Kellogg allowed small-town editors like White

to adorn their papers with stylistic fonts, images, and ornate borders that they would never have been able to produce in their simple print shops.

The syndicates built up stables of marquee writers, as well, and promoted them to urban papers in the 1880s. The market for popular columns and serials attracted a number of ambitious young businessmen—including Irving Bacheller, S. S. McClure, and Edward W. Bok—who started their own syndicates specializing in content for Sunday newspaper supplements and would immediately go on to building mass magazines. In this sense, the news syndicates were something of a laboratory for magazines, such as *McClure's* and Bok's *Ladies Home Journal,* that would become the nation's first truly national media. Over the next quarter century, the syndication business experienced phenomenal growth as newspapers and readerships expanded. New businesses sprouted up to license everything from William Allen White's observations to the German Kaiser's diaries.

The bustling trade in features did not go unnoticed by the era's biggest press barons—William Randolph Hearst, Joseph Pulitzer, and E. W. Scripps—who perhaps better than anyone recognized the value of newspaper content with mass appeal. Newspaper reading for many Americans of the era was first and foremost a leisure activity and they sought out papers that offered the greatest entertainment value. Hearst and his cohort attracted legions of novice readers by filling their papers with gossip columns, women's pages, sports commentary, comic strips, and other innovations. Sunday supplements—bulging with nearly one hundred pages of serials, columns, rotogravures, and color comics—took this approach to newspaper publishing to its extreme. The cornucopia of material in papers like the New York *World* and *New York Journal* were a print distillation of the vibrant city cultures arising at the time. Their focus on sports and entertainment reflected the rise of public amusements and rendered the papers themselves one of those amusements.

With newspaper reading reoriented toward entertainment, urban publishers fought over the most popular features, looking to woo their creators and with them the devoted readers that would follow. In the most celebrated case, Hearst pried cartoonist Richard Outcault and his "Yellow Kid" strip (the namesake of "yellow journalism") away from Pulitzer in 1896 to launch his Sunday comic supplement in grand style. In the decades to follow, the big city paper's most popular writers and comics spread throughout the United States as press lords built national chains and launched their own syndicates. Scripps established United Features (1891), Pulitzer the World Syndicate (1905), Hearst the International News Service (1909), and King Features (1916).

The birth of these syndicates marked a new chapter in the industry's development. While Western Newspaper Union—which in the 1900s and 1910s bought out A. N. Kellogg and the rest of its rivals in the "boiler plate" trade—continued to serve printing needs of small presses, the locus of the industry had firmly shifted toward the licensing of nationally recognized media titles. In the half century leading to the 1940s, syndicated features were central to American culture and as such became one of the most important aspects of the newspaper industry. Buster Brown, Little Nemo, Krazy Kat, the Gumps, Buck Rogers, Little Orphan Annie, and dozens of other comic-strip characters were among the most recognized icons in the country. And many of these characters permeated the entire media environment, surfacing in magazines, films, radio, and advertisements.

Similarly, syndicated columnists were not only celebrity journalists but bona fide celebrities. The columns of New York– and Los Angeles–based writers Adela Rogers St. John, Damon Runyon, Walter Winchell, and Louella Parsons served as eyes on the emerging culture industries for American in smaller cities, towns, and rural areas. As such, these writers held incredible sway over the industries they covered. Hollywood producers, actors, and actresses, for instance, lived in fear of Parsons's capacity to spread harmful rumors.

Of the celebrity columnists, Winchell was by far the most powerful. He rose to fame during the 1920s and 1930s as his Broadway column climbed the ranks from a lowly trade paper to Bernarr Macfadden's *New York Graphic* and then to Hearst's *New York Mirror.* Winchell's defection from the *Graphic* to the *Mirror* was treated with similar fanfare as Hearst's "Yellow Kid" coup three decades prior. The glitzy nightlife Winchell chronicled in his column, characterized by his punchy tone and trademark neologisms, was an encapsulation of Jazz Age city life, and it was requisite reading for the millions

that fantasized about that world. Winchell parlayed his print notoriety into even greater national reach through his weekly radio broadcast. And as his fame mounted, Winchell sprinkled political commentary into his show business gossip. The columnist's power to shape public opinion won him elite access to Franklin D. Roosevelt and FBI chief J. Edgar Hoover, who both sought to use him as a conduit.

The cultural potency of syndicated material in the first half of the twentieth century translated into tremendous economic power. The *Chicago Tribune*–New York *Daily News* syndicate's comics supplement was the country's single most expensive ad medium in the early 1930s. Ownership of a menu of well-syndicated features was a powerful tool in the hands of an aggressive executive. Hearst used his King Features columns and comics to underwrite expansion of his newspaper chain in the 1920s. At the same time, he could use his growing chain to build his syndication business. Hearst's syndication deputy claimed that the company only needed to allude to the possibility of starting a newspaper in an area to scare a nonsubscriber into signing up for King features.

Syndicates in the Twenty-First Century

While the era to the 1940s would be the high-water mark for news syndicates, the business model established then would remain entrenched. Syndicates, many of whom operate as part of larger media conglomerates, continue to concentrate on marketing columns, comics, features, and media brands. A handful of especially successful comic properties, most notably Charles Schulz's *Peanuts,* would gain the sort of cultural ubiquity common a few decades before. But it is difficult to imagine a new comic reaching those heights today. Likewise, while a name such as Ann Landers could become synonymous with personal advice in the mid- to late twentieth century, she does not appear to have a twenty-first-century successor. The decline of cultural icons in the syndication business has not meant a collapse for the industry, however. Newspapers remain dependent upon syndicates for the high production values and variety that readers expect.

Syndicates have also benefited from the rise of punditry. Signed political columns emerged in the 1920s and 1930s as newspapers looked for writers who could interpret the news's import for readers. Behind this development was the growing consensus among journalistic elites that modern life's complexities outstripped the average person's mental faculties. Some of the earliest pundits, such as Arthur Brisbane, Mark Sullivan, and Westbrook Pegler, were essentially mouthpieces for the overwhelmingly conservative views of the publishing class. But more liberal columnists, including Walter Lippmann and Raymond Clapper, often appeared on the same pages to counter those views. This gallery of vying interpreters became institutionalized in the form of op-ed pages over the following decades.

Like Winchell, the most widely syndicated political columnists enjoy elite access to the corridors of governmental power. The quintessential columnist in this vein, James "Scotty" Reston of *The New York Times,* wrote from the perspective of an insider privy to a firsthand view of history. Reston's columns, informed by his conversations with Presidents, secretaries of state, and premiers, were generally understood to be a window on their thinking. This sense of direct access has been central to cultivating an aura of authority around the punditry.

Today's syndicates present themselves as brand powerhouses offering content to be plugged directly into newspapers and websites. The New York Times News Service/Syndicate not only sells its own articles and op-ed pieces but also science news from *Nature,* investing tips from *Smart Money,* and dozens of other branded packages. Creator's Syndicate, which codes its comics "S" for strip and "P" for panel, also codes its political commentators "C" for conservative and "L" for liberal. Each can be conveniently dropped into place.

The nature of the syndicates' basic product—plug-in content—has partly insulated them from some of the newspaper industry's recent economic woes. As managers have looked for ways of raising profit margins, many have cut newsroom staff and outsourced their work to syndicates. But at the same time, those boosts have been balanced out, or even erased, by shrinking—and in some cases disappearing—newspaper sections. Syndicates have responded to print developments, however, by repackaging their columns and comics for sale as web content.

The news syndicate's origins lie in the long tradition of sharing news content. They have provided the valuable service of democratizing access to an array of material. In theory, syndication allows readers anywhere to access the most insightful columnists or enjoy the most talented cartoonists. But the other side to that geography-defying access is the persistent threat of homogenization—a nation of community media obliterated of local character. The role the syndicates have played, historically and in the present, straddles these two extremes. Their most important function has been to spatially and temporally situate journalistic products. As a national culture developed, syndicated material marked local media as a part of a broader community stretching beyond the horizon in every direction. As editors have responded to popular trends by syndicating serials or Sudoku puzzles, they have marked their papers as products of a cultural moment.

News Values

Journalists are taught either through workplace socialization or college training that events and people may possess any of a half dozen attributes, which can make them newsworthy. Informally "scoring" potential stories for those values is one of several routines used by news workers to define, select, and deliver news.

Lists of news values offered by professional and academic authors vary, but most agree upon these six attributes: conflict (struggles featuring people, governments, or social and natural forces), impact (the number of people affected and how much they are affected), proximity (geographic or demographic closeness to the reader, listener, or viewer), timeliness (the more recent, the more newsworthy), prominence (how widely known a person or event is on the local, regional or national and international levels), and novelty (unique or bizarre people and events). Human interest sometimes is cited as a distinct attribute, but many argue that it is a component of the other six.

Novice news workers usually are taught to test for the presence of these news values by asking a classic series of questions—Who? What? Where? When? Why? and How? And they learn that news is often what is different from the norm. "Man bites dog, not dog bites man," for instance, exemplifies the novelty news value. Beginners also learn that potential stories usually should incorporate more than one value, and researchers have found that the initial paragraph or lead of most newspaper stories contain at least two news values.

Development

Determining an event or person's news value can be traced as a media routine at least to the early

nineteenth-century "penny press" newspapers of Britain and the United States, the first designed for general audiences. Judgment about "news value" had undoubtedly been determined even earlier for communication not intended for wide distribution because of limited literacy. News values also were surely applied to political or business papers slanted heavily toward opinion directed to social elites.

Indeed, printed enumerations of news values date at least to a 1695 German guidebook on reading the news that listed importance and proximity. Later lists of news values worked their way into early journalism textbooks. In a revision to his 1913 *Newspaper Writing and Editing* text, Willard Grosvenor Bleyer (1873–35) listed timeliness and reader interest as prime news values. Bleyer further subdivided reader interest into extraordinary events; struggles for supremacy by individuals or nations; romance; mystery; adventure; human interest; and children, animals, and amusements. He wrote that audience interest in the news was proportionate to the reader's degree of familiarity with the event, the event's importance or prominence in the reader's life, and the event's proximity to the reader's home and business. He argued that the best news was that which had the greatest effect on the largest number or readers. Over time, Bleyer's list was simplified to six or seven distinct elements. The 1977 edition of Curtis D. MacDougall's (1903–85) popular *Interpretative Reporting* text listed news values to be timeliness, proximity, prominence, consequence (another term for impact), and human interest. Popular twenty-first-century reporting texts suggest that these values apply to both traditional as well as newer digital media.

Measuring news value does not guarantee bias-free stories. The scoring process can and is affected by reporter and editor culture and ideology, type of news medium, size of news organization, the application of other news routines, and more general social, technical, and other factors. For instance, Western media tend to favor stories that incorporate conflict and prominent people. Media in developing countries may test events or people for proof that the news relates to the social and economic development of their societies. These countries often resist attempts of transnational companies to establish media outlets within their borders out of concern that such ventures could displace indigenous news values with those from other cultures.

Traditional print and broadcast media, depending on their type or size, usually demonstrate a preference for different news value clusters in their content selection process. Broadcast media prefer timely news because of the speed and frequency with which they can issue reports, and some research indicates television especially collapses the traditional news values list into audience interest, importance, and visual quality. Small weekly newspapers favor stories high in proximity, while small dailies favor proximity in combination with human interest or timeliness. On the other hand, metropolitan dailies favor stories emphasizing timeliness combined with prominence and conflict.

Somewhat similar groupings of news values occur when global news organizations communicate about less developed countries. These distant places rarely receive attention, but when they do, the emphasis tends to be on hard news such as reports on natural disasters or armed confrontations that are high in conflict value. Researchers also have found that journalists are less likely to apply professional story selection standards when they report on an event or person closely connected to their own national interests. For instance, news from abroad must deal with more victims—a form of impact news value—before receiving attention. Two decades ago, William Adams's study of U.S. broadcast news developed a crude "exchange rate": The news value assigned to the death of 1 Western European equals 3 Eastern Europeans, or 9 Latin Americans, or 11 Middle Easterners, or 12 Asians. Research also indicates that any country's media demonstrate a preference for stories from other regions that are culturally, geographically, or psychologically proximate.

Other Influences

News value decisions made by metropolitan elite or prestige media can filter down to smaller organizations. This "arterial process" means that the less prestigious news organizations mimic the selection decisions made by their larger broadcast and print counterparts because those organizations have more resources to pursue the news. The filtering process can occur rapidly because prestige media often own press and video services that

syndicate stories to smaller organizations as well as communicate what stories will be featured in the elite organization's next broadcast or print edition. The same holds true for the Associated Press and other news agencies. This "top-down" influence on journalists can be unconscious. "Gatekeeper" studies found that editors responsible for selecting news agency stories for their publications were unconsciously selecting those stories from topical categories in the same proportion as the wire services offered them.

Application of other news routines, like source selection, can influence the types of stories produced by news organizations. Reporters usually seek news from sources "affiliated" with societal institutions like law enforcement agencies that are conveniently located on a reporter's beat. The number and diversity of sources used to tell a story—sometimes used by researchers and news professionals as one indicator of news quality—is naturally affected by economics. For example, development of non-routine, diverse sources is highest for stories about nearby events with high conflict news value. News organizations can rarely afford to develop the same variety of sources for events outside their immediate marketplace. Affiliated sources who subsidize the collection and preparation of news stories by partially preparing them also can influence the news value scoring process. Several studies have found that 9 to 50 percent of content (depending on the medium) is provided by public relations professionals. Newspaper content represents the high end of that percentage range. Reliance on such affiliated sources eventually marginalizes or eliminates nonaffiliated or underfunded sources. Consequently, these sources may not appear or they may become associated with stories demonstrating other news values. Unaffiliated sources, for instance, often are used as examples of victims or criminals in stories high in conflict or human interest value. Likewise, affiliated sources often are paired with public affairs stories presumably high in prominence or impact news value.

Journalists generally have little contact with or feedback from readers, viewers, and listeners. Consequently, they strive to produce work that satisfies or that is praised by their immediate peer group. Critics have called such peer groups "monocultures" because news organizations often are staffed predominately by white, male, middle-class workers who share the same ideological outlook. The influence of the news monoculture is so strong because it creates an unconscious bias for familiar places, cultures, and life histories when journalists, write or select stories. Presumably, this socialization effect can be particularly powerful when it is not offset by college-level education *about* journalism—the situation for a substantial minority of print journalists at the close of the twentieth century. Monocultures also bias news value scoring in another way. Members have a tendency to replicate previous story selections made in daily budget meetings. These meetings determine the content of broadcasts and newspapers. After initially picking a particular type of story, editors and producers who attend these meetings have a tendency to pick the same type for later editions or broadcasts.

News Definition

Finally, digital communication technology that erodes a traditional medium's dominance can set off a series of changes that affect the application of news values. These may lead to a larger definition of legitimate news or reorder the importance of traditional news values as journalists struggle to maintain or change the balance between what audiences *need* in order to function in society with what they *want*. For example, the timeliness news value declined in importance for newspapers during the late twentieth century given competition with broadcasters, particularly 24-hour cable news services. Newspapers adapted by pursuing stories with more proximity value—and greater depth. They later rejoined the competition for timely news by creating online website versions that permitted continuous updating of stories.

The competition for news and audiences driven by digital technologies early in the twenty-first century created a dilemma for all media, which theoretically now had unlimited space and time to transmit news in cyberspace. Should media make the investments in newsgathering assets to produce enough "important news" to fill their increased time and space? Or should they expand the definition of news to include more events and people that were easily accessible with the existing newsgathering resources, but which were previously considered to be in the private sphere? This cycle of changing technology, renewed competition, and

reconsideration of news and news values is now common in news media.

In a sense this is not new, for traditional news paradigms and the values that underpin them have been challenged in the past. In the 1890s, for example, new printing and typesetting machinery and increased advertising revenue made it possible to print larger newspapers more quickly and cheaply than previously. A single invention, the linotype, made it possible for one operator to set as much type in an hour as a hand compositor could set in a day. This put a premium on timely news, but it also challenged journalists to find ways to fill ever larger newspapers with material attractive to readers. As a result, editors and reporters expanded their definition of legitimate news to include material not previously used or used infrequently; they also resorted to sensationalism. The "new journalism" of the turn of the last century embraced more sports, fashion, and what later would be known as lifestyle stories—topics that had news value for niche audiences. Journalists also developed an appetite for reporting gossip, fabrication, rumor, and events previously considered private, not public. Contemporary critics concluded that the traditional news paradigm had succumbed to business values that prized rapidity and titillation. Those who defended the new form of journalism argued that it incorporated a more egalitarian approach to the news and produced results for the everyday reader, not just social elites.

Digital News Technologies

At the turn of the twenty-first century, digital technologies again challenged an existing news paradigm. News professionals and their critics asked whether the consensus over news values was breaking down, whether this meant media content was being designed to entertain more than to inform, and whether this indicated a general decline in professional standards.

Some suggest that new media (as well as traditional forms) were being stuffed with opinion rather than news because opinion was unlimited in supply, cheap to produce, and entertaining for audiences. Using it, however, risked eroding the standards for separating news from commentary and confusing readers, listeners, and viewers about the difference. In some cases, these trends overpowered traditional journalistic routines while creating new ones. Media observer James Hamilton believed the changes were so basic that the "five Ws and one H" that had defined past news values had given way to a new focus. The questions now were about profits and audiences, not news.

The "opinion journalism" found online, on 24-hour cable talk shows, and privately produced blogs often failed to observe the routines and standards found in mainstream journalism. Not only did opinion journalism threaten the traditional news boundary, it tempted mainstream media to rely on gossip and trivia to attract audiences in a scenario reminiscent of the 1890s. Watergate journalist Carl Bernstein (1944–) called the result "junk journalism." Coincidentally, the media also produced more stories about how they did their jobs. These "covering the coverage" stories were cheap to produce and displaced news that audiences might have found more useful. Media historian Marion Marzolf observed that outsiders like A. J. Liebling (1904–63) of *The New Yorker* historically had critiqued media performance, but that changed during the latter part of the twentieth century. Now rank-and-file reporters, not opinion writers or editorial writers, were producing the critiques. This represented a conflict of interest.

Late-nineteenth-century journalism eventually managed to reform itself by experimenting with new content paradigms embracing objectivity and Progressive values before evolving into the social responsibility paradigm of the mid-twentieth century that thrived on impact and conflict news values. During the first decade of the twenty-first century, journalism again struggled with similar technology, news routine, and reform issues.

In this new struggle, the traditional questions used to isolate and to report the news likely will endure, but who asks those questions will expand as technology generates more and faster means of communication. For now, the traditional media find themselves competing with anyone who can claim a foothold in cyberspace. These new communicators are forcing the exchange of mass messages toward opinion and entertainment. Over time, whoever proves to be the most credible information broker likely will have the power to dictate what the "new" news will be.

Newsweekly Magazines

Newsweeklies or news magazines have for over 80 years grown to become a journalistic mainstay in the United States and in many other countries. They typically seek to encapsulate the events of the previous week into digestible sections, helping to make clear what is important and often interpreting that news. The format was designed from the beginning to help busy readers with only limited reading time to learn of the most important (or at least interesting) news, trends, and people. In recent years, a pronounced shift from hard to softer news is evident in cover stories and overall content.

Newsweeklies have always emphasized good writing, sometimes erratic style, and a growing use of photos and graphics. Most such publications are careful with facts and offer opinion in a gentle rather than overt fashion. They are intended for a general readership that has many pulls on its time, and thus by the early 2000s, newsweeklies presumed less than an hour of attention from their typical reader. Further, growing competition from television, cable news networks, and the Internet cut into potential reader priorities and in the 1980s, newsweeklies began to lose their central place in American journalism. By the early 2000s, they had stagnant circulations and occupied an increasingly peripheral place in the news media.

Newsmagazines differ from another type of publication with which they are sometimes confused—the weekly or monthly opinion magazine. Journals such as *The New Republic, The National Review,* or, in Britain, *The Spectator,* all deal with current events and controversies, but within a context of commenting on them more than reporting about them. They are, in part, aimed at the "already converted" on the right or left, the magazines serving to reinforce a mindset already in place. Other weeklies of comment, including *The New Yorker,* include essays, fiction, reviews, and a heavier dose of culture than newsweeklies usually include.

The most widely emulated example of the newsweekly genre is *Time,* which has published for 85 years. But depending how one defines the genre, *Time* was not the first such weekly—that honor would seem to go to Britain's *Economist,* which dates to the 1840s.

American Newsweeklies

The United States has long featured an active newsweekly market with three competing titles, the rankings of which changed little over the years. They appear here in the order of their circulation size.

Time

After some time spent on fund-raising and development, on March 3, 1923, *Time: The Weekly*

News-Magazine was launched by former Yale classmates Briton Hadden and Henry R. Luce. Its content, printing, and business operations were amateurish at first. Stories were largely rewritten from New York dailies, then presented in sections on national affairs, foreign news, music, education, religion, medicine, law, science, crime, and the press—among the 22 sections in early issues. The editors eschewed a separate editorial page but did initiate a careful fact-checking system at the outset. From the beginning, *Time* writing (dubbed "timestyle") was at least brash and sometimes nongrammatical with some sentences that seemed to run backward. *The New Yorker*'s Wolcott Gibbs famously provided his own example in a 1936 profile of Luce: "Backward ran sentences until reeled the mind." Once they got used to it, readers seemed to love it. The magazine's political coloration was generally Republican. The first color advertising (and the red band around the cover) appeared in 1927 by which time circulation reached 136,000. Hadden died in 1929, and for the next four decades, Luce dominated the growing company, which began *Fortune* as a monthly business magazine the next year and the weekly pictorial *Life* in 1936. A popular radio documentary, *The March of Time,* built on the content of the newsweekly. In 1927, *Time* began to select a "man of the year"—the first was flier Charles Lindbergh. Beginning in the late 1930s, *Time* provided excellent clear maps to support its stories.

Change came gradually to the magazine during Luce's years as publisher. A section on Modern Living begun in mid-1961 helped cover cultural trends. In 1965 the occasional "essay" was introduced to allow deeper consideration of topics not readily fitting into one of the established sections. Covers featuring issues or trends rather than people became more common after the 1960s—in 1982 the personal computer became "machine of the year." Increasingly in an era of television and then Internet-based news, the magazine veered away from simply reporting what had happened and more into assessment and interpretation. Graphics—and constant updating of the magazine's look—became common. By the late 1990s, the magazine seemed increasingly focused on soft or cultural news, with an emphasis on personality and show business.

The magazine was quickly successful, making it surprising in retrospect that it took a decade for competition to appear—which took the form of two different new titles. Throughout the competition, *Time* has always enjoyed the largest circulation, often by quite a margin.

Newsweek

Originally *News-Week,* the magazine was first published by Thomas J. C. Martyn (a former editor of foreign news for *Time*) on February 17, 1933. That issue, with an initial circulation of about 50,000 copies, featured seven photographs from the week's news on the cover. In 1937, *Newsweek* merged with the weekly journal *Today,* edited by Raymond Moley, who nominally took over the merged product. Malcolm Muir later took over as president and editor-in-chief. Muir changed the name to *Newsweek* and emphasized more interpretative stories. To expand its reach, *Newsweek* crossed overseas during World War II, putting out a pocket-size special edition for American forces in Europe. At war's end in 1945, *Newsweek*'s first international editions were published in Tokyo and Paris. The magazine was purchased for $15 million by the Washington Post Company in 1961 and five years later became the first newsweekly to initiate reporter bylines. In 1972 the magazine introduced the first woman to write a regular column for a newsweekly. *Newsweek* is usually considered the most politically liberal of the three American competitors, an alternative for those who dislike *Time*.

With four English editions and eight local-language editions, by the early twenty-first century, *Newsweek* claimed the most extensive global network of any newsweekly. Its first Asian-language edition appeared in 1986 in Japan and by the early 2000s was circulating about 100,000 copies. This was followed by a Korean-language edition in 1991 (reaching about 80,000 readers), and a Polish-language edition with an early 2000s' circulation of almost 140,000. A Spanish-language edition, begun in 1996, circulates to about 100,000 throughout Latin America (where a specialized English-language version also appears). An Arabic-language version, begun in 2000, circulates to about 30,000 readers in the Middle East. In 2004 Newsweek initiated *Newsweek Select* in China

and *Russky Newsweek* with a Russian circulation of about 50,000.

U.S. News & World Report

This newsweekly began as a daily newspaper, *United States Daily,* which first appeared in 1926, edited by journalist David Lawrence. Several years of losses, made worse by the Depression, let to its conversion to a weekly, *United States News,* which first appeared in May 1933, still edited by Lawrence. Throughout its early years, it focused on domestic issues and especially the New Deal changes in Washington, and how they affected the country. It remained in newspaper format until 1940. Only then did it look like and consider itself a true newsweekly, one that reached a circulation of about 90,000, much smaller than either of its competitors. In 1946, Lawrence launched another newsweekly, *World Report.* When the two merged in 1948, *U.S. News & World Report* was born with a circulation rising to a half million by the early 1950s. A decade later, readership approached 1.5 million. Content was less narrative in style than its competitors, and made less use of illustrations and color, providing primarily hard news. It often presented long interviews with newsmakers. From 1962 to 1984, *U.S. News* was employee owned. In 1984, publisher and real estate developer Mortimer B. Zuckerman bought the company.

In 1983, *U.S. News* began what became its hugely popular and influential annual rankings of American colleges and universities, which first appeared as a newsstand book in late 1987. It was joined by a similar ranked listing of *America's Best Graduate Schools* in 1994. *U.S. News* began its Internet presence in 1993, with a two-year stint as a content provider to CompuServe. Its own website, U.S. News Online, began in November 1995, including articles from the print edition. Long considered the most politically conservative of the three American newsweeklies, *U.S. News* reached a circulation of about two million in the early 2000s. Late in 2008, the magazine announced it would leave this competitive market in which it had always played third place. It ceased issuing a printed magazine (they had reduced to biweekly publication earlier in the year), reverting solely to a web presence, and monthly consumer-oriented magazines built around single topics—such as their famous college ranking guide.

International Examples

There are potentially dozens of titles published around the world which can—depending on one's definition—be seen as newsweeklies. Most are products of the post–World War II era.

The Economist

While relatively new to many readers in America, this British weekly is actually the oldest newsweekly. In 1843, James Wilson launched the newspaper (as it still calls itself) in London, in part to provide backing to the Anti-Corn Law League, a policy battle concerning tariffs on agricultural products. He remained the editor until 1857. The appointment of Walter Bagehot as editor in 1861 marked a major milestone. Under Bagehot, the newspaper established its reputation for editorial independence as it began to develop many of its most long-lasting features, including anonymity. Instead of attributing bylines, *The Economist* sought a collective voice, with a focus on the words and story, not on who wrote them. Only in 1888 did *The Economist* begin accepting advertisements. Under Bagehot, circulation stood at less than 4,000 and even by 1920, the print run only reached 6,000. Despite these small numbers, *The Economist* was also consistently profitable. After something of a battle over control, the present ownership initiated in 1928 with a 50–50 ownership structure between Economist Trust and the *Financial News* (later *Financial Times*).

By the late 1930s, half of the newspaper's circulation was being sent abroad; a dedicated "American" section was launched in 1941. From 18,000 at the end of World War II, circulation rose to more than 50,000 by the end of the 1950s, the first color ads appeared in 1960, and circulation first topped 100,000 in 1974. A redesign of the magazine featuring full-color editorial content came in 2001, followed, unfortunately, by layoffs to restore profitability. By the middle of the first twenty-first-century decade, the paper enjoyed a circulation of about 900,000, a third of it in the United States.

Maclean's

This Canadian newsweekly began in 1905 as a pocket-size business magazine reprinting stories

from Canadian newspapers. It first appeared under its current title (named after the publisher, Toronto businessman John Maclean) five years later. But it was not yet a newsmagazine—rather, it published fiction and nonfiction with a Canadian flavor. By 1919 its circulation reached 70,000 copies. In the 1920s, issues swelled to 100 or so pages, shrinking to less than half of that in the 1930s. The Second World War brought more change. *Maclean's* produced a "bantam" overseas edition at its own expense (it carried no ads) to meet Canadian forces' hunger for news from home. It was half the size of a regular issue, but proved immensely popular. By the time of its final edition of February 1946, the Department of National Defence had distributed an estimated 800,000 copies. The 1957 Canadian federal election created one of the magazine's more embarrassing moments. Written before the results were in, the magazine's June 22, 1957, editorial solemnly asserted that the Liberals had won. The words reached the newsstands the day after Canadians had given the Conservatives a resounding mandate. The following issue featured a retraction.

By the mid-1960s, *Maclean's* was losing money for the first time since the end of the Depression and reverted to a monthly in January 1967. Two years later, it reduced its size and raised its cover price to 35 cents. On October 6, 1975, *Maclean's* resumed publishing every two weeks and by then had bureaus in Ottawa, Vancouver, Calgary, Montreal, Halifax, Washington, and London. Weekly appearance was achieved once again three years later.

Der Spiegel

The German weekly (the title means "The Mirror"), founded by Rudolf Augstein, began on January 4, 1947, with a print run of 15,000 copies. It followed *Diese Woche* ("This Week"), the first German newsweekly (censored by British occupation authorities), which lasted only six issues. *Der Spiegel* began in Hanover and soon moved to Hamburg, its content striving to be interesting and often emphasizing people. And it developed an expertise in investigative reporting that became a mainstay of its journalism (such stories today can run for 10–15 pages). By late 1950, circulation reached 100,000. In 1962 the magazine was accused of treason for a report on NATO maneuvers and its editors (led by Augstein) were arrested, some remaining in prison for two months. Other journals helped the staff get out the next issue amid a growing storm of protest about the government's heavy-handed action. A court later found the journal innocent and the country's defense minister had to resign, followed not long after by the government of Konrad Adenauer. *Der Spiegel*'s reputation and circulation soared. The magazine has had difficult relations with nearly all of Germany's chancellors—which its critics see as evidence of its independence.

In 1974, Augstein, then publisher and largely owner of the newsweekly, gave half of its stock to the employees. (In 2007, by which time *Der Spiegel* enjoyed a circulation of 1.7 million copies, employees voted to oust longtime editor Stefan Aust.) Over the years, more than 20 competing newsweekly titles appeared in Germany, but most lasted no more than two years. A partial exception is *Stern,* a pictorial newsweekly first published in 1948. But its reputation was severely weakened when in 1985 it published so-called Hitler "diaries" that later proved to be a forgery.

L'Express

France's first newsweekly was modeled on *Time*. In 1953 Jean-Jacques Servan-Schreiber launched *L'Express*. Subtitled *Les Echos de Samedi* (Echoes of Saturday), the new weekly originally formed part of the financial weekly *Les Echos,* which dated back to 1908. *L'Express* managed to turn a slight profit by 1955. It was formed in part to support the economic and social policies of French Premier Pierre Mendes France, diametrically opposed to initiatives supported by Charles DeGaulle. It also enthusiastically championed America and the free-market economy. In September 1955 Servan-Schreiber converted *L'Express* into a daily newspaper, placing his support firmly behind the reelection of Mendes France to the country's premiership. After Mendes France's defeat the next year, *L'Express* returned to a weekly format. Coverage centered on domestic political disputes and the future independence of the French colony of Algeria. In 1964 *L'Express* modified its strong political advocacy to become more of a general newsweekly, and its weekly sales

rose from 150,000 to 500,000 within three years. In 1970, however, *L'Express'* editor won a seat in the French National Assembly representing his left-of-center party. Complaints about the "politicization" of *L'Express* swelled into a full office showdown between Servan-Schreiber and his staff in mid-1971, resulting in the mass resignation of the magazine's senior editorial staff, several of whom initiated a new magazine to compete with their former employer. It launched as *Le Point* in 1972 and the two have competed ever since.

In 1977, Servan-Schreiber sold *L'Express*. The present publisher, the Express-Expansion Group, produces 20 other magazines and newsletters as well as eight websites with free or subscriber services, organizes conferences, and produces approximately 100 practical guides every year in a variety of fields. *L'Express* by the early 2000s had a staff of about 120 serving a circulation of about a half million.

Tempo

Indonesia's premier news magazine (the title means "Time") was founded in 1971, early in the New Order, the autocratic regime that General Soeharto brought to power in 1966. Led by poet and intellectual Goenawan Mohammad, *Tempo* initially supported the planning that promised to bring stability and economic development to the world's fourth largest nation. *Tempo* deliberately imitated *Time* magazine, including its trademark red border. Notable for lively writing and innovative use of the Indonesian language, *Tempo* had a fresh, breezy style that lived up to its slogan "pleasant to read and necessary." As the New Order government solidified its power in the mid-1970s, and the Ministry of Information increased efforts to rein in the Indonesian press through a system of bannings, licensing, and intimidation known as "telephone culture," *Tempo* developed strategies to maintain its independence. Although like other Indonesian media it was obligated to report the official version of events, readers were nevertheless able to find a "hidden message" in the magazine's pages. While *Tempo*'s sales figures were never high—probably peaking at about 200,000 in the early 1990s—the magazine was enormously influential with political elites as well as the rising middle class.

In June 1994, *Tempo* was banned by the Soeharto government, ostensibly over a cover story reporting a dispute within the government over buying used warships from the former East Germany. To the surprise of many observers, *Tempo*'s banning sparked widespread protests. It also led to the creation of an underground movement, in which former *Tempo* journalists and activists joined forces to bring independent news to Indonesians via the internet. As senior Indonesian journalist Aristides Katoppo put it, it was as if "the regular army had joined the guerillas" (quoted in Steele). In May 1998, Soeharto was toppled by a student movement very much like the one that had brought him to power, and *Tempo* got its license back. Returning to publication in October, the new *Tempo* had a harder news edge and included investigative reports as well as opinion pieces, all unthinkable under Soeharto. No longer required to use the oblique language of the previous era, *Tempo* continues to provide credible information to the public and to work to institutionalize and secure freedom of expression in Indonesia.

Contemporary Issues

American news magazines have shifted their content markedly in the era of the Internet. No longer do any of them focus on the previous week's news, though that is still included. Nor is their prime concern usually hard domestic or foreign news, though, again, the most important events still receive some treatment. Foreign news, particularly, dropped off by the 1980s. Instead, somewhat paralleling a similar shift in the daily press, they have been moving more and more toward lighter material stressing people and celebrities, show business, social trends and controversies, and other soft news. The trend is most evident in cover stories, and is supported by run-of-color (use of color printing on editorial as well as advertising pages) illustrations and often striking graphics.

Newsstand sales account for only a tiny percentage of overall sales for American newsweeklies. Single-copy sales tend to rise following major news events or disasters (the terrorist attacks of September 11, 2001, led to record sales for all the newsweeklies discussed here). Tragedies—or scandal—are their bread and butter. By mid-2005, for example, weekly newsstand sales for *Time* averaged nearly

160,000 copies against a total circulation of 4.05 million. *Newsweek* single-copy sales ran a bit more than 125,000, a small part of its total circulation of 3.2 million. And *U.S. News & World Report* sold fewer than 38,000 newsstand copies as part of its overall circulation of 2 million.

New World Information and Communication Order (NWICO)

Despite dramatic geopolitical and media changes worldwide, the New World Information and Communication Order (NWICO) continues to be a topic of interest to researchers and practitioners interested in international media. The conceptual framework of the NWICO placed journalism practice and international news media flow at the center of the political, economic, and cultural agenda of countries in both the developed and developing world. In the early twenty-first century, NWICO provides useful insight for understanding of current journalism trends. This entry provides a brief history of NWICO, its importance when it emerged in the early 1980s, its main concepts and principles, and its present significance.

Although its origins can be traced back to the critical perspectives on media and communication that emerged in the early 1970s, the NWICO was the product of the 1980 MacBride Commission report, *Many Voices, One World,* commissioned by the United Nations Educational, Scientific and Cultural Organization (UNESCO) as a contribution to the debate about equity in international communication. Named after its head, former Irish foreign minister and 1974 Nobel Prize–winner Sean MacBride, the commission was charged with assessing international communication problems and making suggestions for their resolution in an effort to place these issues at the forefront of the international policy agenda (Thussu 2005). Proponents of NWICO identified the commission as part of an ongoing process, not as a compiler of "any given set of conditions and practices" (MacBride et al. 1980, xviii). Ensuring justice, equity, and reciprocity in information exchange; less dependency and downward diffusion of media; and increased self-reliance and cultural identity were the primary goals of NWICO.

UNESCO formed a commission that began work in December 1977 focusing on issues of accuracy and balance of information, infrastructure and functioning of news media, and rights and responsibilities of journalists and news media organizations. Its report included 82 recommendations aimed at reducing the gap between "the info-rich" and "the info-poor." However, many around the world read the report as a forceful critique of the role of hegemonic influence of Western news media in the context of international relations and conflict resolution.

The MacBride report called for capacity building efforts in media and communication in developing countries through both infrastructure and human resource development. In addition, it also called for improvements in international news reporting, particularly in breaking away from what was described as an excessive focus on "negative news." Rather, the commission proposed development journalism, and the use of media technologies such as radio and TV for development and preservation of cultural identity, as important functions in the context of developing countries. The commission emphasized the effective integration of communication into development and culture throughout its report. This included language related to people's participation in media production and elimination of barriers to diversity and choices of media products and content. The commission also called for international cooperation and partnership in the process of increased balances in information flow for reducing dependency of developing nations on media products from developed countries in the field of communication as a means to promote peace and security and to lessen political tensions.

However, the report—and NWICO more generally—quickly became highly political and controversial in a world dominated by cold war politics. Developed countries, particularly those opposed to Communism and Soviet-driven views, were skeptical of UNESCO's role in shaping international communication in the 1980s. Western countries were supporters of the "free flow of information," a position particularly aimed at countering the Eastern block's tilt toward state media control (Carlsson 2003). This position was fueled by NWICO recommendations supporting the state's role in addressing communication problems. The focus on the East-West dispute was broadened as NWICO included language bent on increasing flow of other media products South-South (in other words, from developing nation to other developing nations), and cultural and technical cooperation besides news, which were perceived as important in international relations (Carlsson 2003). Although the commission's report received broad international support, it was heavily criticized by the United States and the United Kingdom (UK) as a bold attack on freedom of the press, leading to the withdrawal of both countries from UNESCO membership in 1984 and 1985, respectively. While the UK rejoined UNESCO in 1997, U.S. separation lasted until 2003 (McPhail 2002).

Self-reliance and cultural identity emerged as key principles among the MacBride Commission's recommendations, which many nonaligned states incorporated into their planning. The commission also introduced such language as "local level and horizontal communication into thinking about development" (Carlsson 2003). Such recommendations led UNESCO to launch an International Program for the Development of Communication (IPDC) to assist developing or poor countries in building media infrastructure, developing communication capacities for more balanced flow of information, and promoting regional cooperation among developing countries through media programming.

NWICO sought to integrate people's participation in the process of societal development. However, globalization of media systems spurred by deregulation and commercialization in an increasing international economy ultimately sealed the fate of NWICO as a viable issue. Implementation of NWICO's recommendations in the late 1980s was a difficult task for most countries due to a lack of financial and human resources and a rapidly changing political, financial, and social environment, turning NWICO into an interesting process in the history of international communications with limited, if any, impact in the view of most researchers and academics.

The commission argued that negative news of disaster and political and ethnic conflict was affecting international perceptions about both developing and developed countries. Readers from Third World countries, for example, saw the "western coverage of their countries as disproportionate

and distorted" (Chaudhary 2001, 241). By the same token, such media coverage in Western countries also prompted the media in Third World countries to "overemphasize the negative issues about western countries" (242). But after the commission came forward with recommendations emphasizing a need for professional standards and integrity in news media, both Western and Third World media became more cautious in news reporting, as is evidenced in recent studies.

In analyzing the continuing debates around NWICO, Thussu explains that "despite many advances in democratization of the media, some of the key criticisms in the report are as valid in 2005 as they were in 1980" due to the impact of globalization as epitomized by media mogul Rupert Murdoch (1937–) (Thussu 2005, 47). Continuing imbalances in international news media flow, and the trend toward globalization and privatization of the media, accelerated by media conglomeration and concentration, has undermined public communication in a global media culture. Although media networks in the developing world emerged early in the twenty-first century (i.e., Tele Sur in Latin America; Al Jazeera in the Arab world) with the objective of countering dominant Western international news media (CNN, BBC, international news agencies) and providing an alternative perspective to international current affairs, international news flows remain largely dominated by large media corporations based in the developed world. In other words, the players have changed from countries to transnational media corporations but the issues remain the same.

Access to communication technology in developing countries is not much better owing to a huge technology gap between developed and developing countries. The United Nations Conference on Trade and Development (UNCTAD) report on the "Digital Divide" (defined as the gap between those with access to digital communication and technologies and those without access to them) supports such an assertion with the following:

> a person in a high-income country is over 22 times more likely to be an Internet user than someone in a low-income country. Secure Internet servers, a rough indicator of electronic commerce, are over 100 times more common in high income than low-income countries. In high-income countries, mobile phones are 29 times more prevalent and mainline penetration is 21 times that of low-income countries. (UNCTAD 2006, iii)

Historically, low income, limited infrastructure, insufficient and untrained personnel due to a continuing brain drain from poor to wealthy countries, and weak competitive and regulatory environments have slowed the adoption of newer technologies in poor developing countries. However, adoption of satellite and broadband communication systems in some developing nations in Southeast Asia, South Asia, and Africa has helped them further cultivate diversified and innovative approaches for socioeconomic development.

While for many journalism scholars the NWICO debate has turned into a relic primarily studied as a historical issue, international media developments such as the increasing concentration of media ownership and the predominance of few news media sources on the global media landscape are similar to those studied by the MacBride Commission, albeit in a changed political and economic context. Perhaps, it is time to reassess the recommendations of the MacBride report as part of a renewed discussion on international media and communication issues.

New York

New York City is the self-described "capital of the world" and arguably the capital of U.S. journalism and mass media. The nation's largest market, it is host to the major U.S. television networks, various cable channels, and conglomerates like AOL/Time Warner, Viacom, News Corp., and the Hearst Corporation. Much of the book publishing industry, more than 200 newspapers, and over 350 magazines have offices in New York. Major magazine publishers include Condé Nast and Time, Inc. Major book publishers include Penguin, Simon and Schuster, and Random House. New York is home to the Associated Press headquarters, a significant film industry, and large recording companies, radio operations, and other media as well as the biggest advertising and public relations firms. Four of the top ten circulation newspapers in the United States are found in New York City. It is the site of elite and influential newspapers such as *The New York Times* and *The Wall Street Journal*. It has also hosted major alternative media, from *The Masses* to the *Village Voice*. It is home to a diverse foreign-language press including the oldest Spanish- and Russian-language newspapers in the United States. Major world news media keep bureaus in New York, increasing its profile in the international news flow.

The key to understanding New York's position is in its history. The city's rise as a center of journalism and mass media was connected to its rise as a commercial and financial center, the growth of New York as a major metropolis in a growing world power, and then its prominence on the international stage as the seat of the United Nations and many foreign consulates. Thus, the city has grown to become a political as well as business and cultural center. It is also noteworthy as a site of news production and dissemination. It is the largest media market in the largest national economy in the world. Its impact on journalism has been so substantial that it is difficult to separate the history of American journalism from that of New York journalism.

Development

New York's development as a center of communications and commerce was tied to its geography. Set on the island of Manhattan, the colony, first settled by the Dutch and taken over by the English in 1664, possessed a fine natural port. The water was deep near the shore and it was fairly free from difficult winds and ice. It was suitable for transportation up and down the American Atlantic coast and to and from Europe. The Hudson River provided a corridor

into the mainland. The influence of geography on New York's experience as a central communications point is illustrated by the eighteenth-century newspaper title *Rivington's New-York Gazette; or, the Connecticut, New-Jersey, Hudson's River, and Quebec Weekly Advertiser*. The Erie Canal, completed in 1825, extended New York City's waterborn transit to Buffalo and toward the Midwest. New York became the busiest port in the world in the nineteenth and early twentieth centuries, concurrent with its rise in size and stature. The city has always been dependent on trade and transport. Thus it has also always been a key communications point. Journalism developed in line with the city's growth as a marketplace.

In the nineteenth century, New York's population grew exponentially, aided in large part by immigration. By 1890, 36 percent of the city was foreign born. The city's population grew from 60,515 in 1800 to nearly 3.5 million a century later. It received a major boost in 1898 by consolidating with its "outer boroughs." In 2006, New York City had a population of nearly 8.3 million. The size and growth of this potential media audience has driven development of journalism and mass media in the city.

New York's first printing press was established in 1693 by William Bradford, who also started its first newspaper, the *New-York Gazette* in 1725. A second paper, the *New-York Weekly Journal,* began publication in 1733 by Bradford's former apprentice John Peter Zenger. A year later, Zenger found himself on trial for seditious libel for criticizing colonial governor William Cosby and his policies. Zenger, defended by Andrew Hamilton, who used the truth of Zenger's comments as a defense, was acquitted in a jury trial. The episode is often cited as a watershed event in establishing principles of press freedom and truth as a defense against libel, but it highlights the political nature of journalism in the eighteenth century and did not result in immediate changes in the law (that came in 1805, after another press law case, this one involving Alexander Hamilton). The early New York press, as elsewhere in the United States, was highly partisan and indeed Zenger had been supported by a political faction in the city intent on challenging Cosby and his Bradford-printed mouthpiece.

New York's partisan press engaged in the great political contests of the eighteenth century. John Holt's *New York Journal* criticized British policy before the American Revolution and James Rivington's *Royal Gazette* supported colonial authority under the city's occupation. Substantial support for the federalists was later found in the city and articulated in newspapers such as the *New York Evening Post,* the *New York Independent Journal, Gazette of the United States,* and Noah Webster's *Minerva*. The partisan press was published primarily for those who could afford to subscribe and had a say in commercial and political life. However, the early New York press was not entirely highbrow, and newspapers were fairly widely available in public places. Still, few of them expressed the views of the city's un-propertied classes until the early nineteenth century. The first African American newspaper, *Freedom's Journal,* for example, was established in 1827.

Newspapers

The character of New York's press began to change in the nineteenth century, prompted by changes in population, technology, and the Industrial Revolution. As the city became an industrial as well as a shipping center, its population grew rapidly, creating a diverse and massive potential readership. Industry centered on mass production and marketing. In 1827, the Washington hand press, a technological improvement in printing, was invented in New York, soon to be superseded by the steam press. In the 1830s, such presses were manufactured in the city by Robert Hoe. The rise in population coupled with such advances made possible a popular mass media often called the penny press for its price.

Into the 1830s, partisan newspapers had been dependent upon party patronage for financial feasibility. Slowly advertising became a source for not only financial stability, but significant profit. Newspapers became the principal means through which advertisers could reach mass audiences. Thus, journalism could be liberated from serving as party organs. (This is not to say that editors did not still use their papers to promote political positions.) Relying on advertising for revenue and seeking larger audiences for their advertisers, newspapers reduced their prices. Instead of relying on subscriptions, they also turned to street distribution known to all by the use of the iconic newsboy. The penny press signaled an important shift in

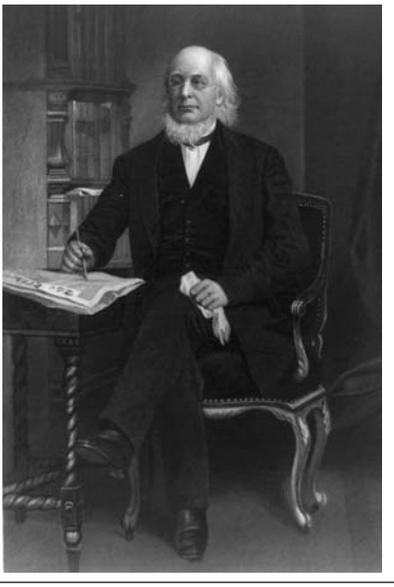
journalism whereby readers began to be seen as consumers.

The first New York City penny paper was Benjamin Day's *Sun,* which began in 1833. It was quickly followed by many others, most notably James Gordon Bennett's *New York Herald,* which became the largest daily newspaper in the United States by the Civil War. The *Herald* was notable not only for its unprecedented circulation but also for its extensive news gathering, utilizing rail, ship, and telegraph and a set of correspondents in Europe. Like other penny papers, it was also characterized by sensationalism. It financed Henry Stanley's expedition to Africa to find missionary and explorer Dr. David Livingstone and sought readers through coverage of titillating scandals such as the murder of prostitute Helen Jewett.

The *Herald* generally supported the Democratic Party. Politically and in business, it met a rival in the *New York Tribune,* started by Horace Greeley in 1841. The paper's weekly edition was the largest Republican newspaper in the country. Despite the partisan positions of most newspapers, the penny press is generally credited with laying seeds for journalism's convention of objectivity that later came to serve as a goal to be strived for. By drawing revenue from advertising, the penny papers did not need support from a political party, increasing the publisher's independence. Further, in the quest for ever larger audiences, such independence was an attractive way to court a wide range of customers.

Press competition was fierce in nineteenth-century New York. Newspapers aggressively sought to gather and impart news as quickly and extensively as possible. Samuel F. B. Morse's telegraph cut down to minutes the time it took information to travel great distances. New York newspapers rapidly adopted the technology in the race to get news out first and boost circulations. The first lines to the city opened in 1846, and its position as a financial and shipping capital quickly made it the center of a telegraph network as well. The telegraph shrunk the world and facilitated the rise of the cooperative newsgathering Associated Press (AP), which quickly adopted the telegraph in combination with other means of transporting news.

The AP was a news cooperative formed in 1848 by six city newspapers—the *Sun,* the *New York Herald,* the *Journal of Commerce,* the *New York Express,* the *Courier and Enquirer,* and the *New York Tribune*. *The New York Times* joined on its founding three years later. The AP engaged in monopolistic practices and was reorganized in 1892, continuing to expand to become one of the world's major purveyors of news. Still headquartered in New York, the modern AP employs more than 37,000 people around the world. The AP was rivaled for much of the twentieth century by United Press (later UPI). The news wire aided the development of modern journalism conventions in that news to be shared cooperatively among a wide range of newspapers could not be overly partisan in nature.



Steel engraving of one of New York's most well-known newspaper men, Horace Greeley, founder of the New York Tribune, *established in 1841.*

Source: Library of Congress.

Scandal and sensationalism ruled much of nineteenth-century news. Newspapers became big business, and needed large readerships for big profits and to support staff and facilities. In 1895, for example, Joseph Pulitzer's New York *World* had 1,200 employees. Pulitzer had acquired the paper a dozen years earlier. His use of both investigative journalism and sensationalism produced financial success and skepticism at the time. He employed the muckraking journalist Nellie Bly, who went undercover to explore deplorable conditions in a New York insane asylum, but Pulitzer's reputation for yellow journalism (a term derived from a comic character called the Yellow Kid that

appeared in *The World*) was such that when he later approached Columbia University offering to fund a journalism program, he was initially turned away. After reconsideration, the university opened a school bearing his name in 1912 (Columbia also administers the Pulitzer Prizes, the most prestigious awards in American journalism).

Pulitzer's major competitor was William Randolph Hearst, who bought the *New York Journal* in 1895. The two competed bitterly along with the *Sun,* which was then under the leadership of Charles A. Dana. Much of their news coverage was sensational and scandalous, but the papers also attracted talented contributors in the muckraking tradition such as Lincoln Steffens, Stephen Crane, and Jacob Riis. This brand of investigative journalism encapsulated a kind of social criticism, also developed among such New York magazines as *McClure's* and *Collier's*.

To set itself apart from the sensationalism of its rivals, Adolf Ochs bought *The New York Times* in 1896, and adopted the slogan "All the news that's fit to print." The newspaper is often credited with developing the objective model that is now a standard of journalism through its practice and success. It is frequently referred to as the newspaper of record because of the many people who trust in its accuracy and neutrality. Initially the paper supported the Republican Party, but by the end of the nineteenth century had become independent. Although later accused of being too liberal, the *Times* stood firmly against socialism in the wake of the Bolshevik Revolution in Russia in 1917. Over the past century, it has won more Pulitzer Prizes than any other newspaper.

The New York *Daily News* became the city's first heavily illustrated tabloid daily in 1919, using the slogan "New York's Picture Newspaper." The *Daily News* achieved a huge circulation with its popular coverage and by the early 2000s was the fifth largest newspaper in the country. Its chief competitor is the *New York Post,* one of America's oldest newspapers which began as Alexander Hamilton's *New-York Evening Post*. Later it was under the management of Oswald Garrison Villard, who also ran *The Nation*. Finally it became a tabloid under Dorothy Schiff and Ted Thackery in the early 1940s. The *Post* was purchased by Rupert Murdoch in 1976. Both the *Daily News* and the *Post* are top ten U.S. newspapers in circulation and compete with each other mostly through sensational local coverage, celebrity gossip, and sports.

Alternative and Ethnic Newspapers

New York has not only served as the home for many of the biggest mainstream media but also as a center for alternative journalism as well. It has hosted journalism born of a wide range of political and cultural movements. Left-wing political journalism has particularly strong roots in the city. Labor-oriented and union newspapers existed in the city from the 1830s. The Socialist Labor Party was established in the city in 1877 and published *The People,* from which the current Social Labor Party of America newspaper draws lineage. The New York *Call* was founded in New York in 1908 and became America's leading socialist newspaper. It attracted prominent figures to write for it such as Margaret Sanger and Eugene Debbs.

New York has also long been home to extensive ethnic and foreign-language media. The first black newspaper in the United States, *Freedom's Journal,* began in New York in 1827. The leading modern African American newspaper is the New York *Amsterdam News,* which was founded in Harlem in 1909 and reached a peak circulation of around 100,000 in the 1940s. The German-language *New York Stats-Zeitung* had a circulation of over 200,000 in the 1940s. Foreign-language publishing in the city has ebbed and flowed with immigration and assimilation patterns, but many of the city's ethnic communities have long journalism traditions. For instance, the Russian newspaper *Russkoe Slovo,* founded in 1910, still publishes (since 1920 under the name *Novoe Russkoe Slovo*). The first Chinese-language newspaper appeared in New York in 1883. Today there are seven daily newspapers in Chinese. Spanish-language journalism began in New York with *Diario Cubano* in 1870 and today is led by *El Diario La Prensa*. The newspaper claims to be the oldest Spanish-language paper by drawing lineage to *Le Prensa,* established in 1913. *El Diario* was founded in 1948 and the two merged in 1963. Many other nationalities have published newspapers in New York City, adding to the volume of press in the media saturated metropolis. Many have used broadcast outlets as well.

Magazines

Magazine publishing had started in New York in the 1750s and within a century the city dominated the industry. The post–Civil War years saw a boom for New York–based magazines as much as newspapers. Utilizing improved printing technologies and advertising support, most magazines sought larger audiences. A strong market for smaller and specialized magazines also developed, many of them political in nature. *Revolution,* edited by Susan B. Anthony, was published in New York from 1868 to 1872, and *The Nation* began in 1865. Magazines aimed at women have a long tradition in New York beginning with the *New York Weekly Magazine* in 1794. Several nineteenth-century publications are still publishing in the city today such as *Harper's Bazaar, Vogue, Good Housekeeping, Cosmopolitan,* and *Ladies' Home Journal.* In the twentieth century, diverse women's magazines from *Mademoiselle* and *Glamour* to *Essence* and *Ms.* rose to prominence in the city.

Today's top circulation news magazines, *Time* and *Newsweek,* are also New York publications. *Time* was the first weekly news magazine in the United States. It was founded by Henry Luce and Briton Hadden in 1923, and initially offered a summary of news based on the work of New York newspapers, but later fielded its own reporters and became a very influential magazine. *Newsweek* was started in 1933 by Thomas Martyn, a former editor at *Time.* Both *Time* and *Newsweek* have overseas editions.

As with its newspapers, the city supported alternative magazines. *The Masses* was an influential socialist magazine from 1911 to 1917, edited by Max Eastman. The anarchist Emma Golman's *Mother Earth* began publication in New York in 1906. These publications were repressed under the Espionage Act of 1917, for their opposition to the war effort. After the Bolshevik Revolution, socialist publishing in New York ideologically split according support or lack of support for the Soviet Union. In 1933, Dorothy Day and Peter Maurin established the *Catholic Worker,* which was not affiliated with any socialist party but advocated pacifism. It received a boost in readership in the 1960s, but interest has since declined although it is still published in New York.

The 1960s saw a flourishing left-wing smaller-scale (sometimes called "underground") press in the city. Publications included the *Rat Subterranean,* the *Realist,* and the *East Village Other.* The publications were numerous enough and professional enough to support the establishment of an Underground Press Syndicate. The *Village Voice* rose to the greatest prominence in this era and has since become an essentially mainstream weekly.

Changing Technology and the Birth of Radio and Television

Developments in printing technology brought about lavishly illustrated magazines including *Harper's Weekly* and *Frank Leslie's Illustrated Newspaper.* Beginning in the late 1880s newspapers also printed photographs and within a decade used color and stereotyped plates. Telephone systems were established in New York in the 1870s and were soon put to work in newspaper and magazine offices.

Guglielmo Marconi introduced the city to wireless telegraphy in 1899 when the *New York Herald* sponsored a demonstration. Marconi reported the America's Cup sailing race from the harbor, while the *Herald* posted the news at bulletin boards throughout the city. In 1913 Columbia University student Edwin Armstrong invented the regenerative circuit, ending the need for headphones. In the early 1930s he innovated frequency modulation (FM) radio. The city saw development of the first radio networks when the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS), were formed in the late 1920s. Radio journalism developed slowly in the 1930s, becoming important during World War II, when reporter Edward R. Murrow and many others made their mark as journalists.

World War II delayed the diffusion of television, which was largely developed in and near New York. American Telephone and Telegraph conducted experiments with a mechanical television system in the 1920s. The radio networks CBS and NBC created experimental stations in the 1930s when a few television sets were first sold in the city. Modern electronic television broadcasting began in 1941 with three television stations broadcasting to 5,000 homes in New York. After the war, the city was home to four networks: CBS, NBC, the American Broadcasting Company (ABC), and DuMont. New York dominated television

production in its early years, but much of it later moved to Hollywood. However, network headquarters and their flagship news programs remained in New York.

The history of journalism in New York reflects the history of American journalism in various ways. Many milestones in the development of news media were first reached in the city. These include circulation records, changes regarding reporting practices and styles, important institutions such as wire services and broadcast networks, technological changes in printing, journalism education, and landmark legal cases. The press and the city have become a backdrop for popular culture as well. Superman worked at the *Daily Planet*, modeled on the *Daily News*.

Many trends in American journalism are also New York trends. These range from the shift from a partisan press to the more broadly appealing penny press and from muckraking to new journalism. Yet these are not New York trends alone and did not exist isolated on the island of Manhattan. Further, it is evident from the New York press that there is no one journalism history, but many histories. The institution of journalism has never been monolithic even in one city and even in the city most associated with the development of U.S. journalism.

New York is so prominent in American journalism past and present because it became the largest media market, as well as a vital financial and cultural center, and an important center of domestic politics. When media development has begun elsewhere, it has often reached its apex in New York. The trend has continued with the rise of the Internet as indicated by the merger of America Online and Time Warner in 2001, although the marriage did not prove as successful as predicted. To the degree that American journalism is big business, it happened first in New York, a city that continues to host the most important news media organizations. New York is also a diverse city and its alternative journalism has often set a pattern for the nation. Journalism is a central part of New York's life and places the city at the center of national and international media systems.

New York Times, The

The New York Times is the leading U.S. national newspaper and is based in New York City with 16 regional, 11 national, and 26 foreign bureaus. In early 2008, the paper had 1,332 newsroom employees, more than during any other point in its history and more than any other American newspaper. However, due to industry-wide financial losses, in 2008 the publisher decided to reduce 100 newsroom staff positions. The *Times* has distribution outlets throughout the world, with home delivery available for select U.S. cities. In 2007, its 12-month average circulation was 1,066,600 on weekdays and 1,529,700 on Sundays. The *Times* publishes in several formats: the standard print edition; electronic edition; Times Reader edition, a software program enabling users to download

the paper and read it in a paginated version on or offline for a monthly subscription fee; and Nytimes.com edition, the online version of the paper based on a scrolling format and available without a subscription.

The New York Times is widely recognized as the country's "newspaper of record," meaning it is touted as the preeminent and most authoritative news source documenting current events. The *Times* first used the title to describe itself in 1927. The top of the paper carries the motto: "All the news that's fit to print," first used in 1896 and a permanent front-page feature a year later. The *Times* serves as an agenda setter for other newspapers and electronic media, which look to the *Times* to develop stories ideas and find leads. *The New York Times* ranks first among newspapers in terms of the number of Pulitzer prizes awarded. *The New York Times* Company received 120 Pulitzer Prizes, 96 of which were awarded to *The New York Times,* the rest awarded to other publications owned by the company. The paper was dubbed the "Grey Lady" early on because of its heavy text orientation. In 1997, it made extensive changes including the addition of color to advertisements and photographs in its daily editions, and the daily inclusion of separate sports and culture and entertainment sections. The first online addition appeared in 1995.

The New York Times is the chief and best known product of The New York Times Media Group, owned by the New York Times Company. In 2007, annual revenues for the company totaled $3.2 billion. The firm is divided into four business units. In addition to *The New York Times,* the New York Times Media Group includes *International Herald Tribune* (Paris), radio station WQXR-FM (New York), NYTimes.com, and Baseline Studio Systems, a leading database of corporate television and film information available by subscription. The New England Media Group includes *The Boston Globe, Telegram & Gazette* (Worcester, MA), and Boston.com. The Regional Media Group includes fifteen dailies, including *The Gainesville Sun* (Gainesville, Florida) and *The Press Democrat* (Santa Rosa, California). Development

The New York Times was founded by 31-year-old Henry Jarvis Raymond, speaker of the New York State Assembly, and George Jones, a banker. The first issue was published on September 18, 1851. Raymond had previously worked for other New York papers, including Horace Greeley's *Tribune*. Jones met Raymond while working at the *Tribune*. The *Times*'s coverage of the sinking of the *Arctic,* a transatlantic steamer in 1854, and the Italian Battle of Solferino in 1859, both relied on eyewitness accounts, which enabled the paper to get the scoop before its competitors.

When Raymond died in 1869, Jones gained editorial control and financial oversight of the paper. He served as editor until his death in 1891. In 1871, the *Times* began printing the misdeeds of William Marcy "Boss" Tweed, the head of the Tammany Hall political patronage system. The coverage is credited with bringing public attention to the Tweed Ring as well as to the newspaper. In 1884 the paper endorsed Democratic presidential candidate Grover Cleveland, breaking with its reputation as a Republican newspaper. The paper also provided significant coverage of the Civil War and Reconstruction. When Jones died in 1891, control of the *Times* passed to his heirs, who sold the paper to a group of investors known as The New York Times Publishing Company, led by Charles Ransom Miller.

In 1896, 38-year old Adolph S. Ochs, the successful newspaper publisher of the *Chattanooga Times,* bought the then-failing *New York Times*. It has remained under the control of the Ochs-Sulzberger family since. The *Times* became a public company in 1967, though the family retained ownership of Class B stocks holding controlling voting rights. In March 2008, the *Times* gave two hedge funds a seat on the board, the first time the *Times* has accepted directors nominated by outsiders. Despite the Jewish background of the Ochs and Sulzberger families, the paper has been criticized for downplaying the Holocaust of World War II and for some of its coverage of Israeli affairs.

When Adolph Ochs revived *The New York Times* starting in 1896, the paper began to value fact over entertainment, the two dominant values of news reporting in the 1890s. It also became the

elite paper of New York (attracting a wealthy, upper-class audience) and soon developed the standard for modern mass circulation newspapers. In 1914, the paper was the first to report on the sinking of the *Titanic*. It was the only paper in the world to publish the entire Treaty of Versailles in 1918. In 1927, the *Times* attained exclusive worldwide rights to Charles A. Lindbergh's personal account of his New York to Paris flight.

When Ochs died in 1935, control passed to his daughter Iphigene Sulzberger, her husband Arthur Hays Sulzberger, and his favorite nephew Julius Ochs Adler, as trustees of the Ochs Trust. Arthur Hays Sulzberger became the publisher, while Iphigene Sulzberger directed from behind the scenes. A passionate suffragist, she pushed the paper towards more progressive policies. In 1945, a drafted *Times* journalist was the only reporter on the Nagasaki bombing mission. In 1955, the paper published the entire 138,000-word transcript of the Yalta Peace Conference. Arthur Sulzberger, in turn, passed control of the *Times* to his son-in-law, Orvil Eugene Dryfoos in 1963. In December 1962, the company's printers, represented by the International Typographical Union, led a strike against the *Times* and other city papers, which dragged on for an unsurpassed 114 days. After the strike, the *Times* revenues were down by $16 million, and daily circulation had dropped 80,000, making it the costliest strike in New York's history. The price of the paper went up for the first time since 1946. Dryfoos felt personal responsibility for the crisis and the stress took its toll on his health. He died of heart failure, aged only 50, in 1963.

Arthur Ochs "Punch" Sulzberger, son of Arthur Hays Sulzberger, took over as publisher after Dryfoos' death. The younger Sulzberger served as publisher until 1992, and is credited with turning the *Times* into a public corporation, with its 1967 offering of stock shares. Sulzberger oversaw the initial publication of the *Times*' national edition in 1980. He appointed a *Times* reporter and correspondent who had won the Pulitzer Prize for international reporting, as managing editor. Rosenthal served from 1969 to 1986, prompting Robert McFadden of the *Times,* writer of Rosenthal's obituary, to refer to him as "a principle architect of the modern *New York Times*." The *Times* was the first paper to report on General Westmoreland's request for 200,000 troops in Vietnam following the Tet Offensive of 1968. In 1970, the op-ed section was added opposite the editorial page and in 1971, the Business section was added. The *Times* won the Pulitzer Prize for its critical coverage of the causes behind the *Challenger* space shuttle explosion in 1986, which killed all seven astronauts on board.

Arthur Ochs Sulzberger Jr. became publisher in 1992. He oversaw the *Times*' transition to the Internet and appointed Howell Raines, another Pulitzer Prize–winning *Times* journalist, as executive editor in 2001. But Raines resigned just two years later following the scandal over Jayson Blair, a *Times* reporter forced to resign for plagiarism and fabrication of information in many of his stories.

Women at the *Times*

The New York Times, like many other newspapers, has had a long history of gender-based discrimination. Compared with other major U.S. papers, however, the *Times* took longer to elevate women into positions of power in the newsroom. Adolph S. Ochs opposed even hiring women and resisted doing so even when more women moved into the workforce during World Wars I and II. During his tenure to 1935, only four women worked as reporters in the *Times* city room. Yet women had worked there before. Sara Jane Clarke, hired in the 1850s, was the first female reporter on the payroll, working under the pen name Grace Greenwood. In 1869, Maria Morgan became the first woman to have a desk in the *Times* city room, the heart of news operations. In 1921, Anne O'Hare McCormick began writing stories for the *Times,* but was not put on the payroll until 1936, a year after Ochs' death. In 1937, McCormick, who had interviewed Stalin, Hitler, Mussolini, and FDR, became the first woman to win a major category Pulitzer (for her foreign correspondence). Unlike other papers, *The New York Times* did not hire women en masse during World War II.

On February 1, 1972, a small group of women from *The New York Times,* which included Betsy Wade, founded the Women's Caucus to address discriminatory practices. They later drafted a letter to the publishing family and

directors documenting salary inequality, raise discrimination, and violation of civil rights. In 1974, seven discrimination lawsuits were brought against the *Times* in the U.S. Southern District Court of New York. In 1977, the judge approved a petition to pursue *Boylan v. New York Times,* a class action suit including 550 women. It was settled out of court in 1978.

"Actual Malice"

The landmark *New York Times Co. v. Sullivan* Supreme Court case arose as a result of a full-page ad, "Heed Their Voices," published in the *Times* on March 29, 1960. The court decision established "actual malice" as the standard to be met by public officials in libel cases. It marked the first time the Supreme Court dealt with civil libel law, which previously fell within state jurisdiction. Before *Times v. Sullivan,* many different definitions of malice existed in various states.

The Union Advertising Service for the Committee to Defend Martin Luther King and the Struggle for Freedom in the South, a civil rights group, paid for the full-page ad that ignited the lawsuit. The ad included text critical of violence against student civil rights activists and the Southern justice system. Four Montgomery County commissioners brought a civil libel suit against the *Times* for the ad's content. The suit brought by Commissioner L. B. Sullivan was the first to go to trial and move on to the Alabama Supreme Court which ruled in favor of the plaintiff, stating that the *Times* ad had identified and defamed the plaintiff. The defense could not argue truth (the standard defense), as there were factual errors in the ad. The case was appealed by the *Times* to the U.S. Supreme Court.

The Court unanimously ruled in favor of *The New York Times.* Justice Brennan wrote, "A state cannot, under the First and Fourteenth Amendments, award damages to a public official for defamatory falsehood relating to his official conduct unless he proves 'actual malice'—that the statement was made with knowledge of its falsity or with reckless disregard of whether it was true or false." The Court also held that falsity is not sufficient to warrant the award of damages to public officials in libel cases.

Pentagon Papers

The Pentagon Papers was the informal name of a 47-volume, 7,000-page classified study commissioned by the Pentagon to assess U.S. policy and planning in Vietnam. The study was made public in a *Times* series that began on Saturday, June 12, 1971. *The Washington Post* and other papers soon picked up the story. The publication of the stories and the ensuing Supreme Court case (on whether the papers were within their rights to publish secret government documents) were significant because they dealt with government accountability, censorship, and the papers' First Amendment rights. The studies were classified as top secret-sensitive and only fifteen copies of the final study were produced. Former RAND and Pentagon researcher Daniel Ellsberg leaked the Pentagon Papers to *Times* reporter Neil Sheehan. Familiar with the Papers from his work at the Pentagon, Ellsberg was convinced that making the documents public could stop what he perceived as escalation, let alone continuation, of the war. There was significant debate among the top officials at the *Times* over whether or not to publish the Papers, and if so, how. In the end, publisher Arthur Ochs Sulzberger approved a ten-part series, with a six-page daily limit.

On June 14, 1971, the day after publication of the initial report on the classified documents, Attorney General John Mitchell requested that the *Times* halt publication of the series, claiming that publication posed a significant and immediate threat to national security. On June 15, the government won a temporary restraining order against the *Times,* which stopped publication. The order was later extended to *The Washington Post* when they commenced publication. The *Times* appealed the injunction against publication to the Supreme Court, arguing that the restraining order constituted prior restraint in violation of its First Amendment rights. Relying on language from the 1931 *Near v. Minnesota* decision (the first concerning the First Amendment's press clause), the government argued that publication posed a threat to national security, which trumped the First Amendment rights of the press. The Court ruled 6 to 3 in favor of the *Times,* issuing a per curiam opinion (one that is not signed by any one justice)

which stated, "Any system of prior restraints of expression comes to this Court bearing a heavy presumption against its constitutional validity. . . . [The government] thus carries a heavy burden showing justification for the enforcement of such a restraint." Weakening the precedent-setting value of the decision, however, there were nine separate opinions, none joined by more than three justices.

The Court's decision affirmed that the First Amendment rights of *The New York Times* and *The Washington Post* to publish the Pentagon Papers could not be abridged by the government. At the same time, the court did not hold that prior restraint was always unconstitutional. There was no evidence that the publication of the Pentagon Paper harmed the U.S. military, defense, intelligence, or international affairs. Nor did publication lead to the end of the war. What publication did do was add to the public debate over whether or not government had intentionally misled the American public.

The New York Times has long been the leading daily American newspaper. It has played an important role in U.S. history and it has been a party to landmark legal cases, which have set important precedents for the press. As an agenda setter for other media outlets, the stories the *Times* covers and the type of coverage it provides is significant. As traditional newspapers struggle to survive in an online market, *The New York Times* has managed to stay afloat. How it negotiates the changes in the marketplace, especially the online world, will determine whether or not the *Times* remains the preeminent news source in the United States.

Obituaries

An obituary (the root of the word is *obit,* Latin for "death") is a news report of someone's death, often with a biographical sketch of the deceased. Obituaries typically appear within days or a week after the subject has died. Usually appearing in a newspaper, an obituary not only announces the fact of the individual's passing but also offers an account of the texture and significance of his or her life. An obituary differs from a death (or funeral) notice, which is a paid announcement of the death and funeral details written by family members and placed in a newspaper either by the family or the funeral home.

Origins

If one includes memorial walls and stones left to honor kings and heroes, the obituary dates back to ancient Egypt. In North America, the first obituaries that would be recognized as such by modern readers appeared in Boston newspapers as early as 1704. These early obituaries tended to be short, more like current death notices. Invention of the rotary press in the mid-nineteenth century allowed newspapers space for more news and short death notices evolved into flowery obituaries.

In some of the newspapers for Richmond and Lynchburg, Virginia, for example, longer obituaries began appearing in the 1830s and 1840s, depending on the prominence of the person. These would often list some of the details of the individual's life, but they usually gave little family information other than naming a wife and mentioning—but not naming—children, plus brief details about funeral services. True obituaries listing such details as next of kin, cause of death, place of burial, funeral service information, and the deceased's occupation and activities in civic and cultural groups seem to have first appeared in newspapers between 1875 and 1890, depending on the paper and its coverage area. As obituaries became more commonplace, so did the realization that many individuals had amazing life stories, and the practice of publishing obituaries for every member of at least smaller communities became expected of newspapers. Rather than being a "depressing public service," obituaries are often among the most frequently and closely read sections of a newspaper.

Most nineteenth-century obituaries focused on a person's character. By the twentieth century, writers focused more on describing the accomplishments and associations of the deceased and dwelled less on their character. According to historian Nigel Starck (2005),

> The obituary art in its first incarnation was practiced by the newsbook compilers of 17th century England.... It flowered in the 18th century... it grew luxuriant, and sometimes ornate, in the 19th century; it became unfashionable and fell into widespread neglect in the 20th. Then, with the appointment of reformist editors, the obituary experienced its own restoration.

He also points out that in early America, some people were excluded from the obituary notices,

notably "those who were not white, not well off or not powerful. Also typically excluded were women and children." This began to change in the twentieth century as women and minorities took on a greater role in society.

Types and Process

Newspaper obituaries can be divided into two categories: news and feature. The news approach is a traditional news story that includes full name of the deceased, age or birth date, address or hometown, occupation, affiliations, significant accomplishments, survivors, and details of the memorial service. It may also note cause of death, education, military service, honors, and awards. Put another way, the news obituary sums up the life, usually centering on a person's most noteworthy accomplishments or activities.

Most community newspapers run at least a short item on every death in town. "In community journalism, the writing of obits is one of the most important things we do," says James A. Raykie Jr., editor of *The Herald* in Sharon, Pennsylvania (quoted in Scanlon 2003). The paper publishes about 2,000 obituaries a year, most written by a full-time obit writer assisted by other reporters and newsroom assistants on days when local deaths exceed an average of nine. The paper learned just how important obituaries are to readers when a 1988 redesign moved these from the front to the back page; reader complaints prompted the paper to go back to front-page stories. In larger cities, where 50 or more people die daily, newspapers will run an obituary for only a handful. Alden Whitman, for years the chief obituary writer for *The New York Times,* said for someone to rate an obituary in a metropolitan newspaper, a person had to be "either unassailably famous or utterly infamous" (Siegel 1997, 18).

The famous and infamous usually rate a "feature" obituary; the basic information is fleshed out with personal insights, including anecdotes, descriptions, quotes, and reminiscences. A feature obituary attempts to provide a fuller account of the texture as well as significance of the life of someone who has died. *New Yorker* writer Mark Singer offered this elegant definition of the feature obituary: a "completed cycle of accomplishment or notoriety, concisely wrought" (2002, 28). Feature obituaries include more quotations (from both the subject and others) and more extensive biographies than news obituaries. Interviews with survivors and friends often turn up interesting material. Incidents in the person's life that are well-known to the public are included in the obituary, but it is the lesser-known events that raise the feature obituary to an art form.

Although feature obituaries are usually limited to prominent people, a new form—dubbed the "common man" (and woman) feature obit—emerged in the 1980s. At the *Philadelphia Daily News,* former investigative reporter Jim Nicholson won numerous awards for his feature obituaries, including the American Society of Newspaper Editors' first obituary writing award in 1987, for his sensitive portrayals of the lives and deaths of ordinary men and women, in the process earning the nickname "Dr. Death." In his work, we found out that Marie Byrne smacked her kids for "making the nuns upset" and that she had a "private prayer list with countless people on it." We learned that John Ciavardone, "skinny as a lead pencil," cried only once over his terrible war injuries and referred to his buddy, Mickey DiSanto, as his seeing-eye dog, his "canine." The astonishing body of Dr. Death's work also proves that "news is culture," and that an important role of journalism is to chronicle the achievements, failures, rhythms, and rites of passage of one person's life.

The Associated Press keeps 1,000 "biographical sketches" of prominent people on hand, frequently updated. *The New York Times* has 1,200 on file. A community newspaper, depending on its size, may have a similar file about prominent people in town. When a well-known person dies, the background, or "B-Matter," is ready so that all the reporter need write is an obit lead and the funeral arrangements. At many newspapers, obit files are compiled on the most prominent people while still alive, which allows the newspaper to run an obituary promptly and with considerable detail. The practice has lead, on rare occasion, to premature obituaries being published mistakenly. Unsubstantiated reports of the death of a prominent person induces a harried editor, facing tight deadlines or seeking to scoop the competition, to print one of these ready-to-run obituaries. One famous instance of this was for Mark Twain, published in the *New York Journal* in 1897, to which he commented,

"the reports of my death are greatly exaggerated." (He died in 1910.)

New print reporters are often inducted into the profession by a stint of obituary writing because it stresses the need for accuracy in reporting names and dates and his or her ability to work under pressure—people are always dying on deadline. As Jock Lauterer writes, "It's a mortal fact lost on many young reporters: The older people become, the more they pay attention to obituaries. And the enduring irony is that many young reporters are required to write 'obits'" (2006, 113). It is a test—of accuracy, humility, enterprise, and journalistic craft—and for many novice journalists a rite of passage. Some beginners consider obituary writing a dull assignment of little importance. "What nonsense. What an opportunity," says Joseph Galloway, a senior writer for *U.S. News & World Report,* who wrote his share of obituaries when he broke into newspaper work at a small Texas daily.

The obituary has come to be held in such regard that in 1999, the International Association of Obituarists was formed. Along with holding international writers' conferences, seminars and workshops, the organization seeks to enhance public and professional appreciation for the art of obituary writing, to generate educational activities related to obituary writing, and to serve as an advocate for the craft. Its educational branch also responds to research requests from scholars in the fields of journalism, history, genealogy and anthropology. Finally, the association honors distinguished efforts in writing obituaries with a series of awards and an annual recognition program.

Obituaries, more than most items in a newspaper, speak directly to journalism as the "first draft of history." Obits are as significant to the present community as to posterity, as much about ourselves as about the deceased.

Objectivity

Objectivity is a central yet contested tenet of modern journalism. At its core, it seeks to define the role that journalists should play in selecting, gathering and relaying news to the general public. While frequently viewed as a technique for reporting only the "facts" of a story, objectivity is more importantly understood as an idea whose meanings have changed over time. To question, criticize, and renegotiate objectivity is to rethink what is wanted and needed from journalism, and the society it covers.

Origins

While the exact meaning of objectivity is always in dispute, there is an identifiable history of its nature and practice in American journalism. Historians cite the beginnings of the penny press (low-cost, tabloid-style papers) in the 1830s as its earliest formation.

Prior to the 1830s, most American newspapers were partisan. Financed primarily by political parties, these papers also made use of paid subscriptions for revenue; in turn, the party often dictated editorial policy. Journalism historian Michael Schudson comments that there was nothing misleading about this practice; it was recognized as standard and accepted as such. These partisan newspapers were generally read only by party members and were too expensive for most nonmembers to purchase. Because of this, "fairness" and "balance" were not primary journalistic concerns; rather, the purpose was to support and spread the party's positions.

In the 1830s, however, a new type of newspaper began to emerge. The *New York Sun,* first published by Benjamin Day in 1833, was the earliest successful penny paper (so called because it cost one cent while partisan and mercantile papers cost up to six cents). Thus began a trend away from dependence on political elites for both content and financial support and toward a reliance on larger circulation and advertising for revenue.

As the economic structure of newspapers began to change from heavy reliance on political elites to a more commercially based model, so, too did news content shift. Whereas the partisan press reported primarily on business and political affairs, the pennies trafficked heavily in human interest, and stories of society, crime, and sports began to appear more frequently. One of the most widely reported stories in 1836, for example, was the ax murder of prostitute Ellen Jewett. This shift of content, according to communications researcher David Mindich, helped establish one of objectivity's first components: detachment.

Journalistic detachment was of two kinds—a detachment from former political and business alliances, as well as from the divisiveness of the social order of the day. One of the hallmarks of modern objectivity—that journalists should question those in power—first appears in the penny papers. Detachment from the elites served to promote the creation of the idea of "the public" and the "common good." The human capacity to reason was commonly cited. The *Boston Daily Times,* for example, claimed to be "neutral in politics," while the *Baltimore Sun* wrote:

> We shall give no place to religious controversy nor to political discussions of merely partisan character. On political principles, and questions involving the interests of honor of the whole country, it will be free, firm and temperate. Our object will be the common good, without regard to that of sects, factions, or parties; and for this object we shall labor without fear or partiality. (quoted in Schudson 1978, 22)

Penny papers were not alone in promoting the common good. The labor movement supported establishment of at least 50 papers between 1827 and 1832 that were dedicated to wide-ranging social reforms. Penny papers, conversely, demonstrated their commitment to the public good because they knew such an approach would be profitable.

Nonpartisanship

Most importantly, the penny press was detached from political parties. Nonpartisanship thus became an early element of objectivity. Mindich notes that while nonpartisanship is distinctly attainable, objectivity may not be. Critics have questioned the usefulness of judging objectivity from a purely political viewpoint, though a diversity of political voices is an essential component of modern objectivity.

In research on the relationship between the press and the political system, Daniel Hallin proposed three concentric spheres. In the first, called the sphere of consensus, the political system is accepted and the press seeks to speak to all those within its boundaries. For example, in times of war, Hallin suggests that a country's own soldiers are seen by journalists as being above political debate; each contending political party—Democrats and Republicans, for example—profess support. The second, the sphere of legitimate controversy, sees conflict among contending political groups and attempts to mediate between them. Whereas support for troops is seen as sacrosanct, contending political groups may disagree on the rightness of a particular war, an argument that journalists will seek to highlight. Lastly, the sphere of illegitimate controversy, denotes controversy that lay outside the norms of the political system. Radical antiwar protests are typically seen as

lying in this sphere, especially in the earliest days of a war.

Inverted Pyramid Style

We can begin to see tensions in the notion of objectivity by looking at the development of the "inverted pyramid" style of reporting. Early penny press stories, for example, did not resemble what we would today call "objective" journalism. According to Mindich, they followed a pattern of traditional storytelling, relating a logical beginning, middle, and end in chronological fashion. What today would be considered important facts—the top of the inverted pyramid—might only appear well into the body of a story. Consider the *Morning Courier and New York Enquirer*'s 1832 front-page story:

> A most distressing occurrence took place at Alstead, East Providence on the 18th of last month.
>
> On the Saturday evening preceding between the hours of 10 and 11, a family consisting of Capt. Kidder and wife, one son, one daughter, a nephew . . . and a boy . . . retired in health, and under circumstances of comfort.
>
> About one o'clock in the morning, Mrs. K was suddenly awaked [*sic*] from a sound sleep, and found the house was on fire. (cited in Mindich 1998, 65)

As Mindich notes, it is not until the third sentence that we learn what happened—why this is a story. The modern lede—the telling of facts in descending order of importance rather than chronologically—signifies a radical shift in journalism. It also represents a step towards the modern idea of objectivity because it displaces the eighteenth-century essay, which focused heavily on the author's point of view. By contrast, the "inverted pyramid" developed as a way to briefly relay the facts in a way that would be timely and easily understood by answering who, what, where, when, and why an event took place.

To understand why the inverted pyramid became the dominant form for objective reporting, it is necessary to grasp the increasingly important role played by facts in nineteenth-century thought. The philosophy of positivism in both history and science encouraged the general cultural acceptance of an objective world that could be reported on. Communications researcher Dan Schiller presents an intriguing example of the power of "objectivity" in an 1835 story about the existence of "man-bats" on the moon. The story, initially printed by the *New York Sun,* claimed that a scientific journal in England had discovered bats on the moon by using a new telescope. Both the journal and the bats were of spurious origin: neither actually existed. The premise of their discovery was the "invention" of a new telescope that allowed scientists to identify the geology, geography, and natural history of the moon. Several newspapers in the United States ran the story and a group of Yale scientists became intrigued by the reports. Many scientists, according to Schiller, were initially deceived by the claims, but upon further investigation, the scientists demonstrated the falsity of the reports. What is important is that the story caught on and became popular in the American press because, as Schiller suggests, the story's veracity was reinforced by repeated references to scientifically credentialed individuals confirming it. It was the presumed scientific objectivity of these stories that helped give them their power and momentum.

The inverted pyramid begins with a reverence for facts (as opposed to beliefs) and for the promise that facts could hold for public enlightenment. However, even the moon hoax stories were not written in the inverted pyramid style. Mindich suggests that the earliest form of the style can be seen not in the writings of nineteenth-century journalists but, rather, in the war reporting of Edwin M. Stanton, Lincoln's War Secretary.

Many historians of American journalism cite the Civil War as a time when journalists' reportage underwent significant change. New demands for timeliness, coupled with the earlier invention of the telegraph, which allowed for faster transmission, are generally cited as the primary reasons for adopting the inverted pyramid. History suggests, however, that the style rose primarily as a means of writing quick, terse accounts. The perspective most frequently used was that of the government's.

Journalism critic Gaye Tuchman has suggested that objectivity is a "strategic ritual." She argues that journalists have come to over rely on official sources for information, such as government officials and leaders of social standing. Journalists

rely "strategically" on these official sources to support their own legitimacy. In doing this, we see the inverted pyramid—objectivity's hallmark form—serving to reinforce the existing power structure. Whereas the penny press represented detachment, reliance on official sources represents a new symbiotic relationship between the press and the government.

Balance

By the early 1890s, many of the elements required for objective journalism had come together: a reverence for facts, a commitment to nonpartisanship, and reportage written in the inverted pyramid style. Additionally, news and editorial pages were considered distinct, with the former dominant. Objectivity was recognized as *the* dominant frame for American journalists. As Mindich expresses it, "In the 1890s, consciousness and clearheadedness had not yet been complicated by Freud, observation had not yet been problematized by Einstein, and perspective had not yet been challenged by Picasso."

Balance suggests a dichotomized viewpoint from which the press was to operate. Two or more sides have a story to tell and the job of the journalist is to allow these different views to be expressed. In seeking to "balance" stories, journalism historian James Carey suggested that journalists underwent a "conversion downward" from "independent interpreter of events" to "brokers in symbols who mediated between audiences and institutions."

The New York Times' coverage of lynching in the 1890s offers an insight into one of the ways in which objectivity failed to capture the truth of a situation. In trying to "balance" stories about the lynching of African Americans in the South, the *Times* often published reports saying that the lynched African Americans had raped white women. Nearly all such reports were proved false and the idea of the black rapist was a product of the Southern white mind. And it was conveyed to a larger audience via "objective" journalism. The desire for facts, for a knowable world ordered around science and rational understanding, helped develop the system of objectivity that led to this coverage of the lynching. Nothing close to the truth, however, came out of the *Times* coverage. The dichotomized perspective of "he said, she said" balance failed to convey the horror of what was happening. Historians suggest two reasons: first, the pattern developed for balance was most adept at dealing with information and not with developing a narrative. As such, journalists were asked to convey "just the facts," though knowing what the facts were was dependent on how one perceived the events. Second, balance and objectivity are subject to cultural biases. A public that still harbors fear and hatred toward a group of people will be more inclined to believe that their biases are actually the "truth."

Varieties of Objectivity

Over the past century, a variety of criticisms to the principle and practice of objectivity have been raised, with three main concerns. First, criticisms of objectivity arise in the breech. When objectivity works, few people question it. However, when the lynching of black Americans receives imbalanced coverage disguised as balanced and fair, objectivity's efficacy is called into question. Second, each critique of objectivity can be seen as a specific way of reevaluating and criticizing how journalism is practiced. Third, while few would argue that complete, textbook objectivity is possible, most journalists are offended when it is suggested that he or she has not been "objective." In other words, while few agree on its definition, no journalist wants to violate the concept.

With the rise of propaganda and public relations during and after World War I, a naïve faith in facts was soon replaced with skepticism. Michael Schudson points out that the idea of "interpretive reporting" emerged in reaction to objectivity. Yet interpretive reporting did not serve as a wholesale replacement of the objective ideal. A 1999 Pew Research Center survey of journalists and news executives found that 75 percent said it was possible to obtain a true, accurate and widely agreed upon account of an event.

What resulted from interpretive reporting and objectivity was more of a blended approach, one that, according to journalist Brent Cunningham, allows reporters the freedom to analyze, explain, and contextualize the news, thus helping news consumers to navigate through the glut of information available to them.

Many varieties of objectivity exist. If we imagine the journalist's role on a continuum, we see the

general public on one end, and government and business leaders (who are typically the focus of news stories) on the other. "Objectivity" suggests where a journalist should stand in relation to the two. Should the journalist present news and information in a way that helps public life go more smoothly? Or should a reporter be concerned with holding the government accountable, even if the public is not in favor?

A new view of objectivity can be seen in public journalism. Begun through a consortium of concerned newspaper editors and journalists, as well as interested academics and a few sponsoring foundations, public journalism began as a small movement with a large aim: to rethink the mission of the press as supporting development of a healthier public climate.

This concept stirred concerns about "objectivity" being compromised. Supporters argue that the idea requires journalists to rethink the ethos of objectivity in their craft. Media researcher Jay Rosen argues that journalists too often use objectivity–the idea of disinterested detachment—as a shield to protect themselves from criticism. If all sides are upset, the argument goes, then they must be doing their job well. In formulating an argument for a new set of values, he argues that journalists need to be more aware not just of the decisions they make but, also, *who* the actors are in the decision-making process:

> If we describe it [news writing] simply as providing facts, we're going to miss a lot of what the institution [of journalism] does. . . . The political drama given to us by the press is dominated by professionals in politics, by insiders, by discussions of strategy and technique and manipulation. It is almost exclusively a story of conflict and controversy within the political class, and it is increasingly out of touch with the rest of the country and out of step with the problems we face as a democracy.

Public journalism, on the other hand, sees the origins of objectivity as tightly connected to the modern development of the general public. Without one, the other cannot exist. Therefore, it advocates for bringing the public back into play.

The second contemporary view focuses upon the truth of reporting. In a widely cited 2003 article, Brent Cunningham suggested that the "principle of objectivity" "make[s] us [journalists] passive recipients of the news, rather than aggressive analyzers and explainers of it." This assessment begins by asking why so few stories in the lead-up to the American-led war in Iraq inquired in a serious and sustained way into the Bush administration's raison d'etre for war (Saddam Hussein's alleged possession of weapons of mass destruction) and with the problems that might arise after an invasion.

Cunningham cites four developments to explain why the ideal of objectivity has come unbound. The first looks to the early economic reasons for adopting objectivity as a working philosophy. In attempting to appeal to a broader audience, the penny press (and later, the wire services) worked to remove partisan views from stories. Today economic requirements have stripped journalists of space and time allocated to news as opposed to advertising. This shrinking "news hole" leaves less space for the difficult balancing act of objectivity, as there is less time or space for context and analysis.

A second development that works against objectivity is the 24-hour-news cycle. With reporters of all media now accessing the Internet, there is less time to dig for sources. As a result, reliance on official sources has increased. Another is the rise of "attitude" in the news, as well as point-of-view reporting. Epitomized by Fox News, much of talk radio, and the Murdoch press, the idea of a measured and balanced report increasingly becomes, Cunningham suggests, "anachronistic."

Perhaps most important is the pervasive and infinitely expanding world of public relations and spin. These forces work to make the concept of balance at best moot and at worst confusing. Cunningham remarks that nearly all of the information a reporter gets from any official source has been carefully engineered to produce a desired effect.

These elements combine to make objectivity an increasingly passive and docile working philosophy for news media. Cunningham's alternative is to refashion objectivity so that journalists recognize their obligation to cover important news that is being ignored, even if elected officials are unwilling to talk about it. The new test thus becomes one based not on an abstract concept of balance but rather on a test of whether or not the reported news is true.

Objectivity Today

Objectivity developed as both an idea and a practice in the world of nineteenth-century American journalism. To the extent that wire services, like the Associated Press, have achieved a global reach, they, too, have globalized the tenets of objectivity. However, it is noteworthy that criticisms of objectivity as currently practiced in the United States are often tempered by claims that objectivity should not be abandoned entirely in favor of the more explicitly partisan viewpoints found in the European press. Notable exceptions include communications researcher Robert Hackett's position that such a viewpoint may perhaps be preferable to objectivity.

With the growth of multimedia technologies expanding the ways in which news stories are told, and especially the proliferation of the blogosphere that expands and challenges the conception of what it means to be a journalist, arguments about objectivity continue to shape much of the criticism of contemporary journalism. The varied uses of objectivity can be seen in criticism of press coverage of two different cases. In the lead up to, and coverage of, the Iraq war, journalists in Washington were criticized for relying too heavily on the Bush administration for information. Critics have suggested that journalists were too caught up in the patriotism following September 11, 2001, and failed to be a proper check on governmental power. Here, objectivity is seen as a force that can detach itself from the specifics of a situation and offer insightful reporting and analysis.

Conversely, critics suggest that coverage of the intercultural strife in the Darfur region of the Sudan failed largely because it did not sufficiently expose the human costs of the conflict. Large numbers of people dying will not sway the sympathies of the general public, nor even register the true horror of the event. Coverage of such an event requires personalization and real-life stories that can define a humanitarian disaster in more human terms. It is also important to note that what is considered an appropriate use of objectivity in one case is not always appropriate in another. This suggests that objectivity is most useful when discussed on a case-by-case basis.

Objectivity continues to function as one of the primary values for American journalists. Rarely is it followed blindly, and no single definition exists. It developed in American journalism for economic reasons and became a working philosophy. One of the initial aims of objectivity was to serve the creation of a general public with diverse political or social orientations. The enduring importance of objectivity is in its value to question, criticize and renegotiate what is wanted and needed from journalism.

Op-Ed Page

In contrast to newspapers in other countries where opinions are expressed throughout the paper, in the United States, opinion is relegated to the editorial or "op-ed" section of the newspaper. "op-ed" is abbreviated from *opposite editorial* due to the tradition of newspapers placing opinion material on the page opposite the editorial page.

The editorial section is the page or two pages of the first news section of the newspaper where the masthead and staff listing of the newspaper can be found, including the owner's name, one to four editorials, syndicated and local guest writers, political cartoons, and letters to the editor. It is only here that openly acknowledged opinion (as opposed to traditional "neutral" reporting) is supposedly published. While the editorial page usually contains the opinions of the publisher, the op-ed page is reserved for articles by other writers who are often not affiliated with the paper. Articles may come from freelance writers, advocacy and industry groups, public relations agencies, and others. Some of the most prominent op-ed pages are those of *The New York Times, The Washington Post, USA Today,* and *The Wall Street Journal.*

The Essay

The op-ed essay itself is a short essay intending to inform the public about an issue and to indicate some means for its resolution. As suggested by *New York Times* editor Patricia Cohen, many op-ed essays tend to follow one basic structure: lede (around a news hook), thesis (statement of argument—either explicit or implied), argument based on evidence (such as statistics, news, reports from credible organizations, expert quotes, scholarship, history, firsthand experience), a "To Be Sure" paragraph (in which the author preempts potential critics by acknowledging any flaws in the argument, and addresses any obvious counterarguments), and the conclusion (often circling back to the author's lead).

Some editors, such as Frank Partsch of the Omaha *World Herald,* believe that the op-ed page has a primary duty to provide opinions not ordinarily found on the editorial page. Secondarily, it provides a variety of opinions selected as being, in the editors' judgment, useful to readers. Often, these come from a regular line-up of syndicated columnists—columnists with a following that limit the editors' ability to cut them to make room for more nonregulars. Vying for the remaining handful of slots are unsolicited articles, made ever more voluminous in the 1990s, with the wider use of fax machines and e-mail. According to some editors, a rebuttal by a person or institution criticized in an editorial gets top priority. An article by a public official going behind or beyond the news is usually picked up. Editors also look for scholarly analysis of public policy and infrequent pieces in which a regular reader finds a fresh and creative voice and deals authoritatively with an issue worthy of general reader attention.

Development

The current American model of journalistic objectivity is a fairly recent development, predated by the partisan press and interspersed with various reactionary movements, such as new journalism (1960–70s) and public journalism (1990s). But since roughly the 1940s, American mainstream papers have been expected to operate within the norms of the objective model. The editorial section of the paper is the exception. These pages are the outlets for the editorial board, the publisher—sanctioned mouthpiece of the newspaper, to collectively craft and publish its views on a wide range of topics.

Along with the editorial section, the op-ed pages of the paper, where the content comes from outside the paper in most cases—from columnists and contributors—are historical remnants of the partisan press system in the United States that subsumed opinion within news columns. Under this partisan press system, news organizations aligned themselves politically and presented news from a specific partisan point of view, without the guise of objectivity. When the U.S. press system evolved from a partisan system to one with an objective

ideal, op-ed pages were created to distinguish the opinion section from the news sections of the paper.

In 1970, *The New York Times* opened a corner of prestigious journalistic real estate to outside nonjournalist contributors in an effort to provide space for what it later described as "doctrinal counterpoints to the liberalism of the paper's editorial columns and its columnists." In that spirit, the *Times* hired a conservative nonjournalist, William Safire, as a regular op-ed columnist. According to Stephen Rosenfeld, former editorial page editor of the *Washington Post,* in doing so, the *Times* was responding to popular calls for the institutions of authority in American society to, in effect, move over and make room for other participants. A growing appreciation of the complexity of issues of public policy made newspapers ready to share different perspectives on those issues.

However, *The New York Times* did not create the first op-ed page. Instead, the idea was conceived of by Herbert Bayard Swope, an editor at the New York *World* newspaper in the 1920s, who used the name "Op. Ed." In a letter written by Swope to newspaperman Gene Fowler, Swope wrote, ". . . nothing is more interesting than opinion when opinion is interesting, so I devised a method of cleaning off the page opposite the editorial, which became the most important in America . . . and thereupon I decided to print opinions, ignoring facts" (quoted in Meyer 1990). The difference from op-ed pages then and now is that Swope did not print unsolicited letters from the general public; instead he rounded up big names to write the letters.

Even so, *The New York Times* is widely credited for developing the archetype of modern op-ed pages in September 1970. By the 1970s, editors tried to distinguish their op-ed pages from others, but most adopted the common practice of devoting most, if not all, of their op-ed pages to outside voices. The *Chicago Tribune* used its op-ed page in the 1970s to run opinions that countered the *Tribune*'s "staunchly conservative views," while the *Los Angles Times* opted for more localized opinions of a less intellectual bent than those found in *The New York Times*. In the early 1980s, the *Cleveland Plain Dealer* tried to engage its readers with more local voices by dropping syndicated columnists entirely for a time and recruiting local writers to contribute periodically.

The increased use of op-ed pages encouraged the development of political columns in the 1960s and 1970s, and the sense that readers needed help in understanding not only politics, government, and business but also changing lifestyles led to a marked proliferation in types as well as numbers of columns.

By 1980, most newspapers had humorists as well as analysts on their editorial or opposite editorial pages, and some, especially smaller ones that did not have separate business or lifestyle sections, ran advice columns on business and other topics there. A survey conducted during the middle 1970s found that virtually all newspapers used some type of column on their editorial or op-ed pages. Political analysis and political reporting, presented in 93 percent and 75 percent of these columns respectively, were the most popular. Other columns featured humor (63 percent), business (33 percent), religion (20 percent), advice (13 percent), and gossip (1 percent).

By including op-ed pages, some newspapers were inadvertently responding to the admonition decades earlier of the Commission on Freedom of the Press in the mid-1940s that newspapers provide a forum for the exchange of comment and criticism. Then and now, some newspapers may be looking for a comparatively inexpensive way to look good and attract readers. Some may obtain columnists to keep opposition newspapers from using them. Many look to columnists for information, analysis, and comment concerning national and international affairs they cannot afford to obtain on their own and which are not necessarily available through the basic wire services. Some newspapers run columnists whose voices support and reinforce the philosophy of the publishers; some run columnists that differ with them politically, philosophically, or both, to provide readers a choice of benchmarks against which to measure their own views. Columnists can help satisfy these goals and perhaps provide incidental benefits such as provision of ideas for editorials.

Editors note that one challenge of maintaining a distinct op-ed page is generating a steady supply of quality submissions in order to fill the daily page. While prominent pages such as *The New York Times* and *The Washington Post* often ask noteworthy people to write op-eds, many newspapers

seem to rely on a combination of volunteer writers from the community and unsolicited contributions. Some newspapers create "contributor boards," or groups of diverse people from the community, who are asked to occasionally write columns. Some newspapers rely entirely on unsolicited contributions. A few use their op-ed pages for special purposes, such as publishing the submissions of scholastic essay contests or carrying a variety of opinions on specific themes that are of interest to the community.

Some journalists and journalism scholars have noted another challenge facing op-ed editors: keeping the page open to "citizen writers" as opposed to politicians, scholars, newsmakers, public relations specialists, and special interest groups. In a 1994 survey of op-ed editors, researchers found that the editors often gave preference to submissions from people who were principals in news stories, experts in the topic area discussed, or prominent at the local or national levels. About a third of newspapers that run op-ed pages sell space on the page for "image ads," or advocacy-statement advertisements developed by corporations, special interests, further limiting the space for essays from "citizen writers."

By the turn of the twenty-first century, many newspapers had expanded the role of the op-ed page to their editorial pages, sometimes surrendering space normally reserved for the newspaper's editorials for essays and letters from contributors and readers. Many newspapers that have just one opinion page per edition will construct them more as op-ed pages than as traditional editorial pages.

Smaller, more local newspapers sometimes feature community issue sections in their op-ed pages where members of the paper's readership can weigh in on topics that affect their local community. At larger papers, letters to the editor are often selected and printed in the op-ed pages on the basis of the authority or notoriety of the writer, but often on the basis of the point of view expressed. Letters to the editor usually range in length from 200 to 500 words and are shorter than op-ed essays.

Corporations have strategically engaged in op-ed campaigns using paid issue advertisements that are printed in the op-ed pages of newspapers, such as the Mobil Oil Corporation's op-ed campaigns between 1982 and 1986. Other organizations, including universities, have used unpaid essays on op-ed pages as a way of increasing the institution's visibility. Public figures and academics often attempt to act as public intellectuals by getting their essays or columns published in the pages of well-known newspapers and magazines. In these ways, the op-ed pages may be used by interested parties to try to persuade readers to their point of view and gain recognition.

As of 2007, men's voices dominated the nation's op-ed pages, and women's voices were noticeably lacking. Many opinion page editors at major newspapers across the country said that 65 or 75 percent of unsolicited manuscripts, or more, come from men. Some successful op-ed contributors, in the spirit of increasing diversity of opinion, are training women at universities, foundations, and corporations to write op-ed essays and get them published.

As Vaughn (2008) observes, over time, the term "op-ed" itself has evolved into an adjective denoting all opinion aspects of newspapers, such that some use the term to mean "opinion/editorial" rather than "opposite editorial."

Until the late 1990s and beginning of the twenty-first century, which saw the rise and proliferation of internet venues for news and opinion, op-ed pages were one of the few places in mainstream media where members of the public were provided an opportunity to offer their perspectives and shape public debate.

Conclusion

In the twenty-first century, venues for opinionated public affairs content have proliferated in all forms of media, even those traditionally reserved for "objective" news. In news magazines, newspapers, television news broadcasts, and internet news sites, opinion and editorial sections abound. In many instances, they continue to be demarcated as such and cordoned off through section headers or prefaces and disclaimers from the official news sections of those publications and broadcasts. In other cases, the line between news and opinion is less clear. Some scholars argue that with the ability of the average person to become a "citizen journalist" and blog online, singular access to public space through newspaper op-ed sections is

rendered less crucial. And so while newspaper op-ed pages still potentially wield power by influencing the sentiments of their readers, they are only one force of opinion in an ever-growing opinion media landscape.

P

Pacifica Radio

The Pacifica Radio Foundation owns the licenses for and manages the affairs of five listener supported, noncommercial FM radio stations in the United States: KPFA in Berkeley, California (inaugurated in 1949); KPFK in Los Angeles, California (1959); WBAI in New York City (1960); KPFT in Houston, Texas (1970); and WPFW in Washington, D.C. (1977). Pacifica also funds and promotes news and public affairs programs for its own and nearly 100 affiliated community radio stations, most notably *Democracy Now* and *Free Speech Radio News*. The organization's main contribution to U.S. journalism has been the consistent airing of perspectives of the American and global political left that are often excluded from or marginalized by mainstream broadcasting.

World War II–era conscientious objectors created the Pacifica Foundation in August of 1946. Pacifist Lewis Hill, nephew of an Oklahoma oil millionaire, had worked as an announcer at a news radio station in Washington, D.C., following his release from a conscientious objector camp in 1944. Hill saw radio as a way to rescue organized pacifism from its sudden marginalization following Japan's attack on Pearl Harbor in December 1941 and the consequent U.S. entry into World War II. He envisioned listener support or "sponsorship" as a means of establishing a funding base independent of advertisers or educational institutions, the latter the most common source of support for nonprofit broadcasting.

Pacifica launched KPFA in Berkeley in 1949 largely through volunteer labor. The focus of the station was primarily cultural, including commentaries by movie critic Pauline Kael, Zen scholar Alan Watts, and beat poet Kenneth Rexroth. Although the station broadcasted political commentaries, most notably Hill expressing opposition to the FBI and the Korean War, news and public affairs programming took a backseat to culture until the arrival of Elsa Knight Thompson in the mid-1950s.

Thompson, a journalist who had worked at the BBC in London during World War II, pushed to build a news and public affairs department at KPFA. She produced many path-breaking programs, including a lengthy 1958 broadcast on the civil liberties of homosexuals that is generally recognized as the first gay rights radio documentary. In 1960 Knight Thompson took a team of reporters to San Francisco City Hall to provide live coverage of hearings held by the House Committee on Un-American Activities. When subpoenaed witnesses denounced the committee in testimony and students rioted outside the hearing chambers, the KPFA team turned the broadcast into a widely distributed radio documentary.

The opening of Pacifica stations KPFK in Los Angeles and the acquisition of WBAI in New York City accelerated the foundation's emphasis on news and public affairs. KPFK's Terry Drinkwater, later to join CBS, produced a provocative interview in 1959 with notorious anti-Semite Gerald L. K. Smith. In October 1962, WBAI producers Richard Elman and Chris Koch, the latter an acolyte of

Knight Thompson, interviewed a disgruntled FBI ex-trainee on his experiences with the bureau. For three hours WBAI listeners heard Jack Levine disclose anecdotes of racism and anti-Semitism at the agency, as well as revelations of J. Edgar Hoover's alleged distaste for trainees with sweaty hands. The FBI retaliated by producing a dossier of nearly everyone in Pacifica and handing it over to the Senate Internal Security Subcommittee. The senators subpoenaed members of the Pacifica board while the Federal Communications Commission stalled the renewal of Pacifica station licenses. Only the resignation of a Pacifica board member once associated with the Communist Party enabled the foundation to survive the ordeal intact.

During the 1960s, WBAI enhanced its reputation with unique coverage of the Vietnam War. While Dale Minor provided dispatches from the Battle of Hue in South Vietnam, in 1965 Koch became the first U.S. reporter to visit Hanoi and return with lengthy commentaries and interviews from the north. WBAI won a huge audience in greater New York by including European news service items in its daily newscast on the war. All three Pacifica stations developed daily newscasts.

As a critical mass of journalists developed at Pacifica, the organization began to cobble together an alternative radio news service which included many future National Public Radio reporters, such as WBAI's Margot Adler. Begun in 1968, the program's audience grew as community radio stations proliferated across the country, joining forces in 1975 to form the National Federation of Community Broadcasters (NFCB). In 1972 journalist Larry Bensky anchored live coverage of both the Democratic and Republican National Conventions, held in Miami, sending narration and actuality feeds to two dozen community stations via telephone connections. By the early 1980s, Pacifica was producing a daily national newscast whose contributors included journalists Marc Cooper and Tim Frasca of KPFK, Alan Snitow of KPFA, and Robert Knight of WBAI. The production drew on correspondents around the world, including Israeli reporter Peretz Kidron, a prominent critic of that country's occupation of the West Bank and Gaza Strip.

In 1987 Pacifica and Bensky once again put the organization on the national news map by providing live gavel-to-gavel coverage of the Senate's Iran Contra hearings. This time Pacifica employed a satellite connection to reach a much larger group of community radio stations. Bensky interviewed hundreds of guests during the hearings and took listener call-ins to get audience reaction on the scandal. The production won Bensky, his producer Bill Wax, and Pacifica a prestigious George Polk Award. The organization continued using this means of distribution for a while, providing live coverage of the Senate confirmation hearings of controversial Supreme Court nominees Robert Bork and Clarence Thomas.

By the early 1990s Pacifica's leadership had committed itself to centralizing the organization's resources in order to produce and distribute more national programming. In 1992 former PBS official Gail Christian completed a study for the organization. Titled "A Strategy for National Programming," the document recommended creation of a national production facility for the network that would provide about 100 hours a month of programming to 100 community radio stations, including Pacifica's. Although the organization never created this service, it began to experiment with a wide range of national programs, including Dennis Bernstein and Robert Knight's *Iran-Contra Report,* the *Julianne Malveaux Show,* featuring the progressive economist and her guests, and former California governor Jerry Brown's program *We the People.*

By the mid-1990s Pacifica noticed that affiliate community station KFCF in Fresno, California, had been buying access to a commercial satellite system operating on the so-called Ku-band (14.0 to 15.5 Ghz for uplinks) in order to route KPFA programming to its audience. Another service, *Radio Bilingue,* distributed its program to community stations via the system. Pacifica followed suit in 1997 with a Ku band service that distributed a wide variety of programs to community radio stations, including Marc Cooper's *Radio Nation,* Michio Kaku's *Explorations in Science,* and the *Pacifica Network News* (PNN).

The centerpiece program of the satellite system was *Democracy Now,* inaugurated in 1996 and hosted by WBAI programmer Amy Goodman and *New York Daily News* reporter Juan Gonzalez. *Democracy Now* represented a significant departure for Pacifica radio. Unlike earlier Pacifica programming that usually interviewed prominent leftists, Goodman also aggressively courted the

participation of government officials, corporate spokespersons, and conservative ideologues. Often Goodman would clash with these guests, as she did in confrontations with House Speaker Newt Gingrich and President Bill Clinton. But these exchanges only heightened the popularity of the show among Pacifica and community radio listeners. Goodman has also won acclaim for her coverage of events in Haiti and East Timor. By the late 1990s *Democracy Now* broadcast to almost 80 community radio affiliate stations and an estimated audience of 750,000 to 1 million listeners.

An internecine crisis over governance at Pacifica radio from 1999 through 2001 resulted in the collapse of PNN. *Democracy Now* became an independent programming service, but continued to receive substantial funding and promotion from Pacifica. In 2000 many reporters affiliated with PNN reorganized themselves as *Free Speech Radio News* (FSRN), an independent service. As of the mid-2000s, FSRN broadcast to 93 community stations and 11 Internet and low-power FM stations. Pacifica provides substantial financial and distributional support to FSRN. Both groups have publicly committed themselves to reintegrating FSRN back into the auspices of Pacifica governance.

Pacifica also distributes other national programs, including Larry Bensky's discussion show *Sunday Salon,* Dennis Bernstein's investigative magazine *Flashpoints,* and *Informed Dissent,* a week-in-review election show.

Pacifica radio's most important contribution to broadcasting remains its demonstration that Lewis Hill's listener-sponsorship system works in big, urban areas—although it is less successful in poorer and rural regions where fewer people with disposable income are listening. KPFA, KPFK, and WBAI, with their emphasis on localism and community advisory boards, served as models for the burgeoning community radio movement of the 1960s and 1970s. Today, Pacifica functions as an ongoing broadcasting forum for those who see the U.S. government's "war on terror" as a threat to global stability and civil liberties.

Pacific Area

A difficult region to characterize briefly, the Pacific (also called "Oceania") consists largely of island nations including—to name only the largest—Indonesia, New Zealand, Papua New Guinea, the Philippines, Taiwan, and many smaller island groups. With the exception of the first four, populations are sparse and widely scattered. The development of satellite communications in and since the 1970s has made them easier to reach without substantial delay.

Indonesia

The world's fourth largest country, and its largest Muslim nation, this island nation (with some

6,000 inhabited islands) was a Dutch colony from the early 1600s until after World War II. In 1816 the Dutch established the first newspaper, which appeared until the Japanese occupation of 1942–45. There were about 30 papers—all in Dutch—by the mid-nineteenth century, at which point some of the first indigenous language periodicals began publishing. The first Indonesian language newspaper began in 1907. While circulations remained small due to limited literacy, they reached important population segments and helped to fan nationalist feelings in the years before World War II and until independence was achieved in 1949.

Just under half of Indonesia's 230 million people live on the island of Java, where Jakarta is located, and numerous newspapers are published there as well as in other cities. The country is served by about 175 daily newspapers (many others have come and gone with varied political winds) with a total circulation approaching eight million. Most of the newsprint they use is made in the country, some by companies that also own newspapers.

There are some 40 television stations (the first began operating in 1964), most of which operate within one of ten national networks, and some 800 radio stations (60 of them in the Jakarta area). In 1974, the country launched its first communication satellite to ease and speed communication across thousands of miles of islands. An all-news television station began operating in 2000 in Jakarta, broadcasting to both Indonesian and Chinese audiences. By the early twenty-first century, perhaps 2,000 radio transmitters operate as pirates without official clearance to get around stiff licensing requirements.

As in many developing nations, press–government relations depend on the political winds and players of any given time. During the long regimes of Sukarno and then Suharto, government control or repression of news media (including licensing) was severe. Since the latter's overthrow in 1998, however, there has been a considerable expansion of print and broadcast services. Freedom House concludes that early-twenty-first-century news media are partially free of government repression, with major liabilities being defamation suits filed by public officials against reporters or their media, and physical attacks on journalists.

New Zealand

An independent Dominion (since 1907) within the British Commonwealth, New Zealand's first newspaper appeared in 1840; within two decades there were dozens of them. By the end of the nineteenth century there were nearly 200, largely modeled on those in Britain, and a New Zealand Press Association was already two decades old. A century later there were nearly 30 dailies (though only ten published on Sundays), and many regional and free newspapers. The first radio station aired in 1921 and initial laws regulating the service were in place in 1923, well ahead of many larger nations.

Broadcasting was largely deregulated in the 1990s. The country of more than four million people is served by some 40 television and 400 radio stations, mostly commercial, located on the country's two main islands (most on the North Island). There is a government-operated public service network of both radio and television stations, somewhat modeled on the BBC. Australian media firms control half of the country's newspapers including the largest, the *New Zealand Herald*. A growing number of media outlets exist to serve the indigenous Maori population, often in their own language. The country enjoys one of the most free journalism systems in the world.

Papua New Guinea

An independent country since 1975, this island nation (half of one major island and some 600 smaller ones) was long governed by Britain and then Australia. The first radio station aired in 1961 and television appeared only in 1987. With more than 5 million people, there are only two daily newspapers (both published in English, one owned by an Australian firm, the other by a Malaysian company), one television station (controlled from Fiji), and over 50 radio outlets, some operated as a public service network, and the rest commercial. While there are occasional press-government tensions, the news media are generally considered free of repression.

Philippines

A Spanish colony from 1521 to 1898 when the United States took over as a result of the Spanish-American War, the 7,000 islands that make up the

Philippines became independent in 1946. While there had been some Spanish-language newspapers in the nineteenth century, the first English-language papers appeared at the turn of the twentieth century and the news system was largely modeled on that in the United States, though with tight control on any criticism of military or colonial authorities. The first radio stations took to the air in Manila in 1922. Newspapers became more critical in tone during the 1930s, and shed light upon government malfeasance in the 1940s and 1950s. Television began local operation in 1952, again in Manila. In the 1970s and early 1980s the press was largely controlled by President Ferdinand Marcos or his close associates.

In a country of some 85 million people, about 40 percent of Filipinos work in agriculture and another 20 percent in the government or social services. They are served by less than a dozen national daily papers and some 400 community weeklies, the most important of which are controlled by a few wealthy families. There are about 30 television and more than 650 radio stations, most of which are privately owned, but operating parallel to government services in both media.

Several things trouble Filipino journalism—tough libel laws that are often a means of controlling news media criticism (perhaps ironically, a holdover from the days of American administration), a high level of physical assaults on or murders of journalists, and sometimes shaky ethical standards. Despite this, newspapers maintain investigative reporters to keep an eye on governmental wrongdoing (and a Philippine Center for Investigative Journalism is active). The expanding broadcast media are important news conduits.

Taiwan

Also known as Formosa, this large island off mainland China was a Chinese province until 1895 when Japan annexed it, ruling until the end of World War II. At the end of the Chinese Civil War in 1949, the remnants of Chang Kai-shek's Nationalist army fled to the island, styling themselves the surviving Republic of China. Tension between the two Chinas has largely dictated political and media policy in the 60 years since. Governmental control of media, direct or indirect, has declined sharply in recent years and the country now has one of the freest systems of mass media in Asia.

The Japanese banned Chinese media in their half century of control, creating a few small circulation Japanese newspapers and establishing the first radio station in Taipei in 1925. There were only a handful of stations operating by 1945, and just ten by 1955. By the early 1970s, radio had expanded to 110 outlets operating twice as many transmitters around the island. The island's first television station began broadcasting in 1962. By the early 1980s, about 15 to 20 percent of broadcast time was devoted to news. In 2006 the government-operated Taiwan Broadcasting System, a public service operation, was privatized.

There are more than 360 private newspapers, about 170 radio stations and some 30 television stations serving the nation of nearly 25 million people. Internet service is widely used.

PanAfrican News Agency

The PanAfrican News Agency (PANA), formally known since 1997 as PANAPRESS, is a continent-wide news-gathering and sharing operation, linking the many national African news agencies to reduce their dependency on major Western news agencies.

Development

The dream of an Africa-based global news agency is an old one. Ghana, the first former colony to become independent (in 1957) sought to create just such an entity. Years of often frustrating discussion and negotiation followed the independence of other former colonies into the 1960s. In April 1963, African nation ministers of information agreed to create the Union des Agences d'informations Africaines, based in Tunis, Tunisia, which provided some news services for all of the continent's nations. Although its services were by no means comprehensive, the nascent information agency did suggest what might be accomplished with stronger organizational and financial support.

In July 1979, the Organization of African Unity (OAU) formed the PanAfrican News Agency, or PANA, as one of its own specialized agencies, charged with serving as a true continental news service. An important additional role was to balance and hopefully overcome widely held global views of the continent as corrupt, disease-ridden, poverty-stricken, and backward. Transmission of such news, it was argued, thwarted attempts to develop the continent and limited revenue-generating tourism as well.

All African nations which were members of the OAU also became members, financial supporters, and users of the new PANA. For unlike the major western agencies, PANA, initially based in Addis Ababa, Ethiopia, was created as an intergovernmental entity because most of Africa's individual national agencies also formed a part of their respective governments. Indeed, several of the announced objectives of PANA were clearly more political than professional in nature. From its inception, PANA was intended to promote the objectives of the OAU for the independence, unity, and solidarity of Africa; and to provide information about and assist in the liberation struggle of peoples against exploitation and oppression.

PANA was also known by its French titles as Agence d'Information Panafricaine (AIPA) and Agence Panafricaine d'Information (API). Plans called for 75,000 words of news each day, much of it coming from regional offices that were initially located in Lusaka (Zambia), Lagos (Nigeria), Khartoum (Sudan), Kinshasa (Zaire, later the Congo), and Tripoli (Libya), the only North African bureau originally established. After several years of development and training, and partially overcoming the lack of trained personnel, PANA news service began from Dakar, Senegal (still the news agency's home), on May 25, 1983.

But the governmental organizing principle—and its political as well as professional news-reporting roles—soon made PANA operation (let alone expansion) difficult and created both financial and managerial problems. Within five years, the new venture was bankrupt, largely because more than 40 countries were in arrears on their PANA support payments. At times, the agency's access to telephone and cable services was cut off. By the early 1990s, PANA was not only in decline, it was facing a huge and growing debt.

The United Nations Educational, Scientific and Cultural Organization (UNESCO), one of the original funders of the agency, developed a financial recovery plan to revive PANA starting in 1993. With the advice and leadership of UNESCO staff and experts from other countries (including South Africa which became a member in 1994 after the end of apartheid), a move to professionalize PANA included creation of additional revenue-producing news products and an increase in the agency's overall news output. PANA was privatized as a limited company, becoming known as PANAPRESS on October 1, 1997. The new business's management trimmed staff and payroll by more than 60 percent, raised news output by about 25 percent, and eliminated the cumulative debt from the former operation. By 2001, the agency's website was attracting 165,000 hits a day.

Services

By the end of the first decade of the twenty-first century, PANAPRESS was providing a variety of services on a fee or subscription basis. Its main

news feed included continent-wide, regional, and topical news, transmitted 24 hours a day. The agency claimed to be the only international news service providing quality and current information about Africa, with reporters and stringers in 51 nations. Its "Press Review" offered a weekly summation of African news, "In-Focus" provided a variety of feature stories ranging over many subjects, and the PANAPRESS news archives offered a searchable database of past news stories.

In early 2001, PANA announced a partnership with the Gamma international photo agency that for the first time enabled PANA to enhance its news service with photos. Under the agreement, photographers were based in PANAPRESS headquarters in Dakar, as well as in its seven regional bureaus in Abidjan (Ivory Coast), Addis Ababa (Ethiopia), Johannesburg (South Africa), Nairobi (Kenya), Tripoli (Libya), and Yaounde (Cameroon).

News and features are generally available in a choice of English, French, and Arabic, with the more recent addition of Portuguese. The agency website encourages information searches by topic or by nation and provides several hundred pages of PANAPRESS stories ranging back to 2001.

While PANAPRESS has progressed impressively in its three-decade history, it still suffers from a lack of sufficient personnel and modern equipment. Political problems in Africa are often reflected in the agency's communication (or lack of it when reporters are banned). But there is far more cultural, social, and economic feature material about the Continent available thanks to its efforts.

Parody of News

The parody of print and broadcast news involves the employment of a variety of print, televisual, and filmic representations of journalism and journalists for comedic and often satirical purposes. Closely related to the literary traditions of satire and lampoon, news parodies frequently combine humorous content with biting criticisms of the shortcomings of the media business.

Traditionally, a piece can be considered parody when it draws upon an existing, commonly "serious" work for comical or critical effect. While parody is closely related to satire, the two terms are not interchangeable—the primary purpose of parody is typically humor, while although satire often contains elements of humor, it does not have to be funny. (Satire is more concerned with presenting the faults and failings of some entity or situation with the objective of shaming or ridiculing the target into change.) The roots of parody stretch back to ancient Greece, with Aristophanes often credited as the father of parody for his lampooning of the playwrights Euripides and Aeschylus in *The Frogs.*

The parody of news can focus on news content (the actual stories), news format and conventions, or a combination of the two. A particular parody may address the serious news of the day in a comedic/parody format (e.g., *The Daily Show*), retain the traditional structure of "legitimate" news while parodying the content (e.g., *The Onion*), or lampoon both the format and the content simultaneously (e.g., *Anchorman: The Legend of Ron Burgundy*). Parodies of news can be found across a wide range of media, including print, television, film, and the Internet.

Notable Print Parodies

National Lampoon's Sunday Newspaper Parody, first published in 1978 and re-released as a paperback book in 2004, was originally published in a traditional newspaper (broadsheet) format as *The Dacron* (Ohio) *Republican-Democrat*—proudly proclaiming itself "One of America's Newspapers!"—and extended the parody beyond article content into advertisements, the Sunday magazine section, comics, and movie listings.

("Living Play Things," for example, sells "Ohio's Freshest Pets." Their sale on Teacup Dobermans and Mexican Chili Dogs includes, free with any purchase, a mud-breathing Southern American Muck Puppy. The ad is a sidebar to the articles, but just as much a part of the joke.) The *Sunday Newspaper Parody* published only one issue, and can still be found in book format.

Perhaps the most famous of all parody newspapers is *The Weekly World News,* which at its zenith, enjoyed a circulation of over a million per issue. When the paper began in 1979, it maintained that the articles printed within were true and legitimate. By 2007, when it ceased production, no such pretense remained. *The Weekly World News* existed as a parody of supermarket tabloid newspapers, often printing articles concerning Loch Ness Monster sightings, alien encounters, giant mutant animals, and the mysterious "Bat Boy"—a half-human, half-bat creature that has engaged in a variety of offenses, including stealing an automobile, endorsing Al Gore during the 2000 presidential elections, and campaigning for a gubernatorial seat.

First published in 1988 at the University of Wisconsin–Madison, *The Onion* is a free newspaper which publishes wildly fictitious articles in a very traditional tabloid newspaper layout. The parody of conventional newspapers extends to nearly every section of the publication, from headlines to article content, polls to editorials, horoscopes to advice columns. *The Onion*'s international website, launched in 1996, significantly increased the circulation and national attention of the publication. In 2008, *The Onion* boasted over five million unique page hits per month. *The Onion* also publishes compilations of its articles in compendium volumes including *The Onion Ad Nauseam* and *Our Dumb World*. On occasion, the traditional format of *The Onion* has led the unsuspecting to believe articles published by the paper are true. In 2002, the *Beijing Evening News* cited as factual an *Onion* article detailing Congress's threat to move to another city if Washington, D.C., failed to install a retractable dome on the Capitol building. In 2004, MSNBC commentator Deborah Norville cited an *Onion* article proclaiming that over half of American exercise is televised. *The Onion* has spawned numerous emulators including *The Frumious Bandersnatch, TheSpoof.com,* and *The Wasted Times,* and in 2007 launched *The Onion News Network,* a website dedicated to producing the same *The Onion*-style parody news stories in video format.

Notable Television/Film Parodies

The *Benny Hill Show*'s "News at Ten" (1971) was a spoof of British ITV network's nightly newscast. A dozen years later, French television producers Roland Topor and Henri Xhonneux's *Téléchat* (1983) lampooned news broadcasts using hand puppets of a cat and an ostrich. *Not Necessarily the News* (1983–90) was an American version of Britain's *Not the Nine O'Clock News* (1979–82). Both programs made extensive use of re-editing actual news footage with new voiceovers to create parody stories. In particular, *Not Necessarily the News* on Home Box Office (HBO) often repackaged interview responses from political figures with new questions from the cast to create comic and fictional interview segments—most famously with former Secretary of State Henry Kissinger and the wife of then–Vice President Dan Quayle. The British BBC2 network produced an adaptation of the radio program *On the Hour* for television in 1994. Titled *The Day Today,* the series combined a traditional news magazine format with fictional parody content, skewering not only the overly serious nature of news anchors and field reporters, but the technological gimmickry of news broadcasts. Regularly, the program featured incredibly complicated computerized lead-ins and credit sequences.

Saturday Night Live's "Weekend Update" segment has been a mainstay sketch of the comedy program since its debut in 1975. While 32 different comedians have anchored the news commentary desk, the format has not much changed in the segment's 33-year run. "Weekend Update" typically takes actual events and pairs them with comedic commentary from the anchors in a parody of evening news broadcasts. The segment usually involves guest commentary, editorials, or other special spoofs based on current news items.

Prominent television news anchors have often been spoofed, and in multiple venues, from *The Simpsons'* bumbling news anchorman, Kent Brockman, to *Sesame Street*'s two "Grouch news" anchormen, Dan Rather-Not and Walter Cranky.

Comedian Will Ferrell took the image of the traditional broadcast news anchorman to ridiculous proportions in the film *Anchorman: The Legend of Ron Burgundy,* lampooning not only the stuffy and dowdy seriousness of television news anchors, but inter-station news team rivalries, local journalists' coverage of local media events, and the celebrity that comes with leading a television news team.

Both *The Daily Show with Jon Stewart* and *The Colbert Report* on the Comedy Central cable channel operate within traditional formats—the news magazine and the cable political pundit program, respectively. *The Daily Show*'s host and producer, Jon Stewart, has repeatedly referred to his program as "a fake news show," despite the fact that studies reveal many viewers under 30 use *The Daily Show* as a primary news source. Both programs present actual (though edited) news stories, then provide comedic/parodic commentary about the stories. *The Daily Show* also features news packages from "Senior Correspondents," editorials, and interviews with celebrities and political figures. Its coverage of the Iraq war (titled "Mess O'Potamia") and presidential elections in 2004 and 2008 ("Indecision 2004" and "Indecision 2008") have earned the program multiple Emmy and Peabody Awards. *The Colbert Report* is modeled on cable network pundit Bill O'Reilly's *The O'Reilly Factor,* and is more of a direct parody of both the format and the content of that program.

There have also been many situation comedies which are set in news-related environments, from *NewsRadio* to *The Mary Tyler Moore Show* to *WKRP in Cincinnati,* to *Back to You.* However, the simple pairing of comedy and the news environment does not a parody make. The difference lies in the intent and focus of the comedy in relation to the news environment or content. The intent of the best news parodies is to critique some of the genre's most recognizable features—its serious nature, its predictable and familiar formats, and its reliance upon the myth of photographic truth. In essence, the best of the news parodies are those that take the news industry seriously as they poke fun at it.

Conclusion

It is difficult to definitively state whether the public's appetite for news parody has grown over the years. First, there is the problem of volume—there are vastly more media outlets in 2008 for programs like *The Daily Show* and *The Colbert Report* to exploit than a program like *Not Necessarily the News* had access to in 1983. The advent of the Internet and the entrée to global populations that came with it makes comparison of public demand for news parody challenging. Secondly, and interrelated, *Not Necessarily the News* appeared on HBO, a premium pay cable channel. International programs such as *Téléchat* and *The Day Today* were limited mostly to local or national broadcast. *Saturday Night Live* has been freely available on network television since its debut; *The Daily Show* and *The Colbert Report* appear on basic cable. Audiences are expectedly larger when viewers do not have to pay extra to receive the program.

It is tough to overstate the impact of the Internet on the distribution and consumption by audiences. *The Onion*'s readership exploded upon the launch of its website; even defunct parody outlets such as *The Weekly World News* and *Not Necessarily the News* are kept alive through Internet niches dedicated specifically to those entities. With the increase in access to immediate information the Internet brings comes an increase in access to (and for) those who would poke fun at that information. *The Daily Show* currently maintains a website containing an archive of every episode of the program for free streaming download; *The Onion*'s website allows users to search a collection of over a decade's worth of articles. Whether the public's desire for more parody of news has increased or not, one thing is certain—on the Internet, there is plenty of parody available.

Peace Journalism

Peace journalism, according to its advocates, is a way to report on conflict and not increase the conflict itself. Sounds simple, but its application would surely change the nature of journalism because of a reporter's orientation to conflict as news. Therefore, perhaps the easiest way to understand peace journalism is to examine it in opposition to the previous ways of covering war and conflict. (Some authors even refer to typical journalism as "war" journalism because of the journalistic practice of framing conflict in terms of trying to discover who is winning and who is losing.) A criticism of peace journalism is that it expects journalists not only to take sides but to advocate for peaceful resolutions of conflicts.

The ideas promoted by peace journalism's advocates are best understood in contrast to journalism as it has been traditionally practiced. And the advocates for peace journalism admit that the phrase itself suggests that they are advocating peace. Instead, they say that they hope to "give peace a chance" by ensuring that nonviolent responses to conflict also are covered by journalists (Lynch and McGoldrick 2005, xxi). For example, one "How to do it" list on the web begins: Avoid portraying a conflict as consisting of only two parties contesting one goal (xxi). The logical outcome is for one to win and the other to lose. Peace journalists, instead, would separate the two parties into many smaller groups, thereby opening up more creative potential for a range of outcomes.

Opposing Side-Taking

Peace journalism uses conflict analysis and transformation to achieve fairness and accuracy in reporting. As suggested here, traditional journalism seeks to present opposing sides to a problem; the peace journalist hopes to encourage the understanding of multiple positions to each potential conflict. Peace journalism advocates explain that journalism as it has been practiced in America encourages the taking of sides even when that is unnecessary. Because of this craft tradition, reporters who cover war are blind to anything except a polarized presentation of the news. In turn, this polarized approach accelerates conflict. (See peace journalism model in Lynch and McGoldrick, 6.)

Practical tips and suggestions for changing the way a reporter covers conflict are included in a textbook written by British former war correspondents Jake Lynch and Annabel McGoldrick. As they present the material, among the first steps in analyzing conflicts is a process they call "mapping the conflict." Wisely pointing out the effects of language choices of winning and losing, they offer simple lessons in empathy—discovering common ground and common visions for the future and looking beyond slogans and positions to identify opportunities for dialogue.

Lynch and McGoldrick use modern examples which help explain how peace journalism has defused or could defuse conflicts. A useful example is Britain and Ireland and how that conflict has evolved from historical bloodshed to a kind of transcendence. As they note, stopping the fighting does not bring harmony nor does it mean that all disagreements have been resolved.

Many of the tips for reporters who would follow peace journalism's processes are framed in ways to "avoid" certain patterns of speech which lead to the escalation of violence. Examples are the avoidance of the following: assessing the merits of a violent action in terms of policy; letting parties define themselves by quoting a leader's demands or positions; asking about what divides the parties; only reporting violence and describing the horrors; assigning blame and highlighting the fears and grievances of one party; and most importantly, using victimizing language such as "destitute," "defenseless," or "pathetic." Other language to avoid is the imprecise use of emotive words ("genocide," "decimated," "massacre"), adjectives such as "vicious" or "brutal," and labels such as "terrorist," "extremist," or "fanatic."

Phillip Knightley, in his prefatory remarks in the text for peace journalism, points out that "[t]he aim of this ambitious book is to spark off a revolution in journalism—to change the way the media reports wars. It is important and long overdue" (Lynch and McGoldrick 2005, iii). Indeed, if the authors of *Peace Journalism* have their way, journalists will need to change more than their language—they will need to become more analytical and their editors must let them.

Opponents of peace journalism say that it is an (unwelcome) shift from objectivity and offer other important analyses, as well. Canadian researcher Robert Hackett has attempted to analyze the production of news and its complexities in relation to the concepts of peace journalism. He carefully sets forth the arguments of both the peace-journalist advocates and their critics. As he notes, "Peace Journalism is an unwelcome departure from objectivity and towards a journalism of attachment" (Hackett 2006, 2). He goes on to note that the peace journalism movement fails to fully take into account the effects of the actual dynamics of news production.

One Antiwar Correspondent

A reading of some of the advocates against war adds to an understanding of the defusing process. One of the most interesting—and least self-righteous—is a collection of war reporting by Martha Gellhorn called *The Face of War*. Even though it covers wars from 1937 through recent conflicts, it offers surprisingly modern views. The overall tone is antiwar or perhaps prohuman, as well as deeply humane.

Gellhorn, who reported the Spanish Civil War in the 1930s through the Vietnam War 30 years later, has been more known for being the third wife of Ernest Hemingway than for her writing. However, new critical attention may shift the understanding of her international importance. Her pieces are personal and are not as dated as much war correspondence because she does not write about military tactics. Caroline Moorehead, author of *Gellhorn: A Twentieth Century Life,* says the correspondent remained undaunted for most of her 90 years. "I think she was fearless but she knew what it was like to be frightened," a toughness she got from her upbringing. "She didn't write about battles and she didn't know about military tactics," Moorehead says. "What she was really interested in was describing what war does to civilians, does to ordinary people." This creates the timelessness, the overall antiwar feeling to these remarkable pieces.

Peace Advocacy as History

Some of the most interesting research on peace advocacy and its press was the work done about the nineteenth century. Interestingly, the research suggests that much journalism was a form of advocacy, that many publications were often strident in their activism. Indeed, access to different peace approaches can be found in archival copies of peace journals such as the *Messenger of Peace* and the *Herald of Peace*. Often romanticized or considered quaint, these Quaker advocates for reform were courageous in the face of taunting and in the possibility of physical danger.

Scholars of diplomatic and military history have dominated the field of possibilities for peace history, yet many opportunities for future research by journalism historians exist. Like the frames available to war correspondents, the military historians haven't found the peace press provocative or compelling enough, according to journalism historian Nancy Roberts. But peace societies at their inception saw the need for publications to cover the issues which were left out of popular publications. Hence, much of the information about the peace press must be gathered by reading peace periodicals themselves.

Roberts outlines a sampler of peace advocacy publications available at the Swarthmore College Peace Collection. Included are publications which date from 1828. For current topical information, information and articles are available from an interfaith peace website called the "Fellowship of Reconciliation" identified as existing "For a World of Peace, Justice and Nonviolence." Historian Merle Curti has written of earlier peace periodicals that their study is important because they usually contain the annual reports and addresses which earlier were circulated in tract form. Additionally, a tradition of antiwar journalism and an important archive of antiwar newspapers exist, but they are separate from the peace journalism phenomenon.

Both historical studies of peace publications and further analyses of the peace journalism phenomenon are needed to better understand these challenges to the practice of journalism.

PHILADELPHIA

Philadelphia is the second largest city on the East Coast and the sixth largest in the nation, with a population of approximately 1.45 million. Situated between New York and Washington, D.C., Philadelphia's location has long made it a pivotal printing and publishing center and an important city for journalists.

Newspapers

Among the first newspapers to be printed within Philadelphia was *The Pennsylvania Gazette,* published by Benjamin Franklin. The success of the *Gazette* was due in no small part to Franklin's acute awareness of the types of stories that sold newspapers: sex, crime, and gossip. In addition to its distinctive journalistic style, the *Gazette* also distinguished itself by printing, on May 9, 1754, the "Join, or Die" graphic, considered the first political cartoon printed in the United States.

In 1800, when the United States capitol moved from Philadelphia to Washington, D.C., Philadelphia undertook efforts to remake its image. Part of this shift in the city's development throughout the nineteenth century entailed the birth of several newspapers. *The Philadelphia Inquirer* was born on June 1, 1829, making the paper the third-oldest surviving daily in the United States. The *Public Ledger* was first printed on March 25, 1836. Eleven years later the *Philadelphia Evening Bulletin* appeared under the name *Cummings' Evening Telegraphic Bulletin.* The *Philadelphia Tribune,* the voice of the black community, was founded by Christopher J. Perry in 1884, making it the oldest black paper in America. In 1925, the tabloid *Philadelphia Daily News* was founded.

Over the course of the twentieth century, the competition among Philadelphia's various newspapers became fiercer. Although the *Public Ledger* folded in January 1942, the city was left with several dailies. When the *Bulletin* was purchased by William L. McLean in 1895, it was the smallest of the city's 13 daily newspapers with a circulation of 6,300. In ten short years the *Bulletin* was transformed into Philadelphia's premier paper with a circulation exceeding 200,000. After McLean's death in 1931, his son Robert took over. Committed to traditional journalistic norms such as objectivity and balance, McLean's *Bulletin* continued to dominate its prime competitor, the *Inquirer,* and was considered Philadelphia's paper of record for most of the twentieth century, with the exception of the Sunday newspaper, where the *Inquirer* held

a circulation lead. During most of this time, however, the *Bulletin* was the largest evening newspaper in the United States.

