About the General Editor

Christopher H. Sterling is Professor of Media and Public Affairs and of Public Policy and Public Administration at The George Washington University (GW). He earned his B.S. (political science, 1965) and M.S. and Ph.D (both in communication, 1967 and 1969, respectively) from the University of Wisconsin–Madison. He has been an academic for four decades and has served as a member of the GW faculty since 1982. He directed the university's former graduate telecommunication program from 1984 to 1994, and again from 2001 to 2003. He served as associate dean for graduate affairs in the arts and sciences from 1994 to 2001. Before coming to GW, he served as a special assistant to one of the members of the Federal Communications Commission from 1980 to 1982. Through the 1970s, he was on the communications faculty at Temple University in Philadelphia.

Dr. Sterling's primary research interests focus on the history of and policy for both electronic media and telecommunications. With several books still forthcoming, he has authored or edited some 25 monographs since the first appeared in 1973. He was general editor of a three-volume and multi-author *Encyclopedia of Radio* (2004), and the more recent *Military Communications: From Ancient Times to the 21st Century* (2007), a one-volume encyclopedia on that topic. He edits *Communication Booknotes Quarterly* and serves on the editorial boards of six scholarly journals. Among his recent books are *Sounds of Change: A History of FM Broadcasting in America* (co-author, 2008) and *Shaping American Telecommunications: A History of Technology, Policy, and Economics* (co-author, 2006). Among his earlier monographs are *Stay Tuned: A History of American Broadcasting* (co-author, 3rd ed., 2002), *The Focal Guide to Electronic Media* (CD-ROM editor, 1998), and *Broadcasting in America: A Survey of Electronic Media* (co-author with others, several editions). Sterling has also contributed articles to many scholarly books and journals (among them is "Pioneering Risk: Lessons from the U.S. Teletext/Videotex Failure" in the *IEEE Annals of the History of Computing*, 2006), as well as literally hundreds of encyclopedia entries and essays.

About the Key Documents Editor

Glenn Lewis is Director of the Bachelor of Arts in Journalism Degree Program and Professor of English at York College of the City University of New York (CUNY). He initiated and designed the curriculum and wrote or revamped all courses. The BA in Journalism was successfully launched in fall 2008 and includes concentrations in News Writing and Reporting, Broadcast Journalism, and Book and Magazine Publishing. Lewis had previously served for over 20 years as the Coordinator of the Journalism Minor he created and Faculty Advisor to the student publication that won dozens of major college newspaper awards during his tenure.

Lewis is also Professor of Journalism at the CUNY Graduate School of Journalism. He was a member of the founding Curriculum Committee and Admissions Committee in 2005 and currently serves on the Governance Council. Lewis teaches Feature Writing at the Journalism School and wrote the original syllabus. He also teaches narrative journalism and contributed to the creation of that course as well. Lewis wrote and teaches special seminars for the institution's January Academy in Non-Fiction Book Writing and Freelance Writing.

Lewis is a veteran journalist and author who has published scores of articles on media, journalism, sports, business, and societal trends. His work has appeared in numerous publications, including *Publishers Weekly, Sport, Car & Driver, GEO, Sunday Daily News, Family Weekly,* and *Philadelphia Inquirer*. Lewis contributed a series of profiles on legendary journalists to *Library Journal* that included interviews with Walter Cronkite, Jim Lehrer, David Halberstam, Betty Friedan, Studs Terkel, and others. He is currently an on-air journalism and media expert for Fox News television, online, and radio.

As an author, Lewis wrote a popular health and advice book with a model from the Ford Agency that was published by Henry Holt and Company. He also co-created the critically acclaimed Southside Sluggers Baseball Mysteries series for Simon & Schuster. Lewis was President and Creative Director of Book Smart, Inc., a book packaging company that developed projects in the adult trade, reference, and juvenile market.

Lewis has an MA in Creative Writing from City College of New York, CUNY.

Introduction

Daily, hourly, and moment-to-moment journalism permeates nearly everyone's life. In ways most of us take for granted, journalism shapes perceptions of local communities and the world. Whether one tunes into National Public Radio's *Morning Edition* or NBC's *Today* show, follows news events on Internet sites, or reads a daily newspaper or weekly news magazine, journalism weaves through and often defines our days. Indeed, in these early years of the twenty-first century, journalism has become such a massive and ubiquitous process and business, so omnipresent, that it is hard to tell where it begins and ends.

Journalism's many impacts are pervasive across society. The role of news media in political communication—to take but one obvious example—is hard to precisely define because it is such a huge part of the process of both running for office and holding it. Yet even aside from politics, journalism is controversial because it is the messenger bearing both good and bad news on matters of public importance. Debates over hard and soft news, or left- or right-leaning editorial positions, are indicators of journalism's central role in so many things.

The process and content of journalism has been transformed many times in the past by technical breakthroughs, though perhaps never so fundamentally as since the mid-1990s with the rise and near domination of the Internet. Indeed, some have compared instant home and office access to worldwide resources to the fundamental changes wrought by invention of printing with moveable type. Four hundred years later, another dramatic transformation came with the spread of telegraph lines across land and under the sea. And early in the twentieth century, the rise of wireless services began to again transform the process of gathering and reporting news.

Using the Encyclopedia

This encyclopedia surveys the state of journalism at the end of the twenty-first century's first decade. The first four volumes contain some 360 entries ranging in length from 1,000 to 4,000 words, arranged by topic heading from A to Z. Each includes both cross-references and sources for further information and is signed by its author (who are listed with their affiliations on pp. xxi–xxv). The Reader's Guide on pages xiii–xviii is one good entry point to the information gathered here.

The focus of the entries is on the gathering, editing, reporting, and distribution of news. As will be evident, our emphasis is on American media and practice, with some reference to other nations. The encyclopedia has been designed to present a comprehensive analysis of all aspects of journalism—including the trends, issues, concepts, individuals, institutions, media outlets, and events that go into making journalism a pivotal part of contemporary media—and our political, cultural, and social life.

Coverage ranges from entries on specific countries or regions surveying the development and current state of journalism in each, to others focused on the major types of news media publications and programs (with many examples), and specific media markets. There are numerous entries about journalism's changing technologies, legal and ethical issues, education and training for journalism, the processes and routines of journalism, ownership and industry economics, and the audiences for news. While the encyclopedia does not emphasize history, sufficient background is presented to provide context for each entry.

Perhaps surprisingly, you will find no entries on individuals. Given the breadth of journalism, we decided early on to deal with categories of relevant

people, providing many brief biographies as examples of each. These broad categories include publishers, editors, many different types of reporters, television anchors, interviewers, photojournalists, columnists, commentators, and sportscasters, among others. A few people will show up more than once given the variety in their careers. Nor will you find individual entries on most publications (there are a few exceptions) as we deal with important newspapers within the individual market entries (e.g., *The Milwaukee Journal-Sentinel* under Milwaukee). Finally, there are no how-to-do-it entries as there are textbooks aplenty for that aspect of journalism.

At the end of each of the four A-to-Z volumes, you will find a comprehensive index, comprising the content of all six volumes.

The fifth volume provides a carefully selected and annotated collection of documents of importance to journalism past and present. Edited by Glenn Lewis of York College and the CUNY Graduate School of Journalism, these materials are designed for independent use on their own, as well as supporting materials found in the first four volumes.

The sixth and final volume includes a listing of journalism awards and prizes, a section devoted to journalism freedom in the last 30 years, and an extensive subject-divided and annotated bibliography on all aspects of journalism.

Acknowledgments

Getting a project of this scope into your hands depended on the efforts of many individuals. Thanks go first to Margaret Seawell, then the communications editor for Sage, who approached me to take on this editorial task. Although we had worked well together before (for a different publisher), I resisted her offer due to the scope and breadth of what she proposed, my own lack of knowledge about many aspects of journalism, and the several projects already on my plate. On her retirement, however, Rolf Janke, head of Sage's reference division, persuaded me and has been hugely supportive since. And his optimism has been a great support during the thin times any such project goes through.

Making a decision that was central for the project, Rolf contracted with Valerie Tomaselli's MTM Publishing in New York City to handle the huge administrative and editing jobs central to a multivolume encyclopedia project. Valerie and her experienced team have been an absolute delight to work with. Indeed, the multiyear task of developing this encyclopedia could not have been accomplished at all without the vital roles each of them played. For the first year (until he departed to head the reference division of a major university press), Paul Schellinger, with whom I had worked on a previous radio encyclopedia, played a key role in helping us determine how best to shape the encyclopedia to cover a vast field with a limited number of entries. Valerie's New York–based team of Zach Gajewski (who handled all the massive correspondence and kept track of who was doing what and when), Tim Anderson (a solid editor who saved us from multiple gaffes), and Hilary Poole (whose editorial experience with other encyclopedias surely helped this one) all worked well together and with the many authors and me to develop these volumes. I genuinely enjoyed working with this team—they know their business.

Our advisory board provided vital early service with their invaluable advice on developing the list of entry head words (and writing some of them), on suggesting potential entry authors, and on helping to evaluate many of the entry drafts. Their many areas of specialization helped fill in my own background. Among them, Chuck Whitney made the pioneering effort at getting the project started and beginning to shape its content. Mark Feldstein, Christine Ogan, and Barbi Zelizer were especially helpful in identifying potential authors. Many of our advisors also served as authors of one or more entries. And several helped back up the editorial process by reading and commenting on subjects within the manuscript they knew well—these included Donald Browne, Robert Trager, and Silvio Waisbord. Although not a member of the advisory group, Brian Winston played an essential role in rounding up authors for our several entries on British journalism.

Our many individual entry authors were nearly always pictures of patience with our editing and questions. Rex Martin (Bowie State University, Maryland) stands out as particularly helpful, even picking up and writing several "orphan" entries at the last moment when we could give him little time to do the job.

—Christopher H. Sterling
Washington, D.C.

Key Documents Introduction

The job of every journalist is essentially to become an "instant expert" on the subject he or she plans to report on or write about. This is a far cry from becoming a "true expert" on a subject—someone with all the answers, a mantle of authority, and a thorough mastery of an area. The instant expert aims to pick up just enough to comprehend the roots of a story, perhaps the jargon of an industry, and the core issues in play. Then they use this knowledge to form cogent questions.

In the scheme of the *Encyclopedia of Journalism,* Volume 5—Key Documents—plays the role of instant expert, while Volumes I through IV assume the burden of the true expert. The first four volumes contain the collected wisdom of scholars in myriad articles on every aspect of journalism. This volume more pointedly attempts to identify, and shed light on, specific selected documents that best raise fundamental questions about journalism and media. In essence, these documents take researchers back to the source to see where a dialogue on the practical aspects of the field must begin.

The real challenge for Volume 5 is to mount a substantial, revealing examination of the building blocks of journalism without overwhelming the reader. The first step, as in journalism itself, is to consider the needs and interests of the audience—journalism students, teachers, veteran reporters and editors, and researchers. These Volume 5 users are most concerned about the relevant foundations, current practices and prospective future of journalism revealed in four sections here: Journalism, Media, and the Law; Codes of Ethics/Newsroom Policies and Standards; Journalism Education: Preparation for Change; and Data on the Status and Practice of Journalism.

The representative sampling of documents for each section—especially Journalism, Media, and the Law—were painstakingly chosen. There are many traditional areas of journalism or media law with long histories and reams of law that has developed over the years through federal and state legislation and court decisions. This reservoir of media law rapidly continues to deepen as the journalism landscape evolves.

The advent of the Internet and growth in digital media present prime examples of innovation pushing the expansion of media law. There is a slew of regulatory legislation and intellectual property law already connected to online or electronic journalism, with more on the horizon. These newer segments of media law have a profound impact on the practice of journalism going forward. The same can be said for First Amendment law connected to clear and present danger, prior restraint and libel—and matters of privacy, freedom of information, and a reporter's privilege to withhold information. In each of these areas, legal experts weighed in on the landmark cases to include.

Volume 5 begins with the premise that journalists must first understand both the source of their legal limits and the rights they depend on. It then moves on to the self-imposed rules of journalism organizations and individual news outlets designed to protect the integrity of a profession often under attack. Section II looks to the most respected news organizations for the codes of ethics, newsroom policies, and standards of behavior that have become the benchmarks for the industry. It also serves to alert newer journalists to meaningful changes affecting different mediums and beats, including business, medical, education, and entertainment reporting.

Change has become the operative word in the world of journalism and every journalist's career seems to hinge on staying ahead of the curve. As a result, the topic of journalism education—and re-education—is paramount and merits a section of

its own here. Missions and curriculum from a number of the top journalism schools in the country, preceded by the accreditation standards they must meet, give readers a sense of what is being taught. White papers on the needs of the media in the future also paint journalism education as an engine for change.

The last section of Volume 5 presents a wealth of data and respected surveys to measure the current status of journalism in the eyes of the public and telling patterns about the business itself. Information on audience research shows the mediums with growth potential and those losing traction. A look at the Internet's impact on the media illuminates the benefits it provides for reporting, as well as the burden it imposes on the industry to make online journalism profitable. There are straightforward assessments of journalism employment and the progress of minorities and women in the profession. Finally, coverage of major trends in journalism suggest how journalists have changed what they report, the way they report it and their relationship with news consumers.

One of the chief challenges for Volume 5 was to make these lengthy, often dense, documents manageable without lessening their value. The goal here is to keep as much of the original documents and their intent as possible without sacrificing accessibility. As a result, this volume relies on a "key documents" approach. This means that some original documents appear in complete form, while other entries have been excerpted, adapted or perhaps repackaged. In several instances, this involves opting for executive summaries or collected findings taken straight from the original document. Dr. Consuella Askew, the managing editor, was instrumental in the design of sections, finding the most desirable documents, and helping adapt many of them for use.

The introductions for the sections and documents have also been designed with a specific, direct approach in mind. They begin by determining what is being addressed and how it came about. The volume editor then puts the subjects into a broader journalistic context and gives insight into how the journalist might apply the information on the job. In the end, the hope is to breathe life into the documents, and give journalists and researchers a deeper appreciation for the workings of journalism.

—Glenn Lewis
Volume Editor

A

ABC News

The weakest of the three legacy broadcasting networks for several decades, the American Broadcasting Company's (ABC) news division has since the 1970s become a serious contender in network news competition. Building on a fairly weak foundation, news division director Roone Arledge helped develop ABC News into a ratings powerhouse. Time and again, ABC has made effective use of journalists who had built their initial reputation at either CBS or NBC.

Radio Origins

ABC came into being as the Blue Network in 1943, the result of a U.S. Supreme Court decision that broke up NBC's longtime ownership of two radio networks. Blue was sold by NBC to Edward J. Noble, who had made his fortune with Life Saver candies. In 1945, the Blue Network changed its name to the American Broadcasting Company. The radio network was the first to break the national network ban on use of recordings on the air. As the fledgling network lacked the funding to enter television networking, in 1953 the company was taken over by Paramount Theaters under the direction of Leonard Goldenson. Beginning in the late 1950s, ABC fed hourly newscasts to its affiliates five minutes before the hour.

Over the years, the network enjoyed the work of a number of distinguished journalists. Raymond Graham Swing (1887–1968) was one of them, broadcasting Blue Network and then ABC News until 1947, sharing time with Elmer Davis (1890–1958). After a long career, including heading a government information agency during the war, Davis spent his last decade providing news and comment on ABC, offering liberal views and editorials against the communist witch hunts of Senator Joseph McCarthy. Paul Harvey (1918–2009) began his long radio network career on ABC in 1951 and was still on the air with his *Paul Harvey News and Comment* broadcast from Chicago more than a half century later.

A major boost for ABC radio came in early 1968, when the radio network broke away from the traditional network model of a single feed to the same affiliates. ABC radio was divided into four distinct programming services, sharing a single network telephone line to keep costs down. ABC had received permission to do this from the Federal Communications Commission (FCC), which allowed the move as long as only one of the four services was on the air at a time. One of them, the American Information Network, focused on providing news and feature programming and ran its primary newscast at the top of the hour. The other three services, including the first national network built around FM stations, carried their shorter newscasts at different times each hour. When satellite delivery became possible in the 1980s, further services were added.

Only two of these—including the American Information Network—were still operating by the middle years of the first decade of the twenty-first century. Both received what was by then called ABC News Radio service from news division bureaus in New York, Washington, and Los

Angeles, broadcast on the hour (the FCC's limit on simultaneous programming had been dropped in the late 1970s). The American Information Network provided slightly longer stories and more emphasis on world news. In addition, sound bites and premade reporter packages were fed to affiliates for their own use by both satellite and a dedicated website. All told, more than 4,000 radio stations carried ABC newscasts to 100 million listeners a week.

Early TV News

ABC was a weak television ratings contender for years in a world dominated by CBS and NBC. It took time to obtain sufficient affiliate stations to place a decent television network signal over much of the country, something CBS and NBC enjoyed years earlier. During the 1950s, veteran journalist John Charles Daly headed the small network news operation, also anchoring the brief evening television newscast.

ABC gained some notice with its full-time coverage of 36 days (187 hours) of the controversial Army–McCarthy Senate hearings in the spring of 1954 (only the DuMont network also covered the hearings—CBS and NBC stayed with their lucrative daytime soap operas). News director Fritz Littlejohn, who had joined ABC in 1945 when it barely had a news operation, insisted on the "gavel to gavel" live coverage and his argument won the day given ABC's weak daytime program lineup.

In 1960, ABC won the right to televise the last two (of four) debates between presidential candidates Richard Nixon and John F. Kennedy. After Kennedy entered the White House, former President Dwight Eisenhower's press secretary, James Hagerty, became the head of ABC News. In various posts, he would stay for 15 years. Among his early hires was CBS newsman Howard K. Smith (1914–2002), who had fallen out with the leadership of his network. In 1962, Smith joined ABC and soon produced a documentary on "The Political Obituary of Richard Nixon," which created considerable controversy (and turned out to be premature when Nixon was elected President six years later). Smith would briefly serve as one of several anchors of the network's evening newscast before moving on to commentary.

Network chief Leonard Goldenson overruled his news division rarely—but in 1962 he intervened so as to allow independent film producer David Wolper's "The Making of the President 1960" documentary (based on a best-selling book) to air. Wolper (1928–) went on to make other well-received documentary programs for ABC, which again was a leader in breaking down the longtime shared network policy of not airing news or documentary programs made outside the network itself. For years, Wolper gave the network first refusal on his productions.

Former CBS and NBC news executive Elmer Lower (1913–) moved to ABC in 1963 to take charge of day-to-day news operations, reporting to Hagerty. When he began, ABC spent about $5 million on news while its two competitors spent six times that—each. In his 11 years in the post, ABC news expanded from 250 to 750 employees, including future news stars Peter Jennings and Sam Donaldson, among others. Lower also changed network coverage of the political conventions from a full-time affair to a 90-minute evening wrap-up summary.

In early 1986, Capital Cities purchased ABC for $3.5 billion, renaming it Capital Cities/ABC. A decade later the network was taken over by the Disney Studios.

Evening News

John Daly anchored ABC's 15-minute evening newscast for its first seven years from 1953 to 1960, though he was also hosting a game show on rival CBS at the same time. For news film the network relied on Fox Movietone, which served movie theaters with weekly newsreels, and Hearst Telenews. The network had few reporters of its own; much of the news script came directly off the news agency tickers, and viewing audiences were tiny. After Daly left, a variety of people came and went as anchors of the nightly evening news program.

Peter Jennings (1938–2005), who would become something of an iron man at ABC, spent two very different periods in New York, separated by distinguished reporting from overseas, especially the Middle East. Born in Canada as the son of a Canadian Broadcasting Corporation official, Jennings got his start as a radio journalist. He anchored a Canadian network's newscast for two years before joining ABC as a reporter in 1964 (they did not know he was a high school dropout).

He began anchoring ABC's *Peter Jennings with the News* starting in February 1965 (for all of $39,000 a year) when he was only 28 and had little reporting experience. He was up against the older and far more experienced Walter Cronkite at CBS and the duo of Chet Huntley and David Brinkley at NBC. That he was appointed at all says a good deal about the limited options ABC then offered television journalism and its thin bench of reportorial talent. But it also represented the network's clear emphasis on appealing to a youthful audience. To get more experience abroad, he left the anchor chair in late 1967. The network had just extended the evening news program to a half hour, matching the change made four years earlier by CBS and NBC.

What became the *ABC Evening News* then worked through a steady change of anchors, some working solo, others as part of a pair or, briefly, a trio of anchors. Washington reporter Frank Reynolds (1923–83) became senior anchor from the nation's capital. Max Robinson, the first black network anchor (1939–88), co-anchored from Chicago. But few seemed to click with viewers. The 1976 hire of Barbara Walters (1929–) from her post at the NBC *Today* show was front-page news both because she was a woman in what was then very much a man's world (she was the first female news co-anchor for any network), and for her reputed $1 million salary. For two years, she teamed with veteran newsman Harry Reasoner (1923–91) to anchor the evening news before shifting to other programs.

The watershed change for ABC News that shifted it from also-ran to a serious journalistic operation came in 1977. Roone Arledge (1931–2002), ABC's longtime director of sports coverage, was also given the news division in 1977, the first person to head both such units at a network. Arledge sought to hire established network stars from CBS and NBC and brightened the news programs with more—and more effective—use of graphics (drawing on his sports background). He was both brilliant and difficult, from all accounts, as he struggled with a limited but growing budget to build a viable news team from those on board, and others he would soon hire. Arledge would run ABC News for two decades, giving way only in mid-1998 to David Westin.

Peter Jennings returned as one of a trio of evening news anchors in 1978, reporting from London. He was named sole anchor (from New York) of *World News Tonight* in September 1983. For eight years in the 1990s, his program came in ahead of its CBS and NBC competition in audience ratings. Jennings became a U.S. citizen in 2003, and continued anchoring until he fell ill with cancer, leaving the program in April 2005. After briefly experimenting with several young anchors, Charles Gibson (1943–), longtime co-host of the network's *Good Morning America* program, took the chair for *World News Tonight* in mid-2006, three decades after he had first joined the network as a reporter.

Other News Programs

ABC News gained considerable attention through 1980 by covering the Iran hostage crisis with a nightly broadcast *America Held Hostage,* talking about the dozens of hostages taken by angry "student" protesters from the American embassy in Teheran, Iran. As the program's anchor, Ted Koppel (1940–) soon demonstrated his ability to conduct insightful interviews. After the hostages were released at the beginning of the Reagan administration in 1981, the network decided to continue the late night program as *Nightline,* and Koppel remained its host for another 25 years. Often providing news-making interviews, *Nightline* ranged over a wide variety of topics.

Known for a willingness to experiment, the news division under Arledge created many of the network's most enduring—if not most distinguished—programs. Among them are two long-running news magazines. The first was *20/20,* which began in 1978 and was initially hosted by network veteran Hugh Downs (1921–) and Barbara Walters, airing two nights a week. *PrimeTime* began in 1989, anchored by longtime ABC stalwart Sam Donaldson (1934–) and Diane Sawyer (1945–), who had been hired away from CBS. The program originally featured interviews and other live segments, but within a few years melded into a regular magazine format. Both programs strayed from the hard news tradition of the network news division, focusing more—as did other network magazine programs—on stories of personality, crime, and other tabloid topics.

Longtime journalist David Brinkley (1920–2003), feeling underutilized at NBC, moved to ABC in 1981 and took up a variety of news and commentary

roles. He began hosting *This Week with David Brinkley,* a Sunday newsmaker interview program from Washington. It became simply *This Week* when Brinkley retired in 1996. By the early 2000s, the program was hosted by former Clinton administration staffer George Stephanopoulos (1961–).

Changing Technology

Seemingly always strapped for sufficient funding, ABC News was rarely a pioneer user of expensive new technologies. It adopted the use of videotape and color transmission after its competitors.

By the middle years of the first decade of the twenty-first century, ABC NewsOne was the network's affiliate news service. It provided regional, national, and international news to ABC affiliates and foreign networks. ABC News Now was ABC's 24/7 news channel available online and from other sources such as mobile phones. A news brief containing information relevant to college students was shown every hour on MtvU. ABC News segments were packaged or customized for broadcast over Wal-Mart's in-store television network. Its "i-Caught" website encouraged viewers to upload video of newsworthy items, celebrity sightings, or amusing ephemera. In 2006, ABC News Radio initiated an Internet-delivered FM news service aimed especially at younger audiences. And ABC News offered both RSS feeds and podcasts.

Academic Accreditation

The Accrediting Council on Education in Journalism and Mass Communications (ACEJMC) accredits about a quarter of all the journalism programs in the United States and one university outside the country. The council is recognized by the Council for Higher Education Accreditation (CHEA) to accredit programs for professional education in journalism and mass communications in four-year colleges and universities. It is the only accrediting agency in the United States for journalism and mass communications education.

The council's purpose is to foster and encourage excellence and high standards in professional education in journalism and mass communications. The council establishes educational requirements and standards and provides a process of voluntary program reviews by professionals and academicians, awarding accredited status to units that meet its standards. In this role, the council assures students, parents, journalism and mass communications professionals, and the public that accredited programs meet rigorous standards for professional education.

Accreditation is intended to serve students, parents, faculty, employers, universities, and the public by seeking continued improvement in the quality of instruction in journalism and mass

communications through an on-site evaluation every six years.

Development

The structure for evaluating and accrediting journalism and mass communications programs was established in 1945, when the American Council on Education in Journalism was formed. Its name was changed to the Accrediting Council on Education in Journalism and Mass Communications in 1980. The council originally was an association of journalism educators and newspaper organizations. Its membership was later broadened to include national and international associations representing newspapers, broadcasting, advertising, public relations, professional societies, and education in journalism and mass communications.

Accrediting standards are continually reviewed. In 1984, the council had a significant change in its standards. Before that year, schools were evaluated on nine standards. The new 12 standards adopted in 1984 included a commitment to diversity and inclusiveness. Schools were required to have a written diversity plan by 1990. Programs also were asked to develop curricula and instruction that educate faculty and prepare students with the multicultural knowledge, values, and skills essential for professional practice. Accreditation site teams apply this standard in compliance with applicable federal and state laws and regulations.

In 2003, the council underwent another review of its standards. Several pairs of standards topics were collapsed. For example, "Standard 2: Budget" and "Standard 8: Equipment/Facilities" were combined into one resources standard. One new standard, Assessment of Learning Outcomes, was added, resulting in a set of nine standards. This change became effective for accreditation visits during the 2005 to 2006 academic year.

The Assessment of Learning Outcomes requires schools to develop a plan to assess whether students are acquiring the core knowledge, values, and competencies that journalism and mass communications programs seek to teach. Schools must collect the data and use the findings to improve the school's curriculum and instruction. Grade analysis, student performance in contests, internships, capstone courses, portfolio reviews, and alumni surveys are some examples of areas where outcomes can be measured. Schools were required to have written plans for the assessment of educational outcomes by September 2003.

Despite its emphasis on professional education, the council always has embraced the value of a liberal arts and sciences curriculum as the essential foundation for professional education in journalism and mass communications. As part of the 2003 standards review, the council adopted 11 professional values and competencies. They say, "Individual professions in journalism and mass communications may require certain specialized values and competencies. Irrespective of their particular specialization, all graduates should be aware of certain core values and competencies."

The 11 core professional values and competencies are as follows:

1. Understand and apply the principles and laws of freedom of speech and press, including the right to dissent, to monitor and criticize power, and to assemble and petition for redress of grievances;
2. Demonstrate an understanding of the history and role of professionals and institutions in shaping communications;
3. Demonstrate an understanding of diversity of groups in a global society in relationship to communications;
4. Understand concepts and apply theories in the use and presentation of images and information;
5. Demonstrate an understanding of professional ethical principles and work ethically in pursuit of truth, accuracy, fairness, and diversity;
6. Think critically, creatively, and independently;
7. Conduct research and evaluate information by methods appropriate to the communications professions in which they work;
8. Write correctly and clearly in forms and style appropriate for the communications professions, audiences, and purposes they serve;
9. Critically evaluate their own work and that of others for accuracy and fairness, clarity, appropriate style, and grammatical correctness;

10. Apply basic numerical and statistical concepts;
11. Apply tools and technologies appropriate for the communications professions in which they work.

Before the nine standards were adopted in 2003, the diversity standard was most often judged out of compliance by teams visiting schools to determine accreditation (or renewal of same). Insufficient diversity in faculty and student bodies and insufficient coverage of diversity issues in curricula were problematic. In 2003, the council published "Diversity: Best Practices," a handbook designed to help schools meet the diversity standard. The manual described successful diversity initiatives already in place in schools. In the 2007–08 visit cycle, only one school out of 17 was judged out of compliance on the diversity standard. However, no school lost its accreditation because it failed the diversity standard.

The assessment standard has been the one most often judged in noncompliance since 2003. In 2007–08, eight schools out of 17 or nearly half were judged out of compliance with the assessment standard. Problems most often occur when schools do not meet the schedule for collecting assessment data or implementing changes to the curriculum based on those findings.

On the graduate level, the council evaluates only professional, not academic, master's programs. The council does not evaluate PhD programs or other graduate and undergraduate programs that are designed as preparation for academic careers or that provide nonprofessional education. A professional master's degree program in journalism and mass communications is one that prepares students to

- meet the council's basic competencies, with the added competency of contributing to knowledge appropriate to the profession.
- think intelligently, strategically, and critically about the fundamental and complex social and cultural issues of the profession.
- master the skills and responsibilities of the profession with grounding in professional experience.
- perform the profession's roles ethically.

Up to 2006, graduate and undergraduate programs were both evaluated at the same time by a visiting team. Now, accrediting teams make a separate recommendation for the accreditation status of the graduate program. It is possible that a team could recommend a different status for a school's undergraduate program and its professional master's degree program. Accrediting teams also write a separate summary for each of the nine standards for graduate programs.

The Accrediting Council

ACEJMC has 35 members representing professionals and educators. Three of its members have no affiliation with journalism and mass communications and represent the public. The council's president and vice president are a professional and educator respectively.

The council elects an Accrediting Committee composed of 15 journalism and mass communications educators and industry representatives. The majority of the committee members, as well as the chair and vice chair, are educators. The committee meets each spring to make its recommendations based on the reports prepared by visiting teams.

The council can make one of three decisions: accreditation, provisional, or denial. A school may receive provisional accreditation or reaccreditation when the council has found weaknesses that can be corrected in a relatively short time. Provisional accreditation or reaccreditation is for two years. When the council recommends provisional reaccreditation, the program loses no rights or privileges of accreditation. However, if a school receives a provisional decision on an initial visit, it lacks accredited status until the provisional restriction is removed.

The council makes the final decisions on the accreditation status for the schools under review. Accrediting teams may recommend accreditation, the committee may recommend provisional accreditation, and the council can vote to accredit the program. The council considers the teams and committee recommendations very seriously but does have the final vote in all accreditation decisions.

Unlike other accrediting agencies, the council and its committee conduct all business in open meetings. School representatives may attend the meetings to observe and to respond to questions

from committee and council members. The council had its first open meeting in 1988. The council also releases accreditation team reports to the public upon request.

Interest in journalism and mass communications accreditation remains strong. A major indicator is its growth. In 1986, the council had accredited 86 departments and schools; two decades later, there were 112. Currently, an additional 19 schools are working toward initial accreditation. When schools lose accreditation, whether by lack of compliance or lack of resources, parents and students voice the greatest concerns. The programs continue and many offer excellent educational opportunities, as do many schools that opt not to apply for accreditation.

The process of self-examination and peer review provides valued returns from multiple perspectives. Many administrators believe accreditation aids in fundraising efforts. Accreditation is widely viewed as the high mark of standard, thereby enhancing reputation—a factor when parents and prospective students are choosing a program. Several prestigious scholarships, internships, and competitive prizes are only available to students of accredited programs. Practitioners seeking entry-level hires know accredited programs prepare students with a solid professional education.

Academic Associations

With some organizations dating back to the World War I period, a variety of academic associations have helped to shape academic journalism and mass communication programs in the United States for nearly a century. Their interests often overlap but they center on sharing and improving methods of teaching and research into all aspects of journalism. They also reflect trends in the development of American academic teaching and research in mass communication.

Developing Media Education

College and university-level study of mass communication in the United States grew out of courses and programs in many fields, chiefly English and speech, sociology and political science, and later psychology. Other subjects, including management and law, were also contributors. While mass communication education and research in some universities dates to the 1930s, major growth took place only after World War II. By the 1950s, as media programs spread to more schools, a degree of specialization was already evident—a trend which would intensify in later decades.

Over time, the study of "communication" divided into several large subtopics, proponents of which rarely bridged into other areas. These included, among others, speech, journalism, radio-television (or electronic media), mass communication, film studies (starting in the 1970s), and international and comparative studies. This splintering led in the 1960s and 1970s to more free-standing media programs, rather than those subsidiary to a legacy field (such as speech, English, or theater). Most journalism programs, for example, began with a focus on the news/editorial function of the newspaper press, and slowly expanded to incorporate photojournalism, magazines, radio and later television journalism, public relations and advertising, political communications (and news in other fields), sometimes documentary film and video, and, most recently (in the late 1990s), the online world.

A more fundamental divide (which is still evident) is that between practical and sometimes professional training and more theoretical liberal arts–based media education. Sometimes working well together, but in other cases at sword point in opposition, the two traditions grow from very different backgrounds. The professional approach appeared first, developing out of media business needs for trained personnel, and student interest in media careers as well as in actually using media.

Courses in newspaper reporting and editing, and in radio, television, and film production, for example, were important as far back as the 1930s in some places and remain very popular. So were courses in broadcast performance, which grew out of the speech tradition. The more broadly theoretical liberal arts approach, on the other hand, developed largely after World War II, growing out of developing media research in traditional academic fields, including sociology and psychology (media "effects") and political science (media policy and regulation), as well as in communication programs. All of these variations are evident in academic media associations.

Academic Media Associations

Academic associations typically form for several reasons. Faculty active in a field of study seek out like-minded colleagues to compare notes on teaching and research topics and funding. This leads to conferences, some focused on specific topics, others dealing more generally with a broad subject area. Conference panels, discussions, and papers are also a means of gaining recognition beyond a professor's own campus. Another key factor in association formation is to create one or more viable research journals, usually issued quarterly, that help to reflect and project the ways the field is developing. Associations are often at the forefront of introducing new material into programs—such as media ethics in the 1980s. Finally, academic associations help to create national standards, albeit many of them informal, of both teaching and research. The growth of individual academic programs is sometimes encouraged by associations—and they may, in turn, contribute to the expansion of associations on both a regional and national level.

Academic media associations exhibit the strengths and weaknesses of their academic fields, as well as the various specializations, and sometimes controversies, that develop within those fields. They also demonstrate different roles—some actively lead the process of academic change while others reflect trends in media education. The brief descriptions that follow, arranged by organization name, provide brief comment on the background and scope of the primary academic organizations concerned with some aspect of journalism, and active in the early twenty-first century.

Accrediting Council on Education in Journalism and Mass Communications

The ACEJMC (http://www2.ku.edu/~acejmc) is the agency formally recognized by the Council for Higher Education Accreditation for accrediting programs for professional education in journalism and mass communications in colleges and universities. What began as the Joint Committee of Schools of Journalism in 1929 became the American Council on Education in Journalism in 1945, changing to its current name in 1980. Its membership now includes national and international associations representing newspapers, broadcasting, advertising, photo journalism, public relations, professional societies, and education in journalism and mass communications. It includes three public members who are not affiliated with either the journalism business or educational groups concerned with journalism. The ACEJMC develops standards by which programs can be comparatively assessed, and sends small teams to periodically evaluate those programs which invite such consideration. By the early 2000s, about a quarter of the 400 or so academic programs in journalism were accredited. (It should be noted that many programs of quality do not emphasize professional training, often stressing the liberal arts instead, and thus do not qualify for accreditation.)

American Journalism Historians Association

A good example of a niche academic group, the AJHA (http://ajhaonline.org) was founded in 1981, and exists to promote the teaching of (and research into) all aspects of print and electronic journalism history, including people, organizations, content, regulation, and impact. It publishes the research quarterly *American Journalism,* which publishes peer-reviewed articles in all these topics.

Association for Education in Journalism and Mass Communication

The primary academic association for those teaching journalism and mass communication, what is now the AEJMC (http://www.aejmc.org), was founded in 1912 as the American Association of Teachers of Journalism, when the academic field itself was only just getting started. While its title has changed several times, what is now the *Journalism and Mass Communication Quarterly*

began publication in 1924. The association began issuing another quarterly, this one devoted to journalism education, in 1944 and a series of *Monographs* starting in 1966. In 1983, the association began to publish an annual directory of members and journalism programs. AEJMC features many divisions and interest groups that attest to its broad interests in all aspects of print and electronic journalism. They all develop panel sessions for the annual conventions and several publish their own journals. By the early 2000s, AEJMC had nearly 3,500 members.

Association of Schools of Journalism and Mass Communication

A spin-off of the AEJMC, this organization (http://asjmc.org) is made up primarily of the deans and directors of nearly 200 academic schools, departments, or programs of journalism in the United States. It was originally formed as the American Association of Schools and Departments of Journalism in 1917 and took its present name in 1984. As might be expected, its focus concerns the effective administration of academic journalism units (departments, programs, schools) and their improvement.

Black College Communication Association

The BCCA (http://www.bccanews.org/vnews/display.v) was reformed in 2001, having been originally established in the 1990s through a grant from the Freedom Forum. Its purview includes all forms of communications—from speech through mass media. The mission of BCCA is to identify resources necessary for strengthening communications programs at historically black colleges and universities (HBCUs); provide technical assistance to HBCUs seeking accreditation; and establish state-of-the-art hardware systems that can be shared by member institutions. BCCA provides technical assistance to 40 communications programs within the 105 HBCUs in the United States.

Broadcast Education Association

The Association for Professional Broadcasting Education (APBE, http://www.beaweb.org) was formed in 1955 to help developing radio-television programs to better coordinate their efforts—and to create a scholarly journal, which began as the *Journal of Broadcasting* in 1956. APBE became BEA in 1973 in an attempt to better represent those academic programs not focused on professional training. Its annual convention, held each spring in conjunction with the conference and massive technical exhibition of the National Association of Broadcasters, has grown from around 200 attendees in the early 1980s to over 1,200 two decades later. BEA began to publish what is now the twice-yearly *Journal of Radio and Audio Media* in 1998. One of its many divisions focuses specifically on journalism.

Council of Communication Associations

Recognizing the need to coordinate the plethora of related associations, the Council of Communication Associations (CCA, http://www.councilcomm.org) began to form in 1995 as an umbrella organization for seven different national or international communication associations (all are noted here with their own entries). CCA was created to enhance the mission and facilitate the activities of those associations, and to promote advancement of communication as an academic discipline. It is helping to develop a comprehensive directory of relevant research journals and doctoral programs, and has spearheaded the inclusion of the field of communication (for the first time) in the 2007 national decennial survey of doctoral studies conducted by the National Research Council.

International Association for Mass Communication Research

Formed in late 1957, and closely related to the United Nations Educational, Scientific and Cultural Organization (UNESCO), the IAMCR's (http://www.iamcr.org) main aim is to facilitate exchanges of methods and findings between research institutes and to promote personal contacts among individual members—and to seek recognition for mass communication as a subject for independent scientific investigation. It holds a biennial convention in different world cities.

Its more than 2,500 members from some 70 different countries are drawn largely from the critical studies school of research in mass communication.

International Communication Association

Formed as the National Society for the Study of Communication in 1950, having grown from a dissident group within the Speech Association of America (see NCA, below) and beginning publication of the *Journal of Communication* a year later, this became ICA (http://www.icahdq.org) in a 1968 reorganization. From its inception, ICA has focused on research. Fifteen years after its formation, it had about 500 members, most focusing on organizational or mass communications. Another reorganization in 1974 led to the journal being edited by George Gerbner for many years, and a substantial focus on mass communication while two other journals with theoretical and quantitative methodology interests were begun at the same time. ICA now has several thousand members, and assisted in the publication of a 12-volume encyclopedia of the entire field in 2008.

Journalism Education Association

Of the groups listed in this entry, only JEA (http://www.jea.org) focuses on journalism education at the high school level. Founded in 1924, its more than 2,000 members in the early 2000s included high school journalism teachers and publications (newspaper and yearbook) advisers, media professionals, press associations, adviser organizations, libraries, yearbook publishing companies, newspapers, radio stations, and high school journalism programs. They represent the growing number of high school journalism programs, many of which include the publication of school newspapers. Its conferences focus on improving both.

National Communication Association

The National Association of Academic Teachers of Public Speaking, formed in 1914, was the first American communications-related academic association. Paralleling changes in academic research and teaching, it would go through five changes of name over the years, finally becoming the National Communication Association (http://www.natcom.org/nca/Template2.asp?sid=9) in the 1990s. While it has very broad interests (its divisions include those focused on rhetoric and public address, debate, and theater, for example) it has for many decades included one division focused on mass communication. Its major research journal, now *The Quarterly Journal of Speech,* has appeared under various titles since 1916. In 1984, it added to its several journals one that was focused on mass media, *Critical Studies in Mass Communication.* NCA has some 7,000 members, most of whom teach in and conduct research about speech and rhetoric.

Society for Cinema and Media Studies

Founded in 1959, SCMS (http://www.cmstudies.org/index.php?option=com_frontpage&Itemid=1) is a scholarly organization of college and university educators, filmmakers, historians, critics, scholars, and others devoted to the study of the moving image.

They are involved in various fields of study, including film or cinema studies, television studies, media studies, visual arts, broader cultural studies, film and media history, new media, and studies of the moving image. While its primary interest lies in the entertainment film, some of its work includes or even focuses on nonfiction, documentary, and journalistic cinema and television. SCMS publishes the quarterly *Cinema Journal.*

University Film and Video Association

Since 1947, the University Film Producers Association, now the UFVA (http://www.ufva.org), has developed into an organization of almost 800 professionals and institutions involved in the production and study of film, video, and other media arts. The UFVA is an international organization where media production and writing meets the history, theory, and criticism of the media. UFVA members include image-makers, artists, teachers, students, archivists, distributors, college departments, libraries, and manufacturers.

Access to Media

This entry concerns an individual's right to speak through privately owned media and the availability to the public of diverse views. It reviews the development of the concept of "access" to media and how that concept applies to print and electronic media. The increasing opportunities for journalists and others to contribute to what some call the "marketplace of ideas" raise a host of complex legal issues as well as concerns important to democratic deliberation.

The phrases "right to know" or "right to access media" do not appear in the U.S. Constitution, but they are not empty slogans. The Supreme Court, Congress, and federal regulators have all recognized the concept of listener or viewer rights and the importance of access to diverse sources of information in the large body of court decisions regarding the First Amendment, as well as in legislation and regulation requiring speaker access to certain media. While this entry focuses on access to media in the United States, this concept is also expressed in Article 19 of the United Nations Universal Declaration of Human Rights (1948), which states: "Everyone has the right to freedom of opinion and expression: this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers." Whether UN declarations, U.S. free speech jurisprudence, or media policies will or should change in an era of digital communication is the subject of considerable debate. And whether access to media is even salient as Internet communication becomes more available is also the subject of considerable debate.

In general, while the founders advanced the access of citizens to media by subsidizing the distribution of newspapers through the postal service, their concern was to make print publications available to the general public. Debate over the obligations of media owners to allow public access to their communications services did not begin until the federal government began to license broadcasters, and provide protections and impose limits regarding who controlled stations in a community. A very limited right of access would be applied to broadcasting and media distributing broadcast signals, such as cable and satellite. But arguments that similar access rights should be extended to print media would fail. The debate over access to media was informed by notions about "free speech" that developed in the early 1900s.

Early Free Speech Jurisprudence

Few Americans cited the First Amendment's prohibition of government abridgement of speech, or even proposed a right to access media for the first hundred years of U.S. legal history. The beginnings of free speech jurisprudence in the United States were not encouraging. For example, Thomas Patterson, a U.S. senator and newspaper publisher in Colorado, was charged with criminal contempt for criticizing a court decision in his home state that

reversed a Denver election. In *Patterson v. Colorado* (1907), the Supreme Court upheld the state court's ruling against Patterson. Writing for the majority, Oliver Wendell Holmes ruled that the First Amendment does not limit punishment for speech whether the speech is true or false. In another Holmes opinion, *Fox v. Washington* (1915), the Court upheld the conviction of a writer who had endorsed a boycott of opponents of nude bathing. And in 1919, Holmes wrote for a unanimous Court in *Schenck v. United States* (1919), ruling that it was illegal to distribute fliers opposing the draft during World War I because, as Holmes put it, Charles Schenck's leaflet was akin to "falsely shouting fire in a theatre and causing a panic" and was thus "a clear and present danger" to the public.

That same year, Holmes issued his famous dissent that many consider the birth of modern free speech jurisprudence regarding access to media. In *Abrams v. U.S.* (1919) the Court held that criticism of U.S. involvement in World War I was not protected by the First Amendment, because the leaflet at issue advocated a strike in weapons production and the violent overthrow of the government. Holmes argued that the "surreptitious publishing of a silly leaflet by an unknown man" did not present a clear and present danger. Although Holmes's reasoning in *Abrams,* focusing on the weak voice of the speaker, has been ignored by subsequent courts, this part of his dissent survives: "But when men have realized that time has upset many fighting faiths, they may come to believe even more than they believe the very foundations of their own conduct that the ultimate good desired is better reached by free trade in ideas—that the best test of truth is the power of the thought to get itself accepted in the competition of the market, and that truth is the only ground upon which their wishes safely can be carried out."

Holmes's views regarding a "free trade in ideas" would not be fully embraced by the Supreme Court for another 20 years. The U.S. Post Office would regularly confiscate mail it deemed objectionable from pacifists, birth control advocates, and the NAACP. Free speech jurisprudence would be advanced both by a very different Supreme Court dominated by Franklin Roosevelt appointments and by the emergence of a new medium that would challenge the newspaper industry's dominance of the marketplace of ideas.

Oliver Wendell Holmes circa 1907. Holmes's early-twentieth-century rulings and dissents from the Supreme Court would affect free speech issues long after his tenure on the Court.

Early Broadcasting Regulation

A right to media access, a right to access the marketplace of ideas through a medium controlled by another private party, became salient in the United States with the beginnings of broadcasting. Understanding the history of both the unique licensing and commercial regime of broadcasting as they developed in the United States is important to understand the foundation for a right to access media.

The regulation of radio began in response to the sinking of the *Titanic*. The press provided the public sensational stories of the celebrities and millionaires who drowned or were saved by the heroic Marconi operators as they relayed messages to shore. Congress responded with the Radio Act of 1912, which required a federal license to transmit radio signals. Though there was earlier regulation of certain ocean-going

ships requiring radio communication, the 1912 act established the basic pillars of U.S. broadcast law: federal control over the airwaves, the link between radio transmission and the public good, and federal licensing to limit interference. Almost a thousand existing transmitting stations were licensed within the year. The law however did not give the executive branch the right to refuse a license. Despite this loophole, many amateurs continued to operate without bothering to obtain federal permission. While most users were sending Morse code, a few were actually sending voice signals.

In the years immediately after World War I, Radio Corporation of America (RCA) stockholders General Electric and Westinghouse engaged in radio transmission as a way to promote the sale of the radio receivers they manufactured. While other commercial operators were not in the business of making or selling radio equipment, they saw radio as a way to draw attention to their grocery store or newspaper; they were not engaged in selling air time for others to advertise products or services. In 1920 the operators of a Westinghouse-owned transmitter in East Pittsburgh broadcast results of an election to a few listeners. The new experiment in programming was heralded in newspaper stories across the country, and the Department of Commerce adopted broadcasting as a new class of service and began issuing licenses in 1921, slowly at first but exceeding 500 by 1922.

In the early 1920s, most radio stations operated unreliably and with limited range, transmitting their signals only a few miles at best. The vast majority of the licensees were not affiliated with the RCA combination; they were schools, local churches, labor unions, or ethnic organizations, directing their programs toward communities not much beyond the neighborhood of the transmitter. Much of what was broadcast reflected the interests of the licensee, and most of the programming was live and recorded music, but also on the air were religious services, local and national political discussions, and "nationality hours" with news from other nations, such as Germany or Italy, and often in languages other than English. Given its limited power radio's beginning suggested a medium that would focus on the needs of communities sometimes ignored by local newspapers. Early radio was to some extent a technological solution to the limited access to the public at large provided by newspapers and the Associated Press wire service.

In 1922, AT&T, a partner in the RCA combination, experimented with something it called "toll" broadcasting at its New York station WEAF. Individuals and corporations were invited to come into the broadcast "toll" booth and send out, for a fee, any message they wanted. This was the beginning of commercial broadcasting as we think of it today. The RCA allies soon began to adopt the AT&T business model.

Almost as soon as he was appointed in 1921, Secretary of Commerce Herbert Hoover was bombarded with letters and petitions from the emerging commercial broadcasting industry regarding wireless interference. The commercial broadcasters argued that chaos was on the way if something was not done to resolve the problems of interference.

Hoover expressed strong reservations regarding his powers to regulate broadcasting. But at the second of four conferences on radio he called in 1923, Hoover was compelled to regulate station hours, transmission power, and frequency. The attendees, mainly commercial operators, resolved that regulation was necessary because their businesses would suffer if they could not broadcast with greater power and less interference. The emerging commercial broadcast industry argued for limits on broadcast licensing to support their ability to generate revenue. Hoover responded with a reallocation of the spectrum that would stand for years to come.

However, when Hoover sought to penalize a Chicago station owned by Zenith for operating on an unauthorized frequency, a federal court in Illinois ruled in 1926 that the 1912 act did not permit him to deny the license. Congress was pressed to address this problem and so it passed the Radio Act of 1927, reaffirming the intent of the federal government to exercise exclusive control over radio transmission and to issue licenses for the use of designated frequencies, reserving spectrum ownership to the public. A newly formed Federal Radio Commission (FRC) would have legislative, executive, and judicial authority—and the power to revoke licenses. In addition to a new "independent" bureaucracy to manage the airwaves, Congress introduced a new term—"the

public interest." Hoover had expressed this concept in a speech before his 1925 radio conference:

> The ether is a public medium, and its use must be for a public benefit. The use of a radio channel is justified only if there is public benefit. The dominant element for consideration in the radio field is, and always will be, the great body of the listening public, millions in number, country wide in distribution.

In March 1927, as the FRC was being formed there were 732 radio broadcast stations in the United States, more than 600 of them independent and unaffiliated with the RCA trust. A year later the FRC described the public interest requirement as follows:

> [Despite the fact that] the conscience and judgment of a station's management are necessarily personal…the station itself must be operated as if owned by the public…It is as if people of a community should own a station and turn it over to the best man in sight with this injunction: "Manage this station in our interest." The standing of every station is determined by that conception.

In August 1928, the FRC issued General Order 40, which set aside 40 "clear channel" frequencies where commercial broadcasters would be able to operate nationwide at very high power, 34 channels for regional broadcasts, and 30 low-power channels in each of the five zones. Twenty-three of the first 25 "clear channel" stations were affiliated with RCA/NBC, and the 6 percent of stations untouched by the massive reallocation were affiliated with either the National Broadcasting Company, which operated two networks, or the Columbia Broadcasting System. General Order 40 also created a process where anyone could challenge an existing broadcaster for a frequency assignment every three months. Beyond the technical capacities of applicants, the FRC established a two-step test as the basis for determining the outcome of a challenge: Was the broadcaster inclined to serve itself or listeners? And were the intended station listeners representative of the entire listening public or a specific audience? As the commission noted: "There is not room in the broadcast band for every school of thought, religious, political, social, and economic, each to have its separate broadcasting station, its mouthpiece in the ether." Thus, the doctrine of scarcity of broadcast licenses and service to a wide public reflected the interests of commercial broadcasters. General Order 40 would become the foundation for a set of FCC policies known as the Fairness Doctrine. The 1927 Radio Act was updated and enlarged in the 1934 creation of the Federal Communications Commission (FCC).

Much of Franklin Roosevelt's success in his first two elections has been attributed to his access to the public through radio, overcoming the near rabid opposition to his policies expressed by the most widely read newspaper publishers. Despite Roosevelt's fondness for the radio industry, the Great Depression spurred increased regulation of large corporations, including the radio trusts. Roosevelt's appointed FCC chairman, James Lawrence Fly, would complete a review of the networks (called "chains") and their influence over local stations.

The initial *Report on Chain Broadcasting* was released in 1941 and put into effect in 1942. The report found that NBC used its two networks to suppress competition. And it found that the CBS contract with affiliates, wherein it held an option to take over any period in the affiliate's schedule, amounted to a surrender of control and a violation of the station's license to serve its community. To correct these abuses the FCC ordered: "No license shall be issued to a standard broadcast station affiliated with a network organization which maintains more than one network." The FCC also ruled that the local station had the unquestioned right to reject any network offering.

The networks took the FCC to court. In 1943 the Supreme Court handed down a victory for the nine-year-old FCC using the very argument commercial broadcasters used to convince Hoover to regulate radio frequencies. After a review of the relatively new history of federal regulation of the airwaves, and the still recent experiences of interference, Justice Felix Frankfurter, writing for the Court in *NBC v. U.S.* (1943), ruled that the FCC had the authority to establish regulations in line with what they determined was in the public interest. As to whether such regulations abridged the broadcasters'

free speech rights, Frankfurter wrote: "The Regulations, even if valid in all other respects, must fall because they abridge, say the appellants, their right of free speech. If that be so, it would follow that every person whose application for a license to operate a station is denied by the Commission is thereby denied his constitutional right of free speech. Freedom of utterance is abridged to many who wish to use the limited facilities of radio. Unlike other modes of expression, radio inherently is not available to all." The doctrine of broadcast scarcity was thus firmly established as was the rationale for the unique set of media access requirements imposed on broadcasters.

Redefining the Public's First Amendment Rights

The radio trusts were not the only media conglomerates subject to federal scrutiny during the Roosevelt years. In 1945 the federal government determined that the Associated Press (AP) contract with its affiliated newspapers was a violation of the Sherman Act antitrust rules. AP argued that the government was in violation of the free press clause of the First Amendment. Writing for the majority in *Associated Press v. U.S.* (1945), Justice Hugo Black ruled against AP and clarified that freedom of the press was not designed to serve the private press. "The First Amendment," he wrote, "rests on the assumption that the widest possible dissemination of information from diverse and antagonistic sources is essential to the welfare of the public, that a free press is a condition of a free society."

Neither Black's nor Holmes's ideas about free speech have meant a right to access either public or private forums without restriction. In general, government can limit the time, place, and manner of speech if those restrictions are not because of the impact or intent of the speech. In other words, the restrictions must be content-neutral. Even if the speech occurs in a public forum, such as a park or a city street, the government may impose narrow restrictions if it can show that the regulation is necessary to address a significant government interest. In *Schneider v. State* (1939) the court held that mere administrative convenience (keeping the streets clean of leaflets) was not sufficient to prohibit speech. However, a ban on posting signs in public places to prevent "visual blight" was deemed a significant government interest in *Los Angeles v. Taxpayers for Vincent* (1984), and that a city has a substantial interest in protecting citizens from unwelcome and excessive noise (*Ward v. Rock Against Racism,* 1989). Both crowd and traffic control may justify limiting access to public forums.

There is a limited right of access to semi-public forums, such as schools, libraries, and fairgrounds, as long as the expression is compatible with the normal activity of the place. And while there are those who argue that government enforcement of limits placed on access to shopping centers and lecture halls inhibits the "free trade of ideas," in general there is no right of access to these private forums. Nor is there a right of access to one of the most important channels of communication, newspapers. Broadcast media are an important exception to this rule.

As stated earlier, commercial broadcasters lobbied for the responsibility to use the frequencies to which they were licensed to provide service to the entire community as a way to distinguish them from the independent ("noncommercial") broadcast operations. The resulting regulation is often characterized as the "public trustee" concept of broadcast regulation.

The concept of broadcaster as public trustee was most controversial in the implementation of FCC policies that became known as the Fairness Doctrine. Though applied in earlier cases, the broad understanding of the Fairness Doctrine was stated by the FCC in 1949 as a requirement that broadcasters present controversial issues of public importance, and that such issues must be presented in a fair and balanced manner. In 1959 Congress amended the 1934 Communications Act by adding: "Nothing in the foregoing sentence shall be construed as relieving broadcasters…from the obligation imposed upon them in this chapter to operate in the public interest and to afford reasonable opportunity for the discussion of conflicting views on issues of public importance."

The Fairness Doctrine was a powerful symbol, even the National Association of Broadcasters adopted much of its language in a "Code of Conduct" local broadcasters adopted and boasted of it on the air until the mid-1980s. The Supreme Court ruled that the Fairness Doctrine was constitutional in 1969 in resolving a conflict between two lower court rulings. One ruling involved a

Pennsylvania radio station operated by the Red Lion Broadcasting Company; the other ruling resulted from a suit brought by the Radio Television News Directors Association (RTNDA) claiming that the Fairness Doctrine was a violation of the First Amendment. In *Red Lion Broadcasting v. FCC* (1969), Justice Byron White reiterated much of Frankfurter's language from the *NBC* decision, but clarified that the First Amendment right of the broadcasters was subject to a balancing test, "the people as a whole retain their interest in free speech by radio and their collective right to have the medium function consistently with the ends and purposes of the First Amendment. It is the right of the viewers and listeners, not the right of the broadcasters, which is paramount."

As important as the Fairness Doctrine was in establishing the First Amendment rights of listeners, it left those listeners powerless to complain to the FCC about how the broadcast licensees were serving them. This limitation was addressed when the United Church of Christ–Office of Communication and a Jackson, Mississippi, chapter of the NAACP sued the FCC over the racist actions of WLBT. Writing for the Court of Appeals (D.C. Circuit) in *UCC v. FCC* (1966), Warren Burger shook the broadcasting industry: "in order to safeguard the public interest in broadcasting…we hold that some 'audience participation' must be allowed in license renewal proceedings." Burger delayed his ascension to the Supreme Court to admonish the FCC and take away WLBT's license in 1969 in part because of the station's violation of the Fairness Doctrine.

A *Right* to Access Media?

The media environment has changed significantly since the early 1790s when the marketplace of ideas was dominated by small printing presses. This change was noted by the Supreme Court as early as the *Associated Press* case of 1945, and in 1947 a Commission on Freedom of the Press led by the great educational scholar Robert Hutchins stated that "[t]he right of free public expression has…lost its earlier reality." Press monopolies in many markets combined with the introduction of new forms of communication, such as radio, also subject to local monopolies, were seen to constrict the free speech rights of the public.

In an influential *Harvard Law Review* article, Jerome Barron argued in 1967 that the time had come to establish a right of access to the press. In 1973, Barron had the opportunity to make his case before the Supreme Court as the lead attorney supporting a state "right of reply" statute in *Miami Herald v. Tornillo* (1974). The dispute centered on a Florida statute that provided that any candidate for nomination or election criticized by a newspaper had the "right of reply" free of charge, and that the reply must appear in as conspicuous a place and in the same type as the initial criticism. Pat Tornillo, the executive director of the Classroom Teachers Association and a candidate for the Florida House of Representatives, invoked the "right of reply" statute in response to *Miami Herald* editorials critical of him. The state supreme court upheld the statute, but the U.S. Supreme Court reversed. For a unanimous court, Chief Justice Warren Burger wrote that "the Florida statute fails to clear the barriers of the First Amendment because of its intrusion into the function of editors. A newspaper is more than a passive receptacle or conduit for news, comment, and advertising." The limited right of access applied to broadcast licensees would not apply to newspapers.

But to read *Red Lion* or *UCC v. FCC* as establishing a right to access broadcast media that might be enforced through public participation would be wrong. In *Columbia Broadcasting v. Democratic National Committee* (1973), the Supreme Court ruled that neither the Communications Act nor the First Amendment *requires* broadcasters to accept paid editorial advertisements. The Business Executives' Move for Vietnam Peace (BEMVP) filed a complaint with the FCC, alleging that a broadcast station's refusal to sell it time to broadcast spot announcements expressing the group's views on the Vietnam conflict was a violation of the Fairness Doctrine. Washington, D.C., station WTOP established a policy of refusing to accept paid announcements on controversial issues. In its defense, the station argued that it presented full and fair coverage of the Vietnam conflict. The FCC rejected BEMVP's Fairness Doctrine challenge and ruled that a broadcaster was not prohibited from having a policy of refusing to accept paid editorial advertisements. The Supreme Court upheld the FCC ruling and supported its authority to determine Fairness Doctrine violations on a case by case

basis. Organizations such as MoveOn and the United Church of Christ engaged in battles in the early 2000s over the policies of many broadcast and cable operations prohibiting the airing of advertisements on public policy issues they deem controversial.

In 1987, the FCC announced it would no longer enforce the Fairness Doctrine on the grounds that it actually limited or "chilled" free speech. The FCC was supported in its decision by the U.S. Court of Appeals for the D.C. Circuit decision in the case *Syracuse Peace Council v. FCC* (1989). In every congressional session since *Syracuse Peace Council* a few legislators introduce bills to reinstate the Fairness Doctrine, and there are still regulations reflecting the underlying rationale for that doctrine, such as the rules on candidate appearances and political advertising, that remain in effect. The Communications Act authorizes the FCC to require "reasonable access to or to permit purchase of reasonable amounts of time" by a legally qualified candidate for federal elective office, and equal opportunities must be afforded all other candidates for that office. And Section 315 of the Communications Act still requires commercial broadcasters "to operate in the public interest and to afford reasonable opportunity for the discussion of conflicting views of issues of public importance."

Access to Cable and Satellite Services

Even as First Amendment jurisprudence regarding media access was becoming clearer for broadcast and print media a new medium was taking shape. While cable television was nearly as old as broadcast television it was largely limited to an antennae service in those communities with reception problems. "CATV" (Community Antenna Television) was the name initially given to the technology now more commonly known as cable television. In the mid-1960s cable television combined with two-way closed-circuit television technology to fire the hopes of free speech advocates and regulators. Cable visionaries imagined a media environment that offered perhaps three or maybe even ten times as many television channels as the three or four channels available in most communities. Moreover, these visionaries anticipated "wired communities" where every interest, every minority group could be served, and where citizens and their elected officials could engage in live two-way dialogue over important local issues.

In 1969, the FCC issued its *First Cable Report & Order* (1969), stating that leasing channels on a first-come, first-served, nondiscriminatory basis was a way to promote First Amendment goals, especially desirable "[i]n view of the importance of an informed electorate and speech concerning public affairs to self government, the right of the public to receive suitable access to social, political, aesthetic, moral and other ideas and experiences, and the CATV systems' monopoly position over cable access to the subscribers' premises." The FCC did not, however, craft specific rules regarding leased access until 1972. The Supreme Court sustained only the provisions requiring that cable operators originate some of their programming locally in *United States v. Midwest Video Corp.* (1972). The FCC attempted another set of orders in a 1976 *Report & Order,* again requiring Public, Educational, and Government (PEG) channels to be set aside. In 1979, the Supreme Court again ruled that the FCC had overreached its authority under the 1934 Communications Act (*FCC v. Midwest Video Corp.,* 1979). Although the Court did not reach the cable operators' First Amendment claims, it noted in a footnote that the lower court's First Amendment discussion (finding the FCC rules in violation of the First Amendment) was not "frivolous."

In 1984 Congress stepped in. Section 612 of the Cable Communications Policy Act of 1984 provided for commercial leased access with the express intent of providing cable "subscribers with the diversity of information sources intended by the First Amendment." However, "[t]he diversity envisioned by this scheme is to be brought about in a manner which is not inconsistent with the growth and development of cable systems." In other words, a right of leased access would be subject to a demonstration that such access did not harm the financial interests of the cable operator. And public or PEG access would be *allowed,* subject to the negotiation of the local franchising authority, but not mandated.

As the Court acknowledged in *Time Warner v. FCC* (1996), "The 1984 legislation did not accomplish much. Unaffiliated programming [programming from sources entirely independent from the

cable operators] on leased access channels rarely appeared." Amendments enacted in 1992 authorized the FCC to establish a maximum price for leased access, to regulate terms and conditions, and to establish procedures for the expedited resolution of disputes. Congress also repeated its intent that leased access would "promote competition in the delivery of diverse sources of video programming." And in upholding the FCC provisions regarding leased access, the Court also referred again to Justice Black's language in *Associated Press* (Lampert 1992).

The 1992 Cable Act also affirmed that the FCC was authorized to require direct broadcast satellite service (DBS) operators to abide by certain remnants of the Fairness Doctrine: "reasonable access" for federal candidates and "equal time" for all political candidates. In addition, the court in *Time Warner* upheld those provisions of the 1992 act which authorizes the FCC to require DBS operators to "reserve a portion of its channel capacity, equal to not less than 4 percent nor more than 7 percent, exclusively for noncommercial programming of an educational or informational nature." The FCC's regulation places the selection of programmers who appear on these channels in the hands of the DBS operators. DBS operators, like broadcasters, are able to choose the diversity their viewers have access to.

Access to the Internet

Many think the greatest hope of media access may be offered by the Internet. In *Reno v. ACLU* (1997) the Supreme Court noted: "Access to most Web pages is freely available, but some allow access only to those who have purchased the right from a commercial provider. The Web is thus comparable, from the readers' viewpoint, to both a vast library including millions of readily available and indexed publications and a sprawling mall offering goods and services.... From the publishers' point of view, it constitutes a vast platform from which to address and hear from a worldwide audience of millions of readers, viewers, researchers, and buyers. Any person or organization with a computer connected to the Internet can 'publish' information." In affirming a lower court ruling that two provisions of the Communications Decency Act of 1996 violated the First Amendment prohibition against government abridgement of speech, the Court granted the Internet the highest protections against federal regulation. In part because it is "unlike radio, [the Internet] receives full First Amendment protection." Many legal scholars argue that this decision means that those companies that control access to Internet services are not subject to government regulation.

The apparent openness of Internet communication recalls the openness and chaos of the early days of radio before federal regulation. As Internet service providers, telecommunications companies, and other media began to find ways to generate revenue from Internet activity, the limits to access became clearer. Commercial Internet service providers began to prefer customers who offer opportunities for financial gain. Chat rooms developed non-negotiable rules for user conduct and began to monitor and edit user activity. Many websites began to introduce code that limited user access to material on their once open site. As some video and interactive services began to require greater bandwidth and speed, telecommunications companies—many telephone and cable operators—began to limit access by creating different tiers of service with faster service and fewer controls for those who would pay more. What began as a commons, an open environment with rules and capabilities applied equally, has to some extent become a series of walled gardens (Lessig 1999).

As the Supreme Court noted in *Reno,* the Internet offers expanded opportunities to communicate, but there are important limits. If one is insulted on an Internet website, one will likely be able to find or create a website to respond, but there is no right to reply on the site where the insult was launched. Internet service providers have no obligation to allow every paying user the ability to read or watch or listen to the Internet. A telecommunications company is not required to allow a potential publisher of an article or producer of a movie access to distribute on the Internet. Although the FCC has articulated a set of guidelines that suggest network operators provide nondiscriminatory access to all lawful content, services, and equipment, these guidelines are not binding. There is considerable debate over whether legislation that would enforce "net neutrality"

would stifle access because it may limit the revenue Internet operators can generate, or whether it would increase access because it would generate greater innovation of Internet technologies. At present, there is no *right* to access a privately controlled website or Internet service such as a chat room or a weblog (blog).

The public debate of ideas, the democratic deliberation dreamt of by the founders, is both limited and expanded by privately mediated communication mechanisms such as newspapers, radio, and the Internet. The obligation of media to provide the public with diverse discussion in accordance with a relatively modern interpretation of the First Amendment is broadly stated in law, but very limited in the regulation. In our complex media environment of print, broadcast, cable, and Internet communication, there is no effective right of access to mediated public debate despite the continued salience of media access as a political concept.

ADVERTISING

Advertising has had a profound influence on American journalism. An enormous portion of media in this country have been advertising-supported. The implications of this are many, including the need for journalists to appeal to broad audiences, making their publication more attractive to advertisers. Of course reliance on advertisers has created challenges regarding how the news is reported. To truly understand the impact of advertising upon journalism, it is important to define what advertising is and what it is not.

Definition

Advertising is, according to Jef Richards and Catherine Curran, "a paid, mediated, form of communication from an identifiable source, designed to persuade the reader [listener, or viewer] to take some action, now or in the future." The term *mediated* means that some intervening medium like television or a newspaper or the Internet conveys the message from sender to receiver, as opposed to direct "in-person" communication. The term *identifiable source* distinguishes advertising from anonymous communications, such as those often found in unsolicited e-mail or spam. The *action* can be buying a product or service, but it also can be directed at voting behavior, or social behavior like recycling, saving money, saving the whales, or preventing abortion.

One aspect of this definition that clearly makes advertising stand apart from most concepts of journalism is the phrase "designed to persuade." The persuasive purpose of advertising is unambiguous. Further, advertising is distinguished from journalistic content since it is purchased, rather than decided by editorial opinion. Still, the two fields share a long history.

The Evolution of Advertising and Journalism in the United States

U.S. mass media developed a for-profit model funded predominantly by advertising. The result is a symbiotic relationship of media and advertising, whereby people rely on mass media for information and entertainment, and media depend on audiences to attract advertisers. Most media cannot financially survive unless they are able to deliver an audience that advertisers want and are willing to pay to reach.

As a consequence, advertising-supported media equates success with audience delivery. As the editor of *Ladies' Home Journal* said in 1898, "It is the growth of advertising in this country which, more than any single element, has brought the American magazine to its present enviable position in points of literary, illustrative and mechanical excellence. The American advertiser has made the superior American magazine of today possible" (quoted in Wright). In spite of this dependence on advertisers, and acknowledging that advertisers do have some influence on media content, most news media organizations strive to maintain a separation between advertisers and editorial content.

Advertising, it can be argued, was born of journalism's need for economic support. As a separate business, the modern concept of advertising emerged just over a century and a half ago.

In 1841, while selling ad space for a newspaper in Philadelphia, Volney Palmer realized the profit potential of independently buying and reselling prime newspaper space. Using that concept, he left his job to form the first advertising agency. In 1875, N.W. Ayer became the first agency to charge a *commission* based on the "net cost of space." By the end of the nineteenth century, advertising agencies such as J. Walter Thompson and Lord & Thomas (the predecessor to today's DraftFCB agency) began to develop and produce the ads for their clients (the advertisers) as a way of adding value to their media buying operation.

The role of advertising agencies has evolved concomitant with media technology. When radio became broadly available in the 1930s, advertising agencies provided clients with the means to sell products by sponsoring radio programs. Advertisers funded the programs while advertising agencies developed and produced the most popular network programming. The term "soap operas" reflects the fact that many early radio daytime dramas were owned by Procter & Gamble, a seller of soap products. The sponsorship model also ensured radio programming was primarily entertainment-driven, to attract large audiences.

The growth of television, starting in the late 1940s, had a dramatic effect on the advertising industry. Many advertisers made the transition to television. For example, the Kraft company began sponsoring the Kraft Television Theater in 1947. Indeed, by 1950 sponsors were moving *en masse* from both network and local station radio to television. Television was far more expensive than radio, however, posing a serious challenge to the agencies' commission structure. The prevalence of advertiser-produced programming ended during the late 1950s because some sponsors were condemned for manipulating the outcomes of popular quiz shows in order to create buzz and draw in more viewers. To appease public apprehension, networks moved to take more control of the programs they aired.

The 1959 quiz show scandal highlighted the public's perception that advertiser greed outweighed the integrity of program content. By assuming control of content, broadcast networks sought to reassert the image of media as an impartial provider of content. This impartiality was enhanced by federal regulations that ensured balanced presentation of political views and relatively neutral news broadcasts. Consequently, during the 1960s, mass media managed to portray advertising and programming as separate.

As the networks assumed the role of content providers, the advertising agencies developed an "all media" structure, divesting themselves of their programming responsibilities and focusing on creating advertising messages and buying space and time in a broad range of media. And instead of funding a single show, they purchased shorter time periods (at first 60 seconds, and later 30 seconds or less) across multiple programs. In this manner, advertisers continued to have economic power over content, selecting programs on the basis of audience delivery as well as whether or not they provided a suitable environment for their messages. By demanding both, advertisers still were in a position to determine the fate of television programs. Controversial programs risked advertiser boycotts and inevitable cancellation.

During the 1980s, media deregulation gave rise to a plethora of cable networks seeking advertisers. Unrestrained by broadcast regulations, cable networks offered advertisers an opportunity to reintegrate their messages into television programming. In fact, consolidation of media ownership, together with developing cable television networks, allowed advertisers to negotiate with companies that bundled an assortment of media into single packages, creating one stop shopping. The 1980s also gave rise to product placement, whereby advertisers could pay to have their products used by actors within entertainment programs. Once again, the lines between content and advertising were blurring.

The evolution of corporate media empires also had significant impact on the role of televised journalism. News departments became designated profit centers and were required to attract advertisers in their own right. Inevitably, television journalism began to share similarities with entertainment programming. Both departments had to provide audiences and environments that were suitable for advertisers.

Interestingly, however, the rise of cable television created new opportunities for journalism. The increased competition allowed cable networks to carve out market segments that were very appealing to advertisers, rather than court a broad audience. For instance, advertisers sought opportunities to address the educated, upper income men who frequently formed the bulk of cable news viewership. Cable made this narrower "targeting" by advertisers possible. In fact, cable news became adept at providing programming to attract specific audiences beyond the traditional news audience.

The rise of media conglomerates also had an enormous impact on the structure of advertising agencies. The media companies achieved greater negotiating power, putting agencies at a disadvantage. To compete, agency media buying operations needed a broader base of clients with a wide range of media needs. But media departments had a hard time acquiring new clients without risking conflicts of interest with existing clients. To avoid potential client conflicts, many advertising agencies split off their media buying function, allowing them to operate independently from the rest of the agency. Although most agencies maintained control of media planning, the separate media buying agencies began assuming greater planning responsibility.

During the 1990s, the introduction of Internet browsers once again changed the way Americans sought information and entertainment. This new medium, too, sought advertising support. Simultaneously, the Internet spurred a migration of newspaper readers to digital media, creating a crisis within the journalism-based industries. Lost readership translated into lost advertising revenues for newspapers. To compensate for lower revenue, newspaper owners sought new business models involving, among other things, lower costs (fewer reporters) and more sensationalism (to generate readers). Meanwhile, advertisers sought to measure the online audiences and the effectiveness of advertising messages in the new medium. A measurable audience is, after all, the basis of advertising sales. Effective advertising allows advertisers to take advantage of that audience.

While struggling to adjust to changing realities in the marketplace, advertising professionals also have changed the advertisements themselves. The messages conveyed, and the form they take, also evolved over the decades.

Seeking a Better Message

Research into advertising effectiveness, since the 1890s, has affected how advertisers communicate with audiences. Early efforts were crude by today's standards, but in 1904 John E. Kennedy defined advertising as "salesmanship in print." This concept drove message creation, as advertisements emulated the pitches of salesmen.

Unique Selling Proposition

In the 1940s Rosser Reeves introduced the concept of a unique selling proposition (USP), where an advertisement highlighted a specific benefit that distinguished one brand's product from its competition. Reeves believed the role of advertising was to make consumers aware of these unique, product-based, differences. This strategy remains effective when marketing a product that provides an obvious difference from competitors.

Increasingly, however, product-based advantages are both marginal and difficult to sustain, thanks largely to product proliferation. Consider,

for example, the number of brands and forms of laundry detergents. They are differentiated not only by format (powder, liquid, cakes), additives (e.g., fabric softener, bleach), or cleaning power (tough or gentle), but also by smaller distinctions, such as scent. While the fresh scent of lavender may be a distinct attribute, it might not motivate purchase. As differentiation among products became less significant, more advertising was focused on differentiating consumers rather than products.

Market Segmentation

Rather than market a product to a broad audience, many advertisers began focusing on how a brand could uniquely satisfy needs of one or more specific groups of consumers. Consumer needs vary by lifestyle, attitudes, or even aptitudes. An urban teenager usually has different wants and needs than a suburban soccer mom, so they likely use different criteria when evaluating cell phones, athletic shoes, and fast food. Depending upon the advertiser's intended or "target" market, the advertising message may promise different benefits or even use different language, graphics, and media.

As media became more fragmented, from a handful of television channels in the 1960s to hundreds four decades later, targeting a message to a specific market segment became easier. And emergence of "addressable" media such as direct mail and Internet marketing made "narrowcasting"—targeting a *very* specific audience—increasingly efficient and effective.

Positioning

In the 1970s Al Ries and Jack Trout introduced the concept of "positioning," which effectively combined segmentation with the USP approach. Their idea was to place a product within a specific context, or position, in the consumer's mind. For example, rather than compare gas mileage or acceleration, Volvo positioned its cars as the safe choice for responsible parents. Any parents who want a safe car to protect their children may search that "position" in their memories dealing with all things about safety, and they should recall that Volvo was linked with safety.

Advertising Effects

Advertising serves four functions in business and society. It is a marketing tool, a transmitter of information, an economic stimulant, and a purveyor of values. As part of the marketing mix, advertising communicates information about goods and services. It also adds product value by creating enduring "brands." Successful marketing campaigns stimulate demand and subsequent economic growth, but there are concerns regarding its effects on society.

Societal Impact

Among other concerns, critics believe advertising promotes materialism and encourages consumers to buy products they do not need. They also argue that advertising manipulates, perpetuates stereotypes, preys on children, is used to sell harmful products, and contributes to a variety of other social ills. It also is clear that in at least some instances advertisers exert financial pressure on media as a means of controlling or even censoring entertainment and editorial content in those media.

Those who defend advertising note that it is merely a tool, a form of communication that can be used for good as well as bad purposes, depending upon the advertiser. It is used not only to sell products, but also to gain donations for charities, as well as for other causes. And while advertising may deserve some blame for biasing media, it is not as simple as typically depicted. In fact, advertising is an enormous industry that is frequently defended by noting its economic contribution to society.

Economic Impact

Advertising is a global industry. In the United States alone, approximately $300 billion was spent on advertising during 2008. U.S. advertising revenues have accounted for approximately 2 percent of the GDP since 1950. Procter & Gamble, the leading advertiser, alone spent $5 billion during 2007. These expenditures affect everyone involved in advertising, including the advertisers, their agencies, and the media companies that provide advertisers with an audience.

For the market economy to work properly, consumers must be able to freely make informed

decisions in a competitive marketplace. Advertising provides that information and enhances competition. Furthermore, advertising reduces the time and cost for consumers to gather this information.

While critics suggest that advertising costs are passed along to consumers in the form of higher prices (as in prescription and other drugs, for example), in many cases it reduces prices by increasing sales volume. Increased consumer demand contributes to the economies of scale that reduce production costs and, consequently, consumer pricing. While these critics often believe advertising costs are a barrier to entry for new products, by increasing consumer demand advertising actually can stimulate competition in many cases. Advertising can be used to stabilize business cycles by generating uniform product demand and avoiding disruptive seasonal spikes and declines in volume, further reducing costs.

Advertising also can enhance product quality. By creating broad awareness of new products, advertising encourages diffusion of innovation and more rapid adoption of new technologies, thereby ensuring a steady stream of product innovation and improvement. Put another way, advertising can encourage introduction of new brands that compete on price or improved product attributes.

Finally, as mentioned above, advertising lowers media costs, allowing consumers to enjoy quality information and entertainment at a fraction of the production cost. For instance, "free" media such as broadcast television and radio, as well as much content on the Internet, would not exist as we know them today without the support of advertising, and even "pay" media such as newspapers, magazines, and cable television would cost much more.

Law and Ethics

Because advertising is a communication industry, the First Amendment of the U.S. Constitution limits government's role in regulating it. There are, however, regulatory standards imposed by the government to ensure fair competition and protect consumers from deception. The Federal Trade Commission (FTC) is the primary federal agency governing advertising. The FTC is primarily concerned with eliminating advertising deception. The Federal Communication Commission (FCC), too, is involved through its licensing and oversight of broadcast stations, having the authority to fine broadcasters for violating mandated standards. The Food and Drug Administration (FDA) monitors advertising claims regarding food and drugs.

In addition, in the early 1970s the advertising industry created a major self-regulatory mechanism designed to supplement government regulation. The National Advertising Review Council (NARC) of the Council of Better Business Bureaus accepts and reviews consumer complaints about advertising. It follows a process for charging advertisers with violating accepted standards, judging their compliance, and enforcing subsequent corrective actions. When an advertiser is found in violation of established standards, voluntary corrections are sought. Failure to comply then can result in an announcement of noncompliance sent to the FTC and to the media.

Areas of Advertising

Historically, advertisers worked with what are now called "full-service" advertising agencies. Full-service agencies provide a range of services to their clients, including research, marketing, creative, media planning, media buying, and advertising production. In recent years, though, more and more advertisers have taken an a la carte approach, seeking agencies that specialize in a narrower segment of the business. Those traditional segments include account management, research, creative, production, and media.

Account Management

Account executives provide the interface between agency and client. Within the agency they represent client needs, pursuing services necessary to provide adequate support. This includes working with the client to develop business objectives for the agency to meet. Once the agency has developed an advertising plan to meet those objectives, account management must sell the client on the merits of that plan.

Research and Account Planning

Effective advertising is usually based on solid research. Both quantitative and qualitative research

are used to provide information about product use and performance. Agencies conduct any necessary research through a research or account planning (also called strategic planning) department. Account Planning is a newer twist on traditional research departments, and it is seen as representing the voice of the consumer. In this capacity, the Account Planning team provides consumer insights to the creative team regarding how the brand is used and perceived, to help determine the best way to approach the consumer.

Creative

The Creative department is responsible for actually designing the advertisement. The "creatives" work with the Account Management team to understand the business objectives, and with the Account Planners to understand how consumers interact with the brand. They then develop a "creative concept" that will drive the campaign, which one or more art directors and copy writers then use to guide them in making the advertisements. Ultimately, the client must approve their work before it goes into production.

Production

Once a campaign is approved, the Creative department relies upon the Production department to produce the final ad. Production is responsible for recommending production companies and directors, negotiating contracts, and overseeing all production budgets. They work closely with the Creative teams to ensure that the final ads meet client expectations.

Media Planning and Buying

For advertisements to work, they must be seen by many prospective customers. The Media department must develop a plan that delivers the necessary consumer exposure within the confines of the client's budget. It recommends the media that should be used and the schedule to be followed to achieve each client's objectives. Because budget is the ultimate constraint, media prices are crucial to planning. Agencies that secure the best pricing can deliver more powerful plans, hence the rise of specialty agencies that do nothing but media buying. While most advertising agencies have maintained media planning departments, these specialty media buying agencies have assumed a greater role in recent years.

Alternatives

In addition to media buying agencies, clients have turned to a number of other alternatives to the full-service agency. Newer options include industry-focused agencies that specialize in certain subject matters like health care, while minority agencies provide clients with greater expertise concerning specific racial or ethnic targets. Interactive agencies provide corporate and brand website development, as well as expertise regarding all aspects of interactive marketing. Creative boutiques focus on creative planning, development, and execution.

Agencies are struggling with these specializations and other means of differentiating themselves from competitors, while at the same time mergers and acquisitions have been leading to a consolidation of the advertising business into a handful of multinational corporations. The industry, like the market, continues to change.

Advertising's Future

Society faces numerous changes in media that will continue to affect creation and delivery of advertising. One ongoing development is that consumers now enjoy mass media sources of an almost limitless range. Media, including television, radio, newspapers, and magazines, have splintered into greater specialization tailored to target specific demographics. No single television channel or network commands the share of audience it once did. Newspapers, radio, and magazines are no different, as there are now thousands of these targeting special interests, regional areas, local communities, and global audiences. Technological innovations have created new media (i.e., the Internet) and altered existing media. Each of these developments represents challenges for the advertising industry.

Nevertheless, advertising has survived economic recessions, wars, and industry scandals. It survives because it plays an essential role in American business. Advertising proved its ability to reinvent itself when radio broke into the media environment in the 1920s and 1930s. Its innovation required

advertising agencies to acquire new skills, restructure their organizations, and make significant investments in talent and technology. When television began to overtake radio, advertising again redefined its mission and developed a new direction. More recently, the emergence of media conglomerates, cable television, and interactive web-based media again has altered the advertising landscape. It is possible that smaller, more flexible, agencies will prove nimbler and more able to out-perform their larger counterparts. The large, global agencies may end up following rather than leading over the coming years. Regardless, in some form, advertising will continue to be an essential part of selling a product, service, or idea. And it is likely it also will remain a significant support mechanism for providing the public with entertainment, news, and information.

ADVERTORIALS

An advertorial is any form of paid editorial material that has been written, designed, and executed

so as to resemble a news story, editorial, or other content. Advertorials form two broad categories depending on their desired outcome. Political/corporate advertorials are published statements about a controversial issue, pending legislation, or a public affairs initiative. Rather than selling a product or service, political/corporate advertorials seek to persuade the reader or viewer to a certain point of view on a public issue. Consumer advertorials, by contrast, function in a manner similar to paid advertising. These consumer advertorials, frequently referred to as "special advertising sections," usually include lengthy written copy that conform to the style format for nonpaid editorial content. Consumer advertorials seek to directly sell a product or service, while corporate/political advertorials seek to advance a public relations objective. Both categories of advertorials can take many forms. An advertorial may be a single print or broadcast advertisement or it can be an entire special section of paid advertising designed to approximate the editorial style as well as the typographical look and feel of a newspaper or magazine's editorial content. Text copy and visual images within an advertorial may be created by the advertiser itself, by an advertising agency, or in some rare cases by the editorial staff of the publication. However, the space is sold as an advertisement; and the advertiser, not the editor, has editorial control over both text and images within the space. Most printed advertorials are clearly marked as advertising. Disclaimers may be as simple as the word "Advertisement" printed near the advertorial, or as ambiguous as legal text implying the content is paid advertising. However, some advertorials carry no disclaimer at all. Most print publications allow advertorials with restrictions, and most allow them to have a similar typography and style as their editorial content.

Evolution of Advertorials

Advertorials are likely as old as mass-circulation print publications. In the seventeenth and eighteenth centuries, wealthy patrons and aristocrats would pay printers for access to space in or near editorial content, usually in the form of letters addressed to the public. However, it is often difficult to distinguish between early advertorials and publicity advertisements. The practice of advertising firms creating and placing paid editorial content developed during the early twentieth century. The term *advertorial* may have been coined by advertising agencies themselves to avoid a negative reaction to a covert practice of influencing magazine editors. It first appeared in dictionaries in 1961.

Generally nationally distributed large metropolitan newspapers have been more associated with political/corporate advertorials because of their trusted editorial relationship with government leaders and corporate decision-makers. Advertising access to national newspapers (the *Wall Street Journal*) and large metropolitan dailies (*The Washington Post*) is expensive and involves more negotiation with the editorial staff and owners. Popular consumer magazines have traditionally been associated with consumer advertorials because of their national reach, slower production schedule, and special demographic relationship with their readers. As niche media, magazines have specific images and brands that are deeply linked to the relevance of their editorial focus to their readership. This brand connection is very valuable to a magazine's regular advertisers. The advertiser's product brand can be enhanced by the magazine's brand, and vice versa.

Thus consumer advertorials in magazines and other niche media allow advertisers to tailor a creative message to very specific audiences that can be both very diverse and very targeted; for example, an advertorial might target readers across different ethnic and class demographics who are the same age and topic interest level. An advertorial can be changed to match the readership of a specific magazine, while still retaining the marketing content of the overall advertising campaign. For example, an advertorial run annually in the *Arizona Republic* was designed to promote the local hockey team, an association of local restaurants, and a supermarket chain in a seamless campaign appealing to several related demographics while retaining an esthetic of soft news coverage. According to audience research in 2001 in *Mass Communication and Society,* the vast majority of both newspaper and magazine readers can easily differentiate between editorial content and advertorials, but tend to quickly forget the "advertising section" label. Marketing research by the Affinity Research Group has shown that a substantial majority of readers are less likely to read advertorials than a

periodical's editorial content. However, those readers who do read advertorials are far more likely to remember the product or take an action. Because of this unique retention factor, advertisers use advertorials as keystones in marketing campaigns because they allow longer portions of text to be published than standard advertisements, particularly for well-known brands.

Famous paid op-ed pieces in large metropolitan daily newspapers have evolved from simple letters written on behalf of boards and stockholders into sophisticated public affairs campaigns used by special interest groups. The contentious subject matter of political/corporate advertorials frequently receives both positive and negative press coverage from other journalists. For example, in 1999 the *Los Angeles Times* allocated their entire *Sunday Magazine* to the opening of the Staples Center, a new sports complex in which it had a financial interest. The publication admitted breaches in journalistic integrity, but continued the practice of advertorial placements. During congressional debates of politically controversial topics such as healthcare funding, reproductive rights, defense authorizations, and the impeachment trial of President Clinton, various political action groups have used political advertorials to forward their positions.

Reactions to Advertorials

Critics of advertorials believe that the practice is coercive because the placement in a print publication in or near editorial content implies endorsement or editorial oversight. Proponents of advertorials believe that the practice can enhance the brand of the publication and the product without damaging the journalistic credibility of the publication. Taken to a logical extreme, advertorials have been expanded to become independently published brand magazines and magalogs, hybrids of fashion magazines and catalogs. Well-known examples include *A&F Quarterly, Bloomingdale's,* and *Sony Style.* At the commercial extremes of corporate/political advertorials, media conglomerations have been accused of simply purchasing trusted news publications in order to gain editorial control of an entire newspaper. Well-known examples include the Hearst publications in the twentieth century, and News Corporation in the twenty-first.

The advertorial model has been applied to other media with limited success. Local radio stations sell large blocks of airtime to local advertisers who are given access to studios and production personnel and allowed editorial control within the operating practices of the station. The effectiveness of these sponsored time slots is limited and has not been embraced by advertisers in general. Local television stations and small cable networks also sell blocks of airtime for pre-produced advertising, usually in half-hour and hour time slots. The resulting "Infomercials" attempt to replicate the technical esthetics of regular programming, such as the talk show format or audience call-in format. While infomercials are largely reviled by audiences, the format can very effectively target specific demographics, particularly in niche cable programming. Advertising agencies that specialize in advertorials, magalogs, and infomercials pioneered the concept of "per inquiry" or "per order" advertising where the advertiser is paid for each individual action taken by a consumer. This practice has become a standard for online advertising, particularly paid search results and pay-per-click banner advertising.

The effectiveness of online advertorials is disputed. Many advertisers believe that readers can too easily bypass, block, or ignore online advertorials.

Cultural critics of advertorials believe they are an example of the erosion of the traditional "fire wall" between a publication or station's editorial and sales staff, and, furthermore, that advertorials are an example of the "creeping commercialism" within journalism and media culture. As narrowcast media such as print magazines, online magazines, and advertiser-supported weblogs continue to connect with their readership in a special way that emphasizes their particular editorial brand, it appears that some form of consumer advertorial will accompany them. As corporations and advocacy and political action groups grow more sophisticated they will continue to evolve the political/corporate advertorial into new forms of media distribution.

Advocacy Groups

Advocacy groups are an important part of journalism. They represent a wide range of stakeholders, many of which have a vested interest in journalistic performance and therefore often monitor news outlets very closely. Advocacy groups often will seek to influence the substance of news content either directly or indirectly via a wide range of means, including direct pressure or protests aimed at news outlets, or via pressure placed on news outlets' advertisers, or even via efforts to affect the regulations and policies that impact the news media. In these ways, advocacy groups represent an important, and potentially influential, collection of organizations that closely monitor the journalistic field.

Group Types

The term *advocacy group* can be applied to any collective with shared social or political objectives that actively seeks to influence relevant institutions in order to achieve those objectives. When assessing advocacy groups' relationship to journalism, news media can serve best as a mechanism by which advocacy groups publicize their goals. Any advocacy group, regardless of its specific cause, seeks positive media coverage for the group and its cause.

News coverage is a vital mechanism by which these groups make the public aware of their stance and possibly increase the group's constituency. It also helps legitimize their position in the minds of decision-makers, whether they are elected officials, administrative policymakers, or business leaders.

There is a wide range of organizations that focus specifically on the practices and institutions of journalism. The content of news, structure of news organizations, and relationship between journalism and the democratic process are all points of focus for a diverse and vocal advocacy community. Among the more well known of such groups are Fairness and Accuracy In Reporting (FAIR), Project Censored, the Project for Excellence in Journalism, Reporters Without Borders, the Society for Professional Journalists, and Free Press.

Some of these, such as FAIR, the Project for Excellence and Journalism, and Project Censored, are concerned primarily with monitoring and publicly critiquing the nature of news coverage. These "watchdog" groups seek to hold news outlets accountable to specific journalistic standards. Many watchdog groups have a strong ideological orientation, operating on behalf of a broader political agenda. There often are public duels over whether news media are too liberal or conservative. Many advocacy groups focus on specific elements of news coverage, such as political news, or news about the environment.

Many groups also advocate on behalf of some part of the journalism community. Thus, for instance, international groups such as Reporters Without Borders and the Committee to Protect Journalists work to protect reporters in their professional rights (free speech, the right to maintain confidential sources, etc.), but also when they could be in physical danger. Many recent high tension situations such as conflicts in the Middle East have seen reporters harmed, kidnapped, or killed while gathering and reporting news.

Other advocacy groups are concerned with particular subsectors of the journalism community. Organizations such as the National Association of Black Journalists, the National Federation of Press Women, and the National Association of Hispanic Journalists promote job opportunities and programs designed to increase newsroom diversity. A key underlying premise of these organizations is that journalism institutions must be representative of the demographic diversity of the country.

In many instances, issues impacting journalism spill into the policy arena. Thus, such advocacy groups as Free Press and the Media Access Project center on policies that may impact journalism practice and institutions. These include media ownership regulation, minority employment requirements, and broadcasters' public interest obligations. Such concerns are perceived to have a significant bearing on how news is produced and disseminated. For instance, Congress has often considered reinstitution of the Fairness Doctrine, a policy (eliminated by the Federal Communications Commission in 1987) that called for broadcasters to provide balanced coverage of controversial issues of public importance. This has sparked considerable debate among advocacy groups over whether such a regulation enhances or undermines the quality of broadcast news and talk programming.

The advocacy group landscape is complicated by so-called astroturf groups—those that appear to be grassroots organizations, but in reality are faux-advocacy groups covertly organized and funded by one or more industry stakeholders. These groups illustrate the blurring of the "self-interested" and real public interest organizations. Self-interested groups work on behalf of the economic interests of a particular industry sector or firm. This line is not always clear, as self-interested advocacy organizations increasingly cloak their advocacy with public interest pitches. For example, Microsoft has at various times been accused of attempting to influence news coverage via astroturf groups with names such as Americans for Technology Leadership and the Freedom to Innovate Network. In recent years, journalists have come under increased criticism for often failing to identify the underlying sources of funding and organization for what appear, on the surface, to be traditional public interest advocacy organizations.

Influence Tools

Advocacy groups use many tools to achieve their goals. The most common mechanism is to provide what media researcher Oscar Gandy (1982) has described as "information subsidies." These include press releases, staged media events, press conferences, reports, protests, and packaged news reports or videos. Boycotts are another method, applied particularly when groups have been unhappy with news coverage. These can involve boycotting news outlets directly, or boycotting their advertisers. Both approaches seek to motivate news outlets to alter coverage out of fear of revenue losses.

Policy advocacy can also influence journalism. There has been continuing controversy surrounding FCC deregulations of media ownership. A key aspect of the debate has involved whether greater concentration of ownership will help or hinder quality news and public affairs. Some advocacy groups argue that more concentrated ownership will allow for economies of scale that will support more and higher quality news; others argue such concentration will undermine the diversity of news sources and narrow the range of viewpoints expressed.

In such a debate, policy advocacy can range from directly lobbying policymakers, to mounting court challenges to specific policy decisions, to building constituencies that may influence policymakers. Advocacy organizations such as the National Rifle Association (NRA) weighed in on the media ownership issue out of concerns that a more concentrated media environment would make it harder for the NRA to effectively deliver its message.

Conducting and publicizing the results of research is another mechanism by which advocacy groups seek to influence journalism. Press watchdog groups, in particular, are often quite active in conducting detailed and sophisticated analyses of news content in an effort to critique journalistic performance. The Project for Excellence in Journalism, for example, disseminates detailed analyses of news content in an effort to improve journalistic performance and to identify broad trends in news coverage. Similarly, more partisan groups try to document liberal or conservative biases in the news media. Some of the earliest and most historically significant research in this vein was conducted in the 1960s by the Office of Communication of the United Church of Christ, working with minority rights groups to challenge the license of a Jackson, Mississippi, television station that broadcast biased coverage of the African American community and the civil rights movement. This research contributed to the eventual revocation of the station's license.

Conclusion

As these examples illustrate, news content is constantly undergoing scrutiny from a wide range of advocacy groups. Such groups play a wide range of roles. Some work to support journalists while others critique them. Many seek news that better serves their interests. With the wide range of influence tools at their disposal, advocacy groups represent an important, diverse, and potentially very influential category of stakeholder capable of impacting journalism in many ways.

Advocacy Newspapers

Often passionate and fiercely opinionated, advocacy journalism rejects the separation of news and opinion that characterizes contemporary journalistic norms. While still rooted in gathering, organizing, and presenting reliable information, the advocacy journalist is openly trying to make a case, rather than affecting objectivity. Advocacy journalism has often been linked to political parties or social movements, serving as part of a broader mobilization effort intended to bring about social change (or sometimes to hold it at bay). However, advocacy journalists would insist that they are as committed to accuracy as anyone—perhaps more so, given the need to build credibility with readers accustomed to a different style of reporting.

A Journalism of Ideas

Advocacy journalism is one of the two founding strains in modern journalism (the other being the provision of the commercial and political news essential to societal elites). Most early newspapers were closely tied to political and religious factions; although some were explicit campaign organs, more typically newspapers adopted a stance of impersonal journalism in which the editor advocated his cause not in a strident tone, but rather through the mix of essays, letters, minutes, poetry, and other items selected for publication. Advocacy journalism served its cause by presenting information and ideas that supported a point of view, and secondarily by serving as a forum in which political and social currents could develop to and articulate a common program.

Until fairly recently, advocacy journalism was the norm, at least in coverage of political and social issues. From the earliest colonial newspapers to the partisan press of the early 1800s, editors were actively engaged in the political struggles of their day—and indeed formed the backbone of the emerging two-party system. The partisan press is perhaps the best known expression of advocacy journalism, and the mythology of a party press run amok that is often cited as the backdrop against which more commercially oriented popular newspapers emerged in the 1830s. Partisan

newspapers such as Boston's *Daily Advertiser,* the New York *Courier and Enquirer,* or Cincinnati's *Gazette* published detailed reports of the workings of government, helped mobilize voters and organize disparate interest groups into viable national political groupings, and crusaded on behalf of their party's pet nostrums—exposing the perfidy of Free Masonry, chartering the Bank of the United States, and of course singing the praises of their particular candidates. But penny papers such as the *New York Tribune* were every bit as politically engaged as the traditional partisan organs that served elite audiences. *Tribune* editor Horace Greeley rejected both "servile partisanship" and "mincing neutrality," opening his paper's columns to a wide variety of reform schemes from the establishment of socialist communities to temperance and universal public education. While there was a steady trend toward avowed political independence during the nineteenth century, as newspaper revenues shifted from subscription-based to advertising-based, advocacy retained a prominent role in many newspapers.

The new journalism that began in the late 1870s and was the dominant newspaper form by the turn of the century, boasted of its independence from party spirit, but nonetheless pulled no punches in its relentless pursuit of what it saw to be in the public interest. In the early twentieth century, muckrakers, similarly, were unabashed in their advocacy of greater regulation, civil service reforms, and other measures to safeguard the public from special interests and emerging corporate power. And if advocacy journalism continued to play a prominent role in the mainstream press, advocacy was central to the emerging foreign-language press and to the legions of periodicals issued by African Americans, labor unions, socialists, women's rights activists, and a host of other movement organizations. So central was journalism to these movements that when Chicago authorities set out to suppress the radical labor movement in the aftermath of the 1886 eight-hour working day movement, police raided the offices of the German-language daily *Chicagoer Arbeiter-Zeitung,* arresting and ultimately hanging its editor and business manager, as well as the editor of the English-language labor weekly *The Alarm*. Chicago supported multiple radical labor dailies published in the various languages spoken by its immigrant workers for decades to come, as did other major cities. These newspapers published agitational and theoretical articles on a wide range of subjects, as well as cultural material and local advertising. But the heart of the newspapers was articles on local events and workers' struggles, often written by participants in the movements they served.

By the end of World War I, this foreign-language press was in decline, and newspaper consolidation encouraged newspapers to embrace the language of objectivity. While advocacy journalism never disappeared, it was gradually displaced in mainstream U.S. newspapers by more event-centered reports, and a journalistic ideology that sought to present an objective, even scientific, account of the day's events to a readership that crossed class, ethnic, and political boundaries. Newspapers seen to embrace a partisan tilt were reviled by journalism critics, and generations of reporters were trained to produce journalistic accounts free of the taint of political bias or personal judgment. It is far from clear that this just-the-facts style connected with readers; even as newspapers were banishing opinion and personal expression from their news reports, they were institutionalizing the columnist and entire sections devoted to features. The broadcast networks hired "commentators" for their news programs, and listeners were rarely forced to guess where they stood on the major issues. As broadcast news divisions became institutionalized and moved from single-sponsor programs to spot sales, however, they too increasingly sought objectivity in their reports.

New Forms of Advocacy

After being pushed to the margins by the 1920s (though a great deal of overt advocacy could still be found in the columns of William Randolph Hearst's newspapers, and sometimes more discreetly elsewhere), advocacy in the early twenty-first century is again a popular style of journalism, with Fox News' overt if undeclared partisanship, the "reported editorials" of *The Wall Street Journal,* the launch of conservative daily newspapers such as the *Washington Times* (even if these have not proved commercial successes), the growth of alternative weekly and community papers that often bring a more personalized approach to their articles, and a resurgent interpretive journalism that

inevitably blurs the lines between straight reportage and advocacy.

While many alternative newspapers and magazines have struggled to find distribution and financial support, leading to the collapse of the Independent Press Association in December 2006, much of the advocacy once found in their pages has shifted to the Internet. Sites such as Alternet, the Huffington Post, or ZNet offer a mix of commentary and reporting, including many carefully researched investigative reports. In San Diego, California, local activists have revived the underground OB Rag of the early 1970s as an online journal (and have posted scans of several issues of the original paper), one of several locally oriented online alternative news sites. The more eclectic IndyMedia offers diverse global perspectives through its many sites around the world, combining its contributors' activist commitments with grassroots journalism.

Because of their close connection to the grassroots, alternative journalists have often been able to break news stories or offer perspectives unavailable to established media, a phenomenon documented in the United States each year by Project Censored. Few who followed alternative journalists' reports would have shared the otherwise seemingly universal astonishment at the U.S.-British failure to uncover weapons of mass destruction in post-invasion Iraq. Just as alternative journalists, writing for such publications as the *National Anti-Slavery Standard,* Frederick Douglass' *North Star*, or the *Arena,* once forced the horrors of slavery and child labor onto the national agenda, more recent generations writing in *Ramparts, The Nation,* and a host of alternative publications exposed war crimes in Chechnya and Vietnam, published the first accounts of the AIDS epidemic, and gave voice to victims of police brutality and political repression around the world. The mainstream press, too, publishes much advocacy, even if it is often confined to editorial pages and op-ed page columns, or to magazine sections. *The New York Times'* Nicholas Kristof, for example, played a central role in pushing human rights abuses in Darfur onto the world stage, while media outlets of all stripes frequently advocate for civic improvement or other nonpartisan causes even on their front pages.

Advocacy journalism remains highly controversial within journalistic circles, however, even as evidence mounts that many in the audience are unable to distinguish between unabashed partisanship and journalistic reports that adhere to the norms of objectivity. As mainstream journalism outlets have experimented with more interpretive and narrative storytelling frameworks, many have accused them of slipping into (or, worse, embracing) advocacy. The charge of advocacy is seen as so serious that Fox News officially denies that it is engaged in advocacy journalism—instead adopting the motto "We report, you decide." (At the same time, the founder of the overtly partisan Huffington Post website differentiates her journalists' unabashed advocacy from Fox News by maintaining that her site is committed to providing accurate reports, and providing important information even when it sometimes undercuts causes or candidates they otherwise support.)

And yet, faced with continued erosion of public participation in the public sphere that has been a historic focus of journalism since its origins—reflected in the post–World War II era by declines in voting rates, newspaper readership, associational life, and even participation in amateur bowling and softball leagues—many media organizations turned to initiatives such as public or civic journalism in the 1990s, as part of an effort to simultaneously revive the public sphere and the practice of journalism. The *San Francisco Chronicle,* the only surviving metropolitan daily in its market (albeit one surrounded by a plethora of local free dailies, and suburban and foreign-language papers), announced in 2007 that it was embracing a "Journalism of Action," combining traditional reporting with information encouraging people to become involved in seeking solutions to the city's and region's problems.

Many have turned to civic engagement as a way of resolving the crisis facing journalism, and urged more interpretive and action-oriented coverage as one approach that might serve as a vehicle for rebuilding the public sphere. While journalism scholars argue that media need to promote civic reengagement, many journalists fear that this would challenge the objectivity they see as central to the journalistic profession. This debate resulted in some media outlets pulling back from public journalism initiatives, though interpretive and explanatory articles still press the boundaries of objectivity even as journalists are urged to offer more personal reflections on online blogs. But while many see

advocacy creeping into the mainstream (if often under the guise of analysis, or through special projects), it remains the core editorial mission for many nonmainstream media outlets, ranging from community radio and cable access public affairs programming, to alternative tabloids published in most major cities, to a plethora of "movement" publications. This advocacy plays an important role in enabling communities to identify and deal with concerns, and in providing millions with a voice in public debate that would otherwise be missing.

Africa, North

North Africa includes the countries bordering the Mediterranean Sea, which form a large region sharing many cultural and geographic characteristics substantially different from the majority of African countries found south of the Sahara Desert. Four of these nations, Libya, Tunisia, Algeria, and Morocco, are collectively known by the Arab term *Maghreb*, or "land of the sunset."

At least two major historical periods strongly influenced the development of news media across North Africa. Increasingly after the seventh century, Islam rose to prominence and soon dominance of the region, creating a largely shared religious, linguistic, and cultural influence. With the nineteenth century came European colonialists (Britain in Egypt and the Sudan; France in Algeria, Tunisia and Morocco; and Italy in Libya) who introduced Western ideas, culture, and forms of administration. Both historical traditions are widely evident across the region today.

Most news media in North Africa operate under the dominance of their respective governments, whether administered directly or indirectly. While national constitutions and communications laws speak of freedom of the press, the reality is a very controlled press and broadcast service. Freedom of expression and of news media is limited in the name of (among other factors) religion, culture, and one-party government. Internet access is minor and usually controlled as well. Each country has its own news agency (usually controlled if not operated by the government), and many have at least one daily newspaper that speaks for the government.

This entry surveys the five major North African countries from east to west, beginning with Egypt, which is the most important media center.

Egypt

With a population of more than 75 million, and a literacy rate of about 50 percent, Egypt holds a dominant position in the Arab world. Thanks to its location at the intersection of the Middle East and North Africa, and to its long history of civilization, Egypt has been the cultural and information center of Arab publishing and media, and its press and broadcast facilities are the most developed in the region.

Most Egyptians (nearly all of them Sunni Muslims) live along the Nile River as 95 percent of the country is desert. Opening of the Suez Canal in 1867 began a period of European influence, and

until independence in 1923, British dominance. Britain maintained troops in the country until after World War II. The Egyptian army revolted in 1952, forcing out King Farouk and by 1954 Gamal Abdel Nasser was in full charge of what became a fairly stable one-party state, with only two successive leaders after Nasser's death in 1970.

The Egyptian press consists of nearly 500 newspapers and magazines. Three major dailies published in Cairo are controlled by the government, and *Al-Ahram* (with a circulation of nearly a million copies by the early 2000s) serves as the semi-official voice of the regime. Among the first papers in the country, it began as a weekly in 1875. The number of papers slowly expanded, most of them becoming increasingly partisan after World War I. After the 1952 army takeover, however, many newspapers disappeared and all others were closely censored for years. By the early twenty-first century, however, many weekly party papers were publishing in addition to the government-supported press. Virtually all are printed at government-owned printing facilities. Despite amendments in 2006, the country's press law still provides for punishment for publication of "false" news, attacks on Egypt's or foreign leaders, or libel.

Egyptian broadcasting is among the most important services in the region. The first radio stations began in 1926 in Cairo under private ownership, but the Egyptian Broadcasting Corporation, designed along the lines of the BBC, took over all operations in 1934. Radio service expanded substantially after 1952 and radio receivers are widely available. Egyptian television began service in mid-1960. In 1970 a new decree established the Egyptian Radio and Television Union (ERTU) with four sectors: Radio, Television, Engineering, and Finance, each reporting to the Ministry of Information. ERTU established two national terrestrial television channels (ERTU 1 and 2) that provide news for various Egyptian channels, supported by both advertising and listener license fees. By the early twenty-first century there were eight television channels operating, three based in Cairo. Cable service in Cairo began in 1990. Two private radio stations, Nijoom FM and Nile FM, which provide news, entertainment, and music in English, were established to appeal to younger listeners, with an underlining philosophy of promoting Islamic religion and customs. The country's first communication satellite (Nilesat) was launched in 1998 (followed by a second one two years later) to expand television service in Egypt and neighboring nations, and includes a news channel. Two privately owned television channels appeared in Cairo in the early 2000s. Internet use is expanding but remains only a tiny source of news for most people, though the government does not censor websites.

Libya

A desert nation with a small population (about 6 million, most of whom are Sunni Muslims living near the coast), Libya became an Italian colony in 1911. The country gained its independence in 1951 as a monarchy, but the army overthrew the king in 1969. Arabic is the national language, but Italian and English are used by urban elites. Oil is the primary export but Libya imports most of its food and consumer goods. While literacy is high, with 75 percent of the population able to read, newspapers have small circulations. Of the country's seven newspapers, only *Al-Jadeed* is published in English while the others (and radio and television stations) use French and Arabic as the language of communication.

Though freedom of the press was seemingly guaranteed by the 1969 constitution, the role of the press falls within the political principles of the revolution. All private newspapers were nationalized in 1973 and a public press organization was created to publish them. Under the arrangement, two daily newspapers were published, one in Arabic and the other in Benghazi, a major language in Libya. Periodicals may not challenge or criticize the principles behind the country's revolution, spread rumors, or publish materials offensive to religions. The government also operates all electronic media (the first radio station began service only in 1957; television began a decade later). Internet usage is very limited and closely monitored.

Tunisia

Geographically the smallest of the countries discussed here, Tunisia has more than 10 million people, two-thirds of whom are literate. France took over Tunisia in the 1880s and only ceded control in 1956. The country's laws and news

media long resembled those of France, and French is still spoken by urban elites.

Though one government French language newspaper was formed in 1861, *Le Petit Tunisien* was founded in 1889 to reflect the official position of the colonial government. The publication and others established thereafter (most in French, a handful in Arabic) were banned from expressing independent views. To enforce censorship, the government closed down all the nationalist newspapers and periodicals in 1933, only slowly allowing some to resume publication.

There are seven major newspapers published in the capital city of Tunis, three of them run by the government and the rest privately owned (by French newspapers) but supportive of the regime. Only one has a circulation of more than 100,000. There are many more small weekly papers. The widespread existence of self-censorship and absence of much opposition may be due to the fact that virtually all papers enjoy government subsidies.

Radio was introduced by French colonial authorities in 1930, primarily to serve French expatriates. There are now nearly 30 transmitters, and receivers are widely available. Television began in Tunis in 1966 and, unlike other North African nations, service was soon available through the entire country.

Algeria

With more than 30 million people, and a literacy rate of about 62 percent, Algeria is among the largest African nations. Most of its people live along the Mediterranean coast as much of the interior is dry desert. Arabic is the standard and official language, only about 15 percent speaking one of the Berber tongues. For much of the nineteenth century and up to 1962, France controlled the country, departing only after a bitter seven-year war.

The first daily Algerian newspapers were published in French, aimed chiefly at colonial elites in Algiers and other cities. Very little was published in Arabic. With independence in 1962, press-government relations varied but generally were under the thumb of the ruling FLN party. Newspapers circulated largely to the literate elite. While things opened up a bit in the late 1980s, the army takeover in early 1992 curtailed press freedom again. Through the 1990s and since, papers and individual journalists were often in jeopardy of government crack-downs, and dozens of newspapers were closed down. By 2001, laws made any criticism of government officials a matter of libel. While about 100 small, private newspapers do offer criticism, government control of most printing plants gives officials considerable control over what is disseminated.

The first private radio stations aired in Algiers in 1925. French colonial authorities took over operating stations in 1957, a year after the country's first television station began service. By the 1990s, broadcasting networks (one television and three radio) and stations were all operated by the government. Radio service covers most of the country, but television signals are limited to the coastal areas where most people live.

Morocco

Morocco is the westernmost of the four Maghreb countries, located on the northwestern corner of Africa's coastline along both the Mediterranean and the Atlantic Ocean. A protectorate of both Spain and France for the half century before it gained independence in 1956, the country is the only kingdom in the Maghreb. Of its more than 30 million people, slightly under half are literate. Morocco still demonstrates strong French cultural leanings; though Arabic is the official language, French is widely spoken among urbanized elites.

Newspapers were predominantly French in language and content under the Protectorate, and censorship was introduced during World War II. The few nationalist papers that did appear were quickly suppressed. Political Arabic newspapers proliferated in both the capital of Rabat and Casablanca after independence, though many were suppressed after 1959. While the constitution promises freedom of the press, press laws forbid, for example, criticism of the monarchy or Islam. Of the more than 20 major dailies, Arabic language papers have gained the highest circulation, and more appear each year. Indeed, there are more than 600 daily and weekly papers, plus another 700 or so periodicals published in the country. But the largest dailies, with perhaps three-quarters of all circulation, while they seek commercial support, rely on government publication subsidies.

Radio stations were privately owned until they were nationalized in 1959. Television began under private ownership in 1954 (the first in the Maghreb) but failed in two years. Service was only reintroduced in 1962. Broadcasting is operated by Radio Fusion television, Marocaine (RTM), also known as Radio Maroc, an agency in the Ministry of Information. Internet access was available to about 15 percent of the population in 2007.

Conclusion

In an era of satellite transmission, all of these nations can receive Al Jazeera, which provides an alternative source of regional and world news. As Internet penetration slowly increases, that, too, provides additional journalism options. But the domestic newspaper and broadcast media in these countries, generally held not to be free by Western observers, exhibit considerable self-censorship to avoid government regulation or outright suppression. Several of the governments license journalists (and one cannot practice the profession without such a license), another way of controlling political content.

Africa, Sub-Saharan

Among the 48 sub-Saharan African countries, the liberalization of the media has been at the center of debate since a wave of democratic reform swept through the region in the 1990s. Within this wave of democratization, authoritarian one-party regimes yielded to multiparty systems in most African states. At the onset of democratization, a wide range of media reforms surfaced with countries opening up and deregulating their media sector. Moreover, legal frameworks emerged to restore press freedom. One key feature of the newfound media freedom has been the proliferation of independent media.

Despite these developments, sub-Saharan Africa receives only a tiny percentage of global news coverage. Furthermore, the region forms a complex cultural and ethnic tableau of 788 million people who speak approximately 2,000 languages. Although rich in natural resources, most of sub-Saharan Africa falls behind the rest of the world in terms of economic development due to poor infrastructure, government instability, natural disasters, vagaries of international markets, and the impact of HIV/AIDS. Situated in this environment is a complex political structure. In 2007, the region was home to several electoral democracies—for example, Cape Verde, Botswana, South Africa, Ghana, and Namibia—having held competitive, multiparty elections. Newspapers and the electronic media in these countries are relatively free to report and comment, and to expose corruption. As for the rest of the sub-Saharan African countries, there are emerging democracies, such as Senegal and Togo; a one-party state, Eritrea; a monarchy, Swaziland; and two transitional governments, Sudan and Somalia, where the leadership was installed through a nondemocratic process.

Given the varying degrees of political systems along with the region's diversity and economic variabilities, the media face insurmountable odds in order to operate. Some of the difficulties are historically situated within the legacy of colonialism.

Colonial Era

With the exception of Ethiopia, almost all African countries were colonized by one of seven European

powers (Britain, France, Germany before 1914, Belgium, Portugal, Spain, and Italy). Out of this colonialism and missionary activity, the region's first newspapers evolved. By the late nineteenth and early twentieth centuries three press systems had emerged: one was owned by churches and was expressly intended for spreading the Christian gospel and reaffirming colonial rule; the second, a local or foreign-owned press; and the third, an African-owned and -financed press—sometimes with missionaries' financial support. In an interesting way, the colonial structure (especially in the British colonies) allowed a free and independent press, though not one without government control. In addition to laws controlling sedition and defamation, the British colonial administration, fearing the rising anticolonial press, began to codify press laws that required, for example, newspaper registration and the posting of a bond to publish a single newspaper. And although each colonial power established its own method of administering its colonies, they shared a common view of Africans. In line with the pseudoscientific racial thinking of the nineteenth century, colonial governments saw Africans as simple, and even subhuman. Without careful control, newspapers might easily excite this semibarbaric population that greatly outnumbered whites and lead to a backlash against colonial authority.

By the mid-twentieth century, the African press (whether published in colonial languages or in vernacular tongues) grew exponentially as anticolonial movements arose. Not surprisingly, several early African journalists were leaders in resistance movements and, after achieving their country's independence, became Africa's first heads of state. Nnamdi Azikiwe, a radical journalist and later the first President of Nigeria, established the *West African Pilot* in 1937. By the 1950s, he controlled ten newspapers. Ghana's first Prime Minister, Kwame Nkrumah, used two of his newspapers, *The Accra Evening News* and the *Cape Coast Daily Mail,* to proclaim his rallying cry for decolonization. Jomo Kenyatta, first Prime Minister and President of Kenya, established *Muigwithamia* in 1928. The leader of Tanzania African National Union (TANU) and first President of Tanzania, Julius Nyerere, was the editor of the party organ, *Sauti ya TANU.*

During the colonial era, many African newspapers served as symbols of freedom against further European occupation. Serving as the voice of the oppressed, newspaper editors and journalists became heroes for displaying the fortitude to stand up to a colonial government even if it meant being imprisoned. Their actions gave them celebrity status, which boosted newspaper sales and enhanced the platform on which to organize resistance. As a result, several of the nationalist journalists were charged with sedition and were either heavily fined or ended up in prison.

When African countries regained their independence from European rule, they lacked many of the prerequisites for pluralistic democracy upon which press freedom is built. Consequently, the political systems that arose in the postcolonial era were usually authoritarian and resembled the same patterns of governance imposed by the former colonial regimes. In terms of the press, colonial governments made little effort to establish the legacy of Western libertarian press freedom. For the first 30 years of independence, the media became integrated into the party and government structure, relegating journalists and editors to the civil service.

Present Media Landscape

The democratization wave in the 1990s led to two significant developments: a rising conscientiousness and articulation of press freedom and a significant increase in independent media.

On May 3, 1991, the "Windhoek Declaration on Promoting an Independent and Pluralistic African Press," adopted by African journalists in Namibia and later endorsed by the General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), concluded that an "independent, pluralistic and free press is essential to the development and maintenance of democracy in a nation, and for economic development." A year later, the Charter for a Free Press, adopted by journalists at a conference sponsored by the World Press Freedom Committee, began with "A free press means a free people." In 1993, the UN General Assembly proclaimed World Press Freedom Day as a means to raise awareness of the importance of press freedom in strengthening democracy and fostering development around the world.

The Windhoek Declaration and subsequent pronouncements lent support to the democratic transitions that were forcing authoritarian rulers

in most sub-Saharan nations to undertake a growing range of political reforms. By the end of the 1990s, some 42 nations entered a new era of multiparty democracy culminating with constitutional reforms that included freedom of the press and expression.

With these newfound political freedoms, along with the extensive media reforms, CNN-International, Canal France International, Radio Television Portugal International, India's Zee T, the Discovery Channel, and BBC World became household names. A proliferation of independent and community media, especially in radio broadcasting, also emerged. In 1985, there were only 10 independent (non-government-owned) radio stations in all of sub-Saharan Africa. By 2004, Uganda alone had nearly 100 radio stations jostling for space on the FM dial. In Kenya, the number of private radio stations soared from one in 1996 to 49 in 2005. Of the 122 licensed radio stations in South Africa in 2005, nearly 90 were community stations. From 2000 to 2005, Senegal's community radio expanded from seven to 19 while private regional stations increased from 20 to 35.

Access to television is also on the rise with penetration showing enormous range across countries as well as the rural/urban divide. In Kenya, for example, television reaches 56 percent of the population, in Nigeria 83 percent, but only 2 percent in Somalia. Namibia's television penetration is 66 percent in urban areas and only 37 percent in rural regions—a fairly typical ratio for much of the continent.

Television programs from North America and Europe are still available including *The Oprah Winfrey Show, 700 Club, The Bold and the Beautiful, Desperate Housewives, Everybody Hates Chris, Grey's Anatomy*, and *Judge Hatchett*. And this is because it has always been more cost effective to import foreign programs than to produce local content. However, since the mid-1990s, there has been a steady rise of regional production companies, especially in West and Southern Africa, generating more African-content television programs. With a highly developed media infrastructure, South Africa has been leading the way in producing and distributing these programs. In the early twenty-first century, one of the largest providers of television programs in the region is South Africa's M-Net's DSTV (a subscription television service available throughout Africa). However, a number of their program offerings are simply an African version of American or British programs: *Survival Africa, Who Wants to be a Millionaire, Catwalk Kenya*, and *Idols in Africa*. However, soap operas such as *Egoli: Place of God* have a distinct African flavor. In May 2003, M-Net's DSTV launched Africa's first international-format reality program, *Big Brother Africa,* to audiences in 42 sub-Saharan African countries with an estimated viewership of 30 million. South African–based Gateway Communications has already captured the pay-TV market with its services available in Kenya, Uganda, Tanzania, Botswana, Rwanda, Mauritius, Malawi, Zambia, Ghana, Namibia, Ethiopia, and Sierra Leone. It is proceeding with a phased roll-out across sub-Saharan Africa in 2008.

Across the region newspapers are still concentrated in urban areas where literacy is higher and distribution comparatively easy. In countries where the economy is booming and democracy has taken a strong foothold, the newspaper market has been growing, such as South Africa, Senegal, and Mozambique. In other countries (e.g., Uganda and Zambia) newspaper growth is sluggish due to market stress and government policy. In countries, like Eritrea, where the government is hostile to the private media, newspapers have gone out of business. There are, however, other factors that put newspapers at risk or have led to their decline. For one, many newspaper entrepreneurs entered the market during the democratization wave with little understanding of the news business and were, therefore, unable to make a profit. Many of these newspapers have been short-lived. Six years after Côte d'Ivoire returned to multiparty governance in 1996, 187 newspapers were being published. By 2001, about 50 were still being published (about 20 were dailies while 30 were periodicals). In 2007, there were about six private daily newspapers.

Due to its limited penetration, the Internet is not yet posing a serious competition threat for newspapers. What the Internet has done, however, is provide a platform for both independent and state-owned and -operated media to put forth their own positions for the global market. Therefore, almost all media organizations in the region, regardless of their editorial stance, ideological leanings, or political affiliation, have an online presence and

regularly update their content. Probably the biggest and best-known international newspaper, South Africa's *The Daily Mail & Guardian,* was Africa's first online newspaper, launched in 1994.

Certainly the Internet is reshaping the media in the region. By 2000, all countries had secured access, at least in their capital cities. As personal computer penetration is low, users rely on cybercafes, community telecenters, schools, and other public access services. But sub-Saharan Africa still lags behind the rest of the world in Internet penetration, which is only approaching 5 percent. Internal disparities are huge. With a population of just over 3 million, for instance, Liberia had about 1,000 Internet users in 2007. The Congo, with a population roughly equivalent to Liberia, had about 70,000 users. In addition, the rural population, which comprises the vast majority of Africans, has not yet benefited from any of these new communication technologies.

However, the largest growth in telecommunication has been in the region's mobile market, which has been increasing by about 50–60 percent annually. Mobile technology is beginning to have a great impact on journalists who were previously hampered by poor communication infrastructure. Today, mobile technology is being looked at as an expedient and cost effective way for journalists to send images, news video clips, and news reports back to the newsroom.

In terms of news agencies, the South African Press Association (SAPA), which was founded by several urban newspapers in 1938, is one of the oldest in the region. Indeed the South African model is rare. In the post-independence period, governments began to establish their own news-gathering agencies, whether they followed a one-party state or multiparty democratic forms of governments. Following its independence in 1990, and with the establishment of multiparty democracy, the Namibian government created the Namibia Press Agency (NAMPA), which it owns and operates. Journalists working for government agencies such as NAMPA have long been accused of practicing self-censorship. In other countries, news agencies originally established to control the spin from the one-party state governments have undergone a metamorphosis since the 1990s. One year after Angola gained its independence from Portugal in 1975, the Angola Press Agency (ANGOP) was created as the propaganda instrument of the one-party state. However, after the democratization process and the introduction of a multiparty system in 2002, ANGOP became a provider of news for all media in the country. With the help of UNESCO, ANGOP was transformed from a state-owned and -controlled agency to a public enterprise.

Media Structure

Whether involving news agencies, newspapers, or electronic media, the pattern that is evident in most sub-Saharan African countries is that of a dual-media structure: state-owned and -controlled media along with privately owned media. This does not mean that such a structure is always harmonious and does not foment conflict. Depending on the system of government, the independent media face overwhelming obstacles and can be censored or forced out of business at any time. Where repression exists, new communication technologies have opened space for bloggers and others to develop alternative voices to state media institutions. Zimbabwean journalists who found themselves restricted from practicing their profession launched the ZimOnline News Agency in 2004 as part of an effort to establish just such an alternative voice.

Regardless of government interference, it is the private ownership patterns that are slowly changing the media landscape. The emerging pattern is one of concentrated ownership and conglomeration among local and foreign interests. In Kenya, the Royal Media Services own multiple media platforms including Citizen Television, Radio Citizen, The Leader Newspaper, and eight local-language radio stations, whereas two major publishing houses, Nation and Standard, dominate the print media. Following the dismantling of apartheid policies in 1995, the foreign-owned Independent News and Media bought the controlling share in the Argus group publishing empire; in 1996, Johnnic Communications (now Avusa) acquired control of newspaper publisher Times Media Limited, making it the biggest black-owned media company in South Africa; and in 1998 Caxton Publishers bought the controlling share in media and publishing corporation Perskor and consolidated its focus on community newspapers and free

news sheets. South Africa's MIH Holdings—a multinational media company, with its major operations in electronic media, including pay TV, Internet and instant-messaging subscriber platforms, and related technologies—has spread to the 48 sub-Saharan African countries, Greece, Cyprus, the Netherlands, the United States, Thailand, China, and Brazil. MIH also has print media interests in Brazil, China, Nigeria, Kenya, and Angola.

Training

After gaining independence from colonial rule, it was clear that a void existed in Africa's media infrastructure and that journalists needed training. In most countries there were no schools of journalism and no tradition of formal journalism education or systematic training. On-the-job training was the predominant model at the time, and continues to be the model most preferred by newspapers, which have resisted formal training of journalists.

Today, there are several models of journalism training available throughout the region. One is the workshop model for practicing journalists, which emphasize a particular set of skills such as investigative reporting, science reporting, and reporting on HIV/AIDS. These workshops, usually funded by donors and in partnership with a local nongovernmental organization (NGO), involve a limited number of participants, and are conducted either in the host country, inter-regionally, or in the donor's country. Another approach are vocational institutes that offer three-year diplomas in journalism, such as the Evelyn Hone College in Zambia and the Polytechnic of Namibia. Recognizing the need for in-country degree training at the university level, several countries—even those that gained independence in the early 1960s—established undergraduate degree programs. Nnamdi Azikiwe, the first President of Nigeria, saw the value of linking journalism education to a university and imported the American land-grant university model to the University of Nigeria Nsukka, thereby instituting Nigeria's first university journalism program. With 30 universities offering journalism training as of 2006, Nigeria had the highest number of university journalism degree-granting training entities in sub-Saharan Africa, followed by South Africa with 10. However, across the region journalism training institutions face a number of challenges.

The UNESCO report, *Criteria and Indicators for Quality Journalism Training Institutions & Identifying Potential Centres of Excellence in Journalism Training in Africa,* written in 2007 by journalism professors Guy Berger and Corinne Matras, outlines the challenges these institutions face: shortages of staff, the need for PhD qualifications among full-time faculty, insufficient scholarships for disadvantaged students, under-equipped facilities, insufficient funding, out-of-date curricula, lack of funds to replace and update computer/lab equipment, insufficient web knowledge, and poor Internet connectivity. Another challenge is sustainability. The Nigerian Institute of Journalism, for example, closed in 1999, due to a disagreement about the status of the institute and its programs, only to reopen four years later.

Professional Organizations

Another striking feature of the democracy transformation is the rise in professional associations. These professional organizations follow several patterns with varying agendas and levels of success. There are a few subregional organizations, such as the Media Institute of Southern Africa (MISA), which was established in 1992 and represents 14 southern African countries. Launched in 1997, the Media Foundation for West Africa (MFWA) represents the 16 West African countries. Congolese journalists established Journaliste en Danger (JED) to monitor and defend press freedom in the Democratic Republic of the Congo in 1998. The JED expanded its work to eight central African French-speaking countries by 2003. These regional organizations see their common mission as that of being advocates for press freedom and raising professional standards through training. Well organized and with a range of global media partners and national branches or collaborators within each country, they also have a good track record in terms of monitoring constitutional press infractions by governments, disseminating annual reports on the state of the media.

In addition, professional journalistic associations and unions proliferate in many countries, although journalists find it difficult to sustain these organizations as well as their level of power within

the government structure. Some of these organizations pre-date the democratic wave. The Ghana Journalist Association (GJA) was established in 1949 and was incorporated into the state apparatus by then-President Kwame Nkrumah. Under the leadership of Kabral Blay-Amihere, the GJA changed its direction in the early 1990s to include journalists across sectors, and has since become an independent organization for professional training and socialization that displays an adversarial edge when it comes to government. Benin's Union of Private Press Journalists, established in 1966, brings together journalists working in the public press (state-owned). Since the wave of democratization in the early 1990s, over 25 organizations have been established in Benin, each catering to various specialized journalists (e.g., cultural, economic, environmental, and parliamentary journalists).

Some organizations cater solely to journalists working in the private press, such as Mali's Association des Editeurs de la Presse Privée du Mali. Others are gender-specific, such as the Uganda Media Women's Association that was created in 1983 as a nongovernmental organization for women journalists from government and private media. Science writers from Nigeria, Kenya, Ghana, and Uganda have partnered with the Canadian-based World Federation of Science Journalists to develop their own organization. In post-apartheid South Africa, senior journalists, editors, and journalism trainers formed the South African National Editors' Forum in 1996 to reflect South Africa's diversity, champion press freedom, and improve quality and ethics in journalism.

Legal and Other Constraints

Although the majority of sub-Saharan nations have adopted constitutions guaranteeing free expression and a free press, these protections are often limited through legislation inherited from colonial and early nationalist regimes. The MISA suggests that in Swaziland there are at least 32 pieces of legislation that can limit constitutional guarantees of press freedom, some dating back to 1938. While press freedom is constitutionally guaranteed in Equatorial Guinea, the government severely restricts freedom through a 1992 press law, which authorizes government censorship of all publications. In 2006, the U.S.-based Committee to Protect Journalists ranked Equatorial Guinea as one of the five most censored countries in the world. Criticisms of the President (who came into power in 1979) is not tolerated, and self-censorship among journalists is the norm.

Perhaps the most damaging colonial holdover is the so-called insult laws, a form of criminal defamation. Once designed to shield kings from dishonor, these laws make it a criminal offense to insult the honor or dignity of a public official in all but five sub-Saharan countries. In the first five months of 2007, insult laws led to the harassment, arrest, or imprisonment of more than a hundred journalists in 26 African countries. In mid-2007, the International Federation of Journalists launched the "Africa Journalist out of Jail Campaign," calling on African leaders to release journalists imprisoned in Ethiopia, Eritrea, and the Gambia. The World Association of Newspapers and the World Editors Forum in their Declaration of Table Mountain also issued a similar call against insult laws.

Adding to the problem of inherited laws is new legislation being enacted in a number of countries that impact press freedom. The 2002 Access to Information and Protection of Privacy Act (AIPPA) in Zimbabwe, for example, is designed to protect the Mugabe government from scrutiny by restricting access to information held by public bodies and penalizing public or media inquiries into its actions. Since its passage, several independent media outlets have been shut down, journalists have been arrested, and foreign journalists have been prevented from working in Zimbabwe.

Even in countries with a relatively free press, criticizing the government can backfire. In March 2001, the Namibian government banned all government advertising and prohibited any government department from purchasing the independent daily *The Namibian* as a result of it being too critical of government policies. In June 2007, the government of Lesotho banned all state and semi-government agencies from purchasing advertising in the privately owned weekly *Public Eye*. Given the relative dearth of commercial advertising in much of the continent, this type of economic pressure has a strong and immediate impact on targeted media.

The African press is in a quandary because both government officials and journalists operate

within two opposing press ideologies. Governments require loyalty from the media, whether public or private. Since independence, African leaders have argued that to avoid political instability, media should work in partnership with the government to achieve national development objectives. The partnership model generally works well within state-controlled media where journalists tend to appear as public relations specialists. However, independent media tend to model their professional ethics around the libertarian Western model of a free press that calls for freedom from state intervention. Conflicts regularly occur.

It is safe to say that journalists face a myriad of conditions that impact their careers. These include low wages, poor working conditions, lack of experience and professional training, and a culture of secrecy and self-censorship. Aside from these obstacles is the "brown envelope" syndrome. This is a widespread practice in many countries wherein journalists accept bribes or routinely seek payments from the individuals or organizations they cover. As is often the case in government and business, journalists contend that low salaries drive such unethical practices.

Across sub-Saharan Africa, self-regulation through codes of conduct is becoming the norm for encouraging high professional and ethical standards. Some countries, such as South Africa, have multiple codes for newspapers (*The Mail & Guardian's* Professional Code, *Business Day* and *Financial Mail, Die Burger*), television (e.tv, South Africa's first private free-to-air television channel), professional organizations (the South African Union of Journalists and South Africa National Editors' Forum), state regulatory bodies (the Independent Communications Authority of South Africa), and those concerned with national health issues (Reporting on HIV/AIDS: Ethical Guidelines for South African Media). Similarly, Tanzania has varied codes of conduct for media managers and editors, journalists, news agencies, and media photographers. There are also subregional codes of ethics. The East Africa Free Press Assembly adopted an East and Central African Code of Ethics in 2001, which was reaffirmed in 2002. Additional codes of conduct can be found in Rwanda, Angola, Kenya, Zambia, Malawi, Namibia, and Zimbabwe.

Conclusion

Given continued ethnic strife, the apparent rebirth of authoritarianism in a number of states, the massive diversity across the region, the struggle to create and maintain democratic governance that many countries are experiencing for the first time, and various legal impediments, press freedom in sub-Saharan Africa remains a constant struggle. Despite these challenges, African journalists have been building organizations that support a free and independent press as well as self-regulatory bodies to promote professional standards.

The developments associated with the 1990s wave of democratization have transformed the media in most countries from a predominantly state-owned and -controlled propaganda tool to a more open and independent media. However, within this open system there is a myriad of ways in which individual countries have responded to the liberalization and privatization of the media. The news and broadcast media are undergoing immense growth in sub-Saharan Africa. Yet there is a digital divide that separates sub-Saharan African countries from each other and the rest of the world. Internet penetration is low while costs are high. Mobile technology is rapidly expanding and journalists are beginning to reap the benefits of this technology. Conglomeration and convergence is shaping the media industry in many countries. Broadcasting formats and programming imported from North America and Europe continue to shape the cultural discourse. And despite commonalities, there isn't a one-size-fits-all media model. Sub-Saharan Africa has a varied media landscape in terms of media choice, accessibility, levels of government intrusion, and the legal and economic structures in which they operate.

African American News Media

African American news media grew—as media so often do—from a need to communicate displeasure, in this case, of blacks with the way the white U.S. majority had treated them. A single publication blossomed into several hundred, driving a popular movement for equality as well as a people's struggle toward civic, educational, and economic fulfillment. The black press dominated much of the first two centuries of that struggle, showcasing the debate on its pages while transmitting mainstream values and ideals to its readership and modeling prevailing newspaper business practices. Advances in technology have led to other, more viable forms of media, most notably radio and television—which continued to provide alternative, if relatively few, voices to the concerns of blacks. At the dawn of the Internet era, African Americans continue to struggle and plead their cause.

Origins

Despite their plight, African slaves who were brought to North America beginning in the 1600s created a strong, expressive tradition, singing songs and spirituals and orally passing down poetry and narratives through the years. But decades of being ignored or inaccurately portrayed by mainstream media prompted a group of free African Americans—led by college-educated John B. Russwurm and ordained minister Samuel Cornish—to start *Freedom's Journal* on March 16, 1827. The weekly paper advocated antislavery issues and furthered discussion on affluent, middle-class lifestyle and cultural matters (e.g., fashion and religion), becoming the model for the 40 or so black newspapers across the United States until the Civil War's end (and the ascent of political equality issues) in 1865, most of them in the North (although *The Daily Creole,* the first African American daily, was started in 1864 in New Orleans).

Raising blacks' political profile, inspiring them, and creating middle-class aspirations required passion and business insight, as black illiteracy and the lack of advertising support posed significant challenges for the early African American press. As illiteracy declined and black mobility increased after the war, black newspapers proliferated (more than 500 started in 1890 alone), but many were short-lived. Unlike white papers, the black press had to rely on copy sales—rather than advertising—for most of its income because there weren't many black businesses and no white businesses would advertise in the publications. And with literacy rates among African Americans reaching

only 50 percent by 1900, sales income was so low that many black editors had to take second jobs.

After the Civil War, with the increasingly mobile and literate black population spreading across the country, more and more black newspapers started publishing (although many died just as quickly), including one present-day survivor, *The Philadelphia Tribune,* started in 1884. No one paper dominated the continuing battle against segregation, lynching, and discrimination. Rather, a collection of papers of varying influences and duration took up the fight against injustice, particularly as portrayed by the southern white press (i.e., blacks as bungling, uncivilized, and morally lax). Southern black papers—including the *Charleston* (South Carolina) *New Era, Huntsville* (Alabama) *Gazette,* and *Savannah* (Georgia) *Tribune*—upheld the premise that blacks were human and deserving of better treatment but these three newspapers needed every voice of support they could muster as more and more of them had trouble surviving. Newspapers that did survive found much to write about, particularly the abolition of lynching and the power of the Ku Klux Klan (KKK) in the South. Because the government and the courts would not "control" blacks, private white citizens took to illegal means to do so, resulting in terror among black families (between 1884 and 1900, some 2,500 African Americans were lynched) and fears of a return to slavery. So the Reconstruction Era (ca. 1865–77) black press continued to publicize wrongdoings and provide an outlet for racial pride and self-determination, albeit in short bursts because inadequate funding prevented consistent publishing schedules. Many black publishers did not operate their publications as profit-making businesses; they were so busy maintaining watch on the Republican Party and black-related concerns and issues and—as a result—neglecting advertising needs that they often couldn't subsist. Still, many renowned newspapers were published in major urban areas (in addition to Philadelphia), most notably Indianapolis, Washington, New York, and Cleveland; many were circulated throughout their respective states, effectively becoming more than local newspapers and wielding regional power.

The combination of moral outrage at perceived inequities and optimism that African Americans still could achieve the American dream helped to unite African Americans and inspire them to persevere at a time when complete freedom seemed unattainable. When the U.S. Supreme Court in 1883 ruled the Civil Rights Act of 1875 (which guaranteed equal treatment in public accommodations) unconstitutional—essentially denying federal protection of African Americans against discrimination in the use of their newly won rights—and the federal government withdrew troops from the South the same year, Jim Crow laws (requiring separate public facilities for blacks) began to appear (in nine states by 1892). Blacks protested this and other perceived wrongs through the black press, particularly in the North. (Southern and Midwest papers tended to be less demanding and more compromising.) Despite these dire trends, African Americans overall continued to be optimistic and to turn to black newspapers for inspiration.

Outstanding papers during this Reconstruction era included *The New York Globe* (later alternately known as *The Freeman* or *The Age,* the latter becoming the most widely read and influential black newspaper of its time), which promoted the idea of a national organization—the forerunner of the National Association for the Advancement of Colored People (NAACP)—formed to contest racial discrimination and related issues. *Globe* founder T. Thomas Fortune suggested blacks stand firm and hold their ground against mounting white violence, contrary to the advice of more moderate black leaders such as Booker T. Washington. Fortune, the first to use the term "Afro American," said blacks should die for their rights, if necessary. Although he believed in following the law, Fortune also felt that, lacking adequate legal protection, blacks should protect themselves—even if it meant bearing arms.

A different type of black press leadership came from Baltimore, where in 1892 the *Baltimore Afro American*—by the early twenty-first century second only to the Philadelphia newspaper as the longest, continuously operating black newspaper—was started by former slave and later Virginia minister John H. Murphy Jr. Establishing a strong reputation for local sensationalistic news as well as coverage of black issues, the paper—under the direction of printshop supervisor-turned-manager John H. Murphy and his family—outlasted a half-dozen similar local publications by building its infrastructure through the selling of stock and building its content on its appeal to working-class blacks

rather than the elite. It also maintained a dual outlook toward racial issues—denouncing racial segregation while advocating for the best circumstances for blacks within the racist system—while increasing its influence beyond its midatlantic and Southern black readership to become more of a national voice for black America.

Political Action, With Restraint and Booker T. Washington's Help

Around the turn of the century, many black papers started to reflect the *Afro American* in that they were philosophically split on racial issues—but in large part they concentrated on how to reverse blacks' declining fortunes. Despite the moderation advanced by successful African Americans such as Booker T. Washington, some African Americans began to tout migration as a solution to the plight of Southern blacks in the columns of the black press. So encouraged, nearly 2 million blacks moved from the rural South to the more industrial North between 1910 and 1930. Inequities persisted, particularly regarding competition for jobs and housing; riots sometimes resulted, leading to the creation of the aforementioned NAACP in 1910. But regular American life—freedom from slavery, in other words—began to return some dividends: literacy growth (fostered by free public education) led to improved employment capacity for blacks. This resulting intellectual divide between middle- and lower-class blacks, combined with blacks' improved economic power and potential and the racially segregated housing and social patterns of the industrialized cities, laid the groundwork for a fairly dramatic change in the black press.

Washington's idea—essentially that through hard work, self-education, and patience, African Americans could better themselves and show whites that blacks were worthy of full citizenship—resonated with many black newspaper publishers. It helped that he headed Tuskegee Institute, which supplied the black-oriented National Press bureau with news releases and advertising while directly aiding some newspapers (via subsidies, free content, and advertising). Although it was not among the papers affiliated with the bureau, *The Chicago Defender*—founded in 1905 and generally acknowledged as one of the top three influential black papers in the country—nonetheless led the way in commercializing the black press. Increased reliance on advertising, combined with increased and controversial news coverage, helped position *The Defender* and its editor Robert Abbott as models for other publications. Not only did the paper advocate for blacks, it made a profit, too.

Washington's philosophy of advancement through financial success subtly worked its way into the very foundations of the black press. *The Defender*—while sensationalist in its own right—was an early proponent of the northward migration and at the outset shunned political coverage, concentrating more on branding itself as a voice for blacks throughout the country. By taking this approach, it was able to build up circulations in various cities that had their local *Defender* editions and successfully copy the circulation-is-king model of U.S. newspaper icons James Gordon Bennett and William Randolph Hearst. The increased circulation drew advertising, which led to development of ad-only sections and greater reliance on advertisers for revenue. *The Afro American* soon began to imitate this model, which continues to this day in certain states and metropolitan areas with large black populations (*The Atlanta* [Georgia] *Daily World,* for example, started as a weekly in 1928 and became the first black daily in 1932; it expanded to include 60 *Daily World*s across the country until economic realities and politics [it did not support sit-ins of downtown Atlanta restaurants in the 1960s] reduced its influence to only Atlanta; Birmingham, Alabama; and Memphis, Tennessee). By 1918, white advertising agencies were representing black papers to white advertisers, and black newspapers enjoyed an economic "golden age" until 1930 (*The Defender* grew from 21 columns of advertising per printing in 1917 to more than 61 columns in 1919).

But many black papers, despite their flourishing thanks to the advertising and the growing black middle class, also reflected the pro-protest position (i.e., that blacks should oppose and doubt whites' views) advocated by activist and scholar W. E. B. Du Bois and other intellectuals. Such papers—often carrying fewer commercial advertisements because their advertising space promoted socialistic ideas—joined their more commercial peers in condemning race-based policies; but they also tried to promote a certain kind of united black identity rooted in reform, dissent, equality, and integration. Partly

because of Washington's heavy-handedness (via his own news and distribution service; his influence in gaining grants for black papers that refrained from certain criticisms of him or his political contacts; and his covert efforts to economically damage independent, critical black newspapers), however, these papers were dwarfed by those that urged self-betterment, domestic life, gradual social progress, schooling, and economic enhancement via conventional channels. Few editors could resist Washington's financial support and thus his influence, not even T. Thomas Fortune, who was befriended and later politically castigated by Washington.

World War I, meanwhile, assisted black economic progress by driving African Americans into the work force to fill the job vacancies left by whites going into the armed forces. Chicago (aided by *The Defender*'s continued encouragement of migration) became a magnet for blacks; two of every three copies of *The Defender* were sold outside Chicago, primarily in the South, indicating that Chicago beckoned as a black oasis in the United States. Headlines such as "Call the White fiends to the Door and Shoot them Down" did not endear the paper to whites. Not surprisingly, the paper became a target of war-time investigation by federal agencies and lasting southern ire.

The war added equal treatment for black soldiers to the newspapers' agenda, putting the black press in the position of having to protest while simultaneously being a patriotic war supporter. As

a result, the federal government—through flattery and legal threat—tried to monitor and control anything the 200 or so black newspapers did that approached war-time criticism. Anti-German and pro-patriotism materials, speakers, and events sponsored by the black press were not enough to pacify suspicious Justice Department officials, who often surveilled, interrogated, and occasionally jailed black editors and publishers, but never prosecuted them, for fear of seeming hypocritical—fighting for freedom and equality for non-Americans while some within its own borders weren't allowed the same privileges—to other countries.

Setting the Table for Civil Rights

At war's end, the black press resumed the struggle for civil rights. The federal government—led by Attorney General Mitchell Palmer's vigilance against any perceived collaboration between civil rights and communist groups soon after the Russian Revolution of 1917—never relaxed its scrutiny of the black press and attempted (albeit unsuccessfully) to pass peacetime antitreason legislation. Black newspapers, for their part, renewed the fight against lynching and the resurgent KKK while reaping the benefits of still-increasing black literacy and postwar black yearning for social progress. Soon many of the nearly 500 black newspapers, most of them published weekly, fostered a protest movement initially based on the ideas of Jamaican intellectual and editor Marcus Garvey, who believed that only self-reliance by African Americans could break the bonds of racism. Garvey also stressed the importance of the liberation of Africa from colonial powers and global black pride. These ideas inspired similar-thinking groups—such as the National Urban League, the NAACP, and the National Negro Congress—to call for mass black protest—notions that took hold not only in Chicago but also in the many other northern cities that benefited from black migration, such as Philadelphia, Cleveland, and New York.

One such city, Pittsburgh, began to nurture a rival to *The Defender* with *The Pittsburgh Courier*. Improved reporting and interesting content (coverage of notable black achievements and political satire, for example) enhanced the paper's reputation. Southern emigrant, lawyer, and *Courier* editor-publisher Robert Vann emulated *The Defender*'s business model, as well as its sensationalist ways, but tempered its coverage of the lurid and scandalous with expansive investigative reports on the American South and Africa, earning it readers nationally and abroad. Its continuous front-page campaign to integrate the U.S. Army and to urge African Americans to contact their congressmen about the importance of integration only shored up its support in the black community—so much so that it came under FBI suspicion and investigation in the late 1930s and early 1940s. Other black papers followed *The Courier* in lobbying for integration of the Army, to the point that in 1940 President Franklin Roosevelt (1933–45) signed a military draft bill that included a nondiscrimination section.

But the battle for military integration spilled over into World War II. *The Courier* started its "Double V" (double victory) campaign signifying that African Americans would fight for democracy abroad *and* at home for the war's duration. The paper enlisted black and white celebrities—such as singer Marian Anderson, band musician Lionel Hampton, writer Sinclair Lewis, actor Humphrey Bogart, and broadcast mogul William S. Paley—and held Double V–related events, sold Double V pins, held congressmen-writing parties, and even once had a Double V song broadcast on a national network radio program on NBC. Meanwhile, other black papers highlighted numerous wrongs committed against African Americans in the military, culminating in a meeting of some black publishers and select Roosevelt aides who were threatening censorship via the courts; also at stake was federally supplied "patriotic" advertising—businesses were granted tax breaks in exchange for reinvesting the gains in the economy in a novel manner (such as advertising in the black press). The meeting ended with the government agreeing to make its war officials available for interviews while the black newspapers toned down their criticism of the federal government. Eventually, Roosevelt—under criticism from the black press for not making himself available to black groups—met with members of the Negro Newspaper Publishers Association in February 1944 and—as a direct result—three days later a black reporter was finally allowed to join the White House press corps.

With the economic gains made by African Americans serving in the military and in civilian

wartime jobs, the black press grew in stature. A 1944 national study commissioned by the Carnegie Foundation highlighted the black press's role in developing black pride and unity and its importance as a pressure group that encouraged strike lines and protest rallies with integrationist aims. *Ebony,* a national black magazine focusing on middle-class lifestyles, debuted in 1945. But any feelings of complacency about having "made it" into mainstream America on the part of the black press didn't last because of its continuing reliance on circulation sales (instead of advertising sales). This reliance on readership revenue would prove damaging amidst the growing civil rights movement.

Overcoming, but Not in Business

The limited success of protest emboldened African Americans to step up the pressure for change. The courts served as a backdrop for many such efforts, particularly the U.S. Supreme Court's 1954 *Brown v. Topeka Board of Education* verdict that struck down the "separate but equal" doctrine used by state and federal governments since the nineteenth century to segregate blacks from whites. Although appeals and attempts to evade the ruling by recalcitrant southern states slowed its implementation, the federal government soon made it clear by distribution of funding and enactment of other, equality-driven measures in government agencies that full citizenship rights for African Americans were inevitable. The NAACP pursued several other education-related cases intending to increase black access to graduate and professional training between the 1930s and *Brown*. The black press highlighted the victories while criticizing and calling attention to the decisions' deficiencies and the subsequent foot-dragging by the losing parties.

In the face of escalating civil rights protests in the 1960s, the growing impact of African American voters on elections, the clever manipulation of the news media by those in the civil rights movement (the use of peaceful confrontations and marches was ready-made news), and the violent riots that resulted in several major cities by the mid- and late 1960s, the mainstream press could no longer ignore black protests and politics. Major daily newspapers and the broadcasting networks began to search black press newsrooms for reporters who could gain access to black sources at the heart of the civil rights story. Black newspapers soon became training grounds for the prestige news media. The number of black journalists working in mainstream publications in the mid-1960s was relatively small—the National Association of Black Journalists, for example, began with 44 members in 1975—and no official statistics about the number of black journalists were kept until the late 1970s, when there were 1,700 minority journalists out of a national total of 43,000—constituting just 4 percent. That number steadily increased to—and then stabilized around—8,000, or about 14 percent, in 2007, despite the fact that minorities represent about a third of the U.S. population.

Black readership also underwent change. Prior to the 1960s' push for civil rights, the centralized ghettoes of industrialized U.S. cities created a ready-made distribution area for the black press. But as literacy increased in the late 1940s and into the 1950s and 1960s among African Americans, they also discovered and began reading mainstream newspapers as well as the black press. Ironically, mainstream advertisers felt no need to advertise in the black press—because African Americans also read the mainstream press. Increased literacy, more education, and better jobs among African Americans also meant a flourishing black middle class, many of whom could afford to leave the ghetto, thus complicating black press distribution and making it more costly; the local black paper now had to find a way to reach areas outside the central black community. By the 1960s and commonly by the 1970s, the national black newspapers, in order to save the costs of expanded distribution, began to restrain distribution of their editions to areas closer to their base.

As a typical small business, the weekly black newspaper could not compete with daily news media. If an event occurred after the weekly deadline, the newspaper had to find another way to report about that event; this would take extra time for most reporters. Moreover, losing "star" staffers to the higher salaries and greater prestige of the mainstream press made finding experienced replacements difficult and costly. The black press's conservative (i.e., advocating gradual political change), middle class, integrationist editorial stances and approach to news also disagreed with many younger black journalists who often sought

the faster-paced change that mainstream news media could potentially offer.

In the modern era, what remains of the black press varies by locale. Some major cities, such as Houston, New York, or Los Angeles, may have multiple black newspapers—many of them unknown to (because they are too small to afford membership dues) or not members of the 200-member National Newspaper Publishers Association (NNPA), the self-proclaimed "black press of America." The two remaining black dailies—the *Atlanta Daily World* and *The Defender* top the NNPA membership list; the rest of black newspapers are weekly or monthly. *The Defender*'s circulation dropped from a prewar high of 157,000 to about 30,000 in 2008 while *The Daily World* saw circulation fall to 16,000 in the mid-1960s from its peak of 75,000. Meanwhile, the NNPA has partnered with Howard University in Washington to expand its operation to the Internet with BlackPressUSA.com, a daily compendium of news, art, sports, entertainment, and history. Developments such as this one suggest that the black press now finds itself a complement to the mainstream press, rather than a substitute for it.

Balancing Politics and Revenue

Lack of money perennially plagues the typical black newspaper, usually considered a "small business" with 50 or so employees (and most with perhaps two dozen or fewer). Advertising staffs are relatively small and typically solicit advertising from businesses that make products specifically for blacks. As national black newspapers' circulation began to dwindle in the 1960s, black press advertising staffers lacked the expertise and resources necessary to effectively promote the black press to advertisers. Indeed, only three local black newspapers undertook costly verification of their readership to assure advertisers of their audience's size.

By the 1970s, black publishers had to walk the line between becoming too strident in tone (satisfying younger or more race-conscious readers) and too dependent on sales (and thus seeking more advertising from mainstream businesses that want to try to sell to older, more conservative, and middle-class readers). This spawned a division in the black press between traditional and profitable integrationist-yet-critical newspapers and the more "militant" newspapers that increasingly appeared to have become somewhat obsolete protest vehicles.

Still, a successful business must make a profit to exist, which meant black newspapers had to more assertively start seeking advertising and appealing to readership in more interesting and diverse ways. With the gains made by the civil rights movement, African Americans *en masse* began to join the rest of the country in consuming products of the U.S. market economy. As a result, by the 1970s businesses took note, advertisers began to notice blacks' brand loyalty, and black entrepreneurs (along with the rest of the mainstream media) responded by trying to reach various segments of the black audience. For example, the first issue of *Essence*—a monthly publication targeting black women—appeared in November 1945. Its editors designed the 50,000 copies to foster readers' confidence in their physical appearances and supply an outlet for discussion of such issues as workplace politics and personal experiences.

Ebony publisher John Johnson also took a cue from the change in black readers' tastes. Johnson had simultaneously tried to promote his *Negro Digest,* a broad, integrationist publication (started in 1942) that had changed in the 1960s to cover black nationalism and related issues via content linking literature and politics. But lack of sales prompted Johnson to close the publication in 1970 and place greater emphasis on *Jet,* which he had started in 1951 as a general, small, and easy-to-read news magazine that immediately became nationally popular.

Earl Graves, a former aide to President John Kennedy (1961–63), used his experience and exposure to how wealth and power worked to inspire his creation of *Black Enterprise* in 1970. Graves had also been a consultant to many companies on economic development and urban affairs and parlayed his idea for a newsletter that detailed the successes of black businesspeople into *Black Enterprise,* which initially depended on tobacco and liquor corporations for advertising before eventually convincing technology and other business sectors that he had a viable audience.

Black Broadcasting

In the 1970s and 1980s, around the same time that black newspapers began to be challenged by their

readers' exodus to the suburbs, other black-owned news media also started appearing with more regularity. Although the first radio station to be owned by blacks was bought in 1948 in Atlanta, Georgia, only 16 such stations—out of several thousand in the country—existed by 1970. By 1980 that number increased to 140 and by 2000 it jumped to 211 stations, many of which featured gospel, rhythm and blues, rap, and other modern formats. Unlike the black press, black radio attracts white, Latino, and Asian American listeners as well; still, more than 75 percent of the listeners are black.

For many radio stations, however, ownership doesn't automatically mean programming reflects that ownership. Noncommercial radio stations tend to use this programming approach more than commercial stations that simply play music as a way of attracting advertisers. Such "community" stations usually are listener-supported, nonprofit organizations that try to represent alternative voices on various public issues. For example, during the 1980s, KUCB in Des Moines, Iowa, established a reputation for strong, community-based activism on racial matters and particularly stirred controversy in its crusades against police brutality.

Still, the role of black radio in African American progress is significant. Led by pioneers such as vaudevillian performer Jack Cooper and actor-scholar-athlete Paul Robeson in the late 1930s and early 1940s, black radio journalists, educators, and entertainers played an instrumental part in ending racial discrimination in federal agencies and defense plants and educating black and white audiences about each other in an effort to promote racial harmony at home during World War II. But postwar racist resentment returned and combined with cold war and "Red Scare" activities—such as allegations and campaign rhetoric by politicians that American Communist Party members (and, by association, communist Russia) were behind U.S. integration efforts—forced black broadcasters to find alternative channels in which to combat ignorance and discrimination. For example, *New World a-Coming* premiered on a local, non-network outlet in New York City and showcased dramas or documentaries on local and race issues, while Chicago's WMAQ-produced *Destination Freedom* presented similar programming. In the process, such local productions helped rouse black community identities across the country and black radio began to emerge from its blackface-and-minstrelsy origins and rival the black press as a particularly local force. During the 1950s and 1960s, black radio helped marshal blacks to attend civil rights protests, marches, and rallies as no newspaper could because almost every black household had a radio. That influence continued into the early 1970s, reaching full fruition particularly on the eastern seaboard, in cities such as New York and Washington, where several stations employed numerous journalists to cover local black issues.

This also was around the time of the first black-owned television station, which began to broadcast in Detroit in 1973. In the decades since, Congress has urged the Federal Communications Commission (FCC)—the agency that issues broadcast licenses—to find ways to increase minority-group ownership. In 1978, President Jimmy Carter (1977–81) created the Minority Telecommunications Development Program to specifically focus on the problem. But by the mid-1990s, such "affirmative action" programs began to encounter political opposition in Congress and stricter federal court interpretations as to what constituted legal, proactive FCC behavior on behalf of minorities. In 2007, while blacks constituted 13 percent of the population, they owned only 3.4 percent of commercial radio stations and 1.3 percent of commercial television stations.

Changes in broadcast ownership policy to allow more conglomeration reduced the odds of African Americans making gains in broadcast ownership. Black-owned stations are usually one-owner establishments and can't compete with conglomerate-level efficiency. Such difficult-to-beat competition prompted many black owners to sell their stations. Not surprisingly, the government reported that the number of black-owned television stations declined from 1995 (28) to 2000 (20) so that only 10 percent of the country's larger markets featured minority-owned TV stations. An independent, nongovernment report in 2006 put the number of black-owned TV stations at 18. Most of those stations are in areas lacking substantial black populations—such as Syracuse, New York; Salem, Oregon; and Rhinelander, Wisconsin—-suggesting blacks may be buying stations where they are least expensive. Put another way, black-owned stations are found in just 5 of the 59 urban areas where African Americans constitute a majority of the population.

Likewise, many black-oriented radio stations are owned by one or two large corporations. Some perceive that such ownership threatens African Americans' chances of affecting and becoming viable actors not only in the music business but the news business as well. In fact, 43 percent of all minority-owned stations in 2007 were locally owned (i.e., owned by a resident in the station's market). For many African Americans, black radio has replaced the black press as the central community information hub and the one medium that strongly advocates politically for African Americans. In 2000, 96 percent of African Americans age 12 or older listened to radio at least 20 hours a week. In addition, as with the black press, advertising remains a concern for black radio. In 2001, a New York radio station owner had to switch the format of one of his stations from urban contemporary—which aimed toward African Americans—to adult contemporary when some merchants told his advertising sales staff that they did not want African Americans in their stores. In 2007, Radio One, one of the top U.S. radio broadcasting companies, was the largest company to mainly aim at an African American radio audience. It owned and/or operated 69 radio stations in 22 U.S. markets and reached 12 million weekly listeners. Though it did provide news programming, it was generally embedded in other shows, particularly the morning drive-time shows. By 2008 the company was in what appeared to be a financial free-fall as stock value dropped in a difficult economic market.

African American radio listeners are also served by American Urban Radio Networks (AURN), launched in 1991. As of 2008, AURN provides programming—including a newscast and other political reporting—to over 300 affiliate stations across the country.

Blacks and Cable TV

Radio One also co-owned (with Comcast) the cable channel TV One. Launched in 2004, it featured reruns from previously popular shows as well as talk, celebrity, reality, entertainment, and news shows to about 2 million subscribers. In comparison, however, the efforts of former cable industry activist Robert Johnson stand out. He started Black Entertainment Television (BET) cable network in 1980, showing reruns, old movies, and infomercials on a part-time basis. Shrewd management allowed BET to flourish and eventually sell shares on the New York Stock Exchange, which added new investors that included media conglomerates Time Warner and Tele-Communications Inc. (TCI).

Initially, music videos made up more than three-fourths of BET's programming, which had millions of U.S. subscribers. The company bought three other cable channels, published several black magazines, and created an urban radio network to add to its assets. These moves provided enough profit to allow BET to add public affairs programming (e.g., news and talk shows such as *BET Tonight with Ed Gordon,* its successor *BET Tonight with Tavis Smiley, Lead Story,* and *Teen Summit*) and original entertainment shows to its programming schedule and enable it to boast that in 2004, 9 of every 10 U.S. African American cable households subscribed to BET; also, in 1993, 60 percent of BET's audience was non–African American. Still, some criticized BET's role as a black voice in America because of its relative lack of original programming and suggested it was more about business than about politics. In 1999, Johnson sold BET to Viacom, a media conglomerate that owns several other cable networks, including Nickelodeon and MTV. In 2002, Viacom cut back the public affairs programming drastically and eliminated regularly scheduled newscasts to save money.

Internet

With the exception of BET and the *Ebony*-dominated Johnson empires, African Americans have struggled to reach media conglomerate status. Media, as labor-intensive businesses, require large sums of money to operate. African Americans, because of the longtime denials of equal opportunity, have struggled to amass such capital; few have succeeded. New technology has made it more feasible for many individuals to create their own websites to house their own publications. Black newspapers have not rushed as a group to the web, but black online news sites have proliferated (as of 2008, the entry "black news sites" in Google yielded more than 3,000 sites).

One of the black sites most widely read on the Internet, *BlackPressUSA.com,* belongs to the NNPA, a 200-member group collectively known as "the black press." Some 27 NNPA members—of the 92 that offer online versions—in 15 states form the nucleus of the news provided by the site. An additional 14 locales (and their websites) in four additional states are to be added to the main site, which has 15 million readers at various times. But the fact that most African American newspapers are not online remains a concern, especially since although online site hosting is relatively inexpensive compared to running a newspaper, websites still require people to produce, monitor, and change content on an oftentimes more-than-weekly basis. This amounts to extra costs for African American newspapers, most already cash-strapped, so they have been slow to migrate to the web. Coupled with the aging of their primary audiences, the black press' slow development of a successful Internet strategy probably is costing it potential new, younger readers, and in general reflects a decrease in newspaper and magazine reading among African Americans. *Jet* saw a 5 percent readership decrease in 2006, for example.

While African Americans in major U.S. markets are purchasing electronic technology or using the Internet in greater numbers than previously thought—broadband penetration doubled from 2005 to 2006, while 43 percent of black households in 2008 had broadband connections—many experts still worry that its cost may be too expensive for less-affluent African Americans. In addition, today there are many more media outlets than when the black press started, which means that more media enterprises—including, probably, alternative media such as black-owned news media—will likely suffer.

Despite the marketability, readership, and circulation woes of print media, African American news media remain a viable voice for the black community. The ability "to plead our own cause," still resonates with many blacks, as it continues to do with other U.S. minority groups.

Agence France-Presse

Based in Paris, the Agence France-Presse (AFP) is one of the relative handful of news agencies operating globally in the early twenty-first century.

Development

The modern French news service grew out of the century-old Havas agency. Havas had been reorganized during the 1940–44 German occupation as the French Information Office (FIO). Following on similar earlier actions in Algiers (after the allied invasion of North Africa in late 1942), French Resistance journalists took control of FIO offices and personnel on the liberation of Paris in August 1944. To make clear the change in control that had taken place, they began to issue wartime news dispatches under a new name—Agence France-Presse. At the end of September of that year, AFP took over the facilities

and some of the staff of the old, now discredited, Havas service, and became a provisional public corporation—essentially, an arm of the government.

AFP's initial job was to rebuild the global news-gathering network once enjoyed by Havas. That they were at least partially successful was indicated in March 1953 when AFP broke the news to the West of Soviet dictator Joseph Stalin's death. By 1957, AFP had 25 bureaus across France and nearly 60 overseas bureaus (the first in China opened a year later), 13 of them based in what were for a few more years French colonies in Africa and Asia. AFP correspondents were active in 116 countries and the agency distributed news to 73 nations, all of it coordinated at the Paris headquarters. It enjoyed a near monopoly on service to newspaper and broadcast clients within France, though some larger newspapers also subscribed to other agencies, chiefly the AP or Reuters.

However, the AFP remained under the effective control of the government, with only a provisional charter. In an attempt to provide it with greater organizational stability and independence, the basic law under which the AFP operated was revised in January 1957. It defined fundamental principles that guaranteed the independence of the agency and freedom of operation for its journalists. Article 2, for example, stated "Agence France-Presse may not under any circumstances take account of influences or considerations that would compromise the accuracy or objectivity of the news; it must not under any circumstances pass under legal or de facto control of an ideological, political or economic group." The law remained in effect a half century later. Yet indirect government support (in the form of subscriptions for service from government agencies) remained essential to AFP's survival even if it did somewhat limit the agency's freedom of action to critique government policies.

The use of satellite transmission began in 1971. A year later *The Washington Post* and the *Los Angeles Times* agreed to distribute AFP service in the United States—an important breakthrough to the world's largest news market. By 1979, AFP operated 108 bureaus and had a presence in 167 countries. Total employment was just under 2,000 people. Depending on the technology utilized (cable teleprinter or satellite), total agency output was between 1.1 and 1.3 million words daily. An audio news service was launched in 1984 and a photo service just a year later. A news graphics service appeared in 1988.

Continually restricted by budget limitations, however, AFP was slow to use the Internet effectively, and by the mid-1990s its overall income was only a fraction of that going to Reuters. AFP finally launched a financial service on the World Wide Web in 1997. Just two years earlier, having terminated its longtime agreement with the Associated Press, AFP began to set up its own news-gathering operation in the United States. AFP-Direct was launched to allow customized news agency transmissions to subscribers. The agency also signed an agreement with mobile telephone manufacturing giant Nokia in late 1999: AFP began providing sports, financial, and news transmissions in five languages (English, French, German, Portuguese, and Spanish) to global mobile telephone subscribers.

The Modern AFP

In the late twentieth and early twenty-first century, AFP was the world's third largest news agency (after the Associated Press and Thomson Reuters). AFP's customers included about 2,000 print and broadcast media outlets worldwide. An AFP Foundation was developed in 2007 to help promote better journalism standards worldwide.

Under its half-century old enabling law, AFP has never had private shareholders—it operates as a public corporation under a government charter. The agency is headed by a chief executive officer elected for a three-year term (who may be reelected), and is advised by a board made of 15 representative members: eight from the French press, three from the government (one each appointed by the prime minister, minister of foreign affairs, and minister of finance), two from among the agency's own personnel, and two from the French government-owned public television and radio operation. This shared governance, which includes a majority of members from among the agency's subscribers, is a key reason for its limited budgets, as well as an indication of the compromises made to achieve a continuing operation.

Many French government entities subscribe to the AFP service, and their payments have long provided an indirect subsidy to the agency's

operations. New agency leadership at the turn of the century began to push for the right to seek private investors (and thus reduce the need for so many government agency subscriptions), and to provide more services in English—a belated recognition of the global importance of that language. Late in 2008, the government made moves to increase private investment, but the strong AFP unions began petitions against the idea, which they saw as a trend toward privatizing the agency.

Agenda Setting

Agenda setting is a concept that explores effects of exposure to news media. The logic behind agenda setting is that the news media do not necessarily tell people *what* to think but instead influence what people think *about*—they are an influence on the public's perception of which issues are important. The agenda-setting effect involves social learning—individuals learn the relative importance of a menu of issues based on how much coverage those issues receive in the news media. Since the initial study conducted during the 1968 U.S. presidential election (McCombs and Shaw, 1972), several hundred research studies have examined this process, making it one of the most thoroughly researched theories in the journalism and mass communication field.

Agenda setting has been a remarkably flexible theoretical approach. Researchers have applied the agenda-setting theoretical framework to studies involving such topics as content analyses of news coverage on a single issue and experiments examining information processing of news content.

The process of agenda setting begins with coverage of a particular issue. For example, a local newspaper could decide to run a series of stories dealing with why we need strict gun control laws. The paper's readers would be exposed to the stories. The stories would not necessarily lead readers to believe that the United States needs strict gun control laws. Rather, the effect of the stories would be to raise the salience of gun control as an issue in readers' minds. The coverage would lead readers to raise gun control on their own agenda of issues with which they are concerned.

Because agenda-setting research concerns the transferal of issue salience from news media to the public, analyses often combine two research methodologies: a content analysis of media coverage and responses to a public opinion survey. Many studies employ a survey item commonly used in Gallup polls. This "most important problem" question asks respondents: "What is the number one problem facing our country today?" Responses to this open-ended question are then used to form the public agenda.

Agenda-setting research can be grouped into five categories: original tests of the hypothesis, contingent conditions affecting the magnitude of agenda-setting effects, influences on the media agenda, consequences of agenda setting, and second-level agenda setting.

Original Hypothesis

The original hypothesis emerged at a time when media effects research was struggling. Prior research in the 1950s and early 1960s consistently found minimal effects of mass media. Many of these studies, however, were looking for behavioral effects of mass communication—notably, media influence on voting behavior. Early agenda-setting researchers, however, examined a different effect of mass media—a cognitive effect in which individuals learn about the important issues of the day from media coverage. Thus, instead of a powerful (behavioral) effect of media, agenda-setting researchers were proposing a moderate (cognitive) effect.

Agenda-setting researchers have examined this moderate effect using many different methodologies. At the heart of the analyses has been a comparison of two issue agendas—the media agenda, or those issues receiving news coverage, and the public agenda, or the list of issues perceived as important by the public. Research centers on how issue salience is transferred from the media to the public.

The original agenda-setting hypothesis proposed an analysis of an "agenda" of issues—or a series of issues. Some researchers, however, have conducted analyses employing a single issue. Single issue studies are especially effective at examining agenda-setting effects across time—how the rise and fall of media coverage coincides with the parallel rise and fall of public concern about the issue. Issues examined in agenda-setting research have included the economy, the environment, civil rights, and Watergate.

Researchers also have employed different units of analysis. Some studies focus on the issue as the unit of analysis by aggregating survey respondents—grouping individuals according to the issue that they believe is the most important problem. Other studies examine differences across individuals—which personal characteristics play a role in the agenda-setting process. Finally, agenda-setting effects have been studied in many different countries and cultures. In addition to the United States, these include Taiwan, Germany, Sweden, Australia, South Korea, China, Argentina, and Japan, among others.

Contingent Conditions

From the onset, researchers have sought to discover variables that either enhance or inhibit the agenda-setting effect. Even early researchers acknowledged that effects were not uniform across all individuals. Wanta (1997), for example, tested a model of agenda setting in which attitudes toward news media led to reliance on media for information about issues. This reliance led to exposure to the media, which in turn led to agenda-setting effects. Also impacting the agenda-setting process were interpersonal communication and political attitudes. If individuals talked often with others about issues that received a great deal of coverage in the news (e.g., the economy), this provided a second exposure to information about the issues and thus increased the agenda-setting impact. On the other hand, if individuals talked often with others about issues not in the news media, issues that received little media coverage (e.g., AIDS), this provided an issue agenda that conflicted with the media agenda and thus lessened the agenda-setting effect. In addition, people highly interested in politics were more likely to attend to media messages and therefore become influenced by them.

Weaver (1997) suggested a similar process is at work. His "need for orientation" concept predicted that if individuals had high uncertainty about issues and were highly interested in issues (issues had high relevance to them), they would be highly motivated to use the news media and thus demonstrate strong agenda-setting influences. Uncertainty and relevance therefore played key roles in the agenda-setting process through the need for orientation.

Educational level appears to be especially important. Studies have consistently found the strongest agenda-setting effects among highly educated survey respondents.

Influences on the Media Agenda

Several agenda-setting researchers have examined how the media agenda is constructed through news gathering routines. As these routines make abundant use of sources, important sources, such as the U.S. President, can impact the news media's issue agenda. One such study examined a series of presidential State of the Union addresses and whether the news media influenced issues mentioned in the presidential speeches, or if the speeches influenced subsequent media coverage (Wanta, Stephenson, Turk, and McCombs 1989). The findings were mixed. The issues emphasized in President Nixon's speech influenced subsequent media coverage in 1970. President Carter, on the other hand, was influenced *by* media coverage leading up to his speech in 1978. In other words, President Carter was reacting to the media agenda. President Reagan appeared to have influenced newspaper coverage but was, in turn, influenced by television news coverage. Thus, Reagan was reacting to newscast coverage, but print media were following Reagan's issue priorities.

The relationship among the President, press, and public has often been termed "agenda-building." Lang and Lang (1983), in their examination of President Nixon and the Watergate scandal, argued that the President, press, and public are highly connected. A President may discuss an issue, which will in turn receive media coverage which leads to public concern. That concern may lead to additional reactions from sources, which will lead to additional media coverage. This process will continue until one of the three actors tires of an issue.

Other researchers have examined coverage of city council issues, and how U.S. automakers' executives influenced news coverage of international trade. Public relations practitioners also have been shown to impact media coverage. Broadly, most studies demonstrate strong influences of sources on the media agenda.

In addition, some research has examined intermedia agenda setting, or how elite media set the agenda of other news organizations. *The New York Times* and Associated Press news service, for example, often impact coverage patterns of other media. Intermedia agenda setting has been examined through the Internet as well. Journalists routinely monitor Internet news sites and blogs for news story ideas. In turn, these websites and blogs monitor traditional media for their topics. The relationship between the traditional media and Internet, then, appears to be reciprocal if not circular.

Consequences of Agenda Setting

While research into the sources of the media agenda examine how the news is constructed—analyses of a process leading up to the press–public interface—research dealing with consequences of agenda setting investigates what happens later in the process, after the media agenda impacts the public. There are two main substreams in this area.

First, some studies have examined behavioral effects that follow the typical agenda-setting influences. Does media coverage ultimately motivate the public into action? In other words, research seeks out potential behavioral effects, such as voting behavior, which was largely abandoned after much early research (prior to the 1960s) showed minimal effects of mass communication. Other behavioral variables examined in agenda-setting research include writing letters to the editor, posting messages on electronic bulletin boards, and purchasing of products—all of which have been linked to media coverage.

Other studies have examined whether public officials act on issues or concerns brought to the fore by agenda setting. Such "policy agenda-setting" studies examine how policymakers take cues from both media coverage and public opinion to propose laws aimed at relieving a societal problem. But thus far such research has been scant, possibly because many issues receive inconsistent coverage over time. Thus, many policy studies are more anecdotal than empirical. They have examined media coverage and subsequent policy actions for issues such as child abuse and governmental corruption. Another reason for the limited research in this area is that public officials, the news media, and the public tend to interact with each other in the agenda-building process—creating a circular relationship that is difficult to track.

Studies of the consequences of agenda setting demonstrate the importance of the news media. Not only do the issues covered in the news raise the perceived importance of the issues among the public, but they often mobilize both the public and public officials to take action.

Second-Level Agenda Setting

The newest agenda-setting research involves the study of a "second level." Instead of an agenda of issues, second-level agenda-setting research investigates an agenda of attributes—the characteristics of people, places, and things in the news.

Second-level agenda-setting research is closely related to framing. Framing describes the process in which the media "frame" issues in the news by concentrating on certain elements but ignoring others. It is impossible to cover every aspect of every news story, so reporters must choose what to include and eliminate. Neither can the news media include every characteristic of objects in the news. Again, reporters must choose among attributes of objects. The public learns the significance of these attributes based on how often they appear in the news. Thus, the media again set the public agenda, here an agenda of attributes, through their coverage.

Researchers have commonly examined two dimensions of second-level agenda-setting research: substantive and affective attributes. Substantive attributes involve information about qualities of newsmakers, such as a presidential candidate's experience with foreign affairs. Affective attributes involve positive, neutral, and negative qualities. In other words, the substantive attributes deal with factual information and affective attributes deal with evaluations of newsmakers.

McCombs, Lopez-Escobar, and Llamas (2000) found support for media influence on both of these dimensions in their study during the Spanish national election of 1996. First, they found that public perceptions of substantive attributes were closely related to media coverage of those attributes. Likewise, they found that public perceptions of affective attributes were highly correlated with media coverage. Thus, the public linked both information about candidate characteristics and positive/negative evaluations of candidates to media coverage.

Second-level agenda setting has largely concerned people in the news as the object of the analysis, including analyses of the President or candidates in elections. Recent studies have investigated media coverage and public perceptions of other objects, such as countries and large corporations. Issues also can be examined as an object, with subissues acting as attributes. The economy, for example, could be an object, with inflation, unemployment, the budget deficit, gasoline prices, and so on, as substantive attributes.

Conclusion

Agenda setting has been an important theory in mass communication research for a third of a century. It has retained its importance even with the emergence of the Internet as a source of information that differs greatly from traditional news media. And it has evolved to include a second-level of study—an agenda of attributes. Indeed, there are many possible agendas and many possible objects that can be the focus of research. Agenda setting highlights a process of media effects that underlines the importance of the news business. Issues covered in news stories become those that the public believes are important.

Agriculture Journalism, Electronic

Agricultural news and market programs on radio, and to a lesser degree television, have long served the farming community. More recently, the Internet has offered further options for targeted rural communication.

Origins

Even before World War I, experimental wireless stations often included farm news and market reports (sometimes broadcast in Morse code) in their scattered program offerings. Station 9XM at the University of Wisconsin was one of these. Soon after World War I, when radios became the exciting new mode of entertainment in the rural areas, a rural audience in Illinois was willing in 1921 to listen to station KYW broadcast an entire season of the Chicago Civic Opera—and nothing else. Music and variety and other standard urban-based entertainment were the first rural radio offerings, but early on programmers realized that farm audiences had different music tastes and information needs. The "barn dance" format of square dance and fiddle (as opposed to violin) was one of the earliest and most popular offerings, consisting of "hillbilly" music and broad comedy; one of these—the *Grand Ole Opry,* which first aired from Nashville in 1925—is still playing today.

In addition to entertainment, both the U.S. Department of Agriculture (USDA) and land grant universities rapidly realized this new medium's potential to reach the nation's farmers, many of whom were scratch producers, barely eking a living from the land. By 1922, the USDA started sending market reports on grain and livestock prices to radio stations, joining the U.S. weather bureau that began releasing official weather reports in 1921. This was no small service. With the new information, farmers could avoid some of the effects of rains and early freezes and time their harvests and shipments with higher crop prices.

In the 1920s, however, the six and a half million farms in rural America were largely without electrical power, and only the well-to-do few were able to afford such luxuries as telephone and automobiles. Even those who could afford a radio and its required batteries might not have the money or the mechanical knowledge to repair the frequently malfunctioning sets. Nevertheless, by the 1930s Department of Agricultural Census, roughly 20 percent of farms had radios, a figure that varied wildly between the relatively well-off North and Midwest, where adoption was as high as 50 percent in some areas, to lows of 3 percent in some of the poorer areas of the South. African Americans, often sharecroppers, were least likely to adopt.

From the 1930s to the early days of television, radio was a major source of farm and farm household agricultural news and entertainment. Television and, to some degree, changes in population demographics decreased the revenue that advertisers were willing to spend for entertainment and increased the amount of competition for direct advertising dollars. These same factors, and changes in direct marketing tactics in the post–World War II era, also challenged farm radio revenue streams, but even with the increased competition from other types of media agricultural radio has remained an overall informational mainstay for farmers.

From the start, typical farm broadcasting included market information, weather, and some agricultural news or features, which range from extremely local (interviews with 4-H members at the fair) to national (reports on the current farm bill's progress through Congress). The length of the broadcasts varies dramatically from a very few all-day agriculture stations to a few minutes of livestock and crop market reports and news briefs.

Farm Broadcasting Today

By the early 2000s, roughly 1,100 stations (both radio and television, but largely the former) offered some farm broadcast news. Typically radio farm news is delivered in one of two ways. In the Midwest, particularly Illinois, Minnesota, and Wisconsin, some radio stations have designated farm broadcasters, who report a variety of agricultural news and features. However, the majority of coverage originates with specialized networks that produce agricultural news and sell segments to affiliates or subscribers for airing.

Television is a minor (some 10–12 programs) portion of the electronic market. Television shows, such as *Ag Day* and *This Week in Agribusiness,* are mainly connected to university or farm bureau associations and include a similar range of news, features, and market information to that provided by radio.

Agricultural broadcasting is a demanding form of programming, requiring an unusually wide range of skills. Agricultural reporting is one of the more complex journalism jobs, requiring all of the skills of reporting in highly technical (scientific) areas and financial information, as well as covering the political news of national legislation affecting

agriculture. At the same time, however, farm broadcasters are expected to establish personal relationships with the area that they serve. Two thirds of those who listen to farm radio can name their farm broadcaster, and those from local stations are expected to cover such local events as the county fair.

Almost all farm broadcasters grew up on a farm and many include their active ties with agriculture—such as living on a farm or in a rural area, and raising animals—in their descriptions of their qualifications as broadcasters. The primary professional association for farm broadcasters, established in 1944 as the National Association of Radio Farm Directors, is the National Association of Farm Broadcasting (NAFB). It serves a mixed membership, including both farm broadcasters and agribusiness representatives, and is—according to its own description—"an established liaison between farm broadcast stations and networks and the AgriMarketing community of companies and agencies." The 146 NAFB members represent the vast majority of all farm broadcasters in the United States.

According to a 2005 Agricultural Media Research study commissioned by the NAFB, most farmers listen to—and rely on—farm broadcasters. Ninety percent of farmers over 40 said that the farm radio was an important medium to get information they need and over 50 percent said farm radio was extremely important. Farmers under age 40 were slightly less likely to say that that farm radio was extremely important (43 percent), but just as likely (90 percent) to say that farm radio was, at the very least, important.

The dominant agricultural broadcast challenge in the late 1990s and early 2000s grows out of the consolidation of the input side of agriculture—chemical and fertilizer companies. Not only were there fewer advertisers, but they were less and less likely to advertise through a general medium such as radio when farm numbers were now small enough to target through direct mail. Many farm stations, faced with the choice of "getting bigger, looking bigger, or getting out," changed their formats, dropping agricultural content.

Other farm broadcasters are exploring the larger (and growing) rural lifestyle market. Farm broadcasters offering stories on local wells, septic tanks, where to buy horse feed, or a weekly interview with local veterinarian (topics that appeal to newcomers to small towns and rural areas) are also opening up more avenues for local advertising.

The primary ethical challenge for farm broadcasters is whether the relationship between broadcasters and the industry they cover is too close, specifically whether farm broadcasters are advocates *for* agriculture rather than journalists *covering* the subject. This issue covers many situations, among them that the easiest way for farm broadcasters to make money is to produce paid-for content. However, the fundamental question is whether farm broadcasters *should* be advocates. Some broadcasters clearly take the position that farm broadcasters are first and foremost journalists and the best service they can give agriculture is to maintain a critical distance and the freedom to ask harsh question. Others see no problem with farm broadcasters being advocates for farmers, arguing that as a whole, farmers have few media representatives who are specifically looking out for their needs.

Internet Services

The Telecommunications Act of 1996, a major overhauling of American communication law, set a goal of universal access to the Internet, stating that "consumers in all regions of the Nation, including low-income consumers and those in rural, insular, and high cost areas, should have access to telecommunications and information services…that are reasonably comparable to those services provided in urban areas." Since the passage of this law, Internet use by farmers has grown relatively rapidly. Roughly 20 percent of all farmers have access to high speed Internet, but the majority of farmers still rely on dial-up (40 percent) or don't use the Internet at all. Those producers who are actively engaged in capital intensive conventional farming are a much higher percentage of those using broadband than the rest of the target populations, indicating that the farm audience is gradually becoming adapted to Internet usage.

The potential of the Internet offers a challenge for farm broadcasting in the next two decades, specifically in the way that agricultural radio stations will adapt to the information gathering habits of younger farmers who are more used to having information on demand. Universities and agricultural news networks and stations are experimenting with a variety

of Internet services, including blogs, information databases, and web-based audio. However, the larger challenge is how to tailor audio information that can be selected, downloaded, and available to farmers in whatever setting—tractor, living room, or grain elevator—that most directly suits their needs.

Agriculture Journalism, Print

Agriculture—a $250-billion-plus-a-year industry, with $69 billion in crop exports in 2006—is one of the oldest and largest of all American industries. Every export dollar creates another $1.48 so that agriculture generated another $102 billion in supporting business. The major source of information about this industry for those in it is, and has been over the last hundred years, the agricultural/farm magazine.

Agricultural media became a viable—that is, fairly reliable, roughly continuous, and relatively current—industry some few decades after the Civil War, ironically during roughly the same period in which the number of non–farm workers first surpassed the number of farm workers. The number of publications grew from 157 to over 400 from 1880 to 1920, prompted by sweeping changes in the nation as a whole. The postal act of 1879, which allowed magazines to be mailed at two (later one) cents per pound, coupled with railways, better wagon roads, and more mechanized publishing technology, increased the ability of communicators to produce and deliver magazines. During this period industry and large-scale capitalism was penetrating into the farm commodity chain primarily through farming production technology—such as the steel plow. Farmers financed those purchases by increasing their sale of market goods and learned about the technology through farm magazines. At the same time, farm editors were switching from being authorities on agriculture to becoming communicators who supplied information coming from agricultural colleges, state and federal government, and advertisers of agricultural products, a network of sources that has remained essentially unaltered since that time.

Prior to the Civil War, publishers had generally disapproved of what they called "foreign matter" in their magazine, but by the 1880s their objections to advertising had largely disappeared. Advertising revenue allowed publishers to drop their subscription prices and by the 1890s publishers were receiving more income from advertising than from subscriptions. And, since farm magazine advertisers were interested in selling farm products, it was important to these advertisers that farm families, rather than other types of families, received the magazine. The 1915 government survey of commercial farm periodicals was the first record of editors using controlled circulation (the practice of sending magazines free to lists of selected farmers who have advertiser-preferred demographic characteristics) as a method to increase their attractiveness to advertisers.

In terms of content, however, the farm magazine strategy remained essentially unchanged from the 1880s through the 1920s. Aimed primarily at the farm family, the magazines promoted the values of agrarian fundamentalism and Jeffersonian ideals of the rural life as the most moral balance between the untapped wildness of "nature" and the moral degeneracy of the "city." Farm magazines carried articles on family life, poems, fiction, advice on home management and raising children, and articles on production concerns, such as how

to increase the number of pigs per litter. One of the more major changes in content for farmers was the use of the "success story," a case study of a particularly successful farmer.

As the agricultural price slump of 1920 slid into the Great Depression, the main story of farm publications was their consolidation from 405 in 1920 to 295 at the end of World War II, although the number of readers increased somewhat. The main change in the farm press industry during the period 1920 to 1940 was a distinct increase in the number of publications produced by farm organizations, most particularly the Farm Bureau and the Grange. Overall, those magazines that survived these two decades kept their same editorial and circulation strategies.

The end of the war, and Europe's need for foodstuffs, brought back some degree of prosperity to farming in the later 1940s and 1950s and both the circulation and the number of farm publications increased somewhat during that time. But in the 1950s and 1960s, consumer-goods advertisers switched to television, radio, and consumer magazines, precipitating yet another drop in both numbers of magazines and breadth of content. In these decades, the media changes of the 1920s and 1930s—movies, radio, and new popular literature—effectively weakened farm publications' advertising base to the point that farm magazines dropped the home, family living, and fiction sections of the farm magazines to concentrate specifically on agricultural production information, which became—in terms of content—essentially the farm magazines of today. A second change, also continuing up to the present, was the change in advertisers' attitudes on the preferred audience mix, resulting in a move from desiring large circulations to a more specialized demand for high numbers of farmers in the mix of readers. As a strategy, more and more general agricultural magazines switched from paid subscriptions to controlled subscriptions, or a combination of controlled and paid. As had been true in the past, farm publication numbers ebbed and flowed with the health of the agriculture industry, going through a bonanza period in the early postwar years and declining with the farm crisis of the 1980s and the livestock consolidations in the 1990s.

Today farm magazines are considered trade publications primarily concerned with agriculture as a business, but are also regarded as advocates for agricultural interests. At just over 250 magazines in 2007, the number of farm publications is lower than at any time since 1885, partly due to the rapid consolidation of agriculture itself, which has significantly reduced advertising dollars. Since the 1950s farms have continually grown in size as the more successful farmers pushed the less successful out of business, a process that was particularly rapid during the farm-debt crisis of the 1980s. In addition, companies that produce agricultural herbicides, for example, have merged and have, more importantly, reduced the overall amount of money budgeted for magazines. For example, Monsanto, a giant in the agricultural industry, has been using genetic engineering to couple seeds with a specific herbicide, dramatically reducing its need to advertise that herbicide. Finally, the livestock industry significantly concentrated in the 1990s and early 2000s, reducing the total number of producers and increasing incentives to do direct marketing rather than advertising in farm publications. In addition, most farm publishers are acutely aware that the Internet is looming as yet another competitor for agricultural advertising revenue.

Magazines by Content Area

Roughly 30 agricultural magazines focus on "general agriculture," that is, they cover the variety of crops that would be found on a diversified farming operation. Of these, *Farm Journal* (circulation 443,000) is perhaps the closest to a truly national agricultural publication. However, this reach is somewhat deceptive since *Farm Journal* varies its content by region and allows geographically specific advertising buys. *Progressive Farmer*'s various editions (circulation 3.5 million) collectively cover the range of the continental United States, but are specified by geographical region—*Progressive Farmer Midwest, Midsouth, Southeast,* and *Southwest*. *Successful Farming* (circulation 440,000) is also widely distributed, but after these three the remaining general agricultural magazines are far more regionally specialized, commonly circulating in the 10,000 to 70,000 circulation range.

In contrast to the three leading titles, *Farm Journal, Successful Farming,* and *Progressive Farmer,* other general agricultural magazines are usually focused by geographical region or topic.

Such magazines as *Iowa Farmer Today, Maine Organic Farmer and Gardener,* or *Missouri Ruralist* cover a wide range of agricultural topics within their state—information on federal and state-specific regulations and incentives, crops and livestock management techniques, and research from the state's land grant university agricultural scientists. Less than 2 percent of all agricultural magazines are specifically aimed at small or organic producers.

Commercial media produce the majority of general agricultural magazines, with associations (Farm Bureau, National Farmers Union, Grange) producing roughly a third. The association publications tend to concentrate more on news and agricultural policy, rather than specific production techniques.

Livestock Magazines

Just under a third of agricultural magazines are livestock specific, although the numbers are slightly skewed by the inclusion of magazines aimed at horse owners, breeders, and racers. Livestock magazines are generally specific to a particular type of animal, and often a particular breed. Commercial firms produce a few magazines with controlled circulations and large readerships: *Beef* (100,000), *Drovers* (99,000), *National Cattleman* (38,000, paid and controlled).

The beef magazines are most commonly one of two types: geographically specific magazines sponsored by state livestock associations (*Alabama Cattleman, Montana Stockgrowers*) or breed specific magazines sponsored by that breed's official association (*American Red Angus, Hereford World, Red Poll Beef Journal*). Seventy-five percent of the nation's inventory of over 60 million cattle is raised on larger farms with 50 or more cattle and most of the geographically specific livestock magazines are aimed at readers with these larger herds. Breed magazines have different purposes, specifically to control and promote changes and developments in lines of cattle that have been bred for specific characteristics over the last several hundred years. These magazines are primarily for association members who are developing and selling purebred cattle.

The dairy industry magazine sector has much the same structure and purpose as the beef, with production magazines for the active dairy farmer—*Dairy Herd Management (*circulation 71,000, paid), *Dairy Today* (circulation 52,000, controlled), and *Hoard's Dairyman* (82,000, controlled)—and breed magazines for Ayrshire, Brown Swiss, Gurnsey, Holstein, Jersey, and Milking Shorthorn dairy cattle breeders. Less than 20 additional magazines serve the rest of the livestock industry, including swine, poultry, and more specialty livestock—emus, sheep, and goats.

The magazines for field crops, fruits, nuts, vegetables, and bees are relatively evenly split between paid and controlled circulation and cover production techniques, equipment, and input (fertilizers, herbicides, and seeds) for producers, with a few additional journals for researchers such as *Rangeland Ecology and Management, Soil Sciences,* and the *Journal of Animal Science.*

In additional to magazines aimed at active farmers, ranchers, and associated professionals, agricultural magazines cater to audiences served by rural electrical cooperatives and to horse owners, racers, breeders, and showers.

The industry's major challenges today include declining number of publications and fewer job opportunities combined with the increased complexity of the subject matter. Agriculture is becoming more specialized, globalized, and contested, and with a greater range of subject matter—from genetic modification of food crops to energy production. Analyzing specific commodity groups and writing articles about organic wine production or gardening require significantly different sets of skills, as well as different circles of sources.

An additional, related problem in writing for agriculture is the need to balance the varying and competing interests of commodity producers, food producers, and consumers. Adding further tension, many agricultural publications have limited travel budgets, encouraging agricultural journalists to accept travel opportunities from producer groups and/or agribusiness, which calls into question their editorial independence to some degree, but more importantly means that journalists report on less important, but more affordable, stories.

Advertising

Farm Progress (which publishes *Prairie Farmer*), PriMedia (which owns a variety of horse magazines), Farm Journal Media (*Farm Journal*), and

Meredith Corporation (*Successful Farming*) consistently held the top market share, with Farm Progress the clear leader. The predominance of these media firms over the total agricultural publishing fields means that agricultural magazines are a tight oligopoly, a market structure with only a few firms, none of which has complete market power. The effects of oligopolies on journalism are relatively ambiguous and depend on the degree to which the members of the oligopoly pay attention to each other. On the positive side, when oligopolies take notice of each other's activities, innovations from one can spread rapidly to other members. On the negative, however, if journalists have very few publishers in a particular field, the effects of limited employment opportunities might have a chilling effect on covering controversial stories, particularly those that challenge the financial interests of the parent company.

Both *Successful Farming* and the *Farm Journal* offer sophisticated marketing services for their advertising base. *Successful Farming,* for example, has a market research panel of roughly a thousand magazine subscribers, active farmers who are interviewed 8 to 12 times a year. Farm Journal Media offers a database that focuses on Class 1A farmers, those with over $100,000 of annual gross farm income. According to Farm Journal Media's description of its database, these "450,000 decision makers are responsible for nearly 80% of America's $200-billion farm production" and, hence, represent an enormous segment of the total food and fiber produced in the United States. Farm Journal Media also includes Farm Journal Database Strategies, a marketing service that "provides clients with a range of products including data analysis, direct marketing, consulting, systems design, and development and demographic enhancement," and Farmail, rented mailing lists drawn from the Farm Journal database guaranteed as viable addresses for the marketers' chosen demographics.

Conclusion

Agricultural communicators provide a majority of agriculture–related technical information to the producers who are responsible for growing food and fiber. The number and types of publications have decreased over time, and by the early 2000s, are significantly limited in kind and in scope. In addition, given the limited number of companies advertising agrichemical products, editors in general are wary of printing articles that will offend these companies. The pressure to self-censor stories, in particular stories that cast potential and current advertisers in an unfavorable light, has been and continues to be one of the major ethical concerns for agricultural journalists.

Air America

Air America Radio (AAR) is a radio network that emphasizes liberal political talk shows in contrast to the conservative tone of most syndicated talk radio. From its formation in the early 2000s, however, Air

America struggled with insufficient capital, a declining number of affiliate stations, and many changes in ownership and management.

Origin

The beginnings of what became Air America date to late 2002. Chicago venture capitalists and Democratic Party activists Sheldon and Anita Drobny sought to arrange national syndication of Mike Malloy, a local talk show host they admired but who had lost his radio post. Working with radio consultant Jon Sinton, the Drobnys formed AnShell Media, and began to raise funds for a national network (or, failing that, a program syndication service) building on Malloy's work. News that they were raising funds for a liberal counterpart to radio's dominant conservative talk programming received considerable attention, initial support, and newspaper reports about the pending venture. Network plans included attempts to purchase up to five stations on which to secure the operation.

But when funds ran short, the original investment team sold out to Evan Cohen (whose money came from advertising), who formed Progress Media, with Sinton staying as president. Already evident was a growing tension between those driven by liberal ideology and those seeking to develop a successful broadcasting business.

Still, by early 2004, more staff was hired and an affiliation agreement was struck with New York AM station WLIB, a low-rated outlet. Indeed, many of the AAR affiliate agreements were made with stations with low ratings that had little to lose giving the new network a try. On March 31, 2004, the newly named Air America Radio Network began operation. (This was preceded by a potentially bad omen: An earlier "America Radio Network," which had also attempted marketing a liberal approach to radio talk programs, left the air just before Air America began.)

Programming

The notion behind AAR from its inception was to provide a menu of news, public affairs, interview, and entertainment programs that would reflect a progressive or liberal point of view. Critics argued such a network would have a hard time finding an audience amidst the right-wing domination of commercial radio talk shows (whose top stars were heard on hundreds of stations). And they added that the network seemed focused much more on having an impact on election politics than on broadcasting. As much to the point, the new network would have to buy program time on stations, a financial model the conservative talk shows had pioneered beginning in the late 1980s.

With some effort, Sinton persuaded comedian, author, and commentator Al Franken to become the network's centerpiece talent. Franken, already well known for skewering the political right, would be the network's best known on-air personality for the next three years. Soon others, hearing about the Franken deal and the developing network idea, also came onboard. When it first aired, many programs leaned toward political satire rather than hard news. Many of the on-air personalities were known for their comedy and entertainment backgrounds. In April 2005, AAR signed Jerry Springer to host *Springer on the Radio,* arguing that recognition, not to say notoriety, might help the network develop. Unlike his earlier television incarnation, the controversial Springer said his new venture was entirely political in nature.

In late 2005, popular comedian and AAR morning program co-host Marc Maron was let go (he would return in February on a different program). Others left AAR as well, including Sinton by mid-2006. In August nighttime host Mike Malloy—around whose role the network idea had begun four years earlier—was also let go. While not explained, some suggested that his criticism of Israel during its Lebanon incursion that summer may have played a part. Observing all of this confusion and people coming and going, many conservative radio talk shows highlighted Air America's problems in their own programs, and did so with considerable glee.

By late 2006, AAR was providing 19 daily hours of original programming and was being heard on 92 affiliates reaching nearly 60 percent of the country, and about 2.4 million listeners per week. Randi Rhodes' talk program was on the air twice each weekday, early in the morning and again in afternoon drive time, for three hours each. The Young Turks dominated the all important morning drive hours. And Thom Hartmann held

down the middle of the day. These and other programs featured call-ins as well as active webpages and audio and video streaming.

Seeking Stability

Air America appeared strong at first, signing about 100 affiliate stations, including outlets in 18 of the 20 largest markets, in six months. Each of these would be paid to carry network programs. But behind the scenes, insufficient capital was a continuing issue, as were disagreements among funders and managers. Almost immediately, however, affiliate stations in Chicago and Santa Monica claimed they had not received the contract payment for carrying AAR programs. Subsequent litigation and bad press contributed to further problems, as did the loss of network coverage in both Chicago and Los Angeles.

Just a month after the network's debut, several officers departed, though Sinton remained in charge. The network decided to stop trying to buy radio stations, and to allow its affiliates to carry programming outside of the network's offerings. In mid-2006, AAR lost its affiliation with WLIB and had to shift its New York affiliation to a smaller station WWRL, another outlet that had traditionally programmed to African Americans (for 15 years it had been a gospel station, which is what WLIB became). WWRL became the new network flagship affiliate.

In October 2006, the network was forced to file for bankruptcy protection (it had lost more than $40 million since first airing in 2004). The same Santa Monica affiliate that had complained about nonpayment two years earlier had sought to freeze the network's accounts. Recriminations were rife, some arguing the network had been overstaffed, a sign of its political expectations, rather than its broadcast revenues reality.

In late January 2007, AAR announced plans for its acquisition by the Green Realty Corporation, a New York office building firm. By the time the $4 million deal was consummated in March, and a new management team (headed by longtime liberal activist Mark Green, brother of the new owner) took control, however, AAR was down to 70 affiliates reaching a weekly audience of 1.7 million listeners. In an attempt to shore up its revenues, AAR signed with radio giant Westwood One to oversee all network and affiliate station advertising sales. Franken left the air February 2007 and announced plans to run for the U.S. Senate seat from Minnesota.

By early 2008, AAR was producing 21 hours of weekday network programming for its 62 remaining stations, though only about 40 carried most of the schedule. Indeed, some outlets carried only one or two programs. While AAR programs did well in such traditionally liberal towns as San Francisco; Portland, Oregon; and Madison, Wisconsin; ratings were often anemic in other markets. Yet even small audiences were often hugely loyal to specific talk show hosts, giving their programs greater impact. AAR programs were also carried on an XM Satellite Radio channel, and streamed on its own website.

Al Arabiya

The Al Arabiya satellite TV channel, based in Media City, Dubai, was established in March 2003 with an investment of $300 million by

Middle East News, a Dubai-based production company that also runs the Middle East Broadcasting Center (MBC). From the start, Al Arabiya has billed itself as the less provocative alternative to Al Jazeera.

The company is owned by the brother-in-law of Saudi Arabia's King Fahd, Lebanon's Hariri Group, and other investors from Saudi Arabia, Kuwait, and the Gulf. Unconfirmed reports suggest that the Kuwaiti funding for Al Arabiya has been withdrawn. Before the establishment of the Qatari-based Al Jazeera satellite channel in 1996, Saudi businessmen owned almost all of the major pan-Arab media, ensuring that Saudi rulers were rarely scrutinized by the Arab media. Qatar's prince did not interfere in the station's editorial decisions, thus allowing Al Jazeera reporters to take on the Saudis as well as other governments in the Middle East. Saudi Arabia's response to Al Jazeera came in 2003 with Al Arabiya TV, established just in time for the Iraq war.

The choice of Salah Qallab, a former Jordanian information minister who was also a columnist for a Saudi-funded newspaper in London, as the first director-general of Al Arabiya ensured that the station would not challenge Arab regimes the way Al Jazeera has. Noted Qallab, "We are not going to make problems for Arab countries. We'll stick with the truth, but there's no sensationalism" (Urbina 2003). Most of Al Arabiya's programs are prerecorded, allowing the station to avoid on-air call-ins venting against Arab leaders, Israel, or the United States. Because Al Arabiya competes with Al Jazeera for the same audiences, however, it initially tried to scoop its rival. In August 2003, Al Arabiya broadcast a clip of masked men threatening to kill members of the U.S.-appointed Iraqi governing council, leading a spokesperson for the U.S. State Department to call the station's action "irresponsible in the extreme." In September 2003, the Governing Council of Iraq restricted the operations of Al Arabiya and Al Jazeera for two weeks after the channels showed more footage of masked men calling for attacks against U.S.-led forces. Al Arabiya broadcast audio tapes by the then-fugitive Saddam Hussein exhorting Iraqis to rise up against the United States on November 16, 2003, leading Iraq's interim government to ban it from reporting from Iraq for two months.

According to Andrew Hammond in 2007, Al Arabiya's agenda took some months to unfold after the Iraq war when it ran documentaries about mass graves and other human rights abuses in pre-invasion Iraq in what may have been taken by viewers as an effort to create a balanced debate about tyranny, democracy, and nationalism in the Arab world. "To others, the programs appeared aimed at undermining the Iraqi insurgency which had wide support among public opinion throughout the Arab world." Islamist websites began to refer to Al Arabiya dismissively as Al 'Ibriya or "the Hebrew Channel" because it granted considerable space to American officials and their allies in Iraq and elsewhere to explain their policies. Like Al Jazeera, Al Arabiya designed powerful montages of Israeli soldiers putting down the Palestinian *Intifada* (Uprising), but it also discredited the activities of the Islamist insurgency movement in Saudi Arabia.

Al Arabiya has 40 news bureaus across the world, including both Israel and the occupied Palestinian territories. The channel airs a news bulletin every hour around the clock. Although Al Arabiya has a strong news presence and several successful talk shows, it also broadcasts light items not found on Al Jazeera and distinguishes itself from its rival by keeping individual news items shorter than two and a half minutes. The channel notes on its website that it covers Gulf Council Countries (GCC), an area some feel Al Jazeera does not cover regularly. The channel is available in the United States via cable subscriptions and worldwide on the Internet via Canadian Jump TV.

In 2004, Al Arabiya was placed under the management of Abdel Rahman Al Rashed, a Saudi who wrote opinion pieces against Islamists. Al-Rashed moved Al Arabiya away from the graphic images of the aftermath of bombings and the bloody scenes of the conflict to which Americans objected, toward a more sanitized version of the news. But the channel still covered the Faluja battle of April 2004 aggressively and had a reporter inside the city while the fighting was going on. On the other hand, Al Arabiya expanded what counts as news by adding the type of apolitical stories critics of the American media dub as infotainment. Thus, in one November 2007 week, the five "most read" items covered the following topics: (1) short-term "pleasure marriages" of Iraqi women to Syrian and Iraqi men in Egypt; (2) Saudi court imprisonment and threatened flogging of a woman who was kidnapped and gang raped; (3) Saddam Hussein

in the eyes of his warden: he is nice and polite, and he "deserves to be loved"; (4) How an Indonesian turned into a tree after suffering from a rare disease; and (5) New information on Saddam Hussein in prison before his execution.

Under Al Rashed, Al Arabiya also took a turn to the right by discouraging the use of left-leaning British papers, *The Guardian* and *The Independent,* in the channel's international press roundup. Anchors and correspondents were instructed to refer to American troops in Iraq as "multinational" not "occupying" forces, and "[h]osts were instructed to cut off guests who digress into anti-American rants" (Shapiro 2005). The instructions did not result in the total elimination of that terminology owing to both staff and guest resistance. Still, President Bush was interviewed by the station at least three times, once in May 2004 to explain that Abu Ghraib was an aberrant incident, not U.S. policy; in October 2005 to comment on Lebanon, Syria, and Palestine; and in October 2007 to give an Al Arabiya correspondent a tour of the White House ("where decisions of war and peace are made") and the Rose Garden, and to assure him that the United States is not against Islam as Al Qaeda claims, and that it has no intention of partitioning Iraq.

Unlike Al Jazeera, the station has no trouble securing political or commercial ads. Still, Al Arabiya has been subject to attack in Iraq and elsewhere. One previously unknown Islamist group, in an Internet statement in late 2007, claimed responsibility for attacking the station "because it has insisted on praising [Iraqi Prime Minister Ayad] Allawi's government and the criminal Americans, describing them as the liberators" of Iraq, and because Al Arabiya "pretends to be unaware of the heroic mujahideen operations." Eleven Al Arabiya staff members were killed, five in a suicide car bombing of the channel's bureau in Baghdad in October 2006, and two "were killed by American occupation force" (Al Arabiya 2007).

Programming

By 2007, Al Arabiya was transmitting two regular news media review programs. The first, *The Fourth Estate,* reviews opinions of the international print media on Middle East issues, and hosts international journalists who comment on current issues. The second, *Last Edition,* reviews regional and Arab print media and interviews Arab journalists to learn their perspectives on regional and world events. The channel features a mixture of solid political programming as well as lighter fare. *Bilarabi* (In Arabic) hosts prominent and high profile guests and discusses past decisions they have made, then discusses current events. *Across the Ocean* concentrates on American policy toward the Arab world and examines Arab American issues. *From Iraq* conducts "interviews with influential figures in Iraq to highlight the daily lives of Iraqis, their daily problems, concerns, and how they see their future." Al Arabiya notes that *From Iraq* is highly rated in Iraq and large quantities of pirated CDs and videos are sold the day after the program is broadcast. *Ida'at* (Illuminations) hosts prominent guests from the Gulf region. *Mahattat* (Stations) covers "new or weird" aspects of life. *Point of Order* "hosts controversial characters." *Under the Light* is a political live talk show that hosts three or four guests from different countries with different opinions to shed light on a hot topic (Al Arabiya TV Popular Programs 2007).

Over the years, polls have differed on how popular the channel is. A U.S. State Department poll in seven Iraqi cities in October 2003 found that among Iraqis with satellite dishes, 37 percent named Al Arabiya as their preferred news source, followed by Al Jazeera at 26 percent (Department of State, 2003). A Zogby poll conducted in Jordan, Lebanon, Morocco, Saudi Arabia, Egypt, and United Arab Emirates in October 2005 asked: When you watch the international news, which of the following network's broadcasts do you watch most often? Results revealed that 65 percent chose Al Jazeera, while 34 percent preferred Al Arabiya (Telhami 2006). The poll was criticized for not polling Iraqis.

Brian Whitaker, Middle East editor of *The Guardian,* believes that "even with the best intentions Al Arabiya's journalists could feel constrained about reporting fearlessly on issues such as the succession, internal reform and the rise of separatist currents in the kingdom" of Saudi Arabia (Feuilherade 2003). But the channel's managers seem pleased about how well they are competing against their rival, Al Jazeera.

Al Jazeera

Al Jazeera was not the first Arab satellite channel, but it was the first global news channel broadcasting in Arabic from the Middle East rather than Europe. The channel started broadcasting in November of 1996 with a six-hour transmission schedule that was increased to 24 hours by February 1, 1999. Al Jazeera broadcasts news updates every 60 minutes and has four main news bulletins, one of which includes sign language.

In March 2006, Al Jazeera was formally named the Al Jazeera Network. It now consists of the flagship Al Jazeera Arabic, Al Jazeera English, Al Jazeera Documentary, Al Jazeera Sport, Al Jazeera .net (the English and Arabic websites), the Al Jazeera Media Training and Development Center, the Al Jazeera Center for Studies, Al Jazeera Mubasher (Live), and Al Jazeera Mobile. Al Jazeera expanded to Malaysia in November 2002 where it is translated into Malay for six hours a day.

A special issue of *Al-Hadath* magazine devoted to Al Jazeera in March 9, 2000, concluded that 50 years from that date, "historians would rate the establishment of Al Jazeera as one of the most important events in the Arab political arena at the end of the century." Others credit the station for loosening the stranglehold of Saudi money on Arab media globally. In the 1990s petrodollars allowed Saudi Arabia "to steal the thunder of Egypt, once the Arab media leader in the 1950s and 1960s with its Arab nationalist political ideology" by buying up newspapers and establishing TV stations outside Saudi Arabia. "Egypt's once omnipotent 'media of mobilization' (i'lam ta'bawi) gave way to Saudi Arabia's 'media of pacification,' or i'lam tanwimi," Egyptian journalist and political activist Salah Issa told Andrew Hammond, Reuters reporter in Saudi Arabia, in a 2002 interview. In such media, "entertainment helps put the political mind to sleep and politics is maintained within strict limits. If [Egyptian President] Abdel-Nasser wanted you fi-shari' (on the street), Al Saud wants you fi-sala (in the living room)" (Hammond 2007). Qatar's Al Jazeera news policy "filled the glaring gaps in political and social coverage of the Saudi media with frank discussions of internal situations in Arab countries where opposition and government figures were

equally welcome to offer their viewpoint" (Hammond 2007).

Al Jazeera ignores Arab media laws which forbid criticism of rulers, foreign ambassadors, and other Arab countries, and shies away from discussing sex or religion, the national currency, the army, or other controversial topics. The news channel's open media policy led six Arab countries to withdraw their ambassadors from Qatar, while others, like Saudi Arabia and Tunisia, refused to allow Al Jazeera to open offices in their countries. By refusing to buckle under Arab government pressure, however, Al Jazeera gained the respect of Arab viewers who soon made it the most-watched and credible station in the Arab world with 50 million viewers. A 2006 study of Arab expatriates in Egypt found that Al Jazeera is the first source for political news when its newscasts are broadcast simultaneously with other stations for 75 percent of the Arab expatriates, followed by Al Arabiya (19 percent), and the BBC (10 percent). In 2005 Inter-Brand ranked Al Jazeera as the most recognizable and influential news brand globally.

Al Jazeera Arabic reached a deal to provide a cable channel in the United States in April 2004 for about $29 (basic package). It now also transmits its contents on the Internet and posts transcripts of its programs within 36 hours of airing them.

Al Jazeera, which means "the Peninsula," has put the small country of Qatar on the map of Arab and international politics. Aided by its adopted slogan, "The Opinion and Other Opinion," the network has edged out Egypt and Saudi Arabia as the media leaders/funders in the Arab world. Critics and defenders agree that the station is important for accomplishing the following: creating a vibrant pan-Arab and inter-regional news space in which viewers can discuss formerly taboo political and social issues that authoritarian Arab governments may complain about but not directly censor; establishing news bureaus that American planes have bombed three times, once in Afghanistan, and twice in Iraq, but could not silence; giving dissidents in the Arab world a forum denied them by their own governments; making an Arab channel an important source of international news, thus weaning Arabs from their reliance on the West for information about themselves (Al Jazeera has since become a model for Latin America's TeleSur and for a proposed pan-African project); actually instituting the "New World Information and Communication Order" discussed during UNESCO debates of the 1970s and 1980s, thus reversing the direction of news transmission by making it move from East to East and West, and from South to South and North; forcing Western governments to take account of Arab and Islamic public opinion, after years of stubborn reliance solely on the opinion of Arab rulers; forcing important U.S. government officials to play on Al Jazeera's own media turf by granting it interviews after first ignoring the channel; and enabling Arab viewers to confront the reality of Israel by interviewing Israeli officials.

The establishment of Al Jazeera in Qatar came about through a lucky set of events. The BBC, which has always had a strong Arabic section with staff drawn from several Arab countries, signed an agreement with the Saudi-owned Orbit Communications to provide Arabic newscasts for Orbit's main Middle East channel. When Orbit pulled out of the deal, the Prince of Qatar, Hamad bin Khalifa al-Thani, hired 150 out of the BBC's 250 Arabic service employees. The prince wisely financed the station to the tune of $137 million annually, initially until November 2001, thus ensuring its quality. At the same time, he adopted a hands-off policy on its content, leaving that to its board of directors. Qatar continues to finance the station because Saudi pressure prevents advertisers from supporting the station for fear of losing access to the lucrative Saudi market. By dedicating Al Jazeera to news, instead of entertainment, however, and by allowing the channel editorial independence, the rulers of Qatar signaled to the Arab world that Qatar was radically departing from the Saudi practice of controlling the media they finance.

By late 2007, Al Jazeera employed 41 on-air presenters, 15 of whom were women from various Arab countries, though none was a Gulf national. Whereas in the past Arab services depended on foreign news video to tell their stories, Al Jazeera relies on 39 correspondents, six of them women, stationed all over the globe. The correspondents represent different currents of thought in the Arab world. An examination of staff biographies posted on Al Jazeera shows that its reporters are a cosmopolitan and highly educated group who speak several languages including Russian and Chinese.

Programming

Al Jazeera is primarily a news and public affairs channel. It transmits daily press reviews and weekly roundups in which it summarizes news reports on Middle East issues in Arab and international papers. Al Jazeera also features documentaries, for example, *Our History and Their Archives,* a series in which Arab history is told through the archives of mostly European powers that colonized the area in the late nineteenth and early twentieth centuries. *The Book Is the Best Companion* and *I Read for You* deal mostly with academic books on Middle East politics. Both shows invite either the books' authors or professors to summarize and then discuss the selected books.

Four broad issues occupy Al Jazeera: Palestine, Iraq, political reform, and America. The channel concentrates mostly on the Arabic speaking regions of North Africa and the Sudan and Somalia, both because of its viewers' interests and the recruitment problems it had faced in other areas of Africa. The channel is best known for its weekly political talk show programs, *More Than One Opinion, The Opinion and the Other Opinion,* and *No Limits. The Opposite Direction,* Al Jazeera's most popular program, once pitted Safinaz Kazem, an Islamist woman from Egypt, against Toujan Faisal, a Jordanian feminist and former member of parliament who has had run-ins with Islamists in Jordan over her interpretation of Islam. Kazem walked off the set while the show was on the air because she had never heard anyone question her or religious authority in such an open manner. This practice of assembling diametrically opposed panelists together on the same program (an Iraqi female member of the Communist Party who believes in gay rights next to a religious woman and a Sheik, for example) to discuss combustible topics reflects the button-pushing ethos of Al Jazeera.

Al Jazeera highlighted women's rights and their political and professional achievements in two programs, *For Women Only* and the one that replaced it, *Pioneers*. Both removed women's programs from the kitchen and the nursery where they had resided for years. But the main contribution to public debate on women's issues was their "taking as their starting point that qualified women should be aiming for decision-making jobs and that the subject of debate was not whether to aim for them but how" (Sakr 2007, 142).

The level of political interactivity of Al Jazeera in large part accounts for its popularity. The channel's call-in shows have been "particularly distinctive…as almost any voices could potentially be heard and individuals were placed into unscripted, uncensored dialogue over which hosts could exercise only some control" (Lynch 2006, 248). The sparks that fly from the religious and ideological debates and confrontations keep the viewers coming back, but lead some Arab critics to accuse Al Jazeera of sensationalism.

Those unedited on-air programs continue to get the channel in trouble with Arab rulers allied to the United States and with the American administration because viewers are openly critical of U.S. Middle East policy on air. Al Jazeera has always covered the United States extensively, including broadcasting American military CENTCOM briefings in full, as well as airing presidential speeches and debates. The station ran afoul of the American administration, however, as early as 1998 when the U.S. embassy of Qatar lodged a strong protest after calls to strike U.S. interests were made on air by callers to the program *The Opposite Direction.* (Al Jazeera's had covered the Anglo-American bombing of Baghdad in December 1998.) Yet despite various criticisms lodged against Al Jazeera, it "offered a diverse array of forums, each privileging very different participation and debate. Dissenting views and reasoned analysis could be heard, albeit within a generally accepted [Arab] identity framework. These debates produced a consensus that was hostile not only to the American project, but also to the perspectives of the Arab regimes eager to stifle reform" (Lynch 2007, 116). The U.S. government may object to Al Jazeera's coverage, but since September 11, its top officials have realized that they need to use the network to address Arab public opinion they had previously ignored. American officials who have appeared on the channel include the Secretary of Defense, National Security Advisor, and the Secretary of State.

American government attempts to prevent Al Jazeera from airing taunting videos from Osama Bin Laden failed, earning the channel the wrath of the frustrated U.S. administration. In defense of Al Jazeera, Hafez al-Mirrazi, then host of *From*

Washington, said, "How can you say to a news channel, 'You can't carry this guy because we hate him'?" al-Mirrazi found that stance "ridiculous, especially coming from the leader of the free world" (Heckman 2002). British journalist Hugh Miles explains that when the service offers its viewers exclusive interviews of Bin Laden, "it's easy to confuse access with endorsement." He adds that the channel's "willingness to present terrorists as legitimate political commentators" has enraged critics such as U.S. Defense Secretary Donald Rumsfeld, who found its coverage "inaccurate and inexcusable" (Miles 2003). Al Jazeera was a pioneer in interviewing Israelis, a fact that did not go over well with some of its Arab viewers who accused it of being in the pocket of the CIA or Mossad, the Israeli intelligence service. Bahraini rulers used that charge as well when they attacked Al Jazeera's coverage of Bahrain.

Al Jazeera Scoops International Media in Afghanistan

Unlike Western media, Al Jazeera had opened an office in Afghanistan in 1999, two years before Western media, which thought the country was too unimportant to cover even when they were offered the opportunity to set up news bureaus. On September 19, 2001, when the Taliban evacuated the last foreign journalist from the capital Kabul, only two Al Jazeera correspondents in Kabul and Kandahar and three Afghan reporters working for Reuters, AFP, and AP news were allowed to stay, forcing all Western stations to use Al Jazeera footage. An examination of the footage and transcripts of Al Jazeera broadcasts of video of Afghan casualties between October 9 and 28, however, reveals that CNN, using Al Jazeera footage, ran photos of physical damage, but not the attendant human cost. In contrast, Al Jazeera went to hospitals, talked to the parents of the dead, and showed closeups of wounded children, which infuriated American government officials. Al Jazeera photographer Sami Al-Haj was picked up on his way to Afghanistan on assignment in December 2001 and even though he had a legitimate visa, he was still being held at Guantanamo as an "enemy combatant" in 2008, as Al Jazeera Arabic and English remind their viewers in a solidarity message placed on their websites.

Al Jazeera Scoops International Media in Iraq

Al Jazeera launched an English-language website dedicated to special coverage of Iraq in March 2003, as the U.S. invasion began, with the intention of offering a perspective differing from that of the Western media, which Al Jazeera described as the "most spinned in history" (Timms 2003). In Iraq, the coalition commanders claimed that Iraqi troops had been surrendering in droves, that morale had collapsed in the South of Iraq and that most of one Iraqi division had become POWs. Al Jazeera showed reports that contradicted some of those claims and even interviewed an Iraqi military leader the coalition claimed had surrendered. When a marine commander in Qatar dismissed Iraqi claims to have captured U.S. troops as "Iraqi lies," Al Jazeera broadcast pictures of five captured American servicemen. The Iraqis also told tall tales of their own that Al Jazeera had broadcast such as the claim of Muhammad Said Al Sahhaf, the Iraqi minister of information, "that American tanks had not attacked the presidential palaces…it is a ruse spread by their failed communication organs" and his claim that the Americans had not occupied Baghdad when they were around the corner from the location of his press conference.

The rebroadcast of video of American dead soldiers shot by Iraqi TV as well as the video of American POWs looking scared, at a time when the United States was projecting a "Shock and Awe" stance, infuriated the American leadership. That, combined with the way Al Jazeera covered the first Battle of Faluja in 2004 by concentrating on civilian casualties and the plight of families who were forced to leave the city, earned the station the enmity of the American administration and some members of the American public who hacked the station's website, taking it offline for a while. Al Jazeera had eight teams all over Iraq, allowing it to scoop international media. The staff of Al Jazeera had a hard time battling first the Iraqi handlers before Saddam Hussein disappeared, and later, the American military, who detained several Iraqi Al Jazeera staffers and placed one in the Abu Ghraib prison.

The United States bombed Al Jazeera offices in Afghanistan in 2001, shelled the Basra hotel where

Al Jazeera journalists were the only guests on April 8, 2003, and killed Al Jazeera's Iraq correspondent Tareq Ayoub and two Spanish journalists a few days later when it bombed the Palestine hotel in Baghdad. Though the American military said the bombing was accidental, Al Jazeera staff believe it was deliberate because they gave Americans the coordinates of Al Jazeera offices to avoid accidental bombing. Britain's *Daily Mirror* reported that during an April 2004 White House meeting with British Prime Minister Tony Blair at the peak of the first U.S. siege of Faluja, President Bush floated the idea of bombing Al Jazeera's headquarters in Qatar, according to leaked "top secret" minutes of the summit. Al Jazeera was one of the few news outlets broadcasting from inside the city. Its exclusive footage was carried by every network from CNN to the BBC. The story raised fresh doubts over U.S. claims that previous attacks against Al Jazeera staff were military errors. Furthermore, following the handover of sovereignty in Iraq the U.S.-backed Prime Minister Iyad Allawi closed the offices of Al Jazeera and banned it from operating for a month in August 2004. Al Jazeera broadcast a short clip in which accusations leveled against it by Saddam-era government officials were intercut with similar statements made by Allawi and his officials, suggesting that nothing had changed for the media in Iraq. But despite Allawi's antipathy toward Al Jazeera and his placing of ads on rival network Al Arabiya when he wanted to reach the pan-Arab audience, he chose to be interviewed by Al Jazeera and submitted to a grilling by a well-informed Iraqi presenter, Layla Sheikhali in August 2007.

The station continues to scoop international media and even Arab media in different countries. In July 2007, for example, Al Jazeera showed ballot stuffing in Egypt, shot via a long lens through a window of a polling center. It also has carried dramatic cell phone footage from Iraq.

Al Jazeera has had a profound effect on Arab public opinion. Demonstrations erupted in several Arab countries in support of Palestinians after Al Jazeera broadcast images of the 2002 Israeli siege of the city of Jenín. The channel is able to circumvent two sources of marginalization of Arab public opinion: Arab governments that used to control traditional borders and prevent journalists from other Arab or foreign publications from entering their countries; and Western news agencies that Arabs felt treated their issues unfairly.

Al Jazeera English (AJE)

Al Jazeera English (AJE) started broadcasting as a 24-hour English-language news and current affairs channel on November 15, 2006. Even though it set as its original launch target 40 million cable and satellite homes, less than one year after its launch, it was transmitting to 100 million viewers. AJE is now determined to obtain broad distribution in the highly competitive U.S. market, closed to it due to conservative pressures on cable TV stations as well as commercial considerations. The news channel has attracted veteran journalists from around the world, which make up some of the 800 employees from 55 countries.

AJE is seen by some as an alternative to American stations that chase ratings by catering to the lowest common denominator. Because Qatar's prince funds Al Jazeera, it is free from the economic pressures that drive U.S. media. AJE broadcasts from Doha in Qatar; London; Washington, D.C.; and Kuala Lumpur, Malaysia, and has 21 supporting bureaus—in the Middle East, Africa, Europe, the Americas, Asia, and Australia. AJE has a strong presence in Africa through its bureaus in Egypt, Ivory Coast, Kenya, South Africa, and Zimbabwe, and it shares the resources of Al Jazeera Arabic Channel's African bureaus located in Chad, Libya, Mauritania, Morocco, Senegal, Somalia, South Africa, and Sudan. The station seeks out interesting stories neglected by the Western-oriented media in Latin America, Southeast Asia, the G-8 countries (Canada, France, Germany, Italy, Japan, Russia, United Kingdom, and the United States), and the Middle East. Half a million of AJE's viewers are Israeli. AJE is also attempting a deeper penetration into India and China. In the United States, however, the service may be seen only on a handful of cable systems including Buckeye Cable in Ohio; Burlington Cable in Vermont; Washington Cable; and Fision, a fiber-optic entertainment network seen only in Houston. Elsewhere, viewers may access the station on several Internet sources. AJE provides service online, and has a dedicated program on YouTube. Al Jazeera English's decision to retain the Arabic logo of its sister channel has paid off

despite the controversy surrounding the Arabic station.

When the English service began, there was some dispute over its identity, with some in the Arab world suggesting that it is of no use to fund such a channel if it would be no different than other Western TV channels regarding Arab issues. But AJE sees itself as the world's first global English language news channel to be headquartered in the Middle East, and says on its website that "[f]rom this unique position, Al Jazeera English is destined to be the English-language channel of reference for Middle Eastern events, balancing the current typical information flow by reporting from the developing world back to the West. . . . The channel gives voice to untold stories, promotes debate, and challenges established perceptions."

Conclusion

On the Arab level, Al Jazeera has contributed to the formation of a pan-Arab political public space in which important issues avoided by government television are discussed without censorship; namely, American-Israeli relations, Arab rulers and the Iraq war, autocratic governments, dissent, human rights, corruption, religion, and social issues of gender and class. By breaking all the taboos imposed on Arab communication, the station earned the enmity of many an Arab government, but gained the trust of the millions of Arabs who have adopted Al Jazeera as their most trusted source of political information.

Throughout recent history, Arabs were forced to view the wars waged against them through Western eyes. They saw the Suez War of 1956, in which Israel, Britain, and France invaded Egypt, through the news agencies of their enemies: Reuters and Agence France-Presse. They saw the 1991 Gulf War through the lens of CNN. Al Jazeera, by contrast, showed the 2003 invasion of Iraq through Arab eyes. For the first time an Arab station had the resources to beat the West at its own broadcasting game. As former Marine spokesperson, now AJE presenter, Josh Rushing put it, "That war looked starkly different than the war that Al-Jazeera was showing. If CNN were to show where the missile took off, Al-Jazeera would try to show where the missile landed" (NPR 2007). Knowing where the missiles landed was enormously important to Arabs, and very frustrating for the Americans who could no longer control the war narrative. Thus, Al Jazeera gave Arabs a voice they never had before, and sparked competition from other Arab stations. On the other hand, it spurred the governments of the United States, Britain, France, Germany, and Russia to start their own media in Arabic in an attempt to reach the Arab public. American media pundits constantly refer to Al Jazeera and wonder what the channel will make of various news items, an awareness that suggests that the channel cannot be ignored, and is now a major source for shaping or questioning conventional communication wisdom in a world in which the West used to enjoy media dominance, but no longer does.

Al-Manar

Al-Manar ("The Lighthouse") is a satellite television service based in Lebanon. It is the mouthpiece of Hizbullah (The Party of God), established in the mid-1980s as an umbrella group uniting religious Shi'a Muslim groups in Lebanon in the wake of the Israeli invasion. The organization played a major role in ending Israel's 22-year occupation of the South of Lebanon, with the exception of the Sheba'a farms, which Israel still occupied in 2008.

As Al-Manar explained on its website when it was established in June 1991, the need for the channel arose because, even when 20 percent of Lebanon was under Israeli occupation, it was not unusual for Lebanon to be under Israeli fire "while singers chanted on numerous TV channels simultaneously. There had to be a TV that committed itself to put in images the suffering of our people in the occupied territories."

Al-Manar identified five parts of its communication strategy for what it called *Al I'lam al Muqawim,* or "resistance communication":

> 1) Inoculating Lebanese society against Israeli psychological warfare by exposing the Israeli attempt to divide the Lebanese along ethnic and sectarian lines; 2) Shining a spotlight on the brave daily resistance to the Israeli occupation of the border strip so that, cumulatively, the person who resists becomes a symbol that…embodies the military and moral power Arab nations have lost…and highlights the need to exert human effort to make liberation possible; 3) Demolishing the myth of "an [Israeli] army that is never defeated"; 4) Correcting the misinformation spread by Israel and its supporters; [and] 5) Making world public opinion accept the legitimacy of resisting Israeli occupation. (Muhsen 1998, 58–66)

Al-Manar was especially sensitive to the language of conflict and avoided terms that suggested that only Hizbullah had a stake in the liberation of the South of Lebanon because Shi'ia live there. It objected to calling the 10-mile strip Israel occupied in the South "the security zone" as Israel and the international media had been doing, and it called fighters killed "martyrs" because "they died defending their country against an occupier." It objected to calling the Israeli army "the Israeli Defense Forces" rather than "the army of occupation it is."

Development

Al-Manar was one of fifty unlicensed Lebanese television stations that went unregulated until Lebanon promulgated a broadcasting law in 1991 and enforced it five years later. Al-Manar later received a license for satellite transmission just in time to broadcast the Israeli withdrawal from most of the South on May 24, 2000, a withdrawal it

attributed to its own resistance and to the support it received from the Lebanese people. The prolonged victory celebrations of a channel that calls itself the "channel of resistance" (*qanat al-muqawama*) allowed Arab viewers to compare the exploits of a nongovernment actor to the inactivity of Arab governments that were unable to liberate their territories from Israel through peaceful means.

Al-Manar, like other advocacy media, does not claim neutrality but bills itself as partisan to the cause of its constituents: initially, the disadvantaged and poor Shi'ia of the South and the Beka'a valley in Lebanon; later expanded to include the larger Arab and Islamic worlds. The channel provided extensive coverage of the second Intifada (Uprising against Israel) of 2000 in the occupied Palestinian territories, and later, the war in Iraq. Hizbullah, through its media, took on the mantle of the protector of Palestinians, a cause Marc Lynch says tends "to produce an unchallenged consensus unifying different sectors of Arab opinion." The channel "communicates the idea that Israel is hegemonic in the region, tightly connected to the United States, and that Israel and the United States want a weakened Lebanon and Syria, unable to resist Israel's actions. Iraq was targeted to fragment the country, not make it sovereign" (Baylouny 2006). Regarding U.S. positions on Lebanon, one Al-Manar spot compares how the United States deals with UN Resolution 1559 (calling for Syria to withdraw from Lebanon), by showing a menacing man ready to strike with a stick he is holding. "This is followed by another scene, with the words 'and this is how the United States treats UN resolutions regarding Israel.' The screen shows a man picking the petals of a daisy" and stating: "it applies, it does not apply, it applies, and so on" (Baylouny 2006).

The Shi'ia Hizbullah, Al-Manar's patron, began to see itself as a pan-Islamic organization that speaks for both Sunni and Shi'ia, as well as a pan-Arab organization that has Christian allies. Lebanon's largest Christian political party, the Free Patriotic Movement, is Hizbullah's ally. Hizbullah has participated in elections in a democratic fashion, allying with other religious groups, including Christians, and encouraging its members to vote for them. The party won 14 seats of a 128-member parliament in the 2005 elections.

Programming

Unlike Lebanese channels that often import Western programming or present local versions of Western reality shows, Al-Manar produces its own programming based on Arab or Islamic history, or hosts serious talk shows. The station does not allow advertising for tobacco or alcohol or any advertising that treats women as sexual objects to sell products. Female announcers appear in head scarfs, but "Al-Manar does not conform to stereotypes of it (or of Hizbullah) that it marginalizes women or injects religion in all its programming. On the contrary, the station highlights practical problems of women and solutions proposed by them" (Baylouny 2006).

And while Al Jazeera lists standard New York and Mecca time, Al-Manar lists Jerusalem time. It is no wonder, then, that the station is the second most popular station among Palestinians, right after Al Jazeera.

Al-Manar pioneered the idea of embedded videographers who accompanied Hizbullah fighters on their missions. The channel admitted it was deliberately trying to sow fear into the hearts of Israeli mothers by convincing them (programming in Hebrew since 1996), that it is futile to fight Hizbullah. The station showed video of dead Israeli soldiers not broadcast on Israeli TV.

On December 14, 2004, Al-Manar was placed on the U.S. Terrorist Exclusion List, preventing it from operating in the United States or receiving funds from American citizens. France had similarly banned the service a week earlier.

The idea of banning Al-Manar "originated with Israel's Natan Sharansky and former Foreign Minister Silvan Shalom," then expanded to include "the Anti-Defamation League, CAMERA.org, American Jewish Congress," and several other foundations. Furthermore, "[t]he neocon Middle East Media Research Institute (MEMRI) took credit for persuading" some world leaders to outlaw Al-Manar (Schuh 2006).

Al-Manar ridicules the American military in Iraq by juxtaposing claims of precision bombing over photos of dead children. After the Abu Ghraib torture photos were broadcast, Al-Manar taunted the United States over human rights abuses committed under its watch. But more recently Al-Manar has attempted to moderate its

programming due to a new awareness of how it is being perceived in the West.

On July 12, 2006, Israeli warplanes demolished Al-Manar's five-story headquarters in Beirut's southern suburbs in seven separate attacks, injuring three staff members. They also hit the station's infrastructure in the Beqa'a valley. Al-Manar was off the air only for two minutes as the service's engineers had prepared undisclosed alternative transmission and studio sites.

In Lebanon, where Al-Manar ranks fifth in viewer popularity among the country's nine stations, its news bulletins are popular because they are deemed to be reliable and balanced about local politics. Al-Manar, however, is detested by the Arab regimes of Saudi Arabia, Egypt, and Jordan, which accused Hizbullah of giving Israel an excuse to invade Lebanon in the summer of 2006.

Although Al-Manar's enemies accuse it of serving as a voice for terrorism, one researcher found that the channel "both represents the ideas of its audience and attempts to alter them, to spur the constituency to action. A part of this process is altering their self-concepts from victim to empowered and proud. Tactically, many of the emphases of al-Manar can be viewed as effective frames for mobilizing against a militarily superior enemy [Israel]." She added that one could also view Al-Manar "as an opposition or resistance media, covering the non-dominant perspective," by airing interviews with Palestinian rejectionist groups (Baylouny 2006).

Conclusion

The attempt to prevent reception of Al-Manar is seen by many Arabs as more than an issue of the rights of broadcasting by a specific service, but as an example of the hypocrisy of Western governments who defend their right to broadcast offensive materials about Arabs and Muslims such as the anti-Muhammad cartoons in the name of free speech, but feel threatened when others transmit programming they do not like. So Western governments and Israel are faulted for lecturing Arabs on the need for free communication, but denying transmission to services they disapprove of or, worse, bombing them. The International Federation of Journalists, located in Belgium, described the ban on Al-Manar as "political censorship of the worst kind" and criticized the bombing of its facilities. Yet Al-Manar continues functioning despite an advertising boycott, and despite the refusal of several international satellites to carry its signal. It is now available on the Internet.

Alternative and Underground Newspapers

During the 1960s and early 1970s, underground periodicals critiqued the government and mainstream society and celebrated alternative lifestyles. Some underground writers and editors thought they were inventing America's first alternative press, but in many ways, the nation's first newspaper—*Publick Occurrences, Both Forreign and*

Domestick—of 1690 took the honor when it was suspended because it had been printed without government authority.

Origins: Labor and Abolition

After the American Revolution, most commercial newspapers continued to represent white, middle- to upper-class male readers. Most ignored the plight of laborers, slaves, other people of color, immigrants, and women. In reaction, alternative newspapers appeared during the first half of the nineteenth century. Most used journalism as an agent for social change.

The country's first successful labor newspaper, the *Mechanic's Free Press,* was launched in 1827 in Philadelphia by shoemaker William Heighton. Between then and 1832, 50 to 60 labor weeklies were published around the country. The commercial press overreacted to the new labor press, and the two groups soon traded insults in print. Labor newspapers promoted eliminating child labor, subsidizing education for poor children, closing debtors' prisons, and instituting a 10-hour workday. Their most important goal was to transform the working class into a political force and elect labor candidates to public office. By the 1830s, there were early successes. Most early union members were skilled artisans. Later in the century factory workers, including so-called factory girls, began unionizing and publishing their own newspapers.

During the early nineteenth century, abolitionists, both black and white, founded antislavery newspapers. The first abolitionist newspaper, Charles Osborn's *The Philanthropist,* was printed in Ohio in 1817, and fellow Quaker Elihu Embree began printing *Manumission Intelligencer* (later renamed the *Emancipator*) in Tennessee in 1819. Some publishers advocated gradual emancipation; others argued for the immediate abolition of slavery. Some wanted slaves to be assimilated; others, such as Benjamin Lundy of the *Genius of Universal Emancipation* (1821), advocated colonizing slaves in Africa. The first black newspaper, Samuel Cornish and John Russworm's *Freedom's Journal,* was founded in New York City in 1827. With a readership of 1,000, the anticolonization paper focused on improving the lot of free blacks, emancipating slaves, and eliminating lynching. The same year in Philadelphia, *The African Observer* began publishing articles about the evils of slavery.

In 1831, William Lloyd Garrison, who had worked with *Genius* editor Lundy, began printing the *Liberator* from Boston. Garrison had ceased supporting Lundy's gradual approach to ending slavery. His newspaper, printed for 35 years, was the longest-lived abolitionist newspaper.

The abolitionist movement reached its peak between 1830 and 1860. Cornish edited *The Colored American* (1837), which ran articles about freed slaves' achievements and their involvement in the abolitionist movement. In 1840, Lydia Maria Child and David Lee Child established the *National Anti-Slavery Standard,* the official weekly of the American Anti-Slavery Society. In early 1847, Willis Hodges founded *The Ram's Horn* in New York. John Brown (later of Harper's Ferry fame) and Frederick Douglass, a former slave and a celebrated antislavery speaker and writer, were two of Hodges's contributors. Douglass started his own paper, the *North Star,* in Rochester, New York, in December 1847. It reached more than 4,000 readers, including many whites, in the United States, Europe, and the Caribbean. The *North Star* merged with the *Emancipator* in 1851, and continued as *Frederick Douglass' Paper* until he began *Douglass' Monthly,* an abolitionist magazine in 1860. The pages of Douglass's publications served as forums for women and other marginalized people. The *North Star*'s motto was "Right is of no Sex—Truth is of no Color—God is the Father of us all, and we are all brethren."

Women's Voices

Women's newspapers did not appear until mid-century, but within a few decades, there were approximately 30 woman's rights periodicals. Many grew out of the abolitionist and temperance movements. For example, Amelia Bloomer had been involved in the temperance movement in Seneca Falls, New York, for years before she began editing *The Lily* (1849), a newspaper for the local women's temperance society. The next year Elizabeth Cady Stanton, using the pseudonym Sunflower, helped Bloomer edit the paper. Through Stanton's influence, *The Lily* switched its focus to woman's rights.

Social reformer Paulina Wright Davis, who was president of what early feminists considered the

first convention for women's rights in 1850, started *The Una* in 1853 in Providence, Rhode Island. *Una* (Latin for "one") is considered the first newspaper devoted solely to woman's rights.

The next woman's rights newspaper was Lydia Sayer Hasbrouck's *The Sibyl: A Review of Tastes, Errors and Fashions of Society* (1856). Published for nine years, the biweekly *Sibyl* covered woman's rights, suffrage, and abolition, but its focus was dress reform. In her paper, she argued that women's equality and health were connected and depended on doing away with corsets and stays that confined and deformed women's bodies and heavy hoops that hampered their mobility.

After the Fourteenth and Fifteenth Amendments to the Constitution granted the right to vote to all men, but still withheld it from women, the woman's movement broke into two camps. In 1868, the more radical faction began a newspaper, *The Revolution.* Susan B. Anthony published it, Stanton and Parker Pillsbury wrote for and edited it, and George Francis Train helped fund it. Its motto read, "Men, their rights and nothing more; women, their rights and nothing less." The reforms the *Revolution* championed included property rights, divorce and custody law, birth control, and education, among others.

In 1870, Lucy Stone and her husband Harry P. Blackwell began publishing *The Woman's Journal* in Boston. The newspaper, which featured authors such as Harriet Beecher Stowe, Louisa May Alcott, and Julia Ward Howe, appealed to more conservative readers than *Revolution*'s. It survived until 1917, when it was merged with other suffrage periodicals and became *The Woman Citizen.*

Besides promoting suffrage, *Woodhull & Claflin's Weekly* (1870) advocated free love and licensed prostitution, raising some Victorian eyebrows. Victoria Woodhull, the first woman to run for President, established the newspaper with her younger sister Tennessee Claflin. Despite the sisters' affinity for edgy topics, they never covered birth control; not until almost 50 years later, when Margaret Sanger wrote *The Woman Rebel, No Gods No Masters* (1914), would the subject be addressed extensively. Sanger, a nurse and major figure in the American birth control movement, advocated sex education and birth control as alternatives to abortion. In her short-lived paper, Sanger wrote "a woman's body belongs to herself alone." The Post Office eventually suppressed it under the nineteenth century Comstock laws, which prohibited using the U.S. mails for distributing information about contraception.

Historians have paid more attention to abolitionist and feminist newspapers than to the periodicals of immigrants and people of color. Immigrant papers, which had been published in the colonies, increased during the new century, as did ethnic newspapers, such as Georgia's *Cherokee Phoenix* (1828). Approximately 1,300 nineteenth-century foreign-language newspapers provided immigrants with news from home as well as local, national, and world news. Not all editors thought retaining their readers' mother tongue important. Most editors, however, emphasized retention of both language and culture.

Political Papers

Race, ethnicity, language, and gender weren't the only things separating people in the nineteenth century. Commercial newspapers, which were frequently affiliated with one national political party or another, did not cover other political parties. Therefore, advocates of liberalism, populism, anarchism, progressivism, socialism, and communism had their own newspapers.

The *Nation,* the oldest continuously published weekly magazine, by the early twenty-first century described itself as the flagship of the left. When abolitionists founded it in 1865 at the start of Reconstruction, it was socially liberal but politically conservative. The magazine, edited by E. L. Godkin, covered politics, the sciences, literature, and art for an intelligent, engaged audience. Newspaper magnate Henry Villard bought the *Nation* in 1881, and for almost four decades, it was a weekly literary supplement for his newspaper, the *New York Evening Post.* In 1918, Villard's son, Oswald Garrison Villard, took over as editor. Under him, the magazine became a liberal current-affairs magazine. The *Nation* has continued to represent the liberal left to the present.

The Madison-based *Progressive* (1909) is still published a century later. Founded by Progressive Wisconsin Senator Robert M. La Follette, the magazine had contributors such as Jane Addams, Helen Keller, Jack London, Upton Sinclair, and Lincoln Steffens. Many issues covered in its early years remain timely, such as U.S. interventionism,

corporate power, civil rights, environmental policies, and women's rights. A third liberal magazine, the *New Republic* (1914), also continued into the twenty-first century. Originally edited by Herbert Croly, it promoted Theodore Roosevelt's reform philosophy.

Like liberals and progressives, populists had their publications. The populist movement of the 1890s appealed to discontented farmers and small businesspeople, who feared Eastern industrialists and bankers. They wanted banks, railroads, and communication regulated, so government would be put back in the hands of common people. During the populist era, about 900 newspapers backed the movement.

Radical Dissent

Several alternative periodicals focused on groups that were more radical than the liberal, progressive, and populist movements. One of the most successful, the Kansas-based *Appeal to Reason,* was founded in 1895. By 1912, the socialist weekly had 760,000 paid subscribers, more than any American radical publication before or since. *Appeal* editor, A. J. Wayland, supported organized labor, attacked capitalism, and promoted the American socialist movement. His contributors included Jack London, Helen Keller, and Upton Sinclair, whose muckraking article on the Chicago meatpacking industry was serialized in the *Appeal* before it became the celebrated 1906 book, *The Jungle.* Other prominent socialist newspapers included the *New York Evening Call* (1908) and the *Milwaukee Leader* (1911).

The Masses (1911), another socialist magazine, was a mix of antiestablishment politics, fiction, poetry, art, and culture. Well-known contributors included Carl Sandburg, Walter Lippman, Sherwood Anderson, John Read, and Max Eastman, who became its editor in 1913. Many other writers and artists of this cooperative magazine lived in Greenwich Village. Because of the paper's pacifism, several staff members were tried unsuccessfully under the Espionage Act in 1917, the same year the magazine, weakened by the turmoil, ceased publication.

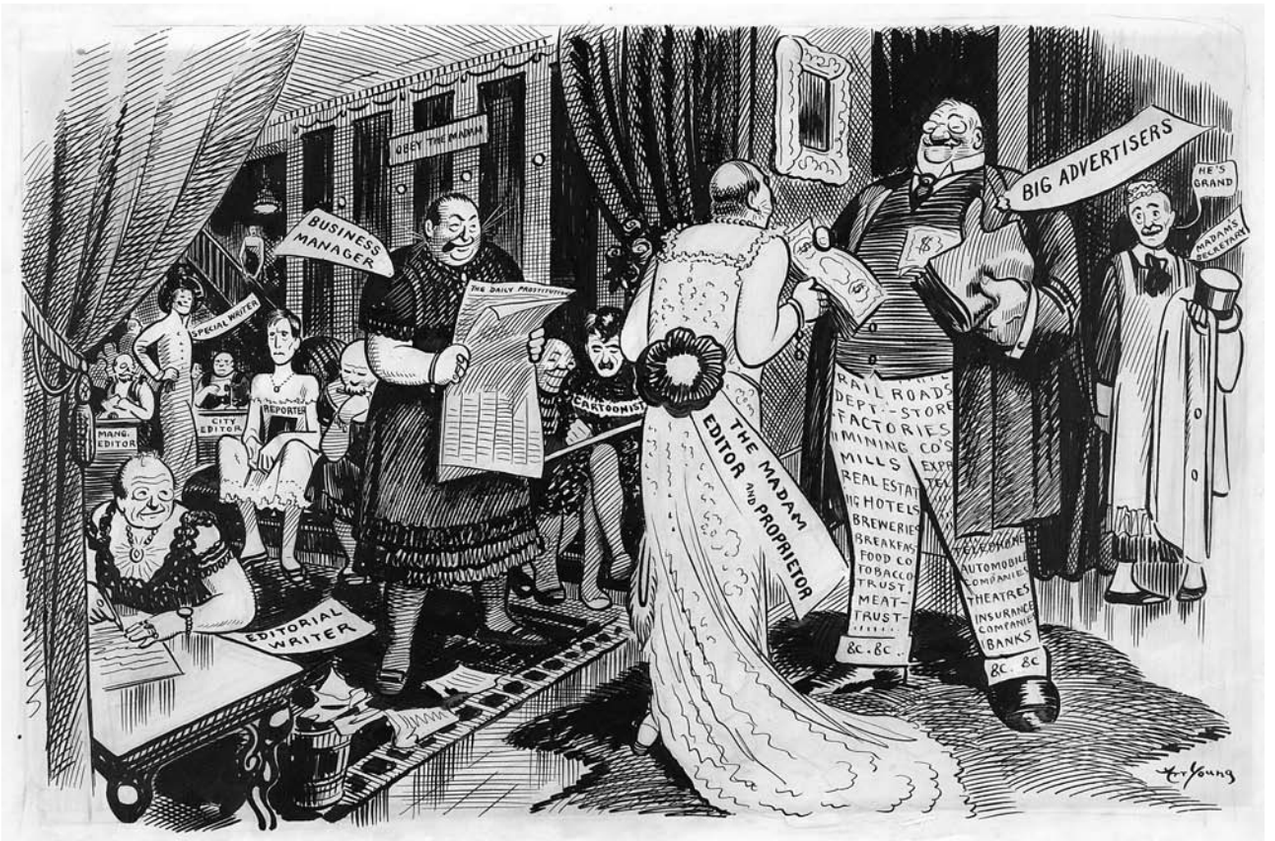
Anarchists were also active in publishing early in the twentieth century. In 1904, Mexican revolutionary Ricardo Flores Magón escaped Mexican dictator Porfirio Díaz and moved to the American Southwest, where he reestablished *Regeneración,* his anti-Díaz newspaper. American authorities, in tandem with the Díaz regime, persecuted him. He was imprisoned several times in the United States and died in Leavenworth Penitentiary in 1922. During his stay in the United States, Flores Magón had become friends with many radical American intellectuals.

Among them was Emma Goldman, who in 1906 founded an anarchist magazine, *Mother Earth, A Monthly Magazine Devoted to Social Science and Literature.* Besides Flores Magón, her contributors included famous radical and anarchist thinkers—historian Will Durant, playwright Eugene O'Neill, novelists Leo Tolstoy and Maxim Gorky, screenwriter/director Ben Hecht, and anarchist theorist Prince Peter Kropotkin. Famous artists, including Man Ray, did cover art. In addition to anarchism, Goldman covered the labor movement, education, literature and the arts, woman's rights, sexual freedom, and birth control. On September 11, 1917, *Mother Earth* was excluded from the mails under the Espionage Act, and in December 1919, Goldman was deported to the newly established Soviet Union.

The Communist Party published several periodicals, such as the *Midwest Daily Record, People's World, New Masses,* and many foreign-language newspapers. In 1924, the American Communist Party started the *Daily Worker.* From the Depression through the cold war it grappled with red baiting, McCarthyism, and changing party lines. With a few name changes and a merger, it survived until 1991. *The Militant* (1928), another communist newspaper, was Trotskyist and promoted the Socialist Workers Party (SWP). A weekly, it also published books by SWP leaders and revolutionaries, such as Lenin, Trotsky, Malcolm X, and "Che" Guevara.

Underground Forebears

While the country's long tradition of dissident and/or alternative periodicals paved the way for the underground press, some other more contemporary predecessors did as well. The *Catholic Worker* (1933), edited by Dorothy Day, provided an example of a pacifist publication that some antiwar periodicals would follow. *I. F. Stone's Weekly* (1953) with its iconoclastic reporting, pro–civil rights and anti-Vietnam stands, and hard-hitting investigative



Political cartoon from the December 1912 issue of The Masses, *criticizing the mainstream press for being influenced by its advertisers, such as mining companies, factories, railroads, and banks. The cartoon compares popular newspaper media of the time to a house of prostitution, with the editor as the proprietor and the advertiser as the patron.*

Source: Library of Congress.

journalism inspired many underground reporters. The *Nation,* under the editorship of Carey McWilliam, also strongly opposed U.S. involvement in Southeast Asia and turned out first-rate investigative pieces.

Earlier investigative journalists—the muckrakers—also inspired many underground writers. Their detailed investigative pieces about society's ills exposed the downside of capitalism in the age of the robber barons and often resulted in significant changes in society. S. S. McClure founded *McClure's* (1893), which became the best-known muckraking publication. In 1902, Ida Tarbell began a series on John D. Rockefeller's business practices and the Standard Oil Company that lasted until 1904 and later became a book. Lincoln Steffens wrote a series on corruption in major cities across the country, and Ray Stannard Baker wrote about labor problems.

The *Guardian* (1948), *The Realist* (1958), and the *Village Voice* (1955) were further role models for underground journalists. The *Village Voice*'s irreverent motto, "Some people swear by us . . . other people swear AT us," speaks volumes about the future of the underground press.

Counterculture Pacifism

To fully understand America's alternative press in the mid-1960s and 1970s, it's necessary to know something about the era's mainstream media—publications that represented the interests of the established social, economic, and political order. Because commercial newspapers were in business

to make money, they catered to and protected the establishment, who often were the papers' advertisers. In addition, they tried to reach a large and universal audience to sell more papers. This focus resulted in marginal social groups—the poor, workers, immigrants, minorities, women, and political dissidents—being stereotyped, misrepresented, undercovered, and/or not covered.

An estimated 500 underground papers gave these groups and others a voice. By the end of the 1960s, most major cities had at least one underground publication. Some advocated social and political action while others created their own news to promote their causes. Many just wanted to celebrate the music and art counterculture.

What made the underground press possible? Many factors went into its creation: millions of baby boomers, a widely perceived generation gap between parents and children, distrust of authority, changing lifestyles, a sexual revolution, a drug culture, ethnic and racial pride, the draft and the unpopular Vietnam War, and the failure of mainstream media to recognize that times were changing. The editorial mix of underground publications typically focused on leftist politics, antiwar sentiments, the counterculture, and anything that contradicted the mainstream. Some newspapers that focused exclusively on culture began covering politics as the war escalated. Later they reverted to covering lifestyle issues. Some publications combined politics and culture.

Art Kunkin's *Los Angeles Free Press* is considered by many to be the earliest—as well as the most successful—underground newspaper. First published in 1964 as a broadsheet for the Southern California Renaissance Faire, the *Faire Free Press* became the *Los Angeles Free Press,* or *Freep,* and changed to a tabloid format in 1965. Controversial stories, such as a 1969 article listing the names, addresses, and phone numbers of eighty narcotics agents in Los Angeles, got the paper in trouble with local police and state authorities. During its heyday, more than 100,000 copies of *Freep* were printed every week. According to some sources, the paper was responsible for spearheading the counterculture movement.

Others consider *The Berkeley Barb* the most influential underground paper in the country. In 1965, Max Scherr sold his Berkeley bar, the Steppenwolf, for $10,000 (about $65,000 today) and started *The Berkeley Barb*. Scherr advocated a menu of political, social, and sexual change and used his newspaper to criticize the establishment. At its peak in 1968, the *Barb* had a weekly circulation of about 90,000. Many of those copies were sold by flower children on street corners. In 1970, Scherr sold the newspaper to a Berkeley anthropology professor and it ceased publication a decade later.

Other influential underground newspapers of similar ilk from the era included the *San Francisco Oracle, San Francisco Express-Times, Berkeley Tribe,* and *The Helix* (Seattle) on the West Coast; the *Fifth Estate* (Detroit), the *Seed* (Chicago), *Kaleidoscope* (Milwaukee), and *The Spectator* (Bloomington, Indiana) in the Midwest; *The Kudzu* (Jackson, Mississippi), *The Great Speckled Bird* (Atlanta), and *The Inquisition* (Charlotte, North Carolina) in the South; *The Rag* (Austin) and *Space City!* (Houston) in Texas, and the *Rat Subterranean News* (New York; later called *Women's LibeRATion*), the *East Village Other* (New York), *Distant Drummer* (Philadelphia), *Avatar* (Boston), *Old Mole* (Cambridge, Massachusetts), and *off our backs* and the *Washington Free Press* (Washington, D.C.) on the East Coast.

Many college towns supported underground papers, some independent and others funded by universities. Most were antiwar and anti-university administration. Some examples include *Columbia Free Press* (University of Missouri), *Connections* (University of Wisconsin), and *Mother of Voices* (Amherst). According to some sources, the FBI operated several fake underground papers in college towns. There were approximately 3,000 underground high school papers, most of them short-lived and of limited circulation. There were also military underground newspapers as well as papers published by liberation movements—women, gays, blacks, and Native Americans. Two Hispanic publications included *El Malcriado* (1964), a paper started by the United Farm Workers (UFW) leaders Delores Huerta and Cesar Chavez in Delano, California, and Los Angeles's *La Raza* (1967), a bilingual newspaper and later magazine that filled a definite need for Chicanos in the L.A. barrio.

While few alternative publications were moneymakers, some counterculture newspapers were prosperous. Advertisers discovered that they were good vehicles for reaching college-age readers, an attractive demographic. Because the mainstream

media ignored changing formats of popular music, underground press coverage of the music scene increased circulation and thus attracted advertising from Columbia and other record labels.

Rolling Stone (1967) was the most financially successful underground publication. Its coverage of the Doors, the Beatles, the Rolling Stones, Jimi Hendrix, Janis Joplin, and other musicians ensured a circulation that could command ad revenue unlike any other underground publication.

Another thing that attracted *Rolling Stone* readers was its look. The cover art and the cartoons and drawings inside most counterculture newspapers were imaginative and iconoclastic and as revolutionary as the ideas discussed in most papers' pages. Psychedelic colors drew readers in as much as content. The split-fountain technique of inking colors allowed colors to bleed into one another and created unique softly colored effects. On the technical side, two inventions—offset printing and cold-type composition—made starting underground publications financially feasible. Offset printing was a quick, inexpensive way to create innovative publications with colorful, groundbreaking design concepts.

Underground publications naturally did not exist in a vacuum. Some 60 underground and radical papers, including *The Black Panther, Guardian, East Village Other, San Francisco Oracle, Los Angeles Free Press, Berkeley Barb,* and *The Paper,* formed the Underground Press Syndicate in 1967 in Washington, D.C. The UPS was a wire service for members, who were free to reprint shared information, articles, and breaking news reports. They also sold communal advertising. Police harassment was something else many publications shared in common at both a local and national level. The FBI allegedly conducted surveillance and disrupted the underground press.

Some underground publications, such as *Rolling Stone* and *Ramparts,* endure. Most, however, were gone by the end of the 1970s or early 1980s. Many staff members never wrote again; some joined established or newer alternative periodicals while other reporters, cartoonists, and artists worked in corporate media or in academe. For instance, Abe Peck, editor of the Chicago *Seed,* went on to work at *Rolling Stone,* Associated Press, and the *Chicago Sun Times* before he became a journalism professor at Northwestern University.

The idea of an alternative and dissident press thrives again in the age of the World Wide Web. Periodicals geared toward activists of all stripes—animal rights, AIDS, human rights, the environment—abound. Then there are small, self-published zines, which are usually outside the mainstream, that reach a small community of loyal readers. At the same time, many long-standing publications are abandoning their print products for a strictly Web presence, and some zines are evolving into E-zines. And with the savings in paper, printing, and postage, new alternative media are mushrooming all the time on the Internet.

Anchors, Television

Television news anchors are among the few journalists known to the public on a national scale. They capture attention because they are vested with a special and powerful role. In addition to keeping the public informed, viewers who watch a television newscast come to feel as though they *know* the people who report the news. Of all

those practicing television journalism, the struggle between the time-honored principles of print and radio journalism and the elements of television appearance, personality, emotion, and celebrity is experienced to the greatest degree by network television news anchors.

Although TV news anchors often ascend to their network posts from local stations and from jobs as correspondents and reporters, they are soon distinguished by their status as the most recognizable figureheads on the nightly network news broadcasts. TV anchors' implicit associations with "hard news" as opposed to softer news and entertainment formats also distinguish them from such other television personalities as program hosts or commentators. Critics note that while British television reporters are rightfully referred to as "newsreaders" (accurately reflecting what they actually do), a marked difference exists in the way they are regarded in the United States where "anchor" and "host" are often used interchangeably. The prestige and notoriety of American television news anchors grew steadily between the inception of the phenomenon in the 1940s and the 1980s, the decade during which they reached their apex in terms of attention and autonomy. Since then, with the influx of competition for viewers' attention from other TV news channels, including cable and satellite, as well as from other newer forms of electronic media, the power of the network television news anchor has been somewhat diluted amidst the sea of available news options, but the anchors are still regarded as an institution within TV news.

Emergence of TV Anchors

The American TV news anchor role came into being after World War II. Although television began operating on a commercial basis in mid-1941, the medium had been stunted by wartime priorities and a halt in the manufacture of receivers. The earliest television newscasts were little more than radio journalists reading the news in front of a camera, sometimes accompanied by still photographs.

In 1948 NBC began a newsreel program that included film clips of news items spliced together. A year later, the program was expanded to 15 minutes and became the *Camel News Caravan,* anchored by John Cameron Swayze, and lasting until 1957. Swayze provided the introductions to, explanations of, and transitions between the film clips presented. CBS contracted with Telenews, a subsidiary of Hearst-MGM newsreel, for film, and began a regular nightly bulletin, *CBS News with Douglas Edwards,* in 1948 sponsored by General Motors. As a precursor to current practices, Edwards was seen as "a speaking subject against an abstract map" (quoted in Winston 1993, 187). Later NBC anchor John Chancellor is also credited with having helped define television news in these early days.

Discrepant accounts characterize early anchors as humble figures who merely read the news, yet, at the same time, had some control over the broadcasts. Television journalists developed onscreen personas to connect with viewers by using strategies to mimic face-to-face interaction. These included the anchor looking into the camera (and thus directly into the eyes of the viewer), and speaking directly and personally to each viewer.

Dimensions of appearance and performance introduced by television brought a disjuncture in the standards that Edward R. Murrow and his followers had established for radio journalism. While print experience was prized in radio journalism, training and experience would not suffice for television as an element of showmanship became an essential trait for video journalists. An ability to communicate and connect with viewers became paramount. Until the mid-1950s, the 15-minute evening network newscasts were treated as unimportant by the networks and their anchors were similarly regarded.

As the medium's reach expanded across the country in the early 1950s, television became an important political force. President Eisenhower embraced the new medium, and Richard Nixon saved his political life with his televised "Checkers" speech. In 1952 NBC's morning news and talk program debuted with Dave Garroway anchoring the *Today* show. It would not have a morning news competitor until the launch of ABC's *Good Morning America* in 1975. The softer and more eclectic morning news format offered a more informal forum for showcasing the onscreen talents and versatility of Jane Pauley, Barbara Walters, Tom Brokaw, and other hosts over the years.

CNN's entry into cable television news in 1980 offered opportunities for new faces on TV news. For many ambitious young correspondents, the

1990–91 Gulf War represented a big break. Bernard Shaw and Wolf Blitzer were among the CNN correspondents who benefited from hours of wartime coverage. Shaw was a pioneering black anchor, while Judy Woodruff, Paula Zahn, and Anderson Cooper are other well-known anchors who have been featured on CNN. Other cable news networks were founded and rose in the late 1980s and 1990s, including CNBC in 1989, MSNBC in 1996, and the Fox News Channel also in 1996.

The Anchor's Role

In addition to the TV journalist who appeared on camera, many others worked to assemble the components of each news broadcast. As early as 1949, for example, Douglas Edwards was supported by a full-time CBS staff of 16 plus 14 part-timers.

With Walter Cronkite at CBS, the network anchor also assumed the title of "managing editor" of the broadcast. This was a means of allowing the TV anchor to use his news judgment to select, hone, and shape news stories in the broadcast, while alerting the news staff and viewers that the anchor was more than a face on the screen. All solo network evening news anchors to follow would also hold the dual titles of anchor and managing editor. Yet an anchor may have little to no involvement in many stories other than reading materials prepared for him or her by others.

The advent of the TV news anchor posed challenges to traditional journalistic values and routines largely because of anchor celebrity, authority, and salary. At the heart of continuing criticism is the placing of an anchor's pleasing persona and appearance over journalistic ability, the pervasive influence of market research on hiring and promotion of TV journalists, and the enormous salaries that network anchors receive.

Conclusion

By 2005, most industry analysts agreed that the networks' morning news programs, which typified the hybridization of news and entertainment, were eclipsing the evening news programs in viewer popularity and thus value within their news organizations. Reexamination of the anchor's role was sparked by the departures of anchors at all three broadcast networks in 2005–06, in addition to growing challenges posed by 24-hour cable news networks.

Routes to entry and promotion within the TV news field have also changed over time. The generation of television reporters who came to prominence in the 1960s and 1970s often had been trained in the wire services or radio and gained experience as foreign or war correspondents or by working their way up through local station and network ranks. In contrast, the trajectory of TV journalists in the 1980s and 1990s was somewhat different. Some of these new anchors entered the field through journalism schools (Jane Pauley is an example), or by working up through the newsroom ranks. Other anchors rose from semi-entertainment backgrounds (as with Katie Couric).

By 2006, the anchors and their signature newscasts on broadcast and cable TV were still commanding an average of 30 million viewers. TV news anchors deliver information to people about the world around them in a visual, personal, emotional, and dramatic way that television made possible. Even as television faces new challenges from online and mobile technology, the news anchors remain some of the most recognizable faces in American media.

Notable American TV News Anchors

Tom Brokaw (1940–)

Brokaw began his career in local news, and after several local news positions around the country, he moved to Washington, eventually becoming NBC's White House correspondent during the Watergate era. He shifted from hosting NBC's morning *Today* show in 1983 to anchoring the network's evening newscast. He was briefly paired with Roger Mudd as co-anchor in 1982–83, and then remained the sole anchor of the broadcast until his retirement in 2004.

Connie Chung (1946–)

Chung was hired by CBS during the women's movement of the early 1970s when the networks put more women on the air. By 1974, the three networks had added about a dozen women reporters and were recruiting more. After working her way up from positions at local TV news stations to

the network level, Chung was named co-anchor of the *CBS Evening News* with Dan Rather in 1993. She was the second woman (after Barbara Walters) to become an anchor, but the pairing only lasted two years. Subsequently, Chung co-anchored ABC News' *20/20* and *Connie Chung Tonight* on CNN. She is the only person (male or female) to have served as a substitute anchor for all three network nightly newscasts as well as all three network morning newscasts.

Katie Couric (1957–2009)

In 2006, Katie Couric moved from her post she held for 15 years as co-anchor of NBC's *Today* to CBS where she anchors the *CBS Evening News with Katie Couric*. The move made her the first solo female anchor in network television evening news. Couric and NBC made the deliberate choice of calling her "Katie" from the onset of her *Today* show career, while she had previously been known as "Katherine" as a local TV reporter and as a reporter for CNN.

Walter Cronkite (1916–2009)

Cronkite began as a United Press wire service reporter who then anchored local news for the CBS-owned Washington station in 1950. He rose to become a journalistic star with coverage of the 1952 political conventions. The first use of the term *anchorman* came at this time. According to Barbara Matusow, author of *The Evening Stars*, Sig Mickelson, then head of CBS television news, and producer Don Hewitt "discussed the need to have their strongest person in the booth, holding together the coverage from the floor. Hewitt compared the arrangement to a relay team, where the strongest runner, who runs the final leg of the race, is called the 'anchorman.'" From the late 1960s until his retirement in 1981, Cronkite presided over the top-rated network news program.

Two moments epitomized Cronkite's career and impact. His visibly emotional relay of the November 1963 assassination of President Kennedy's death included, according to communications researcher Barbie Zelizer, "removing his eyeglasses in a distracted fashion and forgetting to put on his suit jacket." In a sense, he shared the national shock at the event. Five years later, on his return from onsite reporting from Vietnam, he clearly expressed his opinion that the war would never be won on military grounds and that the only end was negotiation. The two-part editorial, broadcast on successive days, was one catalyst for President Johnson's decision to not run for reelection.

Charles Gibson (1943–)

Gibson moved from hosting ABC's *Good Morning America* to solo anchoring *World News Tonight* in 2006. Gibson returned to the morning program with Diane Sawyer in January 1999. He previously co-anchored the morning program from 1987 to 1998. In addition, Gibson was also co-anchor of *Primetime,* and was a regular substitute anchor on *World News Tonight* before his permanent appointment.

Chet Huntley (1911–74) and David Brinkley (1920–2003)

Huntley and Brinkley emerged as news stars with their coverage of the 1956 political convention coverage for NBC. Huntley had previously worked for Movietone News and then CBS radio in Los Angeles, as well as NBC TV in Los Angeles. Brinkley was a former UPI reporter. The Huntley–Brinkley duo that dominated network news in the early and mid-1960s was created to appeal to viewers in all parts of the country, as Chet Huntley was from the West and David Brinkley hailed from the East. Their nightly *Huntley-Brinkley Report* ran on NBC until 1970. Other networks tried to replicate the on-screen chemistry of the Huntley-Brinkley duo, but subsequent anchor pairings, such as those of Barbara Walters and Harry Reasoner on ABC, of Tom Brokaw and Roger Mudd on NBC, and of Connie Chung and Dan Rather on CBS, were all short-lived.

Peter Jennings (1938–2005)

Jennings was a high school dropout who transformed himself into one of the most well-known network TV anchors. In an attempt to raise its newscast from the depths of third place against Cronkite and Huntley–Brinkley, who had emerged as trailblazers from their coverage of the decades' assassinations and scandals, ABC made Jennings, a

26-year-old former Canadian television anchor, the anchor of its evening news broadcast in 1965, making him by far the youngest national network anchor. Although the network thought his fresh and handsome looks would appeal to younger viewers, his inexperience and the strength of his competition led Jennings to seek other assignments and ABC replaced him in 1968. Jennings would later gain recognition as the first network correspondent on the scene when Palestinian terrorists murdered Israeli athletes at the 1972 Munich Olympics. He returned, substantially more seasoned, to the anchor chair in 1978. He remained at the helm of ABC's *World News Tonight* until his death from lung cancer.

Robert MacNeil (1931–) and Jim Lehrer (1934–)

MacNeil and Lehrer began their television partnership in 1973 when they provided the National Public Affairs Center for Television's (NPACT) continuous live coverage of the Senate Watergate hearings, broadcast on PBS. Lehrer was the solo anchor for subsequent PBS coverage of the House Judiciary Committee's impeachment inquiry of Richard Nixon. Lehrer had previously been a Texas newspaper reporter. Lehrer's newspaper career led him to public television, first in Dallas, as KERA-TV's executive director of public affairs, on-air host, and editor of a nightly news program. He subsequently moved to Washington, D.C., to serve as the public affairs coordinator for PBS. Canadian born MacNeil had previously reported for Reuters News Agency and NBC News and for the BBC. In October 1975, the half-hour *Robert MacNeil Report,* with Jim Lehrer as the Washington correspondent, premiered on Thirteen/WNET New York. In September 1983, Lehrer and MacNeil launched *The MacNeil/Lehrer NewsHour*. MacNeil departed the program in 1995 and Lehrer took stewardship of the program under a new title, *The NewsHour with Jim Lehrer*. In addition, Lehrer served as a moderator for ten nationally televised debates among the candidates in the presidential elections since 1988.

Roger Mudd (1928–)

Mudd began his journalism career in 1953 as a reporter for the now-defunct Richmond News-Leader and was news director at WRNL-AM in Richmond. He also worked as a reporter for WTOP-TV in Washington. Mudd joined CBS News in 1961 and worked as a correspondent for 19 years. In 1980, Mudd moved to NBC as co-anchor of the *NBC Nightly News* with Tom Brokaw (1982–83), and co-anchor of *Meet the Press*. Later, he became the primary anchor of The History Channel. From 1987 until 1992, he was an essayist and correspondent for the *McNeil-Lehrer NewsHour* on PBS. He left the program in 1992 and became a journalism professor at Princeton University.

Edward R. Murrow (1908–65)

Murrow made his name with radio reports during World War II. While he was more comfortable with radio, Murrow established a tradition on television as well—that of the crusading reporter—with his 1954 attack on Senator Joseph McCarthy and in reporting on the injustices committed against those accused of communist sympathies. He also introduced such techniques as the multipoint radio roundup and the split screen interview. He anchored the weekly TV documentary series *See It Now* on CBS from 1951 to 1955.

Dan Rather (1931–)

Rather succeeded Walter Cronkite as anchor of the CBS evening news in 1981. In the mid-1980s, the program was the leading evening newscast. An early groundbreaking moment for Rather was his televised exchange with President Nixon during a news conference, recounted in Rather's 1977 memoir, in which Nixon asked Rather, "Are you running for something?" and Rather replied, "No, Mr. President, are you?" This began a protracted grudge conservatives would hold toward Rather, and the first of many media tornadoes in which Rather would find himself. Among them was his six-minute walk-out to protest that the U.S. Open Tennis tournament had cut into the *Evening News* in 1987. CBS struggled at times to manage and withstand the fallout from Rather's behavior over the years, yet stuck by him through his controversies. However, in 2006, Rather left CBS, having been unable to quell criticism brought on by a flawed broadcast report during the 2004 elections. He signed on to host a weekly news program on HDNet.

Harry Reasoner (1923–91)

Reasoner was a reporter, White House correspondent, and anchor while at CBS News from 1956 to 1970. In 1968, he became one of the original correspondents for CBS's news magazine program *60 Minutes*. In 1970, Reasoner left CBS to become an evening news anchor for ABC, at first paired with Howard K. Smith, and later with Barbara Walters. He returned to CBS and *60 Minutes* in 1979, where he continued to work full time until 1991.

Frank Reynolds (1923–83)

Reynolds was the primary anchor of ABC *World News Tonight,* with co-anchors Peter Jennings in London and Max Robinson in Chicago, until his death in 1983. Reynolds began his career in local radio broadcasting and then local television broadcasting in Chicago for CBS and ABC affiliates. In 1965, he became the only Chicago television reporter to travel to South Vietnam to report from the battlefront. That same year, he became an ABC network correspondent in Washington. His first stint at anchoring the evening news took place in the late 1960s, ending in December 1970. For the next eight years, he covered major stories for ABC News until he was made co-anchor again in 1978.

Max Robinson (1939–88)

Robinson became the first (and thus far the only) black anchor on broadcast network television in 1981, as the Chicago-based co-anchor of ABC's *World News Tonight* with Peter Jennings and Frank Reynolds. Robinson caused a stir when the press reported that he had made remarks about the TV networks discriminating against black reporters and that "unconscious racism" existed at the decision-making levels in news media at a speech he gave at Smith College in 1981. Robinson then became anchor of the local news in Chicago, a reversal of the normal progression of an on-camera reporter's career.

Bob Schieffer (1937–)

Schieffer succeeded Dan Rather as anchor of the CBS *Evening News* on an interim basis in 2006 as speculation abounded as to what long-term shape the program might take. He became a contributor to the broadcast when Katie Couric was named as a permanent replacement in April 2006. Schieffer began his career with CBS News in 1969, and was anchor of the CBS *Evening News* Sunday edition from 1973 to 1976 and anchor of the Saturday edition from 1976 to 1996.

Elizabeth Vargas (1962–) and Bob Woodruff (1961–)

Vargas and Woodruff were paired to anchor ABC's *World News Tonight* after Peter Jenning's death in 2005. ABC had scrambled to find a successor, and emerged with not one anchor, but two. This was ABC's attempt at returning to a multi-anchor format, although not by repeating the placement of one male and one female anchor side by side at a desk, but rather a tag-team format whereby one anchor reports from the desk in New York and one from assignment in the field. In 2006, Vargas thus briefly became the first woman of Hispanic descent to achieve the network evening news anchor post. However, less than six months after the pairing, with Woodruff recovering from serious injuries sustained while on assignment in Iraq in January 2006, and Vargas preparing for maternity leave, ABC named Charles Gibson the sole anchor of its evening newscast.

Barbara Walters (1929–)

Walters left her job as the first female co-host of NBC's *Today* show in 1976 to become the first female co-anchor of a network evening newscast, ABC's *Evening News* with Harry Reasoner, also becoming the first million-dollar anchor on television. Her "auction" brought into question the entire issue of the anchor as celebrity. Considering that journalism had been slow in promoting minorities and women, the fact that the first million-dollar anchor would be a woman made the announcement all the more sensational. When Walters' pairing with Reasoner ended in 1978, she continued hosting *The Barbara Walters Special,* which featured interviews with a newsmaker or celebrity. Walters also co-hosted the ABC news magazine show *20/20* beginning in 1979. In 1997, she became the main host and

producer of the all-female ensemble-hosted morning talk show *The View* on ABC.

Brian Williams (1959–)

Williams started his journalism career at a small TV station in Kansas. After working as a reporter for a number of local East Coast stations, Williams moved to CBS in New York City. In 1993, he shifted to NBC and a year later became the network's chief White House correspondent. For seven years beginning in 1996, he was anchor and managing editor of *The News with Brian Williams*, a nightly program on MSNBC and then on CNBC. Williams served as anchor and managing editor of the Saturday edition of NBC *Nightly News* for six years before becoming anchor of the weekday edition. He was subsequently named to succeed Tom Brokaw in 2004.

ANTITRUST

On several occasions during and since the twentieth century, antitrust (or antimonopoly) law has had important impacts on the news media business. Antitrust enforcement is designed to limit or break up monopolies. Yet many de facto media monopolies have existed for decades—monopoly metropolitan newspapers in most American markets, and monopoly cable television systems in many areas. The question is what triggers either a private or government antitrust decision.

Antitrust Laws and Agencies

Two federal laws about a century-old dictate national antitrust policy (some states have antitrust authority within their own borders, but that rarely concerns media mergers). In 1890 the Sherman Antitrust Act, the country's first antimonopoly law, outlawed monopolies and monopolization, and said any contracts, combinations, or conspiracies in restraint of trade were illegal. Price fixing and profit pooling were also prohibited. The very short law awarded triple damages to successful claimants, and gave regulatory powers to the Justice Department which in 1903 formed its Antitrust Division headed by an assistant attorney general.

The 1914 Clayton Antitrust Act clarified the Sherman Act and expanded antitrust enforcement. The new law held that business practices as well as market domination could be the subject of antitrust enforcement. Among the practices prohibited were so-called tying arrangements (having to buy one product in order to get another) and refusal to

deal (not selling to those who buy from competitors). This law added the new Federal Trade Commission (FTC, created just a month earlier) as a player in antitrust concerns. The FTC's Bureau of Competition focuses on monopoly and antitrust concerns.

With formation of the Federal Communications Commission (FCC) by the Communications Act of 1934, antitrust concerns again played a part. Section 313 of the act requires the FCC to deny a license to any applicant for a broadcast station who has been found guilty of monopoly practices. While the roles of the FTC and Antitrust Division are expressly stated in the antitrust laws, the FCC has no specified authority. The commission cannot legally block a merger, but it can refuse to grant license transfers, or it can place conditions on those transfers. Indeed, many have criticized the agency for using a merger review process to extract concessions from companies that may have nothing to do with the merger.

Other critics have argued that FCC merger reviews take far too long for the fast moving electronic media industry. Some criticize the FCC for leaking information about the progress of its reviews. And many have called on the agency to at least adopt rules that define and govern its antitrust merger reviews. In an attempt to clarify the overlapping agency issue—and the delays that often result—it has been suggested that for mergers in regulated industries (such as broadcasting), the relevant antitrust agency (Justice Department) should perform the competition analysis. The relevant regulatory authority (FCC) should not then redo the competition analysis of the antitrust agency. But all of this remains unresolved.

Key Supreme Court Media Cases

There have been a number of landmark Supreme Court decisions that have helped define the role of antitrust in media ownership and operation.

Associated Press (1945)

The Associated Press's restrictive membership policies triggered a very important Supreme Court decision. When the *Chicago Sun* and *Washington Times-Herald* newspapers applied for AP membership, several AP members objected. According to the AP rules at the time, new members had to have the approval of existing members in the same market, and then had to pay exorbitant dues to join. The Justice Department challenged the AP rules, and the Supreme Court held that simply because the agency handles news while other companies handle goods "does not afford the publisher a peculiar Constitutional sanctuary.... Freedom to publish means freedom for all and not for some.... Freedom of the press from government interference doesn't sanction repression of freedom by private interests." The 5–3 vote (one justice did not participate), which the Court refused to revisit when petitioned to do so by the AP, opened AP service to anyone willing to subscribe.

As a result, over the next few years, AP's client list rapidly expanded. Many papers began multiple subscriptions to the AP as well as the UP and INS. But as the number of dailies (especially evening papers) slowly declined in the 1950s and afterwards, the cost of subscribing to largely duplicative news services made less sense to a growing number of newspapers. They began dropping their UP and INS (which merged to become UPI in 1958) contracts, thereby weakening the AP competitor's commercial underpinning. Thus the 1945 Court decision contributed to an ironic result of strengthening the AP until by the turn of the twenty-first century, it held a virtual monopoly as the sole American news agency.

Paramount (1948)

Monopoly concerns in the motion picture business are perhaps only tangentially related to journalism. But for many years, the government had been concerned about the major film studios that controlled the production, distribution, and exhibition of their popular theatrical motion pictures. The major studios were said to be vertically integrated, and their control of film making, distribution, and theatrical exhibition made it virtually impossible for any new entity to enter the market and compete. While the studios owned less than a fifth of the country's theaters, those theaters controlled about 45 percent of film theater revenue.

Concern about the studios' unfair trade practices with theaters (which had arisen in the silent

film era) finally led to all the major movie studios being sued in 1938 by the Department of Justice's Antitrust Division. The complex case was initially settled with a consent decree in mid-1940, which allowed the government to reinstate the lawsuit if, in three years' time, it had not seen a satisfactory level of compliance with its conditions by the studios. The government did not and refiled its suit in 1943. The Supreme Court in 1948 decided 8–0 against the movie studios and forced Paramount (and in a parallel series of new consent decrees, the other major studios) to divest their theater chain. New and independent owners of those theaters could exhibit films from any studio or independent producer.

That the decision came down just as television was beginning its network service was coincidental but made the decision's impact that much stronger. By the 1950s, the Hollywood studios were in trouble, no longer able to count on theater chains automatically supporting high levels of film production. At the same time, expanding availability of television kept people at home and away from the theaters. Film revenues dropped accordingly, and the once-strong studio system slowly fell apart.

Lorain Journal (1951)

The *Lorain Journal* enjoyed a 15-year monopoly on newspaper and radio advertising in its small Ohio market—until a competing radio station began operation after World War II. In response, the newspaper refused to accept advertising from any entity that purchased time on the new radio outlet, thereby threatening its survival as retailers could not risk giving up newspaper advertising. Put another way, the newspaper created a boycott of the new radio station. The station filed suit on the grounds that the newspaper's "refusal to deal" with recalcitrant advertisers was a clearly illegal "attempt to monopolize" the Lorain market, in violation of the Sherman Act. A federal trial court agreed, and on appeal the Supreme Court confirmed that decision, making clear that its findings violated no First Amendment rights.

The *Lorain* case underlined that newspapers and broadcast stations had to compete fairly, and could not adopt practices intended to keep out or drive out potential competitors.

RCA (1959)

In the 1950s, Westinghouse had two NBC television affiliates (Boston and Philadelphia) and valued their network contracts. It was seeking to add another affiliate in Pittsburgh. These affiliations gave the network considerable leverage over Westinghouse. Unhappy with its own owned-and-operated station WPTZ in Cleveland, Ohio—a much smaller and thus financially less-desirable market—NBC sought to swap with the Westinghouse Philadelphia station, KYW. The network allegedly threatened Westinghouse with the loss of one or more of its existing or potential network affiliation agreements if it did not comply. The FCC, apparently unaware of the latter point, approved the license transfer in 1955.

The Justice Department filed suit against RCA (the parent company of the network), claiming it had used its network monopoly power in the market exchange. NBC argued that the FCC had the information (including allegations of antitrust issues) it needed to issue its approval of the trade. But the Court concluded in a 7–0 vote that the FCC had no independent antitrust role here and directed the commission to undo the exchange. KYW returned to Westinghouse in Philadelphia (though the licensee has changed names, it continues to own the station today), and NBC continued to operate the Cleveland WPTZ (which it soon sold).

This case created the important precedent for the Antitrust Division to challenge broadcast mergers and transfers even if they have been approved by the FCC.

Citizen Publishing (1969)

This case demonstrates that Congress can always step in and change the law to get around a Supreme Court decision it does not like. A joint operating agreement (JOA) between two Tucson newspapers was held to be in violation of antitrust law. Justice William O. Douglas said the only defense against antitrust was if one of the companies was on the verge of failing. Many JOAs had been created in markets where neither newspaper was actually failing. Now that these were all threatened by the Court's decision, newspaper publishers lobbied Congress into passing the Newspaper Preservation Act of 1970, which legalized existing joint operations and cleared the way for new ones (if approved

by the Attorney General), in effect overriding the Court's constitutional interpretation.

The Antitrust Division continued to oppose some mergers, for example, blocking them in cases where the two papers were in adjacent markets. It appeared to be legal for chains to own many newspapers in various places, but not in close proximity. During the Reagan administration (1981–89), proposed mergers in Seattle and Detroit were not blocked, but in 1995, the Justice Department blocked the sale of a Fayetteville, Arkansas, newspaper to a group that owned another major newspaper in the northwestern part of the state.

Recent Merger Activity

In the aftermath of the Telecommunications Act of 1996, which generally deregulated the ownership of radio stations, the Antitrust Division moved to block a number of proposed mergers. For example, by early 1997, the division had acted in five cases where mergers would have allowed too much control of radio advertising in single markets to accrue to one owner.

In 2001, EchoStar made a $26 billion bid to buy larger satellite-TV rival DirecTV from General Motors. Analysts figured regulators likely would balk at the idea of giving one company control of 91 percent of the U.S. satellite-TV market. The Federal Communications Commission ruled against it in October 2002, then the U.S. Justice Department and 23 states filed suit to block the merger. Rupert Murdoch's News Corp., which ardently lobbied against the EchoStar-DirecTV union on antitrust grounds, ultimately swooped in to buy DirecTV in 2003. Less than four years later, News Corp. in December agreed to sell its 38 percent DirecTV stake to John Malone's Liberty Media.

In 2003, the Justice Department issued a consent decree in *United States v. Village Voice Media*. NT Media ("New Times") and Village Voice Media were head-to-head competitors in publishing alternative newsweeklies in Cleveland and Los Angeles. In October 2002, New Times agreed to shut down its Los Angeles alternative newsweekly, the *New Times Los Angeles,* if Village Voice Media closed its newsweekly in Cleveland, the *Cleveland Free Times*. The companies essentially swapped markets, leaving New Times with a monopoly in Cleveland and Village Voice Media with a monopoly in Los Angeles. This eliminated the competition that had brought advertisers in both cities lower advertising rates, more promotional opportunities, and better service, and that had benefitted readers with a higher quality product. The consent decree undid the arrangement.

Early in 2007, in a deal that seemed to parallel the satellite television attempt, the two satellite radio companies, Sirius and XM, proposed a merger of their multichannel (including many news and talk services) companies. The Justice Department approved the deal in March 2008 and the FCC, as expected, approved the merger in July of the same year, with conditions.

Despite all of this, many large-scale proposed media mergers have *not* been blocked in recent years: Time Inc. merging with Warner Brothers; Viacom taking over the Paramount studio; MCA/Universal buying Polygram Records; Disney taking over the ABC network; Viacom taking over CBS; Time Warner buying Turner Broadcasting (including its CNN cable network); Time Warner's takeover by AOL (in what became an infamous failed deal); AT&T and the TCI cable multiple system operator; Vivendi and Universal Studios; and AT&T Cable's purchase by Comcast. In each of these cases, a determination was made that allowing the merger did not harm overall competition in the various media markets affected.

Arab Countries

Defining what countries constitute the Arab Middle East can be a tricky and politically charged exercise. The term *Middle East* defines a geographical area in Asia, but it lacks predefined borders. Although Egypt is largely located in North Africa, it is often included as a Middle Eastern nation due to the Sinai Peninsula's location in Asia and the country's Arab-speaking population and political influence in the Middle East. Iran is also counted as a Middle Eastern nation due to its political influence in the region and its location in Asia. Here, the Arab Middle Eastern borders include Egypt, the countries that make up the Mediterranean Sea's eastern border to Turkey (Syria, Lebanon, and the Palestinian Territories), the Red Sea's eastern coast (Jordan and Saudi Arabia), the Gulf of Aden's northern coast (Yemen and Oman), and the countries that abut the Persian Gulf (Iran, Iraq, Kuwait, Bahrain, Qatar, and the United Arab Emirates).

Summarizing journalism in the Arab Middle East is equally difficult considering the varying political and social nuances that exist in the countries that comprise this dynamic region of the world. Journalists in some of these countries enjoy relative freedom while others operate under strict controls. As a region, however, Western watchdog organizations like Freedom House and Reporters Without Borders annually rank Middle Eastern nations among the worst in the world for press freedom.

In its 2008 annual ranking of global press freedom, Freedom House lists only three Arab countries—Kuwait, Lebanon, and Egypt—as even "partly free" while the rest are considered "not free." Media experts in the Middle East question the validity of Western watchdog organizations' assessments of complex foreign political systems, claiming Middle Eastern evaluators could better understand subtle social nuances and their impact on media. However, when Arab organizations like the Amman Centre for Human Rights Studies (ACHRS) rank Arab media, their rankings are fairly consistent with those of the Western groups.

In general, the primary role of media in Middle Eastern countries is to support national development. Historically, a country's political system determines the type of journalism practiced. In the case of the Middle East, the country's political leaders play a direct role in how journalists are able to ply their trade. Journalists work amid a panoply of restrictive laws that punish reporters and their editors with criminal charges if they should violate these laws and punish the media organizations with fines or closures. The result is that the free-flow of information to consumers is hindered by overt government censorship, willing self-censorship by journalists, and collusion by political players and media operators.

Traditionally, the Western press has been considered the enemy of closed-press systems. With the recent rise of Pan-Arab media properties (media organizations that can be seen, heard, or read throughout the Middle East and often around the world) and various Internet channels, however, a new dimension to the Middle Eastern journalistic landscape has been created. These Pan-Arab channels—like the Qatar-based Al Jazeera television channels and the London-based Al-Hayat newspaper—break the mold by aggressively criticizing Middle Eastern leaders and their governments.

Governmental Influence

Throughout the region, each country's government has a great influence on the style of journalism practiced therein. The job of the journalist in these countries is perceived as producing news items that support national development, inform the population of activities by the country's leaders, and promote the continuation of good relations with the

nation's allies. Unreleased information about the inner workings of government is heavily controlled. Strict laws prohibiting libel and the insult of monarchs and public figures also shackle reporters. With this overall lack of governmental transparency in its day-to-day operations, it is not surprising there is little investigative journalism or opportunity for reporters to delve deeply into social problems. It is equally not surprising that enemies of the state—the nation of Israel, for example—are wholly vilified in the media as a means of supporting the country's official political view.

Religion also plays a large part in the Arab countries' social and political landscapes. Even among Muslim nations, a split exists between the Shia and Sunni factions of Islam, which contributes to the unrest in the region. The majority of Muslims are Sunnis, but Shia are in the majority in several important countries in the region—Iran, Iraq, Bahrain, and, some say, Yemen.

Two powerful nations represent both factions—Saudi Arabia for the Sunnis and Iran for the Shia—and a competition for power exists within the region. These power struggles often erupt into sectarian violence within countries threatening civil war and unrest in the region.

Governmental licensing and oversight of journalists is common in the Middle East. A journalist cannot work unless a governmental agency (often a Ministry of Information) has approved a license. This applies to journalists working for domestic media and those working for international media organizations such as the BBC, *The New York Times,* or CNN. Such licensing makes it easier for the government to monitor, marginalize, or keep critical journalists out of the country entirely. A union or association exists in some countries to act as a unified voice for reporters and editors. But these unions have limited influence and are even prohibited in some countries. Such unions are no match against governments that actively seek to stifle the work of reporters.

Reporters Without Borders calls Saudi Arabia "one of the world's biggest enemies of press freedom." No criticism of the Saudi leadership is tolerated and journalists are punished for unflattering reports about other Muslim nations. One result of this draconian treatment of journalists is that self-censorship is widely practiced by reporters. Since local news is thus often unreliable, some Saudis turn to foreign television channels and the Internet for news and information. The often critical Al Jazeera service, however, is banned in Saudi Arabia.

Reporting from the Palestinian Territories requires journalists to deal with multiple parties—the Israeli military, Hamas in the West Bank and Gaza Strip, and its political opposition, Al Fatah. Newsrooms have been ransacked by all sides, Hamas disbanded the journalists union, and Fatah radio and television stations were forced off the air. One of the most prominent journalistic cases that received international coverage was the kidnapping of BBC journalist Alan Johnston by a Palestinian militant group, Army of Islam, in March 2007. Johnston was released four months later after negotiations with Hamas's leadership.

Journalism's Varied Roles

Journalism in the Middle East is perceived as a public service. A journalist's role is to report on and support the regime and the nation's development. To this end, media reports tend to cover daily activities of the nation's leadership, recent social or economic successes the nation has enjoyed, and noncritical reports about what allied nations are doing. Media maintain social norms by encouraging the agenda set by political figures and discourage behavior that detracts from national development.

As a theocracy, Iran's spiritual and political leaders are one and the same so any political criticism of the system or its leaders leveled by journalists can be construed as blasphemy by the clerics and punishment can be doled out by the state. Generally, the social and political agendas are dictated by the clerics. There was an exception in the mid-1990s. During President Mohammad Khatami's reformist administration, from 1997 to 2005, the role of the press was to determine the political agenda for the nation. Khatami's belief in free expression and a strong civil society created a positive journalistic atmosphere, and the number of newspapers grew exponentially during this time. But journalists may have pushed for change too hard and too quickly. In 2000, fearing social instability, the government ordered a series of bans on press coverage and the closure of reformist newspapers. The sudden lack of the reformist press forced people to seek information from illicit leaflets, flyers, and the Internet.

In the early twenty-first century, the press remains a vigorous, but harassed, channel for political debate in Iran. Khatami's government was succeeded by a much more conservative one that is far more hostile to press freedoms. Reformist newspapers have assumed a more moderate stance, but even that has not spared them from harassment by the Ministry of Culture. Dozens of journalists were arrested in 2006 for criticizing authorities and some were secretly imprisoned without access to lawyers. In March 2008, Iran banned nine lifestyle magazines for publishing personal details and photos of celebrities that Iran's culture minister found offensive. Governmental closures of publications like these are usually inconsequential; journalists simply launch a new publication under a different name. Even book authors were advised by the ministry to self-censor rather than face the government's prepublication red pencil. The government has curbed its jailing of journalists but reporters are still routinely threatened. In July 2007, Ayfer Serce, a Turkish journalist for the Euphrates News Agency who was investigating several suicides by Kurdish women, was killed by the Iranian army in the northwestern province of Azerbaijan. At first it appeared she was killed in combat with Kurdish rebels, but evidence later indicated she was killed afterward. The government refused to explain the circumstances of her death and would not return the reporter's body to her family. In February 2007, several media outlets were ransacked by the government for insulting the architect of the 1979 Iranian Revolution, Ayatollah Ruhollah Khomeini.

Due to the Iraq war (2003–), Iraq is one of the most dangerous places to work as a journalist. According to the Committee to Protect Journalists, 124 journalists and 49 media workers have died in Iraq since March 2003. One third of those killed worked for international news organizations. In 2007, 31 journalists were killed, making that year one of the deadliest for journalists in ten years. Both Iraqi and U.S. authorities have carried out violence against journalists. Although the number of journalist detentions decreased in 2007, Al Jazeera camera operator Sami Al-Hajj was held in Guantanamo Bay in Cuba for six years. No charges were ever filed and he never stood trial before he was released in 2008. The United States detained Associated Press photographer Bilal Hussein for over two years in Iraq without presenting evidence against him.

Media Operators

To ensure adherence to often strict regulations, media outlets in Middle Eastern countries are (1) operated by the government, (2) operated by compatriots of and heavily funded by government subsidies, or (3) privately owned and operated. In the second and third cases, veteran journalists reinforce the stringent press laws with their supervision of reporters. As libel lawsuits often include the editor in addition to the reporter who penned the story, there is more incentive for supervisors to adhere to press regulations.

Lebanon remains a unique example among Arab countries. It has one of the most aggressive media operations in the region mostly because the media represent political ideologies. Unlike in many parts of the region, journalists and columnists in the country's many press organs frequently criticize the government, but that criticism comes largely from antigovernment political press organs. However, Lebanon is also where Shia and Sunni factions vie for power, often by using the Lebanese media as their megaphones. In Lebanon political parties operate their own media outlets. Thus, media are at the center of sectarian divisions that add to the country's instability. The newspaper *Al Mustaqbal* is a progovernment publication. Hezbollah, a political and paramilitary organization that opposes the government, operates the Al-Manar television channel, and Sa'ad Hariri, a Sunni political leader, owns Future Television and Radio Orient. It is not uncommon in Lebanon for government to take opposition media channels like Al-Manar off the air under the auspices of maintaining social stability.

Lebanese radio is dynamic, diverse and political. On one end of the spectrum stations like pro-Hezbollah Al-Nour broadcast political and religious messages along with a heavy amount of anti-Zionist rhetoric. On the other end are stations like Mix FM, which broadcasts dance music and sponsors concerts and beach parties that feature Arab and Western musical artists.

Lebanese television can be divided into two political camps. Hezbollah-supported Al-Manar TV, the National Broadcasting Network (NBN),

and New TV oppose the government, while Mustaqbal (Future) TV and the Lebanese Broadcasting Corporation (LBC) are progovernment. LBC is a pan-Arab channel that was originally launched in 1996 by the leader of the Lebanese Forces. From its outset, LBC was intended to be the voice of Lebanese Christians, but it is now considered a progovernment channel.

Despite a law prohibiting sectarianism, Lebanon's media are being blamed for fanning sectarian fires in the country via news and talk programs. Future TV and Al-Manar are often singled out as particularly sectarian. A recent addition, Orange TV, is a 24-hour news channel launched by Future TV and utilizes the ubiquitous color of a particular political party in its name.

In a region where most countries' television channels are government operated or co-opted, Lebanon is an exception to the rule. Its kaleidoscope of politically tinged media outlets can be seen either as a healthy and vigorous attempt at free expression or as a means of fueling social and political instability.

Press Laws

In general, in the Middle East, one's right to know is secondary to a person's right to privacy. Other laws impacting journalists make it a crime to criticize or insult the ruler or other prominent persons. Such laws make reporting a political minefield for journalists. To compound the issue, most media laws in Middle Eastern countries are woefully outdated as well as extremely stringent. In many cases errors are treated as criminal offenses where reporters and editors could face imprisonment. Although plans are underway in many of these Arab countries to update these "rules of the road" for journalists, the process is slow and politically charged.

Reforming Jordan's strict press and publications law has been tabled several times while the government continues to keep journalists under surveillance, censor news organizations like Al Jazeera, and enforce laws that prohibit the criticism of rulers or the ruling family. The professional journalist union—the Jordan Press Association—is a progovernment body and membership is mandatory for all working journalists. The result is a cowed press corps that prefers self-censorship to governmental run-ins.

Progress in updating press laws is being made in some countries. In March 2006, the Kuwaiti parliament approved a new press law designed to better protect journalists' basic rights. The government ceded its monopoly control over issuing operating licenses for the media and established an appeals process for unsuccessful license requests. The new law also allows for new political newspapers and the expansion of the overall number of newspapers. It specifies that only judges can order imprisonment of journalists.

Creating a media-friendly atmosphere for free expression is a stated goal of the United Arab Emirates (UAE). Political leaders encourage journalists to push the envelope on reporting and say that critically evaluating official institutions contributes to the UAE's progress toward becoming a modern state. However, despite promises to do so, the government has not updated its press law since 1980 and international watchdog groups list it as one of the most restrictive in the Arab world. The UAE closely monitors journalists. Local and foreign reporters and editors cannot work unless annually licensed by the Ministry of Information. Self-censorship remains the biggest challenge facing press freedom in the UAE. Newspaper management is legally held accountable for what is published. Faced with possible imprisonment alongside their reporters, section heads and editors err on the side of journalistic conservatism rather than jeopardize their careers with critical reporting.

In October 2007, UAE journalists adopted a code of ethics that recognizes the press's responsibility to inform the public. In March 2008, the UAE Vice President and ruler of Dubai signed an order that limited a person suing for libel to suits against media organizations, not individual journalists, as had long been customary. Official orders like this in support of a freer press are viewed by journalists as hopeful signs of change.

In April 2008, a rise in sectarian violence in Bahrain brought media regulation front and center. Despite government orders for press organs to practice responsible journalism and calls from political societies and other organizations for journalists to refrain from fueling sectarian views through their reporting, the government claims that media websites that feature political blogs instigate unrest. Websites were not covered in the 2002 press law and are thus considered immune

from potential lawsuits. In May 2008 Bahrain took steps to amend that law by decriminalizing press offenses and lifting preprint censorship on local (but not foreign) publications, and the Bahrain Journalists Association is considering a code of ethics to guide reporters. Lawmakers fear an updated press law may grant too many special privileges to journalists, but journalists hope parliament will abide by the wishes of the king to amend the law.

The overall workforce in Qatar—and this includes the press corps—largely consists of expatriates. Since permission for foreigners to live and work in the country is dependent on a governmental-issued visa, reporters are often conscious of falling afoul of the law and facing expulsion. Journalists also face fines and detention for violating the numerous articles in Qatar's strict press law, further intensifying the pressure to self-censor. Qatari law prohibits the formation of professional associations (such as a journalist's union) by non-Qataris, making it difficult for journalists to present a unified front on press freedom issues when dealing with the government. Paradoxically, Qatar has housed and nurtured Al Jazeera, one of the most provocative media organizations in the region. As one of the first pan-Arab satellite channels, Al Jazeera has helped redefine Arab journalism by challenging actions of regional leaders and encouraging its journalists to report freely instead of self-censoring their stories. Al Jazeera is owned by a member of Qatar's ruling family and, maybe not surprisingly, appears less critical of the Qatari ruling family and of social, political, and economic development in Qatar.

Censorship and Self-Censorship

Outdated press laws, shifting lines about what information can and cannot be reported, the cautionary tales of jailed colleagues, and fickle government leaders understandably contribute to uncertainty among journalists. Add to this outright governmental censorship in some countries and it becomes clear why self-censorship is common among the Arab press corps.

In Egypt, a news editor of a local tabloid was sentenced to six months in prison in March 2008 for publishing a story on President Hosni Mubarak's health. The journalist was freed on bail, but the report caused an economic panic among international investors that adversely impacted Egypt's economy. In a separate case, using the social networking website Facebook, one political dissident, who came to be known as "Facebook Girl," organized a protest rally against the Mubarak administration. Though the rally didn't attract large numbers, the "Facebook Girl" was imprisoned for a time by Egyptian authorities. Her Facebook group calling for the protest claimed to have about 75,000 members, an example of the issue of outside media organizations impacting internal politics.

Pan-Arab Journalism

In general, domestic radio and television in the Middle East suffer from lack of originality and poor production values. With a few exceptions, commercial domestic radio still targets a general audience. Although topical hours may be set aside for target audiences like children or the elderly, narrowcasting to specific demographics and format-based programming have yet to catch on in these Arab countries. The exceptions here largely originate in Lebanon. Radio stations that program formats like rhythm and blues, pop, and hip-hop exist and help promote Lebanon's thriving music industry.

Commercial television features political and entertainment talk shows, game shows, a few live, call-in shows, and movies. Entertainment television originating from Lebanon has become a force for attracting the younger audience. *Star Academy,* an ongoing talent contest that pits people from various parts of the Arab world against one another, has become a fan favorite and a source of national pride among viewers. The holy month of Ramadan is a cherished television viewing period as it usually features a fresh line-up of programs for the family to watch. In general, domestic television news in Arab countries lacks investigative journalism and its content usually spotlights national development and the actions of government leaders.

Over-the-air broadcasting in most Arab countries is controlled by the government and features government-owned channels. Cable television, with its pay-TV and commercial stations, has never reached a critical mass in this part of the world. However, satellite television has gained a

foothold. Experts say nearly one in four Middle Eastern households uses home satellite dishes, making this method the primary way that viewers access commercial television in the region. Pan-Arab satellite channels—the most well known being Al Jazeera (Arabic and English), Al Arabiya, the Lebanese Broadcasting Corporation (LBC), Future TV, and MBC—have become increasingly popular for both news and entertainment. Two of these enterprises (LBC and MBC) are overseen by Saudi Arabia. Al Jazeera, which is owned by the ruling family in Qatar, is considered one of the few Arab broadcasters beyond the influence of Saudi Arabia, and it has often produced critical stories about the two most influential Arab countries—Saudi Arabia and Egypt.

Since Al Jazeera burst onto the world stage during the opening days of the 2002 war in Afghanistan other countries have launched their own pan-Arab satellite channels and news operations. A few examples include Nourmina in Jordan, One TV Dubai in the UAE, and Bahrain TV. However, these channels generally lack Al Jazeera's glitzy production values and confrontational style, preferring to more closely reflect the governmentally compliant nature of their country's journalism. Domestic politicians consider satellite television a sign of modernization and therefore support its development and even tolerate their own Pan-Arab channels as a national symbol of progress within the region. However, channels that are critical of regional regimes, like Al Jazeera, which boasts a viewership of about 35 million people, have been threatened with censorship or closure by Arab leaders who permit the channels to broadcast within their borders via an agreement among Arab states.

In February 2007, information ministers of the 22-member League of Arab States adopted a satellite broadcasting charter ostensibly meant to counter Western cultural influence and reinforce "Arab solidarity," but that also placed more governmental control over private Arab satellite channels like Al Jazeera. According to the amended charter, satellite channels that broadcast material that jeopardizes "social peace, national unity, public order and general propriety" or that threatens "pan-Arab cooperation and integration" could face suspension or license revocation by their host governments. Western media watchdog groups like the Committee to Protect Journalists decried the charter as an attempt to further limit free expression, while the Egyptian minister of information promised his country would be one of the first to implement it. By early 2008, the Egyptian government had closed three stations—Al Baraka, Al Hikma, and UK-based Al-Hewar—known for their critical coverage of Arab governments and raided the offices of the Cairo News Company, one of the largest suppliers of breaking news in the region.

The success of pan-Arab satellite channels in reaching Middle Eastern audiences has prompted Western media organizations and governments to respond with their own satellite channels in order to reach, and hopefully influence, the Arab viewer. In March 2008 the British Broadcasting Corporation launched its BBC Arabic news channel. The earlier U.S.-government-funded Al Hurra television and radio stations like Radio Sawa and Radio Farda present Middle Eastern news through an American lens in an attempt to counter criticisms from other Arab channels. The French, Russians, and Germans have followed suit with their own Arabic-language news channels. All of these have had limited success at attracting viewers but seek to engage the Arab audience with Western political ideologies.

Experts think Al Jazeera's significance has less to do with its actual audience size and more with the impact it has had on other regional media. For example, Pan-Arab channels in Jordan, the UAE, and Egypt have adopted Al Jazeera's onscreen appearance and have adopted similar news program formats. Al Jazeera's reputation in the West has generally been as a mouthpiece of Arab anti-Western ideals. However, recent research indicates the launch of Al Jazeera's English channel has improved the image of the Al Jazeera brand in the Western world. In time, Westerners may come to view Al Jazeera in a more positive way, increasing its global credibility, strengthening its position in the region, and easing the way for newer media to gain a journalistic foothold in the Middle East.

Newer Media

Newer media including Internet-based newspapers, blogs, text message alerts, and social-networking websites like Facebook, YouTube, and MySpace promise to broaden information

dissemination and challenge the status quo in the Middle East by creating homegrown channels for discussion, debate, and dissent. However, since these websites can be viewed by anyone, the impact of a local journalistic decision can have international repercussions like the above example of an economic downturn caused by a report in a local newspaper about Egyptian President Mubarak's health. In an attempt to control their global, regional, and local images, Middle Eastern governments are trying to stem the flow of information through monitoring and filtering software.

Yet governments accustomed to controlling traditional media information are finding it harder to control digital information highways. Sophisticated filtering and monitoring software—developed, ironically enough, by such countries as the United States—is simplifying their task. In addition, monopolistic, government-licensed, and government-supported ownership of such systems as mobile phones allows tighter control of the news content via text messaging and identification of people sending and receiving messages. However, as global pressure to deregulate telecommunication increases, such links may become more like satellite communication—difficult to control and ubiquitous within society.

User-generated content from and about Arab nations on websites like YouTube and Facebook is on the rise. Political pressure groups, nongovernmental organizations, and ordinary citizens use these social networking channels to disseminate their messages. Mainstream media often use these materials as examples of voices within their respective countries. Although these newer interactive media tools give voice to the voiceless by empowering citizens as journalists, it also puts the onus of verifying the accuracy of the information on traditional media outlets that use it. Reporters are well aware that many such providers have political agendas to advance and thus their stories must be carefully vetted to ensure the mainstream media do not become inadvertent advocates for a cause.

In April 2008, Queen Rania of Jordan launched a YouTube channel for users to contribute questions, voice opinions, and address common stereotypes about Muslims and Arabs in an attempt for the world to better understand Islam. This example of informal governmental usage of the Internet is an exception, however; most Arab governments are discouraging Internet use for discussion and debate.

Some governments block opposing views on the Internet altogether. In March 2007, authorities in Yemen blocked access to opposition websites and banned news sent via text messaging. In Syria the government's policy of blocking websites and the jailing of cyber-dissidents is considered by Western watchdog organizations to be the worst in the Middle East. The country's Kurdish minority is a particularly taboo subject in Syria.

Overt censorship of websites takes different forms. In Saudi Arabia, the government substitutes the user's desired webpage for another saying the website has been blocked by the authorities. In other countries, including the UAE, sensitive websites suffer from recurring "technical problems" or carry a similar webpage warning that the content on the site does not conform to the country's cultural sensitivities. In the UAE, users at Internet cafes must register before they can sign on.

Bloggers are extremely vulnerable to government harassment and therefore self-censor rather than have their sites shut down. In Egypt bloggers have been arrested and their websites blocked. In 2007, one Egyptian blogger was sentenced to four years in prison for criticizing the President and commenting about religious control of the country's universities.

Bloggers use different methods to skirt governmental censors. Expatriate bloggers may criticize their home country's policies while operating outside its borders. If their Internet site is blocked, another can be started with ease and the new site address relayed to loyal readers. Users can also download a software work-around to access the blocked site via a new path to the same information. As text messaging becomes globally ubiquitous it will become more difficult for censors to wade through the millions of messages that are sent every day.

Although Arab journalism in the Middle East is far from free, progress is being made. Arab media organizations are reaching larger audiences, and technology is making information delivery harder to censor. One result may be greater Arab news media freedom, but it could also mean more harassment of the messenger by desperate leaders

trying to hold back the flood of information that challenges the status quo.

Archives and Museums

Across the world, a vast number of museums and archives hold material relevant to journalism. There are two distinct categories of this material: news media content and the means of producing that content. The first includes newspapers, newsreels, radio recordings, television news footage, photographs, and, most recently, websites. And the second includes objects representing the technology involved in producing and delivering journalism, such as printing presses, cameras, radio and television sets, and computers.

The importance of collecting, preserving and interpreting both categories for the benefit of present and future generations cannot be overstated. It may be hyperbole to describe journalism as "the first draft of history." Nevertheless, much of what journalists produce—whether print, film, or electronic—does constitute an important record of events, trends, and opinions and is therefore an invaluable resource for students of many disciplines. Moreover, everyone recognizes the pervasive influence—whether it be positive or negative—which the news media exercises over public opinion. Therefore, an informed understanding of how news is put together is itself a worthwhile subject for study.

Attempting to categorize and label the museums and archives engaged in this work across the world is a tricky exercise. In almost every area of museological and archival activity, there is rarely an overarching logic explaining why certain collections are held in given institutions. Historical accident, government initiatives, philanthropic whims and fancies, and any number of other factors have produced the museums and collections we have today. Nevertheless, a few broad conclusions can be drawn about both museums and archives relevant to journalism and about how the Internet and the World Wide Web have brought a new dimension to the subject.

Museum Types

Though they are relatively few, there are some museums that deal exclusively in the business of news. They are concerned with the process of journalism as an area of human activity and are interested in

journalism across a number of media genres. The Newseum in Washington, D.C., which reopened its doors in 2008, is the leading example.

There are also countless newspaper museums. Some tell a comprehensive story about the newspaper industry, like the International Newspaper Museum in Germany and Newspark in Yokohama in Japan. Other smaller museums concentrate on the archive and story of particular newspapers. These museums are interested in the process of producing newspapers and also often hold newspaper archives.

Finally, there are museums that deal with one or more media topics in which journalism forms part of the story. Britain's National Media Museum in West Yorkshire and the Paley Center for Media in New York and Los Angeles are both examples of multimedia museums where news material and the news process are included as part of a larger narrative and within a larger collection. Likewise, the many radio and television museums around the world do not specifically focus upon news but they are nevertheless relevant to journalism. In addition, there are a number of museums dealing with computers and the Internet—notably the Computer History Museum in California—that are relevant to the most recent developments in journalism such as news websites and blogging.

Archives

Archives are an equally diverse area. There are a number of major institutions quite independent of news organizations that hold material produced by journalists. The British Newspaper Library in London and the Library of Congress in Washington, D.C., are two examples of archives holding news material for public benefit. Similarly, there are other archives dealing with still or moving images including news material. The British Film Institute's National Film and Television Archive in London is an example.

Additionally, there are archives held by news organizations themselves. Every newspaper in the world will have its own archive—kept primarily as a tool to enable its journalists to do their job. Major broadcasting organizations like the BBC and American networks hold their own archives. Others have transferred their archives to public institutions.