In the 1970s, like many evening newspapers, the *Bulletin's* readership began to decline. With a change in leadership at the *Philadelphia Inquirer* that made it a more viable competitor, the *Bulletin* ceased publication in 1982. Television also played a role in the *Bulletin*'s decline, as did changing modes of transportation. With fewer workers taking public transportation, afternoon newspaper readership suffered.

Like the *Bulletin,* the *Philadelphia Inquirer* was long a family-owned newspaper. In 1936, the *Inquirer* was sold to Moses Annenberg, who began to raise the public visibility of the paper. In 1942 his son Walter Annenberg assumed leadership of the paper. While the newspaper supported Democrats in their efforts to reform the corrupt Republican-led machine that ruled Philadelphia throughout the 1950s, the *Inquirer* remained predominantly allied to the Republican party.

Fifteen years after Walter Annenberg inherited the *Philadelphia Inquirer* from his father, he purchased the *Daily News*. Both were sold to Knight Publishers in 1969 for $55 million. Six years later, Knight became part of the Knight-Ridder media company. The papers' sale signaled a new era in Philadelphia journalism. Native North Carolinians Eugene Roberts Jr. and Rolfe Neil were selected to edit the *Inquirer* and *Daily News,* respectively. The *Inquirer* flourished, soon rivaling the *Bulletin* in quality and surpassing it in the scale and scope of its coverage, and contributing to its demise. Not only was the *Inquirer* able to compete with the *Bulletin*'s infamously local coverage, but the *Inquirer* transformed into the city's primary national and international news source, sending correspondents across the country and abroad. Between 1975 and 1990, the *Inquirer* earned 17 Pulitzer Prizes and more journalism awards than any other newspaper in the United States. Among the Pulitzer Prize winners was investigative journalist William Marimow, a two-time winner who in 2006 returned to the *Philadelphia Inquirer* to assume the post of editor of the newspaper. Marimow earned his first Pulitzer Prize with fellow journalist Jonathan Neumann for a 1977 series of reports investigating the systemic brutality of the city's Homicide Squad. His second Pulitzer came in the wake of a 1985 series of articles uncovering the abuses of the Philadelphia police K-9 unit. The *Daily News,* too, fortified its reputation as the "people paper," through its dedication to intense coverage of local issues such as crime and political corruption. It demonstrated a form of personal journalism largely absent in the city's other print outlets, emphasizing the impact of incidents upon various communities in the city. The paper's urban appeal is reflected in its circulation, which is comprised of approximately 90 percent on-street sales.

After the *Bulletin* closed in 1982, the *Inquirer* and *Daily News* increased their staffs by absorbing many of the *Bulletin*'s reporters and developing more extensive news coverage beyond city limits. In 1995, philly.com, the online service of the *Inquirer* and *Daily News,* was created. In addition to including searchable content of the two newspapers, the site also offers their archives dating from the early 1980s.

Like most urban newspapers however, Philadelphia's print news media have endured hard times since the 1980s. Between March 2003 and March 2006, the *Inquirer*'s daily circulation fell 10 percent, while the *Daily News*' Monday to Friday circulation dropped approximately 19 percent. On May 23, 2006, several local investors operating as Philadelphia Media Holdings bought the *Inquirer* and *Daily News* for $562 million from McClatchy, which had purchased Knight-Ridder just months before.

The *Inquirer* was one of the few large newspapers in the country to experience a circulation increase in 2007, growing by 2.3 percent. In contrast, a 12 percent decline was experienced by the Sunday circulation of the *Philadelphia Tribune,* the nation's oldest African American–controlled and –owned newspaper. The paper is published daily except Saturday and Monday by The Philadelphia Tribune Company, Inc. In September 2006, the *Tribune* launched an extensive ad campaign to broaden readership. Announcing "The Philadelphia *Tribune* . . . only when you want the truth about issues in the African-American Community," the ads were intended to reassert the paper's commitment to African Americans, who comprise approximately 45 percent of the city's population.

Despite the news organizations' efforts to broaden readership, the *Tribune,* like many other newspapers, has suffered.

Broadcasting

While Philadelphia's daily newspapers were vying for dominance throughout the twentieth century, the city's broadcasting media emerged, first with radio and then newspapers' fiercest competitor, television.

The first licensed radio station in Philadelphia was WGL, which was owned by Thomas Howlett. Two years after the station's February 1922 license was granted, it disappeared from the broadcast scene. However, several stations had emerged to replace it, including WIP, WFI, and WLIT. Each of these three stations was originally owned by a department store. WIP was owned by Gimbel Brothers, WFI by Strawbridge & Clothier, and WLIT by Lit Brothers.

WFIL radio was formed following the 1935 merger of WFI and WLIT. In 1946, Triangle Publications, the company owned by *Inquirer* publisher Walter Annenberg, purchased the WFIL radio stations. On September 13, 1947, WFIL-TV first aired and became an affiliate of ABC in 1948. Annenberg sold WFIL-TV in 1971 to Capital Cities Broadcasting and the station became WPVI-TV. Just months before the sale, the station began its "Action News" format, which entailed providing more and shorter stories. This helped catapult WPVI-TV into the top ranking, a position it traded at various points over the course of the decade with Westinghouse's KYW-TV.

Channel 3 first went on the air experimentally in 1932 as W3XE, owned by the Philco Corporation. In 1941, it became WPTZ-TV, as the city's first commercial station. The 1950s marked a period of change to the station. WPTZ-TV was sold to Group W (otherwise known as Westinghouse Radio Stations, Inc.) and later in the decade became the first station in Philadelphia to broadcast color. In 1956, Channel 3 was acquired by NBC. The station's letters changed almost a decade later to KYW-TV. As KYW-TV, the station was known for pioneering the "eyewitness news" format in the late 1960s—a format that relied more on reporters at the scene of breaking news rather than anchors in the studio. KYW-TV's news director, Al Primo, spearheaded the "eyewitness news" charge.

The third television station in the city, WCAU-TV, went on the air on May 23, 1948, and was owned by the *Philadelphia Evening Bulletin,* then the leading daily. When the *Bulletin* received the license for the station, WPEN-TV was the proposed call name, after the paper's radio station, WPEN AM and FM. A decade later the *Bulletin* sold the station to CBS. Affiliated with CBS until 1995, WCAU-TV swapped network affiliation that year with KYW-TV. Since 1995, KYW-TV has been a CBS station while WCAU-TV remains an NBC affiliate. In 2007, WCAU-TV launched Digphilly.com, a site targeted toward the youth market presenting information regarding restaurants, nightlife, social events, and shopping in the Philadelphia area.

Along with a decline in newspaper subscription has come a decline in local television news viewing. According to a June 21, 2007, article in the *Philadelphia Inquirer,* the combined audience for KYW (Channel 3), Action News (Channel 6), and NBC10 (Channel 10) declined from roughly 695,000 to 630,000, a 9.4 percent drop at the 6 p.m. news slot during May sweeps 2007 as compared to a year prior.

In addition to these major television news networks, WHYY, Philadelphia's public television station, has been similarly important to the city's journalistic development. WHYY became the twenty-third public television station in the United States in 1957, three years after WHYY-91FM began broadcasting. While initially the station encountered issues with coverage, WHHY was able to broaden its reach outside the city of Philadelphia in 1990 to include surrounding counties and total coverage for the state of Delaware by adding offices in Wilmington.

Despite the economic and political challenges confronting news organizations today, Philadelphia has proven itself a diverse and adaptive media landscape. While its rich history was pivotal to the development of journalism in the United States, its continued prominence has reinforced the city's importance for present and future journalists.

Photo Agencies

Photo agencies (a category of companies known by several different titles) provide photographs for commercial users including news media, both print and broadcast. Such companies usually make, collect or archive, and distribute photographs for a fee, either on a subscription or per-photo basis, the price depending on the use of the image. Many photo agencies use their own photographers and distribute images shot by others (including smaller photo services and independent photographers). In recent years, declining media use and consolidation has changed the face of the business.

Origins

While magazines and newspapers long used their own staff photographers, what would become the professional news and photo service developed in the late nineteenth and early twentieth centuries. The work of such famous Civil War photographers as Mathew Brady had appeared widely, though often without the photographer's knowledge, let alone permission. In 1895, photographer George Bain began his Bain News Service, one of the earliest firms aimed at the burgeoning print media demand for pictures that had been created by development of the halftone printing process. Other companies soon followed. Underwood & Underwood was formed in 1901 and both Keystone View Company and Culver Pictures appeared about the same time. Later entries included United Newspictures (later Acme), and International News Photos (part of the news agency), both of which were set up in 1915. Wide World Photos followed in 1919, established by *The New York Times,* and the Associated Press began its AP Photos subsidiary in 1927 (it later would take over the Wide World operation, an early example of the consolidation to come).

Until the 1920s, photographs used in newspapers and magazines were either taken locally, or had to be shipped, creating a real deadline problem beyond New York City and other major markets. The only distribution means were by messenger within the city, or by mail outside. There was no effective way for daily newspapers to publish timely photographs of events taking place beyond their immediate local market. It often took several days to a week to get photographs sent from one side of the country to the other. Technology changed that in the mid-1920s.

The wirephoto process—a variation of facsimile technology—was invented as "telephotography" by telephone carrier AT&T in 1924. The new process allowed photographs to be transmitted through the telephone network, anywhere in the country, though it required the use of an expensive and bulky wirephoto machine at both the source and receiving end. The original photograph was placed inside the sender's machine and scanned line by line to translate the image into electrical impulses. These impulses were then sent by telephone line to the receiver where the impulses were translated back into a developed image on photographic paper.

AT&T offered its first commercial service in 1926 (though it would end in 1933 for lack of sufficient income to cover its costs). Early wirephoto machines were large, expensive, and all too often unreliable. The resulting wirephotos were usually

of low definition (far less clarity than any original photo—they were often described as "muddy"), and could be further degraded by occasional problems with telephone line transmission. Further, sending one often took more than an hour and the sender had no idea if a recognizable image would be received at the other end. Thanks to this complex and pricy process, it took more than a decade for the process to be widely adopted.

AP began its wirephoto service in 1935 with links to 47 newspapers in 25 states. The first AP wirephoto showed an airplane crash in rural New York. United Press Telephoto appeared in the next year. The two news agency photo operations quickly dominated the business for newspapers as they focused on the latest news events. As the technology became easier and somewhat faster to use, wirephotos became the dominant form of long-distance photo distribution for newspapers well into the mid-1970s.

By then, building on constantly improving photographic and printing technology, AP instituted its Laserphoto system. This sent images to subscribers far more quickly than the old wirephoto equipment and with much higher image resolution. AP updated this system in 1989 so that full color images could be transmitted in just seconds. These images were displayed on computer monitors and distributed in digital form. The result was newspaper and magazine pictures of much higher quality and the more common use of color photographs. Eventually the news agency-owned photo operation would garner 30 Pulitzer Prizes for its news photographs. By the mid-2000s, they were distributing a thousand photos a day and had accumulated an archive of some 11 million images.

A Changing Business

Starting in the mid-1930s, and doubtless encouraged by the appearance of a growing number of photo-based weekly and monthly magazines as well as improving camera technology, a second wave of photo agencies began to appear. They combined current news photos with a growing photo archive of material, sometimes dubbed picture libraries, or (later) image banks. One of the first was Black Star, formed in 1935 by three refugees from Nazi Germany, one of whom brought some 5,000 photos from his Berlin photo agency. Black Star worked closely with the new *Life* magazine when it appeared starting in November 1936, and sometimes accounted for more than 40 percent of the weekly magazine's images. Otto Bettmann (1903–98) established his Bettmann Archive in 1936 which soon stressed historical photos. And in 1938, Edward Hulton created the Hulton Picture Library. All of these firms—and the earlier photo agencies—were active on the battlefronts and the home fronts of World War II.

The Magnum agency first appeared in 1947 when photojournalists Robert Capa, Henri Cartier-Bresson, George Rodger, and David "Chim" Seymour formed it to distribute their photographs while protecting their image ownership rights. Initially based in Paris and New York and later adding offices in London and Tokyo, Magnum differed from other agencies in two ways. It was created as a cooperative venture in which the staff (which included co-founders Maria Eisner and Rita Vandivert) would support rather than direct the photographers. And copyright to their photos would be retained by the photographers, not by the magazines that published them.

The Gamma agency was established in 1967 by Hubert Henrotte, Hughes Vassal, and Raymond Depardon and the Sygma agency was created in 1973. But by now the picture magazines on which so many agencies had long thrived were disappearing—*Life,* for example, had ceased its weekly publication the year before. As media clients dwindled, photo agencies were forced to broaden their business model to serve a wider variety of clients. Many branched out to serve commercial needs such as providing photos for use in company annual reports, brochures, or other business and industrial applications.

Consolidation

With the rise of the Internet came both a new way to market photos—placing masses of them online for easy perusal by potential customers (sort of a cyber-catalog)—and a continuing decline in traditional media photo markets. Photo agencies increasingly centered their marketing toward nonmedia business users. Web software could also be used to help seek out and fine those illegally placing copyright-protected photos on their own websites.

As with the companies they serve, major consolidation of photo agencies began in the 1980s, accelerating in the years to follow. For example, the Bettmann Archive was purchased by Kraus in 1981. Three years later Kraus took over the United Press International collection (which included the Acme and Pacific & Atlantic agency archives as well). Kraus, in turn was taken over by Corbis in 1995 (the agency formed in 1989 by Bill Gates of Microsoft). Corbis also purchased Sygma in mid-1999. The Getty Images archive was put up for sale at the end of 2007—and was expected to sell for something close to $1.5 billion, an indicator of both the number of photos involved, and the broad commercial value of these growing archives.

Photo Editors

Photo editors are the "visual thinkers" for news in print or online formats. They assess and choose images for publication, assign stories for photographers to cover, administer the photographic department, and make ethical and legal decisions about the visual representation of reality. Their daily routines have changed dramatically with the introduction of digital photography and online news presentation, yet the basic principles that guide their work in the aesthetic, informative, and ethical use of photography remain relatively constant.

The job of the photo editor has its roots in illustrated news that existed even prior to photography. Before the invention of the halftone printing process in the late nineteenth century, which made it possible to reprint actual photographs affordably, newspapers in the United States and Europe used engravings and other graphics, many of them copied from original photographs. Readers devoured illustrated news, and in spite of resistance on the part of writers and publishers who considered such visuals "childish," the use of images proliferated and became integral to journalism.

Illustrating the Story

Before they look at a single shot, photo editors must confer with reporters and photographers on staff to delegate assignments. Reporters may have information and suggestions about photographic opportunities, but often it is left to the editor to plan visual coverage, determine whether credentials are necessary, or arrange for a photographer to cover a particular story. Once those photographs are submitted, the editor's primary, though hardly singular, task involves choosing images to accompany stories in a newspaper or on a webpage. They must consider whether the chosen photo is informative, appealing, and serves to enhance, but not detract from, the story.

A modern photo editor may scan hundreds, if not thousands, of images on a digital server each day. Choosing a photo for display is the first step. In their classic 1951 text on photo editing, Stanley Kalish and Clifton Edom advised editors to look for "eye-stopping appeal." Many of Kalish's principles about what makes an image "eye-stopping"

are still taught at an annual workshop established in his name. Every editor has different criteria for the "right shot." The best have a solid combination of information, design, emotion, and intimacy. Choosing photographs will also depend on the nature of the story, its placement in the publication, and the quality of the image. Editors must balance information and impact, understanding that the photographs must work in tandem with the text. The emotion of a photo can draw people in to learn more from the text, and might be what is remembered even after details fade from memory. Yet another consideration: each publication will have a different photo style for the images it uses. A front-page photograph for the UK's *The Guardian,* for example, is expected to have high-impact color with strong graphic elements in keeping with the overall look of that newspaper. Other publications might emphasize portraiture, such as *Vanity Fair,* or unusual subject matter, as with *National Geographic.*

Photo editors must also make ethical and legal decisions about individual shots. Images of dead bodies, for instance, might be rejected as too offensive for the audience, because they are particularly graphic or because of the identity of the victim. Some violent images, however, may be deemed important to the polity in spite of being graphic. The editors of *Life* magazine, for instance, did indeed upset some readers by publishing some of the first photographs of dead American solders on a Pacific island beach in World War II. They justified their decision in an editorial which asserted that ". . . if (the soldier) had the guts to take it, then we ought to have the guts to look at it . . ." (Moeller 1989, 206–07).

Once chosen, an image may be cropped, sized, retouched, and placed into a layout. Because photographers often have limited control of their composition in the field, cropping can make a significant difference in the meaning relayed by a particular image. It might simply cut off an insignificant element, such as a lamppost or tree; or, with careful positioning, cropping, and resizing, it might draw greater attention to a particular portion of the scene that is more emotional, dramatic, or informative for its new focus.

Larger or more important stories, photo essays, or sequential events might also require editors to choose more than one photograph for publication. Here it is necessary to consider how two images work together, and whether they create new meaning in combination. Without care, juxtapositions can convey inadvertant meaning, sometimes humorous, sometimes problematic, as with a photograph of a woman's facial profile published adjacent to a photograph of a flower. If the two images support one story about stopping to smell the roses, the juxtaposition might work, but if not, the visual joke will detract from text. Some stories might be best told with minimal text and a two-page spread of images in a photo essay. Others might require a short series of images to explain action, for example, with a controversial call at a sporting event. For makeover stories or how-to features, before and after images might also convey the heart of a story better than reams of text ever could.

Styling Photographs

Most news organizations allow photographs to be stylistically altered within limits. Some retouching is acceptable, but changing the information in an image is not. Techniques usually tolerated include the removal of blemishes or the lightening or darkening of segments of a photograph, called "dodging and burning," terms derived from darkroom practices of the pre-digital age. Adding elements, blurring out elements, changing colors of an object, or combining shots without labeling the result a "montage," however, are considered unacceptable in most organizations. The rules are often not spelled out in precise technical terms. The National Press Photographer's Association (NPPA) sums up the ethical responsibilities as follows: "Editing should maintain the integrity of the photographic images' content and context. Do not manipulate images or add or alter sound in any way that can mislead viewers or misrepresent subjects."

Practitioners are left to their own conscience and organizational rules to determine when a line is crossed. One famous infraction occurred in 1994 when *Time* magazine darkened the mugshot portrait of O. J. Simpson used on the cover after he was arrested for murder. Editors made the change ostensbily for dramatic effect but were harshly criticized for what many observers considered a racist move.

Decision-Making

As dramatic, emotional, and appealing a photo might be, it rarely, if ever, can tell its story without words. Captions, subheads, and headlines are critical to the reader's understanding of the connection between an image and its story. Photographers are often charged with writing their own captions, but the responsibility may fall to the photo editor to write it based on information provided, or to polish it and ensure it complements the rest of the layout.

A photo editor's work may be guided by the findings of media effects research. Readers make decisions about whether to read an article in less than a second, and their decision is influenced in part by the size, type, and placement of related images.

Photo editors rarely make any of these decisions unilaterally. They work closely with individual photographers, reporters, and layout artists. In part because of the teamwork involved in photo editing, and to reflect the wide range of decisions involved, the NPPA in 2006 changed the title of its annual competition from "Picture Editing" to "Best Use of Photography."

As newsroom managers, a photo editor generally has administrative responsibilities, such as hiring and scheduling the photographic staff, purchasing equipment, and allocating cameras and related equipment. As newspapers have established websites, photo editors are usually responsible for image management and editing software. They may oversee multimedia productions by the photographic staff, such as audio slide-shows and web videos. Day-to-day routines for photo editors will vary according to the size of a publication. Larger organizations might spread some of the work among more than one editor. A small newspaper might have one person do all this as well as go out on their own photo assignments.

The decisions of a photo editor reverberate beyond the aesthetic and informational elements of individual images and pages. Their work has larger cultural implications over time. Are stories about the poor disproportionately illustrated with images of African Americans? Do photos of female politicians reflect a sexist tendency to focus on their bodies or fashion choices? Photographs of individuals accused of crimes, for instance, might prejudice potential juries; even photographs of individuals not accused, but depicted with police or near the scene of a crime, might unfairly impugn them. Photo editors must ensure that a publication's overall use of imagery is socially responsible.

Image technology is likely to continue to change, and along with it, the methods photo editors use to conduct their work. Video is becoming a popular element to include on newspaper websites; photo editors have been charged with the task of not only learning how to gather video news, but how to edit and deploy it on webpages. Yet even as the pressures of convergence continue to change the daily routines of photo editors, their guiding informative, aesthetic, and ethical considerations, and their key role as the "visual thinkers" for a publication will endure.

PHOTOGRAPHY

Photographs have become an essential tool of journalism. Starting in the late nineteenth century, photography became a regular part of newspaper and magazine stories. By the mid-twentieth century, photos were widely used on television, and more recently still, online journalism.

As a process, photography breaks into three stages, and each has been subject to sometimes difficult development over the past 130 years. The first step is to create a device (today a camera) to expose or "take" the picture; the second is to preserve and print that picture; and the third—and most essential to modern print journalism—is the ability to rapidly duplicate thousands (sometimes millions) of copies of the printed picture.

Making Photographs

The idea of trying to make a permanent image of a scene (without having to paint or draw it) is an old one—dating back to Renaissance times, if not before. "Camera obscura" devices, some of them the size of small rooms, allowed for people to see a pale reflection of an outside scene on the wall of a darkened space. Adding a lens to the small hole that admitted the scene made for a brighter picture. By the seventeeth century, camera obscura equipment could be made small enough to allow it to be carried from place to place. But these were little more than elaborate playthings for the rich as there was no apparent means of preserving the displayed picture. What was needed was some means of "fixing" the reflected scene, and many people experimented with different ways to accomplish that.

Daguerreotypes

The first commercially successful type of photography—though quite different in many ways than what we know today—appeared in mid-1839 when French innovator Louis J. M. Daguerre created the first widely used method of making and displaying pictures. His system created direct positive images on light-sensitive silver-coated surfaces of thin copper plates. Of often exquisite quality, the "Daguerreotype" quickly became popular, especially for making personal portraits. For the first time, exact records of people as well as scenes could be reproduced in a black-and-white (and sometimes sepia-toned) image.

Though seemingly magical in their time, the Daguerreotype had several drawbacks. Taking one required high light levels, and even so, a picture sometimes had to be exposed over many minutes. Some early daylight street scenes were exposed for up to 15 minutes, giving them a lifeless aspect because moving people or vehicles failed to record in the scene. Taking portraits required sitting absolutely still for unnatural periods of time and people were sometimes placed in a metal frame so as to hold the necessary pose long enough. After 1841, improved lenses reduced exposure time to about a minute. The process rendered some color tones better than others (albeit in black and white), but skies turned out a uniform grey, no matter what the weather. And all details, whether facial or scenic, were reversed left to right because of the way the Daguerreotype camera worked.

Furthermore, the resulting image was highly fragile and subject to tarnishing over time. Nor was there any means of making copies as the process produced only positive originals, not a negative image. If multiple pictures were required, just that many different Daguerreotypes would have to be taken, at the risk of trying the patience of both the subject and the Daguerreotypist. Despite these problems, this was the first means of reproducing exact images from life and, for a time, was hugely popular in Europe and the United States.

Early Photography

The next steps took place in England in the 1830s and 1840s where amateur scientist Henry Fox Talbot created vital steps in what Sir John Herschel first labeled "photography." Talbot developed the notion of a photographic negative from which positive copies could be made. He and then Herschel came up with the chemical means to "fix" an image on paper so that it would not continue to darken over time until the whole surface was black. But Talbot's early "calotypes" did not produce the sharp images of Daguerreotype pictures—and could fade over time. Using his system, Talbot produced the world's first photographic book, *The Pencil of Nature,* issued in six

parts from 1844 to 1846, featuring individual calotypes pasted onto pages. All but ignored (save by him) at first was the chief benefit of Talbot's system—the creation of a negative, which allowed production of multiple positive copies.

The picture detail of Daguerreotypes and the ability to reproduce copies from negatives as introduced by the calotype were, in effect, combined in 1851 in the "wet plate" process. Large wet plate or collodion photographic technology would dominate the next two decades. The process required a careful chemical coating of a glass plate, then its exposure and developing, all within minutes before the plate dried. This cumbersome process required considerable training and expertise. In the hands of an experienced photographer, the resulting prints provided excellent results—large pictures of superior quality. Some of the first photos of the landscapes of the American west were produced in this fashion, though to make them required hauling a photographic darkroom by horse or mule. And since the plates created a negative image, multiple prints could be made. Despite their own drawbacks, the wet plate photographs soon replaced the once-popular Daguerreotypes and calotypes.

Thanks to experiments by many inventors and photographers in different countries, cameras slowly became smaller, less cumbersome, and somewhat easier to use after the 1870s. In the early 1880s, inventor George Eastman began his development of dry plate photography, which greatly simplified the process of both taking and developing pictures. In 1889, Eastman created his first celluloid roll film-equipped hand camera. He called it a "Kodak." After taking up to 100 photographs, users returned the camera and the 20-foot role of exposed film to the factory for their pictures to be developed. The factory quickly returned the camera, reloaded with more film, along with the exposed photos. "You press the button, we do the rest" became the Kodak advertising slogan, and the new system soon hugely expanded the popularity and ease of taking pictures.

Printing and Duplicating Photographs

The pioneering wartime photographs (which some point to as the inception of photojournalism) used the wet plate technology, and were taken during the Crimean War (1853–56). The chemicals and facilities to develop the wet plates required a photographer to travel with a portable dark room and other equipment in a horse-drawn wagon, which made an all too enticing target for enemy soldiers. The wet plate process took time and thus almost no action or battle shots resulted—mainly photos of places and posed people.

And after all the effort and danger, the resulting pictures could still not be reproduced directly in newspapers. There was no effective way to print photos within a type-filled page, meaning that the wartime pictures of Mathew Brady and others during and after battles of the American Civil War (1861–65) could not be printed. Instead, photographs had to be carefully redrawn and then intricately engraved in order to be printed in books, newspapers, or magazines. This was a laborious and slow process that often delayed the appearance of news illustrations in the press, though actual photos could be hand-tipped into expensive books. For newspapers, in other words, the photograph was for its first decades more a source rather than a directly usable piece of evidence for news reporting.

Halftones

Some means by which thousands of copies of photos could be made quickly and inexpensively was needed. The first attempt to do so was the Woodburytype of 1866 in which a photo negative was impressed in a lead plate that was then used to print newspaper pages. The resulting picture was good—but the Woodburytypes wore out too fast for use with fast-growing urban newspaper print runs. Approximate photo reproduction was possible with other systems by the next decade, but they could not reproduce the full tonal scale of a good photo.

The eventual resolution of this problem turned out to be the halftone process by which a photo is rephotographed through a fine screen of dots or lines that reflect the lighter and darker tones in a photograph. This is used to create a lithograph plate (in recent years, a photo can be electronically scanned to the same end). In the printed picture, the dots or lines are too small to be seen with the naked eye, yet they are strong enough to endure a long newspaper print run. The new halftone

system was first used for printing a photograph in a newspaper in New York in 1880.

Within a decade, photographs were becoming common in newspapers and magazines alike. The London-based *Daily Mirror,* launched in 1904, became the world's first fully illustrated photo newspaper. Modern tabloid papers, heavily based on the use of photos, first appeared after World War I (1914–18).

Improving Photographs

Once the basic ability to publish photographs in periodicals was resolved by late in the nineteenth century, other improvements soon appeared as well.

Color

All early photographs appeared only in black and white—unless laboriously hand-colored to make them more realistic. Done with water colors, this was dangerous with Daguerreotypes and some other early photos because the image could be damaged. Experimental color photography techniques appeared late in the nineteenth century, paced by improving film and color dyes. Multiple systems had appeared by the early twentieth century, but few worked consistently or well. Hand-coloring continued where needed—as in postcards. Some three-color cameras appeared about the turn of the twentieth century, but they were expensive and difficult to use.

Though several means of producing color still pictures were available in the 1920s, the first practical and widespread use of color came with the introduction in 1935 of the Kodachrome film and development process by Kodak. Introduced first as movie film, a still picture version appeared late in 1936 and quickly became the standard. A New York newspaper published color photos of the *Hindenburg* airship disaster early the next year. *National Geographic* first published Kodachrome pictures in April 1938, and within a year was relying on them for its color photography.

Stereo Views

Hugely popular in the late nineteenth century (and lasting into the next) was the stereo photograph. Placing a camera with two lenses about 2.5 inches apart to photograph the same scene resulted in the ability to print and view two photos from slightly different viewpoints. When mounted on cards and viewed through special wooden viewers, such photo pairs took on a three dimensional quality much like normal human eyesight. Marketed as "stereoscopes" and other names, travel and other photos were widely sold during the late nineteenth century. (Using tiny color transparencies, the idea persisted as a popular toy, the "Viewmaster," nearly a century later.) Published stereo photos (and 3-D motion pictures)—which require special glasses to view—only appeared in the mid-twentieth century and were generally seen as a short-lived gimmick.

Light

For years, it was virtually impossible to take a picture in poor light, let alone at night or within dark interior spaces. Gas lighting was too weak—or if strong enough, then far to hot for human subjects. In the 1880s, flashpowder was introduced that, piled on a small platform and held aloft by the photographer or an assistant, provided about a tenth of a second of very bright light—along with a lot of smoke and ash, not to mention stench. Coordinating this flash with the camera shutter was no easy feat. Still, by the early 1900s, flash-illuminated news pictures became more common.

First developed in 1893, the self-contained flashbulb was a glass bulb filled with magnesium-coated metal ribbon which was ignited electrically to produce a brilliant though brief flash of light—with no residue except a spent bulb. The first models were both expensive and did not always function. Practical disposable flashbulbs appeared around 1925. Reusable electronic flash equipment was developed only in the 1960s.

Transmission

How to distribute photos over a distance remained a problem for decades. While an excellent picture of a person, place, or event might exist in one place, how to get it into the hands of distant newspapers was far more difficult to resolve. For years, pictures could move only as quickly as the mode of transport used—human, horse, and eventually railroad.

Electricity proved the key to faster and more widespread distribution. Early facsimile transmission

systems allowed distribution of photos by 1907, though much of their detail was lost in the initially crude process. Sending photos by radio became possible in the 1920s. Regular wirephotos appeared in the mid-1930s and were soon widely in use, often provided by news agencies and a growing number of specialized photo agencies.

Instant Pictures

With all the other photographic basics in place, one more problem remained—time. Journalists are always seeking to provide more news in less time, and it was the same with photographs. Taking a picture was relatively easy by the early twentieth century, but developing and printing it still took time.

In 1946, Edwin Land demonstrated his Polaroid camera, which combined film and photographic paper to produce a black-and-white picture in about 60 seconds. It went on the market the next year and was a huge commercial hit, even though the process it used was complex and expensive, and the first pictures faded easily (though that was soon remedied). An instant color film appeared in 1963, and the iconic SX-70 folding camera in 1972. Several less expensive models that produced pictures in a minute appeared in years to follow. In 1986, Polaroid won a patent infringement case against Eastman Kodak, which had marketed its own instant cameras to meet market demand.

Instant photography began to give way to easier-to-use 35mm cameras in the 1980s. The quality of the picture produced—as well as Polaroid's lack of a negative (shades of Daguerre)—limited the instant photography appeal, especially to journalists and other serious photographers.

In 2009, the much-diminished Polaroid company announced it would no longer produce the special film for instant cameras. The digital revolution had undone a once dominant technology.

Digital Future

The most important recent development in photography is the digital camera and photography that no longer requires the use of film or a developing process. This has been of huge value to professional journalists, greatly easing their job and all but eliminating the time factor. And the ubiquity of cellphone cameras, first introduced in the late 1990s, has helped make anyone a reporter—as is evident in the widespread newspaper and television invitations to their readers and viewers to share their best photos. The ability to network photos on the Internet further expands who can distribute news—news photos are no longer restricted to those provided by professional journalists.

PHOTOJOURNALISTS

In 1862, Alexander Gardner (1821–82) photographed the dead horse of a Confederate colonel during the American Civil War. A century later, Gordon Parks (1912–2006) depicted, close up, the sweat-covered face of prizefighter Muhammad Ali. And in 1994, Mary Ellen Mark (1940–) photographed Ku Klux Klan members as, in darkness,

they raised a wooden cross before burning it. From world capitals to small towns and in between, photojournalists since the beginnings of photography in the nineteenth century visually have provided information, inspiration, entertainment, and—above all—timely and meaningful news. Photojournalists, John Szarkowski of the Museum of Modern Art wrote, "give us the look and the smell of events that we did not witness" (Szarkowski 1999, 142). The content of these images, historian Michael Carlebach has said, is "as varied as journalism itself" (Carlebach 1992, 2). From wars and disasters to breaking political news to photo stories about how people live their lives, photojournalists document the commonplace and the surprising.

Photojournalists once lugged bulky cameras that relied on glass negatives. Tripods steadied cameras that required long exposures. With equipment advances, photojournalists used steadily smaller cameras and better film. By the 1920s and 1930s—well before the advent of television and the Internet with a constant flow of pictures—newspapers and photo magazines demanded more photographs to accompany written stories as the public appetite for images grew. By the early twenty-first century when visual images saturate the world, digital cameras allow for speedy transfer to websites where pictures—still or moving, black and white or color—combine with sound in slide shows about current events. Regardless of the technology, century, or continent, the discerning eyes and minds of photojournalists distill the essence of the news into visual form, and their images work in concert with captions and stories.

Development

In the late eighteenth- and early nineteenth centuries inventors developed what would become the bones of modern-day photojournalism. Though not yet called by that name, photojournalism started as odd shots of destruction from fires and wars.

During the Mexican War in the mid-1840s, photographers made pictures that could be considered forerunners of photojournalism. A decade later, to counter negative newspaper coverage of the Crimean War along the Black Sea, photographers documented scenes in a favorable way for the British government. Distinctive among propagandists was Roger Fenton (1819–69) of the Photographic Society of London. Focusing less on the ravages of war and more on well-attired British soldiers, Fenton made 360 glass-plate images. His most famous picture, titled "The Valley of the Shadow of Death," showed cannonballs arrayed on the embattled Crimean earth.

Half of a world away and in the next decade, a team headed by Mathew Brady (ca. 1823–96) documented the U.S. Civil War. As with the best photojournalists, Brady and his photographers recognized the event's significance. But their images could not be shown in newspapers or magazines because there was no way to convert the photographs into anything a printing press could manage. Instead, the photos inspired illustrations. For example, three separate Brady photographs were merged to form a *Harper's Weekly* illustration of Confederate bodies strewn across a field.

In that era of early photographic technology without artificial lighting, images required long exposures. By the 1880s in New York, social reformer Jacob Riis benefited from a new invention—flash powder—that illuminated the squalor of tenement houses packed with families, filth, and the choking smoke of coal stoves. Another reformer, sociologist Lewis Hine, later would help to establish photojournalistic documentation of societal problems.

A key breakthrough occurred in 1880 with the invention of the halftone method of converting photographic gradations of gray into dots or lines that a printing machine could stamp onto paper. Yet it took 40 years for photojournalism's full flowering. Innovative newspapers and pictorial magazines with higher quality paper and ink—such as *Berliner Illustrierte Zeitung, New York Daily Graphic, Picture Post, Paris Match,* and by the 1930s *Fortune* and *Life*—took advantage of photographs. This was especially true in Europe and the Soviet Union, where the visual movement known as "constructionism" emphasized unusual angles and juxtaposition. Pictorials in German newspapers and magazines flourished in the 1920s as lightweight cameras—the Ermanox and the Leica—came into use. Photographers such as Erich Salomon (1886–1944) took spontaneous, candid pictures with handheld cameras that used available light. In 1927 the Associated Press began a photo service to provide illustrations to newspapers and magazines.

Roger Fenton's famous photograph, "The Valley of the Shadow of Death," shot in 1855 during the Crimean War.

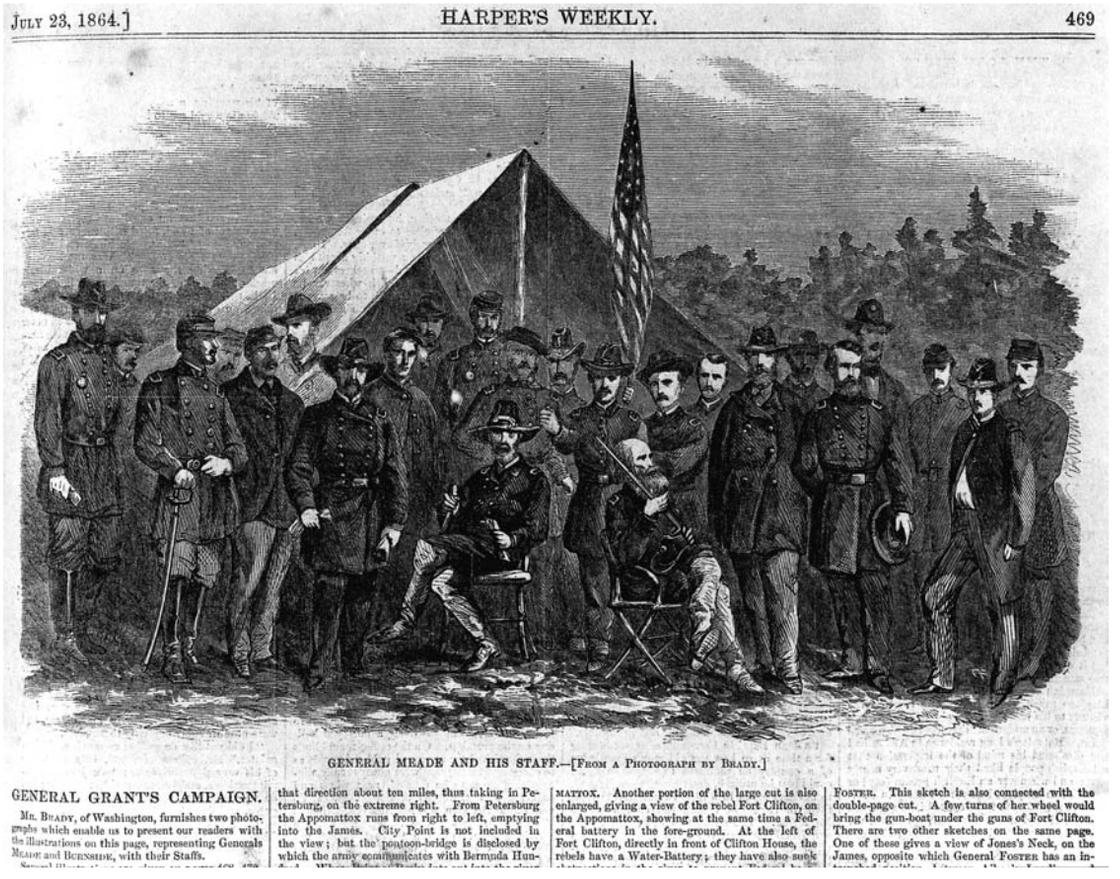
Source: Library of Congress.

During the 1930s' depression, the U.S. government established the Farm Security Administration's photography unit to document the suffering. Although the agency's aim was propagandistic, photographers such as Marion Post Wolcott (1910–90), Walker Evans (1903–75), and Arthur Rothstein (1915–85) established conventions of focusing on intimate human stories. For decades photojournalists would further refine this approach.

"Photo-Journalism"

Indicative of the development of the practice, the term photojournalism came into use in the late 1930s. Alfred Eisenstaedt (1898–1995) in 1938 referred to "photo-journalism," saying that although it was new in the United States, it had taken hold in Europe. Henri Cartier-Bresson (1908–2004) helped codify its concepts. He suggested, with a 1952 book of words and pictures, that photojournalists should capture "the decisive moment." Magnum Agency photographers did their best to document action, not posed instances, without a flash. Cartier-Bresson had founded Magnum with Robert Capa (1913–54), David Seymour (1911–56), George Rodger (1908–95), and Bill Vandivert (1912–). Other photo agencies—Black Star, Sygma, Gamma, and the news agencies, United Press and the Associated Press—provided photojournalists with steady work and supplied images for periodicals worldwide.

The 1940s marked the growing importance of photojournalists whose images of World War II



JULY 23, 1864.] HARPER'S WEEKLY. 469

GENERAL MEADE AND HIS STAFF.—[FROM A PHOTOGRAPH BY BRADY.]

GENERAL GRANT'S CAMPAIGN.

MR. BRADY, of Washington, furnishes two photographs which enable us to present our readers with the illustrations on this page, representing Generals MEADE and BURNSIDE, with their Staffs.

that direction about ten miles, thus taking in Petersburg, on the extreme right. From Petersburg the Appomattox runs from right to left, emptying into the James. City Point is not included in the view; but the pontoon-bridge is disclosed by which the army communicates with Bermuda Hun-

MATTOX. Another portion of the large cut is also enlarged, giving a view of the rebel Fort Clifton, on the Appomattox, showing at the same time a Federal battery in the fore-ground. At the left of Fort Clifton, directly in front of Clifton House, the rebels have a Water-Battery; they have also sunk

FOSTER. This sketch is also connected with the double-page cut. A few turns of her wheel would bring the gun-boat under the guns of Fort Clifton. There are two other sketches on the same page. One of these gives a view of Jones's Neck, on the James, opposite which General FOSTER has an in-

Wood engraving published in the July 23, 1864, issue of Harper's Weekly. *In the magazine's explanation underneath the image, the editors give a detailed explanation of the composition, explaining that it is based on two Mathew Brady photos—one of General Meade with his staff and one of General Burnside with his.*

filled magazines and newspapers. In 1943 the Pulitzer Prizes first gave an award in the category of photography. Milton Brooks (1901–56) of the *Detroit News* won for his picture of Ford autoworkers on strike as they attacked another worker crossing a picket line. (As the nuances of photojournalism changed so did the Pulitzers: By 1968 the single category had been divided in two: "breaking news" and "feature photography.") In 1944 another major photojournalism contest began, known today as Pictures of the Year International. By 1945 a College Photographer of the Year contest started. In 1946 a number of newspaper and newsreel photographers from throughout the United States formed the National Press Photographers Association. They wanted to elevate their status as professionals making a critical contribution. In 1949 Clifton Edom (1907–91), with former Farm Security Administration photo director Roy Stryker (1893–1975) and photographer Russell Lee (1903–86), initiated the Missouri Photo Workshop whose goal was to "show truth with a camera."

Volumes have been written about war photojournalists, especially those from World War II through Vietnam. Counted among the legends are Larry Burrows (1926–71), Donald McCullin (1946–), Eddie Adams (1933–2004), and Catherine Leroy (1945–2006). To list their names evokes iconic images such as the execution of a Vietcong soldier or a grimacing U.S. Marine crawling to rescue a wounded buddy.

One of Mathew Brady's many photos of the Grand Review of the Army in Washington, D.C., in May 1865. This shot shows troops passing in front of the presidential reviewing stand.

Blurring of Lines

As curator of photography at New York's Museum of Modern Art, Edward Steichen (1879–1973) in 1955 staged an exhibit called *The Family of Man;* its pictures revealed the blurring of boundaries across documentary, photojournalism, and fine art photography. In the 1950s and 1960s, photographers such as Robert Frank (1924–) and Diane Arbus (1923–71) paid attention to people and places that photojournalists sometimes had ignored: roadside jukebox music joints, mental institutions, carnivals, or the living room or backyard of ordinary folks. The ordinary became extraordinary with "New" journalism, reportage that considered everyday people as significant as the elite. Innovators such as Richard Avedon (1923–2004), Bruce Davidson (1933–), Danny Lyon (1942–), and Eugene Richards (1944–) offered new ways of photographing relationships between institutions and people affected by them. Under the "big tent" of photojournalism gathered social reformers, documentarians, "shooters" of news that was "hard," "breaking" or "spot," and those who spent weeks, months, or years with their subjects. And a profession long dominated by men increasingly accepted women.

Photojournalists of the 1950s, 1960s, and 1970s documented social change throughout the world. This included the Civil Rights movement. Memorable images came from Charles Moore (1931–), who photographed Birmingham police dogs attacking a Civil Rights protester; Moneta Sleet Jr. (1926–96), who won the Pulitzer Prize for his photograph of Coretta Scott King at the funeral of her husband in 1968; Flip Schulke (1930–), who documented Martin Luther King Jr. leading the Selma to Montgomery march in 1965; and Bill Eppridge (1938–) whose "Kitchen Pieta" showed busboy Juan Romero trying to comfort Robert F. Kennedy after the presidential candidate had been shot in 1968. In the late twentieth and early twenty-first century, *National Geographic* photographers such as Michael "Nick" Nichols (1952–), David Doubilet (1946–), and Frans Lanting (1951–) drew attention to imperiled environmental conditions across the globe, including the loss of habitat for animals such as gorillas.

Conclusion: A Digital Visual Future, for Now

For more than 160 years, photojournalists visually defined the answers to such questions as: What is news? What and how could something be photographed? Representative of this, Don Bartletti of the *Los Angeles Times* rode dangerously atop freight trains to follow Latin American children escaping to *El Norte,* the United States. The youngsters wanted to rendezvous with their parents who had left them behind to seek a better life. Bartletti's images won a 2003 Pulitzer Prize "for his memorable portrayal" (http://www.pulitzer.org/year/2003/feature-photography).

Written words have lost the dominance they held in journalism a century ago. Digital journalist and former *Time* photographer Dirck Halstead has declared "the end of photojournalism as we know it" by saying, "Visual stories will be told primarily through moving images and sound." Yet he says, "The role of the storyteller who can capture the events and people, and place them in perspective for our history, will only be enhanced" (Halstead, http://digitaljournalist.org/issue9912/editorial.htm).

The essence of photography, Cartier-Bresson wrote, "is to hold one's breath when all faculties converge in the face of a fleeing reality . . . it is putting one's head, one's eye, and one's heart on the same axis" (Cartier-Bresson 1999, 16). Photojournalists have done this for years. Regardless of technological changes, they likely will do this for many years to come—recording and circulating the visual news.

Some Noteworthy Photojournalists

Names of photojournalists fill the annals of the Pulitzer Prize, Picture of the Year International, and other photography awards. Truncating the field of journalists known as "shooters," what follows includes founding practitioners and contemporary innovators.

Margaret Bourke-White (1904–71)

Bourke-White was born in New York City and introduced to photography at Columbia University. She graduated from Cornell in 1927 and worked as an industrial photographer in Cleveland. In 1929 she joined Henry Luce's new *Fortune* magazine. She later became one of *Life*'s first photographers, and her evocative image of the Fort Peck Dam on the Missouri River appeared in 1936 on the magazine's first cover. In 1937 with her husband Erskine Caldwell, she published *You Have Seen Their Faces,* documenting rural Southern sharecroppers. During World War II she became the first woman accredited as a U.S. military photographer. In 1948 she photographed nonviolence advocate Mahatma Gandhi hours before his assassination in India. She worked with *Life* until the 1950s but was hindered by Parkinson's disease. Of photography, she said, "Saturate yourself with your subject and the camera will all but take you by the hand" (Whitman 1971).

Robert Capa (1913–64)

Born Endre Ern Friedmann, Capa became famous during one war and died during another. His photographs of the Spanish Civil War and World War II were graphic and engaging. One image from Spain depicted a soldier at the moment of impact of the gunshot that killed him. In 1947 Capa helped establish one of the most powerful photo agencies, Magnum, but his entry to professional photography was that of a trickster's ruse—he chose the name Robert Capa because it sounded like Hollywood director Frank Capra. Capa and his girlfriend Gerda Taro, herself a photographer, got him work by telling people he was a well-regarded photographer, though he was a Jewish Hungarian immigrant to France with little experience. There he found a home with other photographers, and with them established styles soon considered staples of photojournalism. When he photographed the Allied soldiers storming the beach at Normandy on D-Day on June 6, 1944, for *Life*, Capa said he felt "a new kind of fear shaking my body from toe to hair, and twisting my face" (Winslow 2006). A decade later, while photographing the Indochina War, he stepped on a landmine and was killed.

Henri Cartier-Bresson (1908–2004)

Cartier-Bresson is considered by many as the "father of photojournalism." His love of photography had begun in adolescence with a Brownie camera. He harbored an early interest in painting and drawing and studied both at Cambridge. Eventually, he spent a year photographing in Africa where he contracted blackwater fever. The Gallery Julien Levy in New York in 1932 first displayed his work, and the same year the French magazine, *Vu,* published his photos. In 1940 the Germans imprisoned him as he had served in the French Army Film and Photo Unit. He escaped to photograph the German occupation of Paris in 1940 and later its 1944 liberation. In 1947 he joined four photographers to form the Magnum Photo agency. He disliked "arranged" or cropped photographs and favored candid photography. His notion of capturing "the decisive moment" remains at the core of photojournalism.

Chien-Chi Chang (1961–)

Chang was born in a Taiwanese farming village. He has focused his career on ties that bind humans—literally and figuratively, from incarceration to marriage. In *The Chain,* Chang presents pairs of mentally ill inmates bound by chains. *I do I do I do* displays the elaborate marriage customs in Taiwan,

while *Double Happiness* documents arranged marriages between Taiwanese men and Vietnamese women. Educated at Soochow University in Taiwan, he received a master's degree in education from Indiana University in 1990. He worked for the *Seattle Times* from 1991 to 1993 and for a year at the *Baltimore Sun* before he joined Magnum Photos in 1995. Chang's distinctiveness has earned him awards that include the National Press Photographers Association's 1998 Magazine Photographer of the Year.

Alfred Eisenstaedt (1898–1995)

Eisenstaedt was one of the first four *Life* magazine photographers employed by publisher Henry Luce in 1936. Eisenstaedt's more than 80 covers for *Life* brought him international prominence. Though only 5 foot, 4 inches in height, he was a metaphorical giant among photojournalists. After working as a belt and button salesman, he started as a freelancer in post–World War I Germany. Possibly his most famous image was that of a kiss on V-J day in New York's Times Square. In the exhilaration of news that World War II was over, he followed a sailor in uniform kissing women of all ages and sizes. In one instant, the sailor embraced and kissed a nurse in a white uniform, her back swayed in an arch. Until the year he died, he photographed life around the world. In 2000, the Digital Journalist website declared him "Photographer of the Century."

Arthur Fellig, "Weegee" (1899–1968)

Weegee and his direct flash lit up the noir of New York City nights—whether it was a homicide victim on the pavement or a starlet attending the theater. In 1938 he was the only licensed photographer in the city with a portable police band radio. His tenacious radio listening and his speed to crime scenes led to his being nicknamed after the Ouija board game. ("Weegee" was considered the phonetic spelling of "Ouija.") He seemed to have a preternatural ability to be wherever death, in all of its brutal forms, occurred. His lens not only captured violence but the paradoxical: one night he photographed two high society women awash in fur and glittery jewelry as they passed without notice by a ragged homeless woman staring at them. He titled the photo "The Critic." Weegee branched into fashion photography and film. He was such an icon that the movie, *The Public Eye,* portrayed him. Another film, *The Naked City,* referenced his photo book of the same name. He left a legacy of the archetypal, charismatic, city-toughened photojournalist.

Donna Ferrato (1949–)

Ferrato studied sociology and photography at the San Francisco Art Institute, and then she began her career hoping to capture images of love. But she witnessed domestic violence at a photo shoot and then focused on the men, women, and children affected by physical and emotional abuse in families. In one of her well-known photographs, a young boy points a blaming finger at his father as police search and arrest the man. Ferrato's work led her to activism, and in 1985 she was given a W. Eugene Smith foundation grant. After photographing for a ten-year period, in 1991 she produced *Living with the Enemy*. That same year she received a Robert F. Kennedy Award for a *Philadelphia Inquirer* story. Shifting her attention, she published *Amore* and *Love and Lust,* books that tell love stories in Italy and the United States. Her clients have included *Time, People Weekly,* and *The New York Times Magazine*.

Carol Guzy (1956–)

Born in Bethlehem, Pennsylvania, Guzy studied nursing at North Hampton County Community College. She discovered her love of photography when she attended the Art Institute of Ft. Lauderdale, Florida. After working at the *Miami Herald* from 1980 to 1988, she moved to *The Washington Post*. Guzy has won three photography Pulitzer Prizes: the first for coverage of mudslides in Columbia; the second for images from the U.S. military intervention in Haiti; and the third for work in Kosovo. Guzy has received eight White House Press Photographers Association's Photographer of the Year honors, three National Press Photographers Association Photographer of the Year award, and the Leica Medal of Excellence.

Josef Koudelka (1938–)

Born in Moravia, Koudelka worked as an aeronautical engineer before he became a professional

photographer in the 1960s. As a freelancer, he captured theater life throughout Europe. In Prague in 1968 he photographed the Soviet invasion of Czechoslovakia. Fearing retribution, Koudelka submitted his photographs as "Prague Photographer" or "P.P.," not revealing his identity. As an anonymous photographer, he was awarded the Overseas Press Club's Robert Capa Gold Medal. In 1984 he disclosed that he was "P.P." In exile, he had left Czechoslovakia in 1970 and moved to England, where he lived for a decade. In 1971 he joined Magnum Photos. His book *Gypsies* was published in 1975 and *Exiles* appeared in 1988. His photographs have appeared in such magazines as *Camera* and *Look*.

Dorothea Lange (1895–1965)

Lange was stricken with polio at age seven, resulting in a lifelong limp and, according to her, empathy for those who suffer. In a career that helped to form the essence of documentary photography she demonstrated how sensitivity is revealed visually. As a college student in New York, she visited portrait photographer Arnold Genthe who nurtured her interests by giving her a camera. Eventually she headed to San Francisco to open her own studio. After collaborating on a project with economist Paul Taylor, she married him. As a photographer with the Farm Security Administration during 1930s, she created two of her most famous examples of documentary journalism from the Great Depression. In "White Angel Bread Line" she depicted hungry men waiting in line for bread. In perhaps the most defining picture of that era, she photographed an exhausted migrant mother with her two children. She won a Guggenheim in 1941 and soon after that photographed Japanese Americans in World War II internment camps. She worked for *Life* in the mid-1950s, by which time she had become recognized as a foremost photographer whose work was exhibited in art museums as well as published in newspapers and magazines.

Peter Magubane (1938–)

Magubane spent much of his career covering apartheid violence in South Africa. He was born near Johannesburg and became interested in photography as a child. In 1955 he began photography assignments with *Drum* magazine, a political forum for black people across Africa. He was arrested for the first time in 1956 for photographing protests against government policies of racial segregation. He continued to capture the violence on film for three decades. Magubane was beaten, jailed, and once banned from using his camera for five years. His photographs helped put the international spotlight on bloodshed of two key incidents: the Sharpeville Massacre in 1960 and the Soweto Uprising of 1976.

Susan Meiselas (1948–)

Born in Baltimore, Maryland, Meiselas obtained degrees from Sarah Lawrence College in 1970 and Harvard in 1971. She taught photography in cooperation with the South Carolina and Mississippi Arts Commissions. Her book *Carnival Strippers,* published in 1976, documented New England traveling shows. That same year, Meiselas joined Magnum Photos. Her photography has illuminated life in Central America, including the Nicaraguan revolution of the 1970s. She spent more than a decade covering El Salvador and was co-editor of *El Salvador: Work of Thirty Photographers*. Meiselas continues her in-depth photojournalism as one of six women among the 52 Magnum photographers.

James Nachtwey (1948–)

Nachtwey has captured images of famine in Somalia, AIDS in Africa, and wars throughout the world, including Bosnia, Afghanistan, and Rwanda. Nachtwey uses the camera as a translator to bring viewers into the world he photographs. Born in Massachusetts, Nachtwey studied art history and political science at Dartmouth and graduated in 1970. He was a member of Magnum Photos from 1986 to 2001. After that, he helped to found VII Photo Agency. He has worked with *Time* since 1984. He has won the prestigious Magazine Photographer of the Year seven times. Of his work, he has said his photographs testify about things that "should not be forgotten and must not be repeated."

Gordon Parks (1912–2006)

Parks extended the field of documentary photography with topics ranging from poverty to women's fashion. Born in Fort Scott, Kansas, as

Gordon Roger Alexander Buchanan Parks, he was the youngest of 15 children and held a variety of jobs, including busboy and semi-pro basketball player, before becoming a photographer. He bought his first camera after seeing the work of the Farm Security Administration's photography project, which he joined in 1942. That year he took perhaps his most famous photo, "American Gothic," of Ella Watson, a black cleaning woman in Washington, D.C., in front of an American flag. He became *Life*'s first African American photographer in 1949. In addition to photojournalism, Parks gained fame as a writer, composer, and filmmaker.

Sebastiao Salgado (1944–)

Salgado records undetected or underdetected stories on an international scale. Born in Aimorés, Brazil, he earned an economics master's degree from the University of São Paolo. After completing a PhD in economics at the University of Paris in 1971, he worked for two years for the International Coffee Organization. In his first large project he documented starvation in Africa for the World Council of Churches in 1973. He then became a freelance photographer with Sygma in 1974 and the Gamma Agency, 1975 to 1979. His 1986 photograph of workers in the Serra Pelada Goldmine in Brazil won acclaim as he pictured a worker resembling someone on a crucifix. Salgado was a member of Magnum Photos for 15 years until 1994 when he launched his own agency, Amazonas Images.

W. Eugene Smith (1918–78)

Smith created the language of the photojournalistic essay. With stories such as ones about a country doctor and a Mexican village, Smith taught photojournalists ways to use still images to construct powerful narratives with precise visual syntax. His legacy continues through the W. Eugene Smith Fund to promote "humanistic photography." Smith fought with editors and publishers over image control. His sensitivity allowed him to craft potent pictures, such as his "Tomoko Uemura in Her Bath." Depicting the effects of mercury poisoning from industrial pollution in Japan, the image was published in *Life* magazine in 1972. It shows a mother bathing her deformed daughter and is considered one of the most significant examples of twentieth-century photojournalism.

Huynh Cong (Nick) Ut (1951–)

Ut started photographing the Vietnam War in his native country at age 15. Ut had become a photographer by developing Associated Press negatives and teaching himself to take pictures. He earned fame for his Pulitzer Prize–winning photograph "The Terror of War," which showed a young girl running down a road after being burned by napalm. After photographing the fall of Saigon in 1975, Ut left Vietnam. He worked in Tokyo for Associated Press and then went to Los Angeles, where he is a senior AP photographer.

Photo Magazines

Photo magazines are a type of illustrated periodical popular in media markets around the globe. While characterized by a substantial proportion of photographic illustration, photo magazines generally address issues of a broader, general appeal, emphasizing news and current events. Published weekly (or, less commonly, monthly), their journalistic functions were to (1) visually portray people and events, (2) summarize and contextualize developments beyond daily newspaper coverage, (3) entertain readers by presenting the new and unexpected, and (4) serve as a platform for photojournalists. Despite the fact that photo magazines have lost considerable impact in the age of television and the Internet, where visuals are omnipresent, for years they contributed substantially to the creation of collective memories.

Characteristics

Given that almost every title displayed at an average newsstand includes illustration, the mere fact that a periodical includes photographs is not sufficient to qualify it as a photo magazine. Based on the three major dimensions for classification as suggested by journalism scholar Marcia Prior-Miller (see Abrahamson 1995, 8–17), photo magazines are defined as (a) general rather than special interest magazines, in their audience appeal and editorial scope; (b) news magazines covering many topics rather than focusing on particular fields; and (c) a mixture of information (dominant) and entertainment (subsidiary) centering on current events rather than business, professional issues, or entertainment.

This excludes several types of magazines—those on photography itself, most consumer magazines lacking a "news" component, and the vast field of underground and lifestyle magazines that usually do not aim at a larger audience. But any suggested typology of periodicals falls short of providing clear-cut classifications in the face of an endless diversity of magazines available. The social and journalistic relevance of photo magazines peaked in the mid-twentieth century, with titles such as *Life* and *Look* in the United States; *Weekly Illustrated* and *Picture Post* in Britain; *Vu* and *Paris-Match* in France; and *Münchner Illustrierte* and *Berliner Illustrierte* in Germany.

From a global perspective, the American *Life* magazine, founded in 1936, encompasses most features associated with photo magazines. *Life* set out to tell a story in pictures, or at least to provide pictures to explain what happens in the text. A "reader" needed only the ability and willingness to see, assess, and make sense not only of what was written but also of what was shown. The first prospectus for *Life,* titled *Dime* (after its intended price) and distributed in June 1936, highlighted the famous quote which became programmatic for the new magazine and can speak for photo journals in general:

> To see life; to see the world; to eyewitness great events; to watch the faces of the poor and the gestures of the proud; to see strange things—machines, armies, multitudes, shadows in the jungle and on the moon; to see man's work—his paintings, towers, and discoveries; to see things thousands of miles away, things hidden behind the walls and within rooms, things dangerous to come to; the women that men love and many children; to see and take pleasure in seeing; to see and be amazed; to see and be instructed. . . . Thus, to see, and to be shown, is now the will and new expectancy of half mankind. To see, and to show, is the mission now undertaken by a new kind of publication, The Show-Book of the World. (quoted in Smith)

Early criticism assumed an audience at the mercy of the persuasive power of the picture. Critics speculated that by relying too strongly on pictures, the danger of superficial information, fake statements, and readers' misinformation might increase. Similar allegations continued in discussions about these magazines for years.

Yet despite their strong visual focus with photographs, photo magazines have always been more than mere storybooks. Their journalism could only succeed with texts indicating the content, the context, and often the meaning of what could be seen. Photo magazines also included longer sections with fiction, background reports based on elaborate texts, cartoons and other forms of visualization, and an extensive share of advertising (which in some cases was designed to simulate editorial

content). Other sections included letters to the editor, fashion, or gossip. Special emphasis was placed on the cover that was on display at newsstands and served to showcase the publication. Like a window display promoting new items, the cover needed to arouse interest to convince the potential reader to buy the magazine: considering the particular role of illustrations for photo magazines, readers expect outstanding visuals rather than bold headlines or lengthy previews.

Development

Although *Life* is sometimes called the first photo magazine, the tradition reaches further back in history. Until the end of the nineteenth century, illustrations in magazines could only be reproduced by using wood or other engraving techniques. This changed dramatically at the beginning of the twentieth century as photography became increasingly available thanks to the halftone printing process and improved presses. The fascination of photographs that seemed to promise an unbiased view of reality boosted public interest in magazines, creating an audience growing more accustomed to visual impressions of world events.

The role of photo magazines in journalism grew dramatically between the two world wars. The power of the image on the page was undeniable, and many early American general-circulation magazines such as *Harper's Weekly, The Nation, Saturday Evening Post, Leslie's* or *McClure's,* whose main focus was coverage of current events, added pictures to broaden their appeal.

The true photo magazine first appeared in Germany with the *Berliner Illustrierte Zeitung* (*Berlin Illustrated Times, BIZ*) and its many imitators. For the first time, a publication moved pictures to the center of editorial considerations. Kurt Korff, editor-in chief from 1918 to 1933, argued that "the *BIZ* adopted the editorial principle that all events should be presented in pictures with an eye to the visual dramatic, excluding everything that is visually uninteresting." The *BIZ* expressed a sort of iconographic shift emphasizing "news to see" over "news to read." Famous press photographers such as Erich Salomon, Martin Munkacsi, Felix H. Man, Tim Gidal, Alfred Eisenstaedt, Otto Umbehr, André Kertesz, Yva, or Sasha Stone produced photo essays consisting of five or more pictures that provided the dynamics of an event or issue and that would "tell the story" with a minimum of explanatory text.

An important prerequisite for the photo magazine lay in such new technical equipment as small portable cameras, interchangeable lenses, and roll film that replaced heavy and expensive plates. These devices were used by a new generation of photojournalists to develop a new style of reporting. Unusual perspectives, multiple exposures, or photomontage were a few of the techniques employed to present pictures with the greatest impact. The development of photo agencies to distribute pictures made visuals globally available and emphasized the selection of appropriate photos as the most important newsroom routine in magazine journalism.

The large-size, rotary-printed, and newspaper-like illustrated photo magazines that were so popular in interwar Germany did not find an early equivalent in the American market, which lacked the battle for public opinion present in the streets of Weimar and demanded a fast and cheap medium. U.S. photo agencies continued to offer expressive or funny single pictures with short captions. But this situation changed dramatically when Time, Inc. launched *Life* in November 1936. Analyzing the magazine's founding history, it was pointed out that the vision of publisher Henry Luce has its roots in the ideology of the "American Dream," and during the 1930s *Life* offered an idealized representation of everyday life in America. It is widely acknowledged that Luce took the *BIZ* as a model when creating *Life*—an assertion supported by the most important member of the editorial team—Kurt Korff, the former editor of *BIZ*. Though *Life* built upon an existing formula, it proved an instant success when the first issue sold out in four hours.

Several competitors soon tried to copy the success of *Life,* including *Ken* with its deeply anti-Fascist editorial position; *Focus,* which adopted the muckracker approach; a "National Picture Monthly" called *Click*; or *Friday,* founded in 1940, which proved its anti-Fascist position with articles on anti-Semitism in America. Several other magazines predominantly relied on the photograph as the main carrier of their messages. *Peek*'s first cover in January 1938 showed a person peeping through a keyhole, reinforcing the promise of the magazine's subtitle, "A Look at Life"; *Picture* traded under the name of "The Photographic Digest"

supplementing its photo stories with numbers to suggest a sequence to the viewer. These and other titles exploited the increasing number of picture agencies, public relations outlets, and promotional photos available.

Another publication soon exerted a more formative influence due to its broad appeal. The biweekly *Look,* founded in 1937 by Gardner Cowles, was originally not seen as a "respectable" magazine and was categorized as "barbershop literature" by its critics. Along with its more serious companion publication *Life* (which did not exist when the plans for *Look* were drawn up based on Gallup audience research), it shared the idea of telling stories through pictures. In contrast to the explicitly political orientation of *Life, Look*'s editors, as stated in the first issue, "hunted for their unusual picture stories in the basic and important fields of screen, medicine, foreign lands, adventure, sports, inventions, crime, personalities, sociology, self-improvement, religion, beauty, movies, and the stage." When the publisher's wife Fleur Cowles, the later editor of *Flair* magazine, joined *Look* as an associate editor, the magazine transformed and gained a broader appeal to both men and women by emphasizing the female perspective on issues.

Life soon earned a great deal of prestige with its extensive war coverage, particularly with close-up shots taken under perilous conditions to obtain the most realistic portrayal of men in combat. Until the magazine ceased weekly publication in 1972, *Life* continued its coverage of armed conflicts in the post-war era as well as the nation's political, social, and cultural changes in the 1950s and 1960s. With the end of *Life,* the "golden age" of photo magazines came to an end as the 1970s saw many similar magazines disappearing in different countries of the world. The motion of television had replaced the printed still image as a prime conveyor of visuals for the collective memory. Although photo magazines are still available, their impact has declined even further with the emergence of online communication, which has opened up a seemingly endless and easily accessible universe of photographic documents.

Global Development

The success of photo magazines was a global phenomenon. The examples below will elaborate on four national trends regarding selected magazines in Germany, France, the United Kingdom, and the Soviet Union. Rather than being representative, the sample suggests particular approaches to the diversity of editorial concepts.

Germany

Among the early *BIZ* competitors, it was the *Münchner Illustrierte Presse* (*Munich Illustrated Press, MIP,* 1924) that qualified most as the leader in modern magazine journalism. Its success was closely tied to editor Stefan Lorant, who considered the magazine a vehicle for his personal expressions and interests in the social and political environment. His appreciation of photography shows in the extraordinary salaries he paid his photographers. A third news magazine was the left-wing *Arbeiter Illustrierte Zeitung* (Worker's Illustrated Times, *AIZ,* 1925), now famous for its photomontages created by former Dada artist John Heartfield. A small staff around communist activist Willi Münzenberg aspired to publish a "true medium of the masses" using "worker photographs" as an instrument in the class struggle. For that purpose, the *AIZ* also employed photo essays, often covering the world of industry labor, which allowed German workers to have a glimpse into working conditions in other countries. One of the *AIZ*'s most celebrated achievements in the visual storytelling medium was when it dedicated two complete issues to the daily life and living conditions of one Russian family and one German family earning their living with factory and construction work.

During the twentieth century, the German term *Magazin* (rather than its English counterpart) referred to a book-sized (approximately 7 by 9 inches), illustrated monthly periodical with up to 200 pages dedicated to entertainment and social and cultural life. These publications ranged from the more sophisticated type of Magazin in the "feuilleton" style to the "spicy" type that attracted attention with its risqué and sometimes explicit photographs. The Magazin era peaked in the late 1920s when almost every publisher offered one, and the interested reader could choose among ten or more. All claimed to present interesting insight into arts, science, sport, and crime and were profusely illustrated with the growing number of photographs supplied by photo agencies in and around Berlin. Although "education through entertainment" remained one of

the guiding principles of most Magazin publications the sensationalist approach to content usually prevailed. With minor exceptions, the German Magazin was obsessed with the depiction of beautiful women. Most of the subjects were found among movie stars who served as projections for readers' individual dreams and collective desires.

The American *Look,* distributed in Germany during the Allied occupation, laid the foundation for a magazine genre that was later called the "Illustrierten" (pictorials) in Germany. The term usually refers to the small group of general-circulation illustrated weekly photo magazines focusing on simplified news, glimpses into the private lives of film stars and royalty, and serial romantic novels. This orientation toward triviality (and, later, sexuality and nudism) was called the "4-S-Line (sex, sentiment, sensation, sadism)" by observers and made the "Illustrierte" a matter of public discussion, with critics and politicians accusing the publishers of stultifying their audience.

Between 1946 and 1948, the four most influential photo magazines of postwar Germany first appeared: *Neue Illustrierte* (New Magazine) in September 1946; *Revue* in November 1946; *Quick* in April 1948; and finally *Stern* (Star) in August 1948. They all claimed to cover current events, but throughout the 1950s their content remained mostly apolitical and they may better be described as glamour magazines. Audience research suggested that during any given week in the 1950s, between 70 and 80 percent of adult Germans picked up at least one of these magazines.

France

In the late 1920s, photography became an important feature of the large-sized and lavishly printed *L'Illustration* (The Illustration, 1843). A national flagship publication, the magazine produced occasional special issues of seasonal topics and important events (such as the Paris World Fair in 1938) while regular issues covered the universe of bourgeois interest in high culture. Reproductions were carried out with high diligence, thus making old issues of *L'Illustration* an aesthetic highlight in photo journalism.

The news magazine *Vu* (founded in 1928) developed a visual language unique in the 1930s while reminiscent of the *AIZ* style. Art director Alexander Liberman used photomontage to create some of the most memorable covers in magazine history. The first issue was launched with the editorial statement "In motion like a good movie," and some of the photo reporters working for *Vu* in the early days were the most brilliant documentarists of their age—among others Man Ray, Brassai, Germaine Krull, and one of the cofounders of the legendary Magnum picture agency, Robert Capa, whose famous photograph of a dying soldier in the Spanish Civil War was first published in *Vu*. By mid-1940, when Germany occupied much of France, 633 issues of *Vu* had appeared. Although it was always devoted to current events, its significance lies in its editorial design. *Vu* was the first major photo journal with high circulation that adopted a modern layout as suggested by constructivist or surrealist approaches, the so-called new typography. Thus, it is one of the rare examples of an avant-garde photo journal successful in the mass market. Design was based on the dynamics of pictures, their emotional intensity generated for instance by close-ups or extreme perspectives, and sometimes even contradictory motifs.

Compared to other titles on the market, *Match,* which first appeared in 1938, looked rather conservative. Indeed French press magnate Jean Prouvost wanted nothing more than to replicate the success of *Life* by imitating the American model as closely as possible, from layout to content. In prewar France, the magazine expanded its circulation from 80,000 to 1.4 million in less than two years. Its relaunch in 1949 as *Paris Match* followed the same pattern as the German and American markets, with print-runs peaking in the late 1950s followed by a sharp decline with the diffusion of television in France. *Match,* however, survived by adapting to the changing media landscape by focusing on in-depth articles instead of fresh news. Moreover, cheap-looking snapshots were replaced by stunning and artful color photographs, one reason that *Match* remains one of the most important French news magazines.

United Kingdom

Despite its long-standing journalistic tradition, the British media market did not exert a substantial influence on the development of photo magazines. With the *London Illustrated News,* founded

in the early nineteenth century, the major news magazine still maintained the tradition of engraved illustrations even in the early twentieth century when photography became popular in other nations. Moreover, it had turned into a rather apolitical source following the general appeasement position of the British press toward Germany as suggested by the British government in the late 1930s. A major photo journal emerged in 1938 when former *MIP* editor Lorant, who had left Nazi Germany after being imprisoned under Adolf Hitler, became the driving force behind the British *Picture Post.* Publisher Edward Hulton supported this strong voice against Fascism in general and Nazi Germany in particular. Despite the initial hesitation of advertisers, Hulton sold the first edition of 250,000 copies within minutes.

Although Lorant never officially edited *Picture Post,* his influence on the photo magazine and hence on British photo journalism was substantial. His contract with the magazine was based on sales figures, so he benefited from the tremendous success of *Picture Post,* which had reached a circulation of 1.35 million copies after only four months. Before that, Lorant had designed *Liliput* magazine (1937), a pocket-sized photo magazine that followed the model of the German "Magazin" in size and scope, and another publication that copied the *BIZ* model called *Weekly Illustrated,* published by Odhams Press in London in 1934. Records indicate that publisher Henry Luce and photographer Margaret Bourke-White took a complete set of this magazine as a specimen to New York when they began conceptualizing *Life.* Although Lorant may have arrived in the United States too late to exert an immediate and personal influence, his impact on the emergence of *Life's* journalism through *Weekly Illustrated* and, later, the wide acknowledgement of *Picture Post,* is certainly evident.

Soviet Union

In the post-revolutionary Russia of the 1920s, the new government soon realized that magazines could play a key role in both teaching people to read and encouraging support of communism. The mechanical character of photography was associated with modernity, and its reproducibility suggested democracy. The nation's first photo journal was called *Ogonyok* (*Little Flame,* 1923), and the relevance it gave to photographs of current events is demonstrated by the fact that its editor, Mikhail Koltsov, also edited the influential photo magazine *Sovetskoe foto* (*Soviet Foto,* 1926). More importantly, Koltsov became part of the editorial board when the famous writer Maxim Gorky initiated *SSSR na strojke* (*USSR in Construction*), published between 1930 and 1941 in four different languages (Russian, English, German, and French; a Spanish edition was added later). It served as a prototype for photo magazines worldwide. Sponsored by the state, *SSSR na strojke* was intended both to charm communist leaders and gain friends for the Soviet Union abroad. The editorial statement in the first issue emphasized that photography should be the main editorial tool to depict the construction work going on in the USSR, because pictures conveyed more than even brilliant text. This approach was underscored by the table of contents, which named the photographers and the art director but not the text authors.

From a contemporary perspective, *USSR in Construction* is notable for the participation of leading Soviet artists as freelancers for the production of particular issues, among them Alexander Rodchenko, Nicolai Troshin, and El Lissitzky, who in 1932 was the first designer to be credited on the masthead for artistic composition. The workflow differed substantially from other photo journals, since the editors did not use existing photographs from their archive or provided by picture agencies. Instead, an author created a scenario for the general topic, and the art director transformed this scenario into a sketch that included the nature of pictures he wanted to incorporate. In the case of Lissitzky, he personally advised the photographers how to take the pictures and how the montages should be arranged. Later, the photos were printed in toned rotogravure and often used a large page size (12 by 17 inches), leporello folds, and die-cuts to create highly impressive visuals. The use of strong diagonal lines in layout to evoke movement, together with contrasting close-ups and long-shots, created an overall impression that was cinematic in the tradition of the films of Russian filmmaker Sergei Eisenstein and the documentarist approach of French *Vu.* Interestingly, the launch of *USSR in Construction* was paralleled by a similar initiative by Henry Luce in the United States, *Fortune,* a

monthly magazine focusing on the economy. Just like its Russian counterpart, *Fortune* highlighted the industrial culture of the nation and promoted business enterprises. But in contrast to *USSR in Construction, Fortune* typography was conventional and was employed functionally and without superfluous decoration; only the cover served as a showcase for the avant-garde.

Photo Magazines in the Contemporary Marketplace

In the early twenty-first century, the traditional type of photo magazine that appeals to a general audience plays only a minor role in the media market. Indeed, the American photo magazines such as *Life* and *Look* survived the 1950s with a clear orientation toward the middle-class reader, promoting shared values and a "good life." By 1970, however, six of the nine most prominent mass magazines had ceased publication.

As journalism scholar David Abrahamson wrote in 1996, "Three principal causes led to these failures: competition from television, mismanagement by publishing companies, and, as a less obvious but important undercurrent, an inability of some of the publications to respond to fundamental sociocultural changes."

Instead, the second half of the twentieth century saw the rise of the special interest magazine that remains popular today, as proved by a brief glimpse at any newsstand. An attempt to revitalize *Life* as an editorial supplement of major newspapers in October 2004 was abandoned by March 2007, as the relaunch did not meet expectations in terms of advertising revenue.

The same trend appeared in Europe where the golden age of photojournals ended with the decreasing appreciation for photography amidst the rise of television. Emergence of newer communication technologies such as the Internet made visuals of any form and kind ubiquitously and simultaneously available to both media professionals and the general public. The industrialization of photo production and distribution leaves little room for the comprehensive photo magazine with mass appeal. Instead, globalization of media production has changed the field of special interest magazines as well: international publishing houses produce content for outlets in different countries and sell advertising space to multinational enterprises. This is possible despite many differences in the cultural background of regions, as media consumers often display similar motives for media use. Their demands focus on a limited set of needs that can sometimes be met by content that has universal appeal, such as home-stories of Hollywood actors, reports of disasters, or war coverage. Thus, regionally tailored but universally produced special-interest magazines have replaced the photo magazine as the latter lost its role as provider of collective memories to the moving images of the television age.

PLAGIARISM

Plagiarism, the reuse of original ideas or words without attribution, is regarded as a serious violation of journalistic ethics. It is usually conceived as a form of stealing, taking facts or information that another person developed without giving credit to the source. In journalism, plagiarism usually entails words but can sometimes involve images or sounds. It is an ethical issue and not a legal one; intellectual property or copyright law rarely applies because typical plagiarism does not produce financial harm. Most journalistic organizations treat plagiarism as a serious infraction that, in a majority of cases, results in the employee's dismissal. It is considered a journalistic taboo because it violates an expectation of originality—that the bylined author or on-air correspondent actually reported the story and wrote the words printed or spoken. The two leading professional associations for print and for broadcast journalists place plagiarism in the context of untruthful reporting. The Radio-Television News Directors Association ethics code lists plagiarism as a forbidden activity along with manipulating images or sounds. The Society of Professional Journalists ethics code locates plagiarism along with activities that distort reality such as unbalanced reporting or perpetuating stereotypes.

History

The word *plagiarism* is derived from the Latin word for kidnapping, and thus carries connotations of literary theft. It was applied to writing gradually after the European discovery of moveable type facilitated the notion of authorship. Early American newspapers liberally copied from European periodicals and from one another, although often crediting their sources. Plagiarism did not become an issue until the mid-1800s, after newspapers became major commercial ventures that fought for scoops and promoted the value of their individual writers to differentiate themselves from competitors, at a time when most U.S. cities of any size had multiple newspapers. As appearance of originality created market value, newspapers had a financial incentive to minimize attribution, camouflage copying through paraphrasing, and steal if necessary. Pinching was so rampant that in the late 1800s, as Fedler retells, a Chicago newspaper set a trap by publishing a story with a fictional proclamation in an obscure language that, read backwards, said, "The McMullens will steal this for sure." They did, and the plagiarism was exposed. In reaction to the excesses of cutthroat sensationalism, journalists banded together to create a training school at the University of Missouri in 1908 and formed the American Society of Newspaper Editors in 1922 in part to establish ethical principles. As professional standards were applied to the craft of journalism, plagiarism became unacceptable, though not eliminated. *Time* magazine began in 1923 by rewriting stories clipped from newspapers, before adding its own correspondents. Even in the 1970s, a cadre of newspaper columnists across the nation regularly sent copies of their published writings to each other with the understanding that they were free to reuse as they pleased. Foreign correspondents cribbed from local papers into the 1980s. But generally, these were notable exceptions to plagiarism prohibitions.

The Supreme Court addressed journalistic plagiarism in 1918. The Associated Press complained that a rival news organization, William Randolph Hearst's International News Service, was filching AP copy and distributing it as its own. The court ruled that a news organization could not claim property rights simply by being the first to report on an event. Instead, the court ruled that the AP was a victim of unfair business practices because International News Service was "endeavoring to reap where it has not sown." The justices concluded that using a competitor's story as a tip to independently produce a new version but systematically rewriting someone else's work was misappropriation. The decision did not use the word *plagiarism* and its practical effect was to establish a relatively

high bar for when copying became illegal. Still, the ruling established the "quasi property" value of journalism and affirmed the prevailing idea that plagiarism was wrong.

Today, plagiarism is so widely viewed as an unethical act that it engenders little debate. Journalism ethics textbooks skip the subject in favor of discussions of more nuanced subjects such as conflicts of interest or deceptive newsgathering techniques. Most ethics codes confine coverage of plagiarism to brief prohibitions. Yet plagiarism continues to plague the profession. Despite the notoriety associated with the serial fabrication and plagiarism committed by Jayson Blair (1976–) of *The New York Times* and revealed in May 2003, a new case publicly arises about once a month at the nation's daily newspapers, and about once a year in the television profession. Given the reluctance of any business to air its dirty laundry, the actual rate of plagiarism is undoubtedly greater. Experienced journalists argue that plagiarism occurs less frequently today than it did in prior decades, but seems more prevalent because the Internet allows offenses to be more widely reported.

Definitions

Although plagiarism can be defined as the reuse of original ideas or words without attribution, specifics are elusive, and not just in journalism. There is no agreement in any field on whether plagiarism is measured at the level of a paragraph, sentence, phrase, or word. Neither is there a formula for how many words, consecutively or cumulatively, constitute plagiarism. Ethics codes sometimes prohibit the reuse of "distinctive language" without defining "distinctive." Some of this ambiguity is deliberate so that evaluations of plagiarism don't miss the forest by counting trees. If three consecutive words constitute plagiarism, a copyist who does nothing more than change every third word can still be guilty of de facto plagiarism. On the other hand, some descriptions offer little room for originality; for instance, there are only so many ways that a story concerning a company's filing for Chapter 11 bankruptcy can be summarized. Context also matters, for parody requires imitation. Additionally, definitions vary by culture. In some nations, students are taught by repeating the works of masters without injecting originality. Broadly speaking, plagiarism cannot be defined in absolute terms; its meaning is relative to the situation.

In journalism, judgments about plagiarism generally involve two elements: first, the degree of paraphrasing and second, whether the information was considered "public" or background not requiring attribution. The opposite of plagiarism is not paraphrasing, but attribution. However, many journalists believe the cure for plagiarism is paraphrasing, and that reworking someone else's words, even when no original research is done, negates plagiarism charges. Determining whether plagiarism has occurred depends on an interpretation of whether the original material was paraphrased sufficiently to avoid the appearance of copying. Yet there is no standard for how extensive the rewording needs to be to avoid plagiarism. The second common element in definitions is whether the source is perceived to be sufficiently singular to warrant attribution. If the words or facts used are derived from a one-on-one interview or result from original, enterprise reporting, most journalists believe the reuse of that material requires attribution. No attribution is generally required for news conferences, government reports, or common historical knowledge. As with paraphrasing, determining when information evolves from a private statement to become part of the public domain is open to interpretation. Often, a presumed claim of exclusivity or invention fades quickly with widespread repetition, a sort of journalistic version of squatter's rights. For example, Barbara Bush's 2005 comment about Hurricane Katrina evacuees stuffed inside the Houston Astrodome—"this is working very well for them"—was widely repeated by broadcast and print reporters without attribution, even though it was said in a private interview with National Public Radio. However, in other instances, the taking of quotations from private interviews without attribution has been grounds for dismissal.

Journalists also differ on whether attribution needs to be specific or general. Broadcasters tend to use the term "reportedly" as shorthand for information that was taken from a competitor, especially a local newspaper. Broadcasters defend the minimalist approach to attribution as a concession to brevity while print reporters decry the use of "reportedly" as a dodge to avoid crediting their organization. Yet newspapers are guilty of

blending material from the Associated Press or other wire services with their own reporting with no more attribution than an end-of-story disclaimer such as "information from wire services and online sources was included in this report." A growing and more problematic issue for broadcasters involves the reuse of prepackaged video segments from public relations firms or government agencies, surrounded by stand-ups (on-camera narrations) from a local station reporter, without telling viewers the source of the material. Some broadcasters defend the absence of attribution as an extension of the medium's routine blending of various sources of audio and visual material.

For newspapers, attribution standards can vary by section. While the local news section might require its reporters to attribute hearsay quotations to a spokesperson, it is common practice for sports writers to use "quote packages" compiled by team publicists to write stories without revealing to readers that they never talked to the players. Quotations published by other newspapers are used routinely in many sports "notebook" columns with no more than a boilerplate disclaimer. In some cases, newspapers have fired political reporters for failing to attribute quotations, even as they allow their sports reporters to do the same as a matter of routine. On the opinion page, newspapers demand that letters to the editor be the original words of the authors and reject form letters as a type of plagiarism. Yet many opinion page editors publish "op-ed" columns ostensibly penned by political figures but actually written by aides or publicists.

Journalists further cloud plagiarism by lumping it with another offense, fabrication. While plagiarism is using another person's words or ideas, fabrication involves the creation of fiction while passing it off as genuine. Journalism trade magazines have frequently written about plagiarism and fabrication scandals as if they were somehow linked. A few reporters have committed both, notably Blair of *The New York Times* and Jack Kelley (ca. 1960–) of *USA Today* in 2004. But they are discrete behaviors and rarely mixed. Notorious fabricators Janet Cooke (1954–) of *The Washington Post,* whose Pulitzer Prize was returned in 1984 after she confessed to inventing an eight-year-old heroin addict, and Stephen Glass (1972–) of the *New Republic,* the subject of the 2003 movie *Shattered Glass,* were not found to have committed plagiarism. Conversely, the vast majority of journalists accused of plagiarism do not engage in fabrication.

Although most plagiarism involves words, other types include self-plagiarism, visual plagiarism, and idea plagiarism. Self-plagiarism usually involves reusing words written for a prior employer or a different publisher. Editors disagree over whether self-plagiarism is an offense, and if so, how to respond. Visual plagiarism has been applied sparingly to photographs, political cartoons, and page designs. Idea plagiarism is quite common but rarely acknowledged. Journalists have been reluctant to credit sources of ideas due to professional pride and to maintain distinctiveness in an era when news is a commodity.

The absence of clear standards for plagiarism means that the offense is often defined by extenuating circumstances. Four factors seem to figure most prominently. One occurs when the news organization has suffered an ethical black eye and reacts more harshly to the next offense. After the high-profile Blair case in 2003, the rate of publicly revealed plagiarism nearly tripled, indicating that the newspaper industry expanded its definitions and spoke about the issue more openly. A second extenuating factor involves perceived intent. A common journalistic maxim is that plagiarism must be deliberate. Inadvertently stringing together sentences, paragraphs, and even entire stories is sometimes declared not plagiarism but merely "sloppy" if management believes the journalist involved lacked intent or malice. Although human beings often cloak inappropriate actions with the garb of good intentions, allowing perceived intent to define plagiarism effectively limits the term to extreme cases of malfeasance. A third factor that often influences definition is the track record of the individual involved. News organizations commonly reserve the word *plagiarism* for episodes that result in dismissal. A study of newspaper plagiarism revealed a statistically strong association between the use of terminology and the sanction applied. The word *plagiarism* is associated with cases in which a person is either fired or resigns, while synonyms such as "nearly verbatim" are associated with cases in which the offender retained employment. The fourth factor that can influence definition is the source of the plagiarism complaint.

Journalists tend to view a complaint from the person or organization whose work was allegedly copied as carrying more weight than an accusation from an advocacy group representative or a reader, viewer, or listener.

Why It Happens

Conventional wisdom assesses blame for plagiarism to the offender along two general lines. First is rationalizing dishonesty, perhaps to take a shortcut to meet a deadline, compensate for perceived workplace injustice such as being underpaid or understaffed, or hide doubts about one's own writing ability. Second, and most common, is the use of problematic techniques such as electronic copy-and-paste in a way that mixes someone else's words with original research or employing a competitor's story as a template and too closely resembling the original. Yet plagiarism results not only from individual factors, but also from organizational influences. The two most prominent are ambiguous definitions that result in unmarked boundaries between borrowing and copying, and journalism's reluctance to attribute competitors and other sources of information. Because plagiarism is often undefined—an "I'll know it when I see it" standard—journalists don't know if they need to attribute information from newsroom archives, or cite the source of the background videotape, or credit a press release. As a result, negligence is often shared between the individual and the organization. Journalists have an affirmative obligation to prevent note-mixing and can alter their techniques to avoid copying. At the same time, news organizations contribute to plagiarism by failing to define it in clear terms and by creating an atmosphere in which attribution is minimized.

Conclusion

Despite widespread injunctions against plagiarism, it has defied eradication, in part because of the nature of journalism itself. Journalists gather information produced by others, reduce an issue to its bare essentials, and tell stories without footnotes. Such practices allow journalists to convey information and illuminate issues quickly, but they also promote borrowing and reduce attribution. Professional practice encourages a minimalist approach to attribution, which unwittingly allows plagiarism to occur. While it is difficult to know exactly how often journalistic plagiarism occurs, it continues to stick to the profession like a leech.

PODCASTING

Amid declining newspaper revenue and circulation, many observers hope that journalism can be invigorated by embracing newer media, including online editions, blogs, chats—and a fairly recent adaptation of broadcasting called podcasting.

Podcasts (the term comes from a combination of i*Pod* and broad*cast*ing and refers to both the content and the process used to carry that content) are most often audio programs that are downloaded to a computer or portable listening device so they can be listened to at any time. Indeed, some have called podcasting "radio on demand," as they provide AM and FM broadcasts with the ability to time-shift when one listens. But podcasts can be also be made up of original material formatted especially for the Internet. And, though more complex, video podcasts are growing in popularity as well.

Yet to a considerable degree, podcasting remains a technology still searching for success. It provides yet another means of distributing existing (and some new) content. But thus far it has lacked a clear business model that might pave the way to expansion (podcasts are regularly used only by a fairly small minority of people), more original content, and new markets.

Development

The technology underlying podcasting was less than a decade old when this volume went to press. As a concept, podcasting developed out of many bloggers' desire to include audio and video clips in their otherwise text-based blogs. That growing demand led to technical experiments necessary to create the means for podcasting starting in the late 1990s. Two people are especially credited with creating and promoting the means to bring the idea to reality. They built upon the RSS (eventually dubbed "Really Simple Syndication") software first developed for Netscape in 1999, and later modified by others.

Adam Curry (who had been a video DJ on the MTV cable network from 1987 to 1994) promoted the use of audio in blogs and a means to make them easy to access. He promoted the use of modified RSS software as an "aggregator," a kind of automatic "news reader." This is either client software (housed on individual computer disc drives) or a web application which aggregates (or gathers) syndicated web content such as news headlines, blogs, podcasts, and vlogs (videologs) in a single location for easy viewing. Curry developed some of the first podcast examples—and is often called the "podfather" by aficionados.

Curry approached software programmer Dave Winer to develop a means of helping users stay current when podcasts were changed or otherwise updated. Winer undertook to improve the underlying RSS software to make finding current podcasts far easier for those lacking deep computer experience. Working with his own ideas combined with those from others, Winer had developed RSS 2.0 by early 2001 with "enclosure" technology, a software means of attaching multimedia (audio or video) content to RSS feeds. Those enclosures or attachments would enable creation of audioblogs (or what we now call podcasts). Additionally, RSS "narrators" were developed to provide an added service, converting aggregated text feeds into audio recordings one could hear rather than read.

The developing service still lacked an agreed upon name, though several had been suggested. The term *podcast* first appeared in Britain's *Guardian* newspaper, in a February 2004 story. Creation of the term is credited to reporter Ben Hammersley who in writing his piece used "podcast" as one synonym for audioblogging or amateur Internet radio. The new term stuck and was soon widely adopted, though it caused some inadvertent confusion in the marketplace. Many still assume an Apple iPod is required to receive podcasts—which is not the case, as any MP3 player or Internet-connected computer may be used.

As one indicator of podcasting growth, the number of Google hits on the word *podcast* grew from only two dozen in September 2004 (about the time the first radio broadcasters began to offer podcasts of some of their news or interview programs) to more than 100 million just a year later. Early stories on pioneering podcasters began to appear in major national newspapers late in 2004 and early in 2005, greatly increasing the number of people who knew of the new system. Initial podcasting networks appeared, making it easier to find out who was offering what. In mid-2005, Apple added podcasting capability to its iPod device and added a directory of available podcasts to the iTunes online store, both of which provided a huge boost to the podcasting service. By the fall of 2005, active work with video podcasting was expanding as well.

At least initially, most podcasters focused on providing information about one or more specific topics, with technology news being one of the most common. Pornography (dubbed "podnography") was popular as is so often the case with new technologies. Other subjects include global, national, or (especially) local news—or comment on the news—followed by sports, and updates about the world of music and show business. There has also been considerable interest, judging from the number of books about these topics, in applying podcast technology to various needs of business and education, especially in sales and marketing activities. New "how-to" guides appear weekly.

How Podcasts Work

The popularity of podcasting lies in its ability to let anyone be a kind of broadcaster—a creator of programs rather than merely a listener—with a minimal investment in equipment and not much technical knowledge. Audio podcasting calls for a personal computer, recording software (which can often be downloaded at no charge), a microphone, some kind of input manager or mixer, and available bandwidth on an Internet server. Headphones are useful. Video podcasting is understandably more complex, and thus more expensive as it requires addition of at least a camera and presumably lighting equipment to the list. Either audio or video podcasts operate using any of several free software programs.

Unlike streaming audio and video, which must be used at the time it arrives on one's computer (it has to be re-streamed to be seen or heard again), podcasts are independent digital files that can be downloaded onto media players—such as the iPods which gave the process its name. Users can find and then download podcasts from numerous web portals or specific sites; NPR, for example, hosts a Podcast Directory where users select what they would like to download. Podcast Alley is another portal where users can choose among tens of thousands of podcasts. There are many other portals, and new ones pop up regularly. The number of individual podcasts available is nearly impossible to count.

A far easier and more popular way to keep track of this flood of information, however, is to

The popularity of podcasting is in large part due to the simplicity of recording and creating digital files through affordable and accessible technology. This photo depicts some of the basic tools necessary for a podcast, including a small mixer in the bottom, left corner into which the computer, microphones, and headphones are connected. The sound levels of the audio being recorded are manipulated through the mixer.

Source: iStockphoto.com/leezsnow.

have podcasts of interest delivered and downloaded automatically by setting up a free "subscription" using an RSS feed, which functions somewhat like a digital recorder on a television. RSS formats are specified as either .rss or .xml, a generic specification for the creation of data formats. RSS formats have continued to evolve, and by early 2006, an orange icon (a tiny orange square with white radio waves), first used by the Firefox browser a year earlier, came into widespread use to indicate an RSS (or a competing system created in 2003 called Atom) digital file. By 2008, most podcasts were using the RSS 2.0 software that Winer developed.

No license is required to be a podcaster, as the service does not use spectrum. Nor are any program content controls applied, except for the law of copyright. But given how new podcasting is, many potential legal issues have yet to be resolved—or even identified. The legal situation is made more complex because, as with other Internet applications, a podcast can be placed on the web from anywhere in the world—and heard the same way. National laws vary widely and podcasting will be one test of how and when to apply them in this global context.

Podcasts and Journalism

Podcasting lent itself to the dissemination of news from the start, though for different reasons. A number of newspapers began to provide podcasts of their daily print editions as a service to the visually impaired, somewhat paralleling older reading services for the blind. For radio stations, news and other talk formats did not raise questions of music licensing fees and were thus less complex (and potentially expensive) to distribute as podcasts. Soon newspapers were exploring podcasts for general users—the *San Francisco Chronicle* may have been the first, in 2005.

Almost from the start, public service radio networks and stations became major providers of podcasts with their many talk programs. NPR and the BBC World Service were two of the earliest "legacy" broadcasters to utilize podcasts to further disseminate their programming. Indeed, most NPR news and public affairs programs are available as podcasts and the BBC provides many of its audio documentaries as podcasts as well.

A growing number of television networks and stations are providing the audio portion of their news programs as podcasts. By mid-2005, a few radio broadcast stations even reversed the former order of things, beginning to offer air time for listener-generated podcasts as an inexpensive and, in some cases, even attractive way to fill airtime. At the same time, the weekly White House radio talks by President George Bush began to appear in podcast form—a process continued by the Obama administration in 2009.

Podcasts may, moreover, impact the role of the individual reporter. In an era of both technical change and economic downturn (especially for the press), reporters are increasingly subject to the practice of what some have dubbed "backpack" journalism. Once supported by specialized production personnel who handled audio and video tasks, journalists increasingly carry their own cameras and microphones and record, edit, and produce their own pieces for use across media platforms. Such low-cost multifaceted stories lend themselves to distribution as podcasts. By 2009, the podcast-directory.com portal listed hundreds of available podcasts under "news" and offered more under "news and politics," and "news and talk."

Yet most of those reports are not original material made especially for the podcasts on which they are heard. The podcast aggregating process is still pretty much a vacuuming up of existing news reports prepared initially for print or broadcast media. There is as yet not much general news produced especially for or by podcasting. And that is because there is still no clear business model to make podcasting pay at least enough to support such creative efforts. Whether that will change remains to be seen.

Outlook

While the full potential of podcasting is yet to be reached, it is too early to tell whether or not it will only be a niche service, or whether podcasts will expand in the ways they are applied and used. Many argue podcasting is in something of a holding pattern, awaiting a viable commercial model to proceed. Many podcasts are poorly done from a technical or content point of view (or both). It has been hard for some to reach beyond the early "hippy happy" days of making podcasts for fun

and taking the next step to turn the technology into a real business. Others have made the leap (or began their podcasts with a business bottom line very much in mind), and some podcast services (though apparently not yet any for journalism) already return comfortable advertising revenue.

As traditional newspapers and broadcast outlets continue to suffer audience and revenue declines, it may be that podcasting ventures will provide another important means to keep professional (as well as personal) journalism alive.

Political Action Committees

The political action committee (PAC) is a private group dedicated to shaping and influencing political or public policy and law making. PACs operate to generate, distribute, and spend campaign funding, or money to persuade the public and government about specific issues. As they become more numerous and centrally involved in American political campaigns, coverage of their activities becomes a central part of political journalism as well as coverage of issues of public controversy.

Activities and Financing

While they are often required to register with regulators, PACs are normally conceived as a way of supporting candidates or issues outside of or parallel with the formal political process. PACs can advocate election of a candidate or subject opposition candidates to attack. The sets of alliances and monetary arrangements that develop between PACs and the political establishment are important factors to report on and critically assess. An informed understanding of the role of PACs and the restrictions they face provides journalists with insight into the links between finance and political power.

PACs are defined in U.S. federal and state law. Their roots lie in the 1971 Federal Election Campaign Act, which was designed to regulate political campaign spending and promote greater political and financial transparency in campaign funding. This act was designed to police campaign funding both inside and outside of the formal political process. Within the institutions of party politics, the act placed limits on the amounts those seeking political office could contribute to their own campaigns, as well as requiring that party election committees offer full quarterly accounts of their fundraising activities. Crucially, however, the remit of the Act extended beyond the conventional political parties, and the PAC was established as a means of broadening the requirement for openness and accountability to include more of those who seek to intervene in the campaigning process.

PACs are obliged to register with the Federal Election Commission (FEC). In enforcing regulations, the FEC recognizes a number of types of PACs that are made subject to slightly different rules. One category is referred to by the FEC as a "separate segregated funds" committee, which is a form of PAC affiliated with a union or corporation. The most important restriction on these PACs is that they are confined to raising money only from within their host organizations. The

host organizations are also allowed to pay for the PAC's administrative and running costs.

The "leadership PAC" is formed at the time of biennial federal elections to provide a mechanism for members of Congress to raise campaign money for a candidate other than themselves. While these are clearly allied to the party system, such a PAC cannot be established for a Representative's own political or material benefit. So while the Representative forming the PAC is entitled to draw reasonable travel expenses, he or she has to show the FEC that they do not spend any of the PAC's funds on their own campaigning.

Another category is what the FEC calls the "nonconnected committee." This type of PAC is allowed to raise funds from the general public, but on the strict condition that the PAC remains free from affiliation with corporations or unions. Such "independent" PACs are more often driven by issues rather than political allegiance, although recommendations on how to vote are routinely issued. While they are entitled to solicit public contributions, independent PACs have to make certain that no individual contribution exceeds a set legal limit. Additionally, all of the operational costs of the independent PAC need to be met through money given by the public. This is an attempt to ensure that such PACs don't become mechanisms for organizations or individuals to bankroll favored causes.

Coverage of PACs

Journalists face a difficult challenge covering PAC activities due to their complexity and the involved laws that supposedly control them. While the task of the journalist is to be alert to the influence exercised by PACs in representing either conservative or liberal causes, journalists should also consider the unbalanced spread of PACs across the political spectrum. For example, there are few PACs supported by nonprofit organizations, and those formed by citizen groups tend to suffer from poor infrastructure. This means that the most "effective" PACs tend to be Republican rather than Democratic supporters, leading to potential questions of balance in election or issue coverage.

While unevenness of distribution is important, it is perhaps the motivation, quality, and veracity of their political arguments that most concern the democratically minded journalist. Many journalists maintain that it is the category that the FEC calls nonconnected PACs that warrant the closest attention. On a consistent basis, nonconnected PACs have been associated with orchestrating what have become known as "Astroturf" campaigns that appear to be coming from the "grassroots," but in reality are arranged by lavishly funded and well-organized political concerns. A celebrated example of this is documented in Carl Bernstein and Bob Woodward's book about the Watergate scandal, *All the President's Men,* and centers on the Nixon-supporting "Committee for the Re-election of the President," a group that sought to influence the 1972 election by using "false telegrams and ads to stir up phony support" for a controversial decision involving the Vietnam War.

Alternatively, many journalists choose to concentrate on whether PACs are keeping to the rules in the ways they generate and spend money, which demands current knowledge of the relevant legislation. Limitations on expenditure, for example, continue to be modified in updated versions of federal election campaign laws. The current (2008) laws allow the reasonable price of an airplane journey as a running cost, while explicitly forbidding clothing purchases or country club memberships. In the past, fines have been imposed on PACs for such lapses as improper expenditures on accommodation and entertainment when money should have been limited to administration and travel, or for accepting donations beyond the legal limit. When connected to prominent political figures, PACs falling foul of legislation often receive relatively in-depth coverage in newspapers, especially *The New York Times* and *The Washington Post.* Although it happens rarely, this coverage can have an immediate impact on the politician involved. For example, House majority leader Tom DeLay (R-TX) stepped down from office after the Federal Election Commission ruled that a PAC he was running had funded essential administrative activities with forbidden "soft" money. Through the DeLay scandal and afterward, politically engaged newspapers such as Washington-based *The Hill* explained alleged activities and provided a prominent forum for their discussion. Therefore, although the issues involved are complex, good quality and determined journalism can link the administration of PACs with standards of conduct in political office.

More recent development of another form of political committee, the "527 group" (after the tax law from which they emerged) has greatly changed political communication in many campaigns. Five hundred twenty-seven groups have an identical purpose to that of other PACs, except that they are obliged to refrain from explicitly advocating or opposing any candidate for any federal election. If they meet this condition, 527 groups evade the financial restrictions associated with PACs, and fall outside of the Federal Election Commission's regime of accountability. Just such a 527 group—the "Swift Boat Veterans for Truth"—played a part in undermining the military service record of 2004 Democratic presidential candidate John Kerry, and might well have helped determine the occupant of the White House. Yet, in other ways the Swift Boat campaign highlighted the capacity of journalists to probe the activities of political committees and add to public awareness, such that the key charges against John Kerry's war record were investigated and disputed by leading journalists, including those of ABC's *Nightline*. Perhaps as a consequence of this scrutiny, *Time* magazine subsequently found that only a minority of swing voters saw the Swift Boat campaign as credible.

The complexity of the laws governing PACs and 527s, often coupled with the lack of definitive links between PACs and the political figures they help elect, presents an uninviting prospect for a news desk concerned with simplicity and immediacy. Yet as expanding media platforms such as the Internet make distributing political messages easier and identifying their originators more difficult, the role of the knowledgeable, probing, and impartial journalist becomes a more vital component of the democratic system. Recent attempts have been made to introduce uncertainty to the FEC's scope for financial regulation, most notably the Bipartisan Campaign Reform Act of 2002. Journalists need to stay alert to the nature of these changes and help invoke the spirit of the original campaign laws. However, it is inevitable that in the public interest-driven battle to counter the resources of special interest groups such as PACs, journalists will find it ever more difficult to determine which elements of political public discourse are genuinely popular and which are orchestrated.

Political Reporters

American political reporters strive to keep politicians honest, to serve as proxies for the public, and to inform citizens so that they can make better political choices. Many political reporters think of themselves as an independent and vital "Fourth Estate," which operates as a check on political power.

The reasons journalists pursue politics as a specialty are as varied as their backgrounds. Some are attracted by the rich narratives of elections and struggles for power; others relish the role of

watchdogs or referees in the political game. Some are drawn by the policy debate to explain the promises and positions of politicians. Others seek to rub shoulders with the powerful or have an impulse to reform a system they see tilted to the privileged. And, at various historical points, political journalists have been partisans and ideologues.

Regardless of their motives, the group of journalists specializing in politics has played a critical role in American democracy, and their reach has extended to all forms of media. Since the 1960s, these journalists have grown in influence and attracted controversy.

Political reporters constitute one subset of the many journalists who cover public affairs, monitoring the city halls, schools boards, state houses, Congress, and the White House. Political columnists are another subset, although they sometimes overlap with the reporters. Since the 1930s, columnists have been viewed as the royalty of political journalism and the career goal of many reporters.

Among political journalists, print and broadcast media form another dividing line. Television introduced the "news anchor," a prominent figure encompassing the roles of editor, reporter, and commentator. At the national level, news anchors have played important roles in political journalism, presiding over national party conventions and election nights and moderating presidential debates. Several of these anchors first gained prominence as political reporters, including Walter Cronkite (1916–2009), John Chancellor (1927–1996), David Brinkley (1920–2003), Dan Rather (1931–), and Tom Brokaw (1940–).

So what separates the rubric of the political reporter from other political journalists? For the purpose here, three attributes define the political reporter: delivering news and analysis with the next election always in mind; offering information with the stated purpose to inform, not persuade; and striving for independence. To appreciate this category of journalists, one must understand their origin and evolution.

Origins

The entanglement of American journalism and politics dawned with the nation. By the first truly contested presidential election of 1800, partisan newspapers provided the political discourse between the burgeoning parties—Federalists (Hamiltonians) versus Republicans (Jeffersonians). The partisan press peaked in the Jacksonian era of the middle third of the nineteenth century when "Old Hickory" won office through the creation of a network of partisan newspapers. Several editors served in Jackson's "kitchen cabinet," and their newspapers drew financial sustenance from government printing contracts.

These journalists would be more familiar today as political operatives or propagandists. Their rise was also part of the democratization of the young country's politics, a path of upward mobility by artisans and immigrants who manned the presses. Not until the early twentieth century would the craft draw from the nation's educated upper crust, and even today political journalism remains a route for strivers from the hinterlands to climb the social ladder.

The importance of partisan journalists began to fade in the mid-nineteenth century with urbanization and media commercialization. Newspaper publishers and editors replaced their loyalty to party with allegiance to advertisers and the large circulations they demanded. Journalists were still connected to politics, but the seeds were sown for the pursuit of a goal that would mark the political reporter in the next century. Journalists sought to be independent political voices, not the mouthpieces of party organizations.

Three of the most famous "independent" journalists of the second half of the nineteenth century—Horace Greeley (1811–72), Joseph Pulitzer (1847–1911), and William Randolph Hearst (1863–1951)—were political power brokers who held elective office during their careers. Greeley and Hearst had ambitions for the White House. As late as 1920, both major party nominees, Democrat James M. Cox (1870–1957) and Republican Warren G. Harding (1865–1923), were Ohio newspapermen. Since that election, however, rising professional standards of independent journalism have argued against such direct political involvement, although a few remain tempted.

In the early twenty-first century, journalism is dotted with political professionals and journalists who move through the "revolving door." For example, ABC News' Chief Washington Correspondent George Stephanopoulos (1961–) is a

former aide to President Bill Clinton, while journalist R. Anthony "Tony" Snow (1955–2008) moved from Fox News to become the White House press secretary for George W. Bush.

Objectivity

Starting in the 1920s, the "objective" school of journalism arose with the growing professionalism of the craft. The goal was to separate opinion from fact-based news, and political journalists adopted distinct job descriptions. Columnists wrote commentary and reporters chronicled the words and actions of politicians. The reporters were bounded by the objective goals of balance and impartiality, which often translated into deference to authority. This weakness materialized in the 1950s as unquestioning news dispatches became the conduit of Senator Joseph R. McCarthy's "red baiting" charges. Campaign reporters rarely ventured beyond accounts of the candidates' speeches and travels, and they turned a blind eye to the personal lives of the politicians.

New Influence

This passive role of the political reporter was transformed by a number of factors, starting in the 1960s. Social upheaval over the Vietnam War gave reporters new license to question authority. The journalistic exposé of the Watergate scandal of 1972 to 1974 also supercharged the adversarial role of the reporter.

The era also witnessed changes in electoral politics that enhanced the influence of the new breed of political reporters, who were better educated and more politically sophisticated. Party organizations withered as direct primaries increasingly determined the choice of party nominees. Television advertising weakened the ability of party leaders to control communications to voters. Money flooded the process to pay for the advertising. The new politics created subspecialties in reporting beats to cover media advertising and to follow the money. News organizations increasingly used public opinion polls to track campaigns.

In the vacuum previously filled by party leaders, political reporters became gatekeepers. To a considerable extent, reporters decided whether candidates met "expectations"—frequently set by the reporters themselves—in the outcome of primaries or televised debates. Whether a candidate's off-the-cuff gaffe became a crippling mistake would rest largely with reporters. Indeed, in presidential politics, the "invisible primary" of polls, punditry, and money weeds candidate fields before the first votes are cast.

Journalistic form also changed. Theodore H. White (1915–86), the son of poor Jewish immigrants to Boston who worked his way through Harvard University, reshaped the campaign narrative with his *Making of the President 1960,* the first in a series of books by White and his imitators who created a new genre. No longer would coverage center on chronicling a campaign; instead, the campaign unfolded as a dramatic story, told from the inside. The genre would bring new attention to the political process, the historical forces shaping elections, and the character of the politicians.

The change in the role and prominence of political reporters was classically captured by *Rolling Stone* writer Timothy Crouse (1947–) in his 1973 book, *Boys on the Bus.* The son of a Broadway writer and fresh out of college, Crouse portrayed the press corps as a traveling band of mostly male reporters from the big newspapers, news magazines, and television networks who rated the winners and losers, reveling in the horse race. He introduced the term *pack journalism*—referring to the tendency of reporters to produce homogenous coverage—into the political lexicon. Most barriers to women in the political press had fallen by the mid-1980s, but the problem of pack journalism remains for reporters of both genders.

The 1980s witnessed growing scrutiny by reporters of the personal attributes of politicians. This emphasis culminated in 1988 when reporters single-handedly eliminated the Democratic presidential frontrunner, Colorado Senator Gary Hart, by exposing his sexual peccadilloes. In the same period, political scholars, who had long discounted the role of journalists in shaping elections, began to attribute significant influence to journalists as framers of elections. But scholars also criticized the political reporters for being too entranced by the campaign "horse race," serving too often as agents of polarization and cynicism.

The rising influence of political reporters in the last half of the twentieth century was fueled by the newly dominant political medium—television.

The broadcast networks introduced political reporters who would soon achieve fame surpassing that of the columnists. Network correspondents engaged in reporting that was interpretative ("instant analysis"), distinctly mediated ("sound bites"), and highly visual. The three networks lavished money on the coverage by employing expensive technologies and building sophisticated political units to showcase their "talent." In the mid-1970s, more mobile Minicams and videotape increasingly replaced film, accelerating the speed of coverage and making it easer to edit in the correspondent's "voice-over" to dominate the story.

As political changes reshaped journalism, so journalism transformed politics into an activity increasingly governed by media. Satellite technology accelerated the speed of politics even more with live coverage from virtually anywhere and the pursuit of picturesque backdrops for staged political events. Media strategies came to dominate campaigns.

New Media

The 1990s was an important transitional decade for political reporters, although the trends were sometimes contradictory. In response to criticism saying that they were too easily manipulated by candidates who were sophisticated about the new media politics, reporters introduced fact-checking techniques that often made them seem even more adversarial. Reporters created the "Adwatch," a journalistic vetting of the truthfulness of advertisements. They also built a subspecialty in the "the money and politics" beat. Armed with new computer technologies, reporters tracked campaign finances, highlighting the exploding influence of money on politics and bolstering reforms.

These aggressive techniques coincided with an effort to temper political reporters. Civic journalism sought to reduce journalistic detachment, deemphasize horse race campaign coverage, and refocus on issues of interest to citizens. Civic journalism had many applications but in political coverage, news organizations experimented with in-depth polling of citizens to create issue agendas for elections that candidates would be asked to address. The questions of ordinary voters would be asked directly by reporters to candidates or they were posed in "town hall" meetings involving panels of voters who were selected in the surveys. Civic journalism has faded as a distinct movement, but the movement's legacy is a more self-reflecting and interactive media.

At the same time in the 1990s, journalists found new competitors in the changing media environment. Conservative talk radio hosts emerged as powerful voices. Cable news networks began to siphon off viewers from the networks, particularly political audiences, first with creation of CNN and C-SPAN in the 1980s and later with MSNBC and Fox News in the mid-1990s.

The rise of Fox, which emphasizes commentary, was an important development. While declaring itself "fair and balanced," Fox attracted conservatives who viewed it as a welcome alternative to what they perceived as the liberal slant of the broadcast networks and public broadcasting. Polls showed Americans increasingly dividing their media preferences along party lines, though public esteem for all political media declined.

In the face of stiffer competition and dwindling audiences, the broadcast networks retreated from political coverage, cutting staffs and folding political units. The networks remain important, but the political media world shifted toward cable television, which is dominated by talk shows. Ironically, important players in the new "talk" world were traditional reporters from newspapers and magazines. These new "talking heads" often delivered more commentary than would have been permitted in their own media.

Entertainment programs joined in this mix, as politicians sought alternative venues that sidestepped the political reporters. The 1992 presidential campaign saw Clinton play his saxophone on the Fox network's *Arsenio Hall* show and defend his marriage on *Phil Donahue*. By the early twenty-first century, comedians such as Jon Stewart (1962–) of *The Daily Show* were quizzing politicians along with the reporters.

If the changing world of television reshaped political journalism, the rise of the Internet at the century's turn brought about a sea of change. Political reporters found uncharted territory in a new medium through which to report and present the news, but also a new virtual campaign to cover. They also encountered another competitor—and critic—the blogger.

The political Internet blossomed in the 2000 presidential election as candidates used the

Internet to organize supporters and raise money. Political reporters were assigned to cover the online campaigns, and the Internet became a new tool for reporting. Reporters accustomed to the leisurely deadlines of morning newspapers or evening news shows were tasked with filing breaking stories to websites, accelerating the flow of political news.

Print and broadcast journalists extended content to their name brand websites, but nontraditional Internet-based vehicles also emerged to deliver political news. The conservative *Drudge Report* rose as an important portal of political news, and Internet-only political magazines, such as *Salon.com* on the left, emerged. The Internet also undercut the finances of metropolitan newspapers and news magazines, the engines of political journalism for the previous century. A number of top political reporters fled to the new Internet organizations as the print organizations cut staffs, particularly in Washington. A prime example was *Politco.com,* launched in early 2007 by attracting reporters from the major newspapers and magazines. *Politico.com* offers a new model for traditional political journalism aimed at elite audiences.

During the 2004 presidential election, bloggers demonstrated the power of the Internet not only to comment on the reporting of the mainstream media outlets but in some cases to actually affect that political coverage. Named for their interactive weblogs, these new political voices are reminiscent of the old partisan press. They are highly polarized by political party and ideology and many actively recruit and support candidates. Bloggers have become self-appointed critics of the mainstream political journalists, challenging their accuracy and fairness. In 2004, bloggers played a key role in discrediting documents used by CBS News in questioning President George W. Bush's service in the Air National Guard during the Vietnam War. The ensuing flap led to Dan Rather's early retirement from CBS. Political reporters now cover the new online media world as a discrete sphere of political discourse; political reporters increasingly have been asked to participate in that world by writing their own blogs.

To conclude that political reporters have reverted to their partisan origin would be an overstatement, however. Most professional journalists who cover politics remain committed to the ideal of the independent and objective arbiter of politics that arose in the last half of the twentieth century. Yet political reporters in the new era are more embroiled in the political debate, and their influence is diminished as they struggle for mass audiences. For citizens, the new era has brought a wealth of sources of political information, if they seek them. Citizens also face a harder task of filtering what information can be trusted. As never before, citizens need to know the political reporters who bring them their news and their backgrounds.

Some Political Reporters Since 1960

R. W. "Johnny" Apple Jr. (1934–2006)

Apple set the standard of the influential political reporter in his more than four decades with *The New York Times*. The son of an Akron, Ohio, businessman and educated in the Ivy League, Apple was the model of the brash and aggressive reporter. He is credited with first recognizing the importance of the Iowa precinct caucuses that propeled Jimmy Carter to the White House in 1976. In the ensuing three decades, Apple, known for his front-page analysis stories and fascination with the unfolding campaign, set the example for a generation of *The New York Times* political reporters whose reporting continues to influence the coverage of the rest of the political media.

David S. Broder (1929–)

Broder, who covered his first presidential race in 1960, is often called the "dean" of the political press. Growing up in a Chicago suburb, Broder combined graduate study in political science with a boyhood love of newspapers to land at *The Washington Post* in 1966 after quitting *The New York Times*. Over the next 40 years, Broder helped build the *Post*'s political coverage to rival the *Times*. A reporter who also wrote a column, Broder hewed to a nonpartisan and centrist approach. He inspired reporters to critique the mechanics of politics and to use shoe-leather reporting, as well as polling, to explain voter behavior. He won a Pulitzer Prize in 1973 and has written seven books, including 1987's *Behind the Front Page: A Candid Look at How News Is Made.*

Elizabeth Brenner Drew (1935–)

Drew led a cohort of women who entered the ranks of political journalism in the 1960s. A Cincinnati native and Wellesley College graduate, Drew became a prolific magazine reporter, book writer, and television commentator. For almost 20 years starting in 1973, Drew wrote *The New Yorker*'s "Letter from Washington," dispatches from a capital she portrayed as increasingly dominated by the corruption of money. In a 1983 book, *Politics and Money: The Road to Corruption,* Drew presciently recognized the flow into politics of unregulated large donations of "soft money," a term she popularized.

Jack W. Germond (1928–)

Germond and his partner for a quarter century, Jules Witcover (1927–), wrote a column for the *Baltimore Sun,* which relied more on reporting than opinion, and they co-authored a series of books on presidential campaigns from 1980 to 1992. Growing up in a middle-class Boston family, Germond used the GI Bill to pay for a journalism education at the University of Missouri, followed by several decades in newspaper jobs. But television talk shows made Germond, who is bald and rotund, the most unlikely of media stars, starting with the *McLaughlin Group* in 1981 and later on CNN and public broadcasting. The irascible, irreverent, and liberal Germond crystallized the caricature of the political road warrior, which he described in his 1999 autobiography, *Fat Man in a Middle Seat.*

Jeff Greenfield (1943–)

Greenfield, who joined CBS News in 2007 as senior political correspondent, is an example of the political analysts who act as independent sages on politics. The son of a New York lawyer, Greenfield is a graduate of Yale Law School who began his career as a Democratic consultant. Starting in 1983, he was the lead analyst for ABC News before moving to CNN in 1998. Known for his grasp of history, Greenfield gave CNN gravitas during the turbulent 2000 and 2004 elections. Writing widely on politics and media, he authored or co-authored 11 books, including the 2001 *Oh, Waiter, One Order of Crow: Inside the Strangest Presidential Election Finish in American History.*

Mark Halperin (1965–)

Formerly ABC News's political director who joined *Time* magazine in 2007, Halperin is a pioneer of online political journalism. Harvard educated and the son of a Washington establishment figure, Halperin got his break covering Clinton's 1992 campaign as an off-air reporter. But it was Halperin's commitment to the Internet that set him apart. In 2002, he founded ABC.com's *The Note.* The sassy newsletter became the source of political tips, rumors, and news for the political establishment, demonstrating the power of insider news delivered online.

Alexander Britton "Brit" Hume (1943–)

Hume, Washington manager editor of Fox News and anchor of *Special Report with Brit Hume,* is arguably the most respected unabashedly conservative political reporter. A Washingtonian educated at the exclusive St. Albans High School, Hume gained notice as an antiestablishment journalist, working for muckraker Jack Anderson (1922–2005), which led Hume to a 23-year career as a political correspondent with ABC News. Increasingly a critic of liberal bias in the mainstream media, Hume joined the migration to cable news in 1996, bringing credibility to the upstart Fox News.

Gwen Ifill (1955–)

Moderator of PBS's *Washington Week* and correspondent for *The NewsHour with Jim Leher,* Ifill is a testament to the upward mobility of political journalism. The daughter of a poor black immigrant preacher in New York, Ifill built a career as a political reporter following the path of her white male predecessors. She came up through newspapers—from the city beat for the *Baltimore Sun* to the White House for *The New York Times*—and then to NBC News. In 1999, she pierced racial and gender ceilings to enliven and revitalize *Washington Week,* an institution of political journalism for almost 40 years.

Brooks Jackson (1941–)

As a reporter for the Associated Press and *The Wall Street Journal,* Jackson pioneered the "money and politics" beat in the 1980s. The product of

small-town Indiana, he arrived in Washington for the AP to help cover Watergate. In 1988, Jackson authored a respected book on campaign finance, *Honest Graft: Big Money in the American Political System*. He moved to television at CNN and in the 1992 election developed systematic truth testing of campaign messages in "Adwatch" segments. He took the approach to the Internet in 2004 to help found Factcheck.org, a nonpartisan website widely used by news organizations in monitoring campaign advertising.

James C. Lehrer (1934–)

Lehrer, executive editor and anchor of PBS's *NewsHour with Jim Lehrer,* is the quintessential journalist as referee, moderating ten presidential debates and helping establish public broadcasting in political journalism. Born in Wichita, Kansas, Lehrer got his start in Texas newspapers. Starting with the coverage of the Watergate hearings on public television, Lehrer teamed with Robert MacNeil (1931–) to make the *NewsHour* the premier public affairs television show. Lehrer's even-handed and unflappable style made him the choice of both sides of the partisan divide for his unprecedented role in presidential debates.

Walter R. Mears (1935–)

Mears, who covered national politics for the Associated Press from 1960 to 2001, is the model of the straight-reporting, fast-writing wire service political reporter. A no-nonsense New Englander, Mears worked his way up in the AP to set the pace of political news, famously writing news leads that others would follow. He won a Pulitzer Prize for his coverage of the 1976 presidential election. In a 2003 memoir, *Deadlines Past: Forty Years of Presidential Campaigning,* Mears expressed the task of the wire reporter as "keeping the copy terse and keeping yourself out of it."

Roger H. Mudd (1928–)

A CBS News star from 1961 to 1980, Mudd is often called the most respected of the network political correspondents in their heyday. A tall, erudite life-long Washingtonian, Mudd made his mark covering the civil rights debate in Congress, broadcasting from the Capitol steps. Later for NBC News and public broadcasting, Mudd crystallized the image of the sober and knowledgeable reporter, and he was an early critic of television's slide toward sensationalism. Yet, Mudd conducted one of the most famous interviews with a candidate when he questioned—and staggered—Senator Edward M. Kennedy in his 1980 presidential quest with probing questions about Kennedy's personal life. (The shaken candidate had trouble saying why he wanted to be President.)

"Cokie" Roberts (1943–)

An analyst for National Public Radio and ABC News, Roberts helped establish NPR as a player in political news in the 1980s and became one of the most prominent political journalists of the 1990s. A New Orleans native born Mary Martha Corinne Morrison Claiborne Boggs, Roberts grew up in a politically prominent Washington family, and she brought her insider knowledge to NPR in 1978 as a congressional correspondent. With Linda Wertheimer (1943–) and Nina Totenberg (1944–), she formed a trio of women reporters who elevated NPR's Washington reporting. While keeping her NPR job, Roberts became a panelist on ABC's *This Week with David Brinkley* in 1988 and co-anchor of the Sunday talk show from 1996 to 2002.

Timothy J. Russert Jr. (1950–2008)

Before his untimely death in 2008, Russert was moderator of NBC News's *Meet the Press* and was considered political journalism's chief inquisitor. A blue-collar kid from Buffalo, Russert, a lawyer, entered journalism from New York Democratic politics. In 1984, Russert landed a job as an assistant to the president of NBC News and worked his way up to Washington Bureau chief for the network, and then moderator of the 60-year-old Sunday talk show in 1991. Russert took the show to dominance with a new format centered on him interrogating the powerful and frequently confronting guests with their impolitic past comments. Some observers have likened *Meet the Press* to a presidential primary test for White House hopefuls.

Leslie R. Stahl (1941–)

A correspondent for CBS's *60 Minutes,* Stahl rode the first wave of women coming to prominence in

television news and emerged as one of the most tenacious reporters of the adversarial generation. Growing up in an upscale suburb of Boston, Stahl secured a job in CBS's Washington Bureau in 1972, in time to cover Watergate. For the next 20 years, Stahl covered the White Houses of three Presidents and from 1983 to 1991 moderated the Sunday talk show, *Face the Nation*. In a highly personal 1999 memoir, *Reporting Live,* Stahl relished being described as "tough," a characteristic she was able to disguise behind an approachable, well-coiffed exterior.

Judy Woodruff (1946–)

Woodruff, a correspondent for PBS's *NewsHour with Jim Lehrer* and one of the most recognized faces in political journalism, started her career as a "weather girl" for an Atlanta television station in 1969. The daughter of a soldier, the Georgia teenager was the first in her family to attend college, Duke University. In the mid-1970s, Woodruff, then in NBC's Atlanta Bureau, followed Georgia Governor Jimmy Carter to the White House for NBC, a job she kept into the Reagan years before leaving to work for a decade at PBS. In 1993, Woodruff moved to CNN, and for the next 13 years, she helped turn *Inside Politics* into one of the most watched cable news political shows.

Polls and Public Opinion

Put simply, public opinion is "what the public thinks," and a poll is a means for learning those views. But this definition masks substantial complexity. There is much debate about what the public is, what might constitute its thoughts, what polls actually measure, and what the import of expressed opinions may be.

What Is the "Public"?

Consider some images: a crowd at a baseball game, protesters marching with signs and banners, authors of letters to a newspaper, strikers on a picket line, parents at a school board meeting, supporters at an election rally, citizens of a country, members of a special-interest organization (like the ACLU), commentators on a blog, a thousand adults interviewed for a Gallup Poll. In political and social psychologist

Floyd Allport's (inelegant) language, these are "multi-individual situations" in which people may express themselves. But they differ in significant ways. The public is displayed variously as a disconnected assemblage—a "mass"—or a unified group with a common purpose (e.g., crowd, spectators vs. campaign supporters, protesters). It is a group whose existence depends on a particular event (e.g., spectators, meeting attendees, strikers), or individuals whose connection spans space and time, such as members of a "special-interest" organization. Some publics are formed by participants' deliberate action (e.g., attending a meeting) and others depend upon external agency (a polling firm gathering interviews). In short, the public is portrayed variously as more or less allied, more or less inclusive, more or less transitory, more or less volitional. The modes and quality of communication also vary widely. People express themselves in cacophonous or melodic tones, in concert with others or alone, spontaneously or prompted, openly or anonymously, with or without much knowledge and consideration.

These varied images underlie conflicting views about polls and public opinion. Those who advocate the use of polls envision an inclusive process that goes beyond specific situations or involved publics. The barriers to membership are few; one need not demonstrate any particular knowledge or interest, nor act in support of beliefs, nor join with others to affect policy. To be a member of the public, one need only agree to express confidential opinions on questions put by the polling organization. By contrast, those who are opposed to polling have a more exclusive, issue-specific view of the public. Membership costs are higher: belonging depends on the degree of one's engagement with a particular policy question, one's association with others whose level of engagement is also high, and one's willingness to be identified as "taking a side" and acting on belief. According to this view, polls produce top-down "manufactured publics," not genuine manifestations of public opinion. But for George Gallup and other polling pioneers, polls actually empower individual citizens who otherwise would find it difficult to be heard. Because pollsters seek a "cross-section" of society to interview, the advantages of class or education or special interest that ordinarily facilitate political participation are overcome by polls.

What, then, is the real, genuine public? An often-cited exchange at the American Sociological Association meetings in the late 1940s summarizes the argument. Two eminent social scientists on this panel—Herbert Blumer and Theodore Newcomb—represented the two schools of thought just described. Blumer first attacked the idea of polling because, he argued, public opinion is rooted in interest groups that are not captured in cross-section samples. For Blumer, and many theorists who continue to cite his argument, polls construct an artificial public by aggregating the views of randomly sampled individuals. Thus, Blumer argued, polls are blind to the empirical reality of the organization of the public in social ties among members.

Newcomb's reply is less often cited. His principle point was that polling is not incompatible with studying public opinion that is based in social organizations. Cross-section surveys can recruit respondents who are group members and examine their views in comparison to others. Polls can inquire into the social sources of individual opinions. Polls can examine how different "publics"—knowledgeable, ignorant, involved, disengaged, socially connected, isolated—differ in their opinion expression. Blumer was mistaken in conflating the way polls had been employed by some practitioners and the ways in which they could be utilized.

In sum, Newcomb argued that Blumer's "artificial public" analysis was a straw man. Polls can, at once, give a picture of what a cross-section of society thinks about an issue and also examine how group affiliations shape opinion. It is difficult to determine which man won the debate, however. The years since their exchange have seen both frequent return to Blumer in scholarly critiques of the polling enterprise, and marked growth in the number and types of polls. The public "constructed" through polls has become a mainstay of modern discourse and a continuing source of academic criticism. But we do not have to choose between Blumer's and Gallup's vision of the public. Rather, we need to recognize that there are multiple publics: the egalitarian public constructed by polls; the hierarchical, organic, interest group public; and others. Harwood Childs noted that "public opinion is not the name of a something, but a classification of a number of somethings." Debates over the "true" public are rooted not in some empirical criteria, but in normative views that give more or

less weight to ideals of egalitarianism, inclusiveness, degree of group association, engagement, behavioral manifestation, and so forth.

What Is the Public Thinking?

The "opinion" part of "public opinion" involves both descriptive and normative components as well. It refers to perceptions and beliefs about what is happening in the world (the "pictures in our heads" described by American journalist Walter Lippmann) and to judgments related to those cognitions. Opinions frequently are verbal expressions. In addition to responses to poll questions, opinions can be conveyed in many ways, including contacts with elected representatives or customer service agents and letters and comments to media outlets. The Internet has opened up many methods of opinion expression, including self-publication in websites and blogs, and opportunities to review and comment on everything from commercial transactions to Sunday sermons. Of course, elections are a form of opinion expression. Opinions might even be inferred, with less precision, from the collective action of crowds.

In the polling world, opinions were originally thought to be verbal expressions of firm, underlying attitudes and values. More recently, they have been theorized as spontaneously constructed responses to opinion questions, sampled from "top of mind" cognitions and feelings. This divergence follows decades of research on the knowledge basis for public opinion, the extent to which opinions reflect political ideology, and the connection between opinion and behavior. Philip Converse's research has shaped discourse on "what the public is thinking" for the past 50 years. In *The American Voter* and seminal papers on public knowledge, Converse noted that the average level of American citizens' political knowledge is low and the variance is high. A few members of the public possess a great deal of information while the great majority have very little. The amount of knowledge a person possesses has implications for how opinions relate to one another and how they change. Converse found that knowledgeable people are more likely to hold opinions that are organized in an ideological framework. Most citizens do not look at political issues through an ideological lens. Individual opinions also do not change in ways that one would expect. Looking at panel data from three waves of the National Election Study (the basis for *The American Voter*), Converse demonstrated that stasis or slow change in *aggregate* opinion about public policy from 1956 to 1960 masked remarkable *individual* level shifts. Individual shifts virtually cancelled one another, leading to the impression that there was not much change on the whole.

Converse's findings implied that it was wrongheaded to look for sophisticated understanding in most individuals' opinions. This view is supported by methodological research in polls that shows that measured opinion is susceptible to minor changes in question wording and structure, as well as research that finds that a notable number of poll respondents will give opinions about imaginary or virtually unknown policies and proposals. Scholars who differ with Converse question the criteria he used to judge respondent rationality or focus not on characteristics of individual opinion but on how opinion looks in the aggregate. In the first category, some have argued that people do not need a store of political knowledge or an ideological stance to participate effectively in politics. If they follow heuristics provided by organizations (political parties and interest groups), they can form ideas about which policies to support or oppose. In the second group, scholars have found meaningful patterns of opinion change and effect on policy when examining aggregate opinion over time. Such findings are discussed in more detail below.

There has also been an effort to enhance the quality of opinion in the mass public. Led by nongovernment organizations such as Public Agenda and by news organizations, groups of citizens have been recruited to participate in extensive briefings and discussion on important issues so that they have the information to express knowledgeable views. National and local "issue conventions" have been held in both the United States and Great Britain. In the most elaborate form of these gatherings, put forward as alternatives to public opinion polls, organizers bring together in one location a large group of citizens for lectures on public issues and deliberation about them. Participants' opinions are measured prior to and after the convention, with the intent of showing how "informed" opinion differs from the usual findings produced by polls. Factual information and deliberation are

meant to convert raw, malleable opinions into more sound judgments. The participants are selected through probability telephone sampling (thus seeking the ability to generalize the convention results to the larger population) and provided funds to attend the convention. News organizations have sponsored issue conventions as a way to enhance coverage and to involve audiences. For a time in the 1990s, such events were often the centerpiece of "civic" or "public" journalism programs adopted by a number of news organizations around the United States. (Civic journalism programs were efforts by news organizations to identify issues of importance to readers, to report extensively on those matters, and to feed back the information to the audience.) But these efforts have not supplanted public opinion polls. They did not achieve consistently noteworthy change in the quality of opinions expressed by participants. The cost of issues conventions, their limited issue scope, and the lack of compelling evidence for positive effects have combined to reduce their prevalence.

What Do Polls Measure?

Polls measure opinions concerning matters that poll sponsors judge to be interesting and important. They do not measure opinions on other issues that may be significant but do not capture the attention of sponsors. Since many polls are funded by news organizations, the topics covered in questionnaires frequently deal with issues that are currently "in the news." Polling organizations often follow these topics over time to track the rise and fall of attention to news topics. There has been a symbiosis of polls and news organizations since before the advent of "scientific" polling. Newspapers conducted "straw polls" of readers prior to elections in the nineteenth century. The *Literary Digest* sent pre-election questionnaires to subscribers and nonsubscribers early in the twentieth century. George Gallup and other early pollsters syndicated their information to newspaper clients, beginning in the 1930s. A few major news organizations founded in-house polling units later in the century, while others contracted with polling firms for exclusive access to data.

Several factors appear to underlie the easy match between public opinion research and news organizations. Obviously, public opinion is a form of news. Reporting on public views of current events is one of the functions of news media in a democracy. News executives, in addition, have long recognized the appeal of opinion news to consumers. Finally, the act of polling itself is seen as a way to engage readers or viewers in the content offered by the news organization. One can see "polls of the day" or even polls on the subject of particular television programs. One of the most popular American entertainment television programs (*American Idol*) involves audience voting. The advent of communication media including email and text messaging permits synchronous "polling" of the audience.

In the category of opinion news, pre-election polls are one of the most prominent and controversial examples. George Gallup made his reputation and created the current genre of pre-election polls with his work in the 1936 election. Betting his newspaper clients that his results would more closely match the election results than those of the *Literary Digest,* whose publication of poll predictions had been the previous "gold standard," Gallup predicted the landslide Roosevelt victory while the *Digest* picked the loser Alf Landon. Gallup's win led to the adoption of "scientific sampling" methods for subsequent elections. The science involved was probability (or "near probability") sampling. The *Digest* had failed because it did not have a method of sampling prospective voters, allocating to each a chance of selection. Instead, it relied on attracting huge numbers of responses to its mail poll. Gallup and other pollsters (Archibald Crossley, Elmo Roper) demonstrated that a much smaller sample, appropriately selected, would represent the population of prospective voters better.

After this early success, it has become common for new pollsters to prove their mettle in pre-election polls. A track record of calling elections correctly has established the bona fides of polling firms, which, in turn, has led to further political and commercial business. And subsequent pre-election polling failures (e.g., in 1948 and 1980) have led to doubts about the entire survey enterprise. The importance of the high profile pre-election poll to the field justifies a closer look at its workings.

Several major issues confront those who would carry out a pre-election poll. Begin with the selection of the sample: pollsters want to find out the

preferences of people who are going to vote in the upcoming election. This means reaching beyond the usual eligibility criterion for surveys—adulthood—to engage people whose political history and election interest suggest that they are likely to vote. Estimating voting likelihood is fraught with difficulty, particularly in elections which may attract a new, young cohort of voters. In the 2008 New Hampshire Democratic Presidential Primary, the Gallup pre-election poll, like others, miscalled the race in favor of Barack Obama (Hillary Clinton actually won). In post-election analysis, Gallup reported that its likely voter model was a prime reason for the miscue: the raw vote intention data Gallup collected were closer to the election result than were the data weighted by likelihood of turnout.

In addition to likely voter estimation, the pre-election poll must deal with the possibility of shifting preferences as the campaign up to the election plays out. Pre-primary election polls have a riskier environment because, with all candidates seeking to represent the same political party, the effect of the prospective voter's party allegiance on preferences is nullified. The pollster cannot use party identification to predict vote choice. In all campaigns there is the possibility of a shift in voter preferences just as the campaign comes to an end. The timing of the final poll before the election can, therefore, make a big difference in how well the poll estimates the outcome. Pollsters commonly do not predict election outcomes until they have done the last poll of the contest, and, even then, not if the race is tight. The pressure on the final poll results is exacerbated by the speed with which they must be assembled. While other sorts of surveys have the luxury of call-backs to prospective respondents who are not contacted on the first or second try, final pre-election polls, seeking the very latest breakdown of vote intentions, must forego repeated attempts to reach the difficult-to-reach respondents. This means that the final vote intention estimates may be biased if the hard-to-contact prospective voters are numerous and if they differ in their preferences from those who could be recruited for interviews. The threat of nonresponse bias, an increasingly important concern for all surveys, is that much greater in an environment in which attempts to reach nonrespondents are severely limited. The pollster relies upon post-survey adjustments (weights) to correct for demographic imbalances in the achieved sample. This solution may or may not suffice to compensate for the missing respondents.

Pollsters working on pre-election surveys also have the common problem of measuring respondent preferences. But much more is riding on the accuracy of preference measurement in the pre-election poll than in the commercial survey whose results never become public. It is necessary to try to nail down prospective voters' preferences, even when those inclinations may be malleable. Pollsters need to establish rules for dealing with those prospective voters who "lean" toward a particular candidate but have no more of a preference. They must also deal with those who report that they are undecided for whom they will vote. Some pollsters favor dropping these respondents from the analysis while others insist that "undecideds" in races involving an incumbent candidate should be allocated to the challenger (on the view that undecided voters in those races are holdouts against the incumbent, about whom they must know a good deal).