Local and regional archives are another important depository of news material. Most libraries will collect local newspapers. Local film archives will often hold valuable material about events in their areas and will often be the depository for news broadcasters to keep their older archive material.

In addition, although outside the scope of this article, there are commercial picture libraries like Getty Images that hold millions of photographs relevant to journalism.

The digital age is transforming the way journalism works in three main ways. First, the World Wide Web is itself an increasingly significant news outlet in its own right, and preserving news material from the web poses enormous challenges for museums and archives. Also, the Internet is increasing the accessibility of archives and museums by enabling them to make their material available online to audiences who will never visit the actual locations of the archives. Last, many news organizations themselves are making their archives available via the web, which provides a valuable research tool for students.

Museums About News and Journalism

The Newseum, Washington, D.C., USA

The Newseum, which opened on its new site in the heart of Washington, D.C., in April 2008, is a vast 250,000-square-foot museum of news. The exterior includes a 74-foot-high marble engraving of the First Amendment of the United States Constitution (the amendment that guarantees a free press). The Newseum features seven levels of galleries, theatres, retail spaces, and visitor services. It is highly interactive offering visitors an opportunity to try their hand at being a TV reporter or a photojournalist and includes a gallery about the coverage of the 9/11 attacks on New York and Washington. The Newseum—which previously existed on a smaller scale in Arlington, Virginia—is run by the Freedom Forum—an organization dedicated to the celebration and preservation of a free press.

Newseum, 555 Pennsylvania Avenue, Washington, DC 20001, USA. Tel: +1 888 639 7386. Website: http://www.newseum.org.

Rupriikki Media Museum, Tampere, Finland

The Rupriikki Media Museum is much smaller than the Newseum but is one of the relatively few museums in the world which take a holistic look at the news media. The museum contains sections on the press, television, radio, telephones, and computers. It provides an insight into the history and the development of mass communication and sheds light on how news is put together. Rupriikki also provides real, up-to-date information about the media and information on the background of various forms of communication.

Rupriikki Media Museum, Väinö Linnan aukio 13, Tampere, Finland. Tel: +358 3565 66411. Website: www.tampere.fi/mediamuseo/english.htm.

Newspark, Yokohama, Japan

Newspark is Japan's newspaper museum. It was opened in 2000 in Yokohama, the birthplace of Japanese daily newspapers. Starting with Japan's oldest known printing blocks, the museum's vast collection reflects every era of Japanese newspapers. It has roughly 200,000 items on display including a selection of tools used in reporting and newspaper delivery, newspaper supplements, posters, and postcards. There are six areas that trace the history of the medium, describing the dawn of newspapers, the establishment of modern newspapers, the age of military censorship, the birth of Japanese democracy and newspaper revival, the growth of high-quality newspapers, and newspapers in the age of diversified media.

Newspark, Yokohama Media and Communications Center, Yokohama, Japan. Tel: +81 045 661 2040. Website: www.pressnet.or.jp/newspark.

International Newspaper Museum, Aachen, Germany

This museum (Internationales Zeitungsmuseum) in Aachen covers the history of newspapers and the press. It is located in the house where Israel Berr Josaphat Reuter established the first ever news agency—the forerunner of Reuters. The museum houses over 100,000 newspapers from around the world from the seventeenth century to the present day.

International Newspaper Museum, Pontstrasse 13, Aachen 52062, Germany. Tel: +49 (0) 241 432 4910. Website: http://www.izm.de.

Paley Center for Media, New York City and Los Angeles, USA

The former Museum of Television and Radio was renamed the Paley Center for Media in June 2007. It opened in New York in 1976 and then added a second location in Los Angeles in 1996. The Paley Center for Media has an international collection of more than 140,000 programs covering almost 100 years of television and radio history, including news; public affairs programs and documentaries; performing arts programs; children's programming; sports, comedy, and variety shows; and commercial advertising. Some 70 countries are represented in the collection. Throughout the year, the Paley Center for Media hosts discussions with influential newsmakers, journalists, and world leaders on important media issues. It stages annual television and documentary festivals.

The Paley Center for Media: New York: 25 West 52nd Street, New York, New York 10019, USA. Tel: +1 212 621 6800. Los Angeles: 465 North Beverly Drive, Beverly Hills, California 90210, USA. Tel: +1 310 786 1000. Website: http://www.paleycenter.org.

National Media Museum, Bradford, England

The National Media Museum—renamed in 2006 from its previous title of the National Museum of Photography, Film and Television—covers seven floors of a downtown building in Bradford in Northern England. It includes permanent interactive galleries about photography, television, and animation as well as the Magic Factory, which demonstrates the basic optical principles behind those technologies. Its collection, comprising three and a half million items, includes an internationally significant collection of television technology and a vast photography archive including the Royal Photographic Society Collection and the *Daily Herald* Picture Library

(a photojournalism archive covering the first half of the twentieth century). Over 1,000 TV programs can be viewed free of charge in a facility called "TV Heaven." The museum hosts the BBC's local radio, television, and online operations within the museum as a living exhibit.

National Media Museum, Pictureville, Bradford, England BD1 1NQ. Tel: +44 (0)870 7010200. Website: http://www.nationalmediamuseum.org.uk.

NHK Museum of Broadcasting, Atagoyama, Japan

Known as "the birthplace of Japanese broadcasting," Atagoyama is where Japanese radio broadcasts began in 1925. The NHK Museum opened in 1956 as the world's first museum exclusively about broadcasting. The museum houses various exhibits on broadcasting history and has an on-demand video library and a reference library open to the public free of charge. In the Broadcasting Library, visitors can watch approximately 6,000 old NHK programs and can access literature and information relating to broadcasting and its history.

NHK Museum of Broadcasting, 2–1-1 Atago, Minato-ku, Tokyo, 13 105-0002, Japan. Tel: +81 (0)3 5400 6900. Website: http://www.nhk.or.jp/museum/english/about.html.

Computer History Museum, Mountain View, California, USA

This museum is dedicated to the preservation and celebration of computing history. It is home to one of the largest international collections of computing artifacts in the world, encompassing computer hardware and ephemera, photographs, moving images, documents, and software. The museum includes two sections particularly relevant to journalism: the "Visible Storage Gallery," which includes over 600 key objects from the collection; and the "Innovation in the Valley," which offers a study of Silicon Valley start-ups.

Computer History Museum, 1401 N Shoreline Blvd, Mountain View, California 94043, USA. Tel: +1 650 810–1010. Website: http://www.computerhistory.org.

Pavek Museum of Broadcasting, St. Louis Park, Minnesota, USA

The Pavek Museum houses one of the world's finest collections of antique radio, television, and broadcast equipment. The core of the museum is the Joseph R. Pavek Collection of more than 1,000 radio receivers, transmitters, and televisions from the first half of the twentieth century. Highlights include a working 1912 rotary spark-gap transmitter, similar to the one used aboard the Titanic; crystal radios of the early 1920s; a chronologically ordered collection of vacuum tubes; and extensive treasuries of radio literature.

Pavek Museum of Broadcasting, 3515 Raleigh Avenue, St. Louis Park, Minnesota 55416, USA. Tel: +1 952 926 8198; Website: http://www.museumofbroadcasting.org.

Le Musee de Radio France, Paris, France

Le Musee de Radio-France Museum in Paris retraces the history of radio and television and the recording of sound from its earliest days. There are some reconstructions of laboratories used by pioneers such as Guglielmo Marconi, inventor of the radio telegraph, and Heinrich Hertz, who was the first to send and receive radio waves. There are a number of very old appliances and some rare items like early crystal radio receivers and the 1793 Chappe telegraph.

Le Musee de Radio France, 116 Avenue du President Kennedy, Paris 75016, France. Tel: +33 157 050 436. Website: http://www.radiofrance.fr/rf/musee/accueil.

Major Archives

Library of Congress, Washington, D.C., USA

The library is the de facto national library of the United States and the research arm of the U.S. Congress. Located in three buildings in Washington, D.C., it is the largest library in the world. Its collections include 1 million issues of world newspapers spanning the past three centuries, 33,000 bound newspaper volumes, 2.7 million sound recordings, and more than 13.7 million prints and photographs. Audio and video recordings and films are held at the new Packard Center in Culpeper, Virginia, about 40 miles south of Washington.

Library of American Broadcasting, College Park, Maryland, USA

This library holds a wide-ranging collection of audio and video recordings, books, pamphlets, periodicals, personal collections, oral histories, photographs, scripts, and vertical files devoted exclusively to the history of broadcasting. Founded in 1972 as the Broadcast Pioneers Library, it was housed in the headquarters of the National Association of Broadcasters in Washington, D.C., until 1994, when it became part of the University of Maryland Libraries. Housed in an adjacent space are the country's primary public broadcasting archives for both radio and television.

volumes and parcels and over 370,000 reels of microfilm, holdings altogether occupying some 45 kilometers (28 miles) of shelving in total. Over 52,000 separate newspaper, journal, and periodical titles are currently held. Currently about 2,600 UK and Irish newspaper and periodical titles are received including the main London editions of the national daily and Sunday newspapers. Major overseas newspapers printed in European languages are also collected.

The British Newspaper Library, Colindale Avenue, London NW9 5HE, England. Tel: +44 (0)20 7412 7353. Website: www.bl.uk/collections/newspapers.html.

BFI Archive, London, England

The BFI Archive is one of the largest film archives in the world. It collects, preserves, restores, and then shares the films and television programs that have helped shape and record British life since cinema was invented in the late nineteenth century. The BFI's international holdings are substantial. However, the bulk of the collection is necessarily British. The collections themselves are accommodated on several sites. The J. Paul Getty, Jr. Conservation Centre in Berkhamsted, Hertfordshire, named after its benefactor, is the base for much of the work. It now comprises over 200,000 feature, nonfiction, and short films (dating from 1894) and 675,000 television programs. Some of the material is available for public viewing in the BFI Mediatheques on London's Southbank and at QUAD in Derby.

BFI Archive: Kingshill Way, Berkhamsted, Herts HP4 3TP, England; Tel: +44 (0)1442 876301; also BFI, 21 Stephen Street, London W1T 1LN England. Tel: +44 (0)20 7255 1444. Website: www.bfi.org.uk/filmtvinfo/services/ask.

Vanderbilt University Television News Archive, Nashville, Tennessee, USA

The archive, which dates from August 1968, holds recordings of news broadcasts from the U.S. national television networks including ABC, CBS,

NBC, CNN, and Fox News. It operates as a unit of the Vanderbilt University Libraries. Visitors to the archive in Nashville can view all content from the collection. The archive makes all the items in its collection available to the public through a loan service.

Vanderbilt University Television News Archive, 110 Twenty-First Avenue South, Suite 704, Nashville, Tennessee 37203, USA. Tel: +1 615 322 2927. Website: http://www.tvnews.vanderbilt.edu.

BBC Archive, London, England

The BBC Archive consists of about 4 million TV and radio items—equivalent to 600,000 hours of TV and about 350,000 hours of radio. In addition the BBC has a new media archive preserving content from the BBC's websites. There are also large sheet-music collections, commercial music collections, and press cuttings. Like most broadcasters and news organizations, the BBC maintains its archive partly for historical reasons and partly to assist its own program making. Access is available in three separate locations—the British Film Institute (TV holdings), British Library Sound Archive (radio programs), and BBC Written Archives Centre (documents), which is in Caversham. A changing program of archive content is available online.

BBC Archive. Website: http://www.bbc.co.uk/archive.

Conclusion

The wealth of material held in archives and museums around the world about journalism is evidence of the interest in the subject to the general public and academics alike. It remains vital that, in the increasingly competitive world of twenty-first-century news operations, the commitment by news organizations to preserve their own history remains undiminished. Self-interest on the part of news organizations gives cause for hope. There is money to be made from exploiting the archive and the archive is, of course, necessary for doing the job in the future. However, the growth of a more fragmented media landscape, the advent of citizen journalism, the arrival of blogging, and more on-demand delivery of news via the Internet will all mean that the preservation of the history of journalism for future generations will be an increasingly complex and challenging task.

Asia, Central, South, and East

Among the world's continents, Asia has both the largest geographic expanse and the largest population. Approximately one-third of the world's land mass lies within Asia, and the number of people living in Asia, at 3.9 billion, is greater than the rest of the world combined. Media of the region are of a similar scale. The three countries with the largest daily newspaper circulations are in Asia. Audiences for broadcast media exploded in the 1990s, and today the world's two largest national TV audiences are also in Asia. Separate entries on India, China, and Japan that go into more detail on those countries can also be found in these volumes.

The global trend toward liberalization of economies beginning in the 1980s had a large impact in Asia, and the continent therefore experienced the same media restructuring as occurred elsewhere. In Asia, this took the form of media consolidation and—especially in broadcasting—privatization of outlets. Whereas previously most countries in Asia had media that were directly or indirectly managed by government agencies, liberalization effectively weakened or eliminated policymakers' control. A direct result of the growth in specialized media was an erosion of readership for general interest magazines, especially

those that were offered as regional publications. One of the leading news magazines of Asia, *AsiaWeek,* ceased publication of its print edition in 2001, although its online presence continues. Another leading newsweekly, the *Far Eastern Economic Review,* converted to a monthly publication in 2004.

Broadcast media have experienced the greatest changes as a result of economic reforms leading to privatization of media ownership. Print media in most non-socialist countries had already been in private hands before the shift to liberal market-oriented principles began to affect ownership of broadcast media that had generally been under public or state control. Some observers argue that the privatization trend was a good thing, in that government restrictions were inevitably loosened when ownership passed to private parties. However, in practice, this was mitigated somewhat by the fact that the shift from government to corporate control has its own problems. For example, in a number of countries the new private owners were cronies of political leaders, and their corporations demonstrated little independence from government.

Literacy has been a significant impediment to the broad use of media in many countries. Although definitions of literacy vary, there is little doubt that in South Asia this problem has been particularly acute, with most countries there having populations of which less than 50 percent are able to read and write. Afghanistan, for example, reports that less than a third of its citizens have attained literacy. Comparable figures for East and Southeast Asia are generally higher. Compounding this issue is the language complexity found in nearly all countries of Asia, which leads to the question, if an individual has gained literacy skills, does this provide access to the literature and mass media common in the country or region? So, even if a Sri Lankan resident is literate in Tamil, he or she would still be excluded from the readership of the major language newspapers in Singhalese and English. An additional factor affecting literacy is the variety of scripts in common use across the continent. In Sri Lanka, for example, the Tamil and Singhalese languages employ entirely different scripts.

A Survey of Asian Regions

Partly because of its enormous scale, Asia is also the most diverse and culturally complex continent. As a result, any statement about the whole of Asia can only lead to the simplest kinds of generalizations. Because of the cumbersome nature of the continent, most students of Asia prefer to think of it in terms of its constituent subregional parts—East Asia, Southeast Asia, Central Asia, and so on. At least at this level of description the nations have a degree of geographic, historical, economic, and—sometimes—cultural common features. What follows is a short survey of the features of these subregions and their media.

East Asia

The East Asian subregion consists of Korea (North and South), Japan, China (including Hong Kong and Macau), and Taiwan. The wealth and huge population of this subregion provides journalists many high quality media for the practice of their craft. However, the contrasting political and historical features of these countries have produced sharp differences in the media and their audiences. China naturally dominates the region due to the sheer number of its citizens. Despite strict policies to limit population growth, including its one-child-per-family rule, this country's total number of residents exceeded 1.25 billion by 2006. Also, China's economic expansion surpassed 9 percent growth in GDP each year between 2001 and 2006, and seems likely to achieve the same in succeeding years.

A discussion of journalism in China and Japan can be found elsewhere. Taiwan, considered by Beijing as a breakaway province, has a media structure that is more similar to that found in the Philippines or Japan than to that of the mainland. This entity has been dominated by the Kuomintang (KMT) party for a major portion of its existence and represents the remnants of the nationalists who retreated from the mainland after defeat by Communist armies in 1949. The KMT has exerted a predominant influence over media through ownership of key outlets and state regulations. This weakened somewhat after 1987's political liberalization, when martial law was revoked.

The main Taiwanese broadcasting news outlets have been the major television stations of Taipei. Their telecasts present news heavily influenced by KMT ideology and perspectives. These channels held sway until the growth of cable TV in the 1980s broke their exclusive hold on Taiwan audiences. Today, Taiwan has one of the highest cable

penetration rates in the world, reaching more than 80 percent of all television homes by the year 2000. As in the United States, Canada, and other cable saturated regions, this has significantly fragmented audiences and diminished the influence of the over-the-air channels. Newspapers in Taiwan include the *China Times, Liberty Times,* and *UDN,* each published in Chinese. Also important are the English language *China Post* and *Taipei Times.*

Hong Kong holds a unique status in China, under terms of the agreement that set the stage for handover of its control from Britain to China in 1997. This is embodied in the concept of the "One China Two Systems" principle that continues many of the policies and practices from British colonial times. Included are those that afford Hong Kong media a greater degree of freedom, though with less openness than before. (For example, most media in Hong Kong are privately owned, and laws governing media provide for freedom to criticize government.) This small enclave within China hosts more than 50 daily newspapers and numerous other publications. The predominant English language daily, and one of the best known in East Asia, is the *South China Morning Post.* Its influence is greater than its circulation (about 100,000 copies a day) would suggest. The main Chinese language newspapers are the *Apple Daily* and *Oriental Daily News,* both of which have circulations above 300,000. Broadcasting is mixed, made up of both private and publicly owned stations. RTHK, which had been a public corporation service prior to handover, is the official state broadcasting outlet on radio and television. It now provides seven radio channels, a television production house that airs its programs on commercial TV channels (including an educational service), and other services including an online website. There are two large commercial terrestrial broadcasting organizations, Asia Television Ltd (ATV) and Television Broadcasts Ltd (TVB), each transmitting two television channels. These two organizations have been active in the production of Chinese serial dramas that are exported to countries wherever a large population of Chinese expatriates has settled. Additionally, all across Asia Hong Kong is known as the home of STAR TV, the satellite service providing programming to a wide swathe of East, Southeast, and South Asia.

South Korean newspapers include the main national dailies *Chosunilbo, Dongailbo,* and *Joonangilbo.* The Korean Broadcasting Service (KBS) is a public service broadcaster and is the largest radio and television organization in the South. KBS offers two television channels, the schedules of which revolve around primetime newscasts. There are also seven channels of radio programming. Two other large networks are commercial, private services.

In North Korea, there are two radio services available from Pyongyang that can be heard throughout the northern region. There are also three television channels provided by Korean Central Television, but these are only seen in the vicinity of Pyongyang. Other large cities have their own local channels. In North Korea, *Choson Sinbo* is the official daily in Korean and the companion *People's Korea* is published in English.

For purposes of this survey Mongolia will be addressed in this region, although it is sometimes considered to be located in Central Asia or even in what has been called "Inner Asia." This is a large land-locked country that is the most sparsely populated in the world. Mongolia's geographic expanse is about the same as Iran, but it has a population of only 2.8 million, less even than tiny Singapore. The main newspaper is the state-owned *Daily News* published in Mongolian. There is also an English language daily, the *Mongol Messenger.* The latter is part of a newspaper group operated by the official MONTSAME News ("evening urgent news") Agency that also includes publications in Russian and Chinese. This agency also produces the *MONTSAME News* daily. State broadcaster Mongolian Central Radio provides programming throughout the country, but its services have been largely eclipsed by numerous private and community stations. A similar situation prevails in television where National Central TV offers a government service, but private and local channels have gained in popularity.

Southeast Asia

The grouping of eleven nations within this region possibly represents the greatest diversity of social, economic, and political conditions within the entire continent. At one political pole is Brunei, one of the last absolute monarchies remaining in the world, and at the other is the communist government of the Laos People's Democratic Republic. Indonesia, which had long been governed by Suharto and his political allies, emerged from that era with a

uniquely comprehensive but complex democratic political system. There is also a pronounced disparity among the economic systems of the nations in this grouping. On the one hand, there is Timor-Leste (the former East Timor) with a per-capita GDP of about U.S. $800, and on the other there are Brunei and Singapore where personal incomes compare with the developed industrialized countries of Europe and North America. Diversity in the media structures and policies roughly parallels those of these political and economic indicators, with a number of countries having international quality media and press outlets, but others so restricted either by governments or by financial pressures that their publics cannot be properly served.

Singapore, Malaysia, and Thailand have attempted to establish themselves as regional media centers, especially in response to new technologies. As satellite television and the Internet have become important, these nations have sought to encourage local media to carve out special niches for themselves and to compete across the whole of Asia for readers, listeners, and viewers. This was an important aim of Malaysia's Multimedia Super Corridor, an expansive multidimensional effort to project the nation's information and communication technology firms into a global leadership role.

Among print media, a number of daily newspapers stand out as quality publications. From Manila, the *Philippine Daily Inquirer* has the largest national circulation of about 250,000. Other Philippine newspapers include the *Manila Bulletin* and *Manila Times*. In Thailand, English language newspapers *The Nation* and *Bangkok Post* enjoy readership among expatriates and the intellectual community but Thai language newspapers have much larger circulation figures. The journalistic work of *Kompas* and *Tempo,* among others in Indonesia, has been cited as deserving recognition. Both of these magazines faced pressure by authorities over their coverage of stories during the Suharto era and over subsequent political events. Indonesia presents a special difficulty to news professionals because of the lack of a mature and reliable court system. Media called to answer for their news coverage cannot depend on a fair hearing from the judicial system, and this has often reinforced a tendency for self-censorship. Two newspapers, Singapore's *Straits Times* and Malaysia's *New Straits Times,* present an interesting history. The *Straits Times* was founded in 1845 and throughout the colonial period was the newspaper of record for Malaysia. A regional edition of this newspaper in Kuala Lumpur became the *New Straits Times* in 1965 following the split of Singapore from Malaysia in that year. These two can now be considered "semi-official" newspapers, as each is tightly connected to the dominant political party in their respective countries.

Southeast Asia's broadcast media have traditionally been operated by government organizations, either directly as a branch of government or as a state supervised public agency. The sole exception has been the Philippines, which followed the private commercial model established during American colonization (1898–1946). State media's power has been drastically reduced by technologies that emerged beginning in the early 1980s. Starting with video recorders, and then followed by satellite television and finally web-based Internet media, audiences for state broadcasters have shifted to alternative stations and channels.

South Asia

The nations of South Asia share a British colonial history, and this has afforded them certain similarities in their systems of education, jurisprudence, and governance. Many aspects of media also have drawn heavily from examples in Britain or from practices common during the colonial period. The British Raj, that is, colonial British India, encompassed what are now Pakistan, Bangladesh, and contemporary India, while Nepal, Sri Lanka, Maldives, and Bhutan were separate British territories. Naturally, in many respects the subregion is overshadowed by India, where the population approaches 1.2 billion (Indian journalism is addressed elsewhere).

Radio was the dominant broadcast medium across the subregion until the 1980s and had the greatest influence on the masses because lagging literacy prevented much of the population from making use of print media. Radio services were loosely modeled on the BBC during colonial times, and thus carried some of its high professional standards. Radio Ceylon, for instance, offered an extremely popular service from the earliest days of radio. Its broadcasts were on high powered transmitters that could be received from the Philippines to Iran. All India Radio had been the official radio broadcasting voice of British India, and it grew to

become one of the largest broadcasting organizations in Asia by the time of independence in 1947. This broadcaster served as a foundation for the Pakistan Broadcasting Corporation that inherited its radio services after partition. It was also somewhat a model for Bangladesh Betar (radio) after East and West Pakistan separated in 1971.

Television services grew slowly in South Asia, and only by the middle of the 1980s did it become a significant factor in any of the nation's media. The establishment of Pakistan Television, Sri Lanka Rupavahini, and other national television services in the region produced a large growth in audiences. However, by the 1990s satellite television channels became available, and cable services sprang up everywhere to receive their signals from space and to deliver them to audiences. Across South Asia, a similar pattern prevailed—audiences for television exploded and a growth in channels followed, eventually spurred on by the development of popular satellite channels in national languages all across the region.

Even though Pakistan has languished under military rule for much of its 60 years since independence, it has developed a lively and increasingly independent media scene. Although much smaller in geography and population than India, it is nevertheless a large country of 160 million residents. A favorable business climate since 2000 has made it possible for many private channels to start operations, mostly via satellite relays. The state broadcasters are Pakistan Broadcasting Corporation (radio) and Pakistan Television (PTV). PTV offers several channels both by terrestrial and satellite transmissions and is the official voice of government. Private channels have larger audiences, especially Geo TV, and they carry news that is largely free from interference by authorities. Many Pakistanis have access to Indian TV channels that present news in Hindi and English and are easily understood by most viewers. Outside the country, the best known Pakistani newspaper is *Dawn,* which has the largest circulation of any English language daily. However, its circulation is tiny in comparison to the *Jang Daily,* which claims 1.2 million readers each day.

Central Asia

The five countries of this subregion—Uzbekistan, Kyrgyzstan, Kazakhstan, Tajikistan, and Turkmenistan—were all incorporated as republics into the Soviet Union until independence came in 1991. The sudden collapse of the Soviet Union presented a huge challenge to these societies because there was no opportunity to manage a smooth transition to independence. These countries lurched from their status as a remote region of the vast Soviet nation to a group of societies cast away to determine their own destiny. On top of this, an immediate cause of the dissolution of the Soviet Union—a failing economy—was left for the inheritors to correct and resolve.

For media in all the Central Asian republics, the fundamental problem after independence was reform; organizations were poorly adapted to a post-Soviet reality. Workers had been trained in Marxist-Leninist principles in which journalists were expected to function as propagandists, in the special communistic ideological sense. In such a role, the purpose of news was not one of disseminating information, but to move publics toward party goals. Consequently, under these principles news priorities were entirely different. For example, timeliness of reports was of secondary importance; stories sometimes took days to pass through complex editorial review channels. Furthermore, media organizations had become highly bureaucratic; they were bound in red tape and rigid rules.

In the years immediately following 1991 there was little change in the large dominant media organizations; they carried on in much the same manner as they had before. The real changes occurred in the private stations that sprang up where they were allowed. For example, in the Kyrgyz Republic private commercial radio operations began services by 1994, and their programs contrasted greatly with sleepy state programming, although news was not an important feature in their schedules. Indeed, among the five republics, only one—Kyrgyzstan—has offered support for development of comparatively free and open media. Soon after independence, three private radio "stations" emerged in Bishkek, Kyrgyzstan's capital, but all were forced to share hours each day on a single FM transmitter supplied by the government.

In Kazakhstan, private media are reasonably well developed in the republic, and a vigorous competitive media environment has emerged, especially in the capital, Almaty. Although subject to restrictions and considerable informal pressure

from officials, independent media have become well established there. Media in Uzbekistan are among the most restricted in all of Central Asia. Tashkent is the largest city and serves as the capital not only of Uzbekistan but, unofficially, the entire region. While private media are allowed, they are not in any sense independent of government, which keeps its watchful eye on all outlets. In Tajikistan, a protracted civil war at independence produced conditions unfavorable to development of quality journalism. Many journalists were killed during that conflict, either in covering stories or by assassination, and media still remain under that shadow. Nevertheless, several fledgling media corporations have arisen, though their journalistic practices are hampered by government restriction and a lack of training. In Turkmenistan, genuine independent media have not been allowed to start operation. This country has the smallest population of the five republics, and its economy is poorly developed. The Committee for Protection of Journalists rates Turkmenistan among the five most censored nations.

Journalism and Asian Values

Asia has been the site of a philosophical debate about the proper role of journalism in society, centering on journalists' relationship to government authorities and on the regulation of news media content. This argument arises from the proposition that in Asia there are unique cultural values that bind people of the region together, and these values dictate that journalists respect and yield to the authority of political leaders. The values most often cited as fundamental to Asian societies have been a strong attachment to families and to patriarchal family structures, social harmony, and an extension of these principles into the workplace. These "Asian values" are nevertheless fragile and can be overwhelmed by inauthentic foreign—that is, Western—values. Censoring of media content is the solution most often proposed to counter foreign challenges. This "Asian" way of media supervision has had both critics and defenders.

Critics of the Asian values thesis point out that key cultural values such as family orientation and group harmony are definitely not unique to the Asian setting and can be found to some extent across the globe. Moreover, they argue, it seems unlikely that a single set of values exists uniformly in countries from the Pacific to the Mediterranean. Indeed, research has shown that among certain countries of Asia, differences in core cultural values are very large. Many observers criticized the Asian values thesis on the grounds that it was merely used as a justification for authoritarian political control of media and information within nations of Asia.

Nevertheless, content control of media has been institutionalized across the Asian region. Of course, how the process works differs greatly from country to country. In socialist countries such as Vietnam, Laos, and China, content is controlled within media organizations, because all of them are state enterprises. In other countries there may be no formal provision for reviewing content before publication or broadcast, but guidelines for content are sometimes spelled out. When guidelines are available, they typically are broad and open to various interpretations.

In other cases there may be no formal guidelines. But even in these situations journalists develop a notion of the boundaries imposed on their work. This tends to shift responsibility for meeting content requirements to journalists themselves. The vagueness of rules forces journalists to approach subjects with utmost conservatism, since a sanction by officials over their coverage can wreck a career. Self-censorship is commonly practiced throughout the region as a consequence. Studies have shown that Asian journalists tend to impose on themselves more strict rules than they would have to face if content regulations were more clearly spelled out and directly enforced by government authorities.

Community Media

The lives of most Asians are circumscribed by geographically and culturally defined communities. The costs and difficulty of travel, language and physical barriers, and related factors narrowly focus the lives of the majority of residents on their own localities. These factors, plus the fact that the cost of building grassroots media has declined sharply thanks to technological advances, have produced an explosion of community journalism in many places. The trend has been especially pronounced in countries that have experienced strong

increases in educational levels. In countries that have permitted them, these community outlets have become an important part of the mix of media available to the public.

Indonesia, Thailand, and Nepal, to name just three, have experienced a large expansion in community radio. In these countries, low-power radio transmitters together with simple production setups provide local residents the capacity to create and broadcast content catering to localized issues and themes. Although programs tend to lack professional polish, they enjoy great popularity in many places because they provide relevant and up-to-date information of precisely the sort needed within somewhat insular communities. One researcher described how one small community radio station in Thailand collected and broadcast news on the latest market prices for locally grown fruit, information that no conventional radio station would bother providing. Another community radio station in the South of Thailand offered programs for the under-served Malay speakers of the region, a service not available on any official station.

The operation of community media is fraught with numerous problems, however. Most such outlets are purely volunteer projects, and so they seldom have full-time professional staff. Consequently, their operations tend to suffer from poor planning and coordination, and the information they broadcast may not always pass proper standards of journalism. Such shortcomings can lead, of course, to serious problems.

New Media and Online Journalism

A great many news organizations in Asia employ new media, particularly those utilizing online and streaming web services. Internet-focused organizations have substantially changed the nature of news reception in certain countries, even though access to the Internet is quite uneven. In some countries—for instance, Burma—Internet access is strictly regulated. In other nations, the costs inherent in using the Internet are prohibitively high, given low household incomes. Overall, access to the Internet totals only about 12 percent of Asian residents. It is important to stress that these conditions do not accurately characterize the entire continent. Nine of the countries having the largest number of Internet users are in Asia. In fact, Asia has more Internet users than any other region, a figure totaling almost a half a billion persons. (The comparable figure for North America is about half that of Asia.)

The boom in online journalism started when news organizations began placing some of their content on the web. At first, this was done as something of an afterthought, a kind of service for those who did not have direct access to print or broadcast editions. In Asia as elsewhere, for the major news outlets this practice soon developed into a range of full-blown distinctive services. Today, no major newspaper or broadcaster would think of operating without an online presence. In Asia, a major function of online journalism is to bring news from home countries to those who have moved overseas. For nations having large populations that have emigrated—China, India, Vietnam, Korea, among others—this enables official media to reach out to their expatriates who might otherwise lose contact with their home country.

Part of the explanation for growth in new media is in the burgeoning expansion of technology industries of East, South, and Southeast Asia. Much of the hardware used in new technologies originates from countries in these subregions. In particular, India, Taiwan, China, and Singapore have become home to well-established high-tech industrial centers, and national policies have fostered wide adoption of technologies in related fields—including the media—to support their technology firms' efforts to compete at the global level. The enormous popularity of mobile telephones is another potential way of disseminating news. India's Doordarshan television started a pilot service for cell phones in 2007, streaming eight different channels of content, including one all-news telecast.

Another factor that has apparently spurred growth in online journalism is that across the continent there are many barriers to the establishment of conventional news media free of government control. Because news websites can be located offshore, it is impossible for governments to restrict them at their source; the only means of blocking these websites is through restrictions at the receiving end. The technical requirements for blocking websites from users are such that only a few nations, China and Singapore, for example, are able to employ them. As a consequence, Asian online news outlets have sprung up that aim to

give voice to alternative political and social movements. In Singapore, Sintercom has been a news site that attempted to provide independent news reports, despite efforts by government to check its operation. This website's server, which was originally based in the United States, experimented with operation from Singapore. After a time in its home country it was moved out of the country to protect it from government rules meant to restrict its content. This news website has no print edition and is representative of online journalism sites that have been established to circumvent domestic media restrictions. A problem faced by many online newspapers like this is that they tend to be hosted by individuals who lack credentials as professional journalists; therefore, their news product may lack polish, and they may not even meet professional standards for accuracy, sourcing, and clear exposition.

How online newspapers in Asia can become profitable remains a question. For some, websites are merely cost centers and no revenue is expected, but for others, advertising must help defray the additional cost of the online operation. A few charge subscriber fees. *Malaysiakini* is an online Malaysian newspaper that must rely on subscriptions, as it has no print version and it must depend exclusively on revenues generated by its website. Unlike most other news sites, it is operated by professional journalists and it has earned many awards for the quality of its reporting.

Satellite News Media

Satellite television has significantly changed the practice of journalism across Asia. By satellite, television signals are distributed across vast sections of Asia, including many areas where no other access to the medium is possible. Rural portions of the continent can now receive programs that were once only available in major cities. New channels that sprang up beginning in the 1990s also provide an alternative to the heavily controlled media present in most of the region. Of course, satellite channels are independent of state control and therefore are able to carry alternative, even opposition news. This was possible because the point of origin could be moved out of the country and beyond the reach of domestic authorities. A few countries attempted to block these channels by outlawing or restricting satellite receiving setups, but most did not act quickly enough to make this strategy effective. In Indonesia, for instance, a domestic cottage industry grew up around the construction of homemade satellite receiving stations. By the time the government realized that thousands were receiving foreign signals by satellite it was too late to ban their use. Malaysia, on the other hand, did ban home satellite reception before any significant number had been placed in service. Even so, in time the number of clandestine receivers grew and so policymakers eventually were forced to change their approach. Their solution was to license Malaysia's own satellite television service, ASTRO, to accommodate public demand for more channels and for access to international programming.

Satellite Television Asian Region Limited (STAR) can be credited with pioneering satellite television in Asia. STAR began multichannel transmissions from Hong Kong at the end of 1991. Founded by a partnership of Hutchinson Wampoa of Hong Kong and its chairman Ka-Shing Li, STAR television gained a new partner when Rupert Murdoch's News Corporation purchased a 63.6 percent share of ownership in 1993. STAR audiences have showed consistent growth and after ten years of operation, the organization claimed an aggregate audience of about 300 million viewers, though the largest portion was in Chinese-speaking areas of Asia.

Many other broadcasters have tried to emulate STAR's success, generally by seeking more narrowly targeted audiences. In the more populous Asian nations all-news channels in the national language (or English in South Asia) have become influential information sources. Pakistan's Dawn News is one such channel, complementing its print edition with television coverage seen via satellite across the Indian subcontinent. A few satellite services have tried to reach a broader audience. Al Jazeera, based in Qatar, is a prominent example. After successes in the Middle East, it has opened an English news channel from Kuala Lumpur, Malaysia. Its programs are relayed by satellite across Asia and around the world. From nearby Singapore Channel NewsAsia, another MediaCorp holding, seeks to draw an audience with news coverage tailored specifically for Asian viewers. It offers news in English by satellite in two feeds—one just for Asian audiences and another for international viewers outside the region.

In summary, media in Asia have tended to benefit from high literacy and expanding economies across the continent. Together, the rises in wealth and ability to read have brought media within the reach of even the most humble households. This, together with economic reforms, has made possible a growth in numbers of private media outlets. Asia has also seen a dramatic spread of technologies such as the Internet and satellite media. As a consequence, Asian journalism is now characterized by an ongoing tension between political leaderships—long accustomed to strict control of the media—and the new media that are far less susceptible to restrictions.

Asian American News Media

Asian American journalism can be defined in two ways: through publications and electronic media that focus expressly on Asian American interests and issues, and through Asian American journalists who ply their craft in any medium. The importance of this subset of journalism is rising, due to the large Asian immigration influx that has taken place in the United States over recent decades. Prior to the 1965 Hart-Celler Act, a set of preferences based upon "national origins" established immigration quotas that blocked large numbers arriving from Asia. Under the new law, these restrictions were lifted for all Asian countries, and by the 1970s there were great increases in immigration from many parts of the continent.

Asians in America

Asian Americans are generally defined as persons who are descendants of immigrants or who are themselves immigrants from Asia, and who are also either citizens of the United States or are permanent residents. However, the term *Asian American* cloaks an enormous diversity in cultures, religions, and other aspects of social life that characterizes those who come from the Asian region. (Usually persons from the Middle East are not considered Asian Americans, even though this region is part of Asia.) Asia is the world's largest continent and its total population exceeds the rest of the world combined. Hence diversity stems from the huge span of immigration from the continent. Once, the stereotypical view of Asians as "all alike" was common, but this is clearly refuted by the vast differences in social traditions among different groups that make up Asian American communities.

The number of Asian Americans identified by the 2000 census was approximately 12 million, thus constituting a bit less than 5 percent of the total U.S. population. At about 4 million, Philippine Americans form the largest group, slightly larger than the 3.5 million Chinese Americans. Korean, Japanese, Vietnamese, and Indian descendants each number more than 1 million. Asian Americans tend to live near the West Coast, especially in California, or in Hawaii, and

the majority live in urban areas. The racial prejudices that gave rise to the earlier immigration barriers have become less obvious, though some have been outspoken in their criticism of persistent discrimination they have experienced as Asian Americans in journalism. For instance, in television news, about 21 percent of persons employed in the field are minority journalists, and the proportion shows little growth since 2000. Though in a recent year for which figures are available, most of the 1 percent annual growth in minority hiring was for Asian Americans, according to a 2005 Radio-Television News Directors Association study, across the nation only 1.9 percent of personnel working in TV newsrooms were Asian American. A higher proportion can be found on the two coasts and a lesser proportion in the Midwest United States.

Development

A growing number of Asian Americans have gained prominence in the news media, despite barriers that have been present. One of the most noteworthy is William Woo (1936–2006) who was the first Asian American to become editor of a major U.S. newspaper. He was named editor at the *St. Louis Post-Dispatch* in 1986 and served for ten years before joining the journalism faculty at Stanford. Three times he was a finalist for the Pulitzer Prize. Another leading journalist is Nancy Yoshihara, who has served in various reporting and editorial capacities for the *Los Angeles Times*. She won the Los Angeles Press Club award and the John Hancock award in 1989 for her editorial writing and with Stanley Karnow authored *Asian Americans in Transition* in 1992. For many Americans perhaps the most familiar Asian American journalist is Connie Chung (1946–), who briefly co-anchored the *CBS Evening News* and hosted *Eye to Eye with Connie Chung* until 1995. She co-anchored *20/20* from 1998 to 2002 on ABC. Chung was recipient of three Emmy awards for her television work.

Newspapers serving Asian Americans have been published since the mid-nineteenth century. In 1854, immigrants from China started publication of *Kim-Shan Jit San-Luk* (Golden Hills' News) in the San Francisco area. Before 1900 a number of other publications aimed at different communities had appeared. Because of the diverse nature of Asian Americans, media aimed at them tend to be segmented according to country of origin or language. For the smaller population groups, publications can be newsletters rather than broadsheets or tabloids, and some of these may appear irregularly. Newspapers for each of the major immigrant groups as well as many smaller immigrant nationalities can be found scattered across the United States. Most of these newspapers are published weekly, but some are dailies. Some examples: *Hokubei Mainichi* (North American Daily) is aimed at Japanese Americans. Published in San Francisco five times weekly and distributed mainly in northern California, it is a bilingual newspaper covering international and national news as well as regional and local stories. For the Korean American community the *Korea Daily* and *Korea Times* are dailies that are published in a number of cities across the country. *Asia Observer* is a weekly newspaper catering to an American South Asian readership published in New Jersey but distributed throughout North America. A news weekly with a circulation of about 20,000, *Nokor Thom* (Great Nation) is published in Long Beach for the Cambodian American community. It was once the largest daily published in Phnom Penh but moved to the United States after the Khmer Rouge takeover of Cambodia in the 1970s. The oldest Vietnamese language newspaper is *Nguoi Viet Daily News* (Vietnamese People Daily News) published since the mid-1970s in California. It was founded by Yen Do, who had been a war correspondent for American newspapers before Vietnamese reunification in 1975 when he immigrated to the United States. Today, the daily has a circulation of 17,000 and a staff of about 50. For readers from the Indian subcontinent, the leading publication is *India Abroad*. This weekly claims to be the largest and oldest of the South Asian American publications and has been in operation since 1970. It is available in paper and online versions. For Pakistani Americans, there is *Sada E Pakistan*, published in New York City with a circulation of about 30,000.

By the end of the 1960s, a new generation of Asian American publications emerged based less on a single ethnic identity and presenting a more pan-ethnic view. These publications frequently presented themselves as alternative voices for all

Asian Americans. The times were politically turbulent and many of these alternative publications had a strong political agenda. Many were short lived. Arising out of this period was *Amerasian Journal,* the most important scholarly publication for general Asian American subjects. Begun at Yale University in 1971, it is now published by UCLA. Its contents are devoted to serious scholarship on Asian American topics, especially on historical as well as current issues faced by Asian Americans.

Another such national newspaper, *AsianWeek,* is a weekly aimed at readers among all Asian American communities. *AsianWeek* bills itself as "The Voice of Asian America" and "the oldest and largest English language newspaper serving the Asian/Pacific Islander American community." Based in San Francisco, it attempts to offer a broad diet of news that would interest readers across the country, although there tends to be an emphasis on Bay area items. This tabloid was founded in 1979 and today enjoys a circulation of about 60,000. But *AsianWeek* has been embroiled in controversy due to its editorial policies. In 2007 editor Kenneth Eng authored several inflammatory columns including ones titled "Why I Hate Blacks" and "Proof that Whites Inherently Hate Us." Some Asian American groups reacted with outrage, calling for a repudiation of the column by the newspaper publisher. Editor-in-Chief Samson Wong answered critics with the statement that "*AsianWeek's* operation and editorial policy are based on a philosophy of diversity. This includes fighting to promote diversity of opinion in our own community and even to expose its disturbing warts." In March 2007, Wong was demoted to "Senior Editorial Consultant," apparently as a result of this incident.

Broadcast

Although the main news media for Asian communities are principally print publications, there are broadcast media aimed at them as well. One of the pioneers of Asian American broadcasting was Leo Chen, who has been dubbed the "Father of Chinese Television" in America. He used his own financial resources to purchase airtime for his program *Asia-Am TV* on San Francisco's KEMO-TV beginning in 1973. Chen was producer and newscaster in the weekly telecasts. In localities where large concentrations of Asian American populations have settled, it is common to find local radio broadcasts or television programs aimed at these communities. This trend matches a growing fragmentation of broadcast audiences everywhere in the United States. As more and more radio and television stations and cable channels have opened, they have been forced to appeal to ever narrower segments of the total audience in order to maintain their viability.

The San Francisco area has enjoyed a variety of Asian American media outlets because Asian Americans make up nearly a third of the population in the city. For instance, KSJX-AM in San Jose has a Vietnamese program containing local, national, and international news. A Cantonese language program is aired by KVTO-AM in San Francisco, also presenting a complete newscast of local as well as national and international news in Mandarin. One example (among several others) of an over-the-air television station that provides programming for Asian audiences is KTSF in Brisbane, California, which provides broadcasts available throughout the San Francisco Bay area. News is presented in a number of languages, including Mandarin, Filipino, and Japanese. A number of this station's newscasts are relayed from broadcasters in Asia such as NHK Japan. Some communities make use of public access channels on cable for local news programs aimed at Asian American groups. The advantage of these channels is that their use is free, or nearly so, and cable companies sometimes provide facilities and production support.

Another station operating from California is KVNR in Westminster, just south of Los Angeles in Orange County. Known as Little Saigon Radio, it is also retransmitted in San Jose for Bay Area residents. A third broadcast station is also part of this mini-network, KYND in Houston, Texas. The stations share programs and pick up additional programming from international broadcasters such as the BBC.

Online media have grown in importance as Internet access has become widespread among Asian Americans. Most websites for the Asian American community, though not all, are extensions of existing legacy media organizations. For instance, Little Saigon Radio provides additional services in Vietnamese via its website. For radio and television broadcasters, text based news and streaming audio or video are commonly offered,

and newspapers can maintain continuous news coverage through their websites. This is especially important for weeklies, as it allows a newspaper to maintain contact with its target readership between editions.

Community

In 1981 the Asian American Journalists Association (AAJA) was formed as a support organization for Asian Americans working in the media and to encourage Asian Americans to consider careers in the news field. At the time, Asians were practically invisible in the media. This organization has grown to become the predominant professional association for Asian Americans working in the media, and the membership numbers about 2,000 in twenty chapters across the United States. AAJA has four goals—providing training for Asian American and Pacific Islander journalists so that they can promote positive change in the news field; building relationships with Asian American and Pacific Islander communities; strengthening its chapters; and building financial resources. Another organization with similar aims is the South Asian Journalists Association (SAJA) formed in New York in 1994 and today claiming more than 1,000 members. According to the organization's officers, it is not a competitor to AAJA and many of its members belong to both. SAJA annually hosts a convention attended by more than 500 participants.

There has been little research into the media habits of Asian Americans, though the few studies that are publicly available suggest, not surprisingly, differences in consumption preferences among various communities. Overall, much as in the general U.S. population, Asian Americans tend to watch television, listen to radio, and read newspapers avidly. Research indicates that television is the medium most often used by Asian Americans, followed in order by newspapers, radio, and magazines. One study of school age children found that Asian American youth watched television at a rate slightly higher than their European American counterparts but their limited use of newspapers was similar.

For Asian Americans, media tend to serve broad functions: First, Asian American media help build and sustain a sense of community, without which many immigrants would simply be swept into the general population. Such media present their readers with a reassuring affirmation of their identity and cultural heritage. Second, for some Asians, media of all types provide a valuable means to acquire language proficiency. Immigrants frequently arrive with limited ability to use English, and so media, especially television, can provide daily lessons in conversational American speech. Finally, community media offer recent immigrants an opportunity to become acquainted with the everyday concerns and interests of Americans—in short, to serve as a tool of acculturation. In this sense, these media serve an important purpose not only for the community but for the larger society as well, helping provide a smooth induction for immigrants into the national mainstream.

Associated Press

The Associated Press (AP) is a not-for-profit news cooperative in which "members" of the cooperative are required to contribute and share news

with the AP for mutual benefit. The AP serves as a central clearinghouse for that contributed member news. It also reports, writes, and produces news of its own for its members. The AP serves approximately 1,500 U.S. daily newspaper members, who are the primary stakeholders in the cooperative and who, through an elected board of directors from member news organizations, oversee the AP's organization, policy, and strategy. It also serves 5,000 radio and television broadcasters in the United States.

The AP also serves news organizations in more than 120 countries in five languages, and delivers news in multiple media formats for newspapers, radio stations, television stations, and online and wireless services. In 2007, more than 4,000 employees staffed more than 240 AP bureaus in 97 countries, making AP's reach and news dominance nearly unparalleled.

News delivered by the AP is normally marked with the AP dateline or "AP bug": (AP). The dateline is an indication of the story's origin, such as "New York (AP)—." AP correspondent names are included with AP produced reports, but are not required to be included in member-produced media. Thus, much of AP's staff is unknown to the public, leaving the AP as one of the last media organizations mostly untouched by the impact of celebrity journalism.

AP's dominance, traditions of objectivity, and speed in news gathering are well documented. Particularly in the United States, AP is a leading agenda setter for news, creating daily digests or lists of "top news items" in each state and for the nation and world that news editors use to determine the day's top stories. Because so much of the AP news report contains member-contributed news and because the AP serves so many diverse news organizations, AP editors strive to produce an unbiased news report that reflects the multiple viewpoints each story might require and that would appeal to the most members. Through an elaborate network of computers and satellites that reach both its bureaus and the news organizations it serves, the AP is able to receive breaking news within moments and redistribute that news to the globe. Thus, the story on a plane crash in a remote section of the United States might be reported by a small local member newspaper, shared with the Associated Press and sent worldwide within minutes, and even seconds. Because of its reputation for speed and reliability, news organizations around the world are often known to confidently attribute news to AP, particularly breaking news, with phrases such as, "According to the Associated Press…," "The AP reports today…," or "This just in from the Associated Press. . . ."

Origins

The concept of cooperative news sharing did not originate with the AP, but the AP was among the first news organizations to perfect the idea. Prior to the 1840s, the flow of news between Europe and the United States and within the United States was subject to the ability to deliver news by foot, pony express and sailing ships. The sources of news came from other news publications, in addition to firsthand accounts of travelers from other regions. Beginning in 1840, Cunard (and soon other) steamships delivered passengers and European news to Boston and Halifax, and later to New York City. Representatives from the local U.S. coastal papers in these areas raced in smaller boats to meet those steamships, sometimes as far as 200 miles from shore, often engaging in bitter battles on the waters and devising tactics to outwit their competitors to meet the incoming steamships. The competition was particularly fierce and strenuous. Harry Blake, who gathered news in Boston for Boston's *New England Palladium* and the *Boston Courier* would often venture out in a boat "in darkness, storm and tempest," said historian Joseph Buckingham. He adds that Blake's rugged lifestyle led "to indulgences not justified by strict requirements of temperance" (Schwarzlose 1989, 13–14). The historical record is replete with fantastic tales of brave correspondents racing to meet the sources of news and then racing to deliver the information to various news outlets, often risking their lives in the process. The action-packed stories of correspondent news gathering at that time are tales that encouraged further interest in the speed of news delivery as well as interest in the romance and thrill of the profession itself.

Both the fierce and growing competition in news delivery and the arrival of the electric telegraph after 1844 led six competitive New York City newspapers to consider the benefits of news sharing, particularly political and business news

from overseas. The six New York City papers included: the *Courier & Enquirer,* the *Express,* the *Journal of Commerce,* the *Sun,* the *Herald,* and the *Tribune*. They first established a cooperative harbor news organization that coordinated news arriving from overseas. They also hired AP's first general agent, Alexander Jones (1802–63), who gathered that news and wrote a single one-to-two column daily news dispatch that was shared among the six papers. By 1851, Jones hired agents in Baltimore, Buffalo, New Orleans, Boston, Albany, Cincinnati, Norfolk, Montreal, and Toronto, and the AP was well on its way to establishing its reach and dominance in the United States. The AP model in New York would soon be copied by other regions and led to the formation of five other regional APs, including those in New England, New York State, Philadelphia, Baltimore, and the Southern AP.

For years, historians and the AP itself agreed that the first meeting of the six New York City papers was in the spring of 1848, in a meeting led by James Gordon Bennett, the flamboyant publisher of the *New York Herald*. But new evidence indicates that the discussions to form the cooperative may have taken place two years earlier, in 1846. Documents obtained in 2007 from the great-great-grandson of Moses Yale Beach (1800–68), the second owner-publisher of the original *New York Sun,* indicate that the sharing of news took place at Beach's urging, when the *Sun* agreed to share news it gathered from the U.S. war with Mexico with the other five papers. In an interview in the New York *World* of January 20, 1884, Moses Sperry Beach (1822–92) said the Mexican War "was the beginning of The Associated Press. It all grew out of this." Given the fierce competition and ego of the six founding members, it is not at all surprising that the date of AP's origin has been a source of considerable debate since its founding. Such member debates would be common throughout AP's history, as members made peace with the "necessary evil" of cooperating and sharing news with their competitors to make maximum use of the new technology and the demand for current news.

In 1851, the New York AP replaced General Manager Alexander Jones with Daniel Craig (1814–95), who had a long history of running pigeons carrying news from Halifax to U.S. East Coast destinations. Craig set out to expand the cooperative and became a shrewd negotiator with Western Union, primary operator of the telegraphic wires, working to secure the best rates for the cooperative. In doing so, and in securing control of news off the Cunard steamships, Craig began establishing AP's dominance over the flow of news.

AP's rise after 1860 was interrupted by the Civil War, leaving the cooperative and Craig mostly with only official dispatches. AP's news was heavily censored. Midwestern papers were particularly unsatisfied with AP's war coverage and placed their own agent in New York to gather more news independently. In March 1865, these papers formed the Western Associated Press, headquartered in Chicago, and emerged as a major power in cooperative news gathering. Their growing influence would later fuel a showdown with the New York AP toward the turn of the century.

AP's bylaws restricted its membership. Local newspapers with existing franchises retained their exclusivity to publish AP reports while competing papers were effectively denied access to those reports. This exclusivity opened up room for competitors, and in 1882, the United Press (UP) appeared, offering non-AP newspapers access to shared news and giving AP its first substantial competition. By this time, both the New York AP and Western AP were singularly managed from New York. To protect AP's dominance, AP general manager William Henry Smith (1833–96) covertly arranged with the UP to divide up the country. The AP and UP signed two trust agreements to limit competition between them in 1885 and 1887. Under the agreement, UP stock was sold to AP members in exchange for the delivery of AP news to UP members. When the secret stock pool arrangement was discovered by a new generation of Western AP members, the Western AP broke ties with the New York AP and formed a singular Associated Press in Illinois under the leadership of General Manager Melville Stone (1848–1929). Members of the New York AP joined what remained of the first United Press, but that organization folded in 1896. The new Associated Press, formed by the former Western AP members, created a singular national AP, removing all the regional AP structure and centralizing the operation. Historian Richard Schwarzlose wrote that the elimination of the regional AP structure created a

national dominance that placed an even stronger emphasis on local publisher rights to the AP report and greater protections for it than had existed under the New York AP.

Such dominance did not go unchallenged. Between 1888 and 1914, AP's bylaws were challenged in more than a dozen court cases around the country. Challengers claimed the AP's bylaws restrained trade and violated the 1890 Sherman Antitrust Act, with which Congress sought to prevent trusts from creating restraints on trade or commerce and reducing competition. The AP won nearly all these cases. The courts found that as a private business, the AP wasn't obligated to provide news service to all organizations seeking its service.

But in 1900, in *Inter-Ocean Publishing Co. v. AP* the Illinois Supreme Court disagreed. The court determined that because AP's business involved the telegraph and its news was "of vast importance to the public," it was a public utility with a public interest and could therefore be regulated. The court found that AP's bylaws restricted competition and created a monopoly. As a result of the *Inter-Ocean* decision, the AP moved its headquarters in 1900 from Chicago to New York, where a new corporation was formed, and the AP became a not-for-profit cooperative. The AP reworked its bylaws to address *Inter-Ocean* concerns, but the decision to exclude nonmembers remained. Excluding nonmembers from using the AP report was left up to the board of directors, and the board continued to exclude those that threatened the strength of its existing membership.

AP in the Twentieth Century

By the turn of the twentieth century, the AP had more than 900 newspaper members, and AP General Manager Melville Stone had firm control of the operation. But competition remained a great concern for Stone, and when publishers E. W. Scripps (1854–1926) and William Randolph Hearst (1863–1951) were unable to obtain AP memberships for their papers, they formed their own wire services. Scripps' new United Press (UP) was formed in 1897 and Hearst's International News Service (INS) began operation in 1909. Both were privately owned companies and proved to be significant competitors for the AP.

With increasing competition, AP's leadership grew increasingly protective of its report. In the late 1800s, news piracy grew rampant, a byproduct of the increasingly competitive nature of the news business. The AP was particularly vulnerable. Historian Barbara Cloud's research indicates that one-half of the news distributed by other news agencies during the latter half of the nineteenth century was stolen from the AP.

General Manager Stone set out to protect AP's news-gathering investment, but unsuccessfully lobbied Congress for a statute to protect "hot news" from theft. When INS began pilfering AP dispatches from the front during World War I, the AP sued for misappropriation, and the case ultimately reached the U.S. Supreme Court. In *INS v. AP,* the Court ruled for the AP and established a limited property right in news that lasted as long as the "hot news" had value. This common law right gave AP—as well as other news organizations—an additional weapon from which to protect its product from competitors.

The 1920s saw the end of Melville Stone's reign at the AP and the beginning of Kent Cooper's (1880–1965) leadership. Cooper, who was AP's chief of the traffic department and thus responsible for delivery of AP news, quickly rose to the top. While Stone is remembered as the modern AP's founder, Cooper is often credited with advancing AP's technology and guiding the cooperative through the golden age of newspaper journalism and the advent of broadcasting. Cooper began the practice of adding bylines to AP stories, eliminating the anonymity of those who produced the report, and he expanded the report by adding human interest stories and expanding other features, such as sports and entertainment. He oversaw the transition from telegraphy to Teletype that moved AP copy at 60 words per minute in 1933, and he helped to support development of technology to move photos by wire in 1935.

Despite lawsuits and fierce competition, AP's dominance continued, and the AP board maintained the right to refuse memberships to those who sought them. The debate came to a head in 1942, when the *Chicago Tribune,* a longtime AP member, prevented the new *Chicago Sun* from obtaining AP membership. The government sued the AP for antitrust violations and this time, in a 1945 decision handed down by the Supreme

Court, the AP lost and was compelled to open up its membership. Writing for the district court, which ruled against the AP (and was upheld by the high court), Judge Learned Hand wrote that AP

> . . . serves one of the most vital of all general interests: the dissemination of news from as many different sources, and with as many different facets and colors as possible. That interest is closely akin to, if indeed it is not the same as, the interest protected by the First Amendment; it presupposes that right conclusions are more likely to be gathered out of a multitude of tongues than through any kind of authoritative selection. To many this is, and always will be, folly; but we have staked upon it our all. [111 U.S. 53, 55 (1884)]

Following the decision, AP membership was opened to all, and many more newspapers sought to join. Ironically, the Supreme Court's decision thus helped to boost AP's reach and dominance, forcing its competitors to combine, which in 1958, the UP and INS did. The new organization became United Press International, under the leadership of the Scripps organization, and strongly challenged AP's dominance.

The Supreme Court's decision also ended the debate about whether radio broadcasters would be permitted to join the cooperative. After several years of denying use of its report by radio stations, the AP formed a separate organization, the Press Association, Inc., in 1941, to deliver AP news to broadcasters. AP broadcasters eventually gained the title of "associate members" and became part of the AP in 1947. Today, broadcasters hold two seats on AP's board of directors, but the majority of seats—22—belong to newspaper members, and thus they continue to determine the cooperative's future.

In the latter part of the twentieth century, the corporate story of the AP was primarily one of technological change. In the 1960s, AP began to computerize its operations and move away from Teletype transmission. This began with the computerization of stock listings in 1962. By 1970, the AP began to transmit news by computer. Two years later AP introduced its high-speed computer service, "Datastream," with which news was delivered at 1,200 words a minute, up from 66 words a minute on the Teletype. Under the leadership of President Louis D. Boccardi (1938–), the AP began to rely on satellites for connecting AP bureaus and member news organizations in the 1980s.

AP also continued its dominance in news photography and transmission, pioneering much of the development of digital news photography. This began with the introduction of LaserPhoto in 1976, in which photos were laser-scanned for transmission, and with the first news electronic darkroom, in which computers not only delivered photos but also handled the tasks of a conventional darkroom. Color photos were first sent to members in 1982 and were first sent by satellite in 1987. In the 1990s, the AP introduced its LeafPicture Desks (AP's first electronic picture desk and the first time news photos were on computer) into member newsrooms, effectively forcing newspapers—many then still operating traditional film darkrooms—into the computer handling of news photography. It was a significant investment on AP's part, and AP bore the brunt of the cost and member grumbling about the change. But the move would keep newspaper members competitive amidst rapid technological changes in media.

By the late 1990s, the AP began experimenting with digital cameras and helped introduce digital equipment specifically designed for news photographers in the field. AP's early digital cameras were initially criticized as not quite ready for serious news photography. Photographers criticized the cameras' slow shutters, heavy weight, and short-lived batteries. But with later versions—and the emergence of the Internet—the plunge into digital photography was inevitable. By 2007, all AP photographers used high-end digital cameras.

Not surprisingly, the AP also made more significant investments in radio, television, and online transmission as the twenty-first century approached. In 1994, the AP launched a 24-hour radio news network, AP All News Radio, and also initiated AP Television (APTV), based in London. Later named Associated Press Television News (APTN), this video news operation quickly gained in popularity and challenged Reuters Television. By 2007, APTN had 550 international broadcast members and became a major supplier of international video to the world's leading news broadcast and cable operations.

Online Revolution

In 1996, the AP began a service for members with online news sites, and eventually made AP news available to online sites such as Yahoo! and AOL. This shift proved a sore point with many newspaper members, who felt their contributed news was offered to online operations which could then compete with their own content and without remuneration. As retired writer and former AP executive Walter Mears (1935–) described the dilemma for AP and its members, "it was a matter of getting on board or being rolled over." "The audience is shifting to digital, on-demand platforms," AP President Tom Curley (1948–) told some reluctant publishers in 2005. "Advertising is following the migrating eyeballs, and new distribution networks are requiring us to rethink how our content reaches the consumer" (Associated Press 2007).

Indeed, the state of the newspaper industry at the time was grim. According to the Project for Excellence in Journalism, newspaper revenues were flat and earnings fell in 2006. The price of newspaper stocks fell about 11 percent, after 20 percent declines the year before, precipitating layoffs, particularly at large metro dailies. AP, like many news organization at the time, was compelled to seek new revenue sources, mostly online, to adapt to the changing media landscape.

"The wire of the next century and a half," wrote Jim Kennedy (1953–), vice president and director of strategic planning for the Associated Press, "will be plugged into a database that will be able to deliver almost any kind of news experience, from text headlines to rich images and sounds" (Kennedy 2006, 57–58). Though born of newspapers and the telegraph, the AP of twenty-first century will emerge as far more of an online, multimedia product. With newspapers still the major stakeholders in the running of the cooperative, however, the challenge will be how willingly and quickly those print monoliths will respond to the growing importance of content provided online.

Key Stories Covered

During its more than 160 years of existence, the AP has reported some of the most critical moments in world history, and often has been the first to document their occurrence. It has 49 Pulitzer Prizes to its credit, including 30 for photography. It has lost more than 30 correspondents in the line of duty. Some of AP's notable stories include the following.

1863. AP stringer Joseph Ignatius Gilbert (1842–1924) is credited by historians with delivering the most accurate version of President Abraham Lincoln's remarks at the dedication of the cemetery in Gettysburg, Pennsylvania, November 19, 1863. Gilbert reportedly borrowed Lincoln's handwritten text, copied it word, for word, and used that for his story.

1906. Paul Cowles (1867–1935), chief of the AP San Francisco bureau delivered first word of the San Francisco earthquake that killed thousands by relaying a news bulletin via Honolulu.

1912. In cooperation with its members, the AP delivered precinct-by-precinct, county-by-county votes in the U.S. presidential race between President Woodrow Wilson and Republican Charles Evans Hughes.

1932. AP's Frank Jamieson (1904–60) won the Pulitzer Prize for coverage of the kidnapped infant son of aviation hero Charles Lindbergh. Lindbergh's son was missing for 11 weeks and eventually found dead in Hopewell, New Jersey.

1943. Hal Boyle (1911–74), war correspondent and often known as AP's first columnist, won a Pulitzer Prize for his stories from the North African and European war theaters during World War II. He began reporting the experiences of G.I.s at the front in 1943. After the war, Boyle filed stories with datelines from 66 countries on six continents, writing nearly 8,000 columns.

1945. AP war correspondent Joe Morton (1911–45) was executed by the Nazis along with nine American and four British officers. Morton is the only known journalist executed by the Axis powers during World War II. The same year, AP Paris bureau chief Edward Kennedy (1905–63) reported Germany's surrender in violation of an Allied Headquarters news blackout. Kennedy was dismissed by the AP. And AP photographer Joe Rosenthal (1911–2006) captured what has been described as the most reproduced photo of all-time: the raising of the flag on Iwo Jima. Rosenthal

won the Pulitzer Prize for the shot, and the picture was used worldwide. Initially, it was adopted in a war fund-raising campaign and a decade later was recreated in the Marine Corps War Memorial statue in Washington, D.C.

1950. AP photographer Frank Noel (1906–66) won a Pulitzer Prize for his photos of a POW camp in North Korea during the Korean War. Noel secretly took the photos as a POW himself.

1961–75. During the Vietnam War, the Associated Press established a major presence in Saigon, winning five Pulitzer Prizes for its war coverage. AP's Vietnam War correspondents, particularly Malcolm Browne (1931–), Peter Arnett (1934–), and George Esper (1932–), became familiar names at home. Several AP photos emerged as iconic images of the war including Browne's photo of a Buddhist monk who lit himself on fire in protest of the Vietnamese government, Eddie Adams' (1933–2004) photo of the execution of a Vietcong prisoner by Vietnamese soldiers, and the Nick Ut (1951–) photo of a young South Vietnamese girl running naked from a napalm attack. "They were very good, the men, and in time the women, of the [AP Saigon] bureau, both at the beginning and at the end," wrote David Halberstam (1934–2007), who was a colleague. "And gradually people realized how good they were, that they were as good as those legendary journalistic figures from the past who had covered previous wars and from whose shadow they had emerged, until they were casting their own shadows" (Associated Press 2007). Esper was among the last correspondents in Saigon when the capital was overrun by North Vietnamese troops in 1975.

1984. On March 16, AP chief Middle East correspondent Terry Anderson (1947–) was kidnapped by Islamic militants in Beirut. He was held captive for six years and eight months, the longest held journalist captive in the Middle East.

2000. The AP won its first Pulitzer Prize for investigative reporting. The story involved allegations of a massacre by U.S. troops of South Korean refugees under a railway bridge at No Gun Ri a half century earlier. Using the Freedom of Information Act and other investigative methods, a team of journalists led by AP's Charles J. Hanley (1947–) found evidence that as many as 300 were shot to death. In 2001, the U.S. Army issued a report that refuted key parts of the AP story. After the Pulitzer was awarded, one witness quoted in the story was found not to have been at No Gun Ri, raising more questions. Others did confirm the AP account, and most news media reviews of the series since its publication support the story, though there were continuing disputes about the number of casualties. In 2007, for example, AP uncovered evidence that the Army failed to release key documents in its 2001 investigation, and relatives of the No Gun Ri incident demanded a new investigation and an apology.

Conclusion

The Associated Press for more than 160 years has been a major contributor in the flow and distribution of news within the United States and throughout the world. Much of its business success can be attributed to three key factors: Its not-for-profit cooperative structure; its ability to adopt new technology for news delivery; and its global reach. The AP's cooperative structure requires member participation and sharing of news without the pressure of meeting public stockholder demands for profitability. As a result, the AP is able to invest in technology and personnel to deliver news ahead of other concerns, and in the various formats that its subscribers demand. With bureaus and correspondents around the globe, the AP is also able to deliver breaking news within minutes. In creating an organization with such tremendous stability, reach, and versatility, however, the AP has also harnessed significant power in setting the world's news agenda. Over the years, many have questioned AP's domination of the wire services and of the news in general.

The advent of Internet journalism and the rise of citizen media present challenges to that dominance and AP's future will depend on how it reacts to the changing media environment.

By the early 2000s, for example, a number of newspapers (including the large *Chicago Tribune* chain) announced plans to withdraw from AP membership (they must provide two years' notice) because of their own declining revenues and because of growing unhappiness with some of the

agency's practices that compete with its member papers (such as selling news to Google and other websites). AP held its membership fees flat from 2005 through 2008 in the face of this concern. Nonmember clients provide about three-quarters of the agency's revenue. But the message was clear—-even AP is being affected by the steady decline of American newspapers.

Atlanta

The financial and media capital of the American South, Atlanta has always found its formula for success through compromise. After the Civil War left it burned down to the red clay, this upcountry Georgia city reemerged, phoenix-like, by embracing a New South of industry and marketing. *The Atlanta Constitution* helped bring about a series of World's Fair–like expositions, such as the 1895 international expo that featured the "Atlanta Compromise" speech of black leader Booker T. Washington. Eventually, justice caught up with this attempted compromise on racial segregation, leading to the civil rights movement of the 1960s. New compromises over race were reached, led by the Chamber of Commerce, City Hall, and native son Martin Luther King Jr. This set the stage for untrammeled growth of the metropolitan area and a positive international image symbolized by Ted Turner's Cable News Network (CNN). In the twenty-first century, the challenge for Atlanta's news media was to recover some measure of civic influence after so much of civic culture had been compromised, in the negative sense, by the sprawl of this hustling city.

With a name coined in 1845 from the feminization of Western & Atlantic Railroad, Atlanta quickly evolved from a rail terminal to a major crossroad. City boosters touted Atlanta's ideal location. Temperate in its seasons and a good in-between spot for the eastern United States, Atlanta would become an airline hub with the busiest airport in the country, Hartsfield-Jackson Atlanta International Airport, named for two of the city's mayors. The city limits stopped growing in 1950 and its population peaked in the early 1970s just below half a million, with white flight leaving a black majority and black political control. But the 20-county Metropolitan Statistical Area was the fastest-growing metro area in the country by 2005, with 4,768,685 residents.

Early Development

Atlanta's earliest daily newspapers were *The Examiner* and *The Atlanta Intelligencer,* which both began in 1854 and were eventually merged because of financial difficulties. *The New Era* appeared immediately after the Civil War to defend "radical" Reconstruction against attacks in other Southern papers, and *The Atlanta Daily Herald* introduced New York–style sensationalism in 1872. But these and other Atlanta papers died and were buried in the historical dust left by the two dailies that ultimately survived: the *Constitution* and the *Journal.* Colonel Carey W. Styles launched *The Atlanta Constitution* on June 16, 1868, the name of the paper having been suggested to Styles by President Andrew Johnson in bitterness after losing his fights with Congress for a less harsh postwar Reconstruction. Other business partners and editors followed in quick succession. One of them, William A. Hemphill, brought in some of the best editors and writers on any newspaper in the country for that period. Among these were lawyer-editor Evan P. Howell, poet-columnist Frank L. Stanton, folklorist Joel Chandler Harris, and New South orator-editor Henry W. Grady. Howell's son Clark Howell and grandson Clark Howell Jr. became *Constitution* editors and part owners, keeping the newspaper in that family for 70 years. Joel Chandler Harris, who as a boy had been a print-shop apprentice on a Georgia plantation during the Civil War, became one of the most popular writers in America with his Uncle Remus and Br'r Rabbit tales.

Grady was the boy-wonder of the Southern press. He had already edited and partly owned several Georgia newspapers when he joined the *Constitution* in 1876, at age 26. Even while writing for and managing the *Constitution,* he was a popular speaker and an aggressive stringer for *The New York Herald* and other non-Southern newspapers. He was one of the pioneers of the journalistic interview (following Horace Greeley's example) and made a historic turn away from the region's long tradition of personal and partisan journalism. Declining an invitation by Atlanta leaders to run for Congress, Grady declared, "[J]ournalism is a jealous profession, and demands the fullest allegiance of those who seek its honors or its emoluments." As a stringer for distant newspapers, he scooped the national press on such major stories as the voter fraud in Florida in the Tilden-Hayes presidential election of 1876 and the devastation of Charleston, South Carolina, by an earthquake on August 31, 1886. At the celebrated dinner in New York where he delivered his powerful "New South" oration later that year, he assured his elite business-minded audience that the South was working on the race problem "in honor and equity" and had "put business before politics." Grady spoke publicly for the South, but behind the scenes he always worked for the special advancement of his "brave and beautiful city," Atlanta. When he died at 39, of pneumonia aggravated by a tiring trip to Boston in December for a speech, Grady was eulogized as the South's greatest editor and first post–Civil War visionary.

The *Evening Journal* was first published on February 23, 1883, by Confederate veteran E. F. Hoge. It flourished under other owners and editors, including Hoke Smith, a lawyer who sold the paper in 1900 and would later become governor. The *Journal* started the first women's page in the South in 1887, gave unprecedented coverage to sporting events starting in 1901, and launched the region's first enduring Sunday supplement in 1912. The Sunday *Journal* magazine's first editor, Angus Perkerson, trained staff writers from Margaret Mitchell (*Gone with the Wind,* 1936) to Olive Ann Burns (*Cold Sassy Tree,* 1984). In December 1939, the *Journal* was bought by former Ohio Governor James M. Cox, owner of several Ohio newspapers and the unsuccessful Democratic candidate for President in 1920. This also gave him control of the broadcasting affiliate WSB (the station call letters standing for "Welcome South, Brother"), which started the South's first radio station in 1922 and would launch the region's first television station in September 1948. Cox also bought and shut down the daily *Atlanta Georgian,* and in 1950, bought his only other Atlanta rival, the *Constitution.* The two papers, under the private Cox chain, together moved into a new nine-story downtown building in 1972 and merged newsrooms in 1982.

A Changing Media Landscape

Thus ended the last serious newspaper competition in Atlanta. In 2001, the *Journal* was shut down,

leaving a combined morning *Atlanta Journal-Constitution* (AJC) as the only daily paper for the wider metro area. But this "monopoly" staggered from the many hits of postmodern media competition: direct-mail advertising, hyper-local suburban papers, public cynicism or indifference, free Internet classified ads and news, and most of all, the time rush of consumers snarled in traffic or plugged into the latest telecommunication product. The AJC's paid circulation dropped steadily, despite metro growth, to 357,399 on weekdays and 523,687 on Sundays (by early 2007), down from a peak of 508,169 daily and 719,047 Sunday (in 1990 and 1994, respectively). Its popular online website, ajc.com, was free to readers. For broadcasters, metro Atlanta was the ninth largest market in the United States, but competition for time and market share was fierce among the 13 television stations, 91 radio stations, and many cable and satellite offerings across a territory 185 miles wide.

Starting in the mid-1950s, *Newsweek* and *Time* established bureaus in Atlanta to cover the growing civil rights story in the South, and national newspapers soon followed suit. Atlanta was also the base from which the national news media covered the story of economic growth across the South. In time, it became a center for national and international 24-hour cable stations such as the Weather Channel and Ted Turner's array of news and entertainment channels. Turner, starting with a billboard company inherited from his father in the 1960s, repeatedly shattered conventions of the media business with his impish self-confidence. He changed a dying UHF TV station into a satellite-beamed "Superstation" that broadcast the Atlanta Braves, which he bought in 1976. He launched the world's first round-the-clock television news, CNN, in 1980. He bought MGM's studios and film library to provide content for his Turner Classic Movies channel. With other startups such as the Cartoon Network, Turner Network Television, and a Southern-sports channel, Turner's Atlanta-based enterprises merged with Time Warner in 1996.

Atlanta's black population, strengthened by a professional middle-class and the city's complex of five historically black colleges and universities, presented a complicated dynamic for the local press. Conservative black owners of *The Atlanta Daily World*, the only black daily in the country to survive between 1932 and 1956, trained many black journalists but struggled financially. Far more influential during the civil rights era of the 1960s were the *Constitution*'s then-publisher Ralph McGill and editor Gene Patterson, each writing daily columns arguing for decency and justice in race relations. Their columns on civil rights were often lyrical, always moral, and instinctively aimed at fellow white Southerners. Both writers worried about getting too far "ahead" of their white readers—or, despite winning Pulitzer Prizes, their corporate bosses. McGill was so worried about this, he held on to a secret offer to write public relations for Coca-Cola should he need another job.

Such uneasiness between Cox corporate management and other talented journalists at the *Journal* and *Constitution* was common. Pay scales were for years well below those of other large metro papers, and the company dealt harshly with staff efforts to organize strong unions. Investigative reporters who won Pulitzer Prizes in 1948 and 1960 at the *Journal* and *Constitution,* respectively, had not been nominated by the papers' managements. Gene Patterson left in a fight with management in 1968, and editor Bill Kovach did the same in 1988. Editorial resources became far more robust starting in the 1980s, but the slow growth, then fall, of circulation forced continual rethinking of the "product." In 2007, employee buy-outs and attrition cut 70 veteran journalists, about 14 percent of the editorial staff, and the news operation was reorganized to reflect a fundamental break with the past. "Digital" and "print" became separate units, and "content-providers" (writers, editors, photographers, and artists) separate from either. With short, 24-hour news updates diverted to online ajc.com, the newspaper was to be a better-written, more local, more aggressive publication for a smaller group of older readers. But even this was sure to change again, for everything changes in Atlanta.

New money, new high-rise buildings, and the accelerating pace of mobile technology made Atlanta the most energized city in the Southeast for new and old media alike. A highly competitive market for advertising dollars and audience put every local medium into play—cable and broadcast

television, radio, the Internet, and newspapers. How to make money from news in such a sprawling, too-busy city became increasingly problematic, but the trend in Atlanta around the turn of the current century was toward hyper-local coverage and a diversity of voices.

Audience

Three important generalizations can be made about the collective entity known as "the audience." First, in journalism, the audience is *sine qua non*: the audience is king. Second, despite its primacy, the defining characteristic of the mass media audience is its uncertainty, unpredictability, and "unknowability"; indeed, the very notion of "the audience" is elastic. Third, in contemporary journalism, the audience is changing at a pace surpassing that of any prior era, as the number of competitors for audience attention has proliferated.

To say that the audience is king begs an extraordinarily important question: In what sense is this true? Is it because democratic theory presumes that the rationale for a free press is informing the public so that it may make reasoned civic judgments? While journalists' sense of their *relationship* with their readers, viewers, and listeners most often conforms to a public service ideal of informing the audience and serving the "watchdog" function as a check on powerful institutions (most especially government), that sense of social responsibility increasingly is not shared by media owners and managers. For example, declines in audience size are used to justify the pruning of news staffs. Is the audience king because it directly or indirectly provides the economic support sustaining news media? In most of the world, the economic basis for news media is advertiser support, coupled, for print media, with subscription or circulation support. Thus news media attract audiences to collect revenue either directly from subscriptions or indirectly from advertisers' payments to reach the eyes and ears of that audience.

Origins

The concept of the audience is as old as theorizing about communication; indeed, Aristotle's rhetoric with its emphasis on the *pathos* or impact on the intended audience, was a first effort at establishing its primacy in the West. But the audience for mass media in general and journalism in particular is at great remove from the living, breathing, present and public audience of ancient Greece. For much of human history, "the audience" was aural, and the word itself derives from the Latin *audire,* to hear. Assembled audiences were necessarily ephemeral, active, and interactive.

While such audiences continue to exist, the dominant characterization of audience was shaped first by the technology of writing, amplified by that of printing, and then transformed by newer technologies of electronic communication.

Writing and then printing fundamentally altered the nature of communication, from being spontaneous and transitory to being fixed; the nature of the communicative relationship from taking place solely between speakers and listeners to also involving writers and readers; and the nature of modes of reception from essentially public and social to *primarily* private and individual. As part of that process, the relationship between message producer and receiver changes fundamentally. The audience becomes separated in time and space from the producer; it is literally anonymous and unknown to that producer (and much of the time, elements of the audience are likewise unknown to each other), and whatever feedback is available to the producer is delayed, fragmentary, and, in the modern era, industrialized and institutionalized, through, for example, audience research.

Moreover, the emergence of the true mass audience in the nineteenth century with the advent of the penny press is accompanied by the emergence of mass marketing and advertising, by the coming of industrialization, urbanization, commercialization, and modernism. The development of modern mass media up to the age of television gives rise to a very media-centric desire to "know the audience," to build it as a commercial base, and to regulate its attention; at the same time, critics of media performance domestically and from other normative systems of regulation press for attention to the audience's needs and rights. More recently, economic and technological changes have led to the fragmentation of news and other mass media audiences, giving rise to other urgent concerns over maintaining existing audiences and meeting the needs of new ones. Critical here is the idea that, especially compared with the "classical" audience, the mass media audience cannot be "known" in any way: predictions about what an audience will want, will buy, and will read can be made with varying degrees of accuracy, and assessments of what media sources that audience has liked, been moved by, or learned from are likewise murky.

Theorizing about the mass media audience generally begins with the proposition that a defining characteristic of such media is that the "actual" audience is remote, atomized (members are physically separated and unknown to each other), and unknown to the mass communicator, and feedback from that audience is slight, partial, and structured.

In discussing the mass media audience, its existence as an ineffable and remote abstraction is usually taken as its defining characteristic. Media theorist Martin Allor has noted that "the audience" really exists only as an analytic construct and doesn't inhabit any real space. Put slightly more concretely, we can think of the audience in any number of ways—as a *market,* as a *public,* or as *fans,* for example—and we may likewise distinguish between thinking of the audience from an "audience-centered" and a "media-centered" point of view. The former would explore such goals as meeting responsibilities to serve the audience, evaluating press performance from an audience point of view, or exploring contexts of media use. The latter would include measuring audience composition and reach for advertising and marketing reasons, predicting and managing audience choice behaviors, or indexing methods of reaching new audiences. And finally, again cross-cutting prior categories, we may approach the audience *empirically* (how can we describe, define, measure, or predict it?) and *normatively* (how should it be served?). Media sociologist Denis McQuail has noted:

> An audience can…thus be defined in different and overlapping ways: by *place* (as in the case of local media); by *people* (as when a medium is characterized by an appeal to a certain age group, gender, political belief or income category); by the particular type of *medium* or *channel* involved (technology and organization combined); by the *content* of its messages (genres, subject matter, styles); by *time* (as when one speaks of the "daytime" or "primetime" audience, or an audience that is fleeting and short term compared with one that endures).

Further, citing Virginia Nightingale (2003), McQuail notes a more audience-centric typology of (a) *audience as "the people assembled,"* focusing attention on the aggregation of spectators or readers of a given performance or product; (b) *audience as "the people addressed,"* referring to the imagined characteristics—including wants, needs, capacities, and perhaps weaknesses of an audience—sometimes called the "inscribed," "interpellated," or

imagined audience; (c) *audience as "happening,"* focusing on the experience of reception of an audience member alone or in the company of others; and (d) *audience as "hearing" or "audition,"* focusing attention on the participatory audience experience; this notion has particular relevance for newer interactive forms of online journalism.

The Journalists' Audience

As noted earlier, journalists frequently cite service to the audience as primary values; the most respected survey of U.S. journalists, repeated about every ten years over the past three decades, *The American Journalist in the 21st Century,* has consistently found journalists' agreeing most uniformly to two value propositions—that journalism's primary responsibilities are to *investigate government claims* and to *get information to the public quickly*. Both value statements adhere to the venerable notion of the "public's right to know" and the journalists' insistence that theirs is a public service craft or profession. They believe, in short, that the audience and the public are one and the same.

At the same time, a recurrent theme in journalism studies is that journalists' "imagined audiences" are at best hazy. A classic study of BBC journalists argued that, lacking any concrete evidence about audience composition, interests, and tastes, communicators relied on a paternalistic set of professional attitudes about what sorts of programming audiences *needed*. Herbert Gans's (1979) observation of elite journalists at national newsmagazines and network evening newscasts found both that they paid scant attention to, and showed decided lack of interest in, the business and financial side of their firms and that they were likewise uninterested in their audiences, about which they knew next to nothing. (Famously, television newsmen with whom he talked had no idea that half their audiences were age 60 or older.) Gans noted that these journalists, lacking concern for what audiences learned from their news or what coverage they cared about, were themselves unconcerned, since their "interpellated audiences" were their colleagues and superiors in the newsroom and their competitive peers. Other research on journalists' notions of their audience in the 1980s and 1990s confirmed that their ideas about its composition and taste were frequently drawn from relatively rare examples of feedback—which they frequently acknowledge as being unrepresentative—and from encounters with friends and family. Such imagined audiences led journalists to invoke both professional norms and "rules of thumb" for production practices that may diverge significantly from empirical reality.

Radical changes affecting newsrooms in the past 15 years, including far more widely diffused readership and market research, have changed matters. Most journalists today have at least passing knowledge of the basic demographics of their audience, and increasingly managers call attention to the most popular items from daily newspaper and television websites as measured by page views and most popular emailed and blogged items. We return to this conflict below.

Other Imagined Audiences

The idea that what one believes about the audience is of great importance is significant not just for journalists and other mass communicators but also for regulators and for the audience itself. In an intriguing argument, researchers James Webster and Patricia Phalen have argued that the imagined audience that Federal Communications Commissioners invoke in governing broadcast media makes a great difference in the sorts of regulations they enact. When approaching the "audience as victim"—that is, that broadcasters have the capacity to harm the audience, particularly the most vulnerable segments within it such as children—regulation is likely to be punitive and proscriptive: Punishing indecency is a prominent example, but the commission may under this model also promote regulation if it believes licensees are not living up to public service ideals. However, since the 1990s, commissioners have concurrently, but far more often, invoked a "marketplace" or "consumer" model which assumes audience members are able to make rational, informed program choices; it enacts laissez-faire regulations or deregulates to "let the market decide" what sort of content is available. Finally, the FCC may instead invoke a "commodity" model which wholly depersonalizes the audience and treats it as a "coin of exchange" to be bought, sold, or bartered; in this mode, the FCC considers only whether competitors are fairly buying and selling the economic

commodity value the audience represents. A second stream of inquiry under the general notion of "third person effects" argues that a principal way that media, and especially news media, influence the audience is indirectly: A message may not be seen by individuals as having any influence on them personally (a "first-person" effect), or on others seen to be like them (friends, family, and others in a comparable social group; a "second-person" effect). The message may have a profound indirect effect if an audience believes *other* "third persons" are somehow likely to be influenced by the message. Unsubstantiated rumors on a political website might have impact on us, for example, not because the reader believes them but because he or she believes that politically less sophisticated persons would.

The Audience as Aggregate

If the audience is "the people assembled," we can give attention to measuring the size and scope and characteristics of any audience, and audience research does just this. Although entries in this section note declines in the audience for "mass news" on network television and in daily newspapers, the aggregated audiences for media delivering news are huge, and the introduction of new media capable of delivering news continues to make them so. Data and estimates from the Census Bureau's *Statistical Abstract of the United States 2008* showed total annual use of all media growing from 3,543 hours per year in 2005 (about 9.7 hours per day) to an estimated 3,620 hours (9.9 hours per day) in 2010. Clearly not all this media use involves news and information, but the data bring into vivid relief the idea that media use in general occupies more time than any waking activity: an "average" person working 40 hours per week, 50 weeks per year would spend almost one and a half times as much time attending to media. However, just 184 of 2007's 3,620 hours of media attention went to newspapers, a number expected to drop to 165 hours by 2010. Data from other census tables show, too, that aggregate news and media use varies by demographic categories as well. For example, age is related to use of most media, with younger persons slightly less likely to use television and much less likely to use newspapers, and the oldest age cohorts somewhat less likely to listen to radio and much less likely to access the Internet; gender is only very modestly related to attention to television, cable, radio, newspaper, or Internet use. Likewise, education is unrelated to television viewership but less-well-educated individuals are less likely to view cable television or listen to radio and considerably less likely to read newspapers or use the web, a pattern consistent with income distributions as well.

Audience as Market

Much of the news media's concern with audience is understandably economic: in the United States and much of the rest of the world, the audience contributes directly to the support of newspapers, newsmagazines, and other print media through subscriptions and direct purchases and indirectly to these media as well as to broadcast and cable media and Internet sites through advertising sales. Advertising billings to all media in 2008 were estimated at $285 billion, with just over half of that going to media, including the Internet, that carry journalistic content. The audience in virtually every respect is pivotal to the continuing existence of commercial media, and a number of media critics have noted that even noncommercial media must cater to audience wants and desires in ways almost identical to their commercial counterparts, in order to convince corporate and governmental sponsors of their public worth.

Meeting audience wants is in and of itself no criticism of journalism; where journalists become concerned is when (a) catering to audience desires becomes the exclusive concern of a newspaper, magazine, or newscast and (b) where the *arbiters* of audience wishes are not themselves journalists. While ploys to attract, retain, and expand the audience date at least to the nineteenth century, the fragmentation of the news audience, as more news outlets scatter that audience into smaller fractions, coupled with increasing attention by corporate owners to the bottom line, has led to new tactics of attracting audiences, from the development of "infotainment" programming to increased sensationalizing of the news (particularly with regard to crime stories), use of fear-laden teasers, and increasing prevalence of "soft news"—all frequently at the urging of managers and owners unsteeped in the craft of journalism. Here is a conflict of *audience*

values between the business of journalism and its professional counterpart. If Allor is correct that the audience is no more than a rhetorical device to stake out different sorts of claims, there is a clash between the audience as *market* and the audience as *public.*

The Audience as Public

In their examination of a journalism undergoing a critical reexamination of itself in the face of economic, political, technological, and existential challenges, journalistic researchers Bill Kovach and Tom Rosensteil have offered up a series of prescriptions of "what newspeople should know and the public should expect," sometimes dismissed as "journalism for dummies" but likely the best-read book about journalism in the past decade. It opens with a list of ten "elements of journalism," noting that "the primary purpose of journalism is to provide citizens with the information they need to be free and self-governing." Their quick history explicating this idea is consistent with most other Anglo-American histories, emphasizing journalism's *raison d'être,* as embodied in the First Amendment guarantees of free expression, is an unfettered search for truth; the protection of the press from government in this reasoning is primarily if not exclusively to the process of winnowing truth from falsehood so that the public may govern itself.

At the time of the ratification of the U.S. Constitution (1789), the nation's population was a shade under 4 million, and fewer than a hundred newspapers existed, most circulating a few hundred copies or less. "Citizens" at the time were free white males, and in most states, voting required proof of property ownership, but except for those citizens in the remotest rural districts, most of the public would have had some personal relationship with a publisher. The audience-public at the end of the eighteenth century contrasts drastically to the present, when a population of somewhat more than 300 million, virtually all with access to news and information through thousands of sources; most of today's citizens would have only the remotest connection to a publisher, editor, reporter, or producer of news. The imposition of the audience-as-market notion led the late journalism researcher James Carey to remark that we now have "a journalism that justifies itself in the public's name but in which the public plays no role, except as an audience" (cited in Kovach and Rosensteil).

The Audience as Journalist

Kovach and Rosensteil end their list of elements with a notation that "[c]itizens, too, have rights and responsibilities when it comes to the news." Paradoxically, Carey's complaint that the public's role within journalism is limited to that of mere receivers has collapsed, aided and abetted by revolutionary technological advances that potentially make virtually everyone a global publisher; a weblog by virtual unknown renegade journalist Matt Drudge was the first to report a sexual relationship between then-President Bill Clinton and White House intern Monica Lewinsky in 1998; a digital video posted in 2006 on YouTube—a website that did not exist until 2005—in which a U.S. senator running for reelection in Virginia used a racial epithet on an audience member, was widely credited with leading to his loss in the election. In the 2008 presidential primary campaign, an audio recording by a "citizen journalist" of a closed-door fundraiser in which then-Democratic candidate Barack Obama talked about "bitter" rural voters "clinging" to their guns led to several days of mainstream media attention to this issue. This is not to suggest that intrepid freelancers invariably get the facts right: In the aftermath of the 2008 election, bloggers' reports that former vice presidential candidate Sarah Palin thought that Africa was a country, reports that were amplified by attention on cable news programs on Fox and MSNBC, were from a nonexistent "source." Fox, however, stood by its story and did not disclose its veiled source for its version of the story.

New media technologies, then, place the ability to make news in the hands of nonprofessional journalists; for the moment, the three primary impacts of "citizen journalists" are in introducing isolated but newsworthy bits into the information stream for amplification by more mainstream media (MSM); for deconstruction and parsing of what is in MSM accounts; and for the creation of large numbers of blogspots that aggregate the work of individual bloggers and vie for the attention of an increasingly fractionated audience. We have arrived, according to citizen-journalism advocate Jay Rosen, at a new journalism that is in

the hands of "the people formerly known as the audience," and in which the position of the audience is less than clear: Large audiences are shrinking, small audiences are born daily, and the power relationships between the producers of mainstream media and their audiences are shifting ground.

Audience Research

News media are increasingly guided by audience research in making decisions about what stories to cover, to what depth, and in what fashion. Critics argue that "happy talk" infotainment is not really news, but some news executives point to research showing that such programming is exactly what many readers and viewers want.

In his famous "Vast Wasteland" speech of 1961, then–Federal Communications Commission Chair Newton Minow chided broadcasters for providing too much programming that catered to the desires of their audiences, and not enough to inspire and inform. Minow wanted broadcasters to offer programs that would help listeners and viewers become more enlightened citizens. The dichotomy he identified exemplifies a central debate in journalism—should news give people what they want, or what they "need"?

Those who advocate the "want" approach argue that the audience is supreme, and its preferences should drive the content of print and electronic information. Theirs is a marketplace model of news that privileges free expression, and the profitable fulfillment of audience demand. Those

who advocate the "need" approach, on the other hand, base their argument on a social responsibility model of journalism. They view news media as guardians of public knowledge, responsible for meeting informational needs of readers, listeners, and viewers. Both characterizations represent extremes, with multiple variations in between—"ideal" journalism in a democratic society has as many definitions as it does advocates. Regardless of one's preferred definition, however, the goals of news organizations and journalists are tested through research on the news audience—which makes an understanding of audience research methods and interpretations central to evaluating the performance of news media.

News audience research, whether for print, broadcast, or Internet media, takes many forms and serves a broad range of interests. Advertisers want to know who is exposed to their messages in ad-supported media. In fact, the development of research on news audiences in the United States can only be understood in the context of the commercial nature of American mass media. Research methods were developed to supply advertisers with the information they needed to sell products; but the same information is used by others to evaluate the quality and influence of news. Some research on news audiences is syndicated, meaning it is available to anyone who pays a subscription fee; some is proprietary, conducted by organizations only for their own purposes. Academic research may be available to the public, or may be conducted to support the work of an individual or organization.

Development of Research Methods

Virtually any social science research method can be applied to the study of news audiences. Surveys assess which news stories interest viewers and readers. Effects studies using experiments and quasi-experiments measure changes in attitudes or opinions based on the content or format of news. Interviews with news consumers (focus groups) determine which elements of news programs or articles "work" and which do not. Research studies may provide anything from relatively straightforward estimates of the number and demographic characteristics of audience members, to measures of psychological, behavioral, and geo-demographic patterns used to predict economic or political choices. But they all have one thing in common: they describe the audience for some type of news media content so the "success" of that content can be evaluated.

The simplest measurements of news audiences were implemented with the growth of newspapers in the early twentieth century. As advertising revenue became an important means of financial support, publishers had to provide information about the people who were most likely to see the ads. The readership of newspapers and magazines is relatively straightforward to measure and report, simply because customers pay for copies of publications. Publishers can combine billing information with data on single-issue sales to generate "circulation" numbers that tell advertisers who is buying (and thus presumably reading) a paper or magazine. Once publishers and advertisers agreed on a mutually acceptable way to calculate "circulation," that statistic became the basis for setting advertising space rates.

The next hurdle the industry faced was overcoming a transaction cost problem—the potential for cheating. Publishers had an incentive to inflate their circulation numbers to command higher prices in the ad market. After a few false starts, industry organizations found a workable solution to this threat. In 1914 they formed an organization to conduct reliable and unbiased verification of circulation estimates: the Audit Bureau of Circulations (ABC). Today ABC provides the same service for which it was founded—auditing member publications to ensure fair negotiations with advertisers. Its board of directors includes representatives from among advertisers, publishers, and advertising agencies in order to ensure fair treatment of all categories of trading partners. Audited circulation numbers can be compared across publications to find out which readers gravitate toward which kinds of news content.

The basic information conveyed by circulation figures has been expanded over the years through different types of research. Some studies have been done by industry associations on behalf of member publications; others have been performed by individual publishing organizations or the third-party research services they hire. One of the earliest readership reports, "So They Don't Read the Ads?" used consumer-interview data gathered by media industry researcher C. E. Hooper in the

1940s. Publishers used the information he provided to convince advertisers that newspaper readers paid close attention to all types of content. This report paved the way for an industry-wide study, commissioned by the Bureau of Advertising, which sent researchers door to door in Rochester, New York, and Louisville, Kentucky, to elicit information on reading habits. The results were encouraging (and intriguing) enough to prompt investment in an ongoing study, "The Continuing Study of Newspaper Reading." More knowledge about readership led to further studies. Publishers wanted to know which readers spent the most time with different sections of their publications, and they used this information to convince advertisers to place ads more strategically.

The dominance of print news and information was first challenged by radio in the early 1930s. Simple comparisons of readership could no longer capture the news consumption patterns. In fact, the idea of "circulation" became deeply problematic because there were no bills to audit—radio news was there for anyone who had a receiver. Thus, neither advertisers nor broadcasters could directly verify an audience.

Broadcast Research

A solution was provided by survey researchers using techniques of quantitative research. They could design representative samples of radio listeners, ask them about their media consumption habits, and use this information not only to estimate the total potential radio audience, but also to further define the groups who listened to news programs. Although stations could employ researchers to conduct their own audience studies, they faced the same problem as the publishers who provided circulation numbers. Advertisers were wary of information generated by the seller of advertising time because radio stations had a strong economic motive to inflate the audience numbers. The answer was to hire third party research organizations that served the entire industry—or at least any player in the industry that paid to subscribe to the research service. Early radio audience researchers, including C. E. Hooper and Archibald Crossley, eventually gave way to larger companies including Nielsen Media Research and Arbitron, which now conduct most of the radio and television audience studies that are used to negotiate advertising prices.

Early radio audience measurement relied on surveys conducted by telephone, in-person, or via paper survey instruments called diaries. As technology developed, researchers used electronic methods, specifically a recording meter inside the receiver, to capture when the radio was in use and what stations were tuned. By the time television became a standard household medium in the early 1950s, these research methods were well developed and accepted by media, advertisers, and the public and were easily adapted for the newer technology. Over time, Nielsen Media Research, Arbitron, and others continued to develop more sophisticated measurements of audience preferences based on their research experience in the broadcast world.

With newer media came new challenges to audience research methodologies. By the end of the twentieth century, television and radio audiences were increasingly fragmented by cable channels, direct broadcast satellite, video recording, and the Internet. Established research companies had to redesign their audience samples to measure use of niche programming services, which had smaller, more highly targeted, audiences than did the large networks. Researchers developed a system of embedded electronic program codes to identify digital video recorder (DVR) playback patterns as more viewers shifted their viewing to times more convenient for busy lifestyles. For the most part, advances in distribution technology required the tweaking of old methods of sampling and measurement. But as the Internet gained momentum in the late 1990s, and audiences began to seek news and information online that they previously acquired through print and broadcast, researchers had to develop means to track a new generation of media consumers.

Internet Research

Internet audience research relies on software programs that record individual choices. The information is collected and sorted by such third party research organizations as Nielsen/NetRatings and comScore Media Metrix, and made available to subscribers. Although the statistics look much the same as those provided to broadcasters, the information collected from Internet users is much more detailed. In fact, the amount of data can be

overwhelming. As newspapers place more content on the web, the recall methods used in early readership studies can be, at least partially, replaced with real-time monitoring of audience behavior. Variables such as article choice and time spent reading or viewing can be captured electronically and tracked in far more detail than was previously possible. These real-time measurements of content choice probably say much more about attention than earlier, post hoc, estimates of reader interest.

Researchers face another challenge: finding ways to measure audiences for increasingly personalized—and mobile—technologies. Viewers and listeners now have much more control over the time and place they choose to consume news and information, and they come in contact with a wide variety of media on a daily basis. The personal diary, which was used effectively for decades to estimate radio and television audiences, is simply too limited to keep track of so many media options. To address this challenge, Arbitron developed the Portable People Meter (PPM), a small device designed to pick up signals from any electronic source of media content. All a sample respondent has to do is carry the PPM; exposure to the media is recorded automatically. Some are skeptical about this technology because (1) it cannot distinguish between signals to which the respondent is actively paying attention and those that are only background noise, and (2) the respondent must remember to keep the PPM with him or her at all times. Even so, many stakeholders see this option as the wave of the future.

Uses and Limitations of Research

As the technologies of measurement have developed, so too has the speed with which decision-makers gain information about the popularity of news content choices. This presents two problems for evaluating content. First, audience research of any kind can be deceptively "accurate." When statistical techniques are used to estimate audiences, there is always a chance of error due to inadequate sampling, poor response rates, and reporting errors. Too often, these errors are ignored in programming decisions. Second, media content needs time to build an audience, especially when hundreds of options are vying for consumer attention. But virtually immediate estimates of audiences, combined with pressure to make decisions quickly, means that some content is not given adequate time to build a following.

Research on print, radio, television, and Internet news serves a number of purposes, depending on who is using the information. Advertisers, news directors, and politicians use the data to find out whether they are reaching the right target for their messages, and whether the effects of these messages vary by medium. Policymakers, lobbyists, and research institutions take advantage of audience research to argue in support of, or against, proposed laws and regulations. Academics and professional analysts ask questions about the contribution of news to political knowledge, citizenship, and the worldviews expressed by news consumers. Psychologists and others are interested in how news audiences of different ages, demographic characteristics, and education levels process media content. Even when these interest groups rely on the same research, they often differ in their interpretation and application of audience data.

Research on news audiences is often conducted by nonprofit groups interested in the health of modern democracy. The Pew Research Center for the People & the Press, for example, generates research on variables including public opinion, news consumption patterns, the effects of news stories, and the public's attitude toward the news. Audience information is also collected in ongoing studies such as those conducted by Roper and Scarborough research organizations. Their surveys question respondents about their news consumption habits so researchers can track changing patterns over time. Some data are made available free of charge to interested parties, but much of the research on audiences is proprietary and either unavailable or available only at some cost to the consumer.

While commercial news organizations use audience information to increase advertising revenues, noncommercial news organizations such as National Public Radio (NPR) and Public Broadcasting Service (PBS) use the data to prove effective public service. The motive might be to show its relevance as a news provider or to justify government, donor, and underwriter support. Pressure for noncommercial media organizations to attract large audiences may be less than for their

commercial counterparts, but the pressure exists nonetheless.

Media organizations' dependence on advertisers has created a continued tension between news professionals and the businesspeople responsible for profit margins. It's a short step from discovering that a particular item of content attracts a large audience to mandating more of that content to increase audiences. The same holds true for specific socioeconomic and demographic groups—if affluent viewers prefer a particular type of news content, why not create more of the same in order to attract audiences that are likely to go out and buy advertised products? But a large or affluent audience does not mean a quality news product, even if it does mean lots of revenue—and professional journalists know the difference. The use of audience research to determine the direction of news and information will continue to fuel this tension.

Audience Research Companies

Largely because of advertiser demand for reader, listener, and viewer information, print and electronic media spend millions of dollars each year obtaining those data. They rarely develop the data themselves as that is seen as an obvious conflict of interest. Indeed, in the nineteenth century, newspapers and some magazines routinely inflated their circulation information to impress and attract advertisers. Advertisers want audience figures they can trust and even verify, preferably from independent (nonmedia) sources.

Encouraged by advertisers, newspaper and magazine publishers founded the Audit Bureau of Circulations (ABC) in 1914 as the world's first independent media audience measurement source. The ABC would create standard ways of measuring circulation that would allow ready comparison across publications. Fifteen years later, the nascent radio business took the same step, though here advertisers played a more overt role in forming the Cooperative Analysis of Broadcasting (CAB). Getting data on radio listeners was harder because tuning in was ephemeral—there was nothing physical (like copies of newspapers) to measure. Indeed, how best to research who was listening took years to resolve as different companies tried different methods, and many fundamental questions of sampling and measurement remain controversial to this day.

The audience research companies and services that developed to meet the needs of both advertisers and media have all been independent, meaning they are not owned by media companies or advertisers, the two chief clients for their products. Many of these firms (A. C. Nielsen is a prime example) provide extensive marketing research with media "ratings" merely being one part of their corporate mix. Each company faces the same central problem—how to conduct the best possible research at the lowest possible cost. Commercial audience research is the result of a compromise between these two conflicting goals. Determining the absolute numbers of readers or viewers for any given medium would cost far more than any client could afford. Instead, media audience research must rely on a "good enough" standard balancing the expense of obtaining and publishing the information with what customers are willing to pay for that information.

Described here are the more important organizations (most of them commercial companies), past and present, that have researched audiences

for print, radio, television, and (eventually) newer news media. Each company tended to specialize in how it sampled and measured audiences (these methods are described elsewhere), and usually focused on print or electronic media.

Pioneering Research Firms

Early commercial media audience research organizations (arbitrarily defined as those formed before 1960) are arranged here in approximate chronological order by their date of formation. While many are no longer in operation, some of the most important names in the current audience research business appeared early on.

Audit Bureau of Circulations (1914–Present)

ABC (http://www.accessabc.com) has for nearly a century monitored the circulation of newspapers and both consumer and business (trade) magazines in the United States. It was the world's first such circulation-auditing agency, designed to provide a trusted standard measure of how many copies of periodicals are published and distributed. A nonprofit organization based since 1980 in Schaumburg (outside of Chicago) Illinois, ABC is funded by dues and service fees paid by the three groups it serves: advertisers, advertising agencies, and publishers. As of mid-2008, ABC was serving 863 daily and 250 weekly newspapers, 800 consumer magazines, 213 business and 23 farm publications, more than 415 advertisers, and nearly 700 ad agencies. In recent years, ABC has expanded its reports to include Internet-based use of print publications, thus providing a fuller picture of their audiences.

Cooperative Analysis of Broadcasting (1930–46)

The Crossley Business Research Company conducted its first interview-based studies of radio advertising in 1927 and again two years later. Company president Archibald Crossley suggested to the Association of National Advertisers that his method (of telephone interviews) to determine who was listening be established on a regular basis and with broad advertiser support, the CAB began in March 1930 to provide monthly reports on audiences for sponsored (advertiser-supported) network radio programs. By 1937, both NBC and CBS were helping support the effort, known to the public as the Crossley ratings. Telephone calls were placed to households in some 30 cities, asking people to recall what they had listened to over the previous several hours. CAB ratings were widely trusted by the advertising community but in the face of competition declined in use during World War II and the firm was purchased by Hooper.

C. E. Hooper (1934–71)

C. E. Hooper was another source of radio network program ratings, issuing regular "Hooperatings" to subscribers. Formed by Claude E. Hooper and a partner (who left in 1938), the company used a different research method than the CAB, asking in its telephone interviews what program respondents were listening to at the time of (coincidental to) the call. Early results suggested, among other things, that people were least likely to remember news broadcasts. Because Hooper actively popularized his ratings service and their results (such as the top ten network programs), they became better known and more widely used than those of the CAB, which Hooper purchased after World War II. As television began to expand, however, Hooper sold his national broadcast rating service to A. C. Nielsen in 1950, and died four years later in a boating accident. Hooper gathering of local daytime radio ratings (alternated with local television watching information) continued for another two decades before the firm, unable to adequately measure out-of-home or late night listening—both very important in radio—was sold in 1969, becoming Starch-INRA-Hooper. Its television ratings stopped appearing two years later.

A. C. Nielsen (1936–Present)

A. C. Nielsen (http://www.nielsen.com) began as a product testing and market research firm in 1923, providing surveys to consumer drug and other companies. After purchasing the key patents for and pursuing further experimentation with automatic meter devices installed in radio receivers beginning in 1936, it first offered its commercial Nielsen Radio Index service in 1942. Nielsen purchased the Hooper radio and television ratings surveys in 1950 and expanded its Nielsen Television Index network meter operations into the growing local television

business with its Nielsen Station Index in 1954. A decade later, Nielsen dropped its radio ratings to focus on both local market and national television ratings, a field it has dominated ever since. Nielsen was acquired by Dun & Bradstreet in 1984, and three years later began its "Peoplemeter" service, which provided more demographic information on individual viewers. The Dutch firm VNU took control of Nielsen Media Research in 1999, and the whole company a year later. In recent years, Nielsen has studied how best to measure use of television recording devices and the delayed viewing they allow. Late in 2008, Nielsen announced its return to the measurement of radio audiences (using written diaries) after Arbitron faced continuing problems with its PPM service.

The Pulse (1941–78)

The Pulse was founded by psychologist Sydney Roslow in New York and assessed radio (and later television) audiences using personal interviews. Its interviewers visited a cross section of homes in New York City, and soon expanded to 64 markets. They aided listener (and later viewer) memories by displaying a program schedule for that day and the previous one, asking what programs anyone in the household had seen or heard. Every tenth interview was checked by a follow-up letter to the family. For a time, The Pulse was the largest local radio research service, measuring listening in nearly 250 markets. The company began television research in 1949 (as Tele-Pulse). By the mid-1950s, for the average half-hour nighttime television network program, The Pulse based its rating on some 7,000 interviews in 70 markets, assembling a national rating from its local surveys, and claiming the largest sample among firms then providing television audience ratings. But competition from Nielsen and others forced it to leave that field in 1958.

Taylor Nelson Sofres (TNS) (1946–Present)

TNS (http://www.tnsglobal.com) began as the National Family Opinion public opinion polling company. During the 1960s, the company expanded globally, forming Intersearch (1960), AGB in Britain (1962), Sofres in France (1963), Frank Small Associates in Australia (1964), and Taylor Nelson in Britain (1965). Over time these consolidated to form, by 1997, the present TNS. Media audience measurements are among many marketing services the firm provides.

American Research Bureau (ARB) (1949–Present)

ARB/Arbitron (http://www.arbitron.com/home/content.stm) was founded by James Seiler, research director for an NBC radio station, who sought to measure individual rather than household listening. ARB developed the use of written one- or two-week "diaries" of respondent listening and viewing, and in 1957, a receiver meter to provide overnight ratings from New York area viewers. In 1961, ARB was taken over by the Committee for Economic and Industrial Research (CEIR), which despite its name was a commercial research company. CEIR dismissed Seiler in 1964 and most of ARB's management joined him at his new Media Statistics Inc. Control Data Corp. bought the then-struggling ARM in 1967. The name of ARB's meter-based audience survey, Arbitron, became the name of the company in 1973. The firm has since become the primary source of radio station ratings, having left the television market to Nielsen after 1992, after a failed attempt to introduce its "ScanAmerica" peoplemeter service. By 2008–9 its Portable People Meter (PPM) service was being rolled out for radio measurement, though to considerable controversy over its sample and methods, as initial results often ranked stations very differently than had more traditional diary methods.

Sindlinger & Co. (1948–Present)

Albert E. Sindlinger built a radio research business based on recall-based interviews with individual listeners, rather than focusing on households. From his start with national polling in 1955 (as one of the pioneers determining levels of "consumer confidence"), he began offering data on radio network listening in 1962, using recall telephone interviewing techniques pioneered by the CAB. Until 1967, this was the only radio network ratings service. Building on their radio research, the company attempted a national television ratings service in 1961, but dropped it a year later. Sindlinger focused largely on custom market-level research based on continuing interviews with sample households.

Videodex (1949–58)

Videodex used a diary system to report television audiences. It issued a monthly *National TV Rating Report* based on a larger sample than any other service at the time, and for a while provided more local market ratings (and more frequently) than did other services.

Trendex (1950–61)

Trendex used the telephone interview method pioneered for radio by Hooper. To spot-check viewing while the television receiver was on, the company assigned phoning to 400 women who called from their homes in 15 major cities in which all three networks competed. Results for each program were based on about a thousand completed calls. The interviewers used a set list of questions and a pattern for randomly selecting phone numbers. Not a national survey, a true sample nor even a gauge of audience size, Trendex provided an index of relative program popularity in the 15 cities, reporting its results overnight (faster than any other ratings firm).

Modern Commercial Research

Modern audience research companies (those formed since 1960) are arranged alphabetically by their corporate name.

AGB Research (1962–Present)

AGB, a British firm (the initials once stood for Audits of Great Britain), began to provide meter-based television ratings to the commercial companies in Britain in 1968, expanding to report on audiences in several other countries, and finally, in 1981, the BBC. Having introduced peoplemeter technology in Europe, in 1982, AGB announced plans to do the same in the United States, beginning with a market test in Boston. Faced with introduction of the Nielsen peoplemeter service, however, it left the U.S. market in 1988. The company is now tied to Nielsen through common ownership.

Birch Radio Ratings (1978–92)

Birch was formed by Tom Birch, and grew to become the largest provider of newspaper audience data and, for a while, the second largest provider (after Arbitron) of radio audience ratings. Using a daily telephone interview to capture prior day listening, Birch was successful in gaining widespread support from radio stations, advertisers, and their agencies. At its peak, Birch conducted over 100,000 monthly telephone interviews, measuring nearly 250 markets in the United States and Canada. The firm was sold in 1987 to Dutch publishing conglomerate VNU (which would later acquire A. C. Nielsen), and merged with VNU's subsidiary Scarborough Research. In December 1992, VNU sold a half interest in Scarborough to Arbitron, which closed down the Birch ratings service.

International Demographics Inc. (1971–Present)

International Demographics (http://www.themediaaudit.com/company.htm) was founded in Texas. Among other services, it provides a syndicated local-market, qualitative-audience survey conducted in over 80 markets and sold as *The Media Audit* to communications business subscribers. These are not the program ratings most people know; rather, they seek to find out why people use media and for what purpose.

iTVX (2001–Present)

iTVX (http://www.itvx.com) was founded by Frank Zazza, a pioneer in the product placement business. The company evaluates the impact (such as consumer recall) of product placements within television drama and other programs. Again, this is not a "ratings" kind of research, but rather focuses on what ads viewers recall—-and why.

Knowledge Networks (1998–Present)

KN (http://www.knowledgenetworks.com/index3.html) was founded by two Stanford University professors to pioneer market and consumer online research. Since the early 1990s, the firm has conducted annual studies (more than 40,000 interviews) designed to understand how consumers approach media, the circumstances that bring them into the audience, and the decisions and behaviors that characterize their use. Issued as *How People Use Media,* this analysis forms the core of the company's media research. Among

other topics, KN provides radio ratings for children 6 to 14 and mothers with children 2 to 11, making it the default source for the demographic. KN took over Statistical Research Inc (SRI) in the early 2000s.

Media Statistics Inc. (1964–84)

MSI was formed by James Seiler after he left Arbitron. After considerable effort, MSI began a 40-market radio and television listening diary service in 1965 after an initial test in New York City. Faced with expanding competition from Arbitron, however, MSI sold its list of ratings subscribers to them in 1967. It moved on to more customized research including its monthly Mediatrend recall questionnaire-based analyses of radio listening covering several major markets. Birch took this over in the early 1980s.

Scarborough Research (1975–Present)

Scarborough (http://www.scarborough.com) was developed as a newspaper measurement researcher and continues to be important in that industry. Its radio ratings service (offered with Birch) was closed in 1992. Scarborough then expanded to include broader media and lifestyle research, regularly surveying by telephone more than 80 markets. Scarborough is a joint partnership with Nielsen and Arbitron, and is a provider of local television, radio, and newspaper qualitative and shopping behavior information, and serves agencies, sports teams and leagues, and outdoor companies.

Statistical Research Inc. (1969–Early 2000s)

SRI was founded by Dr. Gerald Glasser of New York University and former Nielsen researcher Gale Metzger. Among many other media measurement services, SRI developed the sample for the first RADAR (Radio's All Dimension Audience Research) studies of radio network audiences, and after 1972 administered the telephone interview-based surveys as well. An attempted survey of television audiences dubbed SMART (for Systems for Measuring and Reporting Television) was terminated in 1999 for lack of industry support. SRI was taken over by Knowledge Networks in the early 2000s.

Public Broadcasting Research

Two commercial research operations have focused on analyses of audiences for American public radio and television stations.

Audience Research Analysis (1977–Present)

Audience Research Analysis (http://www.aranet.com) was founded by David Giovannoni and is a primary provider of audience research for American public radio stations. Many of its reports are available at the firm's website at no charge. Giovannoni's research suggested, among other findings, that public radio station supporters (those who contribute financially) preferred news and public affairs content over music. Other studies have helped determine the specific appeal of different kinds of National Public Radio programs.

TRAC Media Services (1979–Present)

TRAC (http://www.tracmedia.org) was created by Drs. Judith and David LeRoy and provides analysis of Nielsen ratings research, conducts community surveys, offers programmer and development training seminars, holds "core viewer" forums, and generates public station audience analysis. TRAC has conducted research with the PBS network, PBS stations, and the Corporation for Public Broadcasting on topics as diverse as ethnic public television viewing, station membership and pledge drives, and electronic philanthropy.

Audio and Video News Services

An audio or video news service is usually a commercial entity that provides prerecorded sound or video for news media, general business corporations, or (more recently) individuals. In its overall purpose, it somewhat parallels the function of a photo agency. Some entities operate as a part of long-recognized news services (such as the Associated Press or CNN) that make their own reports or footage available, but increasingly, many are independent firms making use of the Internet for inexpensive distribution of both professional and amateur (or "home") audio or video recordings.

Audio and video news services developed as recording and playback technology made them possible. In the Internet era, much of the business lacks a formal structure—there are new companies popping up all the time. Some firms produce video news releases, which are described elsewhere. Others focus on producing "stock" audio or video that can be used as background for station news programs.

Audio News Services

Audio news services appeared as effective means of analog sound recording made them possible. The earliest began in the 1950s as more and better reel-to-reel audio tape recording equipment became available, and as equipment prices dropped. The innovation of audio tape cartridges and cassettes in the 1960s and 1970s made the handling of sound recordings much easier for stations to use. Early automated radio station operations relied on such technology where music and advertisements could be preprogrammed, allowing occasional inserts of live news and other features.

Both United Press International (which was first, in 1958) and the Associated Press initiated audio services to serve their radio station subscribers with recorded hourly newscasts and sound actualities they could insert into their own news. Stations received a daily menu of recorded stories and features from which they could select. For the first time, even "local" radio news from smaller markets could feature a variety of audio features from across the country and around the world. Audio quality was a problem as the news agencies used telephone lines for distribution. AP Radio began in 1974 and became a 24-hour all-news operation two decades later. UPI Audio became the UPI Radio Network with extensive hourly feeds to local stations, but closed in 1999 as the parent agency began to wither.

Government agencies quickly joined what became an expanding audio services bandwagon. Many federal agencies maintain sources of sound bites and scripted reports for news media use (though others can also use them). The U.S. Department of the Interior, to cite one example, provides recordings concerning the national parks, as well as Native Americans. The Department of Education offers recorded reports on all aspects of primary and secondary education. Availability of such audio reports makes their use by broadcast stations more likely.

One type of specialized audio service that dates to the 1930s is the production and distribution of sound effects. While early stations and fledgling networks produced needed sounds in the studio (as in the network *March of Time* series), by the late 1930s, prerecorded sound effects of all types were coming on the market for use by radio journalists and others as needed. Indexed collections of 78-rpm discs provided almost any imaginable sound effect. Most were used in drama—news was more traditionally conceived by most radio broadcasters as using only sounds that might be actually present, and not added later on.

Video News Services

Several factors contributed to the development of video news services, the first of which was technology, as had been the case with audio. News film was the only means of recording images for television for the medium's first decade. It was cumbersome to use and required extensive processing before it could be used on the air. Major news events—such as the coronation of Queen Elizabeth in London in June 1953—were filmed and (in this one case) the film was developed aboard aircraft flying across the Atlantic to Canada. From there, developed pictures were sent to New York for transmission by the networks to their affiliates—all less than a day after the real events. Still, the process was time consuming and costly.

The transformative breakthrough came with video tape recording in 1956. While pricy and cumbersome at first, and thus used only on the network level (including for both the CBS and NBC evening newscasts), video equipment grew both smaller and less expensive. Development and use of time-base correctors and other devices made use of video recordings on the air easier. As news programming (newscasts and documentaries) became widespread, demand by networks and stations for video clips and reports rose. By the 1970s, portable equipment further expanded video use. And in the next decade widespread availability of satellite distribution made transmission of video news and feature material to stations and cable systems almost cost-free.

As with audio recordings, federal departments (and many nonprofit organizations as well as commercial courses) soon provided video as well. The U.S. Department of Defense, for example, became a ready source for video clips and often complete narrated reports on weapons of land, sea, and air.

Developing Online Services

Just as technology had made earlier audio and video news services possible, development of the commercial Internet in the mid-1990s soon suggested new options. Audio was used first in an era of narrowband connections and limited capacity. Many organizational websites soon offered archives of audio news and related clips, chiefly for news media, but often available to anyone.

Adding broadband capabilities by the 2000s opened up the ability to speedily syndicate video to news media as well as individual consumers. Facebook and other popular networking websites soon flooded over with news clips. Advertisers, eager to reach a global audience, snapped up options to purchase space on such websites, which provided free consumer access.

Broadband distribution further blurred the one-time division between traditional journalism and wider civic participation and sharing of news. Such widespread distribution naturally raised questions of copyright. Websites made clear that material was copyrighted and placed limits on how it could be used (beyond individual viewing on personal computers or laptops).

MSN Video was by the mid-2000s the largest video-only streaming service on the web, offering 41 channels of content updated many times each day. In addition to streaming an average of 66 million news, entertainment, and sports video clips per month from more than 45 content partners, MSN Video provided an array of live events. Advertiser supported, MSN Video is available to consumers at no charge and is available in the United States, Canada, Japan, and Australia; and in beta testing in the United Kingdom.

Announced late in 2005, the Associate Press's Online Video Network (OVN) was launched early in 2006 and by mid-2007 was reaching 61 million unduplicated visitors and serving over 1,800 radio and television affiliates (it began with less than 500). Using a Microsoft Network local video contribution option, OVN affiliates can use their own content to combine AP breaking news video with national advertising. Also by mid-2007 OVN was providing some 40 video clips per day covering national, international, technology, business, and entertainment news. At about the same time, CNN.com launched its own broadband video news service and the other cable and broadcast networks were soon active as well.

AUSTRALIA

Australia falls very much within the traditions of Anglo-American journalism. Historically the strongest influences were British, inheriting a mixed model of public and private broadcasting and a strong but not constitutionally protected tradition of press freedom. Australia's smaller market and concentrated media ownership have sometimes inhibited more diverse offerings. Today it shares with other advanced liberal democracies a trend toward ever larger media organizations, and a multitude of challenges with technological changes, an expansion of many parajournalistic genres and fragmenting audiences.

Colonial Period

European settlement began in Australia with the founding of the penal colony at Sydney Cove in 1788, and a printing press was carried aboard the first fleet. However, it was not until 1803 that the first newspaper, the *Sydney Gazette,* began rather inauspiciously as a government-licensed publication carrying officially sanctioned information. By the 1820s there were several independent, competing newspapers, taking up the rights of emancipated convicts and free settlers, and the principle of press liberty was officially recognized and observed. Fierce conflicts with officialdom soon arose, with some journalists being jailed and some papers charged with sedition. When the conflicts abated, however, the principles of independent journalism with rights at least equal to those in the colonial power, Britain, prevailed.

The bulk of the newspapers formed in this period were very small operations run by a publisher/editor with minimal supporting staff. Representative self-government came to the colonies from the 1850s. As gold rushes and agricultural development transformed the colonies' economies, the move toward federation and a growing sense of Australian nationalism gathered increasing impetus. The press was responsive to these political currents. Its role in the major cities became more politically important and their editorial attitudes more varied and strongly stated.

The outstanding figure of Australian journalism from the mid-nineteenth century was David Syme, editor and publisher of the *Age* in Melbourne and a strong voice for federation and also for tariff protection to allow the infant country's industries to grow. Meanwhile the major Sydney paper, the *Sydney Morning Herald,* was more conservative, favoring free trade, and less enthusiastic about moves toward severing ties with mother Britain. Nevertheless the mainstream metropolitan press was unanimous in its sense of hope and patriotism for the new nation in 1901.

The Murdochs

From the 1920s, the most powerful figure in Australian journalism was Sir Keith Murdoch, father of contemporary global media magnate Rupert Murdoch. Murdoch senior had become famous and an intimate of political leaders and press barons as a result of his disclosures about the disasters of the 1915 Gallipolli campaign in World War I. After the war, he pioneered English tabloid techniques in Australia. Indeed he was nicknamed Southcliffe, the antipodean version of Britain's famous tabloid press baron, Lord Northcliffe, with whom he had a close personal association.

At least as important as his journalistic innovations was that Murdoch was a leader in the consolidation of Australian press ownership. In the 1930s, the Great Depression brought the collapse of many papers, and most of the survivors were under financial stress. This facilitated Murdoch's task. By his death in the early 1950s, the company of which he was chief executive officer (but not the major shareholder, much to the chagrin of his son Rupert, for whom keeping family control of his company became an abiding preoccupation) had a central presence in all Australian state capitals except Sydney.

Such concentration has made Australian media proprietors very important in the development of journalism, probably even more so than in other democracies. The trend toward concentration was further enhanced when television started in 1956 because ownership of the commercial channels was dominated by newspaper proprietors, the biggest of whom were also active in radio and magazines.

Television and Competition

The 1960s was a time of ferment in Australian journalism. Television had opened up new possibilities, even though in the early days the primitive technology imposed great logistical constraints. Later, a combination of legislative and technological changes, and the emergence of public affairs programs, made radio a more dynamic medium for news. The better use of the telephone and tape recorder allowed more actuality reporting and for the first time reporters' voices, rather than just announcers' voices, became part of radio journalism.

Moreover, the greater competition in speed and audience reach from broadcasting as well as internal developments prompted considerable movement in the press. Overall there has been great stability in Australian metropolitan morning newspaper titles. The majority of today's papers had their origins in the nineteenth century, but the three most recent surviving daily titles all were born in the first half of the 1960s. Two existing titles became daily—the business newspaper, the *Australian Financial Review,* and the national capital's *Canberra Times*. Most importantly Rupert Murdoch founded a national newspaper, *The Australian,* in 1964. These ventures set off competition for good journalists, especially among the quality newspapers, changing the balance of power somewhat between the better known journalists and their proprietors. Bylines became more common, as did political columns, which started to probe more deeply behind the political facades.

Era of Crisis

The greater vigor in journalism that these changes brought was reinforced by a period of political change. The reign of Australia's longest-serving Prime Minister, Sir Robert Menzies, came to an end in 1966. His dominance of the political environment—the relative one-sidedness of the electoral competition, the stability inside his conservative government, the economic growth and rising prosperity, and not least his close relationship with the major press proprietors—allowed him to achieve news coverage and editorial commentary largely supportive of his government. As divisions appeared among his successors, and the electoral initiative passed to the Labor Party, a new generation of reporters in the Federal Parliamentary Press Gallery also came to the fore, many of them university graduates, more vigorous and competitive and with more contemporary outlooks than the generation they were displacing.

Once television became established, and newspaper competition stabilized, Australian media ownership was for some decades marked by stable and entrenched oligopoly. Four companies dominated the major TV channels, the daily press, and were important players in other media as well. Changes to media policy by the Hawke Labor government in 1987 stimulated a radical transformation of media ownership, but one that in some ways resulted in even more concentration. In less than a year, 12 of the then 19 metropolitan daily newspapers changed owners, three of them twice, while one closed. Eleven of the 17 metropolitan television channels changed owners, two of them twice. None of the four companies that had dominated Australian television in November 1986 was still involved a year later. All had sold out at a handsome profit, as new aspirants, thinking this would be the last opportunity to buy into television, laid out vast amounts of money. But the debts they incurred were too great and within a few years all had to exit the medium.

In the 1990s, television stabilized and returned to its traditionally high profit levels. However, it is arguable that the financial crisis changed industry attitudes toward journalism. Throughout the 1970s and 1980s television journalists had had a very tangible sense of improvement in their work. This stemmed most obviously from technological developments. Color TV had come to Australia in 1974, and daily satellite transmission soon after. There was an increasing capacity for "live crosses" to outside locations, and the introduction of ENG (Electronic News Gathering) made gathering film

easier and the editing of it much quicker. As a result TV news could cover stories closer to their deadline, could cover stories from a much wider range of locations, and could edit more elaborately—with the result that although each sound bite became shorter, the number and variety of them in each story increased greatly. At the time also television schedulers thought that capturing audiences for the prime time news, which often began adults' viewing for the evening, was a key to ratings success more generally, and so for reasons of both prestige and strategy were prepared to invest in their news programs. However, the shake-out in ownership following the debt crises changed these attitudes, and—in journalists' parlance—the accountants and marketers became more dominant, making for more financial stringency and for the commercial networks to move "down market" in their news priorities.

Journalists in Contemporary Australia

The financially straitened state of the media industry was a factor weakening journalists' power in the early 1990s, especially given the large loss of jobs, for example, with all Australia's afternoon newspapers going out of business within a few years of each other. Although the Australian Journalists Association (AJA), later to become incorporated in the Media Entertainment and Arts Alliance (MEAA) as many trade unions amalgamated in the 1980s to maintain their strength, was one of Australia's first white collar unions, its bargaining strength has always been limited. To some extent there has been a buyer's market. Both the narrowness of ownership and the limited outlets in any city limited job mobility. Moreover, to some degree the individualism of journalists and the variety of their career routes also limited the capacity for collective action. Just as Walter Lippmann described journalism in America as a refuge for the vaguely talented, in Australia the founder of the AJA, Bert Cook, thought it attracted "that frayed type of somewhat cultured mankind who had fallen to the temptations of the wayside" (quoted in Lloyd 1985). Another major recruitment pool was from the talented upwardly mobile, often individualistic but eager for opportunity and so wishing to please their employer.

Fewer than one in five Australian journalists have had tertiary training in journalism, although journalism schools have been going for more than 40 years. No professional body controls entry. While the traditionally high degree of nepotism has greatly decreased, recruitment processes (and training and induction) are still extremely varied. No association has the power to enforce observance of professional standards. Journalists are employees with no direct relationship with their clients, with whom they interact only as consumers of the larger product to which they contribute. Moreover, as employees they have limited control over their own professional output.

As an occupation Australian journalism is surrounded by apparent contradictions. Although public surveys show it consistently ranks low compared with other occupational groups, it is one of the most sought after careers with typically far more applicants than vacancies. Although difficult to break into, the occupation also has a very high voluntary departure rate. This is despite the fact that from quite early in their careers, journalists may gain a public profile through their bylines in print or their on-air reports in broadcasting. But this upward mobility often plateaus. The high exit rate from journalism is partly because of increased opportunities elsewhere. Cognate occupations, most especially public relations, have grown much faster than mainstream journalism itself, and frequently they offer more pay, more security, and better working conditions. "Push" factors in the nature of journalistic work itself are also pertinent. Many tire of the daily pressure involved in meeting deadlines. What produced an adrenaline surge early in their careers may later just become tiresome and stressful.

While Australia's media entered the 1990s in a battered state, the period since has continued to be a dynamic era of expansion and innovation, stimulated by technological change, globalization, and the seemingly ever-expanding variety of media markets. This dynamism, wedded to changing patterns of employment in the economy generally, has changed many of the assumptions that marked journalistic careers and management practices. At an ever accelerating pace, there have emerged far more individualistic and various career patterns. The capacity of the media to manufacture "stars"

in journalism as well as entertainment gives those individuals much more leverage with potential employers, as well as often of an increasing sense of their own worth as commodities. The increasing number of niches and individual outlets has broadened the talents that are rewarded. The ranks of journalism have become more socially diverse. (The 1970s was the crucial decade for women to break into the occupation in large numbers, and in the time since successive glass ceilings have been broken.)

Genres

As in most other advanced democracies, the forms of journalism are becoming ever more varied. There are increasing numbers of outlets which are somewhat journalistic, but without necessarily having the disciplines and accountability mechanisms ideally associated with its pursuit. Advertising supplements in newspapers and infotainment outlets on television are often tied in ways invisible to the audience with advertising and public relations transactions, and do not necessarily aim at balanced or penetrating accounts. Travel programs, for example, have been described as showing the sun but not the sunburn. The magazine industry, especially perhaps women's magazines, is increasingly linked with public relations exercises, especially involving stories about celebrities, in which any attempt to balance conflicting viewpoints is typically absent.

The Australian journalistic tradition has always been closer to the Anglo-American straight news, objective reporting model than to continental journalism of opinion models. Television was required to be impartial through the licensing system, but more importantly the audiences of the major networks are split down the middle in terms of partisan affiliation, giving them an incentive toward balanced presentations. Nevertheless an increasing number of platforms reward opinion over reporting. As in the United States, there has been a great increase in columns in newspapers, overwhelmingly skewed toward the conservative end of the political spectrum.

Similarly talk radio, especially on commercial stations, has grown enormously and mainly as a vehicle for strongly opinionated presentations, often conducted with a minimum of empirical discipline. Some years ago some of the most famous presenters were found by the Australian Broadcasting Authority to have accepted "cash for comment," but although the cases received intense publicity, their careers continued almost uninterrupted. The most famous figure, John Laws, rather disarmingly told the inquiry he was an entertainer not a journalist, so there was "no hook for ethics" (quoted in Tiffen 2002).

As elsewhere the Internet has seen huge growth in Australia since the mid-1990s, and a large number of people now seek news online. The major providers in Australia are still the established, "brand name" organizations, although some new, smaller businesses have arisen. Australia has not yet seen "bloggers" arise as an important part of the political environment.

With the multichannel environment fragmenting the broadcasting audience, with newspaper circulation in a slow but clear long-term decline, and with advertising, especially classified advertising, moving to other areas, such as the Internet, with the public service broadcasters increasingly squeezed by governments for funds, and with major media proprietors increasingly preoccupied with achieving profit levels, there are increasing issues about how quality journalism will be funded in the future. Even as media channels proliferate, there are questions about who will bear the cost of independent and active reporting, or whether there will be increasing reliance on what official sources and other groups seeking publicity make available.

It would be wrong to jump to dismal conclusions. There was never a golden age of journalism in Australia, and there are many contradictory trends at present. In some ways the information mix is becoming richer, but in others there seem to be fewer checks and balances. The material rewards for successful journalists are greater than ever, but how that success correlates with a professional excellence beyond immediate market forces is increasingly problematic. But the many forces for change suggest that in coming decades Australian journalism will continue to be transformed in both its career structure and social role.

AUTOMATION

In both news gathering and production/distribution, automation can be divided into three separate but parallel aspects. These include newspaper automation of both layout and printing, broadcast automation of studio operations, and more general automation of news writing, editing, and distribution functions across media platforms. Naturally, there has been a progression of convergence among these three aspects of automation as the technologies of printing, broadcasting, and news gathering move several different technologies into common digital platforms. Both journalists and the general public have maintained a neutral view concerning the impact of news automation, praising the efficiency, speed, and control it allows, while remaining guarded about its negative effect on the workforce, the growing reliance on technology, and a continued conglomeration of news outlets into fewer corporations. Most powerfully, news automation has long been a self-reinforcing cycle, with one form of automation leading to the adoption of another.

News automation has had an enormous impact on all forms of news gathering as well as entertainment productions. Automation continues to be a driving force across all electronic media. At one extreme, news automation can be considered a form of "strong" technological determinism, whereby the techniques and technologies used in a process become the driving factors in the content produced. For example, newsroom automation and other technical advantages have made real-time satellite uplinks and downlinks commonplace. Frequent use of several direct satellite connections is now perceived as a necessity for many television newscasts. The ubiquity of the technology begins to control not only the format but also the content of news gathering and production. However, built-in checks and balances, particularly editorial oversight and professional adherence to journalistic and ethical standards, remain a balancing factor in news automation both now and into the future. This balancing of editorial standards with the effects of technology is referred to as "weak" technological determinism, where news automation is one of many social and cultural factors which have pronounced effects on news gathering and production but do not control form and content. Other examples of technological determinism include the addition of complex moving graphics to broadcast journalism, the publication of zoned editions of metropolitan daily newspapers, portable in-field production and editing in radio news, and the expectation of frequent updates and headlines in all news media.

A continuing argument regarding news automation is that it inherently created the 24-hour news cycle. This would be an example of strong technological determinism, stating that the technological advances in journalism drove the society that produced them to find newsworthy events more frequently in order to create content for ubiquitous news media. The counter argument in favor of weak technological determinism is that as societies

grow larger and more sophisticated they create both more information and the technological means for easy gathering and mass distribution of this information. However, both arguments agree that there is an expectation by both society and professional journalists for speed as well as accuracy in news gathering that did not exist before industrial automation.

Automation in Print Media

In print journalism, automation of the printing process in turn created the need to automate and streamline the editorial process in order to take full advantage of the opportunities of faster print times. From the late nineteenth through the twentieth century, the process of typesetting, printing, and finishing newspapers and magazines was increasingly mechanized. This process began with the labor-intensive procedure that required editorial staff to first arrange, then proof the typesetting placed on the print sheet. With the development of mechanized presses, precision manufacturing, and print-finishing (folding and binding), printers no longer had to feed individual sheets into presses, making creation of larger newspapers—and more of them—fast and fairly inexpensive. As printing times shortened, editorial roles adapted to allow more last minute deadlines and coordinated drop-shipping of finished newspapers. With each technological advance, the trend of shorter and shorter production schedules, driven by commercial competition, continued. The technical evolution of print automation included the linotype, which allowed for faster mechanized typesetting; off-set lithography, which allowed images to be printed from reusable plates; and rotary presses and flexography; which used flexible rubberized or silicone plates that curve as they print their image onto paper rolls. Each of these technological advances allowed for more rapid and increasingly sophisticated typography, higher-quality illustrations and photographs, and faster layout of individual print runs. These physical printing processes were collectively referred to a "hot printing." In the 1940s the process of phototypesetting, or "cold printing," was perfected. It involved making photonegative images of typesetting and illustrations that were then transferred directly to curved silicone plates for printing. Again, this process made page layout faster, necessitating increased automation of editorial oversight.

Each increased degree of automation required fewer workers. The new printing technologies did not require heavy and unwieldy metal type plates, which in turn meant that the physical location of the printing presses could be moved away from the newsroom and layout facilities. The printing and editorial staff became increasingly specialized and removed from each other. Throughout the late twentieth century this process of automation continued to decrease the production time for all printing, allowing for later deadlines and the contraction of the news cycle from several days to just one or even less. With the advent of computer-assisted layout toward the end of the twentieth century, software programs such as PageMaker and Quark XPress pulled the process of layout out of print shops and into the desktop computers of editorial personnel. Simultaneously, wide-scale adoption of word processing software allowed for full workflow automation of print journalism from the reporting and editing stages to layout and printing. Today, this automation has created nearly real-time news cycles, with even newspapers able to respond to last minute events and still achieve widespread and timely distribution.

Automation in News Gathering

The process of automation in news gathering arguably began with the first news pools in the early nineteenth century and continued with the establishment of news agencies in the mid-1800s. News pooling involved an agreement between several newspapers in a metropolitan area to send a single reporter to cover a predictable news story or area, for example, a minor city hall hearing, small press conference, or ship arrivals and departures. Simple reports involving basic facts, and little or no editorial opinion, would be copied and sent to all participating newspapers. This practice evolved into separate news agencies that collected information, press releases, and on-location stories and automated the process by regularly sending the information to subscribing newspapers. Individual reporters and editors could access basic factual information gathered by other on-location reporters not necessarily directly employed by the newspaper (or later broadcast network).

Early news pool and news agency stories and information were gathered by editors and physically posted or filed in newsrooms. News agencies grew in sophistication thanks to the telegraph and undersea cables, which came into use in the 1840s and 1866, respectively. This allowed for dispatch of news agency stories from considerable geographical distance for use in local newspapers. More importantly, the text of a news agency story could be integrated into the local reporter's story. As information arrived in newsrooms faster, the process of story assignment, research, and writing was increasingly automated.

By the mid-twentieth century, news agencies adopted Telex and teleprinter automation technologies, which took advantage of the newer pulse-dial telephony systems to deliver formatted text to multiple terminals. This also allowed reporters to file stories back to newsrooms from remote locations, further speeding and automating the process of news gathering and dissemination. As individual newspapers and broadcast stations adopted computerized word processing, news agency stories could be directly electronically copied into news stories in progress. For stations and networks, production rundowns (an outline of each news production's content) moved from being a physical print-out or paste-board to an electronic document. Editors and multiple reporters could directly collaborate and edit one single news story in the process of preparation while approaching deadlines could be pushed close to broadcast time thanks to broadcast automation.

Broadcast Automation

The rise of radio networks in the 1920s, and television networks three decades later, posed several logistical problems that were resolved by automation. Broadcast journalists and newsroom producers face multiple live events and dozens of playback sources, far tighter broadcast deadlines than traditional newspapers, and the need to standardize the division of labor within broadcast facilities. Early broadcast automation included control of film or video playback machines and switching to and from the network signal using simple electronic pulse control. This automation was standardized using time code for program switching in television network news gathering and distribution. Time code involves assigning each frame of video a sequential number allowing for perfect cuing of sources. The Society for Motion Picture and Television Engineers (SMPTE) sets and maintains the engineering standards for broadcasting. SMPTE time code is the most widely used format for broadcast automation. Networks and television stations adopted a master clock to generate a time code to which all playback and routing devices are synchronized. A central control device, usually the facility's broadcast switcher, can then control live elements and combine them with prerecorded playback.

Proprietary engineering of individual playback devices was slowly replaced with open technical standards that allowed for better integration of equipment. This trend expanded in the 1980s and 1990s to include graphic character generators, TelePrompTers, and robotic cameras. As most video production by the turn of the twenty-first century became digital and "tapeless," all playback devices can utilize an expanded form of open standards referred to as MOS (metal oxide semiconductor) technology. This ensures that all equipment will be compatible with all software, a change from earlier engineering systems, which were still split into production automation (such as the BASYS system for tape control), and work flow automation (such as scheduling software). (MOS technology should not be confused with the script marking of "M.O.S.," an abbreviation for "minus optical sound" referring to any visual medium used without sound.)

Toward Fully Automated Media

The development of television and later satellite/cable network news operations was greatly aided by expanding automation. Television reporters and producers were able to cover multiple events. The movement toward full news automation allows newswire stories, production rundowns, and finished stories to be acquired, tracked, and loaded from individual reporters and editors into a central computer server for access by all members of the production and engineering teams. Central control of the production process has become "Rundown Based"; every element in a production is linked to a single electronic document that can be viewed by all members of the production team.

Key to this process is the addition of standardized metadata and tags. Metadata are small pieces of information at the beginning (or head) of each digital file of information—scripts, rundowns, visuals, and moving image media that define the individual file based on which news story was created. This metadata allows individual operators to determine if the information is relevant to their particular production or news story. During live broadcasts, directors and technical operators can control all linked machines using one single protocol for moving information. Increasingly the open MOS technology uses XML standards for data control. During automated playback, a master control device can operate all devices, thus reducing the need for personnel. Broadcast automation has made possible the techniques creating interconnected global broadcast news operations. Automation systems also allow for inexpensive backup redundancy, archiving of productions, and a more intuitive graphic user interface that displays information in two-column script format.

Implementation of newsroom automation is capital intensive and has been resisted by some news professionals. Historically, small and mid-sized news-gathering operations first embraced news automation, and leveraged its benefits. Many newspapers and broadcasters adopted automation in phases. The first phase usually involves automation of playback devices (both analog and digital) and cameras. The second automates rundowns and story editing along with newswire services and TelePrompTers. The third phase involves a complete switch to all-digital media and the addition of metadata to all media, stories, and rundowns for control and oversight.

Many news organizations retain a "hybrid automation" system integrating personnel-based control with computer automation. Advocates claim this system allows for greater flexibility and faster reaction to unscripted elements such as breaking news, retains a human element, and allows for faster switching back to full manual control. Editorial objections to full automation include the idea that automation can obscure the difference between subjective reports and objective facts, the continuing problem of verifying multiple sources under tight deadlines, and the contentious idea that news automation weakens the editorial firewall between professional editors and corporate media owners. Many of the objections to full automation of news are being addressed by improved software and digital hardware, and by new generations of "digital natives" comfortable with an all-digital environment working in newsrooms.

Some news automation uses business enterprise software specifically designed for newsroom operations, such as EZ-News and Avid. Consumer software packages such as Adobe InDesign for desktop publishing and open source software such as CampCaster for radio news production bring converging news and broadcast automation within the financial reach of even small news organizations and citizen journalists. Collaboration brought about by news automation has also eroded the concept of single authorship of news stories. While individual field reporters remain, some news gathering organizations have begun to eliminate bylines as a direct outcome of newsroom automation. Paradoxically, some broadcast news has become increasingly "personality driven" as news anchors and reporters now require fewer technical skills in order to create broadcasts.

Continuing Impact and Evolution

Automation continues to converge print and electronic news to the point where historical divisions between them become obscured. Traditional employees in news organizations such as engineers and technical producers have been retrained or phased out. Personnel duties have also converged, as many employees have duties that combine elements of the technical, editorial, and creative. RSS feeds and news aggregators—automated computer software that collects news stories and has begun to assemble "news front pages"—are increasingly taking on the traditional function of assistant editors, who worked as background researchers. Archiving of news stories through automation with XML metadata allows for easy later retrieval by both news personnel and their audiences through ubiquitous websites. The tight deadline and scoop-based journalism that characterize the 24-hour news cycle are arguably a direct result of growing automation and greater connectivity. News aggregators and RSS feeds will likely continue this trend in the future with the audience automating its process of news consumption. Discussions and debates

about technological determinism and other effects of automation will continue as the technology continues to evolve and change and influence editorial practices and methods of news gathering.

B

Baltimore

Baltimore is the largest city in Maryland, its metropolitan area the twentieth largest in the United States. In 2007, the population of Baltimore was 641,000 people to which the suburbs add another 2 million residents. The city is part of the Baltimore-Washington metropolitan region of 8 million people. Once an industrial seaport with an economic base in heavy manufacturing and shipping/transportation, Baltimore's economy has shifted since World War II to the services sector, with the largest employer no longer Bethlehem Steel, but the Johns Hopkins hospital and research center.

Although lying just 40 miles northeast of Washington, D.C., Baltimore is a major media market in itself. With over 400,000 subscribers, the daily *Baltimore Sun* was the country's twenty-seventh largest in 2006. The same year, Baltimore was rated the twenty-fourth television and the twenty-first radio market.

Newspaper Origins

The colonial Maryland General Assembly created the Port of Baltimore in 1706. Due to its sheltered harbor and the relatively easy routes inland, it became an important port for the colonies. After New York City, it was the second city in the colonies to reach a population of 100,000. Baltimore became the second leading port of entry for immigrants during the early 1800s. Until 1860 it was the second largest city in population, only then being surpassed by Philadelphia.

In such a fast-growing city, broadsheets to supply news of Britain and other colonies appeared before the American Revolution, published and posted by local printers on an irregular basis. The best known of these were the competing *Baltimore Advertiser* and *Maryland Journal,* both printed during 1773. Following independence, several short-lived weekly newspapers were founded: the *Palladium of Freedom* (1787), the *Baltimore Evening Post* (1792–93), the *Baltimore Daily Gazette* (1794–95), and the *Baltimore Town and Fell's Point Gazette* (1796–98). In 1798, the *Baltimore Intelligencer,* the first successful newspaper in the city, arose from the collapse of the *Gazette;* under a variety of names, it would be published continuously until 1964 when, as the *Baltimore American,* it would merge with the *Baltimore News-Post* and become the Hearst-owned *Baltimore News-American,* which folded in May 1986. Its demise left the *Baltimore Sun* as the city's sole broad circulation daily newspaper.

Founded by Arunah S. Abell, a journeyman printer from Rhode Island, the *Baltimore Sun* first appeared in May 1837. It consisted of four tabloid-size pages and sold for a penny, in marked contrast to the six-cent daily newspapers then in fashion. The lead story in that first issue dealt with recent actions by the Baltimore City Council, which none of the other half-dozen papers published in the city bothered to report. Over the next few years, Abell created a prototype of the inexpensive, community-focused, impersonal, institutional paper

that today dominates American journalism. The *Sun* was the national leader in innovative news-gathering methods and community journalism through the Civil War. The company was a pioneer in the use of the telegraph (the first line running from Washington to Baltimore brought "News from the Hill" daily), high-speed presses, and underwater cables to maintain contact with overseas bureaus. The *Sun* was the first to use railroads to distribute papers to outlying communities, and among the first to conduct reader service surveys.

A Washington bureau was established by the paper early on. That tradition of focusing on how distant events affected Baltimore residents was demonstrated as the paper augmented the fledgling wire services with its own correspondents. The *Sun* was the first to inform President James Polk (1845–49) of the surrender of the Mexican city of Vera Cruz to American forces, signaling the end of the Mexican War. In 1924, the *Sun* opened its first overseas bureau in London.

The Abell family ran the paper through 1910, after which the A.S. Abell Company held controlling interest until 1986, when the paper was acquired by the Times-Mirror Company. For 85 years there were two editions of the *Sun,* a morning edition (which is still published) and the *Evening Sun,* published from 1910 to 1995. In 2006, the *Baltimore Sun* had approximately 1,500 full- and part-time employees, making it one of the largest businesses in the city.

Modern Press Scene

Besides the *Baltimore Sun* with its traditional coverage, the *Daily Record* provides local business and legal news. In 2006, the *Baltimore Examiner* was launched as a free daily newspaper. Founded in 1977, the *City Paper* is a free, alternative weekly newspaper focused on local issues and events. Ethnic newspapers include the Baltimore edition of the *Afro-American,* the *Catholic Review,* and the *Baltimore Jewish Times*. The *Baltimore Business Journal* and the *Jeffersonian,* published in Baltimore County, are business-oriented weeklies. Over 200 newspapers, periodicals, and journals are published in Baltimore, including numerous medical publications.

For topics and views not normally found in the mainstream newspapers, residents turn to the Baltimore *City Paper,* a controlled circulation weekly founded in 1977. Distributed free at over 1800 locations in the metro area, it is best known to visitors for providing information and reviews on avant-garde clubs, concerts, and restaurants, but it also offers an alternative source of news and opinions on local politics, communities, and culture. Its extensive editorial pages give provocative views on everything from sports to sex to cyberspace to city hall. The paper has even published controversial fiction and poetry unable to find a venue elsewhere. In 2007, the paper's management claimed a readership of over 300,000.

A recent challenger to the *Baltimore Sun* is the *Baltimore Examiner,* launched in 2006 by the Clarity Media Group. Through boxes and home delivery, primarily in affluent neighborhoods, the free paper offers traditional coverage of both national and local news. The company also publishes the *Washington Examiner* and *San Francisco Examiner,* in competition with the established daily newspapers in those cities. The same national and international stories are run in all three, but local offices produce city coverage and advertising. Plans by the paper call for distribution of an eventual 250,000 copies in Baltimore, published Monday through Saturday.

Baltimore has an ethnically diverse population, and a number of nationally influential newspaper evolved to serve specific groups. The *Afro-American* is the oldest family-owned black newspaper in the United States. It was founded in 1892 by former slave John H. Murphy Sr. by merging three local church publications. By 1922, Murphy had increased the paper from a one-page weekly to the most widely circulated black newspaper along the East Coast. Under his son Carl Murphy, who served as its editor for 45 years, the paper rose to national prominence, with editions in Baltimore, Washington, Philadelphia, Richmond, and Newark. The *Afro-American*'s status as a black paper serving black communities endowed it with an authoritarian voice on civil rights, and it took on issues from the Southern Railroad's use of "Jim Crow" cars to a fight to obtain equal pay for Maryland's black schoolteachers. The paper frequently joined the National Association for the Advancement of Colored People in legal cases, such as the 1954 lawsuit against the University of Maryland Law School for its segregationist admissions policies.

The paper continues to offer a uniquely African American view of the news, with weekly editions published in Baltimore and Washington.

The *Catholic Review,* founded in 1833 as the *Catholic Mirror,* is Maryland's largest paid weekly newspaper, with 72,000 subscribers in 2006. It offers a Catholic view of national and international events, and serves as the paper of record for the Archdiocese of Baltimore. Edited by lay Catholics since its inception, it has displayed a decidedly liberal stance as well as taking an active role in various social movements. Even in the 1800s, the paper rallied against opposition to mass immigration into the city, called for religious tolerance for other faiths, advocated Catholic outreach to African Americans and Native Americans, and supported public assistance for the poor. Following the second Vatican Council (1962–65), the paper turned to issues such as birth control, liturgical music, and women's roles in the church. In the 1960s the paper was one of the first to support integration, even condemning a Catholic gubernatorial candidate trying to woo the segregation vote.

The *Baltimore Jewish Times* is a weekly newspaper serving the Jewish community, and is one of the most respected publications in the country for readers of that faith. The paper was founded in 1919 by David Alter, and in 1972 editorial direction was taken over by Charles Buerger, Alter's grandson, who expanded the scope of the coverage and the size of the paper; in the 1980s, the paper regularly exceeded 200 pages and claimed 50,000 readers. Although it has declined slightly since its peak, in 2006 weekly issues still averaged 120 pages with a paid circulation of 15,000.

In May 1844, Samuel Morse transmitted a message by telegraph, over wires running from the Supreme Court Chamber in Washington to the Baltimore & Ohio Railroad's "outer depot" in Baltimore. Even before the line was complete, the impact of the telegraph on journalism had been shown to be profound. The previous month Henry Clay had been nominated as the Whig Party's presidential candidate. A report was carried by rail to Annapolis Junction, from which the telegraph then "wired" the news to the capital, where it appeared in newspapers the next day. It was the first news story sent by telegraph.

Broadcasting

The oldest radio station serving Baltimore, WCAO, began broadcasting in May 1922. Having passed through several formats, by 2000 the AM station was broadcasting gospel and evangelical programming, its news programs taking a distinctive Christian perspective in topic and slant. CBS affiliate WHFS began broadcasting in November 1961 in FM (hence the call sign for "Washington High Fidelity Stereo") as the first station in the region to broadcast in stereo. It has passed through various music formats, from classical to contemporary.

WBAL is the best-known news/talk radio station in the area. It began in 1925 as an AM subsidiary of the *Baltimore News American,* owned by the Hearst Corporation. The station took on its all-news format in the 1950s, and employs the largest number of news staff of any station in the state. WBAL and its sister FM station WIYY are the only two stations still run by the Hearst Corporation.

WMAR-FM was launched in 1958 by the Abell Company, owner of the *Baltimore Sun* and WMAR-TV. The station was transformed into "98Rock," celebrating its thirtieth year in that format in March 2007. WJFK and WNST are both sports radio stations. WYPR is the National Public Radio affiliate in the city, carrying content from NPR and the BBC World Service, as well as self-generated programs focused on local affairs. Starting in 1979 as WJHU, owned by John Hopkins University, its programming has expanded over the years to be primarily news/talk during the daytime and classical music overnight.

Radio One Inc. the nation's seventh largest radio broadcasting company, operating 69 stations in 22 American cities, is the largest radio network that primarily targets African American and urban listeners. Founded in 1980 in the Baltimore suburb of Lanham, it produces a number of syndicated news and talk shows, and operates the only nationwide African American talk channel simulcast over multiple stations.

Television began in Baltimore in October 1947 when WMAR-TV began as the eleventh television station in the country. It was launched by the A.S. Abell Company, then publisher of the *Baltimore Sun.* In March 1948, WBAL-TV introduced itself from its downtown studio with an avowed mission of providing the community with superior news

reports. The station was owned by the Hearst Corporation, one of two stations created (rather than purchased) by the company. In the 1950s, the station made its mark with live programming, including *Romper Room,* the first live morning children's variety show and eventually nationally syndicated. Baltimore's third television station was launched in November 1948 as WAAM with presidential election returns. Its studio was the first in the city specifically designed for television news yet it was the only station without ties to a city newspaper. Westinghouse Corporation purchased WAAM in 1957 and renamed it WJZ-TV. WJZ was the first station to hire a full-time consumer reporter, as well as the first station in the city to create an investigative reporting crew. In 1965, Wiley Daniels became the first African American broadcast reporter in Baltimore at WJZ, joined two years later by the first black anchorman Jerry Turner.

In 1959, WMAR, WBAL, and WJZ combined efforts to build the world's first three-antenna "candelabra" tower. The 730-foot tower significantly improved the stations' coverage in the region, even reaching into Pennsylvania and Delaware.

Baltimore has been home to a number of independent television stations, several of which have become affiliates for new networks. In March 1967, WMET-TV signed on as Channel 24, the first UHF in the city and touted as "Baltimore's fourth television news station." A low-budget and low-power sister station to WFAN-TV in Washington, it was owned by United Television; in 1972 both stations ceased broadcasting due to financial difficulties. WBFF-TV began operations in April 1971, Baltimore's second UHF station; it is now a Fox network affiliate.

Maryland Public Television (MPT), established in 1966, is overseen by a governor-appointed commission. Broadcast from several transmitters in the state, MPT shows a number of original news and documentary programs, as well as airing PBS series. It has been a leader in producing news and public affairs programming.

In 2007, seven television stations were broadcasting from Baltimore. These included affiliates of ABC, CBS, NBC, Fox, CW, public television, and the Home Shopping Network. Several services provide access to CNN, ESPN, MSNBC, and other cable networks. In 2007, the 17 Baltimore and nine suburban AM and FM radio stations broadcast programming that included talk radio stations focused on news, sports, or religion, and music stations that ranged from classical to country to contemporary.

Media Notables

A number of important journalists have spent part or all of their careers working in Baltimore. These include H. L. Mencken, Drew Pearson, Louis Rukeyser, Jim McKay, Edmund Duffy, and Oprah Winfrey.

Perhaps the best-known and most influential newsman in Baltimore's history was Henry Louis (H. L.) Mencken (1880–1956), an editor and columnist for the *Baltimore Sun.* Known later in his life as the "Sage of Baltimore," he was born and raised in the city. In 1899, Mencken became a reporter for the Baltimore *Morning Herald,* then joined the staff of the *Baltimore Sun* in 1906, where he remained until his retirement in 1948. In only a few years at the *Sun,* Mencken moved from reporting to writing editorials. His writing was known for its acerbic wit, its crisp style, and the subjects these addressed. Often turning his eye on local and American politics, he was a fierce libertarian before the word came into common usage. By the 1920s, Mencken was a nationally syndicated columnist and the acclaimed author of several books on American language, literature, and politics. His editorials in opposition to Prohibition and the New Deal, on segregation, patriotism, and organized religion, were filled with pungent and scathing invective, usually aimed at what he saw as the smugly ignorant, self-righteous, and overly credulous American middle class. His pieces opposing American involvement in World War II saw him fall out of favor. By the end of his career, by his own estimate, he had written more than 3,000 editorials. Mencken has been accused of elitism, misogyny, racism, and anti-Semitism. Whatever his faults, his pugnacious insights and erudite style set the standard for political pundits and his editorials remain useful reading for aspiring columnists.

Among the other renowned journalists who began their careers in Baltimore is Drew Pearson (1897–1969), one of the most prominent newspaper and radio journalists during the 1940s and

1950s, best known for his muckraking column on national politics. In 1929, he became the Washington correspondent for the *Baltimore Sun*. In 1931 and 1932, Pearson anonymously co-authored a controversial expose book (and a sequel) on politics titled *Washington Merry-Go-Round*. When the *Sun* editors discovered in 1932 that these works were written by Pearson, he was promptly fired for what was seen as a conflict of interests.

Louis Rukeyser (1933–2006), best known as the host of television news programs and editor of financial newsletters devoted to coverage of Wall Street, spent 11 years as a political and foreign correspondent for the *Baltimore Sun* newspapers. In 1970, Rukeyser joined MPT, a PBS affiliate based in the Baltimore suburb of Owings Mills, in creating *Wall $treet Week,* the first television news show to focus on the stock market.

Other notables at the Baltimore papers include Edmund Duffy (1900–62), an editorial cartoonist for the *Baltimore Sun*. Joining the paper in 1924 and friendly with Mencken, he would win the Pulitzer Prize for Editorial Cartooning three times between 1931 and 1940. He was among the first white cartoonists to attack the Ku Klux Klan and segregation, with some of his most powerful works depicting lynchings. Jack Germond (1928–) was a veteran award-winning journalist and columnist at the *Washington Star* and, after that paper ceased publication, the *Baltimore Sun*. A noted political insider, he would become a fixture on the television news programs *Meet the Press* beginning in 1972 and *The McLaughlin Group* from its inception in 1982. Somewhat more controversial is Michael Olesker (1945–), a longtime columnist for the *Sun* beginning in 1979. Olesker was known for his liberal viewpoints and criticism of Republican state officials; in 2004 then-Governor Robert Ehrlich even issued an executive order banning state executive employees from talking with Olesker.

Other journalists have made their mark in Baltimore broadcasting. James "Jim McKay" McManus's (1921–) first job was with the *Baltimore Evening Sun*. In 1947 the *Sun*'s management invested in Baltimore's first television station, WMAR-TV, and McKay was chosen as that station's first on-air personality. He served as the station's producer, director, sportswriter, and reporter. His growing reputation as a hardworking sportscaster earned him the opportunity to host a New York City–based CBS variety show. Soon after moving to New York, McKay was offered a position at fledgling ABC Sports.

Perhaps the most successful, at least in terms of income, of Baltimore television journalists is Oprah Winfrey (1954–). In 1976, Winfrey moved to Baltimore's WJZ-TV to co-anchor the six o'clock news. After two years, she was recruited as a co-host of WJZ's local talk show *People Are Talking*. Her easy interviewing style and focus on the astounding stories of common people in the city made her popular and brought her several broadcasting awards. In 1983, she took her skills to Chicago and soon rose to national fame.

The media-rich and competitive environment of Baltimore continues to be a proving ground for aspiring journalists. Given its proximity to Washington, its own distinctive culture, and the size of its market, Baltimore offers a chance for reporters and anchors to quickly gain national recognition.

Bandwagon Journalism

Bandwagon journalism is a type of media behavior whereby journalists follow the actions and storylines of other journalists or broad trends in media coverage as a result of journalism habits, mores, and culture. The term often refers to political news coverage, although the topic of the media coverage can vary, and it is often meant as a pejorative. The term is also somewhat archaic and not widely used today, though "pack journalism" is still heard and has a similar meaning.

Background

The term takes its name from the late-nineteenth-century bandwagon, a large wagon pulled by draft animals that was part of political processions, sometimes even carrying a band, but also often carrying political figures. The term also refers to circus bandwagons, which were used to carry circus animals, musicians, and supplies. To jump or hop on the bandwagon indicated one's willingness to join the winning political side or the side appearing to have current momentum.

Bandwagon journalism should not be confused with the bandwagon effect in public opinion research. The bandwagon effect suggests voters are influenced in an election by their perception of which side is winning. The bandwagon effect holds that there is pressure on some audience members to alter their opinions to be in agreement with those enjoying greater support, renewed interest, or greater enthusiasm for their cause.

Application to Journalism

Bandwagon journalism is often used to describe the behavior of political journalists who, broadly speaking, appear to be following the lead of other journalists in their news media coverage. In this way, bandwagon journalism is sometimes used interchangeably with the term *pack journalism,* which is the tendency of journalists to concentrate on the same stories and storylines. The term *pack journalism* originated in the 1970s and is now more widely used and understood than bandwagon journalism.

Bandwagon journalism differs from pack journalism by the former's emphasis on the reasons why the coverage looks the same across media outlets. Bandwagon journalism is said to take place when journalists cover a political candidate or social movement because it is seen to have momentum and rapidly gathering support. One example of this is when a political candidate is considered likely to win political office and therefore attracts more news coverage than other candidates. Bandwagon journalism suggests that journalists react to political momentum by concentrating their coverage on the candidate who is benefiting from that momentum. Often this coverage is considered more favorable or positive than that accorded others in the race.

At the same time, the positive news coverage prompted by the bandwagon in the political realm can be short lived. Once a candidate has moved to front-runner status or has received greater attention in the news, journalists may resume a more critical "watchdog" stance in their coverage.

Researcher Thomas Patterson has pointed to what he sees as an effect that is the opposite of the bandwagon, the "losing-ground" candidate. When a candidate is seen to have lessening support in polls or has a campaign that is in disarray, news coverage becomes steadily less favorable. In this case, the losing ground bandwagon takes place as journalists follow the lead of other journalists in writing about problems within the campaign and the likely loss of the election.

The 1948 presidential campaign between incumbent Democrat Harry S. Truman and challenger Republican Thomas E. Dewey is a study in the impotence of bandwagon journalism. Truman was widely expected to lose the election and faced a press corps convinced he would lose. The resulting coverage included historic gaffes that reflected the media mood, such as the *Chicago Tribune* headline the day after the election—"Dewey Defeats Truman." But bandwagon journalism did not influence voters or portend Dewey's loss. Several scholars have focused on examples of bandwagon journalism in presidential primary news coverage, which can move negative to positive nearly overnight and thrust candidates into the spotlight or consign them to also-ran status. A candidate perceived to be winning enjoys more coverage that is more positive.

A losing-ground candidate suffers the reverse. Perhaps the clearest example in recent history is

the deluge of positive news coverage for Democratic presidential candidate Howard Dean in 2004. Dean was considered the front-runner for the nomination after raising more money than expected and engaging his supporters via Internet technology, but his electoral support was thin and he quit the race a month after the first caucuses in Iowa, never having won a caucus or primary. The criticism of bandwagon journalism was also made of the press corps following Barack Obama during the 2008 presidential campaign. Critics argued that campaign coverage was overly positive because of the consistent lead Obama had in the polls, his charismatic candidacy, and the historic backdrop of the likely first black President.

Pack journalism, on the other hand, centers more on journalists' behavior in relation to each other. It is promoted by journalistic norms that reward reporters for obtaining "scoops," or exclusive stories, and even more importantly, not being scooped by others. Journalists thus practice what has been called "defensive journalism," or covering events mostly to preclude a competing media outlet from obtaining an exclusive. This practice discourages journalists from reporting on their own and encourages them to stay close to their competition. It may happen more often when journalists are forced to work closely together, such as during political campaigns, where reporters may travel together and work side-by-side for long periods of time. The term *pack journalism* takes its name from journalists moving in a group while covering a story.

Several authors have pointed to this tendency of journalists to adopt similar storylines with political news coverage and to be unwilling to deviate from the accepted wisdom of the current coverage. Journalists make up a risk averse profession, and shy away from coverage too dissimilar from their colleagues. The same effect can take place among editors or broadcast producers who must compare the journalists' output with that of other news sources. In doing so, both reporters and their editors push coverage to greater sameness. The effects of both bandwagon and pack journalism are thus parallel to one another: similar news content centered around widely accepted storylines with similar sources. However, the reasons for this coverage differ between the two.

In common usage, the phrase *bandwagon journalism* is generally held to be a pejorative. It is often used as a criticism of news media coverage or the behavior of journalists, and it is often used in a broad, general way. The term suggests reporting conduct that is lazy, unthinking, and too shackled by journalism habits. It is often used by one side in a political race to downplay the reporting of the other.

Bias

The subject of media bias has become a hot topic of contemporary political discourse. Conservatives have succeeded in making the phrase "the liberal media" a staple of the American vernacular while other scholars argue the media promote a more conservative, pro-American, pro-free-market bias. In recent years, best-selling books on the topic have further driven public debate. However, these works rely heavily, if not exclusively, on anecdotal evidence and lack coherent, quantitative analysis to back up their claims. Scholarly studies of media bias have focused largely on elections; empirical research on bias, or slanted presentation, in domestic political issues, such as health care, is lacking.

Agenda Setting, Priming, and Framing

In a 2007 article called "Framing Bias," Robert Entman suggested that future studies on media bias should incorporate previous work on the

effects of agenda-setting, priming, and framing. Agenda-setting research has shown a strong, positive relationship between the amount of attention the media give certain issues and which issues the public regards as important. Priming research suggests that the more prominently an issue is featured in the media, the more important that issue becomes in citizens' evaluations of political leaders. Finally, framing is a matter of selection and salience—highlighting certain aspects of an issue and featuring them more prominently.

So how does all of this relate to bias? Entman argues that by use of framing, political actors prime audiences to think a certain way about an issue. In other words, the existence and amount of coverage (agenda-setting) and the way it is framed will prime news consumers to think a certain way. News slant exists when news stories feature the preferred framing of one group (say, the administration) over another (i.e., the opposition party) in a dispute. In order to demonstrate bias, one would have to show a consistent pattern of slanted news coverage of a certain issue.

One key determinant of a frame's success or failure is cultural congruence. These types of messages resonate with the public, falling in line with accepted ideas and attitudes within the dominant political culture. Culturally congruent messages are more likely to be accepted by the general public and the media. Incongruent messages are likely to block mental associations and may even discourage further thinking.

An incumbent administration enjoys an advantage in setting the dominant frame given its resources and media reliance on it as a source. One might call this an "official source" bias. However, presidential administrations have had mixed success in framing certain initiatives. The demise of the 1993 Clinton health care plan is one example of culturally incongruent framing. By highlighting the redistributive impact of the plan and promoting it as a boon to the poor and the uninsured, the administration opened themselves up to counterframes highlighting individual liberty, effort, and responsibility, which are more culturally congruent notions within dominant political culture in the United States.

Criticism has been leveled that media are too critical of government policies or are not critical enough; favor "horse-race" over substantive coverage; or oversimplify complex events. While lacking empirical evidence of "bias" as defined by Entman, researchers have identified a conservative slant in media coverage of certain cases, such as social movements, unions' tax policy, and, oddly enough, media bias (more on this below).

In 2005, Tim Groseclose and Jeff Milyo found evidence of a strong liberal bias in mainstream media; however, their measurement of what constitutes a liberal news outlet is somewhat convoluted. The authors develop an ideological score for media outlets based upon the number of times a news outlet cites a think tank or policy group and compares that with the number of times members of Congress (who have been given a liberalism/conservatism score by the Americans for Democratic Action) cite the same think tank or policy group. This measure seems overly complex and the authors provide no content analysis to examine the context in which these groups were cited. However, this article received quite a buzz within the political world upon its release and remains one of the most-cited media bias studies, especially by conservatives and others who argue the existence of a "liberal media" bias.

In 1992, James Kuklinski and Lee Sigelman examined coverage of U.S. senators throughout the 1970s and 1980s and found the coverage to be fairly objective. In 2000, Dave D'Alessio and Mike Allen performed a meta-analysis, combining existing studies of bias in television network news, and found an admittedly small, liberal "coverage bias," meaning Democrats received more airtime. However, to say that coverage was biased because one side was given more air time is disingenuous if you do not take into account what the coverage looked like. It is almost certain that a candidate would prefer less coverage to negative coverage.

More recently, a group of researchers from Yale University performed a field experiment by assigning individuals in the Washington, D.C., area to receive subscriptions of *The Washington Post* and the *Washington Times,* then conducted exit poll surveys on these subjects after the 2005 Virginia gubernatorial election. They found that those who received the *Post* were eight percentage points more likely to vote for the Democratic candidate. They also found that a subscription to either paper

resulted in a decrease in approval ratings for President George W. Bush and the Republicans.

Journalists and the Perception of Liberal Bias

Perceptions of media bias seem to be based on one of three premises. First, it is possible that the media actually *are* biased, although consistent empirical evidence is lacking. Second, apart from whether or not the news media actually do slant to liberal or conservative views, viewers often perceive the media to be hostile to their own political views. Finally, perceptions of bias might be the result of an increase in news coverage of bias, especially claims of liberal bias.

David Domke, a well-known political communications researcher, argues that the growing percentage of the public who say the news has a liberal bias is due not to changes in the news coverage, but to the increase in coverage of liberal bias claims. In a 1999 study, Domke found that, over the course of the 1988, 1992, and 1996 election campaigns, when media reported claims of media bias, 95 percent of the time they were speaking of a liberal bias.

The conventional wisdom on bias, especially liberal bias, whether in journalism or scholarly literature, focuses heavily on how personal political views of journalists might affect news content. In his best-selling book *Bias,* former CBS reporter Bernard Goldberg argued that journalists and media elites cannot help but slant the news because of their largely shared liberal views. "Almost all of them think the same way on the big social issues of our time: abortion, gun control, feminism, gay rights, the environment, school prayer," he said. "After a while they start to believe that all civilized people think the same way they and their friends do. That's why they don't simply disagree with conservatives. They see them as morally deficient."

Goldberg and others argue that journalists, as a demographic, tend to be liberal. Indeed, as a collective group, journalists are more liberal than the general public. However, these authors fail to recognize that a journalist's political persuasion is only one of many factors that could lead to slanted coverage. In fact, some journalists work so hard to prevent their personal biases from creeping into their work that they overcompensate and end up supporting the opposite viewpoint.

Certainly a journalist's personal political opinions influence their thinking and possibly their work, but during the course of a given day, journalists have to contend with a number of other issues. The time constraints and deadline pressures of a newsroom affect a reporter's final product as do other institutional factors like monetary considerations or newsroom politics. Journalists don't have the time or money to seek out every source or explore every possible avenue.

A lot of current debate focuses on whether a report gives "both sides" of the story, if it is "fair and balanced." But sometimes a story has more than two sides. It's also possible that both sides are making claims and only some of them are true. It is the journalist's job to determine the truth of any situation, to the extent that he or she can, and report it as fairly as possible to members of the public who could not attend the city council meeting, or the state representative's press conference, or the Supreme Court hearing. This sounds simple enough, but as mentioned above, a journalist has to manage many obstacles when reporting a particular story. Who are the players involved? Are they credible? Are they telling the truth?

The journalist serves as the conduit through which messages are sent and when average people flip on the news or pick up a newspaper in the morning, they're not only seeing a news item through the ideological eyes of a particular journalist, but they are also witnessing a framing battle between participants in that story. Which side's message was given more attention? Was the congressman presented as a credible source while the local Green Party candidate was marginalized? Were all sides presented fairly? The way average news consumers answer those questions is likely to result from their own personal biases. It is the journalist's job, in the face of that scrutiny and criticism that is sure to come from the reader, to report the facts.

The "Game" Frame

There is one type of bias that scholars do agree on: the media's tendency to frame policy issues in terms of a "horse race," or a "game," focusing more on political strategy and competition rather than substantive issues or underlying interests. The "game" frame is more likely to appear in election

campaigns than substantive policy- or issue-based coverage. Horse-race coverage bleeds into other public policy issue areas as well.

In his 2004 book, *Projections of Power,* Entman used a somewhat different terminology to distinguish between horse-race and more substantial reporting. He argued that procedural frames (including "game" or "horse-race" frames) emphasize political actors' successes and failures, and the legislative process in general. Substantive frames, on the other hand, are those that are "clearly relevant to audience members' understanding and acceptance of a policy remedy." In their landmark book *The Spiral of Cynicism,* Joseph Cappella and Kathleen Hall Jamieson argued that the use of strategic or procedural frames in news coverage creates feelings of cynicism and helplessness toward the political process that discourage participation. In 2000, Regina Lawrence said this phenomenon was particularly unfortunate, given that "news organizations are most likely to approach the political world with the superficial and cynical game schema at precisely those times when public opinion is most likely to be formulated, mobilized, and listened to by politicians: during elections and highly consequential legislative debates." Relying on strategic frames has the added benefit of making a journalist's job easier. Focusing on the "horse race" gives the impression of being "fair and balanced." It also, Lawrence said, allows journalists to display a level of expertise that does not require extensive research or a deep understanding of complex issues.

The Limits of 50/50 Coverage

As noted above, discussion of bias begs the key question: what should news coverage, in general, look like? If congressional and popular support are strongly in favor of a particular program, is 50/50 coverage that gives equal time and legitimacy to both sides really ideal? Some have argued that the side which wins the framing competition in news media can have an impact on public opinion. In 2005, Kevin Armitage argued that counterclaims challenging the "global warming" frame, and especially given their equal treatment in media coverage, have resulted in something of a stalemate. "At the time when science confirmed the existence of global warming, the public in the United States grew less sure of its reality," Armitage said. "Clearly the intense media pressure of right-wing global warming deniers has had a profound effect." The implication, at least in this case, is that news coverage should reflect fact, based on evidence and scientific consensus, rather than journalistic norms of reporting "both sides." In 2005, researchers Sandy Tolan and Alexandra Berzon argued "the weight many journalists give to such ['lack of consensus'] views, in insisting on balance but not on putting it within a broader scientific and political context, appears to be at the heart of the confusion among Americans."

Future research into slant or media bias should seek to establish a theoretical foundation for thinking about the issue. What is the existing conventional wisdom? How do Americans form opinions on this or any issue? What factors are likely to influence news slant, beyond whether or not a claim is positive or negative? In normative terms, it could be argued that—as with the global warming debate—media coverage of important policy issues or legislative debates should reflect, as much as is possible, the empirical evidence, instead of ensuring that dueling ideologies are equally represented irrespective of their own support or validity.

Blacklisting

The relationship between news/public affairs broadcasting and political affairs has been close since radio's launch in 1920. The ability to transmit messages to potentially large audiences made broadcasting a tantalizing prospect to politicians of all colors. The divisive political struggle between conservatives and liberals influenced broadcasting most visibly and negatively during the period known as the Red Scare (1947–57). Although news media are constitutionally protected from government influence in the United States, the historical reality is that broadcasting is frequently susceptible to political pressures.

The early cold war (1945–60) following World War II saw a growing distrust of communism and a deep-seated fear that "Reds" were infiltrating the United States. Political conservatives sought and identified suspected Communists in every walk of life. Although anti-Communists vigorously asserted that they were responding to a threat to national security, historical evidence is ambiguous. Some historians interpret the Red Scare as a conservative backlash against liberals long in power. Recent research in the former Soviet Union, however, reveals that the USSR did successfully infiltrate several institutions in the United States during the 1940s and 1950s. At the time, however, with little evidence to support the Red denunciations but innuendo and blacklists, the fear of being labeled a Communist left the country nearly paralyzed.

Broadcasters were susceptible to politically motivated attacks for a number of reasons. Significantly, they are licensed by the Federal Communications Commission (FCC), which is overseen by the legislative branch. Further complicating their vulnerability to the Red Scare was broadcast dependence upon sponsors. Until about 1960, network entertainment programs were produced by sponsors and their advertising agencies. The considerable profits reaped by selling airtime enabled broadcast networks to subsidize news and public affairs programming. Accordingly, accusations of coddling Communists threatened that relationship. At the same time, the rapid transition from radio to television placed networks and stations under greater financial pressure.

Network Response

Although the influence of the Red Scare on broadcasting started as early as 1941, a single publication in June 1950 escalated political pressure on the industry. A conservative group issued a paperback book entitled *Red Channels: The Report of Communist Influence in Radio and Television* that took the form of a "blacklist" which publicly identified an individual with communism with the intent of denying employment and socially alienating the accused. *Red Channels* listed the names of nearly 150 individuals, including 10 broadcast journalists. NBC and CBS took immediate notice of *Red Channels,* although the two networks responded differently.

NBC was undeterred by *Red Channels* or other blacklists and rarely denied employment to a person accused of being a Communist. NBC was a subsidiary of RCA, one of the most profitable and powerful corporations of the mid-twentieth century, and was led by David Sarnoff, whose power

over NBC/RCA was unquestioned and whose conservative politics were indisputable. Further, NBC enjoyed the luxury of RCA's financial resources to support it through the transition from radio to television. For these reasons, NBC could financially and politically afford to risk criticism for failing to heed the blacklists; its corporate and political credentials were above reproach.

CBS was more vulnerable as it lacked the financial largesse that NBC enjoyed from RCA. By 1950, when *Red Channels* was published, CBS was involved in two very expensive endeavors: developing its television network and its consequent need for programming and affiliates, and the innovation of a color television system. Further complicating the situation was the perception that network chief William S. Paley was considered politically liberal. These factors prompted CBS to respond very differently to *Red Channels*. It developed a two-layer system of investigating alleged subversive activities of its employees. A "clearance" system vetted talent for "suspicious" activity and individuals whose names were blacklisted were fired or not hired by CBS. The second layer required employees to sign loyalty oaths on which they swore they were not and never had been Communists. The elite corps of broadcast journalists at CBS, led by Edward R. Murrow and including Eric Sevareid, William Shirer, Charles Collingwood, Alexander Kendrick, and Don Hollenbeck, was incensed by the loyalty oaths. Nevertheless, Murrow encouraged his team of journalists to sign the oath, as he did himself. Murrow chose his battles carefully and was already considering future broadcast investigations of the Red Scare; thus he was willing to sign the loyalty oath. CBS's willingness to institute a loyalty oath for its employees revealed the lengths to which the network went to protect itself and its business interests.

Broadcast Journalists

"Are you now, or have you ever been, a Communist?" Although relatively few broadcast journalists were asked this question before a congressional hearing, being labeled as suspected Communist or sympathizer was an anxiety that many endured. Radio commentators were an early target of *Counterattack,* the newsletter that began publishing in 1947 as, in the words of writer David Everitt, an "anti-Red muckraking publication that would drag not only Communists but all their defenders out into the light." Anti-Communists feared journalists would use their access to the airwaves to broadcast views favoring Communist positions and responded by publicly naming journalists they believed to be Communist sympathizers.

In 1950, the publishers of *Counterattack* released *Red Channels* and identified ten broadcast journalists whose political affiliations allegedly indicated Communist sympathies. The list included prominent journalists such as Kendrick and Shirer, as well as Howard K. Smith and Lisa Sergio. The evidence cited was questionable, largely depending upon the testimony of suspected Communists before congressional committees, or on the speeches, appearances, or organizational memberships of the journalists. For example, chief among Shirer's "offenses" was that he signed a petition to the Supreme Court encouraging reversal of the convictions of the "Hollywood Ten" for refusing to testify as to their political beliefs. Smith allegedly criticized the U.S. government for meddling in the 1948 Italian elections. Kendrick's offenses included publishing essays in *New Masses* and *Soviet Russia Today* and leading a panel discussion during a meeting of the National Council of American-Soviet Friendship. Sergio, a commentator and broadcast journalist for both NBC and ABC, was cited for signing a petition that urged outlawing anti-Semitism. It is notable that none of the "evidence" that *Red Channels* listed against the ten broadcast journalists included any actual broadcasts. Smith and Kendrick later reported that their inclusion on the blacklist did not affect their professional or personal lives. Shirer, on the other hand, believed that being blacklisted had a significant impact on his career, and soon after his *Red Channels* appearance he left broadcasting and turned to freelance writing and lecturing. Interestingly, Soviet archives later revealed that one of the lesser-known journalists included in *Red Channels,* Johannes Steel, was, indeed, a Soviet agent.

Blacklisting was accomplished through other means in addition to *Red Channels*. Aware, Inc. was formed in 1953 to ferret out Communists from radio and television. It produced "Publication No. 12" in which suspected Communists were named and, as John Cogley writes in *Report on Blacklisting,* "decreed 'unemployable.'" Other journalists were

identified in the popular press. One of the tragic repercussions of blacklisting was the case of Don Hollenbeck, who worked for CBS News and was identified as a Communist-sympathizer by Jack O'Brian, a columnist for the Hearst-owned *New York Journal American*. Hollenbeck's subsequent suicide in June 1954 was understood to be partly the result of being blacklisted. Whatever the means of public identification, the reputations and credibility of broadcast journalists suffered as a result of extreme political pressures.

News Programs

Fundamentally, the Red Scare in broadcasting came down to concerns about content. Although there is no evidence to suggest that any broadcast journalist communicated pro-Communist messages, blacklisters nonetheless feared that they might. Anti-Communists sought to prevent the spread of communism by creating a climate of fear in which journalists self-censored their material. Broadcast journalists who were blacklisted correctly understood that they were targeted because their personal convictions challenged conservative politics.

Although the networks and many advertisers capitulated to the atmosphere of fear, either tacitly like NBC or overtly like CBS, one voice of resistance was heard amidst the silence. By the autumn of 1953, Murrow, arguably the most influential broadcast journalist of his time, decided to confront the Red Scare. In a series of reports broadcast for his television program *See It Now,* Murrow hosted a number of investigations into prominent figures of the Red Scare, including Air Force Lieutenant Milo Radulovich and Pentagon employee Annie Lee Moss. Radulovich had been dismissed from the Air Force for maintaining close relationships with suspected Communists (his father and sister), while Moss was suspended from her clerical position for being a suspected Communist. The most influential and historically significant broadcast, however, was Murrow's March 1954 investigation of the tactics used by Senator Joseph McCarthy, in which Murrow used television clips to skillfully and publicly denounce the senator. It was a blacklister's greatest fear come true. Although Murrow did not espouse a pro-Communist message, he adeptly used television to publicly challenge the power of the leading anti-Communist crusader. Even so, the business aspects of the broadcasts remained paramount. Murrow had to get his sponsor's permission to shift its commercials, and CBS refused to advertise the programs for fear of the political and commercial backlash. Nonetheless, many historians consider the Murrow–McCarthy broadcast to be one of the more important in the history of television as an early example of the medium's power, particularly in the hands of a skilled and credible journalist.

Implications

The Red Scare started to fade with the U.S. Senate's censure of McCarthy in 1954, and blacklisting was fully exposed and discredited in 1962 when Aware, Inc. was found guilty of libel when it blacklisted an actor. With enough political and historical distance, industry leaders such as Paley and Frank Stanton of CBS later regretted instituting the loyalty oaths and using blacklists. Certainly the lives of blacklisted figures were changed, some more than others.

The Red Scare period of blacklisting is a case study of the dangers of using political yardsticks to measure journalists. Although anti-Communists did not directly engage in prior restraint, their accusations and blacklists had a strongly chilling effect on broadcast journalists whose personal politics were used as "evidence" of their lack of objectivity and credibility. The end result was that one of the most significant news stories of the 1950s received remarkably little broadcast news attention.

The tenuous relationship between politics and broadcasting reverberated after the decline of the Red Scare and continues today. Walter Cronkite's denunciation of the Vietnam War in 1968 was a turning point in the public's antiwar attitudes. Richard Nixon used the FCC to target television stations that opposed his politics. By the late 1990s as American politics became more conservative and the FCC loosened station ownership restrictions and suspended its former Fairness Doctrine, the number of broadcast and cable outlets that carried conservative talk shows escalated while liberal voices remained largely unheard. Broadcasters seem to avoid identifying themselves as liberal, while outlets such as Fox News readily communicate conservatism. More subtly, the broadcast news media so

vigilantly protect their business interests that they rarely investigate the actions of corporate America. Perhaps that trend started in the 1950s, when the fear of being labeled a Communist taught the broadcast journalists that the economic and political risks of being identified as "liberal" were too great.

Blogs and Bloggers

A weblog (or blog) is a webpage format that allows people, either as individuals or as part of larger groups, to discuss issues and events by posting hyperlinks to and commenting on other Internet-based materials, including other blogs. Generally speaking, a blog consists of the author's (or authors') entries, arranged in reverse chronological order, as well as hyperlinks to other Internet-based materials mentioned in those entries. Blogs usually also feature an additional list of more permanent hyperlinks to other sources that the author believes to be relevant to potential readers (commonly referred to as the blogroll). Since the early 1990s, when blogs first appeared, three different types of journalistic significance have emerged: (1) those produced by individual citizens, such as *Bluye Blog* and *Jon Swift*; (2) those produced by professional journalists, such as *Behind the News* by Elisabeth Donovan and *First Draft* by Tim Porter; and (3) news media-hosted blogs produced by professional journalists, such as *Ask the Editors* by the *Spokesman-Review* and *WE Blog* by the *Wichita Eagle*. Given that most of the claims about the journalistic significance of blogs have centered around those produced by individuals, the following sections will briefly describe the two other types of blogs, followed by a more comprehensive discussion of citizen-produced blogs.

Private Blogs Produced by Professional Journalists

By the middle of the first decade of the 2000s, hundreds of professional journalists began to produce their own blogs, which they use, among other things, to publish the complete transcripts of interviews with sources, invite fact-checking of given stories, and solicit suggestions for future stories. Moreover, many professional journalists use such

A screen shot from the popular blog Wonkette, *established in 2004, features irreverent political gossip concerning Washington, D.C., movers and shakers. Its first star editor, Ana Marie Cox, went on to become a political reporter for* Time *magazine, for which she covered John McCain in the 2008 presidential election.*

Source: Wonkette.com, used by permission.

blogs to further comment on the topics of published or broadcast stories. This latter practice has not been without its problems, however. Indeed, a number of professional journalists have been reprimanded, or even fired, for crossing the line between news and views on their private blogs. For example, Steve Olafson, a longtime journalist at the *Houston Chronicle,* was fired after he had used his private blog to criticize local politicians he was assigned to cover at the *Chronicle*.

News Media–Hosted Blogs Produced by Professional Journalists

By the middle of the first decade of the 2000s, dozens of mainstream news organizations around the world began to host blogs produced by professional journalists, notably in the form of so-called editorial blogs and editorial board blogs. Such organizations as the BBC, CBS, the *Guardian,* the *Los Angeles Times,* and *The New York Times* have added editorial blogs to their online sites where senior editors explain editorial decisions; invite questions, comments, and feedback from readers and viewers; and respond to their concerns. Similarly, many newspapers, including the *Dallas Morning News,* the *Sacramento Bee,* the *Seattle Post-Intelligencer,* the *Spokesman-Review,* and the *Wichita Eagle,* have added editorial board blogs to their online sites where members of the editorial board, either individually or as a collective, outline their ideas for upcoming editorials, discuss those ideas with interested readers, and respond to their comments on published editorials. While some papers, like the *Seattle Post-Intelligencer,* announce topics being considered for the next day's edition following their editorial board meetings each day, other papers, including the *Dallas Morning News,* invite reader comments as editorial topics are still being discussed by the editorial board.

While a growing number of newspapers use their editorial (board) blogs to make their editorial decisions more transparent as well as to hold themselves more publicly accountable for those decisions through direct interaction with readers, there are reasons to question their broader journalistic significance. First, many of these efforts began after newsroom scandals at such high-profile news organizations as CBS, CNN, *Newsweek, The New York Times,* and *USA Today*. To take just two prominent examples, CBS's editorial blog, the "Public Eye," was created after a controversy on the disputed authenticity of documents presented on *60 Minutes,* concerning President George W. Bush. Similarly, *The New York Times*' editorial blog, the "Public Editor's Journal," appeared following a scandal surrounding journalist Jayson Blair's dishonest reporting. The reactive nature of these and other editorial (board) blogs makes one wonder whether the underlying motivation is to truly make editorial decisions more transparent or whether the motivation is to enhance newspaper and broadcaster credibility with citizens. Indeed, once the scandals fade from memory, some of the current initiatives might be abandoned. While editorial (board) blogs have yet to inspire scholarly research, the little research that does exist shows that such blogs leave much to be desired. Most notably, few such blogs address or acknowledge the commercial interests of media owners and advertisers, organizational pressures and work routines, and information-gathering and news-reporting conventions. Similarly, despite discussions between editorial board members and readers about editorials and editorial topics, few discuss what members of the editorial board are trying to achieve in a broader political sense as reflected in those editorials.

Private Blogs Produced by Ordinary Citizens

If there is reason to question the significance of news media–hosted blogs, this is even more so the case for blogs produced by ordinary citizens, the type that continues to be the focus of scholarly and journalistic speculation. Citizen blogs gained rapidly in popularity in the late 1990s with the appearance of easy-to-use, freely available software like LiveJournal and Blogger. Indeed, from an estimated 30,000 citizen-produced blogs in 1998, the number of such blogs grew exponentially to about 60 million by 2007. Content analyses suggesting that about 17 percent of citizen blogs deal with public affairs would put the number of journalistically oriented, citizen-produced blogs at around 10 million.

Their wider visibility and claims about their journalistic significance owe much to several high-profile cases of their alleged ability to force topics

onto mainstream news agendas and thus to inspire changes within both politics and journalism. For example, many observers claim that the concerted publicity of thousands of ordinary blog writers forced Senator Trent Lott (R-MS) to resign as Senate Majority Leader following his racially insensitive remarks in 2002. Lott's remarks initially attracted little attention in the news media. It was only after Lott's remarks appeared on the popular blog *TalkingPointsMemo* as well as on numerous other citizen-produced blogs that the mainstream news media began to devote coverage to the event. Similarly, many observers claim that the negative fallout from the aforementioned newsroom scandals was largely due to citizen-produced blogs. Among other incidents, the concerted publicity of thousands of ordinary blog writers has been credited with leading to the firing of CNN executive Eason Jordan in 2005, following his remarks at the World Economic Forum that U.S. troops had deliberately targeted American journalists during the war in Iraq.

Observers argue the journalistic significance of citizen-produced blogs is based upon their capacity for independent, original news reporting. In contrast to the centralized, top-down approach to news reporting of most mainstream news media—based as it is on elite sources of information—blogs facilitate a decentralized, bottom-up approach by turning traditionally passive news consumers into active news producers. One of the most widely cited examples of citizens engaging in independent, original news reporting is Salam Pax, an anonymous Iraqi architect. During the war in Iraq, Salam Pax used his blog, *Where Is Raed?,* to file regular eyewitness reports on life in Baghdad before, during, and after the 2003 allied bombing. Pax juxtaposed what he and relatives witnessed with what was reported in both Western and Arab news media.

Finally, some observers suggest that the interactivity of blogs, and especially the practice of linking to and commenting on other Internet-based materials, gives rise to a radically different kind of news discourse than found in mainstream news media. Specifically, the practice of juxtaposing news reporting and commentary from a wide range of sources, which has been referred to as an act of "consumptive production," is seen to facilitate a multifaceted news discourse. By juxtaposing reporting and commentary from many sources, blog writers not only challenge the narrow range of topics and sources featured in mainstream news media, but also allow their readers to compare numerous competing truth claims. Taken together, these features have led observers to characterize citizen-produced blogs as amateur journalism, folk journalism, grassroots journalism, personal journalism, and public journalism.

While critics claim that citizen-produced blogs signify the dawn of a new public journalism, empirical research tells a very different story. First, although it is possible that at least some political and newsroom scandals were brought to wider public attention through the concerted efforts of thousands of ordinary blogs, there is little evidence that citizen-produced blogs forced those scandals onto the mainstream news media agenda. The Trent Lott scandal, for example, which remains one of the most widely cited examples of the ability of ordinary blog writers to steer mainstream news media coverage, owes much to the influence of other mainstream news organizations. While Lott's remarks were initially publicized on the popular, left-leaning blog *TalkingPointsMemo,* they were reported by the online magazine *Slate* and *The Washington Post,* before they gained widespread attention elsewhere. Indeed, many early hyperlinks to the story were to the *Slate* article rather than to *TalkingPointsMemo*. Similarly, while CNN executive Eason Jordan's remarks were initially publicized on *Forumblog.org,* an independent blog devoted to coverage of the World Economic Forum, they were also reported by a number of mainstream news media, including the *New York Post, The Wall Street Journal,* and *The Washington Post,* before they gained widespread attention on other news media.

More generally, aside from the example of Salam Pax, and the ordinary blog writers invited to cover the 2004 Democratic and Republican Party conventions, there is little evidence of any independent, original news reporting. Ironically, even Salam Pax is no longer an independent reporter; having been located by the *Guardian* in May 2003, he now writes for its online counterpart, the *Guardian Unlimited,* as well as for the BBC.

The vast array of alternative news providers available on the Internet *could* afford ordinary blog writers the opportunity to cover a wide range of

topics using an ideologically diverse range of sources, thereby facilitating more varied news discourse. Yet research shows that ordinary blog writers rarely challenge mainstream news media's narrow range of topics and sources. In much the same way that the topics discussed in other popular, citizen-based media of communication like electronic bulletin boards follow the agendas of traditional mainstream news media, many studies have confirmed that topics discussed on citizen blogs parallel the narrow agenda featured in mainstream news media. Even more problematically, these same studies make clear that most blog writers simply repeat accounts from a narrow range of elite news organizations, notably *The New York Times, The Wall Street Journal,* and *The Washington Post.*

The same pattern of news media influence on citizen-produced blogs has been found with respect to so-called warblogs, those blogs devoted to the U.S. War on Terrorism. Two content analyses of selected warblogs found that their primary sources of news reporting and commentary were such elite news organizations as the BBC, CNN, *The New York Times,* and *The Times*. Only about 5 percent of hyperlinks were to alternative news providers, of which only a handful was to alternative news media in the Middle East. Similarly, other studies have found that warblogging is based upon remediation of mainstream news media content. While warblogging would lose relevance if it departed too far from agendas of broad social concern, the heavy reliance on mainstream news is problematic. Like blog coverage more generally, warblogs' remediation of mainstream news perspectives serves to strengthen, as opposed to challenge, the views of their elite sources, notably U.S. government officials. Indeed, considering the strong influence of mainstream news media on warblog coverage, and their general support of the U.S. government's war in Iraq, it should come as little surprise that most warblog writers have been found to be supportive of the war. Given the influence of mainstream news media on blog coverage, it is ironic that so many blog writers cultivate a sense that they are outsiders from mainstream news organizations.

While only a few studies have looked at the commentary that ordinary blog writers attach by means of hyperlinks, available evidence suggests that commentary also serves to further amplify the views of mainstream elite sources of information. While one study found that ordinary blog writers simply link to given news stories without attaching much evaluative commentary, another found that the commentary falls within the narrow parameters of political elites.

This lack of originality on the part of citizen blog writers also shows in their resistance to engage in genuine deliberation across ideological divides. Research on inter-blog linking patterns shows that ordinary blog writers primarily interact with those of similar political persuasions: conservatives link to other conservatives, liberals to other liberals. In the rare instances where conservative and liberal blog writers do link to one another's postings, their commentary most often puts up straw-man arguments so that the political positions of others are repudiated as being fundamentally flawed.

If mainstream news media dominate the blogosphere, a small number of blog writers have become highly influential. Indeed, in much the same way that elite news organizations like *The New York Times, The Washington Post,* and the major television networks set the agenda for numerous smaller news organizations and, apparently, also for citizen-produced blogs, a phenomenon commonly referred to as inter-media agenda-setting, these highly influential blog writers function as what could be called inter-blog agenda-setters. Three studies of inter-blog linking patterns found that a small number of blogs receive a highly disproportionate number of all incoming blog links.

The highly skewed distribution of inter-blog links, a phenomenon that has been found to characterize the distribution of hyperlinks on Internet websites more generally and politically oriented websites in particular, suggests that an internal hierarchy has emerged within the blogosphere. Indeed, it shows that the topics discussed in the blogosphere do not arise more or less spontaneously through interaction among thousands of ordinary blog writers or, as many observers claim, that blog discourse is the result of many simultaneous, distributed conversations, but rather that those conversations are initiated by a select few blog writers. And to the extent that these take their cues from mainstream news media coverage, rather than vice versa, they serve as intermediaries (or opinion-leaders), channeling information from

the mainstream news media to the blogosphere at large. Put differently, empirical research suggests that the agenda-setting process runs from mainstream news media, through certain influential blog writers, to the blogosphere at large.

While it is difficult to determine, in the absence of large-scale surveys, why so many ordinary blog writers link to so few blogs, it is certainly possible, as some speculate, that they do so to enhance their own visibility and credibility. Though prevailing netiquette requires ordinary blog writers to link back to those who link to them, the highly skewed distribution of inter-blog links shows that these influential blog writers do not usually reciprocate.

The influence of mainstream news media on blog coverage is certainly strengthened by the fact that some of the most highly linked blog writers are professional journalists rather than ordinary citizens. According to blog counts such as Blogdex, Blogstreet, Daypop, Technorati, and Truthlaidbear, such highly linked blog writers as Mickey Kaus (*KausFiles*), Joshua Marshall (*TalkingPointsMemo*), and Andrew Sullivan (*AndrewSullivan*), also write for such elite news outlets as *Newsweek* (Kaus), *The New York Times* (Marshall), and the *Sunday Times* in London (Sullivan). As media employees, these blog writers might be even less likely than ordinary citizens to juxtapose the reporting and commentary of an ideologically diverse range of sources for fear of upsetting their employers.

Given the disproportionate influence wielded by a few blog writers, it should come as little surprise that few professional journalists read a variety of citizen-produced blogs to gauge public opinion. A survey of more than 140 journalists found that, although the respondents collectively read more than 125 different blogs, the 10 most read accounted for more than half of the blogs mentioned. Among journalists working for elite news organizations, this skewing was even more pronounced: the 10 most read blogs accounted for three-quarters of the blogs mentioned. For all respondents, the blogs maintained by Mickey Kaus, Joshua Marshall, and Andrew Sullivan were among the five most read. Considering that a small number of blog writers wield a strong influence, professional journalists need only to attend to these blog writers to obtain a relatively accurate impression of the distribution of opinions on any given topic.

Conclusion

Blogs have become a prominent component of the contemporary news media landscape. While private blogs produced by professional journalists are used to offer citizens a more comprehensive understanding of the basis upon which journalists construct their stories, news media–hosted blogs produced by professional journalists are used to enhance the transparency of news decision-making processes and to render the outcomes of those decision-making processes more publicly accountable. Citizen-produced blogs generally cite the news reporting and commentary of mainstream news media and, by implication, their elite sources of information.

Bloomberg

Bloomberg News is a news service based out of New York operated by Bloomberg L.P. that in the past two decades has increased the competition among business news wires. Although it is best known for providing business and economic news to investors, it also carries content in other areas, including the arts, politics, and sports. In 2008, Bloomberg News had more than 2,200 reporters and editors in 130 bureaus and published more than 5,500 stories per day. It has become a well-known news-gathering organization that has won dozens of awards and now includes television, radio, magazines, and book publishing divisions.

Former Salomon Brothers general partner Michael Bloomberg founded the company that became Bloomberg L.P. with his severance pay in 1981. Originally, the company just sold computer terminals to Wall Street investment banks that included financial data about stocks, bonds, and other investments. Those financial data still provide the bulk of the company's revenue.

The name changed (1986), and the company began what was originally called Bloomberg Business News (1990) with a six-person editorial team. Bloomberg hired *Wall Street Journal* reporter Matthew Winkler, who had written a story about Bloomberg for the *Journal,* to run the operation. The news service was—and still is—provided on the terminals, which are leased for about $1,800 per month. The first Bloomberg news story was published in June 1990.

During its first year, Bloomberg Business News opened bureaus in New York, Washington, London, Tokyo, Toronto, and Princeton, New Jersey, writing about the stock market and company news that had previously been covered by other wire services such as Dow Jones, the Associated Press, and Reuters. By early 1995, the organization had grown to 325 reporters and editors in 54 bureaus and had started an investing magazine called *Bloomberg Personal* that was distributed as a Sunday newspaper supplement. The two main newsrooms at that time were in Princeton—for business and company news—and New York—for markets and financial news.

In its early years, Bloomberg Business News distributed its editorial content to other media organizations as a way to improve its name recognition, giving terminals for free to newspapers in virtually every U.S. city. Those newspapers then pulled Bloomberg stories off the wire and ran them in their business sections. In many cases, Bloomberg helped the newspapers by creating an index of local stocks that could run each day in the business section.

Bloomberg attracted business journalists from daily newspapers and other media organizations by offering them higher salaries and stock certificates that fluctuated in value based on the number of terminals sold by the company. The number of installed terminals reached 10,000 in 1990 and doubled by 1992, the same year that the company introduced *Bloomberg Markets* magazine. The fifty thousandth terminal was installed in 1995, and the company leased its seventy-five thousandth terminal in 1997. In 2004, the company surpassed the 200,000 installed terminals mark.

The organization purchased WBBR-AM, a New York–based radio station with a business focus, and launched a show on several New York area television stations in the 1990s. WBBR is the flagship radio station of Bloomberg Radio (1993), which syndicates reports to more than 840 radio stations around the world. Bloomberg Television (1994) operates 24 hours a day, competing against CNBC and Fox Business Network, and reaches more than 200 million homes worldwide, operating in seven languages. The company also launched *Bloomberg Morning News,* a daily financial news program on 155 public television stations.

In 1996, Bloomberg started Bloomberg Press, which publishes books for financial professions and the general public on investing, economics, and current affairs. One of the first books was based on the reporting of Bloomberg business journalists Carrick Mollenkamp, Joseph Menn, and Adam Levy.

In 1997, *Time* magazine's Wall Street columnist Daniel Kadlec criticized Bloomberg in a *Columbia Journalism Review* article for putting pressure on newspapers and other media outlets to use more of the media organization's content. Kadlec noted that Bloomberg had pulled its terminals out of some newsrooms that weren't using or attributing Bloomberg editorial content in its publications. Bloomberg's Winkler denied that the organization placed quotas on other news organizations. However, by the end of the decade, Bloomberg had stopped giving its terminals to other media organizations at no charge.

As Bloomberg grew in the business news world, its competitors became wary of its success. "Bloomberg found niches that Dow Jones and Reuters didn't fill," wrote Bloomberg in his 1997 autobiography *Bloomberg by Bloomberg,* cowritten with Winkler. "From the start, it was easier for us to add to our basic product what they provided, than for them to add what we built to theirs." Dow Jones ended up selling its Telerate data operations (similar to the Bloomberg terminal in that they were leased to Wall Street traders and contained data about investments) because it couldn't compete with Bloomberg, and in 1998, Reuters employees were accused of stealing confidential data from Bloomberg in an attempt to copy some of its services. A competing service, Bridge Information Systems, started in the 1990s, but went out of business after the stock market bubble burst in 2000.

Bloomberg has been a major force behind changes in journalism. Winkler pushed federal government agencies to recognize it as a media organization in the 1990s, allowing its reporters to be credentialed to cover breaking news such as monthly unemployment statistics and quarterly gross domestic product numbers. Bloomberg reporters had been denied credentials because their news was distributed through terminals, not a wire service or in a publication.

In addition, Winkler was behind a push for Regulation Fair Disclosure, a law enacted by the Securities and Exchange Commission that requires public companies to disseminate important information to everyone at the same time. Previously, companies could choose to block investors, analysts, and journalists from listening to its conference calls discussing its earnings or other news, and from attending meetings where it discussed its operations. The new regulation gave business journalists access to more information about the companies they covered.

Bloomberg's newsrooms have traditionally included fish tanks with exotic fish from around the world for a soothing presence and snack bars filled with soft drinks, potato chips, cookies, and fruit designed to keep reporters and editors at their desks. It also has a reputation of having an intense, editor-driven culture, and employees who leave Bloomberg for other media organizations are not hired back, per company policy.

Business journalists who join Bloomberg are trained to write stories in a specific manner based on the internal stylebook, *The Bloomberg Way*. The book, which has been updated several times since its original publication in 1995, tells its reporters how to cover specific stories, such as company earnings and the daily stock market performance. Basic Bloomberg News stories are known for their four-paragraph lead structure, which includes the "nut" paragraph (the paragraph that explains the rationale for the story) as the third paragraph and a quote in the fourth paragraph.

The Bloomberg terminal has become a handy reporting tool for many business journalists around the country. The terminal provides access to information about millions of company executives, Wall Street analysts and investors, and industry consultants, including phone numbers and e-mail addresses. It also provides Securities and Exchange Commission documents for all public companies, and a recent addition to the service includes lawsuits and legal rulings.

For years, rumors persisted that Michael Bloomberg would sell the company, which is 20 percent owned by Merrill Lynch. Those rumors increased after he was elected mayor of New York in 2001. However, in October 2006, Bloomberg announced that he was not selling the company despite receiving overtures from interested parties. Since his election, the company has been run by his friend Peter Grauer, a former Wall Street banker.

Business journalist Carol Loomis of *Fortune* estimated in 2007 that the company's 2006 operating profits were about $1.5 billion with $4.7 billion in revenues. Loomis also estimated that Bloomberg's stake in the company is worth more than $13 billion, and that the overall company is worth about $20 billion. In 2007, Bloomberg consolidated its Princeton and New York newsrooms into a new operation in its New York headquarters.

Winkler remained editor-in-chief of Bloomberg News in 2008. In recent years, the company has continued to hire business journalists at a time when many other news organizations were contracting. Some of its best-known hires were Amanda Bennett, the former editor of the *Philadelphia Inquirer,* and former *Fortune* and *Wall Street Journal* reporter John Helyar, co-author of the seminal business book *Barbarians at the Gate*.

Bloomberg News reporters and editors have won some of the top business journalism awards, though its editorial staff has not won a Pulitzer Prize. Its stories and data are now syndicated in more than 400 newspapers around the world.

The acquisition of rival Reuters by Canadian media company Thomson in 2008 meant increased competition for Bloomberg. Combined, Reuters and Thomson Corp. hold about a third of the financial data and news market, roughly equal to Bloomberg's market share. With business news coverage growing in importance in the early twenty-first century, however, it seems likely that Bloomberg News' stature will likely continue to grow.

Books as Journalism

Journalistic books are described in many ways. Sometimes they are classified as "new journalism" or "*new* new journalism"; at other times such books are seen as "literary" or "literary narrative" journalism, sometimes as "literary nonfiction," or "nonfiction reportage," "journalit," or "nonfiction novel." There are varying arguments about what makes a nonfiction book a journalistic work rather than a literary one. One way such books differ from other journalism is in the way the traditional journalistic approaches to news gathering are expanded. Journalists' research can last for years, allowing writers to immerse themselves into the characters' lives and environment, sometimes undercover. Journalists who are unable within the limits of their publication restraints to expand news stories will often return to earlier work and expand that into book-length treatments.

The debate over required elements of the form and its very name is closely related to arguments over *who* can write it. Some argue that only journalists can write such books because of the methods of research required and the narrative approach to the stories. Others feel that literary or creative writers can also produce works that address their subject in a journalistic manner. One example is Rachel Carson's 1962 path-breaking ecology book, *Silent Spring*. Although a scientist by training, her work is recognized as the catalyst that banned DDT pesticide use in America.

Regardless of authorship, the ultimate goal is to produce a news *story* that not only tells what has happened or is happening but strives to make readers feel like they are a part of the story. Beyond telling a human-experience story, journalistic books are often written to inspire change. This approach is closely related to the "muckraking" of a century ago. Such writing uses such literary techniques as an emphasis on characterization, symbols, narrative, and plot motifs, which often allow subjects of a news event to tell their own story. These books can be written as nonfiction or they can include entertaining fictional aspects.

Regardless of the term used, book-length journalism remains underrepresented in scholarly studies and the works themselves are rarely categorized as a separate genre in libraries or bookstores. Rather than being recognized as a separate genre, these books are categorized by their subject matter, making it more difficult to build a sense of commonality, let alone scholarly analysis.

Development

Journalism books have developed in at least three major periods: the late 1890s, the 1930s and 1940s, and the 1960s and 1970s. The early twenty-first century has already been suggested as a fourth period.

The origin of book-length journalism is often debated. Some suggest the beginning dates to the end of the American Civil War (1861–65) and the growing popularity of literary journalism. Others believe the genre's origins lay in the famous "yellow journalism" newspaper rivalries of the 1890s between Joseph Pulitzer and William Randolph Hearst. Matthew Arnold coined the phrase "new journalism" in 1887 to refer to Pulitzer's innovative editorial style of sensationalist and entertaining reporting.

Relevant books include those of both nonfiction and historical fiction. These are often intertwined with factual elements in the central narrative, including a heavy emphasis on characterization (more than a shorter journalistic report, though sometimes with fictional names), or the use of literary symbols. However, these books can also tell a fictional story with relevant social themes, issues, or criticisms that reflect the society about which the author is writing. Examples include several of Charles Dickens' books critiquing nineteenth-century British society and Upton Sinclair's *The Jungle* about conditions in Chicago meat-packing plants early in the twentieth century.

Such books combined the truth of current events with dramatic fiction using literary techniques such as involved plot motifs, careful characterization, and literary symbols with social criticism undertones. This book-as-journalism was so closely linked with its literary cousin that it was not uncommon for many aspiring novelists to see journalism as an avenue to literary fame.

Many works produced before the 1890s are now perceived as early examples of literary journalism thanks to their use of similar techniques. One example is Mark Twain's *Life on the Mississippi* (1883), which described his earlier years in the riverboat world.

Again between the twentieth century's world wars, new forms of literary book-length journalism were produced by such authors as Ernest Hemingway. While the genre experienced a period of renewal in the 1930s and 1940s, Hemingway was one of the few authors to remain quite active in the genre during the 1920s. His work during this decade includes *The Sun Also Rises* (1926), focusing on society's lost innocence and optimism after the war as manifested in the "lost generation"; and *The Killers* (1927), a satirical description of the human experience (although a short story first published in *Scribner's Magazine,* is an example of precursory work in the genre). His contribution to the genre's renewed popularity in the 1930s and 1940s includes *The Fifth Column and the First Forty-Nine Stories* (1938), a collection of writing including *The Fifth Column,* a full-length play about the Spanish Civil War, and *The Denunciation* (written in 1938, although not published until 1969 in *Fifth Column and Four Stories of the Spanish Civil War*).

In the 1960s, Tom Wolfe published a handbook about journalism writing that argued that his "new journalism" stemmed from earlier authors (not newspapers) who used their fiction to bring current social issues into public light. Instead of being concerned with class, Wolfe's new journalism addressed broader social issues such as one's class status.

As with other social institutions, news reporting experienced a shift during the early twentieth century. Objectivity became the cultural expectation in journalism, one which remains today. Thus the "new" journalism books of recent years are often called books of "*new* new" journalism. While these often mixed nonfiction with fictional elements, the "*new* new" journalism books of recent years often lack fictional elements. Prior to being published in book form, these stories often feature pieces in magazines or newspapers. Many of the new journalism books have also been made into motion pictures including *Black Hawk Down* (1999, 2001) and *A Civil Action* (1995, 1998).

The twenty-first century ushered in a fourth period of development of these books. The so-called new new journalism is characterized by the journalists' new depth to reporting. The books are written after living for years among their subjects and in some cases attempting to assimilate into their subject's culture. Barbara Ehrenreich's *Nickel and Dimed: On (Not) Getting By in America* (2001)—in which the author investigates the impact of welfare reform on the working poor by traveling to Florida, Maine, and Minnesota and working in a series of low-paying jobs at Wal-Mart, a nursing home, a cleaning franchise, and several restaurants—is an example of this twenty-first-century model of journalistic books.

Selected Authors

James Agee (1909–55)

Agee began his career as a magazine journalist. His famous journalistic book *Let Us Now Praise Famous Men* (1941) was a result of an assignment with *Fortune* that was never published (possibly because he was unable to write in a way suited to the magazine). He turned his experience living with poor white Alabama sharecroppers into a compelling book, one acclaimed as showing Agee's daring ability to share his emotion. Another similar human experience placed Agee and his family as the subjects. The title *A Death in the Family* (1958) was a fictional piece based on his father's death that was published posthumously and received a Pulitzer Prize.

Mark Bowden (1951–)

Bowden authored *Black Hawk Down: A Story of Modern War* (1999), about an American military raid into Mogadishu, Somalia, that was originally reported for the *Philadelphia Inquirer*. The book made such a profound statement about the way the government determines a successful or failed mission and resulted in such public outcry that it was made into a motion picture two years later.

Truman Capote (1924–84)

Capote mixed journalism and fictional elements in much of his writing. One of his most famous pieces, which Capote called the first "nonfiction novel" and which is considered a forerunner of the "new journalism" genre, is *In Cold Blood* (1966). Capote chronicles murders that shook Holcomb, Kansas, in 1959. While he was accused of including fictional elements in the book, he maintained that all details were drawn

from interviews or official documents. His use of literary techniques to tell a true story (that he spent six years researching and writing) explains why it is considered a major book of journalism. It is often used as a marker for the second phase in the genre's development. The book was originally written in 1965 as a four-part series for *The New Yorker*.

Stephen Crane (1871–1900)

Crane utilized many literary journalistic techniques in his human-interest sketches of daily life in New York City in the 1890s. These include "When Man Falls a Crowd Gathers" (about the selfish reasons people gather around accidents or victims as seen in a crowd reaction to a man's epileptic seizure), "The Men in the Storm" (about homeless men in the snow waiting for a shelter to open), and "A Lovely Jag in a Crowded Car" (societal reactions to alcohol abuse). Crane was fascinated with the city's poorer areas such as the Bowery, which had been transformed from a respectable prosperous neighborhood to one considered immoral and rife with saloons, brothels, and flophouses. Crane felt that nothing real had been written about life in this area and immersed himself in the community to do just that. After his time in the Bowery, Crane wrote *Maggie: A Girl of the Streets* (1893), which Hamlin Garland proclaimed in a review as one of the most honest accounts of the slums ever written. Despite this review, *Maggie* was less than successful. In stark contrast, *The Red Badge of Courage* (1895), Crane's book about the American Civil War, which critically addresses the realities and human side of war, earned him international acclaim.

Charles Dickens (1812–70)

Dickens is identified as one of the revolutionaries in new journalism by Tom Wolfe and is most famous for his literature, or as some have categorized it, literary journalism. Most of Dickens' nineteenth-century novels used character development, literary and social symbols, and narrative to criticize or bring to public attention the social issues of the poor, including workhouses, orphanages, crime, and street gangs. His most representative works include *Oliver Twist, Little Dorrit, The Pickwick Papers, Nicholas Nickleby, Dombey and Son, Bleak House, Great Expectations,* and *Hard Times.* While they read as entertainment, each includes socially loaded themes and criticisms.

Jonathan Harr (1948–)

Harr's *Civil Action* (1995) chronicles lawsuits brought by eight families in Woburn, Massachusetts, against Beatrice's tannery and W. R. Grace's factory for allegedly contaminating drinking water that caused their children to develop leukemia. Harr was a staff writer for *New England Monthly* when he decided to pursue the story. Rather than focusing on the victims as he had in the past—a popular approach in journalistic books—Harr focuses on the lawyers. He was initially questioned about the ways in which he obtained what were seen as some very intimate details; however, all documentation subsequently released has supported Harr's book. In 1998 it was made into a motion picture.

Lincoln Steffens (1866–1936)

Steffens was known for his muckraking journalism and was one of the earliest champions of literary journalism at the *New York Commercial Advertiser* where he was city editor in the 1890s. His muckraking work included what is referred to as a "critical consciousness" of journalism, which even then was seen as a form of not quite journalism because of its emotional consciousness and not quite literature because the content was factual. While most of his work appeared as feature-length magazine pieces in *McClure's,* his articles calling for urban political reform were also published in *The Shame of the Cities* (1904) and in *The Struggle for Self-Government* (1906).

Mark Twain (1835–1910)

Twain, pen name for Samuel Langhorne Clemens, is often cited as a journalist because of his background and the realism in his fiction. Twain's narrative journalistic pieces were often published in weekly magazines for their entertainment value. However, his narratives and most of his books are really critiques of such human

fallacies as vanity and hypocrisy. A majority of his works chronicle his own travels and the lives he encountered, often resulting in insightful criticism of society. Among his important titles are *The Innocents Abroad* (1869), which critiqued a movement to profit from history; *Life on the Mississippi* (1883), which detailed society's greed and tragedy; and *Adventures of Huckleberry Finn* (1884), a fictional narrative criticizing Southern American antebellum society.

Tom Wolfe (1931–)

Wolfe is credited with shaping and driving "new journalism" in the twentieth century. Wolfe is perceived as a father of "new journalism" (despite the earlier coinage of the term in the 1890s and his open dislike for the term). He believed that this type of journalism would rival novels to the point that the genre should fear the new journalism genre. Some of his important titles include *The Electric Kool-Aid Acid Test* (1968), *The Pump House Gang* (1968), *Radical Chic & Mau-Mauing the Flak Catchers* (essays in book form, 1970), *Mauve Gloves & Madmen, Clutter & Vine* (1977), and *The Right Stuff* (1979).

Boston

Boston is the birthplace of American journalism: the first three newspapers in colonial America were started there, beginning with *Publick Occurrences, Both Forreign and Domestick* in 1690. Modern Boston (pop. 600,000 or about 2 million with surrounding suburbs) is a media-rich city with many universities and information technology businesses, and serves as the hub of New England's political, commercial, scientific, artistic, educational, and sports activity. The Boston Designated Market Area (Boston–Manchester, New Hampshire) encompasses 2.4 million homes and is the seventh largest market in the country.

Boston is credited with several other firsts in American journalism, including the first woman editor of a major paper, Cornelia Wells Walker of the *Boston Transcript,* 1842–47; the first woman founder of a major American daily, Mary Baker Eddy, who in 1908 created *The Christian Science Monitor* to promote "clean journalism" in the face of the prevailing "yellow journalism" of her time; the first news story transmitted via telephone, *The Boston Globe,* 1877; the first full-page advertisement, *The Boston Globe,* 1875; the first commercial radio license, WBZ, 1921; and the first all-women radio station, WASN (All Shopping News), 1927.

Newspapers

Publick Occurrences, a 6- by 10-inch three-pager, was immediately accused of printing "sundry doubtful and uncertain Reports" and was shut down by the colonial authorities five days after its appearance. It was never resurrected. *The Boston News-Letter* (1704) and the *Boston Gazette* (1719) lasted much longer. Early news items dealt first with financial and commercial issues and later with politics and urban life. James Franklin's *New England Courant* (1721) is credited by some historians as being the first American newspaper to carry on a crusade—it was against the smallpox inoculation.

The 1800s were dominated by continuous appearances and disappearances of newspaper titles. At one time in the 1830s the city had 15 daily and weekly newspapers, some of which

offered short-lived evening editions. Most were concentrated in downtown Boston's famous "newspaper row" on Washington Street where one of the popular traditions was the daily display of handwritten news signs or blackboards in a newspaper's street-level windows.

Most notable newspapers of that era included the *Boston Daily Advertiser* (1813), the first successful New England paper catering to the interests of the elite, purchased by William Randolph Hearst in 1917; *The Boston Traveler* (1825), originally dedicated to stagecoach listings and the first Boston paper to use newsboys to sell copies in the streets; The *Boston Transcript* (1830), a stodgy, literary paper, which served the city's gentry, and was the subject of T. S. Eliot's poem "The Boston Evening Transcript"; *The Daily Post* (1831), a very successful paper (at its peak it sold more than 600,000 copies daily) that was Democrat and prolabor; *The Liberator* (1831), published by abolitionist William Lloyd Garrison; *The Boston Herald* (1846), a penny-paper founded by a group of area printers; and William Randolph Hearst's *The American* (1904). In 1912 the *Herald* bought the *Traveler* and in 1967 they combined to form the *Boston Herald-Traveler*. In 1972 the *Herald-Traveler* was forced by a government decision to sell its broadcast stations and was soon sold to Hearst's *Record-American* to survive. These properties eventually formed the *Boston Herald*.

A new era in Boston journalism was launched with the appearance of *The Boston Globe* in 1872. The newspaper was the result of a $150,000 joint investment by six prominent local businessmen, led by Eben Jordan, one of the owners of the Jordan Marsh department store. The paper's first year was disappointing, but in 1873 the investors were able to hire Colonel Charles H. Taylor, a Civil War veteran and publisher of the struggling *American Homes Magazine,* to run the paper. Taylor changed the *Globe* from Republican to Democrat, insisted on impartial news presentation, introduced stories of interest to women and children, and cut the price to two cents. It turned out to be a formula for long-term success.

Helped by the steady leadership of one family, the Taylors, for more than 100 years and the special talents of editor Lawrence Winship and later his son Thomas, the *Globe* has been Boston's journalism standard. It has won numerous journalistic distinctions, including 19 Pulitzer Prizes between 1966 and 2007. Some of the most notable of those were the 1975 "Public Service" award for its coverage of the Boston school desegregation crisis; the 1984 "Investigative Reporting" award for its coverage of race relations in Boston; and the 2003 "Public Service" award for its series on children abused by Boston-area Catholic priests. In 1993 the *Globe* was acquired by *The New York Times,* and by the next decade had a circulation of about 400,000.

The *Globe*'s main competitor in the early twenty-first century was the *Herald,* a scrappy blue-collar tabloid with a circulation of about 200,000. The *Herald*'s four Pulitzers in editorial writing are among the most ever won by any one newspaper in that category. Its other three Pulitzers are for its news photography. One of the Pulitzers was given for a 1926 editorial that reversed a long-held *Herald* position and asked for a new trial for Ferdinando Sacco and Bartolomeo Vanzetti, who had been tried and convicted for the murder of two payroll clerks and were facing execution, though the judge and the prosecution had been widely criticized for improper conduct. Over the years, the paper faced continuous financial difficulties and was sold to Rupert Murdoch's News Corp. in 1981. Murdoch sought to expand his Boston electronic media holdings but was unable to overcome Federal Communications Commission cross-ownership restrictions. In order to acquire WFXT-TV, the Fox Boston affiliate, Murdoch sold the *Herald* to one of its News Corp. officers in 1982.

In addition to the *Globe* and the *Herald,* the last major player in the Boston newspaper market was the *Post,* "New England's Great Breakfast Table Paper," which went out of business in 1956. The paper gained prominence after its 1891 acquisition by Edwin Grozier, one of the editors of Joseph Pulitzer's New York *World*. Probably the *Post*'s most famous story was its investigation and 1920 exposé of the "Ponzi scheme," which resulted in the imprisonment and eventual deportation of serial swindler Carlo Ponzi. Grozier had brought with him the Pulitzer formula for success—not only sharp writing and sound news judgment, but also great promotional stunts for circulation building. Some of the most notorious were the daily giveaway of a Ford car for the day's best essay, the gold-tipped ebony cane to be given to a town's oldest citizen, and the "primitive man stunt" that

resulted in a crowd of up to 250,000 Bostonians coming to newspaper row to see the condition of a man who had entered the Maine wilderness naked and stayed there for two months. One of its promotional gimmicks survives to this day—the *Post* Santa (a Christmas campaign to collect toys for poor children) is now the *Globe* Santa.

By 2009, the city has five dailies: *The Boston Globe,* the *Boston Herald, The Christian Science Monitor,* and the free *Boston Metro* and *Boston Now.*

Boston also enjoys a large variety of nondailies and weeklies, the most notable of which are the alternative, arts-oriented *Boston Phoenix;* the *Boston Business Journal;* the African American community's *Bay State Banner;* the Roman Catholic Archdiocese's *The Pilot;* the gay, lesbian, bisexual, and transgender community's *Bay Windows* and *In Newsweekly;* the South End's *Boston Courant;* and the ethnic *Asian Times, Boston Korea, Irish Emigrant, The Jewish Advocate, El Mundo, Post-Gazette, Sampan,* and *El Planeta.*

Finally, Boston is home to the third oldest American magazine, the *Boston Weekly Magazine* of 1743, which was followed later the same year by *The American Magazine and Historical Chronicle.* Boston's signature magazine over the years, however, was the literary *Atlantic Monthly,* which was started in 1857 and featured the works of such famous New Englanders as Ralph Waldo Emerson, Henry Wadsworth Longfellow, and Oliver Wendell Holmes, among others. The magazine moved to its new headquarters in Washington, D.C., in 2005. Many scientific, business, and entertainment magazines are published in Boston today, including *The New England Journal of Medicine, Horticulture Magazine, CFO, Dollars and Sense, Creative Business, Non-Profit Quarterly,* and *New England Home. Boston* is the city's main culture and entertainment magazine.

Radio

Boston was served by one of the early radio stations in America—1XE, later known as WGI, was sporadically broadcasting after 1916. An arrangement between 1XE and the Boston *American* yielded two newscasts per day in 1922. The first U.S. commercial license was assigned in 1921 to WBZ, which remains one of the city's premier stations.

John Shepard, owner of Shepard Department Stores, started another important radio outlet, WNAC, in 1922. WNAC innovated by broadcasting live music from the black Broadway musical "Shuffle Along," which was touring Boston. By 1924 WNAC was broadcasting synagogue services (Rabbi Harry Levi became known as the "radio rabbi") and in 1926 it broadcast live play-by-play coverage of a Boston Red Sox–New York Yankees baseball game.

Boston was briefly served by the country's first all-female station, WASN (All Shopping News), which in 1927 was headed by Station Manager Marion Smith, announcer Grace Lawrence, and saleswoman Claire Crawford. The station lasted six months and was replaced by WBIS (Boston's Information Service) later the same year. It featured phonograph record music obtained from Shepard's Department Store.

Shepard linked up with his brother's radio station WEAN in Providence and with New Bedford's WNBH to form the Yankee Network in 1930. As his network grew, Shepard searched for agreements with newspapers, but encountered significant opposition until he formed the Yankee News Service in 1934 and successfully challenged the newspapers and AP agreements that would allow radio stations only two newscasts per day.

In 1937 Shepard was granted a permit to build an FM station in the Boston area, W1XOJ (later W43B), but construction problems delayed the start of transmission for a couple of years. Shepard's second FM station, W1XOY in Mt. Washington, New Hampshire, created the first FM relay network in America (1940). In 1941 Shepard sold his first FM network commercial to Socony-Vacuum Oil Company.

In 1941 a disgruntled former Shepard employee founded the Mayflower Broadcasting Company and challenged the FCC license renewal of WAAB, one of Yankee Network's Boston stations, on the grounds that the station's editorials and political coverage were unfair and unbalanced. The commission found that WAAB made "no pretense" to report objectively or impartially, but said that for a radio station to be "an instrument of democracy" it must serve "the public interest—and not the private." The FCC asked WAAB to present issues "fairly, objectively and without bias." WAAB agreed to change its ways and retained its license.

In 1949 the Mayflower decision was replaced by the Fairness Doctrine.

The promise of the emerging electronic media market led to several newspapers looking into diversifying into radio and television. In 1946 the *Herald-Traveler* bought WHDH-AM, and later WHDH-FM and WHDH-TV. In 1972 the conglomerate was challenged by other local competitors to divest. The Supreme Court agreed and the *Herald-Traveler* had to sell the stations that had long supported the paper, which eventually caused its demise.

Some of Boston's key radio stations in the early twenty-first century included WBZ-AM (news-talk), WJMN-FM (contemporary hits), WBCN-FM (alternative), WMJX-FM (adult contemporary), WODS-FM (oldies), WRKO-AM (talk), WEEI-FM (sports), WTKK-FM (talk), WKLB-FM (country), WAAF-FM (active rock), and WCRB-FM (classical). WBUR-FM and -AM are the NPR affiliates and are known nationally for such programs as "Car Talk" and "On Point." WGBH-FM is another NPR affiliate known nationally for its classical, blues, and jazz programming.

Television

In 1928, the engineers of WLEX, the radio station of the Boston suburb of Lexington, were optimistic they would soon be able to transmit sound and pictures. Station engineers had been working on mechanical television (a device that would capture and display images through a revolving disk with a series of holes in a spiral pattern) and Raytheon Manufacturing Co., also of Lexington, was beginning to produce the "kino lamp" that was to be central to the new television technology.

Boston newspapers the *Post* and the *Evening Transcript* were supportive but the experiments were unsuccessful—the images were unclear and crude and the sound was noisy. Just as support for the experiments was beginning to lag seriously, the New England Council, a group of area business leaders, stepped in and underwrote the project's funding. New equipment was brought in and a television-specific structure was built, thus allowing for the better separation of the sound and sight transmission frequencies. This time the experiments were successful.

The first commercial television station in New England was WBZ (Channel 4), which went on the air in June 1948. Originally an NBC affiliate (CBS has owned and operated the station since 1995), WBZ was the first New England outlet to offer regular newscasts and to broadcast live play-by-play accounts of Boston Red Sox and Boston Braves baseball games.

Among the long-running programs on WBZ have been the *Big Brother Bob Emery Show* and Rex Trailer's *Boomtown* and *People Are Talking*. Anchors Liz Walker and Jack Williams, along with sportscaster Bob Lobel, formed an anchor team for two decades, from 1980 until 2000. Williams and Lobel continued anchoring into the new century. In 1965–68, the station featured the city's first African American anchor, Terry Carter.

Channel 7 is the second oldest television station in Boston, having started just 12 days after WBZ in 1948 as WNAC-TV. It became WHDH in 1961. The station offers an extensive selection of weekly programs addressing various religious and ethnic Boston communities (i.e., *Asian Focus, Higher Ground, Jewish Perspective, Revista Hispana,* and *Urban Update*). WHDH is Boston's NBC affiliate. Since 2006 it has been producing the 10 p.m. weeknight newscast for its sister station WLVI.

WLVI (Channel 56) is Boston's oldest UHF station (1953) and is a CW (CBS and Warner Bros.) network affiliate. For lack of funds, the station closed twice (1956 and 1962). From 1966 to 1969 and again from 1985 to 1990 the station served as the broadcast source for Boston Celtics road games. In 1999 it served as the flagship station of the Boston Red Sox.

WGBH (Channel 2), the Boston public television outlet, went on the air in 1955 as an early non-commercial television station. In the early 2000s it was a major production center for the Public Broadcasting Service with such programs as *Antiques Roadshow, American Experience, Basic Black,* and *Greater Boston.*

WCVB (Channel 5) took the channel originally allocated to WHDH, which was owned by the Boston Herald-Traveler Corporation. Pressure by local competitors forced the FCC to raise ownership concentration issues and WHDH had to relinquish its ownership. WCVB went on the air in 1972 with a strong schedule of public affairs programs. Starting in the early 1980s, husband-and-wife team Natalie Jacobson and Chet Curtis formed the city's most successful anchor team for

more than 20 years. Since 1982 the station has been producing the nightly news magazine *Chronicle*. WCVB is Boston's ABC affiliate.

WSBK (Channel 38), the city's youngest station, went on the air in 1964 under the ownership of the Boston Catholic Television Center with call letters WIHS-TV. At various times in the past, the station broadcast Boston Bruins, Celtics, and Red Sox games.

More than 300 years after the first colonial newspaper appeared in this city, Boston continues to play an important role in the life of American journalism. Veteran and budding journalists in Boston's many established news outlets and academic institutions are working on the cutting edge of journalism's future. They research and experiment with new multimedia platforms and storytelling techniques as they prepare the next chapter of journalism in America.

British Broadcasting Corporation

The British Broadcasting Corporation (BBC) is one of the world's most prominent and successful broadcasting organizations, and is viewed by many as the premier national public service broadcaster. It has gained a reputation for high levels of creativity across a range of programming formats. None has been more prominent than its journalistic output, whether at the local, regional, national, or international level. Throughout the twentieth century the prevailing form of broadcasting globally, with the prominent exception of the United States, was that of public service broadcasting. There is perhaps no greater testimony to the importance of the BBC and its principles and values than the fact that many countries, when they were establishing broadcasting in the early decades of the twentieth century, chose the BBC as the model to emulate (with, it has to be said, varying degrees of success). This was particularly the case with its journalistic output, where the BBC was seen to set the gold standard for independence, impartiality, balance, and comprehensiveness in its output. In the twenty-first century, however, there is a growing use of market values to determine the output of electronic media.

Origins

The BBC began life as the British Broadcasting Company on October 18, 1922. It was formed by a group of radio manufacturers, including radiotelegraph inventor Guglielmo Marconi, who were eager for an organization to provide programming for their product. Daily broadcasts began on November 14, 1922. The general manager was a dour 33-year-old Scottish engineer, John Reith. In these fledgling years some news was broadcast, but never before 7 p.m. so that newspaper sales would not be affected. In 1926 the BBC faced the first major crisis over what, even then, was taken to be absolutely axiomatic to its founding principles: its editorial independence. During the general strike of that year the biggest and most intense conflict between the trade union movement and the government in modern British history took place and the public turned to the BBC for news because no newspapers were being published. The BBC sought, with a modicum of success, to represent the news of the strike as seen from both sides. This infuriated the then chancellor of the exchequer, Winston Churchill, who

wanted the BBC to be taken over by the government. Reith and then–Prime Minister Stanley Baldwin resisted, and the BBC maintained its independence. The incident would be the first of many conflicts between the BBC and the government of the day. Yet the 1926 conflict demonstrated just how effectively the BBC was fulfilling its commitment to independent journalism on the grounds that if the government is disturbed about news coverage then the corporation must be doing something right.

At the beginning of 1927 the BBC became the British Broadcasting Corporation, established by a Royal Charter. This would be crucial to its continued efforts to maintain its independence since the charter meant that the BBC was an institution of the monarchy and not the state. The charter also established a board of governors, appointed by the monarch, who were deemed to be trustees of the public interest. The significance of this for the BBC's independence in general, and its journalism in particular, was that the only way the government could seek to control the BBC would be, ultimately, by getting the monarch to remove the governors. Since this would inevitably be extremely controversial, and since under the terms of the (unwritten) British constitution the monarch cannot be seen to be involved in political controversy, the possibility of the governors being removed was remote in the extreme. It was also determined that the BBC would be funded by a license fee, paid by anyone who owned a radio receiver and, later, a television. The purpose here was to provide financial independence for the corporation, so that it was reliant neither on advertising nor state subvention. The thinking behind this was very much that of Reith who looked west to the unregulated radio of America and east to the rigidly controlled radio of the Soviet system and did not like what he saw in either direction.

In January 2007, the BBC's latest Royal Charter came into force and will continue through 2016. From that date the BBC was to be governed by the BBC Trust, rather than a board of governors. The trust's function is to set the strategic direction of the corporation, leaving operational responsibility to an executive board, chaired by the director general. The charter also reasserts the BBC's editorial independence.

Journalism and the BBC's Basic Values

The BBC's purpose through its history has been to "inform, educate and entertain." Drawing from a number of sources, such as the Broadcasting Research Unit's "Public Service Broadcasting: Main Principles," it is possible to suggest the intellectual framework that defines the BBC and that, therefore, provides the framework within which it practices its journalism:

- *Universality of Availability:* Public broadcasting historically sought to ensure that its signals were available to all, wherever they might live. The imperative that guided this principle was not that of maximizing customers in a market but of serving citizens in a democracy, on the basis that if one defines one's audience as all the citizens of a country, then logically one has to reach them all.

- *Universality of Appeal:* Public broadcasting sought to provide programs that catered to the many different tastes and interests that constitute a society's life, understanding that each of us, at different moments, is part of a majority and a minority. The rather optimistic premise was that well-produced programs can please a lot of the people a lot of the time, and everybody some of the time, driven by the desire, to use an aphorism coined by a senior BBC executive Hugh Wheldon, to make good programs popular and popular programs good. This goal, however, set its face against giving people what they want. This was a vital principle for the BBC's journalistic output since the corporation understood its role as one of providing the citizenry of the United Kingdom with the information they needed to exercise that citizenship, rather than what they, the public, wanted, which was assumed would be trivial and not healthy for democratic culture.

- *Provision for Minorities, Especially Those Disadvantaged by Physical or Social Circumstance:* Public broadcasting saw the public as a rich tapestry of tastes and interests each of which, insofar as possible, should be served. Journalistically this meant that the BBC undertook to provide news and information for specific groups and interests, as well as for the general citizenry.

- *Serving the Public Sphere:* Public broadcasting recognized its special relationship to a sense of national identity and broad community. Any

nation is a patchwork of localities and regions, but it also is a nation, heterogeneous and homogeneous at one and the same time. Public broadcasting's very nature was then to nurture the public sphere as a means of serving the public good, since it is within the public sphere that individuals function as citizens. The corporation's journalistic output was key to this commitment.

- *A Commitment to the Education of the Public:* The most outstanding example of public broadcasting's commitment to the audience-as-citizen is the longtime provision, in almost all public broadcasting systems, of educational programming at every level. The basic premise was that political and social literacy, as well as literal literacy, are an essential prerequisite to the healthy working of a democratic order. Above all else, the commitment to this principle required that it treat its audience as mature, rational beings capable of learning, growing, and demanding information.

- *Distance From All Vested Interests:* It is a simple but key principle of public broadcasting that its programs can best serve the public with excellence and diversity when they are produced from within a structure of independence.

- *Competition for Good Programming Rather Than Competition for Numbers:* This principle was central to public service broadcasting and essentially involves a commitment to making programs that are of high quality, whatever their intended audience. Hence the BBC's commitment to "quality" news and current affairs.

- *Liberal Broadcasting Rules for Program Makers:* While it was understood that all broadcasting will inevitably be governed by certain prescriptions—"educate," "inform," "entertain," "balance," "fairness"—the essence of the legislative foundation empowering it should sustain a liberal function for the program maker.

These principles, articulated by an independent think tank, were echoed in the BBC's own 2007 "statement of purpose" when it declared that it creates "public value" in six ways: sustaining citizenship and civil society; promoting education and learning; stimulating creativity and cultural excellence; representing the United Kingdom and its nations, regions, and communities; bringing the United Kingdom to the world and world to the UK; and delivering the benefit of emerging communications technologies. From the standpoint of its journalistic practices all these values are clearly present: it supports civic and cultural life by providing news and information "that helps citizens make sense of the world and encourages them to engage it"; it seeks "to broaden the national conversation"; it provides news at the national, regional, and local level, as well as having a growing international role; and it defines itself as "the world's most trusted provider of international news and information."

The Royal Charter identifies another purpose, one that is and will continue to be of enormous importance in the BBC's proffering of news and current affairs programming: in promoting its other purposes the BBC will deliver to the public the benefit of emerging communications technologies and services and, in addition, take a leading role in the switchover to digital television. The anchoring of the BBC to the monarchy, historically a key part of sustaining its independence, is maintained, and defined in article 12(3): "The Chairman, Vice-Chairman and ordinary members of the Trust shall be appointed by Order in Council." The "Council" is the constitutional body overseen by the monarch.

An "agreement" complements the 2007 charter, and was made between the BBC and the Secretary of State for culture, Media and Society following a debate in Parliament in July 2006. The agreement goes into more detail than the charter in relation to the obligations of the BBC and how they will be pursued. With regard to news and current affairs, the agreement declares that the public "can trust the BBC to provide high-quality news, current affairs and factual programming that keeps you informed and supports debate about important issues and political developments in an engaging way."

The agreement also declared that the BBC's journalism would encourage conversation and debate about news, current affairs, and topical issues among friends, family, and wider groups through forums for debate such as phone-ins and online discussion areas. It also declared its intent to build a greater understanding of the parliamentary process and political institutions governing Britain, including those of the European Union.

The BBC also defines a number of values that it uses to guide its journalistic practices and that it

demands of its journalists: news and current affairs programs that are balanced and unbiased; reporting that strives for accuracy and truth; commitment to fairness and privacy; respect for the audience through production and broadcast of "dignified programming"; and the maintaining of its independence from all vested interests, be they economic or political.

BBC Journalism: Organization and Output

There are three main organizational elements to the BBC's journalistic activities:

1. The Journalism Group consists of the BBC's journalism at the international, national, regional, and local levels across radio, television, and online interactive media. Within the group, BBC News provides all the UK-wide news and current affairs content and news gathering. The BBC News website is one of the fastest growing areas of the BBC. In 2007, 80 percent of all adults in the United Kingdom accessed the BBC each week, either through radio, television, or the Internet.

2. BBC Global News includes BBC World Service Radio, BBC World Television, and online services. In 2006, the different services reached an estimated 233 million people globally and outperformed CNN International (CNNI) and other international competitors. In 2006–07, BBC World was available in 280 million homes around the world, and the BBC World Service Radio reached 183 million homes across its 33 language services.

In 2006–07, through its national television services (BBC1, BBC2, BBC3, BBC4, BBC24, and BBC Parliament) the corporation produced 20,287 hours of news and weather reports inside the UK. It also produced 821 hours of current affairs programming. Through its national radio services (Radio 1, Radio 2, Radio 3, Radio 4, Radio 5 Live, 1Extra, BBC Music, and BBC Asian Network) the corporation produced 12,642 hours of news and weather reports, and 3,470 hours of current affairs programming. While figures were not available for the journalistic output of BBC Global News, BBC World Services produced 1,258 hours each week, in 33 languages, which is 65,400 hours a year. In addition, there are tens of thousands of hours of news and current affairs broadcast by the BBC's affiliate stations at BBC Scotland, BBC Wales, and BBC Northern Ireland, and in its English Regions and its large network of local radio stations.

3. In 2007 the BBC established a web-based College of Journalism, open to the BBC's 7,500 journalistic staff, with the purpose of promoting "the BBC's values and the highest ethical and editorial standards, as well as developing the strongest craft skills and knowledge base across the BBC." The website contains modules, practical guides to journalism, and blogs, all provided by BBC journalists. There are also sections on values, ethical dilemmas, law, writing, audiences, and craft skills.

BBC Journalism and Credibility

The essence of the BBC's commitment to journalism has historically been its declared editorial independence and its commitment to impartiality. This means that it is axiomatic that no other institution, in public or private life, can tell it what to do or how to do it, and the BBC does not take sides on issues when covering the news and public life in general. However, audience research in the first decade of the twenty-first century suggested that there was a growing sense among the public that the BBC is failing in these areas. The BBC, in its annual report in 2007, declared that 76 percent of respondents in a survey said that they trusted BBC news programs "the most to give a fair, informed and balanced view on important issues and events. Overall, 53 percent rate the BBC as fair and impartial, against 18 percent who believe it is biased." However, in a survey conducted on behalf of the BBC World Service, as part of a global report into perceptions of media freedom, and reported in the press in December 2007, only 29 percent of 1,003 Britons polled said they rated the BBC positively. Forty-three percent percent said the BBC's performance was "average" in reporting news, and 26 percent said it was poor. In fact, British respondents thought less of their publicly funded news organization than those in countries such as Venezuela, Russia, Egypt, Kenya, and Nigeria. Britain, much to the embarrassment of the corporation, came eleventh out of 14 countries polled in levels of trust toward that national public broadcaster. One of the other revealing findings was that many Britons were critical of the accuracy of the BBC's news reporting.

A possible explanation for this negative public opinion might have been that the survey was conducted at a time when the whole of British broadcasting, including the BBC, was rocked by a number of scandals. These included fraudulent call-in programs, where the results of what were supposed to be open contests in which the public could vote by telephone or text message were found to rigged. While these didn't originate within the BBC news and current affairs departments, the general sense of a lack of honesty seemed, to some observers, to wash over public judgments about the BBC's news output.

There were, however, specific instances in 2007 in which BBC news and current affairs programs engaged in what can only be described as deceptive practices. One such became known as "Queengate." The BBC was making a documentary of a year in the life of the Queen. In one sequence, the Queen seemed irritated by a particular question. In the promotional film for the documentary the question and her irritated response are shown and then she is seen walking away in some haste, as if she had stormed out of the set where she was being filmed. In fact, the sequence of her walking was shot before the question had been posed and she was in fact walking toward the set. This caused a huge furor, particularly on the grounds that if footage of the monarch could be manipulated in order to garner attention for the program, what else in news and current affairs could be manipulated? The head of BBC One, which had commissioned the documentary, was forced to resign. In a similar vein a current affairs program edited footage of then–Chancellor of the Exchequer (later Prime Minister) Gordon Brown in reverse chronological order simply to obtain a more dramatic effect. The BBC was forced to apologize.

Another more profound explanation for the decline of public trust might have been that, as with every other news broadcaster, the BBC was functioning in a global and national political environment that was ever more fractious and polarized, and in which its reportage was much more susceptible to accusations of bias. One stark example of this was when the Israeli government banned the BBC from press conferences because of what it took to be the BBC's anti-Israel agenda in its coverage of the Israeli-Palestinian conflict. There was an enormous collision between the BBC and the British government after a news report from the corporation claimed that the government had manipulated intelligence in the run up to the Iraq war. An official inquiry, headed by Lord (Brian) Hutton, severely criticized the BBC for offering misleading information, and both the chairman and director general were forced to resign.

The BBC recognized that serious and threatening questions about its impartiality were afoot and that they were propelled by a number of different forces. In June 2007, a report titled *From Seesaw to Wagon Wheel* from an internal Impartiality Steering Group was published. It is a particularly important statement about the issues swirling around the BBC's journalistic practices since it examined not just the politics within which it now had to function, but also the ways in which its practices were being drastically affected by a radically changed media ecology:

> Impartiality in broadcasting has long been assumed to apply mainly to party politics and industrial disputes. It involved keeping a balance to ensure the seesaw did not tip too far to one side or the other. Those days are over. In today's multi-polar Britain, with its range of cultures, beliefs and identities, impartiality involves many more than two sides to an argument. Party politics is in decline, and industrial disputes are only rarely central to national debate.
>
> From its foundation, the BBC developed an impartial approach which distinguished it from the largely partisan world of print. Other broadcasters followed this lead, and impartiality became a central feature of public service broadcasting. Now, in the early 21st century, with digital switchover only a few years away, impartiality is under increasing pressure, whether from shock-jocks, opinionated news channels, or unregulated broadband broadcasters.
>
> The BBC is not isolated from these developments. Thanks to the revolution in communications technology, its programs swim in the same sea. The convergence of platforms, services, and technical devices is blurring the boundaries between television, radio, and print, and creating a single media market. People no longer need to go to fixed points to watch or listen: they can now access BBC material almost anywhere, by wireless connections and handheld devices and

> often via portals which have no interest in or understanding of impartiality. The public can tailor content to suit themselves, and are increasingly able to view or listen on demand.

The significance of this statement lies in its recognition that the issues confronting the BBC's journalism, as the twenty-first century unfolded, lay not just in the relationship between good and bad practice, but rather in underlying structural change and disruption. The corporation could not escape the fundamental reality that it was one part of a larger media environment, and that just as global warming could drastically affect the physical environment, so could the developing conjunction of technology and new patterns of audience choice drastically influence the character of even the most famous and renowned of broadcasters.

Conclusion

Perhaps the greatest challenge to the BBC's journalistic mission in the twenty-first century will not be issues of its professionalism, nor the ever-present collisions with the government over political content. Rather it will be—indeed already was in the century's first decade—the growing indifference of a public, particularly a young public, distracted by the myriad new ways of being entertained and informed, not to mention a continuing decline in its revenue stream from the license fee. The decisive development that enjoined these two processes began in the Thatcher years (1979–90) when repeated collisions with Conservative governments over such issues as civil war in Northern Ireland and industrial disputes did not endear the corporation to the Conservatives. This also coincided with the effort by government to implement neoliberal social, economic, and cultural policies throughout British society such as reducing the value of the license fee, creating greater competition among different broadcasters for the audience, and removing all public service commitments from ITV, the BBC's main competitor for the mass audience. This translated into the ever-greater desire to employ market forces to guide the destiny of the nation. That trend of conflict and the pursuit of market economics continued, with even greater animus and energy, under the Labour government, which came to power in 1997, along with the escalating migration of audiences to the web for entertainment and information, particularly among the young. The result will be a shift from the provision of news and information by a large organization to citizens, to a culture of consumers who will choose what they do or do not want of the news and information being offered. It is a profound inversion of that original Reithian conception of the role of the public broadcaster (demonstrated by the BBC's own growing use of multiple platforms, and branding and marketing of its news and current affairs output) alongside a serious reduction in resources for its journalistic output.

As the end of the first decade of the twenty-first century approached it seemed that the BBC was in what professor Georgina Born of the University of Cambridge had called the "post-impartial era." In reality, the shift was deeper than that and the BBC was to all intents and purposes starting to live within the post–public service broadcasting era. In that sense the BBC was coming full circle, back to a time when it was the British Broadcasting Company, that is, a commercial enterprise. The implications of this for the BBC, its journalism, and its role within the democratic culture of the United Kingdom are likely to be enormous and, if one believes in the democratic process, deeply negative as news and current affairs programming become mere commodities in the vast markets of a new media universe.

British Broadcasting Regulation

Regulation has played a major role in the development of British broadcast journalism. In a number of areas British broadcasting regulation has been more rigorous and extensive than that in other Western democracies. British regulators have set high standards for broadcast content—not only in traditional areas for regulation such as taste and offence (the portrayal of sex and violence, offensive language) but also in journalism—requiring broadcast news and current affairs to be both accurate and impartial.

As well as setting content standards, regulators have also been closely involved in determining the structure of British broadcasting and assessing the quality of its program output. Regulation has extended to the scheduling and length of news programs, their resources and budgets, as well as the amount of current affairs programming. At the same time, the regulatory bodies, in a country that does not have the same constitutional protection of freedom of expression as the United States, have had to maintain their own independence from political and commercial influence and protect the independence of the broadcasters.

For much of the twentieth century this approach to broadcasting regulation helped ensure high programming standards in both publicly funded and commercial broadcasters. The benefits of this competition were most clearly seen in journalism, where the British Broadcasting Corporation (BBC) and its commercial counterparts were encouraged to devote substantial resources and air time to high quality journalism. But with the growth of a more competitive media market in multichannel television and online media at the end of the century, the traditional British model came under severe pressure, and the role of regulation in commercial broadcasting began to weaken, although it continued to have a major role in publicly funded media like the BBC. The implications for British broadcast journalism were significant.

The BBC

British broadcasting regulation began in 1926 with the first BBC charter. The BBC at the time had a monopoly on radio and the politicians wanted to ensure that it could not be captured by any special interest. The BBC charter gave the job of regulating to the BBC Board of Governors, 12 men and women appointed by the Crown on the advice of the government to ensure that the BBC was properly managed, that its programs met the required standards and that it remained independent. The charter was renewed and reviewed every ten years until the replacement of the governors by a new body—the BBC Trust—in 2006.

From the start, the BBC was expected to be impartial in its coverage of public affairs and not broadcast its own or its staff's opinions. Impartiality became an essential part of the BBC's culture and the governors were responsible for regulating it. The 1996 charter reinforced this by formally requiring the governors to ensure that controversial subjects were treated with due impartiality, but it was only making explicit a requirement that had existed for more than 70 years.

The governors combined these regulatory responsibilities with the strategic direction of the BBC—hiring and firing the director-general (chief executive) and approving the BBC's budget.

Constitutionally, the governors *were* the BBC, putting them in the unusual position of being both regulator and part of the organization they were regulating. This led, at the end of the century, to growing criticisms that their regulation of the BBC was insufficiently independent and rigorous—that in arguments over BBC news coverage, for example, or the way the BBC's growing commercial activities affected its competitors, the governors had been "captured" by the management and would support it against valid outside criticism.

Commercial Television

The arrival of commercial Independent Television (ITV) in Britain in 1955 meant the BBC faced competition for the first time. A separate regulatory structure was created to ensure that the new commercial stations were in some ways as tightly regulated as the publicly funded BBC. Initially, the regulators—first the Independent Television Authority (ITA) and, from 1972, the Independent Broadcasting Authority (IBA)—were legally the broadcasters and had the right to decide what could be broadcast. The regulators also had enormous power over the regional companies that made up the ITV Network. The regulators awarded and renewed their licenses on the basis of the companies' promises to deliver high quality programming in areas such as regional and national news, education, current affairs, and documentaries.

The regulators would set quotas for the amount of programming in different categories, and for the amount of regionally based production—local news and documentaries, for example. In addition, the commercial broadcasters were subject to the same content regulation as the BBC in areas such as taste and offense—as well as the same obligations of accuracy and impartiality in news.

When a second commercial channel—Channel 4—was launched in 1982 it was again subject to tight regulatory control. Although its role was to innovate, it was also clearly part of public service broadcasting. The regulator set out the channel's program remit in some detail, including the minimum amounts of time to be devoted to different genres—such as news, documentaries, and education. The result was the launch of Channel 4 News in 1982, a 50-minute-long nightly news analysis program combining news and current affairs that rapidly became one of the channel's iconic programs.

When the license for the third commercial broadcaster—Channel 5—was awarded in 1996, the regulator gave the license to the company that had the most ambitious news plans, and *Five News,* with a new, informal, style of presentation, rapidly became one of the key programs on the new network. The *Five News* newscaster, Kirsty Young, the first woman to be the principal newscaster of a UK network, presented while perched on a desk in the newsroom or walking around rather than seated behind a conventional desk on a conventional news set. *Five News* also made more use of video diaries and user generated content than its competitors. Both of these new news services were subject to the same regulatory obligations on impartiality.

A similar regulatory model was adopted when commercial radio was introduced into the UK in 1973. Licenses were awarded on promises of performance and stations were encouraged to provide current affairs programming and news as well as music. Radio journalism too was required to be impartial.

In 1990, the Broadcasting Act set up two new regulators for commercial television. The Independent Television Commission (ITC) took over most of the IBA's functions but no longer had the right to censor programs before they were broadcast. And somewhat confusingly, the ITC had to share responsibility for content standards and complaints with a new, separate regulator, the Broadcasting Standards Council (BSC) whose remit was also extended to hearing standards complaints about BBC programs (except for those related to impartiality and accuracy). Radio was given its own regulator, the Radio Authority. The multiplicity of commercial regulators was all replaced in 2003 by a new single regulator, the Office of Communications (Ofcom).

Independence

A key objective of British broadcasting regulation, in addition to high programming standards, is independence. The BBC governors and the members of the various commercial regulators were, in the main, independent figures from the professions—such as lawyers and academics, business

executives from media and nonmedia industries, and people with experience of the creative arts, such as writers and directors—rather than politicians. They were expected to operate in the public interest rather than as representatives of any party. As politicians became more aware of the growing influence of television, from the 1960s onward, there were tensions between broadcasters and the government that often found expression in arguments over regulation.

Generally, regulators tried to maintain their own independence as well as that of the broadcasters, but there have been occasions where they were seen to bow to government pressure, particularly over coverage of the tense political and religious situation in Northern Ireland. In 1978 the government of James Callaghan persuaded the IBA to use its powers of pretransmission censorship to pull from the schedule a current affairs documentary by Thames Television, the biggest ITV company at the time, on allegations of ill treatment of suspected members of the Irish Republican Army (IRA) in the Castlereagh interrogation centre in Northern Ireland.

In 1985 the BBC governors, under pressure from the government of Prime Minister Margaret Thatcher, previewed and stopped transmission of *At the Edge of the Union,* a documentary that featured the Sinn Fein leader Martin McGuinness. Sinn Fein was the political wing of the IRA and McGuinness, as well as being a prominent figure in Sinn Fein, was also believed at the time to be an IRA commander. The decision of the governors led to a protest strike by BBC staff and at the insistence of the director-general, who argued that as editor-in-chief of the BBC the final decision was his, the program was later broadcast.

On other occasions, the regulators stood firm. In 1986 the IBA defied a government request to ban the transmission on *Death on the Rock,* a current affairs documentary by Thames that challenged the official version of the killing by British security forces of three IRA terrorists in Gibraltar. And in 1988, after the Thatcher government had failed to persuade the broadcasters and the regulators to stop programs carrying interviews with members of Sinn Fein, the government bypassed the regulators and ordered a ban on Sinn Fein and other republican voices being heard on the airwaves. The broadcasters, with the support of their regulators, continued to interview republicans, but had their words voiced by actors. The ban was eventually lifted in 1994.

In 2003 the BBC governors backed a BBC broadcast that alleged that Prime Minister Tony Blair's government had deliberately misled the public when it claimed before the Iraq war that Saddam Hussein had weapons of mass destruction. The BBC's source, a government scientist, Dr. David Kelly, was revealed and committed suicide. A judicial inquiry into the affair by Lord Hutton found that the most damaging part of the story—the allegation of dishonesty—was untrue. The BBC's management and governors were severely criticized. The publication of the Hutton Report in January 2004 provoked the biggest crisis in the BBC's history. Gavyn Davies, the chairman, resigned on the day of publication. The next day, Greg Dyke, the director-general, resigned, having failed to win the full support of the Board of Governors.

Impartiality

One of the most striking characteristics of British broadcasting regulation is its insistence that news and current affairs should report on controversial subjects with "due impartiality"—that is, not show any bias in favor of any argument or party. This obligation was actively policed by the regulators, who also acted as the final court of appeal in the event of any complaint that a program had failed to show impartiality. The BBC governors and their replacement, the BBC Trust, were responsible for impartiality on the BBC; the commercial regulators had similar responsibilities for all other broadcasting.

Impartiality was an essential part of the culture of British broadcasting from the start and continued to be a key value into the twenty-first century. It was recognized and appreciated by the audience—surveys of public opinion show that broadcast journalism was far ahead of print journalism in its reputation with the public for accuracy and fairness. As trust in many British institutions and professions—including politicians—declined in the last quarter of the twentieth century, public trust in broadcast journalism remained high. In 2004, a major independent review of UK government communications by Bob Phillis, the chief executive of the Guardian Media Group, reported research that

showed 74 percent of the British public trusted television newscasters to tell the truth, compared with 36 percent for civil servants and 29 percent for business leaders. And the report also pointed out that in the 2003 Iraq war, 70 percent of the British public thought television news was the most trustworthy source of information, compared with 14 percent for radio and just 6 percent for newspapers.

The notion of impartiality is a controversial one. Some critics argue that it is unachievable—that what the broadcasters call impartiality is simply their preferred bias—though critics disagree over whether the bias is too liberal or too conservative. At the start of the twenty-first century a new criticism of impartiality was heard—that it was irrelevant in a world of multiple news sources where plurality mattered more than impartiality. It was argued that impartiality rules should only apply to the traditional UK public service broadcasters and not to foreign news channels such as Fox News and Al Jazeera.

Harm and Offense

British broadcasting regulation has always set content standards in areas such as harm and offense—bad language, portrayal of sex and violence, the protection of children from inappropriate content at times when they were likely to be watching television—as well as fairness in the way broadcasters behave—issues such as respecting individuals' right to privacy and proper treatment of interviewees and contributors. The regulators' role has been to try and strike a balance between freedom of expression and the rights of broadcasters to be creative and experimental. They and the broadcasters evolved a system of programming codes and guidelines to make clear what was permitted and the regulators acted as the court of final appeal in the case of complaints about programs.

The regulators also have the role of policing the "watershed" in British television. This is a rule that material unsuitable for family viewing is not shown on broadcast channels before 9:00 p.m. In making their judgments on taste, the regulators have always taken into account the time at which programs were broadcast and the likely composition and expectations of the audience.

Regulators have substantial powers to punish broadcasters who break their codes and guidelines. They can require the offending program to be re-edited, prevent its retransmission, and in many cases fine the broadcasters. They are particularly concerned about the honesty of broadcast journalism. In 1999 the ITC fined Carlton Television, a leading ITV company, the record sum of £2 million for broadcasting *The Connection,* a documentary on the cocaine trade that had faked a number of sequences.

The End of the Duopoly

The unique British experiment in regulating all broadcasting as a public service could only exist as long as there was effectively a duopoly of the BBC and the commercial broadcasters who in turn enjoyed a monopoly on advertising revenue. The arrival of multichannel television—particularly Rupert Murdoch's BSkyB in 1990—changed that stable situation, as satellite and cable television services were subject to much lighter regulation. The commercial television regulators were responsible, however, for ensuring that news programs on multichannel television (such as Sky News, the first 24-hour British news channel) met existing national standards for impartiality.

Margaret Thatcher's 1980–91 government used regulation to inject further competition into what it saw as a complacent and overmanned industry. The 1990 Broadcasting Act marked the beginning of the end of the long British experiment in public service broadcasting. The new commercial regulator, the ITC, was given the job of awarding new ITV licenses when they came up for renewal in 1992 not on the basis of program promises, as in the past, but in a blind auction where once a minimum-quality threshold had been met the highest bidder was given the license.

The new ITV companies lobbied the ITC to be allowed to make cost savings through mergers and to be relieved of the most expensive of their surviving public service obligations. By 2003, ITV in England and Wales was one company; and although some programming obligations remained, these were seen as living on borrowed time as Britain moved toward its digital transition (planned for 2008–12) at the end of which, the ITV companies argued, their licenses were no longer worth enough to justify providing expensive programming like regional news. They had agreed to invest in these genres when their licenses, in an era of spectrum

scarcity, gave them a near monopoly of television advertising. The move to digital meant that their competitors could take channels on the new platforms without having to make expensive promises to the regulator.

In the new, more commercial environment, regulators allowed broadcasters, particularly ITV, to cut back on their commitments to news and current affairs. ITV lost its dominant position in regional news to the BBC. ITV also fought a long battle in the 1990s with the regulators to move its most successful network news program, *News at Ten,* from its regular weeknight slot to make way for entertainment programming. The move proved a disaster for ITV, which eventually restored the news to its traditional slot in 2008, by which time it had lost much of its news audience to the BBC.

The New Age of Regulation

At the start of the twenty-first century, two new institutions were created that marked a significant shift in the structure of British broadcast regulation. In 2003 the Blair government (1995–2007) set up a new telecommunications and broadcasting regulator, the Office of Communications, or Ofcom. This agency policed surviving public service obligations like regional production quotas and was given an overarching role as a "converged" regulator, to consider long-term policy in the telecoms and broadcasting fields as the two industries came closer together. It was responsible for all content standards in commercial television and all standards except impartiality and accuracy for the BBC.

Ofcom published a series of far-reaching reviews of public service broadcasting from 2004 to 2008 that suggested a difficult future for commercial broadcast journalism. In particular, in its analysis of the future of news in 2007 it put forward that ITV, the main commercial channel, would not be able to afford regional news in the long term. Ofcom offered various options for broadcast financing in the future—including the possibility of some of the BBC license fee being "top-sliced" (taking some of the license fee income that had always been given only to the BBC and giving it to Channel 4 and others) to help subsidize commercial public service broadcasters.

An equally significant change took place in BBC regulation. When the BBC's charter was renewed in 2006 the governors were replaced by a new body, the BBC Trust, tasked with representing the interests of licence fee payers (the British audience) and being more clearly independent of BBC management. It retained the governors' old responsibility for accuracy and impartiality.

The new system's first real test was a series of scandals in 2007 involving dishonest programming by both BBC and commercial broadcasters. Radio programs had been broadcasting faked calls from viewers; the results of television competitions had been rigged; viewers had been encouraged to take part in phone competitions (and charged high tariffs for the privilege) when the competition had already closed and their calls had no chance of winning or being counted.

Ofcom and the BBC Trust both commissioned independent investigations into what had gone wrong. A number of producers lost their jobs; commercial companies and the BBC were fined; and new and tougher guidelines and rules were introduced. The scandals did not involve journalistic programs and public trust in broadcast journalism was not undermined.

Conclusion

The new structure of regulation pointed to the fact that the commercial and publicly funded parts of British broadcasting were parting ways at the start of the twenty-first century. The BBC was to continue to be tightly regulated, as an organization paid for by the public through the television license fee; the commercial sector could look forward to lighter regulation. However, public and political support for high quality, impartial broadcast news, guaranteed by external regulation, remained as perhaps the last enduring journalistic legacy of the British experience with public service broadcasting.

British Commercial News Broadcasting

Since 1955 British commercial broadcast journalism services have provided an alternative to and competition for the publicly funded British Broadcasting Corporation (BBC). For 40 years, that competition resulted in high levels of investment in broadcast journalism, both news and current affairs, and high standards of editorial and production quality together with a commitment, in the main, to a quality editorial agenda. Journalism on commercial networks was supported by a regulatory regime that rewarded investment in high quality news and current affairs and insisted on impartiality and accuracy as the key journalistic values. For most of the period, commercial broadcast journalism enjoyed a reputation for enterprising and investigative reporting and was seen to match the BBC for quality. At the end of the twentieth century, however, growing competition for audiences and the progressive deregulation of British television led to a decline in the significance of broadcast journalism in commercial television. By the early twenty-first century, one of the major issues as Britain switched to digital television was how much of that journalist heritage would survive.

Network News on ITV

When commercial television was launched in the UK in 1955 it was as a network of regional companies. None of them had the resources or expertise to produce national and international news. Despite that, the then regulator, the Independent Television Authority (ITA), insisted that the Independent Television (ITV) companies provide high quality national and international news as part of their licence obligations. With the regulator's encouragement, they set up a separate company, Independent Television News (ITN), to provide the network news service. It soon established itself as an enterprising and innovative operation. Geoffrey Cox, ITN's editor from 1956 to 1968, was one of the creators of modern television news in the UK. Where the BBC had used presenters to read the news, he hired experienced journalists to write as well as read news stories. ITN soon also employed the first woman newscaster (Barbara Mandell) in British television.

Cox introduced interviews into news programs, making headlines with a controversial interview by his star interviewer, Robin Day (later the BBC's main current affairs interviewer), with President Gamal Abdel Nasser of Egypt in 1957, a few months after British forces had temporarily seized the Suez Canal. ITN's news coverage was equally enterprising and daring. When the Soviet Union crushed an uprising in Hungary in 1956, ITN's cameraman shot the classic pictures of the column of Soviet T34 tanks heading for Budapest. During the 1960s, ITN developed the technique of the "reporter package"—cutting pictures to match the correspondent's commentary—which had been pioneered by CBS and other American broadcasters. Cox was determined that television news should be accurate

and impartial and have the same high ethical standards as the BBC. He helped ensure that the culture of impartiality was deeply embedded in British broadcast journalism.

News at Ten

Cox's most important innovation came at the end of his editorship. In 1967 he persuaded the regulator and the skeptical ITV companies to experiment with a 30-minute news program in prime time—at 10 p.m. on weeknights. The broadcast was called *News at Ten* and it immediately established itself as one of the most important programs on the network, with audiences regularly in the top 20 or even top ten ITV programs of the week. In 1968 it was the most popular show on British television on three occasions and for 30 years it remained a fixed point in the ITV schedule. Its newscasters from Alastair Burnet to Trevor McDonald—the first black journalist to be a British television network's principal newscaster—became household names. Its style of presentation owed something to American network news at the time with a combination of serious, frontline reporting and stories with a popular touch—the program often ending with a lighter, human interest item introduced with the words "and finally…."

Starting in the 1970s, ITN offered three main newscasts each weekday—at lunchtime, in the early evening, and *News at Ten*. The company had a reputation for technical innovation—making effective use of lightweight electronic news-gathering (ENG) cameras, video editing, computer graphics, and satellite news gathering (SNG). ITN usually matched and sometimes beat the BBC in its coverage of major events—elections, space shots, the fall of European communism, the 1990–91 Gulf War. However its owners did not allow it to diversify into current affairs or regional news and it entered the 1990s too dependent on its contract with ITV and on the reputation and prestige of *News at Ten*.

Channel 4 News

When Channel 4 was launched in 1982, its remit was to provide a commercially funded alternative to both the BBC and ITV. Nowhere was that more evident than in its news service. Channel 4 was a publisher/broadcaster—it did not make its own programs but commissioned them from independent producers. It commissioned its news from ITN, but with the brief to be very different from the ITV service. Where ITV was appealing to the mass audience, *Channel 4 News,* at 7:00 p.m. each weeknight, was unashamedly high-brow—combining news and current affairs in an hour-long program with specialist reporting, in-depth analysis, and studio interviews.

After a disastrous start with zero ratings, *Channel 4 News* was turned around by its second editor, Stewart Purvis, who soon made it one of the channel's most respected programs and a key part of its assignment from the regulator. Like *News at Ten* it became a fixed point in its channel's schedule and its investigative, in-depth approach to journalism won it numerous industry awards. In 1992 a joint *Channel 4 News/News at Ten* team discovered the Bosnian Serb detention camps at Trnopolje and Omarska. The pictures of emaciated Bosnian Muslim prisoners, which were rapidly distributed around the world, caused an international outcry.

Five News

The last terrestrial television network to launch in Britain was *Five News*. It had a much smaller budget than ITV and Channel 4 but the company that had won the license had promised the regulator a high quality news service with a distinctive approach to news, aimed at a younger audience than its competitors. *Five News* initially commissioned ITN to produce the program, presented by Kirsty Young, the first woman to be chosen as principal presenter of any British network's news service. While her (predominantly male) rivals sat behind desks in conventional news studios, she perched on a desk in the middle of the newsroom.

The program launched in the middle of the British general election in 1997 and rapidly established itself as one of *Five News*'s most distinctive and admired offerings, with an appeal to younger viewers who were turning away from more conventional newscasts. A number of its innovative approaches to news production—video diaries, deconstructing the reporter package—were copied by other programs.

Current Affairs

From the early days of ITV, the regional companies were obliged by the regulator to produce and broadcast serious current affairs programming in prime time. Over the first 40 years of its history, ITV produced an impressive amount of analytical and investigative journalism—notably two flagship programs in prime time.

The first, *This Week,* began in 1956. It was produced by the company that held the London weekday franchise, initially Associated Rediffusion and then its successor, Thames Television. It specialized in controversy and investigations—bringing it into conflict with the British government, particularly over tensions within Northern Ireland. In 1977 a program criticizing the treatment of Irish terrorist suspects was pulled from the schedules by the regulator under government pressure. In 1988, a program entitled *Death on the Rock* challenged the official version of the circumstances in which three members of an Irish Republican Army (IRA) unit had been killed by British security forces in Gibraltar. There was speculation that *Death on the Rock* was a factor in the government of Margaret Thatcher deciding to have a blind auction for ITV licenses in 1991, as a result of which Thames lost its license and stopped broadcasting in 1992.

From 1963 *This Week* was joined by *World in Action,* produced by Granada, which held the franchise for the northwest of England. *World in Action* also produced a string of hard hitting programs. It investigated miscarriages of justice such as the Birmingham Six—a group of men wrongly convicted of an IRA Birmingham pub bombing in 1974 who were eventually released in 1991.

ITV also produced more populist current affairs, particularly consumer investigations such as *The Cook Report,* which usually ended with a dramatic confrontation between the reporter and the alleged villains. And an impressive roster of current affairs programming was completed by the more cerebral *Weekend World,* produced by London Weekend for a Sunday lunchtime slot, which from 1972 to 1988 offered an hour's analysis of an issue of the week, including an extended interview with a key figure in the news (usually a politician), rather like the American networks' Sunday morning programs.

Channel 4 was also under a regulatory obligation to carry serious current affairs in prime time. After a number of experiments it found a format that worked—*Dispatches.* This was a 45-minute program that looked in depth at a single subject each week. Each edition was produced by a different independent production company. It focused on investigative journalism and international stories and won numerous industry awards for its analytical reporting.

Regional News

ITV had begun as a network of regional companies, so the regulator required them as a condition of their licences to produce high quality regional news and current affairs programming. For many of the smaller companies in the network, these local programs were the most important output they produced and a key factor in retaining their lucrative licenses when they came up for review. ITV was the most important broadcaster of regional news in the UK. Its programs were better resourced and had larger audiences than their BBC counterparts. Their newscasters were important personalities in their local communities. Many, if not all, of the senior executives in the ITV system began their careers in local newsrooms.

The regional companies also fed pictures and stories to ITN for incorporation in the network news, but resisted any attempts to merge the different operations. Their programs carried the names of their companies—*Granada Reports, Thames News*—rather than any reference to the ITV network as a whole. The regions they served were determined by the location of the regional transmitter network, so the companies began to split some of their regions into subregions. At the system's peak, ITV was running 17 different early evening news programs to its regions and subregions. At the end of the century, the British government established a Scottish Parliament and similar assemblies in Northern Ireland and Wales, with new powers to run major parts of domestic policy such as health and education. This led to a wave of investment in broadcast journalism (facilities and programs) in Scotland, Wales, and Northern Ireland to match the transfer of responsibilities from the Westminster Parliament to the new bodies.

Cable and Satellite News

In 1989 Rupert Murdoch launched Sky News as Britain's first 24-hour news channel. Although produced at a loss and with small audiences compared with the terrestrial newscasts, it brought credibility to the emerging satellite and cable sector. Its fast moving, popular style of journalism gradually won it greater respect and it established itself as a channel with a reputation for frontline reporting and innovative techniques.

Until 1997, when the BBC launched its news channel, Sky's only competition was from international news channels such as CNN International. Sky was able to position itself as the first place for viewers to go for breaking news. It benefited from consistent and heavy investment by the Murdoch empire. By the turn of the century BSkyB, a satellite operation, was spending more on its news service than terrestrial ITV, and Sky News was beginning to compete head-to-head with the BBC and ITN for industry awards.

Throughout the 1990s, Sky News tried hard to persuade the terrestrial broadcasters to move their news contracts from ITN to Sky when they came up for renewal. The competition helped the terrestrial broadcasters force down the price of their news from ITN at a time when they were trying to cut costs. ITV and Channel 4 stayed with ITN. But in 2005 *Five News* moved the contract for its news service to Sky, giving Sky News a significant foothold in public service broadcasting.

In 2000, ITN entered the news channel market with its own 24-hour channel, ITN News. After two years of losses, ITV bought the channel and renamed it ITV News. But it continued to lose money, falling third in the ratings behind Sky and the BBC. ITV closed it in 2005.

Radio News

When British commercial radio was launched in 1973, it was as a growing group of local stations, which were required by their licenses to provide local, national, and international news. They decided to provide their own local news services, but to take their network news from a new company, Independent Radio News (IRN), which was run by the main London radio station, the London Broadcasting Company (LBC).

IRN and LBC were pioneers of new approaches to radio journalism with much greater use of location reporting and introducing program techniques such as the phone-in during which correspondents and presenters could discuss the news with listeners. They borrowed formats from North America and Australia and many of their editorial staff were Australian and New Zealand journalists. IRN became a training ground for many reporters and producers who went on to great success in commercial television. But British commercial radio lacked network service and there was never a 24-hour news and information station to support further expansion of the news service beyond, in the main, short newscasts aired on music stations.

In 1991, after LBC ran into financial problems, the IRN service was contracted out to ITN. This was one of the first "bi-media"—combined radio and television—operations in British journalism, with ITN television staff providing material for radio bulletins. As BBC Radio expanded its news and current affairs output the gap between publicly funded and commercially funded journalism in radio was much more pronounced than in television.

The System in Decline

The range and quality of commercial broadcast journalism had been protected by spectrum scarcity that had limited competition and by a regulatory system that actively encouraged and rewarded investment in and commitment to high-quality journalism. The deregulation of the British television market in the 1990s and the arrival of digital television undermined the business model that had supported commercial broadcast journalism as a match, on television at least, for the journalism produced by the publicly funded BBC.

The first sector to show the strain was ITV current affairs programming. A senior executive of one of the new ITV companies that won the blind auction in 1991 said that it was not the job of ITV programs to get innocent people out of jail. In an environment in which entertainment and ratings were the priorities, the network's serious current affairs programming began to decline. In 1992, after Thames Television lost its license, *This Week* disappeared from ITV schedules, to be replaced by less successful and less demanding

programs such as *The Big Story*. Six years later *World in Action* was replaced by a more populist program, *Tonight,* with a similar agenda and approach to U.S. news magazines of the period such as *Dateline NBC*. The new regulator, the Independent Television Commission (ITC), allowed ITV to cut the number of network current affairs programs and cut back radically on regional current affairs and factual programming.

Equally dramatic changes took place in network news. From 1992 to 2001, ITV halved ITN's budget for national and international news in real terms. In 1998 it shut down its most important journalistic brand, *News at Ten*. This proved to be a disastrous decision. When the regulator, alarmed at collapsing news audiences, tried to get ITV to reinstate it a year later, the result was an unsatisfactory compromise where the program started sometimes at 10 p.m. and sometimes at 10:30, leading it to be branded "News at When." ITV then got the regulator to agree to move its news to 10:30 p.m. again in 2002, only for *News at Ten* to be revived by new ITV management in 2008. But by that time the BBC had moved its flagship news to 10 p.m. and ITV found it very difficult to get viewers back to a program it had abandoned.

The picture in regional news was equally grim. ITV changed its early evening schedule and began to cut back on regional news budgets. By the end of the century the BBC had for the first time overtaken the early evening ITV regional news audience in every region of the UK. ITV executives warned that their commitment to regional news could not be guaranteed after digital switchover, where all viewers would have access to multichannel television and ITV no longer enjoyed the advantages of being one of the five terrestrial networks.

Uncertain Future

The beginning of the twenty-first century saw government, industry, and regulators engage in a complex debate and negotiation about the future of British commercial public service broadcasting. Many of those discussions centered on how much of commercial television's journalistic heritage could be preserved for the digital age.

Analysis by the Office of Communication (Ofcom), the ITC's successor in 2004 as commercial broadcasting's regulator, suggested that network news of high quality on ITV, Channel Four, and *Five News* would probably survive digital switchover and there would still be room in the schedules for some current affairs. But Ofcom was much more pessimistic about the regional news services on ITV—which might need to cut back the network to a smaller group of big regions and even then might require some form of public subsidy to survive.

There was also the beginning of a debate about whether the obligations of impartiality should still apply to commercially funded news and current affairs, with some politicians, regulators, and broadcasters arguing that in a world of digital media, plurality of opinion and approach to news was more important than adherence to the strict rules of impartiality at least as far as commercial broadcasting was concerned.

Conclusion

Despite these challenges, British commercial broadcast journalism remains more diverse, better resourced, and more committed to high standards than in many other Western democracies, where commercial pressures and deregulation have resulted in a more marked decline. And the strong program culture of British broadcast journalism—a commitment to impartiality and accuracy and to a less tabloid agenda than many mass circulation newspapers—ensures that in many ways those standards are maintained into the digital age.

British Literary Journalism

According to the American media historian and theorist, Michael Schudson, "Reporters make stories. Making is not faking, not lying, but neither is it a passive mechanical recording. It cannot be done without play and imagination." Such a view lies at the heart of this brief overview of British literary journalism—and it can transform our perceptions of the epistemology, functions, form, and content of journalism. For by stressing the creativity of journalism we can identify it as a specific literary field yet one closely linked to fiction—and the other arts.

Too often, journalism and literature in Britain and the United States are seen as two separate spheres (one "low," the other "high"). And while the British media today exert enormous political, ideological, and cultural power, journalism paradoxically still retains only a precarious position within literary culture and academe. One result is that literary journalism (defined here simply as the journalism of authors, poets, and playwrights) is usually either forgotten or marginalized.

The many factors (historical, cultural, ideological, and political) behind the marginalization of journalism as a literary genre in Britain are complex. Certainly, since their emergence in the early seventeenth century in Europe's cities, particularly London, the "news media" (variously known as corantos, diurnals, gazettes, proceedings, and mercuries) have been associated with scandal, gossip, and "low" culture. As British archivist Louise Craven comments, these publications "brought sex and scandal, fantasy, sensationalism, bawdiness, violence and prophecy to their readers: monstrous births, dragons, mermaids and most horrible murders."

Defoe and the Blurred Boundaries Between Fact and Fiction

Intriguingly, Daniel Defoe, an eminent early British journalist, presented all his writings—whether fact or his now famous fiction such as *Robinson Crusoe* (1719) and *Moll Flanders* (1722)—as fact, almost all of it anonymously. While the boundaries between fact and fiction can often blur, journalism from its outset generally succeeded on the basis of its claims to accuracy and authenticity. Thus Defoe was at pains to stress in *The Storm* (1704), his celebrated account of a tempest that struck the British Isles in November 1703, the accuracy of his observations and the authenticity of the documents he drew on. There may well have been ironies here. Yet within the diversified literary culture of early eighteenth century England, Defoe's rhetoric of factuality became all the more necessary, if only to win the trust of readers—and the support of advertisers.

A fascination with "human interest" also lies at the core of the journalistic imagination. Defoe's *The Storm* was a pioneering example of the "human interest" story making it particularly compelling for modern readers. Moreover, Defoe's journalism was very much a product of his times. While the first specialist women's magazine, the *Ladies' Mercury,* was launched as a monthly in 1693, the lapsing of the restrictive Licensing Act in 1696 unleashed a torrent of new literary forms. Not only did Britain's first recognizable newspaper, the *Daily Courant,* appear on March 11, 1702, but the journalistic imagination also expanded about this time to incorporate war stories, parliamentary proceedings, travel accounts, political editorials, book adverts, bills of mortality, cargoes of ships, biographies, bibliographies, Hebrew anagrams, lottery numbers, assize reports, literary criticism, and social comment.

Hackery and the Higher, Literary Form of Journalism

By the early eighteenth century the derogatory term *Grub Street* had come to be associated with all forms of struggling, low-life publishing. Originally applied to Milton Street, a warren of garrets and tenements in the London Moorfields area where poor writers lived, by the 1720s Grub Street had spread through the impoverished wards on the edges of the city, close to Clerkenwell and St. John's Gate—home of the *Gentleman's Magazine* in the 1730s. Around the same time the word *hack* (and *hackney*) came to be associated with writers and prostitutes—basically anything overused, hired out, or common. Even after hundreds of years of cultural change, the words *hack* and *Grub Street* are still associated with journalism.

A "higher," extraordinarily rich literary form of journalism evolved in Britain during the eighteenth century: It included the literary essays of Joseph Addison and Richard Steele in *The Spectator;* the polemical writing of Lord Bolingbroke, Cato, and Junius; the legislative reports of Dr. (Samuel) Johnson in the *Gentleman's Magazine;* and, later, of Henry Sampson Woodfall, one of the first Gallery reporters, in the *Public Advertiser*. By the mid-nineteenth century, an unprecedented number of serious journals of opinion were prospering, including the *Saturday Review, Fortnightly, National Review, Macmillan's,* and *Cornhill,* under the command of the novelist William Thackeray.

Yet overall the low status of journalism as a form of literature has persisted. While the term *journalist* was imported from France in the 1830s to refer to writers on periodicals (distinguishing them from writers of book-length literature), the identification of journalism largely with newspapers and mass culture has had a profound impact on the sensibilities of writers. For instance, William Hazlitt was a literary journalist in two senses: both as a literary writer and one who discussed literature. In other words, he practiced the "higher" journalism. Yet his journalism was deeply inflected by his belief in the marginal position of journalism in relation to the "aristocratic" writers of "literature." As a result, his literariness became (like Keats's) intrinsically combative. According to researcher Kirsten Daly, Hazlitt's essays amount to a defense of the craft of literary journalism as a valid form of creative writing. Hazlitt, she suggests, puts forward an alternative model of creativity that values quotation: the effective articulation of someone else's words.

Certainly issues of creative control and his relationship to the mass audience fascinated Charles Dickens as he strove (in the end with remarkable success) to become a major editor and proprietor with his magazines *Household Words* and *All the Year Round*. Dickens, well known as the author of such masterpieces as *Oliver Twist, David Copperfield,* and *A Tale of Two Cities,* also published about 350 articles—more than a million words—in magazines and newspapers. But only in recent years has the scale of his achievement as a journalist been recognized.

Journalism and the Distorting Effects of the Market

On one level, journalism has provided writers with an income. Yet this has reinforced journalism's position as a subliterary genre. For while literature is often seen as the fruit of "scholarship"—hence pure and disinterested and above market considerations, including those of being readable and accessible—journalistic writing is viewed as distorted through the constraints of the market, tight deadlines, or word limits. The poet Samuel Taylor Coleridge, for instance, wrote for a variety of journals (such as the *Morning Post* and the *Watchman*) throughout his life in a range of genres—nonpolitical essays, profiles, leading articles, parliamentary reports. But these are largely ignored today by both the public and scholars.

While Coleridge may be considered one of Britain's first "modern journalists" or "professional intellectuals," his journalism was never a source of pride for him. He much preferred to think of himself as a humble poet. To some extent, the attitudes Coleridge expressed toward journalism live on today in the academy since academic writing in general—"scholarship"—is meant to be disinterested, above mere market considerations.

By the 1930s, the critic Cyril Connolly was bewailing the "victory" of journalism over literature. Journalism's plain style, he claimed, had thrust aside the "Mandarin style"—characterized by long sentences with many dependent clauses, allusions, metaphors, long images, Latin terminology,

subtlety, and conceits. Literature was merely responding to market demands and the democratization of culture epitomized in the growth of the mass-selling media: books grew cheaper and reading them ceased to be a luxury, and the reading public multiplied and demanded less exacting entertainment. And these trends horrified Connolly.

Journalism as a Lower Form of Writing

Another effect of the low status of journalism has been the tendency among critics to see it as a genre that writers exploit to experiment with styles, voices, and ideas that are later expressed more fully in their higher or literary writing. Virginia Woolf, though a literary journalist for much of her career, was very critical of the politics of the journalistic economy—seeing it as male-dominated. For instance, her original version of *Orlando* has a great deal to say on literary politics—censorship, men's opinions of women, the corruption of the literary marketplace, the idiocy of the Burdett-Coutts literary prize, and the embargoes on women writers. In her poem, *Fantasy,* the journalist is depicted as a bug, repellent, crawling, and blood-sucking. However, the failure of critics to acknowledge the significance of her extensive career as a journalist (1904–41) has produced a seriously distorted image of Woolf's literary project and personality. In dismissing her nonfiction altogether, critics have perpetuated the construction of a literary figure, and the Modernist movement with which she is so often associated, as separate from a whole sphere of literary and cultural production.

Similarly George Orwell, considered by many as one of the greatest, if not the greatest, British journalists of the last century, was dismissive of journalism. In his columns, published between 1943 and 1947 in the leftist, London-based journal *Tribune*, he displays a remarkable range of tones, styles, and themes. But, throughout his career, Orwell constantly looked down on his journalism as mere pamphleteering and a "lesser" form of literature. He had a horror of hack reporting and despised what he referred to in a 1944 "As I Please" column for the *Tribune,* as the "dreary sub-world of the freelance journalist." And while this column has received almost unanimous praise from critics, there has been no major critical assessment of its literary elements.

Yet Orwell used his columns effectively to define a new kind of radical politics. This involved reducing the power of the press barons, facing up to racial intolerance, and defending civil liberties. It also incorporated an awareness of the power of language and propaganda, a celebration of the joys of nature, and an acknowledgment of the cultural power of both Marxism and Christianity. Above all, in the face of the vast political, cultural, and economic factors driving history, it recognized the extraordinary richness of the individual's experience.

Likewise, Graham Greene's stints as a film reviewer have attracted little critical attention. Yet David Finkelstein in 2007 argued that the author of more than two dozen novels (such as *Brighton Rock* and *End of the Affair*) was also among the best film critics of his generation. Linden Peach similarly suggests the journalism of Angela Carter is rarely acknowledged as a significant part of her output, worthy of serious consideration in its own right. In fact, her journalism was an intrinsic part of her broader intellectual project—to scrutinize and resist dominant ways of thinking that constrain or distort intellectual, emotional, sexual, and aesthetic development. Peach remarks, "As cultural and political commentaries, her journalism is as original, tough-minded, intelligent and as astute as her other writings."

Literary Journalism's Plain Style

Journalism also has its own voice and style. Its vocabulary is the vocabulary of public discourse. At best, journalism's strength lies in its clarity of language and structure—and conciseness. Even the seventeenth-century "mercurists" reinforced the veracity claims of their reporting with a sober "perfect style of language." And in the following century, Defoe defined journalism's "plain style," in his 1726 work *The Complete English Tradesman,* as one "in which a man speaking to five hundred people of all common and various capacities, idiots and lunatics excepted, should be understood by them all." Dickens's capacity to observe, mirror, and recreate popular speech was another crucial element of his own journalism.

But journalism's "plain style" does not mean it is incapable of capturing complexity. For instance, Kirsten Daly suggests William Hazlitt's "familiar

style," in fact, helped him negotiate the complex tensions inherent in his position as a literary journalist and theatre critic: the need to adopt a persona, whilst speaking honestly about the works under review, and the need to present authors' words to readers through the medium of print in a way that did justice to the original performance context. Moreover, according to Linden Peach, Angela Carter not only covered a wide variety of literary and cultural topics in her journalism in the *Guardian, London Magazine,* and *New Society,* but often displayed the linguistic and narrative experimentation that characterizes her fiction.

Whether he was writing a novel, poem, essay, review, column, or polemic, Orwell was always "journalistic," using direct and pared-down language. Significantly, in his essay, "Politics and the English Language" (first published in *Horizon* in April 1946), Orwell linked clarity of expression with sincerity. "The great enemy of clear language is insincerity. When there is a gap between one's real and one's declared aims, one turns as it were instinctively to long words and exhausted idioms, like a cuttlefish squirting out ink."

On the Qualities of Journalism

Within the intellectual economy of modern societies, authors, editors, publishers, campaigners, and academics are found regularly changing roles. Indeed, for so many of the men (and women) of letters since the eighteenth century the continuous flow of their writing has incorporated not only books, reviews, polemics, sociological research, or poetry—but also journalism. Today, the flame of literary journalism in Britain is being carried by a host of novelists, such as Monica Ali, Martin Amis, Julian Barnes, Gordon Burn, Zoe Heller, Salman Rushdie, Will Self, and Adam Thirlwell.

Moreover, as the work of the writers highlighted here demonstrates, a range of textual and thematic continuities and contrasts can be identified between authors' journalism and their other literary works. Journalism is best seen, then, not as a marginal literary pursuit, but as a central cultural field that writers exploit for a variety of reasons and where, crucially, they self-consciously construct their public identities.

Much academic commentary on the media (for understandable reasons) is highly critical. Either journalists are too trite, sensational, or perpetuating of various kinds of stereotypes (racist, sexist, militarist, and so on), or they are purveyors of myth, propaganda, and lies. This brief selection of British literary journalists, in contrast, provides models worth celebrating and from whom students of English and journalism can learn such a lot.

British Magazines

The world's first "magazine" was published in Britain. The *Gentleman's Magazine* (or *Monthly*

Intelligencer), published by Edward Cave in 1731, is widely regarded as the first publication to use the term *magazine,* a term adapted from the Arabic *makhazin,* meaning "storehouse," to denote a periodical miscellany aimed at a general readership. While other British periodicals were issued before that date, such as *The Ladies Mercury,* founded in 1693, *The Tatler* (1709), and *The Spectator* (1711), they were not referred to as *magazines* and Samuel Johnson's 1755 *Dictionary of the English Language* credits Cave with inventing the term. The roots of contemporary British magazines, whose principal tenets are to serve, entertain, and involve their readers while of course making a profit, can be found in these early publications.

Origins

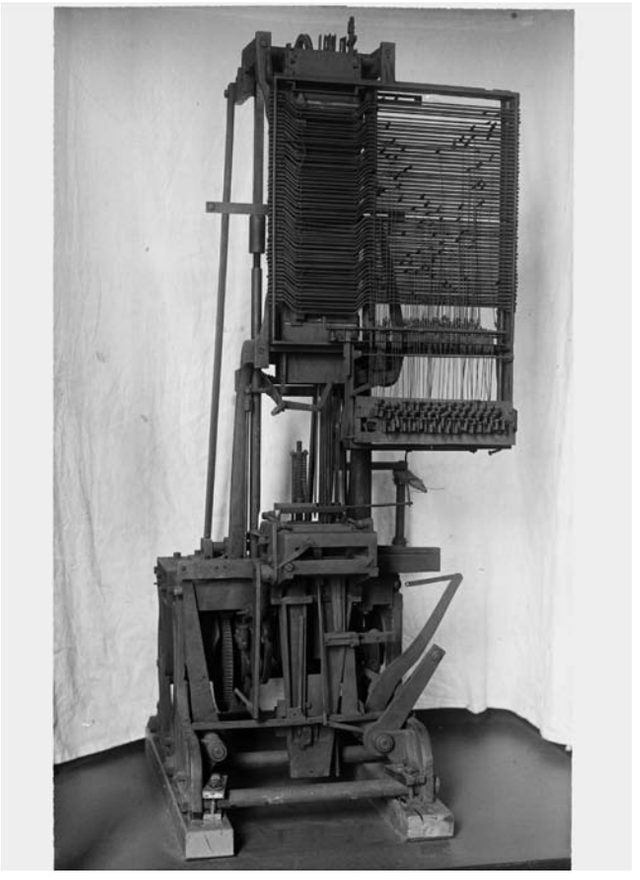
Not only did the *Gentleman's Magazine,* which soon sold 10,000 copies a week, make Edward Cave rich, it also laid the foundations for the "reader comes first" mantra that all British magazine publishing employees learn to recite like a prayer from their first day working in the industry.

Serving the reader generally takes three forms—what is sometimes called the "sacred trinity" of information, education, and entertainment—and Cave realized this from the start. He called his magazine *A Collection of All Matters, Of Information and Amusement* and introduced it in response to what he saw as readers' demand for a publication that explained complicated matters, such as parliamentary debates, in a language they could understand. He also recognized that with "two hundred or so Halfsheets per Month thrown Upon the Press," there would be a demand for a publication that brought all the news of the latest "Accidents and Occurrences" together into one magazine (quoted in Ardburgham). "Newspapers," he wrote, "are of late so multiplied as to render it impossible…to consult them all" (quoted in Ballaster et al.). Like the magazine industry in the early twenty-first century, Cave was innovative—parliamentary debates, for example, had never been reported on before—and he experimented with new forms of writing—the government declared parliamentary coverage illegal in 1738 but Cave got around this by having his reporter write in code about a so-called Parliament (or Senate) of Lilliput. British magazine editors are passionate about their publications and their readers, and Cave was no different. His magazine combined essays, stories, poems, biographies, political commentary, and even recipes. It covered pretty much everything Cave thought his readers would want to know about, from the fluctuating prices of grain or coal to the latest diseases, inventions, and executions. It had a star writer, Samuel Johnson, and several female contributors in an age when "ladies" would never dream of publishing under their own name: a significant forerunner for an industry that is closer than most to abolishing the glass ceiling. The one thing setting *Gentleman's Magazine* apart from most new twenty-first-century magazines is its longevity: even with a circulation that is small by twenty-first-century standards it survived for 183 years.

Birth of Mass Consumer Media

Throughout the eighteenth and nineteenth centuries, magazines tended to be largely the playthings of the upper classes, favoring text-heavy formats and literary discussion aimed at an educated audience. But technological advances, most notably the linotype machine (1886), which moved magazine production away from painstaking letter by letter text assembly to allow type to be printed line by line, and the rotary printing press (1833), which could produce a million pages per day, gave publishers the opportunity to broaden their audiences. This, along with increased literacy rates (public education was introduced in 1870); improvements in lithography, which allowed magazines to use illustrations and, later, photography; and the growth of advertising in the 1870s and 1880s in response to an increased disposable income across most societal groups in Britain, laid the foundations by the end of the nineteenth century for the development of a mass consumer media.

By 1896, there were over 2,000 magazines circulating in Britain (compared to 557 in 1866), many of which targeted readers with specific interests. The first special interest magazine, *The Field* (1853), was followed by titles including *Shooting Times* (1882) and *Horse and Hound* (1884), which used glossier paper and improved photo-reproduction techniques. The first general interest magazines, such as *Titbits* (1881) and *Answers to Correspondents* (1888), pioneered by the newspaper barons George



The linotype machine, invented by Ottmar Mergenthaler in 1886, catalyzed the mass communication revolution in Britain and other countries through its line-by-line automation of the printing process.

Source: Library of Congress.

Newnes and Alfred Harmsworth, began the rise of the high circulation "weeklies," (at one stage *Titbits* was selling 400,000–600,000 copies a week), which packaged information as entertainment, thrived on news and gossip, exposed scandals, and gave readers a voice by printing their letters.

During the 1930s, thanks to technological advances in cameras and lithography, photography and photojournalism began to take hold of British magazines, following pioneering work by *Muncher Illustrierte Presse* and *Berliner Illustrierte Zeitung* in Germany and *Life* and *Picture Post* in the United States. By the 1950s, the "glossies" like *Vogue* (1916) and *Esquire* (1933) were evolving the high production values and reputations as arbiters of taste they still aspire to today, while a distinctive "women's market" was increasingly apparent with weeklies like *Woman's Own* (1933) and *Woman* (1937) becoming their readers' trusted advisors, full of lifestyle tips and consumer goods to indulge in as wartime rationing came to an end (1953). The general interest men's magazine market didn't really take off until the 1990s, with the launch of the irreverent *Loaded* (1994) and *FHM* (1996). Before these, men's magazines were generally seen as being merely part of the pornography magazine sector (e.g., *Playboy,* 1953).

By the end of the twentieth century, magazine publication had undergone yet another technological revolution, with the rise of desktop publishing and computers in every office. This has led to many magazines surviving with much smaller production teams and a heavy reliance on freelance contributors for content. It has also led to a proliferation of "niche" publishing, with the business magazines sector in particular showing strong growth in the last years of the century.

Magazines in the Early Twenty-First Century

British magazines in the first decade of the new century exist in a tough market, although, for those that succeed, the rewards are great. The industry is worth about £7 billion ($12.3 billion) and employs 185,000 people, more than half of whom are women (the female-to-male ratio being 53 percent to 47 percent). Although there are local magazine companies, such as The Regional Magazine Company in Sheffield, the industry is predominantly based in London and the South East and 42 percent of all magazine staff work for companies employing more than 200 staff. As of 2008, some of the major publishers included IPC Media, Reed Business Information, BBC Magazines, Condé Nast, H Bauer, The National Magazine Company, CMP Information, Haymarket, Redwood Publishing, Future Publishing, and IDG Communications.

By 2008 there were around 8,500 magazines published in Britain and more than half of all UK journalists are employed in the magazine industry. The magazines they work on can be divided broadly into three sectors: consumer magazines such as Condé Nast's *Glamour* or BBC Magazines' *Radio Times,* which provide leisure time information and entertainment; business to business (B2B) magazines, which are trade publications marketed to industry sectors such as CMP's *Property Week*

for the real estate industry or Haymarket's *Management Today;* and customer (or contract) magazines produced to promote a particular client's business such as Redwood's *Land Rover Onelife,* published for the car manufacturer, and *Your M&S,* published for the food and clothing retailer Mark's and Spencer's. There is a great deal of variety within the sectors. Consumer magazines, for example, include lifestyle or "guide to life" titles like The National Magazine Company's *Cosmopolitan* and specialist titles such as *Trout Fisherman* (Bauer), *Digital Camera* (Future Publishing), and the political magazine, *The Spectator* (The Daily Telegraph group). As of 2008, there were 311 magazines about sports and 199 magazines for women.

In the business sector, the big markets are sciences (412 magazines), business management (282 magazines), finance (220 magazines), and computers (201 magazines). There are magazines for every conceivable taste and if there isn't, a publisher will soon start a new one.

Magazines have been advertising consumer goods for over a century and advertising remains a huge source of revenue. Consumer magazines make about 36 percent of their revenue from advertising, although the bulk of their income comes from subscriptions and single copy sales. The majority of business magazines' revenue (82 percent) comes from advertising. Other sources of revenue for magazine publishers include awards, such as the annual Elle Style Awards; events like the *Sugar* magazine roadshow and model competition; showcases such as *Dazed and Confused*'s art exhibition; and the sale of data such as subscriber mailing lists to marketing companies.

The highest circulation magazine in 2008 was *Sky, the magazine*—a free customer magazine sent out to all customers of Sky, the biggest digital television provider in the UK. Other big magazines in the UK with sales around the million mark include Bauer's *TV Choice,* IPC Media's *What's on TV* and *Radio Times,* all program listings magazines, and *Take a Break* (Bauer), a women's weekly. The consumer magazines that have been thriving in the first decade of the new century in the UK market include the men's weeklies, such as IPC's *Nuts* and Bauer's *Zoo,* the women's glossy weeklies (e.g., Bauer's *Grazia*), customer magazines (the supermarket titles *Tesco* and *Asda*), celebrity weeklies (Bauer's *Heat* and *Closer,* Northern and Shell's *OK!,* and IPC's *Now*), and the real life weeklies (*Take a Break,* IPC's *Chat,* and Bauer's *That's Life*). Magazines that have been struggling, such as teen magazines, have been looking to the weeklies for inspiration but some titles simply have had their day. Currently, the magazine market is flat but dynamic, with some sectors, such as young children's magazines, growing while others, such as women's monthlies, are losing ground.

And the industry continues to look for new markets. A recent innovation (2007) has been the "free" consumer men's weekly, *Shortlist,* which is given away free on public transport in London. Before the men's weeklies *Nuts* and *Zoo,* there was no men's weekly market at all; now the two magazines combined sell over 400,000 copies a week. These sales may already be on the wane but both magazines are now showing huge growth in website traffic, and competition between them remains as intense as it has been since they launched within a week of each other in 2004.

Competition, which began with the earliest magazines, continues to be fierce in the magazine industry. The *Gentleman's Magazine* was endlessly plagiarized, and among its imitators was *The Lady's Magazine* (1759), which copied Cave's design and content (minus the parliamentary debates) almost exactly. If *Shortlist* succeeds, more free weeklies will surely follow.

With such intense competition, it is inevitable that the magazine publishing industry is littered with the corpses of dead magazines. The teen magazine sector, for example, has suffered greatly since the 1990s with the arrival of the Internet. The preteen market—sometimes called "tweenage" or "tweenies"—has seen some growth—magazines like the BBC's *Girl Talk* and Egmont UK's *Go Girl* are doing well. But beloved titles for teenagers such as *Jackie, Just Seventeen,* and *Smash Hits* have long been consigned to magazine heaven as their readers migrated in droves to the web. *Sugar* (Hachette Filipacchi) and *Bliss* (Panini) survive but managing their Internet provision is increasingly core to their business. *TV Hits* (Essential Publishing) a teen "celebrity" title, recently moved its entire production online. *Cosmo Girl* did the same thing but its digital version, *Jellyfish,* launched in March 2007, survived only five months.

Online Magazines

Experiments with digital magazines—effectively an online facsimile of a print product—have been largely unsuccessful, but the online magazine business was by 2008 a huge growth area as publishers began to work out new ways to develop their brands in the new formats offered by the Internet such as podcasts, rss and mobile feeds, video diaries, breaking news e-alerts, webisodes, and blogs. British magazine publishers talk about achieving the perfect "circle"—a magazine website that sends readers back to the printed product, which then sends readers back again to the website. It has taken time for publishers to feel comfortable with the web, and the dot.com financial crash in 2001 generated even more caution after innovative online magazine experiments like IPC's Beme.com and Uploaded.com were forced to close. But the online magazine revolution is surging ahead as publishers gradually find new ways of making money from their online content through access fees and competition sponsorship, as well as through the traditional route of advertising. The buzz words in magazine offices are all about the Internet: things like "search engine optimization"—how to get your web news stories to come up first on search engines—and "user-bility"—how to produce a website that's easy for readers to use and keeps them coming back.

Over time successful British magazine operations have moved a long way from the printed miscellany pioneered by Cave. In the early twenty-first century they also often include a complementary online presence, and sometimes even a TV show, such as Nuts TV, or a radio channel, such as Heat radio. Editors, in addition to reading proofs and supervising covers and design, appear on web video, sharing insider magazine gossip, promoting new content. They also respond to reader forums and create podcasts. In the ever-changing magazine market, editors function as the guardians of an entire brand.

If much has changed technologically for British magazines, generally readers still want the same things—information, entertainment, and news from a magazine they trust. Editors use many of the same techniques pioneered by the early magazines to win reader loyalty. The principles laid down by *The Ladies Mercury* in 1693, which promised to answer "all the most nice and curious Questions concerning Love, Marriage, Behaviour, Dress and Humour of the Female Sex, whether Virgins, Wives, or Widows" (quoted in Ardburgham) can still be seen in the "how to" material prevalent in contemporary women's magazines while *The Spectator,* which covered everything from "deep moral and aesthetic questions to the latest fashion in gloves" was realizing the vital importance of reader participation, urging responses in its first issue for "those who have a mind to correspond with me"—a practice that clearly prefigures the readers' letters, web forums, and reader polls of early-twenty-first-century magazines.

There is, however, a feeling among British magazine managers that readers have become harder to please than they once were. The bright, gaudy magazine covers, crammed with cover lines and free gifts, are in strong contrast to the dense typography of early publications, which appeared to assume readers had unlimited time and enthusiasm.

Magazines have also become more news hungry. Cave's approach was to "reprint" news rather than transmit it, an important distinction that enabled him to avoid a government stamp tax applied only to "news" publications. But while there may have been a time when British magazines were more than happy to develop and build on the news rather than break it, they are now moving away from this. In an increasingly difficult market, magazines are increasingly run like newspapers, endeavoring to break news and exclusives, rather than simply recycling old news or covering the issues thrown up by news media outlets in more depth. The web is driving this too, with magazine editors determined to get their best news stories online as quickly as the newspapers while still finding a news angle that works in the printed form, in a bid to keep the new "click it, have it" generation of readers, who want everything immediately, interested.

Many publishers feel that pleasing the reader has gotten out of hand—particularly with the contentious introduction of "cover-mounts" (free gifts) in the mid-1990s, which have left British editors wondering why they bother spending hours perfecting their editorial if their readers are now only buying their magazines because of the free sunglasses or CD on the front. There has been a growing sense that far from increasing brand loyalty, what

started as a cost effective way of attracting new readers has created a new, promiscuous reader who is now happy to ditch their old magazine for whichever publication offers the better gift. Covermounting may also put off advertisers, who have previously been attracted by the special relationship between reader and magazine often described as an "unconditional friendship": they may now feel that readers don't trust and feel loyal to their magazines as they once did and will consequently feel less likely to buy advertising space.

Nonetheless, even if their readers do love them less, magazine editors will never give up trying to win back their love. And magazines must be doing something right with many arguing that the rather less affluent newspaper industry that has been hit hard by the web revolution has been engaged in a process of "magazinization" for some time, appropriating magazine formats by creating magazine cover style front pages and endeavoring to tailor their publications as closely as possible to the interests of their readers in a bid to replicate the close personal relationship that magazines and their readers have tended to share.

Criticism of Magazines

Some British academics have been quite critical of magazines, seeing them as part of a sinister consumerist conspiracy—offering readers the remedy to all their problems through consumption. The lifestyle titles in particular have been criticized for helping to reinforce stereotypes by failing to embrace racial and sexual diversity and treating readers as a homogeneous whole rather than as individuals. Some critics have questioned the way magazines such as *Cosmopolitan,* ironically the magazine that once promised its readers they could "have it all," was seen to construct modes of femininity that were all about looking good and pleasing men rather than celebrating their achievements. Feminists have also written angrily about men's magazines such as *Loaded* and *FHM,* which are seen to promote women as sex objects and construct identities for men in which a man's role is little more than voyeur. The body image debate has also come to dominate media discourse with women's magazines' use of stick thin models and the retouching of models by both men's and women's titles coming under scrutiny. The vogue in the past decade for "they're just like us" celebrity journalism, pioneered by *Heat* magazine (launched in 1999), in which the editorial content criticizes famous women who gain weight/have acne/fail to do their hair, has also added to a picture of a media that, rather than serving its readers, is actually putting them under pressure to be more than they are. Some critics have even accused magazines of causing anorexia.

Although these criticisms tend to focus on magazines, and women's magazines in particular, they are problems that afflict the media as a whole—newspapers, television, and the Internet are guilty too—though this is rarely addressed. More recently, a postmodern approach to magazines has begun to enter academic criticism with a move toward accepting that readers may actually be capable of subverting media messages and using magazines for their own ends. But magazine editors still have questions to answer. Editors fervently insist that their content choices are only designed to give readers what they want and, of course, that makes sense—they want to sell copies. But some commentators have recognized that however much market research they do or how many reader events they attend, or reader forums they participate in, editors may never really know their readers and may sometimes be guilty of concentrating on an "ideal" reader rather than listening to the "actual" one.

Conclusion

Some publishers believe that, in business to business publishing at least, paper magazines may disappear altogether as companies increasingly move their content online. Set-up costs for a website are a fraction of those for a magazine, and eco-arguments make the continuation of such paper-intensive products increasingly hard to justify. Yet, readers continue to love their magazines—after all, you can't read a laptop in the bath—and the techniques pioneered by Edward Cave in the 1730s have served the industry well ever since. The only question now is whether they will still be here in another 300 years.

British New Media

The production, distribution, and reception of news in Britain are all changing as digital media provide new possibilities for producers and consumers alike. The key trend is toward convergence of media content, computing, and telecommunications sectors. According to the UK government Office of Communications, as of August 2008, broadband was available to more than half of all British households, with a rapid increase in mobile broadband use; 87 percent of homes had digital television; and the number of active cell phone accounts exceeded the country's population. The increasing ubiquity of such platforms means that news is increasingly accessed on computers and mobile devices, creating opportunities for new kinds of news organizations, original approaches to circulating content, and new forms of audience participation. However, undergirding these significant transformations are two distinctive and continuing characteristics of news in Britain: the dominance of the British Broadcasting Corporation (BBC) in broadcasting and the highly competitive market in national newspapers.

Broadcasters and the New Media Environment

British broadcast news is provided by a mix of publicly funded and commercial organizations, operating across free-to-air analog and digital platforms as well as subscription-based satellite and cable services. By far the biggest and most influential institution is the BBC, formed in 1922. Transformed into the British Broadcasting Corporation on January 1, 1927, with a now-formal government mandate to "inform, educate and entertain," advertisements and editorializing were strictly prohibited. The BBC's funding relied upon the sale of licenses to users and, indeed, the BBC continues to receive most of its funding from compulsory TV licenses. As of July 2008, a license is required for all households owning a television: the annual rate is £139.50 (about $280) for those with a color TV set (and less for households owning only black-and-white receivers).

According to the BBC's *Annual Report* for 2007–08, more than 80 percent of Britain's population over the age of 15 make some weekly use of BBC news services. Worldwide, 233 million people accessed the BBC's online, TV, and radio news services. Its online services are especially popular: the BBC Mobile service is the most-used cell phone news service in Britain. In December 2007, the BBC launched its iPlayer, an on-demand service for downloading or streaming TV and radio content to computers and mobile devices. The service was an immediate hit: within four months, the BBC claimed that downloads and streams associated with the iPlayer accounted for up to 5 percent of all Internet traffic in the country.

The BBC is the world's largest public service broadcaster, and it has extended its public service role to the use of new media in its news services. In November 1997, it launched two initiatives: a rolling news channel BBC News 24 (renamed the BBC News Channel in 2008), and the BBC News Online service. The BBC News website offers visitors a choice of British or international versions, with corresponding differences in emphases. The BBC's size, reach, and resources give it a significant advantage over competitors: its online staff can

draw upon hundreds of BBC correspondents around the world.

The BBC News website maintains a searchable archive of every item posted on the site since its 1997 inception. The site has developed in ways that exploit three central possibilities offered by convergent media. First, it offers *automated* services—email digests and headlines; news feeds to the user's cell phone; news alerts sent straight to the user's desktop; RSS feeds; and audio and video podcasts, including edited versions of the key TV current affairs shows *Newsnight* and *Question Time*. Second, it offers scope for the user to *personalize* the site—for example, to choose between international and British versions, between more or fewer graphics, and from text offered in a range of languages, including Spanish and Mandarin Chinese. And third, it offers some modest possibilities for the user to *participate* in the news process—there is a "Have Your Say" section, offering an ability to respond using automated forms. More significantly, readers are invited to submit story ideas, pictures, or video, with the iconic cell phone camera images of the London bombings of July 7, 2005, included on the page as a reminder of how contributions from the audience ("user-generated content") can become central to even the biggest news stories.

Newspapers and the Internet

Britain has an extremely competitive national daily and Sunday newspaper market. There are 11 national daily newspapers, and many other regional and metropolitan titles. Free newspapers such as *Metro* have also gained a significant national readership. This competition for readers and advertisers is a significant driver of the papers' online ventures. All national papers have a web presence, and some of these have been significant innovators, particularly in incorporating user-generated content.

The *Guardian,* a liberal daily, has won a number of awards for its website, including one for best newspaper website in 2005, 2006, and 2007, beating leading American dailies. A distinctive feature of the *Guardian* site is its large collection of blogs: as of July 2008, the site ran 28 specialist blogs on aspects of news, education, entertainment, travel, politics, arts, and gardening. The largest of these, "Comment Is Free," is an online extension of the newspaper's op-ed page, opening all its opinion columns up to moderated comments from readers, and augmenting these with additional columns and featured debates. Users must register in order to post comments, and these are moderated after posting. Comments are often deleted for breaches of the stated guidelines, but the basic principle of "publish first, moderate later" is unmatched by other British newspaper websites. The blog format attracts significant numbers of contributors: for example, in July 2008, one column by satirist Charlie Brooker drew more than 1,700 comments in three days. While this degree of participation was exceptional, many columnists routinely draw several hundred comments from users.