Considering the significant problems confronting pre-election pollsters, their track record is quite good. Periodic reviews of poll performance suggest that there are far more close fits between poll estimates and vote outcomes than spectacular failures. (The failures—viz. the *Chicago Daily Tribune*'s 1948 headline: "Dewey Defeats Truman"—live longer in memory). Because of problems plaguing the entire survey industry, most notably growing nonresponse, it is not clear if the established track record will be maintained in elections to come. Whether so or not, pre-election polls have established another sort of prominence in journalistic treatments of elections and in commentary on contemporary politics. In 2004, in line with increasingly bitter partisanship in American politics, media polls came under attack from both the Left and Right for pre-election estimates unfavorable to the candidate of choice. The complaint that news coverage of elections is dominated by the "horse race" has been with us for several decades. In the latter 1970s and 1980s this complaint appeared to resonate with editors at elite news organizations and poll coverage highlighted issues rather than candidate standings. By 2008, however, there had been a marked proliferation of polling organizations offering pre-election poll numbers and "news

aggregator" websites, such as Pollster.com and FiveThirtyEight.com, which collected, synthesized, and modeled poll findings to track the "horse race" with more putative accuracy than ever before.

Apart from pre-election polls, news organizations sponsor or conduct numerous polls that serve as the focus of coverage or accompany broader stories. These polls are often pegged to milestones (e.g., anniversaries of events such as the beginning of the Iraq war or the State of the Union Address). The polls provide data that not only add systematic evidence on the state of American society but also, archived at such venues as the Roper Center for Public Opinion Research, give scholars the opportunity to track the public's viewpoints over time. Such polls serve as a more authoritative counterweight to the many "man on the street" interviews that populate much of journalistic coverage of current events.

This is not to say that polls measure all significant trends in public views. As noted earlier, they address issues that sponsors feel are worth examining. Other forms of public opinion expression are useful to see what polls are not measuring. Taeku Lee has noted that letters addressed to elected officials may contain evidence of public concern about issues that are not judged as important by poll patrons. He argues for the analysis of constituency mail to understand the opinions of an "active" public during the Civil Rights era. He notes that the reliance of public opinion scholars on survey evidence may lead to erroneous conclusions about the roles of political elites and non-elites in public policy formation. This is so because routine survey practice may not capture the views of interested citizens whose attempts to influence government actions in a particular sphere do not coincide with survey efforts to measure public opinion in that topic area. During the Civil Rights Movement, in particular, survey measurement of opinion lagged behind the efforts of letter-writing African Americans to influence government policy. As a consequence of this disjuncture in timing, Lee argues that analyses of the Civil Rights Movement that rely on survey data overemphasize the role of elites such as Martin Luther King Jr. in the effort, neglecting the importance of hundreds of letters to the White House from ordinary citizens. More investigations of what the polls do not capture would be a valuable addition to research on public opinion.

What Is the Impact of Public Opinion?

It is fairly easy to make the case that public opinion measured in polls has little, some, or a great deal of influence on public policy. The case for minimal impact rests on the fact that public opinion measured in polls appears uninformed and contradictory and that politicians routinely eschew the idea that they pay attention to polls. In addition, the routine success of some organized interests in policymaking over the expressed views of the public in polls (viz., gun control in the United States) casts doubt on the effect of polls on policy. A picture of more potent influence of polls can be drawn if we consider cases where data appeared to stand in the way of elite action. Bill Clinton's unwavering popularity in the polls almost certainly played a role during the Senate trial after his impeachment. The strongest case for the impact of polls is to be found in studies of White House polling operations, and in long term, aggregate measurements of public mood and policy making. The Nixon, Carter, Reagan, and Clinton White Houses had elaborate polling operations (Nixon, who actually wrote poll questions, kept his multiple polling operations secret, even from each other). The two Bush administrations also made use of polls, but endeavored to appear immune to public opinion influence. Political scientists who take the long view and examine aggregates of polls and policy actions have noted that the broad contours of public opinion do appear to lead general trends in policy.

What Is the Future of Polls?

Marked changes in lifestyles, cultural norms, and technology are having a major impact on polling. The heyday of polling was probably in the 1970s through 1990s when the telephone made it possible to do quick and relatively cheap polls. Compared to earlier times when time-consuming face-to-face data collection was required (because probability sampling of telephone numbers had not yet been developed), the telephone era featured far more polls and more news organizations were able to sponsor them. The telephone era may now be coming to an end, due to decreasing willingness of people to respond to poll invitations, to increased use of call blocking technology, and to the rapid growth of cell phone usage, which is supplanting

land line connections in increasing numbers of households. Pollsters are scrambling to deal with these developments. Meanwhile, the Internet has opened a new possibility for contacting poll respondents, but major obstacles stand in the way of its becoming the next dominant technology. There is no sampling frame of e-mail addresses that corresponds to the universal list of telephone numbers that can be sampled through random digit dialing. Therefore, there is no way to construct a probability sample of Internet users. Further, while Internet penetration is now quite high, it still falls short of telephone penetration, excluding many people from possible participation in web polls. Volunteer web panels are now a big business. They obviously include only those people who want to participate in surveys (in exchange for money or other gratuities). Thus, the panels are not representative of the larger population. Weighting schemes that seek to bring volunteer-based results in line with the general population lack validation. These developments may lead pollsters back to archaic methods such as the face-to-face interview or the mail questionnaire. Whatever the outcome, the future of polling rests on the ingenuity of methodologists and the financial investment of news organizations and other sponsors

Poverty, Coverage of

As poverty became a clearly recognized problem during the twentieth century, journalists sought to describe and cover the problem, shedding light on its causes as well as those groups working to alleviate its impact. Coverage of poverty involves politics and economics but also sociology and crime, among other topics.

Definition

One of the biggest challenges to the coverage of poverty issues is the lack of consensus about defining what poverty is at any given time or place. Typically, poverty is related to economics and low income levels. Many countries have a government-set "poverty line," a baseline amount of total family income, and any family or household making less than this income is considered to be living "below the poverty line."

However, there is agreement that poverty is also defined by cultural perceptions and, as Nobel Prize–winning economist Amartya Sen suggests, includes deprivation of political, economic, and social rights resulting in and exaggerated by public shame. Added to this conundrum is that the poor are often socially ostracized. The United Nations Development Program's (UNDP) Human Development Index adds life expectancy and education level to its dimensions of poverty.

Regardless of exact definition, the poverty line is a standard that shifts over time and place. The ways in which it shifts and the criteria for shifts are continuously at issue. More specifically, there is considerable argument about whether or not the criteria and shifts should automatically respond to the shifts in community living standards. In the United States, the federal poverty line as of late 2007 had not shifted (except for inflation) in four decades and has been considerably criticized.

Criticism of Coverage

There are many criticisms of media coverage of poverty, both in the United States and elsewhere. Rarely is poverty covered without strong subthemes of race or gender. Although the majority of people living in poverty in America are white (45 percent in 2007), most Americans believe that the poor are dominated by blacks (although they only accounted for 24 percent in 2007) or Hispanics (in reality representing only 24 percent in 2007), in part as news coverage of the poor often highlights these groups. A 2007 FAIR (Fairness & Accuracy In Reporting) study of poverty reporting found that during a three month study of three major U.S. networks (CBS, NBC, and ABC), the racial representation of the 76 poor sources quoted (out of a total of 191 quoted sources) in the 58 aired stories were non-Latino whites, 39 percent; African Americans, 38 percent; Latinos, 12 percent. While these percentages alone may not lead to misguided perceptions of the poor in the United States, the percentage of non-poor sources may have helped to exaggerate the stereotypes (whites, 79 percent; African Americans, 18 percent; Latinos, zero).

The most frequent stories about poverty in many countries are focused on that suffered elsewhere with little coverage of their own, unless prompted by an event, political campaign, or crime statistics. A recurring criticism of mainstream news media coverage of poverty is that their reports create distance between those living in poverty and those not, by portraying those who are poor as intrinsically different. An example of this type of coverage includes stories highlighting drug use, alcoholism, or criminal activity of the poor. It is argued that this portrayed difference from the middle class perpetuates a feeling of either indifference about poverty or acceptance that poverty is undefeatable, that, as stated in Matthew 26:11 of the Bible ("For you always have the poor with you") and as FAIR titled its 2007 poverty report, it "will always be with us."

The lack of poverty coverage in broadcast news is often attributed to advertisers' distaste for depressing news stories surrounding product advertisements. Journalists often refer to the producers' distaste for stories without happy endings as one element discouraging more poverty stories.

Elections

Stories about poverty or the poor tend to increase during political campaigns. However, the stories often focus on politicians' motives behind poverty policy proposals. Very few discuss the broader issues surrounding poverty and its causes such as income gaps, education, health care, social services, stereotypes, social stigmas, or welfare. There is also much debate over the "deserving poor" (those who are working) and "undeserving poor" (those seen as unwilling to work) which seldom makes it into news coverage. Furthermore, few news pieces, whether print or broadcast, use real individuals living in poverty as sources—and thus the public is often unaware of the human side of poverty.

Democratic presidential candidate John Edwards is credited with highlighting the issue of poverty in

the 2008 presidential election. Although he lost his attempt to gain the Democratic nomination, his devotion to poverty elimination pressured his competitors Hillary Clinton and Barack Obama to focus their proposed policies on poverty. Edwards conducted a "poverty tour," on which he took major U.S. daily newspaper editors or reporters to eight states along a three-day, 1,800-mile route, and visited factories, farms, health care clinics, and schools to talk to the country's poorest inhabitants. As a result, each of those newspapers and the three weekly news magazines all published articles on poverty in America.

Natural Disasters

As with political campaigns, coverage of poverty is typically heightened after a major event, such as a natural disaster, or a social trend such as crime. Even so, while these events draw attention to the issues of poverty, they usually focus more on the actual events. After concern about the events passes, rarely does discussion of poverty remain in the news media. For example, during and immediately following Hurricane Katrina, which wiped out parts of New Orleans in 2005, poverty was frequently in the news as it related to the thousands seen as being left behind in the storm's floodwaters, but as concern began to recede, poverty coverage dropped off again. This drop in poverty coverage took place despite the media's renewed vow (first made after the 1992 Los Angeles riots) to increase their poverty coverage. Syracuse University reported in 2006 that its public opinion survey (of the same year) concluded that after national news media increased poverty coverage following Hurricane Katrina, 52 percent of Americans polled felt that national income inequality was "a serious problem." Despite this, poverty again fell off the national news agenda not long after.

Poverty and Crime

Poverty coverage also enters the news media after an act of crime. A series of riots in Los Angeles in 1992 received national attention and led journalists to vow to increase their coverage of poverty. Despite the promise, such coverage declined shortly after the riots. Often reports of crime revive poverty coverage in the news, though usually only because the crime involves those living in poverty. Once the crime news is reported, the underlying issue of poverty is often left untouched. For example, during a spike of violent attacks (over 140) on homeless people in 2007 across the United States, news media frequently focused their reports on the criminal actions, rather than the more complex issues of the underlying poverty that led to the crimes. Journalists argue this is because events and actions are much easier and less controversial to report than broader social or economic trends. Indeed, often the most thorough coverage of poverty appears in book-length analyses rather than in the periodical press.

Poverty Elsewhere

Most American coverage of poverty relates to those living in Third World countries. These reports typically are linked to stories of disease or famine—or immigration. Often the reports are heavily larded with government statistics more than stories from those living in such conditions. Such reports are often cited as increasing the emotional distance between those viewing or reading the report (and not living in poverty) and those actually existing in poverty. Evidence for such criticism is the frequency with which images and reports of Third World poverty are recalled in the minds of the U.S. public before images and reports of poverty closer to home.

The most common reports of Third World poverty are produced by nonprofit organizations, some religiously based, in an effort to raise awareness and increase sponsorship (through donations) of a child or family living in poverty in a foreign country, typically Africa. During these reports, while statistics are heavily used, there is usually a significant effort to show the human side of poverty and develop an emotional connection. However, there is still a clear element of distance (geographical and cultural) involved.

Print Media Coverage

Articles about poverty increase during presidential election periods. Compared to 2004, the number of articles about poverty during the 2008 campaign more than doubled. More specifically, there were just over a thousand poverty news stories in

American newspapers and news wires in 2004, and some 2,600 in 2008. During non-election times, print media have increasingly included discussion of poverty in political pieces. However, criticisms of such pieces argue that the stories rarely quote the poor or tell their stories and that reporters in general are more concerned with the politicians' motives or policy issues, do not offer causes or solutions to poverty, and continue to perpetuate a feeling of distance between the nonpoor and the "other."

Book-length journalistic pieces are often written on poverty and occasionally top best-seller lists. The popularity of books dealing with American poverty reinforces public opinion data finding that the public does indeed consider poverty a significant issue. For example, Barbara Ehrenreich's *Nickel and Dimed: On (Not) Getting by in America* (2001) remained on *The New York Times* best seller list for two years.

Electronic Media Coverage

Broadcast news reports rarely include stories about the poor. As with print, the numbers of reports increase during election periods, after natural disasters or crimes, and also during the Christmas and Thanksgiving holidays. However, these reports rarely include discussion with poor individuals, focusing instead on experts or charity workers. The stories rarely address policy issues surrounding poverty or possible solutions; of those, it is even rarer that the opinions are offered by the poor. The majority of poverty stories, if the poor are included, portray general suffering. An exception to this was two NBC stories (2005, 2006) during which residents of the Lower 9th Ward in New Orleans shared their thoughts on the Hurricane Katrina recovery process.

Some attribute the lack of actual poor sources quoted in poverty coverage to the fact that the public/media relations firms do not represent the poor. The oversaturation of nonpoor expert sources is fostered by the experts' corporate communications agents and resources.

Poverty stories are continually criticized for including overtones which perpetuate the "deserving"/"nondeserving" poor dichotomy through the use of language such as "working poor" (with the criticism that these words imply that the nonworking poor are undeserving of sympathy or assistance). Frequently stories about the poor highlight the elderly and veterans.

From September 2003 to October 2006, the three major U.S. news networks aired fewer than 60 stories about the poor or poverty (despite a 2005 U.S. Census reporting that 37 million Americans were living below the federal poverty line). Most of the stories rarely showed the poor, but rather relied more heavily on sources other than those living in poverty. Of the poor shown in the reports, African Americans were overrepresented compared to their proportion of American poor (38 percent shown/24 percent actual). Women were slightly underrepresented as poverty sources compared to the percentage of poor (46 percent shown/57 percent actual).

Often the more in-depth coverage of poverty airs on special programming. For example, PBS aired Roger Weisberg's documentary "Waging a Living" in 2006 as a part of its *POV* series, and ABC's *20/20* aired a special report "Waiting on the World to Change" in 2007.

Discussion of poverty is most often found online, primarily on nonprofit organizations' websites rather than those of major news outlets.

The Future

Many organizations recognize the absence of what they consider adequate and accurate coverage of poverty by journalists and have developed workshops to increase such coverage. An example is the partnership between the Inter Press Service (IPS), an international news agency, and the United Nations Development Program (UNDP). The goal of these workshops is to affect governmental policy through media generated awareness and pressure.

The Harry Chapin Media Awards (formerly World Hunger Media Awards) are presented to journalists who cover poverty, inequality, and development in newspapers, periodicals, radio, television, film, book, and photojournalism. Nikon is the exclusive sponsor of the awards ceremony and event.

These initiatives are meant to improve the quality of poverty coverage and race and gender representation of sources. Despite these programs, media watchdog reports, and other news media research organizations calling attention to the

weaknesses in poverty coverage, doubts remain that any dramatic improvements in coverage will be realized in the near future.

Precision Journalism

Precision journalism is the application of social and behavioral science research methods to the practice of journalism. The term was coined by Everette E. Dennis for a "Seminar in the New Journalism" that he taught in the winter of 1971 at the University of Oregon. The concept was explicated by one of his students, Neil Felgenhauer, in a term paper that became a chapter in a book based on the seminar's work.

Most of the "new journalism" that inspired the seminar was the creation of talented writers such as Tom Wolfe, Gay Talese, and Norman Mailer, who used fiction techniques to construct powerful narratives about real people and events. The class discussion contrasted their work with precision journalism. "In essence, all the other new journalists push reporting toward art. Precision journalists push it toward science," said Dennis and William L. Rivers in a 1974 report.

Within the field of investigative reporting, there is also a contrast of method. Some follow paper trails, and a subset uses scientific method in the analysis. Others base their investigations on anonymous sources whose motivation, as well as identity, is veiled or not revealed at all. The work of the former can be verified because its methods are transparent and replicable. Like a scientist, a precision journalist describes the data collection and the methodology in sufficient detail that another investigator could retrace the steps and arrive at the same conclusions. Precision journalists can also build confidence by posting their data in university archives for secondary analysis.

The genesis of precision journalism can be traced to the first public opinion polls that used scientific sampling instead of casual person-on-the-street interviewing. Dr. George Gallup based a newspaper column on national polls and scored a coup by using more rigorous methods and getting a better result than the more famous *Literary Digest* poll, which failed to predict the outcome of the presidential election of 1936. However, Gallup and other national pollsters did not adopt probability sampling, a basic tool of modern social science, until after their own error in calling the 1948 election for Thomas E. Dewey instead of Harry S. Truman.

Other pioneers in the use of precision journalism were the broadcast networks striving to be first to announce the winner in presidential elections. In 1960, CBS used a computer-driven statistical model based on the timing of the results. It captured the Republican and Democratic standings at given points in time and compared them to their standings at the same times in the 1956 election. The initial extrapolation proved flawed, however, because Kansas had adopted a faster method of vote counting. The resulting Republican bias produced an early and erroneous call for Richard Nixon. Later network projections were based on geographic sampling and proved more reliable.

The civil rights and antiwar movements of the 1960s created further demand for new reporting

techniques. Standard journalism was drawn to the loudest and most visible spokespersons for their respective movements and tended to overgeneralize from them. *Newsweek* magazine recognized this problem when it commissioned Louis Harris to do special polls among black Americans to detect a broader spectrum of attitudes.

When Detroit blacks rioted in the summer of 1967, Knight Newspapers detached Philip Meyer from its Washington Bureau to help the *Detroit Free Press* cover the story. Meyer stayed to design and direct a survey of the stricken neighborhoods that could assess black grievances and the root causes of the riot, using techniques he had learned as a Nieman Fellow at Harvard University in the previous academic year. The stories that resulted were one of several factors in the awarding of the 1968 Pulitzer Prize for general local reporting to the staff of the *Free Press*.

Knight management assigned Meyer to return to Detroit for a one-year follow-up of the condition of the riot area residents and to do a separate survey in a major black community that had not rioted. The chosen target was Miami, which had been the site of Florida's first public school desegregation nine years before. While that survey was being analyzed, Martin Luther King Jr. was assassinated, and, Meyer returned to his same Miami respondents for a before-and-after assessment of the effect of King's death on the civil rights movement. The conventional wisdom, that King's philosophy of nonviolent protest would die with him, was contradicted. The size of the pro-violence minority was unchanged, and support for King's position actually grew after his death. Meyer wrote two versions of that story: one was published in *The Miami Herald* and the other in an academic journal, *Public Opinion Quarterly*.

In 1969, the Russell Sage Foundation engaged Meyer to take a leave of absence from Knight Newspapers and direct a project to prepare a handbook for journalists with the working title, "The Applications of Social and Behavioral Science Methodology to the Practice of Journalism." The project was completed in 1970, and the decision to use Dennis's term *precision journalism* for the title was made jointly by Meyer and John Gallman, director of Indiana University Press, who accepted the work for publication in 1973.

Because precision journalism usually involves large-scale data collection and analysis requiring the use of computers, it is sometimes confused with computer-assisted reporting, including Internet searching. But computers are neither necessary nor sufficient to define precision journalism. Much journalistic work with computers involves simple searching and sorting operations that do not involve scientific generalization. It also overlaps with public opinion polling, which is sometimes scientific and sometimes not.

The range of precision journalism is as broad as its underlying methodology. It has included content analysis of public records, survey research—especially of newsworthy subsets of the population, such as the 1967 Detroit rioters—field experiments, and making statistical inference from observation of events that form natural experiments. Although precision journalism was considered routine for major new organizations by the twenly-first century, its introduction was met with mixed reviews.

For example, the two-year delay in publication of Meyer's *Precision Journalism* was caused by skepticism among a number of publishers, including its original sponsor, the Russell Sage Foundation, that there would be a market for it. The concept of a journalist practicing the scientific method was too alien. Even the use of computers was suspect. The low-cost personal computer was still years away, and the necessary statistical work had to be done at mainframe computer centers where time was expensive and the machines were hard to program. (Meyer used the Harvard Data-Text system, a higher-level language for the IBM 7090 that anticipated SPSS, today's popular statistical package for both mainframe and personal computers.)

When, in 1972, Meyer guided Donald Barlett and James Steele through their analysis of court records in Philadelphia to produce evidence of racial bias in the criminal justice system, the resulting series was nominated for a Pulitzer Prize. Barlett was later told that the use of a computer was the reason for its rejection. It seemed to the judges that reporters who used a machine to do statistical analysis were taking an unfair advantage over their peers.

The National Science Foundation helped improve the acceptance of precision journalism by sponsoring two three-week training programs conducted for mid-career journalists at Northwestern University in 1974 and 1975. Reporters from *The*

New York Times and *The Washington Post* participated and followed up with related projects at their papers that helped introduce precision journalism to the mainstream. Later, the National Institute for Computer Assisted Reporting (NICAR) began including precision journalism concepts in its training.

It would take another decade, however, for the first precision journalism project to win a Pulitzer Prize. It happened in 1989 when Bill Dedman of the *Atlanta Journal and Constitution* won the prize for investigative reporting with his series, "The Color of Money," about racial bias in lending practices. The data came from federal records, and the data analysis was coordinated by Dwight Morris, assistant managing editor for special projects. Since then, precision journalism projects have become commonplace among Pulitzer winners, including the 2007 public service prize to *The Wall Street Journal* "for its creative and comprehensive probe into backdated stock options for business executives that triggered investigations, the ouster of top officials and widespread change in corporate America."

Presidential Families, Coverage of

Throughout American history the news media have capitalized on presidential families. Family members have made news as political players in the own right, presidential advisors, and media celebrities. News media coverage has enhanced the ability of presidential family members to develop their own political careers as well as to make them symbols of the human side of the presidency.

A long-standing theme in American politics has been the family relationships between Presidents themselves as illustrated by father–son relationships. The second President, John Adams, elected in 1796, was the father of the sixth President, John Quincy Adams, who took office in 1825. President William Henry Harrison, elected in 1840, was the grandfather of President Benjamin Harrison, elected in 1888. Media coverage has helped some presidential family members parlay their White House relationships into successful political careers. The most obvious case is that of Hillary Rodham Clinton, wife of President Bill Clinton, who was elected in 1992. She successfully ran for the U.S. Senate in 2000 while still First Lady and in 2007 became a leading Democratic candidate for the presidency herself. Before her election to the Senate, she was widely criticized as a presidential advisor when her husband put her in charge of a health care plan that failed to be adopted. The first President of the twenty-first century, George W. Bush, is the son of George Herbert Walker Bush, elected in 1988 as the second-to-last President of the twentieth century and himself the son of a U.S. senator, Prescott Bush.

Early Depictions

It was not until the mid-nineteenth-century birth of photography that likenesses of the President's wife and children, along with feature stories about their activities, became part of the accepted fare of the news media. Prior to that time presidential families received relatively little attention, although they were not exempt from accusations of misconduct by partisan newspapers. In general when wives of the first Presidents received press attention, opposition editors used them as surrogates for attacks on their husbands.

Martha Washington was berated for riding in an elegant coach more suited for a queen than for the wife of George Washington, the first President of a republic. Abigail Adams was pictured unflatteringly as the power behind her husband John. Even Dolley Madison, although almost universally praised for her skills as a hostess, did not escape newspaper criticism. She was falsely accused of having been the mistress of President Thomas Jefferson, to further the career of her husband James Madison, who followed Jefferson as President in 1809. Rachel Jackson, who died before Andrew Jackson was inaugurated as President in 1829, was maligned by Jackson's enemies in the press as an adulterer and bigamist because the couple had married by mistake before her divorce was final from her first husband.

In the decades immediately before the Civil War, some presidential spouses shrank from public view. When she died in 1841, Letitia Tyler, the invalid wife of President John Tyler, was mentioned only briefly in newspapers as a wife, mother, and Christian. By contrast her successor, the youthful Julia Gardiner Tyler, with whom Tyler eloped in 1844, determinedly cultivated a reporter for the *New York Herald,* a prime example of the new penny press that was supplanting partisan newspapers by printing human interest content. To her delight, the *Herald* called her the "Lovely Lady Presidentress" and claimed she was superior to Queen Victoria. But Margaret Taylor, the invalid wife of President Zachary Taylor, refused even to sit for her portrait. She was so little known to the public that when Taylor died in office in 1850 an engraver eager to sell depictions of the deathbed scene covered her face with a handkerchief because he had no idea what she looked like. Jane Pierce, the wife of President Franklin Pierce, stayed secluded in the White House in mourning for the death of her son in 1852. (Illustrating yet another link between White House families, Pierce was the great-great-great uncle of Barbara Pierce Bush, wife of George H. W. Bush and mother of George W. Bush.)

The First First Lady

Curiously, it was the hostess for the nation's only bachelor President, James Buchanan, elected in 1856, to whom journalists initially gave the honorary title of "First Lady" that has become a synonym for presidential wives. Harriet Lane, Buchanan's niece, was a popular figure in Washington on the eve of the Civil War, arranging seating at White House dinners to keep Northerners and Southerners apart. In 1858 *Harper's Weekly,* a popular news magazine, referred to her as "Our Lady of the White House." *Frank Leslie's Illustrated Newspaper* published an engraving of her with a caption that said, "The subject of our illustration…may rightly be called the first lady of the land."

When Abraham Lincoln and his family arrived in Washington in 1861, journalists referred to the temperamental Mary Todd Lincoln as First Lady. By this time telegraphic news reports from Washington were sought-after commodities for a thriving daily press along with drawings that showed Washington society. Mrs. Lincoln, who mistakenly attempted to carry on extensive entertaining and redecorate the White House in the midst of the Civil War, became well known to newspaper readers. Some newspapers unjustly accused the First Lady, who came from a slaveholding family in Kentucky, of being a Confederate spy. She became mentally unstable following the death of 11-year-old Tad in 1862, but was not treated sympathetically in the press.

Later Nineteenth-Century Coverage

Women journalists who came to Washington after the Civil War to write society columns found the White House a logical place to center their efforts. Attention given to the lavish wedding in 1874 of Nellie Grant, the daughter of President Ulysses S. Grant and his wife Julie, who entertained in a conspicuous fashion, helped legitimize the President's family as a fertile source of feature material. Correspondents took note of the pious, hymn-singing gatherings of Lucy Hayes, wife of President Rutherford B. Hayes, who followed Grant in 1877, giving special attention to her stand on temperance. She was nicknamed "Lemonade Lucy," because she declined to serve alcoholic beverages in the White House.

When President Grover Cleveland married his ward, Frances Folsom, who was 27 years younger, in a private ceremony in 1886, some journalists tried to spy on the newlyweds with binoculars, but the bride did not seem fazed by the publicity. Public enthusiasm for Frances Cleveland, who exhibited charm and tact in social settings, helped

her husband overcome allegations of impropriety in his private life. These included an admission that he might have fathered a child out of wedlock years earlier.

As photography advanced, pictures of presidential families entranced the readers of women's pages in newspapers and new women's magazines like the *Ladies' Home Journal* and *Good Housekeeping* that carried the first national advertising of food products. Both newspapers and magazines glorified presidential wives and families as idealized representatives of American life. "Baby McKee," the grandchild of President Benjamin Harrison, who defeated Cleveland in 1888, was known as the most photographed child in America as a result of publicity photographs handed out by Harrison's wife, Caroline.

Twentieth-Century Celebrities

The high-spirited Alice Roosevelt, the oldest child of Theodore Roosevelt, who became President in 1901, stood out as one of the first media celebrities of the twentieth century. Her antics, which included the then-unusual practices (for a woman) of smoking and driving an open car, both amused and shocked the public. Questioned about her conduct, President Roosevelt said that he could run the country or control Alice but that he could not possibly do both. Married in a White House wedding in 1906 to Nicholas Longworth, a congressman from Ohio, she remained a notable Washington figure, known for her dinner parties and barbed wit, until her death at the age of 96 in 1980.

Another President's daughter, Susan Ford, was the subject of raised eyebrows, not for what she did but for what her mother, Betty Ford, wife of President Gerald Ford, said that she might do. Asked on a television program in 1975 what she would do if her teenage daughter had an affair, Betty Ford replied that she would not be surprised and called for open communication between parents and children. A public outcry resulted with thousands writing the White House to attack the First Lady for seeming to support immorality, although a poll later showed that the majority of Americans were not offended by her answer.

Presidential siblings also have been drawn into the media spotlight. During the presidency of Jimmy Carter, his brother Billy was pictured as the prototype of the Southern "good ol' boy" because he ran a gas station and promoted a beer called Billy Beer. His mother, known as Miss Lillian, defended Billy Carter on grounds of his likeability. His activities became an embarrassment to the Carter administration when he received loans from the government of Libya, which was accused of terrorist activities, and was found to owe large sums of back income taxes. Richard Nixon also had a troublesome brother who was often in the news.

Family Dynasties

The Roosevelts provided an earlier example of a family political dynasty. Theodore Roosevelt and Franklin D. Roosevelt, who was elected President in 1932, were distant (fifth) cousins, while Eleanor Roosevelt, the niece of Theodore, was the wife of Franklin (her fifth cousin once removed). First Lady from 1933 to 1945, Eleanor Roosevelt had a remarkable influence on the role of the President's wife as part of White House political communication. She held press conferences for women reporters, published a syndicated daily newspaper column of her activities called "My Day," offered commentary over the radio, and wrote articles and advice columns for women's magazines. Other relatives of Presidents also have married each other. David Eisenhower, the grandson of President Dwight Eisenhower, married Julie Nixon, the daughter of Richard Nixon, in 1968 just before Nixon took office as President.

Few political families have received as much media attention as the star-crossed Kennedys. The election of President John F. Kennedy in 1960 was credited in part to television, which projected his good looks, sharp wit, and photogenic family, particularly his glamorous wife, Jacqueline. Following his assassination in 1963, her dignity and grace made her a national idol until her marriage in 1968 to Aristotle Onassis, a Greek shipping magnate with a questionable reputation. John Kennedy's brother, Senator Robert Kennedy was a strong contender for the Democratic presidential nomination before being assassinated in 1968. Another brother, Edward M. "Ted" Kennedy, has continued to be elected to the U.S. Senate since 1963. His own aspirations for the presidency were thwarted by extensive media coverage of his 1969 car accident on Chappaquiddick Island, Massachusetts, in which a young woman was killed. Countless articles and books have appeared on the Kennedy family over the past half century.

Some children of Presidents have capitalized on public recognition of their family name to pursue career objectives. Jeb Bush, son of George H.W. Bush and brother of George W. Bush, was elected governor of Florida in 1998 and re-elected four years later. James A. and Franklin D. Roosevelt Jr., sons of Franklin and Eleanor Roosevelt, were both elected to Congress. Robert A. Taft, the son of William Howard Taft, elected President in 1908, served as an influential U.S. Senator, and was an unsuccessful candidate for the Republican nomination for President in 1940, 1948, and 1952. Margaret Truman, daughter of Harry S. Truman who became President in 1945, drew on her years in Washington to write a lengthy series of murder mysteries set in the White House and other Washington landmarks. In addition, she wrote a biography of her mother, Bess Truman, while Julie Nixon Eisenhower wrote a similar biography of her mother, Patrician Nixon.

Family Values

With the advent of family values as a sociocultural and political issue in recent decades, presidential families have been scrutinized for evidence that they exemplify personal conduct in line with campaign rhetoric. During the administration of President Ronald Reagan, elected in 1980 as a strong proponent of family values, his opponents pointed their fingers at strained relationships between the Reagans and their children. Initially Nancy Reagan deflected criticism from her genial husband. Dubbed "Queen Nancy" by some journalists, she was accused of being more interested in clothes and new White House china than in social causes. Her image improved dramatically when she launched a "Just Say No" campaign against drug use that was widely covered in the media.

Constantly in the public eye, Presidents' spouses have their own staffs and have been designed de facto officials by a federal appeals court even though they receive no salary. As leading political celebrities and representatives of their husbands, Presidents' spouses humanize the power of the presidency, take part in their husbands' campaigns, and serve as testimony to their husbands' roles as family men. Laura Bush was credited with being a major factor in the 2004 re-election of George W. Bush because of her personal popularity, ability to handle media interviews, and success at raising money on the campaign trail.

In recent decades, especially since Jacqueline Kennedy conducted a popular televised tour of her restoration of the White House in 1962, Presidents' spouses have been expected to have personal projects that translate into positive publicity for their husbands' administrations. Kennedy's successor, Lady Bird Johnson, promoted environmental concerns under the name "beautification," because in the 1960s it was not considered appropriate for a First Lady to be involved in serious efforts to improve the environment. Rosalynn Carter, wife of President Jimmy Carter, pushed for improved mental health legislation when she entered the White House in 1977. Barbara Bush, wife of George H. W. Bush, worked on behalf of literacy. Her daughter-in-law, Laura Bush, who followed her as First Lady in 2001, has been an advocate for eradication of HIV/AIDS and a proponent of reading programs and public libraries (Laura Bush is a former librarian herself).

In 2009, Barack and Michelle Obama and their two young daughters made history by becoming the first African American presidential family and the youngest family to enter the White House since the Kennedys in the 1960s. The election of Barack Obama on the Democratic ticket in 2008 propelled both his immediate and extended family into the national spotlight. Journalists traced Obama's roots among the Luo, the third-largest ethnic group in Kenya, the home of his father, Barack Hussein Obama Sr. They wrote about his numerous relatives who are scattered throughout Africa, Asia, England, and the United States.

Most media attention, however, centered on Obama's wife, Michelle Robinson Obama, an Ivy League–educated lawyer and former hospital executive. She quickly became a symbol of today's professional woman who combines motherhood and a career, gaining public approval ratings higher even than those of her popular husband. She posed for covers of national magazines, described herself as chiefly interested in being "Mrs. Mom" to her daughters Malia Ann and Natasha (called Sasha), and won praise for wearing clothing off the rack as well as designer originals. Considered a political liability during the start of the campaign because she was seen as too assertive and outspoken on racial matters, she quickly toned down comments on public affairs

and concentrated on portraying her husband within the context of family life. The descendant of slaves in South Carolina, she delivered speeches to young minority women urging them to follow her example by gaining an education to achieve success in life. At the White House she publicized the planting of a vegetable garden to promote healthy eating and oversaw family adoption in April 2009 of a Portuguese water dog named Bo, an event given extensive media coverage.

Conclusion

From the earliest days of the presidency to the present, the wives and children of Presidents have been depicted by political allies and foes as satellites that can either enhance or detract from the performance of the President. Presidential families have become part of the American political system, seen by the news media as a reflection of the presidency itself. Some family members have used their media exposure as stepping-stones for their own careers. By giving extensive attention to family members, the news media have made them surrogates for the Presidents' own views on issues related to marriage and family life. Attention given family members has increased public awareness of life in the White House and turned the presidency from a distant and formal office to one more attuned to popular sentiments. While the position of the President's spouse has personified the expanding role of women in American society, she and other family members often have been defined as either political assets or liabilities. What is evident is that Americans have a tremendous appetite for news about presidential families.

Presidential Scandals, Coverage of

Every American President has been subjected to some form of scandalous comment, either about his personal life or political activities, spread by whispering campaigns and, frequently, by the news media. Some scandalous charges have been relatively unimportant and are easily traced to venomous attacks by political opponents. For example, historians today totally discount charges made by opposition newspapers that George Washington (1789–97) wished to be a monarch and behaved like one. Other scandals have changed the course of American history. The degree to which the news media reports on presidential scandals has differed with changes in social mores, media technology, and ideas of what is appropriate for discussion in a public forum. Major scandals marked by allegations of disgraceful conduct have emerged in both Democratic and Republican administrations. The Watergate scandal of the 1970s led to the resignation of Republican Richard M. Nixon (1969–74). Lying about his dalliance with a former White House intern led to the impeachment of Democrat Bill Clinton (1993–2001) in 1998, although he was acquitted. Although there is no clear-cut definition of scandal in the context of the presidency, the term generally refers to incidents of dishonesty or other actions that violate accepted standards of conduct either in private or public life. It does not include ineptitude or failures of performance unless they also involve elements of gross impropriety.

Early Scandals

The role of news media in publicizing scandals is part of the political process in a democracy. Although the news media profit commercially from scandals—people do buy newspapers and listen to television to

learn shocking details—journalists defend reporting scandal as crucial to their responsibility as civic watchdogs. Affected public figures and their supporters generally charge the news media with irresponsibility and crass motivations. Today Presidents make extensive use of both political consultants and public relations experts to minimize damage from charges of wrongdoing.

Accusations of scandalous conduct were hurled at early Presidents—for instance, reports that Thomas Jefferson (1801–09) had fathered children by his slave, Sally Hemings, were published in the partisan press of his day (and proven correct thanks to DNA tests two centuries later). For much of the nineteenth and twentieth centuries, however, news media were reluctant to report on the private failings of Presidents. They drew a line between public and private behavior that concealed the infidelities of John F. Kennedy (1961–63), for example, until after his death. By contrast, rumors of Clinton's affair with the ex-intern spread rapidly via the Internet. Those reports led to official investigations related to a sexual harassment lawsuit and spurred media dissemination of other accounts of Clinton's sexual relations. His wife, Hillary Rodham Clinton, who earlier acknowledged difficulties in their marriage, appeared on television and accused "a vast right-wing conspiracy" of plotting to discredit the President.

In addition to Watergate in the 1970s, the Iran-Contra scandal of the Reagan administration in the early 1980s, and the Clinton affair a decade later, historians list a variety of scandals as particularly noteworthy—the XYZ affair, Credit Mobilier, and Teapot Dome, for example. Each of these was an outgrowth of its period and prominently covered by contemporary media. While partisanship was a factor in publicizing each of these events, the magnitude of the offenses went far beyond the scope of customary political infighting and raised questions of illegal, as well as unethical, activity.

The XYZ affair, a major foreign policy imbroglio, emerged during the John Adams (1797–1801) administration late in the eighteenth century. Adams, like George Washington, was a Federalist who sought a strong central government in contrast to the states' rights orientation of the Democratic-Republican party headed by Jefferson. Each party controlled newspapers that attacked the other in a tense atmosphere stemming from warfare between England and France following the 1789 French Revolution. When Adams pursued a policy of neutrality, Jefferson accused the Federalists of turning their backs on France, which had supported the colonists in the American Revolution against England.

After the French licensed raids against American merchant ships, Adams sent a delegation to Paris in 1797. French representatives asked for a bribe to begin negotiations. Adams refused to pay, ordered his envoys home, and called for the ships to be armed. He did not inform Congress of the bribe attempt until forced to do so by Jefferson's supporters who erroneously concluded Adams wanted to fight France. In response, Adams released documents that referred to the bribe-seekers as "X, Y, and Z." Rather than expressing outrage over the French demand, the Jeffersonian press, however, contended that those seeking the bribe had been impostors, not actual diplomats.

The Federalists retaliated by pushing for passage of the Alien and Sedition Acts aimed at curbing the civil rights of French residents and curtailing the right of newspapers to make false statements about federal officials. Fourteen editors were indicted under the acts, which infuriated the Jeffersonians. They were a factor in the demise of the Federalist party and Jefferson's election as President in 1800. The acts then died a quiet death, but arguments over the right of the news media to criticize government officials, particularly when national defense is at stake, have continued to the present.

During the nineteenth century new technologies greatly enhanced the ability of the news media. Invention of the telegraph and high-speed presses made newspapers, increasingly supported by advertising and circulation revenue rather than political party subsidies, a potent commercial force. The Credit Mobilier scandal became a synonym for political corruption during the two terms of President Ulysses S. Grant (1868–76), an era characterized by the term "Gilded Age" when large fortunes were acquired by often dubious means.

Credit Mobilier was a corporation established to accept large amounts of government money for the building of a transcontinental railroad, the Union Pacific. Through bribes and corporate shenanigans, financiers helped themselves to millions in dollars and railroad stock, making shares of stock available to enrich members of Congress. The scandal was highlighted in 1872 during Grant's re-election campaign with reports in the *New York Sun* and other newspapers of corruption that involved key

officials. Among them were Vice President Schuyler Colfax and Oakes Ames, a congressman from Massachusetts charged with making the actual payoffs.

While Grant himself was not accused of taking bribes, opponents blamed him for allowing the public trust to be violated. Although he easily won a second term, he dropped Colfax as his Vice President, ending his political career. A congressional investigation led to the censure of Ames and another Republican congressman, James Brooks.

Other scandals, including disclosures of improper contracts and unlawful sale of Indian trading posts by Grant appointees, continued to mar the administration. "Whiskey Ring" frauds involved bribes to federal officials to avoid the collection of taxes on some 15 million gallons of alcohol annually. Among those accused of profiting was Orville Babcock, Grant's personal secretary, whom Grant kept from being convicted. The popular Grant maintained that he did not know what was going on, although some newspapers expressed disbelief. Charles A. Dana, editor of the *New York Sun,* outraged by speculation that Grant might seek a third term contrary to custom, coined a phrase that has lived on in politics, "Turn the rascals out!" Grant did not run again.

The first major presidential scandal of the twentieth century involved corruption in the lease of rights to drill for oil in government reserves including one at Teapot Dome, Wyoming. It occurred under the administration of President Warren G. Harding (1921–23). He died while on a cross-country train to improve his image tarnished by reports of wrongdoing among political cronies whom he had appointed to high office. Harding's death spared him the ignominy of witnessing lengthy investigations into the oil leases awarded by Secretary of the Interior Albert Fall, who had received cash and gifts. Fall and a dozen other Harding associates eventually went to prison. Fall's dishonesty obscured public debate on a central theme of the scandal: a major philosophical difference between developers who wished to exploit natural resources and conservationists who wanted to preserve them.

A small-town newspaper publisher from Ohio, the affable, poker-playing Harding enjoyed favorable press coverage from Washington correspondents. They initially believed that he had little knowledge of the misdeeds of those under him, although allegations of shady dealings by his friends in the Veterans' Administration and elsewhere soon surfaced in news reports, stimulated by congressional investigations. When sordid details of his administration were revealed after his death, historians ranked Harding as the worst President. It was further tarnished when his mistress, Nan Britton, who said he had fathered her child, published a book in 1927. It recounted episodes of lovemaking with Harding in a White House closet while the Secret Service stood guard.

Two mid-century Presidents, Harry S. Truman (1945–53), a Democrat, and Dwight D. Eisenhower (1953–61), a Republican, both were targets of allegations of scandal stemming from loyalty to trusted aides. Brigadier General Harry H. Vaughan, Truman's personal friend and military aide, was accused of influence peddling by acting as a go-between for corporations seeking federal contracts. Vaughn asked a manufacturer to provide deep freeze refrigerators, then considered luxury items, for himself and the Truman home in Independence, Missouri. Although Vaughn was criticized by a congressional committee, Truman refused to remove him from the White House. The deep freezes became symbols of alleged corruption in the Truman administration as did a pastel mink coat given a White House secretary by a firm that received a government loan from the Reconstruction Finance Corporation (RFC). A Senate investigation into the RFC, however, did not link Truman with any impropriety.

A fur coat also figured into charges of scandal in the Eisenhower administration when the President initially refused to take action against a top aide, Sherman Adams. A congressional investigation revealed that Adams had received a vicuna coat and many other gifts from Bernard Goldfine (dates unknown), an industrialist for whom Adams had secured favorable treatment by government agencies. Eisenhower expressed support for Adams, but Republican leaders considered him a political liability and insisted that he leave the White House. Adams eventually went to prison for tax violations.

Late Twentieth-Century Scandals

The Watergate scandal, which forced President Richard M. Nixon to resign in 1974 rather than

face charges of impeachment, has frequently been linked in the public mind with the investigative reporting of two young journalists for *The Washington Post*, Bob Woodward and Carl Bernstein. The name Watergate referred to an apartment-hotel complex in Washington where the Democratic National Committee had its headquarters. An attempted burglary there on June 17, 1972, led to the arrest of five men carrying cash and bugging equipment. The *Post*, unlike other news media that virtually ignored the burglary when it occurred, determinedly pursued the relationship of the burglars to the White House, eventually winning a Pulitzer Prize for public service. The suffix *-gate* became a shorthand expression for political scandal and was widely used by news media to tag later scandals.

Ultimately the botched crime was linked to a multifaceted campaign of political corruption and spying on those considered enemies of the Nixon administration. After the failed break-in, Nixon and key associates, several of whom later went to jail, lied about their unconstitutional activities. These included illegal wiretapping for political gain, perjury, misuse of campaign funds, and efforts to pressure the media to stop unfavorable reporting by threats to their broadcasting licenses. In public Nixon maintained that the news media was hostile to him because of his support for the unpopular Vietnam War and famously insisted in 1973, "I am not a crook." Sentiment turned against him when tapes of conversations in the Oval Office were subpoenaed over his objections during grand jury and congressional investigations. They revealed that he personally had engaged in a cover-up of the burglary.

The drama culminated in Nixon's resignation on August 9, 1974, after being overwhelmingly re-elected in 1972. He was the first President to be forced to leave office. Nixon's successor, President Gerald R. Ford (1974–77), pardoned him in an unpopular move believed to have kept Ford from winning the presidential election in 1976.

In comparison to Watergate, the Iran-Contra scandal during the Ronald Reagan administration (1981–89), appeared relatively minor, stemming from the Republican President's opposition to the spread of communism. In spite of a congressional ban against aid to the Contras (a resistance group in Nicaragua opposed to the Communist government there), White House aides, headed by Oliver North, concocted an elaborate plan directed by the CIA to assist the Contras. Weapons were sold to the Iranian government in hopes of gaining the release of American hostages in the Middle East; the proceeds were surreptitiously used to fund the Contras. When a supply plane linked to a CIA-front was shot down over Nicaragua in 1986, the plot unraveled, particularly after a foreign magazine published details then picked up by American news media. A congressional investigation ensued, but it was never made clear whether Reagan knew the details of what had transpired. North and others were convicted on various charges involving lying to Congress. All were pardoned by President George H. W. Bush (1989–93), Reagan's successor.

President Bill Clinton, survived an impeachment when the U.S. Senate voted on February 12, 1999, to acquit him on two charges brought by the House of Representatives. The only President before him to be impeached was Andrew Johnson who also was acquitted. Clinton was charged with perjuring himself before a federal grand jury and obstructing justice in an effort to hide his sexual relationship with a former White House intern. The vote, largely along party lines, failed to achieve the two-thirds majority necessary to convict. Clinton supporters contended Clinton's private actions were not impeachable offenses. The American public apparently agreed, since polls showed Clinton's ratings remained high.

The charges stemmed from Clinton's testimony in a suit brought by an Arkansas state employee, who alleged Clinton (while governor) had sexually harassed her. Kenneth Starr, an independent counsel who was investigating Clinton for his role in a failed land development project in Arkansas called Whitewater, broadened that inquiry to pursue these allegations. Starr learned of Clinton's White House affair when another former White House employee gave him recordings of her conversations with the intern.

Starr subsequently sent members of the House of Representatives a lengthy report, which Congress made public, containing graphic references to oral sex in the Oval Office. Available on the Internet and in newspapers, the report substantiated accusations first made in 1998 by Matt Drudge, an Internet gossip columnist. Mainstream news media

jumped on the story, giving it saturation coverage that led to some criticism for publicizing lurid details. Clinton initially insisted, "I did not have sex that that woman," but later confessed to "an inappropriate relationship."

Conclusion

Presidential scandals, not surprisingly, have an adverse effect on administrations. Even though a President may remain personally popular during them, they divert attention from the main business of governing and weaken public support for the presidency itself. While the public may, as it did in the case of Clinton, distinguish between private and public acts, unseemly conduct diminishes the position of a President as a leader. Three Presidents whose administrations were mired in scandal, Grant, Harding, and Nixon, are given low rankings by historians. While the news media might be expected to gain respect as a result of reporting scandal, this often is not the case with journalists accused of being more interested in sensation than public service. Today it is inconceivable that reporters would close their eyes to presidential infidelities as they did during the Kennedy era. Competitive pressures to gain an audience compounded by the demands of a 24-hour news cycle mean that Presidents are subject to continual scrutiny. With the advent of bloggers, news organizations are far more likely to circulate reports of scandalous activity, whether verified or not, than in the pre-Internet days. Presidents always have been subjects of journalistic surveillance, but the present news media atmosphere makes it likely that attempts to ferret out scandal will become increasingly common in the years ahead.

Presidents, Coverage of

Presidential news coverage refers to a specific type of political journalism that includes coverage of all aspects of the United States presidency, as well as the communications and actions of the President's cabinet and White House staff. The press coverage afforded U.S. Presidents is often seen as quite subjective, as the President's policy decisions and stated agendas are interpreted, analyzed, and critiqued by pundits. This coverage, like other forms of political journalism, is frequently informed by what is called opinion journalism, which has grown in popularity in recent years. Presidents receive more coverage than either the legislative or judicial branches of the federal government as they provide more news media access to their activities. This has become increasingly so in the early twenty-first century as the Bush and then Obama administrations sought broad public support for their initiatives.

As the relationship between press and President has evolved and the demands on the President's time have increased, the need to effectively manage the press's access to the President has increased as well. The role of the White House press secretary is to act as an intermediary between the

President and the press. He or she is a senior member of the President's staff who serves as the primary spokesperson for the administration and serves at the pleasure of the President.

Responsibilities of the press secretary include gathering and disseminating information regarding the President's daily schedule, any meetings or communications the President has engaged, and the administration's position on any current newsworthy issues. The press secretary also holds press briefings and conferences with the White House press corps, including a daily public news briefing. White House press secretaries have come from a variety of backgrounds, but many have been journalists. George Akerson, a former journalist for the *Minneapolis Tribune,* was the first official White House press secretary, serving under Herbert Hoover from 1929 to 1931. The last press secretary (2007–09) for George W. Bush was Dana Perino, only the second woman after Dee Dee Meyers (1993–94) to serve in the position.

White House Press Corps

The White House press corps refers to the collection of journalists (or correspondents) who are generally stationed at the White House to cover press briefings, conferences, and press releases. Press briefings and conferences take place in the White House press room. This press corps (also sometimes referred to as the White House press pool), while more often dealing with the White House press secretary, generally has more access—direct and indirect—to the President than other journalists.

The White House press corps works in the press corps offices located in the West Wing of the White House, very close to the Oval Office. Windowless and located in a basement, this area was once home to the White House gymnasium and flower shop. Perhaps nowhere else is there a working press office as close as this one is to the head of state.

However, the press corps offices have historically been fairly cramped and technologically challenged. Thanks to the ever-expanding White House press corps, these conditions became exasperated in the early twenty-first century. What once housed a handful of journalists assigned to the White House beat had become home base for several dozen members of the press corps by the time George W. Bush took office in 2001. Consequently, this area, along with the Press Briefing Room, underwent an $8 million renovation beginning in 2006. While some members of the press corps cited concerns about access to the President during the renovation, most agreed the updating of facilities was badly needed. President Bush welcomed the press corps back to their offices and to the James S. Brady Press Briefing Room (named for President Reagan's first press secretary who had been seriously wounded in a 1981 attack on the President) in July 2007.

Development

Perhaps the first President to embrace the press was William McKinley (1897–1901). Unlike many of his predecessors, McKinley welcomed White House coverage. With the country heading into war with Spain, primarily over Cuba, McKinley was acutely aware of abilities of the press to sway public opinion. In an attempt to curry some control over the ways in which information regarding his administration was being handled, McKinley made great efforts to let reporters know he recognized the importance of their jobs. He provided them with daily briefings, via his secretary, and he provided them with a "press room" in which to pass time between briefings. McKinley regularized the interactions between him, his staff, and the reporters stationed at the White House; his tenure marked the establishment of the White House press corps.

Not long after Theodore Roosevelt (1901–09) took over the presidency, the role of the President began to change from an office tangential to Congress to one that would become one of the most powerful offices in the world. Because of the growing stature of the United States on the world stage, the visibility and responsibility of the President rose as well. But Roosevelt's personal popularity within his own Republican party was low as he entered office. If he was to parlay his beliefs about the potential of the presidency into reality, he needed help beyond his own wary partisans. For that, he turned to the press and in doing so changed the relationship between press and President.

Roosevelt supplied a steady news stream to White House reporters and met with them regularly in news conferences. This served multiple purposes. It exposed reporters to Roosevelt's decision-making, thereby helping shape the stories being written, and it kept reporters from having to inform their editors that there was no news for the day. It also kept reporters occupied. Roosevelt

understood that busy reporters had less inclination to pursue sundry or critical stories.

Roosevelt accommodated the press pool by granting interviews and holding numerous press conferences. He also assigned a staff member to see to the needs of the press. This unprecedented access and accommodation helped Roosevelt establish a rapport with the press that served him well. It also established a model for press–President relations that influenced Presidents through the rest of the twentieth century.

While some subsequent Presidents such as William Howard Taft (1909–13) and Herbert Hoover (1929–33) were not as eager to seek press coverage as Roosevelt, others were. Woodrow Wilson (1913–21) reestablished the practice of personally delivering the State of the Union speeches to Congress and shortened them as well, making it easier for newspapers to publish them in their entirety. In 1924, Calvin Coolidge (1923–29) engaged a different medium, delivering the first weekly presidential radio address. Every subsequent President has continued the practice of using broadcast access to the people.

Franklin Roosevelt (FDR, 1933–45) took presidential efforts with the press to a new level. His press secretary, Steve Early, worked hard to meet journalists' needs. FDR read journalists' stories and offered praise, nurturing a feeling of camaraderie with the White House press corps. He took the time to break down policy issues and technicalities of Depression-era decision-making for reporters, and granted them greater access to himself and administration officials. Consequently, press coverage of presidential politics increased substantially, ultimately helping sell the New Deal to Congress and the citizenry.

Sidestepping the Press: The Radio Address

As the role of the presidency grew more complex, so did the relationship between the Oval Office and the press. By the early twentieth century, the era of the party press had ended. President–press dynamics in its aftermath were marked by mostly congenial, but tangible, mutual suspicion. Presidents recognized the power of the press to sway public opinion; the press understood the White House was more invested in selling an agenda than in full disclosure. Though undoubtedly necessary, this relationship increasingly became an uncomfortable symbiosis.

One way Presidents took a little bit of the power back from the press corps was to take their messages directly to the public, foregoing journalists altogether. Radio was the mass medium best suited to this purpose. Though Calvin Coolidge was the first U.S. President to use the radio in this way, it was FDR who made the practice famous. Beginning in 1933, his "fireside chats" calmed a nation in the midst of the Great Depression. Using an informal, conversational style, Roosevelt delivered his messages of hope and reassurance and asked the nation to support the policies of his administration. He took great care in crafting the addresses to inspire citizens' confidence and participation in society. With no fear of being misquoted or directed off topic by the press, Roosevelt delivered over 30 fireside chats, with topics ranging from his New Deal to the Allied efforts in World War II.

Roosevelt's addresses proved very successful, allowing the President to communicate his message directly to the nation. Radio penetration was high during the FDR era. Over 90 percent of U.S. households had a radio and with the television era yet to begin, radio was the most popular national medium. This afforded FDR tremendous access to the populace and his "chats" often attracted even more listeners than some of the most popular national radio shows of the time.

Despite the popularity of these radio addresses, the fireside chats ended with FDR's tenure. The desire of subsequent Presidents to communicate directly with the populace didn't wane, however. Ronald Reagan (1981–89), irritated by what he perceived to be unfair media treatment of his administration, rediscovered the power of the presidential radio address. Beginning in 1982 and continuing through the conclusion of his second term, Reagan spoke to the nation every Saturday regarding issues of the day. In addition to reaching over a million listeners on a regular basis, Reagan also used the weekly addresses to help influence news headlines. The strategy proved highly effective and the Saturday radio addresses became institutionalized. Every President since Reagan, regardless of political party, has delivered a weekly radio address. President Obama continued the broadcasts but also made them available online.

Broadcasting

With radio in the 1920s and then television in the 1950s, broadcasting became a vital tool for the

White House. Broadcasting substantially increased the audience for political journalism, catalyzing the interest in presidential news. As that audience grew, Presidents began to adjust their public activities and efforts toward the press to cater to broadcast needs. Ultimately, a combination of larger audience and presidential scheduling that created more broadcast opportunities resulted in presidential news coverage becoming increasingly central to the relationship. The amount of presidential news jumped significantly thanks to radio and television.

Federal regulations stipulated that radio stations offer public affairs programming as a part of their license responsibilities. Presidential press coverage and radio addresses served that role and provided networks with content that would appeal to national audiences. Television emphasized news from the White House as well. Encouraged by his press secretary James Haggerty, President Dwight Eisenhower (1953–61) allowed television recording of his press conferences, while President John Kennedy (JFK, 1961–63) allowed the first live coverage and, with his sense of humor and timing, became something of a hit on the air.

Television personalized the President in entirely new ways and, in turn, piqued public interest in presidential news. Television was especially effective because in addition to audio, it afforded the audience visual information about the President. Audiences responded, and accordingly, so did advertisers. As television penetration spread across the country through the 1950s and 1960s, the demand for presidential news also grew. With a growing audience and advertisers taking note, national television news boomed as a profit-making enterprise—one that consistently sought reportable content, such as was often provided by the White House.

Television also upped the ante in presidential coverage. Harry Truman (1945–53) delivered the first televised State of the Union address in 1947. Sensing the importance of maximizing effectiveness of the broadcast, Lyndon B. Johnson (1963–69) switched the time of that annual speech from the middle of the day to prime-time. Campaign debates, such as the pioneering Kennedy–Nixon debates in 1960, gave viewers vastly expanded exposure to presidential candidates.

The Press, the President, and Scandal

With the rise of cable news after 1980, an insatiable 24-hour news cycle, combined with a public appetite for negative news and scandal, produced a double-edged sword: Presidents recognized the power of the press to help them sell their image and agendas to the public, and consequently sought to assist and placate the media. However, active reporters also meant that widespread reporting also greatly increased when things went wrong. At the same time, the news media–presidential relationship was changing as reporters grew more suspicious of official government news and began to ask more probing questions. Often fanned by the political opposition, such reporting could get embarrassing for the President and have substantial impact.

Scandals of varying scope struck most administrations. President Truman faced questions about corrupt activities among some of his advisors. President Eisenhower had to dismiss Sherman Adams, his chief of staff, after news reports of wrongdoing. President Kennedy faced fierce criticism in the press after the failed Bay of Pigs invasion of Cuba. President Johnson faced an increasingly hostile press over the dragged out war in Vietnam, as well as over some of his political appointments.

But the Watergate crisis of 1972–74 marked a high-water mark of news media investigation of a growing scandal that resulted in the indictment of several members of President Richard Nixon's (1969–74) administration and ultimately led to Nixon's resignation as President in August 1974. It began with the June 1972 break-in into the Democratic National Committee offices at the Watergate Hotel in Washington, D.C. Subsequent investigations conducted by both government and news media entities revealed several other crimes, some committed by confidants of Nixon. These included campaign fraud, illegal wiretapping, money laundering, improper tax audits, political sabotage, and other illegal break-ins.

The Watergate scandal set a new benchmark for investigative journalism. *Time* magazine, *The New York Times,* and particularly *The Washington Post* doggedly pursued the story. *Post* reporters Bob Woodward and Carl Bernstein uncovered information suggesting that knowledge of the break-in and subsequent attempts to cover it up was widespread. Hearings before a Senate committee were

televised for weeks in 1973 and caused irreparable damage to Nixon's image and presidency. Key members of the administration gave dramatic testimony, and the public was riveted: over 80 percent of U.S. households watched at least a portion of the hearings.

The fallout from Watergate was far-reaching. President Nixon resigned on August 9, 1974. Some of his aides were imprisoned. Thanks in large part to broadcasts of congressional hearings, the Democrats picked up a large number of seats in the November 1974 election.

Two decades later, another presidential scandal gripped the media and the nation. Pundits had praised President Bill Clinton's (1993–2001) adroitness with the press during both of his successful presidential campaigns (1992 and 1996). From the moment he played the saxophone on *The Arsenio Hall Show* through the numerous press conferences of his first term, Clinton was viewed as comfortable interacting with the press, and even craving media attention. This positive view began to come apart not long into his second term. News of an affair with White House intern Monica Lewinsky first appeared on the conservative website the Drudge Report in January 1998. Mainstream media picked up the story, and soon Clinton's wife Hillary joined her husband in denying the affair.

As the press coverage of the scandal intensified, so did calls from Clinton's adversaries for a full investigation. Ultimately, both Lewinsky and Clinton made statements before a grand jury. After his grand jury testimony on August 17, 1998, Clinton made a nationally televised statement in which he admitted he had a relationship with Lewinsky that was "not appropriate." The investigation led to Clinton's impeachment, though he was subsequently acquitted of all charges of perjury and obstruction of justice.

Though Clinton's approval ratings stayed fairly high despite the scandal, the Lewinsky affair illustrated both the increased pervasiveness of the news media by the end of the twentieth century and the changed nature of presidential-press relations from the JFK era; much of the Washington press corps was aware of Kennedy's (alleged) extramarital affairs of the early 1960s, but did not consider them "newsworthy."

In the wake of the attacks of September 11, 2001, and the American invasions of Afganistan and Iraq, many observers accused the news media of losing its critical eye in assessing the President's policies. Yet many in the press corps fear that asking hard questions will simply lead to the President no longer dealing with them.

Contemporary Coverage

Early twenty-first-century President–press relations are informed by new media. The Internet now allows for instantaneous worldwide reporting. Weblogs, or blogs, provide a substantial degree of political commentary. Political bloggers are the modern muckrakers, and many of these blogs have links to traditional news outlets, suggesting the lines between mainstream and citizen journalism will continue to blur. Critics argue that this inevitably leads to a decrease in actual hard news and an increase in infotainment, or soft news. However, other observers note that Internet coverage may encourage greater civic engagement, especially among younger would-be voters. It is this belief that led 2008 Democratic presidential candidate Barack Obama to create a page on MySpace, which helped him raise millions of campaign dollars. As President, Obama continued his extensive use of press conferences and almost-daily press appearances as he grappled with the nation's worst economic crisis in more than a half century.

One trend in political journalism that has been evolving over the past 30 years is the reliance on pundits to interpret an increasingly complex political climate for audience members. While the availability of news content has increased, the amount of time people spend with political news has decreased. Many expect the news of the day to be interpreted and summarized despite the public's growing distrust of news media. In the 2008–09 economic crisis, some pundits applied their economic training or financial experience to help explain the growing complexity of Bush and then Obama administration interventions in the financial and automobile markets.

In response to the growing media distortion at the hands of pundits, the White House continues to seek out new communications options and technologies with which to communicate its messages. While it seems that future Presidents will likely embrace the Internet and other "new media" to address the public, there is nothing to suggest that the more traditional "old media" will cease to be influential, despite the public's growing suspicion

of journalism overall. Despite the efforts of White House officials to have the President sidestep the press corps by using more "direct" means, such as radio addresses or postings on the White House website, the need for Presidents to effectively manage the press remains intact.

Conclusion

Presidential press coverage continues to be an integral part of political journalism and of U.S. society. However, the current media climate that promotes "constant coverage" with an eye toward the personal and/or the salacious, may keep much of the attention on personality quirks or flaws as opposed to actual policies or decision-making. The challenge for news audiences in this age of unprecedented presidential access is to decide exactly what aspects of the presidency matter—and make their media consumption choices accordingly.

Press and Government Relations

The development of news media is closely tied to the emergence of modern government. Indeed, news media organizations have always been intimately tied to government and political institutions more generally; they are often considered a political institution, a kind of "fourth branch of government." Early newspapers served to shape public opinion in the course of battles between and within states, to integrate citizens into developing administrative structures of the modern state and provide them with the information necessary to manage their interactions with those institutions. They were central to the production of the "imagined communities" described by researcher Benedict Anderson, which were the cultural manifestation of the rise of the modern state. The news media expanded in importance as popular participation in political life expanded, often through the extension of institutions of mass democratic politics, but also through authoritarian institutions for the mobilization of mass opinion. News media are tied to the state through a dense and complex network; much of their content focuses on the activities of government, and governments, for their part, often devote large amounts of attention and resources to their relations with news media. There is a long history of political polemics about the relation between journalism and government, and a substantial body of scholarly research and theory on that relationship.

Theories of Press–Government Relations

A key distinction needs to be made between normative and empirical theories of journalism and government, that is, theories of what roles the state and media *should* play in relation to one another, and theories about what roles they *actually* play. The dominant normative theory across most of the modern world is derived from liberalism, as expressed in such classic early works as John Stuart Mill's *On Liberty*. This conception emphasizes the need for a press independent of the state, which will provide the basis for the independent public opinion on which the legitimacy of democratic government is based. In its later formulations, this view is connected with the idea of the news media as a "watchdog" of the state, providing a counterweight to state power.

The polar opposite to liberal theory is what Siebert, Peterson, and Schramm called, in their influential *Four Theories of the Press*, the Authoritarian

theory, in which the state is conceived as having essential responsibility for protecting the interest of society as a whole, the "oppositional" role of the press (so valued in much liberal theory) is consequently seen as socially destructive, and state control of the press or at least close cooperation between press and state are more valued than is press independence. Authoritarian theory was dominant in an earlier era. One of the most developed versions was the communist theory of journalism as an apparatus for revolutionary transformation of society. Another significant version can be found in the idea of "Asian Values" in journalism, as articulated by political leaders in authoritarian states such as Singapore and Malaysia. Malaysian Prime Minister Mahatir once wrote that the press should "conscientiously limit the exercise of its rights" and that "democratic governments have a right to control it" when it does not (quoted in Nain 2000, 146).

Within liberal political systems, some elements of authoritarian theory coexist, as for example with "national security," where many argue that patriotism should prevail over the "watchdog" function of the press. There is also an important distinction in democratic systems between more classical liberal systems—the United States being the most important example—where government intervention is seen as a barrier to press freedom, and systems where government is assigned a more positive role in assuring the conditions under which press freedom can prosper. This is more typical of European societies with traditions of a strong welfare state, where institutions such as public service broadcasting and press subsidy systems are justified in these terms. France, Italy, and the Scandinavian countries, for example, have systems of press subsidies that are intended to keep alive a greater number and diversity of newspapers than the market would otherwise allow.

Functions of the State

The state plays many different kinds of roles in relation to the news media. These include the following:

- *Censor.*
- *Owner.* Public service broadcasting is one version of government-owned media, though such systems are often structured as relatively autonomous from government control; they are publicly owned rather than government owned. In other cases governments or government-owned companies own or invest in media enterprises.
- *Funder.* This can take the form of direct subsidies, tax breaks, loans, government advertising, and sometimes patronage (jobs, contracts, other payments to media owners or journalists).
- *Regulator.* Broadcasting is almost always state regulated. Forms of regulation range from restrictions on cigarette advertising to hate speech laws to shield laws that give journalists special rights to confidentiality.
- *"Primary definer."* This refers to government as a provider of information and of interpretive frameworks relied on by journalists, and as an agenda setter, a provider of cues about what is news and what is not.

News Media as a Fourth Branch of Government

Although liberal press theory emphasizes separation of media and government and even sees them as adversaries, research has often emphasized their interdependence and the ways in which journalists and media have become an integral part of the governing process. The different roles of the state listed above is one illustration. Even in an open society like the United States, government has played an important role in subsidizing news media, which were seen as an essential element of democracy as well as a key lever of power. Subsidized postal rates, government jobs (postmaster, customs inspector, etc.), and printing contracts, for example, were crucial to the early growth of American newspapers.

The government as a primary definer of news also illustrates this interdependence. Research in Britain and the United States has shown the media in those countries rely just as heavily on government officials as news sources as do journalists in other countries (France, for example) where government intervenes much more as a regulator, funder, and owner of media. Theories of the news-making process have consistently emphasized the central role of government officials as sources, and the fact that journalists' routines of news gathering

tie them closely to government officials, as, for example, in the "beat" system that organizes journalism around divisions of the government. Government and media rely heavily on one another: government officials need the media in order to communicate with the mass public and often with other political actors, and journalists rely on the government as a steady source of usable, newsworthy content. The tremendous resources governments often devote to servicing the media have sometimes been referred to as an "information subsidy," as they make it easier and cheaper for journalists to cover the news. Journalists get privileged access to government officials—when the President of the United States travels on *Air Force One*, for example, he is normally accompanied not only by his top aides and other political leaders, but by journalists. Officials, in return, get privileged access to the news media, where their words, concerns, deeds, and faces regularly appear.

Lapdogs or Watchdogs

There are important debates about the balance of power between media and government and the character of the relationship between them, which can be summarized as a debate about whether the media are watchdogs, aggressively scrutinizing government officials, or lapdogs, mostly colluding with or manipulated by them. Communications researcher Gadi Wolfsfeld distinguishes among three characterizations of the media's relations to government; "faithful servant," "semi-honest broker," and "advocate of the underdog." A variant of the latter, which sees the media as an adversary of government, often as an overly aggressive watchdog which hurts the public interest by undermining support for governing institutions and making it more difficult for officials to govern, became more common in the 1970s and 1980s. The media in many countries did shift in that period toward a more assertive stance toward government officials and more negative coverage of politicians and political authority. The growth of political scandals since the 1970s illustrates this trend. There is considerable debate about whether this trend represents a beneficial shift from overly deferential media to something closer to the honest broker role, or from honest broker to dangerous usurper of the authority elected officials should exercise. And there is debate about how much the shift is really driven by media and how much by other actors. Politicians themselves often voiced antigovernment rhetoric beginning in this period—that was central to Ronald Reagan's appeal, for example.

On the other side of the spectrum, the best-known statement of the "faithful servant" perspective is Noam Chomsky and Edward Herman's "propaganda model" of media–government relations, which sees media as dominated by elites who hold wealth and power in society, and are able to use the media to "manufacture consent" in mass public opinion. Their view sees media as dominated not only by government—though they place heavy emphasis on the state—but also by business elites, and they see these two sets of actors as acting in harmony.

Journalists like to see themselves as honest brokers, covering politics in a way that gives fair representation to a wide range of actors, and playing the watchdog role in a responsible and essentially objective way. Wolfsfeld uses the term "semi-honest broker" because virtually all researchers would acknowledge that the media are affected at least to some degree by inequalities of wealth and power, and that some actors—including certainly government officials—will always have more access and influence than others. The bulk of research can be described as falling somewhere between the honest broker and faithful servant perspectives, in the sense that it sees journalists and news organizations as independent actors, often genuinely committed to the watchdog and honest broker ideals, but at the same time recognizes that the newsmaking process is influenced by structures of power, and that government officials exercise central if not unlimited influence. This scholarship also sees the relation between media and government as variable rather than constant, with news media sometimes acting like faithful servants, sometimes more like honest brokers, and sometimes—more rarely—like advocates of the underdog, depending on political circumstances. One version of this is the "indexing" theory, which holds that the range of views represented in the news will be "indexed" to the degree of debate among political elites, becoming wider when elites are divided and actively debating an issue and narrower when they are not. In some versions of this theory, the media not only reflect the varying degrees of elite debate, but their

own role also shifts: they are more independent and assertive in gathering and interpreting the news when elites are divided. Robert Entman's "hierarchy of influences" theory is a related attempt to synthesize research on political communication, which attempts to show how the political role of the media shifts depending on a number of factors, including divisions among political elite, but also, in some cases, such factors as mobilizations by social movements and the cultural resonance of various interpretations with journalists and news audiences.

These theories apply to liberal systems with media that are relatively independent of government economically and organizationally. In other systems, censorship, dependence of media on government, or tight alliances between media owners and governing parties will produce something much more consistently close to the faithful servant model.

Variations in Media–Government Relations

Relations between media and government vary considerably from one political system to another. Differences between liberal and authoritarian systems and between systems in which government intervention in media markets varies have already been mentioned. One important distinction has to do with the degree of political parallelism in the news media, that is, the degree to which news organizations and journalists have political alliances or allegiances. In some systems, media have clearly identifiable political orientations, report the news from the point of view of particular factions, and in some cases participate in the process of debate and negotiation among those factions. In other systems media avoid particular partisan entanglements, and present themselves to audiences as providers of neutral information to a nonaligned public. The effects of many forms of government intervention also vary considerably depending on the nature of governing institutions. Government subsidy to news organizations, for example, may have little effect on media independence in systems with clear and transparent rules for the allocation of subsidies, and great effect in systems where government funds can be used at the discretion of political authorities to reward or punish the media.

Conclusion

The news media form a central institution of political life, and always have a dense network of connections with governing institutions. The nature of those connections varies depending on the role of news media in a particular society—their economic basis, for example, and the culture of journalism that prevails within them—and also on the nature of political institutions—how centralized power is within them, and the extent to which they are governed by legal rules, for example. The relationship of media to government also varies with historical circumstances—the American media acted very differently in relation to government during the 1970s Watergate scandal than they did in the aftermath of the September 11, 2001, attacks.

Press Pools

"Press pool" refers to a small group of reporters, photographers, camera operators, and technicians, typically representing a variety of print and broadcast media organizations, who are chosen to cover a particular event, a series of events, or a particular organization. Press pools are commonly employed both by government institutions (such as the White House or State Department) to facilitate day-to-day coverage, and during large-scale events (such as inaugurations, political conventions, or the Olympics) or events where space is limited, such as a trial. The use of press pools is often driven by convenience or necessity—in many situations, such as on the campaign trail or in White House briefings, there is not enough room for the entire accredited press corps to attend. Pool members are expected to take detailed notes and file "pool reports" (or, in the case of broadcast footage, "pool feeds") to other journalists and news organizations not included in (but represented by) the pool.

Many journalists and scholars have criticized the manner in which press pools operate, particularly in two of its most common uses—covering political and military activities. In both instances, central questions concern journalistic access to crucial sources and information. While government and military officials often point to increasing efficiency and better communication to and within pools, many journalists express concern about curtailment of their freedom and a decreasing variety in news coverage.

Department of Defense National Media Pool

Central to conflicts over the Department of Defense (DoD) National Media Pool has been the dilemma of balancing demands of a free press with needs for secrecy and security during times of war.

Press pools were first widely used during World War II. While reporters were mostly permitted to travel freely, many of their reports were subject to military review and censorship. After the Vietnam War, the Pentagon sought new ways to control transmission of information by reporters during military conflicts. During the 1980s, concerned by advances in technology and transportation that hindered attempts at censorship, military officials attempted an "exclusionary model," which prevented a journalistic presence during military operations. The DoD National Media Pool was created in 1987 after conflicts over the handling of journalists during the 1983 U.S. invasion of the island of Grenada.

The DoD press pool was originally marketed to journalists as a means of increasing their direct access to military personnel and activities while also offering a greater measure of protection for journalists on the battlefield. The pool was composed of journalists from several news organizations, including news agencies, magazines, newspapers, and television and radio outlets, with membership rotating every three months. By limiting the number of journalists with access, the military could better control the flow of information. Secrecy was considered paramount with the Pentagon pool. Only bureau chiefs and the pool members themselves were to know which news organizations were part of the pool. Pool members were required to keep their status and any details about their missions a secret from co-workers and even family members. Pool reports were also often filtered through military officials before being sent back to the pool members' news organizations.

The 1989 military incursion into Panama saw the first use of the modern media pool. Yet despite promises of increased access, the Panama operation was largely considered by many news organizations

a failure and a problematic example of the dangers inherent in military control of press pools. After being dispatched from Washington hours later than anticipated, journalists arrived after the invasion had already begun. When they arrived, the military had no helicopters to transport the news personnel to the combat sites. According to a Pentagon report after the invasion (and ensuing public upset), Secretary of Defense Richard Cheney's "excessive concern with secrecy" prevented pool reporters from witnessing the fighting firsthand.

The next major employment of military pools came during the 1990–91 Gulf War. While representatives from news organizations acknowledged that the pool system was better than in Panama, pool members still complained of excessive monitoring and limitations imposed by military officials.

Gulf War pool members were expected to adhere to what was termed the "Pentagon Rules," which limited the kinds of information they were allowed to report and provided codes of conduct to govern behavior on the battlefield. Journalists were not allowed to identify locations or units and could only interview or photograph with supervision from military officials. Pool reporters also expressed frustration at regulations and pool arrangements that limited them to trips specifically coordinated by military officials.

Some reporters excluded from the pool engaged in "freelancing"—working outside military controls by renting vehicles and independently traveling to interview troops or witness action. In one of the more famous freelancing incidents during the Gulf War, CBS reporter Bob Simon and his crew were captured and held by Iraqi forces for 40 days. While the incident seemed to bolster DoD's contention that pools were necessary to protect journalists, some reporters continued to operate outside the pool during the remainder of the Gulf War. While there were no formal punishments for defying pool regulations, reporters found to be engaging in freelancing could be reported to Saudi authorities, who would temporarily revoke their credentials and visas. The National Media Pool was officially disbanded in late 2001.

Influences on News Content

Concern has been raised by journalists and researchers about the content of news coverage that emerges from a pool system. In both coverage of political news (such as pools at the White House or presidential campaigns) and military activities, news content generated by the pool has been criticized for being too favorable toward the institutions being covered as well as displaying elements of "pack journalism."

More recent research into media pools has examined whether there is a correlation between the mobilization of military media pools, the resulting media characterization of military interventions, and public opinion of military action. For instance, communications researcher Shannon Martin's 2006 study of news content found that when a pool system is in place during a military intervention, news media were more likely to focus on political changes associated with the intervention and public opinion is initially more favorable. When a pool system is not employed, news coverage focuses more attention on the humanitarian aspects of the mission and public opinion is less favorable. Because a military pool system often results in increased control of reporting, there is less opportunity for journalists to independently seek out stories and/or investigate news that might be less than favorable toward the military. Consequently, as during the Gulf War, information from pool reports is often used to add color and texture to news stories rather than provide breaking news.

Correspondingly, pool coverage of the White House and political campaigns has been broadly criticized for not providing enough critical analysis of the President or presidential candidates. Particularly in the case of presidential campaigns, pool coverage is critiqued for providing little in the way of independent coverage and producing reports (and corresponding news coverage) that tend to bolster campaign goals. As with military pool reports, campaign pool reports are likewise often used for "color"—often focusing on lengthy scene-setting descriptions of events or details such as the public turnout for or the setting of a candidate's speech. The pooling of reporters also often results in campaign coverage that is increasingly homogenized. Many critics of the pool system attribute this to a lack of substantive access.

How and what pool reporters have access to is crucial during a campaign. In many cases, they are the only journalists with regular access to the

campaign or information about the candidate. Often, it is the responsibility of this small, rotating group of reporters to decide for all of the media outlets what, in fact, constitutes the news. However, even when they travel with a candidate and see him or her on a daily basis, access to the candidates is typically heavily controlled by campaign staff members. In addition, staff members have the power to make decisions about which journalists will be in the pool when the nature of particular events cannot allow for the full press corps. In many instances these decisions are often "strategic"—rewarding journalists or news organizations for favorable coverage and punishing others—or bypassing the astute pool for unaware local reporters at a campaign stop, knowing the latter are more likely to pose softball questions.

Conclusion

After September 11, 2001, the Department of Defense's official policy, in the press guidelines issued for the 2003 invasion of Iraq, changed from press pools to embedding. Yet the practice of embedding reporters has been likewise criticized for limiting or narrowing the access of journalists.

Although the pool system is still in place for presidential politics and campaigns, it has caused some tension among news organizations. Citing declining interest in traveling with President George W. Bush during the final months of his administration, the White House Correspondents Association modified its pool distribution policy in June 2008. The change, which ended distribution of pool reports to reporters who did not travel with the President, came in response to mounting complaints from larger news organizations who claim it is unfair to force them to share information with other organizations that do not budget for increasingly expensive trips with the President. Pool reports would still continue, however, for events or travel where open coverage is denied.

It is unclear whether this inter-news organization tension will continue during the administration of President Barack Obama, who has commanded a great deal of interest among various news outlets throughout his campaign and transition. While the decreasing number of pool members traveling with Bush could be partially attributed to a lack of interest in the lame-duck President, the tension could continue if news organizations increasingly experience economic turmoil and a corresponding need to decrease costs. Many have also speculated that new technology will influence the manner in which press and government officials interact. The use of the Internet during Obama's campaign and his promise to use new media to speak directly to the American people during his presidency has the potential to dramatically alter the power of the press pool to serve as an intermediary between government officials and the public.

Printing

Printing is the reproduction of text and images in quantity on paper. Modern printing has become highly sophisticated and more digital in nature

and has been transformed from art to science. New digital printing processes combine the use of advanced pre-media systems (preparation of content for printing or publishing), lasers, plates, presses, inks, papers, electronic controls, and digital imaging and printing systems.

Origins

Printing from movable (or exchangeable) type appeared in China and Korea in the eleventh century. The oldest known printed rather than manuscript text was printed from clay in Korea in 1397 A.D. In 1440, Johannes Gutenberg of Mainz (Germany) introduced printing with ink on paper to the Western world with his invention of movable cast metal type mounted on a converted wine press. Until Gutenberg's invention, all books in the West were laboriously handwritten or copied by scribes.

Changes in press construction evolved slowly until the first all-metal press was built in England by the Earl of Stanhope early in the nineteenth century. Expanded use of printing was spurred by the growth of book and newspaper publishing and the need to produce more copies of publications faster. During the Industrial Revolution the job (or platen) press and the cylinder press were developed. The first successful cylinder press, in which a rotating cylinder was used to press the paper against a flat type bed, was the steam-powered press built in London by German inventor Frederick Koenig. It was used for the London *Times* in 1814 and was capable of producing 1,100 sheets per hour. Cylinder presses provided the speed for high-capacity magazine, newspaper, and book printing.

Mechanized Printing

American Richard Hoe manufactured the first rotary press in 1846. The first such press was installed at the *Philadelphia Public Ledger*. Early models produced 2,000 impressions per hour. The first web (roll-fed) press was developed by American William Bullock in 1856. These early web presses delivered 15,000 signatures (multiple pages printed on one large sheet) per hour, printed on both sides. A device for folding the papers as they came from the press was added in 1875.

Letterpress printing (metal type) was replaced by offset lithography in the 1960s.

Lithography

The basic principle of lithography—"stone writing"—is based on the principle that oil-based ink and water do not mix. It was discovered by Alois Senefelder of Munich about 1798. Working on a highly porous stone, he sketched his design with a greasy substance that adhered to the stone. He then wet the entire surface with a mixture of gum arabic and water. It wet the blank or non-image areas, but the greasy image repelled the ink. An ink made of soap, wax, oil, and lampblack was rolled on the stone. This greasy substance coated the image but not the moist blank area.

Senefelder called his invention "chemical printing." Artists used lithography to make reproductions of artwork—drawings and paintings.

The first steam-driven press for lithography was invented in France in 1850, and introduced in the United States by Richard Hoe in 1868. Direct rotary impression for lithography was introduced in the 1890s using grained zinc and aluminum metal plates to which images were hand transferred from stones using starch-coated transfer sheets.

In 1906, the first "offset lithographic" rotary press began printing sheets in Nutley, New Jersey, an invention of Ira Washington Rubel. Offset lithography transfers the image from the plate to a rubber blanket and then to the paper.

Digital Imaging

The age of electronics and computers changed the way printed products were created and produced. The first printing production operation to be affected was typesetting with the introduction of the Intertype Fotosetter in 1949 and the Photon in 1954. Offset lithography did not need metal type and this accelerated the growth of photo offset preparation. In 1950, the PDI Electronic Scanner was introduced for color separations. To print color photographs, they must be "separated" into cyan, magenta, yellow, and black plates. Neither technology advanced until the 1970s, when the video display terminal (VDT) or television screen and computers were combined to improve electronic typesetting, and Electronic Dot Generation (EDG) and digital magnification expanded electronic typesetting.

The digital revolution in typesetting began in 1985 with the introduction of the plain paper

typesetter and the film imagesetter. In 1985 the imagesetter and Raster Image Processor (RIP) fostered the development of device-independent prepress systems known as Desktop Publishing that displaced the device-dependent Color Electronic Prepress System and eventually replaced conventional prepress systems.

Platemaking advances began with laser platemaking in 1975; laser engraved cylinders for flexography (printing from raised plastic plates) and *engraving* assists for gravure (printing from cells etched into the plate) in the 1980s; computer-to-film in the 1980s; to computer-to-metal plates in 1991.

Each modern printing process has three main operations: *Prepress, Press,* and *Postpress*. The first and last steps are very similar for all printing processes. The prepress step involves preparing text and graphics for printing. Before the introduction of electronics and computers in printing, most prepress operations were manual using handset type and/or typesetting machines, process cameras for making page films, film processing, manual color correction, film assembly, and page and signature layout (multiple pages on one plate). *Digital imaging* technology has replaced all of these manual metal and photomechanical operations; pages are now created and assembled on computer screens using desktop software.

Postpress or finishing is the operation for cutting, folding, assembling, and binding sheets into final form—and it is largely unchanged.

On the other hand, the press or printing step uses presses that are different for each printing process. There are two major classifications of printing processes: (1) *plate,* pressure or impact processes such as offset lithography, letterpress, flexography, gravure, and screen printing; and (2) *plateless* or dynamic processes such as electrophotography, inkjet, ion, or electron charge deposition, magnetography, thermal transfer printing, thermal dye sublimation, and electrocoagulation. It is predicted that newspapers will be printed using these new printing processes.

Plate printing processes use mechanical printing presses to exert the heavy pressure needed to transfer ink to paper and are the processes used to support long-run (many copies) magazines, newspapers, books, packaging, and other printed products.

Plateless printing systems are used for copying and digital printing. They produce an image during each cycle of the printing device. The image can be the same or can be changed from cycle to cycle. This feature enables digital printers to print variable information such as coding, addressing, and personalizing promotions and documents. The printing speed, however, is slower than plate processes, but there is no plate loading and no drying time. Therefore they are used primarily for short runs, on-demand, and/or variable information printing.

Ink-Based Printing Processes

All printing processes are concerned with

- *Image* or printing areas,
- *Nonimage* or nonprinting areas.

After the text and imagery have been prepared for reproduction (the prepress step), each printing process has definitive means of separating the image from the nonimage areas. Ink-based or conventional printing has four types of printing processes:

1. *Planographic*—printing and nonprinting areas are on the same plane surface and the difference between them is based on chemical properties—ink is either accepted or rejected. Examples are *offset lithography, collotype,* and *screenless printing*.
2. *Relief*—the printing areas are on a raised surface and the nonprinting areas are below the surface. Examples are *letterpress* and *flexography*.
3. *Intaglio*—the nonprinting areas are on a plane surface and the printing areas are etched or engraved below the surface. Examples are *gravure* and *steel-die engraving*.
4. *Porous*—the printing areas are on fine mesh screens through which ink penetrates, and the nonimage areas are a stencil over the screen to block the flow of ink. Examples are *screen printing* and *stencil duplicating*.

Planographic—Offset Lithography

Offset lithography uses thin aluminum metal or polyester plates with the image and nonimage areas

on the same plane. There are two basic differences between offset lithography and other processes: (1) it is based on the fact that *oil (ink) and water do not mix,* and (2) it uses the *offset principle* in which ink is transferred from the plate to a rubber blanket on an intermediate cylinder, and from the blanket to the paper on an impression cylinder.

On a lithographic printing plate, the printing areas are ink-receptive and water-repellent, and nonprinting areas are water-receptive and ink-repellent. When the plate mounted on the plate cylinder of the offset press is rotated, it comes into contact with rollers wet by a water or dampening solution and rollers wet by ink. The dampening solution wets the nonprinting areas of the plate and prevents the ink from wetting these areas. The ink wets the image areas that immediately are transferred to the blanket cylinder. The inked image is transferred by pressure to the paper as the paper passes between the blanket cylinder and the impression cylinder.

"Offset" is not a process. Letterpress and gravure (and even digital printing) can also be printed using the offset principle. A main advantage of the offset principle is that the resilient rubber blanket produces a clearer impression on a very wide variety of paper surfaces and other materials with both rough and smooth textures. Also, it extends plate life and reduces press makeready (the process of setting up the press for printing by loading plates, paper, and ink).

Both sheetfed and web (roll-fed) presses are used. Sheetfed lithography is used for printing advertising collateral, books, catalogs, greeting cards, posters, labels, packaging, folding boxes, decals, coupons, trading stamps, and art reproductions. Also many sheetfed presses can *perfect* (print both sides of the paper, which is also called *duplexing*) in one pass through the press. Web offset prints on rolls of paper and is used for printing business forms, daily and weekly newspapers, inserts, advertising literature, long-run catalogs, books, encyclopedias, and magazines.

Relief—Letterpress

Letterpress is the method of printing Gutenberg invented in 1440 and has been used for job and commercial printing. It is a *relief* method of printing that can print from cast metal type, molded duplicate plates (still used for some package printing), or photopolymer plates on which the image or printing areas are raised above the nonprinting areas. Viscous oil-base and ultraviolet (UV) inks are used. The ink rollers come in contact with the raised areas only, and the inked image is transferred directly to the paper. Commercial letterpress has declined in use because too much time was consumed in *makeready* (building up of the press form so both the light and heavy areas print with the correct impression). Letterpress makeready is a manual process that is very skill- and time-intensive and therefore very expensive. It is one of the main reasons that the letterpress has declined in use. It is still used for corrugated carton printing, imprinting, and numbering. Four types of presses were used: platen, flatbed cylinder, rotary, and belt. Letterpress is making a comeback in specialty printing using photopolymer plates and UV inks on narrow web presses.

Relief—Flexography

Flexography is a form of rotary web relief printing like letterpress but using flexible rubber or resilient photopolymer relief plates, and fast-drying low-viscosity, solvent-based, water-based, or UV-based inks fed from an anilox inking system (rollers with many cells in them to facilitate ink delivery). Most flexographic presses are web-fed in three basic approaches: *stack, in-line,* and *central impression cylinder* presses. Almost any material that can go through a web press can be printed by flexography—decorated tissue, plastic bags, pressure sensitive labels, corrugated board, and materials such as foil, cellophane, polyethylene, and other plastic films. It is well suited for printing large areas of solid color with high gloss and brilliance. The growth of flexography parallels the expansion of the packaging industry, especially flexible packages. Development was based on the central impression cylinder press, laser-engraved ceramic anilox ink metering systems, laser-imaged photopolymer plates, and water-based and UV inks.

Intaglio—Gravure

Gravure image areas consist of cells or wells etched or engraved into a copper cylinder, while the unetched surface of the cylinder represents the nonprinting areas. The image cylinder rotates in a

bath of ink. The excess is wiped off the surface by a flexible steel *doctor blade*. The ink remaining in the thousands of recessed cells forms the image by direct transfer to the paper as it passes between the plate cylinder and the impression cylinder. Three types of processes are used for making gravure printing cylinders: (1) *chemical etching* produces cells of the same size or area with varying depths; (2) *electromechanical engraving* produces cylinders with cells that vary in area and depth; and (3) *direct digital laser etching* produces cells of varying area and depth. Gravure printing produces excellent reproductions of pictures, but slightly ragged type. The high cylinder-making cost usually limits use to very long runs. The use of halftone and filmless gravure has reduced these costs and made gravure competitive in certain shorter run markets. Gravure is used for long runs of newspaper supplements, circulars, magazines, catalogs, as well as special products such as wallpaper and packaging. Cylinders can be reused many times. Many magazines and catalogs are hybrid publications—part gravure and part lithography. The long-run editorial sections are gravure and the short-run geographic, demographic, and advertising sections are printed with offset lithography. All pages are then assembled in automated bindery systems.

Porous—Screen Printing

Formerly known as silk screen, this method once employed a *porous* screen of fine silk, nylon, dacron, or stainless steel mounted on a frame. Many materials are now used to make the stencil, which is produced, manually, photomechanically, or electronically. Printing is on a wide range of substrates under the screen by applying ink with a thick consistency forced through the fine mesh openings with a rubber squeegee. The production rate, once limited by the drying time of the ink, has been increased by the development of automatic presses, improved dryers, and new UV inks. Most presses are flatbed. Rotary screen presses speed up production considerably because they allow continuous operation. Screen printing usually can be recognized by the thick layer of ink and is used for fabric, apparel (especially T-shirts), signage, and specialty materials.

Lithography, letterpress, flexography, gravure, and screen printing account for the majority of all reproduction on paper and special substrates; however, digital printing processes are making rapid inroads because of their ability to more effectively handle very short runs and variable information printing.

Digital Printing Processes

Copying and digital duplicating are also called *reprography* or *reprographics*. For fewer than 100 copies, the copier has been the fastest and most economical method of reproduction—if only hard copy originals are available. Above 100 copies, high-speed copiers and/or duplicators are used, but these are now mostly *digital printers* and can accept hard copy or digital files. Reprography is used extensively by in-house printing departments and quick printing shops. The only method for making copies of documents before 1940 was the photographic print called a *photostat,* that was time-consuming, and expensive. In the 1950s the 3M Thermo-Fax used heat to make copies. The Xerox 914 in the 1960s was the first to introduce plain paper copying using electrophotography (toner). Subsequently, a number of photocopying systems were developed, such as photo-based diffusion transfer processes that were popular in Europe. Electrophotography (toner) has dominated the copier market, but inkjet printing is making inroads.

Electrophotography, also called *xerography or electrostatic printing,* is based on electrostatic transfer of toner to and from a charged photoconductor surface. Copiers use electrophotographic coatings such as selenium, cadmium sulfide, zinc oxide, or organic photoconductors to produce the images in the copier. The photoconductor converts light energy (photons) into electrical energy (electrons). These coatings are charged with a corona discharge in the dark and lose the charge on standing or when exposed to light, such as that reflected from the white areas of an original or by a laser or other light source. The image areas that remain charged are developed with an oppositely charged dry powder or liquid toner and are transferred from the electrophotographic surface onto plain paper using electrostatic attraction. The electrophotographic coating is cleaned and can be reimaged many times. Color copiers use similar principles but they have four or more colored toners rather than one. The term *digital press* implies

a higher level of operating speed and capability for production applications.

Copiers are no longer manufactured as such. The function of copying a hard copy original is now performed by multifunction printers (MFPs). These devices incorporate a scanner, a digital printer, and a Digital Front End (DFE) to accept files. They can scan, print, fax, and copy. Fewer and fewer copies are made as more and more files are sent to these devices for printing. MFPs may be black-and-white (also called monochrome) or full color. Printers theoretically produce originals, and copiers produce copies—but the term *copy* is used in both cases.

Duplicating

Before copiers and digital presses, copies of pages in quantities from 50 to 5,000 were produced on offset lithographic duplicators. There were offset presses in sizes up to 12 by 18 inches (A3+). The offset duplicator was the mainstay of the printing industry and allowed many entrepreneurs to start printing companies. Copier/duplicators were once small offset presses with online polyester plate-making. Over time they became high-speed copiers that "photographed" paper originals, and today they are digital printers. Stencil and spirit duplicators are based on the mimeograph that was invented by Thomas Edison and marketed by Albert Blake Dick. They work by forcing ink through a porous stencil and produce copies on plain paper. New versions of these printers use digital files to image the stencils.

Digital Prepress

Prepress processes advanced from metal assembly to paste-ups to film. New filmless digital imaging processes create page images directly on printing plates for conventional printing, or directly on plateless presses from computer files. These are called *computer-to-* or *direct-to*-printing processes. The three types of filmless digital printing processes are (1) *computer-to-plate* (CTP), (2) *computer-to-plate-on-press* (DI for direct imaging), and (3) *computer-to-print* (digital printing). All categories use essentially the same prepress digital files output from page composition software, page description languages, and raster image processors (RIP) to drive the lasers or imaging systems of the marking devices.

Digital Printing

Conventional printing uses plates that contain the text and images to be reproduced in quantity on a mechanical press that feeds inks to the plates and exerts heavy pressures to transfer the inked images to paper or other substrate. Digital printers apply copier and new digital technology and use dynamic image carriers. Each cycle of the printer transfers a fresh image to the substrate. It can be the same or different than the previous image. This feature makes it possible to print variable information from print to print, which conventional printing cannot do. It also allows electronic collation which assembles all pages of a publication in order. Digital printing is used for short-run, on-demand printing (print immediately), but the speed for larger and longer-run documents is slower than plate processes.

Digital printing began in 1970 with the introduction of inkjet printing, followed by electrophotographic (EP) laser printers in 1978; color electronic laser printers in 1993; and many EP and inkjet color printing presses introduced since 1995. Other digital printing technologies are Magnetography, Thermal Transfer, Thermal Transfer Dye Sublimation, and Inkjet printing.

Printing today is digital in some manner and all printing technologies accept digital files. Static printing uses an image carrier (plate or cylinder) that makes every impression exactly the same. Digital printing refers to any printing process that does not use a fixed-image image carrier (a plate, for example). The process is based on the regeneration of printed information for each and every impression of a particular job. Toner, solid ink, and inkjet (in all its forms) are considered digital printing. DI printing (imaging plates on-press) or CTP (imaging plates off-press) are digital in nature, but not digital printing. Over time, offset lithographic plates will be imaged on reusable image carriers on-press and the age of "plateless" conventional printing will begin.

Computer-to-Print (EP) Systems

All purely digital printing systems accept digital files and thus become computer-to-print digital

printing systems. They may use electrophotographic photoconductor, inkjet, ion- or electron-charge deposition, magnetography, thermal transfer, and thermal dye sublimation technologies, among others. They are called variable data printing systems because each impression is regenerated and can then include personalized information from a database. Each impression is an original. A copier makes a second-generation copy.

Magnetography and electron deposition printing use special magnetic toners to produce the printed images. In these processes, there is less need for heat to fuse the toner, and thus a wider array of papers may be used, especially when litho is used for pre-printing.

Thermal transfer uses thermal print heads that melt spots of dry thermoplastic ink on a donor ink ribbon and transfer them to a receiver to produce

color labels, logos, wiring diagrams, bar codes, and other similar products. Thermal dye sublimation printers are like thermal transfer printers except the inks on the donor ribbons are replaced by heat-activated dyes. The thermal head converts the dyes to gas spots that condense on the receiver.

Inkjet systems use jets of ink droplets driven by digital signals to print directly on paper or other substrates. The first plateless digital printing system was an inkjet imager introduced in 1970. Two types of inkjet systems are in use:

- Continuous inkjet (CIJ)
- Drop-on-demand (DOD)

Continuous inkjets are used for direct mail and transactional printing, digital color proofing, and variable information on-press color printing systems at speeds up to 1,000 feet/minute.

Drop-on-demand inkjets are divided into *Thermal, Piezo,* and *Solid Ink/Phase Change* digital printing systems.

Thermal inkjet uses heat and *piezo* inkjet uses pressure to create droplets of ink.

Solid ink begins as a solid and is melted to produce drops. Inkjet systems are rapidly gaining in use, especially since new inks have been developed with light- and water-fastness properties for printing on different substrates. There are also *large format* web-fed and flatbed printing systems used for producing displays, murals, outdoor exhibits, posters, and paneled billboards. Water-based (aqueous), solvent, and UV inks are used depending on the printer type. Early water-based inkjet inks used dyes; today many use pigments.

Press Configurations

Printing presses and digital printers are either sheetfed or roll-fed (also web-fed and continuous feed). Sheetfed presses are used for commercial printing where lightweight and heavyweight paper stocks can be easily changed. Roll-fed presses are used for printing longer runs on lighter-weight stocks for magazine, catalog, and newspaper publications.

Presses and printers are further categorized by the sheet size (40-inch presses can print eight pages on one side of the sheet at one time) and roll-fed presses use the width of the roll and the cut-off in defining size. Most publication roll-fed presses cut and fold the paper into units called signatures that contain 4 to 64 pages. Most packaging roll-fed presses are roll to roll.

The printed newspaper is facing many challenges—from electronic readers and distribution to blogs and mobile news access. As print circulation declines and page sizes shrink, newspaper printing is projected to move to digital printing (toner, inkjet, and other methods). These devices do not use plates that print many copies of the same content. Digital printers allow printing of individualized newspapers with information aggregated for one person. Journalism arose because of the printed newspaper and today extends into television, radio, and the web. But the printed newspaper will metamorphose from a mass-produced publication to one that is more personalized and the technology to produce it is at hand.

PRIVACY

The concept of privacy has always been a bit of an outcast in American jurisprudence. The source and scope of a right of privacy has been the subject of debate in both the scholarly literature and in the courts since the late nineteenth century. Over the years, however, concerns about the collection and

dissemination of private information have caused lawmakers and courts to increase efforts to ensure individual privacy. These efforts sometimes come in conflict with the business and practice of journalism, and it appears likely that if compromise is not reached, lawmakers and courts will continue to attempt to place restrictions on journalistic practices. The law has changed and continues to change.

The Legal History of Privacy

Much of the controversy over the right to privacy arises from the fact that this right is not specifically enunciated in the Constitution, though it is implied in the Third Amendment prohibition against the quartering of soldiers in private homes and the Fourth Amendment prohibition against unreasonable searches and seizures. In addition, courts were slow to recognize that harm—mental harm in particular—could occur as a result of an invasion of privacy. Not until 1928 did the Supreme Court, in *Olmstead v. United States,* recognize that there may, indeed, be what Justice Louis Brandeis called a right "to be let alone."

The phrase, which, in fact, had been used some 40 years earlier in a treatise on tort law, caught on and was used in a number of Supreme Court cases through the years. In *Rowan v. U.S. Post Office Department* in 1970, for example, the Court in a junk-mail case involving pornographic material, held that "the right of every person to be let alone must be placed in the scales with the right of others to communicate." "The ancient concept that 'a man's home is his castle' into which 'not even the king may enter,'" the Court wrote, "has lost none of its vitality, and none of the recognized exceptions includes any right to communicate offensively with another." And, in one of its most controversial cases, *Roe v. Wade* (1973), the Court used the right of privacy as part of its rationale for providing women, in some circumstances, with the right to have abortions.

Invasion of privacy, therefore, is a relatively recent tort (civil wrong) in American jurisprudence. Philosophically it traces its origins to a law journal article that Louis Brandeis co-authored long before he joined the Supreme Court. Professor Samuel Warren was apparently impatient with the way the media covered the wedding of his daughter and recruited his colleague on the Harvard Law School faculty to help with the article. "The Right of Privacy" was published in 1890 in the *Harvard Law Review,* and advocated the same right to be left alone that Justice Brandeis would write about nearly 40 years later.

In the meantime, advancements in technology related to the collection and dissemination of information increased interest in the concept of protecting individual privacy. Concerns about how the use of the telephone and camera could invade an individual's privacy by making it easier to publicize private information increased with the development of telephoto lenses, listening devices, and video. With such developments, concerns about the "publishing" of private information became concerns about "publicizing" the information—that is, disseminating it to a large audience through the mass media.

The Body of Privacy Law

It wasn't until the mid-twentieth century, however, that some structure to the tort emerged, primarily thanks to the work of legal scholar William Prosser, the dean of the law school at the University of California at Berkeley. As a reporter for the *Restatement (Second) of Torts* (1977), a reference work for attorneys, and in an article in the *California Law Review,* Prosser proposed that "invasion of privacy" actually constituted four separate and distinct torts: appropriation, intrusion, the publication of private information, and false light invasion of privacy. Each protected specific rights that could be called privacy rights, and each had its own burden of proof and defenses.

Appropriation

Appropriation is the use of the name, likeness, or image of a person without permission for commercial gain. That is, three elements are necessary for a case to be made: (1) use of a likeness (visual or aural), (2) without permission, (3) for commercial gain. Clearly, the use of the image of a celebrity in an advertisement is appropriation, but the tort extends beyond such uses. One need not be a celebrity in order to bring an action. Indeed, a number of appropriation cases have been brought by individuals whose photographs were used without their permission in advertising.

Newsworthiness is generally considered a defense for news media when they are accused of appropriation. That is, if the use of a person's image is part of bona fide news or information reporting, the use is not considered to have been for commercial gain, even though the outlet is a for-profit business. Similarly, news media are allowed to use the images of individuals in order to promote their newsgathering and dissemination operations. That is, the media may appropriate the images of newsworthy individuals for the purposes of advertising their news products.

Intrusion

Intrusion is the physical invasion of a place where an individual has a reasonable expectation of privacy. Publication is not part of the burden of proof—the tort occurs with the physical invasion by use of recording devices, telephoto lenses or by trespassing or entering a place under false pretenses. Intrusion is not recognized by all states, but the interests at which the tort is aimed—that is, protecting individuals who have expectations of privacy—are protected through "peeping Tom" laws, laws prohibiting trespassing, and laws prohibiting the surreptitious taping or photographing of individuals. Such activities are intrusive and may be the subject of both criminal and civil actions, even if jurisdictions do not specifically recognize the tort of intrusion.

Private Information

The publication of private information is the classic invasion of privacy tort where the media are concerned. Publication of private information involves the widespread dissemination of information about an individual that was previously unknown and not subject to disclosure. For the tort to be successfully claimed, a plaintiff must prove (1) that there is publicity (2) about private facts (3) that are not of legitimate public interest and (4) would be considered highly offensive by a reasonable person.

"Publicity," for purposes of invasion of privacy, is not the same as "publication." Publicity means that the private material must be published to a large number of people. Simply reporting the private information to only a few would not qualify as invasion of privacy. In addition, the published information must have been private before the publicity made it widely known. Clearly, nothing that happens in public—on public streets, parks, stadiums or theaters, shopping centers, or in any other public places—can be considered private. In addition, nothing that can be seen from such public places is private. Events occurring on private property, for example, are not private if they can be witnessed by passersby or from otherwise public space. Information is also not private if it appears in public documents, even if few people knew of the information before the publicity. Publicizing something that is well known is insufficient—the information must genuinely be private before the publicity.

The fact that the information was private, however, does not necessarily provide sufficient grounds for a successful lawsuit. The information—or its dissemination—must also be highly offensive to a reasonable person. The standard is subjective, but neither the sensibilities of a highly sensitive nor of a highly calloused individual are considered. The information must be highly offensive to a reasonable person. A classic case is *Barber v. Time* (1942), in which *Time* magazine published a story about Dorothy Barber, who the magazine called the "starving glutton" because no matter how much she ate, she continued to lose weight. The magazine also published a picture of Barber, taken in her hospital bed without her permission. The court ruled that, while the press has the right to take photographs of people in public, that right does not extend to a hospital room where a patient does not give consent. The right to be let alone in such circumstances is not outweighed by the right of the press to take and use such pictures.

Newsworthiness is a defense for a private information lawsuit, because the plaintiff must prove that the private information is not of legitimate public interest. Two cases demonstrate how newsworthiness can trump the other elements of the private information tort. The 1982 case *Cape Publications v. Bridges* began when Hilda Bridges was abducted from her workplace by her estranged husband, taken to their former apartment, and held hostage. The husband forced her to disrobe, thinking her nudity would prevent her from attempting to escape. Eventually, the husband shot himself, and Bridges ran into the street as police

stormed the apartment. A picture of her, nude and distraught, was published by a local newspaper. The judge in her invasion of privacy suit expressed sympathy for her plight, and it was clear that the publication of the photos was highly offensive to a reasonable person, but the event was also newsworthy. "Just because the story and the photograph may be embarrassing or distressful, . . ." the judge ruled, "does not mean the newspaper cannot publish what is otherwise newsworthy."

Similarly, Oliver Sipple was unsuccessful in his invasion of privacy suit against the *San Francisco Chronicle*. Sipple had knocked away the gun hand of an attempted assassin of President Gerald Ford. The resulting publicity about the heroic act also included the news that Sipple was gay, a fact unknown to a number of his relatives. The court found Sipple's sexual orientation (known in San Francisco) newsworthy, dooming the invasion of privacy suit.

False Light

Offensiveness is also an element in the burden of proof for false light invasion of privacy. The false light tort is particularly problematic because of its resemblance to libel, that is, because its focus is on the publication of information about a person that is false. For that reason, some courts have ruled that the tort is no longer recognized in their jurisdictions. In order to prove false light invasion of privacy, a plaintiff is required to prove that the published material is not only false, but also is highly offensive to a reasonable person and was published with "actual malice," that is, with knowledge of falsity or with reckless disregard for the truth. A plaintiff is not required to prove that the published material is defamatory, however. Indeed, some successful lawsuits have been based on the publication of glowing descriptions of individuals who, nevertheless, found the reports highly embarrassing.

The key false light case is *Time, Inc. v. Hill*, which was decided by the Supreme Court in 1967. *Life* magazine published a story about the opening of a play based on the novel *The Desperate Hours*. As part of the story, the *Life* reporter recounted the experiences of members of the Hill family, who were held captive in their home by escaped convicts. The story did not defame the Hills, but they found it highly offensive because it misrepresented their experiences and their relationships with their captors. They sued for false light invasion of privacy and initially won. The Supreme Court, however, overturned the verdict, finding that plaintiffs bringing false light cases must prove actual malice, as defined by the Court in *New York Times Co. v. Sullivan*. The Hills chose not to continue and dropped the case (future President Richard M. Nixon was their attorney).

Beyond Invasion of Privacy

In recent years, however, privacy concerns have extended well beyond the four invasion of privacy torts. In an increasingly technological society, where information is becoming ever easier to access, citizens are becoming more concerned about their privacy, and governments—both state and federal—are responding. The federal Freedom of Information Act, for example, first adopted in 1966, has specific exemptions aimed at keeping personal information about individuals private. In 1974, Congress passed the Privacy Act, in part to supplement the FOIA and give government employees who possess documents more power to keep those documents private.

In addition, in 1994, Congress passed two laws aimed at keeping specific information private: the Family Educational Rights and Privacy Act (1994), called the "Buckley Amendment," which requires educational institutions to keep private certain information about their students; and the Driver's Privacy Protection Act, which limits access to information about persons who have driver's licenses.

As with other areas, the Internet has complicated the issue of privacy. More states are struggling with the issue of online availability of information that has previously been regarded as clearly open (though not so easily obtainable). It concerns lawmakers that information from divorce proceedings, for example, might be accessible by home computer; such information was always accessible, but only by visits to the courthouse. The so-called doctrine of practical obscurity was, because of the inconvenience involved, held to provide a degree of privacy protection. As computer technology breaks down such "obscurity," lawmakers are seeking other means of ensuring privacy.

Given changing technology, privacy concerns, therefore, are likely to continue to be a driving force for both state and federal lawmakers—and of concern to news media.

Producers

Producers are the hidden "voice" of broadcast and especially television news, in local and network newsrooms. Though we rarely see their faces or hear their voices, they control virtually every word that is written in television news, and make the decisions that set the daily news agenda for local and national television and radio programming. Any broadcast or cable news program has been managed by at least one producer, and often many in different roles have shaped the final product.

When most people think about producers, they think about Hollywood film or Broadway theater producers. But while broadcast news producers are rarely involved with the finances or staffing of their programs, they are the key content people. News producers have their hands in every aspect of broadcast or cable news programs, from deciding what stories will be covered and how they will be presented, to the researching, reporting, and writing of those stories, which includes choosing graphics, video, and production elements. Producers also control timing of the newscast, and communicate with talent and production crews during the live presentation. Most broadcast or cable newsrooms today are managed from a "producer-centered" perspective, meaning the producers are the center of the decision-making process about what ends up on the air, or on any of the other distribution platforms those newsrooms now serve, including the Internet, and mobile devices.

Development

The modern dominance of the producing role in broadcast news can be traced back to early television network news programming in the late 1940s and early 1950s. Prior to television, most radio news was written and produced by the reporters and anchors who also delivered it. Two of the earliest network news programs were Edward R. Murrow's *See It Now* (1951–57) documentary series, and the weekday evening *Douglas Edwards and the News* (1948–62) on CBS. The names behind those news programs are almost as famous as the faces and voices viewers knew so well. Fred Friendly, who went on to (briefly) serve as CBS News president, was Murrow's producer and Don Hewitt, later the creator and executive producer (until 2004) of *60 Minutes,* was the creator and producer of the Douglas Edwards broadcast.

At the network (CBS, NBC, and ABC) level, producers such as Friendly and Hewitt had a great deal of influence over their broadcasts. They managed the content working closely with the anchors/hosts of the programs, but those anchors would by the 1960s have the final say on editorial decisions. In a practice begun by CBS's Walter Cronkite, anchors of the major broadcast network evening newscasts carry the title of "Managing Editor" which suggests their editorial power over news

content. At most local stations, however, the role of the news producer developed much later.

In early local television newsrooms, individual reporters and the assignment desk were the focal points for coverage decisions, and news anchors might more typically decide the order in which the stories would be broadcast. If there was a producer, that person was really not much more than an assistant to the anchor, helping with writing, distributing scripts, and maybe sitting in the control room during the live news program to help with timing. But most early producers in local television news had little editorial control or decision-making power.

The television viewing public got one of its first glimpses of this local producing position in the 1970 hit situation comedy, *The Mary Tyler Moore Show*. Actress Mary Tyler Moore played Mary Richards, a single woman who worked in a Minneapolis television newsroom as an assistant producer. Her role as primarily the "Girl Friday" to the egotistical anchor, and the gruff news manager, wasn't that different from the one local television news producers were then playing in real newsrooms. During the seven years the award winning show was on the air, viewers saw Moore's character grow in responsibility and influence in the newsroom. By the late 1970s, the same thing was happening in local television newsrooms.

In the late 1970s and early 1980s, technology was changing the complexity of television news and dramatically compressing story production time. The change from film to videotape cut processing time out of the production process, allowing for the appearance of more recent events in newscasts. The introduction of portable equipment that enabled live coverage allowed reporters to send news from the scene of a story or send videotape back for immediate broadcast. Whereas previously reporters and photographers would have to be back at the station by 4:00 p.m. for a 6:00 p.m. broadcast, now they didn't have to come back at all and could still be shooting a story at 5:30 p.m. that might lead the 6:00 p.m. broadcast. Improved means of generating graphics and better production technology added more production value and visual interest to the newscast.

In addition to rapid technological improvements, in the early 1980s local television stations, building on the attraction of news to viewers and advertisers, began adding more newscasts, expanding from a half-hour at six to an hour, and then 90 minutes in the late afternoon and early evening. They also expanded morning news, and added a half-hour at noon. No longer could one or two people write, produce, and anchor a newscast. There was a need to manage all the elements of multiple newscasts, especially during live transmission, and the manager of those elements became the local news producer. Assistants to the anchors, now full-fledged producers, also gained more control over the editorial content of the newscasts with the increased technological complexity and expansion of "live from the scene" reporting.

By the early 1990s, local television producers had as much influence over local newscasts as their network counterparts. Most station newsrooms were described as "producer-driven," clearly indicating the importance and power of the position. And development of the producing role helped to move women into more prominent positions in television news. As accurately portrayed in *The Mary Tyler Moore Show,* most of those assistants to the anchors, or assistant producers, were women. As the positions grew in importance and power, so did the role of women in television newsrooms. A 1990 survey of television news employees found two-thirds of the producers were women. And as television newsrooms became "producer-driven," the career track to upper level news management shifted from on-air reporting and/or anchoring to the vital behind-the-scenes producing role.

Producer Types

There are four types of producers in television (and some larger radio station) news and their roles range from overseeing content and production of an individual story, to management of an entire newscast, to control over multiple newscasts.

Field Producer

A field producer works very much like a reporter, but is not the face or voice of the story on the air. At most television stations, reporters are their own field producers. They do the research, interviews, writing, and sometimes technical video and/or sound editing of their stories. In larger local stations and at the network level, a field producer

will often do much of the work putting a story together, including research, setting up interviews, writing, and overseeing final editing. A reporter or anchor will then record the script and perhaps go out into the field and conduct interviews that the field producer sets up, as well as do a stand-up (the part of the story where the reporter talks on camera). Field producers are often used for special reports, such as consumer or health stories; investigative reports; and in-depth stories, such as the segments of a news magazine program like *60 Minutes* or *20/20*. They may oversee more than just a single story when there is breaking news or a major event. In that case, much of the coverage of the story will be live from the story scene, so a field producer, or multiple field producers, will supervise coverage from the site such as candidate headquarters on election night or the site of a terrorist attack or natural disaster.

The viewing public was able to see what a field producer does in the 1987 movie *Broadcast News,* in which Holly Hunter played a network field producer who eventually became the supervising producer for an evening news broadcast.

Line or Show Producer

Line or show producer is the position most typically thought of when the title "producer" is used. The line producer is in charge of an entire newscast or news program, or of one segment, such as weather or sports. Line producers manage every part of the newscast and are responsible for everything from the choice and look of the lead story to the spelling of an individual name or location graphic used in that story. They decide what stories will go into their newscasts, in what order those stories will air, how long and in what format the stories will be, which stories will be promoted, and which will be live from the field. Line producers have to write many of the stories in their newscast, decide which stories will use graphics and what those will look like, and communicate every detail of the newscast with reporters, anchors, video/audio editors, graphics artists, production crews, and news managers. While the newscast is on the air live, the line producer has to time the program to make sure it ends on schedule. The line producer is also communicating with live locations in the field, with the anchors, and with the director of the program, to make sure everything is going on the air correctly. Because of their experience in the control room during live newscasts, line producers typically call the shots during live breaking news coverage. With no scripts and no rundowns to guide what goes on the air, the line producer will have to decide on the fly what comes next and communicate that to everyone as it is broadcast. There's nothing more stressful for a producer than live, breaking news producing, but many will tell you, there's also nothing more exciting. The movie *Broadcast News* also gave viewers a relatively realistic view of breaking news producing during the scenes of network coverage of a crisis in the Middle East.

Executive Producer

The executive producer manages other producers and newscasts. The executive producer might have responsibility for overseeing all newscasts of a local station; a group of newscasts, such as the morning and noon news or the early evening newscasts; or perhaps just one newscast. Larger stations are likely to employ multiple executive producers, while smaller stations may only have one. At the network level, each news program has its own executive producer

The executive producer approves the producer's line-up of stories, reviews scripts, and works with reporters on how their stories are developing as well as approving their scripts. The executive producer is the "big picture" person who helps to make sure that each news program follows the overall philosophy toward news and the news audience of the station or network. This is a management position which helps determine the strategic direction of the newsroom and implements that strategy in individual programs. The executive producer also is typically the person who will lead the planning for special event coverage, such as on election night.

Special Projects Producer

This type of producer does not work on daily news programs, but as the name implies, works on special projects that may air during newscasts. A special projects producer will likely oversee feature areas such as health and consumer affairs, investigative reports, and multipart stories produced most

often during sweep periods when local audiences are counted to determine what advertisers will pay. Special projects are usually produced ahead of time and are highly promoted to draw in viewers. The special projects producer may actually field produce segments or stories, or simply supervise the work of other producers and/or reporters.

At the national news level, the cable or broadcast networks will have several producers in each of these categories, for each news program produced. Such credits may include Washington or New York producers, senior producer, supervising producer, foreign producer, assistant producer, segment producer, etc. Most of those titles fit into one of the categories described here, depending on what the producer's responsibilities are.

Producing Pioneers

While many notable producers could be recognized, the following list presents a few who helped define early network television news producing.

Roone Arledge (1931–2002)

Arledge is often most closely associated with his pioneering work in sports broadcasting. It was his success with producing sports programming that led to his taking over the news division for ABC and revitalizing that network's evening news program—taking it from a struggling last place to a ratings winner. An idea for a show called *For Men Only,* modeled after *Playboy* magazine, got Arledge started in network television and on the road to creating a sports and news dynasty. While *For Men Only* never actually aired, the originality of the concept caught the eye of an ABC executive who was about to take the fledgling network into sports programming. In 1960, producing his first college football game, Arledge broke the boundaries between the camera and the sporting event, taking viewers down on the field. From there he created and produced *Wide World of Sports, Monday Night Football,* and ten ABC Olympic broadcasts.

His success with sports led ABC to name him president of the struggling news division (while retaining the sports division) in 1977. Arledge created *20/20* and then reshaped the evening news broadcast to create *ABC World News Tonight,* using many of the same flashy graphics and production techniques he had pioneered in *Wide World of Sports*. He also took the anchors out of New York, and put one in Chicago and one in London, in addition to a third anchor in Washington, though the format did not last long. In 1979 Arledge changed late night television by initiating the series of special reports on the Iranian hostage crisis that became *Nightline*. He also helped develop a strong cast of on-air personnel and behind-the-scenes producers. Arledge stepped down as president of ABC Sports in 1986 but remained president of the news division until his retirement in 1998.

Reuven Frank (1920–2006)

Frank is often credited with bringing television out of radio's shadow by always stressing the pictures. He wrote in a famous 16-page memorandum on his creation, *The Huntley-Brinkley Report,* that "Pictures are the point of television reporting." Frank started his news career as a reporter for the *Newark Evening News* in New Jersey. In 1950 he moved to NBC News and in 1956 he teamed Chet Huntley, broadcasting from New York, with David Brinkley, broadcasting in Washington, to create the network's first news superstars. *The Huntley-Brinkley Report* dominated network television evening news ratings well into the 1960s. Frank's memorandum on the format and look of the newscast was detailed even down to camera angles, and included guidelines for the visual storytelling techniques he believed were the heart and soul of television. The memorandum became a blueprint for television newscasts everywhere. Frank also produced documentaries, including the 1962 Emmy award winning, *The Tunnel,* which detailed the escape of Germans through a tunnel under the Berlin Wall. Frank was president of NBC News for two terms, from 1968 to 1972 and 1982 to 1984.

Fred Friendly (1915–98)

Friendly often falls behind Edward R. Murrow's shadow, but he was truly a pioneer in his own right in producing documentary news programming, first for radio and then for television. He started his news career in radio in the 1930s at a station in Rhode Island. In the late 1940s he began his first producing project with Murrow, developing

historical news event record albums for Columbia Records. He experimented with the use of audiotape from radio news coverage in these albums, and when he did not have the actual tape from the news report, he would re-create the event on tape (which to this day causes headaches for historians because he didn't identify which was real and which was re-created). Friendly also did a stint with NBC radio, producing a news-oriented quiz show, and a 1950 radio series called *The Quick and the Dead* on the atomic bomb which brought together broadcast and print news reporters and the star power of comedian Bob Hope as host. That award winning series led to his full-time job at CBS where he worked with Murrow to produce the CBS Radio documentary series *Hear It Now,* which moved to TV as *See It Now* in 1951, becoming one of the first regularly scheduled television documentary series. A 1954 *See It Now* program critiquing Senator Joseph McCarthy is often credited with helping end the senator's anticommunism crusade and was portrayed in the 2005 movie *Good Night and Good Luck*.

Friendly continued his groundbreaking work in news documentary with *CBS Reports*. As *See It Now* and the *CBS Reports* programs increasingly moved out of the studio and into the field, Friendly incorporated video and natural sound (the sounds other than dialogue heard at a particular scene, such as the crowd cheering at a sporting event, or trees rustling in the wind) in ways that moved television news production toward maximizing what the medium could do best. In 1966 Friendly, who had only shortly before become president of the CBS News Division, resigned in protest when the network cancelled live coverage of Senate hearings on the Vietnam War. After leaving CBS, Friendly was instrumental in helping to get public television and the PBS network established, and he taught broadcast journalism at Columbia University.

Don Hewitt (1922–2009)

Although Hewitt was trained as a journalist and worked the first five years of his career at the *New York Herald Tribune,* when he came to CBS in 1948, he was as involved with the production side of news as he was with content. He was the producer and director for the network's evening newscast for 14 years. He also directed Murrow's *See It Now* program and the first televised presidential debates between Nixon and Kennedy in 1960. As the executive producer for the *CBS Evening News with Walter Cronkite,* Hewitt helped create "the most trusted man in America." He was instrumental in developing many aspects of network evening news. But he is best known for creating the first television news magazine program—and the longest-running prime-time broadcast program—*60 Minutes,* in 1968. Hewitt remained executive producer of *60 Minutes* with a very tight control over story content until he retired in 2004 at age 81.

Al Primo (1938–)

Primo worked in the early days of local television news, and took station producing to a new level with the creation of the first format type exclusively designed for local television news. Primo debuted what he called *Eyewitness News* in 1959 in Cleveland and then took it to Philadelphia and New York, successfully beating the competition in both cities. The format made heavy use of reporters as "eyewitnesses" for the anchor in the studio and the viewer at home. Perhaps less impressively, Primo is also credited with creating "happy talk," in which the studio anchors chat about stories with weather and sports anchors. The *Eyewitness News* format spread across the country and internationally, eventually being used by more than 150 stations in the United States and in Mexico, Canada, Japan, and Australia. A handful of U.S. stations still use the *Eyewitness News* name. The success of the format also led to the development in 1965 of a rival format, *Action News,* which incorporated more short stories and video or some visual element for each story. *Action News* is also still in use by a few stations.

Concerns

As journalism moves through the incredible technological and content changes of the early twenty-first century, several concerns have specifically targeted television news producers. The age and experience level of news producers has been a worry for years, and it continues to be a problem. Good news producers in radio or television are difficult to find and keep at stations and networks. The job is very demanding and stressful, requiring

someone with great writing skills, quick decision-making ability, solid news judgment, creativity, people management skills, and the ability to work well despite deadline pressure. Because of the high stress level, producing tends to be a job for younger people, though one with a high burnout rate. There is a widening gap, especially in local television newsrooms, in age and experience between producers who control news programs, and the anchors and reporters who appear on those programs. A 2001 survey of local television news producers, anchors, reporters, and news managers found that more than 60 percent of anchors had ten-plus years of experience, but only 20 percent of producers had that many years in the news business. News managers and anchors express frustration about the inability to hire producers who not only possess journalism experience but who also have more general life experience, which can assist their daily news story judgment calls. Young producers are less likely to know the communities in which they broadcast, have historical context for stories, or relate easily to the typically much older audience for news. One anchor in the survey said, "Children are producing our newscasts."

Related to both age and experience is a concern over flash versus substance. Younger producers, raised with MTV, video games, and digital media, are increasingly pressured to produce television newscasts that will attract younger viewers like themselves—the audiences of most interest to advertisers. As technology continues to make graphics, music, and other production tools that are easier to use and less expensive, producers focus more on adding movement and sound to their news programs than on story content. A choice between a celebrity story and one on economic trends may land on the side of entertainment rather than journalism. In addition, pressure to be the first with breaking news tends to limit journalism judgment. A television news producer today is often pushed to change a newscast rundown (one that he/she may have worked all day crafting) to find airtime for an accident or crime story that breaks before or even during the newscast. Too often, substantial stories are dropped to accommodate what may be a minor but visually exciting story that just happens to break as the newscast goes to air. This pressure to have more live and breaking news forces producers to continually shuffle their newscasts and communicate with live crews and make instant decisions, with little time for the careful thought that went into the original newscast rundown.

Finally, television news producers are being asked to do more than ever before. The expansion of broadcast content to the web, cell phones, MP3 players, and PDAs (and whatever comes next) has put extraordinary pressure on producers. They are often the ones responsible for making sure their news content is effectively distributed to these multiple platforms.

Conclusion

Broadcast news producers are the people most directly responsible for the news heard on television, cable, radio, and increasingly, many websites. Producing is a high power, high stress job best suited to those who thrive under deadline pressure, who like to be in control, and who can juggle multiple tasks at a time. The position developed from little more than an assistant "gopher" when broadcast news began with very simple productions, to the person at the center of the far more complex news presentations of today.

PROFESSIONALISM

Issues of "professionalism" in journalism have been the focus of commentary and research in the United States for a century. Central to the debate are differing views on what the concept means; whether it is an ideological smokescreen or a measurable empirical reality; and, more to the point, whether professionalism is or should be integral to the work of processing and disseminating news. Since the 1960s, American approaches to the study of journalistic professionalism have grown in sophistication along with the increasing complexity of news media themselves. As governments' role in media recedes and commercialism advances in both industrial nations and developing countries of Africa, Asia, and Latin America, the concept has gained salience worldwide.

Applied to virtually any line of work, professionalism implies doing something full-time for a living, with serious structured expectations, as opposed to something done for diversion or fun or part-time. With somewhat more gravitas, professionalism carries overtones of a mission, career, or "calling" as contrasted with a mere "job." Simply construed, then, a professional journalist is someone who covers news for a living, rather than as a hobby or on the side. The more significant question is whether journalism constitutes a profession as opposed to simply being an occupation or trade. Before that question can be addressed, however, we should examine how professionalism in the context of journalism is defined and maintained.

Origins

The traditional or "original" professions are widely recognized to be medicine and law with the clergy and university teaching sometimes added. The first two historically have been distinguished by long periods of specialized education, self-regulation of membership and boundaries, and an ethos of public service. Of this trinity of attributes, journalism generally claims only one—fulfillment of a public mission. While college journalism programs abound, being a journalist in the United States requires neither degree nor license. Unlike the American Medical Association, the American Bar Association, or testing and certification agencies across a spectrum of other fields, no organization wields such clout for journalists.

Nevertheless, the concept of professionalism has proved elastic enough to encompass many sorts of work besides medicine, law, preaching, and teaching, especially in its applications to twentieth- to twenty-first-century occupations. Ways of assessing and studying professionalism are likewise pliable, with diverse intellectual approaches producing varying interpretations. Building on a base of descriptive studies enumerating professional traits, historians have focused on monopoly, elitism, and exclusion as dynamics in the emergence of professions, while sociologists have construed professions as a socially organized method, grounded in political economy, for organizing and controlling work. Underlying these disparate academic perspectives, however, is a common interest in understanding institutional arrangements for the use of expertise. As a team of scholars from education and management who study socially beneficial work observe: "Being a professional involves a bargain between a person and the community. People agree to provide needed services; the community agrees to compensate them for the services and recognize their right to perform those" (Gardner et al. 2001, 16).

In the United States, the idea of journalism as a profession emerged in late-nineteenth-century discourse surrounding the growth of the mass-market press, and with it the idea of "objective" news coverage separate from partisan politics that would appeal to broad audiences. By this time, journalists were shedding the moniker of "ink-stained wretches" closely associated with the printing trades and

acquiring distinct roles in the processing of news. Further, they no longer were tied to the promotion of political party lines as characterized newspapers of the preceding era. Skill, accuracy, fairness, and integrity came to be seen as synonymous with good business for the modern mainstream press. This was even the case with William Randolph Hearst and Joseph Pulitzer, pioneers of sensationalism as a marketing device in what became known as "yellow journalism." Pulitzer was later the chief benefactor of Columbia University's Graduate School of Journalism, key to his vision for legitimizing the practice of journalism and an early model for comprehensive university journalism education.

Eliot Friedson sees professionals as agents holding "formal knowledge," with an ever-lengthening roster of occupations making claims to specialized expertise as a logical outgrowth of the explosion of knowledge. By virtue of the substantive nature of their work, and fortified by the formalization of their practice, journalists have understandable claim to a knowledge domain (and thus a profession) that figures across cultures. Journalists attain fitness for their work through various combinations of apprenticeship, education, and socialization. They become versed in techniques for trafficking in information that display both commonalities and differences across cultures.

Research

An online search covering 1960 through mid-2007 of the database ComAbstracts, (which inventories literature in journalism, media studies, and related fields) found 391 items with variations of the term "profession*" (i.e., professions, professional, professionalism) in the title; and a *Sociological Abstracts* search for use of both "profession*" and "journalis*" (i.e., journalism, journalist) as descriptors produces 125 citations ranging back to 1955.

Professionalism in news work is often discussed in terms of ethics and codes of conduct. Journalistic professionalism has been explained as an adjunct to commercial strategies, and is criticized as a powerful ideology justifying convenient routines and masking support of the status quo. Some observers link professionalism with neutrality and provision of impartial information; others associate it with the "watchdog" principle, advocacy, and alternative journalism.

Identifying typical attributes or traits associated with professionalism that might apply to journalism is a starting point for many studies. Commonly mentioned professional attributes adapted to news work have included (a) specialized knowledge and/or techniques, evidenced in training and education programs; (b) self-regulation, evidenced in development of standards and codes and occupational associations; (c) emphasis on public service as opposed to economic gain; (d) an occupational culture that entails common values, norms, and symbols; (e) a career orientation to this particular line of work; (f) a work process involving discretion over process and outcomes; and (g) broad latitude, authority, or autonomy to carry out work. Survey research soliciting journalists' reports of their views on such traits has been the most influential approach to measuring journalistic professionalism, spawning a much-replicated "professional orientation" scale (developed by mass communications researchers Jack McLeod and Searle Hawley) and a well-known taxonomy of journalistic roles identifying "interpretative," "disseminator," "adversarial" and "populist mobilizer" types (Johnstone, Slawski, and Bowman).

Some scholars have criticized trait-centered analyses of journalists based on self-reports as both methodologically and theoretically weak, yet the approach still holds sway in the United States and comparative studies. When it comes to gauging professionalism, these studies hinge on a tautology—that is, evidence of purported traits of professionalism is said to manifest professional activity. Nevertheless, their findings are valuable as descriptive markers of circumstances, methods, and standards of practice, and replicated studies reveal intriguing comparisons and contrasts among countries as well as document change over time.

In the U.S. setting, the most ambitious effort is Weaver and colleagues' series of surveys tracking employment conditions and work attitudes among individuals covering general news. This ongoing program of research has created an evolving profile of American journalists over the last quarter of the twentieth century, with professionalism a central theme. In a 2002 survey of nearly 1,500 news workers Weaver et al. found "increased professionalism" measured by characteristics such as proportion of college graduates, levels of compensation and job satisfaction, and endorsement of

goals of journalistic enterprise, including analysis of complex problems and keeping watch on government and business.

In another series of books focusing on specific subsets of journalists, Stephen Hess of the Brookings Institute has provided valuable descriptive studies of U.S. foreign correspondents abroad and international correspondents in the United States. A considerable body of alternative scholarship draws on the sociology of work and occupations to understand journalists in social, economic, and political contexts. This research hinges on power relations, examining individual and collective control of work vis-à-vis employing organizations, other kindred occupations, clients, or governments. Underlying this approach is the conviction that professionalism cannot be gauged by journalists' own descriptions of their work or stated aspirations (i.e., what journalists say they do, or say they would like to do, are unreliable measures); rather, possibilities for professionalism emerge from organizational structures and are made evident in practice.

These studies often use ethnographies of news production; enduring examples include the work of Roshco, Tuchman, and Fishman. Analysis tends to focus on the influence of external stakeholders, such as clients and sponsors, to the systemic imperatives of political economy. From this perspective, the crucial dimensions of professionalism become control and allocation of resources for journalistic work; regulatory frameworks mediating among spheres of journalism, politics, and business; and public acceptance of journalists' ideological claims to exclusive qualification for the job of gathering and delivering the news.

To some scholars, journalistic professionalism operates largely as an ideological discourse, employing occupational myths as crucial props of legitimacy that serve the interests of employers as much as practitioners. Moreover, the romantic vision of the crusading journalist becomes increasingly important to this shared discourse even as the work itself may be growing more routine and constrained.

The Employment Paradox

The maintenance of relatively independent conditions of employment, including self-employment (as often is the case in the fields of medicine and law) or distance from power centers (some clergy), was an important element of the original professions. This independence attenuated through the twentieth century, with professionals increasingly operating within bureaucratic workplaces, and self-employment more the exception than the norm even for lawyers and physicians. The study of professionals employed by organizations has particular relevance to journalists, who usually work for media organizations rather than directly for clients—members of the public—they purport to serve. (Even self-employed freelancers are beholden to media organizations for payment.)

Whether dependence on employers for income necessarily erodes professional prestige and powers is a matter of dispute. Friedson, a leading authority on contemporary professionalism, says not, claiming the more critical issue is the retention of latitude for decision-making related to delivery of services. Professionals working for organizations still possess technical autonomy or the right to apply discretion and judgment in the conduct of their jobs, and in this sense have greater freedom and independence than conventional workers. At the same time, management exercises direction and sets limits via its power to allocate resources.

The fact that professionals can exercise control over the conduct of their duties while lacking control over the economy of the employing organization is the paradox of employed professionals. In journalism this paradox may produce especially sharp contradictions. American media critics and scholars have long decried the dangers that business interests pose to independent news coverage; and in an era of conglomerate media, even those who see good journalism as good business view market pressures as inimical to professionalism. While news outlets and their employees may strive for journalistic excellence, advertisers and stockholders are more concerned with access to audiences and economic return, not journalistic content. As Gardner et al. note, "Success in the business of journalism, unlike other fields, often means intentionally alienating those who pay for your services" (2001, 179).

Critical studies documenting how bottom-line pressures can override occupational accountability concern issues of journalistic professionalism in an era of media consolidation, shrinking news budgets, and the blurring of news and entertainment. Yet this literature also suggests an emergence of

vocational solidarity around assertions of professional identity among U.S. journalists. Even as journalists have seen steady erosion of control over the terms and conditions of their work, they offer an emphatic vision for the *content* of that work, expressed through shared values and objectives.

This is perhaps most evident in studies that identify key elements of professional journalism from surveys as well as from discussions with practitioners. Foremost among these are an obligation to the truth and allegiance to the public interest; other requisites include verification, comprehensiveness, and proportion; serving as a watchdog on power; provision of a public forum; and independence from subjects and sources. From this perspective, journalistic professionalism is far more than demonstration of externally measurable traits, and also more than job autonomy; it becomes a matter of individual conscience as well as collective mission and accumulated practice. The journalist who does "good work," as a team led by Harvard educator Howard Gardner calls it, "internalizes commitment at the deepest intrapersonal level, and the best journalists have internal moral codes that help them resist illegitimate pressures and remain focused on the mission of informing the public in a truthful and comprehensive manner." Moral consciousness is the ultimate bulwark against potent threats to realization of journalism's professional calling, from government secrecy to bottom-line pressures.

International Relevance

Professionalism is usually context-dependent, but that observation is far from a given in studies of journalists. Most comparative research on journalistic professionalism follows outmoded American templates. Growing interest in journalists in developing nations, post-Soviet states, and other systems undergoing change from centrally planned to market-driven economies is just beginning to produce culturally sensitive research on professionalism.

In China, for instance, intricacies of history and philosophy, complexities introduced by commercialization and globalization in the transition to a market-oriented economy, and ambiguities of translation and other factors militate against adaptation of Western concepts. Yet the concept of professionalism remains compelling to scholars and Chinese journalists. Researchers find that evidence of professionalism in Chinese journalism is on the rise, and that professional journalism has emerged as a counterpart to the party journalism or propaganda paradigm.

Journalism in transitional societies often exhibits tendencies associated with professionalism, including the assertion of claims to specialized knowledge, expansion of formal training programs, increased association affiliations, and emphasis on a public service mission. The growth of professional aspirations, such as desire for greater editorial autonomy, responsiveness to the public, emphasis on critical reporting, and pursuit of such values as accuracy and truthfulness, has been a consistent research finding since World War II. In much of the world, official licensing of journalists—either by government or by sanctioned agencies—is the norm; the United States, with its First Amendment stricture against any government control of journalists, is an outlier. Credentialing of journalists raises intriguing questions for professionalism: Is such a system a bulwark for professionalism as guarantor of appropriate expertise and ethical consciousness? Or does it further professionalism in the negative sense of raising barriers to entry and preserving privilege for an existing group? From the U.S. perspective, a centralized, uniform system of licensing equips the state with potential for monitoring journalists and discouraging nonsanctioned expression. At the same time, in providing journalists with recognition of social standing and expertise along with quality assurance, it may be an instrument of co-option as much as a mechanism of control.