The *Telegraph,* a conservative daily, has also made significant use of blogs through its "My Telegraph" service. This allows any user to run a blog on its website, under the *Telegraph* masthead, and to post comments on those of others, as well as to save articles from the paper and to network with other users. Posts and comments on "My Telegraph" blogs are not moderated before publication, although they may be removed if they breach stated policies; in contrast, comments on the paper's own blogs are moderated before publication. Launched in May 2007, "My Telegraph" had drawn more than 20,000 registered users by the end of its first year, making it one of the most successful ventures to date to incorporate user-generated content into an established newspaper business.

However, it is not yet clear whether such innovations in participatory culture are a key factor in driving audience numbers for newspaper websites. As of June 2008, Britain's number one most-visited news website was that of the conservative *Daily Mail* (http://www.dailymail.co.uk), which saw a 100 percent increase in traffic in a year. This site hosts a much smaller number of blogs than the *Guardian* or the *Telegraph* and has a much stricter comments policy, with all comments moderated before publication. The popularity of the *Mail* website may suggest that continuity (in the form of trusted news content) is valued more highly by some audiences than is transformation (in the form of avenues for audience participation).

Independent Online News Sources

The influence of public service broadcasting and the unusually competitive newspaper market may

help explain why Britain has so far not seen the rise of a very influential news blog culture separate from the established news media. While there are many news-related bloggers, there is no site or individual with the profile or influence enjoyed by many American projects. The highest-profile British news-related blog is *Guido Fawkes* (http://www.order-order.com), run by Paul Staines. It is credited by some commentators as the first in the country to force the resignation of a government minister (Peter Hain in January 2008) by pursuing a story that the established news media did not.

However, while there are relatively few individual UK news bloggers of real stature or influence, there are important instances of people using the Internet in the creation of alternative news projects. One example is Make Borders History (http://makebordershistory.org). Created in 2005 as part of the protests against the meeting of leaders of the G8 nations in Scotland, this was a moderated site using the same Mediawiki software as Wikipedia, which allowed anyone to create an account and log in to contribute or edit information on the goals of the project. It combined its activist functions with news reports and features contributed by users and moderators, pointing toward approaches to online news that bypass objectivity and professionalism in favor of a politically engaged, participatory news culture.

The most important of such experiments to date is the international Indymedia movement, established in 1999. Indymedia is a global network of independent news websites, each using a local version of the common domain name indymedia.org; in October 2008, more than 130 Indymedia sites were active. Each site publishes news stories and other items submitted by anyone who wishes to contribute; while this policy is evolving and subject to local variation, the defining principle of Indymedia is the ethos of "open publishing." Open publishing can be thought of as an ethos of transparency as well as one of access: in this view, the mechanisms of the production of news should be as visible as possible and all users should be able to participate. In Britain, a network of 10 regional Indymedia sites operates collectively as UK Indymedia (indymedia.org.uk), and there are additional sites for Scotland and the cities of York and Bristol. This combination of local focus with national and international networking is an important contribution to the online news environment.

The activities of online news projects such as Make Borders History or UK Indymedia are, of course, on a very different scale to the BBC or the *Guardian*. However, they do point toward key trends in Internet use for news in Britain and elsewhere. Such trends include experiments with nontraditional forms of management and organization; alternative approaches to reporting, objectivity, and professionalism; and an emphasis on participatory, audience-centered production in contrast to the top-down hierarchical approach that has characterized much of the established news media.

Conclusion

The use of new media for the production, distribution, and reception of news in the UK demonstrates the extent to which continuity and transformation are contending forces in the digital news environment. While the most influential and trusted news institutions remain the same as they were in the pre-Internet world, those institutions are having to adapt rapidly to the changing media environment. While digital media offer new possibilities for new kinds of producers, some of the most innovative approaches are coming from established organizations that have the reach, financial resources, and expertise to refashion their services to the online environment.

British Newspapers

Newspapers have always been a crucial component of British news media, informing the public sphere, articulating the public interest, and instigating and conducting significant debates on issues vital to democracy. Writers as diverse as Edmund Burke and Richard Carlyle have claimed newspapers as a fourth estate of the realm, a vigilant watchdog holding the powerful to account on behalf of the public. More prosaically, newspapers have also been the archivists and chroniclers of the local, regional, and national communities in which they have circulated, recording the various rites of passage (births, marriages, and deaths) of those communities, as well as the activities of judicial and political elites and institutions, manifest in court reports and publication of the proceedings of parish councils and Parliament. But newspapers have increasingly tried to entertain as well as inform their readers, and to report the social and cultural life of communities. These accounts published in the columns of the local and national press constitute an important record and have been acknowledged to be the "first draft of history."

Contested Futures

In the new millennium, British newspapers confront a pivotal moment in their history. All national papers now have extensive online editions: *Guardian Unlimited,* for example, attracts 16 million readers (unique users) and 147 million page downloads each month. Newspapers understood literally as "news" printed on "paper"—rather than as news content on multiple media platforms that is delivered by the Internet, podcasts, and mobile telephony, more often than by newspaper boys and girls—constitutes an increasingly modest element in the editorial mix in an age of digital convergence. Newspapers in Britain, like many countries around the globe, are once again in a state of flux reflecting the influence of a number of technological, economic, political, and cultural changes.

The scholarly literature offers two distinctive predictions for the British press. The first, pessimistic account argues that newspapers will suffer reduced numbers of published titles, dramatic reductions in circulations, the loss of readers and advertisers to increasingly attractive Internet and television advertising channels, and a decline of public trust in media credibility reflecting—among other factors—newspapers' growing reliance on public relations firms as sources of news. Newspapers' editorial preference for celebrities, human interest, and trivia above the reporting of hard news stories will exacerbate these trends, making newspapers "an endangered species." Some pundits offer unrealistic extrapolations based on declining circulations, to predict the precise date on which the last newspaper reader will vanish.

A second, more optimistic, account acknowledges newspapers' need to strike an urgent editorial and financial accommodation with the web, but suggests that they are well along in adapting both their editorial contents and formats to developments in media technology, pressures of market forces, and readers' changing requirements for news. They believe this "editorial Darwinism" explains how newspapers have survived previous challenges—from telegraph to television—to their business and editorial environments, enabling them to adapt to changing circumstances; this editorial Darwinism is central to understanding the history of newspapers. Moreover, the availability and popularity of new media technologies—in living rooms no less than newsrooms—empowers a growing army of citizen journalists, bloggers, and readers wishing to post comments online, to construct a more pluralist debate about matters of public interest. The "tablets of stone" model of journalism, in which journalists and leader writers

hand down authoritative opinions, is giving way to a new participatory journalism that encourages readers to join journalists in a more interactive discussion.

Which vision for British newspapers will be vindicated by events is uncertain. The ambition here is to offer a brief history of British national and local newspapers and to consider recent policy developments and trends.

Development and Policy

Origins

The first daily London paper, the *Daily Courant,* appeared on March 11, 1702. There is less certainty about the earliest provincial paper, though it was likely the *Norwich Post* in 1701. But the news was rarely new. The *Courant* offered snippets culled from European papers, with some items often more than two weeks old; the price was one penny. The launch editorial claimed the paper would "relate only matters of fact, supposing other people to have sense enough to make reflections for themselves" (Williams 1957). Rehashing such old facts while eschewing informed opinion made the *Courant* a dull read.

Press historians have largely neglected developments in the local press, but like their national counterparts, local and regional newspapers enjoyed readerships in the large but expanding urban areas, and collected and recycled news from the London (rather than European) papers, including any errors. An editorial in the *Northampton Mercury* in 1721 explained, "we hope…readers will not condemn our *Mercury* for the many Falsities that have of late been inserted therein, as we took them all out of the London printed papers" (Walker 2003).

From these rather inauspicious beginnings, British newspapers flourished in the late nineteenth century following the repeal of the "taxes on knowledge." Fueling this growth were the burgeoning numbers of readers and an explosive demand for news reflecting a growing literacy among working class readers and enhanced educational provision in the new urban centers. Technological and editorial changes were also significant. The new linotype printing machines, the expansion of communication via railroads and the telegraph, along with changes in editorial formats and contents, encouraged growing markets for newspapers. The *Daily Telegraph,* launched on the day that stamp duty was abolished, reported news in a more dramatic, lively, and colloquial style than *The Times,* and adopted the typographical and photographical techniques of the American press, which Matthew Arnold dubbed the "new journalism": the use of eye-catching headlines, inclusion of news interviews, coverage of sports in preference to politics, and the use of the inverted pyramid writing style. Sales spiraled from 27,000 in 1856, to 141,700 in 1860, 191,000 in 1871, and in excess of a quarter million by 1880. Editor Joseph Levy claimed "the largest circulation in the world" for the newspaper.

During the twentieth century, up to World War II, three features of the press were significant: expanding circulations (from 4.7 million in 1926 to 10.6 million in 1939 and 15.5 million in 1947); a declining number of separate titles (between 1921 and 1937, 3 national daily papers, 4 Sundays, and 13 provincial papers ceased publication) and increased concentration of newspaper ownership (three newspaper groups, owned by Beaverbrook, Rothermere, and Kelmsley, controlled 43 percent of national newspaper circulation).

Declining Titles and Circulations?

As of late 2008 there were 11 national daily papers, which the Audit Bureau of Circulations (ABC) places into three broad categories reflecting their circulation, editorial style, and, before the arrival of the "compact" editions in 2003, the size of the newspapers. The *Daily Mirror, Daily Record, Daily Star,* and *The Sun* constitute the high circulation, entertainment oriented tabloid papers or "red tops"—reflecting their gaudy mastheads. The "mid-market" papers, the *Daily Express* and *Daily Mail*, report more politics and business news but lack the editorial gravitas of the "qualities." Finally, the *Daily Telegraph, Financial Times, Guardian, Independent,* and *The Times* comprise the "qualities" that report a "hard news agenda" replete with reports of government policy, global economic news and international affairs. They also attract a readership that is more highly educated and enjoys a higher socioeconomic and professional status than other newspaper categories. The Sunday

newspaper market is similarly differentiated: the *Daily Star Sunday, News of the World, Sunday Mirror, Sunday Sport,* and the *People* (Sunday tabloid) typically carry front page reports of celebrity news delivered in a salacious style. The *Mail on Sunday* and *Sunday Express* (mid-market) and *Independent on Sunday, Observer, Sunday Telegraph,* and the *Sunday Times* (qualities) are more sober in editorial style, but as Sundays, these papers offer more feature-length reports summarizing and exploring the stories of the week in great detail and with more opinion and editorial comment.

The development of new "direct input" printing technologies, publisher Rupert Murdoch's 1986 move to a modernized production plant at Wapping, and the weakening of trade union influence in the British press prompted the unprecedented launch of 10 new daily newspapers between 1986 and 1990: *Today* (1986), *The Independent* (1986), the *Sport* (1986), the *Sunday Sport* (1986), the *London Daily News* (1987), the *News on Sunday* (1987), the *Post* (1988), the *Correspondent* (1989), *The Independent on Sunday* (1990), and the *European* (1990). The *London Daily News* survived only five months, *News on Sunday* only eight, while others like *Today* struggled through to 1995. The *Independent* titles face a continuing decline in sales, revenues, and profitability.

The reduction of titles is even more striking for provincial (local) newspapers. The 108 paid daily and 1,306 weekly titles published in 1948 had declined to 94 daily and 526 weekly papers by 2005, a 56 percent reduction in titles. But the hemorrhaging of paid weekly titles was stemmed and their numbers complemented by the emergence of free weekly papers during the 1970s. These papers (disdained as "freesheets" by journalists for their "downmarket" editorial contents and complete reliance on advertising for revenues) enjoyed remarkable growth from 325 titles in 1980 to a peak of 882 six years later; currently 637 titles are published. But since 1999, Associated Newspapers have published an expansive portfolio of (currently ten) daily free *Metro* titles that enjoy wide readerships and advertising revenues; for some commentators they offer a possible business model for the national press. In London, Associated's free *London Lite* and Murdoch's *London Paper* vie for distribution supremacy and advertising revenues. The local press in 2008 offered 1,308 local and regional titles including 32 morning dailies (22 paid and 10 free), 78 evening papers (72 paid and 6 free), 532 paid weeklies, 648 free weeklies, and 18 Sunday newspapers (10 paid and 8 free).

Fewer papers signal fewer readers. Aggregate circulations for national daily and Sunday titles fell from 38.4 million in 1965 to 32.7 million in 1985 but crashed to only 22.6 million in 2008 (11.2 million dailies and 11.4 million Sundays), representing a loss of 15.8 million sales or 41 percent of the market. But the circulation fortunes of the British press vary across market sectors. The circulation of national dailies, for example, has *declined* from 14.8 million copies in 1965 to 11.4 million by 2007 and Sundays have similarly dropped from 23.7 million to 11.3 million across the same period, but quality dailies have *increased* their circulations from 2.0 million to 2.6 million while the quality Sundays have *held steady* selling 2.5 million copies in 2007 compared to 2.7 million in 1965. By contrast daily tabloid and midmarket newspapers have *plummeted* from 12.7 million in 1965 to 8.8 million in 2007; the Sunday popular press has crashed from 20.9 million copies in 1965 to 8.8 in 2007. These figures offer interesting data with which to assess the alleged "dumbing down" debate. In Britain it is the serious quality or broadsheet titles that have sustained or even increased their readerships while the editorially more frivolous tabloid papers have shed readers dramatically. One possible conclusion here is that editors should move editorially up market not down market in order to enhance circulation.

The circulation trends for local and regional papers are also strikingly down, from a peak in 1989 (48 million copies sold each week) to 41 million by 2004: down 15 percent of market. Free papers have similarly declined from a distribution high of 42 million in 1989 to 29 million in 2004 (–28.6 percent) even when the burgeoning free metro newspaper distributions are included. There is much evidence here to support the worst speculations of the pessimists.

Newspaper Organizations: Costs, Revenues, and Profitability

Local and national newspapers enjoy highly profitable returns on their investment compared to

other industries. Typical rates of return for local newspaper groups have varied between 25 percent and 30 percent, although Media Wales (Trinity Mirror Wales before November 2007) achieved quite remarkable pretax profits of 38.2 percent (£20.999 million) in 2005 on a turnover of £54.596 million. National newspaper groups also enjoy healthy profits and high turnovers. Between 1985 and 2004, average profit for the nine newspaper groups was 7.8 percent. The Guardian Media Group, however, enjoyed a 47 percent rise in pretax profits from £66.4 million to £97.7 million in the year ending April 2007, in what was judged to be a "difficult and challenging" year.

Three factors explain this profitability. First, advertising revenues are crucial; they have remained stable, high, and constitute an average 80 percent of local newspapers revenues. In 2004–05, advertising income for the regional press was £3.132 billion and for national papers it was £2.036 billion, with local (20 percent) and national (13 percent) newspapers taking 33 percent of total UK advertising revenues followed by television (26 percent), magazines (12 percent), radio (4 percent), the Internet (4 percent), and cinema (1 percent).

Second, production costs have been kept low by reducing journalism jobs and wages to a minimum. A study of major British newspaper groups between 1985 and 2004 concluded that the average number of editorial employees was fairly constant at around 500 employees per group. In 1985 the average number of journalists for each group was 786, falling to a low of 427 in 1987 following News International's move to Wapping, but rising again through the 1990s to an average 741 in 2005, a figure very close to the number of journalists employed 20 years earlier. But individual cases defy averages. At Express Newspapers Ltd., for example, journalism numbers fell from 968 to 532 between 1996 and 2004, with a sharp increase in job losses reflecting the arrival of new owner and executive editor Richard Desmond. In November 2008, *The Independent* sacked 60 of its 230 journalists and the *Telegraph* similarly laid off 65 journalists. In local newspapers, job cuts are similarly commonplace with Trinity Mirror (now Media Wales), which is Britain's largest provincial newspaper publisher with 232 titles in its portfolio, reducing journalists and other production workers in post by almost 20 percent (19.2 percent) from 6,898 to 5,575 between 2000 and 2005. Those still employed receive modest salaries. Half of British journalists earn less than the national average wage of £26,161, and half of journalists working in the regional press earn less than £20,000 a year.

Third, these economic benefits have been sustained by the consolidation of the regional newspaper industry, via a series of mergers and takeovers during the 1980s and 1990s, into a handful of regionally based monopolies that dominate the local newspaper market. Consequently, the 200 groups publishing local newspapers in 1992 were reduced to 137 by 1998 and 84 in 2008. Thirty-six of these companies own a single newspaper while the "big 20" now own 88.3 percent of all British regional and local newspaper titles and 97 percent of all audited circulation. The five largest groups (Trinity Mirror [186 titles and 12.5 million copies], Associated Newspapers [12; 9.7 million], Johnston Press [295; 9.4 million], Newsquest [210; 9.1 million], and Northcliffe [130; 8 million]) own 833 (64 percent) of all local newspaper titles with aggregate circulations of 48.7 million while the remaining 79 publishers own a mere 25 percent of the market by circulation (14.8 million). Corporations, moreover, make "tacit agreements" with major rivals not to invade each other's "territories" rendering local newspaper markets noncompetitive. They integrate their holdings vertically, horizontally, and diagonally to ensure that they are able to sustain supplies of key production materials but also develop economies of scale such as centralized printing and subediting.

Changing Style and Contents

A key feature of newspapers in the new millennium has been their changing shape (literally), the emphasis on relaunches and redesigns, and the constant "tweaking" of editorial content resulting in a greater emphasis on news and features about lifestyle, fashion, leisure, travel, celebrities, human interest stories, and "infotainment." These changes reflect the increasingly competitive markets for readers and advertising revenues that newspapers confront, rather than developments in media technology. Technological change has played more of an enabling role, with new printing presses providing opportunities for crisper typefaces, color pictures on

every page, the inclusion of illustrative graphics, and enhanced quality for photographic reproduction. These changes to newspaper format, layout, and design to meet readers' changing requirements for news are striking and undeniable; the shifts in contents have proved more contentious.

The global move to tabloid formats since 2001 has also occurred in Britain, but owners and editors have preferred to use the word "compacts," in order to avoid the anticipated opprobrium associated with "tabloid" and to defuse any suggestions of "dumbing down."

The Independent pioneered the move to compact in September 2003, which undoubtedly reflected the title's sustained loss of readers from 400,000 in 1990 to 220,000 a decade later. Research revealed that compact editions would be popular with young readers, women, and commuters but, more significantly, with advertisers. Sales of the new style *Independent* initially soared by 40,000 a day; *The Times* promptly launched a similar compact edition. But amid the celebrations of growing readerships, *Guardian* editor Alan Rusbridger was deeply concerned about the possible impact of this shift to tabloid on editorial contents and argued that a tabloid size would inevitably prompt a tabloid content. He opted for the European style Berliner format exemplified by *Le Monde* which, in terms of page size, sat somewhere between the tabloid and disappearing broadsheet. Only the *Daily Telegraph* retains the broadsheet format.

Visually the most striking feature of the new compact editions is the increased use of photo journalists for telling stories, especially on the front page above the fold. Given the shrinking page size, there are obviously fewer stories with fewer words on each page. *The Independent* exemplifies this design shift by adopting a "poster" style front page featuring a single story, illustrated by a colorful graphic or photograph with virtually no text or even headline. The editor's preference for columnists and editorial comment above "straight" factual news coverage is reflected in his proud boast that *The Independent* is a "viewspaper" not a newspaper.

Online Editions: What's the Business Plan?

All British national and many local and regional papers publish online editions and yet curiously this move to convergence has failed to generate an agreed, industry-wide business model or strategy to make online journalism profitable. Newspaper groups have identified three sources of income from online news: subscription, advertising, and ad hoc sales although each element in the revenue stream is problematic since there are potential economic tensions between them. Company business plans usually employ a judicious mix of all three.

The basic problem with subscriptions to online editions, compared to paying the cover price for a hardcopy newspaper, is that it is not clear why anyone should pay to buy news from the former when essentially the same news is available for free from many other newspaper websites. So charging is problematic except for worldwide quality brands that specialize in a particular news/information sector, such as *The Wall Street Journal Online*. In brief, the business logic of print editions does not transfer online. But even if companies *are* successful in persuading readers to move online, they cannibalize their own print readership and reduce their revenue base because of fewer cover sales but more significantly reduced advertising. The consequences of this cannibalism are severe.

Advertising represents newspapers' vital revenue source, accounting for up to 80 percent of paid papers' revenues and 100 percent of free newspaper income. Web-based advertising revenues are growing (and rapidly) but from a low baseline and constitute a very modest proportion (5.7 percent in 2006) of global revenues ($425 billion) while printed newspapers receive 29.4 percent. Each convert to online editions is won at a substantial financial cost and such victories are Pyrrhic. But companies cannot return to a subscription based strategy since charging for site access reduces reader traffic and with it the vital advertising revenues. Typically, newspaper groups compromise by selling what is popular with readers but unique to their brand. Consequently in Britain, *The Times* charges for its crossword, and *The Independent* for the features by its distinguished Middle East correspondent Robert Fisk.

Ad hoc sales involve newspapers using their valued brand to associate themselves with a range of goods and services such as travel, cars, property, and dating. While newspapers typically offer traditional advertisers simply a paid platform from which to attract readers to their products, the extent of endorsement for some of these products

is much closer. These goods and services provide the fastest growing revenue stream for the sites (20–30 percent a year) but also attract further reader traffic and, in turn, advertising income.

Conclusion

The history of British newspapers has been shaped and informed by newspapers' constant adaptation to a host of changing economic, technological, political, social, and cultural factors; a central concern in a market driven system has been the requirement to meet readers' shifting demands for news and the ways in which it is written and visually presented. This process of "editorial Darwinism" began in 1702 with the launch issue of the *Daily Courant* and is an essential ingredient in understanding the evolution of the British newspaper; it continues to shape future developments. In contemporary Britain, the arrival of Internet technology combined with readers' growing preference for online news is prompting changes in journalism practice and journalists' news-gathering and -reporting regimes. These, in turn, trigger radical changes to the ways in which news is reported and presented online. In northern Europe, newspapers understood simply as "news" printed on "paper" are hemorrhaging readers; online editions are offering new life blood in the form of expansive readerships and advertising revenues to the constantly evolving British press.

British Press Regulation

The history of Britain's struggle for a free press fills five centuries with official bans, threats, and laws passed to intimidate or silence journalists. The signal virtue of British press freedom is that it is long established and has been long fought for, which means its methods and institutions are often copied and frequently admired from afar. Anyone who seeks to found a newspaper in Britain from scratch can do so. There is no license required, nor any great amount of paperwork. As long as you obey the law, you are free to operate—and merger rules, by and large, are less restrictive than they are in, for example, the United States. Only regional monopolies create occasional problems. Because Britain has no written constitution clearly enumerating what is allowed and not allowed, however, there are few certainties regarding the rights of journalists and no guarantee of UK press freedom, such as the American First Amendment.

The history of modern British press regulation, however, is far shorter. Essentially, it began on July 21, 1953, in an office on London's Fleet Street, then the great center for Britain's national newspapers, when a body soon known as the Press Council—two dozen or so leading editors and publishers—met for the first time. These self-elected founding fathers set themselves two public tasks: to defend the freedom of the press and to monitor its standards of conduct.

The Press Council (1953–1991)

After centuries of guerrilla warfare with government, this council would offer a new approach for a new postwar era. A responsible press would police itself—but it would also campaign against oppressive restrictions such as the Official Secrets Act of 1911 (amended in 1989), a law imposing areas of government secrecy and making imprisonment possible for journalists (or anyone else) who pulled aside that curtain. The council's members intended to "Publish and Be Damned" (as the great *Daily Mirror* slogan proclaimed) but also to break some of the chains of libel and defamation litigation that made the United Kingdom one of the most difficult developed countries in the world in which investigative reporters and their editors had to work.

Those who gathered for this first meeting, though, were not exactly starry-eyed about the initiative. As was also the case nearly 40 years later, when the Press Complaints Commission supplanted this first Press Council, newspapers and magazines invented their own solution to a perceived problem to ward off worse official action. Self-regulation was a response to constant government and backbench pressure. Three Royal Commissions on the Press—in 1947, 1962, and 1977—made a continuing case for change; and events, including the beginning of a new tabloid circulation war after publishing magnate Rupert Murdoch bought the restrained middle-market *Sun* in 1969 and transformed it into something more populist, produced an inescapable rise in complaints about the press by the public and an equally inescapable demand for further press reform. There were "still flagrant breaches of acceptable standards," wrote the chairman of the 1977 commission, Sir Oliver McGregor. Though the idea of a Press Council had been welcomed—and copied—around the world from Australia to Sri Lanka, the original concept was steadily battered into irrelevance. It had seemed a big enough step in 1953 to set up a committee of senior journalists and managers under an independent chairman and ask them to investigate cases of supposed bad behavior by newspapers as well as laying down standards of conduct and stepping in to defend and promote the profession (rather like the Bar Council defended lawyers and the General Medical Council defended and policed doctors). But times grew rougher and faith in the council gradually diminished.

The council's critics, inside and outside the newspaper industry, had a litany of complaints: that it was underfunded and unable to initiate its own inquiries; that it had no easy and universally recognized code of practice; that its propensity for choosing lawyers and ex-judges as chairmen made its proceedings inherently legalistic, and, thus, slow moving—so that findings emerged too late, many months after the original offense. Worse—that this almost stagnant pace was exacerbated by the scheduling of aural hearings which were often delayed when witnesses (or solicitors) couldn't make themselves available. Furthermore, critics argued, editors themselves ceased to attend these hearings, sending along surrogates who didn't have the profile needed to command attention. Moreover, confusion over the "legal waiver"—determining whether complainants could sue through the courts as well as pursuing a Press Council judgment—made it impossible for editors to be utterly frank when submitting evidence. Time and again, critics alleged, the original aim of promoting press freedom didn't fit with the way reader demands had developed. How could a council be expected to champion a free press while simultaneously seeking to discipline errant newspapers?

Press Complaints Commission (1991–Present)

All these criticisms were addressed in 1991 when the Press Complaints Commission (PCC) replaced the old Press Council. It was a time, soon after the fall of Margaret Thatcher (1979–90) as Prime Minister, when a supposedly too powerful press had angered members of Parliament (MPs) with its relentless front-page coverage of the many scandals involving MPs (and sex), a trend that contributed to increasing animosity between the press and the government. The arts minister, David Mellor, had famously warned that "the press is drinking in the Last Chance Saloon" as yet another government-commissioned report, by Sir David Calcutt, began to make the case for a PCC with statutory powers to fine offending papers. There was genuine alarm among publishers about new laws on privacy that, it was feared, could do great circulation damage by cutting off the tabloids' supply of

celebrity kiss-and-tell stories. The Newspaper Proprietors Association moved quickly to kick-start a complaints commission chaired by Oliver (now Lord) McGregor, 69, who had made a reputation as chairman of the very successful self-regulatory Advertising Standards Commission. His lessons learned there, as well as his analysis of Press Council failings, provided a foundation for the PCC, and still inform the commission's practices in the early twenty-first century.

The PCC needed proper funding, so a separate fund-raising body, the Press Standards Board of Finance (PressBof), was put in place to secure that. Because it needed a code of behavior to monitor, McGregor helped establish a high-level editors' code committee that set standards by agreement across the whole industry, then handed them to the commission to police. There would be no lawyers on the commission and no aural hearings, which would allow claims to be more speedily processed. commission staff were asked, as a first step, to affect a reconciliation between complainant and newspaper, so that a letter or apology might resolve matters. If a complainant was intent on suing, then the commission's doors were closed to him. As for the authority wielded by the commission, great efforts were made to give the organization a different profile, one far more imposing than the old council. First there would be a minority of "lay members"—senior doctors, retired civil servants, even a former lady in waiting to the Queen—who would sit alongside national and regional editors themselves (no deputies, no surrogates). The lay minority (later to become a majority) was intended to show the public that this was not some cozy, closed journalists' club; the presence of national editors on the commission, in turn, showed other editors how seriously the job in hand was being taken. And, of course, the PCC had no responsibility to uphold press freedom (except by showing that the press could regulate itself successfully). This was a leaner, hopefully faster-moving, more focused body.

The editors code committee—first chaired by the tabloid *News of the World*—began swift and surprisingly fruitful work, with clauses defining the rights to privacy and places where it might be expected, as well as safeguards against harassment or intrusion and even more vexing matters such as the protection of children. A sweeping paragraph of introduction made clear that these rules had "to be observed in the spirit as well as by the letter." And the industry as a whole—regional papers and magazines included—signed up for such regulation. It was, in many respects, an exemplary start.

Perhaps inevitably, however, some problems surfaced rapidly, and others came up repeatedly. The old Press Council did not perish without some hurt and rancor. The National Union of Journalists, which had withdrawn from the Press Council many years before, denounced the new PCC as an employers' organization, and sat outside the tent. Some critics wanted the real pain of fines against offending newspapers, rather than the milder sanction of printing a commission adjudication. Other critics, failing to understand why editors were represented so heavily on the commission, demanded a clear citizen/reader majority. Many up-market journalists, professing distress over tabloid ethics which they felt reflected badly on them, poured scorn on an initiative that lacked sufficient teeth.

Some of these points have been addressed over time. There is a clear lay majority now. Appointments to the commission are made by an independent appointments committee, and vacancies are widely advertised. Observance of the code is written into the employment contracts of journalists and editors, so that a flagrant breach can become a firing offense (with legal force). Increasingly, the commission has prescribed where and how newspapers should print the fiercest PCC adjudications—and so the placing of those adjudications has become more prominent. But some difficulties are not so easily dealt with.

During the commission's early days Lord McGregor experienced problems that almost brought his chairmanship to an embarrassed halt at a time when the tabloids were running with stories of Princess Diana's estrangement from her husband Prince Charles and her involvement in a series of extramarital affairs. On the one hand, the Princess was talking voluminously off the record to tabloid journalist and official biographer Andrew Morton (for his book-writing purposes); on the other hand, she was constantly pursued by paparazzi and ready to complain to the PCC about these pursuits at a moment's notice, with Buckingham Palace's full support. The chairman, filmed on his lawn or standing outside his office, spoke out fiercely against such harassment by the

press. The pursuers and gossip writers "were dabbling in people's souls," as he put it. But editors with better information—those of the Mirror Group, home of the *Daily Mirror,* for instance—poured scorn on McGregor's naivety when he lectured them over the taking of sneak photographs of the Princess at her gym. Lord McGregor, the *Mirror* said, was an "arch buffoon." The commission seemed, for a while, to teeter on the edge of becoming a laughing stock. 1993 was a turbulent, bitter year.

There were—and remain—real problems of striking a proper balance in matters of this kind. The commission was plagued by questions of whether it should be so closely in touch with the gossip of the day that it doesn't rush to defend the indefensible and whether it should put itself more squarely in the place of the ordinary reader who lacks any inside knowledge of, for example, the sex lives of the rich and famous. More irksome, still, was whether the PCC had been put in place primarily to serve the 14 million or so ordinary people who read a newspaper every day—or to intervene obediently when a tiny group of royals wanted its protection. The Mirror papers threatened to withdraw from the entire system and thus to destroy the new edifice. Only much hard talking behind scenes saved the newly created system from collapse.

Contemporary Challenges

The lesson for proprietors and editors, often as sharp-edged as the latest picture of a young prince drunk outside a night club or embarrassing as the hysterical coverage of the missing three-year-old Madeleine McCann, is that self-regulation cannot for a second be taken for granted. It is only as good, and accepted, as its last case or crisis. If its aim is to win public approval, and so reduce the flow of political threats and legislation, then that is a continual battle without final victory. Every morning in the world of daily newspapers presents a fresh challenge.

Such challenges in the years since 1991 have been many and varied. Cases the commission has adjudicated include that of a politician chairman (Lord Wakeham, McGregor's successor) and his ties to disgraced U.S. energy giant Enron in the wake of that company's fraudulent accounting activity and subsequent bankruptcy; the diplomat Sir Christopher Meyer (Wakeham's successor), who sold his memoirs to a newspaper, fueling charges of media favoritism; and one long-standing press member, Peter Hill, editor of the *Daily Express,* who was forced to apologize for grossly misleading reporting in the McCann kidnapping before stepping down from the commission after a number of weeks under public pressure.

The commission has many achievements of which it can be proud. It has a hot telephone and Internet line that readers who feel under some personal threat from press intrusion can call for assistance. Its levels of public recognition and awareness improve every year: 4,340 complaints were received in 2007, with 822 investigations and 1,229 total rulings. The PCC makes itself ever more available as a background organizer of press coverage—for some contentious court case, for example, so that vigorous competition doesn't spill over into chaos or the courts. It increasingly offers help to other newspaper centers around the world, instructing them on creating self-regulation mechanisms. In particular, a complex series of legal judgments have given the PCC some unofficial standing as a kind of court of first resort, so that newspapers following its code of practice have that as a defense in disputes, and a commission ruling in their favor will normally discourage any attempt to take matters further.

The PCC and the Practice of Journalism

Any proper examination of British press regulation has to set a context beyond the central role of the commission. The PCC came into being to restrict the spread of legal impediments to free journalism, but it has in no sense swept such barriers away. Newspapers still need to bear the law in mind every day they go to press. Editors need to worry whether they have inadvertently reported a case where the judge has insisted that no reporting be allowed (often cases involving children, growing more frequent in number annually).

This reporting can cause a trial to be stopped, with newspapers often required to pay the bill for all proceedings before the stopping point. Such contempt of court can be very expensive—and can be used in different ways, so that reporters refusing to reveal a story's source can also be cited for

contempt and sent to prison. Add copyright violation, as a catch-all for the illegal publishing of leaked documents; rights of confidentiality enshrined in many areas of English commercial law; libel law (often reckoned one of the most punishing in the world); and the complexities of reporting on official secrets, and you have a critical mass of legislation to vex any editor. Starting at the end of the twentieth century, moreover, there has been a real growth in privacy law and privacy cases, with the European Convention of Human Rights being incorporated directly into English law and individual judges required to balance the competing influences of Clause 8 (defending privacy) and Clause 10 (defending freedom of expression) in a growing number of celebrity suits which have left judges to decide how and if supermodels, football stars, and other big names have had their privacy invaded by tabloid coverage. Many editors now fear that "judge made law" could spell the eventual end of the traditional "red top" tabloid, with its scarlet masthead and obsessive interest in scarlet behavior.

Self-regulation is one answer here. PCC handling of privacy complaints grows year by year (though it attracts few rich or famous complainants). And self-regulation, even in the face of terrorism's threats, may have a role to play through the long-standing D Notice committee, which brings editors and Ministry of Defense officials around the same table at regular intervals to discuss the imperatives of national security and, in effect, to operate an early warning system so that editors are informed of sensitive areas where care has to be exercised. But self-regulation has not removed legal constraints of a quite onerous nature; it has merely helped to slow the flow of additional law-making. And nobody—after the case of Max Mosley in 2008, which saw a sporting administrator awarded £60,000 (U.S. $119,000) in privacy damages against a paper that had (wrongly) claimed there was a Nazi element in a five-hour video of a sadomasochistic orgy featuring Mosley and five different prostitutes—could say where the flow might stop.

Every major British newspaper, perforce, employs its own specialist team to read copy for libel purposes before publication. Every paper has cases on its books involving millions of pounds in damages. Every paper is also expanding because of the digital revolution in journalism that is changing the nature of the problem and of the threat so that the PCC itself has raised the question of who shall police gray areas where no accepted jurisdiction has been assigned.

An increasing number of issues, for instance, affect more than the traditional print media. Television and radio broadcasting are regulated by statute, with a supreme regulator, the Office of Communication (Ofcom), in charge of everything they do. Thus, words or pictures broadcast by the British Broadcasting Corporation (BBC) are subject to Ofcom criticism—and potentially fines—when shown on the Internet if they give offense through, for example, bad language or if they offer prizes in competitions that are sloppily run. The self-regulating role of the PCC applies to audio and visual streaming on newspapers' online news sites as well as to the print versions. So the same pictures, drawn from the same news agency sources, can have different regulators imposing different criteria in a new media world in which there is no existing Internet regulator. This creates a regulatory anomaly, readily admitted to by the chairman of the PCC, but it could also become a gaping hole in the overall web of media regulation, prompting political demands for an overarching, and statutory, regulator. Ofcom, able to fine and suspend, could surely fill that role if the existing system proves inadequate.

In just the same way, the growing tendency of newspapers to appoint their own ombudsmen (or readers' editors), working to their own house rules of conduct, threatens some clash with the Press Commission code or, indeed, the separate code drawn up by the National Union of Journalists. Confusion, at every level and in every direction, is a constant danger in British journalism.

There is also, all too obviously, no final reconciliation of the tension between articles 8 and 10 of the European Convention of Human Rights, the clauses concerning privacy and free expression, or in the legislation connecting that convention to British law. Moreover, there are differences of legal interpretation even within the UK, where Scottish law is separate and autonomously administered (without a Scottish Press Complaints Commission). There is also a dialogue, continually maintained just off stage, between politicians seeking media support and newspaper proprietors seeking protection against more legislation that could seriously

interfere with their profitable publication of celebrity pictures, among other breaking news.

At first glance, to visiting journalists from outside Britain, the written press appears vigorous and relatively free of governmental meddling or interference from vested interests. Editors today do not often complain about constraints on their freedom to publish. Competition for the public's attention, rather than fear in the face of invasive regulation, appears to be the order of the day. Look closer, however, at the history as well as the practice of British journalism in the early twenty-first century, and a much different, more subtly menacing situation emerges. In a country like Britain, which has no written constitution, freedom of the press is always as frail as the last fragment of law passed through a Parliament gripped by a fear of terrorism. With no First Amendment protection, Britain instead has a thousand little amendments, which can often spell trouble. Regulation is both friend and foe to a free press; and self-regulation—changing its requirements with every fresh case—is a friend in need that needs constant, watchful scrutiny.

British Tabloid Press

A class of popular British newspapers, mainly established in the late nineteenth and early twentieth centuries, aimed at mass readerships, and became notorious for their focus on scandal and sensationalized human interest stories. Although in long-term decline, they remain dominant in terms of circulation and the setting of the news agenda for other British media organizations and politicians.

Britain retains an extensive network of local and regional newspapers, but the British news agenda is still largely determined by 11 national morning daily and 11 Sunday newspapers, principally based in London. Of these, six daily and seven Sunday titles can be described as tabloid.

The term *tabloid* refers to three aspects of popular journalism:

- a style of journalism that is readeer-friendly and uses a stylized imitation of popular speech, a dramatic layout, and large visuals;
- a small format newspaper, generally half the size of a "broadsheet";
- pejoratively, a journalistic content that is stigmatized as "down-market," lacking in veracity, and malignly concerned with titillating its readers with the worst in human behavior.

In June 2008 tabloid newspapers accounted for 7.6 million of the 11.1 million total circulation of British national daily papers and 8.9 million of the 11.3 million Sunday circulation. In addition most local newspapers in Britain have shifted to a small size tabloid format and many cities now have free newspapers, in the same user-friendly shape, distributed to homes or handed out in city centers, so that size alone is no longer a clear indication of a tabloid news approach.

British tabloid newspapers are distinguished by a strident focus on crime, celebrity, scandal, gossip, sport, and human interest stories with relatively little space given to politics, foreign news, and social issues. They tend to have bold layouts and designs, with an emphasis on large headlines and visuals, typically within a small format page ranging in size from 11.8 by 15.6 inches to 11.4 by 14.2 inches, and the use of a striking front page, frequently as a poster promoting the contents within. They deploy a variety of devices to involve readers, including campaigns concerning high-profile issues such as child-abuse, gifts, competitions, gambling (Bingo, Lotto, football, horse-racing), stunts (infiltrating airports with fake bombs, gate-crashing celebrity birthday

parties), and horoscopes, and they carry prominently a range of feature material devoted to lifestyle issues such as health, personal finance, and relationship problems.

Three Tabloid Types

Within this category it is possible to distinguish three distinct, but overlapping types of newspaper. One can be described as mid-market tabloids, or what media researcher Colin Sparks (2000) terms "serious popular" papers, aimed at a prosperous working and lower middle class audience, with some serious news and commentary, a limited amount of overseas news, and extensive treatment of health and personal finance, mixed in with the classic tabloid formula of scandal, celebrity, and human interest. *The Daily Mail* (founded 1896) and the *Daily Express* (1900) and their Sunday editions represent this type. The *Daily Mail* is the dominant newspaper in this category with a 2008 circulation of 2.2 million compared to 700,000 for the *Daily Express*. Both newspapers are characterized by right of center politics.

The second type can be described as "true" or "newsstand" or "classic" tabloids, aimed at an overwhelmingly poorer working class readership with an agenda dominated by scandal, celebrity, television, glamour photography and sport, but with some concern for politics, particularly at election time and in relation to cost of living issues, and for overseas operations by British armed forces, usually described in patriotic mode as "Our Boys and [latterly] Girls." These newspapers are often called "red tops" because of their eye-catching red mastheads. The four titles in this category are the *Sun* (1964), the *Daily Mirror* (1903) and its Scottish stablemate the *Daily Record* (1895), and the *Daily Star* (1978). The *Sun* and the *Daily Mirror* are the circulation leaders and have been fierce competitors since the late 1960s. Circulation figures in 2008 are 3 million for the *Sun* and 1.4 million for the *Mirror*.

The third category can be described as the "supermarket tabloid," characterized by an even greater focus on scandal, sport, strong sexual content, and entertainment. There is no commitment to a serious news agenda but a mischievous interest in constructing fantasy stories, or rather fascinating headlines to which a "story"can be attached. In the United States this category includes the *National Enquirer*. In the UK this category has been solely represented by the *Daily Sport* (1991) and its stablemate the *Sunday Sport* (1986). Circulation for these titles in 2008 was a low 100,000, and many British journalists refuse to describe them as newspapers. The *Daily Sport*'s most celebrated headlines include "World War II bomber found on the moon" and its follow-up some weeks later "World War II bomber missing from moon!" Ironically, campaigns against soft-core pornography and the classified advertising of sexual services have led to some supermarkets refusing to stock the title, or confining it to a high shelf out of children's reach.

The Meaning of Tabloid

In British journalism, the term *tabloid* possesses two overlapping meanings. Historically one meaning described a form of condensed, easy-to-read journalism, aimed at the popular market, and distinct from the so-called quality newspapers aimed at the middle and upper classes. The term *tabloid* itself derives from the words "tablet" and "alkaloid" and was registered as a trademark by the Victorian drug industry in 1884. Within a few years the word was in common use to describe a concentrated form of anything.

Among the appropriators of the term was the Irish-born newspaper magnate Alfred Harmsworth (later Lord Northcliffe), who was in the process of creating his new daily newspaper, the *Daily Mail* (1896). Starting in 1888, Harmsworth had built an empire of inexpensive weekly magazines and then moved on to evening newspapers. Magazines taught him the advantages of short, cheaply produced, often plagiarized factual items combined with fiction and competitions in one handy, economical, entertaining package. Although the *Daily Mail* was produced in a broadsheet format, which aped *The Times* and all the other established morning newspapers, it cost only half the price. And it included many magazine elements; stories were limited in length, and there was an emphasis on human interest and show business, short fiction serials, and competitions and stunts—all designed to build circulation and create a daily newspaper habit. Above all, there was a focus on talking points—short factual items designed to promote a

national conversation—and campaigns on any issues that could, in Harmsworth's favorite phrase, be "worked up," by diligent and sensational journalism, into a national scandal. It was the first daily newspaper in Britain to achieve a circulation of over a million, at the close of the Boer War (1899–1902).

Harmsworth saw himself as the prophet of a new-style, timesaving newspaper fit for a new century. In a rare example of a media innovation flowing from west to east across the Atlantic, he was challenged by Joseph Pulitzer, the publisher of the *New York Daily World,* to edit his paper for a day. Harmsworth produced a "tabloid" version on January 1, 1901. All stories were restricted to 250 words or less, paragraphs and sentences were kept short, and layout was rationalized, with columns of brief new items and stories organized into clearly signposted sections. A page one editorial authored by Harmsworth declared, beneath the headline "The Daily Time-Saver" and "All the News in Sixty Seconds," that "I claim that by my system of condensed or tabloid journalism hundreds of working hours can be saved each year' (quoted in Tulloch 2000).

The second meaning describes a particular newspaper format: the British tabloid of the latter half of the twentieth century was a small newspaper (typically about 16 in. × 12 in.) handy to read on the way to work in the bus or on the underground train. London evening papers pioneered the format in Britain at the end of the nineteenth century, and the first morning example was the *Daily Mirror* (1903), also launched by Alfred Harmsworth. In Britain for most of the last century this format became strongly identified with popular newspapers with large circulations, although elsewhere in Europe the format was utilized for more upmarket papers such as *Le Monde* and *Liberation* in France.

However, in recent years most British broadsheet newspapers, under increasing competition from new media, and rising production costs, have begun to adopt a tabloid format—but such are the negative connotations of tabloid that they christened themselves as "compact" instead. The midmarket newspapers were the first to embrace the format in the 1970s. Of the so-called quality newspapers, *The Independent* (1986) was first to convert from broadsheet to compact format in 2003 and pioneered an issue-based front page using large scale graphics or photos. *The Times* (1785) began to publish a compact edition two months later, alongside a broadsheet version, but with a front page that would hold up to a dozen stories. In 2005, the *Guardian* (1821) converted from broadsheet to the smaller, slimmer "Berliner" format, 18.5 by 12.6 inches. By 2008 only the *Daily Telegraph* (1855) and the *Financial Times* (1888) maintained the old broadsheet format. In addition, the majority of British local newspapers have adopted a tabloid size, but with a considerable variation in the treatment of stories, although all share a heavy emphasis on sensationalized crime coverage. Most major cities also have giveaway or free newspapers in tabloid format, funded exclusively by advertising and distributed to homes or outside railway and bus stations.

History: The Radical Roots

Popular newspapers in Britain were established in the early nineteenth century by radicals campaigning for political reform. Notable examples were the Chartist *Northern Star* (1837) and William Cobbett's *Political Register* (1802–36). These were subject to censorship and control by the state through a series of so-called Taxes on Knowledge on paper and printing. The relaxation of these controls, in pursuit of the mid-Victorian ideal of the free market, encouraged the rise of a commercial popular press. This largely superseded the radical press by mid-century with newspapers financed by advertising as well as sales. Some academics present this as a move from political control of popular expression by censorship and taxation to the use of the market. In particular, Sunday newspapers such as the *News of the World* (1843) and *Reynold's Weekly News* (1850–1967), began to colonize the popular market, with a combination of crime and sports news, and to experiment with the idioms of popular speech that would enable them to directly address their readers. These are the origins of the distinctive stylized language of classic British tabloids. As one observer noted: "The history of the development of the popular newspaper into the tabloid newspaper in Britain is the story of the evolution of that idiom across shifting economic and historical circumstances. Its language was to become the articulation of a particular, proletarian version of Britain" (quoted in Conboy 2006).

Sunday newspapers were undeniably popular with British proletarians but it took another century before the daily newspaper reading habit penetrated to the working class. Harmsworth's *Daily Mail* was mainly aimed at the lower middle classes—the expanding army of clerks and officials required to man the commerce of the late Victorian city. It was the *Daily Mirror,* the *Daily Express,* and the trade union backed *Daily Herald* that achieved a mass circulation breakthrough in the interwar period, 1920 to 1940, and established a working class daily newspaper reading habit.

The *Daily Express,* published in broadsheet format until 1977, was taken over by the Canadian-born businessman and politician Max Aitken (later Lord Beaverbrook) in 1916. Like Northcliffe, Beaverbrook was a "hands-on" proprietor, and an unscrupulous and skilled communicator, serving as British propaganda minister in 1918 and in Winston Churchill's administration in 1940. By adopting and developing tabloid techniques utilized by the *Daily Mail,* Beaverbrook and his editor, the outstanding newspaper technician Arthur Christiansen, achieved a circulation of 2.25 million in 1936 and 4 million by 1949, overtaking the *Mail* and becoming the leading midmarket popular daily. In particular, the *Express* was the pioneer of a new, lively layout with an emphasis on banner headlines, Hollywood features, and gossip columns about celebrities. A paper of pronounced conservative opinions, tied to Beaverbrook's political preoccupations, it campaigned on imperial issues and against accession to the European Common Market.

As the *Express* slugged it out for the midmarket with the *Daily Mail,* the *Daily Mirror* achieved a dominant position as the leading paper of the British working class, creating the classic look of the mid-century British tabloid. This was principally due to a repositioning suggested by the advertising agency J. Walter Thompson in the early 1930s, which argued that the paper should repurpose itself to appeal to a young working class, politically left-of-center audience. Brash and irreverent toward royalty and politicians, with glamour photos and comic strips, the paper pioneered the front page as an all-purpose poster and developed a close relationship with its readers based on readers' letters and "problem" pages. *Mirror* sales increased substantially during World War II and the paper became the most popular among British troops. With a close relation to Britain's Labour Party, the paper also pioneered incisive investigative features exposing the social conditions of the country, and in 1956 notably opposed the invasion of Egypt by British and French forces during the Suez Canal crisis—as half a century later it opposed the second Iraq war.

By the mid-1960s, the *Daily Mirror* had the largest circulation of any daily newspaper in the Western world, selling 5 million copies a day. Serious competition, however, was about to develop. On November 17, 1969, the *Sun*—a defunct broadsheet sold by the *Mirror* group to the global media proprietor Rupert Murdoch—was relaunched as a tabloid, describing itself as "[t]he paper that cares about people. About the kind of world we live in" (quoted in Griffiths 2006). One year later, the *Sun* printed its first picture of a topless model on page three, with the caption "We, like our readers, like pretty girls" (quoted in Griffiths 2006). Overtaking the *Mirror* in 1978, during the 1980s and 1990s the *Sun* achieved international notoriety not just for its page three girl, but for a strident British patriotism and an unflinching support for British Prime Minister Margaret Thatcher (in power 1979–90), best typified by the front page headline "Gotcha!," attached to the story of the Royal Navy's sinking of the Argentinean cruiser *General Belgrano* during the short Falklands war in mid-1982.

Conclusion

With the exception of the BBC, no other British media institution is as well known internationally as the country's tabloid press. However, few British commentators would regard this as a source of international prestige. Loud, turbulent, mischievous, and often scorned and mocked by other journalistic cultures, tabloids function as a handy symbol of the more malign aspects of journalism: a narrow focus on celebrity, a lack of intellectual challenge, xenophobic and flag-waving chauvinism, and a slipshod or deceitful approach to veracity and sourcing.

Cultural anxieties about the role of the British tabloid press crystallize around its alleged role in

- creating moral panics about social issues such as crime, migration, health, and youth culture, and demonizing minorities and "outsiders";

- exerting undue influence on politicians and policymakers as self-appointed tribunes of public opinion;
- routinely breaching human rights and conventional decencies, including the right to privacy;
- a "dumbing down" of the media, as formerly serious newspapers allegedly adopt "tabloid values" or engage in "tabloidization";
- more generally degrading journalistic culture, and fostering a decline in professional standards;
- creating a "theater of cruelty" in which celebrities and other public figures are routinely monstered;
- encouraging legislators to introduce laws restricting freedom of expression on the grounds that the high profile abuses of the tabloids endanger the legal and political process and the right to privacy.

Communications researcher Steven Barnett observes that concerns about declining standards in the British media "go back at least to the launch of the *Daily Mail*." Anxieties about immigration and crime and the political influence of powerful newspapers go back equally as far. More firmly based are the charges about human rights abuses by British tabloids and the ruthless destruction of people in the media spotlight. A 2007–08 example was the coverage of the Madeleine McCann abduction case, which occupied tabloid front pages continuously from May 2007. In March 2008 the *Daily Express* and *Daily Star* were forced to apologize to Madeleine's parents for suggesting they caused the death of their daughter and then covered it up. Another suspect, Robert Murat, won over £600,000 ($1.2 million) in damages from eleven British tabloid newspapers for stories which wrongly suggested he was linked to the abduction of the missing child.

Apart from the millions who still buy them in Britain, tabloids undeniably possess an ambiguous fascination for media academics, who are particularly concerned with their effort to create a special rapport with readers, and the ways in which they attempt to mirror the language and concerns of working people—a process akin to ventriloquism and described by journalism researcher Martin Conboy as the attempt to create a community through language.

Moreover, some commentators would argue along with Barnett that tabloid journalism "has a long and honourable tradition of making difficult concepts or stories 'come alive' for people who lack either the ability or the inclination to read long-winded articles on complex subjects." Defenders of the tabloids might point to certain traditions in British media culture—a brutality of political comment going back at least to the eighteenth century, a strong vein of satire and invective, and a persisting attempt to construct languages of the people. Some commentators value the technical inventiveness of the tabloids, their carnivalesque refusal to take the mighty seriously, and their commitment to entertainment and mischievous fun. The spread of the tabloid techniques of a pithy, colloquial writing that apes a national "language of the people," vividly packaged with large format pictures and graphics in an accessible, reader friendly format, is not necessarily inconsistent with a hard-hitting journalism that values professional integrity and accuracy and reaches out to wider audiences while treating the powerful—politicians, officials, and celebrities—with appropriate suspicion.

Broadsheet Newspapers

The term *broadsheet* refers to the size of the paper used for a newspaper. The large sheets of newsprint characteristic of the broadsheet format have traditionally dominated the daily newspaper industry. In the early days of newspapers, the large size of the page made it easier for printers to print a smaller number of larger pages. Because of cost and other considerations, over time broadsheet newspapers have shrunk in size, and many newspapers have shifted to the smaller tabloid format. The term *broadsheet* also carries particular connotations of journalistic quality and seriousness in contrast to tabloids, which have come to be associated with a more entertainment-oriented, sensationalistic, and colloquial style. While "broadsheet" and "tabloid" continue to connote these different journalistic styles, in practice this divide began to disappear by the 1990s as the content of both types of newspaper began to overlap and as more publishers shifted from the broadsheet to the less expensive tabloid format.

Origins

While newspapers developed during the print revolution that was made possible by the spread of the printing press, they slowly expanded in size to accommodate the medley of content crammed into publications by printers, including shipping news, foreign dispatches, commodity prices, and advertisements. Similar to modern newspapers, these early-seventeenth-century broadsheets organized their text into vertical columns.

The broadsheet form developed largely out of technical necessity. In the 1600s and 1700s, newspapers continued to be printed on wooden presses requiring pages to be pressed against the type one sheet at a time. Printing was a slow, labor-intensive process. This constrained circulation to small numbers and made the single-sheet newspaper a necessity. As editorial and advertising content increased and the need for more space forced newspapers to expand, it made technical and economic sense to increase the size of the page rather than expand the total number of pages. A single page only needed to be folded; not assembled. One large sheet of newsprint could be printed on both sides and folded to create four separate pages.

In the early 1800s, the rise of mechanical presses increased printing speeds and allowed for greater print runs and thus circulations. Implementation of steam-powered presses further quickened the pace with which newspapers could be produced. But this did not lead to a diminishment of page size. Rather, it remained sensible, from the printer's standpoint, to churn out larger pages rather than assemble many smaller sheets. On the extreme end, broadsheet pages grew to enormous sizes due to advertising policies that encouraged yearly contracts, but did not restrict the size of the display ads. As a result, in the 1830s, a page of the New York *Journal of Commerce* measured a width of 35 inches and a height of 58 inches. When opened, the two pages spanned 70 inches, occupying a little over 28 square feet of space. Each page carried news and advertisements across 11 columns. This format came to be known as the "blanket" sheet because of its cumbersome size.

Large sheets remained standard for urban newspapers. In 1867, the *Chicago Tribune* carried ten columns, two more than the eight or nine column pages common in that era. Within columns, spaces between rows of text—known as leading—decreased. With a minimum of graphics, the pages came across as seas of gray type. Because of the large page dimensions, the total number of pages in nineteenth-century papers remained either four or eight, depending on the size of the circulation and the size of the city. This meant only one or two actual pages were needed (before folding). In the twentieth century, the increase in use of graphics and movement away from text-heavy pages led to smaller page sizes and fewer columns—usually five or six. The total number of pages increased and newspapers began to be divided into sections.

Broadsheets and Tabloids

Challenges to the dominance of the broadsheet format began in the United States when some of the penny press newspapers began to run smaller pages. These mid-nineteenth-century newspapers were the original tabloid-sized papers and, in key ways, foreordained the popular journalism of the tabloid newspapers of the twentieth century. Two early twentieth-century examples of tabloid newspapers are the *Daily Mirror* in London and the *Daily News* in New York. The quick success of both newspapers raised interest in the format.

The rise of the tabloid format led to an important differentiation extending beyond simply page size. Tabloids came to be identified with a brash style of emotionally charged journalism. Tabloid pages teemed with short, punchy articles written in a distinct voice with abundant photographs. While broadsheets offered a range of stories on the front page representing the range of stories on any given day, tabloids featured one key story on the front, usually accompanied by a large, attention-grabbing headline.

With the rise of tabloids and their particular brand of populist journalism, broadsheets by comparison came to be identified as more sober with the reputation of seriousness. This was particularly the case in Britain with its nationally circulated newspapers. Tabloids and broadsheets competed across Britain, appealing to different demographics. Broadsheet readers were viewed as more educated and sophisticated whereas tabloid readers, many of whom were working class, were seen as the opposite. This difference was less pronounced in the United States because of the dominance of local market-specific newspapers. Tabloid newspapers competed directly with broadsheets in only the largest markets. Further melding the two approaches, starting in 1981, the national newspaper *USA Today,* while a broadsheet in its dimensions, featured the colorful graphics and short stories characteristic of tabloids.

For a vivid example of the broadsheet-tabloid mix, consider New York City, by far the most competitive American newspaper market, though a shadow of what existed as recently as the 1960s. The two daily broadsheets, *The New York Times* and *The Wall Street Journal,* are considered paragons of in-depth news. By contrast, the *New York Post* and *New York Daily News,* both tabloids, are seen as sensational and succinct. For example, when the city's newspapers carried front page stories about President Gerald Ford's refusal to grant federal funds to help the city avoid bankruptcy, the *Times* ran the headline: FORD, CASTIGATING CITY, ASSERTS HE'D VETO FUND GUARANTEE; OFFERS BANKRUPTCY BILL. By contrast, the *Daily News* ran the now-classic headline: FORD TO CITY: DROP DEAD. The complicated, policy-specific headline at the *Times* contrasted sharply with the emotional paraphrasing of the *Daily News,* whose headline became a famous example of the tabloid style.

The tabloid-broadsheet distinction diminished by the start of the twenty-first century. Rising paper costs, a shrinking audience, declining advertising revenues, and the general unwieldiness of the broadsheet format (especially for public transit commuters) resulted in many European newspapers shifting to a smaller, tabloid size. Even *The Times* of London, once a paragon of the content associated with the broadsheet, shifted to a tabloid format in 2004 after 216 years as a broadsheet. The switch resulted in an increase in circulation, matching the result when the broadsheet *Independent* made the same change. While a tabloid during the week, however, *The Times* continues to publish its Sunday edition in broadsheet format.

In the United States, newspapers have been reluctant to shift to tabloid size, but broadsheet pages have shrunk in the face of rising newsprint costs and decreases in the number of advertisements. The page width of *The New York Times* dropped from 13.5 to 12 inches in 2006. The once-10-column-wide *Chicago Tribune* was reduced to an 11-inch-wide page. Page depths—the vertical measure—generally stood at 21 or 22 inches. Another direction has been a mix of formats. The *St. Louis Post-Dispatch* remains a broadsheet on weekdays and Sunday, but began running its Saturday edition as a tabloid in November 1996.

Conclusion

While the large pages of the broadsheet newspaper have traditionally defined what a quality newspaper looks like, the early twenty-first century marked a shift to smaller sizes, and sometimes a move away from broadsheets altogether. This reversal came about because of changes in production and cost. As content style and page size increasingly came to be unrelated, the journalistic distinction between the broadsheet and the tabloid has become less meaningful. Despite this, invoking "broadsheet journalism" continues to connote quality in-depth, serious news.

Business Journalism

Business journalism refers to reporting and writing about businesses and the economy. In addition, it commonly includes other beats such as labor, workplace, technology, personal finance, investment, and consumer reporting, as well as investigative reporting focusing on these topics. The field is also known as financial journalism, particularly in countries other than the United States. The common theme in all of this coverage is money—who spends it, who earns it, who makes it, and where it comes from. As more consumers of journalism become aware of how the economy and the stock market affects their daily lives, they are increasingly turning to business journalism to explain the significance.

Business journalism in the United States has grown in importance over the past century due to significant changes in the economic makeup of American society. At the time of the great stock market crash of October 1929, less than 10 percent of U.S. households owned shares of any stock. By 2002, more than 50 percent of homes owned stock in at least one company, typically through mutual funds or retirement plans. Also feeding public interest in business news is the fact that fewer people in the twenty-first century remain with one company throughout their careers, which had been typical from the 1940s through the 1970s.

As a result of these developments, more and more people have come to be interested in news about companies, the stock market, and the economy. The amount of business journalism exploded during and since the 1970s, with daily newspapers creating standalone business sections; personal finance magazines such as *Money, Worth,* and *Smart Money* launching; and the number of business journalists working in the country tripling in number to more than 12,000.

In the early twenty-first century, business journalism is presented in various media forms, including the business section of most daily newspapers, weekly business newspapers found in every major metropolitan market, websites such as TheStreet.com and Marketwatch.com covering specific segments of business journalism, and two cable television networks, CNBC and Fox Business Network. There are also a number of business-only daily

newspapers, such as *The Wall Street Journal* (though its focus under new owner Rupert Murdoch appears to be growing somewhat more general) and *Investor's Business Daily*, as well as magazines, such as *BusinessWeek, Conde Nast Portfolio, Forbes,* and *Fortune,* all devoted to business journalism.

Business journalism, in its role as a watchdog on companies and regulators, can be credited for uncovering illegal and unethical practices that have caused investors to lose millions of dollars and workers to lose their jobs. A 2007 Harvard Business School study studied 263 cases of accounting fraud and determined that 29 percent were identified by the business press before the U.S. Securities and Exchange Commission or the company itself announced an investigation. Further, in 36 percent of those early identifications, the reporter conducted original financial analysis to support the story.

Early History

Business journalism can be traced back to the earliest forms of communication. David Forsyth (1964) argues that the genesis of writing and the establishment of a numerical system in the Bronze Age (3300 BCE–1200 BCE) stemmed from economic activity. Even the Hammurabi Code, a set of laws created by the sixth Babylonian king in approximately 1760 BCE, established forerunners of today's interest rate and minimum wage laws.

During the sixteenth and early seventeenth centuries, wealthy families in Europe employed correspondents throughout the continent to provide them letters with business information useful to further their power. One of these families was the Fuggers, a German family of bankers and traders who needed to keep abreast of events that might affect the interest rates they charged their clients. From 1568 to 1604, hundreds of letters were written by correspondents hired by the Fuggers, and the information in them was used to determine whether or not to loan money and at what rate. They also included prices for products and services in the city from which the letter originated. These Fugger newsletters began what has evolved today into the complex system of providing information about business and the economy, which in the early twenty-first century is available almost instantaneously through the Internet and other media forms.

Many newspapers in the eighteenth and nineteenth centuries were created to allow businesses to notify members of the community about the products and services being offered for sale, and early newspapers carried such business information as the cargo of ships arriving in a city's harbor. These newspapers were commonly called "price currents" because they listed the current prices of various products offered for sale by local merchants, and they rarely, if ever, contained any editorial content. The papers were strictly informational and extremely numbers intensive. Among the products listed in most price currents were cotton, flour, furs, leather, oil, animal skins, tobacco, and wheat.

A Philadelphia price current from 1783 also listed sample wages for workers such as carpenters, sail makers, and blacksmiths, and later price currents included information about shipping traffic. Price currents were published in the cities of Baltimore and Boston in the late eighteenth and early nineteenth centuries. The *Boston Daily Advertiser* was one example: it listed prices for foreign and domestic goods on the front page, and most of the rest of the four-page broadsheet contained shipping information and small advertisements from merchants.

As American business and the economy began to flourish in the nineteenth century so did the relevant journalism. James Gordon Bennett's *New York Herald* was the first newspaper that regularly devoted a large amount of space to business and economic news. Started in 1835 on Wall Street, the *Herald* developed the best financial section of any of the mainstream newspapers, according to Forsyth (1964). Bennett was a former economics teacher, and he often wrote what he called the "money page," which was used to explain why stock prices rose and fell. A member of his financial reporting staff, Thomas Prentice Kettell, began writing a financial column for the *Herald* in 1835 and is considered the first financial editor of any daily newspaper in the country. Kettell went on to found *United States Economist* in 1852.

Perhaps the most influential business journalism in the United States during the nineteenth century occurred in an industry newspaper, the *American Railroad Journal*. Edited by Henry Varnum Poor from 1849 to 1862, the publication extensively covered the booming railroad industry.

Poor expanded business journalism from its tendency to simply regurgitate facts and figures of products for sale by requiring the railroads to provide financial statements to his publication. He then dissected these financials for his readers, reporting whether he thought the company was a good investment. This was the first time that business journalism explored the profits or losses of companies in any depth. Poor later collected his data into a book, and his company (today known as Standard & Poor's) tracks the finances of every major industry.

Important Developments

The Industrial Revolution after 1840 resulted in larger companies with more complex structures and control of local communities and as a result, journalists began to pay more attention to business. *The Wall Street Journal* was founded in 1889, providing investors with information about the stock market and business news in New York City. Acquired by Clarence Barron in 1902, it expanded with editions in Philadelphia and Boston, and then started a weekly newspaper named after its founder in 1921. While muckrakers Ida Tarbell, Lincoln Steffens, and Upton Sinclair were not considered business journalists, they wrote widely about business practices and their impact on government and society. Tarbell's "History of the Standard Oil Company" set the future standard for how companies would be covered by journalists because she used public records such as lawsuits and depositions to make her argument that the company had undue control of the U.S. oil market.

The first three decades of the twentieth century saw an important development in business journalism—the creation of magazines devoted solely to business and the economy. Although the now-defunct *Financial World* started in 1902 and the U.S. Chamber of Commerce began publishing *Nation's Business* in 1907, the best-known business magazines were *Forbes,* started in 1917 by a syndicated business columnist for the *New York American.* McGraw-Hill began publishing *The Business Week* in 1929 and Time Inc. founded the monthly *Fortune* early in 1930.

Most publications focused on business journalism suffered circulation declines during the Depression, but none was hurt more than the *Wall Street Journal.* It was seen as a stock market booster, and 1932 congressional hearings uncovered that some stock touts had been paying the paper's journalists to write favorable stories about companies whose shares they held. The *Journal* remade itself in the late 1930s and 1940s into a more critical business newspaper and one that provided a business angle to nearly every news story. Its lead after the Japanese bombed Pearl Harbor on December 7, 1941, stated that "War with Japan means industrial revolution in the United States."

As the postwar economy expanded exponentially in the 1950s and 1960s, business journalism grew as well. The New York Financial Writers Association, which had been created in 1938, and the Society of American Business Editors and Writers, which started in 1964, took on increasingly important roles in promoting business journalism in the country. Both have developed professional standards and ethics codes that prohibit business journalists from participating in the stock market or from accepting gifts from companies they cover—two common practices in earlier years.

Business journalism on television began to gain traction in the late 1960s. Louis Rukeyser began covering business and economics stories for ABC News in 1968, and in 1971 he started hosting *Wall Street Week* on public television. Irving R. Levine began reporting regularly about business and the economy on NBC News that same year. Both became news fixtures in the 1970s, discussing the Arab oil embargo, inflation, price controls, and the changing stock market. The first business news program was *Nightly Business Report,* which began airing in 1979 on public television stations around the country. It remains a fixture today, airing on more than 250 stations.

Growth and Problems

The dramatic growth in the stock market throughout much of the 1980s and 1990s caused a dramatic expansion of business journalism—and led to many problems. Dozens of journalists began covering business and economics stories without a real understanding of the issues and the nuances of how to properly report and write about those topics. Business journalism in the 1990s was criticized—albeit after the fact—for being too boosterish to industries such as the Internet and telecommunications while

turning CEOs of some companies into celebrities, praising them for their operation's results without examining the underlying warts, which included the fact that many of them were not making money for their shareholders.

After the tech bubble burst and the stock market began to drop in March 2000, companies such as Enron, WorldCom, Adelphia, and others were exposed as having duped investors, workers, and the business journalists covering their respective industries into believing fraudulent accounting practices that made the companies look stronger than they actually were. As tech companies began to fail because of their accounting practices, the accounting techniques or other companies began to be reviewed. Some business journalists were criticized for having failed to uncover the scams earlier.

Most of the bigger media outlets compete against each other with their business coverage. *The New York Times* and *The Wall Street Journal,* for example, go toe to toe on many business news stories, such as mergers and acquisitions and corporate scandals. "Business news is now the arena where mainstream editors say they test their mettle against the competition," stated a 1999 report on the status of the American newspaper by the *American Journalism Review*. The report noted that business news was increasingly being found on the front pages of newspapers and on the covers of general interest magazines. In addition, wire services like Reuters, Dow Jones Newswires, Bloomberg News, and the Associated Press compete to have the best coverage on almost every story every hour of the day.

Like most mass communication forms, however, business journalism is undergoing dramatic change in the early twenty-first century. At daily newspapers, standalone business sections at newspapers, such as the *Orange County* (California) *Register* and *The Denver Post*, have been cut and business news now appears in other sections of the paper. In addition, printed stock and mutual fund listings have been dropped from many newspapers and now appear on related websites, primarily as a way for newspapers to trim printing costs.

Business magazines are struggling to overcome a decline in print advertising that has led to fewer pages for stories. Some business titles, including Time Warner's *Business 2.0,* ceased publication because of the advertising decline. The decline in business magazine advertising has been attributed to the increase in Internet advertising by companies such as computer makers and auto makers.

However, business journalism on cable television and in specialized newspapers is growing. The Fox Business Network (FBN) launched on October 15, 2007, to compete with CNBC, which had the cable business journalism market to itself after Time Warner's dedicated financial news channel, CNNfn, stopped airing in 2004. Ratings for FBN, however, were low during the first six months of airing. *The Wall Street Journal,* acquired by News Corp. in 2007, continues to see circulation gains while metro daily newspapers report declines, and its website boasts more than 1 million paying subscribers. Weekly business newspapers continue to boast advertising and circulation gains as they focus their business news on small and medium-sized companies that often go unnoticed by the larger business media.

Several developments in business journalism may improve the quality of reporting. The expansion of the Internet has made it easier for business journalists to gain access to documents and public records that allow them to cover companies in more depth. Until the mid-1990s, documents filed with the Securities and Exchange Commission (SEC) by the 12,000-plus public companies—those whose shares trade on one of the major stock markets—could only be obtained for a fee from a service based in Washington, D.C. The SEC now provides all corporate documents online, as do many other federal and state regulators.

Another major initiative is the Donald W. Reynolds National Center for Business Journalism, launched in 2003. First based at the American Press Institute, it is currently part of the Walter Cronkite School of Journalism and Mass Communication at Arizona State University. The Reynolds Center conducts training sessions around the country and online, and began studying trends in business journalism shortly after its formation. Despite advances in the quality of business journalism, the training is sorely needed. A study in the spring/summer 2002 *Newspaper Research Journal* found that journalists believed that education about business was needed in order for them to be able to do their jobs more effectively. They also believed that such education should apply for all journalists, not just those covering business and the economy.

As more readers turn to the Internet for up-to-date business and financial information, sites such as TheStreet.com and Marketwatch.com appear to be well situated for catering to consumers. In addition, traditional business journalism publications such as *BusinessWeek* and *Fortune* have been boosting the amount of information on their websites. *The Wall Street Journal*'s website, for example, has more than 1 million paid subscribers, making it one of the largest paid sites in the world.

Business Magazines

Magazines devoted to business can be organized into many categories, including those aimed at a management readership (such as *Business Week*), trade publications reporting about and to those in a specific field (such as journalism or banking), periodicals issued by companies about their own products and services, and magazines aimed primarily at consumer investors. All of these, along with business sections of major daily newspapers, specialized cable networks, and a growing number of Internet sites, make up the American business press.

Development

Early magazines included occasional business news stories as early as the eighteenth century. But as business remained a small-scale proposition well into the nineteenth century, there was not much demand for specialized coverage or publications about it. But business news grew in importance as business and industry became national enterprises. The rise of technology-based business such as railways in the mid-nineteenth century, along with the telegraph and telephone in decades that followed, prompted more attention to those and other industries in the press.

A newspaper focused on business, *The Wall Street Journal,* first appeared in 1889. Business leaders and their companies were generally perceived as helping to further develop the country and its commerce and were treated accordingly in press stories. The so-called Gilded Age up to about 1910 was covered positively in papers and magazines. Only the development of muckraking investigative reporting (such as Ida Tarbell's dramatic series on the rise of Standard Oil in *McClure's* magazine in 1902–3, later made into a book) began to suggest a darker side to the rapid rise and consolidation of big business.

During the Depression, much of the perceived sheen came off American business. The economic activities of the federal government during Roosevelt's New Deal in the early 1930s took center stage and thus the spotlight in business magazine reporting. News reports and business publications expressed a more critical view of

management decisions and big business. The appearance of *BusinessWeek* in 1929 and the stately *Fortune* less than a year later ushered in the modern era of business magazines. In their quite different ways (the first providing breaking news, the second lengthy and usually positive profiles of important business leaders, companies, and industries) they raised the importance of business journalism from the low level of attention most magazines and newspapers had devoted to it.

The first consumer periodicals, including *Consumer Reports,* appeared in the late 1930s, helping buyers find the best product or service, while encouraging a skeptical view of advertising promises. World War II manufacturing again reversed the media view of business, contributing to a generally glowing coverage that continued with postwar prosperity. The rise of such business critics as Rachel Carson (whose watershed 1962 book *Silent Spring* detailed the dangers that pesticides pose to the environment and to wildlife) and Ralph Nader in the 1960s (whom General Motors secretly investigated, an act later discovered and reported widely, to its embarrassment) once again placed business on the defensive, as business reporting again sought stories beneath the public relations surface of many corporations.

In Britain, the monthlies *Management Today* and *Director* reported on the country's staid pre-Thatcher business scene, pretty much dividing up potential readership with their sober reporting. Given the dramatic changes wrought by that prime minister in the 1980s (including privatization of many government-run businesses, and breaking much of the political power of British labor unions), however, Conde Nast introduced the well-designed and more sprightly written monthly *Business* in 1987, published in a joint venture with the *Financial Times* newspaper. But the magazine folded in a few years, in part because of the thriving British daily newspaper marketplace which incorporated most of the breaking business news.

During the 1970s, and accelerating into the 1980s, many local or regional business publications appeared in major American markets, often more than one in some cases. Usually aimed at business owners and managers, these publications formed their own trade association in 1979. Three decades later, the Alliance of Area Business Publications boasted some 70 member publications that regularly reached more than a million readers. Their chief concern was gaining sufficient advertising, for which they competed fiercely with urban newspapers.

According to the U.S. Department of Commerce, business and industry was the most popular magazine category in terms of new titles introduced in the growing economy between 1988 and 1998. The number of business titles grew from 358 in 1988 to 694 a decade later. By the early twenty-first century, business was being widely reported in mainstream news media, and any business sector of any size had at least one specialized trade publication devoted to it.

Trade Publications

Trade magazines are, among other roles, news vehicles for their specific field. Those people and companies in the business rely upon them for the latest trends, problems, profiles of other people and companies, as well as policy and regulation. Reporters for the trade press become authorities about their industry. Some trade titles cater to professions, including those in medicine and law.

The first business sector–specific publications appeared in the 1830s, among them two for bankers and others for farming and agriculture, then the dominant sector in American life. Financial services, and journals serving them, began to appear in New York after the Civil War. *Railway Age* is perhaps the oldest industry-specific journal still publishing—it first appeared in 1876. Soon there were many more of them, covering the expanding mining, banking, dry goods, and tobacco industries, among other businesses. Whole new industries—such as electricity and the manufacturing and services based upon it—sparked creation of sector-specific magazines such as *Electric Age* and multiple titles focused on telegraphy and telephony as well as—after 1900—wireless or radio.

Regardless of the specific field involved, trade periodicals are often critical of malfeasance in their industry, backing education about and improved standards for their sector, promoting self-regulation, and generally rejecting government regulation or control. Once established, trade magazines can be hugely profitable as they provide essential information to their readers (and information

often found nowhere else), and can market those readers to advertisers eager to reach such a defined and identified group. Consolidation of the ownership of such magazines has been a continuing trend for decades. Likewise, when a business or industrial sector suffers, so do the periodicals serving it. Downturns in the computer and information sector in the early 2000s, for example, spelled the end of many once-successful titles. The narrower the field the magazine serves, the greater the danger this can happen. And just as such titles become an essential part of the industry they cover, they can also become beholden to a few large advertisers.

Founded in 1964, the American Society of Business Publication Editors (ASBPE) is the professional association for full-time and freelance editors and writers employed in the business, trade, and specialty press. For an annotated guide to current journalism/mass communications–related trade periodicals, see the bibliography in Volume 6, Section 11.

Competition

Business magazines began to face growing competition by the late 1970s. Though newspapers had covered business since the 1890s, *The New York Times* was the first to begin publishing a standalone daily business section in 1978. Many other urban papers soon followed suit, providing local business news reports theretofore not readily available to readers.

Soon thereafter, cable television provided a newer means to distribute business news—and growing competition for business magazines. The specialized Financial News Network began in 1981, aimed at small investors and providing far quicker reporting than was possible on television or in the press. It became a 24-hour cable network in 1985, but weakened by financial scandal in 1989, it closed down in 1991. The longer lasting Consumer News and Business Channel (CNBC) began operations in 1989. The competing Fox Business Network channel first appeared late in 2007, trying to report even serious business with a lighter and sometimes irreverent tone.

Finally, and by far the most important, the appearance of the commercial Internet in 1995 laid the groundwork for upheaval in business periodical journalism just as it did with all other publishing activity. In the years to follow, more business information of all kinds became available at the touch of a button, threatening the longtime dominance of both newspapers and magazines devoted to business news.

Regardless of their format—print or electronic—the business press has always faced a fundamental conundrum. Should journals be supportive of business managers and company trends, or should they take a critical stance, pointing up shortcomings? Each magazine has answered this differently. Independent magazines—including the "big three" described just below—have often been quite critical, especially of outright malfeasance or poor management decision making. At the same time, these titles generally celebrate the capitalist system and business as a general concept. They are often skeptical of government regulation. Those firms and managers who excel are celebrated in these pages. Those who do not may quickly see the back of the journalistic hand at work.

Business's Big Three

Three long-lived publications (each still published by the company that created it) represent the heart of the business press for most American readers.

BusinessWeek (1929–Present)

BusinessWeek was first published (as *The BusinessWeek*) just seven weeks before the Wall Street crash. Owned by McGraw-Hill, the business news weekly is the leading periodical among general business publications. From the early 1930s until 1961 its cover carried a thermometer providing an index of how American business was doing compared to a year earlier, a graphic device that also served as an indicator of the magazine's interest in the overall economy. Only in 1954 did the first woman (who created Tupperware parties) appear on its cover. Circulation by the end of 2008 was about 1.9 million, a loss of nearly a third since 2005.

Forbes (1917–Present)

Forbes was the biweekly pioneering business news magazine (devoted, as the cover initially said, to "doers and doings"), though it was aimed more

at investors than managers. Created by B. K. Forbes, it became best known under his flamboyant son Malcolm who built it up and advertised it as a "capitalist tool," though he promoted more critical reporting. Its circulation exceeded that of *Fortune* by 1976. Its famous lists—that of the country's highest-paid executives, which first ran in 1971, and the 400 richest people first published in 1982—became hugely popular and widely reported. *Forbes* continues to take an irreverent and critical tone in its stories. Circulation is right around 1 million.

Fortune (1930–Present)

Fortune first started out as a monthly, and in 1978 it became a biweekly. It appeared from Time Inc. just months after the 1929 Wall Street crash–not the best timing. And at a then-expensive dollar a copy, it was priced out of the reach of most people. But for the price, a wealthy business leader got a very handsome oversize monthly that quickly set graphic standards for both editorial (business leaders were depicted as "heroic") and advertising content. Excellent and path-breaking use was made of color graphics and both black-and-white and color photography at a time the latter was both new and costly. *Fortune* featured lengthy analyses of specific companies and sometimes industries or trends. The famous "*Fortune* 500" list of the largest companies first appeared in 1955. The magazine became more critical in its tone and coverage after founder Henry Luce's death in 1967. Circulation has varied with business conditions but was about 2.4 million in 2008, down about 20 percent since 2005.

Other General Business/Finance Magazines

A multitude of other publications cover business regularly. These are among the titles ranging over business and finance generally.

Barron's (1921–Present)

This weekly is a finance and market investor's magazine published by *The Wall Street Journal,* and named after its first editor, Clarence W. Barron. For years printed only in black and white, editorial color was introduced in May 1990 and full color throughout six years later. Up to 1994 it was issued in one section, growing into a four-section publication by 2002. Its content focuses on investment decision making. By mid-2008, the magazine circulated about 1.4 million copies and had gained a few percentage points from three years earlier.

Folio (1972–Present)

This monthly is devoted to magazine management including all types of periodicals (consumer and professional). It publishes industry news, covers trends and newsmakers, and highlights the technology influencing magazines. It emphasizes stories concerning magazine management, including their editorial, advertising, and circulation functions, and publishes an annual *Source Book* of statistics and other information.

Harvard Business Review (1922–Present)

The *Review* started out as a bimonthly and became a monthly in 2001. It began as a means of applying Harvard Business School research findings to practical day-to-day management in all fields. It took on a more general management approach after World War II, and by the 1980s had updated its look (even adding cartoons) and content (among other things, interviews) to create a broader appeal. In 2008, the *Review* circulated about a half-million copies.

IndustryWeek (1882–Present)

IndustryWeek began as *Trade Review* in 1882, changed to *Steel* in 1930, and became *IndustryWeek* in 1970. This weekly is aimed at senior management in American manufacturing companies—a shrinking sector of the nation's economy. It covers overall trends, technologies, and management strategies as the only magazine dedicated to covering the managing of a manufacturing company. Circulation is about 125,000.

Nation's Business (1907–Present)

This monthly is published by the U.S. Chamber of Commerce. It covers strategies, newsmakers, technology, human resources, and—as might be expected from this lobbying source—legislation and regulations that affect all aspects of business. Each issue includes profiles of both a small- and a

medium-sized business. Regular sections include an entrepreneur's notebook, advice on managing a small business, plus coverage of finance, enterprise, insurance, technology, and franchising.

Portfolio (2007–Present)

This monthly appeared from publisher Conde Nast (after two years of planning and much expense) as the first new general business magazine started in a decade. It features investigative reporting and breaking news covering finance and technology, media, art, and related topics. Early circulation figures reached about 300,000.

Three Consumer Magazines

Unlike those titles profiled thus far, these titles are directed toward discerning consumers, to help them make better financial planning and purchasing decisions. All have a tone of recommendation to their stories.

Consumer Reports (1936–Present)

This monthly is published by the Consumer's Union, and was the first of the product-review periodicals, and remains the best known today. It is not supported by advertising as an indication of its independence in rigorously testing and ranking consumer products and services of all kinds. As might be expected, it has a skeptical and often downright critical view of business. Circulation approaches 4 million.

Kiplinger's Personal Finance (1947–Present)

Kiplinger's, a monthly, was known for decades as *Changing Times,* taking its present title in 1991. Founded as *The Kiplinger Magazine,* this was the first personal finance magazine, and it covers often complex matters in clear, concise language, including tips on managing money and achieving financial security, saving, investing, planning for retirement, and paying for college and other major purchases. Circulation is just over a million copies.

Money (1972–Present)

This monthly is published by Time Inc. and claims to be the nation's largest magazine of personal finance, with nearly 2 million subscribers and newsstand buyers and more than 7.5 million total readers. Its articles are aimed at anyone responsible for making money decisions in a household. It issues an annual list of the best places to live in America. Circulation dropped about 25 percent from 2005 to 2008.

By the end of the first decade of the twenty-first century, virtually all business journals provided a presence on the web. Some limit this to billboarding the print issue, but most sites are increasingly extensive expansions of what print subscribers see. Some trades—such as the weekly *Aviation Week & Space Technology*—provided subscribers with advance (by a couple of days) access to stories in the print version. Virtually all feature special stories, or expansions of those in the printed magazine, on their websites. *Business Week,* for example, has a special contents page to direct readers to the online attractions, some of which include extensive photo displays or offer video. Many of these magazines provide a view behind the scenes with blogs written by editors or reporters.

Cable News

Since the late 1970s, the number of American cable television networks, services, or channels (but never "stations") has greatly expanded—and continues to do so. While most of them are devoted to some type of entertainment, news and public affairs content is well represented among the many networks available in the middle of the first decade of the twenty-first century. Indeed, operation of various types of cable news networks—from general news to finance, sports, and more specialized types of programs—served to substantially diminish the journalistic importance of the older broadcasting networks, as audiences gained a greater variety of cable viewing options with 24/7 service to which to tune.

Origins

Several factors converged in the mid-1970s to lay the groundwork for the creation of cable networks. The technological basis came first—geostationery orbit communication satellites were well proven by the mid-1970s. By orbiting a satellite about 22,300 miles above Earth, the "bird" would appear to stay in the same place day and night. It could operate like a super-high antenna, and cover a third of the globe. Three of them in the right orbits could theoretically blanket Earth with signals. Given sufficient receiving antenna dishes at local cable systems, a signal sent ("uplinked") to such satellites could be transmitted ("downlinked") around the country, forming an instant network. The question was how to fund all those initial TVRO (TV receive-only) antenna installations to make a viable national network possible.

About a quarter of the country's homes were being served by cable by 1975—many more were "passed" by feeder lines but had not yet subscribed. In just five more years, however, cable penetration reached half the households, a proportion that very slowly rose to something around 70 percent by the 1990s. Here was a vast potential audience for more than simply the local market television signals plus a few distant signals that most cable systems then provided. By the early 1980s, half the cable subscribers were being served by the top ten multiple system operators, creating substantial empires with money to invest in new programming lures to attract more subscribers.

Finally, regulation no longer blocked cable's widespread use of satellite signals. The Federal Communications Commission, after years of trying to protect television broadcasters, had by the late 1970s begun to deregulate cable (or, in some instances, not regulate it in the first place), relying instead on intermedia competition rather than regulation to meet public interest concerns about prices and services. The cable market would no longer be defined or constrained by governmental policies.

The first service to make the jump to using a satellite distribution system was the Home Box Office (HBO) subscription channel owned by Time Inc. HBO announced in 1975 plans to nationally distribute by satellite what had been a regional

service. In Atlanta, television station owner Ted Turner made public his plans to do the same thing—thus making his local UHF station (restyled as WTBS) a "superstation" offering movies and sports programming for use by cable systems across the country. To get these new networks underway, both HBO and Turner announced plans to assist cable systems in buying and installing the needed TVRO antennas so they could link to the promised services, both of which were available by late 1976.

Other independent (non-network affiliate) television stations in Chicago and New York followed Turner's initiative, creating further superstations. Soon the Showtime subscription service began to compete with HBO. By 1979, C-SPAN, the first ESPN sports channel, the Learning Channel, and Nickelodeon (targeted for children) had all begun operation. Taken together, these services were the pioneers of cable networking. Their examples prompted a flood of additional cable channels in coming years. Many focused on some form of journalism.

C-SPAN

Brian Lamb (1941–), a longtime Washington hand and journalist, was the key figure behind the creation of the C-SPAN (Cable Satellite Public Affairs Network) service, which began operating in March 1979. He was still running it three decades later. But C-SPAN, supported from the beginning by funds from other cable operators (figured at five cents per subscriber per month) rather than advertising, has from the beginning exhibited a very different intent than the cable news services that would follow.

After years of debate, Congress was slowly moving (the House first, followed by the Senate) to approve television coverage of its floor proceedings. While Congress would control the cameras and personnel inside the Capitol building, C-SPAN was formed to provide gavel-to-gavel carriage of House and then Senate floor proceedings without any journalistic analysis. When the House was not in session (only about 13 percent of the channel's airtime by the early 2000s), the network covered important committee hearings or other events. 24-hour-a-day programming began in 1982. Two years later, C-SPAN was the only service to provide full-time coverage of the national political conventions (the broadcast networks had long since reduced their coverage to brief nightly summaries).

C-SPAN2 began service in June 1986 to provide full coverage of Senate floor proceedings. And the U.S. Congress was not its only focus. In 1985 C-SPAN began coverage of the Canadian Parliament in Ottawa, followed by the British House of Commons in 1989. C-SPAN3 was initiated in September 1997 to provide live coverage of important (usually Washington-based) events during the week, and longer form documentaries and other programming on weekends. A weekend service devoted to books and libraries, Book TV (strongly reflecting Lamb's own interests), was begun in 1998 on C-SPAN2.

CNN

The landmark cable news breakthrough move came from Atlanta about a year after C-SPAN. In June 1980, the Cable News Network (CNN) began its 24-hour operation. Ted Turner (1938–) had announced his intentions to create an all-news network some months before—to universal disdain from the New York–based broadcast network news divisions which expected little from such a provincial location (they dubbed it the "Chicken Noodle Network," convinced it would fail). Those critics would soon discover that audiences liked the flexibility of a 24-hour service, though CNN was initially losing some $2 million every month and relied upon support from Turner's successful WTBC "superstation."

Slowly advertisers took notice of CNN's rising audience. Its first overseas bureaus were established in London and Rome, with Moscow, Cairo, and Tel Aviv added by 1985. The network broke into the black in 1985. Within four more years, it could be received in 65 countries. CNN developed an evening newscast to better compete with the broadcast television networks, and had added a highly popular interview program hosted by Larry King (1933–).

While CNN slowly built acceptance during the 1980s, the 1990–91 Gulf War was the real baptism of fire that brought the network widespread following and respect. CNN anchor Bernard Shaw (1940–) and reporter Peter Arnett (1934–) were in Baghdad when coalition bombing began, and were able to get their reports out using portable

satellite videophone devices. But much of CNN's reporting relied heavily on access provided by the military and that led to charges the network was just a government mouthpiece. Still, the network was the first source to which many turned for breaking news—often including Pentagon and other government officials.

A separate CNN2, later called CNN Headline News service, began in January 1982, in part to blunt rising competition. For 15 months in 1982–3, CNN was threatened by the Satellite News Channel (SNC), a joint venture of the ABC Network and Westinghouse—both of which had long experience in electronic media journalism. Based in Stamford, Connecticut, SNC, which first aired in June 1982, made heavy use of ABC News video. Unable to obtain sufficient cable system channels, however, it was sold to CNN, which closed it down in October 1983. The second CNN network provided updated news every half hour, a much shorter cycle than the parent network. Three years later, CNN International began airing a variety of global, regional, and "foreign" (a term avoided on the air) news that soon divided into seven regional services (Europe and the Middle East was the first in September 1985; others included Spanish- and German-language services in 1997, and a Turkish service added in 1999).

CNN-produced material is also on view at nearly 40 airports over its Airport Network, begun in January 1992. A doctors' waiting room service, AccentHealth, began three years later. By the early 2000s, the CNN franchise, owned by Time Warner, extended to 16 cable and satellite networks, a dozen websites, two radio networks, and the syndicated "CNN Newsource." One or more of these reached upwards of a billion people across more than 210 countries.

MSNBC

NBC's initial cable venture was America's Talking, which began broadcasting from Ft. Lee, New Jersey (across the Hudson River from New York City), in July 1994. It was largely filled with talk shows. Wildly popular with some, it didn't achieve viable overall ratings and was closed down after two years in favor of a new, more journalistic venture.

MSNBC, the second general cable news channel, began in July 1996 as a joint effort of the Microsoft software firm and the NBC television network, each company investing about $220 million. A fancy news facility was constructed in Redmond, Washington (Microsoft's headquarters), east of Seattle. Part of the network's original intent was to meld television with interaction with viewers (using the Internet) as well as to provide longer stories than those airing on CNN. The schedule combined newscasts with feature programs. And it operated with different personnel and an independent budget from NBC's news division.

When MSNBC scored a scoop with the news of the loss of TWA Flight 800 just a day after the cable network began operating—and beating CNN by eight minutes—their competitive stance was underlined. Audiences grew with its close coverage of the impeachment of President Clinton in 1998–99, but fell thereafter. Overall audiences grew slowly, and rarely approached those of CNN. Programming tensions related to the coverage of breaking news versus the airing of longer form programs arose time and again. So did debate about left- or right-leaning talk shows.

In late 2005, NBC purchased majority control of the cable network, though the software firm retains just under a fifth of the stock. Long headquartered in New Jersey, the all-news operation moved to the New York headquarters of NBC in the fall of 2007 as NBC News and the cable network integrated their operations. They were increasingly marketed as one and the same, as both were produced out of the same facility, using many of the same people, and sharing a busy and widely promoted website.

Fox News

Rupert Murdoch's Fox Broadcasting Company began life as a broadcasting operation in April 1987. The 24-hour Fox News Channel cable network began in October 1996 as a competitor with the established CNN and then-new MSNBC. Murdoch hired former Republican strategist Roger Ailes (1940–) to direct the operation. Due to contractual issues with cable systems, only about 10 million households could receive the news channel at first, and it did not serve viewers in the country's two largest cities, New York and Los Angeles. Legal proceedings finally resolved both "missing" markets. For a time the new network had to pay

cable systems to carry its signal—a reversal of the normal order of business in cable television.

Despite its "fair and balanced" and "we report, you decide" promotional lines, the Fox journalism prompted almost immediate criticism over its perceived conservative bias, especially in opinion and talk shows such as that hosted by Bill O'Reilly. The Fox newscasts looked different as well given the network's emphasis on graphics and other images. Beginning in 2003, it syndicated some of its reports on Fox News Radio and also serviced the broadcasting network.

The news channel achieved a huge bump in ratings during the 2003–04 Iraq war and while audiences dipped somewhat after major fighting concluded, Fox News regularly outpaced both CNN and MSNBC in overall listener levels.

Financial Networks

A more specialized type of cable news includes those channels with a full-time focus on Wall Street, investing, and general business and finance news. It has proved a difficult market, however, with at least two notable cable network failures.

The first attempt at such a service was the Financial News Network (FNN). The channel began in November 1981 as an offshoot of the business television station KWHY in Los Angeles. FNN opened another bureau near Ft. Lauderdale, Florida, in association with WKID-TV. FNN's target audience was small investors watching on affiliated broadcast television stations or on the cable channel. The FNN signal featured a digital stock ticker running across the lower third of the screen, showing constantly changing stock and index prices. In 1982, FNN relocated to the ground floor of Merrill Lynch's headquarters in Manhattan. Three years later, FNN became a full-time cable-only service with news, sports, and other longer-form programs during overnight hours. FNN moved into newly built production facilities in Los Angeles and in New York's Rockefeller Center. A 1990 financial scandal involving its main financial officer spelled the end of the service, which declared bankruptcy early in 1991. After a bitter and confusing bidding war for its satellite transponders and whatever else remained (the fight was between Dow Jones/Westinghouse and NBC), NBC won and FNN left the air in May 1991.

The Consumer News and Business Channel (far better known by its initials as CNBC), created as a joint venture between the NBC network and Dow Jones, publisher of *The Wall Street Journal,* first aired in April 1989. Competing with FNN, it combined newscasts, talk shows, interviews, and even some entertainment programming. By the early 2000s, the network's "Business Day" programming (weekdays from 5:00 a.m. to 7:00 p.m., eastern standard time) was produced at CNBC's headquarters in Englewood Cliffs, New Jersey, near New York City. That it served a wealthy target audience was made clear in a July 2004 survey by Mendelsohn Media Research, which concluded that the median household net worth of a "Business Day" viewer exceeded $1.2 million. CNBC Europe launched in January 1998 carrying both the U.S. and specialized European markets content, and replaced Dow Jones's channel there. In early 2006, NBC Universal took over full ownership of CNBC Europe and CNBC Asia.

The year 1995 saw the start of two further financial networks. In January, Bloomberg Television began service. Bloomberg became widely known for their busy data screen in which news tickers and business data boxes took up most of the television screen. A more simplified image, where the live video concerning people and events is shown almost full screen, was progressively being introduced across the different feeds in the mid-2000s. Bloomberg provides 11 separate channels in seven different languages, and also syndicates some of its news reports to about 100 television stations.

CNN/fn (Financial Network) began operating in December 1995 as a business-related spin-off of the primary CNN service. It was designed to provide business and personal finance stories and utilized a number of digital innovations in both its operations and what viewers could see on the screen. But unable to achieve a sufficient audience, and despite a refocusing on personal investment instead of breaking financial news, it ended its service just less than a decade later, in late 2004.

Most recently, in mid-October 2007, the Fox Business Network inaugurated service. A subsidiary of the Fox News Network, it was in the works for some time, part of Rupert Murdoch's pending purchase of Dow Jones and *The Wall Street Journal.* Initial reactions were that the channel was too light

in tone, and its audiences were a fraction of those reached by CNBC. But Fox had the money and experience behind it to improve the product and become a real competitor.

Sports and Other Networks

The ESPN brand appeared as the Entertainment & Sports Programming Network in September 1979, the first all-sports cable network. It claims to be the first service that aired all four major professional sports—football, basketball, baseball, and hockey—and covers nearly 60 other types of sporting events over a year. Suggesting the appeal of sports content, the network claimed to be the first cable service to reach half of the country's households by mid-1987. Largely owned by the ABC network, the service expanded to ESPN International in January 1988, ESPN Radio in January 1992, ESPN2 in October 1993 and began ESPNews in November 1996. Many of these services are also available on wireless devices. ESPN Classic (purchased in 1997, two years after it began) provides coverage of past sports contests. A high-definition service began in March 2003. All of these services have pioneered various kinds of graphic enhancements of field action, such as computer-generated first-down lines in football games (which first appeared in 1998).

A prime ESPN competitor, Fox Sports Net, was launched in November 1996 and claims to be the only cable network covering national, regional, and local events (the latter produced by local affiliates, many of them older than the parent firm). It produces some 5,000 hours of live events annually and is the primary television "home" for more than 60 professional teams in all sports. While play-by-play is the focus of all of these services, they also provide news, interviews, documentary, and feature material.

Despite the widespread availability of sports on such omnibus multichannel services, there are some specialty networks as well. The Golf Channel began in January 1995, centered on covering golf tournaments worldwide. Talk, news, documentaries, and feature programs fill out the schedule, most broadcast from the Orlando, Florida, network headquarters. There is also a channel devoted to tennis, which began service in May 2003.

A variety of additional networks can be said to specialize in specific kinds of news and public affairs programming, providing a good example of the niche appeal of cable service. A few examples are described here.

The Weather Channel (TWC) debuted in May 1982 to widespread disbelief that 24 hours of nothing but weather could possibly be a success in the increasingly crowded cable market. The original notion of a Chicago meteorologist, TWC utilized constant weather updates with longer form feature programming built around hurricanes, floods, heat waves, and other weather phenomena. The channel also provides special forecasts of aviation weather for different parts of the country, the weather expected for major sports events, heat and other weather danger advisory alerts, and traveler forecasts for major airports, all as early features. Its presumption was that viewers would tune in for short periods of time, perhaps several times a day. And it worked—TWC was a rapid success. The network originally gathered national weather information from the U.S. National Oceanic and Atmospheric Administration (NOAA), and local forecasts from local NOAA offices, but since 2002 it has done its own local forecasting from its Atlanta headquarters. Attempts to broaden the TWC franchise with channels elsewhere have failed, save for one in Canada (The Weather Network, which uses both French and English) and another in Australia. A British version lasted but two years (1996–98), and a Spanish-language version for Latin America closed at the end of 2002. Early in 2008, TWC owner Landmark Communications announced plans to sell the network, and price estimates ranged upwards of $5 billion.

The Discovery Channel began its initial cable network in June 1985 to offer news and "nonfiction" documentaries and series on a variety of topics, especially popular science, history, and geography. By the mid-2000s, this venture had expanded to 29 channels in 33 languages around the world. One of them was The Travel Channel, which first aired in February 1987, with programming devoted to different aspects of traveling, from its history, to exotic destinations, to local road trips. Some of its largely original programming concerns vicarious travel while some focuses on how to find good travel deals.

The Courtroom Television Network (later simply Court TV) first appeared in July 1991, based on the concept that general viewers would be

interested in seeing real court cases as they happened. Backed by a joint venture of Time Warner, NBC, and Cablevision Systems, the channel made use of legal authorities to comment on ongoing trials. Building on the increased access of cameras into state and local (but almost never federal) courtrooms, as well as the seeming never-ending fascination with high-profile or celebrity trials, the network took awhile to shake out its programming. It combines trial coverage with relevant documentaries and some entertainment series. In January 2008 Court TV was renamed truTv. The channel is available in 86 million homes and airs fiction films, news and editorial content, and simulcasts of real criminal trials, further blurring the lines between fiction and nonfiction.

With considerable advanced fanfare, The History Channel debuted in January 1995, part of the Arts & Entertainment complex of cable offerings. Commercially successful in a short time, it relies on documentary programs, special programs or series on historical events or trends, and other formats such as history quizzes and even game shows, all built around history themes. A related spinoff, the Military Channel, provides both history and current events. It replaced a short-lived aviation service ("Wings") and thus many programs focus upon aerial warfare and related topics. Both of these channels are further evidence that the documentary genre has largely shifted to cable from broadcasting.

Cables, Undersea

The first successful transatlantic telegraph cable (1866) transformed the global reporting of news, greatly speeding up the pace of transmission between Europe and North America. News that had taken weeks to travel by ship could now be sent in minutes or hours, making (as many noted both at the time and since) the world seem smaller. Development of the first transatlantic telephone cable (1956) added a new, albeit briefly very expensive, means of reporting. Today's fiber-optic cables span the Northern Hemisphere, putting most major cities within seconds of each other for transmission of audio, visual, and data news communication.

The idea of expanding beyond land telegraphy by laying a telegraph cable under water was delayed for years by two technical factors. The first was the search for an efficient means of insulating the cable from seawater, and the second involved determining the correct amount of power to transmit a message over several thousand miles. A successful telegraph cable was laid under the English Channel in the early 1850s, greatly speeding news communication between London and Paris, but the far greater Atlantic distances delayed

attempts there until late in the decade. An 1858 expedition did complete a cable, but it operated for only about a month before fading into silence, providing a fleeting and tantalizing example of what could be accomplished with such a connection. Though never determined for sure, the cable probably failed due to the excessive power used, which probably weakened the cable's insulation. The American Civil War (1861–65) delayed renewed efforts until 1865, when another attempt failed, the cable breaking shortly before completion of the voyage. Finally, in 1866, a cable was successfully deployed, and soon many others followed across the Atlantic and other seas, including the Indian Ocean by 1870 and all the way to Hong Kong a few years later. British and American trans-Pacific cables entered service only in 1903, the long delay after the Atlantic cables owing to the great distances involved and relative lack of intermediate landing points. Political factors also played a part—the British wanted their empire communication routes based in and relying only on colonial posts where London could maintain control.

Each of the trans-oceanic telegraph cables were developed and operated by major telegraph companies, usually aided by a substantial government subsidy. That subsidy came with the requirement that government and military communications always took priority. Since there was no effective competition (surface ship transport could vary from one week to many, depending on distance), cable charges were at first very high ($10 per word—well over 15 times that in early-twenty-first century values). Only with the development of multiple competing cables and slowly improving technology did costs begin to come down. By the late 1860s, the Associated Press (AP) was moving up to 35,000 words a day by cable. The inception of wireless telegraphy in the early twentieth century, however, offered the first real competition to undersea cables. Even so, the AP was still spending upwards of half a million dollars a year on cable charges during World War I. The major powers fighting in that war also censored all messages, news included, that moved by cable.

The high cost of using cables contributed to development of a world news cartel in the late nineteenth and early twentieth centuries. Members of the cartel could share the high cost of cable transmission. The world's large news agencies—Reuters, Havas (France), Wolff (Germany), and the AP—largely carved up global regions of news dominance, and their cartel lasted into the 1930s. Shortwave radio offered a further degree of cable competition in the 1930s, though cables offered all-weather service which, owing to atmospheric interference, radio transmission could not then match.

American Telephone & Telegraph's Bell Telephone Laboratories provided most of the research that underlay the first telephone cable (Trans-Atlantic or TAT-1) in 1956. Again, initial costs to use the facility were quite high, dropping only as more cables were laid, and especially after fiber-optic cables appeared in the 1980s, dramatically increasing the number of available circuits. Maps of the routes used by the world's hundreds of modern submarine cables, however, reveal an important limitation in news reporting: there are few cables serving Africa or South America, for example. Most Southern Hemisphere nations (Australia and New Zealand are exceptions) must communicate with the rest of the world by linking to the major Northern Hemisphere cable routes.

With the development of communication satellites in the 1960s and 1970s, undersea cables declined as essential modes of news transmission. Satellites offered greater capacity and could be designed and launched more rapidly than a cable could be constructed. With the arrival of fiber-optic cable in the 1980s, however, the tables slowly turned again, as the new cables now offered greater capacity and lower cost, as well as the option of repair. Increasingly, both modes—satellite and cable—are used to back up the other. News can now be transmitted worldwide in seconds, at a fraction of former costs.

Submarine telegraph cables were the first means of effective and nearly instantaneous global communications, first between Europe and North America, and slowly thereafter including the Middle East and eventually Asia. South America and Africa, however, have always been poorly served by cables, forcing those regions to link with major cable lines in the Northern Hemisphere. The costs to use oceanic cables forced a spare reporting and writing style to place the most information into the fewest possible words. The first six decades of oceanic telegraph cable journalism use were largely controlled by a cartel of the world's

major news agencies. Only with rising competition from wireless, then shortwave radio, and finally communication satellites, did cable rates drop. Fiber-optic cables have dominated the field since the early 1980s, providing huge capacity, and further lowering costs.

Cable Television

Cable Television started the multichannel revolution that, with the introduction of CNN in 1980, transformed television news from a nightly half hour to the perpetually present and highly competitive realm of cable news. However, that was a much later culmination of a history of policy and technological changes. Cable television first arose in the United States in the decade after World War II, as the major broadcast networks and much of the country turned to television. Difficulties (chiefly interstation interference and an underestimation of the demand for licenses) with the FCC's initial channel allocation scheme led to a "Freeze" from 1948 to 1952, during which no new television licenses were awarded. Coverage by those stations on the air was spotty, and many communities found their reception blocked by geographic features, or hindered by distance. With demand for television growing, the gap was filled by the pioneering entrepreneurs who built the first community antenna television (CATV) systems in Pennsylvania, Oregon, and Colorado to bring TV signals to homes and businesses. This nascent, wired, distribution system set the stage for an alternative to terrestrial broadcast television, a system that after several transformations has become the dominant mechanism for video distribution in America.

From the beginning, CATV extended the range of local television broadcasts, and was generally seen as a boon to those stations carried, as it expanded audiences and viewership. After 1952, as more stations went on the air, consumer demand for new channels and programming grew. People generally liked having a choice of what programs to view. Some systems began providing additional signals to their customers, either by importing more distant television stations or, more rarely at first, by providing their own programming. Combinations of coax and microwave distribution networks were developed in several regions to import distant stations. Technology (limited channel capacity) and economics (the cost of programming) limited the scope of these efforts; still, a now worried broadcasting industry convinced the FCC to impose programming limits on prospective cable-only channels and restrictions on the importation of distant stations, in addition to other regulations designed to slow cable's expansion. Despite this, early cable saw a slow, steady growth through the 1960s, although largely confined to smaller towns and rural areas.

Imported distant stations started cable's shift from a limited CATV role to a more expansive role as a Multichannel Video Programming Service (MVPS). Distant stations and local programming offered some additional choice, but by the mid-1970s, satellite distribution of video was becoming economically viable. Partly as a response to that, and partly in reaction to some federal court decisions challenging the FCC's assumptions about the impact of cable on broadcasting, regulations changed, allowing the birth and growth of cable networks. Within a decade, dozens of new cable

networks were available. By 2000, more than 250 nationally distributed cable networks were available to cable systems in the United States.

Among those early cable networks were CNN and ESPN. Each was a prototypical niche network, taking an existing program type offered (in a limited way) by traditional television, and providing a dedicated 24-hour channel for interested viewers. Yet their impact went far beyond an initially minimal audience share. CNN as a full time, around the clock, news channel changed the way that both the industry and audiences thought about television news. It brought the potential for immediacy and depth of coverage, arguably changing the news cycle and feeding the growing consumer interest in news. At the very least it expanded audience choice—not only across a growing number of networks, but in letting audiences have news whenever they wanted. CNN's eventual success encouraged the growth of a number of other cable news networks, both within the domestic U.S. market and in the international arena.

ESPN similarly transformed the nature of sports coverage; expanding coverage, developing audiences, and fostering the growth of broadcast sports journalism. Evolving to arguably the most successful cable network, ESPN provided its viewers access to a diverse range of sports and teams, fostering a still growing demand for sports reporting and news. ESPN and its eventual sister networks and competition arguably transformed the sports world, significantly increasing coverage (and financing) to a wide range of teams and sports. And by growing broadcast news and sports coverage, these channels have also significantly expanded opportunities for broadcast journalists, and the expansion of university journalism programs and schools.

The added channels that shifted cable from its original orientation as CATV to a far more expansive MVPS helped to increase the demand for cable as a service, and allowed cable to expand into urban areas where over-the-air signals were freely available. This expansion required resources, and there were significant economies of scale and scope to be found in larger communities and systems, prompting a shift in scale. From a preponderance of small local entrepreneurs and owners, the cable industry saw the entry of large firms, and the first wave of mergers and acquisitions, leading to the increasing dominance of corporate multi-system operators (MSOs). MSOs were also interested in standardizing regulation, and supported the 1984 Cable Act, which finally gave the FCC official oversight authority over cable, although the act's impacts were largely deregulatory in nature. The FCC at that point saw cable as having adequate competition in the form of traditional broadcast television, particularly the older broadcast networks.

The expansion of cable systems slowed in the early 1990s, as most areas where cable was economically viable had been franchised, and the systems built out. And much like the telephone industry, a mix of federal, state, and some local regulations made it difficult, if not impossible, for new firms to enter local cable markets to compete with existing systems. Cable was also beginning to face challenges from a range of alternative video distribution technologies. Continuing technological developments made satellite signals more readily accessible to consumers (affordable direct-to-home satellite systems became available by the early 1990s), and telephone companies were beginning to explore the possibility of sending video to homes through their upgraded digital networks.

The regulatory environment was changing as well. The rapid growth in the 1980s in both system size and the number of channels delivered, combined with the accompanying dominance of MSOs, brought subscriber price increases to many systems and raised concerns about concentration. These contributed to the 1992 Cable Act, which sought to regulate some service prices and performance more closely. Interestingly, they did this largely by changing the definition of competition for cable systems: rather than the presence of over-the-air broadcasters, competition was redefined in terms of the availability of a competing multichannel video programming service. Cable as MVPS had come of age.

However, cable was also becoming a bit of a victim of its own success. In 1995, more than 125 national programming channels were available. Available channels was outstripping existing cable system capacity, requiring significant investment in system upgrades. For their upgrades, cable embraced the use of fiber-optic cables in their installed networks, which offered not only significant increases in channel capacity, but also enabled cable to create "response" or backchannels for

signals, enabling them to supply interactive services. Expensive upgrades put additional pressure on cable finances, already facing slowed growth, increased competition, and heavy debt loads from expansions and acquisitions. The rise of both competition and price regulation from the 1992 act pushed cable operators to look for new sources of revenue. One solution was to more aggressively seek local advertising, exploiting the increased audiences for cable networks. Another solution was to exploit the interactive service potential of cable's upgraded networks and to become more than a one-way multichannel service.

Thus cable entered its third and present incarnation, as a broadband, interactive, telecommunication network. System upgrades, which improved channel capacity and fostered interactivity and the growth of digital applications, paved the way for a range of added high-value services. Further, the 1996 Telecommunication Act removed entry barriers for most telecommunications services, giving firms (including cable) the flexibility to innovate and develop new products, services, and markets. Cable systems with upgraded networks have been rapidly adding data services (broadband Internet connections), residential telephone services (IP telephony), and increased video-on-demand options. All are high-value, and high-profit, services (once you have a sufficiently upgraded network, which over 90 percent of U.S. homes passed by cable systems do). While the core service remains multichannel video, cable's profits increasingly come from local advertising and a range of advanced services.

In the meantime, however, competition is taking its toll. The number of homes subscribing to basic cable in the United States dropped to around 65 million in 2007, down from a high of almost 67 million in 2001. While more than 90 percent of American homes access television through a MVS, cable's competitors now account for more than a third of that, and their share is likely to grow as newer distribution systems, such as Internet Protocal Television (IPTV), become increasingly viable.

Throughout its more than half century of development, the essence of cable has remained fairly consistent: it is predominantly a wired multichannel television distribution system, a mechanism to deliver multiple television signals to homes and offices for a fee. That multichannel nature led to the growth of niche network programming, including significant opportunities for news, documentaries, and sports. These new niche networks not only offered more of the same type of coverage as traditional broadcast networks, but the nature of a niche network as a focused, full-time, source for news and information also helped transform the profession and nature of journalism. Cable's development as a broadband mass communication system now fosters the Internet's viability for distributing audio and video content. This will not only continue the fragmentation of audiences, but the interactive nature of the Internet poses its own issues for the future of journalism.

Canada

Canada is the world's second-largest country in geographic area but its population, just under 33 million in 2008, is relatively small, only one-tenth that of the United States. A harsh winter climate

and rugged northern terrain have led most Canadians to live near the country's long southern border with the United States, with communities becoming more widely scattered as one travels north. This geographic and cultural proximity to the world's leading communications superpower has profoundly influenced Canadian journalism and media.

Origins

When seeking the origins of Canadian journalism, two seemingly unrelated events begin the investigation. One form of journalistic expression sprang up in an army camp in 1759 commanded by an arrogant British general, James Wolfe, who had been told to drive France out of North America. General George Townshend used his skills as a political commentator to communicate his dislike of Wolfe to those around him. Townshend's messages were relayed in numerous sketches, one of which showed Wolfe probing the depths of camp latrines. Wolfe was less than enamored and threatened to bring his tormentor up on charges when they both returned to England. As it turned out Wolfe died in the campaign.

With Wolfe's victory over the French, British influence extended from the islands of Arctic Canada to the Spanish and French colonies that are now part of the southern United States. Bartholomew Greene (who had been posted to Nova Scotia from Massachusetts) decided to remain in the Atlantic colony to establish some form of journalistic activity in what is now the city of Halifax. He began the *Halifax Gazette,* predecessor of the contemporary *Halifax Chronicle Herald*. The unfortunate Greene died before the first issue appeared under the watchful eye of John Bushell, a friend and confidant. Unfortunately, Bushell was more successful at establishing the role of the journalist as an alcoholic than at practicing the craft. His paper survived in spite of its relationship to death and disease. At the same time magazine publishing began as both Halifax and Quebec City provided homes for early ventures though none survived more than a couple of years.

Canadian journalism did not really become Canadian until the United States severed itself from the British Empire. That separation would prove profitable for those attempting to establish a press in the four colonies that would eventually form the base for Canada. Before the British and the Americans would once again tangle in conflict between 1812 and 1814, no fewer than twenty newspapers emerged, publishing in both English and French. When English troops occupied Quebec following the conquest of 1759, they soon discovered that the only printing press in French Canada was assigned exclusively to the publication of religious documents. The situation amongst English occupants was not much better. Early newspapers regularly reissued information extracted from European papers received in the colonies. Like their French speaking counterparts, English newspapers also concentrated on religious documents. Real news of life in the colonies was transmitted orally.

In keeping with the pronounced Scottish influence on the development of the country, the first Canadian journalist of note was a Scot. With the establishment of his *Colonial Advocate* in 1824, William Lyon Mackenzie was determined to become (and succeeded in being) a thorn in the side of the colonial regime. Mackenzie took great delight in reporting on the sermons of the head of the Church of England in Canada, Bishop John Strachan, who was not amused by Mackenzie's analysis. But Mackenzie was no model of perfection. He often had to go into hiding to avoid angry creditors. He managed to get himself elected to the legislative assembly but his behavior got him expelled on numerous occasions. His final act of defiance came in 1837 when he encouraged disgruntled colonists to attack the governing council with a view to overthrowing its authority. The rebellion failed and Mackenzie made it to New York barely ahead of a hanging posse.

The modern age of Canadian journalism began in 1843 when George Brown was commissioned by his father Peter to journey to Canada to establish a religious journal espousing the cause of reform in the Church of Scotland. Brown quickly sensed that the colonists valued and needed accurate and speedy information in the development of government and industry. Brown's Presbyterian journal *The Banner* evolved into a secular weekly called *The Globe* one year later. By 1853 the journal was publishing on a daily basis and Canada was about to enter its golden age of print journalism. Not only would a flourishing daily press

emerge, one determined to cut the ties of reliance on the political infrastructure, it would be accompanied by a few determined souls who began to venture into magazine publishing one more time. Although most of the mid-century publications lived as precariously as their predecessors, the concept of journalism and magazines as legitimate partners took hold.

Golden Age

There were a number of good reasons why the press matured and in some cases prospered during the nineteenth-century reign of Queen Victoria. Britain's excess population, including soldiers and sailors who had been decommissioned following the Napoleonic Wars, took land grants in Canada. Both agricultural development and the first stages of industrialization began to shape in the new world, and journalism was soon to become part of the ethos of development. From five newspapers at the time of the War of 1812, by 1857 there were 159 newspapers in what is now Ontario, with a further 54 in Quebec.

The emergence of an independent press in Canada was clearly the result of the activities of several powerful and determined personalities. George Brown's liberalism was soon challenged by entrepreneurs such as John Ross Robertson, founder of the Protestant *Toronto Evening Telegram*. In London, Ontario, the Blackburn family, supporters of Prime Minister John A. Macdonald, would buy the *London Free Press* and turn it into the voice of Toryism in Southwestern Ontario. Montreal would have its Hugh Graham, later Lord Athlon of the *Montreal Star*. In French language media, one could find Trefflé Berthiaume of *La Presse* and, later on, Henri Bourassa whose views of the world could be found in *Le Devoir*. Journalistic growth was experienced across the West as well, but major economic growth there came in the early twentieth century.

In most respects, the editorial and news pages of the daily press still represented the views of ruling elites. Alternate voices were shoved aside into the margins of the craft, which ultimately had serious consequences. In the late 1860s, trade unionism became a factor in the industrial heartlands in an area stretching from Windsor, Ontario, to Quebec City. Denied access to the daily press, trade unionists began to develop their own journalism. In the period between Confederation and World War II (1867–1914), no fewer than 133 such newspapers emerged.

There also appeared on the Canadian scene a number of artists and commentators who used the press to both inform and entertain. The first of this ilk was the Montreal-based John Henry Walker. He and his father had landed in Montreal from Ireland. At the tender age of 18, Walker junior founded *Punch In Canada,* which featured illustration and commentary on the major social issues of the day and lasted all of three years. Walker would live to 1899 pursuing a career as an artist and professional engraver for other illustrated journals published in and around Montreal.

The most significant of the illustrated journals were published by the Desbarats family of Montreal. Following models published in London, England, and in Paris, France, the *Canadian Illustrated News* made its debut in October 1869. In the following spring, the French language version, *L'Opinion Publique*, began publication. In 1873, the company launched the *New York Daily Graphic,* which would later make history as the first newspaper to publish half-tone photography. All of these journals in one form or another would continue to publish well into the 1880s, when finally the ability to produce photography efficiently and cost effectively rendered the weekly illustrated press redundant. The artists and engravers who flourished in the days of illustrated journalism took their skills to magazines and books as well as to the Sunday editions of many Canadian newspapers, which discovered new audiences for comic strips.

Development of telegraphy and the success in constructing a transatlantic cable system brought Canadian journalism into the international arena. Only in 1859 did Canadian newspapers create their first news agency, the news cooperative still known today as the Canadian Press. It cooperated with the Associated Press in America in the same fashion as they do today. They shared Canadian and American news along with stories from overseas. However, the alliance was not as smooth as some may have wished. Canadian Press faced competition from western wire services, which argued

that a direct connection to the Associated Press would be less costly than routing stories through central cities such as Toronto. In a pique of nationalist fever, there was a feeling in Canada that the stories being sent over the wire were too American in style and editorial direction.

When the first transatlantic cable opened (for only about a month, as it turned out) in 1858, it provided Canadians with other international sources for news. Now more timely British and French news could be published in Canadian newspapers. In many respects, Canadians had no choice but to retrieve their news from two of the most important nations in the world. By the twentieth century, the infrastructure for Canadian journalism had been established. In 1899, Joseph Atkinson took the reins of the *Toronto Daily Star* and established it as one of the country's premier journals. In Montreal, circulation battles were being fought between Hugh Graham's imperialist and Conservative *Montreal Star* and the long established journal owned and operated by the White family, *The Montreal Gazette*. Across town, the French language *La Presse* was by 1900 the largest newspaper in the country, with a loyal readership built on the same sensationalist ingredients as the Hearst and Pulitzer empires in the United States. When French speaking nationalist Henri Bourassa founded *Le Devoir* in 1910 it was everything *La Presse* was not: a home of sober thought in Canadian journalism. But Bourassa's newspaper was in no position to challenge Trefflé Berthiaume's *La Presse* circulation.

In the national capital of Ottawa, the Southam family operated *The Ottawa Citizen* for close to half a century until 1996. Across town, P. D. Ross outlasted the Southams when his management of *The Ottawa Journal* passed into its sixth decade. He died in 1949. Moving westward, newspapers in the Manitoba capital of Winnipeg included *The Winnipeg Free Press,* owned and operated by the Sifton family, who ventured into various media businesses including the community newspaper company called Osprey. The *Free Press* became the base of one of the country's most famous editors, John W. Dafoe. The *Free Press* faced competition from two sources, the *Winnipeg Tribune* and the *Winnipeg Telegram*. Eventually strife, in particular the Winnipeg general strike of 1919, took its toll and in 1920 the *Telegram* merged with the *Tribune* and Winnipeg, like Ottawa, became a two-newspaper town. Although still relatively small by eastern standards, Vancouver residents could choose, as they still can, between the *Sun* and the *Province,* although both are now owned by Winnipeg-based CanWest Global.

In Hamilton, Ontario, the Southam family operated the monopoly *Hamilton Spectator*. Brantford and Windsor were other one-newspaper towns in Ontario. But in London, Ontario, the long established *London Free Press* of the Blackburn family faced the Camerons' *London Advertiser*. Eventually, the *Free Press* took over the market and London became a one-newspaper city up until World War II. In Ottawa, the French language *Le Droit* was founded to support the cause of Roman Catholic, French language education in Ontario, which was primarily English speaking at the time. Virtually every town or city of any size had at least one newspaper after World War II, publishing from one to six issues per week.

Radio News

Canadians were less than diligent in keeping records of early broadcast adventures. Historians have concluded that Canadian communications company Marconi decided to get into broadcasting during the 1919–20 period but less clear is the exact date of the first broadcast. Over the next few years, business people, including newspaper publishers at journals such as the *Toronto Daily Star,* actively pursued radio broadcasting licenses.

During the 1920s, radio broadcasting was a technology in search of a business and did not become an outlet for journalists until well into the 1930s. During its first decade, radio was no more than a means for entertainment focusing mainly on music and local cultural events. This was soon supplemented by network shows, which first began in the United States in 1926–27 and regularly sold their programming to Canadian stations. By 1929, the most popular radio programming in Canada emanated from the United States. Influences from south of the border started to register some concerns in Canada.

The belief that the United States was about to take over radio was the inspiration behind the

government's initiative to investigate alternatives to private ownership of stations. Banker Sir John Aird headed a three person commission and made recommendations on the future of Canadian broadcasting. The consequence was the Broadcasting Act of 1932, which established the Canadian Radio Broadcasting Commission (CRBC), a peculiar mix of public and private initiative. In 1933, the commission began programming a new network, an adventure that would collapse in 1936.

Like many other newspaper operators, the *Toronto Daily Star* entered radio in 1922 when it established CFCA, which continued to broadcast for a dozen years. CFCA's entry into the world of broadcast journalism came when a February 1924 storm in Ontario brought down the lines on which telecommunications depended. When Canadian Press asked the station to broadcast summaries of its wire reports, the station agreed. From then on, news broadcasting offered the short summaries with which listeners are familiar today accompanied by longer and more in-depth programming with coverage of conventions, political party meetings, and deliberations at city hall.

Newspaper-operated radio stations had access to information sources denied to others. The Canadian Press had routinely blocked radio stations' use of its wire services, especially if they were owned by persons not associated with print journalism. But with the founding of the CRBC in 1932, the Canadian Press relented and provided service to the new network broadcaster. However, it still refused to sell the service to private broadcasters, fearing that news-hungry audiences would cancel newspaper subscriptions and listen to radio. However, recognizing that the policy was self-defeating, Canadian Press established a broadcast service late in 1932 called Press News Limited (now Broadcast News) for both public and private stations.

By 1936, the CRBC was in serious trouble, due largely to extremely slanted political broadcasting favoring the ruling Conservative Party in the 1935 federal election. The opposition Liberals campaigned to reform the CRBC and eliminate the private sector's influence at the network. In 1936 they kept the promise, following a successful election campaign, and turned the CRBC into the publicly owned and operated Canadian Broadcasting Corporation (CBC) and La Société Radio-Canada (SRC). That same year Canadian radio made its mark as a genuine member of the journalistic community when a mine disaster at Moose River, Nova Scotia, drew reporter Frank Willis to the scene, where he proceeded to broadcast for three days as a last shot at legitimizing the CRBC. Willis later became well known as a CBC reporter and commentator.

In 1941 as Canadian contributions to the war in Europe began to increase, the CBC set up its first in-house news room with bureaus in five cities linking the Atlantic Provinces to those on the Pacific corridor. The CBC broadcast a national news edition at noon and at 11 p.m., and many private stations were given permission to carry the service. As a consequence, most private stations produced only local news and the CBC quickly established itself as the most important news voice in the country.

Television News

By the time that television came to Canada in 1952, CBC had established itself solidly as Canada's leading news authority. Although there were numerous privately owned television stations in the country, until 1960, they were required to carry a minimum of CBC-oriented programming, including news and information, even when their signals overlapped with each other. The first station to successfully leave the fold was the Hamilton, Ontario–based CHCH–TV, which successfully argued to regulatory authorities that it had no future as a CBC affiliate when the Toronto affiliate was just 45 minutes up the highway. So, in the early 1960s, the country got its first independent television station. Along with movies and sitcoms other stations did not want, there was a smattering of local news on the channel supplemented by syndication services.

When the Liberal Party finally lost federal power in 1957, the Progressive Conservatives formed a government with a promise to strip the CBC of its regulatory powers. This it did and a new Board of Broadcast Governors announced that it would license eight new privately owned and operated television stations that would have no relationship with the CBC. Quickly, a new network was created as Canadian Television or CTV. Stations in what the authorities deemed as

overlapping jurisdictions were offered the choice of staying with the CBC or joining the new CTV network. CTV moved quickly to establish itself as a reputable partner in Canadian television, particularly in news, information, and sports coverage. In the mid-1960s it launched *W-5*, which continues as a news magazine to this day.

David Spencer

Modern News Media

While Canada's news media are similar to those in the United States in enjoying a constitutional guarantee of free expression and a primarily commercial, profit-driven ownership system, there are important differences.

Canada and America

Canada, for example, has long deemed it necessary to protect its cultural industries from a U.S. influence that is perceived as overwhelming. American cultural products (television, radio, movies, magazines, books, newspapers, and Internet) are widely available and very attractive to Canadian audiences. To guard against this cultural invasion, the Canadian government limits foreign ownership of Canadian cultural industries and, since 1970, has required broadcasters to include a specified minimum percentage of Canadian content (the amount varies depending on the medium, time of day, and other factors). It also provides various forms of financial and regulatory support for Canadian cultural products such as magazines, film and television production, and book publishing. And although Canada participates in a free trade agreement with the United States and Mexico, that agreement includes special protections for Canada's cultural industries.

There are also important differences between the two countries' legal systems. Although free expression is guaranteed in both countries, there are limitations on that freedom to protect individuals and groups from hate speech, libel, and slander, and to protect an accused person's right to a fair trial. While the United States also has limits, Canada's are generally conceded to be more stringent. For example, Canada's courts are more likely to find journalists in contempt if they write or broadcast crime stories that do not presume an accused person's absolute innocence until that person is tried and proven guilty. Canada's hate crimes legislation has been frequently used to protect minorities, and led to the deportation of at least one Holocaust-denier who continued to publish his views in defiance of the law. And Canada's defamation law ensures that individuals whose reputations are damaged by undeserved criticism in the media have a reasonable likelihood of redress through the courts.

Another major difference between the two countries is Canada's mixed public and private broadcasting system, which features commercial radio and television networks but also supports publicly funded broadcasting (in both official languages) by the Canadian Broadcasting Corporation (CBC) and Société Radio-Canada (SRC). The CBC and SRC each operate several national television and radio networks (including the Internet-based CBC Radio 3) and contribute programming to CBC North, a network serving remote northern communities with broadcasts in several aboriginal languages as well as English and French. Since 1990 the CBC and SRC have each operated an all-news television network as well.

Canadian News Media in the Twenty-First Century

Canada's mainstream news media include 98 general interest daily newspapers and more than 850 community newspapers (mostly weeklies); five national and three regional television networks (five in English and three in French); and more than 500 radio stations. These traditional news sources do not appear to have lost favor with the Canadian public, as has happened elsewhere. In the United States, for example, skepticism toward journalists and the companies they worked for began to show up in public opinion polls in the 1980s, according to the Pew Center's Project for Excellence in Journalism (2007), which has been monitoring the U.S. media in its annual *State of the Media* reports since that time. The Canadian Senate's Committee on Transport and Communications commissioned a poll that found, in 2005, much higher levels of trust in the mainstream media among Canadians than Americans. A majority of Canadians polled did, however, express the

belief that media do not readily acknowledge their own errors, and even try to cover them up.

The same poll found that 66 percent of Canadians in 2005 got their news from television, 15 percent from newspapers, 9 percent from radio, 9 percent from the Internet, and only 1 percent from magazines. However, there were major differences among age groups. Television, for example, was the news source for 74 percent of people over age 65, but only 1 percent of people in that age group got their news from the Internet. Among respondents age 25 and under, however, 16 percent turned to the Internet for their news. Newspapers were the primary news source for between 13 and 18 percent in all age groups (Senate of Canada 2006, 72–89).

As in the United States, daily newspaper circulation has been declining for several decades in Canada, and television audiences have fragmented into smaller segments with the introduction of hundreds of specialty channels available by cable and satellite. So all is not rosy for Canada's traditional media. A good part of the distress they are feeling is due to new forms of journalism on the Internet.

Geography has contributed in other important ways to journalism in Canada. Vast distances between population centers made it necessary, early in Canada's history, to emphasize strong transportation and communications links. Fortunately, Canada has the resources to build and expand this essential infrastructure and keep pace with rapidly changing communications technology. Indeed, Canadians have often been among the inventors, developers, and pioneer users of technologies such as the telephone, radio, television, satellites, computers, and hand-held electronic devices as well as the Internet.

Largely as a result of this happy coincidence of innovation, resources, and geography, Canada in 2008 ranked twelfth among industrial countries in Gross Domestic Product, with a per capita GDP of $41,600 that ranked sixth. Canada is also among the world's most wired nations, with 73 percent of the population over age 16 reporting that they had access to the Internet in 2007, more than 90 percent of those with access from home. Access at workplaces, schools, public libraries, and a variety of other locations has, since the mid-1990s, made the Internet widely available to Canadians, including those lacking home access. However, there remains a "digital divide" that leaves out many because they lack computer skills or financial resources or live in remote locations. Research in 2007 found a particularly significant gap: among Canadians age 18 to 55, 88 percent are online, but among those over 66, only 61 percent are.

Internet Impact

The ability of so many Canadians, particularly in urban centers, to access the Internet accelerated a transition in Canadian journalism which began in the mid-1990s. News organizations in all media established Internet sites to supplement their publications or broadcasts. It soon became possible to get just about all the news published in newspapers free on the web. Many younger readers, those most comfortable online, never became newspaper subscribers, and newspaper circulations suffered a steep decline. Newspapers also lost revenues from formerly lucrative classified advertising, as Internet sites such as eBay and craigslist, as well as real estate and other online marketing proved more popular. Rise of the Internet has led to predictions of the newspaper's demise. This is particularly worrisome because newspapers have been major generators of news used in all media, initiating many of the stories reported in news broadcasts and on the Internet. If newspapers ultimately go out of business, some wonder, what will become of the news?

Local news, in particular, would suffer greatly from the loss of daily newspapers because Canadian newspapers are based in cities or towns serving their "circulation area," to which print copies can be distributed in a timely manner. Only in the late twentieth century did Canada develop two English-language national newspapers (*The Globe and Mail* and the *National Post*) that use satellite technology to transmit master copies to be printed in cities from coast to coast. A third national newspaper, *Le Devoir*, is distributed primarily in Quebec. The remaining 95 general interest daily newspapers in Canada have local roots, and reporting staffs with expertise in local coverage.

The advent of a widely accessible Internet has given rise to a great many new and alternative media, ranging from all-news websites offering regular "news feeds" to subscribers (who get this service free of charge) to email "listservs" and weblogs or

"blogs." Many report or discuss the news from a particular point of view, making little effort to present opposing views except to criticize them. The early twenty-first century proved an exciting time for Canadian journalists operating in this new environment, though it was difficult to earn a living since much of their online work was unpaid.

Interactivity in the online environment has been reshaping the form and content of Canadian journalism. The Canadian Broadcasting Corporation (CBC), in particular, has taken advantage of the fact that online readers and viewers often want to comment immediately on stories, send feedback to reporters and editors, help to correct errors and omissions, and suggest new ideas and stories. Mainstream media reporters in 2008 were increasingly being expected to write blogs, take pictures, and film video clips to post on the website, in addition to their traditional stories.

Ownership Concentration

Although Canadians do continue, in general, to respect the mainstream media, a great deal of concern at the turn of the twenty-first century was focused on the increased concentration of media ownership. That this is a subject important to Canadians is evident in the three major federal studies since 1970 that have examined the topic at length. Two were conducted by committees of the Senate of Canada: the first in 1970 and the third in 2006. A second, completed in 1981, was conducted by the Royal Commission on Newspapers, established in response to public outrage after two long-lived, respected newspapers—the *Ottawa Journal* and the *Winnipeg Tribune*—were closed on the same day in August 1980, each leaving one newspaper in a monopoly position in that city. It seemed like a suspicious coincidence at the time, though the Royal Commission never did find evidence of collusion. However, the commission's final report, as well as the others, drew significant public attention to the degree of corporate concentration in Canadian media ownership, which is among the highest in the world. Yet the governments that received these reports failed to implement any of their recommendations for reform.

Why is the steady rise in ownership concentration a concern for journalism in Canada? The three studies pointed to a number of problems, such as local monopolies that leave readers without choices and media owners with less motivation to cover all the news. While the first two studies decried a lack of competition between newspapers in a city reduced to only one, other voices could be heard on radio and television. By 2006, however, the situation involved extensive cross-media ownership that reduced or eliminated the diversity of voices across all local media and made it nearly impossible for smaller competitors to thrive, or new ones to start up. The 2006 Senate committee report pointed to three such examples where nearly all media were owned by the same company: Vancouver, on Canada's west coast, where Canwest Global owns both the morning and evening newspapers, two television stations, and a number of community newspapers; the province of New Brunswick, where the Irving family owns all the English daily newspapers and almost all the weekly newspapers, as well as three radio stations and two Internet sites; and Quebec's French-language media, where Quebecor owns the major private television network, is a major player in the newspaper market, and also owns magazines, bookstores, a cable distribution company, and video and music stores.

Yet despite these studies decrying the media ownership situation in Canada, the degree of ownership concentration has continued to increase. Almost all of Canada's news media were, in 2008, owned by a few large conglomerates, most of which had extensive cross-media holdings. The largest of these conglomerates, Canwest Global, in 2008, according to its corporate website, owned two national television networks and 26 specialty television channels as well as one of Canada's largest newspaper chains, with one national newspaper, ten major metropolitan dailies, more than 25 community newspapers, and two commuter newspapers, in addition to a network of newspaper Internet sites. Rivaling Canwest Global in the size of its Canadian media operations was Quebecor Media, whose website in 2008 claimed Canada's largest newspaper chain, with 37 daily newspapers, seven free commuter papers, and more than 180 weeklies, shopping guides, and specialty publications; the cable television company Vidéotron, with 2.5 million viewers in Quebec and a video rental chain; TVA, the largest French television network in North America; as well as French-language magazine and book publishing. A third

major player was CTVglobemedia, which owned the largest commercial television network, CTV; the largest national newspaper, *The Globe and Mail;* and the CHUM Radio division, which operates 34 radio stations across Canada. Torstar Corporation was another fast-growing media empire in 2008. It included the flagship *Toronto Star,* Canada's top-selling newspaper, and a number of Internet sites; Metroland Media, with three daily newspapers and more than 100 community newspapers in Ontario; Harlequin Enterprises, which publishes romances and other "women's fiction"; part ownership in CTVglobemedia and Black Press, which operates 150 newspapers (daily and weekly) in Western Canada and three U.S. states, as well as Transit TV, which runs programming and advertising on public transportation.

Employment

Deep employment cuts occurred while these conglomerates were being formed in the 1990s and 2000s. As media properties exchanged hands there were frequent staff cuts, either to prepare a media property for sale or afterwards to reduce operating costs to offset the burden of debt. Over two decades, these layoffs and buyouts took their toll, and many news organizations were reduced to skeleton staffs. One consequence was that the traditional system, which allowed reporters to develop a level of experience and expertise in covering a certain subject area or "beat," was either eliminated or seriously curtailed. During these years, there was a large-scale move to shift beat reporters to "general assignment," which means they are given new assignments every day, without much chance to develop expertise, or even suggest stories on their own. Catherine McKercher (2002) refers to this process as "deskilling" because it reduces the reporter's level of expertise and thus professionalism. On general assignment, reporters are told what to do by management, reflecting increasing corporate control of the news. Reporters in this situation, particularly if they are called upon to produce several stories per day, are forced to rely on official and institutional sources, often doing these stories by telephone instead of leaving the newsroom. Stories chosen for them by overworked editors tend to come from press releases or, all too often, other media. The task of taking a story written elsewhere and delivered by a wire service, adding a bit of local content along with the local reporter's byline, can be done much more quickly (and therefore cheaply) than the task of ferreting out an original story.

These same journalists suffer from staff reductions, the precarious existence of contract work, freelance journalism, or, when they do get permanent jobs, the threat of being the first to get laid off. Yet Canadian journalists tend to be highly trained. Most hold university degrees and a large number have graduated from one of Canada's eleven undergraduate or six master's-level journalism schools. More than two dozen community colleges in seven of Canada's provinces offer journalism training programs that do not result in a degree.

Multiculturalism

Canada is one of the world's most culturally diverse nations. The 2006 Census found that one in five residents was born elsewhere, a situation attributable to liberal immigration policies dating back to the 1970s. The country was founded as a nation of immigrants, and has worked to maintain its dual French and English heritage. However, it was many years later when Canadians acknowledged the significant cultural contributions of aboriginal Canadians. Canada's multiculturalism policy was designed to support the linguistic and cultural traditions of newcomers. The result of all these influences is policies that encourage and provide financial resources to journalism, particularly public broadcasting, in French and English as well as Canada's aboriginal and immigrant languages. Throughout the country, community newspapers and radio and television programs are produced in a variety of languages that help keep Canada's linguistic and multicultural communities alive. It is a model that could be of interest to a globalizing world.

Cartoonists, Political

Political cartoonists have been a vital part of the nation's dialogue since the colonial period. Combining artistic skill, rhetorical exaggeration, and biting humor, cartoonists have a long tradition of questioning authority, drawing attention to corruption, and highlighting society's ills. In return, political cartoonists occasionally have been offered bribes, threatened with jail time, or faced with other forms of attempted coercion by those in power. Political cartoonists were particularly influential in the years following the Civil War, thanks in large part to the brilliance of cartoonist Thomas Nast, and their prominence continued through the first two decades of the twentieth century. The profession experienced another creative surge in the 1960s and 1970s, reflecting a more adversarial mood in the country as a whole. At the start of the twenty-first century, due to newspaper cutbacks, the number of political cartoonists was in decline, and the profession faced an uncertain future.

Cartoon Elements

A successful political cartoon, argues historian Edward Lordan, requires five elements: a receptive audience, a medium of distribution, an artist with a creative sense of humor, a powerful subject worthy of scorn, and a negative public perception of that subject. Historian Charles Press argues that the artistic quality of the cartoon matters much less than the genuine feeling of indignation and outrage, and adds that cartoons that stand the test of time deal with subjects that have lasting importance.

In terms of subject matter, cartoonists draw from four major sources, as identified by researchers Martin Medhurst and Michael DeSousa: political commonplaces and major recurring subthemes such as national defense and electoral machinery such as campaigning; literary/cultural allusions and references that draw from mythology, literature, or folklore; personal character traits, including morals, truthfulness, and ability to lead; and situational themes, or transient episodes that occur during a campaign and are salient to the audience for a limited period of time, such as when a candidate makes a gaffe during a public speech.

Communication scholars gave increasing attention to political cartooning during the years preceding World War II and continuing after the conflict, suspicious of imagery's role in propaganda. Many of these early studies asserted the power of the cartoon with little if any empirical evidence to support the finding. Later studies revealed the power of the political cartoon was not uniform across populations or media, suggesting that the intensity of preexisting audience attitudes about the subject was very important in caricatures' effectiveness, and that people with preexisting prejudices tended to misinterpret cartoons.

A burst of empirical scholarship beginning in the 1960s cast even more doubt on political cartoons' ability to convey a fixed meaning. A 1968 study in *Journalism Quarterly* by Leroy Carl found that no more than 22 percent of readers extracted the same meaning from the cartoon as the artist intended. Another study of cartoons before and after the Watergate scandal in the 1970s concluded that negative reactions to a caricature were related to topical themes of the cartoon and general popularity of the politician at the time. Our understanding of how cartooning works is limited, and audience interpretations of political cartoons are dependent on many factors. Cartoons are far less likely to change minds than to reinforce preheld conceptions of those viewing the graphic message.

Origins

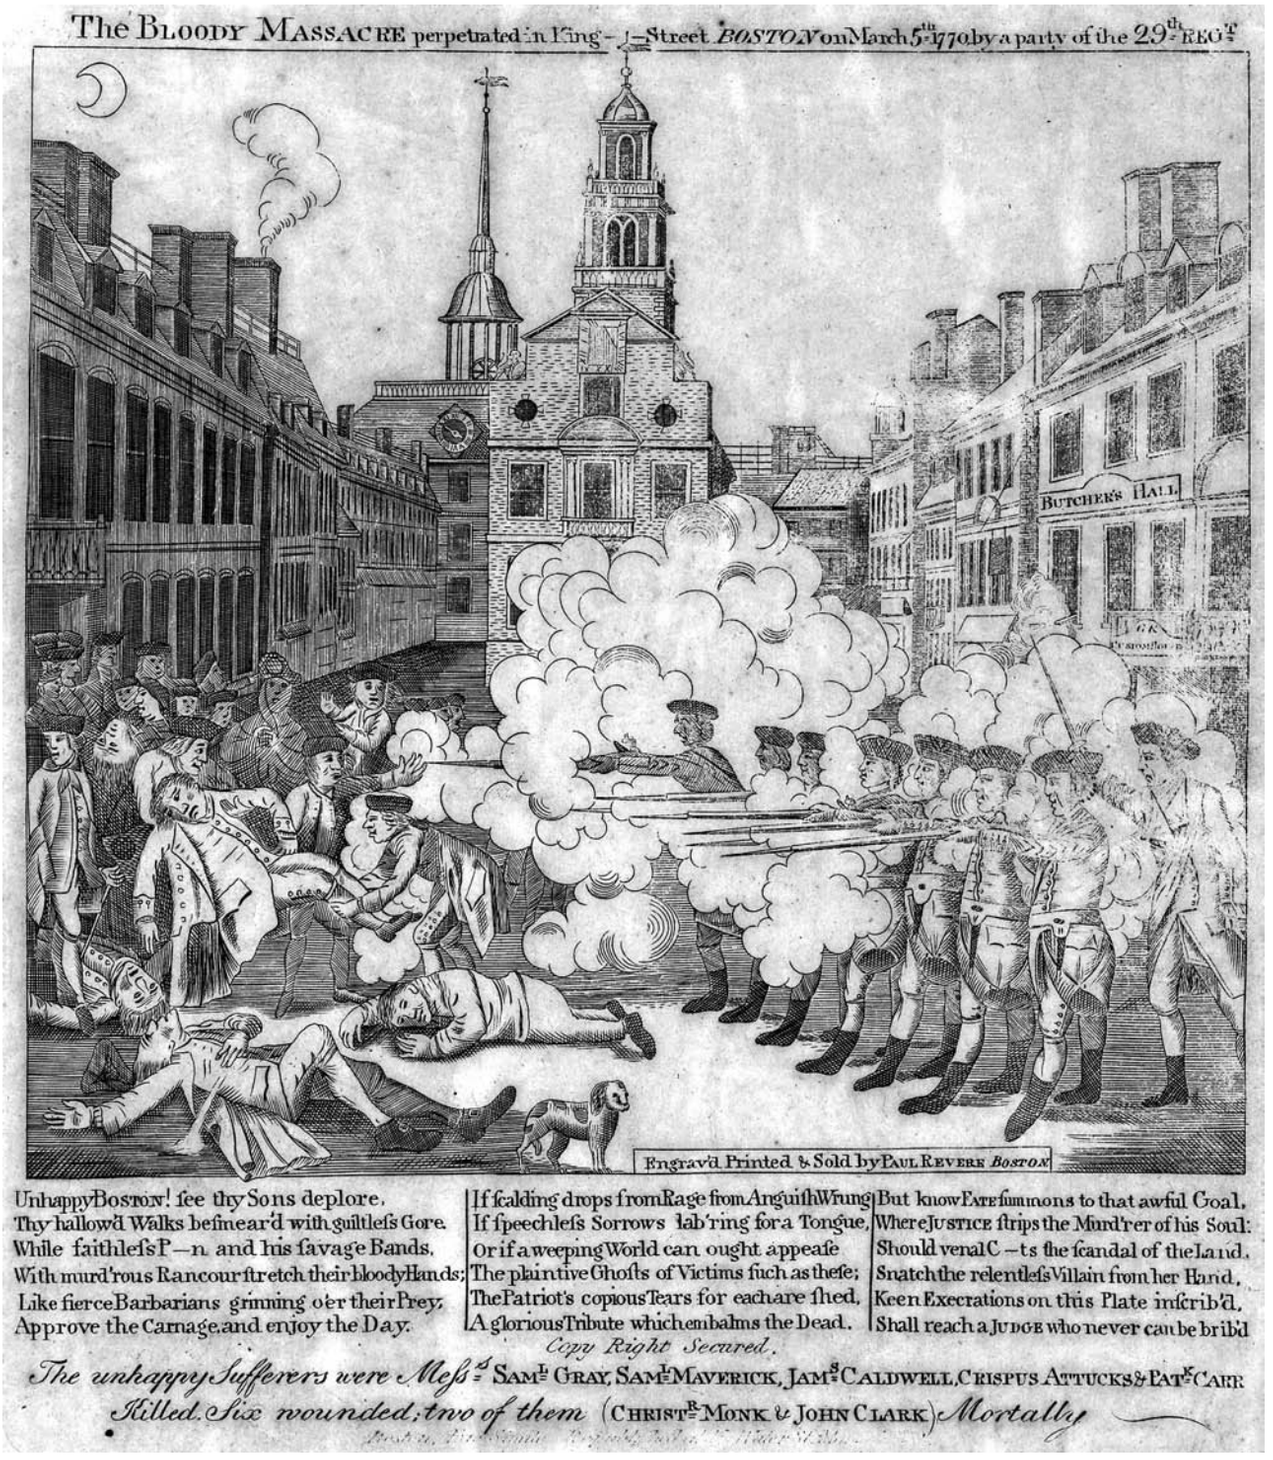
A tradition of political satire through art had been established in England, most notably through prints by William Hogarth in the early and mid-1700s. The first political cartoon in the colonies is credited to Benjamin Franklin (1706–90), who published "Join Or Die" in his *Pennsylvania Gazette*. The image portrayed a segmented snake, each portion representing a colony. Often misinterpreted today as a call to rise up against British tyranny, it actually was published in 1754 to urge colonists to back England in the French and Indian War. "Join Or Die" played off the superstition that if a dismembered snake were put back together before sundown, the snake would live again. The image was appropriated by other publications for various purposes over the next 20-plus years, contributing to modern-day confusion over its original meaning.

While not yet a staple in newspapers because of technological limitations, the political cartoon made its impact on colonists through single broadsheets, such as Paul Revere's depiction of the Boston Massacre in 1770. As political rhetoric, his drawing took liberties with numerous facts of the case—Revere omitted the clubs that some colonists carried, and he portrayed the slain mulatto Crispus Attucks as a white man. While political cartoons were relatively small in number during the Revolution, their impact helped galvanize support against the British.

The political cartoon continued to be a weapon in the early years of the new American nation, the barbs now turned away from England and toward rival political parties who fueled their rancor through a partisan press and savage artistic attacks. Pro-Federalist cartoonists were particularly vicious following the election of Thomas Jefferson to the presidency in 1800, portraying Jefferson as a drunk tearing down the pillars of the nation, and making direct references to reports that Jefferson had fathered a child with one of his slaves. In the 1830s, cartoonists attacked Andrew Jackson's populism, his attempts to concentrate more power in the presidency, and his earthy, simple manner.

The 1830s also brought an increase in the amount of political art available to the public. A more vigorous newspaper business, fueled by cheaper newsprint, faster presses and a new emphasis on advertising, slowly opened more opportunities for cartoonists. In addition, prints by the printmaking company of Currier and Ives became focal points of many home decors. These sold-by-the-individual-copy posters included still-life portraits, holiday scenes, and, in the political realm, presidential candidates, the company making sure to skewer each candidate in order to maximize sales. These and similar prints remained popular throughout the nineteenth century.

The election of Abraham Lincoln and four years of Civil War marked a substantial surge in political cartooning. Lincoln's height and features were easy targets for his political opponents, such as cartoonist Adalbert Volck (1828–1912), who famously portrayed Lincoln signing the Emancipation Proclamation with the Devil's ink while stomping on the Constitution. Lincoln and the Union cause were much more favorably presented by *Harper's Weekly* and its emerging star cartoonist, Thomas



Paul Revere engraved, printed, and sold this 1770 portrayal of the Boston Massacre as a single broadsheet in support of colonists against Britain. The image takes editorial liberties in making its point: the British soldiers firing on the citizens of Boston stand in contrast to the helplessness of the fallen colonists, when in fact many colonists were carrying clubs. It also includes 18 lines of verse (a technique not typically employed in contemporary political cartoons) and a list of those killed and wounded in the incident.

Nast (1840–1902), whom Lincoln reportedly called "our best recruiting sergeant." Nast not only produced patriotic cartoons to stir Union support, but also attacked those who would accept anything other than the unconditional surrender of the Confederacy, as in his "Compromise with the South," which pictured a confederate soldier shaking hands with a Union amputee while standing on the grave of another Union solder.

Thomas Nast: Pioneer Cartoonist

While Nast gained notice during the Civil War, it was his work after the conflict for which he is best known. For example, while the donkey had been loosely associated with the Democratic Party since Andrew Jackson ran for President in 1828, it was a Nast cartoon in 1874 that made the reference stick, while also placing the elephant as a symbol of the Republicans. In "The Third Term Panic," Nast responded to Democrats who decried a possible third presidential term by Ulysses S. Grant as an attempt to give the President powers resembling those of an emperor. An elephant labeled "The Republican Vote" stomped dangerously close to a chasm in the chaos. By the 1880s, the Democrats and Republicans had both incorporated the donkey and elephant into their respective campaigns, although the Democrats have never adopted the donkey as their official symbol.

It was Nast's work attacking the Tweed Ring that brought the cartoonist the most acclaim. William "Boss" Tweed became leader of New York City's Tammany Hall political machine in the late 1860s and proceeded to bilk the city out of as much as $20 million through fraudulent contracts, expense claims, and tax loopholes. Nast's caricatures of Boss Tweed emphasized his large nose, scraggly beard, and bloated body and made him seem even more sinister than the charges against him suggested. The series reached a wide audience—*Harper's Weekly* claimed that readership tripled during the series—and Tweed himself reportedly said that the written attacks on him in newspapers were nothing compared to the impact of "those damn pictures." Nast took on Tammany despite intimidation tactics from Tweed associates and an alleged $500,000 offer to stop the caricatures and leave the country. The legend surrounding Nast and Tweed grew in 1875, when Tweed escaped from jail and fled to Europe only to be arrested by Spanish customs officials, who recognized him from Nast's cartoons.

Emergence of the Comic Weekly

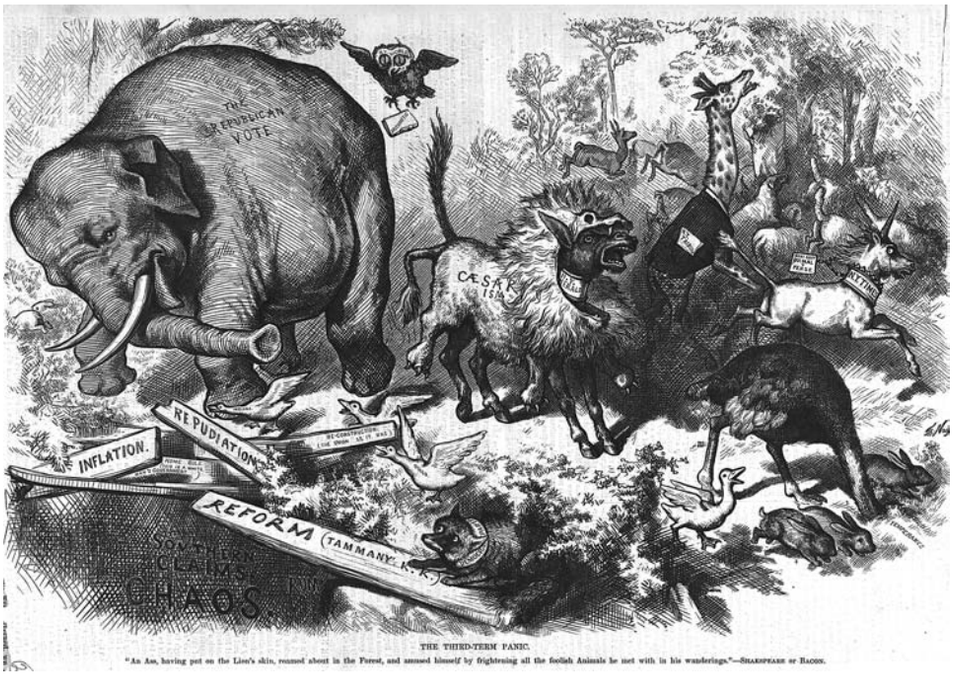
In the late 1800s, a new genre of magazine—the comic weekly—became home to a new style of political cartooning. Most notable of these publications was *Puck*. After a difficult start, *Puck* reported a circulation of 80,000 within five years. *The Judge* and *Life* would later join *Puck* in this new style of cartooning. By 1880, *Puck* was publishing vivid, full-color political cartoons on the cover, centerspread, and back page.

Puck's influence became clear during the election cycle of 1884. Joseph Keppler (1838–94) and fellow cartoonist Bernhard Gillam (1856–96) published a series of 22 cartoons portraying Republican candidate James G. Blaine as a "Tattooed Man," his body covered with tattoos of the various scandals with which he had been associated. The success of the series is indicated, in part, by the fact that numerous other publications began referring to Blaine as "Tattooed" in headlines and text during the campaign. Blaine reportedly considered suing *Puck* for libel, but refrained in order to avoid more attention being brought to his alleged misdeeds.

Newspaper Cartooning

The 1884 presidential campaign also marked the beginning of a more robust period for political cartooning in daily newspapers. Most notable was a front-page cartoon in Joseph Pulitzer's New York *World* by Walt McDougall (1858–1938) just before the election. McDougall's cartoon showed wealthy guests at a Blaine campaign dinner dining on "Lobby Pudding" and "Monopoly Soup" while a poor family begged for crumbs. The public reaction was crystallized as *The World* printed thousands of extras to satisfy the demand, and Democrats made large posters of the cartoon and put them on walls across New York City. Blaine lost the election to Grover Cleveland in one of the closest votes in U.S. history, and the power of the political cartoon was an often-cited reason for the final result.

The newspaper war between Pulitzer's *World* and William Randolph Hearst's *New York Journal* provided another spark for the rise of political cartooning in the 1890s and early twentieth century.



It was after this Thomas Nast cartoon—"The Third-Term Panic"—ran in an 1874 issue of Harper's Weekly *that the symbols for the two major political parties—the elephant for the Republican Party and donkey for the Democratic Party—gained wide currency. The donkey in the cartoon sports a collar labeled* New York Herald, *the newspaper known to be a staunch supporter of the Democrats. The caption of the photo reads: "'An ass, having put on the lion's skin, turned about in the forest, and amused himself by frightening all the foolish animals he met in his wanderings' —Shakespeare or Bacon." The cartoon was a response to Democrats concerned that a third presidential term by Ulysses S. Grant might give the President emperor-like powers.*

Source: Library of Congress.

Upon buying the *Journal* in 1895, Hearst raided much of Pulitzer's best talent, including Richard Outcault (1863–1928) and his popular "Yellow Kid" comic strip character. In the realm of political opinion, Hearst brought along Homer Davenport (1867–1912) from his San Francisco *Examiner* to attack Republicans and their wealthy supporters. Davenport's most-noted subject for attack was Ohio senator Mark Hanna, who reportedly cried while showing one of Davenport's cartoons to a Senate colleague. Davenport later drew cartoons in support of Theodore Roosevelt for the *New York Evening Mail*. A colleague of Davenport's at the *Journal*, former Puck cartoonist Frederick Burr Opper (1857–1937), also attacked the power of industrialists, skewering not only Hanna but also President McKinley and "Papa," a character he created to represent the corporate trusts.

Newspapers throughout the country recognized the success of the Hearst cartoonists and responded by hiring more artists for their staffs, driving up demand and salaries for those in the comic arts. By one estimate, 2,000 editorial cartoonists had full-time positions at the beginning of the twentieth century. This "golden age" of political cartooning did not go unnoticed by politicians, who grew weary of being caricatured. Some went as far as trying to outlaw cartooning, with five state legislatures considering measures between 1897 and 1915, and two states passing ill-fated laws. A California anti-cartoon law in 1899 banned cartoons that reflected on a person's character and required consent of the person being caricatured. The law was never enforced—luckily so, as it doubtless would have been overturned on First Amendment grounds. Campaign cartoons against Pennsylvania gubernatorial candidate Samuel Pennypacker and his associates led to a state law against cartoon "libel" being passed after Pennypacker took office in 1903. Newspapers across the country roundly criticized the law, and it was repealed after Pennypacker left office in 1907.

Dissent During World War I

Cartooning drew the ire of government officials during World War I also, this time at the federal level. Most notably affected was the socialist magazine *The Masses,* edited by Max Eastman and featuring the work of cartoonists Art Young (1866–1943), Boardman Robinson (1876–1952), and Robert Minor (1884–1952). *The Masses,* objecting to war no matter what the cause, produced images such as Minor's "At Last A Perfect Soldier!" depicting a military medical examiner's excitement over seeing a huge, muscular recruit with no head. Dissent such as that displayed by *The Masses* was the exception rather than the norm during World War I, as the vast majority of cartoonists produced patriotic, pro-war work, whether in the spirit engendered by the government's Committee for Public Information propaganda arm, or coerced through the intimidation of the 1917 Espionage Act.

The prominence of political cartoonists began to decline in the 1920s and 1930s. Daily newspapers embraced objectivity as an ideal and were less likely to follow party ideology, resulting in cartoons most often being relegated to an editorial page deep within the edition. The increasing influence of newspaper chains, continuing to swallow up newspapers across the country, put less importance on local issues, and corporate owners were more apt to send syndicated cartoons to its member papers than to hire local artists. In addition, the declining influence of progressives and a more conservative political mood in the country made a less conducive atmosphere for scathing political and social commentary.

A few cartoonists stood out in the period between the two world wars. Bucking a national trend, the cartoons of J. N. "Ding" Darling (1876–1962) remained on the front page of the *Des Moines Register* for 50 years and also reached millions of other readers through syndication. The two-time Pulitzer winner was a strong supporter of Woodrow Wilson's call against isolationism after World War I, but Darling's work later became less partisan, its humor gentle and prodding rather than harsh and cutting. John McCutcheon (1870–1949) of the *Chicago Tribune* took a similar tone and generally promoted probusiness, anti–Franklin Roosevelt ideals. A progressive mood remained in a few quarters, including Edmund Duffy's (ca. 1899–1962) attacks on the Ku Klux Klan in H. L. Mencken's *Baltimore Sun,* and Rollin Kirby's (1875–1952) skewering of Prohibition through his character "Mr. Dry" in the New York *World.*

Cartooning in World War II

World War II cartooning, and press coverage in general, featured even less dissent than that during World War I, due in part to the galvanizing influence of the Japanese attack on Pearl Harbor. A notable exception was the black press, which posed uncomfortable questions about why African Americans were being asked to fight abroad when they did not have equal rights at home. In particular, the work of Oliver Harrington (1912–95) at the *Pittsburgh Courier* and republished in other black newspapers drew attention to racism in the military. The criticism did not go unnoticed by J. Edgar Hoover and the FBI, who repeatedly tried to shut down papers such as the *Courier* during the war, and who later would accumulate an extensive investigative file on Harrington.

The most popular cartoonist during World War II was an enlisted soldier. Bill Mauldin (1921–2003) began drawing cartoons for the *45th Division News,* then moved to the military newspaper *Stars and Stripes* in 1943. Mauldin's dirty, tattered, war-weary infantrymen "Willie and Joe" depicted the conditions under which foot soldiers performed, and at the same time used sarcasm to needle those in the officer class. In 1945, Mauldin, at age 23, was awarded the Pulitzer Prize.

Responding to the Red Scare

The onset of the cold war in the 1950s produced a chilling effect on many forms of communication, as fears of communism turned into paranoia over suspected subversives, not only in government but also in media. Sometimes with little proof, and rarely with a chance to face their accusers, numerous television and film actors, writers, and producers with alleged ties to left-leaning organizations were effectively banned from working through "blacklisting." Congressional proceedings, such as those by the House Un-American Activities Committee led by Richard Nixon, sought to expose those who they deemed as being loyal to the Communist cause. At least one political cartoonist, Oliver Harrington, was investigated by HUAC. Harrington left the country for Europe, never to

return. In this climate of fear, cartoonists generally avoided questioning whether constitutional rights were being circumvented in the name of security.

A few cartoonists were bold enough to criticize the tactics of those in the anti-Communist movement. Walt Kelly's (1913–73) *Pogo* strip skewered FBI director Hoover and produced a character, Simple J. Malarky, as a parody of Senator Joseph McCarthy, who was using his Senate Permanent Subcommittee on Investigations as a bully pulpit against alleged Communists. The most notable cartoonist to take on McCarthy was Herbert Block (1909–2001), better known as "Herblock" to readers of *The Washington Post*. It was Herblock who coined the term *McCarthyism*, using the junior senator from Wisconsin as a broader symbol for the Red Scare that had enveloped the country. In perhaps the most memorable Herblock cartoon from the period, he drew a man labeled "Hysteria" carrying a bucket of water up a ladder and yelling "Fire!" as he made his way to the flame at the top of the Statue of Liberty.

A Surge in the 1960s and 1970s

The social turmoil of the 1960s and the Watergate scandal of the 1970s marked a period of resurgence in the vitality of the profession, as cartoonists, and journalism overall, took a more adversarial stance. Perhaps the most influential cartoonist of the period was a native Australian, Pat Oliphant (1935–), whose work always contained biting satire and often included a tiny penguin, Punk, who occupied the bottom corner and punctuated Oliphant's point with a sardonic comment.

Paul Conrad (1924–) spent three decades at the *Los Angeles Times,* winning three Pulitzer Prizes while taking aim at both Ronald Reagan and Richard Nixon. Conrad ended up on Nixon's infamous "enemies list," a document prepared by the Nixon White House identifying perceived political opponents, and Conrad suspected that a series of tax audits were related to his attacks on the President.

Jeff MacNelly's (1947–2000) conservative-leaning work at the *Richmond News-Leader, Chicago Tribune,* and through syndication gained him national acclaim and three Pulitzer Prizes. MacNelly also created the popular comic strip *Shoe*, inspired by a journalism professor who mentored the cartoonist at the University of North Carolina at Chapel Hill.

While technically a comic strip, Garry Trudeau's (1948–) *Doonesbury* won the Pulitzer for editorial cartooning in 1975, underscoring Trudeau's influence in American political life. *Doonesbury* remains strong in the twenty-first century, being syndicated to more than 1,300 newspapers worldwide.

Noted Political Cartoonists

Herbert Block (1909–2001)

Block, better known as Herblock to his readers, won three Pulitzer Prizes in a career that spanned seven decades. Herblock spent more than 50 years at *The Washington Post*. He is credited with coining the term *McCarthyism* to symbolize the anti-Communist hysteria fueled by the junior senator from Wisconsin. Herblock was a particular nuisance to Richard Nixon. In the 1950s, Herblock depicted the then–Vice President crawling out of a sewer to campaign for fellow Republicans; Nixon would later remark that he had to "erase the Herblock image" from Americans' minds. In the 1970s the cartoonist punctuated the illegalities and missteps of the Nixon White House during Watergate. In 1994, Herblock was awarded the Presidential Medal of Freedom.

Joseph Keppler (1838–94)

Keppler changed the field of political cartooning in terms of both style and technology. An immigrant from Vienna, Keppler teamed with printer Adolph Schwarzmann in 1876 to found the German-language *Puck;* then the following year the pair began publishing an English-language version of the magazine. At first, Keppler was the magazine's lone cartoonist, but Keppler would later guide such influential cartoonists as Bernhard and Victor Gillam, Frederick Burr Opper, and Eugene Zimmerman. In contrast to Nast's single-panel, black-and-white work, *Puck* featured vivid color cartoons on the front, back, and centerspread, and these featured cartoons often included multiple characters. *Puck*'s color printing process had become so famous and successful that the magazine became an attraction at the 1893 World's Columbian Exposition in Chicago, with thousands lining up to see the process and the innovator in person.

Bill Mauldin (1921–2003)

Mauldin became famous as a soldier cartoonist in World War II but would also create memorable images as a civilian in the turbulent 1960s. Mauldin's "Willie and Joe" characters for *Stars and Stripes* delighted enlisted men and the public, while raising the ire of military leaders, including General George Patton, who threatened to ban *Stars and Stripes* from his Third Army unless the characters disappeared from its pages. General Dwight Eisenhower rebuffed Patton, saying that Mauldin's work was a useful outlet for soldier frustrations. Thanks in part to a favorable article by famous war correspondent Ernie Pyle, "Willie and Joe" became available to newspapers across the country through United Feature Syndicate, and the cartoons would win a Pulitzer Prize. As a civilian, Mauldin would later win another Pulitzer with the *St. Louis Post-Dispatch,* and he drew a memorable cartoon for the *Chicago Sun-Times* following the assassination of John F. Kennedy, depicting a crying statue of Abraham Lincoln at the Lincoln Memorial.

Thomas Nast (1840–1902)

Nast is considered by many observers to be the father of the American political cartoon. He is credited with creating many icons, such as the Republican elephant and Democratic donkey that have become part of the language of political life in the United States. While still a teenager, Nast was depicting news events for Frank Leslie's *Illustrated Newspaper* and the *New York Illustrated News*. By 1862, he was working for *Harper's Weekly,* not only depicting Civil War battle scenes, but also creating highly pro-union patriotic images. After the war, Nast became famous for his role in helping root out the corruption of New York City political leader Boss Tweed, as well as his caustic depictions of presidential candidate Horace Greeley in 1872. Nast left *Harper's Weekly* in 1886 and later started an unsuccessful publication, *Nast's Weekly*. Nast died in 1902 while serving as consul general to Ecuador.

Pat Oliphant (1935–)

Oliphant was the most widely syndicated political cartoonist in the world by the 1990s, and *The New York Times* called him "the most influential cartoonist now working." Born in Australia, Oliphant began cartooning at the *Denver Post* in 1964, and by 1967 had won the Pulitzer Prize. Oliphant moved to the *Washington Star* in 1975, and after that paper folded, he worked through Universal Press Syndicate. Oliphant has not shied from controversy, either in his cartoons or public statements. He has criticized the Pulitzer awards for awarding jingoistic work, and he has not submitted an entry since his 1967 victory. Oliphant's work has, on occasion, drawn criticism from Catholic, Asian American, and Arab American groups for what they view as stereotypical images.

Frederick Burr Opper (1857–1937)

Opper had a 58-year career as a political cartoonist, and in the 1930s was selected by a straw poll of fellow cartoonists as the funniest man in newspaper history. After a brief stint at Frank Leslie's *Illustrated Weekly,* Opper was hired in 1880 by *Puck*, where he would continue for nearly 20 years. He was hired by William Randolph Hearst's *New York Journal* in 1899, and Hearst papers throughout the country carried Opper's single panel political cartoon "Willie and His Papa," which attacked William McKinley and business interests aligned with the President, as well as his "Happy Hooligan" comic strip, making the artist a household name.

An Uncertain Future

The end of the twentieth century and beginning of a new millennium brought an uncertain period for political cartooning. While political cartoons still appeared on the editorial pages of most American newspapers, many observers felt the profession was in a state of decline. In a post-9/11 world, many editors and publishers were increasingly reluctant to publish cartoons that might be perceived as unpatriotic or critical of the war on terror. Some newspapers chose to not replace cartoonists who left their staffs. By 2004, the number of full-time editorial cartoonists employed by U.S. newspapers had fallen to an estimated 80 artists.

CBS News

In the early days of network radio, news competed for a place in the daily programming schedule with entertainment fare such as *The Lux Radio Theatre* and Major Bowes's *Original Amateur Hour*. In 1929, CBS's founding father, William S. Paley, decided there was sufficient public interest to warrant a regular daily news summary—five minutes of a morning program called *Something for Everyone*. From the humble beginnings of that regular news program, CBS would go on to become a key player in broadcast journalism, home to such luminaries as Edward R. Murrow and Walter Cronkite. CBS News developed into an integral part of what came to be known as "The Tiffany Network" because of the quality of its broadcasts—and the revenue it generated. This entry examines the news division's history and influence.

Origins

On the evening of September 18, 1927, the United Independent Broadcasters (UIB) and the new Columbia Phonograph Broadcasting System presented an American opera titled "The King's Henchmen" on a "network" of 16 radio stations. The broadcast—marred by technical problems caused in part by a huge thunderstorm—failed to excite potential advertisers.

Within two months, the fledgling network was in financial trouble and it struggled for the next year. Then, on September 26, 1928, William S. Paley, a young man working for his father's cigar company in Philadelphia, became president of the network, two days shy of his twenty-seventh birthday. He bought controlling interest with a loan from his father, combined UIB and Columbia into one company, and renamed it the Columbia Broadcasting System (CBS). Paley would lead CBS to great success in radio and television news and entertainment for the next half century.

Paley spent the first decade of his tenure building a radio network that would be competitive with arch-rival David Sarnoff's industry giant, the National Broadcasting Company (NBC). Paley brought aboard solid managers such as former *New York Times* editor Ed Klauber, and Ohio State University graduate Dr. Frank Stanton who would rise to become president and one of the most influential executives in broadcasting. Paley nurtured young entertainers such as singers Kate Smith and Bing Crosby and in 1935 hired an enterprising Director of Talks, Edward R. Murrow. Paley was making progress, but NBC remained the network leader.

Radio

From its beginning, radio news consisted mostly of commentators who selected their material from

newspapers and wire service reports. The two most prominent commentators on radio in the 1930s were Lowell Thomas of NBC and Boake Carter of CBS. It was Klauber who, as the first head of the CBS news department, developed industry standards for fairness and objectivity, factual reporting, and avoidance of editorializing. Moreover, news divisions were made independent of the advertising offices and had direct access to senior management. His news editor (and head of CBS News from 1933 to 1946) was former United Press reporter Paul White.

As Director of Talks, Edward R. Murrow's principal responsibility was to arrange concerts, speeches, and other interesting programs to air on the network. In 1937, the 29-year-old Murrow was dispatched to Europe for the same purpose. There, he hired former *Chicago Tribune* foreign correspondent William L. Shirer. Together they followed German Chancellor Adolf Hitler's aggressive efforts to build a war machine to conquer Europe. However, their efforts to report on the air about these events were routinely rejected, in large part because some CBS officials in New York were unconvinced American listeners wanted to hear a steady stream of stories that suggested war was coming. Once in 1939—when it was apparent to almost everyone in Europe that war was indeed on the horizon—CBS news manager Paul White demanded that Murrow and Shirer put together a program of cabaret acts as a change of pace. This idea was rejected by both journalists.

Finally, at 8 p.m. eastern standard time on Sunday, March 13, 1938, CBS Radio presented a program that would alter the future of radio news and CBS:

> Tonight the world trembles, torn by conflicting forces. The outside world, gravely shaken by the Austrian crisis, moves cautiously through a maze of diplomatic perils. . . . To bring you the picture of Europe tonight, Columbia now presents a special broadcast which will include pickups from London, Paris and other European capitals. . . . This is Bob Trout speaking to you from New York. . . .

With those words, announcer Robert Trout brought listeners first-hand reports of Hitler's annexation of Austria and its consequences around the world. The program included reports from Shirer in London and Murrow in Vienna. It marked the first time in broadcast history that a group of correspondents in the field was linked by a central anchor. The program resonated with the American public. As a result, CBS presented similar special broadcasts on subsequent evenings and eventually made it a nightly fixture. Thus was born the *CBS World News Roundup* and with it, the era of broadcast journalism.

For the next seven years Murrow and his growing team of colleagues—including Shirer, Eric Sevareid, Charles Collingwood, Howard K. Smith, Richard C. Hottelet, Larry LeSueur, Mary Marvin Breckinridge, Winston Burdett, Bill Downs, Thomas Grandin, and Cecil Brown—brought the drama and tragedy of World War II into American living rooms.

After the war, CBS radio news continued its network broadcasts using well-known wartime reporters. Network radio continued to be an important news medium into the 1950s.

Television

The end of World War II in 1945, however, marked the active development of television. Now armed with a galaxy of entertainment stars and the most respected news department in broadcasting, Paley set about to establish what would become known as the "Tiffany network" for the quality of its public affairs and entertainment programming.

In the summer of 1948, the network launched its first nightly television newscast. *The CBS TV News* aired for fifteen minutes per night, Monday through Friday, at 7:30 p.m. EST. Veteran CBS Radio newsman Douglas Edwards became its first "anchor." In the fall of 1950, the name of the program was changed to *Douglas Edwards with the News* and by September 1951 the newscast was reaching viewers from coast to coast. Edwards would remain at the helm of the nightly newscast until 1962.

In 1948 television provided coverage of the national political conventions. Edwards served as principal reporter for CBS News that year with contributions from others including Murrow, by then head of CBS News.

While still devoted to radio, Murrow nonetheless broke significant ground in television. *See It Now,* a half-hour program anchored by Murrow

and produced by Fred Friendly, first aired in November 1951—its opening program highlighting the marvels of television technology by offering live, simultaneous images of the Brooklyn Bridge in New York and the Golden Gate Bridge in San Francisco. The series went on to present substantive and sometimes controversial programs on national and global issues. *See It Now* aired from 1951 to 1957 and was succeeded by the award-winning documentary series *CBS Reports* from 1959 to 1971.

The brainchild of CBS President Frank Stanton, *Face the Nation* debuted on November 7, 1954, as the network's answer to the NBC program *Meet the Press*. The first moderator was CBS News Washington bureau chief Ted Koop. He was succeeded over the years by others, including Howard K. Smith, Paul Niven, Martin Agronsky, Leslie Stahl, and Bob Schieffer. In 1961, the program was expanded to an hour and moved to prime time but it failed to generate larger ratings against entertainment programming and was cancelled several months later. It returned in 1963 and has remained a staple of Sunday morning news programming ever since. Shieffer, a respected, substantive, and congenial correspondent who joined CBS News in 1969, is the longest serving moderator of *Face the Nation,* having assumed the responsibilities in 1991.

By the early 1960s, NBC's evening news program *The Huntley-Brinkley Report* had surpassed CBS in the ratings. In April 1962 Walter Cronkite succeeded Edwards as the anchor of the CBS evening newscast and in September 1963, the program was expanded from 15 to 30 minutes. Cronkite, a former war correspondent for United Press, joined CBS News in 1950 and began a 28-year run as anchorman for the network's political convention and election coverage. But his place would be firmly established during his tenure as anchor and managing editor of the *CBS Evening News* from 1962 to 1981. His reporting of such events as the assassination of President John F. Kennedy (1961–63), the Vietnam War, the first Apollo Moon landing, and the Watergate scandal provided a steadying influence in times of confusion, joy, and sorrow. National surveys showed him to be "the most trusted man in America." The CBS News Washington Bureau's reputation for excellence during this period was second only to that of the Murrow Boys of World War II.

In 1981, Cronkite stepped down, to be succeeded as anchor by veteran correspondent Dan Rather, who went on to hold the position for 24 years. From 1993 to 1995, correspondent Connie Chung joined Rather as co-anchor. Rather stepped down in 2005 after being stung by a backlash to a controversial CBS News investigative report on the National Guard duty of President George W. Bush (2001–09). Chief Washington correspondent Bob Schieffer, while continuing to moderate *Face the Nation,* stepped in as anchor for an 18-month period. In September 2006 to much fanfare (and a huge reputed salary), Katie Couric left her longtime role as co-anchor of the top rated NBC News program *Today* to become the first solo woman anchor of *The CBS Evening News,* though to disappointing ratings.

In 1968, Don Hewitt, a path-breaking CBS producer and director credited with inventing many of the techniques that drove public affairs television in its formative years, created *60 Minutes,* a weekly news magazine featuring investigative reports, interviews, profiles of people in the news, and feature segments. *60 Minutes* would become the longest running and most successful series in television history. From 1977 to 2000, a record 23 consecutive seasons, it finished among the top-ten-highest rated, regularly scheduled programs. The program finished number one in the Nielsen ratings five times and is the only series in television history to reach that height in three different decades (the 1970s, 1980s, and 1990s).

In 1979, CBS created *Sunday Morning,* a slower paced, 90-minute news and feature magazine hosted by correspondent Charles Kuralt. Upon his retirement in 1994, Kuralt was succeeded by longtime CBS Radio personality Charles Osgood.

Some of the luster rubbed off "The Tiffany Network" beginning in 1986 when Laurence Tisch became CEO of CBS at a time the network was facing possible hostile takeovers. At first hailed by many employees as a savior, during his tenure, which lasted until 1995, Tisch implemented a series of cost-cutting measures, which included firing veteran journalists, closing some news bureaus, and reducing the time the network allocated for news programming. In some ways, CBS News has never recovered from the changes imposed during the Tisch years. *The CBS Evening News with Katie Couric* finishes consistently in third place among

the major commercial network newscasts. The news division has only a handful of foreign bureaus, many of which rely heavily on material from other broadcasters (e.g., Sky News).

CBS News traditions were remembered on the afternoon of November 12, 1999, when 90-year-old Robert Trout entered the radio network newsroom in New York to participate in *The CBS News 20th Century Roundup,* a three-hour radio retrospective anchored by Dan Rather. Among others, Trout was joined on the broadcast by former correspondents Richard C. Hottelet, Howard K. Smith, Larry LeSueur, and the first woman broadcaster, Mary Marvin Breckenridge Patterson. That afternoon, the remaining Murrow Boys came together one more time, to close the book on the twentieth century.

As the new century dawned, the network was building its Internet presence through its website cbsnews.com. The site offered text, audio, and video of the latest news, as well as blogs and podcasts of entire television programs including *The CBS Evening News, 60 Minutes,* and *Face the Nation.*

Like all broadcast news operations, CBS struggles to retain an audience that increasingly finds its information via the Internet and other new technologies. The days of hour-long, prime-time documentaries (e.g., Murrow's famous "Harvest of Shame" broadcast) are gone, and CBS News executives are under increasing pressure to keep expenses to a minimum while still providing coverage of breaking news from around the world. It is a difficult, perhaps eventually impossible, balancing act between the demands of good journalism and the needs of a corporate entity that must provide sufficient returns for investors. This is the age of consolidation in the news business and there is occasional talk of CBS merging with CNN or some other organization to increase efficiencies and save money. Whether CBS's future will be as bright as its proud past is a question still to be answered.

According to Marvin Kalb, the last correspondent personally hired by Edward R. Murrow (in 1957), CBS News left a lasting mark on journalism. "CBS News meant Ed Murrow and Eric Sevareid, Charles Collingwood and Winston Burdett—it meant reporters of the highest quality, writers and observers, who always wanted to be at the heart of the story," Kalb said in an interview in 2008. "Bill Paley, a boss whom we knew and respected, called us 'the jewels in his crown,' and we all took deep pride in our product and our network—it was called 'the Tiffany network.' From those days, journalism has changed profoundly, but it still has the same mission: to find the truth, to report it clearly and fully, with detachment if possible, and always to reach for the stars."

Celebrity and Fan Magazines

Celebrity and fan magazines, also referred to as gossip magazines, feature stories about the personal lives of primarily show business and sports celebrities, often including fashion coverage and especially seeking scandal. They are for-profit magazines intended for the amusement of fans of the popular culture subject matter which they cover. The people who write for these publications often have backgrounds and experience in mainstream journalism.

These magazines differ from industry trade magazines, such as *Entertainment Weekly,* fashion magazines that may feature celebrities on their covers such as *Vogue, Elle,* or *Glamour,* and the broader home design and lifestyle magazines such as *In Style, Vanity Fair,* or *Town & Country* that often feature celebrity homes and interviews, as well as other types of sports, travel, and leisure publications. They are also distinct from supermarket tabloids, such as the *National Enquirer*, which traditionally included stories about aliens, UFOs, and other far-fetched items They can also be distinguished from literary magazines by the target audience of their content, and from amateur fanzines by the professional for-profit nature of their publication. The magazines help to perpetuate a fan subculture that is maintained through familiarity and shared recognition of the details of the celebrities' lives that are reported. Most celebrity magazines have website counterparts.

Celebrity and Fame

Sociologist Leo Lowenthal argued that between 1901 and 1941, biographies in popular magazines underwent a striking change. Whereas earlier biographies of American society's heroes featured "idols of production"—they stemmed from the productive life of business, industry, and natural science—newer magazine heroes being featured were "idols of consumption"—they were directly or indirectly related to the sphere of leisure time, the worlds of entertainment and sports. What Lowenthal was describing was the shift in popular interest to the modern-day celebrity.

Other scholars believe that the development of visual technology was significant in fostering celebrity. As photography lent new importance to the representation of the individual and was increasingly employed in print media, the "dissemination of the face," writes researcher Joshua Gamson, displaced the dissemination of ideas, laying the ground for the "publicizing of people."

Fame is rarely achieved without assistance from partner industries and journalists often play a significant role. The companies and brands for which celebrities work, and not just the celebrities themselves, are responsible for creating and perpetuating the celebrity frenzy. A multifaceted process undertaken by the celebrity industry contributes to fame. As researcher Barbie Zelizer observed, stardom today is largely the result of advances in mass media technology and emerges from publicity activities coupled with repeated and routinized mass media appearances. These technologies and activities have made possible the extension of celebrity status to different kinds of public actors such as heiresses and socialites. This broadening of the term "celebrity" is perpetuated by an elaborate industry for public discourse exemplified not only by magazines, but by television shows such as *Entertainment Tonight, Access Hollywood, Showbiz Tonight,* the entire E! television channel, and websites such as TMZ.com and PerezHilton .com, which regularly engage in commentary and criticism about these figures' professional and nonprofessional activities.

The success of any given celebrity depends on the celebrity and media industries and on audience response. This last factor is vital to creating stars. People's social networks aid the dissemination of celebrity gossip and news. Industry production and distribution networks also circulate newsworthy items in hopes of increasing a celebrity's profile. From the beginning fame has required publicity, but celebrities are usually complicit in building up their own fame. As researcher Leo Braudy wrote in 1986, "societies always generate a number of people willing and eager to live at least part of their lives in the public eye."

Celebrities sacrifice personal privacy as part of the price they pay for their success and fame. While celebrities themselves may not always take action to publicize their personal activities, they rarely shy away from coverage. If personal activity captured on film makes the celebrity look good and more likable to audiences, then the

information that has become public is usually deemed acceptable. But even negative notoriety—wife swaps, babies out of wedlock, and the like—contributes to fame.

The positive notoriety celebrities garner enables them to make endorsement deals for products and events, while negative notoriety can impede celebrities' ability to make these deals and even cause endorsement deals to be withdrawn. These lucrative arrangements make it easier to understand why celebrities are often willing to tolerate the inconvenience of photographers' constant presence in their lives. In this way, celebrity can be seen as a cultural commodity whose economic value is based on potential exchange of fame for sales.

Popular Celebrity Magazines

American celebrity gossip magazines include *Us Weekly,* founded in 1977 by The New York Times Company, and acquired by Wenner Media in 1986. As of 2007, its circulation averaged over 1.9 million. The magazine currently features a different style from its original format when it was a monthly industry news and review magazine. It switched format in 2000 to its current celebrity news focus.

Other American celebrity magazines include *InTouch,* launched in 2002 by Bauer Publishing, and its sister publication, *Life & Style,* launched in 2004. *OK!* and *Hello!* are both British celebrity magazines that became popular in the United States. *OK!* was originally launched as a monthly in 1993 by Northern and Shell, and went weekly in 1996. In 2005, a U.S. version was launched. *Hello!* was launched in 1988 by Spanish publisher Eduardo Sanchez Junco. *Star* magazine is published by American Media, Inc. and was transformed from tabloid to glossy magazine in 2004. The content found in these magazines looks remarkably similar. Oftentimes, a week's issues of competing magazines will contain the same or very similar photographs and feature stories, almost as if these rival magazines' pages were interchangeable. The subjects of these celebrity magazines' stories and photographs are ordinarily stars' budding romances, break-ups, wardrobe choices, scuttles with rivals, outings with their children, multi-million dollar home purchases and sales, vacations, sightings on-location at movie shoots, arrests, and other heart-warming, tragic, and embarrassing moments. Articles in these magazines are usually no longer than two pages, and sometimes as short as a few paragraphs. The focus is as much on the photographs as it is on the text. Examples of these magazine features are *Us Weekly*'s "Just like us," which provides photographs of celebrities captured doing everyday things that the average person might do (such as riding bikes or getting coffee at Starbucks), "Who wore it best?," a side-by-side comparison of celebrities photographed in the same outfit, and "Red carpet style," another comparison of celebrity fashions worn at premiere events.

People magazine, a Time Inc. publication, started in 1974 as a spin-off from the "People" page in *Time* magazine and began as a human interest magazine, but by the 1990s it was largely focused on celebrity content. By 2007, it had an average circulation of over 3.6 million. *People* contains features such as "Star Tracks," brief updates on where celebrities have been seen out and about or en route to an event; "Style Watch," a feature similar to "Who wore it best?" and "Red carpet style"; and "Passages," a section containing brief updates on marriages, divorces, births, deaths, and legal matters of celebrities.

In addition to subscriptions, these half dozen titles are sold at newsstands for between three and five dollars. In a highly competitive marketplace, Bauer Publishing had offered *In Touch* and *Life & Style* to consumers for $1.99, a dollar less than competitor *Us Weekly,* which sold for $2.99 a copy, and two dollars less than *People* which sold for $3.99 a copy, until late 2007, when the price increased to match that of *Us Weekly*. Ninety-eight percent of copies sold each week of *In Touch* and *Life & Style* are purchased at the newsstand.

Through 2007, celebrity magazine titles continued to set the sales standard for the industry. Six titles—*People, Us, In Touch, Star, Life & Style* and *Ok!* (which represent 27 percent of industry sales revenue)—experienced a rise in unit sales and revenue gained. As of 2000, celebrity gossip was one of the fastest-growing sectors of the magazine world, but by 2008, celebrity gossip magazines suffered downturns. Publishers say that in economic downturns, magazines offer cheap luxury, but that conventional wisdom was not greatly evident in 2007–08.

Today's magazines bear some resemblance to the movie and radio fan magazines of the 1930s and 1940s. The rise of the fan magazine phenomenon coincided with the rise of the Hollywood star system but fan magazines were most widely distributed in the heydays of the studio system, that is, from 1920 to 1950. The first issue of the first magazine, *The Motion Picture Story Magazine,* came out in February 1911, and the most popular fan magazine, *Photoplay,* claimed in 1922 that it had about 2 million readers. These publications functioned often as the voice of the studios' public relations people, though they were not published by the studios' PR departments.

Like the celebrity magazines of today, an important part of the content of fan magazines of the 1930s through the 1950s were articles about the lives of the stars outside the studios and various gossip columns containing rumors and details about their private lives. Second, and almost as important, the magazines included extensively illustrated fashion articles, connecting films and filmstars with the female readers. Either the female stars posed in the dresses they had worn or were about to wear in their newest film, or they posed in their "private" wardrobe, thus illustrating the latest fashions. In addition to the glamorous photographs, the readers could obtain information on how to make the clothes themselves or where to buy patterns to sew dresses that looked like the ones worn by the stars—on and off screen.

Just like today's celebrity magazines, fan magazines of the 1930s through 1950s functioned as mediators between Hollywood and the cinema audience. They built up interest in advance for new films to be released and they helped maintain film fandom.

Paparazzi and Celebrity Photos

Celebrity and fan magazines fill their pages with photographs of celebrity subjects. The popular interest in celebrities that these magazines cater to and perpetuate has given rise to paparazzi. Paparazzi are photographers who chase celebrities, public figures, and their families for the opportunity to photograph them in candid moments. The term *paparazzi* was coined in 1961, from the Italian word (actually *paparazzo*), which was the surname of the freelance photographer in Federico Fellini's 1959 film *La Dolce Vita*. As cultures' interest in celebrity photos grows, so do the prices magazines will pay paparazzi for the photos, and the risks paparazzi will take to obtain them. In 2000, paparazzi infamously flew over the backyard wedding of Jennifer Aniston and Brad Pitt in helicopters in attempts to snap aerial photos of the nuptials, while wedding guests had been asked to sign "no photographs" contracts.

Sometimes, celebrities go to great lengths to evade the paparazzi. On occasion, to preempt the paparazzi frenzy that is expected upon a celebrity's major life event, such as a wedding or birth of a child, celebrities will enter into agreements of sale with celebrity magazines to provide them exclusive photographs of their private life events at enormous prices. Many ethical, legal, and privacy issues arise out of this business.

Legal Issues

When violations of exclusive photo or story deals between celebrities and fan magazines occur, or when celebrities believe a fan magazine is guilty of libel, lawsuits often result. Since celebrities are public figures, and magazines are usually able to provide a source for the claims made in their stories, allegations of libel are difficult to prove. In order for a celebrity's claim against a magazine to be successful, it must be proved that the publication acted with actual malice, that is, with knowledge that what it was publishing was false or with reckless disregard to whether it was false or not. The actual-malice standard does not require any ill will on the part of the defendant. Rather, it merely requires the defendant to be aware that the statement is false or very likely false. Reckless disregard is present if the plaintiff can show that the defendant had "serious doubts as to the truth of [the] publication." On occasion, celebrities and paparazzi have filed suits against each other for assault, endangerment, or trespassing.

Legally, in order to take a photo of a celebrity without his or her consent, paparazzi must get the celebrity out in public, away from a private residence or business. If the star is in a private area, the photo must be taken discreetly from a distance and with the photographer standing on public land. In more extreme cases, some paparazzi have taken photographs from rooftops or tree tops

using special camera lenses. They have shot private events from helicopters or boats. In some cases, if the event is in a private building, paparazzi have staged fire alarms or bomb threats to cause its evacuation, forcing their subjects onto the streets. In 2008, members of the paparazzi reported a fake fire at actress Maggie Gyllenhaal's apartment block—just so the new mom would come out into the street with her baby. These tactics are not legal, but with the lucrative nature of the business, legal expenses have become part of operating costs for paparazzi and media organizations that buy their images, and have contributed significantly to the high price tag on such photographs.

Specific anti-paparazzi legislation has been enacted in several countries. France has very strict anti-paparazzi legislation. In the United States, California passed anti-paparazzi legislation after the 1997 death of Princess Diana in a car crash in Paris, which many critics blamed on the extreme tactics used by French paparazzi. That event caused many governments to reexamine their paparazzi laws. The controversy surrounding anti-paparazzi legislation is the question of where to draw the line between legitimate news gathering and invasions of privacy.

Celebrities have used traditional legal protections in response to claims of abuse by the media. For example, in 1999, two photographers were convicted and received fines and jail times for following and blocking a car driven by Arnold Schwarzeneggar in which his wife and at least one of his children were passengers. A freelance journalist who taped a phone call from Nicole Kidman to her husband, actor Tom Cruise, and then sold it to a tabloid newspaper pleaded guilty to a federal wire-tapping charge and was sentenced to six months in a halfway house, fined, and ordered to do community service.

But after the death of Princess Diana in 1997, and as a result of lobbying by a coalition of celebrities, the Screen Actors Guild, and victims' rights groups, four separate anti-paparazzi bills were introduced into Congress in 1998. Although the federal bills died in Congress, the nation's first anti-paparazzi law went into effect in California on January 1, 1999, creating tort liability for "physical" and "constructive" invasions of privacy through photographing, videotaping, or recording a person engaging in a "personal or familial activity." Under the statute, a person may sue for "physical invasion of privacy" when three elements are met: first, a person has knowingly entered the property of another without permission; second, the entry was made with the "intent to capture any type of visual image, sound recording, or other physical impression" of another person engaging in a "personal or familial activity"; and third, the invasion was made "in a manner that is offensive to a reasonable person."

According to communications law attorney Randall Boese, the new legislation may not withstand constitutional scrutiny over time, and could lead to a chilling effect in photojournalism. In the meantime, "substantial litigation should be expected to sort out the hornet's nest of potential legal issues."

Conclusion

Celebrities are easily identifiable at events in their public and private lives, and thus become the targets of paparazzi chases and the subjects of water cooler conversation. The details of their professional and personal lives become the subjects of news. Their pictures and stories appear in the latest issues of celebrity and fan magazines, which in turn helps to perpetuate the larger celebrity culture. Within journalism, celebrity and fan magazines are often considered far less legitimate and prestigious than news and public affairs publications because they are produced for vicarious leisure enjoyment and consumption and employ different standards and tactics for information gathering, but they are a very profitable business. They may also serve to boost, maintain, or undermine the star status of the celebrities they cover.

Censorship

Censorship as defined in the United States refers to the government's prior restriction, limitation, or filtering of information or ideas in speech and various forms of mass media, such as newspapers and broadcasting and other electronic media, most recently including the Internet. Historically, censorship has been a valuable tool for repressive forms of totalitarian government that do not value or allow freedom of speech, expression, or religion, let alone free news media. Under such conditions, draconian censorship often follows a desire to control the public. For example, a government official or agency may have responsibility for reviewing and altering media content prior to publication. In the common law English tradition of making law through judicial decisions, as well as the United States constitutional First Amendment framework, freedom of expression typically begins with the ideal that there shall be no prior restraint on speech or press, but transgressions—such as defamation of character—may be subject to subsequent punishment. English jurist William Blackstone summarized the law in his *Commentaries on the Law of England* (1769), which received wide attention in colonial America.

Basic Concepts

Censorship is traditionally of two types. *Prior restraint*—the prevention of an idea being expressed—is the most typical, but *post-publication punishment* can have the same essential "chilling" effect on the free expression of ideas. Because of the wording of the First Amendment (1791) to the U.S. Constitution ("Congress shall make no law. . ."), in the American legal system censorship nearly always means *government,* not private, actions taken to limit expression.

The classic faith in a marketplace of ideas began with English poet and essayist John Milton's view in *Areopagitica* (1644), which favored a test of competing ideas: "Though all the winds of doctrine were let loose to play upon the earth, so Truth be in the field, we do injuriously by licensing and prohibiting to misdoubt her strength. Let her and Falsehood grapple; who ever knew Truth put to the worse in a free and open encounter?" In essence, Milton's theory is that an open marketplace of ideas, including false ones, favors a steady movement toward correction over time.

In this vein, Blackstone's *Commentaries* summarized common law precedent through cases of an opposition to prior restraints, which are considered government actions that hinder communication by stopping it before publication: "Every freeman has an undoubted right to lay what sentiments he pleases before the public . . . but if he publishes what is improper, mischievous, or illegal, he must take the consequences for his own temerity." The founding of the United States brought over time a series of legislative tendencies, particularly in time of war, toward enacting restrictions on free expression, mostly subsequent punishments

rather than prior restraints, and this was supported by decisions of various courts. Restriction of free expression also has been rationalized on the basis of morality under the guise of protection of communities from obscenity, which has no legal protection.

Modern First Amendment cases may be guided by any number of legal tests. A common law approach adopted by early-twentieth-century courts was to allow subsequent punishment of any speech that had a bad tendency. *Patterson v. Colorado* (1907), for example, upheld criminal libel laws that limited press attacks on government that might incite public disturbances. A few years later, the U.S. Supreme Court in *Schenck v. United States* (1919) offered what amounted to a "clear and present danger" test—one that suggested restricting only that speech that presented a serious and immediate danger to public safety. The Court also has attempted a "balancing" approach to, for example, weigh the rights of adults to access media against the need to protect children.

For those wishing to truly protect First Amendment rights, a strict scrutiny approach—one in which the burden falls to the government to show a compelling reason for the regulation—works best. Under such a test, "narrowly tailored" restrictions may be upheld, as in *Board of Trustees of State of N.Y. v. Fox* (1989).

The scrutiny approach was perhaps most helpfully defined in what has been labeled intermediate scrutiny in the *O'Brien* (1967) case. Scrutiny would require a court to ask four pivotal questions about any attempt to limit media news coverage:

1. Is the government regulation within its constitutional power?
2. Does the regulation further an important or substantial government interest?
3. Is the interest unrelated to the suppression of free expression?
4. Is the incidental restriction of free expression no greater than is essential to the furtherance of the stated government interest?

Use of this four-part test means that it is very difficult for the government to justify restricting speech. Therefore, a court could only uphold those government restrictions that are not targeted at stopping speech. For example, it would be legal to speak out against a war but not violate laws aimed at preventing obstruction of it. Further, any law under this analysis would need to be limited to its goals and no broader than needed to further them.

Censoring the Movies

For much of the twentieth century, for example, numerous states and communities employed censors to review movies before allowing them to be shown in a theatre. In *Times Film Corp. v. Chicago* (1961), the U.S. Supreme Court refused to overturn a municipal code that required submission of all motion pictures for review before public showing. The Chicago board during the late 1950s would not issue a permit for the film *Don Juan* without prior examination by censors. While motion pictures have long been included "within the free speech and free press guaranty of the First and Fourteenth Amendments," as stated in *Joseph Burstyn, Inc., v. Wilson* in 1952, the *Times Film Corp.* court ruled that "[i]t is not for this Court to limit the State in its selection of the remedy it deems most effective to cope with such a problem, absent, of course, a showing of unreasonable strictures on individual liberty resulting from its application in particular circumstances." The split decision left Chief Justice Earl Warren writing for four dissenters: "To me, this case clearly presents the question of our approval of unlimited censorship of motion pictures before exhibition through a system of administrative licensing." In *Freedman v. Maryland* (1965), the Court struck down state law requiring unconstitutional submission of films to a government review board before showing them. The film board era in many states ended soon after and was replaced in 1968 by a voluntary Motion Picture Association of America rating system. From this point forward, prosecutors used criminal obscenity laws to charge people selling or showing obscene media content.

Despite the First Amendment's stricture that "Congress shall make no law," the Supreme Court has never found freedom of speech to be absolute. The classic expression about prior restraint came in *Near v. Minnesota* (1931), when the Court upheld the common law conclusion of Blackstone that generally there shall be no prior restraints on

publication. However, the Court recognized what it termed "exceptional cases": the need to protect fighting forces when a nation is at war, "the primary requirements of decency" to restrict obscene publications, and "security of the community life" from "acts of violence" all allow for government intervention. Likewise, in *Chaplinsky v. New Hampshire* (1942), a statute was upheld that read, "No person shall address any offensive, derisive or annoying word to any other person who is lawfully in any street or other public place, nor call him by any offensive or derisive name, nor make any noise or exclamation in his presence and hearing with intent to deride, offend or annoy him, or to prevent him from pursuing his lawful business or occupation." The court concluded that "[t]here are certain well-defined and narrowly limited classes of speech, the prevention and punishment of which have never been thought to raise any Constitutional problem: These include the lewd and obscene, the profane, the libelous, and the insulting or 'fighting' words—those which by their very utterance inflict injury or tend to incite an immediate breach of the peace." Thus, near the Rochester City Hall, the case determined that it was unlawful to say the following offending words in the face of another: "You are a God damned racketeer" and "a damned Fascist and the whole government of Rochester are Fascists or agents of Fascists."

Journalism, Access, and Censorship

Censorship frequently is a problem for journalists attempting to aggressively report news. The watchdog model of press coverage may place reporters in an adversarial stance with their sources in government. State public record laws and the federal Freedom of Information Act (FOIA) provide journalists (and others) with mechanisms for seeking and obtaining the records vital to much investigative journalism. Typically, such laws establish a time frame and reasonable costs for copying documents. However, material that is classified for national security reasons, personnel records, and other internal agency working documents are among the several exceptions to public records laws.

News reporters also need access to public meetings in order to be the eyes and ears of the general public. Open meetings laws, sometimes called "sunshine laws," seek to keep public officials from conducting their business in secret. State public meetings laws generally require elected public officials conducting official business to vote and take other action in open meetings available to the public and press.

Reporters sometimes grant people who serve as sources of information a promise of confidentiality because public employees may lose their jobs for leaking information to the press. "Whistleblower" laws may protect those who disclose illegal, immoral, or inefficient government practices. At the same time, reporters in some states are protected by shield laws that grant at least a qualified right to protect news sources from court subpoena. At the federal level, bills in 2007–08 failed to receive approval that would protect reporters refusing to disclose a confidential source. Courts have concluded that reporter privilege, or a right to protect sources, is qualified and not absolute. In *Branzburg v. Hayes* (1972), the Supreme Court ruled that the First Amendment does not protect journalists from appearing before a grand jury to provide secret testimony. Some news reporters have gone to jail when refusing to break a promise of confidentiality to an anonymous source when asked to do so by a judge or grand jury. Judith Miller, as a reporter for *The New York Times,* spent more than 80 days in jail in 2005 for refusing to disclose a source. Law enforcement, too, may seek to compel journalists to provide information during the course of a criminal investigation. In 2006–07, for example, blogger Joshua Wolf spent a record 226 days jailed for refusing to give a federal grand jury in California videotapes he had recorded during a demonstration in 2005 in San Francisco.

Another area of concern is the courtroom. The right of a free press (the First Amendment) must be balanced against the right of a defendant to have a "speedy and public" trial (Sixth Amendment). Judges have sought to close courtrooms or issue gag orders to silence the press during the pretrial phase of a sensational case. However, the Supreme Court spoke plainly in the *Nebraska Press Assn. v. Stuart* (1976) case: "A prior restraint . . . has an immediate and irreversible sanction. If it can be said that a threat of criminal or civil sanctions after publication 'chills' speech, prior restraint 'freezes' it at least for the time."

While most state and local courtrooms in America are now open to both broadcast and print journalists, broadcasters are barred from using audio and video equipment in federal court. Laws vary from state to state, and they frequently allow a trial court judge to decide whether or not broadcasting will be disruptive to the fair administration of justice.

Broadcasting and Scarcity

In broadcasting, stations are licensed by the Federal Communications Commission (FCC) to serve in what the 1934 Communications Act calls "the public interest, convenience or necessity." To the extent that common law cases eventually shunned the notion of licensing (e.g., printers in England), broadcast regulation was a departure from the principle that licensing can be viewed as a mechanism of censorship and a vehicle for enforcing prior restraints. Section 326 prohibits censorship of broadcasters, but the licensing process may be seen as a restriction.

In *NBC v. United States* (1943), the Supreme Court treated broadcasting as a medium that uses the scarce spectrum resource as having a fiduciary responsibility to serve the public interest:

> The licensee has the duty of determining what programs shall be broadcast over his station's facilities, and cannot lawfully delegate this duty or transfer the control of his station directly to the network or indirectly to an advertising agency. He cannot lawfully bind himself to accept programs in every case . . . The licensee is obliged to reserve to himself the final decision as to what programs will best serve the public interest. We conclude that a licensee is not fulfilling his obligations to operate in the public interest, and is not operating in accordance with the express requirements of the Communications Act, if he agrees to accept programs on any basis other than his own reasonable decision that the programs are satisfactory.

The scarcity rationale persisted. In *Red Lion v. FCC* (1969), the Supreme Court built upon *NBC* and effectively limited broadcast speech to those with a license to serve public interest:

> Because of the scarcity of radio frequencies, the Government is permitted to put restraints on licensees in favor of others whose views should be expressed on this unique medium. But the people as a whole retain their interest in free speech by radio and their collective right to have the medium function consistently with the ends and purposes of the First Amendment. It is the right of the viewers and listeners, not the right of the broadcasters, which is paramount.

Despite the fact that broadcasting became a primary vehicle for otherwise-protected political speech, (1) those broadcasting without a license could be prosecuted as "pirates," and (2) licensees were obligated to follow FCC rules and regulations.

Broadcasters argued in the 1960s that they had been relegated to second-class status with respect to First Amendment protections. The Radio-Television News Directors Association consistently argued that the chilling effect of, for example, requiring program balance through the Fairness Doctrine was in effective prior restraint. The doctrine required broadcasters to (1) air coverage of controversial issues of public importance; and (2) offer significant contrasting viewpoints of these issues. Eventually, the courts concluded that the doctrine had been developed by the FCC in 1949, and even though Congress (though not the president) supported retaining it, the FCC had the legal authority to discontinue it in 1987. Congress twice attempted to reinstate it, but both times President Ronald Reagan and then President George H. W. Bush refused to sign legislation. The change opened radio airwaves to strident political (largely right-wing) advocates, such as Rush Limbaugh. Balance was replaced by advocacy, as the radio marketplace sold swaths of time for those willing to pay to present their views. Despite this, broadcasting remained a licensed medium.

Obscenity and Indecency

While journalism only rarely approaches questions of obscene or indecent content, it does happen. In the *Miller v. California* (1973) case, the Court's decision offered a three-part test to identify obscenity (which is unprotected by the First Amendment) from indecency (which is): (1) whether the average

person, applying contemporary community standards, would find the work, taken as a whole, appeals to prurient interests; (2) whether the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by applicable state law; and (3) whether the work, taken as a whole, lacks serious literary, artistic, political, or scientific value. A positive finding on all three points defines the obscene. It falls to juries to decide whether the material appeals to "prurient interests" based upon community standards. Patent offensiveness is a question of specific state law. *Miller* affords protection to sexually oriented material if it has some degree of serious value. Print media have been granted greater freedom to publish sexual content, as they are easiest to keep from children through local zoning regulation.

Within obscenity law, child pornography is a special class. *New York v. Ferber* (1982) provided a compelling government interest in protecting minors from any form of exploitation. Nevertheless, *Ashcroft v. Free Speech Coalition* (2002) rejected the Child Pornography Prevention Act of 1996 as an unconstitutional burden on free speech.

One of the clearest divisions between speech limited on broadcast channels and that allowed on subscription services (such as cable or DBS channels) and the Internet is indecent material, which the FCC and Congress have agreed to restrict to a "safe harbor" defined as the hours of 10 p.m. to 6 a.m. on radio and television stations.

In *FCC v. Pacifica Foundation* (1978), the Supreme Court upheld the FCC's enforcement of 18 U.S.C. 1464, which prohibits indecency over the air. When a New York City radio station aired comedian George Carlin's monologue that included "seven words one could not say on television," the FCC took note of the violation of its rules. The Carlin monologue, which was reproduced in the appendix of the case, expressed the forbidden words multiple times.

On appeal, the Supreme Court agreed with the FCC that censoring indecency from the air did not run afoul of First Amendment guarantees, as such speech was allowed during late night hours when a child was less likely to be listening. Nevertheless, Justice William Brennan, one of four dissenters in the case and a First Amendment purist, found such FCC regulation to have crossed the line into unconstitutional government censorship of speech.

Justice Brennan accurately predicted the battle lines drawn over the next three decades, as the FCC later challenged some broadcast "shock jock" programming, such as that of Howard Stern and "Bubba the Love Sponge," both of whom would be eventually removed from broadcasting and shifted to subscription satellite radio, which is far less regulated. Eventually, the FCC extended its regulatory sweep to punish "fleeting expletives"—profanity blurted during a live broadcast (though a federal appeals court forced a review by the Supreme Court). Much of the FCC attention to such programs, in the view of many analysts, appeared to be driven by socially conservative activist mass letter and email campaigns that put pressure on the agency to "clean up" the airwaves.

The FCC has long restricted indecent speech to a late evening hours "safe harbor" when children are less likely to be present in the audience. Broadcast indecency, which blurs the definition between indecent and obscene, is defined (as upheld in the *Pacifica* case) as sexual or excretory activities or organs in material that panders or titillates without broader social or political value. Whether something is indecent or obscene is determined by context, however, thus making each situation unique.

The FCC applies a national contemporary community standard for the broadcast medium. Generally, cable and satellite services have been held by the courts to be largely free from indecency regulation and thus have more program freedom than their broadcast brethren because people must choose to subscribe to and pay for the service.

As it had before (with film and then video tape), technology intervened. The Internet offered a global distribution, network for media content determined to be obscene under the law to become the first profitable online industry—pornography. In the absence of international obscenity laws, national laws are designed to curb or prohibit the production, distribution, and sale of sexual materials. Current enforcement typically includes attempts to identify sexual predators in the online environment and prosecute them. For example, the U.S. Justice Department in 2006 sought but failed to obtain a judicial order against the search engine Google to turn over records on millions of users' searches as part of a government effort to uphold online obscenity law.

Political Speech

Political speech is at the core meaning of the First Amendment. The theory is that a society needs a free exchange of ideas and an unfettered press in order to make good political decisions elect the best representatives and allow democracy to function. Therefore, political speech has the highest level of protection under American law. In recent years, courts have granted broadening commercial speech (advertising) rights, but these are far less sweeping than judicial deference given to any speech found to have political value. In this context, courts apply a strict scrutiny test to governmental restriction targeted at speech. The burden in these cases falls to government to provide justification for limiting free expression. Even where there is a compelling government interest, such attacks on free speech must be supported as necessary, and they must be narrowly tailored to advance the interest. Even here, government may not exercise unconstitutional actions. However, restrictions that are found to be content neutral (i.e., not targeted at specific political messages) may find sympathy from the courts.

Repeatedly, American courts have protected political speech as central to democratic freedom and self-government. Legal theorist Thomas Emerson (1970) offered the strongest theoretical arguments for defending a robust set of First Amendment rights: free speech allows for discovery of truth needed for democratic decisions by serving as a check on excessive government power; free speech increases political stability by offering a safety valve to relieve pressure that builds in a society; and it promotes slower and less traumatic social change. Emerson's summary concludes that free speech allows for the fulfillment of individual enrichment, encouragement of the human spirit, and a greater understanding of humanity. In practice, government today is less engaged in playing the role of censor than are global media corporations, which do so through self-censorship within the context of program decision-making.

The American Library Association (ALA) links censorship to the degree of intellectual freedom in a society. ALA views censorship of all forms of "expressive materials," such as books, videos, or other art, as taking place when these are "removed or kept from public access." Censorship typically begins with an individual, group, or organization raising public concerns about specific media content. These complaints tend to be made to government officials. Often, the objectionable content has a literary or artistic nature. The National Coalition Against Censorship (NCAC) aligns dozens of groups seeking to "educate our own members and the public at large about the dangers of censorship and how to oppose them."

Libel as Censorship

In *New York Times Co. v. Sullivan* (1964), the court made a landmark decision protecting the media's right to criticize the performance of public officials by requiring any such person to prove "actual malice" on the part of media in the publication of a negative report about that official. Failing this high bar, negative media comment stands and is protected. In the case, the context of a 1960 advertisement protesting the treatment of civil rights activists was found not to libel an Alabama public safety official who had brought a suit for libel:

> Thus, we consider this case against the background of a profound national commitment to the principle that debate on public issues should be uninhibited, robust, and wide-open, and that it may well include vehement, caustic, and sometimes unpleasantly sharp attacks on government and public officials.

The *Sullivan* court went so far as to quote James Madison from *Elliot's Debates on the Federal Constitution 4* (1876): "Some degree of abuse is inseparable from the proper use of every thing, and in no instance is this more true than in that of the press."

In the Internet age, the Telecommunications Act of 1996 and the *Reno v. ACLU* (1997) case have been used to protect Internet service providers (ISPs) as well as websites by treating them as publishers. In *Zeran v. America Online* (1997) a federal court limited liability in a libel case. In *Blumenthal v. Drudge* (1998) America Online was protected against a separate libel suit brought by a former aide of President Bill Clinton (1993–2001) against the online gossip website the Drudge Report.

Censorship of media messages has been a constant ever since the freedom to publish and speak began broadening several hundred years ago with case law in England through common law evolution and was carried to the colonies and ultimately enshrined in the First Amendment. The Internet is perhaps the most revolutionary development since the invention of the printing press to empower people, especially those outside elite centers of political and economic power, to use free speech and press as a challenge to the status quo. Thus, government censorship activities may be predicted to extend beyond the press to average citizens disseminating media content.

Central America and the Caribbean

The seven countries of Central America and the many more (often tiny) island nations in the Caribbean region demonstrate news media systems that are more alike than different. Most of them rely on commercial advertising (as well as publication of government information) for their financial support. The ownership of many newspapers and some broadcast outlets is closely allied with the moneyed business elites of each country.

Central America

Several of the nations between Mexico on the north and Colombia to the south were the scene of considerable civil war violence in the 1980s and early 1990s. Their media employees suffered accordingly and violence against reporters rose to dangerous levels for years. So did attempts by government to control what news media provided to their audiences.

Media in Central America generally share several characteristics. While most of the countries' constitutions call for freedom of the press, practice in fact varies widely. The defining media factor in all of Central America is politics even though the vast majority of both print and broadcast media outlets are privately owned. Newspapers are often closely allied with one political faction or another. In some countries, the government controls a radio or television station, one that usually operates in parallel with commercial competitors. Virtually all media depend on advertising, including the paid placement of government notices, the latter providing governments with considerable persuasive power over media operations.

Being a journalist in the region can be a dangerous profession, as attacks on and even killing of journalists, while less prevalent than in the 1980s and 1990s, continue. Furthermore, journalists are nearly always poorly paid, which can lead to corruption as they seek income from other sources. Some countries require journalists to be registered with the national journalist's organizations, and sometimes to hold a journalism degree and some years of experience (though these rules are seldom enforced).

Radio is by far the most important news medium in the region as it is readily accessible—especially useful when literacy levels are low—and can be tuned with widely available and inexpensive receivers. Television is on the rise as an important news medium. The Internet is available at least in the capital city of each country and is rarely controlled by the government, partially because penetration rates remain relatively low.

Belize

Once the colony of British Honduras, this small coastal nation of a quarter-million people became independent in 1981. There are no daily English-language newspapers (though there are several weeklies), and eight television and 33 radio stations operating commercially. Much of the press is closely identified with political parties. The largely English-speaking country generally enjoys news media freedom and that extends to the Internet.

Costa Rica

The first press began operating as early as 1641, though the first newspaper did not appear until 1829, eight years after independence. A tradition of small land owners rather than huge plantations is one reason social groups have interacted more peacefully here than elsewhere in the region. Thanks to the resulting political tradition of compromise and discussion, news media freedom has enjoyed a long history here, the first such law dating to 1835.

The country of nearly 4 million people enjoys one of the most open media systems in the region, including a half dozen tabloid-format dailies. The country's oldest newspaper, *La Prensa Libre,* dates to 1889 and has avoided strong party ties or extreme views. The conservative *La Nación* is the most popular paper, with a circulation of better than 110,000. But illiteracy and poverty still limit newspaper development. Six television stations and more than 100 radio outlets share a fairly rich advertising market and radio is the vital news medium for the nation, with television gaining fast. Most modern media are based in the capital of San Jose and their ownership is concentrated—and generally politically conservative.

El Salvador

Coffee exports are the economic basis of this troubled and sometimes violent country. During the nineteenth and twentieth centuries, a tightly knit oligarchy controlled the business, worked with a series of military governments, and did not support a free press that might threaten their dominance. The handful of newspapers were little more than the propagandistic voice of the military regime of the moment or the coffee oligarchs' conservative party. In part to limit government censorship, most news was limited to social or commercial stories. Things began to change in the 1980s during the civil war (1979–91). Newspapers are now generally free to report, though conservative self-censorship still applies to both print and broadcast media.

This nation of 6.3 million now has five newspapers (the major ones still conservative in tone) and eight television stations (two government operated that offer educational programs). Radio is the primary news medium; there are about 170 AM and FM radio outlets (only one is government operated). Indeed, radio is often aggressive in its reporting. This was especially true of the underground radio stations that operated during the civil war and then became licensed operations in the 1990s. Probably 70 percent of the population obtain their news from radio.

Guatemala

The first newspaper appeared here in 1729 (it was only the second newspaper in the Western Hemisphere). It was closely tied to the political and Catholic leadership of the Spanish colonial regime. The country achieved independence in 1821 but the handful of newspapers remained a

service by and for the country's small economic elite. Now the oldest surviving paper in all of Central America, *Diario de America Central* first appeared in 1880. *La Hora* is the oldest one still publishing. More appeared in the relatively open political regime of the 1940s, only to be stifled under repression a decade later.

Now the most populous nation in the region with 13 million, and one whose bitter guerilla war ended in 1996, Guatemala has seven active Spanish-language dailies appealing largely to the commercial and political elites of the nation, though perhaps 40 percent of the population is Mayan and does not speak the official language. *Prensa Libre* has the largest circulation (about 120,000). There are 26 television stations (which are steadily increasing their share of the advertising revenue pie) and no less than 630 radio outlets (many are merely repeater transmitters), though only a few of the latter cater to the large Mayan minority, in part because frequencies were auctioned to the highest bidder. Government control of broadcast media (especially television) is tighter than that of the printed press. Internet use is expanding and the newspapers all have a web presence.

Honduras

For much of the twentieth century, the Honduras's American United Fruit Company was a dominant business and political power, the latter based on providing some 90 percent of all tax revenues in the 1950s. Military juntas came and went.

The country's 6.5 million people are served by nine dailies (with small circulations due to poverty and illiteracy), six television stations, and five radio services (with some 300 stations), one of them government-operated. Most media are centered in Tegucigalpa. As in neighboring nations, media are largely privately owned and conservative, allied closely with business elites and political parties. While there is considerable press freedom on paper—in the constitution and resulting laws–freedom is often curtailed in practice. There is a tradition of bribery in journalism here and the government can punish transgressing media by withholding publication of official information. Investigative reporting is not common though when it appears, it is usually about noncontroversial topics.

Nicaragua

For four decades (1920s to 1960s) the country was dominated by the Somoza family (which took over after two decades of American military occupation), which dominated the National Guard, followed by years of mismanagement under the Sandanista regime. With a population of over 5 million, Nicaragua enjoys the largest geographic area in Central America, but the considerable political unrest and civil war makes it the poorest save for Haiti.

Newspapers, three of them dailies, are heavily political, controlled by largely conservative owners. Their circulations are small given the high degree of illiteracy, but they speak for the cultural and political elites. There are ten television stations (the first aired in 1955), but only two VHF channels are important as the remainder on UHF have only small audiences. All are based in Managua. Given the medium's 70 percent penetration, television is close to becoming the primary news source. The nearly 140 radio outlets, many organized into networks, and some of them religious broadcasters, are more evenly spread about the country. But there are too many for the limited (and shrinking) amount of advertising they must share. Government advertising is a prime source of financial support for all media—and can be withheld to punish media with whom the resident government is not pleased. There has been some debate, primarily within the country's legislature, about a law to require all journalists to register, as well as journalist concern about low rates of pay.

Panama

With American support (because the United States wanted to build a canal across the isthmus), Panama broke away from Colombia in 1902. After years of American effort, the Panama Canal opened on the eve of World War I (1914) operated by the United States, which retained control of the Canal Zone until 1999. English newspapers served the colonial population. The "twenty families," the wealthy oligarchs that control the economic and social—and thus political—life of the country, formed a conservative oligarchy that, though often polarized, controlled the rest of the country through years of military dictatorships, coups, and counter-coups, all reflected to some degree in the country's media.

Today, Panama's nearly 3 million people depend heavily on the busy (and expanding) Canal for national revenues. Six daily papers are based in Panama City. *La Prensa* is the most important and for many years it enjoyed a diversified ownership. The state owns one television station, but the rest (more than 30) are in private hands. This includes all radio outlets, which, due to limited advertising, have dropped by half to something over 100. While radio is the most important news medium here as elsewhere in the region, television penetration exceeds 70 percent and is more important than elsewhere. Despite laws suggesting press freedom, "gag" orders are a common way for government to stifle its critics. Libel laws are another, though prosecutions are often settled with fines rather than imprisonment.

Caribbean Area

Media across the Caribbean area are more varied than those of Central America, in part because of varied colonial heritage. There are countries with strong Spanish, French (in one case Dutch), or English backgrounds, and language and media often reflect that. Economic conditions vary just as widely, with some nations building on a rising tourist or off-shore banking trade, while others remain mired in poverty. Cuba is an exception to most generalizations due to its long dominance by the Castro regime.

Bahamas

A former British colony, this country made up of 700 islands not far off the Florida coast has a population of over 300,000. Tourism (especially from visiting cruise ships) and offshore banking keep the economy humming and help support a vibrant media scene. Two major daily newspapers publish in Nassau and there are several smaller daily or weekly papers. There is but one television station and six radio outlets. The television station is run by the government broadcast service, which also has a radio channel—other media are privately owned. There is some tension between government politicians and the media, but little overt harassment of the latter by the former.

Cuba

Cuba's first newspaper was published in 1782. When the longtime Spanish colony achieved independence in 1902 (aided considerably by the Spanish-American War of 1898, which had been pushed, in turn, by the journalistic sensationalism of American publishers Hearst and Pulitzer), the press began to prosper and Havana was soon home to about a dozen freewheeling dailies. The first radio station aired in October 1922, and the first television station in October 1950 (only the third one in all of Latin America, after stations in Mexico and Brazil). Eventually more than 150 radio stations and nearly 30 television channels—virtually all privately owned—operated under various political regimes that were built on an economy of sugar plantations and American tourism. Cuban media were heavily modeled on those of the United States, and thus were entertainment-based and sought the largest possible audiences to serve their advertiser supporters.

When Fidel Castro's long rebellion proved successful at the start of 1959, however, it marked a dramatic turning point, the beginning of an era of close government control of both press and broadcast news media. Press harassment began within months of the Castro takeover, and within a year or so, all of the once private media had been taken over by the state. For the next several decades, Cuban media operated under tight government control—a situation that extended into the early twenty-first century.

Three dailies serve the entire island, one of them, *Granma,* the official Communist Party paper founded in 1965, with a circulation approaching 700,000. It is by far the largest newspaper in the Central America/Caribbean area and is also available in several languages on the Internet. Government funding underwrites its cost and that of most other Cuban media. Attempts at creating independent newspapers have been either closely controlled or harshly repressed. Control is as tight of the five national radio services and more than 220 regional radio stations, and about a dozen television outlets. There are few specific laws or regulations of media control.

Cuba has also been the target of extensive propaganda efforts from the United States, some sponsored by the large Cuban exile population in

Miami, and others by the American government. Radio Martí and a later television service have since the 1980s sought to penetrate Cuban media control with news and entertainment, American style, with only minimal success due to Cuban jamming of their signals. Partially in response to these unwanted radio interlopers, the Cuban regime raised the power of many of its domestic stations to cause interference with American commercial stations. This "radio war" has now gone on for over 30 years.

Dominican Republic

Sharing the larger part of the island with Haiti, this former Spanish colony has a population of about 8.7 million. Five national dailies circulate from Santo Domingo. There is a government-run radio-television service plus an additional 300 radio and some 40 television stations, many quite small and regional in their appeal. While there are laws ensuring press freedom, violence against journalists took an upswing in the 2000s, limiting their flexibility.

Haiti

One of the poorest nations in the Western Hemisphere, this is a former French colony with a strong African cultural background based on slaves imported in the eighteenth and early nineteenth centuries. The country of 7 million has a long tradition of either government control or harassment of print and broadcast journalists, though attacks on reporters seemed to diminish in the latter part of the first decade of the twenty-first century. Six newspapers appear several days a week, all owned privately. There is a government television channel plus several privately owned outlets as well. Nearly 70 radio stations serve the country and with the television stations are the primary news media in a nation with substantial illiteracy.

Jamaica

Another former British colony, and now a nation of just under 3 million people, Jamaica enjoys substantial news media freedom. There are three national daily papers plus several local publications. Radio service began only early in World War II. A private company took over its operation in 1950, operating with revenue from commercial time sales. In 1953, Radio Jamaica became the first British Commonwealth country to broadcast regularly in FM radio. The government's broadcast service (Jamaican Broadcasting Corporation) was sold to private interests in 1997, though another was being formed (largely to present educational and cultural programming) a decade later. There are seven television and some 25 radio stations on the island.

Puerto Rico

The earliest newspaper on the island appeared in 1806 and appeared biweekly under the control of the Spanish governor. Many more appeared during the rest of the century, experiencing various degrees of colonial control. Now a commonwealth that has belonged to the United States for more than a century, the island of 4 million people is home to numerous Spanish- and English-language newspapers, but titles come and go. The first radio station aired in 1922 and television followed in 1954. There are more than 20 stations on the air, all regulated by the American Federal Communications Commission.

Chat Rooms

Chat rooms are an important means by which news audiences communicate online with journalists and other news producers. Chat rooms have proven to be an important source of information for breaking news and personal accounts related to sensitive topics. However, the use of chat rooms as journalistic sources can raise ethical questions related to privacy and anonymity.

Chat room is a term that generally describes an online discussion between two or more people in real time, which is called a synchronous environment. The discussion can take place via text alone, the most typical form of chat but also by voice. Some chat rooms incorporate video along with audio and text so users can see and hear each other. However, such chat rooms are far less popular than text-based chat and are typically used in specialized situations, such as business teleconferencing. Virtual worlds or immersive environments have elements of chat rooms because they are typically synchronous and text- or voice-based, although these virtual environments are often thought of as separate online experiences.

The synchronous aspect distinguishes chat rooms from many other online outlets for discourse, such as websites, discussion boards, and blogs, all of which are typically asynchronous. This synchronous nature of chat rooms tends to appeal to fewer users than asynchronous uses of the Internet because more people can readily read material in the days and weeks after it is posted. Even in chat rooms where conversations are archived (or "logged"), the number of users is usually smaller than discussion groups or blogs on similar topics. The definition of chat rooms has been expanded to include forms of instant messaging, which is also synchronous and can include more than one person, depending on the messaging software. The use of instant messaging has grown rapidly and is especially popular among teenagers and college students. A distinction can be drawn between instant messaging and chat rooms because of the directed nature of most instant messages, which are addressed to a specific and known receiver, whereas most chat rooms are open to a community of users.

Development

Chat rooms were one of the earlier uses of Internet technology because of the low bandwidth required to transmit text and the simplicity of the necessary software. Chat rooms using text-based interfaces were initially used in the early 1980s. With the introduction of graphical Internet browsers in the early 1990s, chat rooms became more easily available because the browser could open the chat window.

Chat rooms have been established for nearly any group one can imagine, usually people within an identifiable community, such as hobbyists, those within a particular geographical area or with similar political beliefs. Chat rooms have become valuable sources of entertainment and information for people looking for sports, health, or technical information. Users can play a variety of games, and chat rooms that focus on sexual content are very popular.

On some websites, the availability of chat rooms and archived chat room content is a major attraction. Chat rooms have been important to the development and financial survival of Internet service and content providers such as America Online, which rely on the attraction of the user-generated content of chat rooms to attract other users.

The Pew Internet & American Life Project reported that chat room usage as a percentage of adult Internet users peaked about 2000 when just over a quarter of adult Internet users reported they had used a chat room. Since that time the percentage of users has declined. This probably reflects greater usage of other online means of communication, such as instant messaging and blogs. Nonetheless, there remains a regular audience of chat room users within the context of specific websites and communities. The emergence of virtual environments offers a new version of chat rooms in a three-dimensional environment that typically utilizes avatars, which represent and are controlled by users. (An avatar is a graphical representation of a user, such as a three-dimensional cartoon figure.) These environments include online multiplayer games such as Everquest and World of Warcraft and immersive virtual worlds such as Second Life and There.com.

Chat Rooms and the Media

Traditional media outlets were slow to adopt many innovations in new communication technology, including interactive website features, blogs, and chat rooms. Even in the twenty-first century, few traditional media outlets use chat rooms online. Discussion forums and blogs (which are asynchronous) were more popular choices for the websites developed by traditional media. However, several websites operated by traditional media offer regular online chat forums where newsmakers or journalists answer questions from readers. These chats are nearly always moderated with a time limit and have been called "virtual auditoriums" rather than chat rooms. The content varies from the typical chat room because it is almost never a consistent back-and-forth between those engaged in the discussion but a more strictly controlled question-and-answer format. Nonetheless, these online chat forums have proven popular for several news media outlets (e.g., the website of *The Washington Post*).

Chat rooms have been an important outlet for information and discussion in early, breaking coverage of news events, despite the difficulty of positively identifying sources speaking in chat rooms or verifying the truthfulness of their information. Several observers have noted the heavy traffic in chat rooms and on chat room websites in the aftermath of major media events, such as the launching of the first Gulf War in 1990 or the September 11, 2001, terrorist attacks. Several scholars have pointed to the social reasons for these public discussions during times of stress, and journalists have used such occasions to observe and report on public sentiment.

Chat Rooms and Journalism

Chat rooms have been influential in the routines of news coverage and the relationships between journalists and news sources. Journalists sometimes use the unfiltered conversation of chat rooms as windows into the lives of others. A chat room can offer insights on a community of people and their everyday lives and ideas. Some journalists also use chat room postings as sources for story ideas or as a means to solicit feedback.

Chat rooms have also influenced the relationship between journalists and news consumers. Chat rooms provide a means for media audiences to communicate with news producers via new communication technology (along with blogs, e-mail, and discussion boards). These new means of audience feedback have altered the traditional one-way flow of communication in the mass media from the producer to the consumers. This one-way flow is also sometimes called the broadcast model. Chat rooms promote communication in the reverse direction from the consumer to the producer. For media outlets that have made significant commitments to new communication technology and to promoting its use, the relationship between consumer and producer has become more of a dialogue and less of a one-way broadcast of information and opinion. In some cases, the news consumers have become content providers by offering additional information to supplement news accounts via chat rooms.

Ethics

The use of chat rooms by journalists to gather information for news gathering has prompted ethical concerns, most of which relate to the privacy expectations of chat room participants and the obligations of journalists to identify themselves to others. Journalists continue to wrestle with these questions. Many chat room participants have expectations of nearly complete privacy despite the often anonymous and open nature of the chat room (where anyone is able to log on and enter), and chat room users respond angrily when journalists or researchers observe without identifying themselves.

Despite these new challenges, media gatekeepers maintain that ethical standards remain the same regardless of the medium in which information is gathered or published, although they agree that the immediacy of new communication technology has posed problems. Many argue it has eroded the standards of verification that can be more easily upheld when news gatherers have more time to verify information before publishing.

A journalist who enters a chat room and reports on the tenor of a conversation appears to be working within accepted ethical guidelines, but this behavior is considered less acceptable if the journalist identifies chat room participants or if the chat room topic is sensitive in nature. It is also

typically considered unethical if journalists misrepresent themselves. Despite prohibitions many news media have against using unnamed or unknown sources in published news accounts, numerous examples of unnamed chat room sources can be found in the news media.

Checkbook Journalism

The practice of paying sources for information—known as checkbook journalism—is something that journalists in mainstream news media in the United States generally consider to be unethical. In fact, many news organizations, including *The New York Times* and the *Los Angeles Times,* specifically forbid this practice in their ethics codes. On the other hand, many tabloid publications regularly pay for news.

Mainstream media have derided the practice for decades. In 1962, *Time* magazine took the British press to task for its coverage of a case involving James Hanratty, accused of killing two people two decades earlier. In the *Time* story—which cited accounts from a variety of participants and witnesses, the magazine concludes:

> These gaudy journalistic outbursts had one thing in common: all of the stories were bought and paid for by Britain's popular press. Even Hanratty himself optioned his story to the *Express*—which was shrewdly holding off a while, perhaps until Hanratty's date with the gallows. The prices that Fleet Street paid for its stories were not too high; the *Express,* for example, managed to sew up its principals for some $8,000.

The problem, as *Time* argued, is that sources whose information is being bought "face an irresistible impulse to embroider the truth for the sake of tomorrow's headlines." And others who work in the media worry that paying for information puts the credibility of both that information and the news organization at stake.

But as much as it is considered poor practice, checkbook journalism has a long history and it does not appear to be going away. As early as 1912, *The New York Times* paid a wireless operator on the *Titanic* $1,000 for his story, and *Life* magazine paid the seven *Mercury* astronauts for their stories in the early 1960s. Despite the nickname, payment doesn't always take the form of a check. Hearst newspapers paid the legal bills for Bruno Hauptmann, the man found guilty in 1935 of kidnapping Charles Lindbergh Jr. (the "Lindbergh baby"), to get scoops during the trial. More recently, ABC gave pop singer Michael Jackson a series of free ads for his new album, *HIStory,* worth $1 million in 1995 in the same week that the network interviewed Jackson and his wife at the time, Lisa Marie Presley, on *Prime Time Live*.

In notable and more recent cases:

> In 1969, NBC paid $17,500 for an interview with Sirhan Sirhan, the man who killed Robert Kennedy after the 1968 California primary. *Esquire* paid $20,000 to Lt. William Calley for his cooperation in a series of three articles on the My Lai massacre in Vietnam, which took place on March 16, 1968.

CBS News paid $25,000 to former Nixon chief of staff H. R. Haldeman for an interview about the Watergate scandal that aired in 1975.

Nathan Dykeman, a friend of one of the student gunmen who killed 13 people and wounded 23 others at Columbine High School in Colorado, was paid $10,000 by *The National Enquirer* for home videos and other materials about the killers. He was paid another $16,000 by ABC News for access to the materials and for an exclusive interview on *Good Morning America*.

Hustler publisher Larry Flynt took out an ad in *The Washington Post* in 2007 offering people $1 million for evidence of an illicit relationship with high-ranking elected or appointed officials in Washington, D.C. Former House Speaker-Designate Bob Livingston (R-LA) and Georgia Republican Representative Bob Barr were caught up in the fallout.

Even if mainstream news media are not writing checks or paying the bills, they are mining the tabloids for stories. Reporters turned out in full force in January 1992 for a press conference by Gennifer Flowers organized by *The Star,* the tabloid that reportedly paid her $150,000 for the story of her affair with presidential candidate Bill Clinton.

Among those most often in the media spotlight, the idea of being paid for access to their stories seems to be gaining hold. And the publications that make their profits from relating celebrity lives—*People, Us Weekly, OK!*—don't seem to mind. The story of Jamie Lynn Spears' pregnancy was sold to *OK!* for $1 million, according to a story in *The New York Times*. But that's small change compared to the reported $4.1 million that *People* paid to Brad Pitt and Angelina Jolie for family photos with their newborn daughter, Shiloh, in 2006, or the roughly $6 million the same magazine paid to Jennifer Lopez and Marc Anthony for pictures of their twins, which ran on the cover in March 2008.

Checkbook Journalism in Other Countries

The practice of checkbook journalism is common among the British tabloids, and bidding wars over major news stories have also occurred in New Zealand and Israel. The fall of the Soviet Union in 1990 ushered in "pay for play" journalism in Russia, with city officials asking foreign journalists for cash upfront for access to news sources and news sites. Karen Dukess, in a 1991 article in *Columbia Journalism Review,* wrote that the Moscow police department was charging foreign journalists up to $1,000 a day to film any police work and that footage filmed by the department would cost news organizations $200 a minute.

Police officials defended the practice by saying that they were getting a large number of requests from journalists to film and that the money was being used to buy technical equipment for the department.

The Issues

There are several justifications offered by those who practice checkbook journalism. If news is a commodity, then why shouldn't the people who are the sources for information benefit from what others want? As Louise Mengelkoch argues in *Columbia Journalism Review,* "for the powerless in our culture who knowingly open themselves up to very personal stories that should be told—that have a real message for the public—it seems only fair that they should be compensated for their willingness to go public." Practitioners also cite the increasingly competitive media marketplace and say that if publications like the *National Enquirer* and *People* are willing to pay for information and exclusive photos, sources will start to expect payment from other news media organizations.

Critics, on the other hand have a very different perspective on the issue, saying the problem is that sources may be tempted to embellish their stories to please the news organization or to make more money. Paying sources also can lead to problems with how the public perceives the news, media ethics experts have said. Interviews that come as the result of checkbook journalism lead readers and viewers to think that the information is tainted by the payment, so they find the information to be less credible.

Not only is the information tainted, but some critics argue that the credibility of the news organization and the profession suffers when mainstream news organizations pay for news. In other words it is better to walk away from a story than to pay for it. If news organizations do start to pay for stories, then news will go to the highest bidder,

which will hurt smaller news organizations and only further commodify news itself.

Chicago

Chicago has a longstanding reputation for wildly competitive journalism. The city also had a role to play in the early days of radio and television journalism, and has been a launching pad for a number of famous American writers and broadcast personalities.

Chicago's style of aggressive journalism became known nationally through popular culture: Ben Hecht and Charles MacArthur, both early-twentieth-century Chicago reporters who moved to Hollywood and became screenwriters, co-wrote a successful 1928 comic play, *The Front Page*, based on their own experiences in Chicago's cutthroat journalism during the early twentieth century. Its message was that Chicago reporters would do almost anything—including lying and stealing—to get a scoop. The story's manic energy inspired films and television series, thus spreading Chicago journalism's colorful reputation nationwide.

Newspapers

Chicago's first newspaper, the weekly Chicago *Democrat,* began in the same year as the city's 1833 incorporation, when it had only 300 residents. Other newspapers quickly followed. The Chicago *Tribune,* which survives today as a major Midwestern voice, began in 1847, although its ownership has changed several times. So has the city's other surviving major daily, the Chicago *Sun-Times,* which can trace its lineage even earlier (through a merger and a renaming), to 1844, and the Chicago *Evening Journal.*

Chicago's population shot up to nearly 1.1 million by 1890 as its rapidly expanding industrial base offered jobs to immigrants in manufacturing, transportation, smokestack industries, and related service industries. "Chicago journalism, like the city itself, is one of the wonders of the times," *Harper's* magazine noted in 1883. "As newspapers, as gatherers of the details of the world's daily history, and its presentation with fullness and skill, they have no equals on the continent."

Publisher Joseph Medill joined the Chicago *Tribune* in 1855, eight years after its founding, when he was hired from Cleveland to be the *Tribune*'s managing editor. Medill bought into the *Tribune*'s ownership, became one of the founders of the Republican Party, strongly supported Abraham Lincoln for the U.S. presidency, and used the *Tribune*'s voice to oppose slavery. Medill became a civic leader, even serving as mayor for two years, overseeing some of the city's rebuilding after the Great Chicago Fire of 1871—including starting the city's first public library—before returning to his newspaper. Northwestern University's journalism school was named for Medill at its founding in 1921.

Robert R. McCormick, a grandson of Medill, led the *Tribune* as publisher and editor through much of the first half of the twentieth century.

McCormick followed in his grandfather's civic footsteps, serving on the Chicago City Council and Chicago Plan Commission, and as president of the Chicago sanitary district. McCormick reached the rank of colonel during World War I, an honor he carried proudly for the rest of his life. For several years he ran the *Tribune* with his cousin, Joseph Medill Patterson, who was another grandson of Medill.

The *Tribune* was the city's most prominent newspaper for much of the twentieth century, but not just because of McCormick's famously conservative voice: it offered readers broad local and national news coverage, lots of comics (*Dick Tracy* and *Brenda Starr* started here), and it energetically investigated crooked politicians and gangsters. One of its sports editors, Arch Ward, thought up the idea for major league baseball's annual All-Star Game, first played in 1933.

McCormick's isolationist politics before World War II influenced department store heir Marshall Field III in 1941 to start a competing morning newspaper, the Chicago *Sun*. In 1948, Field bought the failing *Times* and merged it with his *Sun,* creating a lively tabloid that more than held its own with the richer but stodgy *Tribune*. A few years after McCormick died in 1955, the *Tribune* edged toward the ideological center, perhaps partially in response to the *Sun-Times'* increasing popularity.

Muckraking reporting had a footing in Chicago as early as 1906, when Upton Sinclair's *The Jungle* exposed harsh work conditions and factory filth in the Chicago stockyards. Although fictionalized, the book stirred national anger, resulting in the passage of food safety legislation by Congress.

Investigative reporting remained a strong suit in Chicago journalism for many years. In the mid-1940s, two Chicago *Times* reporters researched and helped free a man wrongfully convicted of murder, a case made nationally famous in the 1948 film *Call Northside 777,* starring Jimmy Stewart as a composite of the two reporters. Wrongful conviction investigations continue to this day, at the *Tribune* and Northwestern University.

Chicago's newspaper battles remained strong into the early 1970s, when all four of its major newspapers (Chicago was the last big city to have four downtown dailies) were giving each other serious competition, winning Pulitzers, and keeping tabs on each other through the groundbreaking *Chicago Journalism Review,* one of the nation's first and best local journalism magazines. One of the most famous projects from that era was that of the Mirage Bar, purchased and briefly operated by the *Sun-Times* in 1977 to entrap corrupt city building inspectors. The Mirage series lost out on a Pulitzer because some on the Pulitzer awards committee expressed concern that the newspaper's tactics were deceptive. That case may have marked the end of Chicago's most aggressive period of news gathering. By the end of the 1970s, the city's two afternoon newspapers had closed—the Chicago *Today,* a descendant of the "Front Page"–era *American,* and the well-regarded *Daily News*. And when *Sun-Times* publisher Marshall Field V (grandson of the *Sun*'s founder) sold his newspaper to Rupert Murdoch in 1982, and Murdoch quickly resold the paper to underfunded owners, many felt that an important era in Chicago journalism was over.

Several regional dailies were created in the 1970s and 1980s in two developing population corridors—one in the suburban northwest (the *Daily Herald*) and one in the southwest (the *Daily Southtown*). They found audiences, but as the century came to a close, both ran into the same problem as their downtown cousins: declining advertising because of pressure from the Internet.

Countless reporters have made their reputations in Chicago for their reporting or writing, before moving on to other cities. Among the first was Finley Peter Dunne, who wrote successfully for several Chicago newspapers in the late nineteenth century before moving to the magazine world in New York. His "voice of the people" writing style was emulated by many who came after him. Pulitzer Prize–winning *Daily News* columnist Mike Royko developed such a strong populist reputation in the 1970s and 1980s that he inspired several fictional characters, including John Belushi's columnist character in the 1981 film *Continental Divide*. Perhaps the area's most internationally famous writer, the Nobel Prize–winning Ernest Hemingway, grew up in Oak Park, near Chicago. He started his writing career as a reporter, but didn't find work in Chicago. He had better luck in Kansas City.

Specialized and Trade Publications

Chicago is the home of the nation's most influential African American newspaper, the Chicago

Defender, founded in 1905. In the early twentieth century, the *Defender* was distributed throughout the East and South by train. It is given credit for encouraging the exodus of millions of Southern blacks to the North as factory jobs became more abundant. The *Defender* became a daily in 1956, but it struggled with declining circulation and advertising along with other print media, and it returned to weekly publication early in the twenty-first century.

Another important voice for African Americans is *Ebony* magazine, founded in Chicago in 1945. Johnson Publishing Co. also publishes the pocket-sized *Jet* magazine. *Ebony* and *Jet* have found national audiences presenting minorities in a positive and mainstream light.

The *Chicago Reader,* founded in 1971, set a national journalism standard for alternative newspapers with its extensive arts and community news coverage, and is one of the few remaining Chicago outlets with regular local media criticism. As with many other Chicago media outlets, it is no longer locally owned.

One of the nation's most successful magazine publishers, Hugh Hefner, founded and published *Playboy* magazine in Chicago for many years.

Perhaps less spectacularly but no less significantly, many top trade publications remain based in Chicago, covering fields ranging from medicine (*Journal of the American Medical Association*) and law (*American Bar Association Journal*) to food service (*Restaurants & Institutions*). Crain Communications is a major Chicago-based publisher that prints several top business niche publications (among them, *Advertising Age, Automotive Week, Television Week,* and *Crain's Chicago Business*).

Chicago remains home to an ethnically diverse community, represented in several dozen ethnic newspapers, including Polish language and Spanish language dailies.

Radio, Television, and the Chicago School

When radio broadcasting began in the early 1920s, Chicago had a natural technical advantage because of its central location, which enabled it to send programming over a huge part of the country. With Robert McCormick's sense of broadcasting's potential, the Tribune Company got into radio at its inception. The *Tribune* supplied news to the city's first radio station, KYW, in 1921.

McCormick's company began its own radio station, WGN-AM, three years later. Among its early broadcasts were live remote coverage of the Indianapolis 500 auto race, the Kentucky Derby, and the World Series—all national firsts that helped establish WGN radio as a leader in sports coverage. WGN's call letters stood for "World's Greatest Newspaper," which adorned the newspaper's masthead for most of its existence, until latter-day editors got more humble. The Tribune Co. was also an early entrant into television. For many years, WGN-TV was Chicago viewers' only source for broadcasts of Cubs and White Sox games until the addition of cable and UHF channels expanded the sports teams' broadcasting options. The Tribune Co. now operates the area's only news and features cable channel, CLTV.

Chicago's early on-air television efforts had a distinct style known as the "Chicago School of Television—relaxed, intimate, friendly, natural, subtle," as *Look* magazine described it in 1951 (quoted in Samuels). The Chicago School approach was perhaps exemplified best in early television by Dave Garroway, who started his career in Chicago before moving on to New York to host NBC's *Today* morning news and features program. This easy, personable style (earlier heard on Chicago radio with such programs as *Don McNeil's Breakfast Club*) evolved into the talk-interview format adapted and refined by Phil Donahue and later Oprah Winfrey, whose programs were Chicago-based, along with the earthier Jerry Springer.

A total of 12 AM radio stations, 31 FM stations, and 17 network and independent television stations (not counting the programming available on cable) now serve the greater Chicago area—the nation's third-largest media market, with a population of roughly 9.5 million.

Changing Landscape

As elsewhere, by the early twenty-first century, Chicago journalism was struggling with decreasing profits as communications advertising continued its migration to the Internet. Television news was on stronger financial footing than print, but with far fewer reporters on the streets. The two main newspapers survived, but faced uncertain fates.

The Tribune Co. had expanded dramatically in the 1990s, buying television stations and newspapers nationwide to become one of the largest media companies in the United States. It was privatized in 2007 and taken through painful newsroom and corporate reorganizing by its new CEO, real estate tycoon Samuel Zell. The *Tribune*'s free niche daily tabloid, *RedEye,* alarmed journalism traditionalists with its successful combination of celebrity news and features. But its profits didn't offset the *Tribune*'s massive debt.

Events happened quickly at the *Tribune* in late 2008. A major redesign of the broadsheet and the impending sale of the company's high-priced Chicago Cubs—a buyer was found in early 2009—failed to stop the *Tribune* from declaring Chapter 11 bankruptcy as 2008 ended. Reorganization continued, including staff cutbacks. Early in 2009, the *Tribune* started a tabloid commuter edition to build on its success with the feature-oriented *RedEye* and compete directly with the *Sun-Times.*

The financially struggling *Sun-Times* was even worse off. Hammered by falling circulation, budget cuts, and some corrupt managers (former president Conrad Black and publisher David Radler were jailed in early 2008 after fraud convictions), the paper was up for sale, but there was little interest in it as American print media outlets struggled to find a workable economic model for the twenty-first century. Early in 2009, the *Sun-Times* also declared bankruptcy, a sad comedown for the city that created the Front Page image of aggressively competing newspapers.

China

As one of the world's oldest civilizations, China has a long, rich history in the use of media to communicate, including the inventions of paper and printing. China was the birthplace of an early version of the newspaper, as government news sheets, known as *tipao,* were disseminated among Han Dynasty court officials in the second and third centuries A.D. and later printed during the Tang Dynasty in the eighth and ninth centuries.

But popular journalism in the form of the modern newspaper, which circulates news to a broader mass audience, came relatively late to China, compared to Europe and elsewhere. In the nineteenth century, European missionaries and other foreigners imported the modern newspaper to several major Chinese cities, where notable examples such as the British-owned *Shen-bao* in Shanghai flourished. This foreign involvement reflected the influence of outsiders on journalism developments in China, a pattern that would repeat itself during the twentieth century. This was especially evident between the two world wars in the tumultuous post–Qing Dynasty period of the 1920s and 1930s, with the advent of more independent commercial newspapers and the founding of journalism schools. After 1949, China adopted the Soviet-style propaganda model of journalism.

Regardless of these occasional external influences, China has often retreated from engagement with the outside world and has consistently maintained a dominant role over its own print media and later electronic media. This approach was seen not only as key to political stability but also as morally superior. As China scholar Stephen MacKinnon noted, an elite consensus in China going back to the Han Dynasty (206 BCE–220 CE) has maintained that the written and printed word needed to serve the interests of the Confucian state as a means to instruct and uplift society; it has only been recently that the Chinese term for propaganda, *xuanchuan,* became known in a more pejorative way.

And the state has taken strong and pervasive measures to ensure that control. In the Qing Dynasty of the eighteenth century, for example, persons who spread rumors or produced unofficial newspapers risked beheading. In more modern times, China earned a reputation as the world's leader in imprisoning journalists. Nonetheless, the

country's economic reforms of the late twentieth century spurred a media transformation that in turn demonstrated the crucial role of media in China's national development and society's transformation that continues into the twenty-first century.

Development

The evolution of the modern Chinese press can be divided into four periods. The first period can be characterized predominantly as one of "control," in which China adopted the Stalinist *Pravda* propaganda press model that lasted nearly 30 years from the start of Communist Party rule in 1949 to the onset of economic reforms in 1978. The second was a period of "loosening" press control, triggered by economic expansion and open-door policies, which continued until 1989, when the government crackdown on the Tiananmen Square (Beijing) prodemocracy protest ushered in a new, third, "stifling" period of media restrictions. In 1992, when economic reforms were relaunched, a new fourth era of "change," during which media development and transformation occurred at an accelerated pace, began.

When it took power in 1949, the Communist Party of China (CPC) wanted to build a new China and initially adopted a reasonably tolerant press policy. It established a press structure that consisted of independent commercial newspapers and Communist Party newspapers, notwithstanding that the latter held a principal position. China's Constitution, first promulgated in 1954, included provisions for freedom of speech and freedom of the press. In 1956 reformist leader Liu Shaoqi put forward proposals to promote competition among newspapers and publications and to shift the operation of key party newspapers to organizations other than the party and government. These short-lived attempts to reform the press system, however, ultimately succumbed to political campaigns such as the Anti-Rightist movement and the Cultural Revolution. As a consequence, the press system implemented by the newly founded People's Republic of China (PRC) remained largely the Stalinist *Pravda* model of the Soviet Union, which used the press as a tool for class struggle and for rallying support of party policies. The CPC fully funded all Chinese news organizations and exercised complete control over their decisions.

CPC doctrine set out three main functions for the press. First, media were instruments for agitation and class struggle, a weapon used by the proletarian class to overthrow capitalism and to build up socialism. Second, media were a tool for political organization and mobilization. Third, media were a central instrument of the party to propagandize party policies.

The party press can in some ways trace its roots to journals of the early twentieth century. In the years after the fall of China's last ruling dynasty (Qing) in 1912, the country experienced increasing turmoil and party leaders such as Mao Zedong and Chen Duxiu, a party co-founder, were involved in publishing journals to rally mass opposition to Japanese imperialists and Chinese warlords. Particularly during the Chinese revolutionary wars of the 1920s until the founding of the PRC in 1949, the press was a vital means of leading national resistance to Japanese invasion, articulating messages of support for CPC policies, and exposing then-ruling party Kuomintang (KMT) corruption.

In the 1940s, Mao stressed the press role in learning from the masses and highlighted the propaganda role it should play to articulate a unified voice to solve the masses' problems. The party did this by organizing both party and nonparty journals to target party leadership, government departments, and women, youth, peasant, labor, and social organizations. The diversity of publications aimed at specific audiences remains a key feature of party journalism today. All major news organizations are sponsored and owned either by the CPC or its corresponding government departments or institutions. The levels of the press correspond exactly to those of the territorial-administrative divisions, with complete integration between the news outlet and its corresponding political organization, mass organizations, or public institutions. For example, the CPC's Central Committee publishes *People's Daily,* the party's official mouthpiece, and the Chinese Communist Youth League publishes *China Youth Daily*. Both papers are considered, or ranked, as national publications.

This model is replicated at the provincial and municipal levels. In the southern Guangdong province, for example, the *Southern Daily* newspaper is administered by the Guangdong Province Communist Party Committee, while *Guangzhou*

Daily is sponsored by the Municipal Party Committee of the city of Guangzhou.

Electronic media follow a similar structure. China Central Television (CCTV) is the major national television broadcaster in the country, with more than a billion viewers. CCTV is a statutory agency within the State Administration of Radio, Film and Television and is subordinate to the State Council, the top executive and administrative body, which issues administrative regulations. Shanghai Media Group—a merged group of Shanghai media entities involving multimedia, television, radio, news, and the Internet—is owned and operated by the city government of Shanghai.

In some respects, China's multisectored, multitiered press system, which includes newspapers run by women's federations, trade unions, and other social groups, holds tremendous potential in enabling a multitude of diverse voices to be heard. But disastrous incidents like the Great Leap Forward (1958–61) and the Cultural Revolution (1966–76) have shown that the confines of a monopoly party press structure along with the absence of different forms of ownership all developing and competing within a recognized constitutional and legal framework prevented the Chinese press from reflecting public opinion and serving the public interest.

All news organizations, regardless of market and commercial reform, are considered formal extensions of the party-state, and rely on their official status as central, provincial, county, or municipal government organizations to legitimize their political oversight roles vis-à-vis the party-state. The press is thus not allowed to criticize party institutions of its own rank, but can only criticize individuals and organizations beneath them. Central-government-level news organizations can write critical reports on provincial and local officials, whereas provincial-level papers like *Southern Daily* are only allowed to write critical reports on municipal and lower-level officials.

All news media organizations are also subject to control and regulation by China's Party Propaganda Department. For example, national press institutions like CCTV, *People's Daily*, and Xinhua News Agency, the government's official press agency, are under direct control of the Propaganda Department of the CPC and are headed by a member of the Standing Committee of the CPC Central Committee, which sets media policies, supervises their implementation, and issues directives and regulations. The Provincial Party Committee's Propaganda Department controls the provincial-level press and so on. But all Chinese news media institutions, regardless of commercial reform, are directly under the political supervision of the Propaganda Department.

In the second period beginning in 1978, two years after Mao's death, new party leader Deng Xiaoping announced economic reforms to open the door to foreign technology and investment and to revamp existing institutions, including news media. Two of those reforms had particular impact on the development of Chinese media: the gradual reduction of state funding for all state enterprises, including the state-owned press, and reintroduction of advertising to generate revenue to compensate for the loss of state funding. The subsidy reduction was an outgrowth of the reformist "responsibility systems" in which state-owned enterprises were increasingly held responsible for their own economic survival and performance. With the reduction and eventual elimination of direct subsidies and mandatory subscriptions, news organizations began having to persuade readers to buy their products. To reach these readers and open new markets, the traditional party press created subsidiary publications, such as evening and weekend editions, to provide livelier, more attractive content that sold well. People responded enthusiastically in part because China had just emerged from the Cultural Revolution, Mao's devastating decade-long political campaign to purge rivals that resulted in social and economic chaos. During the Cultural Revolution, many newspapers ceased publication while Red Guard tabloids flourished. Evening papers that featured human interest stories, entertainment, and family-oriented articles were closed down as they did not meet political objectives of the revolution. Three party publications—namely, *People's Daily*, *Liberation Daily*, and *Red Flag Magazine*, which in China were referred to as *liangbao yikan*, or "Two Newspapers and One Journal"—carried the official line in which all other publications had to follow. When deployed by Mao to promote his revolutionary ideas, all articles had to carry the same content, style, and look. In 1978, the country had only 320 newspapers. By 1987, the number had skyrocketed to more than 2,500.

The party saw reintroduction of advertising in news media as part of its program for economic reform, modernization, and social change. And advertising revenue soon became the most important source of income for the newly commercial media. The drive to ensure economic independence gave news organizations increased operational autonomy, particularly for their newly launched evening and weekend editions. This also meant that the power to influence decisions had, to some extent, been transferred from the party-state to advertisers and readers. This was reflected in how the traditional party newspapers moved beyond their usual fare of government announcements and propaganda in their weekend and evening subsidiaries to emphasize news reporting that was informative, short, timely, lively, and in-depth. Popular topics included social news; current affairs; entertainment news about movie stars, writers, and sports stars; human interest stories dealing with family, health, consumer rights, and law and order; profiles of ordinary migrant workers; and trend pieces covering everything from investments and inflation to the problems of an aging population and urban crime.

As news media became responsible for their own economic survival, they were compelled to diversify content to include cultural news, sports, entertainment, social news, and watchdog reporting to meet reader demands. In this way, despite the Chinese Communist Party's continual reinforcement of a key party principle—the press is a "mouthpiece for the party"—news media were often more restricted in theory than in practice. The 1980s brought further commercialization and loosening of restrictions. There were also calls for reforms throughout society, including more democracy, press law protections, and even news media freedom. Many Chinese media workers, including those from *People's Daily,* marched publicly in the streets to support reform during the 1989 pro-democracy movement. That movement ended abruptly on June 4 when troops moved in to stop protests in Beijing's most famous public space, Tiananmen Square.

The Tiananmen crackdown reverberated across society, stalling political and economic reform as well as reforms within the news media. The party now reemphasized that submission by journalists to party leadership and propaganda discipline must always be the basis when speaking on behalf of the people.

Post-1992 Media to the Present

The fourth period of the media's evolution began in the wake of party leader Deng Xiaoping's famed "Southern Tour" in 1992. Deng visited the southern Chinese cities of Guangzhou, Shenzhen, and Zhuhai and spent time in Shanghai, during which he was able to consolidate political support to relaunch stalled economic reforms. As a result, both markets and news media became more liberalized. And the 1990s became known for the emergence of large media groups (as the government began curbing proliferation of media organizations through consolidation) and the rise of watchdog, or investigative, journalism.

Known in China as *yulun jiandu,* or "supervision by public opinion," this type of journalism refers to news reports or commentaries that document, report, and reflect the views of the general Chinese population as a means of monitoring the effectiveness of Communist Party policies. *Yulun jiandu* is used interchangeably with *meiti jiandu,* or "supervision by the media," because the media encompass the mechanism for the Chinese masses to voice opinions and grievances and provide a means for the party to assess public perception of the effectiveness of government policies. These watchdog stories reflected social instability that resulted from accelerated market reforms. These included large-scale worker layoffs in money-losing state enterprises, dislocation of farmers, and unfettered taxation abuses by local governments. China's economic reform policies had created tremendous growth—making the nation among the world's fastest-growing economies—but they also created tremendous opportunities for corrupt politicians and businesses. Inequality increasingly came to characterize the path of Chinese economic development and this created social conditions that led to demands for more critical reporting exposing wanton abuses of official and police power, unscrupulous business practices, tax exploitation, and crime.

Broadcasting in China also underwent similar growth and development, as television and radio news programs multiplied and began competing for news stories, including investigative ones. In

1965 China had a mere dozen television stations and fewer than 100 radio outlets. By 2004, there were 278 radio stations, 315 television stations, and more than 1,300 integrated radio and television stations. CCTV, the official national network which broadcasts news throughout the day on numerous channels, started its popular *Jiaodian Fangtan (Focus)* program in 1994, a daily 13-minute current affairs program that for the first time provided in-depth looks at hot social topics. At its height, the program attracted 300 million viewers daily.

Critical to this development of more complex and demanding news coverage, media outlets began to attract and retain better qualified employees, who now were often expected to have college degrees. Many graduated from one of a growing number of journalism programs at Chinese universities and an increasing number were going overseas to study. The party press also had more flexibility in who they hired and how, including whether workers had to be party members. The media began to hire contract reporters "outside the system" (*tizhiwai*), who had the advantage of not requiring bureaucratic party authorization—with its paper trail of employment history.

Central Party leaders came to see China's press as an effective, comparatively inexpensive tool to reduce official corruption by utilizing public opinion to monitor official power and reflect public debate on China's problems. By doing so, watchdog stories expose government corruption and social ills, vet popular grievances, and create a closer identity between the people and the party. This watchdog function, however, was to be exercised under *yulun daoxiang* or "guidance of public opinion," which meant providing an official framework for controversial topics to "guide" public opinion to fall within the party line. Press exposés of lower-level misdeeds were tolerated and even encouraged by the Central government so long as they abided by the "correct guidance." In reality, however, Chinese journalists, particularly those from the commercial press, frequently found ways to challenge, test, and contravene the party's restrictions. One such example was through *kuadi jiandu,* or "extra-regional media supervision," where the local press aimed their critical reports at officials in other provinces that did not have direct administrative authority over them. Despite these efforts, the Propaganda Department continued to exercise control over Chinese news media through ideological and administrative means such as the replacement of chief editors when the publication attempted to push the envelope too far. More important, though, watchdog reports could not attack core party principles such as socialism or the party's legitimate rule. Thirty years of controlled commercialization of the Chinese press did not necessarily serve to push it toward a Western-style role of being adversarial to the state.

Complicating this relationship, however, has been the rise of Internet journalism and that ordinary people can join journalists in posting articles, videos, photographs, and other materials online outside party media. Since the 1990s, many Chinese citizens have embraced the Internet. By the end of 2008, the number of Internet users in China had reportedly reached 298 million, making it the world's biggest Internet market, although that still represents just 25 percent of the country's population. The number of mainland Chinese bloggers is said to be more than 50 million.

At the same time, however, the party-state developed highly sophisticated monitoring and control mechanisms of the Internet and its users to censor topics considered disruptive to social order. It does this by using the latest technology, additional and existing laws and regulations, and new variations of traditional control tactics. The Ministry of Public Security's "Golden Shield Project," sometimes known as the "Great Firewall," is an extensive communications network and computer information system that operates to block objectionable Internet sites and web feeds and filter unwanted content. The party-state also enlists nongovernment entities and individuals, such as ISPs and content providers, to help it prevent users from posting and accessing sensitive content. And China has stepped up enforcement of its vague criminal laws on state secrets and national security to rein in Internet writers. As of 2008, 100 journalists, cyber dissidents, bloggers, and Internet users were imprisoned in China, according to Reporters Without Borders. Other emerging technologies have even more potential for impact as seen, for example, by the hundreds of millions of Chinese citizens using mobile telephones and text messaging.

Conclusion

Commercialization of the news media has played a significant role in diversifying the media landscape in China. But regardless of three decades of controlled commercialization (starting in the late 1970s) that led to increased editorial autonomy within the newsroom, the Chinese media remain an arm of the party-state, in which the party continues to exercise oversight. At the same time, many scholars warn that news media autonomy gained through commercialization is precarious and paradoxical. They argue that while the freedom that news media are enjoying is chipping away at state control, it is also ushering in a press system increasingly dominated by commercial profits. In this respect, as journalism in China continues to grow, the question as to whether media commercialization in itself will necessarily encourage the development of independent journalism in China remains open.

Chinese Television

After the Chinese Communist Party (CCP) came into power in 1949, China built its media system on the Soviet Union's model. Instead of being a "watchdog" of the government, news media served as a "mouthpiece" or "transmission belt" of the party to propagate socialist ideals and execute government policies. "Party Principle" (*Dangxing Yuanze*) was regarded as the supreme guideline in running the media. Only positive news about the society and the government that benefits the party's administration was allowed to be covered in the media.

Since the end of the 1970s, Deng Xiaoping's reform and opening-door policy has led to dramatic sociopolitical changes in China. The loosening of direct party control and rapid development of a market economy within a socialist political context stimulated Chinese media to undertake a dramatic transformation. They are no longer regarded as pure political-ideological propaganda tools, but have more freedom and autonomy to provide increasing coverage of business information and entertainment, and even negative stories about government officials and social problems.

Television Reform

As the country's most rapidly growing and advanced medium, television has witnessed the drastic sociopolitical changes that underlay the overall development of Chinese media. Television was first introduced into China in the late 1950s. The first television station, Beijing Television Station (BTS), went on the air experimentally on May 1, 1958. Although the disastrous Cultural

Revolution (1966–76) hindered its development, Chinese television broadcasting made great strides after the implementation of the reform policy. On May 1, 1978, Beijing Television Station was renamed China Central Television (CCTV) and began to provide a national service. The number of television stations rapidly increased from 32 in 1975 to 509 in 1990, and nearly 1,000 by 2000. As for relay stations, there were only about 400 in the early 1980s, 22,000 by the end of that decade, and more than 40,000 nationwide in the mid-1990s.

Before the reforms in the late 1970s, the infrastructure of Chinese television broadcasting was highly centralized, with CCTV in the center and all other TV stations at the periphery. With the continuous increase of regional and local television stations, a centralized mechanism was replaced by a four-level television broadcasting system: CCTV plays the leading role at the top, followed by provincial stations, city stations, and county stations. Within this decentralized model, control over television is exercised on two levels: central state supervision of CCTV, and regional and local management at the grass-roots level.

Before 1978, all TV stations were heavily subsidized by the state. After the economic reforms, the state gradually cut subsidies, and advertising became the major revenue source. Once condemned as a corrupt capitalist practice, advertising reappeared in early 1979, and was promoted by the party and government as a potential tool for economic reform and social change. Advertising revenues for the television industry exploded from 3.25 million yuan in 1979 to 2.05 billion yuan in 1992. By 2007, Chinese television advertising revenues reached 4.5 billion yuan, nearly one fourth of which went to CCTV.

Increased dependence on advertising is the major factor contributing to the transformation of television. No longer mere propaganda tools, TV stations began to be managed as business enterprises. The amount of political coverage in television news has decreased, while more news of business and entertainment is offered. Due to changing professional imperatives, the watchdog role of television has been employed to expose social problems such as corruption scandals of government officials, coal mine accidents, environmental pollution, and food safety.

Commercialization of television programming has also contributed to its internationalization. The dramatic change is reflected in the increase of the proportion of imported television programs since 1980. By the end of 2000, 15 percent of the drama programs shown on Chinese television were foreign imports, more than two-thirds of which came from capitalist countries. Joint ventures and the operation of multinational agencies have also widely expanded to television program production, which has speeded diffusion of foreign media culture and the globalization of Chinese television.

The Case of CCTV

Since its inception in 1978, CCTV has established itself as the most prominent and authoritative station in China. As the only national news network, CCTV has the largest television audience. By 2005, it reached nearly 96 percent of the national population, with the number of viewers exceeding 1.2 billion. As a government-owned media corporation, its news programs have high authoritativeness, defining and presenting national and international realities to the Chinese people. CCTV's News Broadcast (*Xinwen Lianbo*) at 7 p.m., a premium source of news about the latest government policies and party activities, enjoys a regular viewership of more than 500 million. Like other television stations, CCTV has seen its state subsidy decline since the late 1970s. Advertising first appeared in October 1979, and advertising sales on CCTV exploded quickly. Now CCTV operating costs are mainly derived from advertising and other business sources. The commercialization of CCTV has resulted in the depoliticization of its news coverage, with the increase of business, sport, and entertainment news.

Although CCTV currently remains the largest television network penetrating into most corners of the country, the dominant position of CCTV has been threatened since the early 1990s, when provincial television stations started using telecommunication satellites to transmit their signals across regions. To maintain its position in an increasingly competitive media market, CCTV further diversified its content to cater to a broader sense of the needs and wants of potential viewers. By 2008, CCTV had launched 16 national channels and one High Definition channel, offering a

wide range of programs from news to variety shows around the clock.

CCTV-1 is a comprehensive channel with emphasis on news and current affairs. The other CCTV channels have their own foci, such as CCTV-2-economics, CCTV-3-arts and entertainment, CCTV-5-sports, CCTV-6-movies, and so on. In order to become an international player in global communication, CCTV has started several international channels targeting overseas audiences. Known as CCTV international, CCTV-4 produces a variety of programs in Mandarin Chinese for overseas viewers. CCTV-9 is China's only 24-hour English channel providing news and feature programs via six satellites to a global audience of 45 million subscribers outside China. CCTV has also increasingly set up foreign news bureaus and stationed more foreign correspondents in major cities around the world to speed up its internationalization process.

To improve its market competitiveness and journalistic professionalism, CCTV also developed a series of investigative programs aimed at exploring social issues and problems, ranging from official corruption to inequalities in society, all issues of concern to the public. The popular investigative programs produced by CCTV include the daily *Oriental Horizon* (*Dongfang Shikong*), the country's earliest news and current affairs magazine that first aired in May 1993. Its great success in non–prime time morning hours changed many Chinese people's habit of not watching television during the daytime. *Focus* (*Jiaodian Fangtan*) started in April 1994, a 13-minute prime-time program broadcast straight after *Xinwen Lianbo*. Known for exposing social conflicts and injustice through in-depth investigative reporting, *Focus* attracts 300 million viewers nightly. *Tell It Like It Is* (*Shihua Shishuo*), a television talk show modeled on *The Oprah Winfrey Show,* started in March 1996. It has covered a range of moral and public issues once considered too sensitive to discuss publicly. *News Probe* (*Xinwen Diaocha*), compares to CBS's *60 Minutes* or ABC's *Nightline,* offering a 45-minute investigative documentary program aired in CCTV every Friday night since May 1996. Following its slogan "hunting the truth," *News Probe* has revealed social problems and insufficiencies of state policies in a straightforward and sharp-edged critical style. These investigative programs are allowed greater autonomy to choose which topic to cover as well as how to cover it in order to fulfill their watchdog function, although such autonomy is still limited by the government.

Conclusion

The dramatic sociopolitical changes in China have a great impact on Chinese television's practice and content. Like other mass media, Chinese television has undertaken profound reform, evolving from state-controlled propaganda machines to market-driven commercial vehicles. The reduced reliance on state subsidies and increased financial dependence on advertising revenues has helped Chinese television win greater autonomy from tight political control. Under the pressure of commercialization and internationalization, Chinese television news has become more professional and de-politicized, more oriented toward the market and audience. Although news media still adhere to the party line, they have to pay attention to the bottom line as well.

As China's window on the world, CCTV epitomizes the process of Chinese television transformation. Faced with furious market competition, CCTV has had to balance its role, being responsible to both party and public. To maximize its market share, it has created dozens of channels, offering diverse and depolitized programs to attract audiences in China and abroad. The investigative news programs produced by CCTV have not only met audience needs, but have strengthened the watchdog function of television news. Although Chinese television remains under the ideological leadership of the party, the trend of commercialization, depolitization, democratization, and internationalization in the television industry is bound to continue, as economic and political reforms are further deepening in China.

Circulation, Controlled

Controlled circulation refers to providing a periodical—newspaper or magazine—at no cost to readers who meet specific advertiser-attractive criteria. Along with newsstand sales and subscriptions, it is the third major form of distribution. Such newspapers and magazines may be mailed free to those on a list, or made available for pick-up in public locations. Although they provide no direct revenue from readers, controlled-circulation publications are an extremely attractive, relatively low-cost advertising vehicle for individuals or companies seeking narrowly defined, captive audiences.

Among the most common examples of this category of journalism are in-flight airline magazines, and those found in many hotel rooms. American Airlines' *Nexos* and the Radisson Hotel's *Voyager* are made available to their customers free of charge, and contain articles and advertisements selected to appeal to travelers and vacationers. Many of the articles are advertorials, provided by public relations and marketing firms promoting services and products.

Controlled circulation was originally developed as a distribution technique in the specialized business and trade magazine field. Indeed, unlike consumer magazines, more than three-quarters of business magazines and newspapers rely primarily on this method of circulation. For example, *Offshore Engineer* is mailed only to individuals who are involved in buying equipment and services for the offshore oil drilling industry. Fishing boat subscribers of *WorkBoat* magazine pay nothing for the magazine because they are highly sought buyers of commercial boats and related equipment. In 2005, more than 4,000 trade magazines used or relied upon controlled circulation.

Origins

The first controlled circulation magazines were published by Putnam Media, based in Itasca, Illinois, which began in the 1920s as a single title buyer-to-buyer publishing house serving manufacturing facilities under the leadership of "Colonel" Russell L. Putman (died 1973). Putman was an innovator in controlled circulation, reader service cards, and four-color printing processes for front covers. With the launch of *Chemical Processing* magazine in 1938 and *Food Processing* two years later (both provided free to those working in these industries), Putman was quickly positioned as a leading publisher in controlled circulation. Mailed free to those registered with professional organizations in these fields, early issues included a prepaid postcard where readers could recommend others who might be interested in receiving *Chemical Processing* or *Food Processing*. With a rapidly growing list of readers, Putnam was able to generate significant ad sales that surpassed any potential subscription revenue. Controlled circulation magazines sell more than 2 million ad pages yearly to reach their defined readers.

Controlled circulation newspapers trace their history back to the 1940s when Walnut Creek

(California) publisher Dean Lesher (1902–93) began what is widely believed to be the first free daily newspaper, now known as the *Contra Costa Times*. It featured advertising, much like a "free shopper" newspaper, along with some community news items, event calendars, and announcements. In 1962 he converted that newspaper and three others in the county that he owned to paid circulation. However, Lesher's model of free distribution of an advertising-dominated newspaper has been copied by other publishers across the country, many of which also produce a separate traditional newspaper. In 2005 there were 1,370 newspapers in the United States with controlled circulation.

Among these are counted a new form of controlled circulation newspapers, the so-called commuter newspapers. These are usually a simplified version of a larger, parent metro newspaper. They are offered free at subway and bus stops and other mass transit venues, or in some cases placed on the vehicles themselves. Content consists of shorter versions of articles, features, reviews, and entertainment items (comic strips, puzzles, horoscopes, and advice columns) that appear in the parent newspaper, along with extensive advertising. One example of such a newspaper is the *Express,* a 20- to 24-page commuter version of the daily *Washington Post* that was launched in August 2003. It is published only Monday through Friday. By the end of 2007, *Post* management claimed that the 190,000 copies of the *Express* were distributed daily at 1,800 locations in the Washington metro area. Given that the expense of producing such commuter papers by a parent daily newspaper is low—typesetting equipment, presses, delivery trucks, and in most cases staff are already in place—advertising revenue is mostly profit.

Advertising is the primary revenue source for all controlled circulation periodicals. Placing advertisements in such periodicals is appealing to companies seeking to reach a targeted customer base, whether determined by geography or common interests. Distributing a magazine or newspaper by controlled circulation gives advertisers complete market coverage, not just distribution to readers who will pay for a subscription or newsstand copy. Controlled circulation publications spend a great deal of time "qualifying" (i.e., ensuring that they meet the advertisers' criteria for potential customers) readers. Many trade and business magazines have circulations that are mainly or almost entirely "by request," meaning that individuals have verified that they are qualified by employment or location to receive the publication and that they desire to receive it. Direct request is the most desirable type of controlled circulation, from most advertisers' point of view, because potential customers are self-selected.

Studies indicate that commuter and free shopper newspapers appeal to a more youthful, professional population than traditional newspapers. Knight Ridder, which acquired the controlled circulation *Palo Alto Daily News* in 2005, found in a survey that 57 percent of that paper's readers were under 45 years of age. These free newspapers become a part of the lifestyle of commuting to work, maintaining an upscale lifestyle, and seeking out ways to spend increasing amounts of leisure time. Controlled circulation newspapers offer a "fast read" for those with busy lifestyles and disposable income, the latter of primary interest to advertisers.

Pros and Cons

The advantages of publishing controlled circulation trade magazines and commuter/shopper newspapers are numerous. Because the target audience is homogeneous, the publisher knows the reader's likely spending habits. This is priceless to marketers wishing to reach and build awareness and relationships within a niche audience. The publication can build stronger relationships with readers by understanding and addressing personal and business needs in editorial content. Readers with a shared interest have a natural affinity for one another. They share mutual problems, solutions, and goals. This enables a strong relationship to be formed between the publications and readers. It is not uncommon for readers to view a controlled circulation publication as an essential community or career tool. Further, the advertising rate base of a controlled circulation publication does not fluctuate, as opposed to a paid circulation with a newsstand component. Thus, publishers can build longer-term relationships with advertisers. Finally, there is no bad debt from nonpaying subscribers, as with the paid-circulation publication model. This enables publishers to make editorial decisions and financial plans with some certainty that income will be available to cover the costs.

When compared to the risks, the opportunities of a controlled-circulation publication greatly outweigh them, but only if the subscriber base is managed carefully. Mistakes, such as inflating circulation numbers or improper management, can challenge the publication's carefully nurtured and well-guarded credibility and cause readers to turn elsewhere. It also can lead to advertisers seeking new marketing vehicles. The inflating of circulation numbers, since there are no subscribers and no newsstand sales, is the most common mistake in controlled circulation publishing.

There are two nonprofit groups whose primary purpose is to verify the circulation figures of periodicals, including those with controlled circulation; such figures are of extreme interest to advertisers in trade and business magazines, commuter papers and free shoppers. The first and largest, the Audit Bureau of Circulations, is an independent nonprofit auditing organization formed in 1914 whose membership is composed of advertisers, advertising agencies, and publishers of newspapers, magazines, and websites that sell advertising space. Smaller and more specialized is the Business Publications Audit of Circulations, formed in 1931 and headquartered in New York. Its purpose is to audit and provide independent verification of print media circulation claims. The organization publishes regular audit reports and publisher's statements that detail its findings. Whereas the Audit Bureau of Circulations concentrates primarily on auditing consumer publications, the Business Publications Audit of Circulations covers 85 percent of all controlled-circulation business and trade publications.

Controlled circulation, whether of commuter or free shopper newspapers or of trade or business magazines, provides an alternative to traditional methods of distribution. In an age of declining readership and sales for the large daily newspapers and general interest magazines, free publications aimed at niche readerships based on lifestyles or careers are filling the void in growing numbers. Supported solely by advertisers targeting those people or professionals, controlled circulation periodicals may represent the future of printing in an increasingly web-wrapped world.

Citizen Journalism

The phenomenon of citizen journalism arose in the late 1990s, powered by new ways of user participation including the Internet. Initially identified with individual blogging, the term *citizen journalism* soon became an umbrella concept encompassing both personal blogging and institutional practices by news organizations. By the early twenty-first century, citizen journalism utilized the practices and technology of web 2.0 for production and distribution while fulfilling some of the social functions carried out by traditional journalism.

Some definitions of citizen journalism include any form of user-generated content. Here the definition of citizen journalism is more strict and refers to contribution to discussion in the public sphere, whether in the form of simple information, synthesis, reporting, or opinion. The contributions can range from very local to global, entering into the "conversation of democracy" in media critic James Carey's phrase. As long as their contents meet this definition, citizen journalists can be individuals making a single contribution (a fact, correction, photo, etc.), bloggers, or professionals editing citizen content for "professional-amateur" (pro-am) sites which integrates the works of professional staff and citizen contributors.

Citizen Journalism Versus Traditional Journalism

Citizen and traditional journalism can be viewed as operating on a series of at least six continua. One major axis is that of primary synthesis versus "crowdsourcing." Traditional journalism acquires primary sources, whether interviews or documents, and then analyzes and synthesizes them. New forms of contribution-based journalism, such as the website *Assignment Zero,* rely more heavily on the "crowd" to collect sources and analyze and synthesize them in a distributed way.

Second is the axis of distributed versus fully crafted narrative. In a distributed narrative, the story emerges in bits and pieces, from the sum of reader contributions in the form of a hyper-linked story. Even self-contained articles can acquire new meaning and context in the network. Traditional journalism synthesizes primary documents or interviews into a coherent story with little or no audience contribution.

Third is the degree of training of professionals and amateurs. Although some people have a professional background, citizen journalism involves journalistic amateurs by definition. However, there are degrees of training for citizen journalists, ranging from none, to web-based guidelines, to local training courses. In some instances citizen journalists are paid through distributed methods or advertisements, but still most remain unpaid.

Fourth, citizen journalism generally blurs the traditional distinction between fact and opinion. While traditional journalism emphasizes that distinction as a norm, many citizen journalism sites, particularly those identified with individual political bloggers, tend to highlight the presence of opinion.

Fifth, the traditional journalistic norm of fairness is less strictly applied. While some citizen journalism sites strive to build in principles of fairness and balance, many rely on the very personal views of bloggers, and allow almost any form of comment, leaving it to the crowd to self-correct potential abuses.

Lastly, there is the variation in the size of the intended audience. Though any online content can potentially reach a worldwide audience, traditional journalism targets a mass audience. On the other hand, citizen journalism sites can be (and often are) as small as one writer talking to a very small circle. So while traditional journalism resides on the "mass" end of the potential audience continuum, citizen journalism's "audience" is much more variable, ranging from tiny to massive.

Development

Citizen journalism has some affinities with the public or civic journalism movement, which began in the late 1980s and continued into the twenty-first century. Led by newspapers, journalists sought to address a perceived crisis in the way news media covered democracy and civic life. Based on the notion that the voices of the citizen and community interests disappeared from public issues, they applied a range of innovations: citizen polls, use of focus groups, special issues projects, new forms of comparative election coverage, and writing with greater individual, authorial voice. Many of these techniques have been adopted in citizen journalism.

Another foundation was the effort to establish practices of collecting and distributing self-created news through computer networks, which dates back to the creation of *FidoNews* in 1984. *FidoNews* was an open contribution online newsletter by the grassroots dial-up bulletin board system called FidoNet. A decade later, the Usenet newsgroup Internews aimed to provide alternative journalism built upon user contribution.

One of the earliest examples of web-based citizen journalism was the IndyMedia network built by protesters against the World Trade Organization meeting in Seattle in 1999. Although the medium was new, IndyMedia actually was a continuation of a long line of independent alternative media, often exhibiting a liberal point of view, beginning with the community radio and television movements of the 1970s.

By 2000, new forms of citizen media developed alongside Web 2.0. Web 2.0 enhanced use of technologies for collaboration, including web-based communities, new social media and social networking sites, wikis, and blogs. By January 2008 there were more than 100 million blogs worldwide. Collaborative user-created content also grew, with the widely popular Wikipedia hosting more than 2 million user-contributed articles in the English language as of early 2008. Mobile phones became increasingly sophisticated devices including the ability to share text, images, video, and

web content. YouTube (founded in 2005) allowed users to easily share video clips anywhere in the world. CNN's IReport.com, which was founded as a form of pro-am citizen journalism in 2006, has received more than 100,000 clips. CurrentTV, which was founded by Al Gore in 2005, is a cable channel programmed entirely by its users.

Citizen Content

One of the most significant drivers of citizen journalism is the ability to post content about events as they are happening, chronicling the events with numerous and varied personal accounts rather than a single in-depth summary. The terrorist attacks on New York and Washington in 2001 prompted a major leap as thousands of eyewitness cell phone pictures and videos were posted on the web within hours, and major news organizations drew heavily from this content to tell the story. During the Southeast Asian tsunami of 2004, many tourists using digital devices captured images of tidal waves, and mainstream media relied almost exclusively on these sources in the early days of coverage. Other prominent events during which citizen journalism helped drive the story include Hurricane Katrina in August 2005 and the Virginia Tech Massacre of April 2007. Likewise, the first news and images on the Szechuan earthquake in China in May 2008 came from the message-sharing site Twitter.com.

Citizen content can have a significant effect in nations with authoritarian rule or censorship. In 2007 the world learned of widespread protests against the repressive Myanmar (Burma) military regime almost exclusively through citizen content smuggled over the border, which, in turn, generated international support and, arguably, tempered the regime's response. The Tibetan protests against China in early 2008 also relied on citizen content to reach the wider world.

Pro-Am Citizen Media

OhmyNews was founded in South Korea in 2000 by Oh Yeon-ho as the first major pro-am site and is still among the most important and successful. Ohmy built on an existing tradition of civic media in South Korea, combined with a widespread need among the public for both personal and democratic self-expression. Initially, Ohmy's four professional editors (there were 60 by 2008) handled hundreds of citizen contributions that poured in daily, ranging from shopkeepers' accounts of daily life to sophisticated political commentary. Ohmy played a major role in the election of reform President Roh Moo-hyun in 2002, and protecting him in 2004 when conservative parties sought to impeach him. While most traditional media sided with the conservatives, Ohmy created a broad public sphere through live coverage of mass candlelight vigils, editorials, and discussion boards. An analytical article by a philosophy professor criticizing the impeachment movement generated a record $27,000 in income through Ohmy's online "tipping" system. Pro-am cartoonists joined to create anti-impeachment editorials, which spread virally through blogs and online forums.

During and after Hurricane Katrina in 2005, the Internet was widely used by citizens to post pictures, search for lost or missing relatives, and to post news of devastated neighborhoods. But the New Orleans *Times-Picayune* played a major role in taking much of this raw citizen-generated material, sifting through it, fact-checking (where possible), and organizing it in a series of narratives, from small local stories with imperfect information to larger master narratives of the cleanup efforts in neighborhoods, the government response, and the restoration of daily life. This is the most extensive case of pro-am collaboration in the production of local news in the United States. With it, the paper won two Pulitzer Prizes in 2006.

Blogosphere and Citizen Journalism

Blogs and forum sites can also be viewed as citizen journalism when they are essentially public conversations, including collaborative community sites that engage in a comprehensive discussion of specific topics. *Slashdot* blends intense discussion of all things technological through a combination of blogs and discussion boards, user contributions, and links. These are then rated or filtered based on community standards, to produce a consensus.

Political blogs have risen to increasing prominence in the first decade of the twenty-first century. Among the most prominent are *Daily Kos* on the democratic left, and *Instapundit* on the conservative side. *Kos,* like most political blogs, began

This photo taken at the site of the World Trade Center in the immediate aftermath of the September 11, 2001, attack in New York City is typical of the eyewitness pictures and videos that mainstream media relied on early in the coverage of the event.

Source: ShutterStock/Anthony Correia.

with the strong authorial voice of its founder Markos Moulitsis, but it quickly grew into a "site of sites," with links to and from many smaller less prominent blogs on the political left. As it expanded, *Kos* gained prominence and was, in turn, linked to by mainstream websites such as CNN and MSNBC, making it a critical aggregator for a mix of news and opinion on the left, finding material across the blogosphere and filtering it for mainstream media. Other sites, like Josh Micah Marshall's Talkingpointsmemo.com, function in a similar way, but do more original reporting, acting more like small independent web journals blending high-quality reporting and opinion. On the right, similar blogs operate in different media ecology, sharing space with the large amplifying media of conservative talk radio and Fox News. Sites like the *Drudge Report* (started in 1994 as a mailing list and the original model of national voice online) often circulate unsubstantiated rumors or talking points, which become amplified as they are picked up by larger media.

Finally, there are a series of blogs that report on changes in the media, and particularly on citizen journalism itself. The broadest may be Pressthink .org, run by Jay Rosen, a professor who was a founder of the public journalism movement. *Pressthink* regularly points to new developments in citizen journalism and critically thematizes and debates issues. Other important sites on citizen journalism are Dan Gilmor's Center for Citizen Media, Jeff Jarvis's Buzzmachine.com, and the *Online Journalism Review*. *J-Lab,* founded by citizen journalism leader Jan Shaffer, has been a critical incubator for new efforts. Prominent media studies think tanks and some foundations focus a significant part of their efforts on citizen journalism, including the Knight Foundation, Harvard Berkman Center, and the Center for Communication and Democracy.

Trends

Citizen journalism is emergent by its nature, which makes it hard to draw overly sharp lines on specific models. However, some general trends are evident.

Incorporation of Locality

One of the strengths of citizen journalism lies in the ability of local citizens to report on topics that have been considered too narrow by traditional media, creating a comparative advantage in both niche targeting and community building. "Hyperlocal" or "place blogging" specializes in matters at the level of zip code or even neighborhood. One of the most prominent is *Baristanet,* a group blog about three neighborhood areas in New Jersey. To make up for its narrow local audience, the site aims for a loyal readership; it received 7,000 daily visits in 2008.

Citizen-generated local media operates on a more public scale. Local media are created and written by local citizens concerned with local issues. *The Forum* in Deerfield, Ohio, and Northfield.org in Northfield, Minnesota, were founded by local volunteer non-profit organizations to build local media where none had existed. The sites are managed by paid staff, but receive reporting from local citizen journalists, emphasizing the role of the local media in strengthening local community.

Aggregation of hyperlocal news also collects reports of local interest from various sources. Since hyperlocal news is generally covered in local citizen media and place blogs, this model practically functions as an overarching news service for local citizen journalism. The site *Outside.in* uses search engines to collect local news sources and categorizes them into over 11,860 towns and neighborhoods. *Outside.in* accepts direct local citizen reporting as well.

Pro-Am

There is a growing recognition of the need to combine professional and amateur reporting. To maintain journalistic quality while keeping entrance barriers low, mixed approaches are being implemented with prominent success. The pro-am civic reporting model incorporates news reports from both citizen contributors and their own professional staff writers. At the New York–based site *Gotham Gazette,* professional staff writers write major articles on current civic issues, while opening the doors for citizen contributions. *Voiceofsandiegoorg,* based in San Diego, takes the level of professionalism a step further. The site is a nonprofit organization, and its news structure resembles traditional daily newspapers while equally incorporating citizen contributions.

On the other hand, the commons and citizen training model puts emphasis on enhancing the journalistic quality of citizen contributions through news reporting training for aspiring citizen journalists. *MyMissourian* and *Twin Cities Daily Planet* are prominent sites that provide open workshops to citizens. *Madison Commons* in Madison, Wisconsin, has trained more than 100 residents in workshops to report on neighborhood topics in the course of two years with the goal of raising citizen reporting standards.

Convergence and Collectivity

Models built on Web 2.0 more directly are implementing new techniques like crowdsourcing. By issuing open calls for citizens to add new information to a story, each contributor is relieved of having to write a whole piece. The resulting articles have a rich layer of information and viewpoints. In 2006, the Fort Myers, Florida–based newspaper *News-Press* opened up its investigative report on local water and sewer system troubles to citizens. An overwhelming number of responses came in via online forums, email submissions, and phone calls, and the issue was covered in more depth and stirred more public discussion than most conventional investigative reporting.

Citizen-contributed aggregators and news services are also growing rapidly. They combine and categorize citizen-produced articles and traditional journalism, blurring the line between the two. Moving a step beyond editor-managed aggregators such as *Huffington Post,* services like *Newsvine* let the citizen's vote decide what articles are shown as headlines, and social indexing can change the categorical context in which an article is read. NowPublic.com is one of the most successful news crowdsourcing sites to date. Any user can submit articles, contribute additional information ranging from related links to cell phone footage, make an open call for others to contribute, and also recommend articles that should be promoted to the front page.

Citizen journalism will continue as the most rapidly growing segment of online reporting. Increasingly, traditional news organizations online will come to resemble mixtures of citizen and traditional journalism.

Civic Journalism

The journalistic concept of "civic" (or "public") journalism is multifaceted. It simultaneously represents (1) an argument about the role and responsibility of journalism in a democratic society; (2) a set of practices that have been tried in actual newsroom settings; and (3) a movement of individuals and institutions concerned about strengthening journalism's contribution to public life. Following this tripartite distinction, this entry outlines public journalism's basic argument, describes how public journalism is practiced, and considers the individuals and institutions most responsible for its development as a journalistic reform movement.

Public journalism's broader journalistic significance lies not only in having inspired hundreds of newsroom experiments in the United States and elsewhere, but also in having prompted much debate among scholars and journalists alike about journalism's fundamental mission. Indeed, public journalism's challenges to mainstream journalism continue to reverberate throughout the profession, notably in discussions about the need for a more citizen-oriented form of journalism.

Basic Argument

Central to public journalism is the underlying argument that journalism and democracy are intrinsically linked, if not mutually dependent. While scholars and journalists acknowledge that the practice of journalism depends on certain democratic protections, most notably freedom from government intervention, they maintain that democracy depends upon journalism that is committed to promoting active citizen participation in democratic processes. Mainstream journalism's failure to encourage citizen participation, advocates argue, has contributed to widespread citizen withdrawal from voting as well as declining civic participation in community affairs. It also has contributed to declining public interest in, and perceived relevance of, political journalism, as evidenced by declining newspaper readership. Put differently, advocates perceive contemporary society as being riven by two widening (though not yet irreversible) gaps: between citizens and government and between news organizations and their audiences. To help reduce those gaps, advocates argue that journalists should inspire increased civic commitment to, and active participation in, democratic processes.

To further such democratic ideals, advocates argue that journalists must change the ways in which they have perceived the public and their own role in public life. Instead of seeing the public as passive spectators who only seek news to be entertained, or even as consumers who watch or read news to learn about government officials, experts, and other elite actors, journalists should perceive the public as engaged citizens who are

concerned about active democratic participation. Implicit in this argument is the claim that mainstream journalism's tendency to focus election reporting on campaign-managed events, candidate strategies and image-management techniques, horse race polls, or scandal coverage positions the public as mere spectators to a political spectacle. At best, mainstream journalism's efforts to inform the public about actions by the political elite suggest that the public need not be actively involved.

Second, and equally important, advocates argue that journalists need to reconceptualize their own role in public life. Instead of perceiving themselves as disinterested or neutral observers who occupy a privileged position detached from other citizens, journalists should be political actors or fair-minded participants who care about whether public life goes well. Implicit in this argument is the claim that journalism's virtually exclusive focus on the perspective of elite actors has distanced news people from concerns of ordinary citizens.

While public journalism is a relatively recent notion (scholarly and practical writing on the topic date to the early 1990s), its basic argument has deep historical roots. Beginning with the famous debate about the role and responsibility of journalism in a democratic society between journalist Walter Lippmann and philosopher John Dewey in the 1920s, public journalism's underpinnings can be traced back to the reports of the Hutchins' Commission on Freedom of the Press in the late 1940s as well as to several theoretical and empirical works on deliberative democracy a half century later. Aside from these influences, the most immediate historical "cause" of public journalism was the much-criticized news coverage of the 1988 U.S. presidential election between the senior George Bush and Michael Dukakis. While the news coverage focused overwhelmingly on the candidates' personalities, strategies and tactics, and horse race polls, the candidates themselves used simplistic image-management techniques to appeal to voters, as exemplified by television advertisements featuring Bush visiting flag factories to show his patriotism and Dukakis climbing aboard a tank to show his tough stance on defense policy. Following the election, scholars and journalists alike, many of whom subsequently became advocates of public journalism, called for radical changes to election reporting, notably a move away from candidate strategies and tactics to a focus on substantive policy issues of concern to voters.

Practical Manifestations

Although much has been said in favor of public journalism, the notion is defined more clearly by practice. In contrast to its advocates' rather general pronunciations about what public journalism should be, many journalists have engaged in practices clearly different from those of mainstream journalism.

Public journalism is best understood as a series of experiments that emerged within the mainstream U.S. news media in the late 1980s and early 1990s. Since 1988, when the first public journalism initiative was launched by the Columbus, Georgia, *Ledger-Enquirer,* more than 600 such initiatives have been carried out across the United States and elsewhere. Most initiatives have been conducted by newspapers—more than 300 dailies, or about one-fifth of all daily newspapers in the United States, have been involved with one or more public journalism initiatives. Similarly, while most of these initiatives have been carried out by individual newspapers, more than 160 (about one-quarter of all initiatives) have included partnerships among newspapers, television, and radio stations.

While public journalism initiatives exhibit different characteristics, these initiatives can be grouped into three categories: (1) elections, (2) special reporting projects, and (3) efforts to make public journalism an integral part of routine journalism practices. During local and national elections, news organizations practicing public journalism have made efforts to focus their reporting on problems of concern to voters rather than on candidate agendas. This has included identifying voter concerns through telephone surveys, in-depth interviews, and focus group discussions; elaborating on voters' opinions and where they differ from those of candidates; soliciting voter questions to candidates and publicizing candidates' answers; facilitating social interaction among voters and candidates in the form of town-hall meetings; and reporting the outcomes of those voter–candidate encounters.

Although election initiatives were an early and visible example of public journalism, they account

for only about 10 percent of the effort to date. Most initiatives have focused special reporting on problems of community concern. Since the early 1990s, news organizations practicing public journalism have engaged in a wide variety of reporting on such problems as racism, educational inequality, and poverty. As with election initiatives, news organizations have used various information-gathering methods to identify problems of concern, reported on those problems from the perspective of residents rather than government officials and other elite actors, offered residents opportunities to articulate their opinions, elaborated on what residents can do to address given problems, and helped organize roundtable discussions, community forums, and local civic organizations.

Aside from such project-based initiatives, news organizations have also sought to make public journalism an integral part of their routine practice. Some news organizations have restructured newsrooms from conventional beat systems to focus instead on geographic- or topic-based teams. Other news organizations have met with residents on a regular basis to discuss which problems they would like to see covered, report on those problems, and encourage residents to evaluate their coverage.

Sources of Support

Several individuals and institutions have helped ensure that public journalism has been one of the best organized social movements inside American journalism. Public journalism efforts can be traced to 1987 when James Batten, then-CEO of Knight-Ridder (purchased by McClathy in 2006), instituted a company-wide initiative known as "Community Connectedness," to strengthen the relationship between its newspapers and their local communities. When Batten learned of the Columbus, Georgia, *Ledger-Enquirer*'s efforts to involve local residents more actively in community affairs through its "Columbus Beyond 2000" initiative, he appointed the *Ledger-Enquirer*'s then-editor Jack Swift "Editor-of-the-Year." Many of public journalism's earliest practitioners, including the *Akron Beacon Journal,* the *Charlotte Observer,* the Columbia, South Carolina, *State,* and the *Wichita Eagle,* were owned by Knight-Ridder.

As he was being lauded, Swift contacted the Kettering Foundation, which works to strengthen democracy in the United States and elsewhere. Kettering introduced him to Professor Jay Rosen of New York University. Rosen and the Kettering Foundation played key roles in the development of public journalism as a journalistic reform movement. Aside from influencing the nascent movement with his writing, Rosen helped establish (with a grant from the Knight Foundation) the Project on Public Life and the Press at New York University. Led by Rosen and Lisa Austin, a former journalist from the *Wichita Eagle,* the project operated from 1993 to 1997, documenting early experiments in public journalism. Since the early 1990s, the Kettering Foundation has helped support public journalism by publishing books and awarding fellowships to scholars and journalists from around the world interested in learning more about the movement.

In 1993, the Project on Public Life and the Press was joined by the Pew Center for Civic Journalism (funded by the Pew Charitable Trusts) to strengthen public life in the United States. A decade-long initiative set in motion by Ed Fouhy, a nationally renowned former CBS producer and its first president, and Jan Schaffer, a Pulitzer Prize–winning editor from the *Philadelphia Inquirer* who became president when Ed Fouhy stepped down in 1998, the Pew Center for Civic Journalism emerged as the most important institutional vehicle for the public journalism movement. From 1993 to 2003, the center supported the movement by organizing numerous workshops for editors and reporters, funding more than 120 newsroom experiments in public journalism, publicizing the most innovative of those experiments through its "James K. Batten Awards for Excellence in Civic Journalism," engaging in extensive publication and outreach efforts, notably through its quarterly *Civic Catalyst* newsletter and various publications on the theory and practice of public journalism, sponsoring empirical research on public journalism's performance, and maintaining a comprehensive archive of newsroom experiments in public journalism submitted to it for recognition and/or advice (now housed at the Wisconsin Historical Society).

Moreover, the Pew Center for Civic Journalism complemented the work of the Project on Public Life and the Press by reaching out to commercial broadcasters, including funding numerous

multiple-media partnerships among press and broadcasters, and with workshops for news directors, producers, and reporters at National Public Radio and the Public Broadcasting Service. Finally, the Pew Center for Civic Journalism was an early supporter of the Civic Journalism Interest Group (formed in 1994 and renamed the Civic and Citizen Journalism Interest Group in 2006) of the Association for Education in Journalism and Mass Communication, the premier scholarly journalism association in the United States. This interest group remains one of the most important sites for journalism scholars, educators, and practicing journalists to assess the theory, practice, and teaching of public journalism.

Since the Pew Center for Civic Journalism closed in 2003, much of its work has been continued by the Public Journalism Network, a global professional association of scholars and journalists committed to public journalism. Led by Professor Leonard Witt of Kennesaw State University in Georgia, who holds an endowed chair in public journalism, the network cosponsors various workshops in collaboration with the Civic and Citizen Journalism Interest Group, produces publications on the theory and practice of public journalism, serves as a forum for the sharing of curricular and instructional innovations in the teaching of public journalism, and maintains a weblog with continuously updated information about public journalism initiatives around the world.

Civil Unrest, Coverage of

Journalism, like most professions, periodically confronts political and social crises which challenge the fundamental norms and routines of its practitioners. For journalists, such crises pose a particularly acute problem. In times of crisis, or more specifically moments of civil disorder or unrest, journalists must not only come to grips with the reality of a situation as individual citizens; they must also attempt to make sense of such incidents for their readers and viewers. Consequently, as storytellers, journalists are located in a precarious position. They must make the often incredible and sometimes inexplicable accessible to audiences. Doing so requires journalists to reposition themselves vis-à-vis the standards and routines of the profession and to consider what the past may offer as a possible reference point for their coverage.

Communication researchers have examined journalists' coverage of civil unrest from many perspectives, reviewing newspaper articles, television broadcasts, visual images, and magazines as items of study. Across media, such studies have focused on issues including sourcing practices, journalistic routines, news content, narrative forms, and collective memory. Alongside these studies, communication scholars have simultaneously examined what impact coverage of civil unrest has had upon the journalistic profession and its audiences. Taken together, these areas of inquiry reinforce the significance of journalists' coverage of civil unrest in shaping discourse surrounding race, class, and gender, among other topics preoccupying contemporary society.

Origins

History is rife with examples of civil unrest, moments which necessarily demand the attention of journalists due to the often unexpected and sometimes widespread nature of such events. Civil unrest is an example of a "primary or cardinal news value," as cultural theorist Stuart Hall and his colleagues assert. Hall et al. point to the newsworthiness of incidents which are dramatic and personalized, have negative consequences, and concern elite individuals or nations. Stories of civil unrest often exemplify these characteristics. Civil unrest is a particular type of "disorder" story—news which threatens the status quo. As sociologist Herbert Gans argued, disorder news typically falls within one of four categories: natural, technological, social, and moral. While the phrase "civil unrest" may be interpreted in a variety of ways, here it is used as a synonym of civil disorder or civil disturbance meant to signify a display of collective discontent by one or more groups. Using this definition, civil unrest may be in the social or moral disorder categories that Gans outlined, though it may be related to natural or technological disorder. Civil unrest may involve violence, but not necessarily. However, news stories which tend to attract most attention from journalists are those of a more extraordinary nature.

Examples of "civil unrest" include, but are not limited to, demonstrations, protests, and riots. The urban riots which broke out across American cities in the late 1960s and the violence which broke out at the 1968 Democratic National Convention in Chicago are highly visible examples of civil unrest turned deadly. The outbreak of violence following the 1992 verdict acquitting Los Angeles police officers tried for beating African American motorist Rodney King is another example of civil unrest. Coverage of civil unrest, thus, may dovetail with media coverage of crime or disaster. Coverage of civil unrest also tends to incorporate those entrusted with quieting protests or subduing rioters: law enforcement officials.

While examples of civil unrest may differ in scale and scope, they raise questions regarding how journalists narrate moments which challenge traditional journalistic routines, what specific frameworks for storytelling journalists deploy to explain incidents to their audiences, as well as how to maintain ideals upon which news media stand. To explore these questions, one must look at the routines which shape news content, from the day-to-day workings of the newsroom to sourcing practices.

Journalistic Routines and Sourcing Practices

Periods of civil unrest—moments which often disrupt traditional journalistic routines—necessarily place journalists in the position of having to generate news under constraints often different from day-to-day workings of a newsroom. Studies of newsroom practice have been undertaken predominantly by sociologists. Warren Breed's seminal 1955 study mapped newsroom contours by exploring mechanisms of "social control" and the often informal ways in which journalists "learn the ropes," emphasizing structures in place intended to encourage conformity. According to Breed, journalists' conformity to the unwritten codes of the profession can typically be attributed to journalists' desire to move up within the organization, their sense of obligation to their superiors, lack of in-group fighting, the general "pleasure" they derive from their jobs, and concern with institutional authority and the potential repercussions of that power, among other factors. More than two decades later, Gaye Tuchman's and Herbert Gans' respective ethnographic studies emerged, offering insight into the practices of news production. Tuchman uncovered "routinization" which journalists undertake daily and the modes of classification and typification such as hard news, soft news, spot news, continuing news, and developing news which help them order their work. In addition to analyzing news content and underlying values embedded in news, Gans examined practices of story selection and sourcing which determined content of news. According to Gans, news is the product of a "tug of war" which reveals structures of power.

The power wielded by journalists to "create" news is one that is negotiated between editors, publishers, and sources. Sources are fundamental to journalistic practice as they provide not only information but also credibility to the story. Thus, as sociologist Leon Sigal has argued, journalists tend to rely heavily on "routine" channels of information gathering such as official proceedings,

press conferences, and press releases, typically seeking out officials and those in power. Sigal's study of news content between 1949 and 1969 showed that while officials remained the most readily cited sources in news articles, their frequency increased over time. This was a finding later reinforced by Gans, who argued that individuals are most likely to be sources if they have power, are able to supply suitable information, and are geographically and socially proximate to journalists themselves. Hall et al. call those who wield the ability to define the parameters of incidents and frame their meaning "primary definers"—those with power and consequently the easiest access to journalists and, by extension, news organizations. While the existence of primary definers suggests that the power to define news is not solely in the hands of journalists, Hall et al. concurrently theorize news organizations performing a secondary role, still within the institution but constrained by its structure. Challenges to journalists' sourcing practices are particularly acute during moments of civil unrest, for often journalists are confronted with the challenge of covering not only the "official" story as told by those in power but also the often less powerful groups displaying their collective discontent.

Content Analysis and Narratives

Because of the often highly visible nature of civil unrest, journalists are obliged to cover such incidents. How journalists cover civil unrest, however, has preoccupied researchers and news people for decades. How an incident is covered is typically examined using methods such as content analysis and/or textual analysis, methods which closely examine *what* is presented by journalists as well as *how* it is presented—what broader frames are constructed to aid in understanding a story. Thus, scholars examining coverage of civil unrest typically fall into two categories: (1) those who study news content; and (2) those who study frames and narrative. Frames, as sociologist Todd Gitlin defines them, are journalistic modes of organizing written and visual texts into digestible forms which necessarily highlight certain pieces of information and exclude others. While these are not wholly independent categories, for communication scholars often study these threads of inquiry simultaneously, each branch of research asks a different set of questions which carry implications for how news is made and subsequently received.

News coverage of civil unrest is considered by many researchers to have widespread effects upon how individuals perceive the nature of the action as well as the individuals participating in it. Consequently, researchers have focused on uncovering what news coverage of civil unrest looks like in different contexts, using different case studies as exemplars.

News Content

In the 1960s, civil unrest dominated American news coverage due to movements sweeping the country including the civil rights, anti–Vietnam War, and women's and gay rights movements, among others. The visibility news media coverage afforded was not lost on these protesters. Civil rights leader Martin Luther King Jr., for instance, encouraged African American protesters to wage their battles before television cameras and reporters for their respective papers, hoping journalists would provide a voice and powerful visuals. Without media coverage, disturbing scenes of protesters being blasted with fire hoses and attacked by police dogs of Birmingham, Alabama, police chief "Bull" Connor in 1963 would not have caused a national outrage over the graphic images.

Gitlin examined the impact of news media coverage on the trajectory of Students for a Democratic Society (SDS), a critical element in the New Left movement of the 1960s, exploring how the organization was depicted. He argued that SDS was profoundly impacted by coverage, for it was news media that gave SDS national visibility, covering its anti–Vietnam War demonstrations. An "adverse symbiotic" relationship emerged between news organizations and SDS: the former needed stories, and SDS needed media to provide continued visibility. Tracing this relationship from SDS's relative invisibility in news to virtual omnipresence, Gitlin argues that media coverage, which eventually uncovered internal workings of the movement, ultimately led to its demise by magnifying developing fractures.

The various frames news organizations deployed for covering SDS and its actions changed over time. Initially, Gitlin argues, news organizations

used several devices to cover SDS including trivialization, polarization, emphasis on internal dissension, and marginalization. Each of these devices was intended to undermine the movement, emphasizing the deviance and extremeness of its members. Yet as news media became increasingly preoccupied with SDS, the movement's leaders sought actions that would attract media attention. Decisions made within the movement became dependent upon what members believed would garner the most news coverage. SDS's reliance on and preoccupation with news coverage contributed to its ultimate demise.

Representation of civil unrest was similarly pivotal during the 1968 Democratic National Convention (DNC) in Chicago. While the DNC was covered famously by such "new journalists" as Norman Mailer, the 1968 convention proved a transformative moment for journalists covering the city's police. The 1968 DNC is a pivotal moment in journalism history and coverage of civil unrest. According to Gans, prior to the convention, police action against demonstrators had been covered by news organizations as a requisite effort needed to restore law and order to unruly masses. Although protesters had proclaimed "police brutality" in the past, efforts of police were typically considered lawful. News coverage of the convention changed that, as images of police beating demonstrators were broadcast nationally. The violence at the convention shifted news discourse of police actions from necessary and lawful to unnecessarily brutal.

Television coverage of the anti–Vietnam War movement in the late 1960s also had a profound effect on how people saw the controversial war. During the early years of the war (to about 1965), reporters subscribed predominantly to a form of consensus journalism that did little to challenge the decisions of the Kennedy or Johnson administrations. However, starting in 1966, according to communications researcher Daniel Hallin, consensus was no longer the norm. Rather, journalists began to reveal dissent, presenting opposition to the Vietnam War. This move, according to Hallin, signified a shift in the nature of coverage from the "sphere of consensus" to a "sphere of legitimate controversy," a site for citizens to protest and debate American involvement in the war. As such, coverage of anti-Vietnam protests and dissenting opinions opened up a potential for greater political involvement by members of the news media as well as audiences. However, the manner in which the anti-Vietnam protesters were covered, at least early on, suggested that they were threatening law and order—that they were extremists "provoking" violence. Thus, while protesters helped shift American opinion against the war, their protests were only slowly legitimated by news coverage.

This general trend—the initial marginalization by news organizations of groups engaging in civil unrest—has been dubbed the "protest paradigm." The "protest paradigm" reinforces the idea that news organizations, while potential agents of social change, are more likely to marginalize groups seen as somehow threatening the status quo. However, while studies have shown a general trend toward marginalizing social protesters, researchers have found that the type of protest impacts coverage as well. Boyle et al., for example, found that war protests tend to be more "deviant" than other forms of demonstration (i.e., labor or social protests).

Conducting a study of protest coverage in Wisconsin newspapers between 1960 and 1999, researchers found that papers became increasingly wedded to the status quo over time. What this meant for news coverage was that the types of protests covered by news media were those deemed less threatening and potentially subversive. Researchers posit that such a shift may be attributable to newspapers' need to cater to demands of their readership. Another alternative is that protests themselves have become less deviant.

Narrative

While many researchers are concerned with the nature of civil unrest news content, studies examining its narratives have flourished since World War II. By 1968, with the report of President Lyndon B. Johnson's Kerner Commission (the National Commission on the Causes and Prevention of Violence) following the outbreak of riots across the United States in cities including Newark, Detroit, and Los Angeles, the effects of how news media narrated stories to their readers and viewers were already being challenged. The commission cited media as one among several factors at fault in perpetuating an atmosphere of civil

unrest across the country. The commission critiqued media for failing to adequately cover the nation's racial tensions, and ultimately charged news media with failing to narrate the plight of African Americans.

Storytelling, or narrative construction, is a fundamental part of journalistic work. The very existence of narratives suggests that there are various ways that any story can be constructed. Researchers have taken up the topic of journalistic narratives of civil unrest and attempted to make sense of them.

In the wake of the urban riots in Detroit in 1967, one sociologist examined the role of television in communicating information to communities during the riots and the sources of information for the black community. He concluded that television proved an important informational tool for city residents who were exposed to a recent history of uprisings through the medium. The news media, he argues, primed the issue of civil unrest through coverage of other protests and riots.

Sociologist Ronald Jacobs examined coverage of the 1965 Watts riots in Los Angeles and 1992 riots following the verdict in the Rodney King police brutality trial, arguing that such coverage revealed the role of the black press in creating an alternate space which could provide a counter-narrative to that provided by the mainstream media. This study of the riots focused on news content as well as the larger narratives within which news stories are told. According to the research, articles immediately following the outbreak of violence surrounding Rodney King focused predominantly on describing the rioters and primary explanations for the causes of destruction. Noting differences between the city's black press and mainstream dailies, Jacobs argues that while news media constructed narratives surrounding race, the nation, and civil society, the black press provided alternative explanations for the outbreak of violence.

Scholars have built upon this work by examining the 1999 Seattle protests against the World Trade Organization (WTO) and how coverage of the globalization movement transformed over time. In their case study, they uncovered the complexity of the relationships between journalists, protesters, and media events, providing evidence of the "protest paradigm" as well as evolution within coverage, framing protest more positively.