Where deployment of journalistic expertise as an adjunct of political authority is giving way to journalism as a branch of knowledge production, changes in power relations may be more significant than conventional markers of professionalism, but also are harder to discern. For journalists, this means escaping constraints imposed by media or government authorities and acquiring greater leverage in dealings with sources and audiences.

Meanwhile, Western and international media watchdog organizations tracking "press freedom" around the world provide a useful prism for gauging advances in journalistic professionalism. Organizations such as Amnesty International, Human Rights Watch, the Paris-based Reporters Without Borders and the U.S. Committee to Protect

Journalists all offer regular reports on social, political, legal, and extralegal treatment of journalists that offer both active examples of journalistic enterprise and investigative zeal and, more often, implied evidence in the form of government harassment or suppression. These organizations are most concerned with government limits on professionalism, rather than market constraints. Indeed, some analysts see a clear link between crusading reporting and market forces compelling media outlets to compete for audiences, with journalists acting "professionally" to help translate popular resentment and social demands into significant pressures on the state. However, scholars of journalism in the Soviet Union, the former Soviet bloc states, and China are beginning to examine the potential for commercialism to undermine professionalism, a stream of research likely to converge with similar concerns in the U.S. context.

Challenges of Newer Media

New technologies, combined with cost-cutting imperatives, have posed mounting challenges to journalistic professionalism. Efforts to extract more content from newsrooms without increasing staff began in the 1970s, with computerization that eliminated typesetters and proofreaders, and continued with downsizing and buyouts. In the Internet era, the impetus to squeeze more out of the same number of people now extends across multiple platforms. Reporters are expected to produce numerous versions of reports—for example, for newspaper, radio, television, and/or the web. With the positive spin of news managers, journalists now have more opportunities than ever to realize their professional skills. To critics, however, the multiskilling facilitated by digital technology accentuates a process of de-professionalizing of journalism that already was well underway.

The rise of multimedia and computer-mediated communications has generated new debates about who is entitled to practice journalism. The ease with which the Internet enables people to disseminate information as well as misinformation, to air measured opinions along with inflammatory ideas, to propound with speed and harangue at length, has inspired impassioned arguments both defending and decrying the conventional roles of "mainstream" journalists. Influential observers continue to maintain a sharp distinction between amateur web scribes and bona fide journalists, even as proponents of cyberspace democracy proclaim that anyone and everyone can be a gatherer and purveyor of news.

Nicholas Lemann, dean of the Columbia University Graduate School of Journalism, is among the skeptics of "citizen journalism"—the idea that anybody can use modern technology to create original media content as well as to fact-check and comment on content produced by others. In a much-discussed August 2006 *New Yorker* article, Lemann critiqued citizen journalism as lacking the authority and discipline of traditional journalism. His colleague Samuel Freedman is even harsher: In a 2006 interview with the CBS News blog "Public Eye," he calls citizen journalism "part of a larger attempt to degrade, even to disenfranchise journalism as practiced by trained professionals," and adds that citizen journalism deals mainly in "raw material, generated by amateurs, that a trained, skilled journalist should know how to weigh, analyze, describe, and explain."

The most enthusiastic advocates of citizen journalism argue that "the people" in aggregate know more than the professionals. The more prevalent position is that citizen journalism augments or supplements conventional journalism rather than supplanting it. At the same time, conventional media organizations are making increasing use of contributions from readers, viewers, and listeners to feed the infinite appetite of websites; appealing to grassroots impulses and populist sentiments, it turns out, is a good way to obtain media content without paying the creators.

Free market enthusiasts offer a different sort of populist take on the new media environment, represented by federal appeals court judge and prolific commentator Richard A. Posner. In a 2005 *New York Times Book Review* essay on trends in American journalism, he asserts that critics and defenders of the news industry alike view journalism as "a profession rather than just a trade." This means, he continues, "that journalists and their employers must not allow profit considerations to dominate, but must acknowledge an ethical duty to report the news accurately, soberly, without bias. . . ." They also agree, he says, that the ostensible purpose of news is to inform a responsible citizenry. Yet Posner implies that personal conviction

and commitment to professional ideals may be irrelevant to journalism in a market system, and proposes that the market has played a trick on the idealists. Increased competition in the news industry has failed to produce more competence and civic engagement "because these are not the goods that most people are seeking from the news media," he writes; instead, bottom-line pressures have produced greater sensationalism. At the same time, he suggests that consumers with genuine interest in public affairs have richer fare than ever before. The market, in Posner's reading, puts "proud professionals" in their place.

Conclusion

While the term *professional journalist* has entered the popular lexicon, its meaning remains unclear, its applicability across cultures insufficiently scrutinized, and its future subject to the vicissitudes of social, cultural, political, and technological change. Positive conceptions of professionalism as a collection of standards and practices developed to ensure quality and promote a public service mission have failed to prevail over negative conceptions of professionalism as a project of self-interested occupational security. News practitioners are under increasing commercial pressure to produce more with fewer resources, for organizations whose main loyalties are to stockholders and advertisers, rather than to the broad public journalists purport to serve. New technologies, meanwhile, have produced grassroots media movements that challenge professional claims to exclusive qualification for gathering, interpreting, and presenting the news.

Public Broadcasting Service

The Public Broadcasting Service (PBS) is a nonprofit media enterprise serving more than 350 noncommercial television stations in the United States and its territories. It was designed in the late 1960s as an alternative to the commercial network-dominated television system that largely defined American broadcasting. As an alternative, it would provide more public affairs, cultural, and educational programming than advertiser-supported stations were offering.

More specifically, its role is to oversee program acquisition, distribution, and promotion for its

member television stations. PBS is also responsible for providing educational services, developing new media ventures, encouraging technology development, and seeking funds for its member stations. With an estimated reach of over 70 million people per week via broadcast and online content, PBS and its member stations are known for their educational children's programs (e.g., *Sesame Street, Mister Rogers' Neighborhood, Arthur*), public affairs and news programs (e.g., *The NewsHour with Jim Lehrer, Frontline, Charlie Rose, Nightly Business Report*), science programs (e.g., *Nova, Scientific American Frontiers*), history programs (e.g., *American Experience*), and documentaries.

Two common misconceptions about the PBS model must be clarified. First, PBS is less a formal network than the commercial television networks (e.g., ABC, CBS, NBC). Rather, it operates as a national "service" that acquires and distributes programs for PBS member stations. These member stations are often compared to network affiliates that air commercial television; however, whereas network affiliates trade local advertising space in exchange for network programs, PBS member stations pay sizable fees for the shows acquired and distributed by PBS. Because each PBS member station pays fees to air specific programs, and has relative autonomy over their schedule, programs on public television often vary depending on the market. Yet, member stations do not have complete control over their schedule. In 1995, PBS instituted "common carriage" guidelines which require most member stations to air the same (or similar) primetime schedules. For example, both *Frontline* and *The NewsHour with Jim Lehrer* are common carriage programs. These common carriage guidelines were established to give PBS programs more national exposure, and thereby guarantee national exposure to corporate sponsors. However, these guidelines have at times been a source of tension, as member stations aim to preserve their local flavor while PBS seeks to promote a national image and program lineup—like a network.

Second, unlike the traditional broadcast television model, PBS does not produce programming. Instead, PBS funds, in part, the creation and/or acquisition of programs from several sources, including major public television stations (e.g., WBGH-Boston; WNET-New York), co-productions between public stations and independent producers, external producers (e.g., Sesame Workshop; Ken Burns), and other sources from around the world. The benefit of this model is that it maintains the producers' creative integrity by allowing them editorial control over their work. PBS then distributes a wide array of programs to its member stations through its satellite program distribution system, the National Programming Service (NPS). Most member stations create their lineup by airing national programs offered by NPS as well as locally produced programs. Ideally, such an arrangement allows for a more diverse body of programming.

Origin

On November 7, 1967, the Public Broadcasting Act of 1967 was signed by President Lyndon Johnson (1963–69). This act declared that

> it is in the public interest to encourage the growth and development of public radio and television broadcasting, including the use of such media for instructional, educational, and cultural purposes; . . . public television and radio stations and public telecommunications services constitute valuable local community resources for utilizing electronic media to address national concerns and solve local problems through community programs and outreach programs.

The act established a new Corporation for Public Broadcasting (CPB) as a private entity responsible for funneling federal funds to public radio and television. CPB was not allowed to operate the programming system (the idea was to separate government funding from program decision making), and thus CPB formed PBS in 1969 to undertake that process for television.

CPB's creation of PBS was an innovative addition to the American media landscape at a time when commercial television was dominated by three major networks. When it was created, advocates believed that PBS would become a valuable alternative to commercial program fare by introducing educational, informative, and entertaining programs not found on commercial networks. In short, the goal of the new public broadcasting system, according to the U.S. Congress's Public Broadcasting Act of 1967, was to foster development of programming that involved "creative

risks" and that addressed the "needs of unserved and underserved audiences."

Funding Controversy

From the early days of PBS, supporters sought a federal commitment to long-term, stable funding through the CPB. At the insistence of Congress, which did not want to lose control over the new entity that used federal funds, the 1967 law required CPB to apply for appropriations annually just as if it was a federal agency. Critics argued this placed government funding too close to programming, a dangerous precedent. But at various times the public broadcasting system has been a prime target for a long line of budgetary threats and political attacks (usually conservative-led).

Public broadcasting was first threatened in 1972 when President Richard Nixon (1969–74) vetoed CPB funding, largely due to his perception of public television programs as flagrantly anti-administration and elitist. After he left office, Congress passed and President Gerald Ford (1974–77) agreed to a system whereby funding is provided for a three-year period, allowing the system to do better planning. CPB still goes to the Hill every year, but they are seeking funding for three years out, not the next year.

Yet the problem of political support for steady system funding arises again and again. During the administration of President Ronald Reagan (1981–89), attacks against public broadcasting sought to phase out federal support as a part of a campaign to reinforce marketplace ideology in the public sector. Faced with yet another budget shortfall, Congress succeeded in rescinding some system advance funding, demonstrating the weakness of the system designed as a political "heat shield" after Nixon's earlier attack. Yet the question of whether—and how much—federal funding to grant each year continually reappears. Only a minority in Congress supports cuts to funding because local public stations enjoy widespread support from voters. Given limited and often threatened federal funding levels, PBS and its member stations have increasingly sought additional means of financial support. As a result, PBS has become increasingly dependent on donations from "Viewers Like You" and corporate sponsorship known as program "underwriting."

Dependence on these two means of funding has stirred debate among critics. By emphasizing the need to secure viewer donations, some critics argue that the need to attract upscale viewers has resulted in an overemphasis on highbrow niche programs (e.g., symphonic music programs, British drama, and documentaries) at the expense of a wider range of programs to serve a broad public audience. The reliance on viewers as donors encourages PBS and its member stations to provide programs aimed at potential wealthy contributors.

Corporate underwriting generates similar concern. PBS defines an underwriter as a third party that has voluntarily contributed cash to finance all or part of the production or acquisition of a PBS program. Federal law requires that corporations and foundations who help pay for a broadcast be disclosed on air at the time of the broadcast. When corporate sponsorship first emerged on PBS, the underwriting credit was limited to a brief, simple on-screen message, often void of graphics or animation (e.g., "The following program was brought to you by . . ."). More recently, the policies governing underwriting have been loosened, leading many critics to argue that the once brief mentions have come to increasingly resemble full-fledged advertisements on commercial television. As such, critics often refer to this as a symptom of the "commercialization of PBS."

Commercialization's Threat to Public Affairs Programming

Among all PBS program genres, critics argue the commercialization of PBS poses the greatest threat to public affairs programs. These programs, including *The NewsHour with Jim Lehrer, Charlie Rose,* and *Frontline,* have long been hailed as serving the public interest by providing meaningful discussions on important and controversial issues—issues that are often ignored or summed up by a ten-second sound bite on mainstream commercial news broadcasts. By engaging and educating viewers on a range of topics and viewpoints, advocates of public affairs programming argue that PBS plays a vital role in contributing to a healthy and functioning democracy.

Now, decades later, there is evidence that financial insecurity and corporate pressures have begun to take their toll on the journalistic integrity of public affairs programs. William Hoynes' study of news and public affairs programs on PBS member

stations found that nearly 40 percent of all on-camera sources were representatives of corporate America or Wall Street, and that this was nearly twice the percentage found in an earlier study. Hoynes' findings led him to argue that instead of wide-ranging discussions, public television provides programs that have become dominated by the standard set of elite and corporate-driven news sources.

Recent Developments and the Future of PBS

Despite the funding dilemma and evidence of commercialization on public television, PBS and its member stations continue to play an important role by providing viewers with a wide variety of programs. Faced with growing competition from cable television, the Internet, and other media choices, PBS has begun to expand its offerings. For example, PBS has created online components to complement its TV programs. The PBS website links companion websites for more than 1,800 PBS television programs and specials, as well as original web-only content, podcasts, blogs, and streaming video. In addition, PBS now provides digital learning content for pre-K through Grade 12 educators, and PBS Kids Play!, an Internet-based educational service for children ages 3 through 6, which uses interactive games and activities to provide a customized educational experience at home. Even with these new developments, most critics agree that PBS and its member stations must do more to distinguish itself from the competition.

As PBS adapts its programming and online content offerings to compete in an increasingly digital environment, the question of its overall role—and thus its funding—remains. Supporters have proposed a 2 percent sales tax on broadcast advertising, a 5 percent tax on the sale or transfer of television and radio licenses, a purchase tax on new televisions, or even an annual license fee; these funding structures have successfully financed public service broadcasting elsewhere. Without the establishment of a long-term, independent funding structure, PBS runs a risk of becoming increasingly commercialized, resembling the very programs for which this service was meant to serve as an alternative.

Publick Occurrences

Although it appeared only once, on September 25, 1690, *Publick Occurrences Both Forreign and Domestick* is considered the first newspaper published in the British American colonies that would later become the United States. *Publick Occurrences,* published in Boston, consisted of three pages of information (approximately 7½ inches by 11½ inches in size) followed by a blank fourth, which the publication's prospectus intimated was left blank so that people who had more news or more accurate information could add it to the paper and then pass it on.

Publick Occurrences was not the first newssheet to appear in Boston. Beginning in 1667, a series of one-time broadsheets appeared in Massachusetts, mostly related to European events that were considered to be of significance to colonials. In 1689, printer Samuel Green Jr. (1615–1702) produced *The Present State of the New-English Affairs*. This broadside dealt with the political power struggle that was taking place in the colony between Governor Edmund Andros and the Puritan hierarchy that the Anglican Andros' appointment had usurped.

What made *Publick Occurrences* different from *New-English Affairs* and the other Massachusetts broadsides was the fact that *Publick Occurrences* was dated. In the top left corner of the front page, "Numb. 1" appeared, meaning that the paper's printer, Benjamin Harris (c. 1647–1720), intended for his newssheet to appear at regular intervals as newspapers did in England. Harris reaffirmed this idea in the opening sentence of the paper's prospectus: "It is designed, that the Countrey shall be furnished once a moneth (of if any Glut of Occurrences happen, oftener,) with an account of such considerable things as have arrived unto our Notice."

Harris was no stranger to newspapers nor to the controversy that *Publick Occurrences* would create in Boston. In the 1670s and 1680s, he began printing pamphlets and tracts for religious dissenters in England. Religion and politics were firmly entwined, and Harris soon turned his attention toward political issues. In 1679, the licensing of publications briefly ended in England, and Harris produced the country's first nongovernment-sanctioned paper, *The Domestick Intelligence; Or, News both from City and Country*. As a Baptist, Harris opposed the Catholic leanings of the Stuart Charles II as well as the Anglican Church. Because he was so outspoken in his opposition to the king, Harris was jailed twice. When he was arrested a third time in 1685 following the reinstitution of licensing, Harris fled to the Netherlands. A year later, he came to America and immediately set up a printing business.

Harris' arrival in Boston coincided with the revocation of Massachusetts' Puritan Charter and Andros' political appointment. Civil unrest following the appointment and, in anger, Massachusetts citizens revolted and removed Andros from office and threw him in jail. For a short time, the colony lacked any strong leadership. It was during this political void that Harris decided to produce *Publick Occurrences*.

With *Publick Occurrences,* Harris hoped to reestablish order and trust within the colony. By providing a regular and reliable information source, the paper's prospectus said, "people every where may better understand the Circumstances of Publique Affairs." In addition, Harris hoped that a reliable news source would also prevent the "many False Reports, maliciously made, and spread among us."

Harris also believed that the newspaper had a divine purpose. He said that *Publick Occurrences* would provide news so "That Memorable Occurrents of Divine Providence may not be neglected or forgotten." To that end, the newspaper carried stories of "Christianized Indians" who had established "a day of Thanksgiving to God for his Mercy in supplying their extream and pinching Necessities," and he noted that if the colonies faired well in their current conflict with the French in Canada that "God alone will have all the Glory." News in the paper also informed readers of a fire that destroyed approximately twenty houses, and it described a smallpox epidemic spreading through Boston. "'Tis not easy to relate the Trouble and Sorrow that poor Boston has felt by this Epidemical Contagion," the paper said.

The paper's commentary surrounding the conflict between England and France, called King William's War by the colonists, ultimately led to *Publick Occurrence*'s suppression. Harris told of a ship seized by the French and Indians. They "Butchered the Master, and several of the men" on board, the paper reported. In addition, *Publick Occurrences* told how colonial forces "cut the faces, and ript the bellies of two Indians, and threw a third Over board in the sight of the French." He complained that colonial officials provided the Mohawks with too much information about colonial military activities. Harris also mentioned that King Louis XIV of France was rumored to be having sexual relations with his "Sons Wife."

Despite the fact that Massachusetts lacked strong political leadership, a Governor's Council still existed, and on September 29, it ordered Harris never again to publish *Publick Occurrences* or any other newssheet in the colony. The decree stated that the newspaper contained "Reflections of a very high nature" and forbid the printing of any newssheet in the future "without License first obtained from those that are or shall be appointed by the Government to grant the same." The council was simply following a 1686 English law, which prohibited the printing of anything in the colonies without "especial leave and license first obtained." The injunction against *Publick Occurrences* called into question the accuracy of the paper's information, as it was obvious that Harris portrayed the government as powerless to stop French and Indian encroachment in the colony's northernmost regions. Later correspondence from

one council member revealed that because Harris chose to publish his paper without authority, complained about dealing with the Mohawks, and disparaged the French king, he raised the council's ire. Despite the fact that England and France were at war, references to royalty and sexual indiscretions were too much for the Puritan council members.

Harris complied with the council's ruling and printed no more newssheets, but he did print a news pamphlet in 1692, the same year he was named the colony's official printer. In 1695, Harris returned to England and resumed newspaper publication with the *London Post*. All copies of *Publick Occurrences* were ordered called in. A single copy is known to exist in London.

Public Opinion

See Polls and Public Opinion

Public Radio Journalism

American public radio journalism consists of the news and public affairs programs that can be heard on noncommercial radio stations and includes a variety of formats, from news magazines to public affairs programs to listener call-in programs. At a time when commercial radio's news content is declining (generally limited to brief newscasts), public radio offers listeners a wide range of news, analysis, and discussion. Public radio journalism offers greater variety and depth than is typically provided on commercial stations, covering not only breaking news but also science and the arts.

The main producers of such programming are National Public Radio (NPR), Public Radio International (PRI), American Public Media (APM), and Pacifica Broadcasting. Programs are also produced by several local public radio stations and independent radio producers and are distributed by NPR, PRI, or APM.

History

NPR, which came into existence as a result of the Public Broadcasting Act of 1967, started broadcasting in 1971 and is a major producer of news programming on public radio. APM is the second largest producer of public radio programs which include news, culture, and music. APM is the name under which Minnesota Public Radio produces and distributes programs nationally. Public Radio International, which began as American Public Radio, was founded in 1983 as a way to distribute programs from public radio stations around the country and diversify offerings on public radio stations. In 1994 its name was changed to Public Radio International (PRI) to reflect its mission of bringing, as it says on its website, "global perspectives to the public airwaves." Through partnerships with public radio stations, independent producers, and the BBC World Service in the United Kingdom, in 2008 it offered over 400 programs per week that were broadcast and streamed online by affiliate stations around the country.

Pacifica Broadcasting was founded in San Francisco in 1949 by Lewis Kimball Hill, a pacifist who saw community radio as a place to begin a dialogue about the betterment of society. The Pacifica Network consists of five radio stations in New York, Los Angeles, Houston, and Washington, D.C., as well as many independent public radio stations that are affiliates. Its goal was to give voice to those without power and to become a

place for progressive viewpoints that questioned the status quo with regard to political discourse, art, and culture on radio. Today it is seen as a place on the radio for a unique point of view that fills a gap in mainstream media coverage and offers alternative analysis and interpretation.

News Programming

News magazines are an especially important part of public radio journalism. NPR's flagship news magazines are the late weekday afternoon *All Things Considered* and the similar but earlier *Morning Edition* and *Weekend Edition*. *All Things Considered* (*ATC*) was created in 1971 as a news program designed to be distinctly different from what commercial radio had to offer and that embodied the NPR mission of celebrating the variety of human experience. The format has evolved over the years and become more structured. *ATC* starts off with headlines on the hour followed by longer stories with in-depth reporting. This long form journalism is characteristic of public radio as is its ability to explain complex issues, take unusual angles on news stories, and offer news with a global reach that makes for greater breadth of coverage.

Recognizing that it needed a news program during morning drive time, NPR added *Morning Edition* in 1979. Introduced eight years after *ATC*, *Morning Edition* was far more a product of audience research than had been the case with *ATC*, with information about audience listening behavior shaping the structure of the program. The program was designed without a clear beginning, middle, or end, an approach that allowed listeners to tune in and out of it depending on their morning routines. The segments were shorter than on *ATC*, with frequent opportunities for member stations to broadcast the local weather, news, and other announcements. In 2008 *Morning Edition* enjoyed the second-largest audience on American radio after Rush Limbaugh.

Weekend Edition (Saturday), hosted by Scott Simon, went on the air in 1985 and was followed by a Sunday version a year later. The program distinguished itself from the weekday newsmagazines with narrative features that combined natural sound with storytelling and commentary on the week's events that extended to sports and entertainment.

In 2003 *Day to Day*, a news magazine hosted by longtime NPR journalist Alex Chadwick, was launched as a way of meeting stations' and audiences' requests for news programming in the middle of the day. It airs from NPR's studios in California, known as NPR West, and is produced in partnership with online magazine *Slate*, whose writers serve as commentators and also produce pieces for the show. As compared to the older morning and evening news magazines, *Day to Day* offers shorter segments and a more conversational tone while trying to provide a different angle on the day's news than that presented on *All Things Considered* or *Morning Edition*. It is also likely to cover lighter news stories such as the launch of a television show featuring a celebrity and how rejection works on social networking sites like Facebook. By using more pieces from independent producers, the program seeks to have a more personal tone and a different sound than established NPR news magazines.

Although its original mission saw NPR being more of an alternative news source to commercial media with a focus on analysis and commentary rather than breaking news, over the years its role has evolved to being a primary news source. This means that there is a greater emphasis on covering all major news events and being on the spot when news breaks. After the attacks of September 11, 2001, for the first time the network reported round-the-clock for a record 90 hours (nearly four days). It has demonstrated a commitment to pursuing stories even after initial commercial media attention has waned. It was one of only two news organizations to continue covering the effects of Hurricane Katrina that hit New Orleans and the Gulf Coast in August 2005. Since 2000, NPR has expanded its overseas bureaus in order to cover breaking news around the world at a time when most news organizations were closing their overseas bureaus because of declining revenues. An endowment from the Kroc family in 2003 helped NPR with its expansion program.

Other public radio entities also provide news programming. In 1996, Public Radio International (PRI) launched its news and public affairs program, *The World*, designed to compete directly with *All Things Considered*. PRI's first venture into program production, *The World* was coproduced by the BBC World Service and public

radio station WGBH in Boston. As its name suggests, the program has an international focus and features a mix of news, interviews, and music from around the globe.

Pacifica Radio produces a daily 30-minute newscast, *Free Speech Pacific News,* to which public radio stations can subscribe. *Democracy Now* is Pacifica's daily one-hour current events program. The newscasts cover stories that rarely achieve attention on commercial radio and even on other public radio stations and are in keeping with its mission of promoting peace and social justice. During the war in Iraq, for example, it regularly carried stories that provided a voice to antiwar groups.

Finding New Audiences

Since 2001 both NPR and PRI have sought to attract younger audiences and have developed news programs that they believe will appeal to this demographic. In 2007 NPR launched the *Bryant Park Project,* a news magazine described on its website as having "the tone and sensibility the next generation of public radio listeners demand." This morning news program connected with its audience through audio, video, text, and photos and sought to foster audience interaction through blogs, e-mails, and call-outs to listeners. With a target demographic of listeners aged 25 to 44, the program covered major news but had a more conversational tone and was almost completely live with producers sometimes getting behind the microphone to talk to the shows' hosts. The show tried to balance hard news with lighter content with segments like the "Ramble" that covered quirky stories such as Japan's development of a robot girlfriend for lonely men while "The Most" features the most emailed stories on Yahoo! and Google. While the *Bryant Park Project* succeeded in attracting a younger audience and in demonstrating that radio can develop an ongoing relationship with its listeners by using online media, its challenge was getting carriage on member stations especially since it aired at the same time as *Morning Edition.* In July 2008, nine months after it was launched, NPR cancelled the program.

In April 2008, PRI launched a new morning drive time news program, *The Takeaway,* coproduced with New York City's public radio station WNYC. The BBC, *The New York Times* station WQXR, and Boston's WGBH, serve as editorial collaborators. Although the desire for a younger audience demographic is not explicit, the conversational tone and personality-driven approach speaks to this aim. On its website, PRI states that the goal was to create a program that "sounds the way people really communicate with each other: conversational, unscripted, and sometimes opinionated." Like NPR's new program, *The Takeaway* uses its website to create a more interactive public radio experience.

Apart from attracting younger audiences, NPR has also consciously sought to broaden its audience profile beyond the traditional educated, white, suburban, college-educated listeners. NPR's first attempt to reach out to minority audiences came with the *Tavis Smiley Show,* produced in collaboration with the African American Public Radio Consortium (a nationwide group of public radio stations that serve primarily African American audiences),which aired between 2002 and 2004. It departed from public radio's signature sound (carefully produced pieces presented by reporters in measured, neutral inflections) and touched on politics, music, comedy, and more. The show targeted African American audiences because it dealt with issues of concern to them, but it also appealed to a more general audience interested in hearing about issues relating to the African American experience. Host Smiley reiterated in an interview that "public radio needs to sound more like America" and invited a lineup of diverse guests and addressed topics overlooked by other media outlets including public radio. Though Smiley did not renew his contract with NPR at the end of two years, in 2005 the *Tavis Smiley Show* returned to public radio on PRI with a similar format as a weekly program.

NPR continued to go after minority audiences and added two programs, *News and Notes* in 2005 and *Tell Me More* in 2007, both in collaboration with the African American Public Radio Consortium. *News and Notes,* hosted by Farai Chideya, is an hour-long daily program produced at NPR West and is described on its website as exploring "issues and people from an African American perspective." Chideya was chosen to replace original host Ed Gordon largely because she had experience with both digital and traditional media and knew how

to unify the two. The program uses experts to provide regular segments but also relies on its audience (on both radio and the Internet) to, as the program's website explains, help "identify issues, spot trends, share discoveries, offer personal essays, participate in shaping the program, and engage in a dialogue with newsmakers."

Tell Me More, hosted by Michel Martin, is another hour-long program, this one originating from NPR's studios in Washington, D.C. While it reaches out to African Americans, Hispanics, Asians, and others who have been underrepresented on NPR, the program also hopes to appeal to white listeners who would be interested in issues that concern these groups. Host Martin said in an interview that the program should not be limited to minority audiences because American society is made up of so many interconnected groups. During the program planning process, Martin started up a blog to give listeners an insight into how decisions about what goes on the air are made and to help increase audience involvement with the program. She continued the blog after the program went on the air.

Like commercial radio, public radio presents discussion shows that feature listener calls. But the similarity ends there. The nationally distributed call-in program *Talk of the Nation* demonstrates that such offerings can be educational and informative and a forum for discussion rather than the often contentious ranting of commercial radio's largely right-wing hosts. *Talk of the Nation* created a space for listeners to interact with experts who represent a diversity of opinions on a chosen subject. The program made its debut during the first Gulf War (1991) as a way to host a nationwide conversation about the war. But its popularity led to it being continued with a broad range of topics ranging from politics and public service to education and healthcare.

Marketplace, a 30-minute business program, is an example of how public radio has taken what many see as a dry and boring topic and put its unique stamp on it. To begin with, the program originates in Los Angeles, away from the East Coast business centers. And rather than focusing on the "numbers" (that is, the performance of stock indices), it looks at the world through the lens of business, economics, and finance. This approach results in stories that go beyond the typical business narrative to ones that are often quirky and off the beaten path and that thus appeal to a wider audience. Sample features on the program in 2008 included stories about how Congress was trying to put the brakes on gas prices; how Gucci was making a shift to cheaper, down-market goods; the challenges facing gay bars; and CBS's plans to expand its outdoor advertising in South America.

Public radio also shows that news can be the source of comedy and humor. Weekly quiz shows NPR's *Wait, Wait, Don't Tell Me* hosted by Peter Sagal and PRI's *Whad'ya Know* hosted by Michael Feldman mix humor and information and are performed before live audiences, giving them an opportunity to interact with the hosts.

Coverage of the Arts

While the arts are covered regularly in segments on public radio news magazines, there are also programs like NPR's *Fresh Air* and PRI's *Studio 360* that are entirely devoted to this subject. *Fresh Air,* produced by public radio station WHYY in Philadelphia, has been available nationally since 1985. Host Terry Gross's interviews with writers, musicians, artists, journalists, and politicians are distinguished by the amount of preparation and research that goes into each of them in order to give listeners unusual insights into their personalities and a sense of who the subjects are as individuals.

Studio 360 was made available nationally to public radio audiences starting in 2001. Hosted by Kurt Andersen, the show is produced by New York's WNYC and distributed by PRI. It combines artist interviews with features that allow reporters to speak in the first person and draw on personal experiences to examine concepts in high and low culture. Each program is built around a chosen theme; themes have ranged from girl culture to loneliness, to youth, to locations of popular television series. In 2006 PRI launched another program in the arts category, *Fair Game.* The hour-long production was hosted by Faith Salie, an actor, comic, and Rhodes scholar, and was geared toward twenty- and thirty-somethings. The program's interviews were interspersed with comedic bits and musical interludes. By using humor to explore issues and people in popular culture and

politics, it took an approach that was more likely to appeal to fans of Comedy Central's *The Daily Show with Jon Stewart*. However, it faced the same challenge that NPR's *Bryant Park Project* did, that of finding carriage on stations, and was cancelled in May 2008, 17 months after it went on the air.

In the realm of culture, public radio also has programs that are built around a single subject. *Speaking of Faith* is an hour-long program that explores spirituality and faith in contemporary life. It is produced and distributed by APM and has been available nationally since 2001. In an interview in 2004 host Krista Tippett said her goal is "to trace the line between theology and human experience," through conversations that explore how individuals struggle to resolve the moral and ethical questions in their religion. The program has tackled subjects ranging from science and Hinduism, to the ethics of eating, to the religion of Rumi. Guests on the program have included Buddhist monk Thich Nhat Hahn, Benedictine nun Joan Chittister, and evangelical leaders Rick and Kay Warren.

The Splendid Table, an hour-long weekly program produced and distributed by APM, explores the place of food in American life. While recipes are a part of its appeal, the discussions about food provide a means to examine culinary traditions in the United States and other cultures. Host Lynne Rossetto Kasper invites luminaries from the world of cooking to share their perspective and memories about food and cooking. During 2008 the program's Locavore Nation segment looked at the efforts of 15 individuals to obtain, prepare, and eat a meal based primarily on locally grown organic ingredients.

On the Media, another weekly hour-long show produced by WNYC and distributed by NPR, examines the culture of the media. A large part of its focus is on how news is made and how journalism is practiced by news organizations, including public radio. Co-host Brooke Gladstone said in an interview that the goal of the program was to explore advertising, television, movie trends, and look at "where media and culture collide, where media holds up the mirror to culture" in order to "show how the media sausage is made." In 2008 the show's segments included an examination of media coverage of the Pope's visit to Washington and New York, the implications of choosing a safe Internet technology, the past and present of the Olympic brand, and a conflict of interest at ESPN.

Public radio journalism encompasses subjects rarely addressed on commercial radio, including science and the environment. NPR's *Talk of the Nation Science Friday* is a weekly science talk presentation broadcast live that focuses on science topics that are in the news. Host Ira Flatow is joined by experts for a discussion on topics that cover science, technology, health, and the environment. Listeners have an opportunity to call in with questions. Flatow says his goal is to make issues in science accessible to his listeners.

PRI's weekly show *Living on Earth* reviews how culture, economics, and technology shape the world around us. Host Steve Curwood invites experts to explore a broad range of topics such as the world food crisis, the move toward green boardrooms, allergic reactions to climate change, and the implication of a 2008 court ruling for the Environmental Protection Agency. For Curwood the challenge is finding a mix of stories so that it does not always focus on bad news.

Rather than develop a stand-alone science program, APM has established a website on sustainability that showcases stories from its lineup of programs. These examine how the needs of the present can be met without compromising the ability of future generations to also meet their needs. In addition to content produced exclusively for the website, there are also links to blogs, multimedia, and interactive features that users can access to examine the impact of their own behavior on the planet.

Everyday Stories

Public radio has broadened its definition of journalism to make room for individual narratives that find a place in radio documentaries and on news magazines like *ATC* and *Morning Edition.* The public radio program that is credited with making the personal narrative hip was Ira Glass's *This American Life,* which features the stories of real people told in their own voices. Each show is built around a single theme—such as what happens when you go from being a private person to a public face or the uneasy interactions between humans and institutions—and is explored through narratives of different individuals in compelling, dramatic, and often comic situations that are often also emotionally moving.

The idea that "people" stories can be interesting is the basis for David Isay's *Story Corps* project launched

in 2003 and Jay Allison's *This I Believe*. *Story Corps* gives ordinary people an opportunity to record their stories. The first booth where stories could be recorded was set up in New York City's Grand Central Station in October 2003; in 2005 two Airstream trailers—traveling recording studios called "MobileBooths"—were launched to record stories told by people across the country. A small portion of these stories are edited down and then featured on public radio programs like *Morning Edition*. According to Isay, the idea that people matter and that they won't be overlooked drives the project. *This I Believe* invites people—some famous, but many not famous—to share the core values and beliefs that guide their lives with the hope that listeners develop respect for values that are different from their own. While the well known are invited to participate in the program, the rest volunteer themselves using the guidelines on the program website to write their essays. These first-person three-minute audio essays are carried on both *ATC* and *Weekend Edition*.

A less heard and perhaps less clearly identified format that has a place on public radio is the documentary. American Radioworks (ARW) produces documentaries that are carried on a variety of public radio programs. Radio documentaries are characterized by "a depth of research or proximity to the subject," according to Stephen Smith, managing editor and correspondent for ARW, and are a way of exploring larger social themes through a character-rich study that unfolds like a photo-essay or a film documentary.

Changing Technology

The Internet has significantly impacted public radio journalism in two areas–-program content and distribution. Thanks to the Internet, public radio journalism has become more interactive by allowing listeners to provide immediate feedback to the programs but also to shape what is covered. Readers are invited to send in story ideas or to share their experiences about a given topic.

The Public Insight Journalism initiative on Minnesota Public radio involves listeners by including them in the newsgathering process. People are invited to share their insights, experiences, and expertise to create a database from which reporters draw. The Internet also makes it possible for editors to create and manage a database of over 20,000 volunteers who are contacted by e-mail when the need arises.

In the Internet age, public radio programs can reach a much wider audience. Listeners are no longer solely dependent on their local public radio station to carry a given program but can listen to any program streamed over the Internet or downloaded as a podcast. Local stations are using the Internet to broaden their offerings with multiple program streams. Programs that don't make it onto the air are available on the station's website for digital access. As high definition radio receivers gain in popularity, they will have the potential to carry multiple streams of programming from public radio stations. Satellite radio is another avenue for disseminating programs from public radio. Both NPR and PRI have a presence on Sirius XM satellite radio.

The Internet has also made it possible for independent program producers to distribute their programs directly to stations, bypassing national gatekeepers like NPR and PRI. The Public Radio Exchange was launched in 2003 as a way to distribute public radio programs using the Internet. A central database of programs in MP3 format which are uploaded onto its website is made available to programmers who sift through this material to find a piece that works for their station.

Funding

Financial support for public radio journalism comes from many sources and varies for different public radio entities. NPR receives funding from Congress by way of the Corporation for Public Broadcasting (CPB), from corporate underwriters, from member stations (whose fees for programs are based on their audience size), and from foundations. PRI's main source of funding is station fees, corporate underwriting of program series, and support from foundations; it also solicits support from listeners. Apart from station fees and funding from foundations, APM has developed a model of private funding with its investment in the catalog company Greenspring (which ended in the late 1990s) and in the social networking site Gather.com. Pacifica Radio relies primarily on support from its listeners and is the only public radio entity that does not accept corporate underwriting.

As funding from the CPB has declined, corporate underwriting and support from foundations has become particularly important for both NPR and PRI. Dependence on these sources of funding

has raised questions about the influence of these entities on the journalism practiced by public radio and the limits such funding might place on investigative reporting on public radio. There is also concern that foundations can buy coverage in their area of interest. *Slate* magazine's collaboration with NPR's *Day to Day* is the first time a public radio news program has joined with a commercial media entity and has led to questions about conflicts of interest regarding coverage of Microsoft (which owns *Slate*) and the possibility of truly independent journalism. In 2007 the National Endowment for the Arts warned that public radio has an obligation that goes beyond maximizing audiences because such a focus leads to journalism that is less likely to take risks and be creative.

Conclusion

As the amount of news on commercial radio has declined, especially with the increase in media consolidation after the Telecommunications Act of 1996, public radio has filled this void. Public radio defines journalism in a broader sense, going beyond hard news to include the arts and other contemporary issues like the environment. This breadth of coverage makes it similar to newspaper journalism. The number of awards earned by public radio programs attests to the exceptional quality of public radio journalism. Public radio journalism is a mix of traditional radio formats and newer ventures that recognize the reality of the current media landscape. The question facing public radio is whether to grow by reaching out to new audiences or by improving service to its core audience with more hours of programming.

Public Television Journalism

Public television news is an alternative to commercial news programming that positions the audience

as information-seeking citizens rather than consumers. The public television model seeks to provide news that is important to a self-governing public regardless of its commercial viability in the electronic media marketplace. American public television news emerged in the mid-twentieth century in response to at least three concerns raised by critics of commercial television news: (1) that concentration of commercial media ownership into fewer hands invited homogenization of news and narrowing of opinions; (2) that commercial imperatives required news to have an entertainment value that prioritized sensationalism over serious reporting; and (3) that privately owned media relegated viewers to the role of passive receivers of news.

Ostensibly free from corporate control, advertising pressures, and the quest for ratings, public television news is generally marked by longer formats, more in-depth coverage of issues, slower pacing, and less focus on visual content compared to commercial news. American public television news typically eschews weather, sports, and entertainment news except in the context of reports with wider social, political, economic, or science implications. The absence of commercial interruptions is a hallmark of public television programs, though programs are often preceded and followed by underwriting credits that use brand names, logos, and information about the sponsoring company and its product. Also, during regularly scheduled national "pledge" drives, news programs are interrupted to ask viewers to make contributions to support public television news.

From their start, public media were envisioned as a vehicle for balanced, inclusive coverage and discussion of the day's events. John Macy, the first president of the Corporation for Public Broadcasting (CPB), believed that public perceptions of declining network news standards in the 1960s created a vacuum that public television news could fill. In 1970, he set three goals for public television news: to provide an alternative to "sensationalist" and "distorted" commercial news; to provide a model of rational discourse in which "reasonable men could work to solve public issues;" and to allow citizens to use television as a platform for expressing their own opinions (Macy 1970, 286–88). Despite such ambitious aims, however, the failure in the United States to secure reliable long-term funding for public television has left its news programs and documentaries vulnerable to financial and political pressures that have led to increasing commercialization and charges of bias from both left and right wing critics. Furthermore, the availability of news from cable networks, satellite, and online sources has steadily eroded the audience for public television news.

Development

Public television news was slow to emerge in the United States. Commercial stations staked early claims to the broadcast spectrum that were subsequently protected by federal legislation. By contrast, in the democracies of Western Europe, public radio news was part of a broad public service mandate for broadcasting that existed before the introduction of commercial television, so licensed stations were required to provide balanced news that was independent of both government and commercial interests.

The forerunner of public television news in the United States was radio programming carried on educational stations operated mainly by public universities. Progressive educators such as John Dewey recognized the enormous potential of broadcasting as a distributor of news and information and as a public space for the exchange of ideas and opinions vital to a deliberative democracy. Nonetheless, the United States opted for a marketplace model of broadcasting. As commercial media established their dominance of radio broadcasting, news was largely eclipsed by entertainment, a pattern that was repeated with the advent of television in the mid-twentieth century.

In 1952, the Federal Communications Commission (FCC) reserved channels on the VHF and UHF bands for noncommercial television channels. Noncommercial television was narrowly cast as "educational" as had been noncommercial radio before it. Still, some early educational television stations experimented with community news and discussions aimed at promoting social and civic reform. One example was a series produced in 1952 by WOI-TV, licensed to Iowa State University. *The Whole Town Is Talking*, a 15-part series funded by the Ford Foundation, featured local citizens discussing current issues in communities throughout Iowa.

The Ford Foundation played a crucial role in funding news programs for early educational

television, particularly with the creation of National Educational Television (NET) in 1963. NET was a consolidation of several Ford Foundation projects that focused on media and education. The first regular public affairs program funded by NET for distribution to educational television stations was *At Issue,* produced by Alvin Perlmutter. NET also sought to redress a media deficiency in the wake of race riots in the 1960s. By funding public affairs programs produced by and for minorities, NET showcased one of the potential strengths of public television news—its capacity to serve marginalized audiences rather than to maximize audience share.

Carnegie Commission

In 1967, the Carnegie Commission of New York released a report of its two-year study of noncommercial television. Titled, *Public Television, a Program for Action,* it outlined a series of recommendations that included increased news and public affairs programming. Lawmakers enacted most of the commission's proposals into law—the Public Broadcasting Act of 1967. The Corporation for Public Broadcasting (CPB) was formed as a nonprofit corporation charged with receiving and disbursing government funds in support of public television and radio. However, Congress rejected the Carnegie recommendation to create a permanent source of CPB funds through excise taxes and opted instead to allocate funding to the CPB through the budgetary process. Consequently, federal funding for public broadcasting, which in real dollars has steadily decreased since the 1980s, remains subject to shifts in the political climate.

Local News

Because of the prohibitive expense, most public television stations do not produce daily news programs. Locally produced news requires equipment, studios, and an extensive commitment of personnel, and it results in only a tiny percentage of weekly broadcast hours. In lieu of conventional newscasts, many stations produce public affairs programs, interview shows, or themed call-ins that connect viewers by telephone or Internet with expert studio guests. Two series—*Newsroom* and *The 51st State*—are commonly considered landmarks in public television local news.

KQED-TV in San Francisco was the first public television station to produce a daily news program. The *Newspaper of the Air* debuted in 1968 in response to a strike that closed San Francisco's two metropolitan dailies. The program featured journalists hired off the picket lines to report and discuss local stories. It quickly became so popular that when the nine-week newspaper strike ended, the Ford Foundation provided a grant to continue the program in a revised format. The new daily program, *Newsroom,* provided in-depth, local coverage of the fractious 1968 presidential campaign, the antiwar movement, and civil rights protests, receiving the prestigious Alfred I. DuPont-Columbia University Award for television journalism for its local coverage. For budgetary reasons, KQED cancelled *Newsroom* after a nine-year run. By then, the program had been replicated at other public television stations including WQED in Pittsburgh, Pennsylvania; WETA in Washington, D.C.; and KERA in Dallas, Texas. *Newsroom* also had a significant impact on commercial television with dozens of local and national news organizations patterning magazine-style programs after its longer, in-depth, interview-oriented format.

The 51st State was a nightly production of New York's WNET-TV from 1972 to 1973 and a weekly series until 1976. The program reported on regional issues such as youth gangs in the South Bronx while also providing New Yorkers' perspectives on national concerns including the Vietnam War. Rejecting the fast pace and headline quality of network news, *The 51st State* adopted unconventional broadcast techniques, such as allowing story content to dictate its length and bringing viewers into the studio to question experts and government officials. The series did not shy away from sensitive subjects, and it experimented with creative formats. For example, an episode that examined the problems of public television was hosted by two Muppet-like anchors.

NPACT

Unlike in most other countries, public broadcasting in the United States does not have a centralized news department. Rather, news is produced by individual member stations for distribution nationwide.

The first effort at national public television news occurred in 1971 when the Ford Foundation and the CPB established the National Public Affairs Center for Television (NPACT). The center was charged with producing news programming and documentaries for the recently established Public Broadcasting System (PBS), the nonprofit corporation collectively owned by member stations throughout the United States. Eventually merging with WETA-TV, the Washington, D.C., public television station, NPACT's early efforts included *Washington Week in Review* which continued to air on public television stations more than 25 years later. In 1972, NPACT began producing a weekly campaign year series for PBS, co-anchored by former NBC reporters Robert MacNeil and Sander Vanocur. *A Public Affair/Election '72* provided the template for what became the *MacNeil/Lehrer NewsHour*. Filled with interviews and studio discussions with visiting experts, *A Public Affair* operated on the principle that news should be delivered as unadorned as possible to prevent distortion or trivialization.

In the early 1970s, *A Public Affair,* along with other news programs and documentaries on public television, provoked the Nixon administration, which accused PBS of having a liberal/leftist agenda. Concerns about the perceived liberal bias of PBS triggered the development of broad journalistic standards for public television news which, according to the CPB's Macy, included balanced programming, objectivity, reflection of "voices both inside and outside society's existing consensus," and "the obligation not to let technique become the master of substance" (Macy 1974, 71). To implement the guidelines, PBS appointed Jim Lehrer, KERA's *Newsroom* anchor in Dallas, as its public affairs coordinator. Lehrer also became a correspondent for NPACT, and in 1973, he teamed up with Robert MacNeil to provide live, continuous coverage of the Senate Select Committee on Watergate, which was investigating high level government corruption in the growing scandal.

NPACT's decision to provide "gavel to gavel" coverage of the Watergate hearings marked a watershed for public television news. While commercial television provided excerpts of the hearings in nightly news broadcasts (and eventually rotated live coverage among themselves), PBS preempted its daytime programming to carry more than 200 hours of coverage. Its Watergate coverage attracted a larger audience in many markets than the networks' prime time coverage. The Watergate broadcasts are widely credited with creating a surge in both viewer interest in and funding for public television news. Nonetheless, the Nixon administration's assault on PBS weakened its news programming. In 1972, a CPB board, dominated by Nixon appointees, voted against funding news and political analysis and rescinded a funding commitment to NPACT. With the exception of *Washington Week in Review,* NPACT programming perceived as hostile to the Nixon administration went off the air once its funding was exhausted.

National Daily News

Although a majority of PBS stations agreed that broadcast journalism should be a significant presence on the national schedule, no daily newscast appeared until 1975. Previously, the Eastern Educational Network (EEN), a group of interconnected public television stations on the East Coast, had contracted with veteran broadcast journalist Martin Agronsky to produce and anchor a news program. Agronsky's *Evening Edition* aired on EEN stations from 1970 to 1974.

In 1975, WNET-TV premiered a 30-minute weeknight program, *The Robert MacNeil Report.* Jim Lehrer served as the program's Washington correspondent. In 1976, the program was renamed the *MacNeil/Lehrer Report.* Similar in format to *Newsroom,* the *Report* devoted each episode to a single issue. That changed in 1983 when the program expanded to a full hour under the title, *MacNeil/Lehrer NewsHour*. In its expanded format, the *NewsHour* pioneered a new approach to nightly newscasts. Its opening segment provided a summary of national and international events. In-depth reports and interviews then provided additional context to news summary stories or introduced conflicting viewpoints. By limiting feature segments to just two or three per program, the *NewsHour* could devote significant attention to a limited number of topics. Pre-taped feature segments were produced by the *NewsHour*'s own staff, by affiliated public television stations, and by producers from Independent Television News, a news content provider headquartered in Great Britain.

Confounding doubts that Americans would watch a full hour of nightly news, the *NewsHour* became one of the most popular and iconic series on PBS. The *NewsHour* continues to experiment with different types of segments. For example, in presidential election years, it airs extended excerpts of primary candidates' stump speeches on the premise that most citizens hear only sound bites and advertisements. The *NewsHour* also introduced weekly debates between conservative and liberal commentators. Another periodic segment that began in the aftermath of the 2003 U.S.-led invasion of Iraq is *Honor Roll* in which the *NewsHour* silently displays the pictures and lists the names, ranks, and hometowns of U.S. military members killed in Iraq. In 2006, *Honor Roll* expanded to include military personnel killed in Afghanistan. With MacNeil's retirement from the program in 1995, the series became *The NewsHour with Jim Lehrer*. As of 2008, it remained the flagship news broadcast on American public television where it is carried by more than 300 stations and available to 99 percent of American viewers.

Other News Programming

Over the years, public television stations have experimented with a variety of formats designed to engage viewers in current events and promote an active, informed citizenry. The *Public Broadcasting Laboratory* (*PBL*), produced from 1967 to 1969 and hosted by veteran journalist Edward P. Morgan, was an innovative and controversial series that tested the limits of public television broadcasting. The first series to be aired over a nationally interconnected network of public television stations, *PBL* was a magazine-style program that aimed to simulate a national dialogue by weaving together video and interview segments from around the country. In one of the program's most controversial segments, *PBL* producers gave a camera to Russell Meeks, a radical African American poet, who chronicled life in the Chicago ghetto while condemning Martin Luther King Jr.'s nonviolence strategy. The program drew condemnation for its subjectivity and incitement to violence. It was also praised for exposing a wider American population to the often invisible world of poor urban blacks and for permitting a marginalized voice to tell his story in his own words. In many ways, *PBL* was the archetype for the magazine news programs that followed such as CBS's *60 Minutes*.

In 1968, the CPB funded a news program for African Americans. *Black Journal* used interviews, documentary productions, surveys, and editorials to examine political, social, and economic issues that were relevant to the African American community. In 1980, Tony Brown, a journalist from WTVS in Detroit, became executive producer. Brown took a special interest in media issues, encouraging African Americans to become involved in broadcasting to counter the racism he perceived in public television. When the CPB withdrew funding for the program in the 1973–74 season, the outcry from the black community forced the CPB to reconsider. Nonetheless, Brown was frustrated with the CPB's tepid support. In 1977, he changed the program's name to *Tony Brown's Journal* and moved it to commercial television. In 1982, he returned to public television where his *Journal* has become one of the longest-running public affairs programs on PBS.

Bill Moyers' Series

Journalist Bill Moyers has hosted several public affairs series on PBS including *Bill Moyers Journal, This Week, NOW,* and *Wide Angle,* as well as one-time specials and miniseries. He is especially noted for his investigative documentaries and for long-form conversations with prominent people seldom seen on television such as social critics Noam Chomsky and Cornel West. Moyers frequently has used his PBS platform to critique government, corporate, and journalistic shortcomings. His progressive views have made him a favorite target for conservative media watchdog groups such as the Committee on Media Integrity (COMINT). His critics often cite his reports, which they perceive to be one-sided, as examples of why the government should not fund public broadcasting. However, many regular public television viewers consider him to be a political and cultural figure of authority, and his work has been honored with numerous journalism and public service awards.

Frontline

PBS's premiere documentary series is *Frontline,* a hard-hitting, investigative program in the tradition

of Edward Murrow's CBS specials. It is PBS's only single-subject, long-form documentary series. It was created, in part, to fill the void left when commercial network news divisions gradually eliminated their own documentary series in the 1970s and 1980s. *Frontline* is unique among public television news programs for at least two reasons. It has never been anchored by a single broadcast journalist or personality. Rather, it has featured both well-known journalists such as Gary Wills, Seymour Hersh, and Bill Moyers along with little-known independent reporters and filmmakers. Further, *Frontline* is not supported by corporate underwriting. Its funding comes from the CPB, PBS, and PBS member stations. Insulated from real or perceived pressures from corporate underwriters, *Frontline* routinely examines important national and international issues and raises probing questions about U.S. domestic and foreign policies. Perennially one of PBS's top-rated programs, *Frontline* frequently generates press reviews and wins major national awards for broadcast journalism. Given the nature of its content, it also incites controversy and is often cited as an example of the purported "liberal bias" of PBS.

Problems of Public Television News

Critics of public television news take issue with both its style and substance. Some believe that the deliberative pace and lack of stimulating visuals does not appeal to younger news viewers. Others consider public television's approach to news to be pedagogic and elitist. A third critique is the failure of public television news to reflect minority viewpoints and marginalized voices as articulated by the Carnegie Commission Report. The most fundamental critique of public television news stems from PBS's lack of a long-term, insulated source of funding and the consequent perceived ideological biases that result from dependence on various funding agencies. Nixon alleged that a leftist bias in public television reflected the ethos of the liberal Ford Foundation which funded many of the early news and public affairs programs. Many other conservative political figures agree. The Republican-controlled Congress of the late 1990s sought to "zero out" federal funding for the public broadcasting system. More recently, some critics see a rightward trend with the addition to the PBS news lineup of conservative commentators.

Growing reliance on corporate underwriting has raised concerns about the ability of public television to practice independent and impartial journalism. Business corporations, brokerage firms, insurance companies, and corporate-supported think tanks have underwritten prominent business news programs such as the *Nightly Business Report* (A.G. Edwards & Sons, Inc.), *Adam Smith's Money World* (Metropolitan Life), *Wall $treet Week with Louis Rukeyser* (Prudential-Bache Securities), William F. Buckley's *Firing Line* (American Enterprise Institute), and *The McLaughlin Group* (General Electric). Even the venerable *NewsHour* has been accused of self-censorship in deference to corporate underwriters. An additional fear provoked by corporate influence is that, to attract the large audiences that underwriters seek, public television news will increasingly become more entertainment-oriented and less of a distinct alternative to commercial news.

News on Public Access Cable

In addition to PBS, cable television offers another forum for public television news—community access channels. These are also known by the acronym "PEG" for the three types of users: the public, education, and government. Although the channels are owned by for-profit cable companies they generally carry no advertising, and they provide local citizens a platform for the distribution of their own noncommercial messages. However, viewers must pay to receive cable channels.

PEG channels emerged in the 1970s. The broadcast industry, fearing a loss of audiences and revenues, maintained that cable posed a threat to "free television." The cable television industry touted their community access channels to demonstrate cable's social responsibility as a content provider. Cable operators argued that access channels enabled them to be more responsive than commercial broadcast networks to the issues and concerns of local communities. In 1972, the FCC required all cable systems with more than 3,500 subscribers to set aside three noncommercial access channels for public, educational, and governmental use. The development of these channels has been uneven, with programs that range from

static shots of school board meetings to lively and highly produced series that examine controversial political, social, and cultural issues. The series *Alternative Views,* produced in Austin, Texas, has been cited as a model for public access news programming. *Alternative Views* was an interview program that addressed issues ignored by the mainstream media. As the program became more technologically sophisticated, the producers introduced documentary film clips and unedited video footage—including graphic scenes of the aftermath of Israeli attacks on refugee camps in Lebanon and Ku Klux Klan assassinations of communist labor organizers.

Under federal law enacted in 1984, cable operators are no longer required to provide local access channels, but local governments have the right to require PEG channels as a condition for awarding a cable franchise. It is estimated that fewer than half of American cities now mandate the provision of local access.

Public television has also experimented with community access projects. For example, in 1971, Boston's WGBH Foundation created *Catch 44,* a nightly 30-minute program that invited any local group to air its views. Participants were encouraged to use the latest portable equipment to create programming. Although other stations initially followed Boston's lead, community access projects did not become a significant source of public television news.

Public Television News Worldwide

Various development models for public media have influenced the types of news carried on public service television (the usual term used abroad) globally. Unlike in the United States where public television belatedly filled a niche neglected by commercial broadcasters, Canada, Australia, and Western European nations (among many others) conceived of television as a public service from the start, so dissemination of news and information was an important part of the media's obligation. Public service television in these countries maintains a prominent role in the political process by routinely covering parliamentary debates, election campaigns, and policy announcements. The European Broadcasting Union (EBU), an organization composed solely of public broadcasters, requires its members to provide balanced programming.

Although created by the government, most European public television systems are funded by annual license fees on television receivers or other taxes. This guaranteed funding insulates news producers from legislative pressures, but it also compels them to produce quality programs that justify the license fees. In this regard, European public broadcasters face some of the same pressures to attract large audiences as American public television producers who seek corporate support.

The British Broadcasting Corporation (BBC) is one of the oldest and most widely respected public service media providers. It is also the world's largest newsgathering operation, reaching more viewers than any other news organization in the world. Although the BBC is prohibited from advertising on any of its domestic media, it programs several commercial channels outside Britain including the BBC World and BBC America cable channels in the United States.

In authoritarian countries, public service television is generally an arm of the government, and news broadcasts have mostly propagandistic purposes. In many developing countries, which often inherited public media systems from colonial powers, strong national leaders have used television news and public affairs to serve their own purposes of unifying the nation and consolidating their own authority. Developing countries have generally funded public service media through a combination of advertising and government allocations because sales of television sets are too meager to produce sufficient funding from excise taxes.

Conclusion

Public television news is widely considered to be an important factor in the maintenance of modern democracies. Unlike commercial television news which seeks to build large audiences that will attract advertisers, public television engages in news gathering and information dissemination for the sake of its viewers. Consequently, public television news can explore serious issues in greater depth and can accommodate a wider range of topics and perspectives than is practicable in ratings-driven commercial news. Despite a reputation for stodginess, public television news has been a force

for innovation in the United States because commercial broadcasters are reluctant to take risks on new formats until they have been proven in the marketplace. Hour-long interview programs, magazine style news shows, news satires, and niche programs such as business news were all pioneered by public television before they were adopted by commercial broadcasters.

State subsidies, corporate underwriting, and viewer support fund public television in the United States. Other countries also rely on license fees, excise taxes, and advertising revenue. Budgetary crises and political tensions have accompanied the development of public television news which has been criticized for both fiscal and ideological reasons.

Regardless of the national structure or funding system, public television news producers worldwide confront the same three challenges in the twenty-first century: (1) greater competition from cable stations that can target narrow niches with specific news, (2) more pressure from powerful global media conglomerates that can absorb the expense of electronic news gathering, and (3) rapidly changing technology that will require public media to make the shift to new digital platforms. To meet these challenges, public television will need to envision new ways of gathering, producing, disseminating, and funding the news.

PUBLISHERS

A publisher prints and disseminates literature or information in books, periodicals, and newspapers. With the advent of the Internet, publishing expanded online as the early twenty-first century introduced e-books and online newspapers.

The publisher represents the owner and sometimes is the owner. He or she controls all stages of producing a newspaper or magazine from development to distribution including acquisition, graphic design, copyediting, production, selling advertising, marketing, and circulation. Virtually every aspect of any publication is the responsibility of the publisher who has final say on important business (and sometimes editorial) decisions.

In the early years of newspaper publishing, one person often filled the roles of publisher, editor, and reporter. The separate role of a publisher as the controller of the business began to emerge in large cities during the late eighteenth century, but became

important only in the nineteenth century as a handful of individuals became well known as press "barons" who dominated all aspects of their publications. By the late twentieth century, however, publishers played a more behind-the-scenes role at most newspapers and magazines, and few were in the public eye. They remained powerful—central—to the publishing process however, for they controlled purse strings and determined how revenues would be spent. Publishers usually appoint editors, for example, thus setting the standard for publication.

Notable Publishers

The following American and British publishers, listed in alphabetical order, all played highly influential roles in the nineteenth- or twentieth-century print journalism industry.

Sir William Maxwell Aitken, 1st Baron Beaverbrook (1879–1964)

Born in Canada, Aitken moved to England as a wealthy stockbroker and was elected to the House of Commons in 1910. In December 1916 Aitken purchased a majority interest in the London *Daily Express*. He later began the London *Sunday Express,* acquired the London *Evening Standard* and the Glasgow *Evening Citizen*. He accepted a peerage as Baron Beaverbrook in 1917. The next year Aitken served as chancellor of Lancaster and minister of information in the cabinet. He enjoyed being active behind the scenes in Tory politics. Aitken became Winston Churchill's war cabinet minister of aircraft production in 1940, then minister of supply in 1941. The following year he became British lend-lease administrator in the United States. Throughout his career Aiken served interchangeably as financier, politician, and newspaper proprietor. His outspoken personality and open support for British imperial gains led Evelyn Waugh to sketch Aitken into his novel, *Scoop* (1938).

James Gorden Bennet (1795–1872)

Bennet emigrated from Scotland in 1819 and spent his early years in New York founding a school, lecturing on political economy, and writing for or editing several newspapers. On May 6, 1835, Bennet published the first edition of *The New York Herald,* a four-page penny paper. The paper soon became a huge success, due in part to Bennet's focus on the gathering of interesting news. Some of the paper's pioneering contributions include: the first Wall Street financial article to appear in an American newspaper (1835); a colorful account of the great New York fire of December 1835 which was accompanied by an illustrated map of the burned area; leading newspaper use of illustration (the illustrated map that accompanied the 1835 article about the New York fire was the first time an American paper had used illustration); establishment of the first European correspondents in 1838; the first society department in 1840; and a report obtained fully by telegraph in 1846.

James Gorden Bennet (1841–1918)

Son of James Gorden Bennet, the younger Bennet took the managing editor responsibilities of *The New York Herald* in 1866 and became editor a year later. After his father's death, Bennet inherited *The New York Herald* and with its success was able to start the *Paris Herald* in 1887. This later became the *International Herald Tribune* often considered the first "global" newspaper.

Harry Chandler (1864–1944)

Raised in New Hampshire, Chandler headed west after he was forced to withdraw from Dartmouth College for medical reasons. Chandler met *Los Angeles Times* publisher Harrison Gray Otis when Chandler started a newspaper delivery business. Otis hired Chandler as general manager at his paper and Chandler married Otis's daughter, Marion. Otis transferred his controlling interest of the *Los Angeles Times* to Chandler in 1914. Three years later when Otis died, Chandler took over his father-in-law's role as publisher of the *Times,* taking a strong stand against labor unions. With the success of the *Times,* Chandler helped to found many Californian institutions including California Institute of Technology (Caltech), the Los Angeles Coliseum (as well as bring the Olympic Games to Los Angeles in 1932), the Biltmore Hotel, KHJ radio, and played important roles in Trans World Airlines, the Douglas Aircraft Company, and the Ambassador Hotel.

Charles Anderson Dana (1819–1897)

Dana became a trustee of the Brook Farm utopian community (1841–46) after illness caused him to leave Harvard College. Hungry for social change, Dana left the community for Boston's *Weekly Chronotype*. In 1847 Dana signed on with the *New York Tribune* and a year later went to Europe to report on the continent's widespread revolutionary movements. Upon his return Dana became managing editor in 1849, a post from which he gave his aggressive support to the antislavery movement. In 1864 Dana was asked to resign due to personality conflicts with Horace Greeley. Dana served in the War Department during the Civil War and from 1864 to 1865 as an assistant to secretary of war, Edwin Stanton. Dana joined the *New York Sun* as editor and part owner in 1868. Over the next three decades, despite some editorial inconsistencies, the *Sun* became an industry icon often thought of as "a newspaperman's newspaper," for its news ("the freshest and sprightliest current") and human interest story specialization.

Frank Earnest Gannett (1876–1957)

Gannet graduated from Cornell University, where he was campus correspondent for local papers, in 1898. He accepted a city editor position followed by managing editor and business manager with the *Ithaca Journal*. In 1906, then aged 30, he bought half of his first newspaper, the *Elmira Gazette*. The following year Gannett purchased the competing *Star* and merged it to form the *Star-Gazette*. In 1923 Gannett founded Gannett Company. Like other publishers, he pursued political interests while running a newspaper conglomerate. Although mainly active in state and local politics, Gannett ran unsuccessfully for the Republican presidential nomination in 1940. Gannett is most recognized for his efforts to modernize regional newspaper conglomerates with technological advances and progressive ideas. By the time Gannett died at 81, his company owned 22 newspapers, 4 radio stations, and 3 television stations. It was only after his death that Gannett Company expanded nationwide to include such titles as *USA Today* (begun in 1981) and the *Arizona Republic,* growing to become the largest U.S. newspaper publisher in terms of total circulation in 2008.

Katharine Meyer Graham (1917–2001)

Graham, daughter of *The Washington Post* publisher Eugene Meyer, took her first reporting job at the *San Francisco News* but left a year later to work as a member of the editorial staff for her father's paper. After marrying Phillip Graham in 1940, Graham placed her newspaper career on hold to raise a family. Phillip Graham became editor of *The Washington Post* in 1946 and the couple bought out her father in 1948. Over the next 15 years the Washington Post Company acquired several radio and television stations as well as the *Washington Times-Herald* (1954) followed by *Newsweek* magazine (1961). After her husband's suicide in 1963, Graham became president of the company. For ten years starting in 1969, Graham served as publisher as well. The *Post* gained growing political clout under editor Ben Bradlee to become Washington's most influential paper. Two important milestones in the *Post*'s evolution were the publication of the Pentagon Papers in 1971 and the two-year investigation of the Watergate scandal of 1972. Graham presided as chairman of the board and CEO of the Washington Post Company for 18 years starting in 1973. Her autobiography earned a Pulitzer Prize.

Horace Greeley (1811–72)

After working as a printer's apprentice in Vermont, Greeley started his publishing career in New York City in 1834 as founding editor of a literary paper, *The New Yorker*. He openly expressed his views as a liberal Whig. Greeley founded the *New York Tribune* in 1841, continuing his commitment to the Whig platform of economic growth and chances for personal advancement. Often called a political bible, the *Tribune* set high standards in news gathering, moral and intellectual content, and even included reporting from Karl Marx and Friedrich Engle. While Whig issues were reflected in its columns, the *Tribune* was known for actively supporting multiple causes. Greeley remained politically outspoken, particularly in his opposition to slavery and support for Western expansion. The Liberal Republicans nominated him for President, a lifelong dream, but he was overwhelmingly defeated by Ulysses S. Grant in 1872. Greeley died not long afterward.

Alfred Charles William Harmsworth, 1st Viscount Northcliffe (1865–1922)

Considered one of the most successful publishers in British press history, Harmsworth began as a freelance journalist and then editor of popular papers. Following the trend of weekly "information snippet" newspapers, he founded *Answers*. With his brother Harold, the two formed several other inexpensive periodicals. These ventures formed the basis of the Amalgamated Press which soon became the world's largest periodical publisher. Harmsworth purchased the *London Evening News* in 1894 bringing it out of near bankruptcy with substantial profits within a year. Harmsworth aimed to start a chain of halfpenny newspapers when he merged two small Glasgow papers into the *Glasgow Daily Record*. In 1896 he published the first issue of the *Daily Mail*, a national paper based in London. Harmsworth's success lay in his ability to anticipate desires of the new reading public after institution of compulsory education, especially their desire for quick news and entertainment. The *Daily Mail* was introduced as "the busy man's daily journal," and "the penny newspaper for one halfpenny." In 1903 he founded the *Daily Mirror,* tapping into the new picture paper market. Two years later Harmsworth rescued the *Observer* and became Lord Northcliffe. He took possession of *The Times* in 1908. In 1917 amid World War I, Harmsworth headed the British war mission in the United States and became a viscount for his efforts. The next year he served as Britain's director of propaganda against Germany and other enemy nations. Throughout his career, Harmsworth greatly influenced the way newspapers approached the new reading masses through commercial exploitation and entertainment. Sadly he became more erratic as he aged and was eased out of his positions after World War I.

William Randolph Hearst (1863–1951)

Hearst was born in San Francisco to a goldmine owner turned politician. At age 23, Hearst petitioned his father to let him take over the ailing *San Francisco Bee*. Upon taking control, Hearst focused on increasing circulation because he believed that there was nothing more important than a large readership. Hearst poured huge resources—technology, journalists—into transforming the *Bee* into "The Monarch of Dailies," with sensational stories and headlines. Although the cost was high, Hearst turned a profit within two years. In 1895 he shifted his focus to the East, purchasing another struggling paper, the *New York Morning Journal*. With his eye on as rapid a revival of profit as possible, Hearst literally bought the best reporters he could find including Stephen Crane and Julian Hawthorne and raided Pulitzer's New York *World* of staff including cartoonist Richard F. Outcault (who created the Yellow Kid cartoons).

His fierce drive to topple competition led to his famous circulation rivalry with Joseph Pulitzer which resulted in "yellow journalism." Hearst's *New York Journal* featured elaborate illustration and color magazine sections, which, along with its sensational headlines and stories, sent circulation through the roof and all for a mere penny's cost. Hearst was also thought to have created phony interviews, events, facts, and photographs to create the sensational news stories people devoured. Most famously, during the short Spanish-American War, which he heavily promoted, he was quoted as instructing his man in Cuba: "You produce the pictures, I'll provide the war."

By 1935 Hearst was at the height of his career. He owned 28 major newspapers, 18 magazines, radio stations, movie companies, and news services. However, Hearst spent extravagantly, and in the Depression his finances were seriously damaged. In order to survive the crisis, he had to sell off failing papers and parts of his art collection, while consolidating some papers. By 1940 his empire was slipping out of his control and he rarely showed his face in public. The following year Orson Welles portrayed a thinly veiled version of Hearst in his highly controversial film, *Citizen Kane*.

John S. Knight (1894–1981)

Educated in Ohio and Maryland, Knight spent his summers working at his father's *Akron Beacon Journal*. After service in World War I, his father persuaded him to return to the paper as a sports reporter where he wrote under a pseudonym until he became managing editor in 1925. Knight became publisher in 1933 though he continued to write occasionally. Over the years Knight became known as a prize-winning editorial writer and an acquisitive publisher whose growing stable of newspapers

enjoyed a combined circulation of one million by 1960. They included *the Miami Herald* (1937), the *Detroit Free Press* (1940), the *Chicago Daily News* (1944), and *the Charlotte Observer* (1954). Knight merged with Ridder Newspapers in 1974 to become the Knight-Ridder Group. Despite the merger, the newspapers continued to reflect Knight's passion for quality journalism and writing even after his death; Knight-Ridder newspapers had won over 80 Pulitzer Prizes by the early twenty-first century, but were sold to a variety of buyers as revenues declined.

Henry Robinson Luce (1898–1967)

Luce, born in China to a Presbyterian missionary family, spent his first years in China and England. He arrived in America to attend preparatory school and Yale University. Luce quickly soared to the top of his class and edited the school newspaper, becoming close friends with fellow Yale student Briton Hadden. After graduation in 1920, Luce and Hadden partnered to launch *Time,* the country's first weekly newsmagazine.

Luce felt that most people were poorly informed and that American newspapers and magazines were missing the mark, especially on coverage of world news. *Time* used a narrative writing style to inform its readers and quickly achieved success. Within a year *Time* was turning a profit; five years later Hadden's death left Luce in full command. Luce created the business monthly, *Fortune,* in 1930 and a year later expanded into radio with the weekly program *The March of Time*. His third magazine, *Life*—a photojournalism platform—was introduced in late 1936 and quickly grew to be the one of the most popular weekly magazines. In 1952 Luce continued to expand his empire with *House & Home* (later sold to McGraw-Hill), and he founded *Sports Illustrated* in 1954. Under his stewardship, Luce's magazines, especially *Time,* hewed to a cosmopolitan Republican line, representing the viewpoints of the country's business and political elites. He relinquished his role of editor-in-chief of Time, Inc. in 1964, becoming editorial chairman until his death three years later.

James McClatchy (1824–83)

McClatchy began as a journalist on Horace Greeley's *New York Tribune*. After gold was struck in California, Greeley encouraged McClatchy (then 24) to head west to "strike it rich," and although he followed the advice, he never struck gold. Instead, he wrote for a number of California papers in the 1850s, exposing government and business malfeasance where he found it. He centered his activity on the *Sacramento Bee,* which his son took over as publisher along with his brother on McClatchy's death. McClatchy's company continued to grow and went public in 1988.

S. S. (Samuel Sidney) McClure (1857–1949)

McClure, an Irish immigrant, arrived in America when he was only nine. He attended Knox College where he co-founded the student newspaper. After moving to New York City, he established a fiction literary syndicate in 1884, obtaining rights to stories by Rudyard Kipling and Sir Arthur Conan Doyle. McClure revolutionized journalism when he and John Sanborn Phillips first published a political and literary monthly called *McClure's Magazine* (1893), which published novels-in-progress and introduced muckraking journalism with Ida Tarbell's 1902 exposé of the Standard Oil Company. While McClure continued to lead the magazine with a renowned staff including Willa Cather and George Kibbe Turner, he left his editorial post in 1914 to pursue his passionate speculations of democracy. However, his books *Obstacles to Peace* (1917), *The Achievements of Liberty* (1935), and *What Freedom Means to Man* (1938) did not sell widely.

Robert R. McCormick (1880–1955)

McCormick spent the first part of his career in public service as a Chicago alderman and later five years as president of the Chicago Sanitary District Board. McCormick was an officer in World War I and was thereafter known as "the Colonel." In 1911 he built on his grandfather Joseph Medill's leadership at the *Chicago Tribune,* becoming president of the Chicago Tribune Company. In 1914 McCormick shared publisher and editor in chief duties with his cousin Joseph Patterson. While partnering with Patterson, the company acquired the tabloid New York *Daily News* in 1919. In 1925 Patterson left to direct the *Daily News* and McCormick took sole control of the

Chicago paper, increasing control over the paper's supply chain and expanding the company's portfolio to include other newspapers and broadcast stations. McCormick, with his conservative editorial line and open political criticism of the New Deal, expanded the *Chicago Tribune* into the nation's largest standard-sized newspaper in circulation, and the world's largest in advertising revenue.

Joseph Medill (1823–99)

Canadian-born Joseph Medill started publishing newspapers in Ohio in 1849. In 1855 he partnered with Charles Ray, a doctor experienced with newspapers, to purchase the *Chicago Tribune*. Medill took on editorial responsibilities immediately. A strong—and early—supporter of Abraham Lincoln's, Medill wrote uncompromising antislavery editorials, and he worked for Lincoln's presidential nomination and later campaign in 1860. Throughout the Civil War, Medill's editorials showed his support for Lincoln's administration and then for the Radical Republicans' reconstruction program in the South. After the Chicago fire of 1871, Medill was elected mayor. While he resigned after only three years, he reorganized the city's finances and municipal government and established the public library. He returned to the *Tribune* as publisher, maintaining a strong editorial stance for free business, against labor unions, and a nationalistic foreign policy. In 1898 Medill urged American intervention in Cuba during the Spanish-American War and in 1893 played a key part in the World's Columbian Exposition held in Chicago. Medill's legacy carried on through Northwestern University's Medill School of Journalism and through the publishing careers of his three grandchildren: Robert McCormick (*Chicago Tribune*), Joseph M. Patterson (New York *Daily News*) and Eleanor M. Patterson (*Washington Times-Herald*).

Keith Rupert Murdoch (1931–)

Born in Australia to newspaper publisher Sir Keith Murdoch, Rupert Murdoch graduated from Worcester College, Oxford (1953), and learned the ways of sensational journalism under Lord Beaverbrook during a brief post as editor of the London *Daily Express*. Murdoch returned to Adelaide, Australia, in 1954 to take over his family's newspapers, the *Sunday Mail* and *The News*. Expanding on his experience under Beaverbrook, he transformed *The News* into a popular sensational paper of sex and scandal. He took a similar approach to subsequent papers throughout Australia. Murdoch established the *Australian* in 1964. In 1969 Murdoch expanded his publishing empire internationally with the purchase of London's *News of the World*. The next year Murdoch acquired *The Sun* (London) making a success out of both papers with attention grabbing stories on human-interest, crime, scandal, sex, sports, and outspoken conservative editorials.

Murdoch expanded his sensationalism style to San Antonio, Texas, in 1973 buying the *San Antonio News* and soon leading area dailies. In 1974 he founded the *Star* as a national weekly tabloid, and two years later acquired the *New York Post*. Both were sold profitably in the late 1980s, though Murdoch repurchased the *Post* in 1993. The 1980s and 1990s were extremely active for Murdoch (including his naturalization in 1985 allowing him to own American television stations), buying and selling numerous publications including the *Chicago Sun-Times, New York* magazine, and the *Village Voice* (New York City) in 1985. Five years earlier, Murdoch had established News Corporation, which grew to be one of the world's three largest media groups. While expanding in the United States and Australia, Murdoch kept active in London newspapers, purchasing the venerable *Times* and *Sunday Times* in 1981. In 1988 Murdoch purchased *TV Guide*.

Murdoch soon tapped into other arenas securing major holdings in video, film and recording companies, radio and television stations, and book publishing companies. One of his most important moves was made in 1985 with the purchase of Twentieth Century-Fox Film Corporation, which he consolidated with seven television stations from Metromedia, Inc. to form a new television network. Launched in 1986, Fox, Inc. grew to be one of the top four U.S. broadcast television networks, a spot it retained into the early twenty-first century. The same year he purchased U.S. book publisher Harper & Row followed by Zondervan (1988), Scott, Foresman (1989), and British publisher William Collins (1989). Murdoch subsequently merged these along with other acquisitions

in Australia and New Zealand into HarperCollins in 1990. Murdoch launched a satellite television service, Sky Television, in 1989, merging with rival British Satellite Broadcasting the following year to forming British Sky Broadcasting (B-Sky-B).

The enormous activity put heavy financial strains on Murdoch's international media giant resulting in the sales of several U.S. magazines (including *Seventeen, New York,* and the *Daily Racing Form*). However, this did not stop the international conglomerate from reaching into the Asian market with the Star TV satellite service in 1993. In 2005 News Corporation expanded its Internet holdings through the acquisition of MySpace.com. News Corporation paid $5 billion for Dow Jones & Company (*The Wall Street Journal*) in 2007.

Allen H. Neuharth (1924–)

Neuharth started his career while a student at the University of South Dakota, editing the student newspaper. After graduating in 1950 he joined the Associated Press as a reporter in Sioux Falls. In 1954 Neuharth joined the Knight chain at the *Miami Herald* and eventually became assistant managing editor. Knight sent him to the struggling *Detroit Free Press*. Later he left Knight for Gannett in 1963 to run its two Rochester, New York, papers as general manager. He slowly rose to head the boardroom and eventually succeeded as publisher. Neuharth founded *USA Today* in 1982, which soon became the most widely read newspaper in the United States. In 1989 Neuharth retired and in 1991 founded the Gannet Foundation (later Freedom Forum), which in turn created the Newseum in Washington, D.C., a museum dedicated to exploring the history of news and the media.

Samuel Irving Newhouse (Solomon Neuhaus) (1895–1979)

S. I. Newhouse was born to poor Jewish immigrants from Eastern Europe. While clerking for a judge in New Jersey, he was asked to take care of the judge's family paper, the *Bayonne Times*. Within a year, the paper was making a profit. Newhouse began purchasing failing papers in the 1920s, cutting costs while increasing advertising just as he had done with the *Bayonne Times*. Newhouse purchased the *Staten Island Advance* and two years later formed the Staten Island Advance Company, changing the name in 1949 to Advance Publications, Inc. Newhouse strongly believed in maintaining the autonomy of his newspapers and often kept their original editorial teams in place after purchase. Once acquired, Newhouse left a newspaper's political opinions untouched. He rejected the "yellow journalism" he grew up on, demanding honest, competent reporting and clean writing from his journalists.

In 1959 Newhouse purchased Conde Nast Publications giving him ownership of magazines such as *Vogue, Glamour,* and *Home & Garden*. At the time of his death 20 years later, Newhouse's media empire had expanded to become the third largest newspaper chain in the nation with 31 papers totaling 3 million circulation, plus 5 radio and 6 television stations, 7 magazines, and 15 cable television systems. Like others before him, Newhouse viewed education as an important investment in the future of media. He donated $15 million to Syracuse University to establish the S.I. Newhouse School of Public Communication. Newhouse's sons took over the firm after their father's death and later purchased book publishers such as Random House (1980).

Joseph Pulitzer (1847–1911)

Raised in Budapest, Pulitzer immigrated to America in 1864, serving with the Union Army in the Civil War. After the war, Pulitzer settled in St. Louis working odd jobs while he fervently studied the English language and American law. Ultimately he was admitted to the bar and practiced law for a short time. In 1868, Pulitzer left law to report for a German language newspaper. A year later, at the age of 22, he became city editor (and then part owner) and was elected to the Missouri legislature. In 1871 he bought a share of the *Westliche Post* which he briefly held then sold for profit. Pulitzer's legal, political, and journalistic experiences his publishing career.

In 1878 Pulitzer acquired the St. Louis *Dispatch* and the *Post* taking the lead in evening sales after merging the two papers. Although Pulitzer pursued a lengthy career in politics he maintained that his papers served no political party. Following an 1882 scandal when Pulitzer's chief editorial writer murdered a political opponent, Pulitzer left St. Louis for New York.

In 1883 he purchased the New York *World,* soon establishing it as a lead voice for the Democratic Party—and resigned from Congress to devote all his time to journalism. In 1887 Pulitzer purchased the *Evening World,* but stepped down from daily managerial control of his papers the same year due to failing health and worsening eyesight.

Pulitzer's contributions include the first color comic strip "The Yellow Kid," which appeared in *The World* and famously played a part in Pulitzer's circulation war with Hearst. As a part of this competition, his papers increasingly focused on sensational or "yellow" (after the cartoon) journalism. He gave large sums to education, including scholarships, enabling poor students to attend college. At his death, Pulitzer left $2 million to Columbia University, creating the Graduate School of Journalism in 1912 and endowing the Pulitzer Prizes.

Edward Willis Scripps (1854–1926)

Scripps got his start in Detroit, working for his half brother. In 1878 Scripps published his first newspaper, the *Cleveland Penny Press* (later the *Cleveland Press*). His publications soon expanded to include newspapers in Detroit, St. Louis, and Cincinnati. He partnered with his half brother George and M. A. McRae in 1894 to create the nation's first significant chain, the Scripps-McRae League of Newspapers. Scripps moved into syndication in 1902, becoming a pioneer in offering feature news, illustrations, and cartoons to newspapers after he founded The Newspaper Enterprise Association. In 1907 Scripps formed the United Press news service to compete with the Associated Press, succeeding as UP was willing to sell stories to any newspapers. Scripps claimed he published his newspapers for the average person keeping his papers affordable, politically independent though liberal, and pro-labor. Four years before his death in 1926 Scripps transferred control of his 34 newspapers across 15 states and his news service to his son Robert who partnered with Roy W. Howard to form the Scripps-Howard chain.

Arthur Ochs Sulzberger (1926–)

Sulzberger was born into the wealthy *New York Times* publishing family. After serving in the Marine Corps during World War II and graduating from Columbia University, he joined his father Arthur Hays Sulzberger at the *Times.* Sulzberger started at the bottom as a cub reporter (1952), departing a year later to report on state and local news at *The Milwaukee Journal.* Soon he returned to the family business to work on the foreign desk and served as a correspondent in London, Paris, and Rome. Just three years after he had started as a reporter, Sulzberger returned to New York as assistant to the publisher and assistant treasurer. At 37, Sulzberger inherited the publisher's role after his brother-in-law, Orvil E. Dryfoos, died. Under his guidance, the paper underwent several restructurings, solidifying its position as a world leader in newspaper publishing. Among his initiatives were streamlining the company organization and expanding editorial scope to include women's news, science, and religion. In 1992 Sulzberger stepped down as publisher, although he remained company chairman for five more years.

DeWitt Wallace (1889–1981)

Wallace began indexing his favorite magazine articles while working as a banker after completing only two years at Macalaster College in Minnesota. He returned to complete his degree at the University of California, and while at Berkeley had the idea to sell booklets of condensed government pamphlets. However, he was only able to produce one such booklet before World War I took him overseas. In 1920 Wallace continued exploring his idea of a condensed booklet, but after producing a sample for various publishers it was rejected. In 1921 he married Lila Bell Acheson who supported his idea and the two began publishing the monthly *Reader's Digest* in New York City in 1922. *Reader's Digest* became a huge success. In 1934 Wallace began to include condensed versions of books and, by 1940, expanded publication to include foreign-language editions. By the early twenty-first century, a quarter century after the founder's death, total circulation reached 23 million worldwide.

William Allen White (1868–1944)

After leaving the University of Kansas, White signed on as business manager of the *Republican*

(El Dorado, Kansas) in 1890. Two years later White began writing editorials for the *Kansas City Star*. In 1895 he left the *Star* to run his own paper, the *Emporia Daily and Weekly Gazette*. Despite the increased responsibility of being publisher, White continued to write insightful editorials, for which he is most famously remembered. His August 15, 1896, editorial "What's the Matter with Kansas?" was credited with helping secure William McKinley's presidential election. A strong advocate of freedom of speech, White's July 27, 1922, editorial "To an Anxious Friend" earned him the 1923 Pulitzer Prize for editorial writing. The following year White ran a fruitless campaign for governor of Kansas.

Publishers' Organizations

Publishers (and owners) of newspapers, magazines, and (increasingly) online services have a variety of associations to serve their needs. As with so many journalism organizations, these groups are heavily alike in their overall makeup and function. They usually focus on one specific type of published material (newspaper, magazine, newsletter), hold annual conventions, give awards for high-quality accomplishment, and support various educational endeavors. Operated as nonprofit entities (though some of their senior people may be paid very well), their prime purpose is to provide a means for mutually useful idea exchanges among publishers. Less often, they may become involved in lobbying efforts for matters of concern. Some have developed codes of ethics. Several of the groups have local chapters. At least two are co-located with academic journalism programs. Most states, if not all, have publisher associations as well, and there are a few regional groups, too. Only national associations (though many have state chapters) are detailed here.

Because publishers are either media owners themselves or represent them and have responsibility for all operational aspects of their publications, publisher organizations are interested in a wide menu of issues. Indeed, more than other journalism organizations, publisher association makeup and interests closely parallel what is happening in news media generally. For example, the declining state of many newspapers (indeed, the bankruptcy and disappearance of some) is of utmost concern to these groups, reflecting, as it does, the deep systemic problems facing mainstream media in their competition with an increasingly online world.

Likewise, the growing role of online services raises questions about just who is a "publisher." Once-clear roles no longer are seen as such.

At least two recent trends stand out among the groups below. Over time there has been a good deal of organizational name changing in an attempt to keep up with technology-driven changes in newspaper and magazine publishing. Groups once focused on traditional newspapers or newsletters are now more inclusive, adding online publication members. And in the Newspaper Association of America we see a drive to efficiency in the melding of seven formerly separate entities into one that is more inclusive and wide ranging. Further consolidation of such groups is likely given the financial pressure on many printed publications.

This entry is one of several briefly describing selected journalism organizations (there are too many to include all, and they come and go over time), so readers should also check additional organizational categories noted under "See also" at the end of this entry. The following information is drawn largely from the associations' websites, which often detail their background, structure, awards and educational programs, and member benefits.

National Publisher Associations

Association of Free Community Papers

AFCP (http://www.afcp.org/General/index.php) serves owners and publishers of free or give-away newspapers, which in total circulate more than 100 million copies a week (twice that of traditional newspapers, reaching a third of the nation's homes) adding up to a $4 billion industry. Indeed, some 3,000 titles are represented in the AFCP. The organization runs an annual conference, holds a leadership (training) institute there, and provides a useful technical glossary on its website.

Magazine Publishers of America

MPA (http://www.magazine.org) has defined its mission: "To advance the interests of magazine publishers with the advertising community, the government, the press and the public." This includes expanding the advertising and reader market for magazines, promoting the value and benefits of magazine (and related online) advertising, championing rights of magazine editors and publishers before Congress and other elements of government (such as the postal service concerning mailing rates), and educating members about changes in technology, law, and industry best practices. MPA offers a variety of conferences each year, many of them focusing increasingly on digital and online options. The MPA additionally provides multiple annual awards to people and publications.

National Newspaper Association

The membership organization for local community newspapers, NNA (http://www.nna.org/eweb/startpage.aspx?site=nna_eweb&design=no) dates back to 1885. It now has some 2,700 members, including daily and nondaily college and online newspapers with at least 25 percent local news content. Members include both free (give-away) and paid subscription newspapers; suppliers to the newspaper industry, journalism students and academics, and retired publishers/owners may also join. NNA conducts an annual convention, is active in debates about postal rates (many of its member papers make extensive use of the mails), and offers numerous relevant awards each year.

Newspaper Association of America

NAA (http://www.naa.org) was formed in June 1992 by the merger of seven associations that were then serving the newspaper industry. These included the American Newspaper Publishers Association (founded in 1887), the Newspaper Advertising Bureau, the Association of Newspaper Classified Advertising Managers, the International Circulation Managers Association, the International Newspapers Advertising and Marketing Executives, the Newspaper Advertising Co-op Network, and the Newspaper Research Council. The newly integrated organization operates an educational foundation, conducts a variety of conferences, provides a good deal of statistical and other information on its website, and also lobbies for newspaper business concerns before government entities. Given its breadth, this is one of the most inclusive and comprehensive newspaper publishers/owner organizations.

Specialized Information Publishers Association

Formed as the Independent Newsletter Association in Washington, D.C., in the 1960s, it was incorporated formally as the Newsletter Association of America in 1977, became the Newsletter Publishers Association in 1983 and the Newsletter & Electronic Publishers Association in 1999, and took its present name in 2006. All the name changes underline the growing role of digital online publication, among other trends. SIPA (http://www.sipaonline.com/index.html) is dedicated to advancing the interests of for-profit subscription newsletter publishers and specialized-information (including directory) services, including education, training, networking, and advocacy. It provides conferences, seminars, and local chapters as well.

Suburban Newspapers of America

SNA (http://www.suburban-news.org) supports the community newspaper industry (some 2,400 of them) and related online media through programs enhancing leadership, education, promotion, and research. It provides a number of conferences a year, operates an educational foundation, and has an awards program.

Quality and Opinion Magazines

Magazines directed toward and appealing to an educated and cultured minority have always been a part of the American journalism scene. These so-called *quality* titles (a term referring to the level of both their content and readership) typically serve elite cultural, business, and political leaders (sometimes snidely dubbed "the chattering classes") and enjoy a greater impact than their limited circulation might suggest.

Most of these magazines of comment and opinion tend to focus on either political and economic issues or literary pursuits, though many include both. Often, long-serving editors have in the past given such magazines much of their image and social role, though more recently their editors have not played such a visible role.

Development

The first American magazines published in the late eighteenth century were directed to the educated and cultured minority that ran the business, social, and political life of the colonies and then the new nation. The handful of titles (there were seldom more that two or three publishing at a time prior to 1800) usually reprinted material from magazines in Britain or the Continent. Content ranged from political commentary to theater reviews. Only slowly did magazines begin to incorporate American authors and content.

Two of the most important and long lasting quality titles to do that appeared in the decade before the Civil War (1861–65). *Harper's New Monthly Magazine* began in June 1850 in New York as a spin-off of a book publishing company, in part to promote newly published titles, though its magazine pages still emphasized English authors for years. The *Atlantic Monthly* first published in November 1857 in Boston, based on the ideas of (and for some time articles from) several literary Brahmins. Both magazines were aimed at educated upper-class readers (only much later called opinion leaders), and included literary fiction while also ranging over major social and political issues of the day, utilizing both rising and experienced authors (though all wrote anonymously as was then common practice). Their editors often stayed at the helm for decades, lending great continuity to their social role. The weekly *Nation* appeared in 1865 under E. L. Godkin, who remained editor through the end of the century. It too combined political and social commentary with occasional poetry and fiction, aimed at an intellectual audience of movers and shakers. Although the notion of "agenda setting" would only appear more than a century later, these elite titles played just that role.

The Golden Age

From perhaps 700 titles at the end of the Civil War, the magazine market expanded to more than 3,000 two decades later. During this golden age, most magazines were published in New York, but only a handful lasted more than a few years.

Among the quality titles, the monthly *Scribner's* (also issued by a book publishing house), *Review of Reviews,* and the *Century* all appeared in this era of rising income and thus readership. Each would thrive into the new century, but disappear between the World Wars amid growing competition from other magazines.

In the years before World War I appeared the first of the so-called little magazines (after their smaller size), which centered on experimental types of fiction writing, and sometimes political commentary as well. One of the first, *Poetry,* first published in 1912. Such titles provided an outlet for material often too controversial for mainstream popular magazines—unpopular arguments for social reform, for example. Many operated at a loss for years (advertising, if accepted at all, was usually sparse), dependent on either a wealthy benefactor, or some sort of institutional underwriting, often from a university or foundation.

The 1920s saw the inception of several quality weeklies including the *Saturday Review of Literature* (began August 1924), based partially on an earlier British magazine of similar title, and focusing on theater and book reviews, later expanding to include broader cultural and social articles. *The New Yorker* (1925) catered to avid readers and activists in the city's social and theater scene and provided fiction and nonfiction essays and interviews. *The American Mercury* appeared monthly beginning in 1924 and began to attack ideals and myths of middle America, commenting (often caustically) on political and literary matters. Social critic H. L. Mencken was its iconoclastic editor until 1933. Under other owners and editors, it turned conservative in the 1950s and declined until ceasing publication in 1981.

A short-lived but influential quality magazine was the liberal biweekly *The Reporter,* which began publication in April 1949 with in-depth and investigative reporting on government and sometimes corporate malfeasance, the news media as a branch of government, and foreign affairs. It survived for two decades as a combination quality and news magazine, before editorial disagreements over the Vietnam War led to its closure in 1968.

Growing magazine specialization and the multiplicity of titles made continued publication of a general weekly or monthly magazine catering to intellectuals an even more marginal proposition by the 1970s. For example, the *Saturday Review* was sold, greatly changed its approach and style, and, after a decline in readership, disappeared that decade after an active half century of publication. Arrival of the Internet two decades later made quality journals more available (including archives of back issues).

Although it also has added further competition for potential reader time, the web has become an important way for these often small-circulation monthlies and quarterlies to attract new readers. While they were often slow to realize this, there is virtually no quality or opinion magazine that doesn't provide a window to its content to anyone interested. The downside of this thus far is the lack of a viable business model for raising revenue using the Internet. Many different approaches have been tried, including limiting some content (often the ability to search the archive of back issues) only to paid subscribers of the print version. A special feature of the opinion magazines is a growing use of blogs by editors and reporters, often referenced specifically in related stories. What used to be a static "letters to the editor" page (which often still continues) has grown to become a wide-ranging give-and-take among magazine staff and readers.

Modern Quality Magazines

The following paragraphs briefly summarize the role and importance of a selection of quality magazines that were publishing as this encyclopedia went to press. While some stress public affairs and others literary topics, many combine both. Taken together, these and other titles help create much of the cultural agenda for America's elites.

American Scholar (1932–present, quarterly) is published by Phi Beta Kappa, the college and university honorary society. Its title is taken from a speech by Ralph Waldo Emerson in 1837. The journal's coverage is quite broad, ranging across public affairs, literature, science, history, and culture. While it long published poetry, fiction first appeared on its pages only in 2006. Circulation is fewer than 50,000.

The Atlantic (1857–present, monthly) was long based in Boston and relied on New England

authors and topics, not unusual when its founders included James Russell Lowell (the first editor), Ralph Waldo Emerson, Henry Wadsworth Longfellow, and Oliver Wendell Holmes. For decades it remained a largely New England–based journal. It often published special one-topic issues or supplements (including one devoted to mass communications in December 1957). Purchased by real estate mogul Morton Zuckerman in 1980, the magazine underwent a gradual modernization in both look and content, with more of an emphasis on political issues. Circulation is about 400,000.

Harper's (1850–present, monthly) began by publishing English authors (a Charles Dickens story appeared in the first issue) as copyright was hard to enforce across the Atlantic. By late in the nineteenth century, fiction was still important and illustrations by the likes of Frederick Remington and Winslow Homer brightened its pages. First published with a long nineteenth-century title, it became simply *Harper's Magazine* in 1913. By the 1950s, publication of fiction gave way increasingly to nonfiction essays and articles concerning politics, social issues, and even economic concerns. Its tone became more liberal and topical. *Harper's* nearly ceased publication in 1980 due to years of declining readership and financial loss, but instead, thanks in part to thousands of protests, the magazine was purchased by two foundations, became a nonprofit entity, and was gradually revived. Circulation is about 220,000.

The New York Review of Books (1963–present, biweekly) was created during a New York City–wide newspaper strike and was intended merely to tide over readers until regular papers reappeared. It quickly became popular, and thus continued publication. Through 2008 it was edited by Robert B. Silvers, and caricaturist David Levine's insightful art illustrated its pages until 2007. Its extensive reviews and lively letters pages are supported in part by book advertising. The *Review* combines editorial rigor with bright writing and often very long essays, though it is sometimes criticized for being written by and for New Yorkers to the seeming exclusion of most others. Circulation is about 140,000.

The New Yorker (1925–present, weekly) was for decades edited by its cofounder, Harold Ross, followed by William Shawn (1951–87). It has always combined news of New York City with extensive reporting (notably John Hersey's "Hiroshima," which made up all of one 1946 issue) and fiction (usually one short story per week) as well as multiple cartoons. Its "Profile" biographies are justly famous and wellwritten. The Newhouse chain of newspapers and magazines bought control in 1985, leading to a fierce though temporary staff crisis. Editor Tina Brown introduced color and photography to its editorial pages in the 1990s. With a circulation of more than 1 million in the early twenty-first century, the liberal-leaning weekly is by far the most financially successful of all titles discussed here. A host of books have been written about the magazine and its editors and contributors. By late 2008, the magazine enjoyed a circulation of 1.5 million (down a third since 2005), by far the largest of any in this category.

The Progressive (1909–present, weekly to 1948, then monthly) grew out of the progressive political movement, starting as *La Follette's Weekly,* and taking its present name a decade later.

It has, to quote its website, "steadfastly stood against militarism, the concentration of power in corporate hands, and the disenfranchisement of the citizenry." Perhaps its most controversial moment was the eventually successful attempt (after attempted government censorship) to publish an investigative report on the H-bomb secret in 1979. Circulation is about 65,000.

The North American Review (1815–present, originally bimonthly, then quarterly, now five times a year) is the oldest (some sources say it was also the first) literary magazine in the United States. It moved to New York in 1878. Publication ceased in 1940 due to a scandal concerning its owner. Only in 1964 did Cornell College in Iowa resume it. Four years later, the *Review* was purchased by the University of Northern Iowa (Cedar Falls). Content has included fiction and poetry from the beginning, with social and other nonfiction essays added by the mid-nineteenth century.

The Paris Review (1953–present, quarterly) is a literary journal first published in Paris, though based in New York since 1973. It was edited for a half century by George Plympton, the social

intellectual, until his death in 2003. The *Review* carries fiction, author interviews (for which it is especially known), and literary reviews. After an editorial and graphic revision in 2005, the journal retains its focus on prose fiction and poetry, but has added non-fiction and even color photography. The famous interviews now include news figures and those involved in news events. Circulation approaches 15,000 copies, up considerably in recent years from the small runs of most of the magazine's history.

The Wilson Quarterly (1976–present, quarterly) is published by the Wilson Center for International Scholars, part of the Smithsonian Institution. It presents a wide variety of usually scholarly views serious research on politics, the environment, the social sciences, foreign affairs, history, the arts, TV and the press, economics, science and technology.

Modern Opinion Magazines

The following titles, all with lengthy histories, emphasize opinion and commentary and almost never delve into literary matters. There are many more, including those at the political extremes. As with the cultural titles above, the following journals help to set the policy agenda for the country's leadership.

Commentary (1945–present, monthly) was created by the American Jewish Committee as a journal to cover politics and international affairs. It began as a liberal journal but by the late 1960s had become neoconservative. In 1990 it began raising its own funds, and by 2007 it was spun off as an independent nonprofit entity. Despite a circulation of less than 30,000 copies, the monthly continues to speak influentially to broad issues of (among other topics) Jewish concern. Circulation is just under 30,000.

Foreign Affairs (1922–present, quarterly) was created by the Council on Foreign Relations, which continues to publish it. The distinguished journal has published many landmark papers, including some on aviation policy as early as the 1920s, and one by George Kennan (famously identified only as "X") arguing in the July 1947 issue for a policy of "containing" the Soviet Union. Many secretaries of state and ministers of foreign affairs for other nations have been contributors, as have other diplomats and journalists. All aspects of international relations have been covered, with an emphasis on examples and the process of high-level policy making. Its review section attempts to survey all important books about its broad interests. The quarterly circulates about 200,000 copies.

The Nation (1865–present, weekly), founded by abolitionists at the end of the Civil War, describes itself as the "flagship of the left" and is the oldest continuously published weekly of any kind in the United States. It has always focused on current affairs with an emphasis on politics. For many years its controversial and critical content (e.g., disarmament, racial equality, and many investigative reports) was closely watched by the FBI, and at one brief point the magazine was not allowed to use the U.S. postal system. Like many quality magazines, it loses money on its subscription and advertising income, and relies on donations from some 30,000 "associates" to keep it afloat. In recent years, it has devoted a summer issue to a detailed survey of mass media ownership. Circulation is about 185,000.

The National Review (1955–present, weekly, later biweekly) was established and edited (until 1990) by conservative William F. Buckley Jr. In its first few years, the magazine sought to write about and encourage a modern or "new right" point of view, eliminating far-right extremists with old-fashioned views. It strongly supported Barry Goldwater in the 1964 presidential election and, more successfully, Ronald Reagan in the 1980s. It has become more controversial in recent years because of splintering conservative social views. As with most political opinion magazines, the magazine carries little corporate advertising and has never turned a profit. Indeed, Buckley said in 2005 that it had lost a cumulative $25 million over its first half century. It stays afloat thanks to donations from subscribers, fund raising receptions, and even sponsored cruises featuring its editors and contributors. Circulation is about 155,000.

The New Republic (1914–present, weekly but biweekly by 2007) was for decades a progressive or liberal political affairs and cultural magazine but in recent years has turned somewhat more conservative in tone. Martin Peretz purchased the magazine in

1974 (he sold control in 2007) and became editor-in-chief five years later. Under him, the journal used its often sprightly writing to back an aggressive U.S. foreign policy and support of Israel, and the reviews section expanded. Its political viewpoints often varied with the issue and the times, and it was widely quoted. In a notable scandal in the late 1990s, reporter Stephen Glass was discovered to have made up elements of many of his stories (this became the subject of a 2003 movie). The magazine changed its format in 2007 in an attempt to widen its appeal (circulation had dropped 40 percent since 2000), adding illustrations, as well as more and larger pages. Circulation is about 60,000.

Quantitative News

See Precision Journalism

R

Race and Ethnicity, Coverage of

As the United States has grown increasingly diverse, journalists have recognized the importance of reporting on issues of race and ethnicity. They also realize they must learn to report on multicultural communities and include people from a wide variety of backgrounds as sources and subjects. This task is not as straightforward as it may seem. As with most other U.S. institutions, those in charge of reporting and writing the mainstream news have almost always been white. They have covered the news based on their own attitudes, experiences, and concerns. As a result, U.S. news organizations have an uneven history of equally and fairly covering all the people who participate in civic life.

Development

When the penny press first arose in the 1830s, it sought to attract a broad audience by combining a low price with plenty of crime news and human interest stories. At its center was the heterogeneous white audience, rather than marginalized racial and ethnic minorities. This financially pragmatic formula, along with the general exclusion of people of color from public and political affairs, shaped general news considerations and practices for decades to come. Scholars have identified four basic approaches in coverage since those days: at different times, mainstream news outlets have (1) excluded racial and ethnic minorities altogether, (2) focused on them as a threat, (3) detailed social confrontations among racial and ethnic groups, and (4) selectively covered minority groups based on a stereotyped view.

At least until the middle of the twentieth century, only community-based outlets provided any in-depth coverage of racial and ethnic minorities. The bilingual *El Misisipí* began publication for Spanish exiles in New Orleans in 1808. It lasted only two years, but *La Prensa,* which later became *El Diarió La Prensa,* still operates in New York. In 1827, the first black-owned, edited, and published newspaper for black Americans was founded, called *Freedom's Journal.* A year later the Cherokee Nation launched its own paper, soon named the *Cherokee Phoenix and Indian Advocate,* with international circulation and the interests of other tribes in mind. The paper ran out of money in 1834, and the Georgia Guard burned its building to the ground just before the tribe's forced relocation. But the Cherokee were able to revive the paper and it still publishes. *China Times,* based in San Francisco, has produced newspapers since 1924.

Several defining moments in U.S. race relations over the past century forced mainstream news outlets to reassess their white-centered approach. In the early 1900s, for instance, mainstream journalists comfortably disregarded the rise of black leaders such as A. Philip Randolph, who led the drive to organize the Brotherhood of Sleeping Car Porters (when trains were still the prime means of long-distance travel); Walter White, executive director of the National Association for the Advancement

of Colored People; and W. E. B. Du Bois, the influential scholar and editor of NAACP's magazine, *Crisis*. *The New York Times* ran only one page-one story mentioning Randolph and none about the others in the five years between 1935 and 1940, according to a review of the newspaper's archive by journalists Gene Roberts and Hank Klibanoff. But the push for desegregation in the late 1940s; the brutal 1955 murder of Emmett Till, a black Chicago teenager visiting family in Mississippi, by two white men who were subsequently acquitted by an all-white jury; the Montgomery Bus Boycott of the mid-1950s; and the 1957 showdown over desegregation at Central High in Little Rock, Arkansas, challenged reporting that had ignored the lives of black people. Roberts and Klibanoff describe white news editors' slow realization that the civil rights movement and the white supremacy resistance to it could no longer be overlooked. A few papers hired black reporters, and white reporters began to venture out into the black community in order to cover the people and issues central to the day. In 1948 Carl T. Rowan took a job as a copy editor at the formerly all-white *Minneapolis Tribune;* in 1950, Marvel Cooke began reporting for the *Daily Compass* in New York; and in 1952, Simeon Booker became the first black reporter at a major newspaper, *The Washington Post*.

The desegregation battles did not, however, inspire news outlets to integrate their own pages in any comprehensive way. Latinos, Asians, and American Indians remained absent in coverage, except at times as criminals and threats. For the most part, it was white reporters that covered the civil rights movement for the white press. The American Society of Newspaper Editors (ASNE) had no nonwhite members at all until 1965, when it allowed the membership of John H. Sengstacke, the editor of the famed black newspaper, *The Chicago Defender*. Some news outlets relegated coverage of black people to one or two special pages. For the general public, it was as if African Americans, American Indians, and people of Hispanic and Asian descent never gave birth, married, achieved in their lives, or died.

In 1967, when President Lyndon Johnson (1963–69) appointed a commission to find out why riots had erupted in urban areas each summer for several years, its members returned with an indictment of the news media. The resulting Kerner Report of 1968 attacked journalists for failing to apply their own tough standards to reporting on the disturbances. The news media reprinted rumors, reported inflated damage statistics, and printed "scare" headlines that exaggerated the disorders' scope and damage across the country, the report's authors concluded. News misrepresented the violence as primarily black–white confrontations. Most importantly, the commission reported after a content analysis of television and newspapers, for years reporters, editors, and producers had neglected the racial problems that had simmered across the country. As prominent journalist Robert C. Maynard described the situation a decade later, "the vast majority of white Americans was left to suppose that for no particular reason a bunch of blacks took it into their heads to burn down the city" (Marzolf and Tolliver 1977).

The Kerner Report pointed to deep injustices within U.S. society and warned that the nation was "moving toward two societies, one black, one white—separate and unequal." Journalists, the commission said, had failed to report the deep problems America faced and neglected to identify potential solutions. The commission, calling news outlets "shockingly backward," urged them to hire black reporters, editors, writers, and commentators beyond token levels. Black Americans should be covered routinely in the context of overall society, they argued. Reporters and other resources should be assigned to "urban" and "ghetto" beats, and news outlets should develop relationships with their counterparts in the black press. Black staffers should be promoted into policy and decision-making levels. The news media reflected "the biases, the paternalism, the indifference of white America," the commission found. "The media report and write from the standpoint of a white man's world."

The report's stinging words triggered a flurry of black hires, but also complaints by news editors that there simply were not enough qualified ethnic minority journalists to bring on. Some universities and foundations stepped forward with programs to meet this objection—although most were short-lived. The University of Wisconsin started a lecturer-counselor program to encourage minority journalists, and the Booth Minority Scholars Program at the University of Michigan master's program provided a scholarship, summer internship, and a guaranteed year of employment with

the Booth newspaper group, which was later bought by S. I. Newhouse. Boston University started a dual-degree program in Afro-American Studies and Public Communication, hoping to educate a generation of journalists to cover urban and racial news in social, historical, and economic contexts.

What is known today as the Robert C. Maynard Institute for Journalism Education in Oakland, California, remains one of the most successful training programs designed to integrate newsrooms and educate journalists of all backgrounds to report fully and completely on all people. It began as a training ground for entry-level minority journalists to develop deadline and production skills, also placing its graduates into jobs. The program gave a start to many outstanding journalists, such as Pulitzer Prize winners Dennis Bell of *Newsday;* Steven Holmes of *The Washington Post;* and David Reyes, Virginia Escalante, and Louis Sahagun (along with institute cofounder Frank Sotomayor) of the *Los Angeles Times*. Milton Coleman, deputy managing editor of *The Washington Post,* and Carolina Garcia, executive editor of the *Los Angeles Daily News,* are both graduates.

Despite the flurry of remedial hiring by news outlets, a conference of high-level journalists that convened ten years after the Kerner Report decried the lack of progress. Minority journalists found work but within a few years often left the business, discouraged. The news still failed to report on both the realities of inner-city life and the positive culture and history of people of color. At heart, the problem really was the definition of news, concluded the group brought together by the University of Michigan. It remained fixed on white, middle-class, and male perceptions of who and what mattered in the world. What was needed, summed up one conference participant, was "greater infusions of minorities and women at a variety of levels in order to make that redefinition of journalism happen naturally through working together" (Marzolf and Tolliver 1977). Maynard, who with his wife, Nancy Hicks Maynard, later became the first black owners of a major metropolitan daily, called the press one of the most segregated institutions in the United States. When only some kinds of people get to control the telling of America's story, he said, "it is impossible for all Americans to understand what they should about each other" (Marzolf and Tolliver 1977).

The Year 2000 Goal

The Maynards and the other faculty of the Institute of Journalism Education developed a plan to push the news media to move faster. At a meeting for the National Association of Newspaper Editors' Committee on Minorities, and again a few months later at the trade association's national conference, they lobbied editors to set a goal: By the end of the century, minority journalists at their newspapers should match their proportion in the nation's population. The plan passed in April 1978, along with a recommendation to survey members each year to assess progress. The first census found that minorities made up only 4 percent of newsroom employees in contrast to 17 percent of the population. Only .4 percent of top editors were journalists of color.

The ASNE goal and yearly reminder of progress helped stimulate additional training and recruiting programs. But as 2000 approached, it was clear the goal would not be met. More than 40 percent of newsrooms remained completely white. About one-third failed to report their data at all. In sum, newsroom composition distressingly trailed the increasingly diverse U.S. population.

With journalists of color still just 11.5 percent of professional newsrooms compared to 26 percent of the population, ASNE members regrouped in 1998. They adopted a new diversity mission statement that extended their timeline, but "strongly reaffirm(ed)" their commitment. The editors reset their goal for newsroom parity with the population to the year 2025 if not sooner. At minimum, the revised statement said, all newspapers should employ journalists of color and every one should reflect the diversity of its own community. The editors added women to their census measures, established three-year benchmarks, and pledged to actively address problems in recruiting, hiring, and opening newsroom cultures to a diverse work force.

Journalists Organize

Journalists of color understood the importance of a diverse newsroom, but also found it difficult to find jobs and advance their own careers. They encountered discrimination in hiring and, once they broke into a news operation, often faced a hostile environment and skepticism about their

abilities. To counter this, they formed a number of associations to support one another, provide training for young journalists, and advance the cause of inclusive newsrooms with a commitment to covering all Americans fully and fairly.

In 1970, about 50 black producers of television and film formed the National Association of Black Media Producers. They elected as president Tony Brown, who later earned fame as the host of the Public Broadcasting Service public affairs program *Tony Brown's Journal*. He discovered a tool in the Communications Act of 1934, which declared that broadcasters, who are dependent on the publicly owned airwaves, have to serve the interests of the whole community. "The broadcast industry would never be the same," he wrote in his book *What Mama Taught Me*. With the help of black community organizations, the association was able to push open broadcaster doors to begin creating jobs for black people in television and radio.

A few years later in Philadelphia, black print and broadcast journalists who were concerned about coverage and hiring practices began to band together. They formed the National Association of Black Journalists in 1975 in an attempt to increase their numbers and put pressure on the industry from the inside. The Asian American Journalists Association formed in 1981, followed by the Native American Journalists Association and the National Association of Hispanic Journalists (NAHJ) in 1984. When the leaders of these four organizations discovered how much their missions held in common, they decided to hold a joint convention. Called UNITY, the event in July 1984 drew 6,000 journalists to Atlanta, what the organizers described as the largest journalist gathering up to that moment. Its resounding success led to a lasting alliance committed to advancing cross-cultural understanding and better race relations through improved news coverage.

The older, more broadly based journalist groups also played a role. The American Newspaper Guild had been inclusive from its founding. The national level of the Society of Professional Journalists (SPJ), however, only later joined the effort to press for change in the news industry. In the 1990s SPJ established chapters at several historically black colleges. Reginald Stuart, at the time a reporter for *The New York Times* and later a corporate recruiter for major news companies, became the organization's first black president in 1994.

Independently and collectively, these organizations took up the task of holding the news business accountable, monitoring both coverage and hiring practices. Scholarships and training supported students and helped keep professionals in their jobs. Stylebooks aimed to help journalists with terminology and racially sensitive issues. Initiatives such as NAHJ's Parity Project boosted hiring and promoted better relations between community leaders and newsrooms. The Maynard Institute developed content and sourcing analysis tools to awaken journalists to bias in coverage. The SPJ Rainbow Sourcebook offered a means for reporters of all backgrounds to broaden the narrow demographic band so often seen and heard in the news.

Even as other businesses made important strides toward integration, however, the news media fell progressively behind the rest of society. In 2007, the Radio-Television News Directors Association survey of newsrooms found that journalists of color made up 22.5 percent of the broadcast news workforce, while the ASNE survey found that they made up 13.6 percent of print editorial staff, compared to a U.S. population with 34 percent people of color. A new pressure on diversity efforts had arisen: economics. Because of shrinking newsroom employment overall, the total number of journalists of color in both broadcast and print declined during the year surveyed.

Ethnic Media

As conventional news coverage lagged in its struggle to keep up with U.S. demographic changes, community and ethnic media leapt in to fill the gap. Circulation increased rapidly for Hispanic and Spanish-language newspapers from 1990 to 2003, when it flattened a bit and then climbed again to 17.8 million by 2006, according to an analysis by the Project for Excellence in Journalism. Univision, the largest Spanish-language broadcaster in the United States, claimed the top two local television news broadcasts among adults 18 to 49 in the ten largest markets in 2008: KMEX in Los Angeles and KXTV New York. Spanish-language radio continued to build audiences even as radio listening flattened overall. Black-oriented radio stations also grew among

teens and adults aged 35 to 44, according to Arbitron ratings released in 2008.

Ethnic media naturally cover their communities in far more depth than do mainstream outlets and follow news developments in areas such as immigration and civil rights more closely. Such community-oriented media also tend to include context that other journalists neglect. In 2008 when *The New Yorker* magazine ran a satirical cover featuring then–presidential candidate Barack Obama as a Muslim terrorist, most news media decried the choice. But black-oriented outlets were more likely to provide a substantive critique, discuss the U.S. history that underpinned the images' potency, and highlight the role of media in shaping stereotypes overall. When covering the increase in U.S. Immigration and Customs Enforcement Agency actions in 2008, Spanish-language media offered a level of diversity in topic and approach not achieved by other outlets. Mainstream news often concentrated on the victims of a particular enforcement raid or focused on examples of companies that hired undocumented workers. Spanish-language outlets covered similar topics in a balanced and neutral fashion, and in addition, brought in the social, historical, and political factors contributing to policy and enforcement.

Such an approach has won loyalty among the populations these niche media target. A multilingual survey of ethnic media audiences in 2005 by a Florida consulting firm concluded that one-quarter of the U.S. population regularly turns to ethnic news outlets. Of those polled—African Americans, Latinos, Asian Americans, Native Americans, and Arab Americans—nearly half preferred ethnic media to mainstream options, although they often consulted both. The demand for more culturally aware and relevant news has helped spawn new outlets such as The Root (theroot.com), a black-oriented news and commentary website owned by *The Washington Post*. The site addresses the feeling in the black community that the general news ignores them, explained Lynette Clemetson, managing editor of the site, at a gathering of the Society of Professional Journalists in 2008. Clemetson said The Root challenges the concept of a black monolith and tries to introduce new voices to the general media. When mainstream journalists quote black people, it's usually the same five sources, she said.

Impact

Many scholars have studied news angles, content, and sourcing in mainstream news and found compelling evidence that overall, mainstream journalists tend to report from a white point of view. People of color are often absent—except in crime, sports, or entertainment news. Local broadcast outlets rarely feature Asian Americans, Latinos, or Native Americans at all. When covering the attacks of September 11, 2001, CNN, NBC, and CBS turned overwhelmingly to white, male sources.

On the other hand, black people do consistently and disproportionately appear on local stations and in newspaper crime news—nearly always as suspects, researchers have found. Other studies have found that a preponderance of black people on network news are poor, complaining, or involved with drugs and crime. While some critics describe these portrayals as realistic, data collected in several studies seem to demonstrate otherwise. In a 2000 comparison of news programming in Los Angeles to California Department of Justice crime statistics done by researchers Travis Dixon and Daniel Linz, for instance, African Americans were overrepresented as lawbreakers. White people and Latinos appeared less often than the crime figures would warrant. On the other hand, whites were overrepresented as law enforcement officers compared to employment data. Latinos once again were included less often than hiring statistics would predict. The cumulative effects of such distortions may be profound.

In experiments testing attitudes and reactions, political scientists Frank D. Gilliam Jr. and Shanto Iyengar concluded that news watchers showed regular, unconscious tendencies to associate black people with crime. Even when they were shown sample news stories with no perpetrator at all, 44 percent of viewers remembered a black criminal. Frequent news watchers in the Los Angeles study tended towards views that the researchers called "new racism": a perception that black people tend to violate traditional values of hard work and make illegitimate demands for government benefits. Communication researchers Travis L. Dixon and Cristina L. Azocar also studied viewer responses to news and found that crime stories with a preponderance of black suspects shaped views that

crime was a black activity. Regular viewers also were more likely to look at crime as a serious problem that required severe punishment. While such studies have limitations and do not prove a causal link, they do give journalists cause for reflection.

Techniques for Better Reporting

At an April 2007 conference, journalists contemplated ways they might counter the unconscious reactions they themselves help create. Fundamentally, they decided, news must create an environment that is truthful. As one component of accuracy, journalists should resist habitually covering story subjects and sources in expected roles or social status positions. Reporters must learn to notice, for example, the female technology wizards, the Native Americans in the executive suite, and Latino families with three generations in community policing. Stories should not only include familiar ideas but also challenge audiences to adjust their assumptions.

As cities across the nation grow more diverse, news outlets are realizing they must change their habits. Some newsroom traditions help lock in imbalance in sourcing and content. Practices such as evaluating a source's "credibility" according to title, status, and familiarity in the newsroom may lead a majority white staff to rely mainly on white sources. Perceptions of "prominence" and "proximity," or measures of the importance of a news topic, may vary according to journalists' familiarity with communities outside of their own neighborhoods and the downtown elite. Source lists handed down on a beat are less likely to include newcomers that reflect the racial, ethnic, and language diversity transforming schools, parks, shops, and workplaces across the country.

Some mainstream news media have forged partnerships with ethnic and community outlets in order to build better awareness of the people and stories they are missing. Ethnic media offer a background in the institutional and social underpinnings of their community's experience. They can share the perspectives and voices of groups that mainstream outlets find hard to access. For their part, the larger news organization can provide resources and connections to political and institutional sources that ethnic media may lack. WNYC's 2005 series *Feet in Two Worlds,* for example, brought together ethnic media and public radio reporters to tell stories that each may have covered less well on their own, including struggling Haitian immigrants tethered by the emotional and financial pull from home; and South Asian gays who have forged a hybrid culture in New York of both sexual freedom and traditional family values.

The Maynard Institute has long taught journalists to cover the whole community by analyzing how they perceive news and what they might be missing. Maynard identifies five forces that shape lives, experiences, and the social tensions in society: the "fault lines" of race, class, generation, gender, and geography. By using this framework, reporters and editors can see how their own upbringing and history shapes their view of the world. They can understand the shared culture within a newsroom and how this affects the news-gathering process. By assessing the ways in which these fault lines mold views about the importance and meaning of issues, the institute argues, journalists can do a better job deciding what to cover and how. They can learn their own "blind spots" and challenge the assumptions they have accumulated over time. They can identify news that might have formerly been obscured, and locate the sources they need in order to build a complete and accurate story. A piece about the health of the Social Security system, for instance, will be much more complete if it takes into account the very different experiences of able white men, people with disabilities, and women in both earnings and benefits.

The Poynter Institute, a school for professional journalists in Florida, places diversity and ethics together in its training and resources. Columns on "Everyday ethics" and "Diversity at Work" sit side by side on its website, as if to signal that inclusion is central to accuracy and fairness. Tools such as a "diversity wheel," which features religion, nationality, physical abilities, and intellect along with the fault lines, help journalists wake up to their own tendencies to make assumptions and avoid certain situations. Indeed, a journalist has a duty to "seek truth and report it" in service of justice and democracy, declares the Society of Professional Journalists, the nation's most broad-based journalism organization, in its Ethics Code. Yet "truth" in the news, both journalists and communication researchers have found, can be a matter of shifting ground. Whether journalists are reporting a car accident or

a riot, their own location, knowledge base, and personal history influences the "truth" they are able to see. The mainstream news media continues to struggle, with uneven success, to report fully on the truth lived by the racial and ethnic minorities in American society.

RECORDING

Recording is the process of making a record, to preserve data, words, sounds, or images in some tangible form. Newspapers and magazines use quotations to capture the verbatim statements of people or documents. Photographs provide a visual record of how something looks, and photojournalism creates visual documentation of events. All of these applications may be journalistic forms of recording. In popular usage, recording is used more specifically to refer to the electronic preservation of sounds and images using audio and video technology. Even more narrowly defined, recording is used to refer to the music business itself, the

"recording industry." In this entry, "recording" is used to describe the processes used to capture and preserve journalistic sounds and images.

Analog Sound Recording

Sound recording refers to the ability to convert acoustical energy (the vibrations of air molecules) into a preservable form for storage and distribution; this converted energy can be mechanical (i.e., the bumps in the groove of a vinyl record) or magnetic (i.e., polarized particles on magnetic tape). The resulting recorded forms in "analog" media, such as vinyl records and recording tape, are analogous to the original sound vibrations. Digital sound media, such as CDs, MP3 players, and the Internet, on the other hand, use a binary numerical representation of analog waveform measurements to manipulate and preserve a mathematical equivalent of sound vibrations. These digital representations are converted to analog acoustical energy when played back.

Thomas Edison is usually credited with inventing the first practical device capable of recording the human voice. Speaking the words of a simple nursery rhyme, "Mary had a little lamb," Edison launched sound recording history. His hand crank driven tinfoil cylinder "phonograph" (a Greek word for "sound writer"), patented in 1878, converted sound vibrations into corresponding indentations in a spiral groove pattern on a cylinder. Among other applications, Edison thought the phonograph could be used for dictation; for educational purposes; to record speeches, books, and music; to make toys, clocks, and music boxes; and to preserve lasting records of telegraph and telephone messages.

Major improvements to the phonograph soon followed. Working with Alexander Graham Bell in 1886, Chichester Bell (Alexander's cousin) and Charles Tainter developed the "graphophone," a wax cylinder machine that increased the number of times a cylinder could be played. Emile Berliner's hard shellac flat disc system,

An image of Edison's early phonograph equipment photographed in his lab in 1892.

Source: Library of Congress.

called the "gramophone," improved sound quality and made both duplication and storage more convenient. In 1929, Berliner sold his patent and "His Master's Voice" logo (a painting showing a dog "Nipper" cocking his head by the horn speaker of a phonograph) to the Victor Talking Machine Company, which later became a division of the Radio Corporation of America. Improved methods of molding cylinders and discs for mass duplication, spring (wind-up) and electric motor drive systems, and significant accomplishments in radio electronics, contributed to developments in microphone, amplifier and loudspeaker technologies. Although an effort was made to market the phonograph as an office dictation machine, consumers adopted these early systems for home entertainment and music recording. RCA Victor became a major producer of phonograph records and the company's "Victrola" players became a prominent piece of furniture in many homes. In 1929, RCA introduced a 16-inch diameter transcription disc, made from "Vitrolac." This recordable "electronic transcription" (ET) disc system enabled radio stations to record and playback music and talk programs.

Other methods of recording sound soon appeared. Optical sound, a photographic representation of the waveform of sound, enabled film producers to synchronize sound with moving pictures. In 1919, a sound-on-film system, "Phonofilm," invented by Lee de Forest, was used to produce experimental short films with music, vaudeville, speeches, and talk. Although the audio quality was initially considered poor, improvements made it possible to record news events, such as speeches by public figures. In 1926, the patent for optical sound was purchased by the Fox Film Corporation, the company that produced Fox Movietone news films, but disc systems remained a viable film sound alternative. Using a synchronized disc system called the "Vitaphone, *The Jazz Singer* was the first feature-length "talkie" in 1927.

Improved magnetic processes for recording also appeared. In magnetic recording, acoustical vibrations are converted to electrical energy, then to a magnetic signal. Magnetic particles, such as iron oxide, are polarized to encode a pattern that represents the original waveform of a sound for storage on tape. The first such device, a magnetic wire cylinder recorder called a "telegraphone," was developed by Danish inventor Valdemar Poulsen in the late 1890s. His recording of Austrian Emperor Franz Joseph at the 1900 Paris Fair is believed to be the oldest surviving example of a magnetic recording. Similar devices, such as the "Blattnerphone," developed in the 1930s in England by German inventor Louis Blattner, and its replacement, a machine developed by wireless inventor Guglielmo Marconi, used razor sharp steel tape as a medium for magnetic recording. Both machines were considered to be so dangerous that they had to be isolated in separate rooms away from operators. Wire and metal tape machines were used to record news event programs as early as World War I. Although the sound quality of these machines was marginal, variations on these magnetic recorders remained in use into the 1950s.

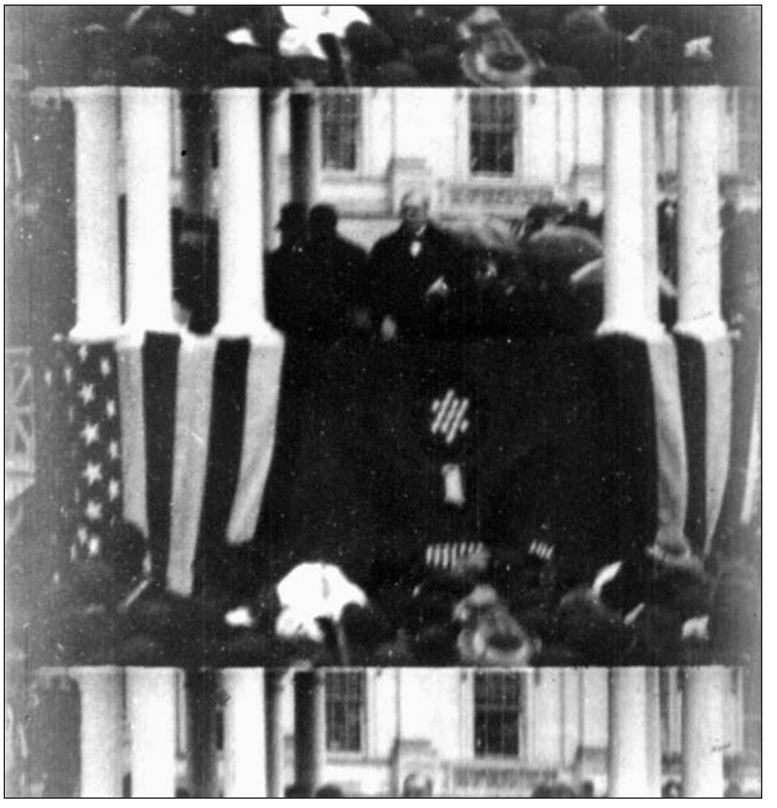
Meanwhile, in the early 1930s, two German companies (AEG and BASF) collaborated to develop the "magenetophone," a machine that recorded on magnetic powder- (iron or ferris oxide) coated paper or cellulose acetate tape. It was not until the end of World War II that American Signal Corps officers brought this improved recording technology back to the United States. Although there was news event programming before the Second World War (a famous example is radio station WLS reporter Herb Morrison's description of the destruction of the airship *Hindenburg* in May 1937), networks and many stations avoided recorded news or talk programs. Most of Edward R. Murrow's famous reports from wartime London under German bombing were broadcast live by shortwave radio from London to New York Some of Murrow's reports were preserved on electronic transcription discs.

The importance of magnetic audio recording tape (cellulose acetate and polyester) to the music and radio industries was dramatic in the post-war period. Prior to development of magnetic tape, with the exception of electronic transcriptions (usually a one-take process) and metal tape recordings, most radio programming was broadcast live. Magnetic tape gave sound engineers the opportunity to produce performances in steps; it improved mixing, balancing, and stereo and multiple channels capabilities; it offered the ability to edit recorded segments; and most importantly, it enhanced the audio quality of recorded sound, despite inherent tape noise. By the late 1960s, noise reductions systems

such as Dolby and Dbx were introduced to reduce background noise ("hiss") and further improve audio quality. Numerous tape formats have been used since, including various size reel-to-reel, endless-loop cartridge (consumer eight-track stereo, and professional "Fidelipac") and cassette formats. Perhaps most significant for personal recording and playback was the compact audio cassette, which was standardized by the Philips Company of the Netherlands in 1962.

Analog Image Recording

For recording moving images on film and video light wave reflections of objects are converted to analog images stored on film or as an electrical signal on video tape. A visual record of motion is created by a rapid succession of still pictures that create the illusion of motion. This illusion is based on a psychophysical principle called "persistence of vision," the ability of the eye to retain an image for a brief moment after it has disappeared, and the ability of the mind to blend successive still images into a continuous motion.



This historic image is a frame isolated from the first motion picture recording of a presidential inauguration: it shows William McKinley taking the oath of office in 1897.

Source: Library of Congress.

The photomechanical and electro-photomechanical film technologies that were developed in the 1800s for creating moving pictures were based on early still photography. These devices include Leonardo da Vinci's "camera obscura," a pinhole dark room capable of projecting a weak reflection of an outside image on an interior wall; the "magic lantern," a seventeenth-century oil lamp device that projected glass slide images; the Zoetrope, a simple rotating cylinder used to view images through vertical slits; Eadweard Muybridge's 1879 invention, the Zoopraxiscope, a device that projected successive still images photographed by multiple cameras; and George Eastman's flexible celluloid film, developed in 1884. Thomas Edison and his assistant William Dickson were key contributors to the development of motion picture technology. Their inventions, the Kinetograph—a camera—and the Kinetoscope—a hand-crank device that allowed viewers to watch short films through a peep-hole in a cabinet—brought together the principles and technologies for recording and viewing moving pictures.

The ability to project films for theatrical exhibition was made possible by devices patented in the mid-1890s, such as Edison's Vitascope, and an American Mutoscope product called the Biograph. These and other early motion picture recording and projection machines were at first novelties. Short films were shown in small exhibition houses called Nickelodeons, because the admission fee was a nickel. Longer films and more sophisticated story telling techniques developed in the early 1900s, as demonstrated in historic works, such as George Melies's *A Trip to the Moon* (1902), Edwin S. Porter's *The Great Train Robbery* (1903), and D. W. Griffith's *The*

Birth of a Nation (1915). By the 1920s, films were shown in ornate movie houses, and an entire motion picture industry developed around well-known actors.

Rapid technological developments added synchronous sound to pictures in the late 1920s, color (tinting and hand coloring in the late 1890s, and two and three color techniques in the early 1900s), and bigger and wider picture screen formats (such as Cinemascope) in the 1950s. Film was also used to record news events visually, such as the rescue of *Titanic* survivors in 1912, and Charles Lindbergh's solo flight across the Atlantic in 1927. Between 1928 and 1963, Fox Movietone News and Universal International News produced weekly "newsreels." These silent and later sound news briefs, which typically used a narrator with background music, were shown before features in movie theatres.

Meanwhile, on a related technological front, RCA introduced its system for electronic television at the 1939 New York World's Fair; however, television as a practical broadcast distribution medium did not become widespread until after World War II. Film remained the primary medium for television news gathering and editing into the early 1970s. Most early television shows were broadcast live, although Kinescope, a complex system for recording the changing television screen on film, was used by NBC and CBS to record news for time-zone delayed broadcast. It was not until the mid-1950s that video systems for recording television became available. Building on magnetic audiotape technology, the Ampex Corporation introduced the first professional videotape recorder (VTR). CBS's *Douglas Edwards and the News* is believed to be the first network news program recorded on videotape in 1956.

Rapid improvements followed with the introduction of the rotating and helical scan record heads (to compensate for the high speed required for recording video), color capability, portable video recorders (camcorders), and professional (U-Matic, a ¾-inch-tape format) and consumer videocassette machines (VCRs) by 1975. After competing for several years, JVC (Victor Company of Japan), with its longer playing VHS (Video Home System), won the technical standards battle for the home video market over Sony Corporation, maker of the more expensive Betamax videotape format. Although prerecorded motion pictures were available, many consumers purchased VCR machines to record and "time-shift" their watching of television programs. Meanwhile, improved portable professional video cameras and videotape editors made ENG (electronic news gathering) possible.

By the late 1970s, new optical (laser) technologies for recording and playing back video were introduced. Early videodisc systems marketed by MCA (DiscoVision), Philips (Video Disc Player) and Pioneer Electronics (Laser VideoDisc), were analog, but later used digital sound. Although these systems had advantages over videotape, such as random access, freeze frame, multiple audio tracks, and a better picture, these analog optical systems were not successful and were replaced by improved digital videodisc recording technologies in the 1980s.

Digital Sound Recording

Although there were gradual improvements in analog audio recording, the process remained fundamentally unchanged until the introduction of digital technology in the 1970s. Based on computer technology, digital audio converts sound waves into a numerical equivalent, which is stored magnetically or optically. During the analog-to-digital conversion process, sound waves are converted to an electrical signal, then systematically sampled and measured for representation in a binary number coding system of ones and zeros. Generally, the more samples per second (sampling rate) and the more numbers to represent each sample (bit resolution), the better the sound quality. During the digital-to-analog process, numerical representations are converted back to analog vibrations for playback through a standard loudspeaker system.

Although professional magnetic digital audio recorders were in use for mastering music in the 1970s, the first successful consumer optical digital device, developed by Sony and Philips, was the five-inch compact disc, first sold in 1984. The CD, which uses a laser to read digitally encoded information, has been the dominant consumer digital audio medium for three decades. Other digital recording and storage media, such as magnetic digital audiotape (DAT) recorders and players, developed in the late 1980s, achieved only limited

success with consumers, in part because of consumer confusion about competing technical standards, and also because of industry concerns about illicit duplicating of copyrighted content.

Hard disk, removable flash drive, and solid-state digital storage devices are the latest innovations in sound recording. Personal portable machines, such as the Apple iPod, MP3 Players, and some cellular telephones, make it possible to distribute music, news, and information on the Internet. "Podcasting," a convenient way to package, access and download digital audio content, is now used by many respected journalism outlets to provide supplemental news and information to listeners.

Digital Image Recording

Digital video converts an analog signal representing an image into numbers for magnetic or optical storage, and uses a laser to read encoded information on a disc. Because of the large amount of information in a moving video image, newer systems use digital compression techniques (algorithms), which reduce the amount of redundant information to save storage space. By the early 1990s various high-density optical storage techniques used the DVD ("Digital Versatile (or Video) Disc") to record and distribute data, audio, and video, making the DVD the most widely used consumer distribution medium for motion picture films. On a related front, broadcast and production technical standards for digital television and High Definition Television (HDTV) were adopted, followed by a new digital video distribution format battle between Blu-ray, sponsored by Sony, and HD-DVD, promoted by Toshiba. Both competed to make their respective system the dominant consumer high-definition DVD video format. By early 2007, Sony's Blu-ray had clearly won the contest.

Personal digital multimedia devices now allow Internet users to download video podcasts or "vodcasts" of television news, information, and music. Solid-state video devices and digital video recorder (DVR) systems, such as TiVo and ReplayTV, use computer technology and hard drives to enable consumers to download, manipulate (with pause, fast forward, reverse, slow-motion, and instant replay functions) and time-shift television programs for viewing at a later time. As recording technology continues to evolve, on-demand systems, available online or through digital cable systems, may reduce the need for consumers to download or record television news and other programs at home.

Religion Journalism

It is an intriguing conundrum that religion has been, and remains, a difficult and challenging subject matter for journalists and journalism. This has been particularly confusing in the case of the United States, the most religious of the major Western Democracies. American traditions of freedom of religion and freedom of the press, linked in the First Amendment, should be linked in traditions of openness and public discourse. Instead, as has often been observed, religion has existed in a peculiar place within journalism. Observers across the political spectrum have criticized American

news coverage of religion along two dimensions: First, that there simply is not enough of it, and second, that when journalists have taken on the religion story, they have failed to do so with the same levels of expertise and seriousness they devote to other, more "important" beats.

Religion in America

Why should religion be part of the news budget? There are a variety of arguments here. First, in the case of the United States, religion is a very prominent feature of public and private life. The place of religion shifted across the course of the twentieth century. Earlier, religion was largely a feature of various so-called religious establishments, most prominently the "Protestant Establishment" that held sway until mid-century, and an emerging presence of Catholicism in American culture. The early years of the century saw as well the emergence of another, "third" force in American religion: Christian Fundamentalism. Fundamentalist and Pentecostal movements were, at the beginning, barely a blip on the public radar screen. As the century progressed, though, they grew and developed, gradually moving beyond their roots in rural, southern, and western states and in lower socioeconomic contexts.

By the middle of the twentieth century, establishment religions were fading, leading to an assumption by some that that religion itself was diminishing, something that had been long predicted by social theorists. This process of "secularization" was predicted to gradually erode the presence and importance of religion in both public and private life. Instead, other religions were emerging. First and foremost, what had been known as "Fundamentalism" by mid-century began to diversify into an older, more conservative form and a newer form, which was called "Evangelicalism" by its leaders, the most prominent of whom was the Evangelist Billy Graham. This new movement came to have important and long-lasting effects on American society and politics by 1976, when a self-avowed Evangelical, Jimmy Carter, was elected President. Well before that, prominent Evangelical broadcasters burst onto both radio and television. One of these "televangelists," Pat Robertson, made a brief run for the presidency in 1988.

Pentecostalism followed a similar trajectory, and by the end of the century was the fastest-growing branch of Christianity worldwide. Other movements such as the Church of Jesus Christ of Latter-day Saints (the Mormons) also grew during the same period, and immigration brought increasing numbers of Muslims, Buddhists and Hindus to the United States. The indigenous Muslim movement, the Nation of Islam, also expanded during this time. Contrary to predictions, furthermore, the story of the more formal and historic faith groups, did not end. New kinds of religion and spirituality arose alongside existing denominations, with such things as the so-called new age movement finding religious and spiritual meaning and motivation in new places and from new sources.

So, while overall church attendance continued a gradual decline throughout the course of the twentieth century, religion was far from fading. It was persisting and reorganizing in new and different ways.

Religion as News

Yet scholars and observers generally agree that journalism lagged in its appreciation for, and coverage of, these developments. Religion continued to find its traditional place in the news budget: confined to feature coverage, weekend sections, and Church advertising in newspapers, but barely present at all in broadcast news.

This was not due to the absence of competent journalists to cover it. Most major metropolitan dailies employed at least one religion reporter or editor during the mid- and late twentieth century, as did the major newsmagazines, though broadcasting did not follow suit. Even newspapers in small and medium-sized markets (such as the Nashville *Tennessean* and Bakersfield *Californian*) devoted some space to religion coverage, and some papers (including the major metro dailies) covered it seriously and well. The problem, as many of these religion journalists noted, was that religion continued to be considered one of the lesser beats in American journalism, and even where trained and sophisticated religion reporters were covering the topic, they still battled more "senior" beats for access to the news pages. Front-page coverage of religion was rare, except in the few cases where religion news looked like "other" news: when religious power struggles or scandals propelled it higher on the news agenda.

Religion had not always been quite so ignored. One of James Gordon Bennett's major innovations

at the *New York Herald* was to provide consistent and serious attention to religion, though as a "city," not a "national" beat. Others followed Bennett's lead, and this lead to the situation describe above, with most metropolitan dailies assuming that religion should be part of their remit. Henry Luce was similarly committed to religion coverage in the *Time/Life* publications, and the other newsmagazines followed *Time*'s lead in instituting regular departments, beats, and (though more rarely) positions in religion. The wire services also included religion as one of their areas of coverage, a tradition that the Associated Press continues to this day.

But what did these journalists cover, what was published, and how? In the main, American religion journalism early in the twentieth century reflected the religious establishment in American political culture. Well into that century, the dominant religious culture remained mainline or "establishment" Protestantism. As was reflected in sociological analyses at mid-century, most business and political leaders through this period were more or less identified with one of the Protestant traditions. But religion was not a highly salient feature of public discourse before the 1970s, nor was it common for political candidates to display their

An example of the early involvement of journalism in religious affairs, this cartoon from the mid-1840s (titled "Jamie & the Bishop") depicts New York Herald *publisher James Gordon Bennett's ongoing conflict with the Catholic bishop of New York, John Hughes. At center left Scottish-born "Jamie" Bennett, with a quill pen tucked behind his ear, empties an enema at Hughes, saying that he can throw "mickle," or much, "dirty water" at the bishop, referring to the power of the Bennett's* New York Herald *to attack Hughes in print.*

Source: Library of Congress.

religion. This was the era described by Will Herberg in his classic study, *Protestant, Catholic, Jew* as a time when these three choices were simply "varieties of ways of being American."

This tacit, or taken-for-granted, approach to religion came under stress largely as a result of growing waves of immigration. The nineteenth century brought more and more religious diversity to American shores. This meant that Catholicism, in particular, was emerging in public culture, and the response of public figures and public institutions was to try to integrate it along the lines described by Herberg. As Dwight Eisenhower is reported to have said, ". . . I think every American should have a religion, and I don't care what it is . . ." (quoted in Chernus 2008). Turn-of-the-century social and political movements did threaten to destabilize this easy arrangement, however, and to do so in public—and thus newsworthy—ways. Two of these, the temperance movement and the rise of conservative Fundamentalism, were harbingers of the emergence of religion in political discourse later in the century. The journalistic construction of Fundamentalism was particularly important, focused as it was around coverage of the Scopes "Monkey Trial" of 1925. The outcome of that event, as reported in the national press, was a widespread political repudiation of fundamentalism, which then turned inward for a half century, emerging in a new form in the 1970s.

The combination of a social consensus that religions should be tolerated in public and private life, the sense that the emerging religious landscape was as described by Herberg, and the continued dominance in social and cultural terms of the Protestant establishment led to a particular approach to religion for most of the twentieth century. The relative lack of religious controversy during the post–World War II era, along with the quietude of the immigrant religions and of the home-grown Christian Fundamentalism, coincided with the commonplace notion that industrialization and education would soon lead to the further decline of religion. This latter idea, rooted in the social theory of "secularization," predicted that religion would gradually fade in importance in public life as modernity moved onward. There was reason to believe that this was the dominant social trend. Overall religious-service attendance and overall levels of identification with religion began a decline after World War II that continues to this day.

There were, of course, contradictory indicators. For example, the 1960 presidential election was dominated in some part by questions over the religion of John F. Kennedy, a Catholic. While he was not the first Catholic to run for that office (Al Smith was, in 1928), his candidacy raised religion to the forefront, and he needed to execute a careful public-relations strategy to overcome it.

The religion journalism of the mid-twentieth century was typified by several characteristics. First, as religion was thought to be of fading importance, it was given relatively little attention at most newspapers. Typical of most was the traditional "church page," a page or section that appeared on Saturday, accompanied by church ads. It was part of newspaper lore that the ads and the coverage were related, that the more space a church bought, the more likely they were to receive news coverage. This also meant that religion coverage was marginalized, limited to that dedicated space and day. It was rare at most newspapers for religion to appear in the news sections and on any day other than Saturday. It was also rare for any of these newspapers to employ a full-time specialist to cover the religion beat.

At the major metropolitan dailies, the situation was somewhat different, with most of them boasting a full-time religion writer or editor, in a few cases (such as *The New York Times* and *Los Angeles Times*), more than one. Still, these reporters found their access to the news pages and to good assignments limited by the assumption that religion remained a marginal beat or dimension of most news stories. The national newsmagazines also tended to employ a religion editor during the mid-twentieth century. For all of these print media, however, religion was limited in where it could appear. It was common, for example, for the major dailies and newsmagazines (and indeed, the television networks) to emphasize religion only during the times of the major religious holidays, most notably at Easter and Passover.

The situation with broadcast news has been even more telling. No major commercial broadcast network has consistently employed a religion reporter or producer for their flagship news programming. In the one exception, ABC employed such a journalist/producer for most of the 1990s but eliminated the post after about eight years for budget reasons. None of the cable news channels has employed a religious reporter or producer or had such a department.

Religion as Controversy

What religion coverage was provided thus operated within these constraints of resources and access. This enforced, and was enforced by, certain approaches to coverage on those occasions when religion did receive attention and space. For most journalists and editors, it was simply assumed that religion was inherently controversial. Thus, coverage of it suffered from a kind of defensiveness that had editors reluctant to assign journalists to stories that might raise the hackles of religionists. There was a sense that, because religion was of fading import anyway, it was really not worth the potential controversy that might arise from coverage.

This fear of controversy dovetailed with the sense that religion is an inherently complex beat. There are, literally, scores of different religions, and how is the reporter or editor to choose among them? This was thought to lead again to controversy and to be an implicit challenge to the competence of the religion editor or writer. With that amount of complexity, surely a level of sophistication, and perhaps formal education in religion, was necessary to sort it all out. Such a lack of context was not, ironically, thought to be an impediment to other "beats," where journalism and journalists have assumed that a well-rounded reporter could rise to the occasion with on-the-job experience. The skills of the journalist were thought to be sufficient to take on nearly any beat. Yet religion has been an exception.

Religious complexity also complicates two other conventions of journalism. First, the notion that journalism relies on sources for its evidence. How do you "source" a religion story? How do you provide evidence of beliefs that inherently defy such material questions? This, of course, assumes that the core of religion is questions of belief, not its actions and consequences in the material and social worlds, but nonetheless, many journalists have been reluctant to take on religion stories because of a fear that at some point, they would need to parse their competing claims to authority.

The second convention confronted by these received notions of religion is that a journalist uses sources and evaluates information according to competing "sides." In the typical story, the journalist need only locate the two competing sets of interests involved and provide space to their ideas and claims. In the case of religion, however, there are often many more "sides." There are multiple religions in even the smallest town in America. How does the journalist decide which ones to cover? Again, this is a received and somewhat naive reading of religion, but it nonetheless has been one of the impediments to religion coverage.

Finally, for most of the twentieth century, religion, particularly the major faith traditions, were treated with a certain sense of deference. The historic faiths, such as Catholicism, Orthodoxy, Orthodox Judaism, and Islam, have cooperated in this view, wishing to be able to reserve themselves from public scrutiny (Protestant Christians have tended to be less concerned about this). Religious authorities in general wish to arrogate to themselves the question of where the boundary between their "sacred centers" and the "profane outside world" should be drawn. As instruments of the outside, secular world, media have been seen as potential threats to this authority. And for most of the century, the media were more than happy to defer to religious institutions, even in matters of some public import such as public policy on education and the family.

Reporting the Religion Story

There has been a good deal of scholarly attention to the ways that journalism has treated the religion story when it has chosen to do so. In general, scholars agree that when journalists cover religion, they do so within received and accepted frameworks. These include consensual ideas about religious and social norms in areas such as personal morality, religious support for the "social safety net," and the ways that these religious and social norms are interrelated. Consistent with the notion that American society is fundamentally religious, even Judeo-Christian, these frames enforce (even on "secular" journalism) certain categories and conventions that define coverage, treating Judaism and Christianity as the religiously "generic." Scholars also agree that as, a socially consensual activity, journalism also tends to enforce what is the religious "mainstream," and define the religiously "different" as that outside that "mainstream." Thus, even though it should be up to religions to enforce social ideas about what is commonplace and what is not, journalism helps enforce these categories.

But as journalism in America operates according to Anglo-American traditions of the marketplace of

ideas and its relationship to democratic discourse, journalism has remained open to coverage of religion beyond the received, more problematic categories already discussed. Thus, when religion looks like other beats, when—for example—it gets involved with scandals or money or politics, it is more comfortable turf for journalists. When a series of major shifts in the nature of religion and its relationship to domestic and international politics began to appear in the late twentieth century, the nature of religion journalism also began to change, a transformation still underway.

The turning point came in the 1970s. The long-dormant conservative Christian movements began to emerge into national consciousness and politics. In 1977, the first Evangelical commander-in-chief, Jimmy Carter, took office. His emergence symbolized something that had been underway for several decades: the gradual emergence of a new form of conservative Protestantism that came to be called Evangelicalism. Its major figure was the Reverend Billy Graham, who had been a fixture on the religious and even political scene since the 1950s. He was a more moderate public face for what had been the marginalized fundamentalism earlier in the century. He was a comfortable media figure, someone whose organization was a major producer of religious media, yet also at ease in the "secular" media, where he excelled at representing this new form of American religion.

Carter's emergence coincided with the formation of a number of Evangelically related television ministries (what we now know as "Televangelism"). These represented both a new forum for conservative Christianity, and a new way of reaching—and organizing—the faithful. Both Carter and the televangelists symbolized the important change: that these conservative Christians were moving away from their traditional reluctance to engage in politics. Indeed, the new political consciousness of Evangelicals came to define segments of American politics for most of the next three decades. This emergence of religion as a political force was prefigured by the antiwar and civil rights movements of the 1960s, both of which drew heavily on religious support and religious ideas.

The second major shock of the 1970s came at the end: the Islamic Revolution in Iran in 1979. American political and journalistic establishments had long held that religion was an insignificant matter in global politics, even in the volatile Middle East. The idea that a religiously defined revolution could overtake one of America's most stalwart allies in that region was indeed a revelation to both the U.S. government and to global media, and both spent years trying to understand what had happened. The general consensus was that both the government and the media had underestimated the importance of religion in the formation and maintenance of modern identities.

Conundrum

The problem of religion journalism persists, however. Even after the emergence of religion into political life in the 1970s, journalism continued to struggle with the perception that religion is exceptional, and that its complexities defy traditional journalistic conventions. There was no marked increase in resources devoted to religion coverage by American news media, even as religion became a more important element of domestic politics. Yet the so-called Reagan Coalition of the 1980s included a burgeoning Evangelical segment, televangelist Pat Robertson ran unsuccessfully for the Republican nomination in 1988, the second Bush administration (2001–09) played strongly to the religious right, and Mitt Romney, a Mormon, and Mike Huckabee, an ordained Baptist minister, both ran for the Republican presidential nomination in 2008.

Perhaps the biggest historical break came on September 11, 2001, when Islamist terrorists carried out successful attacks on New York City and Washington. This was followed by further attacks in other countries. The reaction of Western foreign policy was to focus military resources on the occupation of both Afghanistan and Iraq, and rhetorical resources on what many see as a new "clash of civilizations," rooted in a clash of religious views.

This faceoff between the Muslim world and the West has made the whole question of religion journalism even more complex. Clearly, news media audiences must better understand nuances and layered relations of culture, religion, identity, and politics that define this ongoing story. Journalism should transcend some of its most long-standing definitions and approaches to the religion "beat." In the post-9/11 news context, there is clearly need for more attention to religion

Several things must be addressed in the short term. First, more journalists need to prepare to specialize in coverage of religion. Second, religion

needs to be included as a dimension of stories of global politics and global security, not treated as an isolated beat. Third, journalists need to abandon their assumptions that religion is esoteric and marginal in the face of its central role in both domestic and world politics and power. Fourth, journalists must understand that their goal is not to legitimate certain religious claims or beliefs over others. Rather, it is to make the role and function of religion intelligible to their audiences. Finally, journalists and editors need to overcome their reluctance to cover religion because of its complexity and controversy. The issues are simply too important for journalism to ignore.

Religious News Media

Religious news media comprise an important part of journalism. While the term immediately conjures up contemporary vehicles such as *Belief Net, The 700 Club,* and *Christianity Today,* religious news is nearly as old as religion itself. Given that religion is a cultural universal (though in many different flavors), its involvement in journalism has been enduring and far-reaching. Indeed, at times in history, religious news media have been the only forms of mass communication. Currently, however, religious journalism usually takes a secondary role to more dominant secular media. Nevertheless, the range of religious news media has expanded; they remain vital to the survival of denominations. Religious media raise issues often ignored by secular outlets. On the other hand, concerns about the lack of participatory involvement are raised when religious news becomes the exclusive source of information. While religious news is found in all traditional media forms (i.e., newspapers, radio, television), it is also available from nontraditional sources as well, from religious blogs to mega-churches.

History

From Egyptian stone carvings to the papyri of ancient Rome, media have always been used to convey sacred beliefs. Religion can be defined as news as the term *gospel* translates into *good news*. The world's most important scriptural writings such as the *Bible,* the *Torah,* and the *Koran* are records of sacred news passed down through the centuries. When new media emerge (e.g., stone, papyrus, printing, radio, television broadcasting, digital media) denominations move quickly to exploit them in order to keep adherents informed and to introduce outsiders to their beliefs.

The ability to disseminate information was greatly aided by the printing press—as was the growth of alternative (Protestant) denominations. The press enabled churches to engage in public debates through a medium that was inexpensive and efficient. Already in the 1530s, pamphlets, books, broadsides, and sermons ceaselessly poured forth to address such issues as antinomianism, the Trinity, and the authority of the scriptures. The

polemical pamphlet was one source of religious news, informing citizens of competing positions and strengthened unity within groups. Their main function was to structure public discourse so that religious loyalties and differences could be clarified. These early forms of printed religious material were forerunners to the religious tracts, newspapers, and magazines of the nineteenth and twentieth centuries.

In the early United States, religious media *were* the media as the distinction between religious and secular news was not always clear. When the *Oath of a Free-man* was published at Harvard College in 1638, the American press was in its formative stage. By the time the first newspaper appeared in 1690, the role of religion in American journalism was already being felt. The first religious magazine in the United States was *The Christian History* (1743–45), which questioned the conservative church and conveyed views of revivalist preachers such as Anglican George Whitefield and Presbyterian Gilbert Tennent. Contrary to the popular view, Puritans valued free expression in print; they encouraged discussion of a wide range of topics. Clergy, however, were not to be openly criticized nor God mocked. Such offenses resulted in a fine and a paper affixed to the chest of the offender announcing that he or she was "AN OPEN AND OBSTINATE CONTEMNER OF GOD'S HOLY ORDINANCE."

Into the early 1800s, newspapers combined sacred and secular content. Stories often attributed good fortune to obedience to God and misfortune to disobedience; crime stories were cautionary tales about the importance of living God's law. For example, the first issue of the *New England Weekly Journal* (1721–41) claimed that readers would find the periodical consistent with Christian views. Rather than having a religious reporter, eighteenth-century newspapers covered religion regularly, including stories about sermons and church meetings.

By the middle of the nineteenth century, however, a clear separation of *religion* journalism and *religious* journalism was established. The former is the reporting of news about religion by secular sources; it aims to be objective or neutral. Religious journalism, on the other hand, is news presented from the religious viewpoint. For over a century and a half, this distinction has continued to characterize religious news in the United States. While a number of economic and political factors contributed to this schism, it was a long-term result of Enlightenment thought, the idea that religion was secondary to scientific thought and technological advancement.

Despite the separation of sacred and secular news sources, religious groups continued to develop various media of communication. Fueled by evangelicalism, they became important pioneers in the printing business. Through the *American Bible Society* and the *American Tract Society,* religious publications forged new methods of distribution. By 1865, there were some 350 religious periodicals in America.

Religious News in the Twentieth Century

Religious news media formed an important force into the twentieth century. When secular media failed in its critical role, religious media often filled the void, as when the black church press became a primary voice for civil rights in the 1950s and 1960s and in raising awareness about the AIDS crisis in the 1980s. The Jewish press understandably opposed fascism in Europe and was politically active in the United States.

Despite the preponderance of secular media, a number of religious vehicles have remained influential. With the growth of various denominations as well as expanding general interest in religion, these publications offer alternative points of view and strengthen religious identity among readers. Although its content eventually evolved in a secular direction, the *Christian Science Monitor* (created in 1908) newspaper set out to cover local and world affairs while defending Christian Science. *Christianity Today* (1956) created by the Billy Graham Evangelical Association, reports the news through a religious lens, as does the Buddhist magazine *Bodhi* (1997). Conservative publications such as *Commonweal* (1924) offered Catholic positions while *Commentary* (1945) conveys Jewish perspectives.

A key twentieth-century development has been the growth and widespread use of radio as a religious news medium. Father Charles Coughlin morphed from just another Catholic priest to a radio orator of some note during the 1930s, eventually taking strong political views against the Roosevelt administration. Countless churches

broadcast their worship services. The radio networks provided regular religious news programs. By the end of World War II, Charles Fuller's *Old Fashioned Revival Hour* attracted 20 million listeners worldwide. Since then, the number of religious radio stations has grown dramatically, suggesting that they are a key news source. With the advent of satellite and Internet radio in the late 1990s, individual listeners achieved global access to information from almost countless religions and denominations. About 2,000 American Christian radio stations (and hundreds more from overseas) offered news and commentary by the start of the twenty-first century.

Another development of the last half century has been the hybrid television news program combining preaching and music with the format of a secular television talk show. Although evangelists such as Oral Roberts, Jerry Falwell, Billy Graham, and Jimmy Swaggert delivered desk-pounding sermons and conducted revivals on television starting in the 1950s, others have more recently created a new type of talk program. In the 1980s, Jim and Tammy Faye Baker interviewed guests on-camera, much like network morning television shows *Good Morning America* or the *Today* show. For decades, *The 700 Club,* hosted by Pat Robertson's Christian Broadcast Network (CBN), has offered prayer, preaching, and music within the structure of the talk show format featuring on-set interviews, news anchors, and short film pieces. Many programs rely on their radio and television audiences for financial support—-and pleas for contributions are a central part of most broadcasts. A print version of hybrid religious news is *World* magazine, which contains graphic formats similar to such secular publications as *Newsweek* and *Time*.

Religious News in the Information Age

Perhaps no technology has had greater impact on religious news media than the Internet with its denominational websites and blogs. Surveys indicate that over 100 million Americans use the Internet for religious information and experiences. Internet users are increasingly turning to sites such as *BeliefNet, BuddhaNet,* and the Islamic e-periodical *Renaissance: A Monthly Islamic Journal.* These sources provide news and an opportunity to discuss religious topics with other users.

While places of worship and religious news media were once considered distinct phenomena, the Internet has combined them. Cyber-churches and cyber-temples, for example, not only provide ritual and community similar to that found in face-to-face congregations but also disseminate religious news. News items appear in the form of bulletin board services or can be obtained through chat rooms or e-mail discussion groups.

The web and other technologies present both opportunities and dilemmas for religious news media. The sheer number and variety of religious news sources create an environment for information sharing and learning across denominations. On the other hand, if groups restrict media use only to the religious, denominations become closed systems, retreating from the public discourse of the larger society. Such concerns have been raised about the Amish or ultra-orthodox Jewish communities in the United States, which generally avoid secular news and politics.

Some religious groups created their own news outlets because secular media were perceived as hostile to religion, not covering religious concerns fully or fairly. Some critics disagree with this assessment, arguing that secular journalists' values inevitably turn out to be the same as those advocated by churches. Basic themes in secular news about religion are essentially the same values embraced by religious groups, that is, good works, tolerance, hypocrisy, false prophesy, inclusion, supernatural belief, and declension.

The New Religious Marketplace

Cultural as well as technical trends constantly create new forms of religious news media. Individuals find religion in media of popular culture, among other places. The number of "questers," or those drawing on multiple religious sources, is growing. This not only includes denominational religion but also media activities possessing various elements of religion. Young adults with an increasing affinity for new media are often willing to experience religion through them. Commonly referred to as *popular religion* or *cultural religion,* these sources of religious experience are expanding. For example, the Oprah Winfrey phenomenon in the form of the television program, website, magazine, and book club, provides similar information to that disseminated by

traditional religious news media. Such media encourage a set of values and make suggestions for self-improvement. Stories told on the program as well as recommended readings are morally based.

The mega-church is another emerging form of religious news media. The nondenominational mega-church of Joel Osteen in Houston, Texas, seats 14,000 for Sunday service. Robert Schuler's Crystal Cathedral in California represents a similar facility. Inside the mega-church the congregation receives news through large sound systems and large video screens. The emphasis is on concise messages delivered in 30 or 60 minutes. Many such mega-church meetings can be accessed at home through television and the Internet.

Mega-churches as well as the Oprah Winfrey phenomenon suggest that contemporary definitions of religion are expanding. As they do, we are likely to see new forms of religious media in the future, both inside and beyond specific denominations. Furthermore, American religious media are increasingly active in debates over secular issues and politics. In that sense, the borders that have divided most religious and secular news media for 150 years are steadily dissolving.

Reporters, Online

Broadly defined, online reporters are journalists who utilize the World Wide Web and Internet for researching, editing, producing, and distributing news content. Some do the entirety of their work online while others (an increasing majority of journalists) combine online with more traditional methods of reporting. Since many print and broadcast journalists also use networked computer technologies in their news gathering and distribution, making exact differentiations is difficult. Narrowly defined, journalists who work exclusively or largely online may be classified as online reporters.

Development

The migration of journalism and media content from traditional print and broadcasting media into digital distribution using the Internet has changed and hybridized the nature of the professional reporter. An online reporter may be actively employed by a news-gathering organization, wire service, or broadcast network but may also be a freelance

journalist with long-term ties to several organizations, a member of the alternative press, or may be a self-employed weblogger (blogger) who acts as a news aggregator for a demographic group or simply as a journal keeper. Small-scale online reporters and bloggers often share directly in the advertising revenue which their Internet website generates.

With the rise of digital means of news collection, all of the journalist roles suggested above utilize the same technologies. What differentiates them is their degree of reliance on the web for distribution of their material, adherence to style guides, possible professional affiliations, and how they are paid. Both print and broadcast news organizations were using computers by the late twentieth century. In 1968 the several large mainframes at university campuses, U.S. government agencies and defense contractors were linked into a nonhierarchical network now known as the Internet. By the late 1980s, Internet Protocol was standardized and simplified, allowing for expanded corporate and personal use of the Internet. The resulting World Wide Web uses hypertext links to connect information between various webpages. Any end users, including journalists, reading this information take a far more active role in its synthesis and understanding because multiple individualized paths can be created within the same information. As computer processing power and network speed increased, graphic, audio, and finally video content have been added to the formerly text-only information on the World Wide Web.

Widespread use of hypertext and other web-based forms of information navigation has changed the manner in which end users read news stories and other practical information online. As broadcast news evolves, these same changes are rapidly moving into audiovisual news gathering and distribution, often as seen on supplementary websites linked to the on-air product. Continuing changes in the business of newsgathering, reporting, and distribution has not only led to specialized online reporters but also to other social technological hybrid occupations as well, such as editing.

Categories

"Mobile journalists" are those who have no physical presence at their news-gathering organization. Instead, they collect information in the field, write their stories using portable (laptop or notebook) computers, and upload or email their completed project to their news editors. Some mobile journalists create news reports for use by radio and television newscasts, doing so remotely and using broadband connections to send their often fully edited stories or features to a newsroom or studio. This allows reporters to report more fully from either distant locations or local news events.

"Perma-lancers" are journalists who maintain a long-term freelance relationship with one (or a few) established news gathering organizations without being on the permanent staff. The World Wide Web allows such perma-lancers to communicate with editors and news directors through e-mail, easily edited collaborative sites (wikis), and secure sites for uploading. Although this may be an inevitable outcome of streamlining and downsizing encouraged by computer technologies, some perma-lancers actively seek these relationships because they allow for flexibility and a wider range of potential customers for the reports produced. In 2007, the media holding company Viacom, under considerable pressure from its online reporters, converted several hundred perma-lancer positions into full-time staff positions.

"Citizen journalists" are community volunteers who are given space in a news publication on a rotating basis to cover very specific events or community points of view. They nearly always make use of digital devices from cameras to laptops in preparing their material. Like mobile journalists, they rarely have any physical presence at the news gathering organization. While most citizen journalists are not paid, they are usually required to adhere to the same editorial standards of paid professional journalists.

"Paid bloggers" can be on-staff journalists, local politicians, celebrities, or other well-known individuals who are paid to create blogs or other online content to supplement the coverage of a particular topic, event, or demographic group's concerns. Some established newspapers have paid their staff reporters to start and maintain blogs. These often provide meta-commentary on the "news of the news."

Professionalism and Oversight

Professional editorial oversight of all such contributed material from other than professional

journalists has become a major and controversial concern because there is little precedence for these types of reporters, and the growing amount of material they provide. Nor is there much (if any) control over what many of these "digital independents" actually do. Frequently, citizen journalists and paid bloggers are utilized more for soft news and feature material, as well as editorial or man-on-the-street pieces or a combination of these.

Long-term trends in the degree of professionalism of online reporters have been mixed. Most established news organizations maintain strict editorial oversight and quality from both employed journalists and freelancers, especially for breaking and hard news. With the widespread adoption of online style guides from such traditional sources as the Associated Press, the British Broadcasting Corporation, and others, many citizen journalists and paid bloggers use these accepted stylistic and fact-checking protocols before submitting their stories. Nonetheless, changes in editorial policy are inevitable due to limited budgets, tight deadlines, and pressure for scoops, all of which may make effective oversight difficult. Many online reporters, such as Matt Drudge and the young writers for Gawker Media, have created and maintained maverick reputations of flamboyant personal styles and eagerness to publish news scoops, but have done so with an image of cutting corners as far as fact checking and balance are concerned. A distinctive style of online reporting evolved where hyptertext links are embedded directly into the text of the column or article. In this format of online writing, graphic design and constant links can create a paradox of fluid, yet disjointed, writing where the potential to leave the article to follow links becomes a meta-commentary on the original content of the article.

Since the late 1990s, semi-professional "webzines" have emerged and quickly expanded their readership, become at least partially advertiser-supported, and systematized their professional standards to become recognized online news gathering organizations. These webzines often took their journalistic slant from earlier small or alternative press publications, and blended the aesthetic of the emerging techno-geek culture of early adopters. Examples include *Cult of the Dead Cow, DargonZine,* and *Slash-Dot.*

Online magazines *Salon.com, Slate Magazine,* and *HotWired* were begun at the same time as commercial ventures and exclusively online publications. Many of the online reporters for these publications are established journalists who also write for established print and broadcast media. Increasingly some of the graphic design, personalization, and hypertext style of online journalism have been re-co-opted into print journalism by publications such as *Politico, Wired,* and *Business 2.0.* News agencies, such as AP, Reuters, and UPI, frequently publish their stories to websites after a delay of several hours from when the information is sent to subscribing newsgathering organizations. Thus, many online reporters have access to identical information as reporters in newsrooms. However, many online reporters create content based on news service stories, but link back to the original piece.

As media conglomeration continues along with an expansion of media outlets, the relationship between online reporters and the organizations that employ them should become more stable. Professional and ad hoc style guides will evolve for bloggers, and paid bloggers and web sites will continue to establish professional reputations. While print, broadcast, and online news sources will become indistinguishable due to technologies of printing and mobile Internet use, they will remain differentiated by editorial standards and branding. Online reporters will likely form the majority of the workforce of journalists into the future.

Notable Online Reporters

Andrew Breitbart (1969–)

Andrew Breitbart worked together with Arianna Huffington to create the aggregated news site/blog *The Huffington Post* and created *Breitbart.com* as his online news portal. Breitbart was one of the first online reporters to provide a collection of direct links to other news content and newswire stories within a news blog. Breitbart continues to act as an editor for the *Drudge Report,* and continues to write conservative cultural criticism and nonfiction books.

Tim Cavanaugh (birth date unknown)

Tim Cavanaugh was one on the founding editors and writers of Suck.com, which was published

from 1995 through 2001. Suck.com was arguably the first fully advertiser-supported online blog. Cavanaugh was an early adopter of the hypertext-heavy writing style where links to other articles and websites are embedded into the text of the column, which he named "Hit & Run," often providing another level of meta-commentary. After the closing of Suck.com, he moved to *Reason Magazine*'s website and continued to publish his "Hit & Run" column. Combining aspects of academic writing and gonzo journalism, in 2002, he published *Let Slip the Blogs of War* a commentary on the changing nature of online reporting. He continues to work as an editor, most recently for the *Los Angeles Times*.

Ana Marie Cox (1972–)

The online website *Wonkette,* begun by Ana Marie Cox in 2004, followed the example of Drudge and other online reporters. *Wonkette* blends ironic commentary and satirical sarcasm into its reporting on national political news, yet it follows the more personal, informal style of a blog. Cox later left *Wonkette* to follow a more conventional career as a journalist, writing for *Time* magazine and making television appearances. As it became more recognized, *Wonkette* became part of a larger online journalism media group, Gawker Media, and was sold in 2008.

Nick Denton (1966–)

Denton began his career as a journalist writing for the *Financial Times* in the early 1990s covering the political revolutions in Eastern Europe. He founded two online corporate consulting firms before becoming the online publisher of Gawker Media in 2002. Gawker hosts and publishes multiple blogs each targeted at a very specific demographic or content area, *Gawker* (New York society, culture, and media gossip/commentary), *Gizmodo* (personal technology), *Defamer* (Los Angeles–area gossip, entertainment news, and commentary) *ValleyWag* (technology business) and *Comsumerist* (product news) as well as several other branded blogs. Denton evolved a business model and editorial stance to develop personal blogs into to more established online media sources. Denton sold *Wonkette* (politics) as well as *Idolator* (music news) in 2008, and continues to write long-form nonfiction.

Matt Drudge (1966–)

Arguably the most well-known online reporter, Matt Drudge gained notoriety in the mid 1990s by breaking the sex scandal involving President Bill Clinton (1993–2001) and White House intern Monica Lewinsky. Drudge created a niche online with an e-mail newsletter that offered insider Hollywood and political news several days ahead of local newspapers, and became a regular source for other more traditional journalists. From this initial notoriety Drudge parlayed the traffic on his website the *Drudge Report* into a reputation for both professional news scoops and blog style editorial oversight. Matt Drudge became a rallying point and self-appointed spokesman for Internet-only online reporters. In his 1998 address to the National Press Club titled "Anyone with a Modem Can Report on the World," Drudge posited that communications technology has lowered barriers to entry into the field of journalism. He further expanded on this in his *Drudge Manifesto,* in which he argues the ideas of erosion of the barrier between industry-paid professional journalism and advertiser-paid self-employed freelance journalism.

Elizabeth Spiers (1976–)

Elizabeth Spiers was a Financial Analyst in New York who was one of the original editors for *Gawker* and *Mediabistro,* two advertiser-supported news and gossip blogs. Like other online reporters, she has left web-only journalism and works as a "perma-lancer" for *The New York Times, Fortune,* and the *New York Post*. Spiers is an example of a hybrid journalist who has embraced her freelance status, turning away offers of long-term employment to pursue short-term assignments. She continues to work as a print and online reporter while also appearing as a broadcast news commentator and publishing fiction.

Reporters, Print

The earliest reporters in the United States worked for newspapers in the 1700s and magazines in the 1800s. While an increasing number of journalists now work for broadcast or online outlets, the majority of reporters in the United States are still employed by print publications. According to a 2002 study of the editorial workforce of news media in the United States, 70.5 percent of full-time journalists were working in print media, with the majority of those (50.6 percent) employed by daily newspapers.

While the field's earliest practitioners were almost all white men, women and minorities have more recently made notable inroads. Among different media, female journalists are represented most strongly at news magazines (where they make up 43.5 percent of the workforce as opposed to 33 percent at daily newspapers and 36.9 percent at weekly newspapers). Some scholars attribute this distribution to more attractive hours, pay, and benefits at news magazines. However, survey data from 2002 shows that print news outlets lag behind television in their employment of minority journalists (9.6 percent of daily newspaper journalists, 8.2 percent of news magazine journalists and 5.6 percent of weekly newspaper journalists are minorities as opposed to 14.7 percent of television journalists).

This entry explores the growth and increasing professionalization of print news reporting in the United States and highlights some of the most noted reporters from the last 150 years.

Origins

The work of the earliest newspaper employees was, in many ways, a much different enterprise than it is today. During the colonial period, those who produced newspapers were businessmen who largely used their publications as advertising for their printing businesses. Their content included a large amount of advertisements as well as a collection of gossip and information gathered from European newspapers. On the whole, early newspaper printers did not actively engage in news gathering, waiting instead for information to be distributed to them.

While the earliest colonial papers usually steered clear of political news, in the wake of the Revolutionary War, American newspapers became strongly partisan. Many of the earliest newspapers were small endeavors with no distinct lines between what constituted a reporter, editor, printer, or business manager. Indeed, the earliest "reporters" often took on many roles within the newspaper—from editing to printing—in addition to any reporting duties. These earliest journalists were also very beholden to the commercial interests and political parties who financed their newspapers. As a result, editors strictly limited the types of content they produced to appease these powerful influences, who would sometimes take over and write editorials themselves. The majority of this early journalistic work was actually editorial in nature, with a focus on providing opinions rather than in-depth reporting. While some papers hired "correspondents," these employees were typically friends of the editor with little training or specialty in reporting or writing.

Many scholars point to the 1830s as a dramatic turning point in the nature of both newspapers and print reporting. During this commercial revolution, Benjamin Day's *New York Sun* became the first paper to sell for a penny (as opposed to six cents), and many other newspapers followed. The "penny press" relied on a large circulation and advertising for their financing, thereby reducing the control of political parties and changing the

nature of newspaper reporting. Newspapers began to seek out news (rather than wait for it to be brought to them) and hired employees whose explicit job was to report. The penny press also created the now-common beat system, where individual reporters were hired to regularly cover specific aspects of the news, such as the police, the courts, or sporting events.

Reporting as a Profession

The past century or so has been marked by increasing specialization and professionalization in news reporting. In the decades after the Civil War, editors increasingly sought to hire reporters who were both college educated and passionate about the job. This corresponded with a growth in income and status for reporters as well as a standardization of beliefs regarding the role of the reporter.

The mid-nineteenth century saw the growth of more "objective" reporting, but, even by then, the focus of many reporters was just as much on crafting "literature" as it was on providing information. In many cases, print reporters still believed the purpose of their news accounts was not only to inform, but also to entertain. Reporters sought to distinguish themselves and achieve notoriety through creativity in their writing and facts were often glossed over or modified to create a compelling narrative. This practice at times ran directly counter to the push by many Progressive-era editors in the early twentieth century to prioritize facts and accuracy.

By the turn of the twentieth century, despite differences of opinion on the role of facts and fiction in news accounts, print reporters had carved out a role in the world of newspapers and established a degree of autonomy from editorial controls. Interviewing became a mainstay of the profession and a practice that helped distance reporters from earlier journalists primarily focused on creating literature or forwarding political agendas. Reflecting on journalism in the 1890s, newspaperman Irvin S. Cobb commented that it was the "Age of the Reporter" (Schudson 1981, 65).

The New York Times began to popularize reporting based more in factual accounts than stories—distinguishing itself from other established papers, such as Joseph Pulitzer's New York *World,* who were requiring their reporters to craft increasingly sensational pieces during the period of yellow journalism in the late 1800s. An ethic of objectivity came to dominate print reporting in the earlier decades of the twentieth century, further distinguishing the profession and contributing to a notion of community among journalists. In 1922, the American Society of Newspaper Editors adopted its Canons of Journalism, which called on newspapers and their reporters to cover the news "fairly." During the 1950s and 1960s, the conventions of mainstream print reporting again shifted, moving toward a more interpretative form of journalism spurred by the new journalism movement characterized by in-depth reporting and literary storytelling techniques, and the growth of underground newspapers.

While professional standards and expectations regarding objectivity, sensationalism, and writing conventions shifted throughout the twentieth century, print reporting came to be dominated by an increasing degree of professionalization and standardization of education and training requirements. By 2002, the vast majority of print reporters held a college degree, with the majority of those employed by newspapers majoring in journalism or mass communication. In contrast, far fewer magazine journalists were likely to hold degrees in the same area. In many ways, however, the role of the reporter is far from static. For example, some reporters also function as columnists, suggesting a conflicted notion surrounding the idea of the "unbiased" reporter.

Some Noted Print Reporters

Below are the profiles of noted reporters who have distinguished themselves as pioneers in the field. Included in these entries are a number of reporters who gained notoriety for their investigative pieces of journalism or for their innovative approach to reporting.

Peter Arnett (1934–)

Peter Arnett is a Pulitzer Prize–winning war reporter, renowned both for his coverage of Vietnam for the Associated Press and, later, his Middle East coverage for various broadcast outlets. He was born in New Zealand and got his start at his local paper, the *Southland Times,* after high

school. He left New Zealand in 1956 and went on to have a long career as a war correspondent. In 1960 he ran a small English-language newspaper in Laos and was hired by the AP in 1961. During his time in Vietnam, he repeatedly drew the ire of American military authorities, who often saw his reporting as negative toward military activities. In 1966, he won a Pulitzer Prize. He began working for CNN in 1981 and has had a distinguished career in broadcast news.

Carl Bernstein (1944–)

Carl Bernstein is a Pulitzer Prize–winning reporter renowned for his coverage of the Watergate story of the 1970s with fellow *Washington Post* reporter Bob Woodward. Bernstein was born in Washington, D.C., to parents who were later revealed to have been members of the Communist Party. He began his career in journalism at age 16, working as a copyboy at the *Washington Star*. Never finishing college, he joined *The Washington Post* in 1966 at age 22. During his time at the *Post,* he covered a variety of subjects ranging from local politics to the civil rights movement and even occasionally appeared in print as rock music critic. He was 28 when he began talking, along with Woodward, with anonymous informant "Deep Throat," who revealed information about President Richard Nixon's involvement in a break-in at the Democratic Party's Watergate campaign offices. Their reporting and that of many others ultimately brought the resignation of Nixon. In the aftermath, Bernstein became, along with Woodward, one of the most inspiring figures of twentieth-century investigative reporting, invigorating interest in the journalism profession. The two men published two bestselling books based on their Watergate experiences, 1974's *All the President's Men,* which was later made into a successful motion picture starring Dustin Hoffman and Robert Redford, and 1976's *The Final Days*. Bernstein and Woodward maintained the confidentiality of their anonymous source for 35 years, FBI Assistant Director Mark Felt, who revealed himself as Deep Throat in a 2005 *Vanity Fair* interview. In recent years Bernstein worked for a number of different media outlets, including ABC News, for which he served as the Washington Bureau Chief. He has authored several non-Watergate-related books.

Nellie Bly (1864–1922)

Nellie Bly was born Elizabeth Cochrane, but adopted the pseudonym "Nellie Bly" because it was not considered appropriate for female journalists to use their given names. She started as a young reporter at the *Pittsburgh Dispatch,* where she covered society news and answered letters to the editor, but left her job at the age of 23 to seek more hard news reporting assignments in New York City. She was eventually granted an audition at the country's largest paper, Joseph Pulitzer's New York *World*. She is best known for the controversial undercover reporting methods employed on her first story, about conditions at the Women's Lunatic Asylum on Blackwell's Island. She feigned insanity, checking herself into a working-class boarding-house and frightening those she encountered with deranged expressions and an unkempt appearance. She convinced doctors and officials to commit her to the asylum, where she discovered deplorable conditions and abusive treatment. She was released ten days after her commitment at request of *The World* and went on to write a series of reports about her experience, which was later turned into a book, *Ten Days in a Mad-House*. Her work made her famous, leading to a formal investigation and a $1 million increase in funding from the city of New York to improve conditions at the asylum. She later wrote a number of other stories based on her undercover reporting and became known as an advocate of both women and the poor.

David Halberstam (1934–2007)

David Halberstam was a Pulitzer Prize–winning reporter and author who first gained notoriety for his reporting on Vietnam for *The New York Times*. Halberstam was born and raised in the New York area and went on to attend Harvard, where he was the managing editor of the student newspaper, *The Crimson*. After graduating, he covered civil rights conflicts for both *The West Point Daily Times Leader* in West Point, Mississippi, and *The Nashville Tennessean*. He joined *The New York Times* in 1960. He and his colleagues won a Pulitzer in 1964 for coverage that exposed the failing government in South Vietnam and mistakes by the United States. His reporting caused much ire from the government, famously leading to a suggestion from President John F. Kennedy

that he be fired. He is also remembered for his prolific book writing, authoring more than 20 books over the course of his career. Through his books, he investigated topics including the civil rights movement, the decline of the American automobile industry, baseball rivalries, and New York firefighters killed on September 11. He gained praise for many of his books such as *The Best and the Brightest,* which chronicled America's involvement in Vietnam, and *The Powers That Be,* which examined the rise of modern media. Later in life, he worked as a sports reporter. He died in 2007 in a traffic crash in California.

Judith Miller (1948–)

Judith Miller is a Pulitzer Prize–winning former reporter for *The New York Times*. She gained notoriety after spending 85 days in prison to protect a confidential source, reigniting debates both about the journalistic practice of using anonymous sources and the conflict between the rights of a free press and national security. In 2005, Miller was called to testify before a federal grand jury investigating who leaked the identity of CIA operative Valerie Plame. While Miller never wrote about Plame's CIA operative status, she reportedly held information from an anonymous source about Plame. Miller initially refused to testify and was held in contempt of court. She eventually complied with the court order after her source, Lewis "Scooter" Libby, Vice President Dick Cheney's chief of staff, released her from their agreement. Outside of the Plame affair, Miller was heavily criticized for her reporting on purported Iraqi weapons of mass destruction in the run-up to the Iraq war. She was accused of not rigorously questioning the information given to her by Bush administration officials. Miller defended her work by stating that it was not her job as a reporter to independently analyze the intelligence information given to her, but rather to pass along information to readers about the government's beliefs about Iraqi weapons capabilities. She resigned from the *Times* in 2005 and now writes for several publications, including *The Wall Street Journal* and *Los Angeles Times*. She is also an adjunct fellow at the Manhattan Institute, a conservative policy research think tank, and is a contributing editor for its *City Journal*.

Ernie Pyle (1900–45)

Ernie Pyle was a Pulitzer Prize–winning reporter who became widely known for his "roving" war correspondence during World War II. His reports from the battlefield were widely circulated, drawing a variety of readers (including President Harry S. Truman and Eleanor Roosevelt). Pyle was raised on a farm near Dana, Indiana, and attended Indiana University, where he got his start in journalism working on the school paper, *The Indiana Daily Student*. He withdrew from Indiana University when he was offered a reporting job at the *La Porte Herald*. He later held positions at *The Evening World, The New York Post,* and the *Washington Daily News,* where he was the managing editor. He impressed editors while filling in for a vacationing columnist and was given a national column for Scripps-Howard, where he traveled around America in his car and wrote about the people he met. His popularity grew even more during World War II, during which he produced a number of columns from the front lines featuring the stories of soldiers. He was killed by Japanese machine-gun fire on Ie Island in Guam.

James Reston (1909–95)

James Reston was a Washington correspondent, nationally syndicated columnist, and executive editor of *The New York Times*. Called "perhaps the most influential journalist of his generation" by *The New York Times,* Reston won two Pulitzer Prizes during his 50-year tenure at the *Times*. He was born in Scotland and began his career at the paper's London bureau. Throughout his time at the *Times,* he interviewed many of the world's top leaders and chronicled a number of major news events and issues, including the 1944 Dumbarton Oaks conference, for which he won his first Pulitzer, and President Dwight D. Eisenhower's illness, for which he won his second Pulitzer.

Ida Tarbell (1857–1944)

Ida Tarbell was born in Pennsylvania and became an associate editor of *McClure's Magazine* and an editor and founder of *American Magazine*. She was one of the first female graduates of Allegheny College in 1880. Earlier in her career,

she produced popular biographical pieces on Napoleon and Abraham Lincoln for *McClure's*. She first became well known for her investigations of oil corporations in the early 1900s. Her 1902 *McClure's Magazine* investigative series on the Standard Oil Company monopoly, which later became the two-volume *History of the Standard Oil Company,* is a key document in the era of muckraking, and contributed to the massive antitrust case that broke up the cartel. At *American Magazine,* she wrote biographies of important figures in business at the time and covered the controversial debates about foreign tariffs.

Helen Thomas (1920–)

Helen Thomas was raised in Detroit as one of nine children of Lebanese-born immigrants. She started her career as a copygirl at the *Washington Daily News* a year after she graduated from Wayne State University. She gained notoriety as White House correspondent for United Press International (UPI), distinguishing herself in the male-dominated field of journalism. She became the first woman officer of the National Press Club and the first woman to close presidential news conferences with the now-signature "Thank you, Mr. President." She was given the UPI White House beat in 1961 and, during her tenure, traveled with Presidents Nixon, Ford, Carter, Reagan, Bush, and Clinton and became famous for her persistent questioning. In 2000, she left her job when UPI was acquired by News World Communication, Inc. She has since become a columnist for Hearst Newspapers.

Hunter S. Thompson (1937–2005)

Hunter S. Thompson was an American reporter famous for forwarding what came to be referred to as "gonzo" journalism, a subjective and personal form of reporting that shares some similarities with New Journalism. Thompson's most famous work was the 1972 novel *Fear and Loathing in Las Vegas,* much of which was first published in *Rolling Stone*. Throughout his career, he set himself in strong opposition to mainstream journalism and heavily criticized the standards of objectivity prevalent in much reporting at the time. Instead, Thompson sought inspiration in the works of the Beat Generation and, in particular, Jack Kerouac's novel *On the Road*. Through his work, Thompson offered a critique of both mainstream journalism and society, offering profiles of and personal insights into the American counterculture.

Bob Woodward (1943–)

Bob Woodward is a Pulitzer Prize–winning reporter renowned for his coverage of the 1970s Watergate story with fellow *Washington Post* reporter Carl Bernstein. Together with Bernstein he reported a series of articles for the *Post* that revealed the involvement of high-ranking officials in the Nixon White House in the Watergate break-in and a pattern of "dirty tricks" used during President Nixon's campaign for reelection. Woodward was born in Geneva, Illinois, and obtained a bachelor's degree from Yale University before serving in the Navy from 1965 to 1970. He became an intern at the *Post* but was not hired as a full-time reporter until 1971, after he gained additional reporting experience working at a suburban Maryland paper. After Watergate, Woodward continued working at the *Post,* later rising to the rank of assistant managing editor. He has also authored a number of other nonfiction books about various Presidents and Washington institutions, including a controversial four-volume series on the presidency of George W. Bush (2001–09).

Conclusion

The job description of today's print reporters is rapidly changing due to the increasing influence of new media. Many in the field of print journalism are now grappling with the merging of print and web-based media, with reporters being asked to blog, chat, and make videos for their publication's websites in addition to their traditional reporting and writing duties. In addition, the growing popularity of web-based news has required reporters to participate in a 24-hour news cycle instead operating by traditional daily, weekly, and monthly deadlines.

Reporters, Radio

In a media era dominated by the alluring speed of immediate breaking news coverage on cable television and the Internet, the relevance of radio reporting is often marginalized. However, radio can be the fastest, most accessible way to hear breaking news. Without the luxuries of visuals and text, radio reporters must work harder and more creatively to take us to the scenes of stories with their vivid descriptions and use of sound. While the numbers of radio reporters are dwindling and news budgets at radio stations continue to shrink, radio reporting remains not just a relevant, but also a vital facet of the journalism landscape.

History

Radio reporting dates to the very beginnings of the medium. One of the first people to read news over the radio was Westinghouse Electric engineer Frank Conrad. He first read newspaper stories over the air in 1919. Westinghouse executive Harry Davis reported election-night results of the presidential race on November 2, 1920, an event often cited as the beginning of regular broadcasting.

In 1930, magazine editor Lowell Thomas initiated his regular network nightly news by reading 15-minute newscasts that were simulcast by NBC to the eastern half of the country and CBS to the western states. The program was called *Lowell Thomas and the News*. Radio reporting developed slowly during the Depression, limited by a "press-radio war" where newspapers tried to limit radio's use of news agency reports. That restriction in mid-decade forced larger stations in major markets to field their own reporters. The news agency restriction faded by the end of the decade. The late 1930s became a defining period for radio reporters, who were soon providing field reporting not just from America but also about the growing political crises in Europe and Asia that would lead to World War II.

CBS hired Edward R. Murrow as a manager of radio talks in 1935. Within a few years, now based in London, Murrow began to build the foundation of CBS News. Starting in 1938 he assembled a remarkable radio news war staff that would eventually include Charles Collingwood, Eric Severeid, William L. Shirer, and Howard K. Smith, among others. Murrow's own reporting often involved significant personal risk. His reports beginning with the words "*This is . . . London"* from London streets and rooftops during the 1940 German Blitz became classics. The combination of his evocative delivery and courageous storytelling encouraged people to listen to radio for news about the war. It was one thing to read about the war in the local newspaper, but thanks to Murrow and his colleagues at both CBS and NBC, American audiences could hear war updates much faster and in more vivid detail. By 1945, radio reporting had become a well-established form of journalism.

In the postwar years, radio news developed along two parallel lines—prestigious network reporting on regular newscasts and documentaries, and local station coverage that relied on news agency reports supplemented with local reporters. Despite the growth of television competition in the 1950s, news remained a mainstay of radio network programming.

In the 1960s, station owner Gordon McLendon and others modernized radio news by adding sound bites and natural sound from speeches,

press conferences, and interviews, in addition to live reporting. This approach, basic to today's radio reporting, came about in part because of the growing competition from television news. Many talented radio reporters migrated to television stations. By the peak of the Vietnam War in the late 1960s, it was dubbed "The Living Room War" as the first conflict Americans watched instead of only hearing it on radio.

In 1970, National Public Radio (NPR) was founded and slowly established itself as a leading intellectual force in American life and a primary source of news for millions. Begun with 30 employees and 90 charter stations, by 2006 NPR was distributed to more than 800 independent public radio stations. With NPR's growing importance and popularity came more job opportunities for radio reporters. Some public radio stations gave more time to reporters to tell their stories, allowing them to produce in-depth investigative reports, as well as educational and cultural features.

By the end of the twentieth century, however, radio reporters on commercial stations had fallen on hard times, thanks to continuing technological changes and increased competition from cable and other television news. Many stations dropped local news reports all together.

The popularity of talk radio is increasing, as it is cheaper to produce and is generally considered to be more entertainment than news. The prevalence of opinion on broadcast airwaves has led to more radio commentators than reporters. Where reporters are expected to tell their stories with a neutral tone to their voice, and stick to straightforward, provable facts, always being extra careful to eliminate any words or statements that can be interpreted by the audience as betraying a bias, radio commentators are expected and encouraged to interpret the news or offer their personal opinions to their listeners.

Relevance of Modern Radio Reporting

When electricity fails, news can no longer be accessed from television or the Internet. Newspapers are filled with yesterday's news. The only battery-powered device to receive live, local information is a radio receiver. In emergency situations, radio has repeatedly proved its significance as an accessible, immediate news source.

During Hurricane Katrina (2005) and its aftermath, for example, radio's accessibility made receivers a crucial lifeline for many stranded by the storm. The portability and cost-effectiveness of radio receivers is unrivalled, not to mention their ability to operate on batteries when there is no other source of power. Thousands of people in New Orleans relied on the constant radio news information provided by the United Radio Broadcasters, a consortium of radio stations in Greater New Orleans, Louisiana, established in September 2005 in response to the desperate need for effective information dissemination during Hurricane Katrina. (The group was disbanded two months later.) Radios were distributed to those evacuated to the Houston Astrodome and a mini-station was established to help people communicate with each other and facilitate family reunions.

In everyday, nonemergency situations, radio news can be an easy way to stay informed of the day's events. Americans spend increasing amounts of time in their cars. As commuting distances and times increase, radio serves as a vital source of news and information. Radio reaches more than 73 percent of Americans every day and over 80 percent of adults in their cars as well as on many cell phones and other digital devices every week. Between 6 a.m. and 6 p.m., more people tune in to radio than any other news source, giving radio 44 percent of their media time.

Changing Radio Reporting

A radio reporter's job traditionally involved digging for stories, investigating leads, and following news tips. He or she researched documents, observed and described events at the scene, conducted interviews, took extensive notes, and recorded ambient sound from the scene. The reporter then organized the material, wrote the script, added the voice-over, edited the interviews into short sound bites, and edited the entire story for broadcast. Radio reporters often composed stories and reported "live" from the scene.

The advent of the commercial Internet in 1995, in addition to a growing variety of digital media options, forced drastic changes in the way radio reporters do their jobs. A radio reporter in 1987 still used a relatively cumbersome analog cassette recorder to gather field audio sound and interviews.

He or she came back to the station to edit the audio tape, using large reel to reel machines, a chinagraph (grease) pencil, and a razor blade.

Two decades later, mini-disc recorders and other small, light, and portable digital machines are used in both field and studio. Newer audio editing hardware enables reporters to record directly to a hard drive, thus eliminating the use of tapes and disks. Radio reporters no longer have to return to the studio to edit, as they can now compile their stories much faster in the field on laptop computers using audio editing software. Cell phones have also revolutionized radio reporting. While it takes time to set up a live television feed to cover breaking news, a radio reporter only needs a cell phone to call from the scene and file a live, on-air report. Thanks to these technological shifts, radio reporting has become more immediate than many other news sources.

International Radio Reporting

In many developing countries, radio is the primary source of news. Literacy rates are often too low for newspaper reading, the subscription costs are too high, and circulation to rural areas is difficult. Television sets are not affordable for many people living in parts of Africa, Asia, and South America. When radio correspondents cover stories on these continents, their jobs are far less complicated than television reporters. The equipment involved in radio reporting is much easier to carry around; a radio reporter only needs a portable recorder, a microphone, and headphones to gather audio for a story concerning even remote villages. On the other hand, transportation logistics and costs, language, and local cooperation are factors hindering any such reporting. The high cost of covering international stories has virtually ended American overseas radio reporting (with the notable exception of NPR) in an era when dwindling news budgets have left few opportunities for radio foreign correspondents.

Industry Trends and Radio Reporting

Deregulation has gradually lifted restrictions on how many stations a single person or company may own. Fewer American radio stations are independently or locally owned, as more are acquired by conglomerate corporations. By 2006, ten companies owned nearly a quarter of all commercial stations. The impact this trend has had on radio news is arguably both positive and negative. Critics argue that radio news has diminished as a result of the consolidation of the 1990s. Hundreds of stations have stopped providing local news. Radio industry defenders argue there is a wider variety of choices and more news, talk, and information on the airwaves than ever before. Larger companies have more financial resources, leading to more advanced field equipment and state of the art studio facilities. Radio reporters working for a major corporation are more likely to progress to stations in larger markets owned by the company and benefit from the better salaries and benefits these companies can provide. Large corporations emphasize profit, however, so there is more pressure on radio reporters to appeal to a wide audience. Many local reporters have lost their jobs due to consolidation, and as a result, the "localism" of radio news has declined sharply. It is more cost-effective for large conglomerates to send generic national and regional news via computerized networks to multiple stations from a central location, rather than fund several smaller local news teams.

The frequency and length of radio news reports have declined in smaller markets, as have the resources to produce radio documentaries. With the exception of NPR and large stations in the top five radio markets (New York, Los Angeles, Chicago, Houston, and Philadelphia), it is rare to hear 15- or 30-minute radio newscasts, or an in-depth radio documentary. The shorter five-minute newscast that is primarily focused on weather and traffic has dominated most radio markets and decimated the staffs of thousands of local radio newsrooms. This demise of the radio newscast and more widespread budget cuts at radio stations across the country has prompted many radio reporters to seek careers in television, at online news organizations, or in print journalism.

One newer form of radio relies on the bypassing of the geographic restrictions placed on terrestrial transmitters. Satellite radio news can be heard anywhere in the country and includes many cable television news networks, public radio news sources such as NPR, and international radio news sources including the British Broadcasting Corporation (BBC). The choice of news services on

satellite is much wider than any given terrestrial market, though satellite news is not free, as monthly subscription fees apply. Its audience (approaching 10 million for XM and Sirius combined in 2007) is far smaller than the nearly 250 million who listen to terrestrial radio stations.

In September 2005, the cell phone carrier Sprint added 20 Sirius satellite channels to its cell phone capabilities. Satellite radio carriers have encouraged such portability of programming. Portable satellite receivers the size of cell phones have been released and provide the ability to store recorded audio. "Plug and play" units allow satellite radio subscribers to move the technology between their cars and their homes using a detachable receiver.

Additional new audio distribution capability is provided by the Internet. Public and commercial radio stations have expanded their terrestrial identities to websites. The Internet serves to partially erase the geographical boundaries of terrestrial radio. A local radio reporter in Casper, Wyoming, may receive feedback e-mails from anywhere if his or her story is on the station's website. Thus the Internet has enhanced the role of a radio reporter from simply covering a local story on the air to providing that material for the website. The Internet also facilitates the researching of stories, the finding and contacting of sources, and the sharing of the final radio story. Radio stories can also be archived online and accessed years after the air date.

Diversity Issues

Radio news reporters have long been and are still primarily white and male. There have been slight variations on this profile throughout the years. According to a study by the Radio Television News Directors Association in 2006, 94 percent of radio news employees were Caucasian, 2.5 percent African American, 2 percent Hispanic, and 2 percent Asian American.

Women make up a quarter of the radio news workforce. Stations in major markets are more likely to utilize women and minorities on their staffs. But radio news is far less diverse than television. Noncommercial radio stations are more likely to have diverse news staffs than do their commercial counterparts, and stations in the Northeast are more likely to use minorities than other U.S. regions.

Representative Radio Reporters

John Burnett (1956–)

Prior to joining NPR in 1986, Burnett was based in Guatemala City for United Press International covering Central America conflicts. From 1979 to 1983, he was a general assignment reporter for various Texas newspapers. His reports are heard regularly on NPR's award-winning newsmagazines *Morning Edition, All Things Considered,* and *Weekend Edition*. Burnett has decades of experience covering a wide variety of war correspondence, international news, and longer format investigative radio reporting. In the months following the attacks of September 11, Burnett filed reports from New York City, Pakistan, and Afghanistan. He has extensively examined national issues such as illegal immigration, which have included controversial stories on corruption among federal immigration agents on the U.S.–Mexico border.

Charles Collingwood (1917–85)

Collingwood was a protégé of Edward R. Murrow during World War II. He became well known for his articulate and descriptive accounts of the war. He was part of a distinguished group of pioneering broadcast journalists called "Murrow's Boys" that included Eric Sevareid, Larry LeSueur, Winston Burdett, and Richard C. Hottelet. Collingwood was instrumental in expanding international news coverage at CBS. He eventually transitioned to television and became chief correspondent and hosted the news series *Eyewitness to History*.

Anne Garrels (1951–)

Garrels served as ABC's Moscow bureau chief and correspondent from 1972 to 1982. From 1984 to 1985 she covered the State Department for NBC News and was the network's Central American bureau chief. With NPR since 1988, Garrels is a senior foreign correspondent. She has covered Iraq under Saddam Hussein, as well as the 2003 U.S. invasion and its aftermath. She earned international recognition in 2003 by being one of 16 U.S. journalists to remain in Baghdad during the initial phase of the war.

Max Jordan (1895–1977)

In 1934, Jordan joined NBC radio to coordinate the network's coverage of news events in Europe. With his extensive contacts in Europe, Jordan soon established himself as NBC's main European news correspondent between 1935 and 1937. He was known for taking reporting risks such as venturing into the crater of Mount Vesuvius, or onto the airship *Hindenburg* for its maiden flight to New York in 1936. He continued to provide energetic reports throughout World War II for NBC, returning to Europe in early 1945, where he began contributing reports to the NBC *World News Roundup*. Jordan was the first to broadcast that the Japanese Government had surrendered. It was the biggest scoop of his career.

William L. Shirer (1904–93)

Shirer was one of the first radio war correspondents hired by Edward R. Murrow in 1937. He had just been fired by the International News Service when he met Murrow, who offered him a radio job despite his lack of experience with the medium. Shirer accepted even though he did not feel he had the voice for broadcasting. Murrow's boss was also skeptical, but Murrow prevailed and his instinct for spotting radio news talent was proved accurate, as "The Murrow Boys" eventually became famous for their war reporting.

Shirer's reporting for CBS during the first year of World War II was outstanding. He was an enterprising and witty reporter who gave his audience perceptive accounts of what was happening to the people of Europe, especially Germany, in light of Hitler's rise to power. As Nazi influence increased, Shirer had to take a more cautious approach to reporting the news. In 1940, he returned to New York where he began reporting news and commentary on his own CBS news program. He left CBS in 1947 and began working on several books detailing his own experience (*Berlin Diary, The Rise and Fall of the Third Reich*) in Germany.

Robert Trout (1909–2000)

Trout began broadcasting in 1931 as an announcer at an Alexandria, Virginia, station. He may have been the first person to report live congressional hearings, to transmit from an airplane, and is regarded by some as the first to broadcast a daily news program. In the mid-1930s, Trout established the value of addressing the radio audience intimately, as if the announcer were personally addressing each audience member. He was one of broadcasting's first true anchormen and reporters on CBS. He reported news, special events and entertainment programs at CBS from 1932 to 1948. Trout anchored the network's live D-Day coverage in 1944 and announced the end of World War II.

Faye Gillis Wells (1908–2002)

Wells was a pioneer of overseas radio broacasting. She first reported from Latin America for NBC in 1938. She covered numerous global conflicts, including the Italian-Ethiopian war, riots in Syria, and the diamond trade in Angola during World War II. She moved to Washington in 1963 to open the Washington News Bureau for Storer Broadcasting Company. From 1964 to 1977, she served as Storer's White House correspondent. She was the first female broadcaster accredited to the White House, and one of three women reporters chosen to accompany President Nixon to China in 1972.

Conclusion

Radio reporters have long played an important role in news, diminishing only as their medium gave way to competition from newer services. By the early twenty-first century, the few radio reporters left enjoyed the use of vastly more capable and user-friendly field equipment. Although the amount of radio news declines year by year, the fundamental efficiency of the informational service provided by the radio reporter has not changed since the inception of the medium.

Reporters, Television

In the 60 years since regular television news programs began, the broadcasting—and more recently cable news—networks and local stations have utilized the services of hundreds of reporters. At first, virtually all of them were white men. This entry describes American station- and network-level reporting, especially the latter.

Origins

Just as radio journalism was slow off the mark, television news was also slow to develop, though for different reasons. Based on radio's experience leading up to and during World War II, broadcasting had a clear and important news role to perform. But television was infinitely more complex—and costly—and the initial focus on developing the visual medium focused on entertainment to build audience and advertiser support. News was present at the beginning on the network level, but played only a minor role in overall time on the air.

Television's initial reporters were most often those who had worked in radio and thus were used to working against short deadlines and thinking and adjusting while on the air. They did have to retrain, in a sense, to accommodate the camera, since now visual images counted at least as much as words. Some early reporters were brand new to broadcasting (most often from newspaper reporting positions), and would thus learn the ropes on a medium that few initially watched. Yet while a radio reporter would often cover a story on his own, no television reporter could "do" a story justice without a camera operator and quite possibly a sound technician as well. Such a team was naturally more expensive—in terms of both salary paid and the equipment needed—than was radio, and cost became a vital aspect of television reporting from the beginning.

Indeed, the earliest network newscasts (NBC began the first regular one in early 1948) were little more than televised newsreels, making use of news photography by others as the networks lacked their own dedicated reporters. Partly because of this very lack of reporting personnel, pictures increasingly defined what was news—dramatic photos or film often dictated what stories got on the air at both local stations and the networks.

Only slowly in the early 1950s did network news divisions begin to consider television reporting a serious and viable journalistic option. As Edward R. Murrow of CBS put it in 1951 when beginning his *See It Now* weekly documentary series, he was part of an old radio team learning a new trade. By mid-decade, television news growing pains were still the topic of constant debate and worry. Should pictures drive reporter's stories? Could networks allow television reporters to develop their own specialization or "beats" as had long been the case with print?

In 1963, both CBS and ABC expanded their evening newscasts to a half hour (ABC only

followed in 1967), thus doubling their need for on-air reports—and thus reporters to provide them. Nor were evening newscasts the only consumer of reporters' efforts. Network documentaries experienced something of a golden age in the 1960s, demanding the dedication of teams of reporters and technicians to get their stories on the air. The growing Vietnam War provided another training ground for television reporters in a foreign environment.

Reporting Technology

The microphone was of course the earliest and most significant technology for reporters. Many early television reports consisted of disembodied voices narrating news film. The "talking head" became a staple—and the bane—of early television, as reporters and interviews subjects were shown in static sets. Necessary pictures were either stills, or 35mm film, which required hours of developing and editing before airtime.

Political convention coverage by the three networks (and a few major market stations) offers a useful window onto the changing definition of "portable" reporting technology. Coverage of conventions in 1948 and 1952 was largely restricted to reporter microphones from the floor and television camera pictures from the network booths or other static locations. Photos of floor reporters in the 1950s makes clear just how difficult their job was given the bulk and weight of both sound and motion picture film equipment. Reporters can be seen carrying heavy backpacks of equipment and batteries. Moreover, film had to be developed before it could be aired. By the 1960s, convention coverage—then still provided for hours each day—showed reporters with far more streamlined film cameras and microphones, no longer as weighed down by the tools of their trade. The first video camcorders, however, appeared only in the early 1980s.

Reporters found their jobs affected by several technologies. Videotape appeared in 1956, though bulky initial equipment was useful in the studio more than in day-to-day reporting. Only in 1974 did portable videocassette recording appear, slowly eliminating the need to develop and edit film. Microwave links allowed remote reporting, sometimes on a live basis. All of this meant that an evening station or network newscast could be far more current—with some video arriving only an hour or so before airtime.

Development of satellite newsgathering equipment as well as increasing automation in the 1980s began to transform the role of the television reporter. These technologies made it easier to more quickly get good pictures and sound to stations and networks alike.

Competition

Broadcasters overcame some traditions slowly, especially the hiring of women and ethic minorities to serve as reporters. What had been a white male preserve into the 1970s (with a handful of exceptions) slowly began to more closely resemble the country's population profile by the 1980s and in the years since.

At the same time, what had once been clearly distinguishable local and national television news reporting began to meld together. This was partly a matter of technology—tape, satellite, and digitalization made it easy to obtain and distribute national and world news reports to local stations. Stations expanded their news as advertisers became more supportive, and in some major markets the early "evening" news block extended from 4 p.m. to 7 p.m. or later. While this opened up huge demand for more reporting content, some of this demand was met with syndicated material, while another trend was toward softer more feature-driven reporting on both station and network newscasts.

As local news increased, national reporting declined. The slow demise of network documentary programs began in the 1970s, and accelerated after the rise of cable news services in the 1980s.

Indeed, cable has provided a growing employment base for reporters. The rise of dedicated cable news and documentary networks has offered reporters more options—and encouraged more shifting by reporters across different networks. Gone is the pattern of a life's work at a single network. For several decades, it has been common for reporters to shift from one network to another, across the cable-broadcast divide.

Some Noted Television Reporters

What follows provides a sample of better-known American network reporters, past and present,

intended to describe something of their various career paths and accomplishments.

Christiane Amanpour (1958–)

Christiane Amanpour grew up in Iran and began her career at CNN in 1983 as an assistant at the fledgling network's international news desk. She was serving as a foreign correspondent in Germany in 1989 as the wall dividing east and west came down. She moved on to report the 1990–91 Gulf War and then more extensively covered the various Balkan wars of the mid-1990s. Based in London, she became the cable news network's chief foreign correspondent, noted for obtaining hard-to-get interviews with various national leaders. She has won nine Emmys among many other journalism awards for her reporting.

Peter Arnett (1934–)

Peter Arnett grew up in New Zealand and began his reporting career in 1957 in Southeast Asia where he worked for the Associated Press and won a Pulitzer in 1966. He joined CNN in 1981 when the network was barely a year old, first covering the White House and then a series of war fronts in Central America and the Middle East. He rocketed to national recognition on the strength of his 1991 reporting from Baghdad, then under air attack by U.S. forces, and from which most other Western reporters had been expelled. For more than six weeks he was able to get his live video reports out by using new portable television equipment. But seven years later, he tarnished his reputation with a series of reports for CNN and *Time* magazine alleging that the United States had employed gas warfare during the Vietnam War. Later investigations could not support that claim.

Ed Bradley (1941–2006)

Ed Bradley became best known to American viewers as part of the CBS *60 Minutes* team of reporters in the 1980s and 1990s. He began life as a teacher of mathematics in elementary schools. In the 1960s, he broke into radio, first in Philadelphia and then New York. After a year or so as a network stringer for CBS, he became a full-time foreign correspondent in Southeast Asia for the network, one of the first African Americans to perform such a role. He was one of the few Americans still reporting there as communist forces surged to victory in 1975. He became the network White House correspondent and then anchor of the network's Sunday evening news program. His next role was as a reporter in the *CBS Reports* documentary series for which several of his assignments garnered him journalism awards. In 1981 he replaced Dan Rather on *60 Minutes*, where he served out his career, earning several Emmys among other awards.

Charles Collingwood (1917–85)

Charles Collingwood was one of the famous "Murrow Boys" of World War II. He left a Rhodes Scholarship at Oxford University in 1940 to take up journalism, first reporting for United Press from London. He was but 23 when Edward R. Murrow hired him in 1941 and went on to cover the North African fighting in World War II (winning a coveted Peabody award just two years later). On his return to the United States in 1946, he was assigned to the new United Nations but spent much of his time in the 1950s and 1960s as an urbane foreign correspondent for CBS radio and then television. He was perhaps best known to many Americans for hosting a televised tour of the White House with Mrs. John F. Kennedy in 1962, but he far preferred foreign reporting and was active in Europe and the Far East.

Nancy Dickerson (1927–97)

Nancy Dickerson started out working as a Milwaukee public school teacher, then as a researcher for a U.S. Senate committee. She joined CBS in 1954 as a producer and in 1960 was the first female correspondent hired by CBS News. Obtaining a television interview with then–House Speaker Sam Rayburn (when nobody else could) opened doors. Switching to NBC in 1963, Dickerson became the first woman floor reporter at a presidential convention (1964) and the first to anchor a daily network news program. She left to be an independent producer in 1970 and hosted a syndicated daily news program, also producing programs for public television. Her final television post was as a news commentator for Fox News from 1986 to 1991.

Sam Donaldson (1934–)

Sam Donaldson was long featured on ABC television news, known for sometimes biting questions in interviews. Like many television reporters, he began in radio (in southern California) while still doing graduate work in college. His television work began in 1959 at the CBS affiliate station in Dallas, and then in Washington, D.C. He joined the ABC network in 1967 just as it began to catch up with its two older competitors. He began as ABC's congressional correspondent, followed by a dozen years (until 1989) as White House correspondent. For much of that period he was also anchoring the network's Sunday evening newscast, though he was probably best known for his firm (some would say hectoring or aggressive) interviewing style. He went on to anchor ABC's *PrimeTime Live* until 1998, and other interview programs into the early 2000s.

Fred Francis (1945–)

Fred Francis served for more than three decades with NBC. He began by opening the network's news bureau in Miami in 1975, and from there covering political and military crises throughout Central America. For most of his time at NBC, Francis focused on national security, military, and diplomatic issues. He served as a White House correspondent. After the 9/11 attacks, he joined the network's terrorism task force, and over three months reported from Washington, Islamabad (Pakistan), Hamburg, London, Damascus, and Tel Aviv. He was NBC's principal reporter during the 1990–91 Gulf War, especially from the Pentagon. After the war, Francis worked for three years as the senior correspondent for *Dateline NBC,* before returning to reporting for the network's evening news. He retired late in 2004.

Pauline Frederick (1908–90)

Pauline Frederick was the first women to become a fulltime network television reporter, slowly overcoming a strong network bias against women on the air by doing her own stories. She worked first for a Washington, D.C., newspaper and then shifted to NBC as a radio interviewer. In 1945 she left the network to again report for newspapers, this time for an alliance of papers for which she covered the Nuremberg war crimes trials in 1946 to 1947. She did freelance reporting for the new ABC network and joined them fulltime to cover the United Nations beginning in 1948. In 1953 she returned to NBC, remaining on the UN beat for another two decades. After her retirement in 1974 she turned to news analysis for National Public Radio, and was the first woman to moderate a debate among presidential candidates in 1976.

Bob Jamieson (birth date unknown)

Bob Jamieson began a local station anchor and reporter in St. Louis and then in Chicago, before joining NBC in 1971 where he was first assigned as a national correspondent in the Chicago bureau. He went on to become White House correspondent from 1975 to 1978, and later worked on assignments in London and as a senior national correspondent based in New York. He reported extensively from the Middle East beginning with the 1973 Yom Kippur war and subsequently the 1982 conflict in Lebanon, reporting from Iran, Syria, Jordan, Saudi Arabia, and Iraq. In 1990, he joined ABC in New York and continued his wide variety of both reporting activities with some anchoring.

Marvin Kalb (1930–)

Marvin Kalb served most of his television reporting career as a diplomatic correspondent for CBS and then NBC. He was working toward a Ph.D. at Harvard when Edward R. Murrow hired him at CBS, first as a night desk reporter, but by 1960 as Moscow correspondent (he speaks Russian). He shifted to Washington in 1963 as the network's chief diplomatic reporter, continuing his focus on Soviet affairs, and authoring several journalistic books. In 1980 he shifted his diplomatic reporting to NBC and also moderated the Sunday talk program, *Meet the Press*. After retiring from network reporting, he became the first director of the Shorenstein Center on the Press, Politics, and Public Policy at Harvard, serving for a dozen years until 1999. By the early 2000s, he was hosting *The Kalb Report* news interviews from the National Press Club in Washington.

Charles Kuralt (1934–97)

Charles Kuralt became both famous and beloved for his long-running series of "On the Road" reports for CBS News. He was born and grew up in North Carolina and entered journalism as a newspaper reporter there. He joined CBS as a radio news writer in 1957 and just two years later became the youngest person ever to be a CBS correspondent. After years reporting from both the United States and overseas (he was first based in Rio de Janeiro, then Los Angeles and later New York), he began his "On the Road" reports in 1967, rambling the country in a large motor home and focusing on offbeat locations and people, usually far from major cities. He had an innate ability to narrate a story in a warm and folksy fashion and eventually did so from every one of the 50 states. He later anchored the network's *CBS Sunday Morning* for 15 years. He retired in 1994, having won almost every broadcast journalism award there is.

Andrea Mitchell (1946–)

Andrea Mitchell became one of the best-known women reporters in network television. She began her television journalism career on Philadelphia and then Washington, D.C., stations, before joining the NBC network in 1978. Mitchell served as White House correspondent during the Reagan administration (1981–89), then as congressional correspondent before returning to the White House beat in 1992 to 1994. In 1994 she was named as the network's chief foreign affairs correspondent. Widely traveled, she is one of the most visible faces on the NBC evening newscast.

Roger Mudd (1928–)

Roger Mudd began his journalism career as a newspaper and radio reporter in Richmond, Virginia in 1953. After working for a Washington, D.C., radio station, he joined CBS in 1961, reporting from Capitol Hill. He often served as substitute anchor for Walter Cronkite, but when he was passed over as his replacement, Mudd left for NBC in 1981, where he briefly worked as co-anchor with Tom Brokaw. He reverted to being senior political correspondent in 1983. Mudd was known for polite but insistent interviewing, especially of presidential candidates. In 1987 he left the network and began contributing essays to the Public Broadcasting Service. His final role was as a host on the History Channel. Mudd retired in 2004.

Edward R. Murrow (1908–65)

Edward R. Murrow was the early leader of CBS radio news and hired the team of "Murrow Boys" that reported so much of World War II in Europe. After the war he became effective head of CBS news during the network's early transition to television, though he always preferred radio and continued to service that medium well into the 1950s. He reported the televised presidential nomination conventions from 1948 through 1956, in concert with others. Working with producer Fred Friendly, he also provided important documentary reporting for television in the *See It Now* series of the 1950s, for which "Harvest of Shame" (1959) was his last major production before departing CBS to head the U.S. Information Agency under President Kennedy.

Lisa Myers (1952–)

Lisa Myers broke into journalism (after three years with the Bureau of National Affairs in Washington) as a reporter for a Chicago newspaper in the late 1970s, and then for a Washington, D.C., daily. She joined NBC News in 1981 and focused on political reporting, both at presidential nominating conventions and from Capitol Hill. In 2002 she was named to head the network's investigative reporting unit.

Brian Ross (1948–)

Brian Ross began his professional career in 1971 as a television reporter in Waterloo, Iowa, later working in Miami and Cleveland. He served as a network correspondent for two decades with NBC and began his investigative reporting there before joining ABC in mid-1994. He is the chief investigative correspondent, reporting extensively for all of the network's news programs.

Tim Russert (1950–2008)

Tim Russert completed law school and went to work in a senator's office before joining the staff

of New York's governor. He was hired by NBC in 1984 to work in its Washington bureau, and rose to be bureau chief in 1988. He has been especially active reporting political news, is credited by some for the "red" and "blue" state designations, and became famous in the 2000 campaign for using his low-tech but clear white board to underline key political and voting trends. Russert served as the host of *Meet the Press,* the Sunday morning political talk/interview program, from 1991 until his untimely death in 2008.

Daniel Schorr (1916–)

Daniel Schorr is the last member of the "Murrow" team still active in journalism in the early 2000s. He began as a freelancer for two newspapers during the 1940s and up to 1953 when he joined CBS News. He opened the network's Moscow bureau two years later. Much of his reporting into the 1960s was from Europe. He returned to the U.S. and domestic political reporting in 1966, but after a series of controversies over some of his reports (and several Emmys, it should be noted as well), he left CBS in 1976 and in 1979 was one of the first reporters hired for the new CNN news service, reporting until 1985, when his contract was not renewed. Working past his ninetieth birthday, Schorr has spent his latter years with National Public Radio as a senior news analyst and commentator.

Jake Tapper (1969–)

Jake Tapper began, as had so many of his forebears, as a print reporter. Tapper joined ABC News in mid-2003 and became the network's senior national correspondent three years later. Based in the network's Washington, D.C., bureau, he covers Capitol Hill and served as ABC News's senior political correspondent during the 2008 elections. Seen almost daily, Tapper contributes regularly to *Good Morning America, Nightline, World News with Charles Gibson* and others.

Sander Vanocur (1928–)

Sander Vanocur grew up in Ohio but started reporting in London, writing for the *Manchester Guardian* and providing some material for the BBC's North American service. By 1955, he was in New York working for *The New York Times*. He joined NBC News two years later, serving, among other roles, as White House correspondent. He reported for a variety of network programs and hosted the television magazine *First Tuesday*. In 1971 he shifted to the new Public Broadcasting Service as a senior correspondent for its developing news operation. Two years later, he turned to teaching and consulting, followed by two years at *The Washington Post*. He joined ABC News in 1977 and worked as a convention floor reporter for the 1980 and 1984 elections. He turned to foreign correspondence in 1981, first covering the State Department, then reporting from Buenos Aires. He left in 1991 to form his own consulting firm.

Chris Wallace (1947–)

Chris Wallace followed his father into the television reporting business, beginning at a Boston station as he finished his Harvard education. He then joined NBC's flagship New York station as an investigative reporter, and began serving as a Washington correspondent for the network's evening news in 1981. He varied duties as a weekend news anchor and reporter before joining ABC News in 1989 as a senior correspondent for the *PrimeTime Live* news magazine and occasional host for *Nightline*. In 2003 he shifted allegiance again, joining Fox News as a reporter and occasional anchor.

Mike Wallace (1918–)

Mike Wallace began his career as a radio announcer in Grand Rapids, Michigan, in 1939, then served as a radio news writer and reporter in Chicago in the early 1940s. He first broadcast for CBS in 1951 in various feature and entertainment programs but helped cover the 1952 elections as well. After years of reporting and anchoring feature and interview programs (especially *Night Beat* from 1951 to 1955), and a brief period in the late 1950s working for ABC and doing syndicated programs, he became a full-time CBS correspondent in 1963. He melded reporting work with anchoring daytime news programs for the network. Five years later, he was the original reporter on the new *60 Minutes* weekly news magazine program, a role he

continued until his retirement in the middle part of the first decade of the 2000s.

Judy Woodruff (1946–)

Judy Woodruff began as an Atlanta television station news anchor before serving as NBC's chief White House correspondent from 1977 to 1982, and then covering Washington for the *Today* show. In 1984 she shifted to public television, serving as co-host of PBS's documentary series, *Front Line,* while also reporting Washington events for the *MacNeil-Lehrer Report*. From 1993 to 2005, she hosted CNN's *Inside Politics*. She returned to public television (and radio) a year later, doing both documentaries and regular reporting.

Conclusion

An important reporting trend in television news reporting has been the steady network decline of foreign correspondence. Where once the major television networks retained numerous overseas bureaus, and some reporters stayed on station for years, developing deep expertise of their parts of the world, such operations became too costly to maintain as the news business grew more competitive. Cable news services have taken up some of this, but there are far fewer American television reporters working full-time overseas in the early twenty-first century than a half century before.

Reporters' Organizations

Journalists are joiners. It is the rare reporter, writer, editor, or publisher who is not a part of some journalism organization. This seems especially true when you scan the number of different groups that cater to almost any conceivable writing interest—or the varied ethnic backgrounds of news people. They all share several attributes: providing a basis for exchange of views (conferences and, more recently, websites), educational features (workshops, scholarships), publications (sometimes online), and various awards to recognize superior performance. Some take on advocacy roles, especially with Washington, D.C.–based policymakers. Virtually all are nonprofit in nature.

This entry is one of several that briefly describe selected journalism organizations (there are too many to include all, and they come and go over time), so readers should also check additional organizational categories noted under "see also." What follows is based closely on information in the association websites.

General

A number of organizations appeal to writers and reporters across the board, without reference to specific subject areas covered or type of publication.

American Society of Journalists & Authors

Founded in 1948, the American Society of Journalists and Authors (ASJA, http://www.asja.org) is an organization of independent (generally meaning freelance) nonfiction writers with a membership of more than 1,100 writers of magazine

articles, trade books, and many other forms of nonfiction writing. Members share information on writing rates, publishing contracts, editors, agents, and more. Nonmembers can benefit from ASJA's "contracts watch" newsletter, an annual writers conference, and writing resources. Editors and others can search the membership to hire experienced authors and journalists (with links to their websites and blogs, among other things).

Association of Young Journalists and Writers

The Association of Young Journalists and Writers (AYJW, http:///www.ayjw.org) was established as the Association of Young Journalists, a successor to the Forum of Young Journalists, which had been created in 1981. Soon after its formation, the association added "and Writers" to include a wider range of members. The association works largely online to further its mission of helping young writers and journalists get started publishing in the media. A writer submits material to the website which, upon editorial approval, will be available for newspapers, magazines, publishers and other media to review. How this actually works in progress is not clear from the website.

Editorial Freelancers Association

The Editorial Freelancers Association (EFA, http://www.the-efa.org/index.html) grew out of a book publisher strike in the early 1970s and by 1976 had about 100 members. It opened a New York office in 1979 and hired an office manager six years later as the organization continued to grow. Various affinity groups—those working in specific subject fields—began to form in 1989, and the first regional chapters appeared in 1997. Run almost entirely by volunteers, EFA members work in 45 states and in Canada, England, France, India, Ireland, Israel, and Japan.

National Conference of Editorial Writers

Founded in 1947, the National Conference of Editorial Writers (NCEW, http://www.ncew.org) exists to improve the quality of opinion journalism, meaning (primarily) editorial pages and broadcast editorials, and to promote high standards among opinion writers and editors. Members participate in writing and broadcast critiques, an annual convention, seminars and workshops, the NCEW job bank, *The Masthead* magazine, regional conferences, foreign tours, and an e-mail discussion group.

National Society of Newspaper Columnists

The National Society of Newspaper Columnists (NSNC, http://www.columnists.com) was formed in 1977 to promote professionalism and camaraderie among United States and Canadian newspaper columnists, including general interest, humor, op-ed, and other niche columnists. Academics and student columnists also are eligible to join. An annual conference is NSNC's primary event. By 2000, the NSNC, then with its own website, had outgrown its volunteer base and hired a professional administrator. NSNC also publishes a bimonthly newsletter and advocates for columnists and free press issues as necessary.

Society of Professional Journalists

The Society of Professional Journalists (SPJ, http://www.spj.org) is dedicated to encouraging the free practice of journalism and high standards of ethical behavior. Founded in 1909 as Sigma Delta Chi, SPJ promotes the free flow of information through the daily work of its nearly 10,000 members; works to inspire and educate current and future journalists through professional development; and seeks to promote First Amendment guarantees of freedom of speech and press through advocacy efforts. *The Quill,* the society's magazine, first appeared in 1912, and its initial code of ethics followed in 1926. In 1960, the group converted from a fraternity to the present professional society, the first women were admitted in 1969, and the SPJ name was adopted in 1973.

Specialty Interest

There are a growing number of affinity groups for writers and reporters working specific beats or subject areas. Here are some of them.

American Medical Writers Association

The American Medical Writers Association (AMWA, http://www.amwa.org) was founded in

1940 (as the Mississippi Valley Medical Editors Association) to assist medical authors, taking its present name in 1948. Its mission is to promote excellence in medical communication and to provide educational resources in support of that goal. The more than 5,000 members from around the world include a variety of medical communicators, including reporters and publishers as well as journal editors.

Members work for pharmaceutical companies, universities and medical schools, hospitals, nonprofit organizations, government agencies, journals, and many other businesses and organizations. Many work as freelance writers and editors.

Association of Health Care Journalists

Formed in 1998, the Association of Health Care Journalists (AHCJ, http://www.healthjournalism.org) held its first conference two years later. In 2002 it published a reporter's guide to health care and granted its first awards for journalistic excellence in 2005. By 2007, there were more than a thousand members. AHCJ is dedicated to advancing public understanding of health care issues. Its specific mission is to improve the quality, accuracy, and visibility of health care reporting, writing, and editing.

Garden Writers Association

The Garden Writers Association (GWA, http://www.gardenwriters.org) comprises book authors, staff editors, syndicated columnists, freelance writers, photographers, landscape designers, television and radio personalities, consultants, catalog publishers, extension service agents, and others. It provides the usual media organization range of activities—conferences, educational options, publications, a job bank, and more—all focused on some aspect of gardens and gardening.

International Association of Obituarists

Since 1999, the International Association of Obituarists (IAO, http://www.obitpage.com/index.html) has held national and international obituary writers' conferences. These have generated a worldwide network of writers and readers interested in the art and importance of the newspaper or magazine obituary. The writing of such mini-biographies, often under tight time constraints, is something of an art that the IAO promotes.

National Association of Science Writers

In 1934 a dozen science reporters established the National Association of Science Writers (NASW, http://www.nasw.org) at a meeting in New York. They wanted a forum in which to join forces to improve their craft and encourage conditions that promote good science writing. The association was formally incorporated in 1955 with a charter to "foster the dissemination of accurate information regarding science through all media normally devoted to informing the public." Over the years, its officers have included both freelancers and employees of most of the major newspapers, wire services, magazines, and broadcast networks (an a few larger stations) in the country. Above all, NASW is concerned about the free flow of science news.

National Education Writers Association

Founded in 1947, the National Education Writers Association (EWA, http://www.ewa.org) is the national professional organization of education reporters, originally organized by a group of newspaper reporters with the intent of improving primary, secondary, and higher education reporting. EWA has more than 1,000 members in the United States and Canada, including reporters from both print and broadcast media. Associate members include school and college public information officers and writers who work for educational institutions and organizations.

New York Financial Writers Association

The New York Financial Writers Association (NYFWA, http://www.nyfwa.org) is the nation's oldest organization devoted to business and financial journalism. When it was founded in mid-1938, only financial (not business) writers with three years' experience on recognized newspapers and wire services were eligible to join. In 1945 the association began to admit business writers as associate members—with considerable resulting controversy due to tension between "financial" and "business" reporters. Three decades later, in

1975, the association admitted women to membership (with no controversy save that it had taken awhile). Since then, hundreds of journalists from both legacy and new media news organizations have become active.

Religion Newswriters Association

The Religion Newswriters Association (RNA, http://www.rna.org) is the only association for journalists who cover religion in general circulation news media. The website is huge and offers in-depth resources on most religions of the world. RNA was founded in 1949 to advance the professional standards of religion reporting in the secular press as well as to create a support network for religion reporters.

Society of American Business Editors and Writers

Headquartered at the Missouri School of Journalism at the University of Missouri–Columbia, the Society of American Business Editors and Writers (SABEW, http://www.sabew.com/news/home.htm) was founded in 1964. In 1990, it began offering institutional memberships, and business staffs at major newspapers, business journals, business weeklies, wire services, online publications, and broadcast outlets are members. By the early 2000s it served some 3,200 business journalists, largely in North America.

Society of Environmental Journalists

The Society of Environmental Journalists (SEJ, http://www.sej.org) was founded in 1990 by a small group of reporters, editors, and producers working for the Philadelphia *Inquirer, USA Today,* Turner Broadcasting, Minnesota Public Radio, and *National Geographic.* SEJ's membership now includes more than 1,300 journalists and academics working in every type of news media in the United States, Canada, and some 30 other countries. SEJ provides support to journalists in any medium in their efforts to cover complex issues of environmental responsibly. SEJ also seeks to raise awareness among editors, news managers, publishers, and other key decision-makers in news media on the importance of environmental news reporting.

Minority Journalists

Over the past several decades, groups have developed for reporters of most ethnic and other minority groups.

Asian American Journalists Association

The Asian American Journalists Association (AAJA, http://www.aaja.org) was founded in 1981 by a few Asian American journalists who felt a need to encourage more Asian American and Pacific Islanders to pursue journalism at a time when there were few of them in the media. AAJA owes its founding to the vision of a small group of Los Angeles journalists. AAJA's expansion into a national organization came in 1985 with the formation of additional chapters. With approximately 2,000 members in 20 chapters across the United States and Asia, AAJA's largest memberships are generally concentrated in metropolitan areas.

National Association for Multi-Ethnicity in Communications

The National Association for Multi-Ethnicity in Communications (NAMIC, http://www.namic.com) was founded in 1980 and advocates for multiethnic diversity in employment in both the media and telecommunications industries. It has about 1,500 members in its 17 nationwide chapters.

National Association of Black Journalists

The National Association of Black Journalists (NABJ, http://www.nabj.org), the nation's largest organization of journalists of color, was founded by 44 men and women in late 1975 in Washington, D.C. NABJ held its first convention in 1976 at Texas Southern University, the first black school of communications in the West and the second only to Howard University. Many of NABJ's 3,300 members also belong to one of the dozens of professional and student chapters that serve black journalists nationwide. NABJ is committed to strengthening ties among black journalists and sensitizing all media to the importance of fairness in the workplace for black journalists. (See Volume 5, Section II for the association's code of ethics.)

National Association of Hispanic Journalists

The National Association of Hispanic Journalists (NAHJ, http://www.nahj.org/home/home.shtml) traces its roots to 1982, when the first National Hispanic Media Professionals Conference was held in San Diego, though NAHJ was not formed for two more years and held its first convention in 1990. It has sought to increase journalism employment of Hispanics. NAHJ has approximately 2,300 members, including working journalists, journalism students, other media professionals, and journalism educators.

National Lesbian & Gay Journalists Association

Founded in 1990, the National Lesbian & Gay Journalists Association (NLGJA, http://www.nlgja.org) is an organization of journalists, media professionals, educators, and students that works within the news business to foster fair and accurate coverage of LGBT issues. NLGJA opposes all forms of workplace bias and provides professional development for its members. NLGJA works to enhance the professionalism, skills, and career opportunities for LGBT journalists and to strengthen the identity, respect, and status of LGBT journalists in the newsroom. Membership had grown to 1,300 in 24 chapters by 2005.

Native American Journalists Association

What became the Native American Journalists Association (NAJA, http://www.naja.com) began in 1983, when 30 Native American journalists met at Pennsylvania State University to assess the state of the Native media and to discuss ways to nurture and develop Native communications. A meeting the next year in Oklahoma created the Native American Press Association. The name was changed in 1990 to better reflect the organization's broader goals and the inclusion of radio and television professionals. The NAJA serves some 600 Native members with programs designed to enrich journalism and promote Native cultures.

South Asian Journalists Association

The South Asian Journalists Association (SAJA, http://www.saja.org) was formed in 1994 with 18 members and was incorporated in New York two years later. SAJA provides a networking and resource forum for journalists of South Asian origin and journalists interested in South Asia or the South Asian Diaspora. SAJA's mission also includes acting as a resource to facilitate and promote accurate coverage of South Asia and South Asians in North America.

REUTERS

Based in London and with offices around the world, Reuters (as of 2008, Thomson Reuters) is one of the world's oldest news agencies and for much of the twentieth century was one of the four or five most important global news services. By the early 2000s, however, it had refocused into a financial services entity, however, and only about ten percent of its income was derived from news communication.

Origins

Paul Julius Reuter (1816–99), was born as Israel Beer in Cassel, son of a rabbi, and grew up in Aachen, Germany on the border with Belgium

and the Netherlands. Some time after his father's death in 1829, he gave up his Jewish heritage and name (as did many others due to rife anti-Semitism), though it is not clear how he chose his new name. After working as a printer and bookseller in Berlin, in 1848 he worked briefly as a translator for the new Havas news service in Paris (he may have replaced Bernard Wolff who was soon to begin his own news service in Germany). He briefly operated his own small news service in Paris before it failed and he returned home.

In Aachen he initiated a news and stock price information service (the "Institute for the Promotion of Telegraphic Dispatches") that communicated to different cities using a combination of telegraph cables (the line to Berlin had opened in 1849) and a fleet of carrier pigeons (eventually some 200 birds) that often saved time over train schedules from Brussels, which was linked by telegraph to Paris. Reuters was not the first to use pigeons—Havas had done so in Paris and elsewhere—but his application became the best-known example of the "pigeon post." Reuter sent his birds by rail to Brussels and they then flew back to Aachen the following day (faster than the train would allow) with tiny capsules containing news reports. From Aachen, the news was telegraphed east to Berlin. In 1851, the telegraph link to Aachen was completed and the pigeons were no longer needed.

Moving to London in mid-1851 to be at the center of world news and financial communication, Reuter opened an office close to the Royal Exchange, and the main telegraph offices. From his "Submarine Telegraph" office he began to transmit stock and agricultural market quotations and business news between London and Paris utilizing the new Dover-Calais undersea telegraph cable which opened for service a month later. As the telegraph network gradually extended across Europe, Reuter opened offices in other cities. It took several years for him to break into the tightly knit British newspaper market. He finally signed an agreement with *The Times* in 1858 to carry American news—but the first transatlantic telegraph cable on which the deal depended failed in a few weeks and would not be replaced until after the American Civil War. Instead, Reuter initialed agreements with competing papers to bring them news from the Continent. By late 1858, he was serving many British papers, including *The Times,* with breaking European news. And "news" had expanded beyond politics and war to include science, literature, religion, and even sports. In April 1865, Reuter stunned European financial markets with a two-hour scoop providing their first word of the assassination of Abraham Lincoln in Washington, D.C. Although the Associated Press story took 12 days crossing the Atlantic on a mail steamer, Reuters men chartered a boat to intercept the vessel off Ireland and telegraphed the news on to London. The same year the Reuters Telegram Company Ltd. was registered as a public company.

By the late 1860s, Reuters was serving all the major British newspapers with his by now respected news reports. The papers all paid the same amount for the agency's service, provincial newspapers receiving reports from their cooperative Press Association with which Reuters had a contract (almost from the beginning, Reuters was the only major news agency that did not directly serve its own domestic market). Over the next decade, Reuters telegraphic news service extended out to the Far East and America, following British imperialist moves. In 1870, after having failed in its attempt to purchase the Wolff agency, Reuters signed a news sharing agreement with Havas and Wolff to create a global news cartel or "ring." Reuters was by then the largest and most important of the three thanks to its service to the expanding British Empire. But the three news agencies needed each other, given their varied strengths. Reuters had sole access to the Empire and much of the Far East. The Exchange Telegraph agency formed in London in 1872 to compete on transmission of financial news.

Expansion

The Ring agreement was renewed in 1890, and Reuters experienced its best news agency years prior to World War I. When the war broke out, Reuters briefly suffered due to its German name. Herbert Reuter's death in 1915 ended family control. After years of declining profits due to the cost of operating the service, Reuters was restructured as a private company, Reuters Ltd., in 1916. Its managing director, Roderick Jones took effective control, and until his retirement in 1941 pursued a policy to tie the company more closely to the British government, considering this a basic patriotic role. The news agency refused to carry German

agency news, dubbing it propaganda of the enemy (Havas took the same stance). Jones took on an unpaid job as head of British propaganda efforts during World War I while still running Reuters, a dual role for which he was knighted. Wartime personnel pressures led to the first recruiting of women for editorial work, a policy that did not continue into the postwar period. In November 1918, Reuters beat the government in reporting the Armistice, which ended World War I.

In 1923 Reuters initiated the use of radio to transmit news internationally and began a service of price quotations and exchange rates sent in Morse code by long-wave radio to Europe by the Reuter Continental Broadcasting Service. In the next few years, this became Reuters' chief commercial service in Europe and, when more powerful radio transmitters became available, in the rest of the world. By the late 1930s, fully 90 percent of Reuters news was being transmitted by radio. But the agency's financial situation remained precarious, leading to newspaper concern about its continuation on one hand, or its partial takeover or subsidy by the government on the other (as was the case with Havas, for example). The result was that Jones invited the member newspapers to take a majority of the agency's shares in 1925. Until 1941, the Press Association (the provincial press cooperative) held the majority of shares. But the agency was constrained during the interwar period (years) by not having sufficient funds to expand or effectively compete with other agencies, especially the Associated Press. It increasingly relied, for example, on stringers rather than its own full-time employees. Further, the expansion of radio journalism in most of its markets was a growing threat to both subscribing newspapers and to the agency itself. Indeed, there were considerable tensions between Reuters and the expanding British Broadcasting Corporation (BBC).

Early in 1941, after growing government and Reuters board dissatisfaction with his performance–and that of his agency—Sir Roderick Jones resigned. A few months later, Reuters was reformed as a trust so that it was owned by both the British national and provincial newspapers, together with (as of 1947) the press associations of both Australia and New Zealand. A complex set of Reuters "Trust Principles" were designed to safeguard the agency's independence from government interference, or dominance by any one owner. These governed how the company conducted business, committing it to independence, integrity, and freedom from bias in the gathering and dissemination of news and information.

Reuters served well in World War II, though costs were always a problem, and often allowed American news agencies (with more reporters in the field) to break news faster. British government censorship affected reports for the domestic press, though not so much for international news feeds. Five war correspondents from Reuters were killed during the war. Reuters scooped the world with the June 1941 news that Germany had invaded the Soviet Union. Extra staff was hired and trained in preparation for the invasion of Europe in mid-1944. By the end of the war, the news agency had a far stronger reputation than it had enjoyed in 1939.

By mid-century, the news agency had 2,000 employees (including 350 full-time correspondents) and offices in virtually any city of importance. News was distributed directly to subscribing newspapers in 14 countries, and through national agencies in another 31. Major Reuters news bureaus operated in 23 nations, with the Paris office the largest outside of London headquarters. For its North American service, Reuters relied largely on the Associated Press with which an agreement had been signed in 1947. Reuters celebrated its centennial anniversary in July 1951.

With the exception of India and then Communist China, which expelled Western reporters toward the end of the 1940s (both countries had been substantial Reuters markets), growth continued and the number of subscribers rose as did newly independent nations. The BBC became the largest single subscriber to Reuters news feeds. Reuters personnel helped to form several national press agencies and the Latin service for South America. Transatlantic communications slowly switched in the 1950s from radio (which was subject to atmospheric interference) to use of the new coaxial undersea cables. World news scoops also continued. In 1956, for example, Reuters was the first to report the news of Soviet leader Nikita Khrushchev denouncing the record of his predecessor, Joseph Stalin. Five years later, it broke the story of the new Berlin Wall dividing the city.

Reuters ended its cooperative general news venture with the Associated Press as well as its financial

news relationship with Dow Jones in 1967 and began Reuters North America to distribute news directly to subscribing newspapers and broadcasters. It also operated an extensive audio service to serve radio stations. In 1971 in New York, Reuters began using its first video editing system. Journalists used video display units instead of typewriters to write and transmit news. In 1974, Reuters began to transmit news over coaxial cable at about 6 million words per minute.

By the late 1970s, the London headquarters used 200 editors to keep track of news coming in at about 600,000 to 700,000 words per day. The news agency transmitted upwards of 1.5 million words per day using a leased cable network. The network in the United States alone connected some 1,600 communities. For the short Falklands war between Great Britain and Argentina in 1982, Reuters transferred most of its British personnel from Buenos Aires to nearby Montevideo, Uruguay. Reuters correspondents went in with the British forces to take the islands back from Argentina. Seven years later, Reuters was first with the news of the fall of the Berlin Wall, the beginning of the end of the East German—and later Soviet—regime. More than 50 Reuters staff (and another 30 getting video reports for Visnews, Reuter's video news arm) were on hand to report the traumatic events at Beijing's Tiananmen Square in June 1989.

The news agency continued to grow through acquisition in the 1980s and 1990s. Reuters had launched an international news picture service in 1985, and in 1993, the Visnews TV news film agency (in which Reuters had been a partial owner for years) was acquired and renamed Reuters Television. In 2005 Reuters acquired Action Images, a specialist sports photography agency. In one indicator of how much the Internet was melding real and imagined lifestyles, Reuters launched the first news bureau in the virtual world of Second Life in 2006.

Financial Focus

In part due to the limited nature of its British newspaper subscription base, Reuters began in the 1960s to focus increasingly on its original function of distributing financial and stock exchange news, opening up a new client base in the fields of banking and finance. Indeed, Reuters was transformed under managing director Gerald Long from the mid-1960s to the 1980s, by which time it had become a very valuable financial reporting enterprise, with general news reporting playing but a minor part in overall Reuters operations.

Starting in 1964, Reuters began to transmit market quotations by computer, allowing almost instant monitoring of the New York Stock Exchange by European customers. The network was soon extended to other parts of the world. In 1973 the Reuter Monitor Money Rates Service was launched as an electronic marketplace for foreign exchange just as major Western industrialized countries abandoned fixed exchange rates. By this point, financial news and stock exchange services had outpaced the general news functions of the agency. In 1981 the Reuters Monitor Dealing Service opened, allowing foreign currency dealers to conclude trades over video terminals.

In 1984 Reuters became a public company traded on the London Stock Exchange and NASDAQ as Reuters Holdings PLC. Two years later it acquired Instinet, which would become the world's largest electronic agency brokerage firm by the first decade of the twenty-first century. In 1987 Reuters launched its Equities 2000 quotations service on Integrated Data Network. The stock market crash of later that year slowed Reuters expansion plans. Reuters Financial Television Service for the financial markets was launched in 1994, providing traders live coverage of market moving events on their trading screens. By this time, the company was no longer competing with the AP, but far more so with the Bloomberg service and Dow Jones.

Employment peaked at more than 15,000 employees in the 1990s. Reuters announced initiatives to better exploit the Internet in 2000, and thereby open new markets, reinforced by joint ventures in communications, wireless delivery, and investment research. But the sharp market downturn after March 2000 began to cut into Reuters revenues. Within three years, Reuters stock value had dropped more than 90 percent, and layoffs of some 5,000 workers were one result. Reuters transferred its London headquarters from Fleet Street (where it had been based since 1939) to the developing Canary Wharf business district in East London in 2005. For the first time in years, all Reuters London employees were brought into one building.

The vast majority of clients were now financial institutions (banks and business corporations)—the media made up less than ten percent.

On May 15, 2007, the Canadian publisher Thomson Corporation announced plans to take over the Reuters Group in a deal valued at $17.2 billion. When the deal closed in April 2008, Thomson controlled just over half of the renamed Thomson Reuters company. The combined firm had about a third of the world financial reporting market—about the same as Bloomberg. The Reuters Principles (that had long limited any single owner to no more than 15 percent of the company) were waived to allow the agreement to proceed, ensuring that the global Reuters operation would continue.

Rip-and-Read News

"Rip and read" is a slang phrase describing a radio station journalism practice that dates back to at least the 1940s. News agency stories, especially written for aural delivery over the air (most often those from Associated Press or United Press International), would arrive in the subscribing station's newsroom by means of a bulky teletype machine that printed the stories in purple type onto a continuing roll of light yellow paper. At many local stations, it was common practice to simply rip stories off the roll and read them over the air. (Radio network news personnel never did this—they or other staff wrote out news stories based on both news agency and reporter information.)

The news teletype operated 'round the clock (unless somebody accidentally turned it off), so updated rip-and-read newscasts could repeat the process based on later agency news feeds. But direct reading of wire copy was also one reason why newscasts on many stations often sounded much the same. As different stations were drawing their news "scripts" from the same news services (UPI, for example, focused heavily on serving its several thousand radio clients with a special service written for on-air usage), their newscasts often *were* largely the same. Rip and read was considered an acceptable practice given the lack of time overburdened on-air personnel could devote to occasional short newscasts on stations that emphasized music or other formats. Even then, however, it was expected that station employees would at least logically rearrange stories for the local market.

Better yet, station announcers (or news staff if they were present) could rewrite the news agency or "wire" copy if time was available. Well into the 1980s, however, this meant retyping the stories on a manual or electric typewriter, a more complex and time-consuming process than the ubiquitous computers of today. Still, rewriting had the benefit of usually improving the on-air product. Carefully done, rewriting could emphasize local angles of national or foreign stories that were more relevant and interesting to the station's listeners, perhaps a personal angle or some other connection to the region. Rewriting could also help stories flow seamlessly from one to the next, and when done

well and often, could avoid repetition of the same wording in subsequent newscasts.

But another important factor (and one often overlooked) was the need to correct occasional errors (factual or even style) in the wire copy itself. Nor was it unusual, given transmission problems or teletype machine malfunctions, for an occasional story line to be typed directly over the previous one—resulting in an unreadable solid block of purple color. Going directly on air without at least skimming the stories first was always dangerous, if only for that reason. Newscasts could also run the risk of a batch of ripped news stories (often fairly brief and thus small) falling out of order before use or even on the air.

The basic temptation to rip and read continues today in the hotly competitive world of radio where industry consolidation has reduced or even eliminated dedicated news personnel at many stations or clusters of stations. It is also harder to develop a local angle if the news is being transmitted from a distant location using voice tracking—another increasingly common practice.

Some specialized media services overtly advertise their news feeds of bulleted material as being *designed* for rip-and-read use. In 2007 National Public Radio used the phrase to promote some of their programming (not that they were actually doing what the phrase once meant). Radio stations—those that still provide news at all—now receive agency news feeds on computer screens. These can be more readily edited (and then printed for use as on-air scripts) than was the case with the old combination of teletype machines and station typewriters.

Risk and News

Risk is a "news frame" that highlights dangers, responsible parties, and likely victims. In political communications researcher Robert Entman's well-known definition, "[t]o frame is to select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation." Almost any subject can be reported as risk news. Risk frames can be used to report news about everything from guns to tourism, technology, social security, gasoline, and immigration. Reporting on gasoline can highlight the geopolitical risks of economies that depend on limited sources of energy, or scientific breakthroughs in the development of sources of energy. Stories on international tourism can focus on potential health risks and crime, or on the fact that tourism is an industry that generates jobs and revenues for small economies. Coverage of immigration may emphasize risks that immigrants take when they illegally cross borders, or the economic and cultural benefits that a country draws from migration flows.

News about risk matters because the press is a key institution in the social construction of risk, in that it contributes to the process by which societies select and assess risks. The press plays a crucial role in making objective risks into subjective risks: just because risks exist objectively, it does not follow that societies perceive them as such. Perceived risks do not necessarily mirror those determined, for example, by statistics and research findings (e.g., morbidity and mortality due to tobacco consumption, number of homicides committed by strangers). Experts point out that risk perception is often incommensurate with actual occurrence: people disproportionately fear risks that are not as likely, as dangerous, or as widespread as they believe. The mismatch between objective risks and perceived risks has

important consequences, for it affects how societies prioritize risks and decide what risk-management policies should be pursued. If perceptions are wrong, then societies may focus on the wrong risks. What is the responsibility of the press in this process?

The ubiquitous nature of risk news puts in evidence broader social concerns about risks as well as interest in managing risks in Western society. During the 1970s, the combination of high-profile nuclear accidents, growing concerns about environmental threats, and social mobilization to raise awareness about possible nuclear risks prompted academic efforts to better understand the linkages between risk and society. Since then, scholars have outlined a grim scenario of a global society subjected to both natural and man-made risks that could threaten the very survival of human life.

This renewed interest in risk reflects enduring anxieties in modern societies. Once risk management becomes secularized (in that it is presumed humans can take actions to alleviate or eliminate at least some risks), humans, rather than supernatural forces, are tasked with controlling risk. Although modern societies have managed to reduce risks through technological innovations and enlightened public policies, they have also created new risks (e.g., disease transfers, global warming, pollution, traffic accidents). The parallel movements of risk reduction and creation have made risk a concern across various social sectors.

Risk News and Its Critics

In the view of many critics, print and electronic media typically portray the world as a scary place plagued by uncontrollable risks. What accounts for the constant drive to push fear buttons is a matter of debate. While some argue that fear-mongering news is the result of bottom-line considerations promoting the use of sensationalistic formats that can lead to increased viewership and higher advertising revenue, others suggest that the press exploits universal fears as audiences scan their world in search of reassurance.

Such explanations for why the press devotes so much attention to risk news echo widespread criticisms of news coverage of risks. First, the press is accused of failing to provide timely risk information. The lack of sufficient or timely news coverage may partly explain why people continue to make risky choices and hold inaccurate perceptions. Ignoring or downplaying risks puts people in danger, perpetuates a false sense of safety, and delays public interventions. This point has often been made about the responsibility of the press in perpetuating "silent epidemics," public health situations in which substantial harm is being caused but little public notice is given. Analyses of news coverage of nuclear experiments in the 1950s, HIV/AIDS in the early 1980s, and famine in sub-Saharan Africa all concluded that media silence was a key factor in the lack of public discussion or concern about those issues. Put another way, observers have concluded that the media failed to set the proper agenda.

Second, the press is blamed for offering a warped picture of risks. Health researchers, for example, have documented that media underrepresent some causes of disease (e.g., tobacco use, heart disease) and overrepresent others (e.g., illicit drugs use, motor vehicle accidents, various toxic agents). Many reasons have been suggested to account for distortions in risk reporting, from political and economic interests to professional biases. For example, the press rarely offers an accurate sense of who is vulnerable to various risks. Because news organizations mainly target urban and wealthier audiences, they tend to cover risks that directly affect those groups. Thus, risks that mostly affect rural populations and the poor are less likely to receive news attention. Media attention paid to tuberculosis and malnutrition, for example, is not proportionate to their contribution to the global burden of disease. Because they mainly affect poor people, particularly in the global South, they are rarely news.

Journalistic criteria used to assess newsworthy elements (e.g., conflict, drama, novelty, visuals) can also distort news about risks. Some risks receive a disproportionate amount of news coverage compared to their magnitude. For example, homicide and injuries, which are more visually compelling, typically get more news coverage than cancer and heart disease, despite the fact that the latter lead to a greater number of deaths.

Third, the press is also faulted for offering insufficient risk information. Failure to contextualize specific events or accidents conveys unrealistic risk perceptions. "Bad news" about possible side effects of vaccinations and medications tend to ignore

that moderate negative effects are not unexpected. Individual personal tragedies may make for gripping television news, but they tend to exaggerate risks when taken out of context.

Fourth, the press is criticized for "hyping" risks by bombarding audiences with information about specific risks that do not correspond to their actual magnitude. The media are blamed for exaggerating risks, creating public hysteria, and misdirecting attention. Critics suggest that the press too often fails to offer sufficient perspective on the absolute and relative probabilities of risks. By giving false impressions about the extent and likelihood of risks, the press induces panic and may spread fears among segments of the population who are the least likely to be victims of such overreported risks.

Fifth, the press is also criticized for promoting "moral panics" that tap into prejudice and social anxieties. Moral panics are socially perceived threats to "standard" social and cultural values based on exaggerated perceptions about "out-of-control" dangers posed by ethnic, sexual, racial, cultural, and religious minorities. News coverage framed HIV/AIDS as a risk perpetrated by homosexuals to "normal" standards of sexuality. Immigration has been covered as "polluting" the cultural fabric of the nation. Youth cultures (e.g., music, fashion) have been framed as threats to middle-class morality and authority.

Who Defines Risk?

Like other news, risk is the product of the complex interaction between reporters and sources. Not all sources are equally powerful in affecting the use of risk frames. Risk news is in many ways no different from other news. Government officials can often single-handedly determine whether an issue or event is framed as risk. Officials who resort to "the politics of fear" to draw attention to specific concerns and policies exert tremendous influence in shifting news frames. Conversely, official silence or reluctance to frame specific issues as risks may discourage the creation of risk frames.

Besides official sources, risk stories regularly rely on experts. While official sources often define risk, experts supply credible information to support claims. The regular use of experts is the product of two concurrent developments. On one hand, the experts provide legitimate assessments based on scientific data, research conclusions, and other sources of "hard evidence." Experts' assessments serve to anchor claims of professional, objective reporting. On the other hand, the growing number of think tanks, research centers, industry associations, interest groups, lobbying groups, and nonprofit organizations engaged in "news management" also contribute prominent sources. Organizations seeking public visibility for their causes gladly become reliable sources. However, such experts rarely initiate risk stories. Press releases and reports may circumstantially attract news coverage, but without "news events" or statement from official sources, few expert-initiated stories will remain in the news cycle for long.

Although relations between reporters and expert sources may promote collaboration and promise mutual advantages, actual interactions among them are often not easy. Several studies document tensions and misunderstandings. Scientists express frustration at reporters' focus on flashy tidbits and oversimplified versions of complex subjects and research findings. They accuse journalists of skimming through studies and misrepresenting data and conclusions. Reporters too often cover drama more than substance and symptoms more than causes. A frequent problem is that journalists portray scientific assessments as if experts have conclusive results when in reality experts are often far less certain about risks and prospects than the press frequently portrays them.

Reporters fire back with their own criticisms. Too often, they argue, scientific risk assessments lack obvious newsworthy elements that deserve coverage. Journalists find that experts are rarely deft at translating scientific jargon into accessible information for general audiences. Few experts understand news practices and requirements that determine how risk news is covered.

Compared to official sources and experts, consumers play a secondary role in risk definition, most often appearing as either victim or perpetrator. Stories concerning environmental risks and tobacco consumption, for example, often portray the public as unwitting victim of political passivity and corporate greed. News reports describe the public as "ignorant" and "apathetic"—as with "promiscuous" youth who engage in unsafe sex

and "dangerous" social groups defined by ethnicity or sexual orientation who spread viruses.

Only occasionally are citizens featured in the role of experts. There has been a growing sensitivity in newsrooms to featuring members of the public as "lay experts" alongside professional scientists. Some of the most remarkable examples are health stories on HIV/AIDS and breast cancer, in which affected people are included to validate or contest experts' assessments and offer a different dimension to purely technical accounts of disease. Such lay experts rely on self-education and lived experiences, rather than systematic and rigorous university training. The incorporation of citizens as firsthand experts opens up new sources in risk reporting.

The Impact of Risk News

Two types of research have studied the impact of risk news. One has investigated effects of media reports on audiences, drawing on psychosocial theories and information-processing models. Few conclusive findings allow for broad generations. Studies generally conclude that demographic variables affect how the press organizes risk perception. Several studies concluded that the more information people have about certain risks, the less likely that news coverage has substantial impact. Conversely, when people have a more limited information environment, exposure to news risks would be more likely to amplify risk perception.

A second line of research has been concerned with the policy implications of risk news. From sociological and public policy perspectives, several studies have approached the press as an arena where groups compete over the definition of public problems and aim to shape policy agendas. By highlighting specific risks, the press raises awareness among policy makers and voters, provides information and opinion, and covers legislative debates and processes.

Interest groups engage in media advocacy to affect coverage, public opinion, and policy. They strategically use the rhetoric of risk to draw media attention, shape news frames, and influence policy decisions. Mention of risk in everyday politics, and particularly during election campaigning, provides an environment conducive to framing issues as threats. From abortion to xenophobia, there is no shortage of subjects in contemporary politics that are framed in terms of risk. Supporters and detractors beat the drums of fear and risk management by mobilizing activists, experts, and "news management" strategies with the goal of affecting policy making.

Risk discourses are used to shift or reinforce public perception about specific issues. As long as society considers certain risks as private, then, it is improbable that they will receive public attention, let alone be addressed. The issues of smoking and drunk driving in the United States best illustrate these efforts. Only when they were successfully framed as threats to society did they become matters of public concern and government intervention. Influencing media coverage is a central component of advocacy strategies interested in turning "private risks" into "public dangers" and, subsequently, affecting policy.

Efforts to push for risk frames in news coverage do not always result in sound policies, however. While activists use risk discourses to shape coverage and advance political agendas, some observers worry about cases in which "media-hyped" risks have negative impact on policy decision making. Seeking attention from news organizations avid for dramatic and controversial stories, sources often provide partial, politicized risk assessments. The press contributes to distorting policy priorities when it relays self-interested statements instead of judiciously weighing evidence and balancing alternative positions. The press fails to help rational decision making by reporting its own opinions rather than experts' judgments, beliefs rather than facts, politics rather than science. Reporting scientific knowledge is crucial to contribute to policies addressing real and significant risks.

Although this argument raises legitimate concerns about the implications of risk policies driven by poor news reporting and distorted public priorities, risk news will rarely be politically pristine. For example, in both the tobacco wars and the environmental debates, opposing factions accuse each other of using "junk science" to buttress their claims, demonstrating the difficulties of leaving politics out of risk definition. The social process of risk definition is messy and inevitably political. It is woven into political processes by which mobilized actors struggle over power, public priorities, and resources.

Risk news reflects not only the professional and editorial biases of newsrooms, but also the increased politicization of contemporary life. Coverage of risks often results from organized groups converting their concerns into issues of public attention by framing them as economic, political, and/or cultural threats. Risk news offers both a warped view of what societies fear, and a glimpse at how mobilized publics try to affect press coverage.

Russian Federation

The story of Russian news media is closely linked to the country's political trajectory. Virtually every Russian leader in modern history—from the last Tsars to the Soviet heads of state from 1917 to 1990, to the post-1991 Russian Presidents—have realized the importance of controlling national media in their battles for political and ideological supremacy. As a result, for most of its life so far, Soviet/Russian print and later broadcast news media have been subject to state censorship and used as political and sometimes propaganda weapons. Nevertheless, millions of Russian citizens (as well as many others) have read newspapers such as *Pravda* and *Izvestia* for almost a century, making them some of the world's most successful (if deeply flawed) publications. The sober Soviet anchors presenting the news on the extremely popular TV news show *Vremya* has now given way to a myriad of talking heads. Most of them, however, are still wary of criticizing the country's political leadership, proving that the Russian media generally prefer to mirror the country's political characteristics rather than act as a catalyst for society-wide change.

Media Origins

The first newspaper in Russia was founded during the early 1700s as a propaganda tool for the Tsar, who was fighting a war with Sweden and needed a propaganda vehicle. More than half a century would pass before the Russian press would begin to expand and that would happen thanks to Catherine the Great's Enlightenment-inspired reforms. In 1796, Catherine approved the first official censorship institution in Russia, whose job was to make sure that the journalistic enthusiasm sparked by the importation of printing technology from the West did not translate into "improper" newspaper content. The next stage in the development of the Russian press took place during the reign of Tsar Alexander II (1855–81), who instituted some of the most wide-ranging institutional reforms to that point, including the emancipation of serfs, abolishment of the death penalty, and creation of a new judicial system. Against the background of these reforms and a rapidly industrializing country, the press acquired, for the first time, a significant societal value, with the Russian intelligentsia increasingly involved in its production and consumption.

In 1865, Russian press laws were revised to reflect the changing sociopolitical and ideological situation: censors now focused less on weeding out

"immoral" content in publications, and more on "inflammatory" (read "antiestablishment") content. Such judgments, however, were now the province of the legal courts and newspaper publishers, and contributors could defend themselves in front of a judge. Preliminary censorship of newspapers was eliminated for a while, but publications could still be confiscated by the authorities before they were distributed. The last part of the nineteenth century would see many Russian newspapers, especially those in Moscow and St. Petersburg, align themselves with one of the competing ideologies of the day: liberalism, social-democracy, and monarchism.

The last important stage in the development of the Tsarist press occurred in 1905, one result of the attempted revolution that year. Defeat in the Russo-Japanese War and other economic and sociopolitical factors led to a series of worker strikes and demonstrations, which, in turn, attracted violent governmental repression. While government forces eventually managed to contain and control the revolution, the tsar was forced to sign into law the so-called October Manifest in order to appease the protesters. Among other things, the Manifesto legalized political parties, established a Parliament (the Duma), and guaranteed freedom of thought and conscience to citizens. Newspapers flourished as political parties now legally established their own publications. At the turn of the twentieth century, most newspapers were privately owned.

The "1905 Revolution" also formed a turning point in the history of *Pravda* ("Truth"), the publication that would later become the official organ of the Communist Party of the Soviet Union and the most famous and important newspaper in Russia's history. The increasing focus on workers' issues gave the Russian Social Democratic Labor Party added importance in the country's political life, which contributed to the establishment of several Marxist publications. *Pravda,* one of these publications, was started outside of Russia in 1908 by prominent Marxist exile Leon Trotsky, who became the newspaper's editor, main contributor, and financer over the following years. *Pravda* was intended to provide a left-wing view of such issues as agricultural policies, women's rights, Russian foreign policy, the social democratic movement, and Marxist theory. The newspaper also published regular reports from the Duma, as well as many letters from émigrés, prisoners, soldiers, and workers. The content was written in a simple, direct manner, a style that appealed to Russian workers, who received copies through illicit channels. Trotsky attempted to keep his newspaper outside of the internecine battles of the Russian Social Democratic Labor Party but soon became mired in the disputes between the two main factions, the Mensheviks (who sought a moderate approach to sociopolitical change) and the Bolsheviks (who, led by Vladimir Lenin, stressed the need for more radical measures, including political violence). In 1910, despite Lenin's objections, the Party agreed to finance *Pravda,* but only two years later, following significant changes in the Party's leadership and organization; another *Pravda* was established (this time inside Russia) and took over from Trotsky's publication as the Party press organ.

The Tsarist secret police kept a close watch on the newspaper, and had spies at the highest levels of *Pravda's* management. The government played a cat and mouse game with *Pravda,* harassing it with fines, prison terms for its editors, confiscation of copies, and even the withdrawal of its publishing license. *Pravda*'s leadership did its best to fool the censors and continued to get its copies into the hands of the Russian industrial workers. Contrary to the subsequent official Soviet version, the pre-1917 *Pravda* was financed only in part by workers' donations—some of the money came from the Party, while a significant part came from wealthy sympathizers (including prominent writer Maxim Gorki). The content did not differ a great deal from Trotsky's *Pravda:* it included articles written in an easily accessible language and lots of letters from workers (who were encouraged to document their ever more numerous strikes and protests). *Pravda* quickly established itself as the most popular left-wing publication, reaching a peak of 130,000 printed copies on its second anniversary.

The New Order

Five days after the 1917 revolution that swept the Tsar from power, *Pravda* was printing 100,000 copies a day. The newspaper was closed down by the Provisional Government (which did not take well to *Pravda*'s virulent criticism). In late 1917, the Provisional Government was overthrown by Lenin's Bolsheviks. After a three-year civil war,

the Bolsheviks solidified their control of the Russian government and moved the country's capital to Moscow. *Pravda* followed suit and soon became the official publication of the Party.

The 1917 revolution gave rise to *Izvestia* ("News"). First published by the Petrograd Soviet (workers' council), *Izvestia* would become the official publication of the government of the USSR. *Izvestia* focused more on administrative issues within the government and on foreign affairs, while *Pravda* held a virtual monopoly on disseminating Communist ideology.

Under the Soviet system, journalism prioritized "education" (i.e., indoctrination, "ideological work"); instead of playing the role of the watchdog, it acted as a straightforward outlet for the government. In the communist system, the political completely dominated the economic, and the state owned all media. *Pravda* and *Izvestia* both printed information provided to them by the government; their editorials represented the perspective that the all-powerful Party endorsed and imposed on Soviet society. Successive Soviet governments used the media, and particularly *Pravda,* to rally citizens to official political and economic policies, including a series of succeeding economic five-year plans.

Soviet Media

Many other state- and party-controlled institutions (such as regional parties, trade unions, youth organizations) published newspapers and magazines, some of which, like *Trud* (a labor union publication) and *Komsomolskaya Pravda* (a Communist youth publication), were very popular, regularly attracting a readership of 8 million to 10 million. Besides exerting considerable political influence, top journalists benefited from various other perks, such as large and well-located apartments, vacation houses, and drivers. The editors of such prominent publications as *Pravda* and *Izvestia* were named by top state officials and often were themselves full-fledged members of the Party's Central Committee. They had access to many high-profile political meetings and were expected to participate in most of the country's important political events.

By the early 1980s, *Pravda* occupied several floors in a large building and employed 180 staff journalists and more than 100 correspondents. The newspaper had a circulation of 10.4 million copies and was printed in dozens of cities in the Soviet Union. (*Pravda* reached its peak circulation of just over 11 million in 1987.) One characteristic of Soviet newspapers was the pervasiveness of readers' letters in every issue. In the 1980s, both *Izvestia* and *Pravda* received over half a million letters a year, and Pravda employed 70 people whose job was to read and respond to each writer. The letters ranged in topic and tone, with some offering praise to some local hero, while others denounced mismanagement or corruption. Such accusations, however, were always aimed at lowly party or government members and never at officials who possessed any real power.

Most journalists were members of the Union of Journalists, which was tightly controlled by the Communist Party. In 1988, some 85 percent of all the professional journalists in the country were Union members, and, of those, 80 percent were card-carrying members of the Communist Party. Formal journalism education did not receive much attention from Bolshevik decision makers until the early 1920s, when the Moscow Institute of Journalism was established and already existing newspapers began offering training courses. Additionally, various "newspaper technical schools" opened their doors to prospective journalists drawn primarily from working and peasant families. The journalism curriculum was overwhelmingly comprised of Marxist-Leninist ideology, with scant attention paid to practical skills (e.g., journalistic writing, managing equipment). The typical Soviet journalist was a generalist with some journalistic education (from two months to three years), but with strong ideological credentials. Upon graduation, journalism students were assigned positions in newsrooms around the country.

Given all journalists' explicit allegiance to the Communist ideology as interpreted by the Party leaders, the most efficient form of control in the Soviet media was self-censorship. *Izvestia* was believed to be somewhat more "liberal" than *Pravda,* in terms of both journalistic practices and the topics it approached. (Incidentally, *Izvestia* was the first Soviet newspaper to introduce ads in its pages). During his "reign of terror" (1920s to 1930s), Stalin used his total control of *Pravda*'s editorial content for two main purposes: to mobilize Soviet citizens around his "Five Year Plans"

and to denounce, discredit, and dismiss all potential political rivals. His successor, Nikita Khrushchev, also used the press as a weapon against his opponents, but exercised more control over *Izvestia,* where he appointed his 35-year-old son-in-law as editor-in-chief.

The *Glasnost* Era

In 1985, Soviet media began to experience a true revolution. New leader Mikhail Gorbachev (1985–91) quickly instituted sweeping political and economic reforms. *Perestroika* ("reform," "reorganization") and *glasnost* ("openness," "transparency") became the new slogans, and Soviet newspapers were among the first to benefit from Gorbachev's "new thinking." The press could now carry considerably more information on government affairs, and could engage in criticism, which had been unprecedented. *Izvestia,* for example, was able to approach previously taboo subjects such as drug abuse, AIDS, accidents and disasters, crime, and infant mortality. Previously banned authors such as Boris Pasternak were serialized in newspapers. Jamming of Western radio and television signals was ceased, and in 1990 a newly passed "Law on Press and Other Mass Media" abolished every form of censorship and allowed nonstate entities to establish their own publications. Self-censorship, however, was still operating on multiple levels, and the Soviet media industry could still not be characterized as free and independent, despite ever-increasing boldness in news reporting and editorializing. (*Izvestia* occasionally even went as far as explicitly disagreeing with Gorbachev over foreign policy.) In 1991, however, the Soviet Union imploded and the once authoritarian Communist regime disintegrated. Soviet media faced their biggest crisis.

Radio and Television

The first significant mass radio transmission in the country came in 1917, when Lenin announced the victory of the Bolshevik Revolution in a radio broadcast. Despite being recognized by Lenin as a "powerful means of agitation and propaganda," radio did not receive much attention from the state compared to the situation in America and Western Europe. The development of radio technologies was further slowed by the lack of a viable nationwide electric grid and by a weak manufacturing industry (which could not produce large amounts of receivers and transmitters). It was only during the 1930s that radio began to be introduced on a large scale around the country. Much of the content broadcasted by radio qualified as entertainment (music concerts, readings of plays, and shows for youth and children), with less than 20 percent of the programming devoted to the news. The first experimental TV transmission was made in 1931, and regular broadcasting started in 1939. Like in the case of radio, the Communist state was slow to devote significant resources for the development of television technology and its spread throughout the country. The 1960s were the decade of TV expansion, with millions of TV sets produced every year. If at the beginning of that decade less than 10 percent of the Soviet population watched TV, by 1986, fully 93 percent did. The Gorbachev era further solidified TV's role as the premier source of information for the country's population, as *glasnost* was first and foremost implemented in the audiovisual industry.

Until the fall of the Communist regime, Soviet citizens mainly tuned in to the two national channels: First Program (established in 1960) and Second Program (introduced in 1982). First Program contained extensive news analysis and commentary programming, covered important state events and high official speeches, and provided a regular staple of international news. It also aired limited entertainment programming (mostly stories on the film industry), and dabbled in advertising. Second Program focused more on features about "regular people" than on hard news. It also contained some local programming in the country's 40 minority languages. The most popular programming by far was *Vremya,* a news and commentary show aired by both Programs every evening. Initiated in 1968, *Vremya* carried a variety of economic and political stories, some culture and sports, and a weather update, for 35 minutes without any interruptions. During the Gorbachev years, news and public affairs pieces made up 41 percent of all TV programming, feature films made up 48 percent, and culture and sports constituted the

rest. Live broadcasts were also aired for the first time during the 1980s.

Russian Media Since 1991

Following the fall of the Soviet Union, many of the state's former assets, including media outlets, were hastily privatized, often ending up in the hands of more or less shady alliances of politicians and newly minted "businessmen." In 1992, the new Russian Federation liberalized prices, which led to rampant inflation and spelled poverty for many Russian citizens. The once popular press lost much of its audience, and in the absence of state subsidies, many closed down. The next year, however, marked the development of a previously secondary media outlet: television. Wholly private TV channels appeared on the market, with NTV the most notable example. NTV was considered during the late 1990s to be the most independent and professional media source in the Federation. The station made a name for itself by covering the first Chechen war in a considerably more objective manner than its competitors, and introduced lively, Western-style programming, such as controversial public affairs talk-shows and a steady diet of Hollywood blockbuster movies. In 2000, however, Russia's new leadership under President Vladimir Putin (2000–08) declared war on the "oligarchs" (i.e., individuals who had benefited tremendously from the hasty privatization of Soviet industry), including media magnates. A year later, state-owned gas company Gazprom took over NTV.

Since 2000, the Russian state has continued to consolidate its control of news media in a wide-ranging operation that amounts to a renationalization of the media. The state owns 15 percent of all print media titles, the news agency ITAR-TASS, and the media holding company VGTRK, which controls national TV channels RTR and Kultura, dozens of regional TV stations, and radio channels Rossiyi and Mayak. Other state-owned or state-allied entities, such as gas company Gazprom, also own controlling stakes in the media market. *Izvestia* is in Gazprom's media portfolio, having been bought by the corporation in 2005. Soon after 1991, *Izvestia* had managed to diversify its sources of revenue and had managed to build a reputation as one of new Russia's best newspapers. *Pravda,* on the other hand, had a much rougher post-Communist trajectory. In 1991, President Boris Yeltsin's government shut down the former flagship of the Soviet media. (*Izvestia* had quickly allied itself with the new regime and was thus allowed to prosper). *Pravda* journalists subsequently founded their own newspaper, carrying the same name. The same year, *Pravda* was sold to Greek entrepreneurs, and most of its newsroom personnel resigned in protest. In 1999, many of the former "Pravdists" founded Pravda.ru, a tabloid-like online publication. *Pravda* has since struggled for survival in the Russian market. *Izvestia,* on the other hand, is still one of Russia's best selling newspapers (behind *Argumenty y Fakti, Trud, Moskovsky Komsomolets, Komsomolskaya Pravda,* and *Metro*), although it is now largely seen as the voice of Russia's presidential administration.

Since 1994, murders of high-profile journalists have occurred periodically in the Russian Federation, as the challenges faced by the country's independent media have grown greater by the year. Russia's economic recovery under President Putin was accompanied by a concentration of political and economic power in the hands of a few high state officials and their allies. The government managed to acquire control of most of the country's influential media outlets, and criticism of those in power (particularly Putin) was all but silenced. The President's many critics inside and outside of Russia have spoken of numerous attempts to intimidate the few remaining independent reporters and editors.

The only venue of information that still enjoys a high degree of freedom of speech is the Internet. The amateur personal webpages of the mid-1990s were quickly replaced by sophisticated (and popular) web-only publications and blogs. "Internet fever" swept the country's major cities in 1996, when the presidential election received immense amounts of coverage on the net. However, as of 2007, almost 80 percent of the country's population did not have access to the Internet and, as such, was not exposed to the antiestablishment discourse that characterizes many of the Russian-language politics and public affairs websites. In 2008, the national prosecutor's office proposed that legislation be adopted banning "extremist material" from the Internet. Under the proposed law—which already regulates print media—websites that publish information deemed to be "extremist" would have to be blocked by all Russian providers.

Pravda's and *Izvestia*'s odyssey from Tsarism to Communism to capitalism is a genuine metaphor for Russia's own historical trajectory. Virtually never free from state censorship, Russian journalism has always played a crucial role in the country's political life. The Tsar who founded the first newspaper during the early 1700s used it as a propaganda tool. Centuries later, many Russian leaders are still indebted to an ideal according to which the media's most important role is to serve the interests of those at the top of the political pyramid. Whether a strong and independent press will lay down roots in Russia any time soon is a question that few informed observers of Russian affairs would dare speculate on at this time.

S

San Francisco

California's fourth-largest city, with a population of about 750,000 in the early 2000s, lies at the heart of a metropolitan region of more than 7 million people. The area, which encompasses Oakland and San Jose, was the country's sixth-ranked market in 2008. Starting at the end of the twentieth century, consolidation and cutbacks affected almost every newspaper throughout the Bay Area; the numerous television and radio stations have also downsized. Yet in San Francisco and neighboring Silicon Valley, online innovators hold the promise of providing new sources of revenue for journalistic innovation.

Newspapers

The 1848 Gold Rush turned San Francisco into California's largest city virtually overnight. By 1849, the city had its first newspaper, the *Alta California*. By 1850 four more dailies arose. Newspapers came and went with seeming abandon: the city's roster of dailies rose to 8 in January 1851, dropped to 2 in 1852, and climbed to 12 by December 1853.

On January 16, 1865, three brothers from the de Young family, Charles, Michael Harry and Gustavus, founded *The Daily Dramatic Chronicle,* with a borrowed $20 gold piece, according to legend. The paper's first big scoop came three months later, when Michael walked to the telegraph office one morning and learned President Lincoln had been assassinated. The paper ran an "extra" edition, unleashing the ire of street mobs attacking the paper's competitors that had been critical of Lincoln. In 1868, the de Youngs started a subscription service and the paper was relaunched as *The Daily Morning Chronicle,* then later renamed the *San Francisco Chronicle*.

In 1870, San Francisco was the country's tenth-largest city. By that time, Charles de Young was running sensational, factually suspect stories. In April 1880, the publisher himself made news. The paper was printing embarrassing material about mayoral candidate and de Young rival Isaac Smith Kalloch, a Baptist minister. Kalloch, in turn, leveled embarrassing charges against de Young's mother. De Young responded by shooting Kalloch, who survived the attack and won election as mayor, serving from 1879 to 1881. During the middle of the mayor's term, his son, Isaac Milton Kalloch, shot and killed Charles. Michael de Young took over the paper.

The history of the *Chronicle*'s fiercest competitor is no less unruly. In 1880, Senator George Hearst accepted the 15-year-old *San Francisco Examiner* as payment for a gambling debt. The *Examiner* would later spawn a nationwide Hearst publishing empire that promoted war in the Caribbean and inspired the term *yellow journalism*.

Both papers also put major literary figures to work. Mark Twain wrote articles in exchange for office space at the *Chronicle*. The paper, in turn, defended *Huckleberry Finn* against bans in local libraries. Bret Harte, a clerk at the San Francisco Mint, also wrote for the *Chronicle*. Neither man

was given a byline. In 1888, the *Examiner* was the first to print the baseball poem "Casey at the Bat," by Ernest Lawrence Thayer. Ambrose Bierce and Jack London also claimed *Examiner* bylines. But the publication took shape only after 1887, when William Randolph Hearst, 23, begged his father to take over the "miserable little sheet." In 1889, the son labeled the *Examiner* "The Monarch of the Dailies"—a moniker the paper still displays. Hearst began to acquire other papers, including the *New York Journal*.

The great earthquake and fire of April 18, 1906, destroyed most of San Francisco. The *Examiner,* the *Chronicle* and a third newspaper, the *Morning Call,* produced a joint emergency edition on the *Oakland Herald*'s presses.

By the 1930s, Hearst had built a sprawling castle at San Simeon, 200 miles south of San Francisco. At the same time, he urged his minions—most took home less than $20 weekly—to "work for the romance of the game." Through the century, the Hearst Corporation bought almost every major newspaper in the city, and by the 1960s had absorbed the already combined *San Francisco News* and the *Call-Bulletin*.