Collective Memory

While the ways journalists narrate events have preoccupied many researchers seeking to understand coverage of civil unrest, others have examined journalists' role in the construction and preservation of collective memory. Collective memory's place in studies of journalism has gained greater currency since the 1990s. Memory, as communication scholars have argued, is a complex entity, subject to transformation across time and space.

According to researcher Jill Edy, journalists use the past in three distinct ways: (1) as something to commemorate, (2) as an analogy, and (3) as a context. Using the 1965 riot in Watts, Los Angeles, as an example, journalists periodically return to the story not only to commemorate anniversaries but also to explain and provide context for present-day events. Researchers have also explored how coverage of civil unrest impacts journalism itself. Journalists form an "interpretive community" which unites them through shared discourse and ways of narrating events. Understanding journalists as an interpretive community affords them a degree of authority as interpreters. During moments of crisis or civil unrest, authority of journalists is placed in stark relief as they attempt to make sense of incidents that often defy simple explanation. As communications researcher Barbie Zelizer and others have argued, during moments of crisis or civil unrest journalists must renegotiate the bounds of their practice.

Moral Panics

While journalists use crisis coverage to repair ruptures within their own institutions and reassert their authority as storytellers at a time when their authority is challenged, journalism researchers have also examined how news organizations develop and in some cases perpetuate cases of moral panic. A situation that emerges when official reaction to a given problem or problems is disproportionate to the actual threat itself, moral panic can be a product of disproportionate attention by news organizations. News organizations, as Hall et al. have argued, were instrumental in bolstering the notion of a mugging epidemic in Great Britain in the 1970s and subsequently advanced an understanding of "mugging" that

combined concerns regarding race, youth, and crime. In this case, coverage of crime contributed to civil unrest, as citizens became increasingly concerned with the security of society.

Researchers continue to assess news coverage of civil unrest. While some studies have shown that coverage of civil unrest has revealed a degree of journalistic routinization, the unpredictable and sometimes extraordinary nature of civil unrest continues to challenge conceptions of how journalists cover and describe events and consequently what effects these stories have upon audiences and journalists themselves.

Classified Advertising

Since the mid-1990s the term *classified advertising* has expanded from those relatively short messages merely appearing as print ads to more elaborate types of advertising in various periodicals, as well as on the Internet and cable television. As newspaper classifieds have notably declined, those on electronic media continue to expand.

Classified advertisements have proved to be a boon for consumers and newspapers for hundreds of years. They have proved to be a useful resource across demographic and other boundaries. Today, these ads of the people are "classified" into different categories, ranging from different jobs available, apartment rentals, and even matrimonial propositions.

Characteristically, the text of classified advertisements is set in uniform type size and style, usually without illustration. The three major headings are Employment, Real Estate, and Automotive, although there are many additional categories. Classified advertising is usually located in its own separate section of a publication and has its own rate card. It is responsible for a major portion of most publishers' revenue. Rates are based on the amount of space (words or lines of copy) and the length of time the ad will run. The longer the run, the cheaper the per diem rate will be.

Quite simply, print advertising is divided into two basic categories, classified and display advertising.

Development

The term *classified* emerged in the nineteenth-century newspapers because it generally grouped

together small ads within the publication under headings classifying the product or service being offered. Thus, ads were grouped into distinct categories in one section of the newspaper, distinguished from the larger illustrated "display ads." The latter, interspersed with editorial content, were generally placed by businesses or individuals engaged in at least some moderate-sized enterprises.

There were subtle changes in style over the years. While "want ads" became a category by 1835–36, led by the New York *Morning Herald* in 1848, the practice of placing a small illustration cut in the top left corner of ads as a categorizing tool was discarded in favor of classifieds with the first line set in small capital letters. The only difference for the next century was that only the first or index-word was capitalized, for example, "HOUSE for Sale."

Gilbert Gundersen, in *The Story of Classified Ads,* notes that by the 1920s, one could see readers turn to the back pages of a newspaper, preferring to peruse the classified section before reading through the headlines of the day. For the man out of work, the most vital section of the paper was found in the "Help Wanted" classifieds.

During World War II, help-wanted advertising increased dramatically as men left jobs to enter the armed forces. This left a tremendous number of jobs that needed to be filled. During July 1943, for instance, the *Chicago Tribune* noted that such ads had swelled its classified section to the point where 51 percent of the newsprint consumed that month was devoted to classified ads. Because of the war, newsprint was at a premium; yet the Chicago newspaper wished to maintain its dominance as a classified medium. The solution combined switching to a nine-column format and using smaller type. This actually increased the average number of revenue lines per column by 20 percent.

The author of a leading advertising textbook in 1950, Otto Kleppner (*Advertising Procedure*), articulated the vital importance of classifieds in media culture of the day. Classifieds are closely read, he argued, for the person who looks at them is already interested in the product or service they advertise. Classified advertising remained of major importance to newspapers into the early 1960s, though it was only of occasional interest to national advertisers. More interest had developed in classified display ads: more white space, larger typefaces, illustrations, and, by the 1990s, color.

Some national outlets for classifieds appeared, starting in 1982 with *USA Today*, the first nationally produced general daily newspaper. In August 2008, the newspaper's "Marketplace Today" contained such classified categories as Business Opportunities, Investment Property, and Health/Fitness. "Real Estate Marketplace" consisted most of classified display ads in such categories as Pre-Fab Homes, Land, Time-Share, and Condos.

Other prominent newspapers included classifieds in their national editions. In one representative 2008 issue of *The New York Times*, for example, a typical one-half page section was devoted to "National Classified Advertising," most of which were real estate ads, categorized according to state, city, or even county. Most referred to locations in the New York metropolitan region. In the same month, *The Wall Street Journal* included a page of mostly classified display ads fit under the heading of "Waterfront Properties," with subheadings in various states.

Emerging Technologies

Well into the 1990s, most people turned to print ads when looking for a job, apartment rental, or real estate. Yet the Internet classified market had emerged to change that situation by 2000, and more newspapers were beginning to appear on the World Wide Web, either charging readers for the extra service or including it as a bonus to advertisers. Print classifieds offered very limited information while the web could provide enhanced descriptions as well as digital media, including video and audio, as well as the "search and find" feature.

The initial competition for newspaper classified advertising had come from online services that introduced two concepts to the world of classifieds: aggregation and vertical sites. New web competitors offered vertical services—a single category of classified advertising such as jobs—with the added value benefit of compiling classified advertising from numerous markets. Prospective job seekers, particularly those looking to relocate from other areas, now could look at a single site and see employment opportunities anywhere in the country (or internationally) without seeking out-of-town newspapers.

There is a notable blurring between print and broadcast media, as increasingly local newspapers are turning to broadcast quality video reports on their web locations. It may be getting to the point where there may be no such thing as a print media outlet, broadcast media outlet, or a web media outlet. All will become multimedia outlets.

Sam Diaz, staff writer for *The Washington Post*, wrote in the August 31, 2007, issue that before the advent of the Internet, a classified ad for Andrew Davis's 2001 Mitsubishi Montero SUV might have been limited to two lines of descriptive shorthand: A/C, pwr pkg, 6cyl AT, 2wd, $9k firm. Today, in ads on the Internet, Davis can post pictures of his car in an off-road setting and sharing such details as when the timing belt and water pump were last replaced. He can include a link to a feature article about his car's model in *Popular Mechanics*. All this was posted free in classified ads on Craigslist and other networking sites. He also paid for an ad in *The Washington Post*, a bundled deal that also put his listing on Cars.com and other websites. His approach of putting his vehicle in front of as many potential buyers as possible illustrates how dynamic the process of classified advertising has become.

Changing Revenue Streams

Once a steady source of revenue, classified advertising at some larger newspaper chains dropped 14 to 20 percent in 2007 to 2008, notably in once-lucrative segments such as automotive, real estate, and employment ads. This drop eclipsed that experienced even during the Great Depression of the 1930s, and this is largely due to fundamental newspaper challenges. Circulation is declining as readers move online and advertisers chase them, looking for more targeted and measurable ad outlets. There are also cyclical issues: the economic and real estate downturn in 2007 to 2008 hurt advertising badly, particularly the national, retail, and classified ads that newspapers depend on. As one example, a yield of $12.1 million for classified advertising at the venerable *Milwaukee Journal Sentinel* (both print and online) represented a decrease of about 22 percent for the first quarter of 2008. This was the eleventh consecutive quarterly decrease in the paper's classified advertising.

Internet advertising presents a contrasting picture. By mid-2007, online traffic to classified ad sites had grown 23 percent, to more than 46 million unique visitors, up from about 37 million a year earlier. Wal-Mart, the world's largest retailer, launched an online classified advertising site, a move to open a broader range of shopping to its Internet customers.

Yet all the print news is not bad. Newspapers serving smaller suburban communities are faring much better than their counterparts in large metropolitan areas. Total ad revenues for community papers experienced a relatively modest decline of 2.4 percent in 2008 from the previous year. Community papers provide hyperlocal news and advertising that no other medium can effectively provide. Their unique local product contrasts with national and international news delivered by bigger papers. Yet the very definition of the local audience is expected to change constantly. Many are as apt to check out ads in *USA Today* (in print and on line) or other websites when looking to change jobs as they are to turn to local publications.

The classified market has become increasingly fragmented as a growing number of companies search for ways to convert offline newspaper ads into a web format. Two primary online approaches are emerging. One is simply to shift traditional classifieds to the web, aggregating ads to a single site. The other involves distributing those aggregated ads over as many websites as possible.

Many in the newspaper industry blame Craigslist, the seventh most popular website in the United States, for the downturn of their classified advertising business. A no-frills, ad-free, user-sensitive site, Craigslist has generated more than 600 million free classified listings. But companies are trying to do things online that lead to offline transactions, and because ultimately transactions resulting from classified advertising will involve offline interaction, local papers say they will remain key players, even as classifieds find more venues online.

The Yellow Pages

The very first time the term *yellow pages* was used was in 1881. It is alleged that a printer working on a regular telephone directory ran

out of white paper and used yellow paper instead. Then in 1886, Reuben H. Donnelly produced the first Yellow Pages directory in Chicago, featuring business names and phone numbers, categorized by the types of products and services provided.

While the term *classified advertising* may not bring the Yellow Pages to mind, they are one of the primary examples of this ad form. The Yellow Pages' history goes back to 1864, when Richard Robert Donnelley established a small printing plant in Chicago. In 1874, his company, R.R. Donnelly and Sons, developed and printed the *Chicago City Directory*, the first listing of companies and their addresses, which has evolved into what today is known as the telephone directory. In early 1886, the Chicago Directory Company began publishing a phone directory three times a year for the Chicago Telephone Company. That event is generally acknowledged as the birth of the classified telephone directory advertising industry—the Yellow Pages. The Yellow Pages continue to be an incredibly efficient advertising medium.

With the explosion in classified advertising activity on the Internet since the late 1990s, the Yellow Pages have suffered the same problems as newspapers. And, like many newspapers, directory publishers are competing by setting up their own online sites. In the future of classified ads newspaper publishers understand that their classified advertising businesses will be fundamentally different in the future. Joint efforts go beyond a newspaper posting local help-wanted ads on its own website. CareerBuilder, for example, is a jointly administered site on which Knight Ridder and Tribune Company combine their recruitment ads; the site has national reach and enough traffic to compete with the two leading job posting sites, Monster.com and HotJobs.com. The CareerBuilder site, in turn, can give employers access to individual markets through participating newspapers' print want ads.

In recent years, as customers migrated to the web, the telephone directory business followed, hoping that the Internet would save it. The strategy has not panned out. The audience for online Yellow Pages remains relatively small, and the glut of online directory services competing for the advertiser dollars of local businesses means that there is no authoritative site that advertisers can approach. Actually, between 2005 and 2008, Yellow Pages publishers made concerted efforts to reinvent themselves, launching numerous digital offerings for advertisers. The 2008 economic downturn compounded the situation. In 2009 print and online ad spending on Yellow Pages is expected to plummet 6.3 percent, more than double the rate of decline projected for broadcast television, noted John Janedis, a Wachovia analyst. It's anticipated that from 2008 to 2012, ad spending will fall 39 percent in print directories alone. This is the steepest projected decline across all local media categories, according to media research firm Borrell Associates. Finally, the publishers have been facing considerable debt, posing the real prospects of extinction.

It is crucial for local newspapers to protect their recruitment-ad turf against the national—in fact, borderless—online sites. Classified advertising has generated up to 40 percent of a daily newspaper's revenue, and job recruitment advertising accounts for 44 percent of total classifieds, or about 18 percent of total ad revenue. Newspapers are fighting back by bundling their want ads into websites with a national reach, which puts them in a better position to compete against the giants of online media.

Even the Newspaper Association of America is linking member newspapers via a site called Bona Fide Classified, which provides access to those papers' online classifieds. It allows users the opportunity to search over 1,100 individual newspapers' classified sections. The *Daily News* in Bowling Green, Kentucky, is one of the first newspapers to chart the "mash-up" concept with classified ads. With a daily circulation of 21,000-plus, the newspaper is combining data from Google Maps and yard-sale ads from its classified section. The result is an online map that pinpoints the exact location of the sales.

While their form changes, classified ads are alive and well and will continue to attract readers. Although still dominated by the daily newspaper, they are extending their reach and function into other media, especially the web. Classified advertising is transitioning from its primary print format and embracing the opportunities offered by the Internet not only to expand the methods of ad presentation—through multimedia tools, user

interactivity, hyperlinks, multiple images, and searchability—but also to adapt to the possibilities of a worldwide marketplace.

Clipping Services

Press clipping services monitor media for content of interest to their clients. They scan through newspapers, magazines, and electronic media, select pertinent items, and then package ("clip") them for easy perusal. The industry's name derives from the traditional practice of clipping items with a pair of scissors from the newspaper for safekeeping. Modern-day services track not only newspapers but nearly every print, broadcast, cable, and web-based information outlet, running the spectrum from network news broadcasts to teenagers' blogs.

Development

Clipping services have their origins in the expanding media environments of late-nineteenth-century cities. As the number of newspaper titles grew, editions multiplied, and issues expanded in length, a handful of entrepreneurs independently hit on the idea of a press monitoring service. Henry Romeike started the earliest clipping (or cutting) service in London in 1881 and quickly expanded its operations to New York, Paris, and Berlin. Romeike relocated to the United States in 1886 to take charge of his New York office, servicing a roster of entertainers, politicians, industrialists, and socialites eager to keep track of their press coverage. Frank Burrelle, an attorney who had represented mining companies and other clients grappling with image problems, started a similar operation with wife, Nellie, after detecting a demand for such a service among businessmen. Robert Luce, a Boston reporter and later U.S. congressman, started his service at roughly the same time. Burrelle's, Romeike, Luce, and National Press Intelligence took the national lead during the first decades of the twentieth century, while dozens of smaller companies carved out local markets.

Clipping services used industrialized reading operations to provide clients with a steady stream of articles snipped from newspapers and magazines across the country. The thousands of daily, weekly, and monthly periodicals the services subscribed to were reviewed by large staffs of mostly female readers. Each reader, guided by thousands of keywords committed to memory, scanned papers page by page, marking articles of interest. Marked papers were then turned over to razor-wielding clippers, usually men, who sliced out the items and glued them onto color-coded slips. A third group of workers sorted, packaged, and mailed off the clipped stories to clients. Services were paid a fixed retainer fee and collected a few cents per clipping.

Expansion

The clipping services have since the 1960s steadily expanded their operations beyond print media monitoring. Burrelle's began offering local media directories, inventorying all of the newspapers, magazines, and broadcast outlets in a state or region in 1960. In the 1970s, the company started monitoring radio and television transcripts. Shortly after, VCR technology made it feasible for services to record, edit, and package broadcast news clips.

Throughout its history, the industry has often been derided as a service for self-absorbed celebrities. Admonitions against "reading your own press clippings" even entered the vernacular as a warning to those in danger of becoming too entranced by their public persona. But this image of a frivolous, vanity service has always been a mischaracterization that overlooks the important social, political, and economic work carried out by the industry. From their start, clipping services sold themselves to politicians, businesses, and other powerful interests as a form of surveillance. Romeike's client list counted leading merchants, manufacturers, and political leaders along with actors and entertainers. Burrelle boasted in a 1905 interview of being able to provide the name of every new amputee in the United States to a client who manufactured artificial limbs. Throughout most of the twentieth century, developers and engineering firms relied on clippings to monitor public budgets, new zoning ordinances, and myriad other concerns to guide their marketing plans. Advertisers used the service to keep an eye on competitor's campaigns. Public relations offices relied heavily on clippings to detect threats to their clients' images and gauge their own success in garnering coverage. The U.S. Department of Defense created its own clipping service to publish a daily journal of cuttings, *The Early Bird,* that became a reading staple among inside-the-beltway power players. In this sense, the press clipping can best be understood as a control technology developed for the purpose of transforming raw information into social power.

The clipping services' fortunes have been tied since the 1970s to three interrelated developments—heightened corporate sensitivity to image issues, a higher premium placed on market data, and advances in information technology. While public relations had for decades been central to business strategy, many industries responded to what they deemed an antibusiness climate in the early 1970s, marked by mobilization among environmental, consumer-rights, and corporate-watchdog groups, by dramatically strengthening their image-control efforts. Media monitoring thus became a more crucial activity as businesses built public relations campaigns to deflect the criticisms mounting before them. At the same time, new communication technologies—satellites, data-transmission links, and computer networks—both accelerated the speed of business transactions and drew regional markets across the globe into closer relations. Media surveillance took on added value in this environment as businesses were faced with the problem of sorting through haystacks of information in search of the needles that could give them a competitive edge.

Technology and the Clipping Industry

Automation and new information technologies enabled the clipping industry to meet and, in turn, stoke this heightened demand. Through the 1960s, press clippers had operated in much the same manner they had six decades prior. But beginning in the 1970s, companies turned to computers to streamline their processes and offer new services. Monitors hooked up to mainframes replaced bulky keyword volumes. Workers coded stories onto computer punch cards to offer more efficient storage, faster retrieval options, and powerful new forms of data analysis. New business machines allowed clippers to drastically cut their delivery times as well. Burrelle's, for example, trimmed weeks off the industry standard by offering overnight turnaround via fax machine by the mid-1980s. By the early 1990s, services were developing search programs to crawl databases and World Wide Web pages for items of interest.

The press clipping industry has undergone dramatic changes since the early 1990s. The industry's leading firms merged to form Burrelles*Luce* in 2003. At the same time, many new companies sprang up to capitalize on sophisticated search technologies and the explosion of web content. Automated searches offer clients access to rumors

and breaking news by continuously crawling through webpages, online transcripts, blogs, chat rooms, social-networking sites, and video clips. Along with expanding their reach, web technologies have dramatically changed the way clipping services package and deliver their findings. Rather than mailing or faxing clips, companies offer online portals through which clients can retrieve, organize, and analyze them. And web applications offer near real-time alert services. Critical Mention, a company with a niche specialty in television news, boasts the ability to alert clients within a minute of a clip's airing. In terms of print media, the services have supplanted many of their readers and clippers with electronic scanners as both a labor-saving device and means of building larger, more searchable archives. Burrelles*Luce,* for instance, still produces paper slips, but these are now printed versions of scans rather than physical cuttings from publications. And in addition to the publication and date included on the slips of old, the scans include information ranging from copyright notices to thumbnail-sized images of the source page.

These innovations that have allowed clipping services to exponentially expand their reach and cut their delivery time have had a paradoxical impact on the industry. The same technologies have largely democratized, in the form of popular search engines, the industry's basic service—surveillance of a media universe too big for any one person to keep track of. Influenced by the fortunes the magazine and cable television industries found in audience fragmentation, media research labs experimented with ways of creating electronic newspapers that were narrowly tailored to reflect the interests of individual readers. Knight-Ridder fittingly called its early 1990s prototype—a mobile, tablet-sized computer—the *Daily Me*. While the *Daily Me* never made it to the mass market, Yahoo and Google popularized the basic concept through their news crawling capabilities. Both portals offer individualized news pages gleaned from thousands of international media outlets according to the interests indicated in the user's profile. A hypothetical reader in Seattle interested in Pennsylvania politics, deforestation in the Amazon, and the British soccer club Arsenal can open her web browser every morning to a page made up entirely of clippings on those topics. RSS feeds piped in through Google's ready-made templates can feed readers the news that most interests them as it's posted.

As the lines between clipping services and popular technologies have blurred, the former have looked to value-added services as a means of distinguishing themselves. Burrelles*Luce* bills its web portal as a comprehensive public relations tool offering everything from planning calendars to press release templates. The company also provides copyright policing services. Others look to social science as a means of setting themselves apart. Dow Jones, for example, promotes its subtle understanding of how new ideas diffuse through media networks. And just as its antecedents offered to read through the mountains of metropolitan dailies a century ago, Burrelles*Luce* now offers "editors" that comb through the thousands of hits returned by search engines. The clipping services thus continue to rely on the strategy that has been at their core since the industry's inception—the willingness to read the news in its entirety, no matter how tedious a chore that may be.

Columns and Columnists

Columnists have an enviable job. Journalists given a column are usually chosen for their writing skill, discerning mind, and ability to interest readers. Beyond that, one might say personality is the main characteristic that distinguishes the work of the columnist from that of the reporter and the editorial writer. The reporter's job is to provide readers with an accurate description of news events, written as objectively as possible while keeping the writer and his or her personal opinions out of the story. The editorialist must offer readers the newspaper's positions (not necessarily his or her own) on various public issues, also refraining from writing himself or herself into the editorial. The columnist, on the other hand, filters public issues through his or her own personality and worldview and onto the printed page. A columnist is less directly tied to the news cycle, can take sides, and is free to employ a wider range of approaches and writing devices than may be used by other journalists.

Development

In the early 1800s, newspaper owners and employees began functioning as editorial writers and reporters, thereby improving the content of newspapers, which in the 1700s came largely from letter-writers and exchanges of copy with other newspapers and other publications. Whereas American writers from the pre-1800 days of Benjamin Franklin wrote more or less column-like newspaper and pamphlet copy prior to 1800, writers specifically referred to as columnists emerged later, in the mid-nineteenth century.

A column is an informal essay, or commentary, usually averaging somewhere between 700 and 800 words, is usually signed by its writer, usually addresses a single topic, appears on a regular schedule in the same position in the newspaper or periodical's pages, and is used more for its interest value than for its news value. At base, being interesting to readers is the columnist's *raison d'etre*. The columnist's insight, wit, engaging personality, and pizzazz stand out from the more cautiously crafted editorials with which some columns share space in a newspaper's commentary (often an op-ed page) section. The words of a good columnist also have extra sparkle and resonance compared to the work of news reporters; although reporting is a newspaper's most vital product, it has a way of becoming dry, especially in the present-day climate of corporate service journalism that marks both newspapers and magazines.

Media historians remain somewhat unclear as to exactly when the columnist emerged as a journalistic specialist. Some of the earliest practitioners of this craft were literary figures such as Benjamin Perley Poore, who began his column "Waifs from Washington" in 1854; Ambrose Bierce, in San Francisco in 1868; and Joel Chandler Harris in Georgia in the 1870s. Other pioneering columnists were women, hired as columnists in part to attract more women readers. Sara Parton launched a column in New York in 1855, writing in the guise of "Fanny Fern." Author and journalist Jane Cunningham Croly wrote as "Jennie June" in New York at the same time; Emily Briggs was Philadelphia's "Olivia" beginning in 1866; Mary Clemmer Ames wrote in the nation's capital after the Civil War; and Sallie Joy opined as "Penelope Penfeather," a Boston columnist in 1875.

Later in the 1800s, the popularity of columnists in general was cemented by the enthusiastic reception of humorists such as Henry Wheeler Shaw, who in 1867 began writing a New York City–based column featuring the fictitious rustic character "Josh Billings." Other such writers of humorous, distinctively American sketches who regularized their frequency of publication by becoming humor columnists include Finley Peter Dunne, creator, in 1893, of the fictitious Irish American bartender "Mr. Dooley," deflator of the pompous; and George Ade, a small-town Hoosier turned satirical Chicago dialect humorist whose column was titled "Stories of the Streets and of the Town" (1893). Although African American columnists in the 1800s were very few, Gertrude Mossell began a column in the *New York Age* in 1885, and Lillian Lewis introduced her "They Say" in the *Boston Advocate* in 1889. Noted civil and women's rights activist Ida Wells-Barnett launched her *New York*

Age column in 1892 and a second column in the *Chicago Inter Ocean* in 1894.

If any city deserves to be remembered as "the capital city of columnists," it is Chicago. In the period of its great growth, Chicago produced in 1883 one of the nation's most emulated columnists of them all, Eugene Field. His first column was published in Denver beginning in 1880, but it is with Chicago that he is most identified. As was the custom in those days, he gave his *Chicago Morning News* column a standing title, "Sharps and Flats." In it, the well-read Field, employing both prose and verse, was at times serious, at other times humorous, yet was always personable and popular. In 1900, Baltimore's H. L. Mencken began skewering "Boobus Americanus," and in 1901, Bert Leston Taylor began conducting a well-loved Chicago column titled "A Line o'Type or Two." Although the idea for this column was the brainchild of *Tribune* editor James Keeley, it was Taylor who made it a hit, using, in addition to his own work, items submitted by fellow journalists and readers. He called himself a "colyumnist," jesting about the slang pronunciation used by some Chicagoans. So well liked was his work that the column lived on after Taylor's death. One of Taylor's admiring contributors was Franklin Pierce Adams, who began as a columnist in Chicago, then in 1904 moved to New York, where, as "F.P.A.," he wrote the column "The Conning Tower" and was a member of the celebrated Algonquin Roundtable group of New York wits. Wit was also the commodity of Irvin S. Cobb in his humor column "New York Through Funny Glasses," launched in 1905.

In 1912 appeared a true comic genius, Don Marquis, and his New York "Sun Dial" column, wherein appeared his unforgettable comments on the Roaring Twenties accomplished through two unlikely characters, written lower-case as archie the cockroach and mehitabel the cat. Others in the Marquis cast of fictitious characters were Hermione and her little group of serious thinkers, who were Marquis' way of satirizing overprivileged dilettantes, and Clem Hawley (the Old Soak), the columnist's foil for poking fun at Prohibition.

An early example of the sports writer who broadens his scope past athletics is Ring Lardner, whose witty "In the Wake of the News" ran in Chicago starting in 1913. Poet Carl Sandburg launched a column in 1918 in Chicago.

By 1920, the columnist had become an expected part of the American newspaper, but the popularity of this journalistic specialty went into overdrive in 1921 when the op-ed page appeared, an innovation of *New York Evening World* editor Herbert Bayard Swope. Swope hired Heywood Broun, like Marquis a sports writer, to write a general-interest column, "It Seems to Me," and thereafter built an unprecedented stable of columnists. Other notables of that era were Christopher Morley, who began writing "The Bowling Green" column for the *New York Evening Post* in 1920; Oscar Odd McIntyre, whose "New York Day by Day" column began in 1922; and syndicated cowboy philosopher/humor columnist Will Rogers, who wrote "Slipping the Lariat Over" starting in 1922.

The Syndicated Columnist

Thanks to syndication, local papers could, for a reasonable price, avail themselves of the writing talent of individuals who were well connected to non-local news sources. Two of the earliest columnists to be syndicated to other newspapers across the nation were conservative political columnist David Lawrence, in 1919, and O. O. McIntyre in 1922. Other early syndicated columnists debuting during this early period include Baltimore's Frank Kent in 1922; the regal, stentorian political pundit Walter Lippmann in 1931; the oft-acerbic critic of politicians Doris Fleeson in 1933; the even more outspoken Westbrook Pegler in 1933; moderate political columnist Raymond Clapper in 1934; *The New York Times'* James "Scotty" Reston in 1934; and the gutsy and well-connected Dorothy Thompson in 1936. Two well-known *New York Times* column voices were Arthur Krock, whose "In the Nation" was launched in 1932, and foreign-affairs columnist Anne O'Hair McCormick, who wrote "In Europe" and "Abroad," starting in 1937. A journalist who was syndicated in 1939 and who became America's most admired columnist during World War II was modest, hard-working Ernie Pyle.

Achieving even wider distribution via syndication were such "soft-news columnists" as Hollywood gossip queens Louella Parsons in 1922 and her arch-rival, Hedda Hopper, in 1936, and saucy Broadway columnists Walter Winchell in

1925 and Earl Wilson in 1942. Twin sisters, Esther Lederer, who wrote as "Ann Landers," and Pauline Phillips, as "Dear Abby," became remarkably successful personal advice columnists, starting in 1955 and 1956, respectively; both columns appeared in as many as 1,000 newspapers.

Among the standout political columnists who entered syndication during the second half of the twentieth century were liberals such as Marquis Childs in 1944; the wide-ranging, antiwar Murray Kempton in 1947; Nixon critic Mary McGrory in 1954; advocate for the underdog Nat Hentoff in 1957; Joseph Kraft, a writer mainly associated with the Kennedy administration, in 1963; political/social feminist Ellen Goodman of Boston in 1976; sharp-tongued Texan Molly Ivins in 1980; and *New York Times*–based Anna Quindlen in 1990. Quindlen now writes a column for *Newsweek* magazine.

Syndicated conservatives of the same period include the Jovian, formidable Joseph Alsop and his brother Stewart Alsop in 1958; the theatrical yet patrician William F. Buckley Jr. in 1962; Rowland Evans and Robert Novak, writers of the "Inside Report" in 1963; Nixon intimate William Safire in 1970; button-down intellectual George Will in 1973; perennial presidential candidate Patrick Buchanan in 1975; Cal Thomas, darling of the religious right, in 1984; and A. M. Rosenthal, editor of *The New York Times,* in 1986.

Among that period's moderate columnists were another *New York Times* writer, Tom Wicker, in 1966; intellectual and historically minded Garry Wills in 1970; and well-respected, reportorial David Broder in 1975. The columnist who was probably most often sued for defamation was Drew Pearson, whose investigative column "Washington Merry-Go-Round" (1931) was carried on by Jack Anderson.

Two of the brightest recent stars in the syndicate firmament both write out of *The New York Times,* and both began a column in 1995. These writers are Maureen Dowd, who won the 1999 Pulitzer Prize for Commentary for her coverage of President Bill Clinton's unusual intern policy, then went on to become the scold of the George W. Bush administration (2001–09); and Thomas Friedman, winner of that same prize in 2002 and a writer whose foreign-affairs column does its best to make sense of events in the Middle East.

The Humor Columnist

Best of the modest number of U.S. humor columnists to gain fame since World War II have been the prince of hyperbole, Art Buchwald, whose column began in 1951 and who for decades needled the inside-the-Washington Beltway mighty; Russell Baker of New York, the most cerebral of newspaper humorists; Erma Bombeck, whose "At Wit's End" was the pinnacle of around-the-house humor (1965); down-home Georgia humorist Lewis Grizzard in 1979; and, zaniest of them all, Miami-based Dave Barry in 1983.

The Local Columnist

America's newspapers both great and small have been graced with the work of an army of local columnists, a few of whom have been so popular as to become the unofficial voices of their cities or towns. A few of the best of these writers who have worked in our cities include the witty, chatty Herb Caen of San Francisco (1938); Chicago's gossipy Irv Kupcinet in 1943; Los Angeles verbal stylist Jack Smith in 1958; the almost universally admired Mike Royko, voice of the tough streets of Chicago (1959); Norfolk, Virginia's gentlemanly Guy Friddell in 1963; gruff, streetwise Irish-American Jimmy Breslin of New York City (1968); and national security and foreign affairs specialist Jim Hoagland, who began his column at *The Washington Post* in 1986. Local columnists who came into their own during the 1990s or the opening years of the new century include Jim Dwyer, who won the 1995 Pulitzer for Commentary while at *Newsday,* then moved his column to *The New York Times;* 1997 Pulitzer recipient Eileen McNamara of *The Boston Globe,* a social issues specialist; Mike McAlary of the *New York Daily News,* whose work on police brutality won him the 1998 Pulitzer; and social justice columnist Connie Schultz of *The Plain Dealer* in Cleveland, winner of the 2005 Pulitzer.

The Celebrity Columnist

Occupying an infrequently mentioned corner of column writing are celebrity columnists—individuals who became well known for something quite apart from journalism and are subsequently given

columns. In an America so thoroughly saturated in celebrity worship, it is little wonder that papers and syndicates have approached the great and the near great to offer them columns of their own. Some such columns are the actual work of their famous namesakes; others bear the celebrity's name but are mainly or even entirely written by the great one's minions. The difficulty lies in telling one from the other. Even some of the U.S. Presidents—the most recognized public figures of all—have had columns, including Theodore Roosevelt, Calvin Coolidge, Franklin Roosevelt, Jimmy Carter, and Ronald Reagan. Many other high-ranking political figures have done likewise, such as Fiorello LaGuardia, Eleanor Roosevelt, Barry Goldwater, Eugene McCarthy, Jeane Kirkpatrick, Jack Kemp, and Hillary Clinton, to name a few. Prominent foreign nationals with U.S. columns have included the Soviet Union's Mikhail Gorbachev, Israel's Shimon Peres, South Africa's Desmond Tutu, Pakistan's Benazir Bhutto, and Burma's Aung San Suu Kyi. Members of America's financial elite to have columns include H. L. Hunt, Lee Iacocca, Ross Perot, and Steve Forbes. To these accomplished and colorful individuals may be added such nonpolitical and diverse celebrities as operetta singer and actress Lillian Russell (born Helen Leonard), Wild West figure William Barclay "Bat" Masterson, African American singing and acting great Paul Robeson, show business impresario Billy Rose (born William Rosenberg), comic strip writer Al Capp (born Alfred Caplin), the Grand Ole Opry's "Minnie Pearl" (born Sarah Cannon), and television evangelist Jimmy Swaggart.

The Minority Columnist

In a racially segregated America, minority columnists were slow to appear, other than in the historically black press. Perhaps the earliest black woman to write a column for a mainstream newspaper was Ida Wells-Barnett in 1894 for the Chicago *Inter Ocean*. Most African Americans, however, even the brilliant Langston Hughes, could work only for the historically black press in the United States. Hughes' satirical yet touching "Jesse B. Semple" columns appeared in the *Chicago Defender* from 1942 until 1965. Another early black columnist in a mainstream paper was Delilah Leontium Beasley, appearing in 1923 in the *Oakland Tribune* in California. The earliest black columnist to be syndicated widely was George Schuyler, whose "For the Record" first appeared in 1923. The multi-accomplished Carl Rowan was syndicated in 1965, as was the gentlemanly William Raspberry a year thereafter. Economist Walter Williams began his widely distributed column in 1970; columns by Chuck Stone had an electric effect during the Civil Rights era in Philadelphia; and 1980 saw two new columns, by NAACP executive director Roy Wilkins and Les Payne in New York. In 1984 appeared the most erudite of all these columnists, conservative Thomas Sowell, and stylish writer Clarence Page of Chicago. DeWayne Wickham of the Gannett Group began a column in 1985, and Miami's talented Leonard Pitts was syndicated in 1995.

Likewise, many a talented African American local columnist has been published in the U.S. mainstream press, most of them since around 1970. In 1969, Claude Lewis became a Philadelphia columnist, and in 1970, the Vernon Jarrett column appeared in Chicago. Dorothy Gilliam became the first black woman to have a *Washington Post* column, in 1979; Acel Moore launched his Philadelphia column in 1980; and in 1981, Brenda Payton began her column in Oakland, California. Later appeared such local columnists as Elmer Smith in Philadelphia in 1988, wickedly witty Barry Saunders in Raleigh, North Carolina, in 1994, and Tony Norman in Pittsburgh in 1996.

Among the now-considerable number of Hispanic and Latino columnists, one of the earliest was Ruben Salazar of Los Angeles (1969). Others have included such notables as Andy Porras of Del Rio, Texas, in 1976; Roberto Fabricio of Miami in 1979; Juan Gonzales of New York City in 1988; Ana Veciana-Suarez of Miami in 1989; and Liz Balmaseda, also of Miami, in 1991. Two early Asian American columnists, both based in California, were T. T. Nhu in San Jose and William Wong in Oakland. Among the small number of Native American columnists have been Howard Rock of the *Tundra Times* of Point Hope Village, Alaska, in 1962; Tim Giago of the *Lakota Times* in 1980; and John Christian Hopkins of the Narragansett Indians, in Fall River, Massachusetts, in 1988.

A Trade Organization and a Prize

The principal trade organization for U.S. columnists is the National Society of Newspaper Columnists, and the most coveted award for their work is the Pulitzer Prize. The Pulitzer for Commentary has been awarded since 1970. Given the all-American assumption that bigger equals better, columnists for smaller papers have little hope of winning this award. Since 1970, *The New York Times* leads the field, with eight awards in this category. *The Washington Post* is second, with six; and with three each are the *Miami Herald, Wall Street Journal,* and New York *Daily News.* Having won two each are *The Boston Globe,* Long Island *Newsday,* and *Los Angeles Times.* Winners of one each are the *Chicago Tribune, Chicago Daily News,* Raleigh *News & Observer, Washington Star, St. Louis Post-Dispatch, Hackensack Record,* and the now-defunct *National Observer,* which was a Dow Jones paper.

Non-U.S. Columnists Writing in English

Columnists are, of course, not at all exclusive to the United States. Among such writers in Canada are feminist and social activist Michele Landsberg, whose *Toronto Star* column began in 1978 and ended in 2003; the Toronto *National Post*'s Robert Fulford in 1959; the *Globe and Mail*'s national affairs columnist Jeffrey Simpson in 1984; social issues columnist Margaret Wente in 1992; and political columnist John Ibbitson in 2002. Writing both general (1991) and sports (1997) columns for the *Globe* is William Houston, and doing an unusual column that addresses world politics and intellectual issues since the 1990s is that paper's Doug Saunders.

Of Great Britain's many columnists, one of the most unusual was Lady Diana Cooper, whose column appeared in the Beaverbrook newspapers after World War I; she was said to be England's most beautiful woman of her time. Having a marvelous touch at producing quotable humorous lines was Katharine Elizabeth Whitehorn of *The Observer* in London, whose column appeared from 1960 to 1996. More somber was the column of Auberon Waugh of the *Sunday Telegraph* (1981) and other newspapers and periodicals. Working in both Canada and England has been Barbara Amiel, whose gossipy column appeared in *The Times* of London in 1985 and who has since written columns for the *Daily Telegraph* (1994) and *Maclean's* magazine (2005). Among Great Britain's conservative voices are Mark Steyn of the *Daily Telegraph*; former foreign correspondent Max Hastings, now with the *Daily Mail*; Simon Jenkins, recently of *The Guardian*; and Iraq war supporter Simon Heffer, formerly with the *Daily Mail,* now with the *Daily Telegraph.*

A commentator in British television, radio, and newspapers is Richard Littlejohn, now a columnist for the *Daily Mail.* An opponent of the Iraq war is David Aaronovitch, who writes columns for both *The Times* and *The Guardian.* The *Guardian*'s social democratic voice is Polly Toynbee; and writer of that paper's "Bad Science" column, which pokes fun at pseudoscience, is physician Ben Goldacre. Columnist (*The Independent,* 2000) and comedian Mark Steel lambastes social injustice; *The Guardian*'s Catherine Bennett writes on politics and culture; and investigative leftist George Monbiot of that same paper writes on politics from the left, as does Jonathan Freedland.

A sample of Australian columnists includes political satirist Alan Fitzgerald of the *Canberra Times*; Robert Duffield of *The Australian;* Sam Lipski, who did columns with four papers; *The Advertiser*'s political columnist Dean Jaensch; controversialist Terry Lane of Melbourne's *Sunday Age*; and Padraic "Paddy" McGuiness, late of the *Sydney Morning Herald.*

Bloggers, the New Competitor

Some observers predict that the Internet will spell the end not only of the columnist, but of newspapers themselves. More likely, newspapers will simply adapt, and the skills of columnists will remain in demand, whether their work is read on paper or online. In any case, the columnist's new competitor is the blogger, who is a writer and usually the creator of a blog, or weblog, done in journal or diary format, which informs and entertains, sometimes using images and embedded video in addition to text and directing users to other Internet venues. By 2007, millions of blogs exist, some apparently done by crackpots, others written with considerable skill and talent. Known media figures and other writers such as columnist Andrew Sullivan of

AndrewSullivan.com and lawyer and communications consultant Ron Gunzburger of Politics.com are influential bloggers. Former Vermont congressman and governor Howard Dean popularized the use of blogs by political candidates, and a whole new subset of blogs, warblogs, have sprung up in Iraq and Afghanistan, written by the troops. The advantages of the blog are personal freedom and immediacy; their downside is that they usually lack the benefit of good editing.

Conclusion

During their roughly 140-year history, columnists have brought a kaleidoscope of colorful personalities to newspapers and to many magazines, as well. Some of these writers have been serious-minded political pundits. Others have been of a merrier disposition, not making frontal assaults on the day's issues, but slyly slipping up on them from the side. As to liberalism, conservatism, and any other "ism" one can name, columnists have covered the spectrum from one end to the other. Columnists' chief virtue continues to be the personal touch with which they report and examine their topics. Some scholars regard the early to mid-1900s as the "Golden Age" of the columnist—a time of less competition from newer media. Since that time, however, columnists have continued to multiply like jackrabbits—both the types of columnists discussed here and another multitude of columnists who specialize by topic in such fields as sports, entertainment, gardening, personal finance, bridge and chess, pet care, and the like. The most successful columnists have adapted in an evolutionary manner to the needs of competing media, chiefly television, where they have achieved wider fame and extra income as panelists or pundits. For some columnists, at least, *this* is the Golden Age. Column writing is an old, tried-and-true craft, and in the words of Don Marquis' character mehitabel the alley cat, "There's life in the old dame yet."

Comics

Comics, also known as comic strips, funnies, printed cartoon art, or comic(s) art, have been a key element of the newspaper business since the end of the nineteenth century. They are an important reason for the economic success of many newspapers entering the modern age, a socialization device for both newspaper reading and social mores, an economic and cultural force outside of the newspaper industry, and currently viewed as a way to attract and maintain a youth readership. The future of the comics, similar to the future of the newspaper medium, is unclear.

Comics have long been part of the fabric of American culture and everyday life. Newspaper editors face a serious dilemma when dropping or adding a strip, given the loyalty readers may feel—and express—toward particular comics. Many Sunday family rituals involve reading the color comics section, and the continuing exposure to daily comics characters have touched successive generations of fans to a more enduring degree than virtually any other medium. Major character and plot developments, including character deaths

(Mary Gold in *The Gumps* or the family dog Farley in *For Better or For Worse*), weddings (Dick Tracy to Tess Trueheart), or trauma (B.D.'s loss of a leg in the Iraq war in *Doonesbury*) often spark deep emotional reactions in readers. Comic-strip characters and phrases have transcended the medium to the point where their comic-strip origin is not universally known. Characters such as Buster Brown, Little Orphan Annie, and Popeye, although beginning as comic strips, are perhaps better known for their cultural presence in other forms (in the above cases, as a shoe brand, Broadway musical, and film/TV character, respectively). Moreover, comic strips have popularized, if not wholly created, familiar words and phrases in the American lexicon such as "keeping up with the Joneses," jeep, Sadie Hawkins Day, security blanket, hot dog, and baloney.

Origins

No single creator invented the newspaper comic strip. The use of illustrations combined with words, sequential panels, color, and regularly appearing characters appeared in European and U.S. publications through much of the 1800s. Nevertheless, many attribute at least the popularization and commercial viability of such trends to *Hogan's Alley* (later featuring and known as *The Yellow Kid*), created by Richard F. Outcault and first appearing in Joseph Pulitzer's New York *World* in 1895. Later also published in William Randolph Hearst's *New York Journal,* the character became a national sensation through heavy licensing activity (including appearances in advertising and on Broadway) and through the national distribution of Hearst's Sunday humor section. Other developments soon followed as comics grew, including daily publication and national syndication. The latter allowed newspapers that could not afford their own printing technology or artistic talent to offer comics to their readers as well as give comics characters and trademarks national exposure.

The Yellow Kid and other early examples of ground-breaking comics (*The Katzenjammer Kids, Happy Hooligan, Mutt and Jeff, The Gumps*) developed and illustrated the symbiotic relationship between comics and newspapers. As a part of the newspaper that overtly emphasized entertainment rather than hard-news journalism, comic strips became an important booster of newspaper circulation and one way that children were first exposed to the medium. On the other hand, newspapers served not only as the primary revenue source for comics, at least at first, but also as a popularizer and promoter for character licensing and merchandising, a trend that would become dominant in modern times.

Genres and Styles

There are several different types of comics found in newspapers, although some genres have been more visible during different eras. Gag strips focus on a punch line or humorous situation each day, with characters changing little over the years. Continuity strips often follow plotlines or evolving character developments over weeks, months, or even longer. In some cases, characters age in real time, like the early example of *Gasoline Alley* or later in *For Better or For Worse*. Although continuity strips tend to involve more serious topics (adventure or soap-opera oriented, for example), hybrid strips like *Funky Winkerbean* include characteristics of both. Within each of these two major genres, there are several subgenres, including family, adventure, sports, workplace, kid, and talking-animal strips. Likewise, drawing style can vary from the detailed (*Little Nemo in Slumberland*) to the simple (*The Far Side*) and the realistic (*Prince Valiant*) to the cartoony/stylized (*Dilbert*). Some strips, like *Liberty Meadows* with its mix of realistic humans and funny animals, blended different styles.

Historical trends are shifting away from adventure and serious continuity-oriented strips and toward gag strips, perhaps the result of television's quicker pace, which the syndicates may believe have shortened the patience of readers. Similarly, simplified drawing style, as exemplified by Charles Schulz's *Peanuts,* is much more dominant than the previous illustrator styles of such strips as *Buck Rogers* or *Tarzan,* a result of the shrinking newspaper space devoted to comics and increased emphasis on licensing activity that rewards characters easily transformed into toys or other media.

Syndication and Licensing

The linkage of comic strips to syndication companies has affected the reach and the form of comic

strips. Although syndicates allow for national exposure and can greatly enhance the income of comic strip creators, the gatekeeping power of syndicates may also have encouraged a "mainstreaming" of issues and perspectives to create a "lowest common denominator" appeal and avoid offending publishers, editors, readers, and advertisers. To allow himself to address more political issues in such an environment, Walt Kelly, creator of the often satirical *Pogo,* was known to provide apolitical gag strips that nervous editors could substitute for especially controversial installments. However, in 2001, Frank Cho, creator of *Liberty Meadows,* purportedly stopped creating comic strips for newspapers because he was frustrated with the lack of creative freedom. The influence of individual syndicates over newspapers, although still significant, has perhaps been lessened over the years as one-newspaper towns became the norm and large chains consolidated newspaper control (similar concentration has been a trend in syndication organizations). Copyright and license ownership is also important in the history of comic strip production, with syndicates often controlling licensing activities and creators serving as "work-for-hire" employees for the syndicates, although very-well-paid ones in some cases. In the 1980s, many high-profile creators worked to retain ownership of their creations. In the modern era, major comic-strip syndicates include Hearst's King Features Syndicate (*Blondie, Dennis the Menace*), Andrews McMeel Universal's Universal Press Syndicate (*Doonesbury, Garfield, Cathy*), Scripps' United Media (*Peanuts, Dilbert*), and Creators Syndicate (*B.C., Wizard of Id*).

Comic strip characters since the 1890s have been ripe for merchandising activity through toys, games, and clothes, as endorsers for products in advertisements, and through the licensing of characters into other media such as film, television, and comic books. Buster Brown is an early example in which licensing was used to promote and commercialize a comics character from its inception. With the dominance of television and the success of comic-strip compilations in book form—both trends especially visible in the success of Charles Schulz' *Peanuts*—licensing and merchandising is now an assumed, permanent, and institutionalized part of comics. Many radio and television programs have been based on comic strips, such as *The Boondocks, Baby Blues, Dilbert,* and *Garfield.* The integration of comic strips and licenses also works the other way: many comic strips have been developed to exploit a successful license from another medium. This trend began in the early years of comics with strips featuring Charlie Chaplin's tramp character and later *Mickey Mouse* and *Tarzan,* but it accelerated with television and licensing-oriented multimedia conglomerates. Strips have been created, for example, from such film and television characters as *Spider-Man, The Flintstones, Star Wars*, and *Teenage Mutant Ninja Turtles*.

Politics and Ideology

Comics are also political and ideological artifacts. Several scholars have suggested that comic strips, given their popularity and combination of verbal and visual elements, are particularly appropriate for study as forms of culture that can either uphold or critique the sociopolitical status quo.

Comic strips have long dealt with social issues in both the more serious continuity strips (such as in *Judge Parker* or *Rex Morgan M.D.*), and in hybrid gag/continuity strips like *Funky Winkerbean, Mutts,* and *For Better or For Worse,* focusing discussion on such topics as alcoholism, animal rights, mental illness, and literacy. Taking their cue from editorial cartoons, strips have also commented on the contemporary political scene, either allegorically (*Little Orphan Annie* from the right; *Pogo* from the left, and the more mixed case of *Li'l Abner*), or explicitly, such as the modern examples of *Doonesbury, Bloom County/Outland/Opus,* and the right-leaning *Mallard Fillmore*, which often feature real political figures as characters or as topics for commentary. *Doonesbury,* in fact, appears on the editorial page in some newspapers rather than the comics page, which may protect the strip from angry reactions from readers of those papers but also perhaps has less readership.

Comics may also be politically relevant in a broader sense by highlighting and legitimizing certain social groups and social practices over others, including representations of gender, race, sexual orientation, class, and consumption. Family and domestic comics have been found to reproduce images of traditional patriarchal family structures, presenting sex role stereotypes and perpetuating

gender inequality. Many comics present women as main characters (*Mary Worth* and *Cathy* to name but two), but female characters tend to be underrepresented overall though overrepresented in the home and in child care activities.

Throughout much of the twentieth century, characters who were racial minorities were either underrepresented in comics, or were presented in negative stereotypes. Prior to World War II, African Americans and Asians appeared infrequently in comics and when they did they were depicted as almost subhuman, unable to participate in the social system, and in service roles. The appearance of minorities in comic strips diminished after World War II, perhaps because of an unwillingness to be reminded of societal inequalities after a war fought for freedom and equality and in a booming postwar economy. Gay characters have been largely absent from mainstream newspaper comics, but when they appear they are male and depicted as assimilated into heterosexual culture.

In response to negative or missing portrayals, minority newspapers often featured strips about situations more central and realistic to a particular group's everyday life. African American newspapers such as the *Chicago Defender* offered comic strips drawn by minority creators throughout the middle of the twentieth century. In response to the dearth of gay characters, publications such as *The Advocate* featured gay-themed comics, dealing much more fundamentally and frankly with issues of gay life, such as Howard Cruse's *Wendel.* Today, people of color remain underrepresented in comics but characters are included in a broader array of settings and occupations. Starting with Morrie Turner's *Wee Pals* in the 1960s, other comics including *Luther, Quincy, Curtis, The Boondocks, Secret Asian Man*, and *Cafe Con Leche* feature people of color as main characters.

Although the history of comics offers significant exceptions like the early portrayal of class differences and slum life in *The Yellow Kid,* mainstream comics remain focused largely on the white middle class, typical examples being *Blondie, Hi and Lois,* and *Family Circus.* Capitalist values are commonly found in comics. For instance, comic strips were important in helping shift American culture from a producer to a consumer orientation during the first half of the twentieth century. Comics such as *Gasoline Alley* and *Winnie Winkle* commented on and taught middle- and working-class readers the appropriate way to consume while constructing reader identities around the purchase and consumption of goods and services. *Dilbert* perhaps offers a more critical view of the capitalist workplace by focusing on the dehumanizing experience of a white-collar worker. Some suggest that *Dilbert* helps workers cope with the absurdities of the workplace while also providing an ideological critique, while others suggest that *Dilbert* offers an emotional salve that discourages action and social change.

Scholarship

The serious study of comics has grown from the occasional early work in the mid-twentieth century to a steady interdisciplinary and international output in recent decades. Coulton Waugh's 1947 book *The Comics,* although seen by many contemporary researchers as making the occasional dubious historical claim, nevertheless is the first serious attempt to bring scholarly coherence to the form. Scholars in the 1970s studied comics as part of the growth of popular culture studies, including Russel Nye, Arthur Asa Berger, M. Thomas Inge, and John Lent. In 1999 Lent established an important outlet for scholarship about comic books, comic strips, and editorial cartoons around the world, *The International Journal of Comic Art,* which continued the work of other, more short-lived academic publications about comic art such as *Inks: Cartoon and Comic Art Studies* (1994–97). Several academic libraries have extensive comic art collections, including the Comic Art Collection at Michigan State University and the Cartoon Research Library at Ohio State University. Researchers in the 1990s, also influenced by the cultural importance of comic books, discuss comic art scholarship at such forums as the Comic Art & Comics Division of the Popular Culture Association, the International Comics Art Forum, and the Comics Art Conference held during the Comic-Con International annually in San Diego.

Future Challenges

Comics are still a key part of most newspapers and regularly read by many newspaper readers.

Newspaper personnel see the comics section as a way to attract young readers, a factor of key importance in terms of both newspapers' future longevity and the medium's attractiveness to advertisers. Yet the space for comics in newspapers has shrunk over the decades, as have the number of newspapers. In addition, certain strips, which have existed for decades as new artists/writers have replaced earlier generations (such as with *Blondie*) or are rerun with a "Classic" label (such as *Peanuts*), limit the space for new strips.

Unclear is the extent to which the future of comics is inretractably linked to the future of newspapers. Digital technology allows for the creation, promotion, and distribution of new "webcomics," and the enhanced fidelity and interactive component of digital media may open up new creative possibilities. Distributors and some syndicates have worked to commercialize the Internet and other digital outlets for the strips they control. If comic strips become separated from journalism as the newspaper medium declines in sales, it may mean that comic strips, as a lucrative form of visual entertainment, will become further housed in larger synergistically oriented media conglomerates looking to exploit valuable character licenses. How these factors will affect the creation, commercialization, and fan use of comics is yet to be determined.

Commentators, Radio

The American radio news commentator or analyst role came into being in the late 1930s at a time of rising world tensions that would soon lead to World War II. Commentators provide their opinions about and analysis of domestic and international affairs in news segments or programs clearly identified as comment, as distinct from reportage. They are thus the aural equivalent of newspaper columnists—and of what we would term today "op-ed" contributors. While some large-market radio stations had their own commentators in the period from 1935 to 1950, the best known were network figures. Although only a few were active in radio at any given time, at their peak around 1945 several hundred commentators could be heard on the air across the country. Within a decade, however, the majority of those who remained active had moved to television. By the 1990s, radio talk-show hosts had largely subsumed the commentary role. While traditional commentary had always been by definition subjective even as it attempted balanced judgment on domestic or international events, the new radio talk-show formats have tended to be far more biased and politically polarized in their "commentary."

Development

Commentary on radio is almost as old as the medium itself. In their search for programming to fill air time, many stations welcomed those who appeared informed, could speak clearly and in an interesting fashion, to comment on current events. Indeed, commentators were heard on radio before regular news broadcasts in many cases. Newspaper attempts to quash radio newscasts in the early 1930s

did not target commentary (which was not seen as competitive with newspaper columnists), thus further helping to promote on-air comment. Programs of commentary also lent themselves to commercial sponsorship much better than newscasts at that time. Commentary on radio attracted listeners who could identify with a voice and personality more readily than with mere words on a newspaper page. And commentary attracted an upper socioeconomic class audience—exactly the listeners many upscale advertisers sought. Commentators were respected and widely listened to, their views often quoted elsewhere. Most had extensive professional grounding in newspapers and magazines, and many benefited from both foreign experience and language ability, further distinguishing them from their radio talk-show counterparts of today.

Commentary by its very nature usually deals with matters of controversy. Most commentators made clear that they expressed their own views, not necessarily the ideas of network or station management (and thus should not be confused with occasional broadcaster editorials which *do* speak for management). CBS and NBC developed policies by the late 1930s that appeared to promote news analysis more than commentary, while the newer Mutual (1934) and ABC (1945) networks generally allowed their speakers greater freedom of action. Numerous commentators who began on one of the legacy networks thus ended up on the newer chains. The stated aim to maintain overall objectivity and neutrality on issues—an express goal of most broadcasters who feared offending listeners or advertisers—was a constant countervailing pressure against commentary. So were shifting sponsors, for by the 1940s, advertisers controlled most radio air time. To displease or lose a sponsor often meant losing a given time slot or even leaving the air.

Alongside the rise of television, fear of domestic communism early in the cold war helped end many radio commentator careers as radio sought to survive by airing popular music and generally avoiding controversy. A few major stations continued offering commentary, but by the 1960s most such programs had disappeared from the air. Some commentators (such as Eric Sevareid, often heard on Walter Cronkite's evening television newscast over CBS) shifted from radio to network television. Edward P. Morgan, sponsored by the AFL-CIO labor alliance, was one of the last national radio commentators, his nightly program into the 1960s combining seven minutes of news followed by as much commentary (presented as "the shape of one man's opinion"). Documentaries—often with a point of view—fled to television, only to disappear in their turn to such cable networks as the Discovery or History channels.

Some Noted American Radio Commentators

Hilmar Baukhage (1889–1976)

Baukhage used only his last name on the air, beginning his commentaries simply as "Baukhage Talking." Of German background, he studied there and in France, becoming fluent in both languages as well as English. He worked for a number of newspapers, the Associated Press, and some magazines before being heard on the NBC-Blue network starting in 1932. As World War II began, he broadcast first from Berlin, then from Washington. He continued with a 15-minute daily commentary when NBC-Blue became ABC in 1945, sometimes covering one topic per broadcast, sometimes several. While most concerned with news events, Baukhage would sometimes comment on lighter aspects of life. He began offering commentary on the Mutual network in 1948, moving there full time in 1951. He retired two years later, after the network declined to renew his contract, arguing he was paid too much and spoke too long for modern listeners.

Harold Thomas "Boake" Carter (1903–44)

Carter was born in Russia and grew up in England, arriving in the United States in the early 1920s. He worked for Philadelphia newspapers and was first heard on radio in that city when he broadcast a rugby match in 1930. His early attempts at radio commentary failed (listeners claimed they could not understand his English accent, which he soon modified to sound more American), but he was soon heard on a Philadelphia radio station offering news and brief commentary. His reporting of the Lindbergh baby kidnapping in 1932 propelled him to the CBS network. For five years Carter was a highly popular figure on CBS, offering both news and commentary. The tone of his broadcasts became sharper and more right-wing (and isolationist), however, and the network terminated him in mid-1938 when his sponsor contract ended. Carter broadcast twice a week over the Mutual network until his premature death at age 42.

Upton Close (1894–1960)

Close was born Joseph Washington Hall, but gained his press and radio name from his early articles from and about China (he was a fluent Chinese speaker), which ended with the words "up close." He became a right-wing radio commentator who began his career with fairly liberal views. Close authored seven books and a host of articles about Asia. After a period as a lecturer in the early 1920s, he first broadcast in 1924. He provided occasional broadcasts over NBC from 1934 to 1941, often speaking on Asian affairs. These appearances became weekly by the fall of 1942—and increasingly right-wing in tone, compared to his incisive and balanced Asian reporting. When his commentaries became increasingly focused on perceived conspiracies, NBC removed him from the air in December 1944. He broadcast briefly (1945–46) over the Mutual network and then retired to Mexico.

Elmer Davis (1890–1958)

Davis is perhaps best remembered today for heading the Office of War Information (OWI) during World War II. A Rhodes Scholar (1910), he became a *New York Times* reporter in 1914, and wrote novels and short stories as well. Failing to get the foreign correspondent berth he sought, Davis served as an editorial page writer and editor until leaving the *Times* in 1924 and turning to free-lance writing. His liberal views became clearer as war approached, and he began commentary over CBS radio in September 1939, just after war broke out in Europe. His reasoned, conversational delivery quickly gained him a loyal audience, and his audience ratings were lower than those only of commentator H. V. Kaltenborn and newscaster Lowell Thomas. He employed calm, unemotional words with a dry wit. Early in 1942, after a period of months broadcasting from England, Davis was tapped to head OWI. After the war, in 1945 he shifted to the new ABC network and broadcast news and analysis three evenings a week, alternating with Raymond Swing until 1947, when Davis took over the whole schedule. He retired in 1953, doing occasional television commentary.

H. V. Kaltenborn (1878–1965)

Kaltenborn began his journalism career in newspapers, rising to become editor of the *Brooklyn Eagle* in the 1920s. He may have been the first radio commentator when he appeared over a New York station in 1922, and remained the dean of the field for three decades. His clipped Germanic, rather formal delivery style and his ability to speak without notes—and to translate from several languages—made him widely recognized and respected. He began reporting stories while serving as an American volunteer during the Spanish-American war. Serving as a reporter for the *Brooklyn Eagle,* he rose to become associate editor. He had a regular program on radio by the mid-1920s, and left the *Eagle* for full-time radio work in 1930. Kaltenborn's supreme moment came with the September 1938 Munich crisis, where he stayed at his CBS studio in New York for a month, catching sleep in a nearby room so he could go on the air anytime an important event or speech needed translation and analysis—all of which he did extemporaneously. He shifted to NBC a year or so later, often broadcasting from distant battlefronts. He stopped regular broadcasting in 1953 out of disgust over how television was reducing broadcast journalism by diminishing the spoken word.

Fulton Lewis Jr. (1903–66)

Lewis grew up in and began his newspaper reporting from Washington, D.C. He served for nearly a decade as the Washington bureau chief for the Hearst-owned International News Service. He became especially known for exposing scandal in the nation's capital beginning with the awarding of air mail contracts in the early 1930s that led to a Senate investigation and substantial change in the air transport business. At the same time, Lewis began his broadcasting career with Washington station appearances as one of many newspaper reporters. By 1936, he was featured on the new Mutual network in *The Top of the News* with a host of local sponsors, thus reducing his dependence on any one firm. Lewis's broadcast views were conservative, generally paralleling those of the Republican Party. In 1939, by then one of the country's most popular radio commentators, Lewis led the effort to secure for radio journalists equal seating rights in Congress and the White House as their colleagues in the press. As a result of his efforts, what had been *press* conferences became *news* conferences. He backed isolationists before the Japanese attack on Pearl Harbor and continued

with highly critical commentary on government and military decisions during the war. He remained on the air, ever more conservative, into the 1960s, though with declining audiences.

Edward R. Murrow (1908–65)

Murrow became the most popular radio commentator during and after World War II. Building on his reputation gained from insightful reporting from Europe during the war, he broadcast *Edward R. Murrow with the News* nightly at 7:45 p.m. on the CBS radio network from 1947 to 1959. It was the 15-minute radio showcase for CBS News that concluded with a few moments of Murrow's commentary, called "tailpiece," on people and events in the news. His reassuring voice, combined with his by then extensive experience, made him a widely trusted figure in the 1950s, though also often a target for right-wing attacks on his perceived liberal viewpoint. Because he was using radio, then seen as a media backwater, he had more freedom of commentary than was allowed on his television documentaries.

Dorothy Thompson (1894–1961)

Thompson was a rarity—a woman in the largely male world of radio journalism. An early feminist and speaker for women's suffrage, Thompson became a foreign correspondent (one of the earliest women in that role, too) in Europe for newspapers and news agencies, and then wrote popular columns for, among other publications, the New York *Herald Tribune* and *The Ladies Home Journal*. Her appeal was substantial, as was her audience. She began her radio work in 1936, two years after being expelled from Hitler's Germany, where NBC had sent her to report on the political conventions there. She began a weekly 15-minute radio commentary program a year later, first on NBC and then over Mutual, which lasted until early 1945. She continued writing until the late 1950s. Thompson generally took a strongly internationalist tone on world affairs and an independent approach to domestic issues.

Conclusion

Radio by the 1970s and 1980s no longer had time for or interest in commentary. In an era of "rip-and-read" five-minute newscasts and sound-bite journalism, sustained, thoughtful analysis simply did not fit. The few remaining news commentators—such as the syndicated Paul Harvey or even Charles Osgood on CBS—began reading commercials for their sponsors, something almost no commentator in the medium's golden years had ever done. At the beginning of the twenty-first century, only on public radio did commentary survive in the United States. Daniel Schorr, for example, after years at CBS, joined National Public Radio in 1985 and commented on domestic and international affairs for more than two decades.

By the turn of the twenty-first century, there was virtually no commentary left on broadcast radio, and precious little on television. Instead listeners were inundated with talk-show hosts, most of them conservative in their views, who aggressively presented opinion rather than analytic commentary on local, national, or world affairs. Journalistic commentary had given way to better paying political and social verbal face-offs.

Commentators, Television

Television news commentators populate a historically narrow but sometimes powerful dimension of broadcast journalism that goes beyond reporting.

Commentators peer beneath the surface of news developments in an effort to expose, explain, or illustrate to viewers what the news really means to them. If this step fails to occur, some stories are at risk of being whisked across the television screen too quickly for viewers to understand them well, let alone to benefit from how a commentator can illuminate the issues that stories raise.

Each of television's analytical reports, news-based essays, and opinion pieces—often lumped together as "commentary"—not only is delivered by a human voice, as in radio, but also comes with a human face. Combined, these factors can heighten viewer attention to important news issues. Even traditional journalists often put aside strict journalistic neutrality, most dramatically in moments of crisis, to present their interpretations of events.

Some research suggests that television commentators on political or other topics can have an impact on how viewers think. At a minimum, commentators contribute to an important function of agenda setting: persuading viewers not how to think but what to think *about* as they consider the world around them.

History

In broadcasting, analysis or opinion presented by identifiable people has always had audience appeal. Early radio producers discovered that a thought-provoking commentator could draw an audience to almost any important news topic. By the 1930s, leading commentators such as H. V. Kaltenborn were building their radio reputations. By the 1950s, commentary played a respected role at the legacy networks (ABC, CBS, and NBC), one that would last into the 1970s and occasionally later.

Evening network newscasts in their 1960s to 1980s heyday, thanks to the dependably massive audiences they reached, were the most powerful broadcast news platforms (and revenue producers) available. This made them the logical sites to offer commentary as an added public service. A few specialists in news analysis and comment held regular slots in newscasts, though in some cases the higher-profile anchors of such programs delivered commentaries of their own (notably Walter Cronkite speaking about the Vietnam War in 1968). In addition to the dinner-hour limelight, some commentators thrived in dedicated news and interview hours elsewhere in the weekly schedule.

While network policies sought to draw a clear line between straight reporting and opinion, the divide was at best a fuzzy one. To some viewers, reporters often revealed the speakers' biases or at least their unconscious framing of stories. An interview program or segment positioning veteran reporters near outspoken experts in a field could combine fact, insight, and opinion that would both inform viewers and stimulate further thought. Additional programs such as *CBS Reports* and *NBS White Paper* unfolded in documentary style, using strong visuals to illustrate and frame reporting and analysis.

Selected Network Commentators

Edward R. Murrow (1908–65)

Early CBS documentaries showcased a man who set a standard for reporters, commentators, and journalists in general. Murrow had built a national reputation in 1940 with searing eyewitness radio reports from London about the Battle of Britain. In an often oblique form of commentary, those dramatic reports nevertheless made clear his political-journalistic stance—that the free world had to win the war, which first meant seeing and feeling it intimately. More than a decade later, in the historic CBS *See It Now* television series, Murrow visited soldiers in Korea, and sent back poignant vignettes, often projecting his own empathy with the fighting men in ways that touched the hearts of viewers back home.

Most explicit among Murrow's commentary was his March 1954 *See It Now* episode recounting and ridiculing the actions of Senator Joseph R. McCarthy (R-WI). Murrow called for public rejection of McCarthy's anti-Communist "witch hunt," which had ruined many careers unjustly. Murrow concluded that if McCarthy was allowed to continue, a Shakespeare quote would apply: "The fault, dear Brutus, is not in our stars but in ourselves." He combined a poetic touch and a moral conception of journalism in his work.

Walter Cronkite (1916–2009)

Cronkite, anchor of the *CBS Evening News* from 1962 to 1981, is remembered most for his reassuring presence. Pollster Oliver Quayle in 1972 asked voters what public figure they trusted most, and Cronkite beat out then-President Richard Nixon. That led CBS to brand the anchor "the

most trusted man in America." Cronkite occasionally showed his feelings or took strong positions on the air despite his commitment to public neutrality as an anchor. He was taken beyond the limit of his composure by the 1963 assassination of John F. Kennedy, showing stress and an element of grief while announcing the President's death. Five years later he announced after a combat-zone tour that "the bloody experience of Vietnam is a stalemate" and pushed for negotiation to end the war. President Lyndon Johnson later told an aide, "if I've lost Walter, I've lost Middle America." Cronkite also shed objectivity regarding the U.S. space program; he supported it with a boyish enthusiasm.

John Chancellor (1927–)

Chancellor joined NBC in 1950, when only a fraction of American homes owned television sets. He stayed for more than four decades that would take him from reporting to anchoring to a specialty in commentary. As a correspondent, Chancellor was an astute and aggressive observer and chronicler of everything from civil rights marches to the Vietnam War to Communist takeovers in Europe. Amid hot debate at the 1964 Republican National Convention, cameras caught Chancellor being physically ejected by guards ("This is John Chancellor, somewhere in custody," he signed off), at least ostensibly for blocking an aisle. As anchor or coanchor of *NBC Nightly News* from 1970 to 1982, he presented not just news but sharp, almost scholarly commentaries, spending another 11 years as the network's senior commentator. In something of a signoff, his 1990 book was titled *Promise and Peril: A Commentary on America*.

David Brinkley (1920–2003)

Also at NBC, former wire-service reporter Brinkley first won national notice in 1956, when he and Chet Huntley (1911–74) were paired anchoring *The Huntley-Brinkley Report*. The two-person format, a novelty at the time and a powerful audience draw, followed closely their collaboration in anchoring that year's political conventions. Strong opinions rippled just under the surface of their newscasts. Producer Reuven Frank later said he had put the acerbic (and liberal) Brinkley with the stolid (and conservative) Huntley to achieve a sort of tension that would interest audiences. It did, and soon both were presenting not just news but also commentaries on news topics. After leaving NBC in 1981, Brinkley moved to ABC, where for a decade and a half he headed the Sunday morning *This Week with David Brinkley,* a hybrid weekly political roundup always rich in commentary.

Howard K. Smith (1914–2002)

Prominent anchor-commentator Smith was one of "Murrow's Boys," hired by the CBS standout to help cover World War II. He did so with distinction and later proved he could wage wars of principle on his own. Writing a commentary for CBS on whites' abuses of African Americans during the 1960s civil rights revolution, Smith closed by quoting philosopher Edmund Burke: "All that is necessary for the triumph of evil is for good men to do nothing." The head of CBS cut that line and Smith left the network in protest. He moved to ABC, launched a weekly program highlighting his interpretative skills, *Howard K. Smith—News and Comment,* and later, as anchor for *The ABC Evening News,* delivered hawkish analyses favoring President Nixon's Vietnam War policy. When Vice President Spiro Agnew accused television journalists of open bias against Nixon policies, Smith agreed while most others denounced the Vice President for his attack on the press. Whether standing up against the White House or his own peers, Smith brought conviction and sometimes courage to his commentaries.

Eric Sevareid (1912–92)

Sevareid was one of the most gifted specialists in news analysis and the art of the television essay. A midwesterner of Norwegian stock who gained deep reporting and analytical experience as another of the "Murrow Boys" Sevareid began delivering radio commentaries in 1947, and by the mid-1950s television boom had his own news-analysis shows on camera appearing on CBS. During the 1960s he appeared regularly as a commentator on the *CBS Evening News*. His political pieces, aimed, he said, at "elucidation" of the news, could run to several minutes—an eternity to later generations of news producers. Some of Sevareid's work was designed to inspire contemplation followed by action, but it usually stopped short of advocacy. His fine writing, soothing voice, measured delivery, and on-air *gravitas* secured his place in television history.

Television commentators John Chancellor and David Brinkley joined up to bring live coverage of the 1977 presidential inauguration of Jimmy Carter to NBC Network.

Source: Associated Press.

Bill Moyers (1934–)

Public television has always provided more editorial freedom than commercial network news. Moyers, a one-time Johnson White House aide and later public-television commentator, spent some productive years in network journalism, bringing to it a Texas-inflected down-to-earth directness. After five years as a news host on PBS (Public Broadcasting Service) stations, he joined CBS in 1976 as an editor and correspondent of the documentary series *CBS Reports* and then became senior analyst/commentator of the *CBS Evening News with Dan Rather*. The enforced brevity of his appearances was confining for Moyers, and he eventually returned to life as an author, documentarian, and an esteemed public-affairs interlocutor on public television.

Cokie Roberts (1943–)

Also splitting a career between public and commercial broadcasting, Roberts became one of the few women to achieve network-commentator status. This daughter of Washington lawmakers brought sharp insider analysis to her newspaper columns and op-ed pieces and for six years co-anchored ABC's *This Week with Sam Donaldson & Cokie Roberts,* a Sunday talk program that served as a showcase for her political knowledge. Roberts continued as a news analyst with ABC and also with National Public Radio (NPR), continuously exploring the mechanics of hardball politics and government. NPR anchors frequently interviewed (or "debriefed") her about events and their meaning, eliciting tough political reporting and occasional commentary in return.

Ted Koppel (1940–)

Longtime ABC correspondent Koppel anchored nightly reports on the 1979–81 Iran hostage crisis and parlayed that reporting into a unique nightly late-night news program, *Nightline.* Every evening for a quarter-century, Koppel and his reporting staff presented stories and interviews that sometimes brought criticism framing him as unpatriotic, self-aggrandizing, or inclined to use news as commentary. Never formally a commentator, and rich both in Emmy awards and opinions, Koppel was most popular with an urban, educated audience too small to sustain him as network news budgets grew tighter. A 2004 *Nightline* episode called "The Fallen," showing faces of U.S. Iraq war casualties one by one without comment, upset prowar conservatives. The following year, reportedly forced out, Koppel left ABC after 42 years, becoming an NPR news analyst.

Carl Rowan (1925–2000)

The commentaries of Rowan drew power from his climb out of Tennessee poverty to an advanced education, prominence in print journalism, and diplomatic posts under Presidents Kennedy and Johnson. For half of his adult life, from 1967 to 1996, Rowan was a regular on *Inside Washington,* a political analysis round table seen on television outlets nationally. His appearances soon justified the *Washington Post*'s reference to him as "the most visible black journalist in America." Rowan's contributions to television dialogues often centered on race-related issues, with the stated objective, as his Associated Press obituary quoted him, of countering "the racial mindset of most of the media." Whether in print or on camera, his commentaries were clear, firm, and often eloquent. His views of his country's advantages and shortcomings provided grist for his several books and years of newspaper columns, which won him many honors.

William F. Buckley (1925–2008)

Sometimes commentators with the most tenuous ties to mainstream news have been among the most outspoken while engaged in it. Buckley was one such commentator, Buckley was witty, colorful, and literate, an editor, writer, and publisher bursting with ideas and opinions, and probably the best-known political conservative in the United States for the last half of the twentieth century. Buckley poured forceful commentary into television as host of his own long-running PBS talk program series, *Firing Line,* and also made occasional network appearances as a news analyst. While doing commentary for ABC at the 1968 political conventions, he got into an expletive-spitting squabble with liberal writer Gore Vidal; Buckley said he regretted the episode, but he had rarely been known to muffle his opinions. No other broadcast commentator could match his combination of erudition, pugnacity, and verve.

Commentary's Future

Network television news grew thinner starting in the mid-1980s as new owners stripped down news budgets and new competitors for public attention and advertising revenues began to squeeze news turf. The cost-conscious networks, seeking formulas that would make their news programs attractive to potential new viewers, stopped routinely employing news commentators (few local stations offered commentators). In a 2008 interview, former NBC News executive William Wheatley said he thought network commentary had always contained more analysis than opinion, and still believed that "with the right person doing it, a person of experience and insight, commentary was always valuable to viewers." Now, with paths for political communication proliferating via cable television and the Internet, he acknowledged that the newer outlets were dwarfing the old networks in total daily news volume and openly worried about the trend toward more partisan commentary coming from these new media.

There was reason to worry. Far more people who wished to comment on public affairs, frequently from partisan perspectives, now had cable and web venues in which to do so. The seeming democratization of media contributed to what some called a cacophonous multichannel "argument culture," but it also gave viewers greater access to serious commentary of every stripe. Much of it emerged on cable television, where audiences were relatively small but so was the investment needed to keep commentary and debates over news filling the air for hours a day.

On cable's many channels news analysis (except in national election years, at least) could be muffled under the weight of other content. With commentary dispersed so widely over so many sources, it seemed unlikely that a single media speaker could ever again swing the weight that network television commentators had enjoyed with their huge audiences. This dispersal of commentators' influence was in the nature of the transition at hand, diffusing but not eliminating that "elucidation" of news on which Eric Sevareid once labored.

What will happen to commentators in the early twenty-first century is hard to determine. The mantra of this new age of electronic journalism seems to be *choices*. Utterly unclear is what consequences for helping citizens better understand news these choices might bring.

Community Radio

The history of American community radio is a story of social struggle over media technology. From the earliest radio broadcasters to the present, questions of who can own a radio station and whether or not that station should be based on commercial support continue to be a source of public debate and government policy decisions. Community radio emerged in response to commercial radio, attempting to offer diverse political viewpoints as well as a wide range of musical and cultural products. News and information on community radio often challenges mainstream journalism and politics while providing an outlet for local public affairs programming.

Development

Community radio is a product of the media system established through the combination of government policy and private enterprise. From the Radio Act of 1927, which established the Federal Radio Commission (FRC), to the Communications Act of 1934, establishing the Federal Communications Commission (FCC), to the 1996 Telecommunications Act, tensions between commercial and nonprofit broadcasters have been central to the policy debate around media regulation in the United States.

The debates around media regulation are in large part based on the concept of spectrum scarcity. The limited broadcast spectrum restricts the number of radio stations that can operate in any one location. The radio spectrum has historically been seen as part of the public domain, and any station granted access to this spectrum was using a public resource and, therefore, in the words of the Communications Act of 1934, had an obligation to operate in the "public interest." How this interest is best served—through the market forces of commercially driven radio or through nonprofit, listener-sponsored radio—remains an active area of debate.

During the late 1920s and early 1930s, other countries were working to reconcile the debate between commercial versus noncommercial radio. For example, the British Broadcasting Corporation (BBC) became a state owned but independently operated entity in 1927. The Canadian Broadcasting Corporation (CBC) was established in 1932 as a publicly owned and operated radio network that would later expand to television. These models inspired a media reform movement in the United States, composed of educational broadcasters, organized labor, farmers, religious groups, and others who were dissatisfied with radio's domination by commercial interests like the NBC and CBS networks. The noncommercial broadcast advocates largely lost the debate in the United States, resulting in the current system of commercially dominated radio punctuated by a small number of public and community radio stations.

Pacifica and the Rise of Community Radio

Lewis Hill is considered the father of community radio. As a pacifist and conscientious objector to World War II, Hill had firsthand experience with minority viewpoints that were shut out of the mainstream commercial media system. In 1946, Hill founded the Pacifica Foundation with the goal of promoting pacifism through education. In 1949, the foundation launched KPFA, the United States' first listener-supported community radio station. It rejected funding from both corporations and the government, relying instead on listener donations. KPFA's programming was politically and aesthetically diverse, creating a model that other stations followed.

With the help and coordination of the Pacifica Foundation, the KPFA model was extended to a second San Francisco Bay station, then replicated in 1959 with the introduction of KPFK in Los Angeles and in 1960, the network expanded across the country to include WBAI in New York. KPFT Houston was added in 1970 and WPFW in Washington, D.C., was added in 1977. These five stations form the Pacifica network, along with a series of affiliate stations that rebroadcast syndicated programming.

Drawing on the Pacifica model, Lorenzo Milam created KRAB in Seattle, Washington, in 1962. Hoping to avoid the constraints and left leaning politics of the Pacifica network, KRAB strived to maintain an open forum for the local community. Milam assisted other groups across the country as they attempted to launch community radio stations, including KBOO in Portland, Oregon, in 1968 and KUSP in Santa Cruz, California, in 1972. Milam is also credited with pioneering the fundraising marathon concept, a model now replicated by most every noncommercial radio station, including affiliates of National Public Radio.

The political viewpoints expressed on community radio stations often elicited strong reactions, both positive and negative. KPFA and the Pacifica Foundation were repeatedly charged with being communists and in 1962, the foundation board appeared before a U.S. Senate Internal Security Subcommittee, which was investigating so-called communist infiltration. The diversity of programming on KRAB earned praise from the American Civil Liberties Union and *The New York Times,* as well as local Seattle news media outlets. Other stations were not as readily accepted, such as KPFT Houston, whose studios were bombed off the air twice by the Ku Klux Klan in its first 12 months of operation.

Independence was the hallmark of community radio throughout the politically charged eras of the cold war, McCarthyism, the Vietnam War, and the cultural upheaval of the 1960s and 1970s. These stations provided airtime for the expression of dissenting and minority viewpoints, uninhibited from the commercially driven radio stations that dominated the airwaves.

Low Power FM and Radio Activism

The Public Broadcasting Act of 1967 established the Corporation for Public Broadcasting (CPB), which in turn formed National Public Radio (NPR) but also created some new obstacles for noncommercial community radio. The 1967 act required a station to have five full-time staff members and a transmitter with a minimum of 3,000 watts of power to be eligible for federal financial assistance. At the time more than 80 percent of noncommercial stations did not meet these requirements, and most of these stations relied on a combination of listener support and government grants. Many of these outlets included small, low-power class D (less than 100 watts) FM stations run by

schools, churches, and community organizations. In 1978, the FCC stopped accepting class D applications and made existing class D stations subject to displacement by full-power outlets.

These changes in FCC radio policy set the stage for the struggle over low power FM radio (LPFM) in the late 1980s and 1990s. Like the pioneers of listener sponsored community radio, LPFM activists sought to challenge the form and content of commercial media while communicating with a very local audience. Before LPFM licenses became available, activists challenged the FCC and the way the radio spectrum was being regulated. Using direct action techniques, activists began creating small illegal radio stations and using these stations as models for community radio.

In 1986, Mbanna Kantako began operating WTRA, Black Liberation Radio, in Springfield, Illinois. WTRA was a small radio station operated from Kantako's apartment in a public housing project. When the FCC tried to shut the station down, the National Lawyers Guild Committee on Democratic Communication took on the case to defend Kantako's right to broadcast. The legal defense developed during this case became the basis for the legal challenge that would eventually lead to the authorization of LPFM service in 2001.

In 1993, Stephen Dunifer started Free Radio Berkeley, an unlicensed LPFM radio station in California. Through a series of court cases over the next seven years and building on the arguments developed in the Kantako case, Dunifer argued that the FCC ban on LPFM stations was in violation of the Communications Act of 1934, which required broadcasters to use the "minimum amount of power necessary to carry out the communication desired." Dunifer also demonstrated the feasibility of LPFM, proving that spectrum space existed even in a place as congested as the San Francisco Bay Area. The National Lawyers Guild also assisted Dunifer with his defense and their arguments proved to be persuasive. California District Judge Wilken asked if a "total ban on new licensing of micro radio broadcasting the least restrictive means available to protect against chaos in the airwaves?" (Opel 2004, 9). The court's acceptance of Dunifer's arguments became a significant challenge to the FCC.

The struggle over LPFM gained strength with the emergence of the Internet. Activists shared information about how to start small radio stations as well as what to do when the FCC came knocking. The Prometheus Radio Project in Philadelphia began a "barn raising" process where volunteers traveled around the country helping community groups get LPFM stations up and running over the course of a weekend. The combination of direct action, legal challenges, and local and national media coverage led to an FCC decision in 2000 to authorize LPFM stations for the first time in 20 years. This rule allowed for stations to broadcast with up to 1,000 watts of power, required that the station be operated by a nonprofit organization, limited ownership to one station, and the organization operating the radio station had to be located in the community where the station broadcast.

The National Association of Broadcasters (NAB) opposed the licensing of LPFM stations, arguing that the new stations would cause interference with existing broadcasters. NPR also opposed the LPFM initiative, arguing in part that the limited spectrum space would be better used for translators that would rebroadcast existing public radio signals to outlying areas. In response to pressure from the NAB and NPR, the U.S. Congress amended the FCC's LPFM initiative with the Radio Broadcasting Preservation Act of 2000. This act set a more restrictive standard for separation of stations on the radio dial, revising the FCC's proposal and limiting the number of potential LPFM to a small fraction of the potential number in the original proposal. The stations that have been licensed under the more restrictive policy are in small cities and rural areas. Examples of existing LPFM stations include WRFU-LP, The Socialist Forum in Urbana, Illinois; WEHB-LP, First United Methodist Church in Wadesboro, North Carolina; and KUVC-LP, Ukiah Community Radio in Ukiah, California.

By 2007, the FCC had issued over 1,000 licenses and LPFM stations were operating in all 50 states in the United States, offering everything from diverse music, languages, and political and religious programming. The creation of LPFM is the largest growth of community radio since the pioneering efforts of Lewis Hill and Lorenzo Milam.

International Community Radio

Often cited as a small part of U.S. radio history, community radio has had a significant impact on

developing countries around the world. Community radio has been credited with playing significant roles in political and social struggles across the globe. From Colombia to the Philippines, Tanzania to Korea, small, locally owned and operated community radio stations have played a major role in what scholars have referred to as "participatory communication for social change" (Dargon 2001, 18).

According to a 2001 Rockefeller Foundation Report, the power and influence of community radio in developing countries is a result of five factors. First, the technology is affordable for both the broadcaster and the listener. Second, the listening format is valuable for illiterate populations in rural areas. Third, local traditions and cultures can be shared through local radio. Fourth, the equipment requires little maintenance and programming is dependent on community involvement. Finally, the convergence between radio and the Internet is creating powerful new networking opportunities.

Radio Izcanal in Nueva Granada, El Salvador, is an example of international community radio. Started in 1992 by civil war refugees, Radio Izcanal is an example of participatory media that is owned and operated by the community. This station serves the local indigenous populations with programming geared to the Nahua and Mayan cultures.

Radio Gune Yi in Dakar, Senegal, is run by children for children, funded by PLAN International, a nonprofit children's relief organization. Because children make up more than half the total population in Senegal, Radio Gune Yi was established to empower children and offer them an opportunity to speak directly to their community about issues that concern them. Both these examples face pressures similar to those felt by community broadcasters in the United States—lack of funding, commercial pressures for frequency space, and continued training of volunteer staff.

The World Bank Institute began the Grassroots Media Program in 2000, designed to strengthen community radio in developing countries. This program has projects in South America, Africa, and Southeast Asia. Similarly, the United Nations has actively supported the development and maintenance of community radio stations through the United Nations Population Fund (UNFPA) and the United Nations Development Programme (UNDP).

The power and potential of international community radio are detailed in the documentary film, *The Agronomist* (2004), in which Radio Haiti and the work of Jean Dominique are portrayed in the context of the economic and political struggles of Haiti during the 1980s and 1990s.

Conclusion

Community radio plays a significant role in the marketplace of ideas both in the United States and around the world. Community radio broadcasters pioneered the concept of listener supported media, as well as the fundraising marathon. By avoiding the commercial influences of advertising, community broadcasters offer diverse programming that is often left out of most commercial radio. At the same time, the lack of advertising dollars makes funding an ongoing problem for most every community radio station, resulting in a reliance on volunteers, low-paid staff, and constrained programming possibilities. Combining eclectic music with diverse and sometimes offensive political viewpoints, these stations offer local citizens the opportunity to speak to their local communities. Community stations have expanded the range of debate on critical social issues—war and peace, the environment, health care, the public education system, and more. In an environment of consolidated media dominated by a few large corporations, these stations are the few remaining outlets for the expression of minority viewpoints and lesser known cultural material.

Comparative Law

See International and Comparative Journalism Law

Comparative Models of Journalism

The study of comparative models of journalism endeavors to describe, compare, classify, analyze, and explain news systems in diverse countries, cultures, and political systems, and across time periods. This area of research has evolved from largely descriptive and value-laden efforts of U.S. scholars during the 1950s to differentiate media by systems of political control into an important and increasingly sophisticated subfield of international and comparative communication characterized by an array of different approaches.

In the past, models of journalism have tended to be "normative" or prescriptive in nature, hinging on implicit if not explicit moral judgments about what structures, practices, and outcomes are "best" for a society. Comparative models of journalism also are typically descriptive rather than analytical, concerned with similarities and differences in the features of media systems than with explanations of what accounts for such similarity and difference.

Such comparisons across cultures also have tended to rest on the assumption that Western, and particularly Anglo-American, ways of organizing and doing journalism constituted the desirable norm. Part of this is due simply to the fact that many of the relevant researchers come from North America and Britain. From this perspective, government constraints are seen as the greatest danger to freedom of expression, while private ownership of media is the most important bulwark against government interference.

Although this view has fallen out of favor among academics, partly due to a broader movement to "de-Westernize" media studies, it still prevails in policy studies and advocacy carried out by international media watchdog organizations such as the New York–based Freedom House and the Paris-based Reporters Without Borders, which issue annual rankings of the world's press freedom on a country-by-country basis.

The "Four Theories" Formulation

The roots of such studies go back to the 1956 publication of Siebert et al.'s *Four Theories of the Press,* whose authors sought to explain why mass media (with an emphasis on newspapers) took different forms and served different purposes in different countries. Surmising that variations in financing, technology, resources, urbanization, and national experience were all factors, they identified the most important reason for differences in philosophical and political rationale. They classified press systems as authoritarian, libertarian, Soviet communist, and social responsibility, with each category resting on a particular political philosophy and mode of state organization.

Over the next several decades, the "four theories" formulation was among the most influential approaches to U.S. study and teaching of international and comparative communication. It began to come under more critical scrutiny in the 1970s

and 1980s, as scholars found weaknesses and omissions in the categories, and drew increasing criticism in the 1990s for its underlying cold war premises. Nevertheless, Siebert et al.'s work retains both historical and residual importance in the field, and remains an important starting point for reviewing literature in this area.

In this approach, the *authoritarian* system entails direct government control of mass media, and is characteristic of predemocratic societies in which governing power is concentrated in the hands of small ruling elites, typically monarchies. Media organizations and individuals working for them have no independence under such a system, in which the government is likely to mete out drastic punishment for any expression of difference with established authority.

The *libertarian* system hinges on the political philosophy of European Enlightenment thinkers, and their insistence that human beings have an inherent right to expression. Underlying this system is the conviction that, given exposure to freely circulated information and ideas, a society will go with the best choices, and that freedom from government control is the best way to ensure such an environment. This system rejects state limitations on media and assigns media organizations and workers autonomy from government.

The *Soviet communist* system is a modern variant of the authoritarian category. As the name implies, this system is closely tied to a particular ideology—the communist vision of Marx and Engels that inspired the Russian Revolution—as well as structures and practices that emerged in the Soviet Union, in which all media organizations were owned by the state and ostensibly subordinate to the interests of the working class.

The *social responsibility* system, offered as an improvement on libertarianism, takes its vocabulary from the so-called Hutchins Commission (Commission on the Freedom of the Press, 1947), which emphasized the news media's obligations to provide the public with accurate, balanced, and true information, and warned that increasing concentration of private ownership of news outlets was undermining the media's ability to fulfill these duties. In line with the Hutchins study, Siebert et al. saw the concept of responsibility as key to effective self-regulation by media organizations and practitioners. They did not question or posit alternatives to commercial ownership, nor did they advocate government regulation of media.

Elaboration, Qualification, and Critique of the "Four Theories"

Amidst growing attention to international development after World War II as well as increasing U.S. involvement in development projects abroad, scholars concerned with the role of communication in developing countries offered their own typologies of media systems incorporating this concern. These efforts mainly involved renaming and adding categories.

Longtime journalism educators and collaborators John Merrill and Ralph Lowenstein, in *Media, Messages, and Men* (1979), emphasized mode of ownership, and added a fifth category, social centrist, referring to government or public ownership of a libertarian-oriented press. They also renamed the Soviet communist category social-authoritarian, to suggest that this model also had social responsibility attributes. International communication specialist William Hachten, in the original 1981 edition of his best-known work, *World News Prism* (subsequently revised with James Scotton, 2006) used five categories: authoritarian, Western (incorporating both libertarian and social responsibility), Communist, revolutionary (subversive, devoted to the overthrow of a government), and developmental.

Media researcher Herbert Altschull (1984/1995) found flaws in defining systems by what they purported to do, noting that most every country claims a system providing for the needs and interests of its people. He initially divided the map of media systems into the First World, roughly corresponding with Siebert et al.'s libertarian model; the Second World, or Soviet; and the Third World, or developmental model; but in later efforts to strip his typology of value judgments, he revised his categories as market, communitarian, and advancing. Altschull acknowledged that these were idealized categories, neither mutually exclusive nor exhaustive, and likely to appear in hybrids rather than as pure forms.

Some scholars proposed adding or substituting categories such as development, democratic-participant, democratic-socialist, liberal-pluralist, paternalist, or professional—all with slightly varied

definitions depending on author and time. Others noted that, in stressing political philosophy and the nature of the state as the foundation of the mass media system, Siebert et al. neglected to consider the formative role of mass media on society, including politics, as well as the interdependent and interactive relationships between media and society. In addition, the focus on national-level politics and economics excluded scrutiny of factors operating at occupational, organizational, and individual levels, such as professionalism, socialization, or autonomy, that might have important bearing on media production and products.

In a concerted reassessment of Siebert et al. nearly four decades later, titled *Last Rights: Revisiting Four Theories of the Press* (1995), journalism historian John Nerone and colleagues, building on a series of discussions at the University of Illinois Institute of Communications, provided the most extensive critique to that point, offering sharp conclusions and also raising continuing questions about what they deemed one of the most influential works of communication scholarship to emerge in postwar America and endure through the cold war.

Among their general reservations was the observation that a set of ideas that purported to be applicable across time in fact arose from and remained tied to a particular historical moment just a decade following World War II, characterized by ideological commitments to a free-market media system combined with a neoliberal concern for social welfare and institutional responsibility. Moreover, these critics noted, the formulation put forth as four distinct theories was actually "one theory with four examples"—the underlying proposition being that a communication system reflects the society in which it operates.

The Nerone group found uneven degrees of specificity in the four theories, as well as considerable conceptual confusion; in their view, Siebert et al. failed to distinguish between abstractions and realities in establishing their categories, with the result that the explication of authoritarianism really described a purported set of practices, whereas the discussion of libertarianism rested on ideas of specific thinkers, and the social responsibility and Soviet communist models were grounded in historical experience.

All four categories, according to Nerone et al., are vast oversimplifications. They conclude that authoritarianism is more invention than reality, libertarianism a reduction of a vast amount of diverse liberal political thought into a simple formula, and social responsibility a vague notion that means different things to different people—from calls for limited adjustment in a media system that remains primarily driven by markets and profits to a modern model seeking curtailment of the profit motive in the arena of news and opinion, and a radical approach calling for broader social transformation in which media serve as creators of authentic community.

Finally, Nerone et al. identified the central conceptual problem of the scheme is its ideological grounding in one of the four models—libertarianism—and, in particular, the assumption of a basic dichotomy between the state and private interest as the key to media "freedom." This perspective, they say, generates the thinking and vocabulary behind the entire taxonomy. Furthermore, these ideological underpinnings are never made explicit. They are evident, however, in the absence of consideration of any forms of media controlled by entities other than the state or private capital.

While Nerone et al. cast considerable doubt on the entire enterprise of attempting to map press systems, they do not advocate abandoning the effort. They do suggest, however, that such endeavors may be more useful as history than theory; and that at the very least, scholars attempting such mapping must be cognizant of their own ideological assumptions as well as the context of their times.

Complicating Factors

From the late twentieth century on, historical upheavals, geopolitical realignments, new technologies, and many other factors greatly complicated attempts to identify and characterize journalism models. The collapse of the Soviet Union, the reorientation of development policy in the People's Republic of China from a controlled economy to market-driven reforms, the privatization of national broadcasting systems and emergence of new commercial media outlets in many parts of the world, and other developments made sweeping generalizations about countries, regions, and media systems increasingly untenable.

Meanwhile, the expansion of the Internet and the acceleration of global flows of people, goods,

money, and media blurred boundaries beyond containment, so the conventional unit of analysis for systemic analysis, the nation, often seemed inadequate. At the same time, geopolitical change and globalization made international and comparative communication issues, including the workings of journalism in different societies, of increasing interest to researchers. Nerone et al. identified the changing information environment in both national and global arenas as key to recasting studies of news media. Writing in the 1990s, they noted that journalism's subject matter, constituencies, institutions, and procedures, along with information infrastructure and regulatory regimens, increasingly operated on a global scale.

For twenty-first-century scholarship, the response to the vast changes across the globe has been both greater sophistication and lesser ambitions. Rather than seeking a universal scheme to supplant the once-dominant "four theories," scholars have attempted to distinguish journalism models along clearly defined dimensions—emphasizing, for instance, the role of political economy, the weight of cultural traditions, the influence of occupational or individual values, or, more commonly, interactions among these and other diverse factors. Another response is to attempt to identify models or variations found among a selection of countries defined by region, shared historical experiences or cultural values, and/or other presumably common features—for example, East Asia, Scandinavia, or postsocialist countries.

Scholars attempting to develop a framework that incorporates Asian press systems, for instance, have called for much greater attention to endogenous cultural values shaping journalism philosophy and practice, as well as many Asian countries' diverse experiences with socialism and government intervention.

U.S. media researcher Daniel Hallin and Italian media researcher Paolo Mancini (2004), in their co-authored study of media systems in Western Europe, the United States, and Canada, explicate three models in terms of political and economic arrangements, legal and regulatory frameworks, and professionalization. They identify what they call a Liberal Model (Britain, Ireland, and North America), a Democratic Corporatist Model (continental Europe), and a Polarized Pluralist Model (the Mediterranean), presenting these conclusions as empirical rather than normative models as part of an explicit break with prior approaches. They find that differences among the models are diminishing as journalism's role becomes less political and more commercial.

Overall, empirically based propositions offering fundamental insights into cross-cultural variations in journalism institutions, processes, and products have proved elusive, leading some scholars to believe that large questions about why journalism in any given time and place operates the way it does are not amenable to theorizing at all. In addition, national, regional, and global communications have become moving targets, hard to characterize in any enduring sense. From this perspective, idiosyncratic aspects of journalism in a given setting—arising, for instance, from social movements, elite factionalism, economic stress, or other culturally and/or historically contingent influences and interests, as well as the ways specific social actors behave and respond—may be more significant than aspects common to other settings, while circumstance and even happenstance may be more important explanatory factors than identifiable patterns among key variables.

Computers in Journalism

Computers and computing technologies have fundamentally shaped the practice and nature of journalism both in the United States and around the world. Aside from some scattered pioneers, news media have employed computers as a tool in news reporting and storytelling since the 1970s, and especially since the introduction of the personal computer around 1980. In covering the 1952 U.S. presidential election, CBS News used an early UNIVAC mainframe computer to process election night returns and make predictions on their outcome. In the decades since, computers and computing technology have altered the media landscape in many ways, from the advent of precision journalism to the Internet and online journalism. Digital or computer-based technologies have exerted subtle and not-so-subtle influences on the craft of journalism, for both better and worse. This is not to argue a technologically deterministic viewpoint regarding the role of computers in journalism. Rather, computers and computing technology have enabled a variety of changes to occur, subject to economics, people, and policies.

This entry examines the use and impact of computers and computing technologies in journalism in four broad areas: (1) doing journalistic work; (2) the content of journalism or the news; (3) the structure, management, and culture of news media organizations and the news industry; and (4) the relationships among journalists, news media, audiences, regulators, competitors, and financers.

Doing Journalistic Work

Journalists' tasks include reporting, or gathering the news, writing and other forms of storytelling, and editing. For each of these tasks, computers and what this entry will call generally "digital" technology have had a profound impact. In many cases, this has been positive and planned for. For example, large volumes of data are now processed in short time frames and with much greater efficiency than humans acting without computers could do. This is perhaps best exemplified in precision journalism. Pioneered by Pulitzer Prize winner Philip Meyer, precision journalism applies scientific methods of systematic empirical inquiry to journalism. This might take the form of surveys and public opinion polls or other methods, including the analysis of large databases of public or governmental records (typically records of transactions, such as tax data). Often times the data are obtained in digital form from governmental agencies, although in some cases the data are generated directly by the news organization, sometimes in partnership with a polling organization, for example. Such large data sets could not be analyzed without the use of computers. Landmark studies of this type include Meyer's pioneering 1967 study of the civil rights protests in Detroit, MI, which led to his winning the Pulitzer Prize with the *Detroit Free Press* for the series "The People Beyond 12th Street." David Burnham, the former *New York Times* reporter, who achieved fame for his reporting work with Frank Serpico (as depicted in the motion picture *Serpico*) and the Knapp Commission on police corruption in the 1960s and early 1970s in New York city, was the first journalist to use a computer to analyze crime data by precinct in New York, and with the results write a major series in the early 1970s showing crime rates in different areas of the city. Since these early pioneering efforts, the computer has become a standard part of virtually every investigative reporter's tool kit.

But computers and digital technologies, including the Internet and World Wide Web, had become by 2007 standard equipment for all journalists. Research by Middleberg and Ross shows that most journalists routinely use various computing technologies in gathering and reporting the news. Whether journalists use email to follow up on interviews with sources, the World Wide Web to obtain public records, or Google for preliminary research, digital technologies are ubiquitous in news gathering. Digital cameras and digital satellite imaging are also widely used on a wide variety of stories. Increasingly common are digital audio recorders to

store sound bites from interviews. Storytelling, editing, and communicating with editors, sources, and fellow reporters also depend on heavy use of digital technologies. Reporters routinely use notebook or laptop computers to write copy, crop photographs, edit audio and video, and with wireless Internet connectivity, file multimedia reports with editors for review and publication. In growing numbers, reporters also use such mobile digital technologies as smart-phones capable of not only voice communications but also photography and web access, global positioning satellite (GPS) receivers, or other personal digital appliance (PDA) technologies. Such devices enable reporters to gather, produce, and distribute the news more efficiently and quickly. Sometimes the increasing speed can be an advantage against competitors, but it can also be a problem as journalists may have less time to thoughtfully reflect on a story, source, or lead.

Sometimes digital technology has presented problems in how journalists work, including ethical challenges. Problems with plagiarism have grown in scope as online technologies and computer-based word processing have made it easier and perhaps more tempting for reporters to steal from others' writings. Digital imaging has similarly made it easier for a photojournalist or editor to alter a photo to make it more dramatic or otherwise publishable. An important example occurred during the early 2000s' Iraq war. *Los Angeles Times* photographer Brian Walski took two photos of a British soldier directing Iraqi civilians to take cover from Iraqi fire. Walski used his computer to merge the two photos into one, apparently believing that the merged photo was better than either of the two real versions. The alteration was detected but not until after publication and Walski was fired for violating *Times*' policy.

News Content

The computer has fundamentally influenced news content. Most clearly the Internet and World Wide Web have ushered in a whole new era of interactive, on-demand news content. Although some of this is not much different than more traditional media, much is quite different, and growing more so.

Blogs, podcasts, and interactive graphics are just a few examples of the new forms of storytelling that journalists routinely produce based on the use of digital technologies. Other more experimental forms exist as well, some of them not developed by traditional news organizations. For example, the Columbia Newsblaster (http://www1.cs.columbia.edu/nlp/projects.cgi) is a computer-based tool that uses artificial intelligence natural language processing to obtain, synthesize, and publish in summary form hundreds of news reports produced and distributed online every day. The Newsblaster is a research project of computer science researchers at Columbia University, including at least one former *New York Times* journalist.

The Situated Documentary (http://www1.cs.columbia.edu/graphics/projects/mars/mjwSd.html) is another example. Developed collaboratively by John Pavlik and his Columbia computer science colleague Professor Steven Feiner, it is based on the application of wearable computer technologies known as mobile augmented reality. A cousin of virtual reality, the Situated Documentary permits the news consumer to go to the venue of a previous news event and relive it virtually through a see-through head-worn display and other wireless technologies.

Chicagocrime.org is yet another example. As a form of "mash-up" media, it is a freely searchable database of crime in Chicago. Data are merged, or mashed up, from the crime data reported by the Chicago Police Department, the Citizen Information Collection for Automated Mapping (ICAM), and mapping and satellite data provided by Google. ICAM was developed by the Chicago Police Department. By merging, or mashing up, these data, ChicagoCrime provides users a highly detailed, interactive, and useful look at where crimes have been reported in Chicago. Users can browse the data in a variety of ways, including by type of crime including arson, homicide, and gambling; by street all the way down to the block level, and map nearby crimes. Some established news organizations, such as *The New York Times,* have begun using this same approach, providing interactive, map-based coverage of selected tourist destinations in North America.

Newsroom Structure

Digital technology has enabled news organizations to rethink how they operate. Among the important

changes taking place at many news media is the creation of converged news-gathering and -production facilities. From *The New York Times* to the Gannett company, many news organizations have created converged news rooms where print, online, and audio and video news-gathering and -production operations work together to cover the news. Editors and reporters work face to face but also via online communications, with stories being filed digitally. Gradually taking shape is "the virtual newsroom" that does not depend on a physical location. Rather, it utilizes digital technologies, especially mobile and wireless computing and communication. This permits reporters to stay in the field longer doing reporting and spending less time traveling back and forth to a physical news room. It can also reduce overhead costs for news organizations, whose business models are increasingly challenged by growing competition.

Journalists' Relationships

Digital technology is dramatically altering relationships among journalists, news organizations, and their many publics. The rise of citizen journalism, bloggers, and the like has created a global publishing environment where virtually anyone can report on the news. At least some audiences have been transformed from passive news receivers to active media reporters and publishers. The unprecedented diversity of voices on the Internet has let freedom of expression bloom. Yet, many of these voices do not subscribe to the traditional values of accuracy, objectivity, and fairness that have been the hallmarks of great journalism. As a result, while anyone can go online and access (or even "publish") a wide variety of reports and viewpoints, the reliability or credibility of what is found there is often hard to determine. Youtube might provide millions of endlessly entertaining video clips, but it is not always clear how trustworthy many of these clips may be. Wikipedia is open to almost anyone to contribute or edit, and thus must be used with care, no matter how "democratic" it may appear. Yet, the public is spending increasing amounts of time with these and other alternative sources of news, and as a result more advertisers are shifting their dollars from traditional news media to online venues. This is forcing traditional news media to reinvent themselves with business models that can sustain quality journalism amidst digital competition. Finding ways to attract young people to the news is a primary challenge. Digital television and radio, whether via cable, optical fiber, or satellite, are drawing increasing numbers of audience members and advertisers, and the place for local news in these largely national and international digital media is uncertain.

Relationships with sources of news are also changing amidst the digital environment. The Middleberg/Ross Survey shows that journalists are increasingly using the web as a news-gathering resource and employing email to conduct interviews or follow-up with sources. Reporters are finding sources and leads online through various online forums. Sources are also sometimes publishing their own versions of the news, even contradicting reports published in traditional news media.

Digital technologies are also influencing the relationship between news media and regulatory and legal bodies. Because the Internet can carry news worldwide, news organizations are often confronted by legal requirements in other countries. Chinese authorities, for example, have routinely blocked U.S.-based news websites. Journalists have been charged with criminal activities in India for publishing reports that raise no legal concerns in America. Legal problems for journalists are not limited to international venues. Online journalists, or at least citizen bloggers, have been charged with contempt of court in the United States for not revealing their sources.

Perhaps most vexing for the news media is seeking viable business models amidst digital change. Although some news media (notably *The Wall Street Journal*) have found profitable strategies for publishing online or producing video and audio journalism delivered digitally and on demand, most have not. Layoffs and retrenchment have been widespread in traditional news media. Newspaper chains and other news properties have been sold to private equity firms. How to compete in an online media environment where anyone can publish has presented a crisis many in the news business struggle to meet. At the same time, job prospects for new graduates of journalism and media studies programs at American universities are the brightest they have been in years, largely because of job growth in the digital media sector.

Conclusion

Computing technology has dramatically altered the landscape and practice of journalism. From precision journalism to the Internet and hand-held computing devices, digital technologies have redefined how journalists gather and report the news. News storytelling has changed as blogging, podcasting, and other interactive forms of journalism have empowered online users. Although many of the changes brought about or at least enabled by computers have been for the good, some have fostered new problems. Image manipulation and plagiarism are two of them. Legal and business problems have grown in parallel to the explosion of news sources available online. Though journalism remains essential, it is not clear which news media will survive and thrive in the digital age.

Conflicts of Interest

Conflicts of interest in journalism can exist on both the individual and institutional level. Codes of ethics or outright rules traditionally seek to maintain professional distance between reporters and their sources, while keeping news organizations free from financial or other pressures that could potentially bias their news products. It is the latter conflicts that can constitute corruption. Journalists have long prized their independence and ability to report the truth fairly and accurately, which is why, as a profession, journalism has developed boundaries to protect individuals and institutions from both conflicts of interest and conflicts of commitment. However, as in other professions at the turn of the twenty-first century, these traditional views risk being undermined by changes in the structure and funding of journalism.

This entry describes the scope of conflicts that impede (or can be perceived as impeding) journalists from doing their jobs and explains why the mere appearance of a conflict of interest matters to journalists and their employers. Representative lists of individual and organizational conflicts are provided, along with an explanation of why they are of concern and what is being done to address them.

The Journalist's Job

In a web-centric information era, journalists compete for public notice amid a cacophony of messages. For citizens to appropriately process news

content, it must be distinguished from entertainment, public relations, advertising, and input from bloggers and from the newly dubbed citizen-journalists as well. Traditionally, the role of journalist was first that of gatekeeper. What counted as "news" were those issues and events chosen by editors and reporters. By the start of the twenty-first century, anyone with access to a computer or a cell phone could be a news producer. Members of the public can access information without relying on journalists.

While the journalist's traditional roles as gatekeeper and primary channel of information to citizens have become outdated by technology, the social function of journalism remains vital to democracy. Its role-related responsibility is to provide citizens with information needed for self-governance. The essential shared value that distinguishes journalism from other media and journalists from other information providers is that of timely truth telling. In the virtual world, journalists must ensure that audiences recognize them as credible sources that provide reliable information.

In contrast to how the profession is perceived by working journalists, concentrated ownership of news outlets has increased over the last half century, resulting in a business model that seeks to produce the news "product" at the least cost and greatest profit. The potential conflict between making news and making money is ubiquitous. Traditionally, this issue was managed by the maintenance of a strict "wall" between the editorial function (news gathering, reporting, and placement) and the business function (advertising and circulation). That wall has eroded throughout the industry. For example, two years after Disney acquired the American Broadcasting Corporation (ABC), ABC pulled an investigative television news report regarding pedophiles working at Disney theme parks. While it is not clear why the story did not run, the appearance of conflict of interest with the parent company is inescapable.

Dispassionate Journalism

The idea of the professional journalist who strives to serve the public interest in his or her reporting is a relatively new concept. Until 1850, journalists alternated between political work and reporting for partisan newspapers. Two forces gave rise to more balanced, accurate, relevant, and complete (BARC) accounts.

New techniques such as the cylinder press allowed for cheaper printing in the 1830s, which placed newspapers within the budget of all citizens. Newspapers moved from filling the needs of political parties to an information or news role. The editors who ran these cheap newspapers, dubbed the "penny press," viewed their role as fulfilling a duty to provide a realistic view of contemporary life, to expose abuses, and to report items of human interest. The development of the telegraph prompted formation of news agencies to share the cost of news gathering. This collaborative reporting required a product suitable for a "mass" audience, in which journalists could make no assumptions about the political leanings of their readers. The goal of producing an "objective" news account was based on providing information that could be filtered through any user's political or personal biases.

While accurate reporting is touted as an important ethical principle today, it rests on technological and marketing values of the past. Through that notion of serving no special interest, the concern about conflicts of interests for journalists was born. One author lists common conflicts of interests for journalists as follows:

> *Junkets:* expenses-paid trips that make it attractive for journalists to cover events. . . .
> *Freebies:* gifts like free meals or tickets, to befriend or influence a media professional. . . .
> *Bribes:* outright payments or promises to buy services or goods from a media outlet in return for some favor. For instance, a lawyer can promise to purchase advertising from a TV station if the station's general manager cancels an investigative consumer segment about a product manufactured by the lawyer's client. (Bugeja 2008, 198)

Bugeja goes on to identify nonmonetary conflicts as follows:

> *Personal vs. personal value*: conflicts that occur when your personal value clashes with a personal value of a relative or other person outside your place of employment. . . .
> *Professional vs. professional value*: conflicts that occur when one of your professional values

directly conflicts with another of your professional values or when one of your professional values conflicts with a value of your co-worker, superior, client, source or employer.
Personal vs. professional value: conflicts that occur when one of your personal values directly conflicts with one of your professional values or when one of your personal values conflicts with a professional value of your co-worker, superior, client, source or employer. (200)

Operational Definitions

Individuals and institutions can both have conflicts with external obligations and interests or within internal roles and expectations. Some of these are conflicts of interests; others are conflicts of commitment.

Conflicts of interests are those "between professional interests and personal or financial interests. What distinguishes conflict of interest situations is that the conflict is between what one is trusted or expected to do in one's role . . . and financial or personal influences or interests that will or could compromise one's professional judgment and behavior in that role" (Werhane and Doering 1996, 51).

Conflicts of commitment are those "that entail a conflict between two or more sets of professional commitments that will affect one's focus of time, attention, and responsibility" (Werhane and Doering 1996, 51). Conflicts of commitment can also occur between one's personal and professional roles and between one's own professional commitment and a commitment to a higher principle or external obligation.

All individuals and institutions face potentially conflicting situations. However, while conflicts of *interest* can be ethically managed through avoidance, recusal, or disclosure, conflicts of *commitment* may only sometimes be addressed in these ways. Journalists are appropriately loyal to their professional peers and their employers, in addition to their primary loyalty to their audience. They usually have too many stories to produce in too little time and may need to compromise completeness in pursuit of a timely story.

Journalism may be different from other professions in that nonmonetary issues may be as troubling as financial conflicts. It is easy to recognize the ethical problem inherent in someone offering a bribe to kill a story. Yet failing to report material at the request of a friend or a loved one is just as much an ethical violation. Conflict of interest and commitment expectations are based on the principle that any interest—financial or otherwise—that could deter a journalist from providing citizens with information they need requires attention.

Individual Conflicts of Interest

Conflicts of interests for individuals can be obvious, such as a reporter having romantic or sexual interest in a source or a story subject or accepting a bribe to keep particular information out of a news story. These types of conflicts could (and do) easily compromise an individual's ability to meet his or her professional obligations. Other common types of conflicts of interest include outside employment, such as invitations to produce freelance work for a source or for a competing news organization.

Most professional news-gathering organizations provide guidelines regarding the need for journalists to avoid individual conflicts of interests. For example, the Society of Professional Journalists says in its Code of Ethics, "Journalists should be free of obligation to any interest other than the public's right to know." Along with "avoiding conflicts of interest, real or perceived," and disclosing "unavoidable conflicts," members are counseled to "remain free of associations and activities that may compromise integrity or damage credibility," "refuse gifts, favors, fees, free travel and special treatment, and shun secondary employment, political involvement, public office and service in community organizations if they compromise journalistic integrity," and to "deny favored treatment to advertisers and special interests and resist their pressure to influence news coverage" (Society of Professional Journalists 1996).

After eschewing such codes for years, the venerable *New York Times* developed its own "policy" on ethics, prompted by a series of scandals in the early 2000s. This policy notes that "at a time when two-career families are the norm, the civic and professional activities of spouses, household members and other relatives can create conflicts or the appearance of them." The 14-page document covers a variety of potentially conflicting situations and makes clear that the company will not tolerate

behavior that might interfere with a journalist's neutrality or give the perception of interference, on or off the job.

Journalists who gather and produce images and sound are held to the same standard as their print counterparts. For example, the National Press Photographers Association Code of Ethics says, "Do not accept gifts, favors, or compensation from those who might seek to influence coverage," and "Avoid political, civic and business involvements or other employment that compromise or give the appearance of compromising one's own journalistic independence" (National Press Photographers 2006). The Radio-Television News Directors Association counsels its members to "[u]nderstand that any commitment other than service to the public undermines trust and credibility," not to "accept gifts, favors, or compensation from those who might seek to influence coverage," or "engage in activities that may compromise their integrity or independence." In addition, in a section labeled "Independence," members are reminded, "Professional electronic journalists should: Gather and report news without fear or favor, and vigorously resist undue influence from any outside forces, including advertisers, sources, story subjects, powerful individuals, and special interest groups; Resist those who seek to buy or politically influence news content or who would seek to intimidate those who gather and disseminate the news; Determine news content solely through editorial judgment and not as the result of outside influence; Resist any self-interest or peer pressure that might erode journalistic duty and service to the public; Recognize that sponsorship of the news will not be used in any way to determine, restrict, or manipulate content; and Refuse to allow the interests of ownership or management to influence news judgment and content inappropriately" (Radio-Television News Directors Association & Foundation 2000).

Institutional Conflicts of Interest

According to one study,

> more than 40% of journalists and news executives surveyed admitted that they had engaged in self-censorship by purposely avoiding newsworthy stories or softening the tone of stories. With media organizations trying to attract more readers and larger audiences, market pressures were most often cited as the reason for such self-censorship. . . . More than a third of all respondents said news that might hurt the financial interests of a news organization is sometimes or often ignored. More than one-third said they censored themselves because of personal career concerns. (Croteau and Hoynes 2006, 179)

News organizations have always had to make money. But the late twentieth century saw a shift from news organizations owned by an entity that produced only news to ownership by conglomerates with a variety of interests. With corporate values came news managers hired precisely because they shared those values. "By the 1980s, the consolidation of media ownership put businesspeople, rather than journalists, in ultimate charge of news divisions" (Croteau and Hoynes 2006, 167).

Market pressures are discussed within the journalism ethics literature, but are rarely labeled as the conflicts of interest that they are. For example, a story on the front page of the Arts section of December 4, 2007's *New York Times* says, "Morning programs like *Today* on NBC and *The View* on ABC are the modern equivalents of the old Barbizon Hotel for Women, a frilly haven where men were not allowed above the first floor—or here, after the first hour—and viewers are treated to diet tips, ambush makeovers, cancer health scares, relationship counseling and, of course, shopping." These shows "have blurred the distinction between consumer news and product promotion." Despite noting that "[i]t used to be that hosts who are part of the network's news division maintained an air of neutrality during consumer segments; now they are in on the pitch," the blurring is treated as an extension of the status quo: "Product placement is hardly a new phenomenon, and the morning shows long ago mastered the quid pro quo of daily television: Actors give interviews timed to their latest projects; authors are recruited as experts just as their books hit the stores" (Stanley 2007).

Most observers, along with news organization owners and managers, simply note how economic values are replacing news values. To call these organizational conflicts of interests by name would imply that the organizations have

an obligation to address the ethical implications of failing to meet their responsibilities to citizens. Yet the conflict is clear.

> The responsibility of journalism to report fully and fairly on events of the day has the potential to clash with the interests of corporate parents to promote their businesses and minimize any negative news about their operations. In addition, because their business interests are so broad and far-reaching, there are very few economic or legislative initiatives that do not affect some part of a media conglomerate. (Croteau and Hoynes 2006, 185)

News media credibility rests on citizens' assumptions that their news source is choosing material based on the public interest and is presenting information that is balanced, accurate, relevant, and complete (the "BARC" formula). Anything that challenges this assumption weakens the credibility that separates journalism from other sources of information. But individual journalists are dependent on the news organization to provide the conflict-free latitude for them to do their own best work.

Conflict Examples

Conflicts of interests may arise anytime that the product of news judgment may conflict with the individual's self-interest. Generally, conflicts of interests are construed to be financial conflicts, and certainly those are many and varied. Most news organizations, as is the case with *The New York Times,* prohibit newsroom employees from buying stock or engaging in financial transactions if there is a possibility that they had inside knowledge due to their journalistic status. Journalists are almost always prohibited from accepting compensation from any potential news source or story subject. Generally, they are not allowed to accept anything of value from anyone other than their employer unless it is something also offered to the public. For example, journalists are generally allowed to accept frequent flyer miles for their personal or business-related trips but are generally not allowed to accept free flights.

Managing conflicts of interest when journalists do work on their own behalf, like writing books or maintaining websites, is trickier. The material contained in a news story or production is usually a very small portion of the information that the journalist has collected. It is not unusual, therefore, for a journalist who has been involved in a long investigation or ongoing news story to be approached by an agent or publisher wishing to turn that journalist's observations and expertise into a book-length manuscript. Few news organizations have worked out, in advance, how to negotiate such interests. *The New York Times* bans journalists from using such experience "until the news has played out." *New York Times* staffers who host their own personal webpages or blogs are counseled that they cannot completely separate themselves from their professional connection with the *Times.* They are told that they "must avoid taking stands on divisive public issues." However separate the journalist believes the blog or website to be, he or she "must nevertheless be temperate in tone, reflecting taste, decency and respect for the dignity and privacy of others" (New York Times Company 2005, 13). In a world in which journalists have varied opportunities to contribute to the public discussion, news organizations have an affirmative duty to publish clear guidelines for employees that are available to audience members as well.

Developing an intimate relationship with a source is also considered to be a conflict of interest. While there may not be a financial component, sustaining the relationship may take precedence over following one's news judgment. Similarly, the desire to produce an award-winning story or picture may interfere with news judgment. But, while it is possible for news organizations to disallow close relationships with sources or require disclosure of relationships with potential newsmakers, it is more difficult to control an individual's drive for reward. But through initial training and appropriate prioritizing of values in the newsroom, journalists learn and are reminded that the goal is to produce great news, with the understanding that great news may be rewarded, rather than simply to produce the kind of stories that they hope will be rewarded. This kind of conflict is often more of an issue for visual journalists. Something that everyone in the newsroom agrees is "ahellova picture" may be used for its sensational value rather than its newsworthiness.

News organizations have a combination of interests in making news and making money. Whether

they are complementary or competing depends on management. A classic example of an institutional conflict of interests is the *L.A.Times*/Staples Center case. The *Los Angeles Times* devoted its complete Sunday magazine in October 1999 to coverage of the newly opened Staples Center arena. The journalists who worked on that section did not know that news and business managers had secretly entered into an agreement with Staples Center owners to split the advertising profits from the magazine. Readers and reporters were appalled and top managers lost their jobs. But this was no accidental slip-up or surprising error in judgment. Instead, it was the culmination of the two-year reign of publisher Mark Willes who "announced that he was dismantling the wall between the paper's business and editorial departments, saying he'd blow it up with a 'bazooka' if necessary. Willes contended that the two could work together to help the paper, without allowing advertisers to influence news decisions" (Croteau and Hoynes 2006, 171).

Some forms of "ad-formation" are commonplace. For example, most newspapers feature "special" topical sections each day of the week, on subjects such as science, computers, food, cars, and homes. The reader must look carefully to determine if the section is written by editorial staff or if it is written, and thus financed, through the advertising department. According to Croteau and Hoynes, "At the *Oregonian,* the advertiser-friendly home and auto sections are simply written by the ad department. The *Denver Post* turns over the production of its skiing, gardening, casino gambling, and other sections to its advertising department" (2006, 175). In the absence of disclosure, few readers know if the food section is sponsored by advertisers or is produced by reporters. It is not unusual for local weather pieces to have local sponsors. It is seldom known outside the newsroom if the piece on the local hospital's latest diagnostic tool was really produced as news or if the station is running a video news release produced by the hospital's public relations department in the hopes of generating business for the expensive machine. The lack of transparency by news organizations in this regard creates the appearance of a conflict of interest. As even the appearance of a conflict erodes journalistic credibility, ideally, news organizations have an obligation to separate advertising and sponsorship from all news production.

However, conflicts of interest can develop simply because it is cheaper for news organizations to accept what sources provide—press releases, video news releases, and photo opportunities—rather than to conduct independent and time-consuming news gathering. As the least powerful elements of the community have the least access to marketing techniques and knowledge, they are the least likely to be represented in the pursuit of cheap news production. When news organizations ignore the need of the powerless, the whole community suffers.

Another potential conflict is "transaction journalism," where news accounts are tied to the promotion of products. For example, some online newspapers review sections have links to booksellers. Whether the newspaper gets a percentage of resulting book sales is not visible to the reader. When newspapers do receive a kickback, there is the potential for conflicts of interest. Positive reviews are more likely to result in sales than negative reviews.

There is also reason for concern about the subtle trend toward making news more entertaining. "Sex, violence, spectacle: these sorts of programs are the logical end products of the corporate pursuit of profits. They are relatively cheap to produce and, like an accident on the highway, they predictably draw a regular audience. What these programs lack, however, is any sense of serving a larger public interest by providing substantive content" (Croteau and Hoynes 2006, 164). In the conventional vernacular of local television news, "If it bleeds, it leads." The most visually dramatic or sensational (e.g., crime) story is far more likely to appear at the top of a program than the story that may be more relevant to self-governance, but also predictably less dramatic.

It is not enough to note the drift in the industry from news values to commercial values. Just as for-profit hospitals have a responsibility to provide high quality patient care despite the interests of the stockholders, so too do news organizations have a responsibility to provide information that citizens need for self-governance, regardless of economic interest.

Conflicts of Commitment Examples

Individual journalists' conflicts of commitment most often arise in the social activism arena. It is

natural that journalists should be passionate about political issues and social justice. *Caring* about the news is certainly an essential element to gathering and reporting the news. However, many news organizations and individual journalists have a hard time determining where to draw the line regarding civic participation. Marching in a prochoice or prolife rally is generally not allowed, while contributing to a cause, particularly if the contribution is anonymous, often is. Having campaign signs in one's front yard is generally not allowed, but voting usually is.

The closer one's personal connection is to a newsworthy matter, the more difficult it becomes to justify covering the story. For example, a *San Francisco Chronicle* city hall reporter and photographer were taken off coverage of "marriage for gays and lesbians, because they were among the thousands of same-sex couples who received marriage licenses through the city." The determination was made on the basis "that *Chronicle* journalists directly and personally involved in a major news story—one in whose outcome they also have a personal stake—should not also cover that story" (McBride 2004, 1–2).

Personal involvement in a story damages the journalist's ability to be unbiased, or to be perceived by the audience as unbiased. But so does public political and civic involvement. The question is not *whether* journalists are allowed to participate in matters of social importance. It is rather whether journalists should be allowed *additional* participation in matters of social importance. Journalists are active in the community by nature of doing their jobs. Additional participation provides them additional power to that which they already enjoy. Journalists, through their professional choices of what to cover and how, have more power to influence community interest than any other business. As the power of the personal rides on the coattails of the news organization, it is impossible to effectively separate the two.

Institutional conflicts of commitment arise over the role of the news organization as good corporate citizen. News media, for example, are often involved in local philanthropy from having their own "People in Need" or "Send a Kid to Camp" fund and accompanying stories to involvement in the local United Way campaign. While certainly not wrong, news media organizations run the risk of interfering with their journalists' ability to do independent reporting when they do. Nothing in the community should be above scrutiny. Social service agencies can fail to meet the needs of their clients. Philanthropic organizations can be the site of scandal and misuse of funds. But careful journalistic scrutiny of a cultural, philanthropic, or social service organization is less likely if a manager serves on the board.

Most troublesome is the role that the charity United Way plays in most newsrooms. "Of all the charities and non-profits that exist within a community, only United Way gets the benefit of widespread payroll deductions. Few fund drives involve reporters receiving pledge cards with their paychecks. Even fewer can boast of newsroom 'volunteers' who follow up with colleagues, checking to ensure that everyone has 'had the opportunity to give'" (Elliott 1991). United Way implicitly gets managerial approval that results in newspapers and programs that keep track of the success of the fund-raising drives with plenty of stories to encourage citizens to give. United Way, and the agencies under its wing, do not get much journalistic scrutiny. It is reasonable to expect news media to refrain from involvement with outside organizations that then come to be viewed in the newsroom as exempt from scrutiny.

Attachment to government can also be a problem. It is conventionally understood that journalism serves as the "watchdog" on government. Part of what citizens need to know is what government is doing and any controversies regarding those actions. Participating in the military's "embedded journalism" program may be the only way to cover war in real time, but when news anchors wear American flag lapel pins and newspapers print full-color, full-page flags to display in one's window, news organizations fail the public interest. In a time of national crisis, citizens need news that critically reports our governmental actions and how they are being perceived in a global context. Citizens do not need journalism that simply repeats officials' perspectives or panders to the latest public opinion poll.

Equally troublesome, but conventionally accepted, is the role of news organizations in endorsing candidates or voter initiatives, or weighing in on controversial civic matters through editorials. Along with offering a public forum for citizen and external

commentator opinion, news media present their own well-reasoned arguments in favor of or against a variety of public issues. While most media erect a "wall" between those who write for the news-side and those who write editorials, the separation is rarely apparent to audiences.

Congress and Journalism

As the "People's Branch," and primary policy-making body for the United States, Congress plays a central role in the American political system, and thus congressional journalism plays a vital role in informing the people about politics and policy so they in turn can better perform their jobs as citizens. Yet Congress is a paradoxical institution, and in many ways congressional journalism—indeed, the relationship between Congress and the media generally—is also paradoxical.

Congress is the most accessible, decentralized, and dynamic branch of government, and likewise the most democratic. These features make it relatively easy for reporters to get information, build stories, and document and comment on the activities that make up the legislative process. Members of Congress are usually eager to speak to reporters so as to gain coverage and get their message, name, and image before the public.

But Congress is also the most fractious, complicated, rule-bound, and incomprehensible of the branches, making it hard to convey "what's going on" in a simple, clear fashion; keep track of the actors and the action; and accurately portray its role to a mass audience. So much is happening in different venues, and with procedural variations that only experts can understand, that telling any congressional story can be challenging.

Furthermore, though Congress is the most democratic branch, it is also the least efficient and most internally conflicted. Its openness also reveals the messiness and ugliness of the democratic process. As German Chancellor Otto von Bismarck famously remarked long ago, "No one should see sausages or laws being made." Also as a result, the

media tend to portray Congress in a negative light, and to focus more on the personalities, foibles, scandals, and battles that are part of its functions, arguably helping to fuel public disdain for and cynicism about Congress.

Development

During the first decades of its existence (1790–1850) congressmen generally had the upper hand in dealing with the press. They tightly controlled access to congressional proceedings, as most committee meetings were off-limits to members of the press. The Senate did not even open its floor proceedings until 1795, and continued to keep nomination and treaty debates secret until the twentieth century.

The line between reporter and propagandist was not always clear, as members generally had close relationships with the journalists who covered them, sometimes hiring them in the periods between congressional sessions as clerks and secretaries and giving them other patronage duties. Government printing contracts were also doled out to supportive papers. A prime example of this was the *National Intelligencer,* which was the dominant newspaper of the capitol in this period. For years, its two publishers, William Seaton and Joseph Gales, were the sole reporters for the House and Senate, respectively, and had close ties to Jefferson's Democratic-Republican Party then in control of Congress. They were also the official printers of Congress from 1819 to 1829, and began compiling official reports of the activities of Congress, the precursor to the *Congressional Record*.

Because the locus of national power in the nineteenth century was centered firmly in Congress rather than the presidency, the congressional beat grew in importance and stature. Given the growth of the partisan press into the mid-nineteenth century, the trend of favorable coverage for many members continued, since often their partisan patronage or political connections back home included that of allied newspaper owners and editors—with the exception of those aligned with the opposition party.

More "objective" journalism became the norm in the latter nineteenth century, leading to more documentary and descriptive coverage of Congress's members and legislative activities. By the start of the twentieth century, the rise of muckraking and investigative journalism that exposed numerous scandals of industrialization brought about a more adversarial posture. Phillips's 1906 book *The Treason of the Senate*, about illegal campaign contributions, was one extreme example.

However, with the rise of radio and then television, coupled with the increasing power of the presidency (due to the increasing power of the federal government in domestic and world affairs), Congress ceased to be the main engine of political power. Congressional coverage decreased and became more specialized. Stephen Hess, in *The Washington Reporters,* classifies Congress today as a second-tier news beat in terms of prestige, behind others such as diplomacy, general national news, the military, and the White House.

By the early twenty-first century, there were some 7,000 journalists in the congressional press corps, making it one of the largest in Washington. Using the rules in each of its chambers (the House and Senate), Congress issues credentials for journalists to cover it through official galleries—with separate ones for newspapers, magazines, and broadcast media outlets. In practice, however, Congress allows the reporting fraternity itself to decide who may be part of its galleries. The primary criterion is whether the individual seeking a press pass earns his or her living through journalism or related activities, as lobbyists or paid political consultants are prohibited. Since the late 1990s, there have been attempts to broaden access by members of the online media, opening new issues about who is a "journalist."

One thing that has not changed over time is the need for journalists to regularly cultivate congressional sources. Indeed, in covering the institution, journalists, along with members and their staffs, must come together in order to make news. Cook calls this a "negotiation of newsworthiness" and likens it to an elaborate dance. Both have something the other wants: journalists want information and need sources around which to craft their stories, and politicians want media coverage to help get their message and issues out to constituents and gain favorable attention. Yet each is also independent of the other, as members and their staffs try to manipulate or stage news to their advantage, and choose whether and what kind of information they give out, while reporters try to resist being mere dupes for congressional news management and choose what information they will use and how it will be presented or framed. It

is this interaction that creates the nature and content of congressional news.

Current Coverage

What does that coverage look like? In terms of generalizations about media coverage of Congress overall, the consensus of research has not been good news for either institution.

Decline and Negativity

Coverage has been decreasing—especially when compared with the executive branch—and also has become more negative and combative. Studies have shown the congressional share of the "news hole" in major newspapers (such as *The New York Times* and *The Washington Post*) and television networks (*CBS Evening News*, etc.) has been declining since the late 1970s. One key factor was the role of television that made the President more important, visible, and appealing. Another was a declining interest in politics and government among the public, leading media to focus more on "lifestyle" issues and "infotainment" (soft news about entertainment celebrities, popular culture, and the like). As Farnsworth and Lichter (2005, 95) put it, "Congressional coverage therefore has been shown to have lost twice during recent years: both as a part of the declining amount of news coverage of government overall and as a result of the increasing media attention paid to the White House and other branches."

Congress arguably suffers in comparison to the President for several reasons. As a single figure elected by the entire nation, a President is an interesting individual known by all that is easy to depict to a national audience, whereas Congress contains a diverse group of 435 representatives and 100 senators that rarely speak with one voice. Likewise, the legislative process is a complex one that is hard to explain, and has many avenues of action and players in the game, as opposed to the simpler, often more exciting actions of a chief executive.

What coverage there is of Congress, beyond mere description of its actions or inactions, is also increasingly negative. Arguably, Congress has never been revered within our political system, since senators and representatives, along with their legislative wheeling and dealing, reflect the worst tendencies of politics in the public mind. However, scholars now document that the amount of generally descriptive, even neutral-toned congressional coverage has shrunk dramatically.

The more analytical, critical, and interpretive genre of reporting that grew out of the Watergate scandal of the Nixon administration in the early 1970s also impacted Congress, leading to more critical, penetrating "gotcha" journalism that painted an unflattering picture. This trend was coupled with a more sensationalist, or at least "infotainment" news genre driven in part by increased competition among media outlets. The result has been a focus on the dark side of Congressional behavior at the expense of a more balanced view presenting the larger number of members who do their jobs honestly and well. Coverage now emphasizes scandals and malfeasance; bickering partisanship (the fight over the confirmation of Clarence Thomas to the Supreme Court in 1991, the impeachment of President Clinton by the Republican-controlled House in 1998); or members' capture by unsavory lobbyists such as the Jack Abramoff affair in 2005–06). The point is not that these events shouldn't be covered, just that they drown out other news from Capitol Hill. One study of postwar (1946–92) coverage argued, "Over the years, press coverage of Congress has moved from healthy skepticism to outright cynicism. . . . The press portrays the nation's legislators as self-interested, self-indulgent politicians who exploit the legislative process for personal gain" (Rozell, in Mann and Ornstein 1994, 108–09). Subsequent studies suggested that this pattern has largely continued.

Inequalities and Biases in Coverage

Other notable patterns have emerged in terms of what and who gets covered. Given the media's inherent content limitations, journalists and their editors/producers must make sometimes difficult choices as to what issues and actors will be emphasized in their stories.

Senators attract greater attention than House members. This is largely because there are fewer of them, they are more likely to have some issue expertise or leadership position, and are more likely to be presidential contenders. More importantly, however, party leaders (such as the Speaker

of the House, Senate Majority Leader, or committee chairs) are far more likely to get coverage than are regular "backbenchers" who hold no formal position within the congressional power structure.

Other qualities that lend certain members greater attention, and hence newsworthiness, include taking extreme or controversial issue positions; being a "maverick" or taking stances that go against the mainstream of one's own party; being from a large state or city; or being implicated in a scandal. Local media naturally cover their own delegation in Congress far more than others, even the leadership.

Further biases in coverage have also been identified. Female and ethnic minority members have been found to receive less, and more stereotypical, coverage than white males. African American members not only receive less coverage, they are often portrayed negatively, as solely concerned with civil rights issues, and more with the needs of their own district or ethnic group than the country as a whole. Female members likewise are covered as anomalies, overly concerned with such "women's issues" as child care, education, or abortion. Their roles as wives and mothers in competition with their professional responsibilities are often emphasized, whereas male politicians' "home lives" are rarely profiled. Whether the election of Nancy Pelosi (D-CA) as the first woman Speaker of the House in 2007, coupled with the prominent role of Senators Hillary Clinton (D-NY) and Barack Obama (D-IL) in the Democratic Party nomination race for President in 2008, will substantially alter the depiction of historically under-represented groups in Congress remains to be seen.

Naturally, subjects or pending bills that are the most newsworthy receive more press coverage than others. In practice, this means that major legislation—such as the top priorities of the President or party leadership, including major spending bills, are covered more heavily than are minor or technical issues thought to be of interest only to a few. Legislation or debate on "hot button" controversial topics, such as abortion or gun control, is similarly more likely to merit media attention. Such coverage is important because controversy and conflict attracts readers and viewers.

Legislation and the Legislative Process

Studies of how the legislative process is covered make clear that much congressional activity is not captured by the media. Bills and other legislation are covered as a political process, but tend to be framed more in the context of a political "game" that emphasizes strategy and winning and losing rather than substance—a form of "horse race" journalism also seen in campaign coverage. Bills are usually covered only in their final stages, when they are nearing a vote. Committees, the so-called workshops of Congress, are generally ignored—sometimes because their deliberations are closed, but more often because they are deemed boring and hard to summarize. The exception is when they happen to hold public hearings thought to be exciting or controversial, such as juicy scandal investigations or Senate confirmations of judicial or executive officials. Indeed, committee chairs sometimes intentionally stage hearings for maximum media effect—such as when Judiciary Committee Chair Senator Arlen Specter called adult film star Linda Lovelace to testify in a hearing about child abuse legislation (because she had once been a victim), or then-Senator Al Gore's 1985 committee investigation into obscenity in rock music lyrics that featured the testimony of various performers. Nevertheless, most studies conclude that journalists do a decent, if somewhat cynical, job in conveying the messiness of the legislative process and providing the basics of legislation.

Variations by Media Type

Differences among the media also lead to coverage differences. Print media have fewer time and space constraints than does television, for example, and can better encapsulate congressional work. The visuals and sound bites required for broadcast media often limit the effectiveness and breadth of congressional coverage. Indeed, Congress makes for more difficult television reporting, since it appears made up of people standing or sitting around talking.

There are also differences between local and national coverage. Local coverage tends to focus on members and their activities, and is generally seen as more positive and deferential than national media. Reporters for smaller local newspapers and

radio and TV stations have less time and space for, and professional expertise in, covering Congress. Indeed, most local media rely on news agency reports. Smaller media tend to rely more upon the press secretaries of their local representatives. But Vinson (2003) found that local media coverage of Congress mirrors many aspects of national coverage discussed above, and also appears to have become more negative in the process. Nevertheless, members spend considerable time and effort cultivating journalists from "back home," in their attempts to positively impact voters.

Congress is viewed differently by outlets that specialize in the legislative branch. Publications such as *CQ Weekly, The Hill, National Journal,* and *Roll Call* provide coverage for professional D.C. insiders (staffers, lobbyists, administration officials, and other professional Congress-watchers) who are an especially interested and informed audience. Their coverage is far more in-depth and analytical than the mainstream media, and may include coverage of players and processes not deemed worthy of attention by mass outlets. Reporters who specifically cover the congressional beat (regardless of type of media) generally have a greater respect for and appreciation of both the institution and its members.

Congress and Newer Media

Newer media services developed since the 1980s have also impacted the congressional-media relationship. C-SPAN (Cable-Satellite Public Affairs Network), "the Congress channel," has in some ways fundamentally altered congressional operations. C-SPAN brought live, unedited coverage of the House to American homes with cable or satellite access starting in 1979. Live coverage of the Senate followed in 1986, broadcast on C-SPAN 2, and a newer third channel now focuses on press conferences and other events. For the most part, C-SPAN allows for direct communication from members to voters by broadcasting their floor speeches or press conferences. In addition, they may appear on call-in or interview shows. While the C-SPAN audience is small, it is a well-educated and politically active population, making it more important than mere numbers would suggest. Members use it not only to strategically communicate, but also as a surveillance mechanism to keep track of what else is going on in Congress, in committee hearings, or on the House or Senate floor.

The development of the Internet, e-mail, blogs and the like has similarly altered the media environment. Congressmen now use online media to communicate directly with their constituents and other parties through two-way, even interactive formats. Early studies of congressional websites have found they do provide useful information, though they also offer a platform for credit-claiming and grandstanding and are not as user-friendly or informative as they could be. Another found that one primary purpose of congressional websites is actually to provide press releases and attract the interests of journalists for mainstream media outlets.

The emergence of online journalism has created new outlets for coverage, commentary, and criticism of Congress. This was most clearly illustrated by the withdrawal of Senator Trent Lott (R-MS) as a candidate to be Senate Majority Leader in 2002. Lott appeared to be the heir apparent to the position until he uttered what were seen as anti–civil rights and racially charged remarks. Though these comments were largely ignored by the reporters on the scene, liberal "bloggers" and online political activists who saw the comments on C-SPAN began an Internet firestorm of protest, which was eventually picked up by major newspapers and television stations. Lott was then persuaded to quit the leadership race. Thus, online journalism now plays a significant if unpredictable role in congressional media politics.

Conclusion

At the beginning of the twenty-first century, the relationship between Congress and journalism remains uneasy. Major changes in the media and political environments have led to shrinking coverage and a generally more cynical, adversarial tone since the 1970s. Certainly one reason the public has a low opinion of Congress is due to the nature of media coverage and how journalists frame their reporting of the institution's work. On the bright side, news media do present some of the crucial actions. Good information and sympathetic as well as critical portrayals can be found on the Internet and through specialized media outlets. And finally, the state of congressional news reporting is to some

extent perpetuated by the subjects themselves, as well as a political culture that mistrusts and ridicules politicians.

Consultants, News

Local television stations develop their news staffs and their newscast formats based on a wide variety of considerations. These typically include the resources available, the size and experience of the staff, the overall image the station tries to project in the market, and the journalistic practices advocated by station management and the news director. Many of these decisions are based on the station's own knowledge and experience, but the use of outside consultants to make some of these decisions has proven to be a challenging, and often controversial, practice in local television.

Background

By at least the late 1930s, radio station managers considered local news programming essential to maintaining their license. This philosophy was certainly true for radio in the years prior to the emergence of television and for television during the 1950s and 1960s. During this time managers and owners saw local news as an obligation under the Communications Act of 1934. Local news and public affairs programming provided evidence, come license renewal time, that the stations were properly serving the "public interest, convenience, and necessity."

Accordingly, local television newsrooms generally operated on modest budgets and produced newscasts using unadorned formats of talking heads and film. Most stations did not appear to be overtly attempting to draw large audiences. After all, local news was not seen as a profit center, it was what the stations did to keep peace with the FCC. General managers didn't expect their newscasts to earn much money, but they also didn't want them to lose much either. And, especially, they didn't want their news reporters or anchors to get them into potentially expensive legal battles.

The formats varied little into the 1970s. A 30-minute local news block typically included a 15-minute newscast, a 5-minute weather report and forecast, and a 10-minute sportscast. All times, of course, were reduced by the obligatory commercial interruptions.

Television stations had often used outside consultants for research and advice on a wide range of

issues over the years. Many of the consultants evaluated audience reactions to entertainment programs and commercials. But in the late 1960s, consultants were poised to take on a new, expanded, and often controversial role.

Inception of News Consultants

Former ad executives and market researchers Phillip McHugh and Peter Hoffman formed a partnership in Michigan in 1962 to advise local television stations on their local programming, which at the time included music, variety, and children's programs. During the 1960s, fewer local stations originated programming other than news. As a result, McHugh and Hoffman—as their company came to be known—began to focus their consulting primarily on local newscasts. The "news consultant" or "news doctor" was born.

In 1969 their first major market client, WABC-TV in New York, was where Al Primo had recently created the "Eyewitness News" format. A year later Frank Magid entered the news consultant field. A former social psychology professor at the University of Iowa, Magid had been providing market research data to broadcasters for 12 years. Now he, too, refocused his attention on the newsrooms and newscasts of his client stations.

Unseen by many at the time, a major change was taking place in local television news. These first consultants carried a message to station management that has been magnified and conveyed by many additional consultants since then. The message was clear: If managed correctly, local TV news can make money. Indeed, news could become a major profit center.

This was music to the ears of general managers. A potential new revenue stream is hard to ignore. The consultants had created their niche and were prepared to take full advantage of it. In market after market—beginning in the larger cities—consultants convinced managers that if their stations followed their research and recommendations, they could increase their news viewership, advertising, and station revenues.

Consultant Strategies

The formula consultants used was straightforward. Once they had signed a contract with a local station, they would administer an audience survey, asking viewers to evaluate the competing stations, their strengths and weaknesses, their newscasts, and—importantly—their news, weather, and sports on-air personalities. The presumption was that if stations delivered a news product the audience wanted, more people would watch and ratings would quickly reflect the increased viewership.

The consultants' research reports provided data of value both to station management and to news directors. Together, they could better understand their market position in the eyes of the viewers and could identify things or people that needed changing. As a data source, the audience analyses were generally helpful to the client stations.

But, in addition to the research, the consultants offered—and most client stations purchased—added services that included recommendations for the news product. Many of these recommendations, which often involved new equipment, technology, and facilities, were pricy, but when faced with the potential additional revenue from expanded viewership, station management was generally in a mood to spend more to make more—and lots of it.

In a fairly short time in the early 1970s, consultant recommendations were adopted by stations in most large and medium-sized markets. These stations were invested in news technology—remote trucks, satellite services, helicopters, and weather radar—and in their news, weather, and sports personnel. Consultants offered advice on the "look" of the newscasts, and assisted stations in developing more exciting sets, graphics packages, and newscast formats—all with an eye toward attracting more viewers.

News directors who felt uncomfortable with the increased emphasis on news promotion and marketing often resigned. Yet those who remained found their newsrooms energized by all the new technology and personnel, as well as their higher profile within the station, and their larger news staffs.

Controversy

Controversy soon engulfed the growing role of "news doctors." In conducting their audience analyses, consultants often asked questions about the types of stories viewers preferred on local

newscasts, as well as whether they would like to see "more news." Not surprisingly, many viewers replied that they preferred softer stories, often with a human interest touch—stories about their communities, their friends, and other topics close to their homes and their lives. In response to sometimes leading questions, survey respondents often said they would prefer more such news in their newscasts rather than stories about local government and politics.

Such research results frequently led to consultant recommendations that station newscasts should include shorter stories (i.e., how else can you provide "more news" in the same amount of time?) and more human interest or "friends and neighbors" stories, with less time spent covering local government and related issues. At this point, of course, the consultants had entered the realm of the journalist and were making recommendations regarding newscast content. As a result, at many stations the "give the audience what it wants" mantra replaced the long-standing "give the audience what it needs to know."

Critics—often from within newsrooms—countered that the main reason audiences didn't like local government stories, for example, was because stations didn't do a very good job of covering those stories. Newscasts tended to concentrate on boring governmental meetings, they would contend, rather than on issues being debated. To these critics, the solution to the problem, rather than to downplay or eliminate local government coverage, was to increase—and improve—that coverage so stories were more compelling to viewers.

A handful of the most outraged critics went so far as to file license renewal challenges against stations that had been most overt in their adoption of consultant recommendations. These challenges were based on the contention that such station owners were abdicating responsibility for their news to outsiders. If proven, this would be a violation of the terms of their station licenses. None of these challenges were ultimately successful, but the existence of the threat no doubt caused stations to make their consultant-based changes less conspicuous to viewers than they had been.

Al Primo, the news director at WABC-TV in New York in the 1970s, created the "Eyewitness News" format that consultants began to mimic in their recommendations to other local stations. The format was soon ridiculed by critics, starting at WLS-TV in Chicago, where *Variety* correspondent Morry Roth in 1970 first disparagingly dubbed the station's newscasts "Happy Talk." The Happy Talk label came about because of the nature of the types of stories on the newscasts, but also because of the frequent banter the format required between anchors delivering the newscasts, making them seem like television friends rather than journalists.

Consultants and News Personalities

Also controversial were consultants' recommendations concerning on-air personalities. Consultants' audience research provided a mother lode of data regarding how audiences perceived virtually every aspect of every on-air news, weather, and sports anchor. The goal, of course, was to assemble an anchor "team" that the audience liked, enjoyed, and would make a point of watching.

Research questionnaires often asked questions about anchors such as "Would you like to have this person in your home for a visit?"; "Would you enjoy meeting this person?" and others in a similar vein. In this arena the conflict between journalism and show business came to a head. News, weather, and sports anchors who didn't resonate with the audience were often replaced by others who had been pre-tested by the consultants in other markets for the positive reactions they elicited from audiences. The concept of an anchor "team" was advanced. Anchors were told to smile more, to tell little stories or jokes between themselves during and at the end of the newscast, and to appear more relaxed and informal. Journalistic ability took a back seat to on-air appearance and personality. Some consultants went so far as to provide their client stations with regularly updated lists of suggested banter to be used by the anchors while on the air.

Consultants quickly seized the opportunity not only to screen and identify potential anchors for their client stations, but also to provide advice on appearance, hairstyles, clothing, and numerous other areas that had previously been the exclusive province of show business.

Impact of Consultants

Consultants usually began working with stations in last place in the local news ratings, or at least

those far behind market leaders. These were the stations that had the most to gain and the least to lose. In many markets the impact of the consultant was dramatic. Consultant-driven stations began to show significant local news rating advances—in many cases quickly surpassing their long time and more traditional competitors. And in many markets, this trend to expand viewership of the consultant stations did not necessarily come at the expense of the competition—those stations' ratings often remained relatively unchanged. The increased rating, instead, came from households that had previously not watched local news at all.

Based in part on this success, the impact of consultants quickly moved far beyond changes made at their client stations. As their stations began to show increased ratings, other stations in the market—fearful of their lost market dominance—often would mimic changes at competing outlets. Without using consultant-driven research data, they would try to match, or even surpass, changes implemented by the consultants. In this way, the effect of the consultants on local television news far outpaced just those stations that were their clients.

At the same time, however, in many markets at least one station developed a niche as being the one that did not follow these types of recommendations. These stations retained a largely traditional look and held on to audiences that appreciated the somewhat slower paced and more in-depth approach they offered. Of course, these audiences, although perhaps impressive in numbers, generally didn't provide the youthful demographics so much in demand by today's advertisers.

Consultants in the Twenty-First Century

In recent years news consultants have morphed into a few market leaders—Frank Magid and Associates is still a significant presence, joined by Audience Research and Development (AR&D)—and a number of smaller companies that often work within a geographical region or a station group. Group owners often perform similar services in-house for their own outlets.

Likewise, the services consultants provide have also evolved. Many maintain talent banks of anchors and reporters—often including recent college graduates—who are available for client stations to hire. They also provide coaching services, working with on-air anchors on their presentations. Audience research continues to be a staple of the consultants' efforts. But they also help to design news sets to update the overall look of the newscasts (especially with the development of high definition transmission), including graphics, and the use of music and other transitions.

Some news directors have grown adept at implementing consultant recommendations and have moved among stations based on recommendations of consultants they have worked with. Clearly, some news directors are more comfortable working with such outside advice than others.

Consultants continue to sell their expertise to assist stations with their weather and sports anchors, story presentation and marketing, and facilities. They were among the first news "outsiders" to make systematic recommendations for enhancing weather graphics—including radar—and relying more heavily on graphics for sports scores and statistics. The trend toward hiring bona fide meteorologists as weather anchors and former athletes as sports anchors has been fueled by consultant recommendations.

In the early twenty-first century, consultants have expanded their reach by incorporating more new media recommendations for stations. At a time when local television news is expanding its outlets—to the Internet, cell phones, and other newer technologies—news consultants continue to offer advice on how to maximize applications of these delivery systems.

What began as a series of outside companies appearing to hijack local newsrooms and impose their news formulas on them has evolved into a largely complementary enterprise, working more as a component of station news management. And many stations, after years of relying on consultants' research and advice, are feeling more comfortable performing many of these functions on their own, using consultants less frequently.

Convergence

Convergence is the merging or melding of media, for example, the merging of newspapers, radio, and television on the web, and the creation of multiple versions of a story for different media. There are many dimensions to convergence, including business consolidation, technology integration, functional convergence of news services, audience fragmentation, geographic convergence and changes in government regulations that make convergence possible. *Convergence* is a once popular buzzword that has fallen out of favor, and returned to popularity again because, while the term may have been overused, it captures a process that has been underway for some time, with significant implications for journalism. It is a response to both rapid changes in technology and shifting consumer behavior. Some scholars view convergence as inevitable (a result of the changing media environment); others view it with alarm, arguing that it is driven primarily by the profit motivations of large media conglomerates. For students of journalism, convergence has implications for the training they need, how they will produce news in the future and how they perceive news distribution in a multiplatform media landscape.

A Timeline for Convergence

Media convergence has been underway for decades. Some trace its origins to the convergence of computers and telecommunications in the 1970s. Satellite technology in the 1970s and 1980s also fostered convergence. One example is cable news channels such as CNN that merged television news with a dedicated cable channel and satellite distribution. Starting in 1982, *USA Today* began merging a newspaper with a television news style of colorful, graphically intense, concise stories and distributing the paper via satellite to local printing plants. By the early 1990s, many in the newspaper industry recognized a need to redesign content for multiple media to satisfy different customer needs (Tewlow 1993).

Everette Dennis (2003) identifies four stages of convergence. The first was an awakening of recognition in the 1980s that computing was becoming a core component for many media industries. Second, the Internet became a practical tool for millions of households starting in the mid-1990s. The third stage, in the late 1990s, was an uncritical acceptance of the web as a dominant new medium that was predicted to take over traditional media industries. A fourth stage, in the early 2000s, was the seeming failure of that model and a renewed confidence in older business models for media. Convergence as a concept made a comeback a few years later, admittedly with a more conservative and realistic perspective about future media trends. Journalism research centers such as the Poynter Institute and the Media Center at the American Press Institute began to track convergence and provide analysis of its impacts.

The Many Dimensions of Convergence

Business consolidation is one cornerstone of convergence that has been underway for some time. Consolidation of media properties began with the formation of large chains of newspapers and groups of TV and radio stations under the ownership of a single company during the second half of the twentieth century. It picked up speed in the 1990s and the first decade of the twenty-first century as very large media conglomerates were formed, as with the merger of Time Inc. and Warner Communications into Time Warner. Media conglomerates typically control a number of subdivisions operating across multiple media platforms, such as newspapers, television stations, magazines, and websites. Business consolidation has required

that companies seek efficiencies across their media properties. At one extreme, this usually means personnel layoffs. But it can also involve newspaper reporters writing stories for the company's websites and television news operations. A variation of this process is when a story written specifically for one medium is adapted or "repurposed" for another medium, perhaps by others. On the business side, a sales person may sell advertising for all of the company's media holdings. Facilities may be consolidated, so newspaper personnel may work side by side with those of a television station and website. With modern telecommunication links such as fiber optics, companies can create virtual staff consolidation where people at different locations can share resources as if they were in the same space.

Business consolidation can occur through the acquisition of other media companies, as when News Corporation purchased Dow Jones in 2007, or through partnerships, like the one forged between the New York Times Company and CNBC. As a result of this relationship, *New York Times'* print stories are carried on CNBC's website and CNBC video stories are carried on *The New York Times'* website. An important goal in these acquisitions or partnerships—and one often unreached—is to create synergy among the organizations, so each benefits in ways that would not occur if they continued operating independently.

Technological integration of media, for example, a cell phone that provides text messaging, music, access to the web, and videos as well as voice communication, is another cornerstone of convergence. Technological integration has been made possible by the digitization of media transmission and storage. In a digital world, text, audio, and video are all the same—a string of numbers—making it easier for one device to provide different forms of content. It was once thought that the computer would eliminate the need for other devices such as television receivers. Some observers still believe this may happen. However, the reality has been that most media have taken on additional features: computers can play videos as well as display text and graphics; digital TV sets have many computer-like features and are capable of displaying web content.

Convergence usually involves the functional merger of services. This is most notable on the web, where a news site may carry stories in multiple formats, along with reader forums, blogs, polling, interactive maps, and direct links to shopping sites. Many interesting new reporting formats have emerged, such as slide shows of photos with commentary by a journalist or photographer. Some mergers of content are more controversial such as the merging of information and entertainment into "infotainment." Critics see this as a degradation of professional journalism. Others argue that some infotainment services such as *The Daily Show* on cable or *The Onion* on the web are legitimate and useful forms of satire.