Organized labor started pushing back against the publishing empires. In the 1930s, syndicated columnist Heywood Broun started a national union of newspaper workers. Seventy-one men and two women employees of the *Examiner* furtively signed the "Hearst Manifesto." Three years later, workers at the *Chronicle* joined in. In April 1936, the Newspaper Guild of Northern California was chartered. It continued to grow and earned a contract with the *Oakland Tribune* in the 1960s.

San Francisco's most famous newspaperman of the second half of the twentieth century was prolific columnist Herb Caen (1916–97), who spent most of his career with the *Chronicle*. Caen is credited with inventing the "three-dot column," a terse but witty style of commentary named for the ample application of ellipses between poetic descriptions of quotidian life, humorous nicknames for politicians, and terms defining social movements, such as the word "beatnik." In 1996, Caen was bestowed a rare "special" Pulitzer Prize.

In 1951, Hearst closed the *Oakland Post Enquirer*. In 1965, the *Chronicle* and the *Examiner* formed a 40-year joint operating agreement, which consolidated noneditorial functions into one shared complex. For the latter half of the twentieth century, the *Chronicle* and *Examiner* traded places in their circulation war. In 1952, the *Chronicle* ranked fourth, behind the *Examiner, News Call-Bulletin* and *Oakland Tribune*. But by 1960 it had moved past the *Examiner*. By 1999, the *Chronicle*'s circulation peaked at 482,268, and the *Examiner*—like most afternoon papers—had shrunk, to 114,776.

In June 1999, the *Chronicle* board of directors decided to sell to Hearst. But six months later the deal met resistance in the form of real estate investor Clint Reilly. In a lawsuit, he claimed Hearst wanted to monopolize the San Francisco market by shuttering the *Examiner*. After a federal antitrust trial in which Hearst executive Timothy White admitted to "horse trading" favorable coverage for Mayor Willie Brown's endorsement of the sale, Hearst "sold" the *Examiner* to a local family and paid them $66 million over three years as a startup subsidy. The entire *Examiner* staff was absorbed into the *Chronicle,* as Hearst promised no immediate layoffs.

The new *Examiner*'s launch on November 20, 2000, was inauspicious: A glitch at the printer made it hours late to the newsstand. The top two editors were fired in the first month. Within a year, Ted Fang, the publisher, was ousted by his mother. Ultimately, the Fangs ran through the subsidy, and on February 21, 2003, fired practically the entire editorial staff and turned the paper, then already a tabloid, into a free daily. Nearly a year later, billionaire Philip Anschutz—founder of Qwest Communications and sports teams owner as well as an active patron of religious and conservative causes—purchased the *Examiner* for a reported $20 million.

When the *Chronicle*'s no-layoff agreement expired, the paper began planning to lay off and buy out reporters. In the summer of 2005, the guild agreed to a five-year contract that cut 120 jobs through buyouts. Still, a guild-hired auditor said the paper was losing $62 million a year.

Knight Ridder's *San Jose Mercury News,* the *Chronicle*'s main regional competitor, also lost 4 percent circulation that year. The loss was part of a company-wide downturn that led a Florida investor to call for the chain's sale. On March 13, 2006, Knight Ridder's owners sold the company to the McClatchy chain for $6.5 billion. Its Bay Area holdings included the *Mercury News,* the *Contra Costa Times,* the *Monterey Herald* and the *Palo Alto Daily News* chain of free dailies. McClatchy

quickly announced it did not want the Bay Area papers and flipped them to the MediaNews Group of Denver, which already owned the *Oakland Tribune* and more than a dozen other papers in a cluster it called the Alameda Newspaper Group. Hearst, now owner of the *Chronicle,* agreed to acquire the *Herald* and the *St. Paul Pioneer Press,* and separately "contribute" them to MediaNews. In exchange, Hearst would invest in MediaNews properties outside the Bay Area.

Reilly sued again, this time charging that MediaNews and Hearst conspired to dominate the marketplace for advertising and news by consolidating operations. He settled in April 2007 after the companies agreed not to work together in the Bay Area, and the sale was approved by federal regulators.

When it was all over, MediaNews owned 29 papers in the Bay Area, and consolidated most business and some editorial functions into regional offices. The only remaining major daily papers not part of MediaNews were the *Chronicle,* with a circulation of about 400,000; Anschutz's *Examiner,* claiming 166,000; and the *Santa Rosa Press Democrat,* owned by the New York Times Company, at about 90,000.

Radio

By some accounts, radio broadcasting first appeared in the Bay Area. Around 1910, Charles Herrold used a device he called the "arc fone" to begin regular radio broadcasts of music in San Jose. After going off the air during World War I, by 1921 he was using newer technology at radio station KQW. The AM station moved to San Francisco in 1949 and became KCBS, now one of the most listened-to news stations in the Bay Area. Its biggest commercial competitor is all-talk-radio KGO-AM, started by General Electric in the 1920s.

San Francisco is notable for its wealth of noncommercial public stations. KALW-FM was founded in 1941 as an experiment by teachers at the Samuel Gompers Trades School in San Francisco to provide an over-the-air teaching aid. The first noncommercial FM station west of the Mississippi, KALW is still owned by the San Francisco Unified School District, and now broadcasts a mix of NPR programs, local news and talk shows, and live coverage of school board meetings. Another public station, KQED-FM, started broadcasting in 1969, and began an all-news format in 1987. Since then it has become the most listened-to public radio station in the country, with a combined 840,000 listeners in 2007, some as far east as the Sierra Nevada.

In 1949, Lewis Hill started the Pacifica Foundation's KPFA-FM in nearby Berkeley with a listener-supported noncommercial focus. The station quickly became politically outspoken, criticizing the Korean War in the 1950s and earning the scrutiny of the House Un-American Activities Committee. The Pacifica network has since grown to include five broadcasters and nationally syndicated content with a largely volunteer staff.

Television

The San Francisco Bay Area has five major daily news stations competing for an audience spanning nine counties throughout more than 7,000 square miles. In the beginning of the twenty-first century, such a tightly competitive market led to shifting affiliations and cutbacks at most newsrooms.

Oakland's KTVU Channel 2 got its first FCC license in 1957. Under the two-decade leadership of Fred Zehnder, the station won a reputation as local news leader, winning the highest marks in a 2000 national study by the Project for Excellence in Journalism for its emphasis on politics and economics. The *Ten O'Clock News* was also a ratings winner.

San Francisco's KRON Channel 4 was chartered by the *Chronicle*'s de Young family, first airing in the late 1940s. In 2000, the station was sold to Young Broadcasting for a reported $737 million, now widely seen as an inflated price. The station declined in ratings after losing its affiliation with NBC. In 2005, KRON began to replace traditional three-person camera crews with solo operators, to mixed reviews.

Other stations carved out their own niches. San Jose's KNTV Channel 11 became an NBC station in 2000. KGO Channel 7 in San Francisco, the ABC station, was for a time the only Bay Area station with a full-time Sacramento reporter. KPIX Channel 5, the CBS station in San Francisco, capitalized on its relationship with the network and worked with *60 Minutes* creator Don Hewitt to pilot a quarterly magazine-style news program, *30 Minutes Bay Area.*

The most recent television startup in San Francisco was Current TV, which was launched by Al Gore and Joel Hyatt in 2005 to much fanfare, empowering Internet users to contribute "pods" to its broadcasts.

Magazines and Weeklies

Though not a magazine hub like New York, San Francisco has spawned publications that helped identify the city with the pioneer history of the West, the mid-twentieth-century counterculture, and the computer revolution.

San Francisco gave rise to one of the longest-lasting magazines in the United States, *Sunset*. The "Magazine of Western Living" begun in 1898 as a railroad passengers' publication, was purchased in 1928 by the Lane Publishing Company, and has focused on lifestyle features, how-to guides, and Western history.

In the 1950s and 1960s, many art and culture magazines arose from the city's beatnik and hippie movements. *Rolling Stone* started in San Francisco in 1967 under the leadership of Jann Wenner. The magazine often strayed from underground music into pop, national politics, race relations, the Vietnam War, and feminism. Hunter S. Thompson employed his trademark "gonzo" journalism to cover the 1972 presidential race. Further to the left is *Mother Jones* magazine, founded in 1976 as a nonprofit dedicated to muckraking journalism about national and international affairs.

In 1966, Bruce Brugmann founded one of the first alternative weekly newspapers, the *San Francisco Bay Guardian*. The *Bay Guardian* was joined in the early 1980s by what became *SF Weekly,* a politically centrist free weekly, acquired by the New Times chain (later merged with Village Voice Media) in 1995. In a lawsuit, Brugmann accused the *Weekly* of underpricing its ads to drive his paper out of business. In 2008, a judge awarded the *Bay Guardian* $15.6 million in damages.

Among the first publications to capitalize on the emerging interest in online culture was *Wired Magazine,* which began in 1993, featuring bold predictions of near-future lifestyle changes promised by technology.

Newer Media

The Bay Area was well positioned in the mid-1990s to spearhead the growth of online journalism. Even before the web took off, a community of "digital utopians" founded the WELL, which began as a dial-up service of the *Whole Earth Catalog,* including primitive bulletin boards, the ancestors of today's blogs.

A San Francisco newspaper strike in 1994 spawned the first online daily newspaper—the short-lived *San Francisco Free Press,* staffed by striking union members. The site set an example for the strike's targets, the *Chronicle* and the *Examiner*. In 1995 the papers launched their portal, SFGate.com. By 2008, SFGate was the seventh most popular newspaper website in the United States, with 3.8 million unique monthly visitors.

In Silicon Valley, search pioneers Netscape, Yahoo, and Google all had an influence on journalism. Most of the content on the search portals, notably Google News and Yahoo News, was aggregated from newspapers and other news sites, diverting advertising from the originating sites but also generating traffic. A notable exception to the aggregation-only trend was video journalist Kevin Sites, whose "In the Hot Zone" series starting in 2004 on Yahoo brought web video coverage to global crises while also testing light electronic gear he toted in his backpack as a "solo journalist."

A surprising threat to traditional journalism came from a grassroots website called Craigslist, founded in 1995 by Craig Newmark and based in San Francisco. By allowing users to post almost all classified ads for free, the site grew so fast that housing, personals, computer, and garage sale announcements rapidly fled paid newspaper pages.

Among the better financed journalism startups was Salon.com, launched by former staffers of the San Francisco *Examiner*. The site was one of the few online-only publications to rival newspapers and magazines in journalistic achievement, never shying away from controversy. As one example, in 2006, Salon helped break the Abu Ghraib prison scandal.

Other news organizations created billion-dollar businesses by pursuing specialized journalism online. MarketWatch.com created a fleet-footed business newsroom that was sold to Dow Jones & Co. in 2004 for $519 million. CNet.com became a premiere web destination for technology news and reviews and was sold to CBS in 2008 for $1.8 billion.

While the entrepreneurial spirit that defined San Francisco from its founding in the mid-nineteenth

century helped distinguish the city as a beacon for experimental journalistic voices, it also contributed to setbacks in journalism quality, through rapid technological and corporate transformations. The mass layoffs at newspapers across the Bay Area at the start of the new century showed that the old business structures behind journalism were no longer reliable, and that new innovations in the craft, technology, and economic model were necessary to sustain a robust and independent press.

Satellite News Gathering

Satellite news gathering (SNG) is the transmission of video or sound news reports using communication satellites. SNG allows real-time electronic media reporting from far distant locations. Its use has helped reduce the one-time divide between local and national reporting.

Communication Satellites

The demands of military missiles and communications drove and largely funded the initial development of communication satellites. First theorized by science fiction author and inventor Arthur C. Clarke in a 1945 article, the concept of orbiting satellites some 22,300 miles above Earth would allow three of them to communicate with the entire globe. At that altitude, they would appear to remain stationery (hence "geostationary" orbit) above the same spot. Clarke thought it might take 50 years to develop what he predicted—in fact it took less than 20.

The world's first low-orbit artificial satellite, *Sputnik,* was launched by the Soviet Union in October 1957. Its appearance sent shock waves through government and military circles in the United States and greatly increased federal funding to develop U.S. intercontinental missiles and orbiting satellites. Coverage of rocket launches from Cape Canaveral, Florida, became a regular beat in everyday print and television journalism—starting with the disastrous failed launch of the *Vanguard* satellite in December 1957, which was carried live on television. A year later the *SCORE* satellite carried a prerecorded message from President Eisenhower that was transmitted back to Earth. AT&T's *Telstar* satellite of mid-1962 allowed the first live television transmissions between Europe and the United States for the limited windows of time when the satellite was orbiting over the Atlantic. The *Relay* satellite later that year helped link the United States and Japan with voice communications. But all of these were low-altitude (a few hundred miles above Earth) satellites that could be used only intermittently for a few moments during each Earth orbit.

The breakthrough to Clark's geosynchronous orbit came with *Syncom* early in 1963, the first communications satellite to reach the 22,300-mile altitude. It and the two to follow quickly proved Clark's thesis by being useful 24 hours a day, unlike brief orbital "windows" for the earlier satellites. The United States created the Communications Satellite Corporation (Comsat) to further develop civilian satellite applications, which, in turn, led a year later to the formation of Intelsat to do the same globally. A steadily improved series of Intelsat satellites, starting with *Early Bird* in 1965, slowly expanded the global satellite communications system.

In the United States a growing number of domestic satellites (domsats) laid the groundwork for a wholly new way to interconnect broadcast stations and cable systems, doing away with expensive terrestrial links. Equipped with uplink and downlink antennas, networks and stations could now exchange or distribute programs in real

time (minus a tiny time lag for the signal to travel a total of 44,600 miles) at a fraction of the cost of traditional terrestrial coaxial cable or microwave links. Furthermore, signals could go either way and multiple channels could be accommodated. By the late 1980s, American broadcast and cable networks were all using satellite distribution, and television receive-only (TVRO) "dishes" had become ubiquitous at stations and cable systems.

SNG Development

The first direct application of satellite news gathering appears to have taken place in 1975 when Chicago television station WBBM sought to cover the conspiracy trial of heiress Patty Hearst in San Francisco. The process involved using a portable video camera (itself a relatively new innovation) with a device to transmit (uplink) the signal to one of the first communications satellites. Back in Chicago, station engineers could then downlink that signal for processing into news reports. Though expensive, this early example of breaking down the "local-national" dividing line between network and local station journalism was a portent of the future.

Just seven years later, when Britain decided to contest Argentina's military occupation of the Falkland Islands in the spring of 1982, satellite news communications got a world debut. All news reports from the fighting front had to be transmitted over the 8,000 miles separating the remote South Atlantic islands from London. British army signals units established analog links using satellites, and transmitted both official military information and civilian news reports, usually time-shifted anywhere up to 24 hours.

This one news story demonstrated the drawbacks of SNG as well as its benefits. First and foremost, the process was still costly and the equipment was cumbersome. It was difficult to transport the needed ground equipment, which was heavy and bulky, and it took time to set up and calibrate with the needed satellite. Few commercial users could afford the expense or risk. Further, transmissions were often affected by radio interference on the satellite up- and downlinks.

Within the next decade, however, SNG links had improved markedly. In 1984, Consus Communications began the first American SNG cooperative, which used a fleet of SNG-equipped vans. By 1992, more than 150 television stations were affiliated. They had a lot of competition, for the broadcast and cable networks were also increasingly active in SNG; NBC had 67 SNG trucks, CBS 54, and ABC 48 of them. Sites of major news stories (such as political conventions or important court trials) soon began to resemble crowded parking lots as the satellite vehicles gathered.

SNG was next put to the test in 1990–91 in coverage of the first Gulf War. CNN's Peter Arnett was able to report from Baghdad over a period of weeks by using portable satellite news equipment. He was employing one of the first "fly-away" SNG antennas that could be packed into wheeled cases and carried on a commercial airliner. The smaller antennas could be precisely aimed at satellites—and thus attracted less (possibly hostile) attention. The White House was soon SNG-equipped to allow quicker communication with news media and the public.

Within a year the International Telecommunication Union and various national groups were working on consistent technical standards to more readily enable SNG transmissions. The first were approved in 1992 and the process continued with digital SNG standards into the mid-2000s. But not all SNG issues were technical—use of the devices was sometimes contingent on getting local government or telecommunications authority permission.

Changing Impact

Where one network needed equipment that filled 75 to 100 shipping cases in order for it to cover the attack on Afghanistan in 2002, within a year that same capability could be fit into just five or six cases. By the time of the Iraq war, beginning in 2003, the effect of a steady trend of miniaturization and streamlining was evident. Combining small cameras with desktop video meant that digitally edited reports could be transmitted day and night to networks and stations back home. Breaking news could also be sent by satellite telephone, which used far less bandwidth, though it provided jerky and low-resolution pictures (these sufficed for talking head reports that didn't need to show much movement).

Thanks to the improving equipment, SNG is increasingly able to fulfill its role as a temporary

link arranged on short notice. The continued reduction in equipment size, weight, and complexity—and cost—was aided further by conversion to digital technology over the past decade or so. Many companies provide equipment or full SNG links on a lease basis. Any SNG transmission still requires several pieces of equipment. Other than the satellite itself (by far the most expensive portion of the process), a means of transmitting up to the satellite (the uplink antenna) and back again (downlink) is essential, as well as processing equipment at both ends to receive and edit the video material received. Once the satellite signal is on Earth, it can be forwarded to a studio or elsewhere using microwave links (studio-transmitter links, STL) using different spectrum frequencies than are applied for SNG.

Steadily improving digital SNG equipment has contributed to the end of the traditional distinction between local and national (and international news). With readily portable SNG units down to 70 pounds and a cost of about $130,000 by the mid-2000s, even small market stations can make use of the devices and receive or report stories far from the station.

Satire of News

Satire is a literary genre that employs humor when making commentary on individuals or activities and their perceived vices, shortcomings, or mistakes. In satire, humor is used to underscore an opinion or point about an issue or event. Most often, satirists use wit to criticize or attack something of which they disapprove. Parody (or spoofs), sarcasm, exaggeration, and analogy are defining literary tools of satire that help create its humorous tone.

In journalism, satire most commonly pokes fun at the news, or uses parody portrayed as conventional news. While satirical news is defined by its comedic nature, using deadpan humor to create what is called "fake news," its underlying objective is to make statements about real people, events, and trends, often with the intent of influencing change. In this way, it is usually fundamentally biased. This objective also highlights a key difference between satire of news and parody of news: While parody uses humor for humor's sake, news satire employs humor to attain the greater result of social criticism and/or promote change. Politics and current events are common themes in news satire, although the genre is not limited to them.

Origins

An early example of satire in news is *The Spectator,* an English newspaper that ran in the early 1700s. Created by popular writers Joseph Addison and Richard Steele, the newspaper consisted of one long essay narrated by a fictional character that would report and critique a single aspect of the news each day. Unlike a typical newspaper that would report hard news, *The Spectator* was satirical in a number of ways. First, the use of a fictional character to present real information allowed for variation in tone and a less systematic reporting

style, providing a sense of intimacy through storytelling and creating an element of entertainment. Its application of humor, for example, is definitive of news satire. Furthermore, *The Spectator* provided commentary beyond objective news reporting with the distinct intent to influence change in societal behavior and mindset. This fundamentally satirical goal was clearly evidenced by the newspaper's mission to "enliven Morality with Wit, and to temper Wit with Morality."

Newspapers

Newspapers are the oldest form of news satire, at least as old as conventional journalism in America. In American journalism, one of the most famous news satirists was Samuel Clemens, more popularly known as Mark Twain. In the 1870s, Clemens worked as a young reporter for the Virginia City *Territorial Enterprise,* a newspaper in Nevada. He was relieved of his position at the *Enterprise* for publishing occasional spoof articles that were misconstrued by editors and readers as real. Clemens went on to publish what were deemed "hoaxes" in other newspapers across the country, for which he was also reprimanded.

While the genre of news satire has thus been around for centuries, its prevalence within American journalism dramatically increased with changes in technology. From the rise of the telegraph before the Civil War, to the birth of broadcasting in the early twentieth century, and on to the opening of the Internet to commercial use in 1995, technology has intensified the speed and breadth of mass communication and brought a new, grander scope to the genre of new satire. Today, news satire is disseminated rapidly on a wide scale due to the interconnectedness of modern technology, permeating popular culture and serving as an eminent source of news information for tech-savvy American youth.

One of the most popular satirical news publications today is *The Onion,* a newspaper created in 1988 that has since expanded into a multifaceted "fake news" organization. *The Onion* was first published by Tim Keck and Christopher Johnson, two juniors at the University of Wisconsin-Madison. In 1996, the paper's website began, quickly garnering national attention. It was bought by Comedy Central in 2000, at which point the print version began national distribution. *The Onion* went on to develop a daily web video broadcast in 2007, *The Onion News Network*. Most recently, a film based on the newspaper appeared as *The Onion Movie*.

The Onion is satirical in that it parodies traditional news in its articles, reporting fake stories about local, national, and international events and politics, usually to create underlying social or political commentary. In the early 2000s, it parodies the style of popular newspaper *USA Today* with its use of bright graphics and statistical pie charts, as well as featured sections like "News in Brief," "Opinion," "American Voices" ("What do *you* think?"), and "Infographic." *The Onion* even has a fictional history with a list of fictional contributing writers and editors. In this way, aside from the paper's satirical content, the paper is itself a large satire.

Television

Broadcast news satire arose with the advent of radio news in the early twentieth century, but became more prevalent during the satire boom of the late 1950s in the United Kingdom. A generation of satirical writers popularized satire on television. A cornerstone of this satire renaissance was the television show *That Was the Week That Was,* a popular satirical news program that aired on BBC Television in 1962 and 1963. In America, the NBC television network adapted this British program into *Rowan and Martin's Laugh-In,* a predominantly political comedy show that played from 1968 through 1973. A satirical news sketch that aired as part of the show is an early example of popular televised news satire in the United States. The segment "Laugh-In Looks at the News" parodied network news with a fake anchor giving a comical report on recent news stories, both fake and real. The sketch also satirized historical events and predicted bizarre events far into the future.

Along with *Rowan and Martin's Laugh-In, Saturday Night Live*'s "Weekend Update" segment helped usher in the satire boom in the United States, reaching an audience of about 30 million people every week during its formative years of 1975 through 1980. "Weekend Update" is a satirical news sketch that parodies political and current events, based on *That Was the Week That Was*. The

segment was created and originally hosted by *Saturday Night Live* (*SNL*) comedian Chevy Chase and was introduced on *SNL*'s original broadcast on October 11, 1975. Developed during a pivotal time that included President Richard Nixon's resignation after the Watergate scandal and the end of the Vietnam War, it made light of current events while emphasizing the perceived shortcomings of American politics, thus serving as news satire. "Weekend Update" continues to run as a comedic news program parodying mainstream broadcast journalism.

Perhaps the best known broadcast news satire program in the early twenty-first century is Comedy Central's *The Daily Show with Jon Stewart*. It premiered in 1996 but rose to popular notoriety when Jon Stewart replaced Craig Kilborn as host in 1999. Unlike Kilborn, Stewart also serves as writer and executive producer of the show. A quintessential "fake news" program, *The Daily Show* parodies political figures and mainstream media while satirizing real news, drawing most of its stories from American politics and then mockingly criticizing them. The show's popularity led to the creation of a spin-off, *The Colbert Report,* hosted by Stephen Colbert, formerly a conservative "correspondent" on *The Daily Show*. This news satire program parodies political pundit shows such as Fox News's *The O'Reilly Factor*. A common determinant of news satire as opposed to straight parody, both Comedy Central programs are seen as politically biased, most often using sarcasm to mock and criticize conservative people and politics.

On the Web

Serving as a growing outlet for journalism, the web has also heightened access to and popularity of news satire. It has also exacerbated some of the problems with "fake news."

Although news satire has been on the web since its beginning, *The Onion*'s website, created in 1996, has been the most influential source of satirical news online. Since its inception, myriad news satire articles have been posted across the Internet, often as website articles or on blogs, and hundreds of satirical news websites have been created. Some have been designed to collect popular news parody articles. HumorFeed.com, for example, runs a news satire headline feed with over 60 contributing "fake news" sites.

A fundamental problem with news satire is its ability to be misinterpreted as real by both audiences and even mainstream media. Its use of deadpan humor, which is more covert than typical comedy, makes the "fakeness" of news satire comparatively less apparent and more easily misperceived as actual news. The web intensifies this because of its abilities to repost pieces of news satire out-of-context and disseminate such pieces so speedily. The result is heightened room for misapprehension and confusion concerning what is real and what is parody.

Furthermore, satire is often criticized for defying the conventions of traditional journalism. Neither conventional news nor blatant comedy, satire often escapes the editorial processes of conventional journalism and is less subject to censure. Web publications, including blogs and articles posted on personal websites, are even less subject to review because they may be posted by anyone and escape any process of editing, thereby heightening the confusion. The result is widespread dissemination of satirical pieces whose parodied news has not been checked for accuracy and is less likely to be censured.

Prevalence and Popularity

News satire's integration in American popular culture is demonstrated by the popularity of "fake news" programs and publications. *The Daily Show with Jon Stewart* is a notable example. In March 2007, the Pew Research Center's Project for Excellence in Journalism asked Americans to name the journalist they most admire. Jon Stewart ranked fourth on the final list, following network news anchors Brian Williams, Tom Brokaw, and Dan Rather. The presence of a satirist on such a list underlines the integration of news satire within American culture. Senator John Edwards used *The Daily Show* as a forum to announce his candidacy for the Democratic presidential nomination in September 2003, serving as another example of the conflation of satirical and real news.

Statistics on readership and viewership of satirical news publications and programs further demonstrate the popularity of news satire. For example, *The Onion*'s national print circulation is over 700,000. Likewise, its website is visited by 3 million readers every week, and the *Onion News*

Network is accessed 5 million times each month. *The Daily Show* has won 11 Emmy Awards and has been nominated for an Emmy seven further times, and Nielson ratings report that the program reaches over 1.5 million viewers per episode. Likewise, *The Colbert Report* has been nominated for four Emmy awards between 2004 and 2008, and in 2006, the *Merriam-Webster* dictionary publisher named the show's neologism "truthiness" Word of the Year.

Effects

News satire has had measurable effects on the public in recent years. Satirical news draws a relatively young audience. *The Daily Show,* for example, has a mean viewership age of 35, while over 60 percent of *The Onion*'s website readers are between the ages of 18 and 44—the demographics that appeal to most advertisers.

The Daily Show is a commonly cited barometer for the effect of "fake news" on political opinion. For example, a 2006 Baumgartner and Morris study demonstrated that *Daily Show* viewers exposed to political comedy tended to rate politicians parodied by the show more negatively than nonviewers. Likewise, *Daily Show* viewers demonstrated higher levels of cynicism toward both media and the electoral system at large. Yet these same study participants reported comparatively high levels of confidence in understanding current American politics.

News satire is an increasing source of political news information for American youth. According to a 2004 Pew Research Center poll, 21 percent of 18- to 34-year-olds learn about presidential campaigns from satirical news shows, which is almost equal to the 23 percent who report getting their political information from conventional network news.

The use of satirical news as primary news source has had discernible effects on the political awareness and participation of American audiences. In 2004, the National Annenburg Election Survey found that "fake news" viewers were better informed on political happenings and current affairs than those who relied solely on traditional news media. A quiz given to nearly 20,000 American adults in mid-2004 demonstrated that news satire watchers had more knowledge about the backgrounds of political candidates and candidates' stances on issues than those who did not watch political satire. Moreover, *Daily Show* viewers knew the most about election issues, as compared to viewers of conventional news and straight comedy shows such as *The Tonight Show with Jay Leno* and *Late Show with David Letterman.* Furthermore, while concern has been raised regarding the high levels of political cynicism associated with news satire viewers, a 2008 Gao and Brewer study linked political comedy viewing with increased levels of political participation. This study concludes that exposure to political comedy shows, including satirical news programs, is positively associated with increased participation in political campaigns and membership in a political organization.

Satire has affected journalism and journalists as well. A 2007 study by communications researcher Lauren Feldman underscores the point that, during a year when young Americans' traditional news media consumption was decreasing, their attention to late-night comedy programs as sources of political information was on the rise. Through examination of discourse surrounding satire programs such as *The Daily Show,* the study found that many journalists have recognized this trend and begun using such programs as forums to reflect upon the nature of their work and the current state of journalism in general. The study concludes that the once rigid distinction between news and entertainment is blurring and that journalists themselves are reconsidering the dividing conventions between straight and satirical news.

Television and radio personality Rachel Maddow is a popular journalist who has adopted this merging of news reporting styles in her daily MSNBC series *The Rachel Maddow Show* and her Air America Radio program of the same name. While Maddow's show is news-based, its fundamental tone is humorous, employing satirical commentary in her comedic, often playfully sarcastic discussions of the day's headlines. The show is fundamentally satirical in that it uses humor to poke fun at news, ultimately expressing Maddow's subjective views on the topics at hand. Maddow therefore strays from traditional news reporting by creating a news-entertainment blend, demonstrating the phenomenon discussed in Feldman's 2007 study. As the show's subject is real daily news, it also serves as an example of satire that does not

employ parody, thus illustrating a difference between the two genres. Maddow has been criticized for the satirical tone of her commentary. In October 2008, for example, conservative speechwriter David Frum was interviewed on the television show, and he expressed disapproval of Maddow's use of brazen sarcasm, maintaining that it contributes to deterioration of the political culture. The dispute exemplifies news satire's potential for prompting social contention.

Conclusion

In journalism, satire has been employed as a form of commentary on political issues and current events, using parody, sarcasm, and similar forms of deadpan humor to emphasize a point or critique such subjects. Its popularity has proliferated as communication technology has made news satire more easily and quickly accessible to the masses. Today, *The Onion, The Daily Show with Jon Stewart, Saturday Night Live*'s "Weekend Update," and *The Rachel Maddow Show* are all examples of influential satirical news in American popular culture. Myriad studies have demonstrated palpable effects that news satire has on young audiences as a result of their great popularity, subsequently blurring the lines between conventional and "fake" news.

Satirists, Political

Political satire is a sub-genre of political journalism, and a complex ironic practice of political criticism mixed with rhetorical hyperbole, entertaining humor, deliberate mis-statement and personal insight. Political satire frequently defines (and on occasion, exceeds) the accepted limits of professional journalism because the practice draws attention to biases and subjectivity inherent in news gathering and editing, as well as society in general.

Political satire has roots deep in western history and has flourished in different historical periods and cultures of representative democracy. While such satire can exist in many forms of media, it can make its most pointed effects as a genre of news gathering and political journalism. Like all satire, political satire holds current events and social relationships up against a set of idealized ethical norms such as basic fairness, humanitarianism, and democracy. Political satire can function as topical humor when actual events not only fall short of

proclaimed ideals, but when responsible individuals, organizations, or governments are seen as openly hypocritical. As such, political satire can simultaneously offer humor and social criticism. Political cartoons are a well-known subset of political satire using graphic design, illustration, and physical exaggeration to engage in political commentary. Political satire in essay form utilizes exaggeration, irony, hyperbole, double entendre and other rhetorical devices to simultaneously create humor and social and political commentary.

Origins and Development

The most well-known example of early political satire was the Dionysian theater rituals in classical Greek democracy. During these festivals, performers lampooned political leaders and elaborate skits were performed in the public arenas as a form of acceptable open criticism. As Greek society transitioned to a written culture, these performances were recorded and became lasting records of political satire. Most famous among Greek theatrical satirists was Aristophanes whose plays are still performed and retain much of their original satire of power. Several pre-Socratic philosophers also engaged in written political satire. So powerful were political satire and early theater that Plato harshly criticizes them in his famous political work *The Republic*. Plato is cautious of "poets" and other writers because they have an ability to destabilize a democratic regime by appealing to the base entertainment desire of the audience.

In western cultures satire and political satire were preserved during the Middle Ages by traveling minstrels and bards who obliquely offered social criticisms through lyrics to popular songs performed in informal settings. These coded satires were often of reigning monarchs and the feudal system itself. Many of these folklore songs were eventually collected and written as nursery rhymes and fairy tales, such as "Three Blind Mice" and "Jack and Jill." Simple satires of religious institutions were coded into performances of mystery plays and church dramas. Erasmus's *In Praise of Folly* satirized both the institution of the church and self-delusion on the part of the readers. Political satire regained popularity with the beginning of the Enlightenment era and greater literacy rates in European countries. Political upheavals around the redistribution of wealth and the rise of a mercantile middle class were the subjects of this satire.

British literary satirists including Jonathan Swift and Alexander Pope influenced and encouraged an American colonial tradition of political satire. While attempting to break into establishment newspapers and magazines, Benjamin Franklin and other colonial printers used political satire both to speak out against the excesses and unfairness of British colonial rule and as an effective means of self-promotion. Franklin's *Poor Richards Almanack* traces a fine line between satire, legitimate agricultural information, and outright hoax. This mixture of serious and satirical information is also found in his *Autobiography of Benjamin Franklin*. Such political satire occurs throughout colonial works of journalism, which both reported on current affairs and offered scathing satires of King George III of England. Satire was suppressed along with other political journalism leading toward the American and French revolutions.

Early American Political Satire

Political satire continued to be a noticeable feature in eighteenth- and nineteenth-century journalism from Fleet Street publishers in London to French and American newspapers. While political satire is not unique to English-language journalism, it has made a more powerful impact in these societies. Political historians have argued that satire continued to flourish because these societies valued and enshrined a freer and more open press. Other theories for the continued popularity of satire in the Anglophone world in general and the United States in particular, is that economic power is more widely spread, literacy rates are comparatively high, political engagement is socially encouraged, and political power is frequently balanced in a two-party system.

As printing technologies improved, illustrated political cartoons began to appear in newspapers as engravings and lithographs. Early political cartoons were a powerful form of political satire at a time when newspapers had large circulations but a large percentage of the population was not functionally literate. From Franklin's simple "Join or Die" woodcut to the increasingly elaborate cartoons of Thomas Nast in *Harper's Weekly* to the nuanced illustrations of *Punch* and

The New Yorker, editorial and satirical cartoons have had an enormous impact on the style and substance of journalism. Enduring images such as Uncle Sam, the Republican Elephant, the Democratic Donkey, Columbia/Justice, and "the Bully Pulpit" were all created within cartoons as a form of political satire. Many neologisms of the time, such as *gerrymandering* and *muckraking,* passed into the written satire of the nineteenth century and into the political lexicon of contemporary journalism.

In the United States, satire acted at its most serious when used within the abolition movement and during the U.S. Civil War (1861–65). The continued rise of literacy and the proliferation of periodical magazines created a unique and new literary market in the mid-nineteenth century. Many of these publications turned to satire, particularly political satire, to reach out to new audiences. Satirical books influenced political essays in *Harper's Weekly* and used satire to indirectly criticize the institution of slavery, political corruption, war profiteering, and U.S. imperialism when direct criticism would have been difficult or impossible.

Like Franklin, Mark Twain (the nom de plume of Samuel Clemens) began his long career as a writer and essayist working as an assistant to a printer. Twain frequently made use of satire for political means. While working for a series of newspapers during Reconstruction (1865–77), Twain used the "travelogue" genre as a vehicle for his satire, for example *The Innocents Abroad* and *Roughing It.* Among the political targets of Twain's satire were growing American imperialism, social elitism, phony frontiersmen, and religious dogmatism. His satirical journalism and his novel writing frequently cross-pollinated each other. Twain's famous essay "The Celebrated Jumping Frog of Calaveras County" was originally published in *The New York Saturday Press,* which launched his career as both a satirist and a journalist. In a similar career to that of Twain, Ambrose Bierce also championed political satire within news gathering and journalism. Bierce gained popularity as one of the first permanent columnists for the Hearst newspapers, then as the editor of *The Wasp,* a satirical magazine, and later gained notoriety when one of his satires, of the assignation of Governor Goebel in Kentucky, prefigured the assignation of President William McKinley (1897–1901).

Twentieth-Century Satire

In the early twentieth century the term *debunkers* was broadly applied to political satirists working as journalists. H. L. Mencken, Don Marquis, and Upton Sinclair each used satire to a similar effect. Because much of their satire was directed at changing social norms, many of these satirists were later seen as reactionary. Although Mencken and Sinclair were supportive of and personally involved in the Women's Suffrage movement, they occasionally lampooned the very institutions they promoted. For example, Sinclair lampooned his own socialism in *It Can't*

A satirical, political cartoon that appeared in Harper's Weekly *in November of 1877 by Thomas Nast. Titled "The Lightning Speed of Honesty," the cartoon depicts Uncle Sam seated on a snail named 45th Congress, as he carries army and navy payroll and money, with the Resumption Act in his pocket. The Resumption Act sought to reduce the amount of greenbacks (used to finance the Union side of the Civil War) in circulation.*

Source: Library of Congress.

Happen Here and Mencken satirized his political views in columns for *The Baltimore Sun.* Due to his open criticism and satire of U.S. involvement in both world wars, Mencken was frequently considered to be anti-Semitic and pro-German, despite his outspoken writing to the contrary. In the early twentieth century these same political satirists also began calls for a Civil Rights movement, took aim at prohibition, and championed immigrant rights.

Both Mencken and Marquis pioneered the sharp-tongued, mordantly ironic writing style that would later become the hallmark of political satire in magazine writing, as it began to distinguish itself from newspaper writing. *The Smart Set, Punch,* and other early monthly publications founded and popularized by Mencken, Marquis, and Sinclair eventually lead to the style of *The New Yorker, Vanity Fair,* and other literary and lifestyle magazines. These magazines prided themselves on a highbrow literary style, sharp wit and irony, and an eclecticism that reflected the growing literary movement of urbanity and sophistication in the period between the two world wars. The "Algonquin Roundtable" was an unofficial group of journalists, playwrights, and satirists in the 1920s that moved quick wit, sardonicism, and satire from populist lampooning into high culture and political commentary. Among this group, Dorothy Parker and Robert Benchley were literary essayists and satirists; Alexander Wollcott and Heywood Broun were professional journalists; and other members of the group, such as Harpo Marx, were Broadway and Hollywood actors. While diverse, the group was held together by their use of literary satire for cultural and political aims.

Colleges have also been hotbeds for satire, where student groups published newspapers and magazines such as the *Harvard Lampoon,* continuing the tradition of highbrow satire. The growth of specialized humor magazines has led to more accepted publications for satire such as *National Lampoon, Mad Magazine,* and *Rolling Stone* which frequently mix political satire with farce, pop culture reporting, and music reviews. These magazines retain some of the political satire of college publications, but add a unique blend of consumer culture graphic design and lowbrow shock value. Later examples include *The Onion* and other alternative press magazines which have moved toward mainstream journalism.

The 'Gonzo Journalism' of the countercultural movement of the 1960s was another form of political satire influenced by the libertine ideals of drug and hippie culture. Freely mixing facts with outlandish fictions and personal opinions, this form of satire involved reevaluating serious topics in a sarcastic manner while eschewing objectivity. Championed by writer Hunter S. Thompson, Tom Wolfe, and George Plimpton, gonzo journalism as satire outlasted its hippie origins and continued into the 1980s and continues to influence contemporary journalists. *Rolling Stone* originally published many articles by Thompson that were collected into *Fear and Loathing in Las Vegas.* Gonzo journalism celebrated anarchic popular culture and the civil rights movement, while satirizing the United States involvement in the Vietnam War, the Watergate scandal, the consumerism of the 1970s and 1980s, and the cold war policies of Ronald Reagan.

Political Satire in Newer Media

The personal, subjective, witty, and often outlandish components of Gonzo journalism is typical of contemporary online editorial journalism and can be seen in many online weblogs. The rise of online journalism and the Internet as a means of communications has opened many new spaces for satire.

While print journalism continues to provide successful satire, television and online media have become more central vehicles for the genre. English-language political satires and humor frequently move freely between the United States, Great Britain, Canada, and other Anglophone countries. *That Was the Week That Was* was a satirical sketch comedy show in the UK in the early 1960s which directly influenced broadcast news satire in the United States and Canada such as *Not the Nine O'Clock News* and *Brass Eye* in the UK, *Not Necessarily the News* in the United States, and *This Hour Has 22 Minutes* in Canada. *Monty Python's Flying Circus* was an absurdist sketch comedy show that also originally aired in Britain in the late 1960s and was known for its randomness and a deconstructivist approach to television that continues to influence the style of parody and political satire.

North American sketch comedy programs such as *Laugh-In, SCTV,* and *Saturday Night Live*

engaged in frequent political satire. However, these programs maintained their parody and contrivances openly. By contrast, early-twenty-first-century satire/hoax news shows such as *The Daily Show* and *The Colbert Report* walk a fine line between offering satire and presenting legitimate news, and false or prank news.

Satire and Global Culture

Satire often does not work in terms of media globalism because the irony it employs can be linguistically or regionally very specific. For example the political satire within Bollywood films in India is generally lost on Anglophone audiences. Within bilingual and multilingual countries, such as Canada and Switzerland, satirical newspapers and television shows, such as *La fin du monde est à 7 heures* (*The End of the World Is at 7 O'Clock*) are usually not translated because the essential humor component is lost. The publication of cartoons of the prophet Mohammed by Jyllands-Posten in 2005 was conceived as social and political satire of theocratic Islam, iconoclasm and the process of cultural assimilation. The strong public reaction and controversy the publication created highlighted the differences in responses to political satire by different co-cultures in a globalized media world. Mistranslations and misunderstanding in globalized media have occasionally lead to unintentionally funny occurrences: in 2002 *The Beijing News* translated and ran a satirical story from *The Onion* which humorously claimed that the U.S. Congress had demanded a retractable dome be built to replace the capitol building. Even after the story was revealed as a U.S.-based satire, the editors of the paper refused to publish a clarification or retraction.

While parody and political satire share many attributes, not every political satire is parody and not all parody is satire, political or otherwise. Parody is usually a necessary-but-not-sufficient element to satire. However, both parody and political satire often test the limits of freedom of press and the specifics of libel, slander, cultural sensitivity, privacy rights and copyright and trademark protections. In 1994, the U.S. Supreme Court in *Campbell v. Acuff-Rose Music* found that, "parody has an obvious claim to transformative value." Within the Copyright Act of 1976, section 107 defines fair use. The Supreme Court decision clearly stated that "parody like other comment or criticism may claim fair-use under §107."

Contemporary Political Satirists

"The Capitol Steps"

Formed in the early 1980s in Washington, D.C., this rotating group of comedians (many of them former Senate staffers) perform both parody pop songs and improvised comedy satirizing current political events. In 1994 a Supreme Court ruling allowed them to perform parody and satire without paying royalties for being within legal "fair use." Several groups remain active in live performances and public radio appearances.

Stephen Colbert (1964–)

Colbert is a controversial television satirist known for his portrayal of his alter ego, also known as "Stephen Colbert." While the writer/performer himself is politically progressive, his alter ego parodies the conservative extreme in political punditry. Colbert began as a writer and performer and gained popularity on *The Daily Show*. His television show *The Colbert Report* is a direct spin-off but pushes satire to extreme levels. In 2006 Colbert satirized President George W. Bush at the White House Correspondent's Association Dinner, while remaining in the character of his alter ego.

Al Franken (1951–)

Franken is a liberal political satirist who began his career as an original writer for *Saturday Night Live* in the 1970s and continued to write and perform occasionally through the 1990s. Franken wrote a series of books satirizing conservative media, particularly radio talk shows. Ironically, Franken himself then helped found a satellite radio network. He continues to write articles and books and was elected U.S. Senator (D-MN) in 2008.

Garrison Keillor (1942–)

Keillor is a public radio personality and commentator who began his career in Minnesota Public Radio in the late 1960s. He created *The Prairie Home Companion* in the early 1970s, which he continues to write and perform. The

show is a blend of variety show, monologue, sketch comedy and political satire. Keillor has written several books excerpting stories from his radio show, and continues to work as a freelance commentator and journalist.

Bill Maher (1956–)

Maher began his career as a stand-up comedian and achieved popularity on late-night television with *Politically Incorrect* in the 1990s, a program that blended the roundtable interview format with comedy routines. Maher is an active proponent of blogging and new media and remains involved in disparate political movements. In 2008 he starred in the comedic documentary *Religulous*. He continues to host his late-night talk show on HBO, *Real Time with Bill Maher*.

The Onion

Founded in the late 1980s as a local college humor newspaper in Madison, Wisconsin, *The Onion* gained popularity after the launch of its website in 1996. The publication is distributed in several major cities in the United States and blends parody and satire with entertainment news and interviews. Several satire news stories from *The Onion* have been republished accidentally as legitimate news stories both within the United States and internationally.

P. J. O'Rourke (1947–)

O'Rourke is a conservative political satirist who began his career writing for *The National Lampoon* and *Rolling Stone*. While originally considered a "Gonzo Journalist," he later satirized the genre in a series of books and media appearances. He continues as a freelance writer and political commentator for public radio.

Mark Russell (1932–)

Russell is a political comedian and singer/songwriter who has created musical and political satire for public radio since the early 1980s. He has acted as a television show host and performer of improvisations on current events. During the 1990s Russell was involved in high-profile court cases involving use of copyrighted material in fair use for parody and satire.

Jon Stewart (1962–)

Stewart is a television host and political satirist best known for hosting *The Daily Show,* which mixes satire, interview, parody and absurdity in a complex fake-news production. Stewart began his career as comedian and master of ceremonies for sketch comedy and worked as a substitute host and writer for late night television shows. He continues as both writer and host for *The Daily Show* while writing satirical books and making public appearances as master of ceremonies.

Political satire continues its dynamic relationship with political journalism. Frequently satire is marginalized into opinion or humor sections of newspapers and magazines, while it mixes more freely with legitimate content in the more fluid media of television and Internet hybrids. The occasional marginalization of political satire into realms of editorial opinion or simple entertainment continues to highlight the friction between subjective satire and the notion of a purely objective journalism. As irony becomes increasingly common in twenty-first-century "postmodern" journalism, political satire will continue to define the edges of accepted edited professional journalism.

SCANDINAVIA

Scandinavia forms a geographical and cultural territory in the northern part of Europe. Culturally and sociolinguistically, Scandinavia comprises Sweden, Denmark, and Norway. Geographically, Scandinavia comprises the Scandinavian peninsula, which excludes Denmark but includes the northeastern part of Finland. Scandinavia is part of, but not synonymous with, the Nordic region. The Nordic countries consist of Denmark, Sweden, Norway, Finland, Iceland, Greenland and the Faroe Islands (both part of Denmark), and Åland (part of Finland). As Scandinavia is formally Sweden, Denmark, and Norway this entry will focus on their journalism. These countries constitute very different cases compared to North Atlantic countries (such as the United States) and Mediterranean countries.

Background

All three Scandinavian countries are constitutional monarchies with relatively small populations. They have a common history, as exemplified by the fact that Norway has in the past been ruled by both Denmark and Sweden. Some geographical areas of present day Sweden have been part of Denmark and other geographical areas, part of Norway.

Sweden has approximately 9 million people, Denmark 5.2 million, and Norway 4.6 million. Although all are monarchies, these are largely symbolic and ceremonial. According to *Freedom House's* annual rankings, political rights and civil liberties are protected in all Scandinavian countries, and they all have the status as free countries. In terms of the freedom of the press, in 2007 *Freedom House* ranked Sweden, Norway, and Denmark as among the six freest countries in the world. Sweden was the first country in the world to constitutionally establish the principles of publicity and press freedom, which happened in 1766. Norway followed suit in 1814 and Denmark in 1848.

All three countries have proportional electoral systems and multiparty systems. In 2007, the number of parties represented in each of the three parliaments was seven, and all three countries were governed by coalition governments. Generally speaking, minority or coalition governments are the rule in the Scandinavian countries. Their history and political culture is characterized by compromise and power sharing among political parties and major collective interests, such as unions and business organizations. Since World War II, Social Democratic parties have been dominant in each of the Scandinavian countries, especially in Sweden. Voter turnout ranges upwards of 80 percent or more. According to the nongovernmental organization, *Transparency International,* the level of corruption in the Scandinavian countries is amongst the lowest in the world. All three Scandinavian countries are affluent welfare states. Denmark and Sweden are members of the European Union (since 1973 and 1995, respectively) whereas Norway is not a member. Norway and Denmark have been members of the North Atlantic Treaty Organization (NATO) since its founding (1949), whereas Sweden is not a member.

The Scandinavian countries have been classified as almost indistinguishable cases of the democratic corporatist model characterized by the following: high newspaper circulation; early development of a mass-circulated press; a strong party press and strong political parallelism—that is, the extent to which the media reflect political or social divisions in society; sound journalistic professionalization and institutionalized media self-regulation; extensive state intervention in society, including the media sphere (but with protection for press freedom); and powerful public service broadcasting. Extensive welfare state policies and state intervention in the media sphere has coexisted with strong legal protection for the freedom of the press.

These characteristics are shared across these countries. Indeed, the histories of journalism and

partisan politics have been closely intertwined in all three.

The Party Press

Most Scandinavian newspapers were founded during the nineteenth and early twentieth century. This took place before the introduction of democracy and the institutionalization of political parties, but it was a process that was fueled by and, in turn, fueled the demand for basic democratic rights and freedoms. This period also overlaps with the formation of modern political parties, firstly as loose factions in parliament and then as nationwide organizations. Many prominent publishers were politically involved: being a publicist and being politically involved were two sometimes coinciding means of reforming and democraticizing Scandinavian societies. The press thus paralleled political divisions in society. This continued as the parties successively became institutionalized and mass-circulation of the press became the norm. Most newspapers aligned themselves with a political party. This was particularly true with the non-socialist press, which had been founded before the parties were created. Many social democratic or labor newspapers were initiated by the Social Democratic parties. In the end, almost all newspapers had a political affiliation. This party press was reflected in several ways: in ownership, staffing, readership, and journalistic content. Journalism was thus considered an integral part of politics.

This situation started to change during the second half of the twentieth century. The process was gradual and the timing differed across the Scandinavian countries. During the late 1960s and early 1970s, party newspapers remained the norm. In 1968, party newspapers represented 92 percent of all newspapers in Denmark, 92 percent in Sweden in 1975, and 60 percent in Norway in 1972. But over time, more newspapers declared themselves politically independent. While many newspapers still declare some political orientation in their editorial pages, their news departments are run as separate entities and the political orientations are no longer reflected in the news pages. Today, news journalism in Scandinavia is, generally speaking, politically independent and unaffiliated. The news paradigm and journalistic professionalism have replaced older political paradigms and affiliations.

This process was spurred on by many different factors, among them a declining number of newspapers, which made it economically rewarding for newspapers to de-emphasize their political affiliations in order to reach a broader audience; the development of academic journalistic education with its emphasis on journalistic values; and a new and stronger emphasis on journalistic norms and values such as objectivity and impartiality.

Newspapers

The Scandinavian countries are all newspaper-centric. Per capita circulation is among the highest in the world, and newspaper readership is high in all three countries. More than 70 percent read a newspaper on an average day. However, in recent decades the number of titles has fallen, despite government press subsidies in Norway and Sweden designed to prevent newspaper deaths. These subsidies may have slowed the decline, but have not stopped it. In any case, press subsidies make up less than 3 percent of total average newspaper revenue in Sweden, and but 2 percent in Norway.

In addition, newspaper sales and readership have fallen during the last decade or so, and newspapers are fighting this trend. A trend that emerged during the 1990s was the success of free newspapers, such as *Metro,* launched in Sweden in 1995 and now published in approximately 25 editions in 16 different countries. Traditionally, the press in each Scandinavian country was owned by national media companies. Mergers and media purchases, however, have changed the structure of newspaper ownership and publishing, and the Scandinavian newspaper market has become increasingly integrated with cross-holdings across borders. Only Norway has a law against ownership concentration.

In 2005, Denmark had 33 newspapers published four to seven times a week. At the national level, there are three major morning papers (*Morgenavisen Jyllands-Posten, Berlingske Tidende* and *Politiken*) and two newsstand tabloids (*B. T.* and *Ekstra Bladet*). There are also numerous local and freely distributed weeklies. In Norway there are 76 newspapers published four to seven times a week, with an additional 142 newspapers published one to three times a week. At the national

level there are two main newsstand tabloids (*Verdens Gang* and *Dagbladet*) and one morning paper (*Aftenposten Morgen*). In addition, there are several prominent regional papers. In Sweden, there are 84 newspapers published four to seven times a week and 70 papers that appear one to three days a week. There are two main national morning papers (*Dagens Nyheter* and *Svenska Dagbladet*) and two newsstand tabloids (*Aftonbladet* and *Expressen*), plus *Metro* with local editions around the country. In addition, there are several strong regional newspaper groups that each own several newspapers. The most important news agencies are Ritzaus in Denmark, Norsk Telegrambyrå (NTB) in Norway, and Tidningarnas Telegrambyrå (TT) in Sweden.

Journalism in Scandinavian countries is highly professionalized. Former links with the party press among mass-circulated daily newspapers have been severed. There is also, among both newspaper and broadcast journalists, a rather strong public service ethos. At the same time, there are signs that interpretive and sensational journalism is becoming more common, largely as a result of increasing commercialization. In all three countries there are both academic and nonacademic programs and courses in journalism. The typical length of a university program in journalism is three years, although in Denmark there is one six-year program in journalism. Over time, journalists have become increasingly well educated, and in the Swedish case, almost 70 percent of journalists have a journalism education.

Broadcasting

The rise of objectivity and impartiality as dominant journalistic values has been heavily shaped by the success of television. Television was introduced in Sweden in 1956, in Denmark in 1951, and in Norway only in 1960. While radio broadcasts date to the 1920s, television came to have far more importance than radio in terms of audience reach as well as in shaping journalistic norms and values. In all three countries, television was organized as a public service monopoly that, according to their charters, had to broadcast news in an impartial or objective manner. This focus on public service broadcasting is an example of the active state intervention in the media spheres of the three Scandinavian countries. At the same time, precautions were taken to ensure the editorial freedom of the public service media, and although broadcasters in the 1960s and 1970s were not insensitive to signals from the political sphere, the public service media were not "state" media. This is even more true today, when the public service companies are organized as limited companies or foundations, and thus are editorially insulated from the political sphere in their day-to-day businesses and editorial decisions.

The public service monopoly in broadcasting lasted for several decades, but broadcasting has more recently been successively deregulated. In Sweden, community radio was allowed in 1979, local commercial radio in 1993, and the first terrestrial commercial television channel began broadcasting in 1992. In Denmark, local radio services were permitted in the early 1980s, and nationwide commercial radio was introduced in 2003. With respect to television, the first terrestrial commercially financed (although state-owned) station was launched in 1988. In Norway, local and nonpublic service radio was allowed in 1981, and the first commercial nationwide radio channel was launched in 1993. The definitive end of the public service television monopoly came in 1992, when the first nationwide commercial television channel was launched. Thus, radio and television were deregulated at approximately the same time in all three Scandinavian countries. Public service television remains prominent, however, and the Scandinavian countries all have dual broadcasting systems. The average television viewing time (2005) per day is approximately 2.5 hours in each nation. All the broadcasting media that operate under a charter are supervised by special inspectorates: In Sweden, the *Radio and TV Authority* and the *Swedish Broadcasting Commission;* in Denmark, the *Radio and Television Board;* and in Norway, the *Media Authority.*

The Internet

Another increasingly important feature of the Scandinavian media environment is the Internet. As of 2005, Internet penetration and Internet use is among the highest in the world. In all three countries, more than two-thirds of the population have Internet access in their homes, and daily use exceeds 50 percent. Using e-mail is one of the most important applications of the Internet, but following the

news is also a prominent factor in Scandinavian Internet use. Virtually all major and many smaller media companies have their own webpages, and online news is both widespread and expanding. Blogging is a rather new phenomenon, but has become more common since 2005 to 2006.

Conclusion

Deregulation of broadcast media, development of the Internet, declining newspaper sales and readership, and increasing competition for advertising revenue has increased worries concerning a rapid rise in the commercialization of both media companies and their journalism in the Scandinavian countries. Although comparative studies are rare, research within each of the Scandinavian countries suggests that interpretive, sensational, and soft news is on the rise, whereas the share of hard news is declining. The scope of the changes are not clear, however, though it seems clear that although the absolute amount of informative and public affairs-oriented journalism has increased, the share of news as a proportion of total media output has fallen as new television and radio channels focus more on entertainment. Additionally, modern media owners are more focused on profits and the bottom line than used to be the case, and that has weakened the public service ethos.

Recent shifts and commercialization notwithstanding, changes to media and journalism are always tempered by experiences, perceptions and expectations shaped by history, and generally take place gradually. Thus, for the foreseeable future, media and journalism in Scandinavia will probably continue to be decidedly distinct from that in countries that do not follow the democratic corporatist model.

Scholarly Journals

Scholarly research in journalism and media studies plays an important part in the academic field's health, prestige, and stability. Most faculty members teaching journalism, and especially media studies, are expected to conduct research. They cannot gain promotion or tenure unless they publish research that is significant in quality and quantity. The number of peer-reviewed journals publishing academic research in communication, journalism, and media (unless otherwise explicitly stated, all references below are to such journals) has increased in recent decades. Both individual scholars and publishing companies have inaugurated new journals; national academic organizations are agreeing to sponsor and sometimes to subsidize new journals; and new organizations are seeking to legitimize themselves and their perspectives by establishing journals. Proliferation of journals is not unique to journalism: there has been almost literally exponential growth in academic journal titles since the seventeenth century, as well as expansion in the number of pages of existing titles. Meanwhile, already established journals rarely go out of business.

In a chapter bemoaning communication scholars' failure to produce applied work, and their habit of talking much more to each other than to those outside the field (Avery and Eadie 1993), one former editor recalled that when he asked ABC for funds to help launch *Critical Studies in Mass* (now *Media*) *Communication* (CSMC), published since

1984, he warned that CSMC writers would be highly critical of American broadcasting. Apparently, ABC was not at all worried. The great number of journals in the field as well as in cognate areas would seem to compound the lack of relevance of any one of them. Indeed, much of the more recent expansion has served to balkanize already narrowly defined niches. As a result, scholars are publishing in journals that few will read or even cite. And even fewer outside the niche will see them. Some academic organizations are trying to attract more popular/public attention to scholarship, for if the impact of scholarship is minor among other scholars, that impact is virtually nil on publics, civic organizations, media industries, and policy-makers. Indeed, practicing journalists have long ignored, if they have not ridiculed, academic media research and rarely read such journals.

Journal Structures and Processes

Many of the newer journals developed from the inability of scholars doing research that was new and innovative in theory, topic, or method (feminism is an example) to find appropriate outlets and audiences in the 1970s and 1980s. More recently, the motive to create journals seems primarily financial. Most journals in journalism and media studies are published by a few large commercial (i.e., not university) companies that enjoy economies of scale. Taylor & Francis, part of Routledge, publishes 24 communication-related journals, including all nine journals sponsored by the National Communication Association (NCA). Blackwell, which merged with John Wiley in 2007, publishes some journals of the International Communication Association (ICA), including its flagship quarterly, *Journal of Communication*. The Association for Education in Journalism and Mass Communication (AEJMC) publishes its own three association-wide journals, including its flagship, *Journalism & Mass Communication Quarterly*. Members receive all three, whether they read them or not. In contrast, AEJMC divisions use commercial publishing companies for their journals. A few universities produce their own journals, edited by their own faculty, though few are likely to earn profit or prestige. SAGE Publications produces 11 mass communications journals, and more were added in 2008. Like SAGE, Lawrence Erlbaum Associates (taken over by Taylor & Francis in 2007) has a heavy focus on communication, and publishes at least 15 relevant journals (on media ethics, religion, economics, public relations, and visual communication). Quarterly journals tend to cost $50 to $80 a year for U.S. individuals; unlike subscription prices in many social sciences, the society-published journal prices are not significantly less than commercial publishers.' Relationships with commercial publishers lessen the technical and financial responsibilities of the association and editors. But some authors complain about the policies of some commercial publishers—such as that the sole payment to authors for publishing in Taylor & Francis journals is free online access to their own article and a single copy of the issue in which it appears.

Associations choose editors of their journals for set terms. Editors generally select their own editorial boards and are expected to conform to the society's ethical standards. Editors of journals not connected to associations have no set terms. As in other disciplines, media journals are peer-reviewed through a double-blind process: the editor assigns submissions to two or three reviewers, who may or may not be members of the board but who do not know the identity of the authors, nor are authors told who reviewers are. Although rejected authors accuse reviewers of biases or prejudices of various kinds, there is no research to suggest that the long-accepted process of peer reviewing does not work. (Indeed, very little research has been done on scholarly media journals per se, except for meta-analyses of content—by method, topic, etc.—that are published.) Most editors try to issue a decision within two months, either asking for a revision or rejecting, generally (albeit not always) based on the reviews. Nonetheless, uncooperative reviewers can delay turnaround time by several months; this problem is drawing increasingly vociferous complaints from authors and editors. Rejection rates also vary, running at a higher rate at the most prestigious journals that tend to accept less than 15 percent of submissions. Journals accepting more than 20 percent of submissions are generally regarded as less credible. The primary academic associations, including the ICA, NCA, AEJMC, and the Broadcast Education Association (BEA), generally provide a small stipend to their editors to cover expenses, with the editors' universities expected to provide further support. Commercial publishers, too,

also provide stipends; in a few cases, they even pay a small percentage based on subscription size. In this field, authors are never paid for published articles, but neither must they pay to be reviewed or published ("page charges"). Reviewers are also never paid. Blackwell includes on its website a document outlining major ethical principles of academic publishing as the basis by which editors and academic society partners can develop their own ethics policies.

Thomson Scientific (formerly ISI) compiles annual *Journal Citation Reports*; in 2007 the database ranked 44 journals in communication and media. A consortium of communication and media program representatives proposed adding some 25 journals to the database, but none was added to the list. (In some cases, ISI said the journals were too new to have a sufficient track record; others were rejected as not warranting ranking.) ISI's most important statistic is the "impact factor," which essentially measures how often a journal's articles are cited. ISI-ranked journals often report their impact factor and ranking. But, as ISI itself once warned, its data cannot replace traditional quantitative and subjective input. Moreover, this system reinforces the importance of U.S. (and English language) journals, such that, worldwide prestige and high status requires publishing in English-language journals. Indeed, the entire publication system, including such rankings, serves to push journals toward the research mainstream. Meanwhile, because citation standards differ among fields and impact data can be manipulated, use of the data may be problematic. While major research universities value citations and having an international impact (i.e., readership), other criteria influencing where authors submit their manuscripts include turnaround time, specialized topic and/or perceived interest of editors or readers, and important new initiatives in either topic or methodology. Young scholars looking for a quick publication may seek out journals with high acceptance rates; those applying for tenure or promotion are more likely to consider their university's requirements. Some journals are international in their subject coverage and feature editors or board members from multiple countries.

Potentials of Online Publishing

Moving journals to the Internet was widely discussed in the 1990s. Electronic submission and tracking systems, now widely available, lower the cost and time otherwise required to distribute manuscripts, track down referee reports, and communicate with authors. The availability of digital versions of journals and other kinds of Internet information also means that checking for plagiarism and double-checking references, for example, are easier. Online *publication* goes even further by virtually eliminating most production and distribution costs, while exploiting the advantages of sound, color, hypertext, and other multimedia applications. One disadvantage, however, is a lag in online journal prestige or scholarly respect. Ha (2003) notes that faculty and institutions may see online journals as less valuable because of the perceived ease of starting one, worries about their long-term stability, and uncertainty about the quality of the peer-review process; these factors often resulted in a vicious cycle of low submission rate and low quality. Back issues of many journals are available through various online databases, with an embargo (usually a year) on recent issues; subscribers receive access to both print and online versions. Unfortunately, this dual mode, while offering prestige and ease of access, is inefficient and costly. In any case, few media journals are thus far exclusively available online, with most wholly online journals focusing on Internet and/or new media research; other journals about new media continue to be print based.

Whether enough important scholarship is being produced to justify the amount of material published and whether scholars have the time and energy to referee, guide, and edit submissions to these journals remain unclear. Nonetheless, given the importance to scholarly careers and to universities seeking status of producing and publishing research, the number of journals will continue to increase. At the same time, continuing reduction in library budgets has forced cuts in subscriptions, especially to lesser-used journals. Concerns of such organizations as Scholarly Publishing and Academic Resources Coalition (SPARC), an international alliance of libraries that advocates less expensive ways to disseminate scholarly research, suggest that the future of small paper-based journals is uncertain.

Science and Technology Journalism

Science journalism uses news media to convey information about science and technology topics to the general public. The primary task of a science journalist is to render the complex, precise, and often jargon-laden findings of scientists, inventors, and engineers into a form that the average reader or viewer can understand and appreciate, while still communicating that news accurately and objectively. In recent decades, the amount and extent of scientific news has grown rapidly, with technology playing an increasingly central role in society and everyday life. Health/medical issues and environmental reporting have developed into distinctive "news beats."

The differences between the methods and goals of journalists and of scientists, particularly their distinctive ways of presenting information, have led to challenges for both. Journalists tend to have a greater inclination toward sensationalism and speculation than scientists, whereas scientists focus more on explicit facts and empirical measurement. Scientific reports and studies are often full of numbers, exceptions, and qualifications, and science is an incremental process of discovery composed of many experiments of limited scope. Science journalists regularly come under criticism for oversimplifying or misrepresenting scientific findings and for offering interpretations that scientists did not intend. Scientists, in turn, are viewed by journalists as uncooperative, evasive, and needlessly obtuse. According to the First Amendment Center study, *Worlds Apart,* a majority of journalists surveyed found scientists as sources to be egotistical and overly skeptical of the public's (including journalists') ability to understand even basic scientific principles.

Nonetheless, scientific advances, debates, and discoveries continue to attract the attention of the public. Newspapers describe the latest inventions and chronicle the progress of research; magazines explore scientific concepts and examine the impact of new technologies in more depth. In interviews broadcast on radio and television, scientists discuss current research and comment on ethical and political issues surrounding scientific advances. On television cable channels, science is increasingly offered as entertainment laced with educational content.

It's now widely recognized that the news media are the primary source of scientific and technological information for most people. A 1997 study by the Pew Research Center for the People and the Press found that a fifth of Americans polled stated they enjoyed news stories about science and technology, a higher percentage than for stories about religion, business, or the arts. Another 1997 report, "Americans Talk about Science and Medical News," by the U.S. National Health Council surveyed

2,256 adults and revealed that 75 percent regularly read science and health news and that 58 percent had changed their behavior or beliefs based on such information.

Development

Initially, science journalism was prepared by the scientists themselves. In early newspapers, any attention to science reflected current ideals of progress and national pride. During the late 1700s in broadsheets in America and Europe, articles by botanists, geologists, and explorers sought to satisfy public curiosity about the vast North American and African continents. By the 1800s, a growing number of inventors described their own discoveries to the public; articles in the popular press heralded innovative agricultural techniques or explained the medicinal value of newly discovered plants. Reports of heated debates within scientific communities on new inventions and old theories often made the front pages.

In the explosion of technological optimism that marked the late 1800s and early 1900s, newspaper coverage of science rose dramatically. Indeed, by the 1920s some professional journalists were specializing in science and medicine. A few newspapers, like *The New York Times,* began to assign reporters to cover science exclusively. One influential journalist, Waldemar Kaempffert, started his career in 1897 at *Scientific American,* leaving in 1915 to become editor of *Popular Science Monthly* and then turning to newspaper journalism in the 1920s. Kaempffert served as science editor of *The New York Times* from 1927 to 1928 and again from 1931 through 1956. Another *Times* reporter, William L. Laurence, who worked at the paper from 1930 to 1964, helped found the National Association of Science Writers in 1934, a further sign of science journalism's growing professionalism.

Expansion

Much of the increased attention in the press derived from science's expansion into new realms of study and from genuine public interest, but the scientific community's promotional efforts also played a role. Even though some scientists approached the popularization of their fields with skepticism, others such as physicist Robert A. Millikan and astronomer George Ellery Hale believed that publicity would help in attracting government support and private investment and in overcoming the public's negative view of the development by scientists of horrific weapons during World War I. The American Chemical Society, for example, launched a public relations campaign to popularize new discoveries in chemistry. The society established its permanent "News Service" in 1919, the first of several such created by various scientific associations.

The founding in 1921 of "Science Service," a news syndicate underwritten by newspaper publisher E. W. Scripps, was a direct outgrowth of these public relations campaigns by scholarly societies. Directed by chemist E. E. Slosson and science writer Watson Davis, Science Service initially sought to assist journalists and news operations in putting forth accurate stories by issuing press releases about new scientific advances and providing illustrations, but the organization's ultimate goal was to increase news coverage of science and technology overall. Eventually, Science Service engaged in radio production as well, providing programs to stations at no cost and thereby trumpeting the "benefits of scientific progress" to millions of listeners.

Concurrent with increasing coverage of science in newspapers, more space was being devoted to science and technology news in a variety of magazines. By the end of the nineteenth century, monthlies like *Harper's* and *Atlantic* and newsweeklies like the *Saturday Evening Post* and *Collier's* regularly carried reports and stories of how advances would benefit public health, agriculture, the home, and industry. Specialized periodicals like *Scientific American* (founded in 1845) and *National Geographic Magazine* (1888) sought to translate technology and science for nonspecialist readers. *Scientific American*'s focus reflected the growing interest in invention and technology, while *National Geographic* tapped Americans' fascination with exploration and discovery. From its first issue in 1872, *Popular Science Monthly* sought to popularize science, drawing its authority from close connections to the scientific community. The first two editors, Edward L. Youmans and James McKeen Cattell, emphasized expertise through publication of essays by many of the great scientists of the day.

Education and Entertainment

By the early twentieth century, many readers were seeking more practical information—how to build,

operate and repair technological innovations from typewriters to telephones to electric lamps to washing machines. Magazines like *Popular Mechanics,* founded by Henry H. Windsor in 1902, sought to meet this interest with articles that explained the "mechanics" behind new technology and consumer devices. Since its inception, the magazine has chronicled the design progress of radio, television, airplanes, automobiles, computers, rockets, home appliances, and countless other "gizmos." By 1909, *Popular Mechanics* had a circulation over 200,000. In 1915, as part of the same trend, *Popular Science Monthly* began to focus more on technology and on scientific theories of interest to amateurs and hobbyists. The new version, a dramatic change from the previous scholarly journal, had numerous short, easy-to-read articles by nonscientists intended for the "home craftsman…who wanted to know something about the world of science." The magazine's circulation doubled within the following year.

The Scopes "monkey trial" over the teaching of evolution in 1925 stimulated public interest in science even more, reflected by countless newspaper columns, magazine articles, and popular books debating the viability of the concept of evolution and whether it should be taught in schools. Moreover, the trial featured one of the first remote news broadcasts. The open microphones of WGN, a station owned by the *Chicago Tribune,* gave listeners access to the live testimony, arguments, and judge's decision. From its earliest days, radio offered an important platform for scientific discourse, to the extent that in 1925 opponents of evolution attempted to ban discussions of it from radio altogether.

The approach to broadcasting science initially differed little from how scientists had performed in public lecture halls in the late 1800s, with local radio stations simply providing larger audiences for their lectures and demonstrations. But as professional scientific societies increasingly sought educational outreach through radio, they realized that to compete for public attention their science would have to be presented in more entertaining formats. Some began to work directly with commercial networks to develop such programming. Science Service's *Adventures in Science,* broadcast on CBS from 1938 until 1957, attempted to infuse drama into descriptions of the latest discoveries. The Smithsonian Institution's radio program *The World Is Yours* (1936–42) included segments on its own scientific research, part of a Depression-era Works Progress Administration project. The American Association for the Advancement of Science co-produced with NBC three separate radio programs from 1937 through 1940, which it perceived as a way to encourage confidence in scientific research and methods.

Radio played a significant role in public education in other areas. From the beginning of both educational and commercial broadcasting, farm market reports included scientific advice on such topics as pest control and soil conservation. For 32 years beginning in 1928, NBC's *National Farm and Home Hour* integrated agricultural news and educational presentations with entertainment, alternating segments produced by the U.S. Department of Agriculture with the network's own commercial sponsors. By the early 1930s, government agencies, dairy councils, pharmaceutical companies, and even insurance firms were all producing public health broadcasts. One of the most visible sponsors was the American Medical Association, which underwrote the production of various radio series from the 1930s through the 1950s about new medical procedures and treatments.

The increasing use of dramatization on radio represented an important change in science news tone and techniques, one not always welcomed by scientists. Radio producers emphasized research's "dramatic" aspects to grab the attention of audiences accustomed to comedies, mysteries, and even news programs. One successful and acclaimed series, *The Human Adventure* produced by the University of Chicago from 1939 to 1946, recreated historic moments of discovery through reenactments by actors to explain complex theories for laymen—an early form of "docudrama." Similar shows employed orchestras and Hollywood stars to attract audiences. With radio broadcasts, science news shifted from efforts driven solely by the educational goals of the scientific community to entertainment designed to hold the interest of listeners.

Although World War II severely curtailed the flow of scientific information to the public in all nations, American officials recognized the importance of a science-savvy citizenry. Throughout the war, various government agencies and scientific organizations offered carefully censored news

about new technologies, and both military and civilian applications of scientific research. Respected *New York Times* reporter William Laurence was the only journalist invited to be present at the July 1945 "Trinity" atomic bomb test at Alamagordo, New Mexico, to write the official press releases about the atomic bomb, and to accompany the mission to bomb Nagasaki. He subsequently wrote a book and won a Pulitzer Prize for his accounts of these events.

No scientific development to date sparked such interest among the public as the "A-bomb." Suddenly science had undeniable relevance to government policy and human survival. After the war, the American news media moved quickly to offer articles and programs to "explain" the atom, even while conforming to the government's cold war restrictions on the discussion of weaponry. With the establishment of public information bureaus by the Atomic Energy Commission and other agencies, it became obvious even to laymen that scientific advances were instruments of political and national scope. However, scientists, government officials, and newsmen did not always agree on when, how, or if science should be shared with the public. Science journalists, once inclined to be protective in promoting science, began engaging in investigative and critical reporting about public and private research, the impact of new technology, and science's social and political contexts. Editorials and documentaries played a vital role in enhancing public debate about the development of nuclear, chemical and biological weapons and, later, the space race.

Television offered a unique platform for visualizing science for the public. Technical explanations could be supplemented with animation; programs could include film of scientific tests or natural phenomena and even show images from microscopes and telescopes. Early series like NBC's *The Nature of Things* (1948–54) featured illustrated talks and interviews with guest scientists. Even more popular were programs in which hosts offered visual displays of scientific theories and concepts, as in the primetime show *The Johns Hopkins Science Review* (1948–54) and the children's series *Watch Mr. Wizard* (1951–65) starring Donald Herbert. Each week, "Mr. Wizard" would explain one or two scientific principles to children through simple demonstrations and experiments, often using commonly available items. However, with a few notable exceptions such as these, the majority of science reporting on American television has not appeared in commercial series, but within news reports or in public programming.

Television transformed coverage of space exploration into show business, culminating in the initial *Apollo* moon landing of July 1969, but for a variety of reasons network news broadcasts included only limited details about the science behind it. In the 1960s, to address growing public interest in such details, network news operations began to employ their own science and medical correspondents, often with professional degrees, to produce special reports or comment on emerging controversies. Another approach was taken by the nature series that became popular following the success of *Zoo Parade* (1949–57) and of *Wild Kingdom* (1953–76) starring Marlin Perkins. Beginning in 1965, television specials produced by the National Geographic Society set new standards for video quality, and exploited television's ability to transport viewers to exotic environments. The producers of these nature programs did not merely display beautiful scenes or dramatize the lives of animals, they sought to highlight conservation and environmental issues, with sometimes tenuous links to the underlying science.

Despite public interest and efforts such as the above, the amount of news about "serious" science on American television has been modest at best, most of it sustained by external funding rather than commercial sponsorship. Public television became the primary source of science news in the 1970s, beginning with the premiere of the *Nova* series in 1974 and the broadcast of the British miniseries *Ascent of Man* (1975), followed in 1980 by astronomer Carl Sagan's *Cosmos,* which established a model for lavish science documentaries, distinguished by their charismatic scientist-hosts, computer-generated graphics, and sound bites by recognized experts. Science programming since has demonstrated the dominance of this entertainment approach. In-depth science news stories, which generally require more time than available in most newscasts, are now usually relegated to the websites of cable news networks such as CNN, Fox News (which labels it "scitech"), and MSNBC.

Although journalists once enthusiastically tracked scientific progress, a number of social concerns in

the 1970s and 1980s, such as the debate over regulation of recombinant DNA research and the Three Mile Island nuclear meltdown incident of 1979, chilled previously warm relations between scientists and reporters. Other developing news, such as the ethics of stem cell research and the perceived success and long-range value of NASA's space program, focused attention on the importance of accurate reporting and on the adverse consequences of sensationalism. Despite, or perhaps because of, such controversies, many newspapers initiated regular science pages in the 1980s and 1990s; online news sites now regularly include sections on science, technology and health. Popular magazines continue to be important sources for information about science, thanks to writers like biologist Stephen Jay Gould and physicist Stephen Hawking and to glossy presentations like *Discover* (launched in 1980) and *21st Century Science & Technology* (1988). Currently, Americans interested in science and technology news can access a wide range of print, broadcast, and Internet sources, many of them cross-referenced to assist in the search for relevant information.

Challenges

Scholars at the First Amendment Center at Vanderbilt University conducted a two-year survey of 1,400 scientists and journalists to determine how the two groups viewed each other. The results of that survey, published as *Worlds Apart* in 1997, showed that neither thinks the media do a good job at explaining science to the public. The results revealed a serious lack of confidence in the media's understanding of how science is done and how to interpret the results of research studies. Examples include journalists' frequent confusion about how to interpret statistics, probability, and equations. Journalists in general do not understand the peer-review process in science, and hence may report findings that have not been subjected to independent verification. And they tend to look for sensational results (often termed "eureka!" stories), whereas science usually advances through a series of small, incremental steps. In turn, journalists stated that scientists' insistence on technical jargon and the extensive exceptions with which they limit their findings make communicating their discoveries to the public an almost impossible task. The pressure of deadlines, time and space limitations, and competition only makes this task more daunting.

Journalism training produces general-interest reporters—not science reporters. Most journalists have little or no background in or affinity for science or mathematics. Furthermore, due to budget considerations at newspapers and news stations, a science reporter is often responsible for covering several (or all) science disciplines, which inevitably leads to a lack of insightful, dependable coverage of each or, worse, focus upon pseudoscientific studies. Another challenge is the sheer amount of information journalists working under deadlines are expected to absorb in short amounts of time. As one anonymous respondent in *Worlds Apart* put it: "Journalists are constantly being asked to become crash experts in new fields. Instead of being able to develop a depth of knowledge on one particular beat…I might be writing about cosmology one week and immunology the next."

Specific challenges faced by the science journalist on many stories—getting access to scientists, getting them to talk about their work, the work of their peers, or recent studies, their implications or failings—are also difficult to overcome. Before a journalist can craft a story, he/she needs to grasp the science behind it and identify reliable sources. Sorting through the intricate relationships among academia, the government, and the world of commerce is a major task. Most innovative technological and science research is now undertaken by private companies or the federal government, both of which have a vested interest in insuring a cloak of secrecy. Scientists rarely see talking to the media as a professional obligation. Moreover, it may not benefit them professionally to be quoted in stories taking a critical approach to government studies, commercial products, or the research of other scientists.

The fact that journalists frequently ignore or minimize the precise, qualified language that communicates the tentative nature of research findings angers and dismays many scientists. Scientists in the *Worlds Apart* survey indicated that they are often reluctant to talk to the media for fear of having their work mischaracterized or distorted. Science is a world of qualifications and exceptions which doesn't come through in most reporting. Scientists are notoriously reluctant to state unequivocally that their most recent discovery is "newsworthy"

or a "breakthrough," which, of course, is exactly what the journalist seeks.

By its nature, the work of most scientists proceeds by degree, often slowly, and not with a "eureka" leap forward. In many cases the importance of scientific work is not immediately obvious, sometimes even to the researchers themselves. New discoveries are often but an incremental step toward overall understanding. Working within the bounds of the accepted "scientific method"—observe, hypothesize, test, observe, replicate—only the most foolhardy or unscrupulous researcher or inventor would make the kind of sweeping claims that headline writers desire. On the other hand, journalists contend that if they wait for every conceivable issue to be settled and verified, for every controversy or anomaly to be resolved, the story will never be told. The issue is not that reporters and editors don't respect the integrity of the scientific method, but that journalists are compelled to report news on a constant day-to-day (or more often) basis whereas scientists often have months or years to complete and publish their findings.

Scientific information funneled through journalists soon meets another obstacle: the editors and producers who decide which stories will be printed or broadcast. These uncertain gatekeepers determine the amount and type of science and technology news that reaches the public. Yet few editors feel qualified to make sound judgments about the merits of science stories. To approach science reporting with a traditional journalistic judgment of newsworthiness and objectivity is fundamentally incompatible with how science works. Editors favor interesting stories about dramatic and controversial topics such as global warming, intelligent design, and stem cell research. "When we talk about the marriage of science and journalism, our dilemma is clear," says former science writer Kathy Sawyer of *The Washington Post* (cited in *Worlds Apart*). "Science is slow, patient, precise, careful, conservative and complicated. Journalism is hungry for headlines and drama, fast, short, very imprecise at times."

Moreover, few editors typically have science stories vetted by researchers or experts before they are printed. Too often, without proper framing and context, "eureka" stories are just parroted releases from public relations departments of scientific associations or high-tech companies. Most science news produced by the media is second- or third-hand (or worse), for journalists almost never have time to read scientific journals, attend science conferences, accompany scientific expeditions, or grasp the significance, or lack thereof, of new findings announced by these. Too often, editors err on the side of sensationalism so that "boring" but significant stories don't see print or airtime. Don Melnick, a professor of biology at Columbia University, states in *Worlds Apart* that if a story "doesn't sound newsworthy or front page–worthy, it will be buried or not printed at all. That tends to promote people hyping their research." Editors and news directors, according to John Wilford of *The New York Times,* simply underestimate the ability of their readers to understand well-written science stories.

The fields of both science and journalism tend to attract individuals who are above average in intelligence and education. The best professionals in both fields are highly motivated, curious, and critical. The very best defy conventional thinking in the pursuit of the truth. Nevertheless, according to the *Worlds Apart* study, only 11 percent of the scientists interviewed said they had confidence in the press to present fair and accurate science stories. Less than a quarter of the journalists viewed scientists as credible and useful sources. Yet nearly three-quarters of both groups stated that they felt it vital for the public to know about current scientific research.

A number of professional organizations exist which seek to overcome these challenges and foster excellence in science journalism. The National Association of Science Writers (NASW) was founded in 1934 by several prominent newsmen; according to its constitution, it strives to insure the dissemination of accurate information regarding science and technology in keeping with the highest standards of journalism and to promote the professional interests of science writers. In the wake of the launch of the world's first artificial satellite, *Sputnik*, in 1957 and a perceived trend toward science as entertainment, some members of the NASW feared that their craft might be relegated to "beat" coverage. Together with a number of scientists concerned about the state of science news, these journalists created a nonprofit educational foundation separate from the NASW; this Council for the Advancement of Science Writing (CASW) held its first meeting in

January 1960. It has always been composed of distinguished journalists and scientists working together to develop and fund programs intended to aid both groups in supplying useful information about science to the public. Through workshops, scholarships, conferences, and publications for journalists and scientists, the CASW seeks to overcome the challenges mentioned above.

Conclusion

Understanding scientific developments is vital to the ability of consumers and lawmakers in deciding if the risks (for instance, advances in artificial intelligence) and the benefits of new technology and science are acceptable. Increasingly too, the funding for and morality of some research (such as cloning) has come under the scrutiny of journalists in their role as watchdogs for the public interests. Scientific research, new technologies, paradigm shifts, and challenges to accepted scientific truths are not just science stories. They play a major role in key political, economic, cultural, and social policy debates, as well as in public dialogue. In this sense, the news provided by science journalism is critical in helping people make choices about a fast-changing world.

Despite this, many see a perilous future for science journalism, as evidenced by the 2008 decision by CNN to eliminate its seven-person unit covering science. Curtis Brainard of the *Columbia Journalism Review* wrote in his column on December 8, 2008, "the decision to eliminate the positions seems particularly misguided at a time when world events would seem to warrant expanding science and environmental staff." And unfortunately, the development at CNN is not isolated; even prestigious science news magazines such as *Aviation Week & Space Technology,* which closed its Cape Canaveral bureau in November 2008, are trimming coverage of science news. According to a 1997 National Health Council study, newspaper coverage of science, outside the areas of health and environmental reporting, is steadily eroding in both quantity and quality. In reviewing their newsletters, there appears to be as much pessimism and prognostication among members of NASW and CASW about the decline of science journalism in the mainstream news media, as there is about the decline of good journalism in general.

However, new communication technologies have opened new opportunities for science journalism. At the twenty-fifth-anniversary celebration in 2008 of the Knight Science Journalism Fellowships, a prestigious program that brings career journalists to MIT for a year of study, editors and scholars sought to predict the future form of science journalism. Addressing the gathering Ted Rosenstiel, director of the Project for Excellence in Journalism, said there is "a golden age of science journalism ahead," marked by science blogs, specialized online news sites loaded with hyperlinks, and interactive media packages. He claimed that science journalists' stories will not be the "final destination" for readers; instead the new generation of journalists will be seen as "navigators, aggregators, explainers and referees" of scientific discoveries and debates. Whatever the medium, the challenge remains: to inform readers about important scientific developments without sacrificing accuracy or understanding.

Secrecy and Leaks

Nearly every society maintains an often elaborate structure of government information secrecy and security. The leaking (unofficial and illegal release) of state and industrial secrets is a major concern to government authorities and private corporations as well as those concerned with civil liberties and freedom of communication. This has taken on a heightened urgency in the United States since the attacks of September 11, 2001.

In any democracy there is an inevitable tension between the government's inherent need for secrecy in order to operate and the public's right to access or at least know about government information. The underlying question is: What is the best way to safeguard legitimate government secrets in a manner consistent with freedom of the press?

Layers of Secrets

Secrecy is the governmental or corporate practice of keeping information from the public for various purposes. The term often refers to government secrecy, although corporate secrecy attracts more attention in the press. The key rationale for government secrecy is national security, whether internal or external. In American journalistic practice a government document or statement may be classified in any of three known levels, defined by how much damage each can cause to national security:

- "Top Secret"—unauthorized disclosure could cause *exceptionally grave damage* to national security;
- "Secret"—unauthorized disclosure could cause *serious damage* to national security;
- "Confidential"—unauthorized disclosure could cause *damage* to national security.

A good illustration of government secrecy in practice is the classifying of information affecting national defense and foreign relations. National security is no talismanic justification for blanket secrecy, however. Government secrecy should be balanced with the public's right to know. As the U.S. Supreme Court concluded in *New York Times Co. v. United States* (1971), more widely known as the "Pentagon Papers" case, the First Amendment bars authorities from invoking national security as a justification for secrecy on a *carte blanche* basis against news media.

Over the years, however, the U.S. government has invoked the "state secrets" privilege, which protects classified government information from disclosure in judicial proceedings. In recognizing the state secrets privilege, the Supreme Court held in *United States v. Reynolds* (1953) that if disclosure of the classified documents is proved to pose "a reasonable danger" to national security, the government can withhold the documents from the judges.

The state secrets privilege was rarely used. Between 1953 and 2001, the government claimed the privilege only 55 times. But the Bush administration's assertion of the privilege has multiplied dramatically. From 2001 to 2007, the administration of George W. Bush (2001–09) had resorted to the privilege on 39 occasions, and none of them had been rejected. Indeed, according to privacy lawyers Gayle Sproul and Jeanette Melendez Bead, the state secrets privilege "has proven the most fertile ground for the test of the principle of dismissal for refusal to produce evidence in defamation actions."

The raging controversy over the government's alleged abuse of the state secrets privilege in recent years has led Congress to develop a legislation check on the privilege. The State Secret Protection Act, introduced by Senator Edward Kennedy and Senator Arlen Specter in early 2008, would require judges, prior to ruling on a state secrets claim, to first examine the documents or evidence for which the privilege is invoked rather than deferentially accepting government assertions that the evidence

is too sensitive to be publicly disclosed, even to a judge in chambers. The bill would prevent the government from abusing the privilege as it did in *Reynolds* and its progeny. Tellingly, the *Reynolds* case pivoted around the government's (mis)classified investigative report on a B-29 bomber crash in 1948. But declassification in the mid-1990s revealed that the government's "state secret" document had nothing to do with national security but everything to do with the government's cover-up of its carelessness in causing the fatal midair accident.

Government efforts to protect secrets, more often than not, are frustrated by leaking, or disclosing of confidential information to the public (usually by the press) by informal rather than official channels. Leakers may have a gripe with their employer (government or corporate), may feel that something they know should be more widely known, may be politically prompted to speak out, or may seek to damage a company or government agency. One of the more far-reaching leaks in recent American history happened when former Pentagon official Daniel Ellsberg provided copies of much of the multivolume Pentagon Papers (a top-secret Defense Department study of U.S. involvement in the Vietnam War) in early 1971 to *The New York Times* and *The Washington Post*. Though momentarily constrained from publishing the rest of the story (after a few segments had appeared), the newspapers quickly won Supreme Court agreement that publication was legal.

Rules of the Game

The provision of unattributed but official news to the press by those "in the know" is not a haphazard hide-and-seek process. It occurs when news media assure anonymity to the source of a story. American journalists and government officials have over the years developed terms to define their source confidentiality. The journalistic ground rules for attribution to anonymous sources, albeit not universally agreed upon, are as follows:

- "On the record"—information can be directly or indirectly quoted and attributed specifically to the source by name and title
- "Background" ("Not for attribution")—information can be quoted, but its source cannot be identified by name or by title
- "Deep background"—information can be used but no reference of any kind can be made to its source (leaks would fall under this category)
- "Off the record"—information cannot be used at all; it is only for the reporter's knowledge

Some American news organizations distinguish between anonymous and confidential sources. Anonymous sources are those noted above, whose identity is kept out of the news story, while confidential sources are those whose identity is protected by news media even when a court seeks that identity. Norman Pearlstine, former editor-in-chief of Time, Inc., explains further:

> All confidential sources are anonymous, but most anonymous sources are not confidential. An anonymous source won't see his or her name in the publication. The commitment to maintain a source's anonymity is serious and worth defending in the courts. But if you lose in the courts, you give up the name. A confidential source has a contractual relationship with a reporter and with the publication.

Government Secrecy Versus Press Freedom

In the United States, there is no law similar to the 1911 Official Secrets Act of the United Kingdom, which sets forth the news media's criminal liability for gathering and disseminating sensitive secrets. This explains in part why no American media organization or reporter has yet been prosecuted for disclosing government secrets under the Espionage Act of 1917, which makes the press potentially liable for receiving or disseminating national security secrets. More importantly, the free press clause of the First Amendment prevents the government from punishing the press for publication of truthful information that is *lawfully* obtained by the media unless the punishment is justified by the government interest of the highest order. Although not in the Espionage Act context, the Supreme Court in *Bartnicki v. Vopper* (2001) rejected the government's contention that it should be allowed to punish journalists for receiving and publishing information from a source who has obtained it unlawfully. The Court stated that it would be "quite remarkable" to hold a law-abiding journalist subject to punishment just for receiving and publishing information merely "to deter conduct by a non-law abiding third party."

Nonetheless, several statutes serve as a possible legal authority for the government to subject news media to criminal liability for news reporting. The Espionage Act is a case in point. Under the inchoate liability theory, news reporters can be held liable for aiding and abetting whoever supplies protected state secrets.

A federal district court's 2006 interpretation of the Espionage Act offers a useful example of the legal authority of the statute. *United States v. Rosen* (2006), citing both common sense and precedent, held that the federal law authorizes punishment of "those outside the government" for unlawfully receiving and deliberately distributing national security secrets. Professor Geoffrey Stone of the University of Chicago Law School counters the *Rosen* court's interpretation of the Espionage Act with a press-sensitive proposition: The government can punish a news reporter for receiving or soliciting the disclosure of national secrets from a government employee if the reporter:

- expressly incited the employee unlawfully to disclose classified information;
- knew that publication of the information would result in likely, imminent, and grave harm to the national security; and
- knew that publication of the information would not meaningfully contribute to public debate.

Also potentially affecting the freedom of the press to gather and possess, if not necessarily to publish, national security information are, among others:

- *The Atomic Energy Act* (1946), which prohibits anyone who possesses "restricted data" from communicating or disclosing such data to any person "with intent to injure the United States or with intent to secure an advantage to any foreign nation." The Act does not make clear if Congress intended the act to apply to the news media. *United States v. Progressive* (1979) indicates that it could;
- *The Intelligence Identities Protection Act* (1982), which prohibits the disclosure of information relating to the identity of covert agents by anyone authorized to have access to classified information identifying the agent or by anyone who "discloses any information that identifies an individual as a covert agent to any individual not authorized to receive classified information, knowing that the information disclosed so identifies such individual and that the United States is taking affirmative measures to conceal such individual's classified intelligence relationship to the United States";
- *The Criminal Code* (1950), which criminalized the knowing and willful publication of "any classified information . . . concerning the communication intelligence activities of the United States," imposed criminal liability on any person who steals, or knowingly converts government records or "thing[s] of value" of the United States, and criminalized the receipt or retention of any such record or thing if the recipient intends to "convert it to his use or gain," knowing that it has been stolen or converted;
- *The National Security Act* (1947), which created the CIA and, in a 1984 amendment titled the CIA Information Act, barred much of the CIA's actions from public scrutiny by prohibiting "intelligence sources and methods from unauthorized disclosure";
- *The Freedom of Information Act* (FOIA, 1966), which provides for a statutory right of public access to federal government records, and contains a "catch-all" exemption that covers matters that are "specifically exempted from disclosure by statute . . . , provided that such statute (A) requires that the matters be withheld from the public in such a manner as to leave no discretion on the issue, or (B) establishes particular criteria for withholding or refers to particular type of matters to be withheld"; the "statutory exemption" clause of the FOIA has allowed federal agencies to cite more than 100 laws relating to exclusion of government documents.

Government employees have a freedom of speech right that is more circumscribed than that of ordinary citizens when their speech affects the interest of the government as an employer in promoting an efficient public service. This is especially true when national secrets are knowingly revealed by government employees without any countervailing public interest of whistle-blowing about unlawful government actions.

For example, in 1985, the federal government successfully prosecuted former naval intelligence

analyst Samuel Morison for providing secret spy satellite photos to a British defense magazine. In upholding the Espionage Act's application to the crime of leaking national security information to the press, the Fourth Circuit Court of Appeals, in *United States v. Morison* (1988), dismissed the First Amendment's relevancy caustically:

> [I]t seems beyond controversy that a recreant intelligence department employee who had abstracted from the government files secret intelligence information and had willfully transmitted or given it to one "not entitled to receive it" . . . is not entitled to invoke the First Amendment as a shield to immunize his act of thievery. To permit the thief thus to misuse the Amendment would be to prostitute the salutary purposes of the First Amendment.

If classified information is already leaked to the public, some contend that the government can do little in punishing the "downstream leakers" who disseminate the information more widely to impact public policy debates. Legal precedent generally allows news media to publish information which they have legally received. The *Rosen* court disagreed: The government can use the Espionage Act to punish the further trafficking of the leaked government secrets that, as judicially limited, threaten genuine harm to national security.

Leaking and the Journalist's Privilege

Because the leaking of government secrets likely entails statutory violations, it can pit the journalist's privilege to protect confidential news sources against the government's interest in finding who violates the law. In 2005, for instance, *New York Times* reporter Judith Miller spent 85 days in jail for disobeying a court order to testify about her source, who allegedly "outed" a covert Central Intelligence Angency (CIA) agent in violation of the Intelligence Identities Protection Act.

In addressing whether journalists are privileged by the First Amendment to protect their sources, the U.S. Supreme Court in *Branzburg v. Hayes* (1971) held that journalists had no such privilege to refuse to testify before grand juries. Justice Byron White, writing the majority opinion of the Court, rejected the reporters' assertion that forcing them to reveal the identities of confidential sources would deter the free flow of news information guaranteed by the First Amendment. While acknowledging that news gathering was, to a certain extent, protected as a right under the First Amendment, he noted that the Amendment did not invalidate "every incidental burdening" of the press from the enforcement of generally applicable civil or criminal statutes.

While there is no federal law on the journalist's privilege, state shield laws provide protection to journalists in one way or the other. As of July 2008, 36 states and the District of Columbia had shield laws on the books, though they vary from state to state. Their protection of journalists is far from complete, however, and courts typically interpret them narrowly. Besides the statutory recognition of the journalist's privilege in 37 jurisdictions, 22 states accept the privilege by common law. There have been several attempts to pass a federal shield law, but to the time of writing, none has become law.

The 2007 version of the proposed federal legislation would accord journalists a qualified privilege to shield confidential sources and information. It would protect journalists unless the information is needed "to prevent imminent and actual harm to national security" or "to prevent imminent death or significant bodily injury." Under the bill, a court would compel journalists to divulge the sources of leaks of trade secrets of significant value, identifiable health-related information, or personal or financial information revealed in violation of federal laws. In determining whether the journalist's privilege had been overcome, the court would have to balance *both* the public interest in compelling source disclosure and the public interest in gathering news and maintaining the uninhibited flow of information. The journalist's privilege bill introduced to Congress in 2007, known as the Free Flow of Information Act, defines journalism functionally as the act of "gathering, preparing, collecting, photographing, recording, writing, editing, reporting, or publishing of news or information that concerns local, national or international events or other matters of public interest for dissemination to the public." Bloggers would be covered if their work is journalistic.

Protection of confidential news sources is not entirely a legal matter. It also has an ethical

component. In his survey of international journalists, journalism professor David Weaver of Indiana University has found a high level of global consensus among journalists on the topic of confidential sources, which suggested "a near universal professional norm" of source protection. Journalists around the world agree strongly and consistently that they should never reveal confidential sources, according to Professor Weaver.

It should hardly come as a surprise that an increasing number of countries recognize protection of journalistic sources. The growing acceptance of the journalist's privilege in foreign and international law challenges the often touted American "exceptionalism" in freedom of speech and the press.

In Sweden, for example, the journalist's privilege is treated as a constitutional right under the Freedom of the Press Act (1766). Singularly significant is that the Swedish shield law of 1949, one of the strongest in Europe, empowers sources to take criminal prosecution against journalists if their confidential identity is revealed without their authorization. It further forbids public officials to inquire about journalistic sources. If public officials violate the law, they face fines or one year in jail. The Swedish law, however, is not absolute on the journalist's privilege. Courts may order source disclosure when national security is at stake or when high treason, espionage, or other similar crimes are involved. Courts also deny the source protection when a source is a witness in a crime and when information specifically made secret by statute is revealed.

International law regarding journalist's privilege is still evolving, but has emerged as an issue of increasing significance in the past decade. Two international courts have considered claims that the confidentiality of journalistic sources is part of a right to freedom of expression. The European Court of Human Rights (ECHR) declared in 1996 that journalists have a right not to disclose their sources unless an overriding competing interest outweighs the confidentiality of news sources. And, in 2002, the International Criminal Tribunal for the former Yugoslavia (ICTY) held that war correspondents cannot be compelled to testify about their sources, except under extraordinary circumstances. The approach of the ECHR and the ICTY epitomizes an intriguing irony in the United States vis-à-vis international law on freedom of the press. Their broad recognition of the journalist's immunity from testimony about news reporting was in considerable measure based on American law. Yet U.S. law has been backpedaling on the reporter's privilege over the years. In 2006, First Amendment lawyer Floyd Abrams expressed that, though American lawyers trying to convince a U.S. court to adopt rulings from abroad are rarely successful, American jurisprudence would be served well if it carefully considered the 2003 conclusion of the ECHR ruling that "the protection of journalistic sources is one of the cornerstones of freedom of the press."

Self-Regulation

News media self-regulation—the monitoring of news production by the profession itself as opposed to external control—is one of the mainstays of the concept of press freedom. In general, the public values the ability of news media to report freely, to criticize freely, to serve as its watchdog; but simultaneously, the public expects journalists to uphold certain ethical standards, be mindful of the rights of both readers and subjects, and to be, as far as possible, truthful and balanced in their reports.

Yet occasionally excesses occur and a media story appears which causes both the public and politicians to question the integrity of journalists and journalism in general. Philosopher Stephen Carter suggests that the very nature of journalism can lead to instances where newsmen are so insulated from the rest of society that their decisions are made with a warped sense of their own worth. He has termed this "First Amendment arrogance." To avoid this lack of accountability, some call for government oversight of news media, but most view any statutory regulation of journalistic practice as interference with the freedom that is seen as essential to democracy. Only self-regulation remains.

In modern journalism, there are two elements to self-regulation. On the one hand, professional editors, publishers, and station managers bear substantial responsibility for regulating the conduct of staff and maintaining accepted standards of journalism. On the other, over time various mechanisms beyond such informal and uneven oversight have evolved, including professional codes of practice, public editors, news ombudsmen, and news councils. News consumers have ways to hold news media accountable as well, ranging from the traditional such as "letters to the editor" to the rise of citizen journalism, especially in its online form.

News Scandals

Questionable practices and sensationalism have been a part of journalism since its beginning, reaching a peak during the age of yellow journalism in the United States. Some of the muckraking journalists of the early 1900s were not above fabricating stories and quotes in seeking social justice. Too often, in the hopes of a startling headline or calling attention to a social issue, or sometimes just in the spirit of malevolent journalism, newsmen may cross an ethical line. In 1966, newspaperman Walter Annenberg purportedly directed one of his reporters to ambush Pennsylvania Governor Milton Shapp with the question, "Isn't it true that you have been in a mental institution?" for which there was no evidence. The next day, Annenberg's paper ran front-page headlines screaming "Shapp Denies Having Been in a Mental Home." In November 1992 the news program *Dateline NBC* showed a startling video titled "Waiting to Explode" which depicted a General Motors truck exploding after a low-speed collision; it was later revealed that the explosion was actually triggered by hidden remote-controlled incendiary devices and NBC News President Michael Gardner was forced to resign. Such instances were generally thought isolated and regrettable, but with no long-lasting effect. However, in recent years a number of high-profile scandals have brought issues of self-regulation to the forefront in discussions of how the news media should operate.

Among the more notable: The gripping and heart-wrenching story of an eight-year-old heroin addict named Jimmy written by *Washington Post*

reporter Janet Cooke first appeared on September 29, 1980. She told the tale of a child whose life had been devastated by the thriving and unchecked drug trade that had risen in the low-income neighborhoods of Washington, D.C. The story engendered so much outrage and sympathy among readers that an all-out search for the boy was launched by the city administration. However, the best efforts of the police, social services and school system were unsuccessful; soon claims surfaced that the story was fraudulent. Despite early signs of problems with Cooke's work, the *Post* defended the veracity of the story and it was submitted for a Pulitzer Prize for Feature Writing, which it received in April 1981. Just two days after the prize was announced, however, publisher Donald Graham admitted that the story was untrue and the next day the paper issued a public apology. Although Cooke maintained that Jimmy was a "composite" of a number of D.C. children, she resigned and the Pulitzer was returned. She later claimed that the high-pressure environment of the newsroom to produce significant stories at the *Post* had corrupted her ethical judgment. The report by the paper's then-ombudsman Bill Green on the affair, printed four days after the Pulitzer was returned, covered three pages in the first section of the newspaper, a remarkable public act of contrition.

According to accounts, the editor of *The Boston Globe,* Matthew Storin, first became aware that Patricia Smith was fabricating individuals and events for her "Metro" columns in late 1995 or early 1996. The *Globe* had received several telephone calls from readers expressing doubts about Smith's columns. Storin instituted a formal monitoring procedure for the columnists, similar to the editorial scrutiny reporters labored under, and demanded that all staff supply proof of the identity of anyone featured in their writing; this soon revealed that a series of stories by Smith about a cancer patient named Claire appearing in May 1996 were untrue. Claire didn't exist and the quotes attributed to her were fabrications. Smith was asked to resign, although no action was taken against the various editors who had overlooked her transgressions.

Stephen Glass's reporting at *The New Republic* magazine had drawn criticism long before he was fired in 1998 for making up quotes, sources, and events. The Center for Science in the Public Interest, subject of a hostile Glass article in December 1996, issued a press release pointing out inaccuracies, distortions, and possible plagiarism in the article. An article titled "Don't You D.A.R.E." brought more accusations against Glass by Drug Abuse Resistance Education, the organization featured. A number of letters were received by the editors accusing Glass of falsehoods in his lurid article on drinking and debauchery at the 1997 Conservative Political Action Conference. The story that finally brought his downfall concerned a supposed 15-year-old hacker hired to work for a large company. Soon after the publication of "Hack Heaven," Forbes.com reporter Adam Penenberg sought to verify it and found that no evidence that the company Jukt Micronics or any of the people mentioned and quoted in it even existed. In the ensuing scandal, Glass maintained he had been duped and even created a shell website, fake business cards and a hacker newsletter to present to the magazine's investigators. *The New Republic* subsequently determined that at least 27 of the 41 stories under Glass's byline in its pages contained lies. Glass was promptly fired.

Richard Bragg won a Pulitzer Prize in 1996 for his work at *The New York Times*. In May 2003, after serving a two-week suspension as the result of an investigation that found Bragg had passed off the work and writing of stringers and interns as his own, he resigned from the paper. The story which sparked the investigation was one about Florida oystermen; it was later revealed that he had spent only one day in Apalachicola, site of the story, and had used interviews and research done by another reporter. Bragg's response to criticism and complaints fueled a heated debate in the *Times* newsroom about the mechanics of investigative reporting, proper attribution, "drive-by" journalism, and granting credit to subordinates, freelancers, and interns who contributed. The repercussions of the scandal were felt far beyond the company, as news executives around the world examined and in many cases tightened their policies on these practices. Bragg's resignation sparked more disagreement over journalistic ethics than the clear fraud perpetrated by Cooke, Smith, or Glass.

Jack Kelley, a respected reporter at *USA Today* and finalist for a Pulitzer Prize in 2002, is best known for his professional disgrace two years after it became known he had long been fabricating

stories, going so far as to draft scripts so associates could pretend to be sources when editors called to verify his facts. In early 2004 an anonymous letter to the editor triggered an internal investigation into the conduct of Kelley, who resigned—but continued to deny the charges—after some of the drafts were found on his office computer. The investigation found that Kelley had been fabricating parts of stories since at least 1991. Furthermore, they noted a "climate of fear" in the newsroom that discouraged co-workers to come forward and that editorial favoritism had played a significant role in the situation given Kelley's "star" status at the paper. The *USA Today* publisher Craig Moon subsequently issued a front-page apology and editor Karen Jurgensen and news section managing editor Hal Ritter resigned.

Such instances of carelessness and falsehood were not limited to just news stories or newspapers. In May 2004 *The Boston Globe* published photographs it described as of United States soldiers abusing and raping women in Iraq. Shortly after, the photos were proven to be commercially produced pornography that were originally published on a website titled "Sex in War." Web news sites had exposed the photographs as fake a week before the *Globe* published them. The vaunted Associated Press distributed a story in February 2005 with a picture claiming to be an American soldier held hostage by militants in Iraq. Military authorities took it seriously enough to begin an investigation but found no missing servicemen reported in the region; hours after the story went over the wire, Internet bloggers spread the word that the "hostage" still had his equipment and even hand grenades. Citizen journalists soon found that the hostage depicted was a toy doll of an Air Force special operations airman, and even found an exact match online. The ease of digital manipulation of photographs, as evidenced by the composite photo of professional skaters Tanya Harding and Nancy Kerrigan on the cover of *New York Newsday* in 1994 and the darkening of O. J. Simpson's image on *Time* that same year, has given rise to more concerns about the ethics of the news industry.

However, no incidence brought self-regulation so much to the public's attention as that of Jayson Blair, who resigned from the prestigious *New York Times* after years of plagiarizing and fabricating elements of his reports. After a summer as an intern in 1998, Blair was offered an extended internship. His editors repeatedly castigated Blair in internal memos for the high error rate in his articles and his sloppy work habits. But despite more mistakes than any other reporter for the paper's Metro section, he was made a full-time staff reporter in January 2001, and in 2002 was promoted to the national desk. In the process, complaints began to become public; Fairfax County prosecutor Bob Horan claimed that 60 percent of a story written by Blair about the Beltway sniper attacks, in which he was quoted extensively, was inaccurate. Despite such criticism from the public and the corrections the paper was increasingly forced to make regarding his stories, Blair was allowed to continue to cover critical stories. In his four years at the *Times,* Blair wrote more than 600 news articles that saw print.

It was blatant plagiarism that finally brought Blair down. In April 2003 national editor Jim Roberts confronted Blair about similarities between a *Times* story he had written and one by San Antonio *Express-News* reporter Macarena Hernandez published ten days earlier. The plagiarism was so flagrant that it led to further inquiries by the *Times* editors, who asked Blair to prove he had in fact traveled to Texas and interviewed the woman featured in the piece. Unable to provide proof, Blair resigned in May. An internal investigation led by Allan Siegal discovered that 36 of his 73 national stories were suspect. Following these revelations, the investigation sought to determine how management had allowed a young reporter to rise so quickly. Siegal's findings pointed at what was perceived as a "star system" that advanced some reporters favored by then executive editor Howell Raines, along with a marked lack of communication in the newsroom. Both Raines and managing editor Gerald Boyd resigned a month after Blair. The newspaper itself instituted a number of reforms, not the least the appointment of its first "public editor." And it reported extensively on what was going on.

The Blair incident and the revelations about the self-serving, autocratic nature of the *Time*'s management that followed shook journalism to its core, given that many people regarded *The New York Times* as setting the standard for ethical practice. The reporter and some editors had violated

virtually every precept of the professional codes of conduct to which they supposedly subscribed.

Professional Codes

Professional codes of ethics (or "practice," "principles," or "conduct") developed by various media organizations are generally guidelines for setting expectations (the notion of the "ideal" journalist) and for avoiding perceptions of behavior contrary to the public interest. For many journalists, a formal, widely accepted code of conduct provides their first line of defense against claims of unethical actions. It serves as a reference point for both the public and the journalist in discussions of how the news should be gathered and presented. All organizations of practicing journalists have some written code, either standing alone or incorporated within the organization's bylaws. The Society of Professional Journalists (SPJ) adopted its original code of ethics in 1926; that of the American Society of Newspaper Editors (ASNE) was adopted in 1922 as its "Canons of Journalism"; the Radio-Television News Directors Association (RTNDA) drafted one upon its founding in 1946, as did the National Press Photographers Association that same year. Organizations make code revisions to reflect changing concerns and perceptions; the current RTNDA code was adopted in 2000, and the SPJ's in 1996 after months of debate.

For every national professional code of ethics, there are hundreds of individual codes established by news corporations, publications, networks, and stations. While they may differ slightly from those of the professional organizations, in general they attempt to clarify or identify proper conduct with regard to their specific market or audience. In some cases these corporate codes reiterate points made in the broader codes; in other instances, these may address issues such as personal political activity or ownership of copyright. Corporate codes are as varied as their audiences. An October 2000 ASNE survey of codes of 33 member newspapers, reported in an online piece on its website titled "Can You Improve Your Code of Ethics?" found that all addressed issues of conflict of interest save one, and that 18 of them dealt with confidentiality, but only half had a statement on issuing printed corrections to factual errors.

Codes of ethics serve several self-regulatory functions. Codes educate new and novice professionals about their ethical responsibilities and sensitize them to the ethical problems common in their field. Formal codes are designed to make professionals reflect on their obligations and goals, and on the means to reach them. An effective voluntary code can minimize intrusion of government regulations. For members, a recognized code can serve as justification for refusing to undertake unethical practices, even when requested by employers or the public. Not only do such codes serve as rules of practice for journalists, they may also establish expectations among news consumers as to what is allowable. The authors of the 2000 ASNE survey note that carefully written codes anticipate ethical dilemmas so journalists become custodians of their own behavior.

Critics of ethical codes point to several flaws in relying upon them for self-regulation. Foremost is that the organizations rarely have recourse to punish those who transgress. Unlike the medical and legal professional organizations, journalists are not licensed, cannot be disbarred, cannot be fined, and are subject only to public recriminations. At most, the organization can exclude an unethical journalist from membership. Newspapers and stations are not required to offer corrections, compensation, or even apologies unless legal action is taken by an aggrieved party. Of the corporate codes examined in the 2000 ASNE report, very few address enforcement. The strongest statement was that of *The Dallas Morning News*: "violating some guidelines could result in disciplinary action or termination." Most corporate codes merely suggest (but do not mandate), the need for consultation with supervising editors should a potential ethical problem arise. Only in the most outrageous instances, critics complain, do journalists at fault suffer more than a "slap on the wrist."

Other criticisms of codes of ethics include ambiguity and lack of logical coherence; that codes do not go beyond obvious ethical violations; that codes are often dense and not written for laymen; that few specify individual responsibility as opposed to group admonitions; and that they are self-serving (in that they tout the First Amendment and the rights of journalists) and little concerned with protecting public interests. Pundits are fond of stating that reliance upon ethical codes for self-regulation is the midpoint between gut instincts and reasoning. As the authors of "Can You

Improve Your Code of Ethics" note, codes are not the panacea for ethical dilemmas, nor are they the solution to self-regulation.

All of which, of course, begs the question of whether journalists *are* actually professionals, "white-collar" rather than "blue-collar" workers. Given the growth of *paparazzi* journalism and citizen journalism, perhaps the latter is more indicative of how newsmen operate. In which case, many argue that the public is wrong to hold journalists to a higher set of ethical standards than those in other occupations at all.

Public Editors and Ombudsmen

Those with a complaint about accuracy or balance of a news story have always had the option to write to the newspaper, and letters to the editor have been a feature in American newspapers since the late 1700s. These serve as a public dialogue on social, cultural, and political issues of importance to readers; often they offer counterpoints to editorials in the paper. In some cases, these carry criticism or corrections for news stories appearing in previous issues. However, because there is often limited space on the editorial pages (the traditional venue for printing letters), if a correction or clarification voiced by a reader is valid it is often relegated to a specific section of the newspaper, a column or sidebar where the editors can offer a mea culpa as a form of self-regulatory penance.

Most news publications (and some broadcasters) have a format for announcing corrections. In some cases these are displayed prominently; *The New York Times* puts its corrections on the second page of the first section, although corrections for items appearing in the weekly sections are usually placed in those editions when the section next appears. The news program *60 Minutes* generally issues corrections at the end of the broadcast. Other publications place acknowledged corrections on the editorial pages; some insert them wherever space is available in the layout of each issue, and are often accused of burying such corrections where the readers will not spot them. Newspapers and news stations usually have a specific policy on issuing corrections, but in general most corrections are limited to minor factual errors such as misspellings, names, titles, ages, numbers, times, and places. Occasionally printed corrections will offer additional information or details that should have been incorporated in the original news item. Although rare, sometimes corrections are extensive, and cover gross carelessness or critical mistakes on the part of the reporter.

Many have argued that newspapers don't go far enough in issuing corrections, nor do so frequently enough. In a 2007 study by Professor Scott Maier of 3,600 news stories in ten newspapers, multiple factual errors were found in 1,220 of them. However, just 23 of the flaws, less than two percent, generated published corrections in these newspapers. *The New York Times* averaged one printed correction per day in 1982; by 2004 it averaged nine a day. In December 2003 the *Times* had hired its first "public editor" in the wake of the Jayson Blair scandal to monitor complaints about the paper's performance. So was this increase in published corrections because the *Times* had become more error-prone or was this, as many believe, due to the creation of the public editor position at that paper?

The job of a public editor is to supervise ethical standards among staff, to identify and examine critical errors or omissions, and to act as liaison between the news staff and the public. Though paid by the newspaper, the public editor serves as a high-ranking advocate for the readers' rights, presenting their side if a complaint seems valid and expressing readers' concerns to management. The public editor typically selects letters from readers concerning perceived ethical or factual transgressions for response. At some papers, the public editor writes a regular column concerning the paper's policies and practices, which may be critical of those or merely an effort to facilitate the public's understanding of editorial decisions. Public editors at the newspapers owned by the McClatchy Company have established "community panels" of readers to critique the papers, and they conduct annual "accuracy surveys" to insure that people are quoted correctly and appropriately in published stories. At newspapers that have one, the public editor is available to speak to civic, business, church, and educational groups about the policies and operations of the paper. Finally, the public editor often passes along tips and story concepts to the newspaper staff from readers and viewers, to insure that underserved groups are recognized and given coverage.

Many owners and publishers view the public editor as essential in overcoming the growing distrust the public has for the news media. News media often seem intimidating to contact, let alone challenge. As publisher Orage Quarles III, who had recently installed the first public editor at the Raleigh *News & Observer,* put it in an interview in 2005, "Having someone who will call it the way they see it adds enormous credibility to your product." Approached as self-regulation, the public editor's job is extremely difficult. He or she sits uneasily between satisfying the public without alienating his or her professional colleagues. And they must do so without compromising their own credibility or their independence from the official voice of the newspaper. Perhaps for that reason, at the end of 2006 only 40 daily newspapers in the United States had a public editor. A more common internal approach to self-regulation is that of newspaper ombudsman.

In November 2005 *Washington Post* ombudsman Deborah Howell criticized reporter Bob Woodward for keeping factual information from the readers and the paper's own executive editor. There are few journalists as well known and high profile as Woodward, but the paper's ombudsman publically declared that he should follow the same rules as other *Post* reporters. With an ombudsman seen as willing to take on even the most influential journalists on behalf of readers, listeners, or viewers, any news outlet will be seen to be more responsible and accountable for its content to its consumers.

The origin of the term *ombudsman* lies in medieval Scandinavian, and loosely means "representative." A number of governments, from national to local, now have ombudsmen to serve as an intermediary between the citizenry and government officials, notably in the settling of public complaints. Over the past century, the post of ombudsman has been established by companies in many industries to mediate between aggrieved customers and the organization.

While some of the duties of an ombudsman are similar to those of a public editor, the primary difference between the two roles is that the public editor is a member of the editorial staff (and may even pen a regular column), and so works on the "production" side of the news, while the ombudsman is not a member of the news staff per se, and mostly serves as a "readers' advocate." A news ombudsman at a newspaper or news station investigates complaints from the public and recommends appropriate remedies if deemed necessary; these may range from public corrections or apologies to changes in company policy or practices. Occasionally termed a "readers' representative," the news ombudsman helps his or her organization become more accessible and accountable to its audience and to increase awareness among its news staff about the public's concerns. One of the ombudsman's primary roles is to attempt to resolve issues that might otherwise become costly lawsuits. Although found much earlier in other countries, the first newspaper ombudsman in the United States was appointed in June 1967 to serve the readers of the Louisville (Kentucky) *Courier-Journal.* During the following decade many American newspapers followed suit.

Most news ombudsmen are selected from among senior staff of the organization they monitor, although some are hired from among highly experienced professionals outside the company. Their tasks vary; in general they monitor news and features for accuracy and fairness and bring substandard items to the attention of the editorial staff. They investigate and reply to complaints from the public about news coverage, and obtain explanations from editors and reporters for readers or viewers. Some supervise the preparation of corrections or apologies. News ombudsmen may initiate or coordinate public forums or reader advisory boards. At smaller newspapers they may assume news-related roles such as copy editors or proofreaders. In any event, news ombudsmen function in an advisory, rather than disciplinary, capacity within the news organization. As with all self-regulatory approaches, they serve to encourage—not force—adherence to ethical standards and practices.

While the presence of news ombudsmen in the United States is steadily increasing, questions about their effectiveness have been raised. Critics of the approach argue that ombudsmen are required to perform so many different duties—deal with complaints, monitor news staff, serve public relations functions, draft codes of ethics, and more—that they have difficulty doing any of them adequately. Other critics point to the danger of conflicts of interest when they are expected to openly criticize co-workers, superiors, and the company that pays them. Some argue that the

actions of news ombudsmen can lower staff morale. It may be difficult for an ombudsman to maintain an objective perspective when they are also required to serve other roles, especially that of reporter or editor. Finally, some publishers claim that traditional editors can perform the ombudsman's role more effectively and in a more cost-efficient way. Supporters, however, say that editors are neither as accessible to the public nor as credible as news ombudsmen.

Recognizing this need for credibility, major television news networks have recently instituted the ombudsman position as well: first NPR in 2000, followed by PBS, CNN, Fox News, and even ESPN. In April 2001, MSNBC.com announced the creation of the first Internet news ombudsman when it appointed veteran online journalist Dan Fisher to serve as an advocate for users of that news site. What impact declining newspaper revenues would have on ombudsmen was hard to judge early in 2009.

Electronic Media

Although broadcast news organizations have in place the same mechanisms covered above to police themselves, the worst excesses in radio and television news are mitigated by extensive government regulations already in place. In the United States, from the early years of radio, and due to the perceived immediacy and intrusive nature of broadcast, the federal government has reserved the right to issue licenses, limit ownership, and impose must-carry rules and equal time requirements. Unlike printed newspapers and magazines, broadcast news is seen as having the ability to come "uninvited to the home." Dramatic growth in cable television and satellite technology has significantly expanded the reach of television and radio news, making many regulations obsolete. Both broadcast and cable networks have seen the efficacy of self-regulation to help maintain public credibility.

Even more problematic in terms of ethical issues is online journalism. Thus far in the United States, the First Amendment has been held to cover online content, and except for a few acts dealing with obscenity and indecency pertaining to children, current laws on issues of privacy, plagiarism, and libel are considered sufficient. But the international distribution of online news has made self-regulation even more pressing. The 2002 decision by the High Court of Australia in the libel case *Dow Jones & Co. Inc. v. Gutnick* established the precedent that online news is "published" at the point of use (which can be anywhere), not at the point of origin. Given the great range of laws among countries, and even local governments, covering everything from objectivity to indecency (see, for instance, findings in the U.S. Fourth Circuit Court of Appeals 2002 case *Young v. New Haven Advocate*), self-regulation by online journalism outlets is even more pressing as we move into the second decade of the twenty-first century.

Unfortunately, the practices and principles of online journalism are still in such flux that self-regulation is problematic. Save for corporate codes of conduct by news publishers and networks with online sites, and some efforts at "pro-am" (where professionals oversee the work of amateur journalists) news sites, there has been no move to establish parameters for or to rein in the worse excesses of the amateurs that conduct citizen journalism.

Conclusion

Self-regulation has been a topic of debate among journalists for decades, as evidenced by the professional codes of conduct. The delicate balance between freedom of news media and their responsibilities insures that the debate will continue. In recent years, high profile cases of unethical behavior by reporters and even some editors have brought increased attention to insuring that these transgressions are limited and that appropriate responses are made when they do occur. There is no single solution, not even government regulation, to guarantee that journalists act in the best interests of the people. But imposed legal approaches are sure to interfere, to some extent, with the flow of information and opinion that marks news media in a democracy. The news industry has developed several methods, with varying success, to monitor and if necessary correct its own actions. In the future, new approaches, perhaps grounded in citizen journalism, will evolve as well. Taken together, working in concert, these self-regulatory approaches move the press toward being seen as ethical, responsible, and credible in the eyes of both the public and their lawmakers.

SENSATIONALISM

Sensationalism, a type of news reporting that emphasizes shock value over facts, is a key ingredient of what in the United States became known in the late nineteenth century as "yellow" journalism (after a cartoon character). Yellow or sensational journalism is noted for stories that exploit, distort, or exaggerate the news. Sensationalism triumphs over factual reporting as stories are twisted into forms designed to attract readers and (more recently) viewers. The same style of sensationalized news reappeared in the muckraking journalism of the early twentieth century, the tabloid newspapers of the 1920s, and in print and electronic media in the years since.

Sensational news, however, dates back at least to the news sheets of the seventeenth century. Critics complained about an overemphasis on crime and disaster stories even then. The rise of the penny press popular newspapers in the 1830s often depended on sensational human interest stories offering graphic details even if the technology of the time couldn't provide matching pictures.

"Yellow" Origins

Yellow journalism achieved its peak fame in 1896 with the journalistic practices of competing New York City daily newspaper publishers Joseph Pulitzer and William Randolph Hearst. Newspaper sensationalism dated back much earlier.

In a sense, the idea of sensational treatment of news was introduced by Benjamin Day and James Gordon Bennett during America's penny press era in the 1830s, thanks to their reliance on human interest stories. Everything and everyone, especially the underdogs of society, the butcher, the baker, the shoemaker, and especially the mistress or prostitute, was considered (and thus made) newsworthy. What Day and others did was to place emphasis on the common or unusual person (including those rarely covered in the news to that point) as he or she reflected the political, educational, and social life of the day. Their formula was to blend stories of murder, catastrophe, and love with elements of pathos to produce the human side of news. Pulitzer and Hearst would build on this model decades later.

In the late nineteenth century the development of yellow journalism reflected a society in transition. America was shifting from a predominantly rural to largely urban society. Fueled by a wave of immigrants from Europe, the nation's cities grew by nearly one-third. At the same time, the United States flexed its military might as the army evolved from a small frontier force to the army and navy that in 1898 challenged the remains of Spanish power in the Western hemisphere. As a result of war with Spain—one heavily promoted by Pulitzer and Hearst—the United States collected Puerto

Rico, Cuba, the Hawaiian Islands, and the Philippine Islands. The victory had one unintended effect—it helped promote the belligerent nationalist tone of much of the American press.

Sensationalist yellow journalism became synonymous with the journalism practiced by Pulitzer and Hearst, and soon others as well. Pulitzer's successful *St. Louis Dispatch* allowed him to enter New York journalism in 1883 with purchase of *The World*. Pulitzer's *World* utilized modest typography with headlines in small light-face type that appeared above stories of murder, mayhem, and mystery, every bit as sensational as those of one of the then-popular police gazettes.

By September 1884, *The World* reached a circulation of 100,000; within two years circulation soared to 250,000. When Pulitzer introduced the *Evening World* in 1887, the combined circulation of both editions was 374,000. Meanwhile, his Sunday edition alone reached 250,000 though half was advertising.

Pulitzer's journalism soon affected the character of much of the nation's daily press. He upset the status quo and furnished a new formula for the metropolitan daily by crafting a new concept of news, utilizing many illustrations, employing a crusading tone, and, though less obvious, revitalizing his editorial page and aggressively selling advertising space. His chief contribution was his invention of a formula that Hearst and others later adopted—sex on the front page and a kind of spurious morality on the editorial page.

Pulitzer helped introduce a new definition of sensationalism that, at its most basic, included self-promotion, an updating of the paper's layout, and adoption of an aggressive reporting style. *The World,* for instance, regularly boasted on its front page its high circulation figures and that it printed more advertising than any other paper in the country.

He made stunts a daily fixture in newspapers by 1890. They were often entertaining, sometimes educational, and nearly always attracted readers. His most ambitious was sending Elizabeth Cochran, better known to readers as "Nellie Bly," on a world voyage in an effort to beat the record of the hero of Jules Verne's *Around the World in Eighty Days*.

Thanks to improving printing technology, Pulitzer also introduced colored supplements, including an eight-page comic section, in 1893. The highlight of this section was Richard F. Outcault's "Hogan's Alley," a social satire that depicted life in a New York tenement. The leader of the gang was a one-tooth ragamuffin, "The Yellow Kid," who *World* printers clothed in a bright yellow dress. He would come to symbolize the Pulitzer-Hearst brand of sensational journalism in the 1890s.

During the 1890s yellow journalism was founded upon what journalism historian Frank Luther Mott called "familiar aspects of sensationalism—crime news, scandal and gossip, divorces and sex, and stress upon the reprint of disasters and sports." Its distinguishing characteristics included

- often-huge headlines, in black or red, that "screamed excitement, often about comparatively unimportant news";
- pictures, many without real news significance;
- impostors and such frauds as faked interviews;
- a Sunday supplement, with colored comics (something adopted by many decidedly unsensational papers in the years to come); and
- a "more or less ostentatious sympathy with the 'underdog,' with campaigns against abuses suffered by the common people."

This approach to journalism spread rapidly, influencing most metropolitan newspapers. And it clearly attracted an audience. Two types of readers, immigrants and women, were especially drawn to the yellow press. Department store advertising, directed chiefly to women in the home, also encouraged female readership.

Many who might otherwise criticize the "bottom feeding" approach of sensational news agreed that it served as something of an integrating force, helping to meld the flood of immigrants into the American mainstream. Attracted by the color and pictures, they soon learned to read the words. Further, many readers admired yellow journalism's crusades against privileged and powerful business and political interests, especially when they exposed corruption in municipal government. This motive soon morphed into the muckraking journalism of the early twentieth century, which applied some of the content and methods of sensationalism to a concerted crusade against the malfeasance of big business.

The assassination of President McKinley in 1901 marked the beginning of the end for yellow

journalism. In his first message to Congress, President Theodore Roosevelt said that McKinley's assassin had probably been inflamed by reckless journalism that appealed "to dark and evil spirits." A decline in both *The World*'s and the *Journal*'s circulation was further evidence of the public's declining interest in old-style yellow journalism.

Muckraking and Tabloids

The years leading to World War I saw an important variation of yellow journalism. Called muckraking (after the muck rake in *Pilgrim's Progress*), it was a kind of aggressive investigative reporting aimed at demonstrating the shortcomings of big business and its leaders appeared in books and magazines even more than newspapers. Muckraking authors and reporters hammered constantly at the shortcomings of the Gilded Age, often graphically demonstrating how wealth was produced from the hard efforts of working men and women.

Ida Tarbell's multipart magazine series in *McClure's* magazine exposing the methods John D. Rockefeller used to develop his Standard Oil monopoly (1904), and Upton Sinclair's novel *The Jungle* (1906) are two often-cited examples of dogged reporting that looked under rocks and described things that needed change, or the weak and defenseless that needed help. Child labor was one favorite target in an attempt to get children out of factories and into schools. The thriving Progressive political movement contributed to muckraking and gained useful ideas from it.

But following on years of yellow journalism, the muckrakers soon exhausted their readers as well. It is hard to maintain a state of ready awareness and crusading fervor all the time. Soon one social shortcoming seemed much like the next. Some readers found the constant barrage of stories so overwhelming that it seemed nothing could be done to address the problems identified. By about 1912, the muckraker's time had passed.

The appearance of tabloid newspapers in several of the largest markets in the 1920s provided the next step in sensational news. Chief among them were the *New York Graphic* and the *New York Mirror*. The tabloid offered ease of handling and illustrations—but was built on story selection that emphasized crime and scandal. The tone of such stories was less that of the crusader than of the informer or tattletale. Tabloid stories were intended to titillate more than promote change. The sensational stories were designed to build circulation (which for many years they did) while attracting advertisers who, in turn, sought exposure to the huge readership of the new tabloid papers. The *New York Daily News* managed to sneak a camera into the execution of a murderer, and ran the fuzzy resulting photo on its front page. Short, punchy headlines emphasized the most titillating aspects of *Daily News* stories.

Modern News Sensationalism

In recent decades, news sensationalism has continued in several different forms. Tabloid papers declined after 1980 as readers were drawn off by television and cable, and later by online resources.

By the 1950s, television began to add its own version of sensational news. Requiring pictures to hold viewer attention, television stations early on discovered the visual excitement of fires, accidents, and both natural and man-made disasters. The old line "if it bleeds, it leads" all too often applies to both print and broadcast news which focus on the sensational rather than what may be more important in many cities. Local television news typically centers on stories of murder, robbery and other mayhem, sometimes to the near exclusion of other stories.

A growing focus on celebrities and disasters across print and electronic news media in the late twentieth and early twenty-first century suggests a different kind of sensationalism. Here the emphasis is on the personal as well as professional lives of show business and sports figures (and sometimes people in other walks of life) to the detriment of reporting other, usually more important stories. "Gang" or "crowd" reporting, where masses of reporters and photographers all congregate around one story is an example. The televised trial of O. J. Simpson in the mid-1990s illustrated the lasting appeal of crime news and helped lead to the creation of Court TV, a cable network focused on such things. By the early twenty-first century, murders of children often dominated headlines in print and on the air for months thereafter.

In the end, sensational news reporting can be seen as pandering to the news audience's lowest

concerns—fear (of crime or disease, for example) or morbid fascination (as with those struck by disaster, celebrities in a scandal, or murder victims). On the other hand publishers and broadcasters often defend their sensationalized news as "giving the public what it wants"—there is an element of truth in the claim as circulation and viewership often increase when such sensationalized stories are covered—rather than what some critics argue the public may really need, such as important economic or political news.

Shield Law

Journalists sometimes obtain information from sources who do not want to be identified by name in news stories because they fear retribution or embarrassment. Often, this information helps journalists uncover illegal or unethical behavior by government officials or other powerful people. Journalists in many countries adhere to a long-standing tradition of protecting confidential sources' identities so that these and future sources will trust reporters with sensitive information. However, if the source's information is published and indicates the source may have committed or witnessed a crime or has information helpful to a civil litigant, the journalist may receive a legal order, known in the United States as a subpoena, ordering him or her to reveal the source's identity. Such situations create conflicts between journalists' professional standards and their duties as citizens to obey valid court orders or risk the consequences of disobeying, which can include fines or imprisonment.

Because journalists often are seen as performing a service in a democratic political system by informing the public about what governments and other institutions are doing, legislative bodies sometimes provide protection for journalists' relationships with sources through statutes known as "shield" laws. Such laws are designed to help resolve conflicts between journalists' professional duty to protect sources and the legal system's need for truthful information in the investigation and adjudication of crimes and civil wrongs. In general, shield laws give journalists a limited right to conceal source names and other unpublished information unless there is no alternative source and the information is important and relevant to a legal controversy or public security.

Overview

Specific statutes to protect journalists from being forced to reveal their sources to investigators or courts are rare outside of the United States. Other nations that give journalists at least some protection from subpoenas and similar official coercion usually do so through court interpretations of constitutional guarantees of press freedom or through

general codes of evidence or court procedure. Russia's Federal Law on the Mass Media, for example, is one of the few national laws providing for source protection, and many nations from the former Soviet Union have adopted similar legislation. However, the law allows the government to require news organizations to reveal sources if needed for a criminal investigation, and Russian journalists have found the protection to be stronger on paper than in reality. A change in Russia's Criminal Procedure Code in the early years of the twenty-first century, however, made it harder to punish the media for refusing to reveal sources, which may strengthen the position of Russian journalists.

International law also recognizes a limited right of journalists to protect sources. The European Court of Human Rights in 1996 interpreted the European Convention on Human Rights' Article 10, which guarantees freedom of expression, as providing journalists with the right to conceal source identities. And the International Criminal Tribunal for the former Yugoslavia (ICTY) recognized a limited right of war correspondents to keep their sources confidential in 2002 and reaffirmed that finding in 2005.

In the United States, the Constitution's First Amendment states that Congress cannot abridge freedom of speech or of the press, but whether that also means that journalists cannot be required to identify sources has long been a point of contention. There is no national protection for journalists and their sources at the national level, although Congress has often considered such legislation. Support for shield law legislation rises when the number of journalists facing fines or jail time increases, as was the case in 2004–06 when several journalists went to jail rather than cooperate with federal criminal investigations or individuals suing the government for violating their privacy.

The U.S. Supreme Court ruled in *Branzburg v. Hayes* (1972) that journalists had no right to conceal information from criminal investigatory bodies known as grand juries. However, the nine members of the court were almost evenly divided on the issue and left open the question of whether journalists could conceal sources from courts in criminal and civil cases. The *Branzburg* decision was followed closely by the Watergate crisis, in which journalists using confidential sources uncovered a scandal that led to President Richard Nixon's resignation. But the 1972 court decision also was followed by a sharp rise in the number of subpoenas issued to journalists nationwide. In the lower federal appellate and trial courts, the divided opinion in *Branzburg* led many judges to rule that the First Amendment to the Constitution provides limited protection to journalists seeking to protect the names of confidential sources and other unpublished information. However, not all federal appellate jurisdictions recognize the privilege, and there is disagreement among those that do about who and what are protected. The federal courts' privilege rulings also have little effect on state courts, and vice versa.

Each of the 50 states has its own legal system that is separate from yet co-exists with the federal system. Maryland in 1896 became the first state legislature which passed a shield law for journalists, while Connecticut became the thirty-first state to do so in 2006. New Mexico's highest court adopted a formal court rule in the 1980s that provides similar protection. The District of Columbia (the nation's capital, Washington) also has a shield law among its local statutes. In most of the states without legislatively created shield statutes, courts have recognized some form of limited protection for journalists by interpreting the First Amendment or state constitutions as implying the right to conceal confidential sources. A federal evidence rule instructs federal courts to consult common law, including state court decisions, to determine whether a privilege not to testify exists.

While the state shield laws differ from each other, there are common characteristics. All of the laws define who and what is protected, and limitations on the rights of journalists.

Who Is Protected

One of the most vexing problems with creating a legal privilege that allows American journalists to escape the general citizen's duty to testify before grand juries and courts of law is defining the word "journalist." In *Branzburg v. Hayes* the Supreme Court reiterated what it had said in earlier decisions: that the First Amendment protected the rights of all individuals equally, whether or not they worked for the institutional press. The court said it would be difficult, if not impossible, to define a group called "journalists" that would

receive extraordinary First Amendment protection because journalists were not licensed or in any other way remarkable from other citizens who might inform the public about current events.

Legislation, however, allows a government to define special classes of people who receive legal benefits, as long as the legislation does not strip away rights guaranteed by the federal or state constitutions. In other words, the constitutions, as interpreted by the courts, set a baseline for rights guaranteed to all, and legislation can define classes of persons who get more rights and privileges than others, as long as the legislation does not infringe on those baseline rights of all citizens.

In the case of shield laws for journalists, states have taken several approaches to defining the class of persons who can escape the obligation to testify if doing so would identify a confidential source. Some, like Colorado, extend protection to persons employed by the traditional print media, wire services and news and feature syndicates, and electronic media, including broadcasting stations and cable television systems. Other states, such as Nebraska and Oregon, use the same list as Colorado and add persons employed by or connected with books and pamphlets. Like Colorado, Maryland includes specific media but also includes persons associated with "any printed, photographic, mechanical, or electronic means of disseminating news and information to the public" (The Reporter's Privilege). Other state shield laws are vague about who is protected, saying it may be anyone connected with an organization involved in producing news or just "the news media." Indiana and Delaware specifically require that someone seeking protection from subpoenas be paid by a media organization before she can claim to be a journalist.

State courts tend to narrowly interpret shield laws or other privileges because they may impede the search for truth. Therefore, it may be preferable from journalists' viewpoint to have broad definitions in the legislation. In a Michigan case, *In re Contempt of Stone* (1986), the Michigan Court of Appeals ruled that a television reporter was not protected by the state shield law because it only mentioned print media reporters. The legislature soon amended the law to include broadcast reporters. In 2005, a federal appellate court determined that the Alabama shield law did not protect a magazine writer because the law did not specifically mention magazines. However, in that case, *Price v. Time Inc.,* the court determined that a limited First Amendment privilege protected the writer from revealing his sources.

None of the state shield laws specifically mention the Internet. This may become increasingly problematic as more people create weblogs, or "blogs," that resemble newspapers or magazines and as mainstream media organizations increasingly use the Internet to reach audiences. In 2006, a California state appellate court determined that an Internet magazine, or "e-zine," was protected under the state shield law, which may be the first time that a state appellate court ruled on whether someone working for an Internet site was a journalist.

What Is Protected

All of the American state shield laws protect journalists from being forced to reveal the names of confidential sources. About two-thirds of them also protect unpublished information that may not have been obtained in confidence, such as reporters' notes, photographs, and outtakes from television stories. It may seem counterintuitive to protect journalists' work product, particularly when it is nonconfidential, but many journalists would argue that the added protection makes sense. Supreme Court Justice Potter Stewart, in his dissenting opinion in the *Branzburg* case, suggested that reporters needed protection from subpoenas not only to keep news flowing from sources to reporters to the public but also to protect the independence of the press from government interference. Taking that line of thought a step further, protecting the press from subpoenas for all types of information would enhance its independence and keep it from being forced into becoming an unofficial investigative branch of the government. Journalists have also argued, and courts have sometimes agreed, that news organizations are uniquely vulnerable to subpoenas because they gather information and advertise that fact, creating an undue burden for the media.

State shield laws differ in language regarding what types of information are protected from subpoenas, but it is safe to say that all of them protect journalists from being forced to reveal confidential sources. Only three—in Louisiana, New York, and North Carolina—specifically

protect "nonconfidential" information. Other states, however, imply such protection by listing the types of things protected, including notes, documents, photographs, films, recordings, tapes, and reports, to use one example from Colorado. Other state laws simply say that journalists do not have to disclose "any information" or something similar. Personal observations of criminal activity generally are not protected.

Scope of Protection

In the *Branzburg* decision, Justice Stewart's dissent argued that the government should not be able to subpoena journalists to appear before grand juries without first showing that the information being sought was highly relevant to the investigation, critically important, and unavailable from other sources. Federal courts interpreting the federal constitutional privilege often use this test for balancing the needs of journalists and those seeking information from them, so it has become known as the "Stewart three-part test." However, the test is included in most state shield laws, including some written before *Branzburg* was decided. The test creates what is known as a qualified or limited privilege, meaning that unless someone can satisfy the three requirements of the test, she cannot require a journalist to testify or provide documents.

Some shield laws, however, including those in California and Nevada, do not have qualifying language and thus can be read as absolute. These laws do not provide exceptions to the rule that journalists cannot be forced to cooperate with officials or civil litigants. While this is true in theory, it is not always true in practice. In California, for example, the state's highest court ruled in *Delaney v. Superior Court* (1990) that journalists could be required to testify if failing to do so might harm the Sixth Amendment right of a defendant to a fair trial. In Nevada, the state Supreme Court ruled twice that the shield law had been superseded by another state law requiring disclosure before reversing itself in 2000 and finding that the law created a qualified privilege, despite its absolute language. New York's shield law is a bit of a hybrid, providing absolute protection for confidential information and qualified protection for nonconfidential material.

Conclusion

Shield laws providing journalists with protection from being forced to reveal sources or to provide documents to courts or investigators are largely an American phenomenon. These state laws generally define who is protected under the law and whether those persons may also protect from disclosure unpublished information, such as notes, photographs, and outtakes, that are not confidential. The laws generally are qualified, allowing ways for people seeking information from journalists to persuade courts to order the journalists to cooperate. Even those that are absolute in tone have not been interpreted that way by state courts.

As the Internet becomes more of a news outlet for both mainstream media and citizen journalists, the definition of "journalist" in state shield laws likely will cause controversies over whether a new breed of reporter is included. This tension may force legislatures to amend the laws. At the same time, a lack of consistency in U.S. federal law may spur Congress to act by passing a federal shield law applicable to all federal courts and grand juries. If Congress does not act, however, more states may decide to put their protections for journalists in writing to avoid local versions of controversies in the first years of the twenty-first century that led federal judges to jail journalists to force them to reveal sources.

Shortwave Radio

Shortwave radio is a means of broadcasting over great distances, one that has been used for decades for international propaganda. Since the late 1990s, depending on the service, shortwave has been increasingly superseded by satellite-distributed broadcasts and audio streaming on the Internet.

Origins

Experiments with shortwave radio transmission date to the early 1920s, with much of the important work being done by amateur or "ham" operators. Guglielmo Marconi and other radio innovators also played a part in the technology's development. Pioneer American AM station KDKA in Pittsburgh established an experimental shortwave transmitter in Nebraska in the early 1920s to try retransmitting its signal to the west coast—and farther. A few other stations did likewise, but the limited number of shortwave receivers held back development. Amateur operators sent the first shortwave signal across the Atlantic in 1923. Shortwave was also used for long-distance telephone service across oceans—transatlantic service opened in 1927.

Shortwave came to be called "short" as it was developed because its wavelengths (associated in numerous specific bands within the 3- to 30-MHz portion of the spectrum) are shorter than the long wavelengths then widely used. Shortwave today is also called high-frequency (HF) radio.

Shortwave broadcasts proved themselves in tropical climates in the late 1920s where standard (AM) radio signals were often blotted out by atmospheric interference. Furthermore, the shortwave transmitters needed less power to disseminate a good signal than did the standard stations. By the 1930s, shortwave broadcasting was becoming an established presence in many tropical areas.

Journalism on the Air

Shortwave became a vital part of global journalism in the late 1930s as a growing number of foreign correspondents used the technique to send their reports to and from various continents, especially between Europe and the United States. This was cutting edge technology at the time, and it amazed American listeners to be able to hear Hitler or other European leaders, as well as American correspondents, broadcasting live rather than by means of delayed recording.

CBS led the way in applying shortwave technology among American networks. Cesar Saerchinger arranged all sorts of CBS broadcasts from Britain and Europe, most of them focusing on cultural or entertainment events and venues. NBC's Max Jordan covered Europe in somewhat the same way, slowly moving from arranging light fare to covering hard news. A young Edward R. Murrow, replacing Saerchinger in 1938, began by simply continuing what his predecessor had done—until events forced a change.

During the September 1938 Munich crisis, Murrow worked with a number of stringers to pull together reports for the network (always referred to simply as "New York"), providing the first multicity roundups of reports from journalists in Berlin, Vienna, Rome, Paris, and London, where he was based. This involved working closely with European broadcast organizations, split-second timing, and "getting air" from New York. Back in New York, H. V. Kaltenborn virtually lived in a studio for a month, catching breaks and sleep as he could. Only in that way could the multilingual journalist provide running commentary as well as

translations of important overseas broadcasts given the time zone differences between the continents.

But shortwave transmissions could be notoriously unpredictable, as weather conditions, time of day, and other factors could make a voice fade and then get louder and then fade again—if static didn't obliterate the material entirely. So while broadcasts could be carefully scheduled, and laboriously prepared, they did not always get through. This was a problem of the physical properties of the spectrum used by shortwave signals and could not be overcome. It troubled international radio links for decades.

By the early 2000s, many broadcasters had abandoned shortwave service to some parts of the world. The BBC World Service, for example, now relies on web-based service for North America, Australia, and New Zealand, where high penetration of computers and web access makes such an approach viable as well as far less expensive (not a minor factor as budgets and personnel came under pressure to cut costs). German shortwave broadcasters, among others, soon followed suit.

International Services

Starting in the late 1920s and accelerating over the next decade, international shortwave served a variety of purposes. One was to link distant colonies to the home country, something the Dutch first accomplished in 1927, and the French began in 1931. The British Broadcasting System inaugurated its "Empire Service" in 1932, tying worldwide colonies to the mother country. In 1935, King George V was able to send a Christmas message to the whole Empire using shortwave. A closely related purpose was to broaden interest in and the appeal of a nation's culture—indeed, this turned out to be the most lasting role of shortwave transmission. Carrying the music, art, language, and history of a country to listeners elsewhere was a continuing appeal of the service. In 1933 Radio Luxembourg began a commercially based music and entertainment service that proved hugely popular when European domestic systems were devoted to culture and high-brow entertainment. The appeal of this station troubled other countries who could do little about it.

Probably the best known rationale for shortwave broadcasts was for political or religious persuasion. Radio Moscow was one of the first international broadcasters to utilize shortwave when it began service in 1929, soon joined by most European Nations. What little U.S. international radio there was in the 1930s was in the hands of private operators, including networks (NBC was particularly active) interested in expanding markets and religious broadcasters seeking converts while retaining those already in the fold. There was little interest in shortwave listening within the United States.

As Europe spiraled toward war, shortwave propaganda broadcasts from Germany and Italy began a veritable "radio war" with British and French radio services. In early 1942 the official U.S. shortwave Voice of America begin operating. And during the fighting yet another role for shortwave appeared—so-called black propaganda stations that while originating outside a country were made to sound as though domestic dissidents were broadcasting to their fellow countrymen. Propaganda services reached a peak during World War II with all fighting powers adding to the on-air cacophony. Some countries sought to electronically "jam" reception of the enemy broadcasts by transmitting noise on their channels. "Tokyo Rose" broadcast to American troops from Japan and "Lord Haw-Haw" to allied forces from Berlin in an attempt to weaken their fighting morale. They encouraged tuning in by playing the latest popular music amongst the propaganda rants. In many cases, the fighting men enjoyed the music and ignored the rest.

The cold war from the late 1940s to 1990 made international shortwave radio even more intense. The Voice of America sought to counter the growing broadcasts from the Soviet Union and its satellite nations, all of them transmitting in many different languages. The United States also began (but hid their official funding of) Radio Free Europe and Radio Liberty, which targeted their news and cultural programming to Eastern Europe and Russia, respectively. New voices were heard—China became an important international broadcaster in its own and many western languages. Albania provided its own shrill version of communist propaganda. Some neutral nations—India among them—broadcast their own views.

The end of the cold war drastically changed international shortwave as traditional enemies

began to work together. Radio Free Europe and Radio Liberty essentially merged and began to operate out of cities they had once targeted, and extend their programming into the Middle East. The United States began transmitting other shortwave (as well as FM) radio services into the same region, plus less successful shortwave transmissions into Cuba (Radio Martí) and China (Radio Free Asia), both of which were heavily jammed by their target country's governments.

At the same time evangelical Christian stations greatly increased their shortwave transmissions, often using many more languages (more than 100) than official government services. And a growing number of advertiser-supported commercial services targeted Africa and other regions lacking entertainment (chiefly music, which travels well across borders and cultures) in their own domestic service.

By the 1990s, the benefits of direct satellite broadcasting became increasingly apparent and shortwave transmissions began to decline in favor of the newer technology. The arrival of the Internet in the mid-1990s and its accelerating availability over the next decade created yet another option for effecting international communications at far less cost than big and expensive shortwave transmitters.

SIMULCASTING

To simulcast is to provide the same program at the same time over two or more electronic media (broadcast, cable, or satellite) channels—a simultaneous broadcast. Most typical is simulcasting of broadcasts over an AM and FM station in the same market, or over both a radio and a television station. But there are many variations and the most common today is a radio station simulcasting its signal over the Internet. The relevance of simulcasting to journalism is found most strongly in sportscasting.

Origins

The first widespread use of simulcasting in the United States utilized AM and FM stations in the late 1940s. As the new FM service developed, network and AM broadcasters argued that the most efficient way to build its audiences was with popular AM program fare, both news and entertainment. Given that the new service had little or no money to invest in program personnel or content, the idea made some sense. Of course simulcasting also obviated any reason for consumers to buy FM receivers given their existing radios could provide all the available programming. Indeed, some critics argued simulcasting was really just a plot by the AM business to prevent FM from developing into a competitor. Further, the American Federation of Musicians struck many stations, arguing that musicians should be paid twice if their performances were going to be carried on both AM and FM stations.

The musician's demand was finally resolved among the parties, but the larger AM-FM simulcasting issue took longer, only being put to rest in the 1960s with a series of "nonduplication"

decisions by the Federal Communications Commission (FCC). These required co-located AM and FM stations to program at least half their time on the air separately. The policy argument held that simulcasting was a waste of spectrum space. Broadcasters argued their programs were none of the government's business. But the FCC decisions were upheld despite numerous court appeals. By the early 1980s, the now independently programmed FM business surged ahead of AM listening nationwide—and by the early twenty-first century accounted for nearly 80 percent of all radio listening.

Another application of simulcasting came in the late 1950s with experimental stereo radio broadcasts, usually of music. Before FCC approval of FM stereo technical standards in 1961, co-located AM and FM stations could share a broadcast with one providing the left sound channel and the other the right, though their quality was anything but equal. Likewise, a television and radio station (ideally FM, so both audio channels were of the same quality) could provide, say, right and left stereo channels of a music performance. An early British example came in 1974, when the BBC broadcast a recording of Van Morrison's London Rainbow Concert simultaneously on both its BBC2 television channel and on Radio 2. American public television and radio stations were the most likely to offer such broadcasts, especially when airing a live concert.

Broadcast and Internet Simulcasting

WXYC, a student-operated station at the University of North Carolina in Chapel Hill, began simulcasting its off-air (broadcast) signal on the Internet on November 7, 1994, using technology developed at Cornell University. It claims to have been the first radio station in the world to offer a concurrent Internet simulcast of an off-air signal. Many stations soon followed suit, and by the early twenty-first century such simulcasting (also termed *audio streaming*) had become common, aided by the spread of broadband connections. Listeners could tune in to stations well beyond off-air listening range. Satellite radio services also simulcast their hundreds of channels of music and talk programming for subscribers over the air (to special receivers) and on the Internet.

In September 2006, CBS became the first network to offer a live simulcast of its evening news broadcast over the Internet. CBS also made the *CBS Evening News* available as an on-demand program accessible after the simulcast, and allowed viewers to build their own broadcast online by choosing individual reports from each program.

Sports

Professional sports events often feature simulcast play-by-play broadcasts on radio and television. Typically, one or two announcers provide coverage on both media. The practice was common in the early years of television when many people lived far from a station, but since the 1980s, most teams have employed separate on-air personnel for television and radio coverage. Chick Hearn and Rod Hundley were the last broadcasters in professional basketball to simulcast. In baseball, Vin Scully continues to simulcast the first few innings of games. By the early 2000s, the National Hockey League had two remaining teams of broadcasters that simulcast: Daryl Reaugh and Ralph Strangis (in Dallas) and Rick Jeanneret and Jim Lorentz (in Buffalo).

In December 2007, a professional football game between the New England Patriots and the New York Giants was carried on the NFL Network (which is available on cable in fewer than 40 percent of the nation's homes) and was simulcast on both CBS and NBC, thus reaching virtually every television home.

Changing Technology

As a part of American radio industry consolidation and cost-cutting since the mid-1990s, simulcasting has often involved transmitting the same programming over multiple stations owned by the same entity. Talk and music programming heard in one market may be presented in others at the same time, sometimes using a centrally located announcer or newscaster using voice tracking technology.

Cable television systems simulcast network programs. On some cable systems, analog-digital simulcasting (ADS) means that analog channels are duplicated as digital subchannels. Digital tuners are programmed to use the digital subchannel instead of the analog. This allows for smaller, cheaper cable boxes by eliminating the analog

tuner and some analog circuitry. The primary advantage of ADS is elimination of interference, and as analog channels are dropped, the ability to transmit ten or more standard definition television (or two high definition) channels in their place. The primary drawback is the common problem of overcompression which can result in fuzzy pictures or pixelation (breaking up of the image).

Simulcasts using satellite links raise a different challenge, as there is a significant delay because of the uplink and downlink distances required (nearly 50,000 miles round-trip). Likewise, any simulcasting involving video compression also has a significant additional delay, which is noticeable when watching a local signal from a direct broadcast satellite.

One other application is common in Canada because of heavy viewing of American television programs along the common border. Signal substitution (also known as simulcasting, sim-subbing or commercial substitution) occurs when a cable or satellite company inserts the signal of a Canadian television station onto the channel of an American station that is showing the same program at the same time. Canadian cable and satellite operators only perform commercial substitution when requested to do so by a Canadian network or station–in which case by Canadian law, they must comply.

Singapore

Singapore, one of the most networked societies in the world (both literally and figuratively), is also one of the key media centers in the Asia-Pacific region. Singapore has a multiethnic population of 4 million—consisting of 75 percent Chinese, 14 percent Malays, 8.8 percent Indians and 2.2 percent "others"—and is one of the most affluent nations in Asia, as well as globally. It is also a major Asian financial center, with English as its dominant working language; as such, it attracts many global media to base their Asian operations in Singapore.

Singapore is a one-party state, having been ruled by the People's Action Party (PAP) government since 1959. Described by most observers as an authoritarian regime that is hypersensitive to political criticism, the government is nevertheless astute in its social, economic, and media planning. Its desire is for Singapore to become a vibrant global media and journalism hub under its *Media 21* strategic plan unveiled in 2002 designed to see the media sector's economic contribution reach 3 percent of the nation's GDP by 2010.

Regulation

Singapore's Ministry of Information, Communication and the Arts (MICA) has regulatory oversight of Singapore's media industry in economic as well as social, cultural, and political terms. MICA works hard to attract both internal, and especially external, investments in the sector to fulfill its *Media 21* ambitions. In this regard, Singapore is a successful media center that not only provides technical and technological support to global media companies, digital media trials and projects but also plays regular host to major media trade events and conventions such as BroadcastAsia and MIPAsia.

The "regulatory" aspect of Singapore media is where most critical debates ensue. Like most aspects of life, the media in Singapore—for domestic consumption particularly—are heavily controlled. The government openly rejects the role of the media as a Fourth Estate, accepting instead the "development press model," which presents the media as party to the nation-building process. Its role is therefore to "inform, educate and entertain" as per government edict and policies.

MICA actively polices the media with the assistance of its statutory board, the Media Development Authority (MDA)—formed in 2003 through the

merger of the Singapore Broadcasting Authority, the Films and Publications Department, and the National Film Commission. A good way of differentiating their roles is to perceive MICA as the regulator of print media and MDA as the regulator of broadcasting; screen-based media such as films, mobile-TV, and Internet TV; and newer services, including digital media and games. Where the two agencies converge is over censorship and political communication.

Journalism in Singapore can be broadly divided into three categories: broadcast, print and newer media (including the Internet). Until 1980, the government ran all television and radio stations under a government department, Radio and Television Singapore. This became a statutory body, the Singapore Broadcasting Corporation, through an Act of Parliament before it was corporatized to become Singapore International Media (SIM) in 1994. No longer a statutory board, SIM is a private company wholly owned by the government through its state sovereign wealth fund Temasek Holdings. SIM was subsequently restructured and renamed the Media Corporation of Singapore (MediaCorp) in 1999.

The key legislation governing print media is the Newspaper and Printing Presses Act (NPPA). Enacted in 1974, and amended several times thereafter to tighten its juridical reach, the NPPA empowers the government to determine the composition of a newspaper company's board of directors. With the NPPA's structure and mechanism in place, the control of both domestic and foreign presses and publications has been formidable. Following the passage of this law, many foreign media were taken to task for their reports of unsavory aspects of the government. Foreign publications falling victim to this aspect of the law included the *Far Eastern Economic Review, The Economist, The Asian Wall Street Journal* and *Asiaweek*. Over the past 35 years, Singapore-circulated editions of such publications as *Newsweek, The Times* (London), *The Star* (Malaysia), *Time,* and *International Herald Tribune* have had their editors and/or journalists arraigned on charges of publishing defamatory or libelous articles.

These extensive regulations are deemed to be overly oppressive by many. In its *Annual Worldwide Press Freedom Index 2007,* Reporters Without Borders ranked Singapore a lowly 141 out of 169 nations because its media were not only seen as lacking independence but were also heavily engaged in self-censorship to avoid government crackdowns.

Print Media

At first glance, Singapore appears to house a thriving local print journalism environment that exists alongside wide access to international news and titles—its main English and Chinese language newspapers enjoy strong circulation numbers and its Malay and Tamil newspapers are relatively vibrant despite their small readership base. However, a pattern of mergers and politically motivated closures of various newspaper companies, which began in the mid-1980s, has resulted not only in fewer mainstream newspapers as compared to the 1980s, but also in the formation of the Singapore Press Holdings (SPH), essentially a government-linked print media monopoly. At the start of 2008, 15 newspapers—of which 14 belong to the SPH stable—were in active circulation. Only the tabloid-sized English language daily *Today* is owned by MediaCorp. The 164-year-old *Straits Times* is the flagship English-language daily for SPH as well as Singapore.

Broadcast Media

In broadcasting, the state-owned MediaCorp operates all 7 licensed broadcast television channels, as well as 14 radio channels. To cater to Singapore's multilingual and multicultural audiences, broadcast television channels are quite varied. They include the following:

- Channel 5 (mass English-language channel)
- Channel 8 (mass Mandarin-language channel)
- Channel U (mass Mandarin-language channel)
- Suria (Channel 12; mass Malay-language channel)
- Central (Channel 12; Tamil-language, arts and children's entertainment channel)
- Channel NewsAsia (predominantly English-language news and current affairs channel, also broadcast regionally via satellite)
- TV Mobile (broadcast via digital transmission to public trains and buses)

Due to Singapore's close proximity to Johor Bahru, Malaysia's southernmost city, as well as Indonesia's Batam Island to the south, Singaporeans can receive up to 16 additional broadcast television signals from their closest neighbors (although very few actually tune to these foreign channels).

Private ownership of satellite dishes is illegal in Singapore, although major foreign companies and foreign embassies can be granted special licences to mount dishes on their premises. Starhub Cable Vision (SCV) is the only subscription TV provider in Singapore, offering more than 100 channels—including international news such as CNN, BBC, CNBC Asia, and others—over its nationwide cable network. Singaporeans have access to most of the mainstream global satellite cum cable channels via SCV, although an amendment to the Singapore Broadcasting Act (in 2001) gave the government absolute power to restrict the broadcasting rights of any foreign broadcaster if it was found to be meddling with domestic politics.

With the exception of four radio stations operated by the Singapore Armed Forces Reservists' Association (SAFRA) Radio and SPH UnionWorks, radio stations are run by MediaCorp. Radio in Singapore is technologically advanced, with most of the stations accessible via the Internet and available in Digital Audio Broadcasting (DAB) mode, known as "Smart Radio" in Singapore.

Duopolistic Monopoly

In April 2000, Singapore experimented with limited media liberalization when it introduced competition between the two core local print (SPH) and broadcast media (MediaCorp) players by allowing both companies to operate in each other's turf. That year, SPH became a two-channel broadcaster while MediaCorp ventured into newspaper publishing. This move to liberalize the media was done in part to support Singapore's nascent creative industries and to prepare the media sector for global expansion. Government recognized that the economic framework of Singapore's media sector had to shift away from a monopolistic structure—at least in appearance—in order for the rest of the world to take its global media ambitions seriously.

However, the plan to inject "competition" was a dismal financial failure and a public relations disaster. Based on the sizeable losses that both players sustained over the three-year period after the introduction of competition, it was clear that a monopoly was more realistic for Singapore. At the start of 2005, MediaCorp regained its monopoly on broadcasting under a new entity called MediaCorp TV Holdings (20 percent owned by SPH). Likewise, SPH regained its print media monopoly, with the exception of the tabloid *Today*.

Nevertheless, mainstream media in Singapore remain a duopoly in structural terms, although they are very much a monopoly from a political and journalistic perspective since all forms of media and public communication are, as media researcher Cherian George writes, "subordinate to a common purpose, of which the government is the ultimate oracle." Indeed, Singapore's international journalistic notoriety stems from this very premise.

Internet Media

In 1992, the government proclaimed that Singapore would become the "intelligent island-state" of the Asia-Pacific region by the year 2000. Today, with virtually all households and businesses connected to broadband and more than two-thirds of the population computer-literate, Singaporeans are considered more tech-savvy than Americans, Britons, or Australians. With relatively few regulatory restraints compared to traditional media, the Internet has enabled individuals and groups to create websites or blogs to publicize their own agendas. This unlegislated shift in the media regime has also led to a mushrooming of alternative online media in Singapore.

The potential use of the Internet for alternative discourse was neutralized, however, by a series of laws and self-regulatory codes aimed at controlling political use of the Internet. As early as 1996, the authorities introduced a raft of regulatory guidelines to ensure that online "prohibited material"—defined as "material that is objectionable on the grounds of public interest, public morality, public order, public security, national harmony, or is otherwise prohibited by applicable Singapore laws"—were minimized or restricted (Lee 2002). In addition, a decision was made in 1997 to block 100 pornographic sites via the proxy servers of mass Internet service providers in Singapore. Although this was clearly censorship, the government softened its

impact by arguing that this was really a moral gesture to demonstrate Singapore's societal conservatism and was not politically motivated.

The infamous 100 blocked sites remain blocked and are updated by the MDA periodically to ensure their currency. Still, the effectiveness of such rulemakings have declined with the proliferation of blogs, social networking sites, and video/file-sharing websites simply because they are difficult to police. Being a globally minded technologically deterministic society, it is likely that any future changes to media and journalism in Singapore will come from the digital realm.

Social Movements and Journalism

Social movements have relied heavily on news media not only to publicize their missions and goals but to create positive attitudes and opinions from the public. However, mainstream news media have often portrayed social movements as marginal or even deviant groups. As information and communication technologies (ICTs) develop, the relationship between journalism and social movements become more complex than ever before. The Internet age has empowered social movements to frame issues and publicize their activities without relying on major news media. Furthermore, the Internet has allowed ordinary citizens to report on movement-related issues through blogs, electronic bulletin boards, and online discussion forums using text, audio, and video formats. This ability of citizens to easily transmit and receive news and information without the media filter has transformed the relationship between journalism and social movements.

News Media and Social Movements

Inasmuch as social pressure groups seek to mobilize people who support their objectives and build networks among other groups, they need effective and efficient methods of communication. Communicating face-to-face and disseminating posters or distributing fliers take time, money, and manpower. Mass media, such as newspapers, radio, and television, have historically played vital roles in mobilizing people and forming networks. Given the powerful impact of media on the public's perception and attitude toward public affairs and issues, media can be the most influential means of mobilizing public support. To draw news media attention, social pressure groups have often created events, such as protests and demonstrations that fit the news media's desire to dramatize them with conflict and tension. Furthermore, news coverage has focused more on protesters' appearance and actions than on their core messages and themes.

As an agent for social control, mainstream news coverage of social movements tends to rely on the degree to which a given movement challenges the status quo. Resource-rich groups with large amounts of financial resources and human resources (e.g., staff, members, and volunteers) may get frequent media attention, while resource-poor groups can be marginalized and decentralized due to their relative scarcity of political power. However, even resource-rich groups cannot ensure positive and sustainable news coverage because journalists depend on political and economic elites as news sources, including governmental officials, policy makers, politicians, and the military; these

individuals often have a vested interest in maintaining the status quo, thus, spinning controversial social movements in a negative way to the media and the public. This is especially apparent when radical social movements oppose the current political and social systems.

Numerous historical events demonstrate how mainstream news media portrayed and represented social movements in distorted and negative ways. For example, during the 1960s and 1970s, television news dramatized the anti–Vietnam War protestors and demonstrators by focusing on their violent actions, such as their blocking of roads and attacks on police, rather than on major goals and messages of the movements. During the early years of the gay rights movement of the 1970s and the arrival of the AIDS epidemic in the 1980s, for another example, news media continued to describe gays and/or lesbians as deviant and even criminal groups who were harmful to society. In the early twenty-first century, news media still focus more on negative and stereotypical images of gays, lesbians, bisexual, and transgender groups-a local evening newscast introducing a gay-themed story using footage of bawdy gay pride marches, for example. This type of news coverage may have a significant impact on the general public's perceptions, attitudes, and opinions toward social movements.

Technology and Social Movements

Marginalized and resource-poor movements seek alternatives independent from mainstream media and are often able to use new technologies to their advantage. For example, in the 1979 Iranian revolt, when college students seized the American Embassy in Tehran and held 52 U.S. diplomats hostage, fax machines played a vital role for students to disseminate their missions, goals, and activities. A decade later, radio (and extensive international television coverage) played a crucial role in spreading the goals of insurgents in Beijing's Tiananmen Square in 1989.

Recently, the Internet has become an effective strategic tool and a modern alternative to mainstream media. The Internet allows movement groups to build support through their own websites without any constraints, empowering social movement groups to produce their own ideas, news, strategies, and tactics—indeed, their very identity. The Internet can remove barriers to the rapid diffusion of protest goals, tactics, and strategies as it overcomes the limit of time and speed. Once a message is posted on a given website, it is immediately accessible regardless of geographic barriers and media coverage. Social movements are increasingly going global, connecting groups through online networks. In the Internet age, social movements can also be virtual, which is often called cyberactivism, Internet activism, or hactivism. Perhaps most importantly, the Internet empowers social movement groups, connecting disparate individuals and groups so that they can collectively work for or against specific entities or other groups. For example, social movement groups organized antiglobalization protests during the World Trade Organization summit in Seattle in 1999 when individuals and groups delivered news and information regarding the summit in effective and efficient manners through e-mails and websites. In turn, digital communication technologies in the antiglobalization movements enabled people to organize collective actions that attracted and influenced public opinion.

Journalism and Social Movements in a Digital Age

The relationship between journalism and social movements has become more dynamic as ITCs have empowered social movement groups to communicate directly without relying on mainstream news media. As mentioned, this can be seen in the events in Seattle in 1998, as well as in the anti–Iraq war protests in 2003 in such cities as New York, Washington, D.C., and Chicago. Through their own websites, social movements can report and deliver news and information regarding their missions/goals and activities so that they can frame the issues themselves without relying on news media and communicate directly with the general public. Movement activists and ordinary citizens who have become citizen journalists through innovative technologies, such as weblogs, wiki, and podcasting, increasingly compete with traditional and mainstream journalists. In this regard, citizen journalism may influence how the general public perceives social movements in a more supportive and positive way, in contrast to traditional journalism, which tends to marginalize and decentralize

social movements by showing radical and violent images rather than core messages of movements. This is especially true for those groups who oppose the government, such as the anti-WTO movement in Seattle in 1999 and the anti–Iraq war movements of the first decade of the 2000s.

Yet, although the Internet can be an effective and supplemental tool to mobilize people quickly with low cost and deliver information and news quickly, there is a distinct disadvantage to protest diffusion through the Internet in the sense that the Internet can provide false and misleading information. This lack of information credibility can lead to social movements being compromised rather than bolstered by the Internet. In turn, the general public may not trust the information and news put out by movement organizers.

Moreover, while the Internet plays a vital role in affecting movements' strategies and tactics, mobilizing people easily, and disseminating information quickly, mainstream media with their large (if declining) audiences are still powerful in terms of affecting movement groups' objectives and goals, which in turn can influence movements' successes. For example, MoveOn.org, a liberal and progressive political movement group, has been successfully using digital communication technologies, especially websites, to frame their activities on their own and mobilize the general public who can support their goals and missions.

Lastly, and most importantly, power and market forces, such as elite groups, big media organizations, and large corporations may hamper social movements' activities to maximize the potentials and possibilities of the Internet. In other words, those popular and visible websites by political, economic, and major news media organizations can keep people from visiting alternative movements' websites. Although the Internet can be a movement medium itself for social movement groups, it can also be a mainstream medium for elite groups, preexisting news organizations, and larger corporations. In this vein, the Internet's contributions to social movement groups should be considered within the context of the dynamic relationships among power structures, market systems, mainstream news media, and social movements.

In conclusion, ICTs have empowered social movements to create their own online media and communicate with not only members and volunteers, but also with potential donors and supporters through various technologies, such as blogs, wikis, e-mails, and social networking sites (e.g., MySpace and Facebook) without relying on mainstream news media. Nonetheless, mainstream media can impact movements' success by influencing movements' tactics, strategies, and activities, as well as by shaping the general public's attitudes, perceptions, and opinions toward social movements. As mentioned earlier, although antiwar movements have attempted to organize protests and deliver their goals and missions to the general public, mainstream media's coverage has often depicted those groups as marginalized and decentralized by dramatizing protesters and focusing more on provocative images than major issues. This competition for the public's attention between legacy media organizations and the self-generated newer media utilized by many social movements will no doubt continue as media technologies develop and more message power is put in the hands of individuals.

Social Network Websites

Except for a brief period in their nascent stage—when Meetup.com was an emergent tool designed to create community offline—social networking websites have become the venues in which young people interact in cyberspace. With their ease of access and increasing cache of tools for self-expression and communication, these sites have become one of the most popular ways for youth and others to engage each other and anyone who cares to visit a profile. While other forms of social media—such as blogs, content communities and podcasts—bring together Internet users online, only social networking websites facilitate this interaction primarily for social interaction. One of the essential characteristics of social networking websites is participation—outside of the basic support infrastructure of such sites, the content is entirely user-generated and user-aggregated. A second is community formation—networking sites form the basis of many virtual communities among friends or by commonly shared interests.

The sites allow users to create personal profiles, or pages that contain personal information about that user. Users build their own networks by linking to other profiles and inviting the creators of other profiles, in turn, to link to their own. Users maintain and update their profiles by adding new material and communicating through blogs or other posts to other members of their personal network.

Development

In the 1990s, when consumer World Wide Web technologies were still being developed, analysts spoke of the web's potential as a social connector, creating communities and bringing people together in ways never before thought possible. These idealistic conversations made their trial run with Classmates.com, established in 1995 to reunite long-lost high school friends online. After that, a handful of networking sites spun off the Classmates.com concept, but none took off in the ways that craigslist (launched in 1995), Friendster (2002), and Meetup.com (2004) did in later years. Among these sites, craigslist has grown substantially, serving primarily as an online marketplace based in major cities around the United States and the world. While it fits the networking website definition broadly with its role as social connector, it does not allow its users to create individual profiles.

Facebook was launched in 2004, initially as a space for current college friends and classmates to interact, though it has since broadened to appeal to other groups. Until 2007, the site was considered to be more "closed" than its major competitor, MySpace, which does not require a user to give accurate personal information in order to build a profile. Facebook has grown tremendously, but still plays second fiddle to MySpace, which (as this is written) by far dominates the online social networking arena.

In July 2005, when MySpace was receiving more web hits than Google, Rupert Murdoch (1931–), owner of News Corporation, purchased it for $580 million. The acquisition acknowledged young people's movement away from traditional media, as time spent online was replacing that in front of television receivers. Murdoch's strategy was to expand MySpace into overseas markets, and in November 2006, he announced a Japanese joint venture expansion. Although the site has a level of mass appeal, it has also cultivated a niche as the home of many popular music artists, who have created their own profiles on MySpace as a way of reaching tens of millions of consumers. Emerging from the Los Angeles music scene in 2003, MySpace rapidly became popular with teenagers and young adults. Users often combine streaming video and sound clips to their profiles, along with more conventional text and images. Members communicate with each other by sending messages that are posted on publicly visible bulletin boards, and profiles often list musical tastes, personal heroes, and basic personal information such as date of birth, marital status, or career.

According to a 2007 study by the Pew Internet & American Life Project, among all teens who have created a personal profile on a social networking site, 85 percent used MySpace, 7 percent used Facebook, and 1 percent used Xanga. The most popular of these by far—MySpace—had amassed 107 million members as of 2006.

By 2007, some media analysts began labeling what might be called the balkanization of online social networking. There are now an estimated several hundred networking websites, many of which cater to users who wish for more control and privacy over their networks, as well as many who are more interested in building online relationships around a niche interest. For the latter, there are sites like Dogster, which by definition weed out users who are not interested in sharing information and building a community around canine interests. It is unlikely that these specialty interest networking sites will overtake a giant like MySpace anytime soon, but they are important because they represent the desire for control over content and medium by users that was first given voice by the advent of online social networking. The diversification of networking sites has also made online networking more accessible to older users, many of whom would not have otherwise been compelled to participate in what is generally seen as a youth activity.

Privacy Concerns

Along with the rise in popularity of social networking websites among teens have been concerns about user exposure to predators. The darker side of social networking is in part due to the open nature of most of the sites, where mobility and access are essential to producing greater exposure as well as the easy expansion of individual networks.

In April 2006, MySpace took steps to warn its users against the threats of online pedophiles and other predators, who could potentially victimize users who either "friend" them or leave identifying information for any to see on their profile. The company placed warning ads on the site and announced the installment of an online security officer to patrol the site for potential predators as part of a larger campaign, which came in response to the arrests of two men who had allegedly use MySpace to meet two minors.

The Pew Internet & American Life Project study estimates that among the more than half of all American youth that go online, those between the ages of 12 and 17 have their own profiles on social networking websites. This high concentration of youth in such an anonymous setting, combined with the relative ease with which anyone can develop a personal network, is what has worried parents and advocacy groups.

Networking Websites and the Future of Journalism

Author John Pavlik writes that if newspapers are an editor's medium and broadcasting is a producer's medium, then the Internet is, if anything, a journalist's medium. Not only has the Internet embraced all the traditional storytelling tools of traditional media, but it has incorporated new tools as well, which allows journalists to tell stories with increasing dexterity. The Internet has also introduced a new degree of interactivity to journalism, in which news consumers increasingly participate in the news-creation process, and professional journalists must cater to more fragmented audiences.

Social networking websites have slowly crept into the world of online journalism as these two phenomena have burgeoned (especially the latter). In an April 13, 2005, speech in which Rupert Murdoch discussed News Corporation's purchase of MySpace, he admitted that his company had been risking the loss of a generation of news consumers who prefer not to have their news neatly packaged and presented to them in a tidy box. MySpace—a social networking site that to him represented a younger generation's preferred way of mediating information—allowed users to have control over their own media, in some cases generating it themselves. In the April speech Murdoch insisted that traditional journalists would still retain their role in the new media world he envisions, as suppliers of original content, but profile managers would have the control over its presentation and aggregation. The growing potential of revenue generated by ads sold on networking sites like MySpace indicates that networking websites could draw advertisers even further away from traditional media such as print newspapers. Although networking sites may represent a threat to traditional journalism—though this is debatable—blogs may be the online social medium representing more significant competition to news gathering as we know it.

The most recent phenomenon as these volumes went to press was the growing journalistic use of Twitter. Though infamously restricted to no more than 140 characters per message (thus calling for *very* concise writing), Twitter offered yet another way for virtually anyone to rapidly report breaking news. Whether Twitter would prove of lasting value could not be discerned by mid-2009, though its news applications appeared to be growing.

Conclusion

Social networking websites are perhaps most remarkable for their ability to foster intricate and complex webs of interaction in an increasingly fragmented culture whose digitization might otherwise hamper community-building efforts. The sites are, in many ways, a blank slate providing only the basic infrastructure necessary for facilitating users' self-expression. However, as the sites are increasingly seen as a high-potential market, the rise in advertising may turn some users away.

MySpace's explosion in popularity and Rupert Murdoch's subsequent high-profile purchase of the service illustrate the enormous hype surrounding social networking. But the medium is relatively young, and the new media landscape continues to evolve rapidly. The rise in user-generated content and the interest in virtual communities, however, appear to be two trends that will contribute to the changing definition of journalism and media more broadly. Indeed, social networking sites were one of the Internet's first significant attempts to bring virtual communities and journalism together.

Sound Bites

A sound bite is an audio snippet (often a phrase or sentence) excerpted from a longer quotation, speech, or interview. They are most often heard from political figures but can be used for anyone of interest to the media. By definition, a sound bite lacks context, save what a program announcer, anchor, or host provides. Insertion of sound bites into news broadcasts, while a valuable way of adding variety and reality, is also susceptible to manipulation and requires ethical decision making on the part of news media. Politicians and others in public life quickly learn to produce on-demand sound bites during media interviews as they make it more likely their words will be used on the air.

Most often a short phrase or sentence, a sound bite captures the essence of what the speaker is saying. Such moments stay in the listener's memory and serve as a sample of the larger message. Put another way, the best ones hit home. They may be off-the-cuff remarks or carefully preplanned. Broadcast and cable make heavy use of sound bites and they are increasingly evident on the Internet as well. And they can have negative repercussions for unwary political candidates or show business figures where a momentary comment can haunt a speaker. Senator George Allen (R-VA) learned this in 2006 when an offhanded racist comment became a widely distributed sound bite which helped cost him re-election.

The abbreviating trend in political candidate sound bite use shows up clearly in network evening newscast statistics. In covering presidential elections, 1968 newscasts used campaign speech sound bites averaging 43 seconds in length (easily a paragraph and often longer); by the 1972 race, that figure had dropped sharply to 25 seconds; it declined further to less than 10 seconds by 1984; and under 8 seconds (a short sentence or phrase) by 1992. It

has stayed about the same in elections since. The process of using tinier sound bites contributed to personality-based coverage that stressed the "horse race" aspect of campaigns, as it was extremely difficult to say much of substance about issues in such brief snippets. On the other hand, by the early 2000s, broadcast networks often provided longer excerpts on their affiliated cable channels or posted them online.

Political sound bites are but one part of a larger trend—the ever shorter story on most television newscasts. Audiences were presumed to have short attention spans, and thus stories needed to be "punched up" with visual and sound reality material while still being kept very short. By the early 2000s, a news story of three minutes would be unusual on the television network evening newscasts. In this sense, the use of sound bites merely parallels other trends to brevity in television (including more widespread use of short commercials—ten seconds or even shorter—to squeeze more in and cut the costs of each individual spot). Television news stories are getting shorter, the number of different visual elements (and sometimes sound bites) has increased, and the result is a faster-paced news program.

Two older examples of the staying power of a sound bite demonstrate the value of using the right words at the right time and place. In a speech delivered by then–Federal Communications Commission Chairman Newton Minnow early in 1961—otherwise forgotten today—he described commercial television as "a vast wasteland" and the term stuck. Likewise a political speech of some complexity can be reduced to a handful of words—the term *iron curtain* was not original to Winston Churchill, but when he used it deftly in a March 1946 speech, it soon became a description of the cold war divide in Europe.

The increasing use of sound bites—and their diminishing length—is the result of several factors. They are a product of a decline in listener and viewer attention span. They can help capture the essence of what someone is saying by briefly summarizing a longer statement. Stations and networks often prefer their own analysis to candidate oratory. Politics seem to interest fewer listeners and viewers, and thus stories are compressed to make way for other news. And technology has lent assistance. The switch from film to videotape made editing tiny sound bites far easier. Use of visual captions can identify a speaker without taking valuable extra air time to do it aurally. Digital recording and editing methods make sound or image bits even easier to produce and distribute.

The term *sound bite* can also mean very different things, far removed from journalism. A sound bite can refer to natural sounds (such as a busy street, waves on a beach, or a thunderstorm) that may be used as background for an onsite report or simply as standalone effects. They can be excerpts from motion picture or video soundtracks or musical works, old radio shows, or even bits of audio recordings of print media. Indeed, collections of sound bites are often packaged and sold. While by definition the term usually refers to audio, it has also been applied to visual bites, or even to restaurant reviews.

South America

Journalism in South America encompasses myriad forms and functions, making simple generalizations impossible. Instead, the development of the profession in the region has been influenced by such diffuse factors as competing press models, shifts in media economies, diverse audiences, changing regulatory environments, political instability, and emergence of new technologies, among others. Numerous problems exist for the practice of journalism according to Western standards of a free press, but advancements in the form of dramatic developments in communication technologies, growth of professional associations, and educational opportunities hold promise for the future.

Access and Audiences

According to the United Nations, the population of South America in 2007 was over 373 million, with Brazil (186.8 million), Colombia (44.9 million), and Argentina (38.7 million) forming the most populated countries. More than three-fourths of the continent's populations live in urban areas, with that figure even higher in Argentina, Brazil, Chile, Uruguay, and Venezuela. Colombia, Peru, Bolivia, Paraguay, and Ecuador have somewhat larger rural populations, comparatively. Geographical location, language, literacy, and income, among other variables, have implications for audience access to media. Poorer and rural populations tend to depend more on broadcasting for news and entertainment, and radio and television have provided both in areas plagued by higher rates of poverty and illiteracy. Communications researcher Joseph Straubhaar describes other recent trends in programming: initially dependent on imported programming from developed countries, more South American prime-time broadcast material is now locally or regionally produced; and *telenovelas*—dramatic soap operas now exported worldwide—and reality show programming are especially popular.

Since the 1990s, pay television has also grown considerably, especially among the urban middle- and upper-middle classes. High penetration of pay television is seen in Argentina, which has higher rates of cable subscribers than the rest of South America. Writer John Sinclair attributes the success of cable television in Argentina in part to the government-mandated lack of networks in the country initially put in place in order to tighten controls over content. Argentina, Uruguay, Brazil, and Chile also historically boasted significant audiences for print media, as newspapers played important roles in those countries. But over-the-air broadcasting remained the medium of choice for many throughout South America, as poorer sectors of the population tended to be restricted from print or cable offerings by the cost, literacy rates, limited circulation, infrastructure, or language. Most mainstream print or television products in South America exist in Spanish, with the notable exceptions of Portuguese-language media in Brazil, English in Guyana, Dutch in Surinam, and French in French Guiana, among others. Pay television offerings have English-language channels, as well. However, sizeable indigenous populations speak other languages or live in remote areas and therefore can be more limited in their media options.

Access to Internet technologies also remains, for the most part, a luxury reserved for urban middle- and upper-classes, as Straubhaar discusses. Poor infrastructure to rural areas and costs are associated with fewer home Internet connections. However, since the late 1990s, Internet use has increased in Latin American nations, notably Chile, Uruguay, and Argentina. For those who can afford to use them, Internet cafes are increasingly common across much of South America, particularly in urban areas. However, a 2008 report issued by the World Economic Forum observed that various Latin American nations—among them, Chile, Argentina, Brazil, Colombia, Peru, and Venezuela—have fallen in rankings measuring access and investment in Internet technologies and infrastructure, in comparison to efforts in other countries.

Changing Press Models

Journalism has a long history in South America. While forms of mass communication existed before colonial powers arrived, as writer Leonardo Ferreira discusses, by the late nineteenth century most South American nations had established Spanish- and Portuguese-language presses.

Hybrid press models would emerge and blend in South America during much of the twentieth century. As researcher Silvio Waisbord discusses, one model was in the tradition of European partisan press, where journalists acted as advocates for particular political or ideological perspectives, infusing articles with opinion, rather than remaining neutral observers. Here, journalists had "missions": to espouse certain political views, earn public support for a government or political party, and promote or interpret certain political realities. Political conflicts played out on front pages, or could even birth new outlets, as Waisbord notes was the case in Colombia, including *El Espectador* in 1887 and *El Tiempo* in 1911. Political leaders became publishers and editors, such as Argentinian Bartolome Mitre of *La Nación*. The idea of journalists as active advocates or political militants continues to some extent, in various parts of Latin America. Outlets directly tied to partisan interests and transparent in their ideological loyalties exist among South American newspapers and broadcasters, particularly in countries where political parties are strong, as in Colombia and Uruguay. However, by the early twentieth century, another model had arrived to the continent.

The second model of journalism adhered more to one seen in the United States, where the emphasis was on a complete separation from official influence over content, and toward an "objective," information-centered style of reporting. In comparison to the partisan model, in this sense newspapers were commercial enterprises geared for mass audiences, rather than select sectors. Waisbord discusses how this model arrived on the heels of global transformation, as a wave of globalization swept Latin American countries. New communication technologies and media services—such as photography, film, and wire services—and reorganization of newsrooms pushed transformation, as did a shift toward commercial logics to maximize audiences. At the same time, a growing middle class, emerging private sector, and spread of market research influenced adoption of a business model. Various newspapers shifted to a version of this model, including Argentina's *La Nación,* Chile's *El Mercurio, O Estado de São Paulo* of Brazil, and *El Comercio* of Peru.

However, in South American newsrooms, the U.S. model of the journalist as an impartial purveyor of objective information did not fully consolidate. The state remained an important variable in how journalists and media professionals could ply their professions. Media organizations' abilities to survive without important government subsidies and favorable regulatory decision making in the face of limited market potential and economic and political upheaval was precarious. After various Latin American nations began nationalizing important advertising sectors, such as telephones, airlines, electric companies, mining industries, and others, the state had more financial control over media. Democratic instability could mean contentious relations with various governments, and those who found their editorial line at odds with regime leaders could find their organization censured or closed, as was the case with *La Prensa* and Argentine President Juan Perón's administration in the early 1950s. Other times, media executives formed tight relations with political actors, in the name of partisanship, national security, and economic policy. During the Salvador Allende presidency in Chile in the early 1970s, the daily *El Mercurio* called for the overthrow of the President. In Brazil, top newspapers supported a 1964 coup d'état.

Journalism Education and Licensing

Initial journalism education in Latin America also reflected differing perspectives. Scholars have shown how some public universities, more oriented toward European counterparts, emphasized liberal arts education based on humanities and social sciences, while some private Catholic programs offered more skills-based courses in order to ameliorate societal problems by bringing them to public attention. Argentina and Brazil were among the first nations in Latin America to offer courses in journalism, with programs initiated in Buenos Aires and La Plata in 1934 and courses offered by the Federal University in Rio de Janeiro a year later.

Two nongovernmental regional organizations with interests in journalism and education are the International Center of Higher Journalism Studies for Latin America (CIESPAL) and the Latin American Federation of Social Communication Programs (FELAFACS). In 1959, what would become CIESPAL was established in Quito, Ecuador, to promote the professional and educational advancement of journalism in Latin

America. The center reflected the split between skills training and social communication. At CIESPAL, the emphasis shifted from more skills-based training to be more in line with the model of nonskills training, with an emphasis on critical teachings on social responsibility by the 1970s. By the 1990s, however, CIESPAL was balancing those aspects with a return to professional training, following the U.S. model of journalism education. Conversely, skills training had returned to the forefront in some cases, such as Brazil, during military regimes, when leaders emphasized skills in terms of national economic development, or as nations sought "modernization."

By the 1990s, the number of university programs in communication, as well as students in both skills-based and social communication programs, had significantly increased. Founded in 1981, FELAFACS was formed to support teaching and professional practice. The federation supports research and development, provides resources and otherwise foments communication programs in Latin America. Currently, it counts with hundreds of affiliates.

In some Latin American countries, in order to practice journalism, journalists were required to become a member of a professional organization or to have a journalism degree from certain "recognized" universities, something known as "colegios." By 1993, such policies were enacted in various nations, including Bolivia, Brazil, Colombia, Peru, and Venezuela, even if they were not always in force, as writer Jerry Knudson notes.

Alternative and Community Media

In contrast to mainstream media, South America's alternative presses have functioned under various types of regimes in previous decades, as alternative voices to the political, economic, or social "dominant orders," as Waisbord described them. He notes how these publications initiated investigative reporting into areas where mainstream players feared to tread. One of the most famous journalists was Argentine Rudolfo Walsh, who gained fame, in part, with his reports on politically motivated killings.

Community radio networks in Bolivia owned or affiliated with mining unions or miners have served important functions in regions where geography, poverty, and illiteracy affect media access. In Venezuela, community broadcast media have flourished, and steps to grant them legalized status or licenses have increased in recent years. Various Chilean radio stations played important roles before and during the transition to democratic rule, providing dissenting voices and opposing views to that of the dictatorship.

Watchdog Journalism

One important shift that occurred in South American journalism in the late twentieth century was the shift of watchdog reporting to mainstream media. Watchdog media are those that critically scrutinize events, issues, and power actors to publish information others would not want in the public eye. In regions struggling with deep inequality, a weak rule of law, and ongoing political or economic instability, such reporting has important roles in ongoing processes of democratization. Watchdog media have brought attention to human rights abuses and broaches of civil liberties, high level corruption, mismanagement, and other wrongdoing. Such reporting can lead to government investigation, judiciary proceedings, resignations, or jail time for those found guilty.

Waisbord chronicled various examples of watchdog reporting in South America, including: reporting by Peruvian newsweeklies such as *Caretas* on high-level corruption and state-sanctioned killings in the 1980s and 1990s (others implicated the administration of then-President Alan García in fraud); Brazil's *Folha de São Paulo*'s coverage of high level corruption, plans to buy votes toward presidential reelection, and payoffs in construction of a railway; Argentine media coverage of official involvement in human rights abuses, illegal weapons sales, and homicide within military ranks; and reports from Colombian outlets like *El Espectador* and *Cambio 16* on terrorism wreaked by paramilitary forces and drug cartels, and secret dealings between those forces and public officials.

Observers of Latin American journalism attribute the emergence of muckraking and more assertive forms of reporting in the region to influences operating simultaneously within, between, and external to newsrooms. Increases in private sector advertising, decreases in partisan direct controls, and continuing democratization allowed space to report on official misconduct. As audiences

responded to publications of scandals, market competition increased, spurring further publication of official misdeeds. Politicians noted the growing importance of such stories in election outcomes, and strategic release of information could work to derail opponents or lend a hand to allies. In other cases, journalists' focus on public sphere values changed newsrooms. These "newsroom entrepreneurs," in writer Sallie Hughes's words, steered newsroom coverage in new directions; organizational ideologies influenced reporting toward, or conversely, away from particular political and economic power actors.

In recent years, some have noted declines in watchdog performance in various respects, attributing them, in part, to economic pressures, newsroom shifts, changes in media-state relations, personnel shifts, organizational ideologies, corporate interests, and other variables.

Challenges for Free Press

The Western ideal of a press free from state bonds and located within a context of democratic institutions working in the public interest has for decades mixed with European values regarding socially responsible presses in South America. By the late twentieth century, many countries overcame periods of authoritarian rule, and direct threats to journalists (such as kidnappings and killings) faded somewhat as democratic administrations came to power. Liberal market policies prompted growth of private sector advertising, and various news organizations gained a measure of economic distance from the state.

Various scholars and watchdog groups have argued, however, that attempts to control media have shifted from direct methods to more indirect ones in recent years. Researchers Sallie Hughes and Chappell Lawson, the nongovernmental organization Freedom House, and others attribute low press freedom in Latin America to such control mechanisms as arbitrary regulation and an unwelcoming legal environment where news organizations or individuals may be easily sued in criminal court; oligarchic ownership patterns; highly concentrated private sector advertising; economic instability; varying levels of journalistic professionalism; perceived impunity for those who attack journalists; and little widespread access to alternative sources of information. All of this is exacerbated by extreme poverty and social inequality for a large part of the population.

Media organizations across much of the region have struggled with constant change in their political and economic environments. This unevenness has had implications for performance, as outlets have had to walk a fine line between, as Waisbord put it, "the rock of the state and the hard place of the market." Television was launched to further state or military interests in various countries; many also saw it as a tool for social development. In Uruguay and Chile, universities and churches owned stations mandated to promote educational and cultural goals. But broadcaster relations with the state varied, especially with changes in regime type. Military regimes in Peru and Argentina weakened commercial broadcasting and instituted direct control over content; in Brazil, close relations developed between military leaders and national broadcasters, resulting in less critical coverage of those in power. In Chile, administrators appointed by the military regime held key positions in governing television programming. By the 1980s and 1990s, deregulation and privatization liberalized media markets and broadcasting became more market oriented. But states still retained various means of media control, even with extensive privatization and deregulation. Regulation may give the state political control over media, including broadcast licensing, permit requirements, content restrictions, tariffs on technology, and taxation, and in some cases, with little public input.

Legislation to control media content—such as criminal libel laws or "insult" laws—remains in effect in various parts of Latin America and can be used to silence those who criticize powerful actors. Most Latin American nations punish libel as a criminal offense; according to the Committee to Protect Journalists, journalists were convicted of defamation in Uruguay, Peru, and Ecuador in 2007. In some nations, perceived "insults" or affronts to dignity toward public officials can be punished in the form of *desacato* (insult) laws. Conversely, legal infrastructure to protect or aid journalists is too often superficial, or lacking altogether. Shield laws, or legislation that protects journalists from revealing confidential sources, may not be in force, or if they are, could mean expensive court proceedings. Legislation and initiatives to provide access to

public information have expanded in recent years, yet actual compliance is, in various cases, not fully realized or enforced. State officials may still deny requests for information or ignore them altogether, and the strategic use of state information for particular benefit remains systemic in Latin America. Journalists often must depend on personal relationships for information, rather than access to databases or records. In Venezuela, President Hugo Chavez's contentious relationship with the country's private media has resulted in a stricter legal environment for journalists and an expanded state role in media. Chavez's administrations have increased punitive measures for breaking *desacato* laws, substantially increased spending in state media, and expanded a law of "social responsibility" that limits media content decisions, including mandated transmission of official messages by broadcasters.

Concentrated massive holdings in the hands of a few families or corporations were, in many cases, the consequence of tight media-state relations over a period of time, as Hughes and Lawson describe. In terms of ownership patterns, the South American media landscape is dominated by a few corporate giants, like Globo in Brazil, Venevisión of Venezuela and Grupo Clarín in Argentina. In the case of Globo, relationships between broadcasters and political leaders allowed it to become one of the dominant players in the hemisphere, as it tempered critical content and censored oppositional voices for years, while currying favor with authoritarian leaders. Grupo Clarín rose from the initial holding of the Argentine newspaper, *Clarín,* eventually diversifying holdings into print, broadcast, pay television, distribution, transmission, and production outlets, among others.

By the time democratic rule returned to Chile in the 1990s, writer Rosalind Bresnahan described the presence of an "impressive array of independent media" existing in the country. However, scholars charge that the newly democratic Chilean state failed to support these diverse voices, awarding state advertising primarily to outlets aligned with official views, and with few constraints on ownership concentration, cross-ownership, and foreign investment. Licensing requirements impeded development of independent broadcast voices, as the required technical report for a license was expensive and something smaller independent entities could rarely afford. In several cases, advisors to Pinochet utilized their elite positions in a central state-owned bank to take over ownership of important newspapers and magazines.

Proponents of Internet expansion into developing countries argue that this technology will mitigate inequality by giving more people access to diverse information. But while some countries have been able to facilitate Internet access, what has been done has not significantly closed the digital divide in Latin America. Monopolistic holdings in communication and information industries, controlling major portions of broadcast media, print, pay television, or Internet, can have implications for content or access. Those who can afford Internet access or cable or satellite television subscriptions, and speak English, Spanish, or Portuguese, can readily find alternative news sources. But those who speak traditional indigenous languages or live in areas with less access to media technology infrastructure, lower literacy rates, higher poverty rates, and less education represent significant pockets of South America that are poorly served by increasing media offerings. Such populations can depend on local, community-based radio stations that sometimes operate without official sanction (such as licenses), and they are threatened by so-called market reforms and media concentration.

Importantly, Latin America can be a dangerous place to be a journalist. According to the Committee to Protect Journalists (CPJ), instances of attacks against media professionals continue in Latin America, with few aggressors brought to justice. Recent instances of attacks in South America have occurred, according to the CPJ. Among their other examples: In Brazil, two reporters and their driver were kidnapped and tortured in 2008 while working in a neighborhood of Rio de Janeiro. In Bolivia in 2008, journalists were attacked by both pro-government and opposition factions, and one reporter for a state-run radio station died after being beaten by protestors. By the end of 2008, the CPJ had ranked Colombia and Mexico among the top places in the world for impunity of those who attack journalists.

Further, disparate journalistic standards and training affects how well information is conveyed. Lack of access to formal training in new technologies or education including emphasis on normative principles, can be problematic. Low salaries and long hours compound the problem. Alleged reports of journalistic corruption in the region, in the

forms of bowing to pressure to temper critical content, self-censor, or engage in other ethical compromises, have surfaced periodically.

Conclusion

Journalism in South America remains a mix of influences, subject to the seemingly constant flux of political and economic environments, publishing for disparate audiences mired in deep inequality, and sometimes in the face of limited access to educational and training opportunities or to newer communication technologies. More recent turns to democratic governance and market policies throughout South America have reduced somewhat the direct influence of the state in media function, but most governments retain strong forms of control over media enterprises. Ongoing processes of ownership concentration continue to place media holdings in the hands of a few corporations, a trend seen in other regions of the world. Although newer communication technologies have been made available throughout the continent, access to those media is often limited by geography, language, income, or education. These factors pose significant challenges for a substantial portion of the region's population. A weak rule of law that plagues the region has implications and import for media function, particularly when it comes to investigations into illicit dealings.

South American journalists have managed to overcome formidable challenges in presenting information in the public interest. Exposure of high-level instances of corruption, abuses of human rights, reports on ties between *narcotraficantes* and public officials, and fraud continue, even when such publication has resulted in physical retaliation against journalists. And in perhaps the most positive sign, journalism and mass communication programs continue to draw interest among Latin American students. FELAFACS cites continued growth of and interest in programs of communication, social communication, and journalism in Latin American universities and colleges.

Special Interest Journalism Organizations

As noted elsewhere, journalists are joiners. Perhaps nowhere is that more evident than among the host of specialized journalism organizations—essentially those not covered in other organizational entries. It seems there is hardly a professional journalism role that does not boast at least one association for the sharing of ideas, best practices, and concerns about policy or economic incursions into the work of members.

Some of the groups noted below have formed because they could not join existing organizations. This was true of several women's journalism groups that were controlled by and limited to male membership for decades. Likewise, photographers came together in two different groups in the mid-1940s to seek more overt recognition for the creative efforts of their members in an era when photographs were rarely credited. So did editorial cartoonists, the most famous of whom were widely recognized and could thus help form an association to support the efforts of other cartoonists. Both the American Meteorological Society (AMS) and the National Weather Association (NWA) have certified broadcast meteorologists. As of 2008, nearly a thousand television weather people had been certified by the AMS; starting in 2009, they will issue Certified Broadcast Meteorologist certifications that stations can display. Some groups helped small professional subgroups—ombudsmen are one example—seek comfort and support from others scattered across many markets.

The well-known National Press Club of Washington, D.C., began more as a social gathering place, eventually becoming both an important source of news and a model for countless other similar groups in other cities. It also reflected the social pressures on journalism (and American society generally) which led to very public controversies about the admission of black and later female journalists to its membership roles. Its debates and eventual admission decisions were widely reported simply because of the club's visibility across the capital city and the country at large.

As media change, so do the organizations serving them. The Society of Newspaper Design dropped the "paper" in its name as members increasingly worked across multiple media. The growing number of online journalists—some professionally recognized but many more not—created its own group to help achieve both recognition and common standards. The photographers' groups eventually admitted those doing video for television news. Several groups have formed to protect the interest of reporters and other journalists as government and technology clash and put pressure on rights of access.

The information on each association below is based largely on their individual websites.

Specialized Journalism Organizations

The groups briefly profiled here provide a sense of the wide variety of journalism interests that are represented by organized associations. One group has even cropped up to keep all the many association leaders informed of what other groups are doing. Viewed either separately or together, these groups fill two functions that are similar to those of other news-related organizations—they provide a place for interchange of common concerns and ideas, and they lobby (though few would agree to that verb) for their particular interests. The difference is that the groups described below are more focused—either on a narrow portion of the broad journalism field, or some quite specific aspect of it.

Association of Alternative Newsweeklies

The Association of Alternative Newsweeklies (AAN, http://aan.org/alternative/Aan/index) is a group of "alt-weekly" news organizations that cover every major metropolitan area and reach a print and online audience of more than 25 million in the United States and Canada. AAN was founded in Seattle in 1978 with 30 newspaper members. The 130 papers that now make up the association publish in 41 states and 4 Canadian provinces. These are not mainstream publications, but rather weeklies with a strong focus on local news, culture, and the arts; an informal and sometimes profane style; and an emphasis on strong point-of-view reporting and narrative journalism.

Association of American Editorial Cartoonists

The Association of American Editorial Cartoonists (AAEC, http://editorialcartoonists.com) promotes the interests of staff, freelance, and student editorial cartoonists in the United States. Formed in 1957 by a small group of newspaper cartoonists led by John Stampone of the *Army Times,* the AAEC was created to promote public interest in editorial page cartoons and to encourage closer contact among political cartoonists, of whom nearly 300 are members. The AAEC website offers dozens of new editorial cartoons each day, and an archive of nearly 40,000 more cartoons, most from recent months.

Council of National Journalism Organizations

The Council of National Journalism Organizations (CNJO, http://www.cnjo.org) developed in recognition that there *are* a lot of journalism groups, and that some cooperation and coordination among them would be useful. CNJO was founded in 1991 as the Council of Presidents of National Journalism Organizations to encourage the exchange of information and ideas among national news and editorial associations. By the early twenty-first century, more than 60 organizations belonged to the council, which focuses on such shared concerns as administrative efficiency of member organizations, professional development and standards, diversity in staffing and coverage, the free flow of news and information, and technological and professional innovations. The council usually meets twice annually and the The American Society of Newspaper Editors serves as its informal secretariat.

National Press Club

More than a century old and one of the best-known journalism organizations, the National Press Club (NPC, http://npc.press.org) began in 1908 as a club for journalists in the nation's capital. A success from the beginning, by 1925 the NPC began to construct its own building in downtown Washington just two blocks from the White House, including office space for Washington news bureaus with the NPC occupying its top several floors. It opened in August 1927 and was substantially modernized in the 1980s. Because the NPC was originally open only to white male journalists, the Women's National Press Club was formed in 1919. Reflecting its location and the times, only in 1955 did the NPC vote to admit African American journalists, but women had to wait until early 1971 after a long and contentious battle for their admission. NPC is best known for its newsmaker luncheon speakers who often provide headline stories. NPC membership is open to all active and former journalists, government information officers, and to those considered by journalists to be mainstream news sources. Journalists in many of the country's larger cities have since formed their own press clubs.

The Online News Association

The Online News Association (ONA, http://www.journalists.org), founded in 1999, is composed largely of professional online journalists. Its more than 1,200 members gather or produce news for digital presentation. They include news writers, producers, designers, editors, photographers, and others who produce news for publication on the Internet or other digital delivery systems. One of ONA's concerns is to achieve recognition for its members as "real" journalists amidst the growing tensions created by the steady decline in traditional newspapers.

Organization of News Ombudsmen

Formed in 1980, the Organization of News Ombudsmen (ONO, http://www.newsombudsmen.org) has a membership made up of newspaper ombudsmen worldwide. It organizes annual conferences for discussion of newspaper and other news media practices and issues connected with the often difficult task of being an ombudsman.

Photography

The long struggle for recognition of their work underlines the formation of journalistic photographic organizations. For decades, staff-provided photos appeared with little (and usually no) attribution and the profession was scarcely regarded

as such. The two major associations were founded within two years of each other, growing out of the widely respected role of photographers during World War II, when a number of them lost their lives.

American Society of Media Photographers

Founded in 1944, the American Society of Media Photographers (ASMP, http://www.asmp.org; originally the Society of Magazine Photographers) has become an important resource for community, culture, commerce, and periodicals relating to their photography. ASMP focuses on copyright protection of photos, better working conditions for photographers, combating work-for-hire practices, and providing legal advocacy and lobbying.

National Press Photographer's Association

The National Press Photographer's Association (NPPA, http://www.nppa.org) was founded in 1946. In its early years, NPPA sought to get cameras allowed into courtrooms and to improve government/media relations. NPPA hosts national and regional workshops on everything from general photography methods and motivations to television photography and technology. NPPA, with more than 8,000 members, is open to professional news photographers and others who have a direct professional relationship with photojournalism.

Women

As is discussed elsewhere, women struggled for decades to achieve recognition and parity with their male journalism colleagues. This was but one part of the larger fight for equal treatment in society at large and it took years to take hold.

Association for Women in Communications

What is now the Association for Women in Communications (AWC, http://www.womcom.org) began as the Theta Sigma Phi professional sorority before World War I. It developed into a national network during the 1930s and founded a national office in 1934. It continued to expand in the decades that followed. At its 1972 convention, it became Women in Communications, and (a bit ironically) allowed men to become active members. In 1996, Women in Communications, Inc. was replaced with The Association for Women in Communications. The wide variety of media disciplines represented within the association include print and broadcast journalism, television and radio production, film, advertising, public relations, marketing, graphic design, multi-media design, and photography.

Association for Women in Sports Media

The Association for Women in Sports Media (AWSM, http://www.awsmonline.org) is a volunteer-managed group founded in 1987 to provide support and advocacy for women working in sports writing, editing, broadcast and production, and public and media relations. By the early twenty-first century its membership included more than 400 men and women in the industry as well as students aspiring to sports media careers.

Journalism and Women Symposium

Beginning with a 1984 conference at the University of Missouri, the Journalism and Women Symposium (JAWS, http://www.jaws.org) developed into a more formal organization by the early 1990s. JAWS brings together women journalists and journalism educators and researchers to annual conferences of its several hundred members.

Policy

There are a growing number of groups concerned with the status of journalists and journalism, and that advocate for strong news values, freedom of the press, and more open access to government agencies and officials.

Committee of Concerned Journalists

The Committee of Concerned Journalists (CCJ, http://concernedjournalists.org) is a consortium of journalists, publishers, owners and academics worried about the future of the profession. Starting

in 1997, CCJ organized an ongoing examination of modern news gathering. CCJ held 21 public forums attended by 3,000 people and involving testimony from more than 300 journalists. Later it developed a college-level course to focus on its concerns about whether independent journalism can survive the bottom-line emphasis in most media amidst growing technological change.

Committee to Protect Journalists

The Committee to Protect Journalists (CPJ, http://www.cpj.org) was founded in 1981 by a group of foreign correspondents to promote press freedom worldwide by defending the rights of journalists to report the news without fear of reprisal. It investigates cases of journalist harassment and punishment, of which there are more nearly every year, many in developing nations.

National Freedom of Information Coalition

What would become the National Freedom of Information Coalition (NFOIC, http://www.nfoic.org) first met in 1989 in Dallas as the National Freedom of Information Assembly. Its focus was to protect the public's (and therefore journalism's) right to know. In 1991, the group was formally renamed the National Freedom of Information Coalition. NFOIC offers annual grants to foster creation and growth of state coalitions to protect public rights to an open government, following guidelines established by the federal Freedom of Information Act.

Reporters Committee for Freedom of the Press

The Reporters Committee for Freedom of the Press (RCFP, http://www.rcfp.org) was created in 1970 when news media faced a wave of government subpoenas demanding that reporters name their confidential sources. The committee was a plaintiff in several early test-case lawsuits relying on the efforts of volunteer lawyers from several Washington, D.C., firms. In recent years, the RCFP has built coalitions with other media-related organizations to protect reporters' rights to keep sources confidential and to watch legislative efforts that impact the public's right to know. RCFP issues a quarterly journal and numerous publications advising reporters and editors of their varied legal rights and limitations across the 50 states.

Advertising, Marketing, and Public Relations

Growing out of most traditional news media organizations' reliance on advertising support, there may be more groups concerned with advertising than other journalism organizational categories. Some center on improved methods of advertising, while others are more concerned with ethical issues. All of them reflect the cyclical ups and downs of the advertising and advertising-supported media worlds.

Ad Council

Since its formation in 1942 as the War Advertising Council (which began with a campaign to sell government revenue-generating war bonds), the Ad Council (http://www.adcouncil.org) is the country's leading producer of public service announcements and print advertising. Among its campaigns in print and broadcasting have been those for the Red Cross, polio vaccines, various educational efforts, and preserving the environment.

American Association of Advertising Agencies

The American Association of Advertising Agencies (AAAA, http://www2.aaaa.org/Portal/Pages/default.aspx) was formed in 1917 and is the trade association of advertising agencies. Its members produce approximately 80 percent of the total advertising volume placed by agencies nationwide. Although virtually all of the large multinational agencies are members, most (60 percent) bill less than $10 million per year.

Association of National Advertisers

The Association of National Advertisers (ANA, http://www.ana.net) is the trade association of large national companies that advertise in mainstream media. ANA's membership includes 400 companies with 9,000 brands that collectively spend over $100 billion in marketing communications and advertising. ANA acts as a lobby for

these companies, while encouraging improved marketing practices.

International Newspaper Marketing Association

What became the International Newspaper Marketing Association (INMA, http://www.inma.org) was formed in 1930 and went through several interim names. By 2007, its members were improving marketing activities of newspapers. The INMA has more than 1,000 members in 70 countries, most of them senior marketing officers at daily newspapers. The organization's role has become more complex as newspapers (especially in North America) have entered a period of declining circulation and advertising.

Public Relations Society of America

Formed in 1947, the Public Relations Society of America (PRSA, http://www.prsa.org) is the world's largest public relations organization. Its nearly 21,000 members, organized into more than 100 chapters, represent business and industry, technology, counseling firms, government, associations, hospitals, schools, professional services firms, and nonprofit organizations. PRSA is active in supporting college and university courses and training in public relations practices and ethics.

Technology Focus

Several news organizations center on the professionals involved with the physical production of print and electronic media. As with other groups, they center on shared communication and some lobbying for member concerns.

Society for Technical Communication

What became the Society for Technical Communication (STC, http://www.stc.org) dates to 1953 when two organizations concerned with improving the practice of technical communication were founded: the Society of Technical Writers, and the Association of Technical Writers and Editors. They merged in 1957 to form the Society of Technical Writers and Editors. In 1960, STWE merged again, this time with the Technical Publishing Society, to become the Society of Technical Writers and Publishers. The present name was adopted in 1971. STC is the world's largest professional society dedicated to the advancement of technical journalism across all media platforms.

Society of News Design

The Society for News Design (SND, http://www.snd.org, formed in 1979 as the Society of Newspaper Design) is an international professional organization in the United States and more than 50 other countries, concerned with the design and layout of newspapers and magazines. SND started with 35 members and by the early twenty-first century had more than 2,200. It conducts newspaper design workshops and exhibitions, among other functions.

Spin

Spin refers to the emphasis placed on a certain interpretation of an event. In journalism, spin

involves public relations (and other) professionals paid to emphasize a particular point of view, thereby seeking to manipulate or control the framing of news coverage. The practice of spinning stems primarily from public relations and marketing, though often at the expense of journalistic autonomy and fair and balanced reporting.

Origins

The term *spin* originated with the spinning of yarn or fabric, or the weaving of a tale or a story. William Safire, political columnist and former speechwriter for President Richard Nixon and Vice President Spiro Agnew, suggested in 1975 that spinning was used in the 1950s as a means of telling events; the "spin on a story." Others, including political scientist John Anthony Maltese and media researcher Jerry Palmer, attribute the beginnings of journalistic spin to the Nixon Administration's Office of Communications (1969–74), the goals of which were to ensure that the administration's political team disseminated the agreed upon "truth" so that all media received the same story. These spin goals remain top priorities for political and corporate handlers and other "spin doctors."

Public relations (PR) experts have long utilized media exposure to publicize a product or company, or to further an agenda, but spinning is more than simply a PR maneuver. Spin professionals actively seek to seize control of a story from journalists and thereby exploit media audience reach. Spin professionals seek to use news media to directly influence audiences. As politics is so determined by public opinion, spinning, or spin control, is widely employed in the management of candidates, elected officials, and political issues.

In order to emphasize positive portrayals and minimize negative or controversial aspects in media coverage, spin professionals maintain a strong relationship with news media and journalists. They provide information structured to promote the desired spin about an individual/event/company, by adhering to journalistic conventions such as story construction. To ease this process, spin professionals understand how journalists research and write stories and take advantage of that process for their clients.

Selling the Spin

All news stories are dependent on sources. Potential spin of a news story depends upon sources that are readily available, especially trustworthy, or intriguing. Spin professionals can serve as sources or can provide journalists with sources that will tell the story from the desired angle.

For spin professionals, the ongoing nature of news requires that journalists be provided with plenty of information surrounding news events to ensure that an agreeable package of news will result. Journalists experience pressure to complete multiple stories per day, work under extreme deadline pressures, and have to balance their time in checking facts, background and historical research, and interviewing sources for multiple potential news items. Providing helpful information tends to increase the likelihood of journalists with approaching deadlines and little time for their own legwork to disseminate a story as the spin professionals have constructed it.

The threshold of the story—whether the events have importance for many people—is another crucial news value utilized by spin professionals. In order to appeal to diverse audiences, stories need to be of interest to a wide variety of people. Journalists seek to make news stories unique but applicable to the larger tapestry of daily events for consumers. It is in this balance that news values and the decision of how to spin the story become exceedingly important. Spin professionals take advantage of this balance by emphasizing implications of the event(s) for the greatest number of people, increasing the importance it will have to audiences—and thus to journalists serving these audiences. Again, with spin professionals shaping the news values while providing information to journalists, thereby saving them work, it is more likely that the desired spin on new stories will be distributed "as is" through media outlets. An example of successful spinning would be the reporting on the economic stimulus package of 2008. With information from the federal government and Internal Revenue Service, journalists focused on telling taxpayers how to get their checks, amounts that could be expected, and any exemptions or special circumstances surrounding receiving payment. Less visible in the news coverage is discussion of where the money was coming

from, potential ethical issues in redistributing these finances, and the possible ramifications the stimulus package might have for the economy in the future.

Pseudoevents, or "controlled leaks" are yet another strategy of spin professionals' role in controlling media information. Pseudoevents can involve the "strategic release" of "secret" information to journalists (such as a new political platform or new direction a company might be taking) disguised as a leak in the system or even a breach in security. The salacious nature of secretive information maneuvering its way into a news item makes the issues even more newsworthy. The leak plays upon the news value of unexpectedness and titillates journalists to tell the story inherently (and likely unknowingly) created for them by the spin professionals. At times, these events occur simply in order to be broadcast and witnessed by the public. With pseudoevents, or events manufactured and publicized through media by publicists or media agents, news media become "intermediary" witnesses to the events. Therefore, these events also must be constructed to conform to the expectations of journalistic elements and news items.

For example, with the increased public sensitivity toward environmental issues and the ethical responsibilities of corporations to "go green," a company might stage a pseudoevent to draw attention to their environmental policy and utilize the news media to potentially increase attention and consumer favor. To accomplish this, spin professionals for this company might design a press release much like a news story would be constructed complete with an interesting angle (how the company is taking part in saving the earth), any important related information (what the company is doing and how they're doing it), and the relevance for audiences (audiences supporting this company are helping the company better the earth). Providing journalists with all basic story information limits the amount of legwork that needs to be done and also lessens the potential that journalists might discover that this release of company news wasn't actually news at all but a disguised advertising ploy to cater to environmentally conscious consumers through news media.

When spin professionals are constructing media releases or press conferences they must clearly set out the newsworthiness of the constructed story, describing the relevance for audiences, enhancing the rarity or novelty of the event, and also ensuring that their structure of storytelling coincides with news story construction so that journalists can easily and quickly incorporate the details into a news package. Spin professionals apply these news values to information given to journalists in an effort to ease the work of journalists and ensure that efforts to disseminate a particular spin on an event/news item will be successful.

This involvement of spin professionals in the news process has increased the sensitivity of journalists and media organizations to the ploys of press conferences, inside sources, video news releases, and contact with marketing/PR personnel in general. Since spin professionals are seeking to control and manipulate the framing of news items, it is the responsibility of news professionals to maintain control and objectivity over story angles and content and to be able to report facts to the public without the taint of public relations angles. Therefore, the relationship between public relations specialists and journalists becomes strained and both parties struggle over control of the news content. This tension forces journalists to even more critically examine sources, not just for the veracity of their statements but also for the sources' potential motivations in giving information to journalists. When journalists abandon the qualities of autonomy and objectivity, they cease to work for the public and merely become puppets furthering the agenda of spin professionals working for politicians, governments, or corporations. Considering again the stimulus package coverage, regardless of political persuasion, few journalists or media outlets tackled the larger issues related to the stimulus package and instead coverage tended to be relegated to the dissemination of the payments instead of challenging audiences to question whether this was an appropriate move for the future of the American economy.

Spin professionals working for politicians are particularly concerned with managing not only the image of the individual but also managing the agenda or the types of issues typically represented and discussed regarding the politician. One strategy might include emphasizing a stance on education, even though the politician might feel more strongly about other issues, simply because their opponent has a weak position on education and

that issue is of concern to the voting public. It is then up to spin professionals to provide statements to news media emphasizing the candidate's education platform, in turn driving stories concerning the candidate's stance on education. Since it is not easy to access politicians or CEOs of large corporations directly, journalists do rely upon spokespersons, and are thus at their mercy for the type of information given and the angles or framing of a news story. Again, a tension arises between the motive-driven professionals and the objectively stanced journalists in providing news to the public.

Journalists, aware of spin professionals' motives, should carefully scrutinize press releases, source statements, and invitations to events. Journalists have also challenged attempts to spin the news by portraying spin professionals as forces seeking to manipulate audiences by controlling news stories. An example might be spin professionals seeking to use news media to propagate their view of a highly contentious issue, such as global warming. Because global warming is so contested, journalists are wary of accepting information at face value and instead seek to form a balanced news item presenting both sides of the issue. This process makes spin attempts for these types of contested issues much less attractive for spin professionals as there remains strong criticism and strong counterarguments to both sides of the debate and their viewpoint might become lost. By focusing on attempts to exploit media, journalists aim to portray spin professionals in a poor light while remaining as champions of truth and objectivity for the public. These portrayals tend to increase a "spin cycle" of cynicism, which diminishes the level of trust audiences have in both spin and news professionals.

Framing

An important element in spinning a news story is to impact its framing. Framing emphasizes certain issues while diminishing the importance of others. Framing differs from spinning in that spin refers to overall construction of a story (whether it is told, who the sources are, and what the outcomes are) while framing is selecting the particular lens utilized to convey an angle on events. While journalists might be provided with a finely spun news item by spin professionals, the story still needs to have a frame or angle to help shape the story, such as human interest or public health consequences. It is in this construction of story frames, particularly for negative stories, that control over framing becomes contested. Spin professionals may seek to determine the frame of the story. Journalists are concerned with news values and employing a frame that emphasizes the most interesting, valuable, or even salacious aspects of a story while spin professionals remain focused on limiting damage to political or corporate reputations and promoting positive association.

For example, after a nationwide pet food recall in 2007, spin professionals for the pet food companies sought to emphasize the lack of regulation of pet food products by the Food and Drug Administration (employing a responsibility frame) and also promised manufacturers would no longer use imported products in pet food (the consequences frame). However, news media tended to focus on the human interest/emotional framing of the stories, including affected pet owners discussing how their pets became sick and died because of the pet food companies. Journalists also provided information as to what products to avoid, and about potential class action lawsuits (placing the onus back onto the companies and empowering consumers to act). Spin professionals in this instance were not only seeking to use media to explain the companies' position but also to focus the story frames on shifting responsibility and positive steps that would result from the incidents. By framing the story in human interest terms, journalists largely resisted spin attempts in this case.

In other cases, spin professionals might speak simply to the language used in news stories. This strategy seeks to ensure that journalists will use this same language so that readers and viewers will do so as well. For example, spin professionals working for a political candidate might seek to promote a potentially controversial education issue as "for the good of children." When constructing stories about the candidate, spin professionals hope that journalists will incorporate this phrase into the news piece. Then when audiences think about and form opinions regarding the candidate, "for the good of the children" becomes a positively placed salient point in their minds.

Spinning news is not a novel concept. As companies, organizations, and political parties began to understand the massive reach of news media, they

sought to utilize this tool to promote their interests. Though it is unclear precisely when spinning first became integrated into the journalistic landscape, it is clear that the involvement of spin professionals in the news process creates a tension that remains ever present and unresolved. Spin professionals still seek to control the angle, frame, and language of news items while journalists struggle to maintain objective control of the information. Overall, the most significant ramification of news spinning is the potential of audiences to become a part of the spin cycle and ultimately not only distrust corporations, organizations, politicians, and their spin doctors but also the journalists that propagate their stories. In the end, if audiences distrust involvement of spin doctors and integrity of journalists, it is questionable whether news media will have the power that they once enjoyed.

SPORTSCASTERS, RADIO

Traditionally, sportscasters come in two kinds: *play-by-play announcers* who call the game action and *color commentators* who add background details on plays or players during pauses in field or on-court action. At the broadcast network level, especially for football sportscasts, guests supplement the host color commentator. Most are former players or coaches, filling time by speculating on what the game coaches might do next or how the opposing team might react.

Development

Sportswriters began to summarize games and report their outcomes in late-nineteenth-century newspapers, slowly evolving their reports into game "stories." Starting in the 1920s, radio broadcasters began airing quite imaginative "live" game recreations, and as remote radio transmission improved, sportscasters began delivering actual play-by-play reports of professional baseball games and boxing matches. In the 1930s, sports over the radio were one of the few affordable entertainments, and sportscasters became easily recognized personalities for thousands and then millions of fans. Some legendary radio play-by-play announcers enjoyed careers spanning 30, 40, or 60 years, making their voices familiar to generations of Americans. Some even moved successfully into television in the 1950s.

Radio sportscasters usually announce alone or in pairs, including guests only during rain delays and other long breaks in the on-field action. A single sportscaster (or pair) often stays with a professional or college team for many seasons, and fans come to associate that voice with the home team. Unlike television, which needs fresh

content beyond what viewers can see for themselves, on radio play-by-play sportscasters fill most of the air time by reporting in detail the action on the on-field or in an arena, leaving color sportscasters to supply limited explanation, speculation, or prediction.

Sports programming remains a mainstay of network radio, and since 2000, the all-sports format has been adopted by at least one local radio station in most large cities. Such stations both broadcast over the air and stream over the Internet a mix of live games, sports talk, and sports news, adding still more voices to the flood of network and local game sportscasting of baseball, basketball, football, and hockey. On radio, telephone interviews with coaches or journalists and audience call-in programs fill many of the nongame hours. Such call-in shows encourage ordinary people to get on the air and comment on sports, coaches, and athletes, making the callers sportscasters of a sort, an aspect of the larger social phenomenon of participatory and user-controlled media. At the same time, alongside its video and audio of games, the Internet carries thousands of amateur and professional sports blogs, adding further commentary and analysis of varying quality.

Initially on radio and later on television, dozens of sportscasters achieved national renown by covering one or two teams for many decades. The most important of them were experienced professionals who changed how sports were experienced by fans and consequently influenced generations of sportcasting successors. Among the celebrity superstars of radio, a few stand out for their extraordinary influence, longevity, and expertise.

Selected Radio Sportscasters

Mel Allen (1913–96)

The Yankees were America's team for many long years, and Mel Allen was the voice of the Yankees for 25 years, beloved by millions across the country in the 1940s, 1950s, and into the 1960s. One of the second generation of nationally known sportscasters—who actually attended games rather than recreating them—Allen announced the play-by-play for dozens of World Series, including those the Yankees won, as well a dozens of All-Star Games, and college bowl games, including 14 Rose Bowls. Briefly, he also announced for the New York football Giants, but is best known for his baseball sportscasting. Trademark phrases uttered in his memorable Southern voice ("How about that!" and "Going, going, gone") have joined the all-time legends of sportscasting. His contemporaries labeled him the best play-by-play announcer ever, voting him Sportscaster of the Year for 14 years in a row. Late in his career, he hosted the syndicated highlights show, *This Week in Baseball* (1977–96), and in the 1990s, he recorded the play-by-play for two early computerized baseball games. Allen received every prestigious award for sportscasting, some many times, and alongside Red Barber, he was the first broadcaster to be inducted into the Cooperstown Baseball Hall of Fame. Allen also appears in the National Sportscasters and Sportswriters Association and Hall of Fame, the American Sportscaster Hall of Fame, and the Radio Hall of Fame.

Red Barber (1908–92)

Barber was baseball's classic announcer, broadcasting for more than six decades, making his one of the longest-ever media careers. A contemporary of Mel Allen and Ernie Harwell, Barber was among radio's most popular and influential play-by-play sportscasters, attracting huge audiences for home-team games and audiences in the tens of millions for dozens of World Series games. Best known as the voice of the Brooklyn Dodgers for more than two decades, he followed Mel Allen as play-by-play announcer for the New York Yankees and the football Giants (1954–66). Notably, he was chosen to anchor the first televised professional baseball game in 1953, but one of his most important influences on the game of baseball and the practice of sportscasting was his quiet acceptance of the first black player in major league baseball, Jackie Robinson, in his on-air announcing. For the last decade of his life, National Public Radio audiences benefited from his Friday morning commentary on sports. Like his successor-in-spirit Bob Costas, Barber continues to be recognized for his exceptionally intense preparation before games and his phenomenal memory. Unlike the flamboyance of the preceding generation of sportscasters, Barber represented

the consummate professional, exhibiting reserve and understatement rather than hyperbole even at peak moments. He instituted the kind of objective reporting of game events that is associated with professional sportscasting today. Barber and Mel Allen were the first broadcast inductees in the Cooperstown Baseball Hall of Fame. Barber also appears in the National Sportscasters and Sportswriters Hall of Fame, the American Sportscaster Hall of Fame, and the Radio Hall of Fame.

Ernie Harwell (1918–)

Harwell, who was a network radio sportscaster for many years, is nonetheless best remembered as the voice of the Detroit Tigers. After working as a sportswriter and then announcing the Atlanta Crackers, Harwell was hired in 1948 as a Dodgers fill-in announcer, and worked with such luminaries as Red Barber and Russ Hodges, announcing for the Brooklyn Dodgers, the New York Giants, and the Baltimore Orioles. In 1942, he hosted the first national radio broadcast of the Masters golf tournament, and in 1951, he called the first coast-to-coast network television broadcast of a sporting event. Although he announced several World Series and All-Star baseball games, and many football games on television, he eventually found his home in Detroit in 1960, staying for 42 years with the Tigers, with a few ups and downs in the 1990s as ownership changed. Unlike some staccato announcers and other boisterous ones, Harwell is known as a lyrical announcer, sounding more like a poet or preacher than most sportscasters. During games, he often paused to allow stadium noise to be heard, talked of the fans, and quoted poetry. His call of a home run ("That ball is looooong gone!") has moved into the lexicon of baseball sportscasting history. Harwell's style suited Detroit fans and made him the most famous man in Michigan at one time. Although he retired from the Tigers in 2002, he has since guested on ESPN, Fox Sports Network, and local stations. He has also written six books about baseball. Honored by the Baseball Hall of Fame, Harwell was also inducted into the National Sportscasters and Sportswriters Association and Hall of Fame and the Radio Hall of Fame, among his many other awards.

Graham McNamee (1888–1942)

McNamee is credited with inventing network sportscasting. For two decades beginning in 1923, he broadcast professional baseball for WEAF, the predecessor of the NBC Red network, and the first radio broadcast of a World Series. After the formation of NBC in 1926, along with political and public event coverage, he announced major tennis matches, championship boxing events, and hundreds of network baseball and college football games, including the first broadcast of a Rose Bowl. Most notably, he called the 1927 "fight of the century" between Gene Tunney and Jack Dempsey in his usual emotional and embellished fashion, an heroic style of dramatized announcing suited to audience expectations at the time. Much admired for his trained and vibrant voice, McNamee spoke with careful diction even at the heights of hyperbole, and influenced contemporary sportscasters across the nation (not necessarily for the better) while attracting many aspirants to this new kind of career. He was the first star sportscaster, generating mountains of fan mail, although he knew little about sports and treated it like news headlines. Nonetheless, in his day, a sporting or political event was known as important if McNamee was announcing it. He is credited with developing color announcing, generating celebrity status for top sportscasters, and building a national fan base for major sports. Most famous of the first generation of sportscasters, he was posthumously inducted into the National Sportscasters and Sportswriters Hall of Fame and the American Sportscasters Hall of Fame.

Lindsey Nelson (1919–95)

Nelson was known as the great storyteller, for his ability to see the patterns in game actions and to tell the story of the game or of a player's season or career. His first experiences were as a sportswriter and then a baseball game recreater (announcing after the fact) for the Liberty radio network. Beginning in 1952, Nelson produced and announced a wide variety of sports at NBC radio and television, and in 1962 he left the network to become the first voice of the New York Mets. After 17 years with the Mets, he went west for three years, serving as the San Francisco Giants announcer, and then

retired to teach at the University of Tennessee. He was elected to the Radio Hall of Fame, the National Sportscasters and Sportwriters Hall of Fame, and the American Sportscasters Hall of Fame, and he received a Lifetime Achievement Emmy Award in 1991. In these award ceremonies, Nelson was praised again and again for his honey-voiced wit, his personal and on-air charm, his accuracy in announcing, and his outstanding storytelling ability.

Bill Stern (1907–71)

Stern was also a legendary storyteller, known for his dramatic flair and outright imagination in creating details for his stories. Initially an actor, his radio career began in 1925 as a play-by-play football announcer. But he grew up in a time when fledgling sportscasters listened to game summaries over the telephone and, then for the radio audience, made up actions to fit the scoring. Later during his long career, Stern rarely felt awkward about creating events on the field that would enhance a game's story or fill in what he had missed. He often said his job was to entertain more than report perfectly. Among the lasting legends of sportscasting, he acknowledged introducing a "lateral of the football" to the correct player on the many occasions when he had reported the ball in the wrong hands. This imaginary lateral was his much-joked about solution when he finally figured out his error and realized who actually had [or had had] the ball. Stern joined NBC in 1935 as host of *The Colgate Sports Newsreel,* a popular 15-minute radio show of sports highlights and commentary, one of the first sports talk programs of any kind. He was also the sportscaster for Friday night boxing matches, and boxing commentary continued as one of his specialties well into the television era. After nearly 20 years, he left NBC for ABC to host *Bill Stern Sports* (titles vary). This 15-minute talk program consisted largely of Stern telling tall tales about sports-related events, some too fantastic to believe. Drawing on his training as an actor, he told his stories with pregnant pauses, exaggerated drama, and colorful emotion, but fans found them invariably entertaining. Stern also was sports director for the Mutual Broadcasting System during the late 1950s, and for more than a decade, his voice could be heard in movie theaters narrating MGM's *News of the Day* newsreels. Acknowledging his pioneering of sports talk radio and his wide influence as a national sportscaster, he was inducted into the Radio Hall of Fame, the National Sportscasters and Sportswriters Hall of Fame, and the American Sportscasters Hall of Fame.

Many other sportscasters had long professional and influential careers in radio, and were additional examples to be included here, it would be hard to choose among such notables as the Cubs and the White Sox's announcer Jack Brickhouse; the St. Louis Cardinal's (and CBS Radio's) Jack Buck; the old garbler Dizzy Dean; the voice of boxing great Don Dumphy; the voice of the New York Knicks, Jets, football Giants, and Yonkers Raceway Marty Glickman; and still others. In addition, many sportscasters whose radio careers took off in the 1940s crossed over into the television era.

Increasing Competition

Until recently, broadcast radio had been unique among media because it alone had the ability to reach cars and people on the move or away from their home bases. Portable radios used to be a necessity for such activities as camping, going to the beach, and get-togethers, and for many decades, radio baseball announcers could be heard on summer afternoons in many backyards and most public places. In the 1990s, satellite services extended network radio's reach but also increased competition for listeners by bringing many more audio channels and many more sports. After 2000, the spread of iPods, video cell phones, and wi-fi Internet connections brought even more competition for the public's ear. Coverage of sports has remained one of radio's major programming formats and has become crucial to its fight for survival in many cities. For the foreseeable future, radio sportscasters will continue filling essential announcing and commentating roles on the air and on the web.

Sportcasters, Television

Sportscasters are among television's larger-than-life personalities. The very best have endured on the air across decades of ever-changing players, revolving coaches, and up-and-down seasons, reaching generation after generation of fans. But the era of great sportscasters is fast disappearing. For newcomers, becoming a giant among colleagues is unlikely because the conditions of viewing sports and thus of experiencing sportscasters have changed drastically since the 1990s.

At the network level, teams of play-by-play and color commentators accomplish the game announcing, often covering different leagues within a sport, and as the seasons change, they typically cover several different sports. Their specialties are breadth rather than focused depth, and unlike local announcers, network sportscasters generally hide personal preferences for specific teams. They can show themselves as fans of a sport, such as baseball, golf, or hockey, but cannot favor a particular team except on talk shows where they normally draw on their expertise rather than personal fan preferences. Although cable network sportscasters more often concentrate on a single sport, rather than jump from sport to sport as broadcast network sportscasters do, cable uses the same team approach, matching a high level of game-calling experience in a play-by-play announcer with player, team, and league knowledge in a color announcer. A network's inherent need to balance its game coverage creates distance from the teams and keeps fans equally at a distance from the announcing personalities.

At the local or regional level, announcers are often hired by a team or league and are expected to promote the home team. Personality counts nearly as much as expertise because sportscasters have become part of the entertainment. At the same time, shortened contracts for many local sportscasters have dissipated much of the consistency and predictability that long characterized local sports coverage, reducing fans' dependence on home announcers and thus undercutting identification with individual sportscasters.

Development of Sportscasters

Sporting events were among the very first programs carried on television, and borrowed radio sportscasters used their voices to interpret what viewers could barely see on the first black-and-white television screens. With their small, lighted arenas, boxing, roller derby, and wrestling were ideally suited to the bulky, light-demanding cameras of the 1950s, and the early television sportscasters invented highly original ways to announce, explain, and add color to the events. By the mid-1960s, color and better equipment enhanced the coverage of baseball and football, and a new group of sportscasters emerged with faces as well as voices.

ESPN was formed in 1979, showcasing television's preeminent sports program *SportsCenter*, and sports began providing all-day/everyday content for cable television. Soon, HBO delivered premium (subscription) boxing and other sports events and regional channels sprouted, and the number of sports channels has only grown. Today, sportscasters announce on Fox's more than 20 regional networks, plus its national cable sports network that carries the National Football League (NFL), Major League Baseball (MLB), and the National Association for Stock Car Auto Racing (NASCAR), along with tennis and golf. ESPN also occupies half a dozen channels of television, radio, and the Internet, with hosts and guests providing a continuous stream of sports talk and news along with live or taped games, highlights, and scores. In addition, cable networks MSNBC, TNT, TBS, and WBN carry live games, as well as the Spanish-language

Univision and Telemundo. The U.S. satellite services, DirecTV and Dish Network, each provide a dozen or more premium sports packages of football, baseball, soccer, hockey, basketball, boxing, and wrestling. All these television sports services transmit the words of hundreds of sportscasters daily—all competing for the fan's eye and ear.

As television became more flexible and sophisticated, studio and sideline announcers supplemented the traditional play-by-play and color commentators, and computerized score boxes, multiple crawls, virtual on-field symbols, and other colorful graphics added visual interest to the screen—but at the same time, they took away many of the conventional functions of sportscasters, such as saying the score, bringing up players' and teams' past performances, and giving updates on concurrent games. Nowadays, game teams—one for each of a dozen or so markets—come packaged with before and after studio commentary that typically includes former players, former coaches, and longtime sports journalists. Coverage splits for the actual games and reforms in the studio at halftime and postgame analyses. Especially on Fox NFL Sports, the national group of sportscasters hosts the entire set of games as a single event, although only one game is televised in any market.

The Big Changes

As with all media programming, the coverage of sports has been altered by economic pressures and changing technologies. In particular, four factors affecting sports consumption stand out because they have altered the role of sportscasters.

First, the number of competing sources of sporting events, and thus announcers, has proliferated. On any weekend day and most weeknights, games and sports news and talk fill dozens of channels of broadcast, cable, and satellite television; AM, FM, Internet, and satellite radio; and more recently, cell phones, iPods, and Blackberrys. When watching or listening, present-day fans commonly jump back and forth between multiple media sources, dividing their sports consumption among multiple sources over their lifetimes, thus feeling far less involvement even with preferred event announcers than in the pre-remote control past.

Second, teams and leagues continually switch their media affiliations. It used to be that NFL football—the most popular televised sport of all—always appeared alternately on just two of the largest broadcasting networks. Horseracing and car racing were only on ABC. In the past a single radio station would carry a local team's basketball or baseball games for years on end and consider that sport an integral part of its image. Today, however, national and regional leagues change networks almost annually, and individual games appear unpredictably on broadcast and cable channels (fans must scour the TV listings to keep up). Because network sportscasters are employees of the networks, when the National Football League or the Olympics or some other sports league switches networks, the games or events get new announcers. Long-term stability no longer characterizes either national or local sports media and sports announcing.

Third, games and events can be viewed without sound. Much television is consumed virtually soundlessly via hand-held media or office computers and in such public places as bars, clubs, offices, and restaurants. On-screen graphics supply the information that once came from sportscasters. Even home viewing of sports often occurs in groups where conversation takes priority over listening. Subtitling has become the norm in public locations and during many private parties, so that the "sports announcing" is communicated largely by means of abbreviated words captioned on the screen. Announcer personalities are lost in the anonymity of soundless and computerized television.

Fourth, television programs have shorter life spans. The longest-running television sports program, *Wide World of Sports,* aired for more than four decades but is now gone. *The George Michaels Sports Machine,* a classic, has faded away. ESPN's daily *SportsCenter* commands center stage, but it follows a news wheel format of scores and highlights and seems surrounded by an ever-shifting array of talk series. Fans have too many choices—in sports as well as other programming—and all types of hit television programs now have lives measured in a few seasons rather than the decades of their predecessors.

Future groups of sportscasters may be as informed, articulate, and personable as their predecessors, but because the sports scene has expanded from handfuls of stations and just three broadcast networks to dozens of broadcast and

cable television channels supplemented by the Internet in a wild tumble of multiple competing, conflicting, and repeating voices, building the giant fan bases of earlier times has become nearly impossible for the newest sportscasters.

Selected Television Sportscasters

The true giants of sportscasting have been loved (or cordially hated) by fans in the tens of millions. These are the legendary sportscasters who set the standards against which others are measured. All exhibit longevity, exceptional expertise, national popularity, and uncommon influence, as evidenced by large audiences, celebrity status, and major awards from peers.

Harry Caray (1920–98)

Caray is fondly remembered at the entrance to Chicago's Wrigley Field in a larger-than-life-size statue holding a beer can and waving at the fans. Although he had 25 years as the popular radio sportscaster of the St. Louis Cardinals and spent 11 seasons broadcasting the Chicago White Sox, the world best remembers him as the exuberant play-by-play announcer of the Chicago Cubs. Known as the fan's fan, he probably became so popular because he announced the "Cubbies" during the early television era. His appeal reached across television screens to fans at home, and they could see him waving, singing, and generally exhibiting the oversize personality they came to adore. Caray became a bigger draw than the perennially losing Cubs because he made it fun to be a fan, even of a losing team. His criticisms of management and players stirred up controversy, but his optimism season after season helped fans keep rooting (and watching). Repeated surveys showed that baseball fans wanted to drink a beer and talk baseball with him more than with any other sportscaster. His contemporaries inducted him into the Baseball Hall of Fame, the American Sportscasters Hall of Fame, the Radio Hall of Fame, and the National Sportscasters and Sportswriters Hall of Fame.

Howard Cosell (1918–95)

Cosell, the unforgettable iconoclast of American television, had an indelible influence on sportscasting. Trained in law, Cosell became a journalistic pundit whose topic was sports, particularly boxing and football. His exceptionally erudite commentary took the issues he addressed far beyond the world of sport, and he fearlessly tackled the controversies of his day. In particular, he vocally supported Muhammad Ali at a time when it was highly controversial for a sportscaster to boost a black athlete. Roone Arledge (1931–2002) hired him as a commentator for ABC's *Monday Night Football,* where he analyzed and criticized sports management and athletes for 13 years, raising such contentious issues as players' off the field behavior and the lack of effort they put into unimportant games in order to avoid injury, topics not normally fodder for bland network sportscasting. His abrasive personality made him "the sportscaster fans loved to hate," but viewers by the millions tuned in to hear what he would say, and the issues he raised often became the topics of the next day's sports news. During tense moments in a network football game, viewers unexpectedly heard Cosell announce John Lennon's murder, and he then pointed out to diehard football fans that "this was just a football game" while truly momentous things were going on elsewhere. He also was a field reporter for several Olympics; called horse racing and major league baseball games; hosted a television talk show, *ABC Sportsbeat*; and had his own radio talk show, *Speaking of Everything.* He wrote several books, among them *Like It Is* (1974) and *I Never Played the Game* (1985), in which he coined the word "jockocracy" to describe television's custom of making ex-players into color commentators, a practice he despised because he thought most players untrained and unprepared for the job. In part because of his distinctive voice and his abrupt speaking style, Cosell was the subject of thousands of jokes and imitations during his lifetime. He was so well known he portrayed himself in several movies and was the subject of a 60-minute television biography. At the same time, he was widely respected by his peers for pioneering serious sports journalism. In addition to receiving several Emmy awards and other honors, Cosell appears in the National Sportscasters and Sportswriters Hall of Fame and the American Sportscaster Hall of Fame.

Bob Costas (1952–)

Costas is known as a perfectionist sportscaster, recognized by fans and peers for his phenomenal memory and exhaustive preparation before games and sports anchoring. He is widely quoted as a sports authority, especially on the topic of baseball, his particular love, about which he wrote the best-selling *Fair Ball: A Fan's Case for Baseball* (New York: Random House, 2000). After 7 years at KMOX Radio broadcasting St. Louis Spirits games, he moved to NBC, where for nearly 30 years, he was in-studio host for National Football League coverage; play-by-play announcer for National Basketball Association Finals and Major League Baseball games; and anchor of pre- and postgame NFL broadcasts, Super Bowls, the World Series, and All-Star games. He became world famous for his insightful hosting of seven (to date) NBC Olympics. He is known for shutting himself away for weeks of preparation before a big event, emulating his ABC Olympic predecessor, Jim McKay. In addition to game sportscasting on NBC, the formidable Costas hosted his own television sports talk shows, *Later with Bob Costas* as well as *Football Night in America,* and on HBO he anchored *Inside the NFL* and *On the Record with Bob Costas* (renamed *Costas Now*). He also filled in as host on *Larry King Live* in 2005. He has been awarded nearly 20 Emmys for his outstanding broadcasting, sportscasting, and sportswriting; received a Curt Gowdy Award for his baseball sportscasting; and was honored eight times as Sportscaster of the Year, placing him in the National Sportscasters and Sportswriters Hall of Fame. Loyola College in Maryland gave him an honorary doctorate in humane letters, an unusual award for a sportscaster. And his career is far from over.

Curt Gowdy (1920–2006)

Gowdy was a classic network generalist, sportscasting all major network sports in the pre-cable era and serving as NBC's premier announcer from the 1960s into the mid-1980s. He started in big-time sportscasting as partner to New York's long beloved Mel Allen (1913–96) in 1949, and then he became the voice of the Boston Red Sox for 15 years. Nicknamed the Cowboy, Gowdy exhibited exceptional versatility as NBC's lead play-by-play announcer for network football and baseball, as well as a wide range of sports, gaining an additional nickname as the "broadcaster of everything." In his soft, unemotional, and rather gravelly voice, he called dozens of college basketball championships, Rose Bowls, Super Bowls, and the World Series, and worked on eight Olympics, along with a hectic schedule of regular and postseason NBC games. He most loved hosting *The American Sportsman* on ABC, a genial, slow-paced program about fishing and hunting. For 20 years, it featured Gowdy and a celebrity outdoorsman tramping around and talking while fishing or hunting in beautiful wilderness locations, often in his native Wyoming. He retired from regular broadcasting when the show was canceled. In his later years, he produced and hosted *The Way It Was* and was a commentator for *Inside the NFL*. He wrote two books, *Cowboy at the Mike* (1966) with Al Hirshberg, and *Seasons to Remember: The Way It Was in American Sports, 1945–1960* (1993) with John Powers. Gowdy was the first sportscaster to receive a Peabody Award for excellence in broadcasting. He was also given the Pete Rozelle Award and a Lifetime Achievement Emmy. He appears in the National Sportscasters and Sportswriters Hall of Fame, American Sportscasters Hall of Fame, National Baseball Hall of Fame, American Football League Hall of Fame, and more than a dozen other halls of fame, and a Wyoming state park was named after him.

John Madden (1936–)

Madden has a gargantuan personality that has fostered many nicknames: the Telestrator-Magician, America's Biggest Commuter, the Road Warrior, and, owing to the ubiquity of one particular endorsement deal, the Voice of Ace Hardware. After a successful career as head football coach of the Oakland Raiders (capturing the highest winning percentage in football history), he turned to broadcasting professional football, serving as game commentator for 21 seasons on CBS and Fox in the 1980s and 1990s. He punctuates his announcing with humorous asides and onomatopoetic sounds (boom, bang, pop, and so on), making his unique delivery a memorable part of his exceptionally lucid commentary. Early on, he popularized the use of light-pen telestrators, electronic devices

that superimpose diagrams on top of football footage, which became staples of modern football analysis. He was the last expert analyst for *Monday Night Football* on ABC and then shifted to NBC when the show moved to ESPN. Madden is the only major sports commentator to appear on all four networks. He also provides the voice for the top-selling *Madden NFL* series of video games, and in addition to promoting Ace Hardware he has appeared as the commercial spokesman for Outback Steakhouse, Miller Lite, and Sirius Satellite Radio, among other companies. On Sunday mornings, he can be found on Sirius's *The Stadium Tailgate Show,* and with columnist Dave Anderson (1929–), he has written several books, including *Hey Wait a Minute, I Wrote a Book* (1984), *One Size Doesn't Fit All* (1988), and *All Madden: Boom! Bam! Boink!* (1996). One of Madden's eccentricities is that he has foresworn airplane travel and goes everywhere in a giant customized bus, even crossing the country weekly during the winter season for his stints as football commentator. He reports logging 80,000 miles annually from his home in California to New York studios and east-of-California football arenas. He has won 14 (so far) Emmy Awards for Outstanding Sports Event Analyst, a Pete Rozelle Award, and appears in the Pro Football Hall of Fame. He won 24 Emmys, among many other awards, for his sports work before retiring in April 2009.

Jim McKay (1921–2008)

McKay was television's most beloved jack-of-all-sports for more than 60 years. Although versatile enough to announce any sports event, his premier accomplishments were the hosting of 12 Summer and Winter Olympics, mainly on ABC, and his hosting of more than 40 years of television's quintessential sports anthology show, ABC's *Wide World of Sports* (1961–98). Made possible by the development of videotape, the show consisted of tape footage from varied international and archetypal American sporting events, ranging from the highly unusual—even oddball—events in strange out-of-the-way places to highlights of traditional games, races, and events in major cities. McKay calculated that he traveled some 4.5 million miles over the world capturing events for *Wide World* (reported in his book *My Wide World,* 1973). McKay had the ability to move from playful and light-hearted fare, such as his enthusiastic coverage of a local firemen's bucket-up-a-ladder carrying contest, into more serious and awestruck reporting, such as his coverage of a daredevil skydive from a Mexican cliff or his extolling of an acclaimed racehorse's beauty. *Wide World* was a weekend television staple for millions of sports fans until it was killed off in the late 1990s by cable and Internet networks, which could deliver the same out-of-the-way sporting events that had once given the program its uniqueness. Hosting all Olympiads from 1960 to 1988, McKay set the pattern for expert host commentary that continues to characterize Olympic coverage, moving smoothly back-and-forth between studio and venue as the technology developed. His most famous announcing occurred during the Munich Olympic massacre in 1972, and he has been widely recognized for his dedicated and sensitive journalism that rose far above routine sports coverage. He has also covered special-event sports such as the British Open (golf), the Kentucky Derby (horse racing), the Indianapolis 500 (and other car races), and the first Fédération Internationale de Football Association (FIFA) World Cup held in the United States. In 1992, McKay hosted a television sports special, *Athletes and Addiction: It's Not a Game*. He received 19 Emmy Awards for his outstanding journalistic achievements and excellence in sportscasting, and the George Polk Memorial Award, a Peabody Award, numerous awards from horseracing organizations, and medals from Austria and Germany. He was inducted into the U.S. Olympic Hall of Fame and the American Sportscasters Hall of Fame. McKay died in June 2008.

Leslie Visser (1953–)

Visser is the first and only woman (so far) to be enshrined in the Pro Football Hall of Fame. Honored as a sportswriter and sportscaster for more than 30 years, Visser has been an undoubted pioneer many times over. In the 1970s, she was the first woman beat writer assigned to professional football at *The Boston Globe,* and she became the first woman sportscaster to be taken seriously by professional football. Because of her expertise, CBS Radio made her its first woman NFL color analyst, and CBS Television made her

the first woman to be assigned to a Super Bowl sideline and the first woman to make a Super Bowl trophy presentation. At ABC, she was the first woman to host *Monday Night Football.* When recognized by the Pro Football Hall of Fame in 2006, she was honored for being the first—man or woman—to have been a sportscaster on the Final Four, the Super Bowl, college football, the World Series, the pro-basketball finals, the Triple Crown, Wimbledon, the U.S. Open, the World Figure Skating Championship, and the Olympics, a list of achievements astounding for its breadth and evidence of Visser's sportscasting versatility. Employed primarily by CBS, she has also been a reporter for HBO's *Real Sports* and contributed to ABC's *Wide World of Sports.* Visser has won the Gracie Allen Award for women making exemplary contributions and a Compass Award for altering the direction of football sportscasting. She was named the best woman sportswriter in America in 1983, and won the Women's Sports Foundation Award for Journalism in 1992. For her pioneering accomplishments, she served as the first woman sportscaster to carry the Olympic Torch. She was also inducted into the New England Sports Museum Hall of Fame, and she continues to cover professional football and college basketball at CBS.

Dick Vitale (1939–)

Vitale is college basketball's over-the-top colorcaster. A basketball specialist with favorites (particularly Duke University), Vitale has been venerated (and sometimes reviled) by basketball fans throughout the country for nearly three decades. When his name is associated with a college game, it gains instant importance. Coming to sportscasting in 1979 after several years of college and pro basketball coaching, he joined the fledgling ESPN, and he has since called more than a thousand games for the network, usually as color commentator. His signature catch-phrases ("It's awesome baby!"), his raspy New Jersey accent, and his exuberant delivery make him instantly recognizable on television and radio. Nearly every sentence out of his mouth is an exclamation. He coined many terms that moved into the basketball lexicon ("Diaper Dandy" for a top freshman, "PTPer" for a prime-time performer), and his super-animated style has influenced college fandom. Not only does Vitale himself exhibit consistent vocal enthusiasm for the game, he actively encourages fans to become involved, holding up fan enthusiasm as a crucial game element. He is credited with stimulating an explosion in fan participation in college basketball nationally in the 1980s. Even as he was a relative newcomer, *Basketball Times* named Vitale as one the sport's most influential personalities. In addition, he is a much-requested motivational speaker and philanthropist, known for his many charities and fundraising efforts on behalf of children. His voice appears on several computer/video basketball game series and in three popular videos distributed by ESPN Video; he has made cameo appearances in several movies, starred in several television commercials, and has a Wednesday evening segment on *SportsCenter* called "Dick Vitale's Fast Break." He writes regular columns for *Basketball Times* and *ESPN The Magazine* and serves as a basketball analyst for ABC Radio and ESPN Radio. Acclaimed for his wide knowledge of college and pro basketball, he has been profiled on HBO's *Real Sports,* received two Cable Ace Awards, and was inducted into the NCAA Hall of Fame. Among other recognitions, he received a Curt Gowdy Award and was honored with the first-ever Ethics and Sportsmanship in Sports Media Award in 2003 by the Institute for International Sports. Despite an exceptionally hectic schedule, he has managed to write seven books, including *Holding Court: Reflections on the Game I Love* (with Dick Weiss, 1983); *Vitale: Just Your Average Bald, One-Eyed Basketball Wacko Who Beat the Ziggy and Became a PTP'er* (with Curry Kirkpatrick, 1988); *Time Out, Baby!* (with Dick Weiss, 1991); and *Living a Dream: Reflections on 25 Years Sitting in the Best Seat in the House* (also with Dick Weiss, 2003).

Other Preeminent Sportscasters

In addition to the sportscasters described above, many fans would point to others equally deserving of mention for their expertise, longevity, popularity, and influence on subsequent sportscasters. Among many longtime baseball favorites are the Red Sox's Ken Coleman (1925–2003), the Pittsburgh Pirates' Bob Prince (1916–85), the

Brooklyn and then Los Angeles Dodgers' Vin Scully (1927–), the Baltimore Orioles' Chuck Thompson (1921–2005), and the Milwaukee Brewers' Bob Uecker (1935–), along with NBC's commentator Joe Garagiola (1926–). On the football side, the most prominent, with long broadcast careers and a decided impact on subsequent sportscasters, are the NFL's classic play-by-play man Frank Gifford (1930–), the colorful voice of great football moments Brent Musburger (1939–), ABC college football's voice Keith Jackson (1928–), longtime NBC NFL sportscaster Al Michaels (1944–), the Packers' terse Ray Scott (1920–98), CBS's football and basketball anchor Jim Nantz (1959–), and the NFL's top all-around number-one announcer Pat Summerall (1930–). For his exceptional versatility and influence on aspiring broadcasters, the professional and polished Dick Enberg (1935–) deserves mention. In the 1980s, ESPN's first major personality, the witty and charismatic Chris Berman (1955–), became known for his clever ways of filling empty time on early cable. In addition to his recognized expertise in anchoring *SportsCenter* and calling baseball and hosting football, Berman fostered a tradition of gags and humor in ESPN sports talk. In other sports, notables include tennis's Bud Collins (1929–), who anchored professional tennis matches for more than 35 years on NBC; the Pro Bowler's Tour Chris Schenkel (1923–2005), also an expert in golf, horseracing, tennis, boxing, the Olympics, and nearly everything else in sports; and the popular Olympic host Greg Gumble (1946–), the first African American to announce a Super Bowl. Dozens of others are nationally or locally admired and have been much emulated.

In addition to Leslie Visser, few women sportscasters have scaled the heights of sportscasting fame. The best known include the very first woman sportscaster Donna DeVerona (1947–), ESPN's Robin Roberts (1960–) and Gail Gardner (ca. 1950–), NBC's Hannah Storm (1962–), and CBS's tennis announcer Mary Carillo (1957–). Few newcomers, however, are likely to rank among the all-time greats because the conditions of sportscasting have altered so greatly. The loss of longevity (Roberts and Storm both moved out of sportscasting into network daytime talk television) and the clutter of the media environment diminish the achievements of even the best of today's sportscasters, irrespective of gender.

Other sportscasting personalities worthy of mention do not call games but talk about them, interview athletes and coaches, and stir up lots of debate. Jim Rome (1964–), host of *The Jim Rome Show,* generates weekly storms by challenging his guests and spouting unconventional views of games, players, and events. On the less than serious side is Bob Uecker, comic host of the *Wacky World of Sports*. Someone who also deserves mention is *Sports Illustrated*'s controversial sportwriter Frank DeFord (1938–). Although not a play-by-play or color announcer for most of his career, his appearances on HBO's *Real Sports* and weekly on-air essays on NPR's *Morning Edition* provide exceptionally insightful analyses of college and professional sports, often with a biting and sardonic tone.

What's Ahead

In conventional advertiser-supported broadcasting, the enormous and steadily rising cost of sports rights fees means that the entities that can afford to air them must attract audiences so large that advertisers will pay enough to cover costs. The newer models for sports presume that fragmentation will continue, that international distribution of sports will grow (a two-way street with programming coming into the United States as well as going out), and that pay-per-use satellite, cable, and streaming Internet distribution will eventually provide much of day-to-day access to sports events.

For television sportscasters, the future is likely to hold more jobs but of a specialized nature, focusing on newer or imported sports, teen sports, or women's sports, and generally lacking the opportunity to become widely known. Fads will drive much interest in sports in the coming decades. In the future, sportscasters whose skill, knowledge, and aptitude coincide with a rise in the audience's interest in a sport will become briefly popular, and luck in timing will affect the salience of individual sportscasters' careers.

Sports Journalism

Throughout history, sports have been an occupation for some members of the leisure class, a restorative or leg up for some members of the working class, and an entertaining spectacle for many people in both classes. In parallel, sports journalism began as a means to chronicle the recreational pursuits of the leisure class, and while there are still magazines on yachting and fly fishing, sportswriting has expanded along with the leisure time and income of the working class to focus primarily on professional sports and their feeder leagues. For economic reasons, most sports journalism focuses on athletes and games that typically draw tens of thousands of fans to stadiums and arenas, hundreds of thousands to newspaper and magazine sports pages, and millions to television and radio broadcasts.

Sports journalism is the linchpin in a symbiotic business relationship whereby professional sports teams, and their counterparts in the National Collegiate Athletic Association (NCAA), make money by attracting increasing numbers of high-paying fans, piquing their interest through promotion in sports stories. The media that produce and distribute those stories, in turn, make money by bolstering their audience and selling space or time among their sports stories to advertisers. And advertisers make money by producing ads for companies that serve or make products for major sports' well-defined audience of middle-to-upper income male fans/consumers.

Sports journalism in North America overwhelming comprises stories and broadcasts on professional football, baseball, basketball, and hockey, along with NCAA football and basketball games. Sports that do not have enough stoppages in play or cannot be predicted to end within a regular timeframe, such as soccer (i.e., "football" outside of North America) and cricket, do not meet advertisers' needs and therefore receive less airtime, no matter how popular they are elsewhere around the world. Columbia University historian Jacques Martin Barzun, wrote in 1954: "Whoever wants to know the heart and mind of America had better learn baseball, the rules and realities of the game," but the oft-edited ending of his quotation is, "and do it by watching first some high-school or small-town teams." The reality today is that soccer is more popular than baseball and American football on the fields of most American suburbs and cities, but the media keep people's mind on football and baseball and their advertisers' pitches.

Origins

Sports journalism in America dates to the 1830s, when Vermont publisher William Trotter Porter began producing *Spirit of the Times*. It started out just covering hunting and fishing, but Porter later promoted more competitive sports, such as rowing, yachting, and even baseball. One of the first newspaper sports stories ran on July 4, 1847, when the *Chicago Tribune* chronicled the city's annual Independence Day footrace.

As early as 1858, crowds gathered outside Western Union telegraph offices for round-by-round news of big prizefights across the eastern half of the United States. Such fights and their far-flung fans became international affairs in 1866,

with the laying of the first successful transatlantic cable. The bible of baseball, *The Sporting News,* began publishing in 1886. And in that decade, Joseph Pulitzer's New York *World* opened a new front in New York City's "yellow journalism" circulation wars by creating the first separate sports department at a newspaper. Not to be outdone, William Randolph Hearst then bought the *New York Journal* and in 1895 made it the host of the newspaper industry's first modern sports section. At the fin de siècle, while other newspapers relied on telegraph or nascent telephone lines for their sports coverage, another New York penny paper, the *Herald,* scooped the competition by hiring Guglielmo Marconi to use his new wireless invention to provide up-to-the-minute accounts of the America's Cup yacht race of 1899.

Most early sportswriting was florid, self-conscious, and self-congratulatory; sportswriters knew their job was to convey the escapist and entertainment values of sport while promoting their home teams and, in turn, their home newspaper. Take, for example, the *Chicago Tribune*'s coverage of the first two games of the 1906 World Series, between the Cubs and their upstart cross-town rivals, the White Stockings:

> Civil war breaks loose here today in Mr. Murphy's ball yard, and this morning sporting blood flows red and warm in the veins of the jungle. The big town on the rim of the lake is baseball dizzy, which is several degrees worse than batty. . . . Second Game—Over in the stockyards district, where gentle deeds and smells are rare, the Cubs dragged the Sox around their own killing beds and slaughtered them to a finish. Score: 7 to 1. (Ward 1953, 164)

Such hyperbole and overwriting characterized sportswriting—not just on baseball and not just in Chicago—until American sports lost their innocence, in the 1919 "Black Sox" scandal. When the heavily favored Chicago White Sox lost that year's World Series to the Cincinnati Reds in five games, the *Tribune* reported on rumors that flew more fast and furious than any of the Sox's pitches or bats. It took another full year for the truth to emerge that eight Chicago players had accepted bribes ranging from $5,000 to $20,000 to lose the series, and the *Tribune* joined newspapers around the continent in reporting every shameful detail of the charade.

Sports on the Air

Part of baseball's recovery came out of thin air. Radio announcers reported the results of the 1920 World Series from a station in Detroit, although radio sets had not yet been mass marketed. Promoters launched that process in conjunction with the July 2, 1921, heavyweight fight between Jack Dempsey and French champion "Gorgeous" Georges Carpentier. An estimated 300,000 people heard the radio broadcast of that fight over loudspeakers set up in theaters, lodge halls, ballrooms, and barns across the country. On August 5, 1921, Pittsburgh pioneering station KDKA carried the first live broadcast of a baseball game, with Harold Arlin doing the play-by-play of the Pirates' 8–5 win over the Phillies at Forbes Field. Since the World Series began in 1903, telegraph operators in multiple cities had been reporting pivotal games in "real time" by reflecting updates on elaborate scoreboards that showed ongoing game statistics to throngs of fans in downtown streets. And into the late 1920s, until radio networks spanned the continent, baseball announcers often relied on telegraph reports to "recreate" far-off games as if they were there, in the press box. The telegraph report might say no more than "Foxx flies center," novelist James Michener recounted, but from that, a master re-creator such as St. Louis's Frank Murray would broadcast,

> Jimmy Foxx, second only to Babe Ruth, hunches his mighty shoulders and swings with all his power. Gomez fools him with a low curve that misses the bat by a foot. Jimmy steps out of the batter's box, rubs resin on his immense hands and comes back, glaring. He takes ball one. Lefty Gomez studies him and delivers another tantalizing twister, and again Foxx misses by a foot. Quick delivery: ball two missing the outside corner. Now, Foxx means business. He crowds the plate, daring Gomez to throw at him. The ball comes in high, nothing on it. Foxx swings. [Here Murray raps the desk with his knuckles to simulate the sound of a bat on ball.] What a clout! DiMaggio goes back, back, back. He's on the track, right up against the wall. A leap! He spears it in his gloved hand. The crowd roars. (quoted in Michener)

The visual immediacy of actual sports footage, seen in the ballpark or, later, on television, paled in comparison to the colorful and creative images presented by radio recreators during these early days of sports reporting. Even today, some fans prefer to listen to baseball games rather than watch them on television, and many fans prefer to watch football games on television rather than in the stadium, where most seats are far from the action (and far from free). The first American televised sports event was an experimental broadcast of a meaningless Ivy League baseball game between the Princeton Tigers and the Columbia Lions, in 1939. Only a few hundred Americans owned television sets then. Sports did not begin to become a staple of network television until the mid-1950s, after the rising popularity of local sports broadcasts proved that men would skip weekend chores and family outings to watch games on television. As radio did before it, television often made watching sports at home better than watching from a seat at the stadium, but it accomplished this largely with technology rather than personality. Thanks to the development of close-up shots, instant replays, wireless microphones, and, most recently, high-definition pictures and audio, sports telecasts often exceed the sights and sounds from even the best seats at the game.

The New York Yankees had allowed the televising of several home games in 1946, and NBC aired the 1947 World Series between the Yankees and the Brooklyn Dodgers, but it was not until 1961 that televised sports began to come of age, based on two developments that year. On April 29, ABC's *Wide World of Sports* debuted, with its theme song literally trumpeting how producer Roone Arledge and announcer Jim McKay would be "Spanning the globe to bring you the constant variety of sport … the thrill of victory…and the agony of defeat." It eschewed North America's major team sports in favor of more individualistic, telegenic endeavors such as mountain climbing, figure skating, and track. It made heroes of loners and showed the tears of losers.

Arledge and McKay also teamed up for ABC's seminal telecasts of the Olympics, where Arledge first tried many of the zooms and replays that other networks copied for their Olympics broadcasts—and for sports telecasts of all kinds. Radio coverage of the Olympics began with the 1924 Games in Paris, and television coverage began as early as the 1936 Berlin Olympics. Television coverage did not reach a worldwide audience until the 1956 Olympics in Melbourne, Australia, but after that, television rights for the Olympics mushroomed from $600,000 for the 1964 Tokyo Games to $1.7 billion for the 2008 Beijing Games. Television rights cost a mere $47 million for the Munich Games in 1972, when McKay anchored ABC's coverage of the biggest *news* story in Olympic history. He stayed on the air for 14 hours without a break after the Black September terrorist group took 11 Israeli athletes and coaches hostage. At 3:24 a.m. German time (9:24 p.m. in New York), McKay delivered the news of an attempt to rescue the hostages: "When I was a kid my father used to say 'Our greatest hopes and our worst fears are seldom realized.' Our worst fears have been realized tonight. They have now said there were eleven hostages; two were killed in their rooms yesterday morning, nine were killed at the airport tonight. They're all gone."

The second 1961 landmark for televised sports came on September 30, when football-loving President John F. Kennedy signed a bill exempting the National Football League (NFL) from antitrust laws, allowing franchises to cooperate as a single corporation rather than compete with each other on television contracts, gate receipts, and salary caps for players. Television became the key to transforming the NFL from a laughable confederation of unprofitable franchises and an afterthought to college football into the most popular league in North America, flush with an expanded roster of the most valuable sports teams in the world, having relegated college football to its minor league. Unlike baseball, football offered a ball that was easy to see on television and field action that was easier to anticipate and capture on camera. And unlike Major League Baseball, NFL franchise owners agreed early on to equally share all revenue from television contracts. That enabled the NFL to establish on-field parity among its teams, giving small-market franchises such as Green Bay the same ability to pay and keep their star players as the franchises based in New York, Los Angeles, and Chicago. Combined with the NFL's earlier innovation of allowing teams to go in reverse order of their finish in the previous year's standings when it came time to draft college

football stars, the NFL made it a reality that any team could beat any other team on any given Sunday. That balance yielded games that kept fans glued to their television screens, which pleased advertisers and led to proliferating revenues for the league. By 2000, for instance, the NFL's annual revenue for national broadcast television rights amounted to $660 million, compared with $345 million for Major League Baseball, $120 million for the National Hockey League (NHL) (total for Canada and the United States) and $660 million for the National Basketball Association (NBA), which was similarly well-suited for television and followed the NFL's lead on revenue sharing and reverse-finish drafting of college players.

The NFL cemented its place at the center of sports journalism on September 21, 1970, when Roone Arledge brought it to prime time, launching ABC's *Monday Night Football,* with play-by-play man Keith Jackson flanked by former Dallas Cowboys quarterback Don Meredith and Howard Cosell, a New York broadcaster famous from his verbal sparring matches with boxer Muhammad Ali throughout the 1960s. After a hit first season, Jackson returned to broadcasting college football, and former New York Giants running back Frank Gifford stepped in between Meredith's sing-song pone and Cosell's circumlocutions. Whereas *Wide World of Sports* placed athletics on a pedestal, *Monday Night Football* erased the line between sports and entertainment. Along with Meredith's singing "Turn out the lights" as games wound down, the show started opening in 1988 with upbeat music and country singer Hank Williams Jr. demanding, "Are you ready for some football, the Monday night tradition?"

Monday Night Football migrated in 2006 to ESPN, the all-sports cable channel that launched in 1979. ESPN, which originally stood for Entertainment and Sports Programming Network and initially relied on fillers such as logrolling and beach volleyball, but it began to grow exponentially when ABC television acquired it in 1984 and it telecast its first NFL games in 1987. Also in 1987, ESPN began to span the sports globe, telecasting the America's Cup yacht races live from Australia, and in 1988 it opened the first of its 34 international ESPN channels, in South and Central America. It began showing Major League Baseball games in 1990, launched ESPN Radio in 1992, and introduced the ESPN2 supplementary cable channel in 1993. Along with acquiring Monday Night Football, ESPN rounded out its multimedia sports empire by launching ESPN.com in 1995 and *ESPN The Magazine* in 1998. By 2008, nearly 100 million homes subscribed to ESPN on cable, and it produced more than 5,100 hours of programming a year, covering 65 sports. ESPN's trademark shows, *SportsCenter* and *Baseball Tonight,* gave fans a full hour of highlights from every teams' games, along with analysis, predictions, and repartee from a panel of anchors and famous ex-athletes—plus, taped versions of the shows repeated all night long, so fans who missed their local news and sports broadcast could still catch their favorite team's highlights on ESPN.

On radio, sports joined right-wing politics as one of the mainstays of "talk radio" in the 1980s and '90s, with program hosts airing telephone calls from opinionated fans and provoking more reaction with their own rants and predictions. Many of these AM broadcast sports talk stations became affiliated with ESPN Radio or Fox Sports. Starting in 2001, however, much of the sports talk and attention shifted to satellite radio. That's when XM satellite radio launched its round-the-clock baseball channel, Home Plate, along with play-by-play for every Major League Baseball game, followed the next year by Sirius satellite radio's 24/7 football channel and coverage of every NFL game. By the time the two satellite radio companies merged in 2008, they also had channels devoted exclusively to the National Basketball Association, the National Hockey League, professional golf, and stock car racing.

Blogging the Bouncing Balls

The problem with sports talk radio, from the fans' perspective, is that often there wasn't time for everyone to get on the air and have their say. That's not a problem on the Internet, where anyone with web access can start a sports blog—or at least write a response to someone else's blog entry. Initially, in the late 1990s, most of the traffic went to mainstream media such as espn.com, *Sports Illustrated*'s cnnsi.com, and large newspapers' websites. There, staff sportswriters augmented their print or broadcast stories with extra tidbits, insights, predictions, and opinions. Those blogs

gave fans an opportunity to concur or disagree with the writers—and the moves made by the athletes, coaches, or general managers of their favorite teams. Occasionally, staff writers even responded to a blogger's question or comment, stepping into the unfamiliar territory of creating a conversation between the journalists and their audience.

Early in the twenty-first century, some of the online respondents became so prolific that they started their own sports blogs. No longer did they need mainstream sportswriters to start the conversation. Sports bloggers—free of the sportswriters' need to appear "objective" and maintain locker-room sources—could be as critical and outrageous as they wanted in their comments. Some started blogs on topics sportswriters rarely mentioned, such as minor league baseball and kick boxing, but most focused on the major men's pro and college sports. Few of the bloggers did much original reporting of their own, but some nonetheless gained a reputation for being so provocative and entertaining that they garnered a significant following—and the advertising to go with it. In a May 2008 ranking of the "100 Most Valuable Sports Blogs," the top 15 sites each had a value exceeding $1 million, based on their traffic and referred-link ratings. The top-ranked sports blog, an irreverent critique of off-field scandals and on-field blunders called deadspin.com, had an average of 650,000 page views per day and was valued at $16.5 million.

Sports in Print

Television, radio and the Internet, of course, did not kill print sports journalism. On August 16, 1954, Time Inc. launched a weekly sports magazine in response to audiences spending less time reading and more time watching the new medium of television. Chock full of glossy color photographs and stories of woods and waters where television cameras did not go, *Sports Illustrated* (*SI*) catered mainly to the elite, affluent outdoorsman for its first five years. It carried far more stories about hunting and yachting than baseball or football. But under new editor Andre Laguerre, *SI* applied its high-style writing to attract the burgeoning audiences of the National Football League and Major League Baseball, which was expanding with teams on the West Coast and elsewhere. Whereas the venerable *Sporting News* remained full of statistics and quotidian team updates, and while *Sport* magazine idolized athletes, *SI* took fans inside the locker rooms, explained what made stars "tick," and sometimes shined a harsh light on the hypocrisy of sports—and society. It ran series on the contemporary black athlete, women's rights in athletics, and the effects of technological advancements in sports. It springboarded the careers of some of the century's most innovative sportswriters, such as Frank Deford, Dan Jenkins, George Plimpton, and John Feinstein. But *SI* did not take itself too seriously. Deford and Jenkins alternated their wry accounts of on-field action with humorous off-field anecdotes and outlandish remarks. And then there's the annual swimsuit issue, which began in 1964 and continues to feature bikini-clad models in exotic locales on its cover and in color spreads inside. Other sports magazines tried to imitate *SI* by shifting to more critical reporting, but they fell victim to its supremacy in style and Time Inc. marketing synergy. Its main competitor, *Sport,* was a monthly that had launched in 1946, but it was losing money when it ceased publication in 2000. *SI*'s enduring legacy is the way that metropolitan newspaper sportswriters have imitated its insider irreverence and, occasionally, its investigative initiative on issues such as college sports recruiting abuses and pro stars' illegal steroid use.

Sports Books

The year 1970, when ABC launched *Monday Night Football,* also marked a sea change in sports *writing*. It came from an unlikely source: a once-promising but then washed-up major league pitcher, Jim Bouton. His book, *Ball Four,* coauthored by sportswriter Leonard Shecter, was Bouton's diary of his 1969 season with the Seattle Pilots, which was the team's only year of existence. Rather than the typical dreamer's tale or bench jockey's take on inside baseball, *Ball Four* busted wide the locker room law that "What you see here and what you say here, stays here." Instead, Bouton gleefully detailed his teammates' and opponents' (and his own) petty jealousies, crude humor, drinking, sexual exploits, and routine use of drugs to enhance their performance and forget their failures. He named names, from desperate minor leaguers to legendary Mickey Mantle. En

route to the best-seller list and critical acclaim, Bouton endured tremendous criticism from nearly everyone involved with Major League Baseball, including Commissioner Bowie Kuhn. Bouton's *Ball Four,* however, showed daily newspaper sportswriters they could and should do more than shill for the home team.

Among Bouton's skillful successors has been John Feinstein, a sportswriter for *The Washington Post* and *Sports Illustrated* whose 1987 profanity-laced book, *A Season on the Brink,* told the inside story of the 1985–86 Indiana University basketball team and its volatile coach, Bobby Knight. Feinstein was less critical but no less incisive in his 1995 book about life on the pro golf tour, *A Good Walk Spoiled,* in which he uses the New Journalism techniques of multiple-source interviewing, no attribution, and concise description to recreate key moments on the 1994 PGA (Professional Golfers' Association) tour.

A new generation of sports biographies and autobiographies also combine the narrative techniques of New Journalism with the inside stories—if not the tell-all tawdriness—of *Ball Four*. Hank Aaron, in his 1992 book, *I Had a Hammer,* co-authored by sportswriter Lonnie Wheeler, revealed the extent of hate mail and death threats he received before breaking Babe Ruth's career home run record in 1974. And in his 2006 book *Clemente, Washington Post* associate editor David Maraniss melded the storytelling ability of an historical novelist with the probing techniques of an investigative reporter. He drops attribution almost entirely but then appends the book with 22 pages of endnotes listing his sources for every opinion, allegation, and recreated internal thought in the book.

Investigative and sports journalism have teamed up in the twenty-first century. In 2000, *St. Paul Pioneer Press* sports reporter George Dohrmann won a Pulitzer Prize for his stories revealing that an academic staff member routinely wrote class papers for University of Minnesota men's basketball players. The revelations disqualified the surging team from the NCAA championship tournament, much to the chagrin of Gopher alumni, and led to the resignations of the university's basketball coach and athletics director. In 2006, *San Francisco Chronicle* investigative reporters Mark Fainaru-Wada and Lance Williams released the book *Game of Shadows,* which detailed the evidence that Olympic and professional athletes had been using steroids and other performance-enhancing drugs obtained from a Bay Area lab. The evidence included sealed grand jury testimony by and against Barry Bonds, baseball's single-season and career home run record holder. When Williams and Fainaru-Wada refused to reveal their confidential source for Bonds' grand jury testimony, they were held in contempt and sentenced to prison. Congressional intercession and further evidence spared them from confinement, but their book and its evidence led to Bonds' forced retirement from baseball and indictment on perjury charges.

Race and Gender

The reporting on Bonds, an African American, rekindled charges among some blacks that much sports journalism is prejudiced. Going back to before Jackie Robinson broke baseball's color barrier in 1947, sportswriters had been alternately mirroring and protesting prejudice in society. "The king is dead. Long live the king, even though he be a Negro," the *Chicago Tribune* trumpeted in its story on Jack Johnson's July 4, 1910, defeat of Jim Jeffries for the heavyweight boxing title (quoted in Ward). The press later dubbed boxer Joe Lewis "the brown bomber" and hailed his victories, but they added insult to injury after Max Schmeling defeated him on June 19, 1936. "The colored boy stood up to a beating seldom delivered in any ring," the *Chicago Tribune* reported (quoted in Ward). Similarly, sportswriters almost always referred to Jesse Owens as "colored" (while not mentioning the race of white athletes), but they portrayed his four gold medals in the 1936 Olympics as a victory for the United States over Hitler's Nazi Germany.

Sports stories have long belittled women, too, with backhanded compliments. In 1926, when Frenchwoman "Mlle. Suzanne Lenglen, queen of the tennis world," played American "Miss Helen Wills" in Cannes, it was "the most dramatic, most grueling athletic contest every played by two women. The score was 6–3, 8–6" in Lenglen's favor, the *Chicago Tribune* reported. Ten years later, it also reported that, "The amateur swimming career of Eleanor Holm Jarrett, pretty backstroke-record holder, came to an abrupt end" for breaking training rules by drinking too much alcohol

aboard ship en route to the Berlin Olympics (quoted in Ward). Similar treatment of women athletes continues, such as during the 2008 Beijing Olympics, when Dara Torres ("HOT U.S. Swimmer in 5th Olympics," as one website introduced her) got as much attention in stories—and photos, including a micro-bikini shot on nytimes.com—for being a 41-year-old mother with rippling abdominal muscles as for winning three silver medals. Moreover, women still do not get sports coverage anywhere near proportionate to their participation rates. Since the 1972 passage of the U.S. Title IX law requiring equal access to sports in high schools and college, females now account for more than 40 percent of the scholastic athletes, and the United States now has women's professional leagues in basketball and soccer. But major newspapers devote just 8 to 13 percent of their sports coverage to women, and television gives less than 8 percent of its sports coverage to women, according to the Women's Sports Foundation. A peer-reviewed research study of ESPN *SportCenter* found that its coverage of women's sports stories actually fell, from 5 percent in 1997 to 2.1 percent in 2004.

After World War II, during which black men fought alongside whites and women filled many jobs previously reserved for men, including sportswriting, newspaper sports pages reflected society's begrudging acceptance of women and people of color. Sometimes, sportswriters even championed the causes of Jackie Robinson, Muhammad Ali, Bill Russell, Roberto Clemente, and Martina Navratilova. For example, longtime *Washington Post* columnist Shirley Povich wrote in 1970,

> The trouble with Arthur Ashe wanting to play tennis in South Africa is that he lacked a choice of colors at birth.... Ashe was born a Negro, and in South Africa black ain't beautiful.... In all truth it must be noted that South Africa is not discriminating against Ashe as a person. South Africa discriminates against all Negroes.

Many sportswriters joined most of white America in vilifying 1968 Olympics sprinters Tommie Smith and John Carlos for their gloved "Black power" protest on the medal stand. By 1976, however, liberals began to speak out against America's "love 'em and leave 'em" treatment of black athletes. Popular historian and novelist James A. Michener went so far as to join activist Harry Edwards in calling for black parents to steer their sons away from sports scholarships, arguing, "Sports are the opiate of the black masses."

Conclusion

Sports journalism in North America's metropolitan areas has largely ignored the pursuits of amateur athletes and only occasionally championed the equitable treatment of minorities and women in athletics and society at large. Instead, sportswriters and sportscasters have primarily perpetuated a system of entertaining fans and thereby raising revenue for the journalists' employers, their outlet's advertisers, and the professional sports teams and NCAA. Sports journalism represents a respite for audience members enervated by the concerns and calamities of news and daily living. It can be lively, it can be refreshing, and it can make money. Not many other areas of journalism could say that at the start of the twenty-first century. In the future, Internet bloggers might be able to write as lively as professionals, bloggers might force sportswriters to be more critical of multimillionaire athletes and billionaire franchise owners, and sports journalists surely will have to interact more with their audiences online. The sports leagues, however, are unlikely to relinquish any more of the rights to retransmit their games until new media mavens, like their satellite television and radio forebears, are able to offer them large audiences and large fortunes.

SPORTSWRITERS

While sports coverage is often called "the toy department" in many newsrooms, sportswriting is fiercely competitive, difficult to succeed at, and harder yet to sustain. Sportswriters must pay attention to detail like a copy editor, analyze events like a political reporter, dig into some stories like an investigative journalist, work under tight deadlines like a cops reporter, and, ideally, write like a poet. Those who master this art are often the best writers on their publications—and the ones many readers turn to first. Sportswriters and the athletes they cover have a symbiotic relationship they seldom acknowledge but ignore at their mutual peril. Surly athletes can suck all the fun out of games for sportswriters, and unscrupulous sportswriters can rob athletes of the chance to perform well.

Not only must sportswriters continually find new ways to chronicle dozens of games each season, they must continually heighten fans' interest in their professional and major college home teams. They seldom cover amateur or women's sports, because revenue-generating teams lure them with extensive privileges and promotional information. Sportswriting is essential to teams maintaining their fan base and revenue, and it is essential to newspapers maintaining their readership and revenue, because sports pages deliver to advertisers a concentrated—and prized—readership of men ages 18 to 49.

Selected American Sportswriters

The following brief profiles of some of the best American sportswriters over the past century are far from comprehensive. It reflects the bias of modernity by including writers who have viewed sports with a critical eye and by leaving off those, such as Grantland Rice, who made heroes of players. It includes two African Americans but no female sportswriters or writers about what the world calls football (soccer). Over the past 100 years or so, according to the erudite George Plimpton, the best U.S. sportswriting has reflected games that require the greatest courage or skill: American football, boxing, golf and, especially, baseball. All of these sportswriters have chronicled at least some of those sports.

Henry Chadwick (1824–1908)

Chadwick was the first to make a full career of sports writing, and he promoted baseball as our "national pastime." Chadwick's father was a social reforming English journalist who fell so far out of favor that the family moved to New York when Henry was 13. Just four years later young Chadwick had his first journalism job, reporting cricket scores to *The New York Times*. By 20, he

was a regular contributor to the *Long Island Star,* reporting on all manner of sport and diversions: sailing, horse racing, cricket, billiards, and even chess and theater. He was 31 when he found his life's passion. In 1856, on his way home from a cricket match, he came across a baseball game at Elysian Fields in Brooklyn. "It was not long before I was struck with the idea that base ball was just the game for a national sport for Americans," he wrote afterward. "From this game of ball, a powerful lever might be made by which our people could be lifted into a position of more devotion to physical exercise and healthful out-door recreation than they had hitherto, as a people, been noted for" (Orodenker 2001). In 1858, Chadwick became the world's first baseball editor, at the *New York Clipper,* and he published the first book of "Base Ball Rules." Chadwick developed the box score, and in 1867, he unveiled the first system for scoring a baseball game, with letters denoting every batter's outcome, including the still-used S for sacrifice and K for strikeout. He also devised the first player statistics: batting average and earned run average.

In his final years, Chadwick debated how baseball began, contending it evolved from the old English game of Rounders. Though a commission ultimately decided that Abner Doubleday had invented the game, Chadwick disagreed. But he got his due, being inducted into the founders wing of the National Baseball Hall of Fame when it opened in Cooperstown in 1939, 100 years after Doubleday supposedly invented Chadwick's "national game."

Red Fisher (1926–)

Fisher has covered the national pastime longer and more authoritatively than anyone else, but hardly any U.S. fans know his work. That's because the nation in question is Canada, and the game he covers is hockey. As the Montreal Canadiens celebrated their one hundredth anniversary in 2008 and 2009, Fisher had been covering them for more than 50 of those years. His first game in the press box at the Montreal Forum was March 17, 1955, the night of the infamous "Richard Riot," when fans caused more than $500,000 damage and threw vegetables at Clarence Campbell, then-president of the National Hockey League, because he had suspended Canadiens' icon Maurice Richard for wielding his stick in a fight. Fisher went on to cover 17 of the Canadiens' Stanley Cup titles (out of their professional leagues-leading total of 24 championships) and to become the ultimate sportswriter insider. Players, coaches, and general managers alike sought his advice. Unlike other insiders, Fisher reported his behind-the-scenes stories, often resorting to the passive-voice catch phrase "he was told" to signify his part in the dialogue with players and hockey executives. Fisher covered the Canadiens for the *Montreal Star* from 1955 until it closed in 1979, and he has covered them for the *Montreal Gazette* since then. The Hockey Hall of Fame named Fisher to its writers wing in 1985, and Sports Media Canada gave him its Lifetime Achievement Award in 1999.

Sid Hartman (1920–)

Hartman is one of the worst sports*writers* in the nation, by his own admission. But by all accounts, the Minneapolis *Star Tribune* columnist is one of the best sports *reporters* in the world. "Don't worry about writing; give us the news," Hartman's first editor, Dick Cullum, told him. "Writers are a dime a dozen. Reporters are impossible to find." Even into his mid-80s, the indefatigable "Sir Sidney" still worked daily, scooping reporters a quarter of his age and breaking more national sports stories than any other regional journalist. He was the first to report, for instance, that Ara Parseghian was quitting as Notre Dame football coach in 1975 at the height of his success. Hartman "makes the rounds" to all of the Minnesota Gophers, Twins, Vikings, Timberwolves, and Wild practices to interview coaches and players, but his secret weapon is his large black book of telephone numbers—home, office and mobile—for nearly every sports figure in the country. He has a remarkable ability to track down whoever is in the sports spotlight and, because of his reputation for amiability, they almost always take his call.

Dan Jenkins (1929–)

Jenkins is a throwback to the Ring Lardner school of sportswriting, crafting stories populated by colorful, down-home—and often, fictional—characters. But Jenkins has focused on football

rather than baseball, and his satire is often more profane than Lardner's could be. "I guess by now there can't be too many people anywhere who haven't heard about Billy Clyde Puckett, the humminest sumbitch that ever carried a football," Jenkins wrote in his 1972 breakout novel, *Semi-Tough*. Like many of his story subjects and characters, Jenkins grew up dirt poor in the heart of Texas. He dropped out of Texas Christian University to start writing sports for the *Fort Worth Press* in 1948, moved over to the *Dallas Times Herald* in 1960, and graduated to *Sports Illustrated* in 1962. He wrote hundreds of features on football and golf for *SI* through 1984, when editors accused him of slipping from sublime to silly. Since then, he has dichotomously split his sportswriting between *Playboy* and *Golf Digest,* and he has written more than 20 books. Unlike Lardner, who did as much of his reporting from the dugout and stands as the press box, or Plimpton, who actually got onto the field, Jenkins is infamous for collecting his information on the nineteenth hole and living as large as his characters.

Roger Kahn (1927–)

Kahn titled his 1972 then-and-now book about the Brooklyn Dodgers *The Boys of Summer,* a phrase that has since become the wistful appellation for all professional baseball players. Kahn, who grew up in Brooklyn, worked as a newspaper sportswriter from 1947 to 1976, and has written nearly two dozen books. Kahn dropped out of New York University and began covering sports for the *New York Herald Tribune* when he was 19. He started ghostwriting magazine stories for Jackie Robinson in the early 1950s, and he first saw Willie Mays play when he began covering the New York Giants in 1954. In 1960, Kahn was among the first sportswriters to analyze the ascendancy of football. He wrote about hockey, and he covered presidential campaigns in 1964 and 1968. But like a runner retreating to the bag between pitches, Kahn has always returned to baseball. "The romance between intellectuals and the game of baseball is, for the most part, one-sided to the point of absurdity," he wrote in a 1957 essay. Major league stars are "demigods" to the intellectuals, but players rank the intellectuals "several notches below umpires" (Orodenker 1996).

Sam Lacy (1903–2003)

Lacy lived and worked in a parallel universe to Shirley Povich—but for even longer. Lacy lived to be 99, with all but four of his 85 years in the African American press based in Washington, D.C. In 1920, Lacy turned down a job at the *Washington Tribune* black newspaper and admission to Howard University to play baseball for two years in the Negro Leagues, in Atlantic City and Baltimore. He played little, but he became convinced that blacks were good enough to play in the major leagues. Lacy spent the next two decades advocating for baseball's integration while he wrote sports columns for the *Washington Tribune* from 1928 to 1940, the *Chicago Defender* from 1940 to 1943, and his final newspaper, the Baltimore-based *Afro-American*. Finally, on Lacy's forty-second birthday, the Brooklyn Dodgers' Branch Rickey signed Jackie Robinson and then asked Lacy and fellow black journalist Wendell Smith to be Robinson's caretakers during spring training in segregated Florida. If it hadn't been for their advocacy and friendship, Robinson said after his retirement, he would not have made it in the major leagues. Lacy kept editorializing and pushing for better treatment of black athletes in college sports, pro football, and golf into the twenty-first century.

Ring Lardner (1885–1933)

Lardner set the standard for sportswriting, elevating it from an amalgam of agate type and cheerleading to the level of literature. Ringgold Wilmer Lardner's parents named him after a Civil War admiral and a cousin who had died just before he was born in the southwest Michigan town of Niles. Starting in nearby South Bend, Indiana, Lardner held ten sportswriting jobs from 1905 to 1929, often quarreling with his bosses over his fanciful style and brash opinions. Between assignments and jobs, he wrote 23 books, many of them compilations or expansions of his columns, plus two Broadway plays and a syndicated comic strip on baseball. He rose to prominence in 1913, writing the *Chicago Tribune*'s "In the Wake of the News" syndicated sports column that continues today. By 1916, Lardner had published *You Know Me Al,* a collection of six short stories based on his columns about Jack Keefe, a composite character

presented as a plain-spoken pitcher for the Chicago White Sox. Lardner used "slanguage" to make players and characters relatable to his sports page readers. He wrote extensively about football, boxing, and theater, too, but it was baseball, with its leisurely pace, that best lent itself to his flights of fantasy and labyrinthine digressions. However, he could be direct and biting, too, as he showed when he was the first sportswriter to publicly accuse the Chicago White Sox of throwing the 1919 World Series to the Cincinnati Reds. It took another 11 months for eight Sox players to confess to accepting bribes to throw those games, but the "Black Sox" scandal soured Lardner on baseball for life. He continued to write about the game, usually cynically, but turned more attention to his other loves, the theater and his wife and four sons, all of whom became writers. Nothing is more depressing than an old baseball writer, Lardner said, and he never became one. He died at age 48 from tuberculosis.

Westbrook Pegler (1894–1969)

Pegler was a complicated man whose convictions carried him to national prominence and the Pulitzer Prize but ultimately left him in shame and stewing with stomach cancer. He spent the first few years and latter half of his 57-year career in news, but he is best remembered for his sportswriting. A lover of baseball, Pegler used sports as a springboard for satire and social reform and worried more about prose than box scores. With typical irreverence, Pegler called sports' golden age between the world wars "The Era of Wonderful Nonsense," due to the Black Sox scandal and several prize-fight fiascos that distracted people from the Depression and foreign affairs. In 1925, the *Chicago Tribune* hired him as its New York–based editor and syndicated sports columnist. He kicked at such sacred cows as Army football and Notre Dame football coach Knute Rockne, questioning the teams' recruiting tactics and indifference to athletes' education. And in contrast to Lardner, Pegler wrote almost ruefully about the 1919 Black Sox scandal, saying the eight bribed White Sox could hardly be blamed for naively trying to recoup some of the riches team owners had amassed off them. In late 1933, Pegler shifted from writing about sports in a political fashion to writing about politics in a sporting fashion when Scripps-Howard gave him a $75,000 contract amid the Depression. Pegler, however, took time from his political writing to cover the 1934 World Series, and he wrote his greatest sports stories about his trip to the 1936 Winter Olympics in Germany. Pegler had urged a boycott of the Nazi-hosted games, but failing that, he wrote unflinchingly of how "the German people's favorite sport is to be shoved around by men in uniform" (Orodenker 1996).

George Plimpton (1927–2003)

Plimpton never wrote sports for a daily newspaper, but he authored many memorable pieces for *Sports Illustrated* along with nearly 20 books on sports. Moreover, his cameo appearances in pro games made him the most widely known sportswriter of the twentieth century. Showing readers how hard it is to do the things professional athletes make look so easy, Plimpton trained and played with the pros in exhibition football, baseball, basketball, hockey, boxing, tennis, and golf. He was earnest and courageous but abysmal in all of them—even the sport he played all his life, tennis. But Plimpton accomplished his goals: He survived and gained a unique perspective. "Sportswriters," he said, "have never given the reader a sense of what it's like to be part of a team, of the mystique, ritual, frights and fears of the game" (Orodenker 1996). Plimpton felt compelled to do that through his hands-on exploits because no sportswriter has ever been as overeducated as he, a graduate of St. Bernard's Prep School, Phillips Exeter, Harvard, and King's College, Cambridge. In contrast to sportswriters such as Red Smith and Shirley Povich, who loved reporting but sweated through the writing, Plimpton suffered primarily at the front end of the process, admitting he was often "scared half to death" on the field, rink, court, or ropes. He kept up the derring-do into his mid-50s, then died at age 76 from natural causes.

Shirley Povich (1905–98)

Povich spent his entire 75-year career with *The Washington Post*. In fact, his column might have saved the newspaper, according to its former publisher, Don Graham, who, when Povich died, proposed that many if not most of *the Post*'s 50,000 readers bought the paper in order to read Povich's column every day. Povich, like his New York

counterpart and friend, Red Smith, worked hard at reporting on sports expansively and writing about it economically. He witnessed and reported on nearly all of the major sporting events of the twentieth century, from Walter Johnson and the Washington Senators' only World Series title in 1924 to Cal Ripken's surpassing of Gehrig's consecutive games string in 1995. In between, Povich helped lead the movement to integrate major league baseball and football, and, thanks to his first name, got a mistaken listing in the 1959 *Who's Who of American Women.* (While he was growing up in Bar Harbor, Maine, Shirley was a common boy's name.) Povich made summer money caddying for wealthy vacationers. Among them was Ned McLean, then-owner of *The Washington Post,* who was so taken by the young boy's wit and ambition that he gave him a job at the *Post* and made him the nation's youngest sports editor, at age 21. Povich kept writing for the *Post* until the day before he died, at age 93, having contributed more than 600 columns even after he "retired" in 1974.

Red Smith (1905–82)

Smith was the first major sportswriter to graduate from college, and it showed: He once compared the New York Giants football team to Spartan king Leonidas at Thermopylae. Smith wrote eruditely, concisely, and incisively over a 55-year career that began before Babe Ruth's "called-shot" home run in the 1932 World Series and extended beyond Reggie Jackson's three-home-run game in the 1977 Series. Walter Wellesley Smith grew up in sports-mad Green Bay, Wisconsin, and earned his degree from Notre Dame while it was winning titles under coach Knute Rockne and the "Four Horsemen" running backs. Smith graduated cum laude and went to work for the *Milwaukee Sentinel* in 1927 as a general assignment news reporter. He got his nickname in 1936, when he moved up to the *Philadelphia Record* and equivocated on how his first byline there should read, because he disliked the formality of his first and middle names. The slot editor decided he should be "Red" Smith, and it stuck. He became a columnist in 1939, and in 1945 he achieved his goal of reporting in the nation's sports capital, New York. He covered baseball, boxing, football, and horse racing for the *Herald Tribune* until it closed in 1967. He continued covering those sports as a syndicated columnist until 1971 and for *The New York Times* until his death in 1982. In 1975 he became one of a handful of sportswriters to win journalism's highest honor, the Pulitzer Prize.

Wendell Smith (1914–72)

Smith was the greatest of all black sportswriters, according to none other than Sam Lacy. A star pitcher during high school in Detroit, Smith earned a degree at West Virginia State College and started sportswriting for the *Pittsburgh Courier,* an African American newspaper, in 1937. He covered the Pittsburgh Crawfords and Homestead Grays in the Negro Leagues, and he started interviewing major league players and managers when they were in Pittsburgh, but he had to talk with them at the visiting teams' hotel, because he couldn't get a press pass to work at the Pirates' Forbes Field. It was Smith who recommended Jackie Robinson to the Dodgers' Branch Rickey. Smith's banner year was 1948 when he moved up to the *Chicago American* black newspaper, covered the Summer Olympics in London, got credentials to report on the Chicago White Sox, and became the first black member of the Baseball Writers Association of America. Also that year, he ghost wrote *Jackie Robinson: My Own Story.* Smith continued to cover the major leagues, and in 1962 he was nominated for a Pulitzer Prize for his stories exposing—and ending—the humiliating "Jim Crow" segregation that black players had suffered annually during spring training in Florida. In contrast to Lacy, Smith died young. Cancer killed him at age 58, just a month after the death of his friend Jackie Robinson.

Conclusion

Sportswriters today are better educated and equipped than before to meet the many challenges of their craft. But they also face more competition, not only within their own ranks but especially among the many media and sports vying for attention. Many newspaper readers still turn to the sports pages first, but there are far fewer readers and newspapers than earlier sportswriters had at their disposal. Economic pressures are sapping much of the literature from sportswriting, while it trends

more toward multimedia punditry. Newspapers and magazines have trimmed their sports staffs and cut the travel budgets for those who remain. At the same time, sportswriters get pushed and pulled to regularly provide commentary on TV and radio talk shows, leaving them less time for reporting and refining their writing. In sports, as in political reporting, whether instant analysis equates to increased insight is yet to become evident.

STAR News (Asia)

STAR News Asia provides news and information services by satellite to more than half of the world's population spread over 50 countries. News is delivered primarily in English, but channels also carry newscasts in other languages, notably Chinese in China and Taiwan, and Hindi in India. When STAR began to cover Asia via satellite in the early 1990s, it was a pioneer in creating competition for government-owned media, programming demand in a growing middle class, and a culture for consumerism.

STAR (Satellite Television Asian Region) is owned and operated by News Corporation (News Corp.), a global media conglomerate headed by Rupert Murdoch (1931–), the Australian media mogul who is now a U.S. citizen. As a risky upstart unseating monopolies and offering audiences more choices, STAR exemplifies traits associated with Murdoch's other media enterprises. But Murdoch did not launch STAR, instead buying a controlling share (64 percent) of young news-and-entertainment STAR-TV in July 1993.

STAR was begun by HutchVision, the broadcast subsidiary of Hutchison Whampoa, a Hong Kong conglomerate owned by Li Ka-shing (1928–), the richest man in Hong Kong at the time. He had the foresight to work with the Chinese government to launch the AsiaSat satellite, on which he began broadcasts of STAR in December 1991, setting him ahead of the other main Asian competitor, Television Broadcasts (TVB) AsiaSat1 had been the first commercial satellite to provide regional coverage of Southeast Asia. Li's early move gave STAR a wide territory across which to establish a brand. STAR broadcast its five channels free, with revenue generated by the advertisers Li brought in as investors. With its satellite transmissions, STAR broadcast 24 hours a day to 38 countries stretching from the Middle East to Indonesia. News programming was provided by the British Broadcasting Corporation, a business partner. Less than two years later, and already enjoying an estimated audience of 45 million viewers, Li sold STAR-TV to Murdoch for a profit, even though the service had not yet broken even.

Murdoch's purchase of a controlling share in STAR-TV proved to be a catalyst for commercial satellite competition in Asia. STAR's rival was TVB, a consortium that was already Hong Kong's leading broadcaster. TVB, whose programming included CNN for news coverage, began leasing satellite capacity to expand its reach. The field widened with regional satellites and the digital compression that allowed more room for channels

on them, along with cable TV and phone services. Availability of distribution and content choices focused debate on the effectiveness of pan-Asian advertising as a revenue stream in markets so segmented by cultures and languages. Murdoch's addition of pay TV platforms soon after his purchase helped address this shift. Like Li had done, Murdoch put his sons in managerial positions in order to train and test them for the succession of his global dynasty. James Murdoch (1972–) was running the STAR satellite business in the early twenty-first century.

Transnational satellite broadcasting ushered in wider access to information and entertainment for many Asians, including those of the world's two most populous nations, China and India. Though STAR was programmed from its Hong Kong headquarters, its footprint, or the geographic reach of its satellite signal, extended across Asia to include countries with government-run media that often delivered governmental propaganda as news and did not permit foreigners to own media outlets or distribute programming. Without having to air competing viewpoints, the government voice became the unchallenged authority in interpreting events and disseminating information. Lacking competition from private media enterprises, the state-run channels had little incentive to engage their audiences' interest. With its new voices and wider scope of services, STAR quickly secured millions of viewers. While it did not capture a majority of viewers from the national media, STAR did introduce a new way of presenting information and entertainment, including added foreign perspectives, more attention to media image and modern editing techniques, and commercial priorities. The access epitomized by STAR signaled the beginning of the end of restrictive and sometimes repressive national media environments.

STAR News Asia's newscasts are modeled on those of contemporary Western-style programs. The most dramatic regional and international stories of the day are covered first and repeatedly. Pleasant anchors announce headlines and cut away to packaged coverage in which reporters provide stand-up narration of events. STAR News anchors have garnered name recognition with their audiences, and some have gained celebrity status. To appeal to contemporary audiences in an increasingly competitive market, STAR News Asia updated its logo and on-air look in 2006. The news service shares the STAR menu with an increasingly diverse array of programming, from international sports and entertainment channels to locally produced entertainment and joint ventures.

Amid debate as to whether Western media transmit undue cultural influence, News Corp. has cooperated with Asian governments to develop programming, affiliate with existing channels that broadcast in indigenous languages, involve local talent, and cover stories of regional interest. But the sailing has not always been smooth; some media changes have been initiated in response to cultural and political upheavals. For example, shortly after acquiring STAR, News Corp. dropped *BBC World News* from its telecasts to China. In a September 1993 speech from London, Murdoch predicted that satellite broadcasting would hasten the downfall of authoritarian administrations. Viewing such transnational satellite broadcasts as a threat to its control, China began a crackdown on illegal satellite dishes and reinforced national programming requirements, moves that stunted STAR's growth and potential influence. China took issue with STAR's use of BBC news because of the news service's portrayal of China's Cultural Revolution leader Mao-Tse Tung. Early in 1994, Murdoch split the satellite beam into a north and a south footprint, with the northern beam reaching China and the southern beam reaching India. Two footprints meant that different programming and advertising could be carried to separate audiences. Murdoch appeased the Chinese by dropping BBC service from its northern footprint.

With the advent of satellite broadcasting, burgeoning Asian middle classes demanded balanced information and better programming as well as the products they saw advertised. STAR's two different footprints enabled focused appeals to regional audiences. That, in addition to its partnerships with other non-English channels, attracted more advertisers seeking access to the new consumer populations. In 1995, STAR-TV leased transponders on AsiaSat2, allowing even more tailored channels of programming, languages, and advertising.

As part-owner of British Sky Broadcasting (BSkyB), News Corp. provides its material for STAR News Asia's international coverage. Before making Sky News its Asian news service, STAR carried Sky News on pay channels and on its

Middle East platform. STAR also offered pay channels in Indonesia, Asia's third most populous country, prior to the 2006 acquisition of STAR's first terrestrial broadcast network. To secure regulatory and public approval for a 20 percent stake in Indonesia's ANTV, which is watched by about 5 percent of that country's 180 million viewers, STAR made assurances that broadcast control would remain in local hands and that corporate resources would improve news quality in what is already a competitive media environment and a booming television advertising market.

The STAR system is taking advantage of technology in its production and distribution of news and entertainment in order to reach diverse, new audiences. Having opened up Asia, home to two-thirds of the world's population, STAR is now positioning itself prominently in global media convergence. Its 2006 alliance with China Mobile provided STAR with access to 260 million wireless subscribers, while its holdings in DirecTV, the largest U.S. satellite broadcaster, means that it can beam its Asian news and information across the world to overseas Chinese.

STAR News Asia plays a significant role in the STAR-TV system, which as Asia's largest satellite broadcaster, provided unique access to new audiences and unprecedented competition to government-owned media. STAR is an important player helping to define new and integrated media service. Although STAR initially envisioned its Asian appeal to be the top 5 percent of the population, it has expanded to seek a mass audience by redefining service as a series of interconnected localized appeals.

Stars and Stripes

Stars and Stripes is the daily newspaper published for American military servicemen and U.S. Department of Defense civilians, contractors, and their families. Unique among the many military publications in the world, *Stars and Stripes* operates free of any government control or censorship. It has been published continuously in Europe since 1942, and since 1945 in the Pacific. *Stars and Stripes* has one of the widest distribution ranges of any newspaper in the world; between the Pacific and European editions, it is read in over 50 countries where there are American bases, posts, ships, or embassies. The newspaper publishes approximately 80,000 copies in the Pacific and Europe combined, 363 days each year.

Origins

This military newspaper was first published during the American Civil War, the initial issue produced when Union soldiers of three Illinois regiments set up camp in Bloomfield, Missouri, in November 1861. Upon finding the local newspaper offices abandoned, four ex-newspaper writers decided to print a one-page newspaper for their regiments, relating the troops' daily activities. They named it *Stars and Stripes* but ceased publication when the Union forces continued their advance a few days

later. The Department of Defense has officially recognized Bloomfield as the birthplace of the paper, and the *Stars and Stripes* Museum and Library is located there.

The World War I version first appeared in February 1918 in Paris. It was produced weekly by an all-military staff to provide information to the doughboys of the American Expeditionary Force. At its peak, it had eight pages and claimed more than a half-million readers. It relied upon the improvisation of its staff, many of whom became famous and influential members of postwar American media (editor Harold Ross, for example, returned home to found *The New Yorker* magazine). The *Stars and Stripes* ceased publication after the war ended in November 1918.

In April 1942 in a London print shop, a small group of servicemen founded a four-page weekly version of *Stars and Stripes* for American soldiers in Britain; the new version quickly grew into an eight-page daily newspaper. It was graced by the work of talented young journalists such as Andy Rooney, Steve Kroft, Louis Rukeyser; author Shel Silverstein; and cartoonists Vernon Grant and Bill Mauldin. The latter's famous "Willie and Joe" cartoons laid the foundation for his later work, which garnered two Pulitzer Prizes. Eventually, several editions were published simultaneously in the European theater, some printed very close to the fighting fronts in order to get the latest information to the most troops. At one time, there were as many as 25 publishing locations in operation in Europe, North Africa, the Middle East, and Hawaii. Throughout the war, *Stars and Stripes* had a friend and protector in General Dwight Eisenhower, Supreme Allied Commander in Europe, who issued a "hands-off" policy and defended the paper against protests by others. By V-J Day, August 15, 1945, circulation had risen to a million readers.

When World War II ended, the paper was instructed by the Department of Defense to continue to publish as long as U.S. troops remained abroad. As wartime enlisted staff were demobilized, the newspaper built an experienced staff of full-time civilian journalists, augmented by a small contingent of military journalists and photographers. The paper's reporters joined the troops in the field throughout the Korean and Vietnam conflicts. During the 1991 fighting in Iraq, the paper established a Middle East bureau for reporting the war, as circulation of *Stars and Stripes* nearly doubled within weeks. During the early 2000s Iraq war, reporters from the paper were embedded with military units in Kuwait and Iraq, as well as on Navy ships in the region. Staffers are still reporting from those countries, and thousands of copies of the paper are being printed daily in Iraq and Afghanistan for distribution.

Stars and Stripes Today

In the face of rising costs, in the 1990s the production of *Stars and Stripes* was reorganized. A central editorial office was established in Washington, D.C., that receives news stories, photos, and advertisements from bureaus around the world through a high-tech electronic publishing system with editors then creating electronic pages for different editions that are sent to printing plants around the world by satellite. Since the reorganization, the website has been expanded, a *Stars and Stripes* version for ships at sea was developed and, in 2004, online electronic subscription service was pioneered. The paper is distributed at no charge to troops in combat theaters, offered for sale in coin boxes and military exchanges at bases, and has home delivery to subscribers in several countries. After the restructuring, advertising grew from $3 million to nearly $10 million a year by 2007.

Stars and Stripes maintains news bureaus in Europe, the Pacific, and the Middle East. In addition to national and international news and sports stories, the newspaper seeks to provide all the elements of the hometown papers servicemen left behind, from columns to coupons, comics and crossword puzzles. The "Letters to the Editor" pages have long been a popular feature and forum for lively discussions on issues of interest to members of the military services. In 2008, five daily editions were published: Mideast, Europe, Japan, Korea, and Okinawa. The regional editions, besides the above, offer topical information on political, cultural, and sporting events at the theater military bases and in surrounding communities.

Unlike many of its military media counterparts, *Stars and Stripes* takes no editorial position of its own but strives to maintain a balanced presentation of issues and opinions. The staff, a combination of military and civilian personnel, has been trained in the traditions of American journalism. An ombudsman,

usually a civilian ex-editor, protects the paper's First Amendment rights and investigates any allegations of censorship or news management by government departments or officials. As revised Department of Defense Directive 5122.11 states:

> *Stars and Stripes* is a Department of Defense-authorized daily newspaper distributed overseas for the U.S. military community. Editorially independent of interference from outside its own editorial chain-of-command, it provides commercially available U.S. and world news and objective staff-produced stories relevant to the military community in a balanced, fair, and accurate manner. By keeping its audience informed, *Stars and Stripes* enhances military readiness and better enables U.S. military personnel and their families stationed overseas to exercise their responsibilities of citizenship.

Stars and Stripes is recognized by both journalists and readers as the "G.I.'s newspaper" and has a proud history of being a credible news source. The paper has but one specific mission: to bring American military personnel and their dependents the same international, national, and regional news and opinion from sources available to newspapers throughout the United States.

Historically, *Stars and Stripes*' role becomes most visible in times of overseas conflict, when it expands dramatically to serve a growing number of military personnel. But throughout its tenure as the servicemen's newspaper, it has served to connect American servicemen abroad with each other and with the American home front.

St. Louis

St. Louis was acquired by Thomas Jefferson as part of the Louisiana Purchase from the French government in 1803. The Lewis and Clark Expedition left St. Louis to explore the West the following year and later settled in the city after the completion of their mission. St. Louis elected trustees in 1808 and was incorporated the following year on, November 9, 1809. By the start of the next century St. Louis was the fourth largest city in the country and host of the historic 1904 World's Fair, backdrop for the 1944 Hollywood musical film, *Meet Me in St. Louis*.

To appreciate St. Louis's historic status as an early national news leader, a visitor to today's "Gateway City" might want to first visit the historic "Old Courthouse" located downtown—the site of the famed *Dred Scott* Supreme Court pre-Civil War slavery decision, not far from the confluence of the Mississippi and Missouri Rivers. In exiting the rear doors of the Old Courthouse, the visitor might note the plaque toward the base of the stairway. That is where the Society of Professional Journalists (Sigma Delta Chi) honors Joseph Pulitzer (1847–1911), who bought and merged two newspapers—the *St. Louis Post* and the *Dispatch*—and began an era of what would become known as "New Journalism."

St. Louis gained a nineteenth-century reputation as a Midwest capital of commerce; a place where those heading west could be outfitted—but also, eventually as a center of aggressive, enterprising reporting based primarily on the popular image of the city as the "Gateway to the West."

Print Media

Joseph Pulitzer emigrated to the United States from Hungary to fight with the Union Army in the

American Civil War (1861–65). Told about the major population of German-speaking immigrants, he moved to St. Louis and went to work on a German language newspaper, *Westliche Post*. He became fluent in English, emerged as a leading political reporter, studied law, and held office as state senator. As a newspaper person, he emphasized the importance of accuracy and good writing, and the necessity of the press's watchdog role. He took advantage of his location to focus on sensational stories such as the exploits of the infamous desperado, Jesse James, and the James Gang, in post–Civil War America.

Pulitzer competed with Joseph McCullagh, editor of the *Morning Globe,* who merged his paper with the *St. Louis Democrat* to achieve Associated Press membership. McCullagh provided coverage of religious news and often focused on railroad expansion, as St. Louis became an initial hub for the Midwestern and then transcontinental railroads. Once Pulitzer bought and merged the two local newspapers—the *Post* and the *Dispatch*—other publishers throughout the United States began to copy this reporting style, especially William Randolph Hearst, who became acquainted with Pulitzer's New York *World* as a student at Harvard.

Hearst is often mentioned along with Pulitzer because of his role as a competitor using the same brand of aggressive journalism in New York City in the age of "New Journalism." Tackling local "big wigs," utility companies, and slumlords, Pulitzer's properties, especially, highlighted the sensational, regularly publishing stories with headlines such as "How Babies Are Baked," and "Lines of Little Hearses" that targeted the treatment poor families received at the hands of ruthless landlords. Pulitzer published a platform of principles with practices he endorsed without fear or favor of the upper class, traditional newspaper supporters, and also produced an advertising code to address editorial conflicts. Once his paper became dominant in St. Louis, he expanded further into the New York City media market.

The *Post-Dispatch* captured many major stories. When the *Titanic* sank in April 1912 with 2,201 people on board, a *Post-Dispatch* reporter, Carlos Hurd, was aboard the rescue ship, the *Carpathia*. Hurd interviewed survivors picked up from the freezing water. When World War II ended in 1945, a *Post-Dispatch* reporter, Virginia Irwin, was the first of two civilians into Berlin. While Pulitzer's newspaper maintained a competitive edge, it was subsequently led by sons and grandsons, whose names eventually appeared on the editorial page, or the "dignity page," as it was dubbed by the first Pulitzer.

While St. Louis was once home to over a half dozen daily newspapers in recent years, it has become, like most major American cities, home of but one remaining daily newspaper, and although the *Post-Dispatch* is the sole survivor of a once highly competitive newspaper market, it now struggles with a host of alternative media sources, including community-based suburban publications and the tabloid weekly, *Riverfront Times,* as well as "new media" online websites including those associated with competing television stations such as the market-leading NBC affiliate KSDK-TV, "NewsChannel 5" (formerly owned by the Pulitzers in an advertising market that their company once dominated). The *Post-Dispatch*'s last newspaper competitor, the *St. Louis Globe Democrat,* closed its doors in 1986, after operating as a part of a government-endorsed "joint operating agreement" along with the *Post-Dispatch*. In the final analysis, they shared a printing operation that was only capable of producing one Sunday edition.

While Pulitzer's prize possession, the *St. Louis Post-Dispatch,* remains Midwest-based (now owned by Lee Enterprises of Iowa), the name Pulitzer continues to be associated with the distinguished journalism prize bearing his name, a by-product of a $2 million endowment he made to the Columbia University Graduate School of Journalism in New York City. Over the years, the *Post-Dispatch* received five Pulitzers for "meritorious service" and achieved distinction through prominent employees such as Washington bureau chief Marquis Childs, known for political and economic reporting as well as for books he published; and editorial cartoonist, Daniel Fitzpatrick, who also received two Pulitzer Prizes, one of them for his Vietnam political cartoons.

During the time of the original Joseph Pulitzer in the post–Civil War era, a prominent magazine publisher, William Marion Reedy, also based his operations in St. Louis. His magazine, the *Mirror,* attracted attention for the scope of feature material it included and because of the prominent writers

Reedy encouraged and supported, including novelists Kate Chopin, Alice French, and Fannie Hurst, and poets Orrick Johns and Vachel Lindsay. Unlike national competitors in the magazine field—people such as Cyrus Curtis of *Ladies' Home Journal*; Samuel S. McClure of *McClure's, Munsey's,* and *Cosmopolitan*; and Harold Ross of *The New Yorker*—Reedy was born and raised in St. Louis. He was iconoclastic and searched the nation for talented writers with the same restless mindset and orientation. His magazine enjoyed a national and international readership but the critical focus and overall content of the magazine remained to a large measure on St. Louis and the American Midwest. The legacy of Reedy is carried on today by the *St. Louis Journalism Review,* the nation's last remaining local critical journalism review.

Broadcasting

For an extended period in radio, CBS owned-and-operated network station, KMOX, was a high-powered AM clear-channel operation, meaning its broadcast signal was dominant and did not compete with others in the region. It dominated the market as "The Voice of St. Louis" pioneering call-in talk radio with active listener participation. KMOX was the on-air home of the St. Louis Cardinals baseball team. Before the national move toward broad expansion of the total number of professional baseball teams, St. Louis was the southern- and the western-most major league franchise, and was thus able to attract listeners from divergent parts of the country. Sportscasters such as former players Dizzy Dean and Joe Garagiola, as well as Jack Buck and Harry Caray (before he migrated to the rival Chicago Cubs) were an important element of that scene. Many national radio sports announcers and network television program hosts gained their start at KMOX, including Bob Costas, Dan Dierdorf, and Joe Buck.

St. Louis briefly caught network attention when a CBS-TV documentary titled "Sixteen in Webster Groves," which examined teenage life in middle-class America's wealthy suburbs, aired. The program aired in February 1966 and required a follow-up program six months later and an extended debate over the beliefs, attitudes, and values reflected by the teenagers, who were portrayed in the film as ultra-conservative and very materialistic clones of their parents. The follow-up program represented the first time a national television network returned to a community to access the effects of its initial broadcast. The result was that there were threats on the FCC license of its local affiliate, KMOX, leveled by prominent members of that community, including a columnist for the *Post-Dispatch* and a large number of local broadcasters who happened to live in Webster Groves. In terms of additional national exposure, that same CBS affiliate station, now KMOV, later market tested "live" ENG (electronic newsgathering equipment) gear which was later adopted by CBS News nationally.

Today, St. Louis boasts a half dozen competitive TV stations: KTVI 2 (Fox), KMOV 4 (CBS), KETC 9 (PBS), KPLR 11 (CW), KDNL 30 (ABC), and KSDK 5 (NBC), the perennial market leader. St. Louis is known as having the highest overall rated Public Broadcast Service television station in the nation, in KETC, Channel 9, with a popular weekly talk series, *Donnybrook,* among the highest rated pubic affairs program offerings, hosted by the former editor of the now-defunct *St. Louis Globe-Democrat,* Martin Duggan. St. Louis is also one of the few cities in the United States with an independent community radio station, KDHX.

In the first decade of the 2000s, the city's most dominant media entity is its leading television station, NBC affiliate KSDK (formerly KSD-TV), the nation's first Pulitzer-owned station and a perennial news ratings winner. Former Penn State professor Dan Pfaff uncovered the source of that station's original call letters: the initials of Pulitzer's mother, Kate S. Davis (KSD) in his 1991 book, *Joseph Pulitzer II and the Post-Dispatch*. That station went on the air on February 8, 1947, and drew heavily from the staff of its associated radio station. In some instances, its reporters filed stories jointly for radio and television and used information from the Pulitzer newspaper. The TV station had a staff of distinguished on-air contributors including news director Frank Eschen, a Missouri journalism school graduate, as well as a cast of talented entertainers.

The major stories during early TV journalism in St. Louis included coverage of the kidnapping of Bobby Greenlease, the six-year-old son of millionaire car dealer Robert Cosgrove Greenlease—which began in Kansas City and ended in St. Louis. Other major televised stories included a mine explosion

leaving 100 trapped underground and the death of an archbishop on the eve of being named a Cardinal in the Catholic Church. In other televised news, St. Louis was a host city for Senator Estes Kefauver's televised crime hearings in the early 1950s, in which the Tennessee senator traversed the country uncovering organized crime in America's big cities. Television coverage of a holdup at Southwest Bank provided shocking images to audiences nationwide and thrust the story into the national consciousness. The infamous holdup was later translated into a motion picture starring Steve McQueen, *The Great Bank Robbery*. In 1965, the Gateway Arch structure was completed and then dedicated by the National Park Service three years later. The completion was covered live by all local stations. The architect Eero Saarinen's design of the Gateway Arch commemorates Thomas Jefferson's westward expansion, and an award-winning documentary film, "Monument to the Dream," about the building of the Arch is shown daily in the Museum of Western Expansion, beneath the base of the Arch. The notable symbol and logo for the city has become emblematic of St. Louis's transformative era, which looks forward but also reflects the city's past.

Streaming Media

Audio and video streaming is a distribution technique for multimedia content. Streaming, as opposed to downloading, allows users to watch or listen to the content immediately without having to wait until the whole file is downloaded. Streaming has become a commonplace technique for media organizations to reach their audiences. Likewise, citizens are gaining the capacity to stream their own content as the costs continue to drop.

Advances in bandwidth availability, computer processing power and digital compression techniques allowed streaming to take off in the mid-1990s, making it a practical reality for those with broadband connections. Increases in bandwidth—that is, the capacity of a given channel to carry data—allowed for the streaming of multimedia content (such as music or video) with large file sizes, as opposed to text that demands far less bandwidth. Continuing increases in computer processing power and advances in compression techniques have enabled a significant decrease in the amount of information that streaming techniques requires. While the content will be of somewhat lower quality due to this compression, most users find this an acceptable tradeoff in exchange for faster speeds and more convenience.

To listen or watch content over one's computer has become widely accepted over the years. A 2007 report by the Pew Internet & American Life Project states that 57 percent of Internet users have watched videos online and that most of them share what they find with others (Madden 2007). With Internet access no longer confined to desktop computers, people are increasingly accessing streaming content by means of a wide variety of mobile devices, such as cell phones. These will not replace television receivers for watching news anytime soon, but they can be useful for those on the move, or at work or traveling.

A variety of multimedia content, including most forms of audio and video, can be streamed. Listening to radio online is the most popular example of audio streaming. In contrast, podcasts, though a popular method of listening to radio online, usually have to be downloaded first and cannot be streamed. Podcasts, however, offer the advantage of syndication; users can subscribe to them and download new episodes automatically. Video requires more bandwidth than audio because of the vastly greater amount of information that is transmitted. Steady increases in bandwidth, with broadband Internet, made video streaming feasible, while the advent of video streaming sites like YouTube has made the practice extremely popular.

Streaming content can be prerecorded or live. Prerecorded content can be streamed at any time a user requests it, whereas live content is streamed at a scheduled time, such as a conference talk or a sports event. A media player is required to stream content. The player can be external, as with software such as Windows Media Player or QuickTime, or the player can be embedded in the website, which is how YouTube works.

Buffering is a technique that complements streaming. If an Internet connection is not fast enough, or is unstable and often interrupted, content may not stream smoothly and "lags" might occur—small intermittent breaks in the streaming process where the streaming cannot continue until either the connection is again stable or fast enough. To prevent these lags, streaming software relies on buffering. Buffering is the process where content is preloaded into memory (e.g., "the buffer") until it is full before it is actually streamed—in other words, buffering makes sure that there is sufficient content to allow the content to be played uninterrupted. While content is being streamed, software will continue to fill the buffer to ensure a smooth and uninterrupted streaming experience.

Commercial Implications

Increasingly, media organizations offer users streaming content from their own websites or those of third-parties such as movies and television shows on Hulu (http://www.hulu.com) or radio shows on Live365 (http://www.live365.com/index.live). With television shows, the content is usually made available a day or two after it is first aired in its original medium. From a user perspective, streaming has an advantage over downloading, in that the user does not have to wait until content is completely downloaded before use. The disadvantage of streaming is that users cannot permanently save content to their computers as they would if content had been downloaded.

However, from a commercial point of view, streaming as a form of distribution has commercial value for content providers, precisely because it does not allow users to save content while downloading does. Without a saved copy, users cannot share content with others; streaming thus allows content providers much greater control of distribution. Providers can exploit the commercial value by either charging for access to the content or by carrying advertisements (or both). Advertisements can be placed in the stream before the content is played. For advertisers, this method is desirable because users cannot skip commercials. However, users often find this way of displaying ads annoying, especially if the advertisement takes a long time. Another way to place ads is in the context of the content, for example, in a sidebar next to a video clip on the website.

While streaming generally does not permit users to save content, it is not impossible to do so. The act of recording, ripping or capturing streams, sometimes called de-streaming, saves the streaming content on a hard disk. This is neither trivial nor straightforward, especially if users seek a perfect digital copy. Analog copies are easier to capture and save (akin to recording a radio show with a microphone), but would degrade the level of quality. While it is technically not impossible to record streaming content, content providers have a business incentive to make it as hard as possible for users to do so.

Citizen Journalism

What effects will audio and video streaming have on the ways the public receives and understands information? Every technological advance changes the relationship between the news and the public in its own way. For example, the television changed the dynamics of the Vietnam War. Dubbed the first "television war," it was the first time that a war was brought prominently into the living rooms of American families. Conventional wisdom argues

that one of the effects was that it accelerated a loss of public support for the war, although some scholars disagree. With the introduction of cable television, scholars have similarly tried to understand its effects on the 1990–91 Gulf War. CNN made its name during the Gulf War by broadcasting around the clock and providing the public a sense of immediacy of the war that was different from before the advent of cable television. Since the introduction of streaming, we have seen a few interesting developments suggesting how the nature of news production and consumption is changing. For example, watching live streams became a popular phenomenon during the initial stages of the 2003 war in Iraq when live video transmitted from Baghdad became available at any time to anyone with an Internet connection. People also increasingly share clips with each other, with clips sometimes becoming so popular that they are considered "viral." The possibility of clips going viral has led campaigns in the 2008 presidential election in general and during the debates in particular to be extremely careful not to make gaffes in order to avoid having a "YouTube moment"—a moment where a mistake is made that will be widely shared and watched on YouTube.

A telling example of such a YouTube moment and how users are sometimes able to shape news is the role citizen journalism played in the 2006 Virginia Senate Race. In his reelection campaign, Senator George Allen (R-VA) used the racial slur "macaca" to refer to an Indian American who happened to be filming a campaign event for use by the opposing candidate. Quickly uploaded onto YouTube, the clip was widely shared around the blogosphere, generating much controversy and bad publicity for Senator Allen, who subsequently lost an election he had been favored to win.

Technological advances have increasingly lowered barriers to streaming and allow users to stream content, not just to receive it. Cell phones and digital cameras that are capable of recording video are becoming more affordable. Plus, users no longer need their own web sites to stream content because numerous websites exist that can do streaming for them. The result is that citizens can effectively create their own newscasts. CNN is leveraging this fact through their iReport website by asking users to submit news stories to them. Bloggers are also using video streaming to provide commentary, allowing them to respond to television journalism, much in the way they have previously responded to print journalism.

Opportunities of low cost live streaming for journalism are manifold. One opportunity for institutions is to raise accountability and increase their interactions with the community. For example, news organizations can stream editorial meetings of the newsroom, making the community a part of the newsroom and keeping the journalists accountable to the public. Another opportunity arises when citizens have access to the news and can act as journalist when professional journalists do not have access. For example, Congressman John Culberson (R-TX) used his cell phone to stream discussions that continued after the House of Representatives was adjourned and thus after C-SPAN had stopped recording.

The ability of individuals to stream live content raises opportunities but also ethical questions for journalists. In June 2008, a man drove a truck into a crowd in Tokyo's Akihabara district, and went on a stabbing spree that resulted in seven deaths and many others injured. Two friends sitting in a nearby café saw the commotion and took their cameras and laptops with high-speed wireless cards to the scene, filming and streaming what was happening. Television had video to tell the story, but faced numerous ethical questions about just how much to show.

Legal Implications

Issues of legal liability are relevant when the user created the streaming content, but there is generally no legal liability if a person merely embeds content created and hosted by other sites, for example, when someone embeds a clip from YouTube on a blog. This rule covers most content, except in the case when it involves federal crimes, intellectual property, and electronic communications privacy. For example, in August 2008, a blogger was arrested for streaming songs from an unreleased Guns N' Roses album on a blog that provides "uncensored music reviews and interviews" (Ardia 2008). The creator of streaming content may also have legal liability if material is defamatory or invades privacy of others. If recording is done in a public space, there is generally no reasonable expectation of privacy, although obtaining prior consent and providing notification are

helpful in minimizing liability. If material is created or hosted by a third-party, however, simply streaming it will not result in liability, according to the immunity provisions of Section 230 of the Communications Decency Act, except in the cases when it involves federal crimes, intellectual property, and electronic communications privacy (Citizen Media Law Project 2008).

Conclusion

For media organizations, reaching audiences has become easier with the capacity to stream content wherever there is access to the Internet. By offering streaming content, people can watch shows they missed at any other moment in time. With the proliferation of mobile devices, they can also watch streams at any place they want, as long as they have connection and do not mind the smaller screen and lower quality. Technological advances make it increasingly possible for people to share content, but also to stream their own content in a cost-effective way, using a cameraphone and web services, effectively making every citizen with a camera and Internet connection a potential live reporter. The ability of citizen journalists to stream content carries both opportunities and many legal and ethical implications; we have barely begun to understand what this means for journalism's future.

STUDENT JOURNALISM

Student journalism is practiced across the United States in schools of every level. Not merely limited to schools of journalism, the roles of both student journalists and their publications are diverse. A school publication can report on the school administration; entertain as well as inform its student audience; serve as a window to outsiders; and serve as a training ground for students who hope to become professional journalists. While a few of the largest daily student newspapers offer some coverage that goes beyond their campus, the majority of student newspapers are intensely local, focusing on issues that pertain only to the campus community. Those that do reach beyond the campus grounds typically use stories from wire services.

College and University Papers

The first campus newspaper in the United States was a weekly established at Dartmouth College in 1839. The *Yale Daily News* began publishing in 1873, and still appears at the New Haven, Connecticut–based university. While the first weekly newspaper at Harvard was established in 1856, the *Harvard Crimson* did not go daily until 1883. By the late

nineteenth century, most colleges and universities had at least a weekly newspaper and many already had daily ones. Through the twentieth century, as educational opportunities and institutions expanded, the number, size, and frequency of student newspapers increased as well.

Early collegiate newspapers were small and self-sustaining, having minimal staff, and only limited circulations to support their small budgets. As the size of universities expanded, this press model began to shift. Newspapers, as well as other campus publications, began to depend on student activities fees for their expanding budgets. With schools directly funding campus publications, publication boards of campus administrators were often established to oversee the allocation of funds and, sometimes, the activities of the publications. In some instances, the newspaper and other campus publications were overseen by journalism departments. This dependency on university funds has often caused tension between student editors and school administrators, who may try to influence the content of the publication.

The relationship between publication and school may indicate not only the role the publication has in the school community but also its financial structure. Such relationships can take one of three forms: direct control, amorphous, or independent. With the direct control model the student newspaper is directly controlled by the administration. An amorphous situation occurs when the student newspaper is dependent on university funds but is governed by students. And the independent model is exactly that, as the publication does not receive school funds. Many of the oldest and most respected student publications, such as the *Harvard Crimson* and *Yale Daily News,* are independent.

Regardless of the financial relationship, a paper's student staff is usually comprised of volunteers with little experience. While student publications provide a training ground for students who aspire to a career in journalism, relatively few student journalists continue in the profession. Student publications try to retain staff members by offering scholarships, stipends, and other forms of compensation if possible.

Student journalists are all subject to the same legal standards to which professional journalists are bound, such as libel. But students were not always granted First Amendment protection. In the United States, students began to challenge this imbalance in the 1960s and 1970s. The landmark case that established students' right of free expression was *Tinker v. Des Moines Community School District* (1969). Though not specifically concerned with student journalists, the decision established the student journalist's rights of free speech.

In *Papish v. University of Missouri Curators* (1973), the Supreme Court established that student editors could not be expelled for distributing an underground publication on campus. Barbara Papish, a graduate student at the University of Missouri, published an underground newspaper called the *Free Press Underground*. Its contents were controversial, and the university disapproved, when copies of the *Free Press Underground* were distributed on campus to visiting high school students and their parents. Papish was expelled after she published a cartoon the university deemed obscene. After she sued for reinstatement, the Supreme Court ruled in her favor.

While the *Papish* case established the rights of student editors, it was not the last dispute between student journalists and school administrators at the high school or college level. One of the most salient issues in student journalism is censorship and advanced approval of content prior to publication. Professional organizations, including the Society of Professional Journalists, oppose this practice. While many high schools and universities have established publications as free forums for students to develop editorial and news articles, others do not allow for this.

High School Papers

In the U.S. Supreme Court case *Hazelwood School District v. Kuhlmeier* (1988), a high school student newspaper issued as part of a journalism class operated according to the requirement that all articles be approved by the principal prior to printing. In this instance, the principal chose to censor two articles: one about pregnant students and another about students whose parents were recently divorced. In both instances, the principal felt that though the students' names were not included, their identities were apparent, and the discussion of contraception was not appropriate for younger students. The students sued the school district, and the trial court sided with the students. The appeals

court sided with the students, but by a vote of 5 to 2, the Supreme Court reversed again to side with the school.

The Court concluded that public school newspapers that were part of a curriculum were not established as forums for student expression, and were thus subject to a lesser degree of First Amendment protection than those publications offering independent forums of student expression. While the decision has no bearing on private schools, it is important in that censorship by public school administrators in "nonforum" publications is legal when they can justify that their decision has a legitimate educational purpose. *Hazelwood* also established that public school officials cannot ban in-school distribution of underground or independent student publications if they are free forums of expression. Since the Hazelwood ruling, student journalists often contact local media to print their censored articles, drawing attention to the act of censorship as well as exposing the material to a larger audience.

In April 2005, a federal Court of Appeals decided in *Hosty v. Carter* (Seventh Circuit) that the Supreme Court's decision concerning high schools in *Hazelwood* was also applicable to public colleges and universities under its jurisdiction, which includes Indiana, Illinois, and Wisconsin. While this ruling creates no precedent for other states, student journalists within those three states must establish their publication as open forums of student expression in order to gain full First Amendment protection, or they could be subject to oversight by university officials.

These federal court decisions underline some of the basic rights of (and restrictions upon) student journalists. It is important to remember that these precedents are applicable only to public schools—schools that are funded by the government. There have been so few cases of freedom of the press brought by private school students and/or teachers that there is not yet an established precedent in that area.

Substantial technological advances have increased students' ability to publish. The popularity of weblogs, or blogs, and software that simplifies publication of websites will expand student journalism and allow student journalists to reach out to new audiences. High school and college/university journalism allows students to exercise their right of free speech and gives them training in a field essential to the sociopolitical culture of the United States.

Sunshine Law

In 1976, Congress passed the Government in the Sunshine Act (5 U.S.C. 552b), which took effect the next year. The legislation was modeled on an earlier Florida Sunshine Act. Its purpose was to provide Americans with open access to the meetings of some 50 federal agencies, commissions, and boards. Partly in response to the Watergate scandal earlier in the decade, this law and other antisecrecy measures were enacted to make sure that government agencies, deliberations were open to public scrutiny. The act works in concert with the Federal Advisory Committee Act of 1972, which required that all meetings of federal advisory committees serving the executive branch be open to public observation.

Both this and similar state statutes do not affect or govern the meetings of legislative bodies such as Congress. While sessions for the House are typically

open, the U.S. Senate occasionally holds closed meetings to discuss treaties or personnel issues. For example, during the impeachment trial of President Bill Clinton in 1999, the Senate heard evidence in open session but met in closed session to deliberate.

Generally, agencies must provide at least one week's notice prior to each meeting. The law defines a "meeting" as deliberations of a quorum of members that result in conduct of agency business. This "sunshine" notice must provide the time, place, and subject of the meeting. In addition, the agency must provide the name and phone number of a designated official or contact information regarding whether the meeting is to be open or closed. According to the act, meetings cannot be presumptively closed. Therefore, an agency must vote in advance and make a written copy of the vote available to the public. A majority of the agency must vote in favor of closure and then the agency must also provide a full written explanation of its actions for closing part or all of a meeting.

The law provides for nearly a dozen exemptions that qualify for closing meetings and they are similar in nature to those included in the Freedom of Information Act. They include the following:

1. Issues of national defense and foreign policy
2. Discussion of internal personnel rules and practices
3. Statutory exemptions provided under law
4. Trade Secrets and proprietary information that would injure parties if made public
5. Accusation of crime or formal censure
6. Personal privacy
7. Investigatory records such as those collected by law enforcement
8. Financial institution reports
9. Disclosure of information that could lead to financial speculation or that would frustrate implementation of agency policy.
10. Issuance of subpoena, participation in civil action or proceeding, or formal agency
11. Adjudication

Some executive agencies such as the Federal Trade Commission hold many closed meetings because much of the work of the commission encompasses issues that fall under exemption 10. Lastly, agencies must provide Congress with an annual report regarding their policies, an accounting of the number of meetings held, and whether exemptions applied to the meetings.

The law also includes a general prohibition on *ex parte* communication between government agency decision makers and outside interested parties as a result of this legislation. *Ex parte* literally means "for one party." The idea is that last-minute lobbying should not take place so that one interested party has a better chance to succeed in a decision or rulemaking.

The presumption of closure may be challenged by anyone through the federal District Court system although the courts have strictly interpreted the law in a number of instances. Several examples illustrate problems with the law. The Nuclear Regulatory Commission used the tenth exemption to block access to a meeting where it was discussing the reopening of the Three Mile Island power plant. In another example, the U.S. Court of Appeals said that the law did not apply to the President's Council of Economic Advisors since the purpose of the council was strictly advisory. However, many examples illustrate the significance of the law. The law has opened the door for gavel-to-gavel coverage of important hearings and meetings by C-SPAN and has provided for creating online services like Thomas, a Library of Congress database for federal legislative information.

Critics of the Sunshine Act assert that opening meetings has a tendency to subvert truly open debate at meetings since the participants may be concerned that their remarks will be transcribed or broadcast. Because meetings are open, many chairs of agencies and commissions are reluctant to bring an item to the floor unless they are sure of the outcome of a vote. Journalists frequently complain that commission and agency meetings often seem scripted with commissioners reading from prepared statements and voting in predetermined ways. The Sunshine Act prevents commissioners at federal agencies from informal discussions whenever the number of participants would constitute a quorum, such as three or more at the Federal Communications Commission. As a result, commissioners often resort to using memos or deputizing aides to meet in a commissioner's place as one way of circumventing the intent of the Sunshine Act.

Most states have passed parallel legislation designed to open state and local government agencies to the same level of scrutiny required in the federal law. All 50 states have enacted open-meeting laws but it is difficult to make generalizations

about the different laws. The Reporter's Committee on Freedom of the Press published a comprehensive examination of both the open-meeting and open-records laws in 2001 and concluded that the best laws are those that define a meeting by specifying the number of members of the board, agency, or commission who must be present to constitute a quorum. Laws that are less specific or simply refer to all "regular" or "formal" meetings are less effective. Similar to the federal law, most state statutes provide for closed meetings or "executive sessions" in cases where personnel matters or invasion of privacy may be at issue. Other reasons for meeting in "executive session" may include issues of public safety and labor negotiations. Most states include a provision in their legislations that bars any final actions from being adopted in "executive session." Therefore boards or commissions must reconvene in public before adopting a final determination. Similar to federal legislation, most open meeting statutes require a notification to the public as to when a meeting is to be held. The notification must be given far enough in advance so that interested parties can attend and most laws provide for actions to be taken if the law is violated.

The advent of electronic communications has had an impact on government in the sunshine. For example, the Florida Sunshine Law mandates that cities keep a permanent record of all e-mails sent or received by public employees. The North Dakota law defines all e-mail correspondence as a "meeting" and requires that e-mails to and from public officials must be made public upon request. Some states have enacted Sunshine-style laws that require reporting of the amounts of money or emoluments that pharmaceutical companies pay physicians in connection with marketing activities related to new prescription drugs. A 2007 study in *The Journal of the American Medical Association* found that reporting in some cases was spotty and that companies failed to provide specific information identifying the recipients of gifts.

The Sunshine Laws have allowed journalists insights into the workings of government in a variety of surprising ways. Adding e-mail to the filing requirements of the act has given reporters the ability to look into back-channel communications that often preface a public vote on controversial issues. E-mail messages retrieved during the Iran-Contra scandal between Colonel Oliver North and Admiral John M. Poindexter, then national security advisor under President Ronald Reagan, provided important information regarding the illegal use of funds. In other instances, messages obtained by *The Arizona Republic* showed that e-mail sent among council members in Phoenix calculated the number of votes needed to pass bills related to public financing of public projects and crimefighting.

Voicemail messages and faxes are also subject to the law. In 1995, the president of the school board in Jefferson County, Colorado, used voicemail messages to inform other members of the board about his planned testimony against a proposed educational governance bill. Also in that year, the chairman of the board of regents at the University of Nevada at Las Vegas was found to have violated the law on open public meetings when he sent faxes to many of the board members seeking their approval to issue a press release. These examples illustrate the ability of access laws to provide the public with insight into the public policy process.

With the increasing use of private contractors and outsourcing of some traditional government functions, the application of open records laws becomes a legitimate question. Electronic data collection and use of electronic memoranda also raise questions about whether these actions constitute meeting under the meaning of the statute. The nation's heightened interest in security after the events of 2001 poses further issues for those seeking government in the sunshine.

Supreme Court and Journalism

The American constitutional guarantee of a free press works because an independent judiciary headed by the U.S. Supreme Court has enforced the promise for more than 200 years. The courts are the instrument that gives life to the First Amendment's words that "Congress shall make no law…abridging the freedom of speech, or of the press…." There is almost nothing that American journalists do that has not been affected by rulings of the Supreme Court.

While protecting essential elements of news media freedom, the Supreme Court (and the lower courts which must follow its rulings) has sought to balance the rights of journalists against competing claims to constitutional protection. These include rights to reputation and privacy, fair trial rights, and the needs of government to maintain order and public safety. In determining the rights and duties of the press, the Court usually has given reporters no greater rights than nonjournalists have, the First Amendment's "press clause" notwithstanding.

American federal and state constitutions protect the rights of people to speak and write freely.

The U.S. Constitution, the supreme law of the land (by virtue of Article VI, the Supremacy Clause) seems to protect the news media doubly. To the generalized protection of expression ("free speech" in the First Amendment) a second clause was added guaranteeing freedom of the press. Supreme Court Justice Potter Stewart, in a 1974 speech at Yale, observed that journalism was the only occupation singled out for explicit constitutional protection, "to create a fourth institution outside the Government as an additional check on the three official branches."

That status was not always honored. Barely ten years after the Constitution was adopted in 1789, two dozen editors were arrested—and eight punished—under the Alien and Sedition Act for criticizing the John Adams administration. Later, during the Civil War (1861–65), publishers perceived as sympathetic to the Confederacy faced imprisonment or the closing of their newspapers. In 1918, the Supreme Court failed to even mention the First Amendment when it upheld the contempt conviction of a Toledo, Ohio, newspaper and its editor for their sharp attacks on a judge's rulings in a streetcar dispute.

Three Landmark Decisions

Not until 1925 did the Supreme Court take a first (and giant) step toward recognizing the importance of a free press. While the justices upheld the conviction under a New York law of Socialist leader Benjamin Gitlow for publishing a "Left Wing Manifesto" advocating the violent overthrow of the government, they also proclaimed that under less harmful circumstances the right to print such statements would be among the fundamental liberties protected from state penalty by the due process clause of the Fourteenth Amendment, or, in the case of a limitation imposed by Congress, the First Amendment.

The decision made clear that most legal perils to which the press is exposed arise under state law. For example, there is no federal libel law. Until the early twentieth century, it had been assumed the Bill of Rights (1791) limited only the exercise of federal power. The decision in *Gitlow v. New York* made the free speech–free press guarantees of the First Amendment universal. Whether a case arose under local, state, or federal law, *Gitlow* made it clear that attempts to punish authors, either by the criminal process or by entitling aggrieved parties to use a state-created cause of action for civil damages, clashed with rights protected by the First and Fourteenth Amendments.

Two later decisions, issued three decades apart, are also of towering significance to journalists. In one, the Court ratified the principle that prior restraints on speech and on the press are

presumptively invalid, except in the rarest situations. In the other, it gave the mass media almost complete freedom to report on issues and personalities of public importance without fear that making a mistake could result in ruinous liability.

The Supreme Court first wielded its constitutional sword to strike down a law as a violation of press freedom six years after the *Gitlow* decision. It happened in the case of publishers of a small Minnesota weekly who repeatedly accused local officials of letting "Jewish gangsters" control gambling, bootlegging, and racketeering in Minneapolis, and were ordered to stop publishing under a state law that declared "malicious, scandalous or defamatory" publications a public nuisance.

In its 1931 *Near v. Minnesota* decision, the high court concluded that the shutdown order was akin to censorship, which is never permitted except under very exceptional circumstances (such as reporting troopship sailings in times of war). The Court observed that the First Amendment grew out of the eighteenth century commentaries of the British jurist William Blackstone, who asserted that if harm occurred, the appropriate remedy was to make the publisher answer *afterwards* for printing things that were "improper, mischievous or illegal." The First Amendment was intended to codify Blackstone's abhorrence of *prior* restraints.

The other momentous Court decision—and one which dramatically enlarged press freedom—was its 1964 *New York Times Co. v. Sullivan* ruling. It turned the law of libel upside down in an expansive reading of the First Amendment that literally created a right to be wrong in many instances. Historically, the courts had demanded little of those who claimed a defamatory statement injured their reputation. The burden was on the publisher to prove the statement was true. The circumstances under which the publication occurred, or the fact that the publisher believed the information was accurate, did not alter the risk of liability.

The change in the Court's perspective grew out of the civil rights revolution of the 1950s and 1960s in the American South. Activists seeking integration were often met by brutal efforts to suppress their actions—dogs, fire hoses, tear gas, and truncheons. Annoyed at scathing criticism in the press, especially in Northern news media, Southern officials attempted to silence critics by seizing upon minor errors to file multimillion-dollar libel suits heard by sympathetic local juries. L. B. Sullivan, the Montgomery, Alabama, commissioner responsible for the police department, was awarded $500,000 after *The New York Times* carried a full-page advertisement by civil rights leaders in 1960 charging that peaceful student demonstrators had been met by "a wave of terror." Three other city commissioners and the Alabama governor also sued.

Unanimously overturning the state libel award, the Supreme Court declared that debate on public issues should be "uninhibited, robust and wide open." It said that libel suits like Sullivan's were really a disguised effort to revive discredited laws against sedition (criticism of government), and that public officials accused of wrongdoing had ready access to the media to set the record straight if they were falsely depicted. It concluded that inadvertent error had to be accommodated to provide the necessary breathing-space for public debate, and that public officials could recover damages for a defamatory falsehood relating to their official conduct only when they could prove a news agency acted with "actual malice"—that is, published a story knowing it was false or with "reckless disregard" of whether it was false or not.

In subsequent decisions, the Court added public figures to the category of libel plaintiffs who must meet the higher burden of proving "actual malice" to prevail against news media (*Curtis Publishing Co. v. Butts,* 1966; *Associated Press v. Walker,* 1967). And to receive punitive damages, even nonpublic figures were required to show "actual malice" on the part of the media (*Gertz v. Robert Welch, Inc.,* 1974). Most importantly, the Court rejected the notion that carelessness or the failure to adhere to the standards of a responsible publisher constituted "reckless disregard." Media defendants would be liable for printing or broadcasting false and defamatory statements only if they knew the allegations were untrue or inherently improbable; were made despite a high degree of awareness of their probable falsity; or were made while entertaining serious doubt about their accuracy, or in a deliberate, intentional and purposeful effort to avoid the truth.

Heightened concern about protecting news media from vexatious lawsuits had turned the traditional process upside down. The parties who filed suit would now have the burden of proving each element of libel, including showing that the statements at issue were false and defamatory and made

with the requisite level of fault. The news media no longer had strict liability for what they published about public issues and personalities. The only cost to the media—the price they had to pay for the protection of the "actual malice" requirement—was that they could no longer claim their internal decision-making processes were protected from disclosure by the First Amendment. The state of mind and knowledge of journalists working on a story was now a relevant matter for courts to consider when determining whether a news organization had acted with "actual malice." Office memos, unpublished material, and notes and testimony about editorial decisions would have to be provided when "actual malice" was asserted.

As in the earlier *Near v. Minnesota* case, the *New York Times Co. v. Sullivan* decision balanced competing interests. While it weighed heavily in favor of First Amendment protection, the decision left room for public figures and public officials to prevail in the most egregious cases. Despite the categorical language of the First Amendment forbidding restrictions on the press ("Congress shall make no law…"), the Court has always rejected the view of absolutists such as Justice Hugo Black, who asserted that "no law" meant "just that." The Court left the door open to prior restraints and libel judgments against the mass media in narrowly defined circumstances.

Balancing Rights

To date (mid-2009), the Supreme Court has never upheld a prior restraint by government against the news media. In the 1971 Pentagon Papers case, for example, the Court said the government had failed to show direct, immediate, and irreparable harm that would result from *The New York Times* and *The Washington Post* publication of the Defense Department's 7,000-page history of how the United States went to war in Vietnam. In other contexts, the Court has implied that restraints *might* be proper when spoken or written words are likely to incite imminent lawless conduct, or pose a clear and present danger of grave, immediate injury. However, no such case involving the mass media has been the subject of a Supreme Court ruling.

In some instances, restraints are made possible by statute, such as in cases of copyright infringement or commercial appropriation of someone's name or image. The Supreme Court, in *Roth v. United States* (1957), has also ruled that obscenity is beyond constitutional protection. But the Court has stated repeatedly that prior restraints are the most serious and least tolerable interference with the right to speak and publish freely.

Despite the "press clause" in the First Amendment, which would seem to provide explicit protection for journalists, the Court has generally considered news media issues under the broader "free speech" provision protecting expression by anyone. In one case, the Court appeared to rely on the "press clause" in connection with invalidating a state law imposing a special, discriminatory tax on newspapers, but that was a rare occurrence.

The Court's refusal to give the media more First Amendment "freedom" than other public "speakers" resulted in rulings that journalists have no rights bestowed by the First Amendment to resist grand jury subpoenas, or to enter and report from prisons, or to enter private property without permission just because something newsworthy is occurring there. Nor do they have any special right to travel to countries that the State Department has declared off-limits. In one case in 1981, *Haig v. Agee,* the justices upheld the Secretary of State's revocation of a passport to a former CIA agent-turned-journalist who wished to expose undercover intelligence operations. The high court said the Secretary's action did not impermissibly burden the agent-turned-reporter's freedom to travel or speak, or impede his ability to criticize government policies and practices.

Of course, lawmakers are always free to provide more protection to the news media than the Court says the Constitution requires. This happened in 1980 after the Court ruled, in *Zurcher v. Stanford Daily* (1978), that the First Amendment did not exempt journalists from a search of their files by police with a warrant, looking for information a paper may have kept confidential. Responding to the contention of journalists that newsgathering would be jeopardized without the means to keep some things secret, Congress specifically nullified the high court decision by enacting limitations on news room searches with the Privacy Protection Act of 1980. The restrictions apply to state and local law enforcement officers—as well as federal—and cover a reporter's notes and other material wherever they may be found.

News Reporting and Gathering

The high court has never been comfortable with one pivotal question: whether the right to *report* news freely implies a right to *gather* that news just as freely. Presumably, you can't have one without the other.

The issue was first broached in its 1972 ruling on subpoenas, *Branzburg v. Hayes*. In a 5–4 decision, the Court concluded it was more important to prosecute crimes than to write about them, and that press claims about confidentiality would have to give way when a reporter's testimony was needed. This is why confrontations occur between judges and the news media over the issue of subpoenas to journalists. When *New York Times* reporter Judy Miller was imprisoned for 85 days in 2005 for refusing to disclose her news sources in a leak investigation, she could expect no help from the Supreme Court.

Nonetheless, Justice Byron White hinted at a right of access in the *Branzburg* decision, noting that "without some protection for seeking out the news, freedom of the press could be eviscerated." How much protection? The Court mentioned protection from rogue prosecutors and subpoenas that had only a remote and tenuous connection to an inquiry. However, beyond that, the high court has been silent—with one exception.

Under English common law, individuals had a right to inspect and copy court records, a right of access found as well in American traditions. Courts and court records are presumptively open. Exceptions must be rare and carefully justified. But, here too, the press has no greater right than the general public. In one instance—involving Oval Office tape recordings used in the early 1970s Watergate trials—the Supreme Court, in *Nixon v. Warner Communications* (1978), said the right had been supplanted by an act of Congress specifically directing how the material was to be made public.

If the high court has refused to recognize news people as privileged characters, it is also fair to say it has generally sought to avoid clashes between news media and competing interests, and erected high—although not insurmountable—obstacles in the way of those who would impair First Amendment freedoms.

The 1954 wife murder trial of Dr. Sam Sheppard presented a conflict between his Sixth Amendment right to trial by an impartial jury (made applicable to the states through the Fourteenth Amendment's due process language) and the First Amendment rights of news media to cover legal proceedings energetically and to report whatever they wished. Some news reports headlined highly prejudicial allegations about Sheppard that were never presented in court. Reporters and photographers crowded the courtroom. In hearing an appeal years later, the Supreme Court described the scene as a "media circus." Who had the superior right, news media or a criminal defendant? Which amendment was more important, the First or the Sixth?

The Court declined to say in *Sheppard v. Maxwell* (1966). Instead, it said the trial judge failed to conduct the trial properly and ordered a new one. The justices said the judge should have taken greater steps to control media conduct in the courtroom and to shield jurors from prejudicial publicity. It said he should have considered other measures to reduce the effect of outside influences, such as delaying the trial, moving it, or requiring more extensive questioning of prospective jurors to weed out those who had been swayed by stories in the press. It said that judges could issue "protective orders" (what news media call "gag" orders) limiting what parties could say to reporters. But—mindful of the First Amendment—it declined to lay down rules for media conduct.

The principle of avoiding direct media restraints was developed further in subsequent cases. When a Nebraska judge presiding over a pre-trial hearing in a grisly mass-murder case excluded reporters who refused to omit from their stories details that were strongly implicative of the defendant's guilt, the high court rebuked the judge. In *Nebraska Press Association v. Stuart* in 1976, it said editors, not judges, decide what goes into the paper or on the air. It said the judge should have considered alternative measures such as those described in the *Sheppard* decision.

The Court has developed a number of formulas for protecting news media from being punished when they publish truthful information, lawfully obtained. Commonly, it asks whether a court prohibition was justified by an "interest of the highest order," an interest that outweighs the First Amendment. For example, only a handful of states prohibit naming a rape victim in a news story. Others make it unlawful to publish the name of a

juvenile offender, or a judge or attorney who is the subject of a disciplinary proceeding. In each instance, the Supreme Court has said the state interest at stake was not of "the highest order," and was insufficient to override the First Amendment.

Deference to the First Amendment figured in a significant case involving a federal prohibition, the portion of the anti-eavesdropping laws that forbids not only the interception of other people's phone calls, but also the divulging of the contents. In its 1991 *Bartnicki v. Vopper* decision, the Court said the First Amendment right of the people to know about issues of public concern was more important than the federal prohibition on revealing the contents of telephone conversations, especially when the divulgence was made by someone who was not a party to the illegal interception. It said the federal law had to give way in the case of a Pennsylvania radio station that broadcast a recording it received of an illegally intercepted phone conversation concerning a threat of violence in a local labor dispute.

In contrast to *Bartnicki,* a public "right to know" was given short shrift by the Court in a case involving newspapers in Minneapolis and St. Paul. After pledging confidentiality to a political operative who was spreading "dirt" about opposing candidates, the newspapers concluded that the fact that he was engaged in such reprehensible behavior was more important than the information he provided. It printed his name. Thereafter, he was fired and sued the newspapers for breaking their promise. Upholding a $200,000 jury award, the Supreme Court, in *Cohen v. Cowles Media* (1991), rejected the notion that the papers were immune from suit merely because the information was truthful and important to the electorate. The Court said a promise is a promise, and repeated the familiar refrain that the Constitution gives journalists no greater privileges than others have.

In another case, *Morison v. United States* in 1988, the Supreme Court sustained the conviction of a U.S. Navy civilian employee—who moonlighted as a journalist—for giving classified satellite photographs to *Jane's Defense Weekly,* his after-hours employer. He was imprisoned for four years for violating the espionage laws despite his claim that he sought only to enlighten the public. And, in still another case, *Snepp v. United States* in 1980, the Court summarily let the government seize the profits of a former CIA agent's unauthorized book about the agency, based on a breach of the author's CIA employment contact.

Nonetheless, the Court has not been indifferent to the First Amendment claims of book authors. It struck down a New York "Son of Sam" law, aimed at compensating victims of crimes by giving them the entire proceeds of the sale of a criminal's story. In *Simon & Schuster, Inc. v. New York Crime Victims Board* (1991), the justices said the law went too far in penalizing a convicted person's thoughts and recollections—expressive activity protected by the First Amendment.

The Supreme Court has not been presented with a situation that would pose the most contentious constitutional conflict, the prosecution of a full-time journalist for publishing or broadcasting information that fell clearly within the prohibitions of the Espionage Act. In 1917 to 1918 during World War I, during the cold war in 1957, and on three occasions during the 1970s, Congress declined to specifically criminalize press disclosure of classified information. Although a claim has been made occasionally—even by several Supreme Court justices—that a prosecution would be constitutionally permissible in such a case (suggesting that legitimate national security concerns would trump the First Amendment), the high court has avoided dealing with the issue. Congress's repeated refusal to authorize such prosecutions would seem to settle the matter. As with the legislation limiting newsroom searches, Congress has shown a willingness to give journalists greater rights than other people have—a proposition which the Court has just as consistently rejected.

The Supreme Court's reluctance to give reporters special privileges is evident in its rulings on workaday activities of news media. The Court has declined to excuse trespass or other breaches of the law by a journalist, merely because the news person was engaged in reporting at the time. Reporters have been punished for accompanying civic protestors onto private property, entering public schools and military sites without permission, and testing the enforcement of a law by violating it. In a 1999 ruling, *Wilson v. Layne,* the justices declared that reporters have no right to enter private property even when they are invited to "ride along" by public safety officers executing a search or arrest warrant. While the Court has recognized the right of

the public to receive information—for example, in commercial and political advertising cases—it has rejected the argument that a public "right to know" excuses forbidden conduct, except in the unusual circumstances of the *Bartnicki* case.

In some instances, states have attempted to tell media what they *must* do—the flip side of trying to say what they *can't* do. To provide time for the electorate to reflect on the candidates, an Alabama law barred newspapers from editorializing for or against a candidate on election day. A Florida law required newspapers to provide reply space to candidates they criticized. Both were overturned by the Court, which concluded the First Amendment prohibits government from dictating the content of newspapers (*Miami Herald v. Tornillo* [1974]; *Mills v. Alabama* [1966]). (On the other hand, radio and television stations have to obey congressionally mandated "equal time" and candidate access requirements, but broadcasting is a federally licensed and regulated industry, unlike other media.)

At one time, reporters were subject to punishment for criminal libel as well as civil suits in most states. The premise behind such laws was that some defamatory statements are so inflammatory that merely uttering them posed an immediate prospect of violence and a breach of the peace. However, with rare exceptions, such laws have been repealed or abandoned after the Court declared that they constituted a "heckler's veto" in which the crime was measured more by the lack of self-control of the listeners than by the conduct of the speaker, and could not be sustained without meeting the *New York Times Co. v. Sullivan* standard of actual malice.

Limiting the Media

The Court has always given great weight to the states' determination—through state-enacted libel laws—that the right of people to protect their reputations is just as important as rights of free speech and of the news media. For that reason, the justices have been slow to apply the protection of the *New York Times Co. v. Sullivan* decision too generously or to extend other privileges to news media that might sharply limit libel suits.

For example, the Court ruled that the protection given to opinion may be lost if a statement in a newspaper or broadcast implied knowledge of an objectively verifiable fact. Thus, in *Milkovitch v. Lorain Journal* (1991) it found that a sports columnist, who wrote that everyone who attended an athletic contest "knew in his heart" that the school had lied about what happened when a fight broke out, had stated a fact, not opinion, and could therefore be sued for libel. In other cases, it refused to confer "public figure" status on a prominent Palm Beach socialite, a mental health researcher who received major grants of public money, and a man who had been held in contempt for declining to testify in a grand jury investigation of Communists. In each instance, the individual needed only to show negligence rather than "actual malice" to recover for defamatory misstatements.

The news media did not fare well in other situations, either. When *The Nation* magazine obtained a pre-publication copy of President Gerald Ford's memoirs in 1979 and scooped the publisher by printing excerpts concerning Ford's pardon of Richard Nixon, the Court, in *Harper & Row v. Nation Enterprises* (1983), said the news value of the roughly 300 words taken from the book did not excuse the copyright infringement, and was nothing less than "piracy."

When a CBS News reporter sought the FBI's computerized criminal histories—so-called rap sheets—of individuals he was writing about, the Court, in *Reporters Committee for Freedom of the Press v. Justice Department* (1989), created a far-reaching exception to the federal Freedom of Information Act, asserting that computers had altered the nature of privacy rights. It said information reporters might otherwise be entitled to, stored in practical obscurity, could now be summoned at the push of a button—an unwarranted and unacceptable invasion of personal privacy.

Furthermore, the Court has disappointed journalists by ignoring an important development, the defense of "neutral reportage." A number of jurisdictions have shielded news media from liability when they fairly and accurately report what was said about a person on a matter of public concern, even if the statements were false and defamatory and not otherwise privileged. Despite the importance of such protection, and the patchwork of state laws that do or do not apply it, the high court has not responded to press entreaties to address the issue. Nor has the Court grappled with the nettlesome issue of when news organizations must

disclose confidential sources in response to non-grand jury subpoenas.

Siding With the Press

On the other hand, there are plenty of cases in which the Court sided with the news media. In a case in which a noted psychoanalyst was quoted as saying he would be regarded as "the greatest analyst who ever lived," a statement he denied making, the Court, in *Masson v. New Yorker Magazine* (1991), ruled that altering a person's quotes in ways that made him look vain and foolish was not a knowing falsehood if it reflected the meaning of what he said. In a noteworthy exception to the normal rules, *Bose v. Consumers Union* (1984), the Court said appellate courts could reconsider factual determinations that were reached at trial when a newspaper or broadcaster is being sued for libel. It has encouraged trial and appellate courts to grant summary judgments in libel cases when it is clear to the judges that a suit will not succeed. That means news organizations often can avoid the burden of trial.

In an important "false light" case, *Time, Inc. v. Hill* (1967), in which *Life* magazine greatly exaggerated details of a family's ordeal at the hands of escaped prisoners, the Court extended the *New York Times Co. v. Sullivan* "actual malice" requirement to privacy suits, as well as libel. The justices did the same thing in striking down an emotional injury award to the Reverend Jerry Falwell, who had been the subject of an unseemly parody in Larry Flynt's *Hustler* magazine. In *Falwell v. Flynt* (1986), the Court implied that public personalities have to put up with the rough and tumble of press characterizations and caricatures and could never sue successfully for emotional injury in such cases.

However, in another "false light" case, *Cantrell v. Forest City Publishing* (1974), the Court upheld a judgment against a Cleveland, Ohio, newspaper whose reporter falsely implied he had interviewed the widow of a victim of a bridge collapse. The Court said the paper was guilty of "calculated falsehoods" and "reckless untruth," sufficient to meet the "fault" element it imposed in libel suits.

Rulings on Broadcast Journalism

The high court has had several occasions to consider federal regulation of radio and television journalism. Although the 1934 Communications Act creating the Federal Communications Commission (FCC) specifically prohibited the government from censoring broadcasters, the FCC has over the years adopted a number of rules to regulate broadcast content, consistent with that mandate that licensees should operate "in the public interest, convenience or necessity."

In that regard, the high court affirmed the FCC's authority to compel stations to sell time for federal candidate's campaign advertisements and provide equal opportunities to all qualified candidates for the same public office. However, in *Arkansas Educational Television Commission v. Forbes* (1998), it also upheld an exemption from the equal time rule for broadcasters exercising journalistic judgment in selecting candidates for interviews in "bona fide" news programs and broadcast debates—even on public television stations. In its most celebrated case involving broadcasters, the high court upheld the constitutionality of the FCC's Fairness Doctrine in the 1969 *Red Lion Broadcasting v. FCC* decision. The justices said that the FCC could require a Pennsylvania radio station to give a person air time to reply to a personal attack. It reasoned that the First Amendment rights of the public outweighed the rights of broadcasters. In later years the Court and the FCC showed flagging interest in the rule, and some skepticism, and in 1987 the FCC abandoned its Fairness Doctrine altogether.

Conclusion

Several themes emerge from the high court's many decisions dealing with the mass media. The Court has generally been loath to read the press clause of the Constitution's First Amendment as giving journalists greater rights or privileges than other persons have. The Court has also been skeptical of claims that journalists need to be exempt from rules that may hamper the gathering of news.

On the other hand, the large number and variety of rulings demonstrate the Supreme Court's keen interest in the news media, and the Court's understanding of its role as guardian of a free press. It has placed the burdens heavily on those who would curtail what the media prints or broadcasts. It has almost always tipped the scales of justice in favor of news media whenever discussion of public

issues was at stake, recognizing that the First Amendment serves two constituencies—the media's right to publish or broadcast and the public's right to receive what the news media report.

American news media are free because the Supreme Court and the independent judiciary have kept them free.

Tabloid Newspapers

Strictly speaking, the term *tabloid* refers to some newspapers' size, which is half that of a standard broadsheet. However, over the years it has taken on a broader definition that has less to do with size and more to do with the presentation and style of news. "Tabloid" is now commonly used to describe a particular kind of formulaic, colorful narrative, coupled with dramatic visuals, and usually perceived as distinct from standard, "objective" styles of journalism. Tabloid style is typically seen by critics as inferior, appealing to base instincts and public demand for sensationalism over information. While the term is used to describe both print and electronic news, this entry focuses on print tabloids.

In the twenty-first century, in both the United States and Europe, there are three main types of tabloid. First are the weekly publications often known in the United States as "supermarket tabloids," which focus on celebrity gossip and notable human-interest stories, with the exemplar being the *National Enquirer*. Related, but somewhat different, are daily tabloids, which cover breaking news as well as similar human interest stories, such as the New York *Daily News* and *Post* or the British *Sun, Star,* and *Daily Mirror*. Finally, and generally in response to falling circulations and competition from new media, some newspapers have "gone tabloid" in size if not style, or have launched additional tabloid versions, aimed at such audiences as college students and rail commuters.

Development

True "tabloids" emerged in Britain during the first decade of the twentieth century and in the United States in the 1920s. Entertainingly sensational, they were written in the idioms of the people, as William Randolph Hearst (1863–1951) proudly declared when launching the American *Daily Mirror* in 1924. However, the roots of tabloid journalism can be traced back further to the sensational broadsheets and ballads of the seventeenth and eighteenth centuries, which circulated by the thousands in Europe and the United States. Their subject matter would be familiar in any tabloid today—sensational crimes, gossip about the rich and famous, and dramatic human interest tales about heroism, strange births, and unusual happenings.

In the United States, these themes made their way into the "penny press" of the 1830s, as Benjamin H. Day's (1810–89) New York *Sun* and James Gordon Bennett's (1795–1872) *Herald* targeted a growing mass of semiliterate urbanites with exciting human interest stories. The papers sold for one cent, compared to other papers' six-cent subscription, and were smaller and more portable, foreshadowing the appeal of later tabloids. Equally important were the papers' writing tone. The *Sun* adopted the motto "It Shines for All" and assumed a plain-spoken style, using vivid, active language and colloquialisms and breaking up stories into short paragraphs, a style very different from the wordy colonial press. This clear, active style became the model for journalism; tabloid journalism simply developed the style at its

most formulaic. The penny press also developed new information-gathering techniques, relying on reporter "legwork" and interviews, rather than official documents such as court records.

The 1880s saw more changes that established the tabloid style. Joseph Pulitzer (1847–1911) bought the moribund New York *World* in 1883, launching what soon became known as "yellow" journalism. Pulitzer embarked on a crusade against government corruption, white slavery scandals, and other exciting topics, written in dramatic style. By 1886, *The World*'s daily circulation was the largest of any newspaper ever; in addition to current news and advertising, it ran such features as women's pages, etiquette hints, and advice columns. Reporters built on the style of the penny papers, producing stories full of detailed description and colloquial dialogue. Pulitzer's success spawned imitators, most notably Hearst, who in 1896 bought the New York *Journal,* which in addition to human interest stories, included features like comics, sports, and short, pithy editorial content. Only a slight change in format was required to produce the first tabloids.

True Tabloids Emerge

The first real tabloid was the *Daily Continent,* founded in 1891. However, in direct competition with the Hearst and Pulitzer giants, it failed, and it was left to Alfred Harmsworth (later Lord Northcliffe) (1865–1922) to establish the tabloid as a viable form in Britain. In 1898, Pulitzer invited Northcliffe to produce a New Year's Day tabloid edition of *The World*; although it sold over 100,000 more copies than usual, Pulitzer was not convinced. It was not until 1919 that the first successful U.S. tabloid picture paper, the *New York Daily News,* was established, under Joseph Patterson (1879–1946) and R. R. McCormick (1880–1955).

The *News* was modeled on Northcliffe's British ventures, with short, "personality" stories, and specials like a beauty contest and detective series. Within two years, the *News* had New York's largest circulation, at 400,000, and by 1938, its daily circulation was 1,750,000, with the Sunday edition reaching 3,250,000. Hearst, who was losing circulation to the *News,* established the American *Daily Mirror* in 1924, the same year the New York *Evening Graphic* was founded, launching the era of "jazz journalism." From 1919 to 1929, three New York tabloids vied for an audience with increasingly sensational stories, and the tabloid writing style came into full flower. Indeed, the *Graphic*'s style and content was so extreme that it was dubbed the "Pornographic." Several celebrated murder cases spurred circulation wars; in 1928, the *News* sold a half million extra papers with its retouched photo of murderer Ruth Snyder in the electric chair, obtained by a photographer with a camera attached to his ankle. The interwar tabloids faced a barrage of criticism; they were seen as degrading, demoralizing villains that pandered to the lowest instincts. They pioneered such techniques as composite photographs, reenactments, and dramatically rewritten "quotes." With the arrival of the depression, the tabloids lost appeal. The *Graphic* went under, the *News* prospered by becoming more respectable, featuring more hard news, and the *Mirror* began a steady decline until it closed in 1963. The truly lurid tabloids disappeared, and by 1937, there were 49 successful tabloids, all "middle-of-the-road" big city dailies, featuring the lively, brief reporting of news, features, gossip, and sport that continues today.

In Britain, the trajectory of the tabloid was different, although also built on the development of a "common people's" idiom in the early nineteenth century. However, the British tabloid also incorporated a strong political streak that emerged in the 1830s with a series of radical papers. Tabloids developed within a context of the establishment of a strong sense of proletarian identity, a feature that was largely absent in the U.S. context. Since the early twentieth century, British tabloids have taken much more overt political positions than their U.S. counterparts, ranging from the consistently left-leaning *Daily Mirror* through the conservative *Daily Mail,* to the current market leader, Rupert Murdoch's (1931–) *Sun,* which has switched political stances several times since it was launched in 1964. Other British tabloids include the *Daily Express* and the *Star,* which takes a largely apolitical position and focuses on often lurid celebrity gossip. Since the 1930s, the British tabloids have been in a virtually continuous circulation war. This has been characterized not only by political stridency, but also by the rise of the undraped "page 3 girl," introduced in the *Sun* in 1969. Now many tabloids feature a daily topless

photo of young female models, several of whom have become celebrities in their own right. British tabloids are also far more explicit about sexual matters, unlike the more staid U.S. papers, in spite of the latter's reputation as "scandal sheets."

The American "Supermarket Tabloid"

A new tabloid era dawned when Generoso Pope (1927–88) bought the struggling *National Enquirer* in 1960. At first, his strategy echoed the 1930s *Graphic,* focusing entirely on gruesome murders and traffic accidents, with a sprinkling of mysteries, unusual human interest tales, and often vicious celebrity gossip. Wherever possible, stories featured photos of dead and mutilated bodies. By the late 1960s, circulation had stalled, and Pope pioneered a key change. Noticing the decline of newsstands and other news outlets, he turned to supermarkets, a previously untapped outlet. His new format was "family-friendly," reportedly modeled on *Reader's Digest,* and eschewing both overt violence and explicit sex. Although the writing style was similar, the *Enquirer* did not compete directly with the daily city tabloids; its appeal lay in the titillating nature of the stories, whether the events happened the previous week or two centuries earlier. Pope moved the *Enquirer*'s operation from New York City to Florida in 1971. By this time, the paper was available in all major supermarket chains and its circulation reached 4 million by 1974, the year Rupert Murdoch entered the American tabloid wars with the launch of the full-color weekly *Star*. This drew on Murdoch's proven expertise with the tabloid format in Australia and Britain, with a strong emphasis on sex and working class consciousness. However, after a fast start, it faltered; Murdoch had apparently misread American tastes. He quickly adapted the formula, specializing in celebrity coverage, which has continued into the early twenty-first century.

Meanwhile, in 1980, Pope counterattacked, going to a color format, and launching the low-budget *Weekly World News,* using the old one-color presses. The *News* represented a smaller but quite successful thread in the U.S. tabloid story, specializing in bizarre, basically fictional stories about aliens, psychic predictions, and human freaks. In 1989 MacFadden Holdings bought the paper after Pope's death, later adding the *Star* in the 1990s. MacFadden was subsumed by American Media, and in 2000, the conglomerate also swallowed up the three competing tabloids run by Globe Enterprises—the *Globe, National Examiner,* and *Sun*—and the entire operation consolidated in Boca Raton, Florida. The *Star* moved back to New York in 2003 and in 2004 switched to a higher-grade, magazine format.

Modern Tabloids

Today, the tabloid is ubiquitous, but not uniform. In terms of size, the term "tabloid" is now virtually meaningless, at least in Europe, since many "quality" papers have now switched to a tabloid size, including the London *Times* and the *Independent,* although using the term "compact" to avoid negative connotations. In the United States, many mainstream newspapers have added special tabloid editions or supplements designed to appeal to a younger market, such as the *St. Petersburg Times*' tabloid *TBT*.

Similarly, the "tabloid" is no longer defined by content as it often covers the same topics as mainstream journalism, although more flamboyantly. Essentially the tabloid, whatever its actual size, is defined by its style. Tabloid narrative eschews the "inverted pyramid" format, preferring a "teasing" introduction, followed by the complete tale, laid out concisely. The style has changed little since the 1930s, and allowing for differences in local idiom, it is similar across the English-speaking world. Adjectives abound; stories are "amazing," "baffling," "untold," or "incredible." Particular story types call for familiar words: Heroes are "spunky," or "gutsy"; a male celebrity may have a "gal-pal" or "cutie," while women will have "boy toys" or "hunks." Small children are "tots," dogs are "pooches," husbands are "hubbies," and unsavory types are "creeps" or "sickos." These familiar, stock clichés produce a short-hand style that invites readers into the shared tabloid assumptions of good and bad, appropriate and inappropriate. Reporters recombine information in familiar patterns, giving tabloids their distinctive flavor of titillating novelty delivered with soothing predictability. Standard interview practice is to ask questions requiring a yes or no answer; the question then becomes the quote, producing interview subjects who are consistently "shocked," "flabbergasted," and "bowled over."

Certainly there are differences among recognizable tabloids. British dailies cover politics and "hard" news, although much more briefly and superficially than "quality" newspapers, while much of their space is devoted to celebrity news, sensational human interest stories, advice, and so on. Their U.S. daily counterparts, such as the *New York Daily News,* offer a similar mix, which is proving very successful. Even as newspaper readership is generally declining, the early-twenty-first-century New York City "tabloid war" between the *Daily News* and the Murdoch-owned *Post* produced higher circulations for both papers. U.S. supermarket tabloids rarely touch hard news at all, and now position themselves as competitors of celebrity magazines such as *People, Us,* or *In Touch*. A small group of publications, including the *Weekly World News, National Examiner,* and *Sun,* delivers a mix of alien sightings, biblical predictions, and cheerfully ridiculous fables to a small but loyal following, usually enjoying them from an "ironic" perspective. Tabloids across the world contain familiar mixes of heavily illustrated news, entertainment, sports, and other features; for instance, the largest circulation newspaper in Europe is Germany's *Bild-Zeitung,* which bases its style on British tabloids.

"Tabloidization"

Tabloids have always been blamed for a cheapening of journalistic discourse. "Tabloidization" has become a familiar term used to describe an inexorable decline in "real" journalism, usually framed in terms of increasing trivialization, where celebrity gossip crowds out serious news, and human interest stories receive more coverage than important international events.

However, it is important to consider tabloidization in context. A movement to clearer, more accessible news that speaks more directly to readers does not necessarily equate with a decline in standards. In Mexico, a move toward a more tabloid style has signaled positive forces for social reform and democratic participation, as elite controls on news have loosened. Similar changes are noted in Eastern European nations, where the emergence of more personal, tabloid-like styles go hand in hand with a more open and accessible press. In China, irreverent tabloid media have led the fight against government repression, and the regime has responded by closing some down. Several commentators have pointed out that if done well, "tabloid" features, such as emphasis on the personal over the institutional, can make news more direct and effective.

Thus it is important to understand cultural specificities when discussing tabloidization, or any other journalistic quality. Even in two societies as apparently similar as Britain and the United States, there are significant differences in tabloid media, and thus the implications of tabloidization. British dailies and American weeklies may feature similar layouts, writing styles, and a celebrity focus, and journalists have moved comfortably between the two genres and nations for years. However, they also reflect distinct cultural milieus, notably the much more prurient approach to sex in Britain. Rather ironically, U.S. critics decried the "tabloidization" of mainstream journalism during coverage of the 1998 Bill Clinton/Monica Lewinsky scandal, but in fact, the mainstream press offered far more explicit details than did the tabloids, which did not wish to offend readers with details of cigars and stained dresses. In the early twenty-first century, the supermarket tabloids are struggling, mainly because their gossipy style is no longer unique. The *National Enquirer,* which in the 1980s boasted a circulation of over 5 million, now barely sells 1 to 2 million copies a week.

Today, the definition of "tabloid" is increasingly murky. As a term, it seems to function most effectively as a kind of demon that is evoked wherever there are debates about journalistic standards and quality. As a style, it continues to have robust appeal, even as it continues to permeate the entire journalistic scene, from print, to television, to the Internet.

Tabloid Television

As the term suggests, *tabloid* originates in print journalism where it refers to a diminutive newspaper format. In keeping with their ease of handling, tabloid-sized newspapers are generally regarded as having little engagement with "serious" news, instead exhibiting a predominant concern with trivia and sensation. Just as tabloid newspapers are regarded as dealing with "less serious" news in an attempt to increase their market share, such changes in television have come to be referred to by the term tabloidization. Other related terms are newszak, dumbing-down, infotainment, and, less disapprovingly, personalization and democratization. As is clear from these terms, there are different values attached to this process, which can be seen as detrimental to journalism, or, more positively, as a key driver of the masses to news media.

Development

Across Western media, many believe there is an underlying obligation for media, largely seen as part of the public sphere, to foster citizenship and civic responsibility. Since the 1980s, however, increasing commercial pressure in the form of competition from cable and satellite outlets, the information industries' growing internationalism, and a slackening of government and state regulation have threatened this public service media model. This has resulted in a blurring of the boundaries between public and private, information and entertainment. Recent years have seen a conflation of news and talk programs as journalists shift to being journalist-hosts in studio-based shows that feature audience-centered discussions of topical events. Indeed, there has been such a narrowing between news and entertainment that news/entertainment talk shows had become major forums for presidential candidates in the United States by 1992. For example, Bill Clinton made a saxophone-playing appearance on the *Arsenio Hall Show* in 1992, and more recently during the 2008 presidential election, candidates have appeared on shows such as *The View* (ABC) and *Saturday Night Live* (NBC).

In 1995, the year's "national news event," extensively covered not only on talk shows but also on news programs, was the O. J. Simpson trial, during which television news programs often carried clips of reaction on the talk shows and talk shows carried clips of the footage gleaned from news programs. News merged with and became dependent upon entertainment. Increasingly, it is the norm for "serious" broadcast news reporting to include stories about the personal lives of celebrities among the top stories, and for politicians to readily appear on such talk shows as Oprah Winfrey. This increased focus on personalities, one component of tabloidization, has increasingly become a feature of news and current affairs programming as broadcasters seek new audiences. "Newszak" refers to formerly informational programs, such as *60 Minutes* (CBS), that have developed more in line with traditional notions of entertainment. Thus, while the topics covered in tabloid television can be seen as entertainment-focused, tabloidization also indicates a series of journalistic practices.

Emphasis on the Personal

Part of this process is related to language, where there is a tendency towards more informality, characterized by the use of humor and colloquial speech. There has been an increase in the use of conversational styles in the media since the late 1970s, which has had the positive effect of allowing more people to better understand the complex social and political issues covered by the media. Linguistically, this informality can be as simple as the use of "Hi" rather than "Good evening" to greet an interlocutor, or an exchange of unscripted,

personal anecdotes among news anchors between stories (often dubbed "happy talk"). The viewer overhears personal comments about a journalist's life and thus may regard them as more familiar and trustworthy. A well-known example of a journalist that built a sense of empathy with her audience is longtime NBC morning show host Katie Couric, whose private tragedies served to emphasize her personal appeal and made her one of the most popular television figures of her generation. Yet her switch to become evening news anchor on CBS did not allow her the flexibility on the air she had long enjoyed, and her audiences dwindled. Drawing upon a similar focus on personality, when CBS correspondent Kimberley Dozier was badly injured while reporting from Baghdad in 2006, she returned to the network a year later to make a documentary about her experiences. This example of a correspondent becoming the story enabled her to produce personally informed reports that highlighted the experiences of Iraqi people as well as U.S. service personnel.

In similar fashion, within the course of an interview with a public figure such as a politician or company executive, questions might be asked about their private lives or personal opinions with interviewer and interviewee exchanging anecdotes. Associated with this informality and bonhomie, the use of humor in tabloid broadcasting adds greatly to its entertainment value. Where this appears in programs traditionally devoted to serious news, it has given rise to the term *infotainment*. Such programs include *The O'Reilly Factor* (Fox News Channel), which is well known for its confrontational approach to public debate, and the parody of this, *The Colbert Report* (Comedy Central) that covers similar topics but through highly satirical journalism. Elsewhere, politicians regularly appear on talk shows where the associated informality and humor help them reveal a more personal, human side than would otherwise be visible in official appearances. Dumbing-down journalism is seen by many in the television business as an essential factor in increasing public engagement in politics, meaning that tabloid television shows engage audiences who might otherwise be unresponsive to more conventional media coverage of politics.

There are many advocates of personalization within the journalism business. Ian Hargreaves, former editor of a mainstream daily in the UK, has come out in favor of a shift to focus reporting towards more personal topics. Among the advantages of the personal in the news, he argues, is that journalists can put more resources into writing about, for example, bio-ethics, birth technology, and the perceived breakdown in family life—all issues resulting from the increasing public prominence of women. Journalism scholar Brian McNair emphasizes the positive aspects of the rise in consumer and life-style content, arguing that this reflects recent advances of women in society which have feminized and humanized what had been a male-dominated news agenda, rendering it less pedagogic and more personal. Viewed this way, journalism has become more democratic, and its increased personalization enables more citizens to engage in issues.

Research into viewer responses to American news and current affairs programs suggests that people find it easier to remember and debate human interest topics which might otherwise be regarded as unimportant. As one researcher found, viewers were able to relate these personalized stories to their own experiences, thus ensuring that these narratives, and the issues they dealt with, were remembered. Conversely, she also found that it was difficult for viewers to recall and discuss foreign news stories with a degree of enthusiasm or confidence; stories, that is, which might not lend themselves so easily to immediacy and personalization. Evidence of a deficit of public attention to private matters is also apparent in the American public's responses to news in the United States. A 2008 report by the Pew Research Center shows that, in the middle of a presidential election campaign in 2008, most of those questioned were more interested in the rising price of gas than in the election.

This growing focus on personalized, entertainment-orientated television news has been criticized by many academics. Journalism scholar Bob Franklin warns that "entertainment has superseded the provision of information; human interest has supplanted the public interest; measured judgment has succumbed to sensationalism; the trivial has triumphed over the weighty; the intimate relationships of celebrities, from soap operas, the world of sport or the royal family are judged more "newsworthy" than the reporting of significant

issues and events of international consequence." Hargreaves's support for the tabloidization of journalism is tempered by his condition that politics and foreign affairs should remain serious topics. The argument follows that traditional news values have been undermined by a new set of priorities and that infotainment has extended too far into the media.

The direct link between tabloidization and commercial interests was clear in an apparent direct application of capitalism in tabloid journalism where the prevailing motivation is profit, not ethics. Such links to financial imperatives can be seen as sullying the integrity of the journalist, particularly those involved in making documentaries, which are widely regarded as one benchmark of investigative journalism. Film scholar Bill Nichols suggests that documentary makers have been accused of compromising their agenda and abandoning the "discourses of sobriety" in order to meet demands of program producers who require entertainment to fill their prime time schedules.

This raises issues of "quality" in journalism. But such value judgments often reflect long-held assumptions as to what is public/serious and what is private/trivial. Although researcher Martin Montgomery argues that there has not been a noticeable tabloidization of British news broadcasting in the period 1985 to 2006 in terms of the news agenda, he also observed that there is an increasing tendency in broadcast news for correspondents to start their reports on even the most "serious" topics (such as reporting from war zones or disaster areas) with comment about what it "feels like" rather than what is actually happening. This emphasis on emotion may well engage a wider range of viewers without necessarily making those viewers better informed about specific factual details.

It has been argued that the tabloidization of television and other media ignores the importance of engaging citizens who are, as a consequence, kept badly informed and disenfranchised. For example, media studies researcher Colin Sparks argues tabloid journalism has "little or nothing to contribute to the life of the citizen." The same features designed to make complex matters accessible are criticized for oversimplifying political issues or the dynamics of international affairs, reducing these to polarities of good and bad, winners and losers. Similarly, personalization of politics (on television and elsewhere) is criticized for shifting the emphasis away from polices to personalities. Media theorist Neil Postman was one of the first academics to express concern about the spread of tabloidization of broadcast media, warning that news and politics had been transformed into "congenial adjuncts of show business."

Even the congenial forms of address, so carefully cultivated, are open to criticism, as the shift away from formality and associated personalization has led to accusations of a lack of deference towards those in authority, coupled with perceived declining standards of literacy in the wider society. In Britain, for example, this is most noticeably found in the virtual absence of English regional accents among national news presenters and where attempts to introduce any new presenter with a marked regional identity are greeted by vociferous complaints from viewers.

Uses and Effects

The trend toward tabloid television has changed the way that many public figures engage with the medium. There is an increasing willingness of politicians to appear on talk shows where they are subjected to questioning which veers away from tough issue-oriented questions or partisan debate, favoring instead questions which emphasize the personal and private in a nonconfrontational way. This does have its benefits. Research suggests that in this way many Americans who might otherwise have entirely ignored the presidential election campaign were exposed to at least some information about the candidates. Potential voters who were otherwise unlikely to engage with "serious" news programs, were more likely than their better-informed compatriots to make their voting decisions based on the personal characteristics of the candidates than on public policy issues.

It is easy to sustain a set of links between forms of journalism and public engagement with the dominant news agenda. A Pew Research Center report of 2007 found in a survey of public knowledge of news and current affairs, the best-informed received their information from cable programs such as *The Daily Show, The Colbert Report,* and *The O'Reilly Factor;* Internet sites such as those of major newspapers; broadcast television such as *The NewsHour with Jim Lehrer;* and radio, such as

NPR and Rush Limbaugh. The least well-informed group got their news from Fox News on cable; morning and local news programs on the broadcast networks, and online discussion boards and blogs rather than major newspaper websites. While local news was the most-watched (71 percent of those questioned), followed by Fox News (43 percent) and CNN (39 percent), it seems that these were also the least informative. Only 17 percent of those interviewed watched *The O'Reilly Factor,* 12 percent *The Daily Show,* and 15 percent *NewsHour,* but these gave the most reliable information based on the questions asked by the researchers.

However, it is significant that the questions related to hard news, such as identifying world leaders and international events. A more nuanced account of the relationship between television, journalism, and public knowledge can be found in research by Jody Baumgartner and Jonathan Morris, which found that young Americans who watched *The Daily Show with Jon Stewart* reported an increased confidence in their ability to understand complex contemporary political issues. However, the researchers also concluded that the humor used to negatively portray politicians led to greater cynicism toward the political system and news media in general, resulting in less willingness to participate in politics among younger potential voters.

Much of the expressive power of the term *tabloid television* rests in its ability to cut across genres and take on various meanings in different contexts. While some see it as being a positive development, for others it embodies declining standards in journalism. There is irony in the fact that tabloid television is able to present itself as being on the side of ordinary people, yet is itself driven by economic interests of media corporations. Yet if there is a need to engage a wide-ranging potential audience (which is, after all, the aim of commercial sponsors), it is argued that there must be a balance between informing and entertaining rather than seeing these as stark polarities.

Talk and News Radio

Talk radio and news radio are two once-distinct program formats that have morphed into a single format at many stations. Yet leading industry publications do not measure the two formats separately. As a combined entity, news/talk is measured by *Inside Radio* as the second most popular radio genre, with more than 2,000 stations identified as programming news/talk out of the nation's almost 14,000 radio stations. The radio rating service, Arbitron, breaks the category down into all news, sports talk, news talk, and

personality talk. When all of those are combined, news/talk/information stations enjoy more listeners than any other format. So-called news/talk stations generally have a far heavier emphasis on talk. On the other hand, an all-news station, as its name suggests, is often exclusively news.

A modern news/talk radio station might have a good deal of news and weather, as well as a heavy emphasis on traffic reports during the morning and afternoon "drive time." Most of the other time slots will consist of talk programming that might be consumer oriented, political, or related to the personal, such as call-in advice programs. Many stations will run a combination of these different types of talk shows. Each type of show has a different demographic appeal and will be programmed according to who is listening at any given hour. For instances, a personal advice program aimed at stay-at-home mothers might be on during late morning after children are at school. While most talk radio skews toward an older demographic more interested in current events and ideas and more used to a slower-paced form of radio, sports talk tends to have a younger, male demographic.

All news radio is often a combination of national and local news as well as features and other information programming. There is a heavy emphasis on weather and traffic throughout the day. Much of all news radio is aimed at commuters who need to navigate city traffic, who need to know the weather forecast, and who have an interest in events local, national and international. The demographic tends to be older.

The antecedents of modern talk radio can be heard in the medium's earliest days when local and national radio had professors, preachers, book reviewers, comedians, and others talking to a passive audience. The formats of these programs did not include listener participation. As the programming became interactive, talk radio became so much a part of the American culture that expressions such as "longtime listener, first-time caller" and "ditto, Rush" tell millions of listeners that one's dial is regularly tuned to talk radio.

Developing All News

All-news programming was one experiment that resulted from television forcing radio to change. Until roughly 1950, radio provided a mix of drama, comedy, news, and music and sought to be all things to all listeners. With television taking over that broad role by the early 1950s, radio had to change and over the next decade became a demographically targeted niche medium to ensure its survival.

Historians often cite XTRA as the first all-news radio station broadcasting to the United States. It started 24-hour news programming in 1961, licensed in Tijuana, Mexico, but directed toward southern California with far more power than the Federal Communications Commission (FCC) would have allowed any American station. The station tried not to note its Mexican origin but rather attempted to blend in as a Los Angeles area station, often announcing the address of its Los Angeles sales office. Legendary radio programmer Gordon McLendon (1921–86) developed this initial all-news format. But there was at least one attempt to do all-news earlier. In May 1960, San Francisco station KJBS changed its call letters to KFAX ("K-Facts"). A UPI report published in *The New York Times* in 1960 said the "all-news" station, "is devoting its programming entirely to current events, background material and editorials." The experiment, trying to be for listeners what newspapers were to readers, lasted only four months before changing to religious programming.

But the idea would soon succeed elsewhere. WNUS in Chicago ("W-news") was among the first successful all-news stations. Also programmed by McLendon, WNUS signed on as all news in 1964 and is regarded as the first such station in the United States. It lasted four years. WINS in New York followed in 1965, followed by WCBS two years later. WAVA and WTOP in Washington, D.C., and KCBS in San Francisco all initiated all-news programming about the same time.

The Westinghouse or "Group W" stations included all-news WINS (New York), KYW (Philadelphia), and KFWB (Los Angeles). They featured a 20-minute news "clock" allowing listeners to hear the day's events in a listening period roughly equivalent to the average commute. The stations advertised with the slogan, "You give us 22 minutes, we'll give you the world." The tightly controlled format meant that listeners always knew when they could hear weather, traffic, sports, or news. CBS competed head-to-head with

the Westinghouse stations in New York (with WCBS) and Los Angeles (KNX) featuring network newscasts at the beginning of the hour and a longer local news block. With industry consolidation three decades later, both news stations in New York and Los Angeles came under the same owner, with one station offering a quick headline format and the other a longer-form news approach.

The earliest all-news stations relied heavily on wire services and provided a "rip-and-read" headline service without any reporters. But it has slowly evolved into a more complex offering. By the early 2000s, all-news stations were generally of the 20-minute clock headline type pioneered by Group W or the longer form pioneered by the CBS all-news stations. In both cases, the stations have sizeable news staffs including anchors, reporters, copy editors, assignment editors, and managers as well as a technical and web staff. These stations continue to thrive in major cities where traffic congestion is heavy and traffic reports come every few minutes around the clock. But all-news stations sometimes stray from the format. Even the most committed, such as KNX (Los Angeles) set aside a few hours for a call-in information program. In 2007, the station had a weekly computer show on Saturdays. Other all-news stations offer occasional feature programs as well as lucrative sporting events.

Radio networks dwindled by the 1960s into providers of only news and little else. Their offerings were often limited to hourly short newscasts. NBC Radio started a News and Information Service (NIS) in 1975. Local stations could subscribe to this service and receive a full hour of news, every hour of the day. Too few stations were willing to pay for the service and it became an economic albatross, closing down after less than two years. NBC would later find success in programming talk through its Talknet service, which featured a variety of call-in talk programming. Started in late 1981, Talknet provided stations with call-in talk shows in all day parts. With the FCC Fairness Doctrine still in place, the talk shows tended to be tamer information shows rather than the currently ubiquitous political talk radio programs. Featured hosts talked about finance, health and relationships. Talknet disappeared from the radio in the mid-1990s, the result of many ownership and management changes in network radio.

All news proved too expensive for stations outside the biggest markets. When a station promised to deliver news and only news at all hours of the day and night, that promise became harder and more costly to deliver where events were few. This led stations to fill time with relatively inexpensive talk programming, much of it nationally syndicated rather than locally produced. This hybrid—typically news during morning and afternoon drive periods with talk and information programming during other parts of the day—lead to the now very popular news/talk format. A quarter century ago fewer than 50 stations featured news-talk formats. By the early 2000s, the number was nearly 2,000. The combination is relatively cheap to produce and delivers a wealthy and well educated demographic to advertisers. Some of the best demographics, especially in terms of audience educational level, can be found on public radio, which is a fertile ground for talk programming. National Public Radio features a number of programs geared to news, talk, and information. *Morning Edition* and *All Things Considered* mix hard news, long features, and interviews during the morning and evening drive-time period. *Day to Day,* with Alex Chadwick and Madeleine Brand, takes the formula and skews it more toward features and off-beat interviews suitable for late morning or early afternoon. *Talk of the Nation* with Neal Conan (1949–) is a more traditional interview program with listener call-ins. Unlike some commercial radio shows, this program allows guests time to make their points without the combativeness often on display elsewhere. The forum it provides is the opposite of many commercial radio talk shows, and Conan takes no obvious political point of view.

Public Radio is also known for talk shows that are different from others. *Car Talk* is a show to help listeners with their car problems, but even those with no interest in cars enjoy listening because of the amusing banter of the hosts, Tom and Ray Magliozzi (1936– ; 1948–). They are on almost 600 public radio stations. NPR also has a throwback to one of the oldest forms of talk on radio, the quiz show. *Wait Wait . . . Don't Tell Me!* is a quiz show that is more about satirizing the news of the week than it is about winning the game, but it is also highly informative about the events of the week.

Demographics

News and news-talk is popular with radio listeners. With Americans having longer commutes, and spending more time in their cars generally, radio continues to be an important medium. Arbitron ratings show that while radio has lost many younger listeners, it has declined less rapidly than other mature media. More than 90 percent of Americans older than 12 listen to radio sometime during the week. A 2006 Pew Research Center for the People & the Press survey of news consumption showed that three-quarters of radio listeners tune to radio for information.

News-talk listeners tend to be older and better educated. Arbitron, in its 2007 "Radio Today" research, estimates that more than 43 percent of news/talk/information listeners have college degrees with another 32 percent having some college and an additional 20 percent being high school graduates. News/talk/information listeners are also the most likely of any radio listeners to have postgraduate degrees and to have investments. It is a well-off audience with about 40 percent reporting household income in excess of $75,000 per year and another 23 percent having an income of $50,000 to $75,000. A news-talk or information station was—as of 2007—number one in 6 of the 20 largest U.S. media markets. Talk listeners are more likely to own their own home than listeners to other formats but are less likely to have children at home. News-talk does best in New England and on the west coast. Nationally, listeners tend to spend more than nine hours per week tuned to news talk radio. The audience is overwhelmingly white, with only about 6 percent black and 4 percent Latino. The audience for news talk is mostly male—about 56 percent. Two-thirds of listeners are married. Most are white-collar workers. The average listener age is 58 with three-quarters of the listeners over 45 and more than half over 55. The audience also tends to skew Republican with 36 percent identifying themselves as Republican, 27 percent as Democrats, and 26 percent as Independent.

On stations devoted to sports programming, the hosts talk about local and national sports teams and sports figures and take calls from listeners to discuss and often argue about, teams, players, or data. A number of shows are syndicated nationally, including the popular Jim Rome (1964–) show. Rome is known for his self-described "aggressive, informed, rapid-fire dialogue" on his sports radio show. According to Arbitron, more than 500 stations broadcast in this format in 2006. It is overwhelmingly a male audience at 86 percent. The average age of a listener is 47 with two-thirds of listeners in the key demographic of 25 to 54 years old. It is a wealthy audience with almost half the households earning $75,000 or more. It is also a highly educated demographic with almost 80 percent reporting a college degree or some college education.

Talk

Talk has been a part of radio since the medium began. Talk radio in the early days was a one-way process, featuring someone addressing the listening audience. This might include a university lecturer, a politician, or a firebrand such as Father Charles E. Coughlin (1891–1979)—a right-wing preacher whose anti-Semitic tirades reached as many as 45 million people—or Aimee Semple McPherson (1890–1944)—described as a "celebrity faith healer." But modern talk radio is an interactive medium. The interactivity can come from co-hosts or ensemble players, interviews, listener call-ins, or some combination of these.

Modern talk radio is often credited to Barry Gray (1916–96) in New York who in 1945 put a phone call with band leader Woody Herman on the air and interviewed him. This type of "interactive talk" was to become the staple of talk radio and began its rise in popularity in the 1950s. In 1956, Long John Nebel (1911–78) offered the first nationwide call-in talk show on the Mutual Broadcasting System. One technological invention in the late 1950s helped open the format to listener calls—the seven-second delay. This ability to place time between what was said and the time listeners heard the comment, enabled announcers or engineers to "bleep," or cut, any caller comment that might run afoul of FCC language policy and result in a fine.

Talk radio went through a number of iterations as it developed. In the early 1960s, the call-in host sometimes spent as much time insulting or yelling at his guests as he did partaking in enlightening discourse. The guests were often provocative—a neo-Nazi, a Ku Klux Klansman, a Satanist, or anyone

else out of the mainstream was likely to pop up as a guest. The biggest on air figures included Joe Pyne (1925–70) and Alan Burke (1922–92). Both also had television talk shows that are recognized as among the first tabloid television shows. Pyne was an arch-conservative, pro–Vietnam War, chain-smoking veteran of World War II who was not shy about telling his audience he had a wooden leg as a result of his service. Alan Burke, also a conservative, tried taking a more urbane approach but still delighted in insulting his guests.

In the 1960s and 1970s, talk radio formats developed where people could talk about anything no matter how intimate. Bill Ballance (1918–2004) of KGBS in Los Angeles originated this approach in his show *Feminine Forum,* which combined true confessions and audio voyeurism. The approach was often referred to as "sex radio" or "topless radio." The FCC denounced the format in 1973 and threatened fines—and Ballance quickly changed his show. But one can hear the progeny of this format on the air today.

Like so much in the evolution of radio, the dominance of AM talk grew out of competitive pressure and countervailing regulation. As FM developed into prominence beginning in the 1960s, music began to shift to the higher-fidelity service. AM stations increasingly focused on providing information, making it the perfect home for talk formats. This trend was aided when in 1987, the FCC abandoned its Fairness Doctrine. No longer would broadcasters have to give equal time to various sides of an issue. This opened the door for the largely right-wing political talk—opinionated and unbalanced—that dominates so much of talk radio today.

Notable Talk Radio Hosts

Jim Bohannon (1944–)

Bohannon is the host of a late night national radio talk show. He has been on radio since 1960. A Vietnam veteran, Bohannon was transferred to Washington, D.C., by the Army. He worked at Washington news radio stations WTOP and WRC. He also worked in radio news at WCFL, Chicago. In the 1980s, Bohannon started filling in for Larry King on the radio. He rose to prominence in 1993 when King left his overnight talk show on the Mutual Broadcasting System to devote full time to his television show. The Bohannon show presents guests on all sides of the political spectrum and has a middle-of-the-road point of view. He has been inducted into the Radio Hall of Fame, which says that Bohannon is a self-described "militant moderate" and "voice of reason." In addition to this talk show, Bohannon hosts *America in the Morning,* a network radio news and information program that airs just before drive time. Bohannon's shows are carried by Westwood One, the successor company to the Mutual Broadcasting system.

Neal Conan (1949–)

Conan is host of NPR's *Talk of the Nation,* a serious call-in program that offers a discussion of wide-ranging ideas and issues. Unlike commercial radio talk hosts, Conan does not seek out shouting and polemics that masquerade as discussion. Instead, he gives his subjects time to develop their arguments and present them calmly and fully instead of in short, snappy sound bites. His program is unique in that it provides more light than heat. A longtime political reporter, Conan has been with National Public Radio for more than a quarter century. He has worked for the network in New York, Washington, and London. Conan took a leave of absence from NPR in 2001 to follow his dream of being a play-by-play baseball announcer. He worked for a minor league team and wrote a book about his experience.

Sean Hannity (1961–)

Hannity is one of the younger generation of conservative talk show hosts in the Rush Limbaugh (see next page) mold. His program is similar in approach to Limbaugh's show, stressing patriotism and conservative Republican causes. In addition to his radio program, he has a successful show on the Fox News Channel. Hannity grew up on Long Island, dropped out of college, and worked in construction and as a bartender. His broadcast career started in Alabama and met with success at his next stop in Atlanta on WGST. Hannity moved to WABC in New York City in 1997. His show started national syndication on the ABC Radio Network on September 10, 2001. Hannity is now heard on more than 500 radio stations and he is ranked second in talk show audience by *Talkers* magazine. Hannity has written two best-selling books and his media empire includes "Hannidate"—described by his website as "the place where people of like conservative minds can come together to meet."

Laura Ingraham (1964–)

Ingraham, also a conservative, is the lone woman political talker in the *Talkers* top five, A Dartmouth College graduate, Ingraham earned her law degree at the University of Virginia. She was a clerk to Supreme Court Justice Clarence Thomas and was a speech writer in the final years of the Reagan administration. Ingraham practiced law as a white-collar criminal defense attorney. Her radio program is conservative talk oriented and takes on "the liberals," Hollywood, and the media. Ingraham started as a conservative commentator on television before beginning her nationally syndicated radio show in 2001. Her show is currently syndicated by Talk Radio Network.

Larry King (1933–)

King has been talking on the radio for more than 50 years. He started to gain fame by interviewing celebrities on Miami radio in the late 1950s. By the 1960s he was a well-known Miami personality. It was also during this period when he ran into legal troubles and eventually declared bankruptcy. With his career seemingly in ruins by the mid-1970s, the head of the Mutual Broadcasting System took a chance in 1978 and offered King the overnight talk slot. King worked from midnight until 5:30 a.m. doing a program that combined interviews, call-in questions to the guest, and "open-phone" America where callers could talk to King about anything. The program grew from a handful of affiliates to more than 500 in the 16 years it was on Mutual. King is known for his "everyman" style of questioning guests where he asks simple questions that often elicit revealing answers. He prides himself on doing very little preparation for interviews and not reading the books of authors he speaks with. King left his radio show to devote full time to his CNN television program.

Rush Limbaugh (1951–)

Limbaugh is widely considered to be the person most responsible for the rise of conservative political talk. A cigar-smoking conservative who made an art form out of attacking Bill and Hillary Clinton in the 1990s, his show has consistently been the number one show on talk radio with more than 600 stations carrying his program. Limbaugh started his career as a disc jockey and moved into talk radio in the 1980s with nationwide syndication of his show by 1988. By the start of the 1990s, Limbaugh was gaining a sizeable audience and considerable power, with some crediting him with helping sway the electorate to vote for a Republican congress in 1994. In 2003, Limbaugh admitted addiction to prescription painkillers and, in 2004, he divorced his third wife. These controversies had no effect on the loyalty of his conservative audience.

Joe Pyne (1925–70)

Pyne was doing conservative talk radio well before the genre became popular. Less an ideologue and more a manic right-wing screamer, Pyne was famous for insulting his guests and telling them to "go gargle with razor blades." He started in local radio in the late 1940s saw his popularity rise through the 1950s and reach its peak in the mid- to late 1960s when he also had a television talk show, a precursor to shows such as Jerry Springer. Pyne was known for his wooden leg, a result of combat in World War II. He had no patience for "hippies," "women's libbers," anti-war demonstrators, or anyone who displayed anything less than unwavering patriotism. A heavy smoker, Pyne died of lung cancer.

Laura Schlessinger (1947–)

Schlessinger has one of the most listened to radio talk shows, syndicated on about 300 radio stations. She dispenses advice on relationships, child rearing, and every type of personal problem. Regardless of the caller, the advice runs along conservative traditional lines. Women are advised to stay home with their children; couples are warned against divorce. On her website, she says she "preaches, teaches, and nags about morals, values and ethics." While some listeners might think "Dr. Laura" is a psychotherapist handing out advice, Schlessigner actually holds a PhD in physiology. She has a certificate in marriage, family, and child counseling. Her family values credentials were challenged by some on the left after reports of her infidelity in her first marriage and the surfacing of nude pictures taken by her lover when she was in her twenties.

Ed Schultz (1954–)

Schultz is one of the most listened-to liberal radio talk show hosts. His program, broadcast

from North Dakota, is syndicated on about 100 radio stations. Schultz started out as a conservative talker and changed to what has been described as a "progressive liberal" early in the twenty-first century. Some of his views are antithetical to what one might think of as modern American liberalism: he is a gun owner, is anti-abortion, and opposes gay marriage. Schultz does not scream or rant on his radio show, preferring a low-key approach as opposed to other radio talkers. He claims to have switched from a conservative to liberal viewpoint after his girlfriend—now wife—took him to a soup kitchen to meet "the bums" that he would rail against on his conservative show.

TASS and Russian News Agencies

Although formally named TASS only in 1925, the international Russian news agency began operating in the early twentieth century and after numerous changes in name and control grew to become one of a handful of powerful global news agencies. But TASS is only the oldest among several Russian news agencies that have formed since 1991.

Origins

The Wolff and Reuters news agencies were both operating in Russia by the middle of the nineteenth century, sending chiefly business news. The first foreign news telegram appeared in Russian newspapers in 1856. A decade later, the Tsarist government authorized the operation of the Russian Telegraph Agency (RTA) as the country's first news agency, though it lasted but three years, and Wolff continued to dominate the provision of foreign news in the major Russian newspapers. In 1871 an International Telegraph Agency (MTA) was formed in St. Petersburg, then the country's capital city. It held a monopoly on provision of foreign news to that city and Moscow. Five years later a private agency—though one with a government subsidy so that it would send official news to the foreign press—was formed as the Agence Générale Russe. In 1882, the Northern Telegraph Agency (STA) began operating, also with a government subsidy, though it closed down about a decade later. Finally, a new Imperial RTA appeared in 1895, again privately held but with a government subsidy. It soon

signed an exchange agreement with the Havas news agency.

The inception of what became TASS dates to mid-1902. In an attempt to broaden world knowledge of developments in Russia, a Commercial Telegraph Agency (TTA) was formed in St. Petersburg in 1902, becoming the St. Petersburg Telegraph Agency (SPTA) in 1904. This time, the new agency was created as an official government news source, subordinate to the ministries of finance, foreign affairs, and the interior. Its stated purpose was "to distribute political, financial, economic, trade, and other information of public interest within the country and abroad. . . ." The new entity soon signed exchange agreements with the major European agencies, effectively terminating any privately owned competition within Russia.

Seized by Bolsheviks in the late-1917 revolution, the PTA was soon redefined to become the central information agency of the new Soviet Union. Western news agency personnel were ejected from the country. A year later PTA and the Sovnarkom Press Bureau were merged to become the Russian Telegraph Agency (ROSTA). ROSTA was both a news and propaganda agency during the civil war, printing newspapers and thousands of propaganda posters. Its focus was almost entirely domestic at this point, though it developed formal ties with the United Press in 1922, the Associated Press three years later, and the major European news agencies. In mid-1925, it was renamed the Telegraph Agency of the Soviet Union or TASS.

On June 24, 1941 (two days after Nazi Germany invaded the Soviet Union), the Soviet Information Bureau (Sovinformburo) was created under the central government to oversee coverage of international, military, and domestic events in print and on radio. Three years later, a special bureau on propaganda for foreign countries was made a part of Sovinformburo. In early 1961, the Novosti Press Agency succeeded Sovinformburo, becoming the leading information and press body for Soviet government organizations. Novosti soon had bureaus in over 120 countries and published 60 illustrated newspapers and magazines in 45 languages with a combined circulation of more than 4 million copies. In 1989, a TV center opened, becoming the TV-Novosti television company. In mid-1990, the Information Agency Novosti (IAN) took over these tasks with bureaus in 120 countries. IAN also published 13 illustrated magazines and newspapers.

TASS continued to operate as a state-owned monopoly for more than a half century. While providing service to only a limited number of countries in the early 1950s, within a decade TASS coverage had greatly expanded because the agency provided its services at no cost. Developing nations in Africa and Asia were quick to allow TASS in, given the expense of using Western news agencies—and their desire to break with former colonial masters. Within the Soviet Union, TASS was strengthened because Western news agencies were limited as to the number of staff they could employ in Moscow and Leningrad. Through the cold war—into the 1980s—TASS was often accused by western governments and news sources of providing a means of distributing Soviet propaganda as well as a cover for Soviet intelligence activities, though the blatancy of such content diminished by the 1980s. TASS reports were seen as a good indicator of official Soviet government opinion. As with its Chinese counterpart, the New China News Agency, TASS distributed confidential and unfiltered news reports to the country's political leadership.

By the late 1970s, the TASS agency had several hundred journalists serving the needs of 13,000 subscribers, among them some 4,000 newspapers. More than 500 newspaper-pages' worth of information was transmitted daily. Its 40 bureaus covered 110 countries. Teleprinter and radio links were used to transmit most foreign news while feature and other material went out by mail. Two-way teleprinter links connected the Moscow headquarters with 300 domestic towns and cities and nearly 30 countries. News was transmitted in six languages, including English. TASS radio teletype service was received in 50 countries.

Modern Russian Agencies

In 1989, three years into Soviet leader Mikhail Gorbachev's "perestroika," or openness regime, the privately owned Interfax News Agency (IAN) was formed in Moscow as the first entity to compete with the state-run TASS agency. By 2001 Interfax had about 1,000 staff members located in 70 nations, and it produced 1,500 political and financial news stories daily. Related Interfax agencies were formed in several former Soviet countries and in the Far East. The Interfax Group is a network of about 30 companies in Russia, the

Commonwealth of Independent States (CIS), China, and several Central European countries. It publishes news in Russian, English, Ukrainian, Kazakh, and German and provides about 100 specialized services.

IAN gave way in September 1991 to the Russian Information Agency [RIA] Novosti under the Russian Press and Information Ministry. RIA Novosti had about 80 bureaus and news offices abroad, over 1,500 subscribers in CIS countries and about a hundred elsewhere. In 1993 RIA Novosti became a state news–analytical agency with RIA-Radio and, by 1997, TV channel Kultura. In May 1998, the agency was renamed the Russian Information Agency Vesti, though it retained the media name of RIA Novosti.

Following the collapse of the Soviet Union, TASS was renamed in early 1992 as ITAR [Information Telegraph Agency of Russia]-TASS. It has retained its status of being the state's official central information agency. It has more than 130 bureaus and offices in Russia, 62 of them in 59 other countries. ITAR-TASS also cooperates with more than 80 foreign news agencies. ITAR-TASS provides 45 round-the-clock news–cycles in six languages and more than 40 information bulletins and operates the largest photo agency in the country. Of the numerous Russian news agencies, it remains the best and most widely known.

Prime-TASS, formed in 1996, with ITAR-TASS taking a 35 percent share in ownership, is Russia's leading business news agency. Privately owned, the agency has no political affiliations. With about 250 permanent staff and scores of stringers across Russia and the Commonwealth of Independent States, it provides live coverage of major economic and political news in Russia and the 14 former Soviet states, especially in commodity, energy, and financial markets coverage, as well as Russian and CIS banking and corporate news. The Russian-language service puts out over 400 news and analysis pieces daily. While the agency distributes exclusive information from the Russian government, the Central Bank, and parliament, its editorial policy is independent.

In June 2003 Prime-TASS announced a content exchange and sales partnership with Dow Jones Newswires, so that both partners distribute, market, and sell the other's products in their respective markets. In February 2004 the two services launched DJ Forex, the first Russian-language news service to focus on the foreign exchange markets. The service is targeted at Russians actively trading in currencies, including foreign exchange traders, customers of bank foreign exchange trading portals, and corporate treasury departments.

Prime-TASS's English-language service publishes more than 100 daily news and analysis pieces produced by Western-educated Russian translators, reporters, and editors and rewritten for Western clients. The Russian-language and English-language wires are synchronized so that major news in both languages appears at almost the same time. Many English-language stories and features, such as those highlighting civil unrest or the benefits of democracy, never appear on the Russian wire.

Finally, the Regnum News Agency is a recently formed Russian federal news agency covering domestic news from within Russia and its neighboring countries. Regnum obtains information from its correspondents, affiliate news agencies, and partners to provide coverage of the different regions of Russia, neighboring countries of Europe, and the Transcaucasian area.

Each of these Russian news services has an extensive multilingual web presence as well, though some of these are available only to subscribers.

Telegraph

The telegraph was an electrical network that enabled transmission and receiving of coded electrical signals across wires. The system, used first in Britain and then the United States, was largely developed by Samuel F. B. Morse, and was first demonstrated publicly in 1844. Few new communication technologies have had the impact on society and culture that the telegraph did. It helped open the American West and maintain European colonial empires, revolutionized warfare and business, and changed the way people thought and what they thought about. People could stay in touch with distant relatives, order products from distant stores, and remain connected to a broader culture. But perhaps its most profound effect was on the nature of news. Readers, through reports brought to their local paper by telegraph, came to understand events as connected, to think globally and to see similarities between themselves and those in far away places. The public's perception of what was important was no longer limited to the local, but evolved to encompass the national and international as well.

Origins

While a professor of design at New York University in 1835, Morse demonstrated that coded signals could be transmitted by wire. He had learned of the work of British inventors William Cooke and Charles Wheatstone, whose system of telegraphy began operating there in the 1830s. Morse used pulses of electrical current to deflect an electromagnet, which moved a marker to emboss a strip of paper with dots and dashes. Working with others, he developed what became the Morse code so that in different combinations, these dots and dashes represented individual letters of the alphabet. Morse transmitted his first telegraph message in January 1838 across two miles of wire near Morristown, New Jersey. Following that, he received a $30,000 grant from Congress to construct an experimental line from Washington to Baltimore, a distance of about 40 miles. Six years later, in May 1844, Morse sent the message "What hath God wrought" (quoting the Bible, Numbers 23:23) from the old Supreme Court chamber in the U.S. Capitol building to his assistant Alfred Vail at the Mount Claire railroad depot in Baltimore. The Post Office operated the line from 1844 to 1847, when they sold it to private interests.

Even before this first line had reached Baltimore, the telegraph had shown its worth in the rapid transmission of news. The previous month the Whig party had held its national convention in Baltimore and had nominated Henry Clay as its presidential candidate in the upcoming election. This information was carried by railroad to Annapolis Junction, which the telegraph wire had reached, from which Vail wired it to the Capitol. The news of Clay's nomination was published the next day in local newspapers. It was the first American news report dispatched by electric telegraph, an omen of the future of journalism. News could now be sent across great distances in a short amount of time, slowed only by the process of encoding and decoding the dots and dashes. For the first time, information could outpace land and sea transportation speeds.

These successes proved the reliability and utility of the telegraph, and Morse quickly obtained private funds to extend the line north to Philadelphia and New York. The New York to Boston line went into operation in 1846. By the end of that same year, state capitals in Albany and Harrisburg were connected to the main line. Small telegraph companies sprang up across the East and South, connecting cities and the towns by wire much as the railroads were doing—indeed the two services often used similar rights of way. Western Union,

founded in 1851, opened its first transcontinental telegraph line in 1861, mainly along railroad routes. Spanning North America, the growing number of networks in the eastern states were connected to the small network in California by a line that ran from Omaha, Nebraska, to Carson City, Nevada, via Salt Lake City on October 24. (The famous Pony Express system for moving mail and messages ceased operations two days later.)