There is a seeming contradiction between the convergence process (the coming together of media) and the proliferation of media devices. We use more media devices than in the past, but each one has more features and services. One consequence of the proliferation of media devices is the fragmentation of audiences. Today, few read the same morning newspaper and watch one of three network newscasts in the evening, as millions did decades ago. Instead, news consumption is today scattered across multiple media services. Convergence, in the sense of publishing news on multiple platforms, is one means of attracting fragmented audiences. A second consequence of the changing media environment is that many people now consume news on the web in bite-size chunks rather than a dedicated session of watching or reading a full menu of news content in a newspaper or on television. The design of news content in a web environment must take into account that many readers will read only one story at a news site, then jump to other pages and possibly return several times for other stories or updates of those they read earlier.

Geographic convergence is apparent most clearly on the web, where news providers are both everywhere and nowhere. Anyone can compete for audiences, no matter where they are located. *The New York Times Online* has a large readership outside the United States; Clarín, a major news service based in Argentina, competes directly with American news services on the web for Hispanic readers in the United States. Satellite distribution of newspapers, printed and distributed in local communities, allows *The Wall Street Journal, USA Today,* and *The New York Times* to compete with local newspapers. Similarly, cable news services such as MSNBC (distributed by satellite to local

cable systems) are location-free, unlike local over-the-air broadcast news.

The convergence process, and especially business consolidation, has been made possible by the easing of government regulation. The Telecommunications Act of 1996 weakened restrictions on conglomerate ownership of media properties in the United States. FCC policies in the decade that followed also weakened restrictions on ownership of multiple media in a single market. In television, this led to the disappearance of many independent stations; in radio, it led to the elimination of news operations at many stations owned by conglomerates in other markets. Government regulations of media convergence in other countries vary widely. In Britain, for example, there are stricter rules about cross-ownership of media in the same market and therefore less media convergence.

Practical Implications of Convergence

Many news organizations have, under different names, a news center where stories for multiple platforms originate. Frequently, reporters in such centers are distinguished not by the medium for which they create a story but by their beat. So a crime reporter may create stories for the organization's newspaper, website, and television news programming. One example of a news center is the *Tampa Tribune,* which locates in one facility the reporting staff for the newspaper and its affiliates—WFLA TV and *Tampa Bay Online*. Another example of convergence is *The Topeka Capital-Journal,* which shares stories among its affiliated newspaper, radio stations, and website along with a partner television station owned by another organization. The group promotes itself as "Topeka's Total Convergence Team" and uses each media platform to cross-promote the others. For example, a reporter will appear on a television report and promote a more comprehensive article in the newspaper the next day.

There are many practical implications of convergence and operating decisions that news organizations must consider. At the height of the web bubble, circa 2000, many newspapers had separate web staffs. Several years later, it was more common for the newspaper and website to be served by the same reporters and editors, or have a few dedicated web producers in addition to the centralized reporting staff. Though the concept of producing and distributing news stories to multiple platforms seems straightforward, it is fairly complex. A news organization needs software to manage and distribute stories in different formats, hardware to store files, and budgets that cut across departments and organizations. The assignment editor in a news organization must decide not only what stories to cover but in what formats when, and how to cover a story for multiple media.

Convergence requires a new mindset for journalists. They must consider the multimedia path a story will take and plan ahead for reusing content across different platforms. Many old journalistic instincts don't work in the newer media environment. For example, in a newspaper or television news context, the goal has always been to attract and keep the reader or viewer. In the web environment, readers jump around and expect the reporter to be an expert who will not only convey valuable information but will provide links that send the reader to additional sources. News consumers are much more active in the converged media environment. They comment about stories and sometimes provide news in the form of photos or tips. But all this comes with its own problems. How does a news organization maintain quality, fact check, and avoid outright deception in an era of citizen journalism?

Obstacles and Negative Effects

There are many obstacles to convergence and potentially negative effects. Some labor unions have resisted converged newsrooms and multimedia reporting by "print journalists." Company culture can create barriers to inter- and intra-organizational cooperation. Economic factors are often a barrier. Many newspapers have been under financial pressure for years, forced to maintain or increase profits with fewer resources in the form of reporters and technology. Convergence requires new investment and, often, less profit, at least in the short term.

Reporters have mixed attitudes about convergence. Some view themselves as print or broadcast journalists and do not want to create stories for multiple platforms. Others lack the skills to create for a medium such as television. Still others are cynical and view convergence as a marketing

gimmick. Some reporters say that convergence is a management ploy to get fewer journalists to do more work and promote the news as a "product" not journalism (Kolodzy 2006). There are editors and publishers who resist convergence, viewing it as a jargon term with more hype than reality or a code word for technology taking over the newsroom.

Consumer behavior can be another barrier. We know that consumers have taken to the web for news in very large numbers, but they do not want to pay for content, forcing news organizations into a business model with only one source of revenue—advertising. Consumers have widely adopted cell phones but do they want to get news on a cell phone? There are also generational differences, where younger people will readily accept the cell phone as a multi-application device while older people just want the device to make telephone calls.

Critics of convergence note that it does not always work, can take a long time to recoup investment costs, and is a reaction to technology change rather than a conscious step forward for journalism. AOL's purchase of Time Warner in 2000 is often cited as the prime example of convergence that failed. That merger was a clash of organizational cultures, and few of the promised synergies across media groups materialized. It has also been argued that large conglomerates provide less diversity of opinions due to the concentration of ownership and a need to convey a consistent brand image across media divisions.

Other critics believe that convergence is about the automation of the news production process, leading to fewer reporters and the temptation to lower standards, for example, turning press releases into editorial content because it fills holes in news production, and mixing advertising with content because it increases revenue. It can also lead to the elimination of news programming. Many have noted that consolidation of radio stations in the 1990s and early 2000s led to a sharp cutback in news coverage—as journalism was deemed too expensive.

Conclusion

Convergence in the production and distribution of news content is well underway. In the changing media environment, journalists require a broader set of skills. Writing is no less important than in the past, but writing for multiple media is now a prerequisite for the professional journalist. Convergence has led to more competition as the location of a news organization becomes less important and media that were separated in the past by their means of distribution (e.g., print and broadcast) now occupy the same space on the web. CNN, *The Washington Post,* ABC Radio, the BBC, and *Time* magazine are direct competitors in the web environment.

If there is a threat to journalism from the convergence process, it may be in the commoditization of news. News organizations are under significant financial pressure to create more news, for more media, with fewer resources. Technology and repurposing stories help them do this but will professional reporting be squeezed out in the process and news quality be reduced to the point where it is just a commodity like water or soap? The answer is probably no, but the danger exists. If groups such as Google can create news services with no reporters, simply by aggregating content from other sources, how can news organizations with costly staffs of reporters compete?

Copyright

Copyright is a legal protection of expressions that are fixed in tangible media. Copyright describes, for example, an author's right to reproduce a book manuscript, an artist's right to duplicate his painting, or a musician's right to perform an original score. Copyright is part of a family of legal interests loosely termed *intellectual property*, which also includes trademarks, patents, and trade secrets.

Origins

Civilizations dating to ancient Egypt have inscribed unique marks on physical objects, such as bricks, to indicate ownership or craftsmanship. Greeks first used marks to indicate a creator's association with more cerebral products, such as art and literature. Romans further distinguished an author's right of ownership from an alienable right to reproduce a work. Chinese as early as the Han Dynasty (206 B.C.–A.D. 200) recognized an exclusive legal right to reproduce written works. But intellectual property notions in ancient Eastern cultures developed less fully than in the West because Eastern philosophical traditions tended to be more communal than individual notions of knowledge ownership.

In the West, the prominence of medieval guilds led to increased legal recognition and protection for marks that identified goods and services. These marks correlate closely with marks recognized in modern intellectual property law: trademarks, service marks, and certificate marks. Guilds also maintained trade secrets that correlate closely with modern trade secrets, protected by law against theft as long as the owner takes steps to maintain secrecy. The concept of the patent also dawned at this time, as governments sought to attract new scientific methods in the development of public works by offering creators exclusive legal rights in their designs.

With the introduction of moveable type in Europe in the mid-fifteenth century, authors and printers joined engineers and the traditional guilds in seeking enhanced legal protection for intellectual property. The Republic of Venice became renowned for obliging and accordingly attracting intellectual talent. Venice is credited with adoption of the first patent statute in 1474. The British Crown in 1557 provided a royal charter to the Stationers' Company, a powerful printers' guild, granting its members exclusive rights to reproduce written works, thus essentially to oversee a system of copyright. Governments thus protected intellectual property against piracy and awarded exclusive rights, or privileges, to intellectual property owners to profit from their graphic or mechanical designs and publications.

More definite statutory precursors to modern intellectual property law developed in Britain in the seventeenth and eighteenth centuries. The 1623 Statute of Monopolies generally proscribed the monopolization of inventions, but operated as a patent law by protecting a creator's interest in an invention for the first 14 years. The 1710 statute of [Queen] Anne formalized copyright law, superseding the monopoly of the Stationers' Company. The statute established depository libraries for copyrighted works, gave authors a right of reproduction, and allowed them a 14-year term of copyright, renewable by still-living authors for 14 further years.

Following the lead of such eighteenth-century political philosophers as John Locke (1632–1704), postrevolution governments in the United States and France re-envisioned intellectual property as a natural right, rather than as a privilege awarded by government authority. Still, these new governments limited intellectual property rights with statutory terms. The U.S. Constitution of 1787 (Article I, section 8, clause 8) empowered Congress "[to] promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries." Congress enacted copyright and patent laws in 1790, the former modeled on the Statute of Anne.

Modern American copyright law was inaugurated by the 1909 Copyright Act. It remained in effect, with amendments, until it was superseded by the Copyright Act of 1976, though the older act remained in effect for works copyrighted up to 1978. The 1909 act doubled the terms of initial and renewed copyright to 28 years each and required that copyrighted works bear copyright notice—for example, the typographical symbol, "©"—and be registered at the federal Copyright Office. The 1909 act did not preempt state common law copyright, which provided some protection for unpublished works.

The 1976 law did substantially supersede state common law copyright, but extended the federal system to protect works from the time they are "fixed in a tangible medium of expression," thus encompassing unpublished works. The 1976 act further extended the term of protection to the life of the author plus 50 years. The 1976 act still required notice and registration of a copyright before the owner could employ the enforcement provisions of the law, but defects of process were no longer necessarily fatal to later copyright claims.

U.S. copyright law was amended in 1988 to allow U.S. agreement to the Berne Convention for the Protection of Literary and Artistic Works, a multilateral agreement dating to 1886 that requires nations to recognize one another's copyrights. The 1988 amendments also relaxed procedural formalities of U.S. copyright, notably the requirements of notice and registration as conditions of enforcement. In 1998, Congress again extended the term of U.S. copyright to life of the author plus 70 years, and corporate copyright to the lesser of 95 years from publication or 120 years from creation. Congress implemented other international agreements on copyright by enacting the Digital Millennium Copyright Act of 1998 (DMCA), which in part prohibited the circumvention of technology designed to thwart the piracy of copyrighted electronic content, such as motion pictures on compact discs.

Copyright law in the United States and around the world has subsequently been amended to conform to the international Agreement on Trade-Related Aspects of Intellectual Property Rights, or TRIPS Agreement, which built on the Berne Convention and established the World Trade Organization in 1995. Significantly, TRIPS provides copyright protection to computer software and limited protection to data compilations.

Theory and Criticism

Like other intellectual property interests, copyright reflects a fundamental tension between the public's interest in shared knowledge and free-market trade, on the one hand, and private property rights and the public's interest in encouraging innovation, on the other. On the former score, society has an interest in the exchange of information free of legal restriction so as to facilitate the collective attainment of desirable norms such as truth and equality. The free market also depends in part on a free exchange of information, as actors in a marketplace who are better informed are more likely to make rational decisions that maximize productivity and efficiency.

Critics of these justifications for copyright argue, for example, that excessively long copyright terms unjustly enrich content creators and stifle creative expression that might otherwise emerge. Critics charge that affording creators too broad a spectrum of copyright protection contorts free market dynamics; for example, the anti-circumvention provision of the DMCA arguably inhibits development of content-delivery technologies more efficient than what the market offers.

Copyright is understood as an expression of natural rights, which posits that a creator of intellectual property enjoys a unique relationship with the creation; accordingly, respect for the creator demands that he or she be afforded control over the disposition of the creation. The creation is therefore given the legal status of private property with rights of ownership vested in the creator. This arrangement serves the public interest both because it protects natural rights and because it fosters creation of new intellectual property. Authors and artists who know that they will be permitted to profit from their creations are more likely to create again. Historically, this latter concept, termed "incentive theory," has been important in U.S. law, while the natural rights approach has been of complementary importance in European law.

Because the Internet is an unprecedented medium for the global and nearly instantaneous exchange of content, and by its nature the Internet tends to

defy the legal constraints of national laws, it has become a battleground for government regulators, content owners, open-knowledge advocates, and intellectual-property pirates.

Contemporary Law

U.S. copyright law protects "original works of authorship fixed in any tangible medium of expression . . . from which they can be perceived, reproduced, or otherwise communicated, either directly or with the aid of a machine or device." Original works include the literary (which simply means written or printed—this is not a term denoting any minimal level of quality), musical, dramatic, choreographic, pictorial, graphic, sculptural, audiovisual, and architectural. While copyright protects the expression of ideas, it does not protect ideas themselves. Thus for example, a description of a new accounting method may be copyrighted, but the method itself may not be, and may be described in other words by someone else. Short names, representative symbols, processes, and inventions are not copyrighted, but may be eligible for trademark or patent protection.

A constitutionally required element of a copyrightable work is originality. That means that the work must have been created independently by the copyright holder, and that the work must embody some minimum of creativity. For example, an author who writes a sequel to a classic literary work may copyright the new, independent creation, but not the pre-existing classic. A publisher of calendars may copyright an arrangement of photographs, but may not copyright the ordinary arrangement of dates in a seven-column table.

Generally, a copyright owner enjoys the exclusive legal right to reproduce a work; to prepare work that is derivative of an original; to distribute copies; to perform or display a work; to broadcast a sound recording; or to authorize another to exercise the owner's rights.

Copyright is subject to many limitations. For example, a public library may duplicate the contents of a book threatened by physical decay. A system of compulsory licensing authorizes musical groups to "cover" popular songs. Some statutory limitations on copyright are so complex in their interpretation and application, and the demand to use copyrighted content so high, that industries have developed de facto licensing authorities. For example, the American Society of Composers, Authors and Publishers (ASCAP), founded in 1914, is one of three organizations that oversees the licensing of music for performance and radio broadcast. The Copyright Clearance Center, founded in 1978, handles reproduction licensing for many written works in the United States and has sister organizations around the world.

Fair Use Doctrine

An important limitation on copyright is the fair use doctrine. The doctrine was developed by the courts and expressly incorporated into law with the 1976 Copyright Act. A problem of copyright is that an exclusive right vested in one copyright owner is at odds with the freedom of expression enjoyed by all other persons. Indeed, copyright is at some point at odds with itself, as an excessively repressive regime would choke off the very creative expression that copyright is designed to foster. Fair use means to balance these competing interests by allowing limited though unauthorized use of copyrighted works.

Fair use is generally noncommercial in nature, such as an educator using copyrighted material in a class or a journalist using copyrighted material in a news report. A second fair use factor concerns the nature of the copyrighted work. Works with more original creative content, such as a wholly original fantasy novel, are entitled to greater protection than works of less originality, such as the fact-intensive contents of an almanac. The third fair use factor is the amount and substantiality of the use relative to the whole of the copyrighted work. A reproduced page of a medical treatise is less likely infringing than a reproduced chapter. The last fair use factor concerns the effect of the use on the market value of the original. Reproduction of the climactic scene of a suspense film may well infringe copyright if it depresses consumer demand to see the film.

Application of fair use doctrine is often at the heart of legal disputes over copyright. Flexibility of the four factors means that case outcomes are difficult to predict, and unpredictability breeds more litigation. At the same time, a vigorous fair use doctrine offers essential breathing room for free expression.

Issues

Copyright law has given rise to myriad legal issues and a whole subspecialty of legal practice. Moreover, contention has compounded since the advent of the Internet. Key issues include the copyright worthiness of data compilations, copyright protection against parody, the constitutional limits of copyright duration, and the problem of digital downloading.

A first issue in copyright law is the copyright worthiness of data compilations. A landmark copyright dispute over telephone books reinforced the originality prerequisite of copyright and disallowed copyright protection in mere data. In *Feist Publications, Inc. v. Rural Telephone Service Co.* (1991), a telephone cooperative sued a telephone book publisher for copyright infringement in the unauthorized extraction of compiled listings. The U.S. Supreme Court ruled that no infringement had occurred because a data compilation, while generated by "the sweat of the brow" of the compiler, lacks the minimal originality required for copyright protection. Creative choices, such as the arrangement of data in presentation, or the selection of data for inclusion, may merit copyright protection, but the data themselves do not.

Rejection of the "sweat of the brow" doctrine in the United States differs from its acceptance in Europe. In 1996, the European Community protected database content as well as arrangement and selection. International application turns on reciprocity, so that only databases from participating countries are protected. The desirability of database protection and the market consequences of its absence have spurred heavy lobbying by the U.S. information industry to accept the European regime. Accordingly, industry advocates have litigated in the lower courts to erode *Feist,* while researchers, librarians, and information freedom advocates have defended *Feist.* Responding to industry pressure, the TRIPS Agreement explicitly protects the selection and arrangement of data, but the agreement does not extend protection to underlying data.

A second copyright issue is protection for parody. Parody depends for its humor on the resemblance of the parody to the original, so a vital parody market depends on a tolerant copyright regime. Recognizing this problem and the importance of parody as a form of social criticism, the U.S. Supreme Court built protection for parody into the fair use regime in *Campbell v. Acuff-Rose Music, Inc.* (1994). In *Campbell,* the rap music group 2 Live Crew had produced an unauthorized and commercially lucrative parody of the copyrighted Roy Orbison rock song "Oh, Pretty Woman," borrowing an opening riff and lyrics, but little more. The Court found that 2 Live Crew's taking from the original was not excessive in light of the nature of parody, which must contain enough of the original to conjure it in the mind of the listener. The Court's fair use analysis cut a wide path for parody, recognizing, for example, that a parody's commercial success does not necessarily degrade the market for the original, and might even enhance it.

A third issue has been the duration of copyright protection, specifically, whether the U.S. Constitution places a limit on its duration. The Constitution authorizes copyright protection "for limited Times," but says nothing more. Intellectual freedom advocates cried foul in 1998 when the Copyright Term Extension Act boosted copyright terms and was made retroactive, extending copyright protection for works soon to slip into the public domain. Retroactivity affected many early Hollywood products, including the Walt Disney Company's earliest Mickey Mouse films. Supporters argued that longer life expectancy and the new markets for derivative works warranted longer protection; opponents claimed that the longer terms defied the "limited" command of the Constitution and stifled creative production. The Supreme Court in *Eldred v. Ashcroft* (2003) sided with the supporters, declaring that short of protection in perpetuity, the limits are left to Congress to determine.

Digital downloading makes it possible, with only a home computer, to make a copy of a work of music, video, or art of such high quality that it is indistinguishable from the original. And the Internet makes it possible for copies to be widely shared. "Peer to peer file sharing" (P2P) systems exploit this technology by making it possible for one person to copy a musical composition, for example, from the computer of another. P2P operates without regard for authorization by the copyright owner, so P2P creators and providers initially contested liability on grounds that offended copyright holders must pursue system users instead. But in *MGM Studios,*

Inc. v. Grokster, Ltd. (2005), the Supreme Court unanimously held that defendant P2P software distributors could be held liable for encouraging copyright-infringing uses of their products. Since *Grokster,* the recording and motion picture industries have been aggressive plaintiffs in combating content downloading, though personal identification of online users and jurisdiction over foreign P2P providers have been persistent impediments.

Journalism and Copyright

Copyright is essential to journalism, as the journalist trades on proprietary expression. A journalist's work is copyrighted when it is fixed in an article or a broadcast story. Disputes involving journalists have concerned copyright ownership, copyright in news reports and in news itself, and government copyright.

Under U.S. copyright law, when a work is made "for hire," that is, by an employee, copyright ownership vests in the employer, unless the parties agree otherwise. Thus copyright in a print journalist's news story vests in the newspaper, notwithstanding the byline. This "work for hire" doctrine may apply as well to commissioned works, such as a freelance article. However, in *New York Times Co. v. Tasini* (2001), freelancers objected to the republication of their work in electronic databases without additional compensation. The U.S. Supreme Court ruled for the writers, holding that the electronic databases were new works, distinct from the printed "collective works" to which the freelancers had contributed. Thus the *Times* would have to negotiate new contracts with the freelancers to republish their work.

Copyright also impacts short but critical components such as headlines and hard news leads. Copyright may apply to news reports, but cannot apply to the underlying *facts* of the news. Thus, news may be repackaged and republished in new stories without violating copyright. Arguably, though, there are only so many ways to write a headline or lead with minimal words. Repetition is inevitable, prompting a difficult question as to when a headline or lead is sufficiently imbued with a minimum of originality as to warrant copyright protection. This has been complicated with the Internet, as news aggregators clip headlines to serve as links to news providers' content. In a pioneering case that settled before trial, a Scottish court in *Shetland Times Ltd. v. Wills* (1996) preliminarily enjoined headline links. Courts in Japan and Belgium subsequently found sufficient originality in headlines to compensate news providers for infringement. In contrast, in *Perfect10, Inc. v. Amazon.com, Inc.* (2007), a U.S. court ruled that informational and retail websites' use of thumbnail-image links did not infringe publishers' rights to display the original, full-size images.

A related issue arises from the inability to copyright news facts. In *International News Service v. Associated Press* (1918), the Supreme Court decided that an action may lie in state misappropriation law when one news service pirates the scoops of a competitor. The viability of this "hot news doctrine" has been questioned since the preemption of state common law by the 1976 Copyright Act. Nevertheless, a federal court in *National Basketball Association v. Motorola, Inc.* (1997) maintained the viability of the hot news doctrine. The NBA challenged the practice of a Motorola pager service in transmitting real-time scores and information about games. The court found no misappropriation because, applying the court's test for the hot news doctrine, Motorola expended its own resources to ascertain and convey the information and did not exploit a "free ride" on the NBA.

A final issue concerns the ability of government to claim copyright over public records. While the federal government may not copyright its own work, it may have copyright assigned to it, as by an artist whose work is used on a postage stamp. State and local governments are not precluded from copyright ownership; in that event, copyright law can collide with state laws compelling disclosure of public records. Courts facing this problem have sought refuge in the fair use doctrine. For example, in *County of Suffolk v. First American Real Estate Solutions* (2001), a federal court ruled that copyright law did not preclude disclosure of copyrighted county tax maps under the New York sunshine law, but the sunshine law also would not preclude county action to enforce its copyright if subsequent dissemination of the maps exceeded fair use.

Conclusion

Copyright is a double-edged sword in the law, as it simultaneously fosters and inhibits freedom of

expression. As such, copyright is both friend and foe to the journalist. Courts and policymakers will continue to struggle to define the scope of copyright to preserve this delicate balance.

CREDIBILITY

Questions of credibility of the news media have been a perennially favorite topic for inquiry. Credibility emerged as an important conditional variable in the emerging psychological science of persuasion after World War II. For many decades, journalism researchers have examined various dimensions of credibility of news reports. The Gallup survey, for example, has for many years asked a question about how much "trust and confidence" people have in the mass media—defined as newspapers, television, and radio—"when it comes to reporting the news fully, accurately and fairly" (Gillespie 2004). The proportion of the public having a "great deal" or "fair amount" of confidence in the mass media was 44 percent in 2004, down sharply from the 54 percent measured the previous year, and quite a bit lower than the 68 percent in 1972 when the series began. It is likely that the 2004 dip resulted from negative public reaction to several well-publicized media scandals involving reporters Jayson Blair of *The New York Times* (2003) and Jack Kelley of *USA Today* (2004). In both cases the newspapers were embarrassed by revelations that the reporters had fabricated portions of major stories that received widespread public attention.

Questions about the media's overall credibility were the focus of a number of systematic studies in the 1980s that created the impression there was a "credibility crisis" in the mass media. Examining credibility, several organizations gathered national survey data on the topic, the results of which were widely reported. This perceived credibility crisis in the news media led researchers to pose questions

to link public judgments of credibility to controversies involving journalists and their work practices. The Pew Center for the People & the Press concluded that the public found the press credible but were worried about the ethics of some press practices. For example, journalists were often seen by the public as not being concerned that their stories might hurt people, or that they took advantage of victims of crime or disaster. The public also felt that journalists do not always correct their mistakes and too often violate people's privacy.

Media credibility has been tested by public perceptions of such controversial news practices as using unnamed sources, checking into the background of candidates for office, requesting detailed medical information about public office holders and candidates, and investigations (including stakeouts) into private lives of public officials. Some people feel that the news media are out to "get" officials when controversial investigative methods are trained on their favorite candidate. This appears particularly true when people have not previously paid attention to how news is gathered. Such perceptions call into question the credibility of news reports.

In recent years new diversity in media programming has focused renewed attention on political values and ideology as the basis of judgments of news credibility. Some news sources with explicit ideological slants have become popular with conservatives (e.g., Fox News, Drudge Report) and liberals (e.g., Air America, Huffington Post). This polarization of news exerts pressure on mainstream news organizations and may influence audience judgments about the framing, emphasis, balance, and thus credibility of their reporting.

Credibility has many synonyms. Writers over the years have looked at such elements as trust, integrity, reliability, and honesty. Others have focused on how differences among contesting parties are covered, focusing on the extent to which news is considered balanced, fair, and even-handed. Others have focused on skepticism about media reports, particularly when readers' personal experiences appear to contradict media accounts.

Why Credibility Matters

Most people regularly use news media of many kinds. People have implicit understanding about the purposes of news media, how useful they are in everyday life, and their limitations. Such widely shared beliefs help guide public interaction with media and help users determine the relevance of each, as well as inform judgments about how much time to spend with different media.

Media scholars Gerald Kosicki and Jack McLeod (1990) conducted a series of population surveys asking about people's perceptions of media, how they fit into everyday life, and how they were used. They found that public understanding of media is multidimensional. One of the more important perceptions was related to traditional notions of credibility. Kosicki and McLeod labeled this "news information quality." Other perceptions they found were also quite important, however, and are not usually discussed by journalists or scholars. These included "patterning of news," or its ability to add up to a comprehensive picture of reality over time; and "negative aspects of content," or criticisms that media reports are sensationalistic, biased, and dominated by bad news. "Dependency and control" referred to the perception that media institutions were too much alike and too powerful. "Special interests" reflected a belief that media either were special interests themselves or were largely mouthpieces for special interests.

Media organizations spend money to study credibility because they assume it is important to their circulations, readership, ratings, viewership, page clicks, and other measures of media use and attention. However, credibility (and its many synonyms) may be just the tip of the iceberg. More research could help to tie perceptions of quality to actual consumer decisions to read and view media reports.

Hostile Media Hypothesis

Partisans tend to see news coverage of their favorite topics as being biased against their point of view. This inclination has been explained in two ways. The first is that partisans evaluate fairness differently: they are likely to offer strong critiques of the media's choice of topics and how they are framed. A second explanation is that partisans often recall different aspects of the content, even when they have seen the exact same thing in an experiment. In 1985, researchers Robert Vallone, Lee Ross, and Mark Lepper found that pro-Arab

and pro-Israeli partisans reported more negative references to their preferred side of an issue—in this case, the 1982 massacre of Palestinian refugees in Beirut—and believed this might sway uncommitted persons against their point of view.

The "hostile media hypothesis" has been tested by many investigators in different media contexts. These have included topics such as abortion, genetically modified foods, and the Israel-Palestinian conflict among others. Recent research has attempted to conceptualize and document the psychological mechanisms that account for the effect. These included selective recall—-that people remember different aspects of media reports hostile to their point of view—and selective categorization, where partisans see the same content but assign differential valences to it. A third mechanism is called different standards, suggesting that opposing partisans agree on content of media but see evidence employed by their opponents as irrelevant. Some research argues that selective categorization is the only mechanism that adequately explains the hostile media effect. This suggests that partisans see information as more disagreeable when they encounter it in a media channel as compared to some interpersonal communication. It can be inferred, therefore, that people see news media as a type of communication for which they have particular quality expectations and to which they attribute powerful effects.

Impressions of public issues, candidates for office, and other controversial subjects are not easily changed by new disconfirming information. There are many examples of strongly held beliefs being readily maintained in the face of even massively discrediting information. This is part of a larger pattern in which those strongly committed to particular ideas tend to evaluate evidence to support their existing thinking. Media credibility, in other words, may seem at first glance to be nominally about characteristics of media content, but ultimately it is more about people, their values and commitments, and how they use and perceive media to form judgments about issues.

Credibility and New Media

Although a notable characteristic of newer media (such as blogs) is that they are highly opinionated and upfront about their assumptions and ideology, credibility is also emerging as a key issue relating to them. The Credibility Commons, for example, is a website that studies the credibility of the Internet. The project creates and releases open-source software to facilitate the study of credibility by obtaining user ratings of the quality of Internet sites and displaying them to others who visit a given site.

Evaluating the credibility of information on websites involves considering their ownership, information quality, credentials, ideological commitments, and commercial interests, among other things. To take one example, many assume that all search engines provide similar results. However, advertising and other commercial pressures, such as payments to the firms operating search engines, can affect what turns up across different search engines and in what order the results are displayed. Searches are also affected by the algorithms employed and Google also applies a factor that includes the rating of similar searches by Internet users and which of the many results selected in the search is the final one users tend to look at most often. A number of firms specialize in providing so-called web optimization, which amounts to trying to discern what factors influence the ranking of search results on a given search engine and then attempting to use that information to game the results in favor of their clients' sites. Such practices make some websites more prominent on search results than they would otherwise be.

Although it is difficult to generalize, the online world is generally not more credible than traditional media with the vast majority of people. Pew's polling in 2008 indicated that online news outlets are less credible than traditional news outlets such as newspapers, magazines, and television news. Pew also found that online news sources that mainly display the content of traditional news media, such as Yahoo and Google News, were more credible than other online sources such as Slate, Salon, the Drudge Report and The Huffington Post.

The credibility of information and its sources has remained a critical component in considering the quality and significance of messages and their possible effects. Decades of careful research show that credibility is a complex construct with many considerations. Most importantly, perhaps, credibility is a judgment made by people and one rooted in their experiences with media but also their own life

experiences, political and social views, and expectations from a given communication situation.

Crime and the Courts

News media coverage of crime and the courts highlights, among other things, the clear tension between First and Sixth Amendment rights in the Constitution, those of a free press versus a defendant's right to a fair trial. But such coverage also demonstrates the power of media to contribute to a false view of reality, as when heavy viewers of television feel threatened by a world they perceive as filled with more crime than is the case.

Crime as News

Crime stories dominate most American news media. Numerous content analyses of newspapers and television stations have shown that local media are saturated with accounts of crime, hence the local television newsroom adage, "If it bleeds it leads." Public interest in crime news is generally high, providing a commercial incentive for newspapers and broadcasters to cover more crime news. Furthermore, crimes usually make good news stories in that they provide crucial drama and human interest (and pictures for the electronic media) even though they may not always provide substantial news value. Because of the ways that journalists cultivate relationships on their beats, crime news can be fairly easy to report, often with willing sources (victims, police) who want to tell their stories. However, research has shown that not all violent crime is covered with the same prominence in the media; journalists typically weigh how much a given crime deviates from the norm in deciding how much coverage it gets. So, statistically speaking, unlikely victims or perpetrators, unusual methods, or sympathetic victims receive more coverage than "status quo" criminal events. Intense media coverage has even been correlated with a decrease in plea bargaining in the prosecutor's office.

While crime news coverage can have a direct impact on the actual criminal proceedings, research also shows that the level and types of crime stories are not indicative of actual criminal statistics. Television news, for example, overemphasizes crime and is disproportionately focused on bizarre crimes. Newspaper coverage has shown biases of gender, age, race, and socioeconomic status, and studies suggest that such biases influence public perception of both perpetrators and victims. Repeated exposure to this unbalanced information in the press appears to lead readers and viewers to feel more threatened and afraid of becoming a victim of a violent crime.

Crime news not only dominates local media but also figures prominently on cable news networks with national coverage. Court TV is the obvious example. It came about as one response to the public's seemingly insatiable appetite for crime and court stories. In 1995, Court TV saw a huge boost in viewership during its coverage of the O. J. Simpson murder trial and the increased interest in all courtroom drama. Later, the channel started airing fiction crime and court shows such as *Homicide: Life on the Street* and *Forensic Files*.

Effects of Coverage

This blurring between real and fictional events is significant because polls show that the public forms opinions about crime more from what they see or read in the news media rather than personal experience. Scholars have examined the effect of this crime coverage to show that people who are heavy viewers of television tend to replace actual reality with a television version of that reality. George Gerbner first wrote about this idea, which he dubbed "cultivation," when he argued that people who watch a lot of television base their reality far more on impressions left by television viewing rather than their own experience or knowledge. These television viewers think the world is a scarier place than it really is because television news and drama focus so much on crime. Polls confirm this, showing that a majority of respondents say that media coverage of violent crime increases their own fear of being a victim.

People who are accused of committing crimes are often portrayed as being held by police, sometimes handcuffed or in prison clothes. Such images are significant because initial crime coverage influences the first impressions the public develops of people later accused of crimes and facing juries. This is a serious problem because of two constitutional protections in conflict: the First Amendment rights of the press to report such stories and the Sixth Amendment rights of the eventual defendant. Jury verdicts can be influenced by pretrial publicity, disclosure of a prior record, incriminating testimony (despite being ruled inadmissible by a judge), and disturbing crime scene images. The strong effect of pretrial publicity has been evident in all stages of trial, pretrial, and pre- and post-deliberations.

A host of studies have shown that subjects exposed to pretrial publicity were significantly more likely to presume the defendant's guilt than those who did not see the media coverage. The majority of studies show that the bias remains even after the final verdict. Indeed, they found that this bias was strongest when subjects were tested before the trial even begins, dismal testimony to the premise of "innocent until proven guilty." It is just such concerns that lead judges to seek "gag" orders or other means of limiting media access to, or reporting of, pretrial proceedings.

Media portrayals of defendants can have unintended consequences. Jury research offers numerous examples of how physical characteristics can affect people's judgments. Such research looks at "extralegal bias"—those factors that are not supposed to be considered during a trial. The two most significant are a person's physical attractiveness and his or her race. Several studies have shown that mock jurors treat attractive defendants more leniently than unattractive ones, though this was only a factor in the last stage, sentencing. Whites tend to rate black defendants guilty more often than white ones in murder cases. Black defendants are found guilty more often when their victim is white. Studies have shown that white jurors are more likely to think that a defendant of color is guilty of rape than if the defendant is white. Minority defendants convicted for the rape and murder of white victims are more likely to receive the death penalty than white or black perpetrators who have harmed black victims. This prejudice exists regardless of the type of crime.

Conclusion

Crime news coverage dominates local print and broadcast news and forms an often significant portion of national news as well. Coverage of court trials has become a significant part of the news media, with one cable channel largely devoted to such coverage. Because most people lack direct contact with the legal system, mass mediated forms of information either through fiction programs or the news are the main source of information about crime and the courts. Because First and Sixth Amendment rights are often in direct conflict, a balance is constantly being negotiated to

ensure protection of both rights to the best extent possible.

Criticism and Critics

Although traditions of American journalism typically command impartiality, some journalists are specifically read and valued for the subjective judgments they offer. These are the critics or interpreters of the American cultural landscape. Criticism comes from the Greek root *kritikos* or the Latin *criticus,* terms referring to a person able to make a sound judgment. In journalism particularly, the term refers to the discussion, usually in print, characterizing and appraising a cultural or artistic work. As they describe and analyze the object, critics provide their readers with information, opinion, guidance, and entertainment. They are full- or part-time employees who make a living out of their informed judgment.

Critics specialize in the fields they write about. These mainly include art, theater (drama), literature (or books more generally), music, film, media, and food (restaurants). With the rise of computers and graphic software, the critics' repertoire has also come to comprise digital art. Academics often refer to critics as "arts journalists."

Roland Wolseley, author of an early text on journalistic literary criticism, distinguished critical pieces from feature stories about arts or artists, news reports of arts shows, star gossip, and mere discussions of the book world. He explained that critical writing specifically focuses on the artistic work and is intended to serve as a judicious guide and shape public taste. Other journalistic forms on the arts merely inform or entertain. Critics bring authoritative experience and knowledge into the criticism they write. A 2007 study on the self-image of critics suggests that they view their passion about their field—usually undesirable in journalism—as one of their most distinctive characteristics.

Although people usually refer to criticism and opinion review interchangeably, veteran reviewer Campbell Titchener distinguishes between the two. He explains that both parties usually work in a print medium but reviewers do not focus on a specific art form and commonly offer an overnight reaction to a cultural performance. Critics, on the other hand, specialize in a specific field and offer a studied and contextual evaluation of their topic of concern over time. Their work sometimes appears days or weeks after the concert, exhibit, or play in

question. In brief, reviewing is only one aspect of a critic's occupation.

Finally, arts journalists also differ from academic critics who appraise cultural objects in a journal or book. As Wolseley explains, the latter do not write for a mass public and hence may use technical language that general audiences likely do not understand. Their judgment is rarely concerned with a specific object or event, concentrating on literary, artistic, or cultural tendencies in general. Critics, on the other hand, write for a mass audience and usually address individual cultural events or performances.

Critics and scholars of criticism share a common understanding of how to write a sound critical text. They explain that high-quality criticism deconstructs the art works or performances, revealing their various layers to readers. Such criticism is intended to provide an informed and disciplined opinion that remains respectful, even when negative. Criticism also features astute comparisons that place the object or performance in context and demonstrate a thorough knowledge of the object, its creator, and the general field. Criticism creates a dialogue that assigns art or performance a historical context. Through theoretical knowledge and considerable experience in critical appraisals, critical writing exhibits its author's (and the reader's) acquaintance with, and appreciation of, arts in general. Finally, criticism takes into consideration its target audience, the extent of its exposure, and the boundaries of its sensitivities.

Role and Importance

The rise of blogs and ensuing democratization of opinion have forced critics and students of criticism to explain the importance and defend the role of professional criticism. In a sense, critics are opinion leaders who provide consumers with a sneak peek into the event in question. Consumers read critical writings to reduce their uncertainty about products before consumption. Philip Lopate, author of *American Movie Critics,* says that critics become old friends to whom readers turn for advice. They acknowledge their authority and respect their choices. Famous critic Northrop Frye takes the point a step further. He argues that criticism educates readers as it shapes public opinion. It acquaints many people with prime examples of cultural artifacts and improves public appreciation of the arts. Film critic Richard Schickel writes that criticism provides context and guides readers to new ways of looking at culture and art. The process begins a discussion that may sometimes continue for years.

In *The Death of the Critic,* researcher Rónán McDonald argues that criticism ensures survival of and respect for the superior literary and artistic performance. Addressing literary criticism in particular, he explains that critics act as cultural gatekeepers, motivating writers toward greater achievement. He notes that popular mediocre hits have historically accompanied the decline of professional criticism while some of the most creative works have surfaced during glorious periods of criticism. The financial role of criticism for book authors is central—-awareness and word-of-mouth effects are tantamount to the success of books. Extreme judgments, even if negative, can boost book sales.

Types of Criticism and Famous Critics

As noted, criticism in newspapers and magazines spans many creative fields, usually including art, drama, literature, music, film, media, and food.

Art

The term usually implies the characterization and appraisal of all kinds of artistic, dramatic, media, and literary works. In its narrower sense, however, art criticism refers to published articles describing, analyzing, interpreting, and appraising visual art works. Subjects of the critical text usually include painting, sculpture, photography, and printmaking as well as architecture and dance. Only in the eighteenth century did art criticism become an independent genre. In the United States, art criticism emerged a century later, with development of both popular newspapers and commercial art galleries.

Many art critics have written for U.S. newspapers and magazines but Clement Greenberg and Harold Rosenberg remain among the prime examples. Born into a modest family in New York, Greenberg assumed several random jobs before he began to write on painting, eventually becoming one of the most influential critics on the American

art scene. A formalist who distinguished between "true culture" and kitsch, a term he coined to describe popular art, Greenberg (1909–94) championed the New York school of abstract artists like Jackson Pollock. He preached an avant-garde approach where artists raised their art into an "expression of the absolute." Greenberg worked as editor of the *Partisan Review* between 1940 and 1942 and, from 1942 to 1949, he wrote art critiques for *The Nation*. Between 1944 and 1957, he worked as managing editor then associate editor of the *Contemporary Jewish Record,* later known as *Commentary*.

Born and raised in New York City, Harold Rosenberg (1906–78) was a highly influential philosopher, writer, educator, and art critic. A champion of Abstract Expressionism, he authored numerous books and wrote for *The New Yorker* magazine from 1967 until his death. One of his main contentions posits that the United States is the cultural epicenter of the world and action painting, a style where paint is splashed rather than carefully applied, its most developed cultural form. Rosenberg's provocative and educational analyses helped set up and clarify the various components of abstract painting.

Drama

Theater criticism is as old as the subject it covers. It involves a discussion and evaluation of performing arts such as theatrical shows and operas. Famous drama critic George Nathan explained that, of all criticism, that of the theater is the most personal. It is also essentially self-reflective: As the critics appraise performances, they examine themselves through the theatrical work.

Dramatic criticism in the United States features a number of prominent names, two of whom are George Nathan and Clive Barnes. Born in Indiana and educated at Cornell University, Nathan (1882–1958) began his career as a journalist for the *New York Herald*. In 1908, he joined *The Smart Set* as drama critic and later became its co-editor with H. L. Mencken. In 1924, the two longtime friends founded *The American Mercury*. Nathan authored 34 books on the theater and was the main subject of several others. A notorious bachelor, he inspired the Addison De Witt character in the film *All About Eve*. Renowned for his wit and sarcasm, Nathan was the most important drama critic of his times. His highly influential writings shaped the standards of drama and theater criticism in the United States.

Born in London in 1927 and educated in Oxford, Clive Barnes (1927–) is a powerful dance, drama, and opera critic whose writing can make or break a Broadway show. He worked for *The New York Times* between 1965 and 1977, later moving to the *New York Post*. Barnes wrote a number of books, chiefly on dance.

Literary

Literary criticism is the theory-based analysis and assessment of literary works including poetry and prose. As a *Chicago Evening Post* critic once noted, literary criticism is as old as the study of language. Criticism appeared in the journalistic format in the pamphlets of eighteenth-century Britain and later in its more formal newspapers. But it wasn't until the 1800s that literary criticism flourished in American newspapers and magazines. Although the genre expands beyond the realms of journalism and into the academic domain, press critics have played a prominent role in theoretical literary discourse as well as in the evaluation and promotion of literary works, authors, and trends.

Important publications featuring influential literary criticism include the *Times Literary Supplement, The New York Times Book Review, The Nation,* and *The New Yorker*. Among the most important literary artists who have written for these and other publications are Edmund Wilson and John Leonard. A New Jersey lawyer and general attorney, Wilson (1895–1972) became one of the most preeminent literary critics of twentieth-century America. He served, successively, as managing editor of *Vanity Fair* (1920–21), associate editor of the *New Republic* (1926–31), and book reviewer for *The New Yorker* (1944–48). His writings spanned an array of subjects, including history, poetry, art, politics, society, linguistics, and philosophy. His critical essays often focused on the intersection of literature and society.

A leading critic on the New York scene, John Leonard (1921–2008) was known for his activism and breadth of knowledge. Staunchly liberal and ahead of his time, he championed authors like Toni Morrison and Gabriel Garcia Marquez before

they became known to the American public. Leonard was born in Washington, D.C. He began his career at *The National Review* in the 1960s and later published his literary critiques in an array of publications including *The New York Times* (1970s), *The Nation* (1995–2008), *The New Republic, Harper's,* and *The Atlantic Monthly*. Leonard also worked as television critic for *New York* magazine, columnist for *Newsday,* and cultural commentator for *CBS Sunday Morning*.

Music

Music criticism refers to the publication of articles assessing a musical composition or performance. Although criticism of music as a formal profession emerged during the seventeenth century in Europe, it only acquired a place in American newspapers during the middle of the nineteenth century with the rise of the penny press. Music criticism has since played a fundamental role in the emergence and popularity of musical trends such as jazz and rock. Harold Schonberg, one of the most influential music critics of the twentieth century, explains that premium music critics rely on their imagination and musical experience, more than anything else, to appreciate and assess a musical work. Two of the most influential critics who have followed this approach are Schonberg himself and Lester Bangs (1948–82).

The first music critic to win the Pulitzer Prize for criticism in 1971, Schonberg (1915–2003) was a powerful critic and journalist for *The New York Times*. Born and raised in New York, Schonberg became a record critic for *The American Music Lover* magazine, later known as *The American Record Guide,* in 1939. He joined the *Times* in 1950 and became senior critic in the 1960s. Specializing in the critique of piano, operas, and classical music, he helped develop the newspaper's music staff and significantly affected the national music scene.

Lester Bangs (1948–2002) was the preeminent American critic of rock and roll music and a musician himself. Born in California, he started his writing career in 1969 with *Rolling Stone* magazine. In 1973, the magazine fired him over a negative review. Bangs moved to Detroit to edit and write for *Creem* where he soon acquired national recognition. His articles helped promote (or demote) artists, set trends, and influence public taste. Later in his life, Bangs freelanced for a number of publications including *The Village Voice* and the *New Musical Express*.

Film

Film criticism is the published analysis and evaluation of theatrical motion pictures. Film criticism burgeoned with the rise of cinema at the beginning of the twentieth century. Early critics fought to claim film production as a democratic art—a notion that seemed paradoxical at the time. Indeed, it wasn't until the 1960s that film was finally acknowledged as an art, and film criticism as a kind of art journalism. Unlike film criticism in France, where famous thinkers use poststructuralist, Marxist, or psychoanalytical theories to deconstruct films, criticism in the United States remains primarily review-oriented and practical. Still, a number of American film critics did enchant readers and play a role in the establishment of cinema as a legitimate art. They include James Rufus Agee and Pauline Kael.

Also a distinguished poet, journalist, screenwriter, and activist, Agee (1909–55) became one of America's prime novelists and film critics. He established film criticism as a key feature of the daily paper, earned an Academy Award nomination for his film classic, *The African Queen* (1951), and left a series of memorable books. Born in Tennessee, Agee started his career as a journalist for *Fortune* in 1932 and wrote political and cultural articles for *Time*. He soon became *Time*'s and *The Nation*'s film critic, a role he continued until 1948. Agee's film reviews were rich, fervent, and witty. Pauline Kael (1919–2001), perhaps the most influential film critic in American journalism, started her career as an avant-garde artist—writing plays, working on experimental films, and supporting herself through a myriad of minor jobs. The California-born liberal also wrote film critiques as a freelancer. In 1967, she found her break when she wrote a rave review of the film *Bonnie and Clyde* for *The New Yorker*. The magazine hired her as movie critic, a position she kept for over twenty years. Her articles, distinguished through a conversational writing style, the use of slang, and an improvisational, emotional quality, were as awaited as the movies they appraised.

Kael influenced a generation of filmmakers and critics alike and published more than a dozen books, most of them collections of her reviews and essays.

Media

Media criticism is the public evaluation of print and broadcast media performance. Often focusing particularly on journalism, media criticism contributes to the civic and professional improvement of the profession. Mass communications researcher David Rubin speaks of seven concerns that critics have historically voiced: Sensationalism, triviality and the personality cult, invasion of privacy, the monopolistic industry structure, the influence of advertisers, owner–employee tensions, and the ubiquity of agency-produced material in news. Media criticism has historically appeared in mainstream newspapers and magazines as well as more specialized periodicals like the *Columbia Journalism Review*.

Many American journalists self-reflected on the performance of their profession but William "Will" Irwin and A. J. Liebling were among the most famous. Born in New York, Irwin (1873–1948) was one of the most renowned journalists and media critics of his time. Early in his career, he wrote for *The San Francisco Chronicle* (1901–04), *The New York Sun* (1904–06), and *McClure's* magazine (1906–07) before joining *Collier's* in 1907. Between January and July 1911, Irwin published in *Collier's* a 15-article series on the practices of the press. His most important contribution to media criticism, the articles did for the press what muckrakers had done in other realms of U.S. society.

A. J. Liebling (1904–63), prominent press critic of the 1940s, wrote a weekly column in *The New Yorker* under the title "The Wayward Press." Born in New York, Liebling started his career, in the early 1930s, with the New York *World* and *The World-Telegram*. He joined *The New Yorker* as a reporter and columnist in 1935. Liebling covered World War II and a span of subjects from New York to boxing, French culture, and food. Soon after the war, Liebling began writing "The Wayward Press" column, with a biting humor and a sharp appraisal of editors, publishers, politicians, audiences, and reporters alike. Most of Liebling's books are collections of articles and sketches that originally appeared in *The New Yorker*.

Food/Restaurants

Food criticism includes discussion of food-related topics and/or appraisal of restaurants. Although the two subjects relate, critics do not necessarily cover both. Food criticism is common in newspapers, food magazines, and, to a lesser extent, on television. It is also the focal point of specialized publications such as *Gourmet*. Among the most famous critics who have discussed food and restaurants in the American media are Patricia Wells and Ruth Reichl.

Born in Wisconsin in 1946, Wells is one of the most important food journalists in the United States. She has been, since 1980, a restaurant critic for *The International Herald Tribune* in Paris and a contributor to *The New York Times*' Paris bureau. Specializing in French cuisine, she is known to simplify the intricacies of France's complicated recipes to her American audiences. Wells started her journalistic career as copy editor and reporter for *The Milwaukee Journal* in 1966. She became the food critic for *The Washington Post* in 1972 and *The New York Times* in 1976.

Ruth Reichl, a New York native born in 1948, is a highly acclaimed food critic, writer, coproducer of a PBS culinary show and—as of 1999—editor-in-chief of *Gourmet* magazine. Able to make or break a restaurant, she is known for her honest and unpretentious criticism. Reichl started her career as restaurant chef and co-owner in the 1970s before joining *New West* magazine as food critic in 1973. Reichl assumed the same position at the *Los Angeles Times* between 1984 and 1993 and at *The New York Times* between 1993 and 1999.

Crisis of Criticism

Despite many contributions to society, criticism as a profession has come under considerable attack during the beginning of the twenty-first century. With the rise of the Internet and the proliferation of blogs evaluating all forms of art, channels of amateur criticism have largely replaced the distinctive voices of individual critics. People do not listen to critics anymore, one

critic complains. They trust the communal voices of ordinary reviewers of all ages and backgrounds. Many newspaper articles speak of the death of the critic.

The crisis is real. Many U.S. newspapers and magazines have dismissed or reassigned their critics. Sean P. Means, the *Salt Lake Tribune*'s film critic, posted a list of U.S. film critics who lost their jobs between January 2006 and October 2008. Titled "The Departed," it includes the names of 40 people from an array of publications.

Evidently concerned about the trend, several critics and students of criticism have attempted to diagnose the factors behind the crisis. They noted the range of websites, like rottentomatoes.com and metacritic.com, which provide criticism from an array of opinions from trusted as well as unfamiliar voices. Such sites are so popular they are swarmed by the film studios' public relations machines. Their popularity eclipses the individual opinions of famous newspaper critics. Conscious of this phenomenon, newspaper and magazine managers are reconsidering the value of their arts journalists. In fact, the problem of newspaper criticism is strongly related to the troubling decline of readership.

The crisis is also related to the quality of the critical text in general. Patrick Goldstein, film critic for the *Los Angeles Times,* accuses film critics of expressly writing positive reviews to have their names on movie advertisements and DVD covers. "Awesome!" they would say, regardless of the product's quality. Similarly, Goldstein writes, music critics have a tendency to favor leading artists, as audiences do not appreciate negative appraisals of their favorite stars.

But the problem of criticism involves a more profound battle, mostly taking place on the World Wide Web, over the right to claim expertise. Critics are often accused of being a closed circle of condescending elites who do not necessarily answer the simple questions consumers look for. With the rise of the Internet, unhappy readers, viewers, and art lovers established their own blogs, hijacking the right to provide feedback on the arts. Critics attack this democratization of opinion, arguing that criticism entails expertise and is therefore necessarily elitist. They dismiss blogs and other popular reviews as mere form of speech, not writing.

Conclusion

Criticism or arts journalism provides an added value to newspapers and magazines and constitutes a friendly voice, providing readers with guidance about arts performances and events. Criticism also affects the society around it, appraising—and therefore automatically improving—the cultural and artistic environment and taste. And yet, arts journalism seems to be facing an existential crisis, with people increasingly talking about the decline and even disappearance of the critic. The future of arts journalists ultimately relates to the future of print media and how they adapt to the Internet.

Criticism of Journalism

That journalism is important in American life is evident in the large amount of criticism that news media have always received. The country's early newspapers were hotly criticized for the stories they included or ignored, perceived political bias, cronyism with advertisers, and paying too much attention to the social and political elites rather than common people. And those were merely the highlights. Critics have varied from those who feel themselves mistreated (or their views given little attention) to organizations focused on trying to improve journalism. Some criticism has come from within—-as with the relatively recent appointment of newspaper ombudsmen at a handful of major newspapers—-but most comes from outside the journalistic fraternity. The complaints have probably politically balanced out over time—with sharp attacks coming from both the right and the left.

Journalism Standards

By definition, to critique is to speak of mistakes, flawed processes, or unmet expectations. In so doing, one is applying (if only implicitly) specific standards and norms. While American news media (let alone those elsewhere) are not a monolith, they do tend to operate with shared presumptions of purpose and quality. Perhaps as a result of rapid globalization, more journalists throughout the world are adopting a Western conception of the media as a country's "Fourth Estate." The term is said to have originated with Irish philosopher Edmund Burke when considering journalists of late-eighteenth-century Western Europe to be as important as the nobles, clergy, and commoners (the other three "estates") that made up a country's parliament. The reason for such privileging of unelected individuals has to do with Burke's recognition that, in all human societies, those who possess "knowledge" have power. Since in a representative political system such as the United States, power is supposed to lie with "the people," it follows that those people need access to truthful information. Enter the journalists, whose central role is to provide precisely such information (ideally complete, objective, and carefully researched) to all citizens.

In identifying the fundamental freedoms of all Americans, the First Amendment to the U.S. Constitution explicitly safeguards press freedom. In addition to striving to fulfill the central role of informing the citizenry, contemporary American journalists also hold that those who wield political and economic power should be accountable for their actions. This function of news media, often called the "watchdog role," is accomplished, with various degrees of efficacy, largely by investigative journalists. Many critiques of journalism, therefore, speak either of the journalists' failure to provide quality information, or of their failure to keep a check on those in power—or both.

Selective Coverage

Most journalists in the Western world consider the providing of quality information to be their most important responsibility. This agreement, however, does not extend to the question of exactly what constitutes "quality" information, as media practitioners have different journalistic standards and procedures. Predictably this diversity has led to ideological conflict in the media, one issue being the tension between the so-called elitists and populists. The former expect journalists to be highly educated people able to decide which of the plethora of daily events are worth reporting. Furthermore, since issues that have the most impact are often complicated, difficult-to-explain affairs, journalists can't expect their relevant products (such as in-depth newspaper feature stories or television documentaries) to be very popular with average citizens. Indeed, the elitists argue, journalists should not seek popularity to the detriment of providing important information. "Populists," on the other hand, perceive journalists to be the servants of the people in a more literal sense: whatever information people ask for (or seem to enjoy the most) is what should be provided. And, if that means journalists should spend more time reporting "soft" rather than "hard" news, then so be it. Those agreeing with the elitists bemoan the media's lapse into sensationalism and "infotainment." Conversely, populist sympathizers might argue that journalists are "losing touch" with common folk, as they become closer to political and business elites.

The elitism versus populism debate often shows up when critics focus upon the exclusion of groups

of people from media coverage. Journalists act as "gatekeepers," making judgments about which people and events are worth covering on any given day. Predictably, critics often fault journalists with failing to undertake that gatekeeping obligation in a fair manner. Researchers point out that there are several groups that are rarely granted any positive coverage, if they are covered at all. Arguably the most prominent among these excluded groups are labor organizations and nongovernmental organizations concerned with poverty. These groups are largely ignored because their interests conflict with those of the business conglomerates that own most American news media. Indeed, while labor receives too little media coverage, business interests may be overcovered. The typical American daily newspaper devotes space to the price of stocks (an institution that directly concerns only a small minority of American citizens) but rarely addresses other issues more relevant to working men and women.

Murrow's Indictment

One influential critique of the media was delivered in 1958 by prominent broadcast journalist Edward R. Murrow. Speaking to an audience of broadcast news directors, Murrow offered a stinging indictment of broadcast journalism, accusing it of utterly failing to serve the public interest, focusing, instead, simply on making money. While arguing in favor of the competitive American commercial broadcasting system (which he called "the best and the freest yet devised"), Murrow faulted television news directors for submitting to corporate interests (by modifying their newscasts at the request of high-powered politicians and business people), drastically limiting the amount of news on primetime television and on the radio (while giving priority to such programming as quiz shows), and "sheltering" their audiences from complex and controversial stories. Much like contemporary media critics, Murrow believed that television news should pay more attention to international affairs that have real, albeit oftentimes subtle, repercussions for the United States. Although he argued that television is a "most powerful instrument of communication" and could serve as a "weapon" against ignorance and narrow-mindedness, Murrow concluded it was being used to "distract, delude, amuse and insulate" its viewers. He suggested that news directors might find it morally and civically satisfying—as well as economically profitable—to devote some of their advertising profits to creating public affairs programming that educated the public about complex issues. Although broadcast journalism has changed significantly in the half century since, the objections that Murrow raised continue to be leveled by news media critics.

Bias

America's journalism schools teach that good journalists observe the standard of objectivity when reporting the news. As with "equality" and "democracy," the desirability of having such an ideal is almost never in question—what is always bitterly disputed, however, is how the ideal should be put into practice. What exactly does being fair to all sides of a story really mean? How, and according to which criteria, does one distinguish between competing sides? Does fairness require that the points of view of each party receive equal coverage, regardless of differing degrees of prominence and popularity that the parties enjoy in real life? Media critics have long looked for evidence of bias (privileging one side to the detriment of others) at all levels of the journalistic process. More often than not, the most scrutinized aspect of news reports is the journalist's word choice, as critics look for loaded language—specific words whose cultural connotations subtly promote a positive or negative attitude (bias) toward one of the subjects of the news story. Labels that identify individuals and groups of people are the most sensitive examples. To suggest just one example, to an American audience, the word *terrorism* bears a strongly negative connotation. Its use in a news story is bound to signal that the people identified as such are the "bad guys." Media critics have long argued that a loaded label that is repeated incessantly in the public sphere tends to be internalized by people over time, and its negative or positive connotations become taken-for-granted characteristics of the people it was initially just meant to identify. Because of this chain of consequences, the use of loaded language is perceived by many as an offense against journalistic objectivity.

"Gang" Journalism

Just as few news stories are safe from criticism, few journalistic techniques can claim to be untouchable. The process by which journalists collect information is often critiqued. Questions of privacy (are journalists prying into people's private lives without a legitimate reason?), full disclosure (are reporters identifying themselves as journalists when soliciting information?), the nature of journalist-source relationship (is a source being bribed or forced to collaborate with the journalist, or the other way around?), and conflicts of interest (are reporters involved in the story being researched in any other capacity than that of a journalist?) are frequently leveled.

The frequent campaigns that news media outlets embark upon (e.g., those to find a missing child, to elect a politician, or adopt legislation) are often criticized as mere marketing gimmicks meant to increase audience by artificially creating a story (or by "hyping" an already existing story), and then unleashing a steady diet of sensational scoops. Partly out of fear of losing audience to the competition and partly out of intellectual laziness, mainstream news media outlets often join one another in devoting immense resources to stories that would not normally (that is, according to the standards taught in journalism schools) receive much attention. This phenomenon is often described as "gang" or bandwagon journalism, and is faulted for compromising the ideal of objectivity because it limits stories in terms of quantity and quality. When most media are chasing after the same story at the same time, the manner in which that story gets covered tends to be the same across most channels leading to what is derisively called assembly-line journalism.

Limited International News

American television news differs most from that in other developed countries by its comparative lack of news about foreign countries. Study after study reveals that American television audiences receive steadily decreasing amounts of international news, and what little foreign content does exist is drastically skewed in favor of a limited number of countries deemed to be particularly newsworthy. A 2008 study of African coverage by U.S. television networks, for example, found that the African countries that received the most attention were not those with such serious problems as civil wars, famine, and the AIDS epidemic, but rather those that conduct the most business with the United States and are, overall, the richest countries on the continent. Since Africa receives little news coverage to start with, those African countries that are most afflicted by natural and man-made disasters stand little chance of making their case to Americans.

Most Americans, studies have repeatedly shown, obtain most of their information about international affairs from television. Their attitudes toward other nations are very likely to be influenced by the type of television coverage that these places receive: negative coverage of Zimbabwe, for example, may lead viewers to form a negative opinion of that country. When it comes to international events, therefore, television has a crucial role in the formation of American public opinion, which, in turn, may end up influencing American foreign policies.

Media Representations

The concern with negative images in the news may also impact domestic issues, and even entertainment content. Images presented in the media (especially television and the Internet) exert a considerable influence. Youth are particularly susceptible to such influence, since they lack experience that could act as a reality check to media images. Even when journalism is realistic (as with straightforward news reports), it is too rarely properly contextualized and explained. One commonly discussed phenomenon is the so-called mean world syndrome: people who watch a lot of violence-saturated American TV programming (such as crime dramas or news with violent crime reports) often assume their communities are more violent than statistics actually show them to be.

Media watch groups have long argued that most people referenced in news stories are white males. Dominant groups—whites, males, the middle-aged, heterosexuals, thin rather than fat people, and middle-class or rich people—appear in the news more than their demographic percentages would warrant. Such news reports can be seen as biased by their exclusions as well as their emphases on ethnic minorities and crime.

Concentration of Ownership

Among charges brought against American news media is that of ownership concentration. According to the left-wing magazine *Mother Jones,* as of 2007, upwards of four fifths of America's 1,500 daily newspapers are owned by corporations, while the number of different companies owning TV stations has dropped by 40 percent since 1995. As a result of continued mergers and buyouts, six corporations (among them Disney, Time Warner, Viacom, NBC Universal, and News Corporation) exert dominance over national media, owning thousands of newspapers, magazines, radio and TV channels, publishing houses, movie studios, music labels, and Internet hubs.

Critics of ownership concentration point to a growing homogenization of media messages, which may deprive media audiences from much exposure to minority viewpoints. Since those who control large corporations are often close (demographically, politically, economically, and personally) to the political elite, the journalists they employ may be pressured to go easy on those who provide their paychecks and on their friends in business and government.

Dangerous Relationships

In his 1958 speech, journalist Edward R. Murrow identified the coziness between journalists, advertisers, and corporate managers as one of the biggest threats to effective journalism. One specific problem is the revolving door phenomenon, whereby former politicians often sit on editorial boards and former journalists may become spokespersons for politicians, government agencies, or businesses. If people cannot clearly distinguish between a journalist and a spokesperson, media critics contend, they will cease to trust the former as much as the latter.

The beats structure of news gathering raises another concern. Just as police officers are assigned specific areas or beats to patrol, reporters are often assigned specific domains (e.g., police and the courts; hospitals; political parties; technology; local, state, or federal administration; business). Many of those who deal with such beat reporters (in particular political and business leaders) do their best to befriend them, in the hopes that the journalist will then think twice about publishing information that is potentially damaging to a friend. In order to prevent such potential conflicts of interest from forming, some news media rotate their journalists among various beats.

Finally, the relationships among journalists and their sources are vulnerable to suspicions of impropriety. The use of anonymous sources is particularly relevant, as critics have denounced the increasing trend of citing "a government official" and "a source close to the investigation" to describe those who provide crucial information. Critics are concerned about the public losing confidence in a news media that relies too heavily on such obscure sources. Another point of contention regarding journalistic sources is the practice, on the part of government institutions, of surreptitiously paying individuals to present themselves as independent authorities to news media. In April 2008, *The New York Times* revealed that many of the military analysts employed by American broadcast and cable channels to provide objective analysis of the wars in Iraq and Afghanistan were given preferential access to defense officials, and had close ties to military companies that stood to gain from continued fighting.

Influential American journalist H. L. Mencken often wrote opinion pieces ridiculing American hyperpatriotism in the 1920s and the increasing powers that the government acquired over citizens' daily lives. This concern continues today, most notably by critics who denounce mainstream news media's willingness to buy into the sometimes jingoistic discourse used by the government to justify its military efforts in Afghanistan and Iraq by placing them in a context of fighting terrorism. Critics argue that such flag-waving, especially on cable news channels, gets in the way of effective and balanced news reporting.

Government Regulation and Influence

Critics of American news media are especially concerned with the relationships among government and media, particularly with regard to government regulation of media (principally within broadcast licensing), and the selective granting of media access to government information. The Federal Communications Commission (FCC) licenses radio and television stations and (though to a declining

degree) regulates ownership of electronic media outlets. The power to license includes the right to deny licenses, though there is little evidence of political bias in this process. Still, critics decry the FCC's tendency in its spectrum auctions to favor well-heeled big media companies at the expense of small, independent media.

As for selective access to government information, the danger here is more straightforward: journalists need that information (in order to fulfill their watchdog role) yet government can and often does delay or deny access to information. There is a danger that journalists will become discouraged and report on government officials in a negative or accusatory manner, or simply rely upon press release handouts. For example, journalists who wanted to report on the 2003 invasion of Iraq could only do so by being "embedded" in U.S. military units after agreeing to various conditions restricting the content of their reporting. As a result of that arrangement, numerous instances of self-censorship occurred, resulting in some compromising of journalistic independence and thus credibility.

The Propaganda Model

Edward S. Herman and Noam Chomsky in their 1988 book, *Manufacturing Consent,* suggest an explanatory model to help understand how the media are organized and function—and why. Their propaganda model is highly critical of the state of journalism, essentially accusing news media of catering to the interests of big business and politicians, to the detriment of broader needs. Most American media are commercial. As with any business, their primary role is to make a profit. As such, Herman and Chomsky argue, the media often take the path of least resistance toward advertiser acceptance of content and thus try to avoid controversy. News is often purged (by reporters, editors, or managers) of anything detrimental to advertisers' interests. The same often happens when journalists must depend on government agencies for crucial information. In all such cases, audiences may be deprived of important revelations of abuses of power on the part of those at the top.

Even when information damaging to those in power makes it into the news, media watchdogs cannot claim victory, since the establishment has a highly efficient way of guaranteeing that such information does not get far. This is called "flak" by Herman and Chomsky, and includes coordinating complaints against undesirable journalists that reach these journalists' employers. Such complaints are meant to intimidate the journalists and prevent them from pursuing a line of investigation that might reveal wrongdoing or bad policy. Finally, Herman and Chomsky also note a tendency by news media to reproduce the dominant ideology (whether political or economic, anti-Communist or anti-"terrorist"), espoused by those in power who thus have every interest in maintaining the status quo. Herman and Chomsky's propaganda model has been criticized for its conspiracy-theory flavor, as well as for dismissing the cases where journalists can and do fight against political and economic pressures.

Mechanisms of Accountability

Many organizations, such as Reporters Without Frontiers, have been formed to protect journalists from being silenced (or worse) by those in power. Other organizations have acquired prominence by acting as "watchdogs to the watchdog." Believing that the most sacred cow of the press is the press itself, these groups scrutinize the material being produced daily by news media institutions and release reports on the state of the media. Organizations such as the right-leaning Accuracy In Media (AIM) and the left-leaning Fairness & Accuracy In Reporting (FAIR) wield some influence on American news media, publishing periodic analyses of current media stories, and exposing what they perceive to be bias in the way the news is reported. Journalists can turn to the *The Columbia Journalism Review* and *American Journalism Review* magazines for insightful coverage of such issues as the changing practices of reporting, ethical dilemmas, and the influence of technology on journalism.

The Project for Excellence in Journalism evaluates both journalistic content and trends in the media industry on a regular basis. Besides benefiting from the ever-wider availability of such sources (thanks to the Internet), news media audiences can, in some places in the United States, file complaints about unsatisfactory coverage with

news councils—organizations set up by local media institutions, universities, and various nongovernmental organizations whose role is to bring citizen concerns to the attention of journalists and editors and mediate dialogue between the parties.

In addition, several American media institutions have instituted the position of "ombudsman" to give their audiences a means of communicating with the newsroom. The ombudsman's premier role is to ensure that every story conforms to professional standards. Ombudsmen also play the role of "readers' advocates," receiving complaints about media content and taking these complaints to the proper decision-makers. The first news ombudsman positions were created by Japanese newspapers in the early 1920s. In the United States, major newspapers have employed ombudsmen since 1967, though fewer than 5 percent of American newspapers have such a post. Notable media institutions that have instituted such a position include the *Los Angeles Times,* PBS and NPR, *The Washington Post, Chicago Tribune, The New York Times,* and *USA Today*. The institution of ombudsman is praised by many media critics for its perceived role in keeping the press accountable to its audience. Because most American news ombudsmen are longtime employees of their media companies (oftentimes having served as editors for the newspapers that now employ them as ombudsmen), however, other critics denounce them as a sham.

The unofficial accountability system in the American media industry, however, does not only include punitive mechanisms. Various prestigious institutions also reward what they consider to be exceptional journalistic accomplishment, in the hope that the journalists so recognized will become role models for aspiring journalists. The best-known such award is the Pulitzer Prize, administered by Columbia University and originally funded by publisher Joseph Pulitzer. The prize is awarded annually to writers excelling in each one of 21 categories, including "public service," "investigative reporting," and "local reporting."

Conclusion

Media criticism and its practitioners are certainly here to stay: the immense transformations that the American and global media are currently undergoing are bound to spawn ever more journalism pundits and crusaders. The universal trend toward ownership concentration in the media industry and the continuing convergence of media platforms are accentuating many of the problems mentioned above. In response, more and more school boards in America and elsewhere are introducing media literacy courses designed to provided the "wired generation" with the necessary antidotes against perceived media manipulation.

Dallas–Fort Worth

The Dallas–Fort Worth metropolitan area, with a population of more than 6.8 million, ranks sixth among the top-ten media markets in the United States and is distinctive for its growing Spanish-language community. The region is a business and technology center, home to several corporate headquarters including global oil titan Exxon Mobil Corporation.

Dallas began as a Trinity River trading post founded in 1841 by John Neely Bryan. Other than its affluent "Big D" image and the stereotypes generated by the late-twentieth-century television show *Dallas,* the city is perhaps most famous for being the site of the 1963 assassination of President John F. Kennedy. Thirty miles to the west, Fort Worth grew from its 1849 founding as a U.S. Army fort into "Cowtown," so named for its once-huge cattle stockyards. Today, Fort Worth is an urban center with a vibrant downtown entertainment district and renowned art museums. It is home to AMR Corporation, the parent company of American Airlines, and RadioShack Corporation, among other companies.

Two large newspapers publish in the area: *The Dallas Morning News,* ranked as either the eleventh- or twelfth-largest U.S. daily in 2007 with a daily circulation of more than 373,000, and the *Fort Worth Star-Telegram,* which ranked among the top-45 2007 daily newspapers, with more than 210,000 in daily circulation.

The Dallas–Fort Worth area is home to four major professional sports teams. Newspaper, television, radio, and Internet sports coverage focuses largely on these four. Big 12 Conference college sports also garner coverage, including the annual University of Texas–University of Oklahoma football rivalry at Dallas's Cotton Bowl.

There are many colleges and universities in the region.

Print Media and Websites

On October 1, 1885, *The Dallas Morning News* published its first edition with George Bannerman Dealey as editor. Dealey began his career as an office boy at age 15 for the *Daily News* in Galveston, the paper from which the *Morning News* evolved. Now a subsidiary of Belo, a Dallas-based media company, the newspaper is the largest in north Texas. *The Dallas Morning News* staff members have won eight Pulitzer Prizes since 1986. Belo spun off the *Morning News* and its three other newspapers into a separate company, A. H. Belo Corporation, in early 2008. (This actually happened in early February 2008.)

The company derived its name from Alfred Horatio Belo, a partner in the Galveston *Daily News* who began there in 1865 as a bookkeeper. Belo is able to own a television station and major newspaper in the same city because of a grandfather clause granted by the Federal Communications Commission, as Belo owned both outlets before a 1975 FCC ban on newspaper and television station cross-ownership in the same market.

The Dallas Morning News' primary competitor for more than a century was the *Dallas Times-Herald,* founded in 1888. After a 1970s and 1980s newspaper circulation war between the two, the *Morning News* bought out its rival for $55 million and closed it in 1991. In 2003, *The Dallas Morning News* began distributing *Quick,* a free newspaper aimed toward young people ages 18 to 34. The 150,000-circulation weekday tabloid focuses on short news stories, entertainment, and sports.

The *Fort Worth Star-Telegram* afternoon newspaper began publishing in 1909 after a merger of the Fort Worth *Star* and the *Telegram.* In 1923, Amon G. Carter, who began his career in the newspaper's advertising department, became president and publisher. In 1925, the paper bought the Fort Worth *Record,* a morning newspaper, from William Randolph Hearst, who previously had tried to take over the *Star-Telegram.* Carter later founded Carter Publications, Inc., which owned Fort Worth's first radio station, WBAP, and the NBC television affiliate in Fort Worth, WBAP-TV. After Carter died in 1955, his son, Amon G. Carter Jr., took over the company. In 1974, Carter Jr. sold it to Capital Cities Communications, Inc. The *Star-Telegram* won two Pulitzer Prizes: in 1981 for spot news photography and in 1985 for meritorious public service. In 2006, the McClatchy Company took over ownership of the paper when McClatchy acquired Knight Ridder, which had owned the *Star-Telegram* after Capital Cities.

Other print media in Dallas–Fort Worth include two alternative weekly newspapers: the *Dallas Observer,* published by Village Voice Media, and the *Fort Worth Weekly,* publisher Lee Newquist.

Several local blogs report daily news about the area and suburbs, including Pegasus News, owned by Fisher Communications, Inc., a Seattle-based media company; and Dallas Blog, http://www.dallasblog.com, which calls itself "the independent voice of Dallas."

D magazine, which bills itself as *the* Dallas magazine, has been publishing since 1974. It was founded by Jim Atkinson and Wick Allison. Atkinson is no longer involved, and now Allison is the sole owner and publisher. The magazine publishes several sister publications and operates a website.

Electronic and Spanish-Language Media

In 1920, Dallas launched the first radio station in Texas, WRR, a city-owned station. It continues to broadcast classical music and Dallas City Council meetings on the FM band. Two years later, Dallas's WFAA radio station, first broadcast on June 26, 1922, became the state's first commercial station. On September 27, 1948, Texas's first television station, WBAP-TV, began broadcasting from Fort Worth.

The major television network affiliates in the Dallas–Fort Worth area are ABC station WFAA-TV (Channel 8), CBS station KTVT-TV (Channel 11), NBC station KXAS-TV (Channel 5) and Fox station KDFW-TV (Channel 4). All four broadcast local newscasts. In addition, two other TV stations produce local newscasts: CW affiliate KDAF-TV (Channel 33) and independent KXTA-TV (Channel 21), which airs a KTVT-produced newscast.

Amid a general nationwide trend of declining newspaper readership and television newscast viewership, Spanish-language media is one area marked by growth during the first decade of the twenty-first century. Census figures in 2000 showed 1.2 million Hispanics in the Dallas–Fort Worth market, and 2.1 million are expected to live in the area by 2012. Univision Communication Inc. and Telemundo both operate television stations in the market: KUVN-TV (Channel 23) and KXTX-TV (Channel 39), respectively. Each station broadcasts local Spanish-language newscasts.

Dallas also is home to Univision's radio unit. In 2006, three Spanish-language radio stations were among the top-ten Arbitron-ranked stations in the Dallas–Fort Worth market. Spanish-language newspapers in the area include *Al Dia,* a daily distributed by *The Dallas Morning News,* and *Diario La Estrella,* distributed weekly by the *Fort Worth Star-Telegram.* The websites are http://www.aldiatx.com and http://www.diariolaestrella.com.

With a growing population, the Dallas–Fort Worth area is poised to continue as one of the leading U.S. media markets. By 2030, the region is expected to be home to 9.1 million people.

Deception

Deception has been an effective tool for investigative reporting for more than 100 years. When used in the pursuit of material that is in the public interest, it has been invaluable in helping the press meet its watchdog function. In those instances, it has been used with audience approval. Deception used by news organizations to tease a potential audience, however, or to unnecessarily add drama to a report results in a loss of credibility. Deception also occurs when news organizations fail to disclose important information in their stories. This also interferes with the trust that is essential for journalists to have with audiences and with story subjects.

Definition and Conditions

Deception occurs when someone intentionally acts, or refrains from acting, with the intention to lead one or more persons to form or maintain a false belief. Deception is an ethically questionable act, which means that if there is not adequate justification, the act is ethically prohibited.

The first step to analyzing deception is conceptualization. It is necessary to determine if an act counts as deception before determining if the deception is justified or not.

Necessary Condition No. 1: Intent. Intention is required for any act to be deceptive. When one has uttered a false statement without intention, the normative judgment is that the person is mistaken. On the other hand, to say that a badly placed sign "deceived me" is to speak metaphorically. I was led to a false conclusion, but it is likely that no one has acted with an intention to deceive. As intention is required, journalists act deceptively even if they are unsuccessful in their attempts. For example, when a reporter lets others assume that he is a police investigator at a crime scene to get access to a meeting that is open only to law enforcement, he has acted deceptively even if someone recognizes him as a journalist and escorts him out of the room.

Sufficient Condition No. 1: Uttered falsehood or the nonverbal equivalent. When someone makes a false statement with the intention of leading one or more other persons to form or maintain a false belief, she has acted deceptively. When a journalist tells a real estate agent that she wants to buy a home when the intent is really to see if a neighborhood is redlined to limit racial integration, the journalist has acted deceptively. There are also nonverbal equivalents of lying. For example, when the journalist presents herself through dress or circumstance in a way to make others believe that she is a doctor or a law enforcement officer instead of a journalist working on a story, she has acted deceptively.

Sufficient Condition No. 2: Withholding information under certain conditions. When a person withholds information with the intention of leading one or more persons to form or maintain a false belief and, in the process of withholding, breaks a law, breaks a promise, cheats, or neglects a duty, the withholding of information is deceptive. If a reporter who has been subpoenaed fails to disclose

all that he knows under oath, he has acted deceptively by breaking a law. If a reporter promises to tell a source if she will reveal the source's name, and then fails to tell the source when she has, the reporter has acted deceptively by breaking a promise. If a columnist goes to a party with the intention of developing information for a story and does not tell those from whom he is gathering quotes that they are on the record, the columnist has deceived by cheating. In this case, the journalist has failed to meet reasonable expectations that people have at a party, that is, that those attending are "off duty" and not collecting information for a column. Journalists can also act deceptively by withholding information that they have a duty to tell. The duty, or role-related responsibility of journalists, is to tell citizens information that is needed for self-governance. Citizens need to trust that news reflects journalists' independent determination that the material serves the public interest rather than special interest. When, instead, news organizations present material to serve a politician's or advertiser's agenda, they have acted deceptively toward their audience members. The news organization, in this case, has acted deceptively by failing to do their duty.

Sufficient Condition No. 3: Truth telling with the intent to mislead. It is possible to be entirely truthful, but to tell that truth with the intent of misleading. Journalists may act deceptively by truth telling when they tell sources that a story will run whether or not the source comments or responds to charges. While true, unsophisticated sources may falsely interpret this statement as indicating that the story will be less incriminating with their response. The reporter often knows that quotes from the source will make the source look worse rather than better. In this case, journalists tell the truth with the hope of misleading the source into believing that he should (or must) comment. But journalists may also be deceived by truth telling. Responses to a news organization's request for documents under the Freedom of Information Act (FOIA) have been known to include not only information requested, as required by law, but to also include an extraordinary amount of unnecessary data. This "needle in the haystack" approach amounts to deception because the intent of providing the unnecessary data is to mislead a reporter into missing incriminating information.

The Ethical Problem of Deception

Deception is an ethical problem because of the potential harms to those deceived (and others observing the deception); the manner by which one deceives is immaterial. There is a conventional belief that lying—asserting intentional false statements—is ethically problematic, but that withholding the truth is not, or is less ethically problematic than outright lying. The problem with the conventional belief is that it does not account for potential harm in weighing the significance of the two acts. Consider, for example, a reporter who lies to a relatively unimportant source in saying that he doesn't know where the story is headed when the reporter, indeed does know. This reporter does less harm than another reporter who fails to notify or ask comment from a candidate who is about to be the subject of a story in which an opponent makes significant charges against her.

To say that deception is ethically questionable implies that the act, if lacking adequate justification, is ethically prohibited. Unjustified deception causes harm to the individual deceived, to the larger community, to the practice of journalism, and to the deceiver him or herself. The individual deceived is harmed by being deprived of the freedom to make truly educated decisions. This is true even if the individual does not realize that he has been deceived. Lies disable. The larger community is harmed because communities work on social trust. If a stranger asks for time or directions, it is with the assumption that he will be told the truth to the best of the ability of the person he has stopped. It would not be possible to live in a community if the general expectation was that people deceive without reason. Deception is successful because people assume that others are generally truthful.

Journalism is harmed by unjustified deception because any story based on deception alerts potential sources or subjects that journalists are not to be trusted. Reporters depend on the trust of their sources and subjects to develop information for news stories. Audience members, when faced with unnecessary or unjustified journalistic deception,

rightly wonder how news organizations determine when to be truthful and when not. Deceptive process leads to concerns that the products may be deceptive as well.

Last of all, many philosophers have suggested that the deceiver is harmed as well. Just as a person of integrity knows herself to be the kind of person who can overcome temptation to do what is ethical, the person who deceives knows herself to be a liar. One's own moral progression is stopped by unwillingness to grow beyond limitations.

Justification of Deception

To say that some act is deceptive is not to say that it is necessarily wrong. In some cases, people want to be deceived. Many like to be surprised by parties or gifts. Magicians would not hold on to an audience if they disclosed all of the secrets of their tricks. In addition, citizens implicitly agree to be deceived when they allow undercover law enforcement techniques such as unmarked police cars, speed-checking by radar, and sting operations. But while legislatures and courts determine legal limitations, review, and accountability for deception by law enforcement, journalists have no analogous boundaries. News organizations are on their own in determining if deception is justified.

Four criteria need to be considered for justification of journalistic deception:

1. *All usual means of gathering important information have been attempted and exhausted.* It is not enough for journalists to decide that it would be easier to get information through deception as compared to pursuing the information through honest means.
2. *Regulatory agencies that have the responsibility of overseeing the problem have been approached.* The story that is more important for citizens is often that government is not working rather than journalistic exposure of the initial problem.
3. *No innocent person is deceived.* If the story is important enough to warrant journalistic deception, the problem is broad enough that only persons involved in the wrongdoing should be taken in by the journalistic ruse.
4. *The news organization must publicly discuss its use of questionable tactics, regardless of the outcome of the deception.* Transparency lets the subjects, sources, and audience members know that the news organization is confident enough of the necessity of deception that they will present it even if the story turns out to be different from how they expected.

Some Examples of Journalistic Deception

1. In 1994 producers of the NBC news magazine *Dateline* gained access and cooperation from a trucking firm by telling the firm managers that this was to be a positive segment on the life of long-distance truckers. The firm found itself instead the subject of a story on the dangers truckers pose by using drugs and driving when tired.
2. A 1993 ABC *Primetime Live* story had reporters going undercover with faked resumes and hidden cameras to illustrate how store employees relabeled outdated, spoiled food and placed it back out on the shelves to sell.
3. In 1984, Wilmington, North Carolina, *Morning Star* reporters infiltrated a military base in a mock-terrorist raid.

Of these three examples, the last is the most justified. The newspaper had asked and been told by official sources that the base was secure. All people working on the base should have been security-conscious and in a position to notice and question the journalistic "infiltrators." And, while it turned out that the journalists could have, indeed, carried out a terrorist raid, the newspaper was prepared to write the story in a way that noted base security if the journalists had been caught. For the *Dateline* segment, it would have been possible to make honest and forthright pitches to truckers, by disclosing the real nature of the envisioned story, and then develop the stories through testimonials given by the truckers, many of whom feel exploited by the firms that set unattainable schedules and are available for interview, with or without identification. The *Primetime Live* segment could not have been produced without the undercover journalistic work. It is not clear, however, whether a regulatory agency had been approached and had failed to investigate the concerns.

Each of these examples raised public concern about the journalists' use of deception, with the first two resulting in lawsuits. All were seen, by a significant portion of the audiences, as unnecessary journalistic grandstanding. But, while public perception matters in maintaining subscribers and goodwill, the special responsibility of journalism is to provide citizens with the information that they need for self-governance and to do so without causing unjustified harm.

What citizens need may not always be what they like. What is important is that the journalistic technique be justified on the basis of providing citizens information vital to self-governance.

Journalistic deception is an important tool in the investigative reporting arsenal, but it works best if rarely used.

Denver

Newspapers historically constituted the backbone of news in Denver, which, until the March 2009 closing of the *Rocky Mountain News*, was one of the few American cities served by two weekday daily newspapers, albeit publishing under a joint operating agreement since 2001. At the beginning of the twenty-first century, two trends began reshaping Denver's media landscape. First, the merging of technology and the 24-hour news cycle radically transformed local newsgathering and presentation. Second, the city's growing Hispanic population reconfigured local media, adding more local Spanish-language programming.

Geography and journalism figured prominently in Denver's early development. The city straddles a prime position on the 105th meridian, where the Great Plains end and the Rocky Mountains begin, and newspapers became the primary vehicle for promoting its mineral riches after gold was discovered in 1858. More recently, its strategic location, halfway between Tokyo and Munich, made Denver the natural "bounce" point for satellite signals and the center of the cable and satellite television industries prior to 2000. Both EchoStar and DirecTV, the remaining direct-broadcast satellite operators, maintain uplink facilities in the area to take advantage of the bounce, but the city's dominant role in cable disappeared with the industry consolidation following the 1996 Telecommunications Act.

Newspaper History

Gold, guns, and gamblers dominated Denver's newspaper history. The first issue of the *Rocky Mountain News* rolled off the press on the snowy morning of April 23, 1859, in a room over Wootton's saloon, where local prospectors placed bets on whether it would beat rival *Cherry Creek Pioneer* to be first in print. The *News* won by 20 minutes. Its publisher, William N. Byers, a surveyor and author of a guidebook for prospectors rushing to the newly discovered Colorado goldfields, became the fledging city's biggest booster. He occasionally veered toward the fantastic, as when printing sailing schedules between Denver and New York, but mostly he stuck to the paper's pledge to publish "reliable information" about the gold fields and "to dissuade from disorder [and] assist to organize with dignity and order" a great community (Perkin 1959, 54–55).

By the time a group of disgruntled Democrats launched the *Denver Post* in 1892, the city already boasted five dailies, 37 weeklies, and 22 monthly publications, including three published in German,

three in Italian and two in Swedish. In 1895, Frederick Gilmer Bonfils, a transplant from Kansas City and reputed lottery con man, and Harry Heye Tammen, a former bartender and owner of a curio shop, bought the floundering paper for $12,500, publishing their first edition on October 28, 1895. They inaugurated a new kind of journalism, fueled by sensationalism, entertainment, stunts, and giveaways. Among the *Post*'s outlandish exploits was an incident during which reporters loosed a barrel of monkeys in the State Capitol that "climbed inside the dome, unscrewed light bulbs and peppered onlookers five floors below" (Perkin 464). Such stunts were profitable, and circulation soared, surpassing the *News* in the early 1900s. But its publishers also employed questionable tactics, including threatening merchants with exposes if they did not advertise with the *Post*.

Times Mirror Corporation, publisher of the *Los Angeles Times,* bought the *Denver Post* for $95 million in 1980. Its ownership coincided with one of Colorado's periodic boom-bust economic cycles as oil exploration firms pulled out and savings-and-loan firms collapsed. As the economy weakened, advertising revenue also dipped. Times Mirror began a major restructuring and put the *Post* on the block. Privately held MediaNews Group took control on January 1, 1987. MediaNews, owned by Dean Singleton and Richard B. Scudder, whose family founded the *Newark Evening News* in 1882, entered the Denver market during the worst recession since the 1930s. Still, the *Post* turned a profit within three years, after investing $10 million in new presses and state-of-the-art computerized business, editorial, and printing technology.

Meanwhile, the *News,* backed by Scripps Howard, had become the dominant morning newspaper, which by the 1970s had overtaken afternoon publications in reader preference. The *Post,* which began morning publication in 1981, and the *News* became locked in a cycle of price wars in an effort to boost circulation and remain competitive with advertisers. The final straw was a subscription price war, launched in 1997, which lowered the price of each paper to as little as a penny, a move that eroded circulation revenues by as much as two-thirds. The low prices pumped up the circulation numbers: by 2000, the *Post* reported daily circulation of 416,720, and the *News* 446,465. Even with a 25 percent increase in subscribers, however, the *News* could not translate its gains into profits. On May 12, 2000, after spending $123 million over the preceding decade, the *Rocky Mountain News* capitulated, agreeing to combine its business operations with the *Denver Post* in a joint operating agreement.

The Joint Operating Agreement (JOA)

Under the JOA, the papers merged their advertising, circulation, marketing, production, and distribution operations into a new entity, the Denver Newspaper Agency (DNA), owned equally by E. W. Scripps Company, parent of the *News,* and MediaNews Group Inc., publisher of the *Post.* The 50-year agreement required each paper to publish separate weekday morning editions and a joint weekend edition, the *News* on Saturday and the *Post* on Sunday, under combined mastheads. The editorial staffs and content remained independent, although the two newspapers share space in a new building owned by the DNA. The merger created an advertising giant that produced a combined classified advertising section. Two of DNA's first moves were to double newsstand prices for both weekday and weekend editions and raise advertising rates, in some cases by double or triple, prompting a short-lived court challenge by local advertisers.

Despite the merger, both newspapers lost circulation as readers turned to alternative products that satisfied the needs of a mobile audience for access to continuous information and entertainment. The newspapers turned to online and niche publication to deliver hyper-local content. They also experimented with various forms of customized newspapers that allowed online readers to individualize information, and both launched zoned publications addressed to specific urban and suburban audiences, much of it written by citizen-journalists. The closure of the *Rocky Mountain News* in March of 2009, while a traumatic development to many in the city, was but one indicator of what was happening to many urban papers across the country.

Other newspapers serve the metro Denver area. *Westword,* one of the nation's largest alternative weeklies, has published since 1977. Purchased in 1983 by New Times, it continues to provide respected, often controversial views on everything from politics to baseball. The *Boulder Daily*

Camera began publishing in 1890. Its founders, nephews of Thomas Patterson, an owner of the *Rocky Mountain News,* chose the name because they intended to publish more illustrations, mainly engravings, than most newspapers of the day. L. C. Paddock purchased the *Camera* in 1892, and it remained under family control until Knight Ridder bought it in 1988. In 1997, an ownership swap brought it into the Scripps-Howard stable. The *Aurora Sentinel* has served the state's third-largest city since 1910. In addition to a weekday edition, it also publishes the weekly *Mile High Guardian,* distributed to area military personnel under a Department of Defense contract with Buckley Air Force Base.

Broadcasting

Radio came to Denver early. KLZ received one of the first 10 commercial licenses issued in 1922, but its founder, W. D. Doc Reynolds had begun broadcasting from a 100-watt transmitter on the roof of his home as 9ZAF in 1921. Other stations went on the air in quick succession: KFEL launched in 1923, followed by KOA, owned by General Electric, in 1924, and KPOF in 1928. KLZ began newscasts in 1935, and it aired the first play-by-play football game in 1924 and a year later leased a telephone line to carry live Calvin Coolidge's inauguration. In 1929, KLZ became one of the CBS network's earliest affiliates, and KOA signed with NBC.

Hampered by geography and distance, television took longer to reach the area, and its arrival signaled a shift from local to national ownership for most of the stations. TV debuted in 1948, but it was an experiment seen by a handful of people in the studio, not actually broadcast. KFEL-TV, affiliated with the DuMont Network, signed on in July 1952 and aired the first newscast later that year. Over the years, innovations in cable and satellite television technology pushed Denver to the forefront. By the turn of the century, technological advancements signaled another change.

Portability of video content prodded television news in new directions. New distribution platforms, such as video-ready small-screen wireless devices, fed the demand for "i-news"—content, genres, and topics specifically directed to the individual. Local stations began using text messaging to send news updates to mobile viewers. Websites also became increasingly important sources of information for both viewers and stations, as broadcasters followed up on citizen-generated news tips.

The mandated conversion to high-definition television early in 2009 created demand for more lifelike, enhanced images, especially for local sporting events. To fulfill the Federal Communications Commission's order to transmit digital-only signals, Denver television station operators formed the Lake Cedar Group in 1997 to replace three existing towers with a single supertower on Lookout Mountain in the foothills of Golden, a western suburb. The local community resisted construction, objecting to the height and location of the 730-foot tower. However, the U.S. Congress overrode the community's concerns, enacting legislation in 2007 ordering construction of the tower.

Demographic shifts by the beginning of the twenty-first century also affected Denver media. Entravision Communications' Univision launched a Spanish-language evening television news program on weeknights in 2006, and NBC Universal became the first full-power Telemundo affiliate in the market that year. McGraw-Hill Broadcasting converted three low-power outlets into the local Azteca America Colorado affiliate in 2007, which offered a local Spanish headline-news format. Print publications published in two formats, one Spanish only, the other Spanish and English side by side. The weekly *La Voz Nueva* (The New Voice) distributed to eight metropolitan counties with articles in both English and Spanish. *El Semanario* (The Weekly Magazine) followed a similar format. The *Post* inaugurated *Denver Post al Dia* (Denver Post Today), a daily online source of local news in Spanish, and published a free weekly Spanish-language tabloid, *Viva! Colorado.*

The seismic shift to wireless distribution and 24/7 news transformed Denver media's news gathering and distribution. By the early 2000s, web-based local news sites incorporated multimedia, with little distinction among text, sound, pictures, and video, while the rise of user-generated content and citizen journalism provoked a different issue: how to pay for the content and how to ensure its trustworthiness.

Desktop Publishing

Desktop publishing (DTP) is the process of using computer hardware and software productivity tools to create high-quality, printed documents. Innovations and price reductions in computer hardware and software have dramatically influenced the communication environment, affecting every aspect of the production processes in the newspaper, magazine, advertising, and public relations businesses.

A desktop publishing system includes a computer, layout software, and a printer, but can also be supplemented by scanners, digital cameras, and image and graphic creation software. Documents are created digitally on a computer and either printed on a home computer or saved to a file that can be printed and duplicated at a professional print shop. The widespread availability of desktop publishing tools has greatly increased the ability to develop and publish professional-looking brochures, advertisements, newsletters, and even books. Additionally, desktop publishing systems can create signage, package designs, promotional items, newspapers and magazines, and other printed materials. Companies that once outsourced these activities to professional design or branding firms can now perform these functions in-house.

The phrase "desktop publishing" is most often used to describe the type of software used in a personal publishing system, but is also referred to as "personal publishing," "computer-aided publishing," "electronic page assembly," or "electronic publishing." Contemporary desktop publishing software uses the WYSIWYG (pronounced whizzy-wig)—or What You See Is What You Get—concept that allows the user to see on the computer screen how the output will appear on the printed page. DTP systems allow the user to control layout, typography, color, design, illustrations, photos, and graphics that appear on the page. In addition, professional typesetting functions such as kerning (placing space between text), leading (establishing line spacing), curved and wrapped text, and ligatures (joining two or more letter forms) can now be accomplished with a personal desktop publishing system.

Development

Desktop publishing prior to widespread computer use consisted of documents created on a typewriter and duplicated by a mimeograph machine. Design and layout options were limited, and the documents created rarely looked professional. Professional publishing options were expensive and required commercial-grade typesetting equipment, thus limiting their availability to large organizations, such as newspaper and magazine publishers and other firms.

The origins of modern desktop publishing can be traced to innovations spawned by the Advanced Research Projects Agency of the Department of Defense during the 1960s. Significant funding was made available for military and academic research studies of human and computer interaction that would lead to both desktop publishing and the Internet. During the 1970s, these projects moved to the private sector in the form of major computer hardware and software companies.

The mid-1980s was a time of rapid development of desktop publishing. Innovations by several

companies, when combined, formed the genesis of desktop publishing. The Apple Macintosh debuted in 1984, thus putting the power of computing onto the desktops of countless individuals. The Macintosh used a graphical user interface (GUI) that allowed the non–computer literate to simulate their design processes, just as they would on their physical desktops with scissors and paste, thus the "desktop" metaphor was established. The term "desktop publishing" is originally attributed to Aldus Corporation founder Paul Brainerd, who sought a catchphrase that his company could use to market systems characterized by the small size and relative affordability of such products in contrast to the expensive commercial phototypesetting equipment of the day.

The first laser printers were built by Canon in 1983. A year later, the Xerox Palo Alto Research Center introduced the LaserJet (later licensed to Hewlett Packard), the first desktop printer to produce crisp, 300-dpi (dots per inch) quality prints. In 1985, Adobe introduced PostScript, which became the industry standard Page Description Language (PDL) and Aldus developed PageMaker, the first "desktop publishing" application for the Mac. In 1987, PageMaker for Windows was introduced, but the overriding preference among graphic designers for the Mac platform (that continues to this day), is driven primarily by Apple's early entry into the field.

These innovations marked the beginning of the end for many professional typesetters. Professional typographers had been using similar technologies for years, but significant investment ($80,000–$200,000) in equipment was necessary, making them impractical for most small businesses and home users. Reduced prices for home computers and printers allowed anyone to publish their own documents. By the late 1980s, printers were able to print at resolutions of 600 to 1,200 dpi, virtually indistinguishable from typeset quality.

The Macintosh II, introduced in 1987, featured a larger color screen and mouse, and was considered more user-friendly and suited to DTP applications. Other early improvements in DTP included the introduction by Ventura Publishing of the first PC-based layout package. Ventura improved on PageMaker's pasteboard metaphor by automating stylesheets and pagination processes, making it more suitable for longer documents. QuarkXpress, also released in 1987, became the industry standard for professional publishing during much of the 1990s. Adobe Systems purchased Aldus and PageMaker in 1994, and then introduced a stronger competitor for Quark with its InDesign application in 1999. QuarkXpress and Adobe InDesign were the dominant products in the desktop publishing space in the early 2000s. Many design and publication organizations that were strongly wed to QuarkXpress began switching to InDesign in 2003. Quark's slowness to develop a version that ran on the Macintosh OSX platform and customer complaints of poor service, combined with Adobe's broad line of other design products (Photoshop, Illustrator) and their ability to offer studio packages incorporating multiple titles, provided a strong platform for encouraging users to switch, thus eroding some of Quark's stronghold on DTP.

Many word-processing applications contain basic layout and design functionality that can be used effectively for smaller scale or personal projects, like letters or internal brochures. Spreadsheet programs also offer design capabilities in creating tables, charts, and graphs, which can be printed at a high quality or integrated with other desktop publishing software. Other software can also perform layout and design functionality, although they are best used for photo and image manipulation of files that are later imported into a DTP program. Open-source or free desktop publishing options are available across these offerings.

Although considered a primary skill in various communication careers, DTP is a secondary skill for many in art direction, graphic design, multimedia development, marketing communications, and many administrative roles. Layout and design skills are important to those in the fields of newspaper and magazine publishing, as well as a host of other communication and business careers.

Advantages and Disadvantages

Since the mid-1980s, the use of desktop publishing systems has markedly improved the overall appearance of corporate and personal communications. Neater documents are easier to read and are considered more credible by readers. The presence of these systems quickly spread as the more appealing products gained positive attention. A neater looking document was assumed to be more serious

because of the implied time and professional effort it would take to produce it, and competitors could not afford to appear less competent. A typeset appearance soon became the standard for a majority of professional and personal communications. From church newsletters to band flyers to the annual family Christmas update, the influence of DTP software became ubiquitous.

Advantages of control and cost effectiveness are experienced with a DTP system. Time-consuming and thus expensive changes that used to go through several iterations between client and printer can now be handled cheaply in-house. The ease of training and use of DTP software allows its implementation at a variety of levels within an organization, thus eliminating the need for expensive outside contractors or consultants. Further, color printing has become more cost-effective with the introduction of inexpensive laser printers using four-color processes.

An additional benefit of internally controlling the DTP process is that of security. Sensitive documents regarding corporate secrets, product announcements, or strategic plans can be produced in-house without fear that an external party might leak the information or share with competitors. For individuals, DTP offers a broader range of opportunity to explore creative outlets in developing their own communications. Many home users of DTP have parlayed their skills into gainful careers in graphic design. An entire industry of freelance designers has sprung up around the availability and ease of use of desktop publishing software.

While its advantages are numerous, DTP suffers from some disadvantages. The DTP environment allows the merging of layout, design, and content functions, thus combining functions that were once highly specialized. Critics argue that this lack of specialization can lead to weaknesses in the process. A beautiful document that is not carefully proofread or is littered with factual inaccuracies can cost much in terms of credibility and reputation. In the same vein, a well-written and -researched document that uses poor design and layout, multiple and incompatible typefaces, and uncomplementary colors can be perceived poorly by readers.

From the early years of desktop publishing through to the present, criticisms of the quality of materials produced in a DTP environment have been levied. Critics argue that the widespread availability of hardware and software and the lack of training for many DTP users has lowered design standards and has lead to many print projects lacking in design aesthetic and professionalism.

Future

DTP software continues to improve productivity by adding features and functionality for the management of large-scale projects. Hardware costs of computer equipment and printers continue to decrease while computing power grows. And the popularity of digital photography has improved the ability for users to create and import images into documents. College programs in journalism and mass communication have standard offerings in publication and graphic design that are relevant in the industries of news, advertising, and public relations, and are an important skill that is actively sought by recruiters in these fields.

DTP applications have had a strong influence on the new generation of web design and publishing programs. Many graphical HTML editors (such as Microsoft FrontPage and Adobe Dreamweaver and Flash) use layout features and menu options that are similar to a DTP program. Web design offerings are also being added to many college curricula and are increasingly being seen as essential skills for those entering communication careers.

While many designers remain loyal to the Apple platform based on their early entry in the field and the continued improvement of user interface and software design and integration, the Microsoft Windows environment allows users to run most all DTP applications. A running debate between Apple and Windows users continues, although once-clear advantages for Apple are now generally seen as personal preference. Apple is generally seen as having an eye toward aesthetics and the user environment, while Microsoft is seen as the leader in office productivity applications.

Expect change to be a regular part of the DTP environment. Company mergers and acquisitions, new product releases, advanced functionality, process and workflow improvements, and advances in computer and printing hardware have long characterized the field of desktop publishing. Those in the field of journalism and mass communication

should become familiar with current technologies and processes associated with DTP. But they should also be flexible in responding to the inevitable changes in the environment.

Deutsche Welle

Deutsche Welle (DW) is Germany's international news broadcaster. Through its network of globally accessible radio, television, and Internet services, DW offers news and information about political, cultural, and economic life in Germany and Europe in 30 languages. DW, based in both Bonn and Berlin, consists of DW-RADIO, DW-TV, and the Internet service DW-WORLD.DE. In addition, the DW-AKADEMIE offers training programs for electronic media professionals from the developing world and Eastern Europe. It offers courses in journalism, broadcast technology, and administration both in Germany and abroad.

Origins

DW was inaugurated on May 3, 1953, with an address by German President Theodor Heuss as its first shortwave broadcast. The declared goal of DW was to improve Germany's strained relationship with other nations after the end of the World War II and to present a new, democratic Germany to the rest of the world. In 1954, DW began radio transmission in English, French, Spanish, and Portuguese with broadcasts lasting five minutes each. In the following years, DW rapidly expanded its broadcast services aimed at the then-communist nations of Eastern Europe and added languages such as Russian, Polish, Czech, Slovakian, Hungarian, Serbian, and Croatian. In addition, the English-language service, previously broadcast only to North America, was expanded and could be heard in Australia, East Asia, the Pacific, and Africa. Similarly, the French-language service started broadcasting to Africa.

As the political voice of a free and democratic Germany, DW quickly grew into a major international broadcaster of "unbiased" news and competed successfully with the development of similar foreign radio services in Eastern Europe. In addition to its role as the voice of a Western democracy during the cold war, DW's main functions were to improve the negative image of Germany after World War II and to maintain the political quest for a German reunification among an international audience. DW's international broadcasts were designed specifically to counteract the censored messages of the communist media in Eastern Europe and to help people get a more balanced view of international affairs.

In 1960, DW became an independent public broadcasting service, which allowed the broadcaster to govern itself and operate free of governmental influence. Two years later, on June 7, 1962,

DW formally joined the public broadcasting organization ARD (Arbeitsgemeinschaft der öffentlich-rechtlichen Rundfunkanstalten der Bundesrepublik Deutschland—a joint organization of Germany's regional public broadcasters) as an independent, national broadcasting station. In 1963, DW also started its first television activities by sending abroad dubbed versions of German films and television broadcasts. During the next three decades, DW's television offerings were limited to the international distribution of these dubbed German programs and consequently did not reach large foreign audiences. In 1992, however, DW-TV was launched and began broadcasting six hours of German and English television programs globally via satellite. DW-TV began as RIAS-TV, a television station launched by the West Berlin broadcaster RIAS (Radio in the American Sector) in 1988 to broadcast Western views into East Germany. After German reunification in 1990, RIAS-TV was closed down and DW inherited its broadcast facilities, which were used to broadcast DW-TV's German and English television programs internationally. In July 1993, the programs were expanded to 16 hours, and Spanish was added as a third language. Since 1995, DW-TV has been broadcasting around the clock.

Programming and Funding

DW has about 1,500 full-time employees and hundreds of independent correspondents from more than 60 countries. It maintains foreign bureaus in Washington, D.C.; Moscow; and Brussels. According to its own estimates, DW reaches more than 65 million listeners and 28 million viewers every week around the globe. In addition, the DW-WORLD.DE website, launched in 1994, was accessed about 33 million times in 2006.

Publicly funded, DW is modeled after international broadcasters such as the BBC World Service or Radio Free Europe. However, DW is designed to remain editorially independent and is therefore institutionalized as a public broadcasting organization similar to the BBC—and not as a government agency such as the Voice of America. Unlike other public broadcasters in Germany, DW is mostly financed with funds allocated by the federal government and receives no subscription fees. Its annual budget for 2008 totaled approximately 271 million euros, which continued the declining trend in government funding for DW (302 million euros in 2004).

DW-RADIO is available around the clock via analog and digital shortwave broadcasts and worldwide satellite transmission. In some regions and metropolitan areas, DW-RADIO also offers FM and medium wave broadcasts. The broadcasts are scheduled around two-hour program blocks that present news updates every 30 minutes and are available in 30 languages. All DW-RADIO programs are produced in Bonn.

DW-TV features mainly news, documentaries, and exposes that depict life in contemporary Germany. Half-hour magazines dedicated to specific subjects such as business, politics, sports, and culture in Germany are available every day. DW-TV programs are broadcast globally via satellite 24 hours a day and alternate from German to English every hour, with additional broadcasts in Spanish and Arabic throughout the day. Viewers in the United States, Canada, and Latin America also have access to current German-language television shows and children's programs during prime time. Unlike other international broadcasters, DW-TV does not charge foreign media organizations for the use of its programming. As a result, its television programs, which are produced in Berlin, are rebroadcast on public broadcasting stations in several countries including the United States, Australia, and New Zealand.

DW Today

Since 2004, DW has been officially a three-media organization that offers news and information programs through radio, television, and the Internet. DW's online service DW-WORD.DE is produced in Bonn and Berlin and presents a daily mixture of news and information about Germany and Europe in seven core languages (Arabic, Chinese, English, German, Spanish, Portuguese for Brazilians, and Russian) and 23 other languages that correspond to DW's radio offerings. The site also offers information for tourists interested in visiting Germany and provides the opportunity to learn German through a variety of interactive lessons and games. While DW-WORLD.DE relies on material from DW's central news desk, the material produced for DW's online service is

often original and different from the news and information broadcast by DW-TV or DW-RADIO. To ensure comprehensive news coverage, DW-WORLD.DE also relies on information from several news agencies, including Agence France-Presse (AFP), Deutsche Presse-Agentur (dpa), Associated Press (AP) and Reuters. In addition to the regular news and information offerings, DW-WORLD.DE provides online access to the programs of DW-TV and DW-RADIO in the form of podcasts, live-streams, and video on demand. Since 2007, DW's Internet offerings also are available through mobile phones and a dedicated channel on the video-sharing platform YouTube.

Given the task to represent Germany internationally, DW primarily targets foreign decision makers, opinion leaders and information elites who might be able to influence others with their perceptions of Germany. Consequently, the offerings of DW are clearly defined as part of Germany's public diplomacy efforts by the federal government. According to the official Deutsche Welle Act, the programs "are intended to convey the image of Germany as a cultural state in the European tradition and as a free and democratic constitutional state. They should provide a forum in Europe and on other continents for German (and other) points of view on important topics, primarily in the areas of politics, culture, and economics, with the aim of promoting understanding and the exchange of ideas among different cultures and peoples."

While the Act notes that "reporting shall be comprehensive, truthful and factual," DW journalists are asked to be aware that their work can "affect the relationship of the Federal Republic of Germany with other countries." Since DW is a public service broadcaster and not a government agency, this section of the Deutsche Welle Act is in conflict with press freedom rights that are enshrined in Article 5 of Germany's Basic Law. As a consequence of these obvious tensions between a free press and Germany's public diplomacy efforts, the declared goals of DW mostly reflect the government's desire to promote "German points of view" worldwide. At the same time, DW sees itself primarily as a global advocate of "intercultural dialogue" and "international understanding and tolerance." DW tries to achieve these goals by providing "comprehensive and uncensored information to countries that lack free media, particularly crisis regions and war zones."

The end of the cold war brought significant changes to DW's international programming focus, which was dominated by Eastern Europe until the fall of the Berlin Wall in 1989. The 1990s, for example, saw an expansion of DW programs that targeted politically unstable countries in Southeastern Europe. More recently, Latin America, Asia, and the Arabic world have become primary target markets for DW programs. This trend is a reflection of the fact that these world regions have become important international markets for the export-dependent Germany. It is also clear that DW has paid more emphasis in recent years on achieving mutual understanding and tolerance with countries in the Middle East.

In 2002, for example, DW-TV launched a three-hour Arabic-language program on the NILESAT satellite featuring a DW news program with Arabic subtitles, along with documentaries and features dubbed into Arabic. A year later, DW started Qantara.de (Arabic for "Bridge"), a multilanguage Internet portal that aims to "promote dialogue with the Islamic world." The site, which is produced by DW and various German cultural and political organizations, is available in English, Arabic, Turkish, and German. In 2007, DW made Persian another core language for its main online news service DW-WORLD.DE and created a new Internet site specifically for audiences in Iran.

Development Journalism

Development journalism is a type of reporting and writing on topics related to the process of economic development. Its supporters define it as independent journalism that highlights news of development projects, provides critical coverage of development planning and programs, and informs readers of how the development process is affecting them. Although the concept of development journalism sounds simple, it has been highly politicized since it was first created in the 1960s. Much of the debate over development journalism has focused on the issue of press freedom, and whether or not a commitment to covering economic development from a positive and even "emancipatory" perspective is fundamentally at odds with freedom of the press.

In its early days, development journalism was linked to theories of communication and development and was thus affected by the politics of the cold war. In an era of heightened rhetoric over modernization and the best way to attain it, the United States and the Soviet Union put forth competing visions of the role of the press. During the 1980s, when many developing countries argued that the structure of the world news system left them at a disadvantage, development journalism also played a role in the struggle for a "New World Information and Communication Order" (NWICO). Although American opponents of NWICO lost interest in development journalism after the collapse of Communism, it has continued to survive as a concept in the style of "Asian values" journalism advocated by Singapore and Malaysia. There are also echoes of development journalism in some of the "community radio" projects funded by international nongovernmental organizations (NGOs) working in less-developed countries today.

Origins

The roots of development journalism extend deep into the 1950s, and to the theories of modernization espoused by W. W. Rostow, Daniel Lerner, and Samuel Huntington. In the years after World War II, these theorists described a one-directional means of propelling traditional societies along the road to modernization and economic development, while simultaneously helping them avoid the pitfalls of Communism. Communication was seen as a powerful tool for modernization, and mass media were understood to assist not only in the development of modern personality traits such as "empathy," but also in the expansion of democracy and economic and political participation. Communication theorists such as Wilbur Schramm posited a model of press development that likewise utilized stages and suggested a trajectory in which journalism passed through "authoritarian," "libertarian," and "social responsibility" phases.

One of the first organizations to promote development journalism was the Press Foundation of Asia (PFA). Established in Manila in 1967, the PFA took a practical approach to implementing the modernizers' notion that informing readers about the development processes that were affecting their lives was one way of bringing about social and economic change. The PFA was founded by a group of prominent Asian journalists, and included many champions of press freedom who had previously been jailed by authoritarian regimes. Committed to focusing on development news while steering clear of government interference, the Press Foundation of Asia received little government funding and instead relied on regional newspapers and agencies, international foundations, and the UN to support its programs. These programs included training for journalists, a center for press freedom, and a development news service called Depthnews that served clients throughout the region.

Depthnews was launched in 1969. Its goal was to provide an outlet for graduates of its training programs, and to offer subscriber papers and radio stations a weekly package of articles focusing on development news that they would pay for on a sliding scale. An acronym for "Development, Economics, and Population Themes," Depthnews was distinct from Western news services in that it

aimed to report on the process of development in member countries rather than focusing on specific events. More controversial, it also departed from conventional Western notions of objectivity, and allowed journalists an active role in alerting readers to social problems and promoting change. According to media researcher Floyd McKay, when Depthnews was awarded the prestigious Magsaysay award in 1992, it claimed to have reached a potential audience of 2.3 million readers and 56.5 million radio listeners via 300 regional newspapers and 700 radio stations.

Development News and Authoritarian Regimes

It was not only modernization theorists who saw in journalism a powerful tool for development. Almost as soon as the concept of development journalism was established, it was appropriated by government leaders such as the Philippines' Ferdinand Marcos, Indonesia's Soeharto, Malaysia's Mahathir Mohamad, and Singapore's Lee Kwan Yew. These authoritarian leaders began to espouse policies that drew upon parts of the development journalism agenda while conveniently ignoring others. In many cases, development journalism was used by repressive regimes to justify government control of the press. In Indonesia, for example, the press was expected to serve the interests of the nation as defined by the Soeharto regime. Newspapers were encouraged to showcase economic and social development, and discouraged from reporting on anything that would undermine this positive view.

The politicization of the debate over development journalism was thus based partly on the way in which authoritarian regimes used the notion of development to justify repressive measures taken against journalists. Yet this politicization was minor compared to the role that development journalism played in the cold war debate between the United States and the Soviet Union over the proper role of the press in society. The debate polarized journalists and forced them into two camps: those who supported a "free" and commercial press system versus those who supported a "controlled" one. Development journalism was seen by many Western commentators as being stuck somewhere in the middle.

Developing Nations and the Global News Flow

At the same time that journalists in some less developed countries were arguing that there needed to be a new kind of journalism that informed readers about the development process while simultaneously empowering them toward more democratic participation, others were pointing out that there were sharp inequalities in global news flows. The controversy over the global flow of information—as well as the call for a "New World Information and Communication Order" (NWICO) began with the Non-Aligned Movement of Third-World countries in the 1970s, and climaxed in the 1978 Mass Media Declaration at the United Nations Educational, Scientific and Cultural Organization (UNESCO) general conference. Both of these events were related to development journalism. Proponents of the NWICO argued that most of the world's international news agencies were based in the United States and Europe, and that these companies depicted the developing world in ways that were ethnocentric, shallow, negative, and distorted. They further argued that news flowed in one direction, from North to South, and that developing countries were powerless to counter the largely negative images that emerged from these commercial news agencies. In many cases, developing countries were forced to rely on Western reporting for news of their own regions. Particular targets for criticism were the "big four": Associated Press (AP), United Press International (UPI), Reuters, and Agence France-Presse (AFP). Although TASS (the Telegraph Agency of the Soviet Union) was sometimes mentioned as the fifth international news agency, it received less criticism because, as an instrument of the Soviet Union, it tended to ally itself with Non-Aligned nations in calling for greater state involvement in the media in order to insure a more "responsible" press.

Although the Soviet Union's dispute with the West over government control of the flow of information was ideological, most Third World countries had more practical concerns. The call for a New World Information and Communication Order (sometimes referred to as New World Information Order, or NWIO) led to the formation of the MacBride Commission. This UNESCO

commission, which was tasked with analyzing global structures of news and offering solutions to inequalities in the flow of information to, from, and between developing countries, provoked controversy from the start. Its final report, *Many Voices, One World,* issued in 1980, called for limits to transnational monopolies and concentration, and regulation of international advertising. The MacBride Commission report led to an uproar at UNESCO in part because "distributive justice" in the flow of information and fundamental questions of who owned the means of communication were not seen by the developed countries that funded UNESCO as being part of the international agency's mandate.

The MacBride Commission Report was almost immediately interpreted as being hostile to a free press. Organizations such as the International Press Institute, Freedom House, and the World Press Freedom Committee stated their objections to what they interpreted as calls for state-controlled media, and in doing so used language and rhetoric that dovetailed with preexisting criticisms of development journalism. They argued that there was no conscious effort by the "Big Four" to distort news from the Third World, and that, to the contrary, wire services and other international news organizations made decisions in accordance with standard conventions of newsworthiness. Thus the actions of powerful nations like the United States and the Soviet Union are more newsworthy than those of developing countries because they are more likely to affect the fortunes of the rest of the world. Other supporters of the "Free Flow of Information" pointed out that even in developing countries the national media tend to focus on disasters such as floods and famine, and violent political activities like strikes or coups. Moreover, they argued that the Third World countries demanding a New World Information and Communication Order were actually more interested in halting negative reporting about their own un-democratic regimes than they were about seeking to resolve inequalities in the flow of information.

The discourse over the NWICO was thus quite similar to many of the concerns that had led to the creation development journalism, especially with regard to the feeling that developing countries were not being reported upon fairly in the international media. Proponents of NWICO pointed out that by focusing exclusively on negative events rather than the everyday successes of development projects such as family planning, food distribution, and health care, Western news organizations were not only distorting the realities of life in developing countries, but were also contributing to feelings of frustration and hopelessness. The most frequently proposed NWICO solution was a kind of national communications policy, in which developing nations would encourage the press to cover domestic concerns, especially those related to economic development. The idea was that these policies would assist in advancing the national development agenda, while also helping to foster a sense of cultural identity, something that was at risk of being lost in a media system dominated by transnational corporations. These NWICO proposals further resembled development journalism in that they were premised on the assumption that journalists in developing countries should abandon the value-neutral posture of "objectivity," and instead speak out for values that were consistent with anti-colonialism, democracy, peace, and universal human rights.

The collapse of the Soviet Union in the late 1980s not only took the wind out of the sails of those who advocated government-owned and controlled mass media, but also ended the struggle for the allegiance of the nonaligned nations that was at the heart of the call for distributive justice in global news flows. In 1984, under President Ronald Reagan (1981–89), the United States pulled out of UNESCO for reasons that were related to the agency's continued championing of the NWICO. At this point, the most vocal advocates for government-directed national communication policies were political leaders in developing countries who began to shift the rhetoric to something called "Asian values."

Asian Values

For years, political leaders in Asia have argued that development journalism is uniquely suited to Asian countries. Two noted proponents of development journalism are Singapore's Senior Minister (and former Prime Minister) Lee Kwan Yew and Malaysia's former Prime Minister Mahathir Mohamad. They have argued that in Asia, unlike in liberal Western democracies, a government/media

partnership makes sense for both historical and cultural reasons. Although it is difficult to generalize about "values" in a region as diverse as Asia, both Mahathir and Lee have argued that Asian values include a preference for family over self, community over the individual, and consensus over confrontation. Mahathir and Lee deny that their countries are any less "democratic" than their Western counterparts and contend that whereas the West emphasizes the rights of the individual, the Asian approach promotes the rights of the community, the collective good, and the prosperity of the whole.

Critics of the Asian values approach point out that while controlled media may or may not protect economic development, they clearly protect those who are holding power. Others have suggested that the speedy restoration of press freedom in the Philippines and Indonesia after the toppling of authoritarian regimes suggests that not all "Asians" share the values advocated by Mahathir and Lee.

Conclusion

There is much in the idea of the press as a means of empowering ordinary people to deal with rapid social and economic change that strikes a responsive chord in developing countries. Despite the efforts of political leaders who have tried to use it as a means of staying in power, there is nevertheless something immensely attractive about an emancipatory style of journalism that aims to empower citizens to better understand the forces that affect their lives.

Despite the controversy that continues to stick to development journalism, many international NGOs and USAID contractors practice some if not all of its tenets. Community radio, for example, takes as a given the principle that people in developing countries need information about family planning, health, and agricultural developments in order to lead better lives. In its emphasis on a bottom-up flow of communication, as well as its call for news that gives voice to ordinary citizens, development journalism also resembles the civic journalism movement that became popular in the United States in the 1990s. Development journalism's supporters contend that this style of news reporting and writing is in keeping with one of the most fundamental goals of journalism: to provide citizens with the information they need in order to take control of their lives.

DIFFUSION

News diffusion is the process by which information about people, events, and trends flows through society. The systematic study of news diffusion began in 1945 when Delbert Miller investigated news flow about President Franklin Roosevelt's death. His findings were published in a brief article

in the *American Sociological Review,* launching the theoretical study of news diffusion. Miller found that after initial exposure to the information via the radio, word of mouth was the primary means in which the information spread; thus, the majority of people found out about Roosevelt's death via personal contact. Over the last 65 years, the study of news diffusion has enjoyed periodic enthusiasm in the research community, typically during periods marked by significant news stories. For example, a 2003 study found that 97 percent of Americans knew about the destruction of the World Trade Center on September 11, 2001, within three hours of the attack.

Several academic disciplines study news and information diffusion. While a majority of the research is found in mass communication literature, sociologists and scholars specializing in public opinion have also paid a good deal of attention to news flow. News diffusion theory naturally lends itself to strategically thinking about how to diffuse messages and create information salience within social circles. As a result, news diffusion theories are important not just to journalists, but to other information managers such as advertisers, political consultants, and educators.

Patterns of News Diffusion

Typically, patterns of news diffusion are represented using schematic drawings. An S-curve is most often associated with diffusion and represents an initial small spike that dips then surges again as information about a news event spreads. For example, when President Ronald Reagan was shot, news reporters covering his appearance that day would be the first to know of the event, and they would then share it with their news directors. As the newsroom decided how to manage the flow of information, a brief lull would occur. Scholars have also tried to identify other news diffusion patterns. For example, the J-curve suggests that when an event is of high interest (such as the death of Princess Diana in 1997), the news reaches a few individuals who then diffuse it rapidly through interpersonal channels.

Other patterns of news diffusion have been introduced over the years. Communications researcher Stephen Chaffee suggested in 1975 that news information diffusion had three distinct patterns or types. One is incomplete diffusion, when a story fails to work its way across the audience. The two other patterns are fast-moving news and very slow-moving diffusion. Scholars have found that each of the patterns is related to not only media consumption patterns but also interpersonal communication and what prompts people to tell others about news events. For example, news that impacts everyone, like the explosion of the *Challenger* space shuttle, engages conversation and propels the news diffusion process faster, while news that only impacts a qualified smaller section of people, like a new discovery in the treatment of arthritis, would diffuse more slowly.

The importance of interpersonal communication in news diffusion theory has allied the study of news flow to the work of sociologists Paul Lazarsfeld and Elihu Katz in 1955. Their two-step flow model of communication speculated that mass media's reach is extended by opinion leaders typically people who have the most access to media and who have a strong understanding of media content. The *New York Times* best-seller by Malcolm Gladwell, *The Tipping Point* (2002), called these opinion leaders *mavens,* people who are sought after by others because they have extensive general knowledge about topics important to society. Gladwell writes about the local Jewish maven who can tell you the best place to buy pork sausage simply because he is a person in the know. In practice, news analysts and talk show hosts like CNN's Anderson Cooper are frequently thought of as mavens in that their reporting covers a broad range of topics of the day.

Development of Diffusion Theories

The 1960s saw a number of news diffusion research studies surrounding major news events, such as the assassinations of President John F. Kennedy in 1963 and Dr. Martin Luther King Jr. five years later. These studies affirmed that the more human interest in the event, the more likely it was that interpersonal communication would assist the media and cause the rapid diffusion of news. Communications researcher Bradley Greenberg found in 1964 that within an hour of Kennedy's assassination, 92 percent of Americans knew of the event. Furthermore, he found that how that information was diffused was most often impacted

by whether a person worked and when the event happened. If the event happened during the work week (Kennedy was shot at midday on a Friday), employed people were most likely to find out about the story from a colleague. If the event happened over the weekend, the mass media was primarily responsible for diffusing the story.

During the 1980s, scholars furthered news diffusion research by examining how demographics and political affiliations related to the process. Researchers examining the attempted assassination of President Ronald Reagan in early 1981 once again found that interpersonal communication was the primary means most of those studied had found out about the shooting. Further examination found that demographics did not impact the first awareness of the news event, but did impact how an aware person would *diffuse* the information. Younger persons were more likely to tell someone else what had happened and men and young people were more likely to turn on the television to learn than were women or older people.

Another study of news diffusion about the *Challenger* space shuttle explosion in 1986 found that the more emotionally impacted by the news event, the more likely a person was to diffuse the information to others. For example, aboard the space shuttle was the first teacher in space, Christa McAuliffe, and her death was felt across the academic community. Talking about the event furthered the diffusion of the news and the human contact aided the processing of the emotionally charged information.

Communications researcher Melvin DeFleur (1987) conducted a meta-analysis of news diffusion research and found a lack of systematic study on the news flow process and as a result very little research aimed at theory building. DeFleur also found that frequently studies of news diffusion relied on accidental rather than random sampling, which limited reported results to having little more than anecdotal value. He also argued that one could not apply the principles of technological diffusion (the study of how and why people adopt new technologies, and the focus of much research attention in the 1980s and since) to the study of that news and information diffusion. DeFleur argued that news diffusion was a less rational process than deciding to adopt a new gadget and therefore the same driving concepts were not always at play.

Nevertheless, there is redundancy in the findings of early news diffusion studies that does contribute to theory building. These redundancies include the following trends:

- news of important events quickly diffuses through society by word of mouth, while less important events are learned of from news media;
- if the event occurs over the weekend people are more likely to hear about it from the media; people at work tend to hear from their coworkers about major news events;
- the length of time between when the event occurred and when it is learned of by people is related to how they hear about the event; and
- demographic variables such as education and gender are related to how quickly news diffuses.

A handful of studies have explored why people tell others of news events. Telecommunications researcher Walter Gantz and his colleagues found in 1976 that people are compelled to insert themselves in the news diffusion process based on four needs: to establish social status, to satisfy informational and interest needs, to express one's emotions, and to initiate social contact with others. Their study did not focus on a particular news event, but rather on news in general. One can assume that more newsworthy events might lead to more individuals taking on the opinion leader role of the two-step flow model and diffusing news and information to others. A study of the spread of news about Magic Johnson's 1991 HIV diagnosis found that fans of the basketball player were more likely than nonfans to tell others about the event.

Trends

News events, such as the September 11 attacks (2001) and Hurricane Katrina (2005), have promoted a renewed interest in news diffusion research. Even with the ubiquitous nature of media today, a majority of Americans interviewed on September 12, just a day following the attack on the World Trade Center and the Pentagon, reported first hearing about the event from someone else (50 percent) rather than the mass media (39 percent). The Internet's momentum as a news delivery source also led researchers to wonder

what role the web played in disseminating news about the 9/11 attacks. Researchers found that most people went to the web in search of additional information *after* hearing about the event from traditional news media (primarily television) or another person. This finding, coupled with the fact that forty years earlier news of the death of John F. Kennedy diffused at the same rate as the events of 9/11, confirms the pivotal role of interpersonal communication as the primary driver of news diffusion.

A study of Hurricane Katrina evacuees relocated to other areas of the country after a harrowing week in the New Orleans Superdome found that news did not diffuse to them in an accurate way. These evacuees, who included people from low-income households, non-English-speaking households, and nonwhite households, were described by researchers as being at "high risk" of being left out of the news diffusion process. Researchers found that mainstream media failed to adequately provide these displaced residents with meaningful information about how they could best prepare for the crisis and suggested that crisis communication plans need to consider how to reach populations that are not regular users of the mass media.

Critics of the way news diffusion is studied point out that the bulk of the research has focused on major news events, and as a result we have little understanding of lesser or regular news and how it is diffused. Researchers also point to a growing need for the academic community to understand the role of newer technologies on the news diffusion process. The advent of the Internet, text messaging, and social networking websites (to cite but three examples) all raise interesting questions as to how information is diffused. For example, diffusion studies examining the April 2007 shooting of more than 30 people at Virginia Tech University suggest that as the sniper worked his way through campus, students were text messaging and using Facebook to provide each other information about the events and shootings in real time. These messages were invaluable in the absence of accessible news media and provided an important means of allowing students to secure themselves. This suggests that in the absence of mainstream media coverage, and when interpersonal communication is not possible, individuals will use alternative communication devices to establish news flow as needed.

Digital Journalism Tools

While newspaper readership had been steadily declining since the early 1980s, the decline accelerated with the advent of the commercial Internet into mainstream American in 1995. Journalism organizations noted that a growing segment of their audience turned to the web for news and information. By 2005, both established news organizations and independent journalists began using new digital techniques to create multimedia and interactive storytelling in an attempt to draw and engage audiences.

The earliest form of journalism on the Internet, beginning around 1994, simply took newspaper text and posted it to an Internet page. Many web producers at news organizations derided this early form of Internet journalism as "shovelware" in reference to the act of shoveling the content from

one medium to another. Two major parallel developments in consumer electronics and software programming spurred new forms of reporting and displaying news online. Until 1999, what could be presented online was dictated by slow connection speeds, commonly known as dial-up, at which most people accessed the web. As connection speeds increased with the advent of cable and digital subscriber line (DSL) broadband modems, news on the Internet moved from text-based display to incorporate photographs, and eventually audio and video.

Also prompting change was the rapid decline in the price and size of digital tools, like video and still cameras, recorders, and computers. This put tools that were formerly the purview of professionals into the hands of what Jay Rosen, a journalism professor at New York University, called "the people formerly known as the audience." By around 2000, development of web-based applications (software that runs over the Internet rather on a hard drive of a computer), made it easier for nontechnologists to publish online. These new digital tools and the ability to create publications online at little cost, led to a paradigm shift in journalism.

Web Publishing: Blogs and Wikis

While anyone with an understanding of HTML (Hypertext Markup Language) could design and create webpages, the process was laborious and complex, and any changes had to be made manually. Many could not afford to purchase or develop the expensive content management systems that large news organizations used to update their webpages. By 2002, however, several applications emerged that allowed people to manage webpages easily and at little or no cost. Their original use was to allow people to write journal entries on webpages—sites that soon were called weblogs, or blogs. By 2007, there were more than 80 million active blogs worldwide. The variety of content on blogs continues to proliferate, with people writing about their daily lives, their favorite books or about their political views. Blogging's biggest impact, however, is that it provides a simple, yet powerful publishing platform that allows readers to post comments, thereby generating a conversation.

Since 2004, an increasing number of newspapers and television station websites and Internet-only news organizations have created blogs to supplement their online content and allow their audience to comment on the news and features published on the site. This form of discussion is considered by journalism organization as a critical element in engaging and holding an audience on a site. It also creates a sense of community, bringing readers back repeatedly through the day to view what other readers are writing about particular news stories. In other words, it creates "stickiness," with readers staying on a particular news site for longer periods or returning often.

Blogging applications also allow journalists to focus on covering very small communities, a practice known as hyperlocal reporting.

Another important development was the wiki page, which allows anyone to contribute to a webpage, as well as to edit or delete content on that page. Ward Cunningham developed the first wiki page, wikiwikiweb.com, in 1994; the term *wiki* is Hawaiian for "quick." The use of wiki technology picked up in the mainstream around 2005 as a growing number of people realized its potential for creating collaborative work on the web. By 2007, traditional news organizations had still not implemented the use of Wiki, fearing they could not trust the reliability of those who were adding or editing the wiki page. However, some organizations have harnessed the collaborative powers of wiki technology to cover some major news events. For example, Wikinews users created a page that covered the 2004 Indian Ocean Tsunami. They used material reported in traditional news accounts, linking back to the original source. The goal was to take scattered news coverage to create a comprehensive page. There was also some original reporting, as people posted video and photographs from the scene. The pattern was repeated during other news events including the 2005 London subway bombings and the 2007 Virginia Tech University shootings.

Collaborative Reporting Tools

Wiki pages were a first step toward collaborative reporting and writing. By 2007, Gannett, the

Man arrested in India after mid-air hijack threat on domestic flight

An Indian man has been arrested after threatening to hijack the domestic flight on which he was traveling on February 1. The flight was traveling between New Delhi and Goa in India. The IndiGo Airlines Airbus A320 was coming in to land at the time.

largest U.S. newspaper publisher, was experimenting with collaborative reporting using its reporters and the people from the communities it covers. This professional-amateur collaboration, known as pro-am, requires the use of digital tools that can track what information was provided by which reporter or member of the community. In 2007, Newassignment.net, with financial support from Reuters and editorial support from Wired .com, embarked upon an experiment to create a platform that would allow efficient collaboration over the web between amateurs and professional reporters and editors. This tool will be made available to all interested parties at no cost.

As consumer electronics such as cameras and recorders became smaller, more powerful, and cheaper, these tools—once geared toward the skills of professionals and the finances of large organizations—became available to amateur and citizen reporters. Using such consumer equipment, individuals have created news organizations to cover their local communities and niche topics. In April 2007 when fires raged Los Angeles's Griffith Park, the *Los Angeles Times* ran photographs and video taken by local residents fleeing their homes, giving them prominence on their Internet main page along with photographs taken by the professional staff. Some of these images and videos were captured using cell phones cameras.

Multimedia Tools

Photographs were the first visuals displayed on the web after text-only pieces. This has led to a revival of photojournalism. In an earlier era, even if a photojournalist had dozens of quality images, a newspaper could usually only display two at the most for a major story—one on the front page and one on an inner page. By 1998, the same story could display several photographs online.

By 1999, providing audio—which requires more bandwidth to download—was in an early phase. But by 2003 the exploding popularity of Apple's iPod, a device that holds audio files in several digital format that can be attached to a computer to download and transfer songs at the touch of a button, made providing audio a priority at online news organizations. These supplementary audio pieces came to be known as podcasts, a combination of the words "iPod" and "broadcast."

In 2003, several major news organizations like *The New York Times* on the web and WashingtonPost.com, employed a handful of employees dedicated to capturing news stories on video for their websites. Within two years, YouTube .com, a website that displays videos created by users, popularized online video much as the iPod popularized podcasts. The use of video for a news website became a standard by 2007. Washington Post.com and the Associated Press gave some of its photographers high definition video cameras, whose ability to freeze frame video can produce an image of high photographic quality. This image presented little or no degradation in quality and could be used in magazines and newspapers.

As news websites require new content to constantly update the site (called "feeding the beast" in newsrooms), what was required of reporters also began to evolve. Historically, when journalists reported stories, they would work with the photo desk to suggest ideas for photographs for their pieces. And these reporters were traditionally never expected to collect audio and video. But by 2006, many news organizations—both large and small—required their reporters to take photos and to collect audio and video to complement the written material on the organization's website.

Tools for Editing Digital Content

After photographs, audio and video are captured, each must be edited to prepare it for posting. Photographs are usually edited in Adobe Photoshop, the ubiquitous photo editing software. The most common usage is to color balance, crop and resize the photos for the web. The bulk of the features in this application were developed for designers and artists and can be misused.

In fact, digital manipulation is a growing concern as the tools of computer-aided photography have become more advanced. There have been several instances in which photographers manipulated images to suggest something that was not implied in the original photo. For example, in 2006, a freelance Reuters photographer used a Photoshop feature to enlarge and darken a plume of smoke over Beirut during the brief war between Israel and Hezbollah. He also darkened another area of the photo to make it appear, it seems, as though there were two bomb strikes. The fake

image implied, perhaps, that the bombing was more severe than it was. When the doctoring of the photo was uncovered, Reuters dismissed the photographer.

Audio can be edited in several computer applications that allow a user to cut and rearrange segments, or to add narration or background tracks. The most commonly used professional audio editors are Pro Tools, an application that requires additional hardware; Audacity; and Soundtrack.

Video is edited in two common professional level applications, Final Cut Pro and Avid. These digital tools allow editors to sequence interview and background footage, narration, titles, and subtitles to create a visual narrative. These applications allow the final sequence to be exported as several formats that maximize quality and minimize file size—a critical component for displaying video on the Internet, which always requires greater processing power and bandwidth than audio, photographs, or text.

Tools for Integrating and Displaying Digital Content

Unlike a newscast on television, which a viewer must watch in the order dictated by the decision of the its' editors, the web allows the user to navigate to different points in the narrative. This form of interactivity—when the audience can readily select various parts of the story—requires specialized digital tools to create.

Once all the primary assets (videos, audio, photographs, text) are edited, web journalists integrate them into a single interactive presentation using the ubiquitous Flash application by Adobe. Flash is a powerful program that allows people to create interactive and multimedia environments that can display photographs, audio, and video in any combination, while integrating data and graphics to tell a story. This software is widely used by the major news organization, including *The New York Times* and *The Washington Post*. A particular common practice is to pair photographs with audio. Another popular use is to create interactive maps and graphics. For example, readers can click on various cities on an Iraqi map and a window will pop open which displays important statistics and developments about that particular city. This allows news organizations to provide more information than they could if they crammed all the information on the map itself.

While many of the applications described in this entry can be easily be learned using a manual, the complexity of Flash makes it more challenging and requires people having a basic level of specialization. The program has timelines that must be scripted to carry out actions, and the actions may be nested within yet other timelines within the main timeline. To allow journalists to sidestep this complexity, a few software developers have created programs—like Soundslides—that create templates that can be loaded with photographs and audio and requires no knowledge of Flash. Soundslides is used widely in smaller news organizations.

Additional Tools

Journalists have also harnessed tools used for communications over the Internet—such as electronic mail, instant messenger, and VoIP (Voice over IP, or Internet telephone)—to improve their reporting. For example, using e-mail, journalists, can reach out to sources in distant areas and across time zones. They can also overcome the barrier between them and sources with disabilities—a visually impaired source can have e-mails read while a person with a speech disorder can easily type responses to e-mail queries.

Instant messenger, a popular application that is a faster way to communicate over the Internet than e-mail, can be used in a similar way to e-mail but feels more like a conversation because the immediacy of the questions and answers. It is also used by journalists as a way to stay in touch with their sources and to keep tabs on a particular beat.

An important tool used in conjunction with e-mail or instant messenger to converse with sources who have to worry about their identity is a encryption application called PGP, or Pretty Good Privacy. This application can encrypt communications between two people so that only those two can decrypt the messages they are sending back and forth. Given the sensitivity of some of the topics covered by journalists, this tool can be used to protect the confidentiality of sources. The U.S. government for some time listed PGP as a "nonexportable weapon" because of the strength of its encryption, though it can now be exported with a few exceptions.

Conclusion

As audiences for newspapers and television newscasts continue to defect to the Internet for their news and information, news organizations are harnessing digital tools and techniques to create multimedia and interactive storytelling to draw and engage audiences. Increasing Internet connection speeds and new efficient forms of publishing on the web have allowed news organizations to experiment with new forms of reporting and displaying news online. And as the price of digital video and audio recorders and cameras continues to fall, the tools that formerly only professionals could afford, become more available to amateurs. This has, in turn, spurred experiments to find ways to engage a new generation of news seekers.

Digital Media, Europe

Digital media are an important part of the New Europe that continues to emerge after the breakup of the Soviet Union in the 1980s, the disintegration of Yugoslavia in the 1990s, the implementation of the euro in 2002, and the ongoing waves of immigrants from Africa and Asia. In the twentieth century, Europeans counted on print and broadcast media to help distinguish and coalesce their individual nations. But in the twenty-first century, they expect digital media to help drive a continent-wide economic renaissance, entertain them, and keep them in quick, inexpensive touch with the folks back home, wherever they may be.

In 2008, a trip across Europe would put travelers in touch with digital innovations such as Internet access on trains in England and planes in Germany; 3-D vivisections of Michelangelo's "David" statue in Florence, Italy; digital readouts showing passengers the 200-mph speed of trains in Spain; and six-camera security screens on double-decker buses in Edinburgh, Scotland. Moreover, mobile phones were so ubiquitous that some trains contained quiet cars that banned them, and satellite TV dishes protruded so thickly in some cities that they looked like rows of sunflowers.

Contemporary European officials are far less focused on the social responsibility of the press, the regulation of media monopolies, the quality of public broadcasting, or the media's ability to further democracy than in the past. Instead, new media must fend for and regulate themselves. New media are also expected to fuel technological and economic growth. "The strategic goal for Europe in 2010," the European Council declared in 2000, "is to become the most competitive and dynamic knowledge-based economy in the world, capable of sustainable economic growth with more and better jobs and greater social cohesion."

So far, however, the results of the digital media revolution have been at best uneven across Europe, with as many unintended effects as intended ones. Some northern European countries have a greater percentage of their population on the Internet than the United States' 71 percent in 2007, such as The Netherlands (90 percent), Norway (88 percent), and Iceland (85 percent). But some southern and eastern European nations lagged far behind on Internet diffusion, such as Ukraine (22 percent), Russia (23 percent), Macedonia (33 percent), and Greece (35 percent). Those nations, however, were among the fastest-growing Internet users. Macedonia's Internet user percentage, for instance, was 21 times greater in 2007 than in 2000. Nearly all the European nations, including those with the lowest numbers of Internet users, had mobile phone diffusion rates above the United States' 80 percent, although the only one to exceed the 26 percent rate of U.S. users

Source: Human Development Report 2007–2008. New York: United Nations Human Development Programme, 2008. Available at http://hdrstats.undp.org/indicators/124.html (accessed February 22, 2009).

In 2005, 15 of the 20 countries with the highest number of Internet users in 2005 were in Europe.

of Internet-enabled mobile phones was the United Kingdom, with 29 percent.

Mobile phone usage in eastern and southern Europe does lag several years behind Western Europe, but the former are also abandoning or bypassing landline phones at an even faster rate than the rest of the world. As in the United States, the most intensive mobile phone users in Europe are adolescents. Most of the time, they are communicating with friends near and far by text messaging, not via voice.

Satellite television (though not satellite radio) is more dominant and diverse in Europe than in the United States. Immigrants, migrant workers, and refugees make greater use of satellite TV than other Europeans, because they can use it to pull in stations in their own language. There are more than 30 stations in Arabic and almost as many in Russian, Polish, and Serbian languages that can be seen and heard in homes as far away as Ireland and Sweden. Members of these diasporas—who have fled to Western Europe from wars, ethnic persecution, and unemployment—also make relatively heavy use of the Internet. They use e-mail, instant messaging and Voice-over Internet Protocol (VoIP) services such as Skype to communicate frequently and comparatively freely with their homelands and, increasingly, with other members of their expatriate communities. In this way, the Internet can be a comfort, but some nationalists complain that it slows their assimilation. A few Western European countries have proposed laws limiting the reception of foreign language satellite channels, but none has tried to regulate Internet usage other than to pass copyright safeguards, child pornography bans, and antiterrorism measures.

In Eastern Europe, new media technologies that have arisen since the fall of the Soviet Union have allowed citizens from those countries to communicate frequently with family and friends after emigrating in search of work or education, according to Laura Lengel, a Fulbright Scholar and communications professor at Richmond American International University in London. New media also enabled citizens to issue global calls for help and to report firsthand on conditions during the war in Yugoslavia and the refugee crisis in Kosovo.

The Balkans conflict of the 1990s became the first "Internet War." When Serbians burned the Kosovo Information Center, Albanians set up a website to distribute the same material. And when authorities closed the B92 independent radio station in Belgrade, the broadcasters successfully moved their audio to the web, adding text and video to it. The Internet became a battle front as Serbs attacked NATO's computer systems and the alliance counterattacked by spreading pro-West propaganda on their websites, said Alfred Hermida, a BBC News Online editor in London.

The Internet has also spawned more alternative and independent media in Europe. Among them

are the Arabic Internet Media Network (www.amin.org), which claims to be an uncensored professional journalism site in English and Arabic; the Arab Press Freedom Watch (www.apfwatch.org/en), which works from Europe to struggle for press rights in Arab countries; the website of Palestinian Scientists and Technologists Abroad, www.palesta.gov.ps; a worldwide workers' advocate, labourstart.org; and an alternative media clearinghouse, indymedia.org.

Another new medium promoted as an information boon for Europe is digital television. Finland led the way, starting to digitally transmit its programming as early as 2001. Much of Western Europe has been years ahead of the United States on digital television, using it not only to multiply the number of channels offered but also to increase interactivity with home audiences. Digital set-top boxes and remote controls have allowed Europeans to respond to multiple-choice survey questions on TV, although the largest use of this technology has been for audience members to vote for favorites on reality TV shows. Approaching real-time feedback, they can then see the tabulated results within minutes, rather than the next day or later, as on U.S. "idol" shows where the audience votes via mobile phones. Moreover, digital television has put increased pressure on public broadcasting staffs, who now must fill more programming needs without getting any more funding from their government.

Having additional channels also opens time for more TV programming and movies from the United States. In 2001, an average of 57 percent of the TV programming in Europe came from the United States, while 26.5 percent was from within the country's own borders and the remainder was from elsewhere in Europe (more recent data are not available because there no longer are regulations that require such monitoring). Adding in cinema, Europe's audio-visual trade deficit with North America was $8.2 billion in 2000, up 14 percent from the year before. And by 2000, North American entertainment media generated more revenue overseas than domestically.

Another major use of digital media in Europe is in theme parks and museums. Interactive science and cultural museums have opened in Paris and—thanks to more than £500 million of new funding from the U.K. national lottery—in London, Edinburgh, Newcastle, and Bristol. The interactive digital exhibits have transformed museums, one curator said, from a model characterized by "Learn! You must!" to one of "Discover! You may!"

On a more commercial level, Denmark-based LEGO now has theme parks with elaborate digital displays and computerization in London, Germany, and Denmark, in addition to the United States. Outside of Paris there is Euro Disney; indeed, U.S.-based Disney is far and away the leading provider of children's programming in Europe. In Denmark on Friday nights, for example, nine out of ten Danish children watching TV are viewing "Disney Fun" on the public service channel, DR1.

Overall, Europe can be seen as a bellwether for digital media. As the continent struggles to pull together, create jobs, and capitalize on its increased diversity, digital media have both helped and hindered the process. Digital media have increased consumption and salved some of the loneliness of scattered peoples. The ultimate challenge, however, will be for Europe's digital media to increase capital and community in tandem.

Digital Photography

Digital photography has changed the way photojournalists and newspapers cover the news. In the twenty-first century, digital cameras are the dominant means of generating images in the production of printed news content. The introduction of digital cameras, computers, image editing software and even photo-taking telephones in the news-gathering process has affected visual reportage appreciably. In photojournalism, the digital camera's capacity for reviewing, editing, deleting, and transmitting images on-the-scene changes the landscape of photographic routines guiding visual practice.

Since the 1980s, digital technologies have intensified and altered photography in several ways. The modern digital camera has been shown to increase photographic productivity, encourage experimentation and creativity, and redefine the boundaries of autonomy in the relationship between subject and photographer. Digital single-lens reflex cameras and digital camera phones have greatly improved the flexibility of both professional and amateur photography. Digital photography differs from conventional film photography in that light is converted into electrical charges, which are recorded onto an image sensor.

Development

During the 1980s, electronic imaging (the conversion from analog to digital processing of information) shifted dramatically for many news operations prior to the full-scale adoption of digital cameras in photojournalism. Electronic imaging pulled photojournalists out of darkrooms and placed them in front of computer terminals. One driving force was the Associated Press's (AP) high-speed digital photo transmission and receiver system, which replaced older analog facsimile-style processes in many newsrooms. According to AP senior photo editor Brian Horton, "In 1988, a revolutionary device called an AP Leafax transmitter allowed a photographer to scan his processed film, instead of making a print. The photographer then could send that image to an attached receiver or transmit it over a conventional telephone line" (2000, 203). Furthermore, research by John Russial and Wayne Wanta (1998) showed that "electronic picture desks were used throughout the 1980s by the wire services, but they did not become common in daily newspapers until 1990." The AP Leaf Picture system, with a constant stream of electronic imagery uploaded to thousands of newspapers worldwide, nudged the news business generally and photojournalism more specifically further into the digital age. In 1981, AP introduced its mini-electronic darkroom, capable of converting photos into 2.5 million bytes of information. With an investment of more than $500,000 in developing the new technology, AP promoted its mini-electronic darkroom as a way of providing editors with an "extra deadline service" to meet "special problems" and "provide more color." A few years later, electronic picture desks were promoted along with color film scanner and image processors.

Development of the digital camera can be traced to the development of video tape recording in the late 1950s, a process later expanded for use in space exploration and government surveillance systems. Beginning in the 1960s with advances in computer technology, the U.S. space program began enhancing images transmitted back to earth from unmanned probes.

During the 1970s, Kodak, Canon, and RCA investigated the possibility of converting light into digital images. Using innovations in television photography, still photographers started experimenting with the use of video and electronic imagery in photojournalism. In 1979, *National Geographic* photographer Emory Kristof was the first to use an electronic camera while photographing life at the bottom of the ocean in a miniature submarine. Kristof worked closely with television engineers at RCA to develop what is considered the first use of a charge coupled device (CCD) in photojournalism.

In 1981, Sony heralded its Mavica nonfilm electronic device as the "camera of tomorrow." Photojournalists were skeptical. Writing in *News Photographer* in 1982, Ed Breen contended, "When the electronic camera, and all that goes with it, is finally in our hands—and it will be—it will not be because we have sought it out, but because we are no longer left with a choice." By 1984, photojournalists were already experimenting and using cellular telephones to send images from remote locations through drum transmitters, a device that

scans a continuous tone image, such as a photograph, and converts the linear pattern in order to form an electrical signal.

In the news business, many saw the digitalization of images produced with film cameras as a way to reduce the expense of film development as well as to increase efficiency by eliminating time spent making prints in a darkroom. As Russial and Wanta put it, "Wire services and newspapers experimented with digital cameras in the late 1980s and early 1990s, but cost and quality considerations largely restricted their use to coverage of high-profile news events, such as a presidential inauguration, a Super Bowl, or an Olympics" (1998, 594).

By 1986 Kodak scientists released the first megapixel sensor and later developed a system for recording images on a compact disc. A pixel, short for *picture element,* is made up of bits of information on a grid. A bit refers to the smallest unit of computer memory. The number of bits making up a pixel determines how many colors or tones can be shown in an image. A megapixel represents not only the number of pixels in an image, but also the number of photoreceptors on a digital camera's image sensor. In this case, a three-megapixel camera would have 3,145,728 photoreceptor cells displayed on the image sensor.

One year later, a video still camera, the Canon RC-701, was used for the first time by newspapers covering the Pan-American games. The camera was capable of recording 50 color images, which could be transmitted over a regular telephone line in between 90 seconds and three minutes. Photojournalists were also required to learn new computer skills in digital imaging to keep pace with changes in newsgathering and dissemination. Photographers gradually embraced the computer as an essential part of the image-making process, just as they had learned to accept making prints from film a century earlier.

Throughout the 1980s and into the 1990s, the AP was actively engaged in the development, promotion and sale of digital technologies in news operations across the country. However, with the introduction of cheaper laptop computing options and advanced image software products, such centralized systems have since become obsolete. By 1996, more than 85 percent of newspapers reported that computer skills were either very or somewhat important in the hiring of entry-level journalists. The speed with which photographers have adopted to the digital cameras has been much faster than adapting to 35mm film cameras. More than two decades of transition time allowed photographers to become accustomed to the smaller 35mm camera and format size. With digital, the transition has taken less than a decade and has required acquiring new skills not only with the camera but also in production methods.

Modern professional digital cameras cost between $1,000 and $5,000 and are considered technically far superior to previous models just five years ago. For example, Kodak's latest models offer the highest resolution on a 35mm format at nearly 14 megapixels with an image resolution in the 4,536 x 3,024 pixel range. Nikon and Canon have also released improved devices in recent years. These cameras are especially suited for photojournalism with faster shutter response times and longer battery life, and are capable of making 40 continuous JPEG full-resolution images at a speed of eight frames per second. Previously with film cameras, photographers were limited to the number of exposures in a film cassette.

Conclusion

Driven by a relentless push toward faster, cheaper and greater quantities of information, digital photography is on the leading edge of a wide array of new digital information technologies. Digital cameras enable photographers to review, edit, delete and transmit images immediately after capture. The level of immediacy in digital photography means that photographers do not have to wait for their results to be processed, edited and printed, as previously experienced with film.

Digital cameras, laptop computers, and cellular telephones offer more flexibility for photographers working in the field. "Without a doubt, several aspects of the practice of news photography are changing" (Fahmy and Smith 2003). With digital technology it is no longer necessary to wait to see results after image capture. The photographic routine is situated within cultural practices that symbolically reorganize sensory experience.

With digital photography, the immediacy of reviewing images may save the photographer the embarrassment of returning to reshoot an event if

a mistake is made or may allow him or her more time on assignment since he or she does not have to rush back to process and scan the images as they had with film. In addition, monitoring images after capture may further enhance the accuracy of information or captioning. The digital camera suggests the transference of information technology from an era of a singular source such as a film negative into an age of high-speed infinite facsimile. The seamless and malleable nature of digital information presents great opportunities as well as challenges for photographers today.

Digital Sound

The ability to record sound is a necessity for journalists in the modern converged media environment. Digital sound technology is a convenient way for reporters to collect and edit audio clips from important speeches, conduct interviews with newsmakers, gather natural sounds to provide an aural context for news events, and produce news packages, newscasts, and public affairs programs. Lightweight digital recording devices are easily transportable, have removable memory cards for storage, and provide excellent sound quality.

The term "digital sound" is used to summarize digital audio techniques for capturing, manipulating, storing, and distributing sound. "Sound" is a disturbance of molecules in a compliant medium (such as air) caused by acoustical vibrations made by something moving in an environment (such as human vocal cords or the strings on a piano) and the reception of those vibrations. Sound may be described in terms of the physical properties of a pressure wave: frequency (pitch), amplitude (loudness), and velocity (speed). Thus, "sound" is by definition "analog," both at its point of origination and point of reception. "Audio" is what happens in between origination and reception and refers to both analog and digital processes for converting acoustical energy to a corresponding energy form (analog) or a representational numeric form (digital). The word "digital" refers to a binary numerical encoding process used to represent sound vibrations.

Origins

An analog system uses a continuous signal or pattern that is analogous to the original waveform of a sound. Early analog devices that contributed to the development of recording include: Thomas Edison's phonograph (1878), a hand-cranked and spring-driven machine that converted sound vibrations into indentations in the groove of a tinfoil cylinder; Emile Berliner's flat disc spiral groove gramophone (1888); Lee de Forest's Phonofilm (1919), a sound-on-film technique that produced a photographic representation of sound; magnetic wire and iron oxide–coated tape processes that were developed in the early 1900s; and microphone, amplifier, and loudspeaker technologies associated with the telephone and radio. These and other analogy technologies made it possible to capture, mix, balance, edit, process (alter sonic characteristics), and record stereo or multiple

audio channels, before converting various energy forms back to sound vibrations.

Digital technology converts sound vibrations into discrete numerical values that represent the physical properties of a waveform. The mathematical concept, believed to have originated in the seventeenth century, uses a binary number coding system with two values (0 and 1) to represent numeric values. But the idea to use binary digits (bits) for signal coding was developed much later—in 1929 by Harry Nyquist, a physicist working on telegraph transmission for Bell Telephone Laboratories. He discovered that the sampling rate of a binary system must be at least twice the frequency of the original continuous analog signal. Known as the "Nyquist Theorem," its application to digital audio was made practical after the development of electronic computer technology during and after World War II.

How It Works

Digital audio converts sound to numbers (represented by electronic pulses) for recording, storage, and transmission, and then numbers back to sound for playback. This is accomplished by partitioning the waveform of a sound into discrete units called "samples." Digital audio devices, such as the standard consumer compact disc (CD), sample sound at over 44,000 times a second. The sound pressure energy of each sample, as measured by electrical voltage, is then represented using a binary digit system of zeros and one. This "coding" process is the "digital" part of digital audio. Because each numeric place in a binary digit system can only be expressed as a zero or one, the more places in a string of binary numbers, called a "word," the more accurate the measurement of a sample. For example, a 16-character word (16-bit system) can represent 65,536 different voltage quantities. Generally, the more samples per second and the more numeric values available to represent the voltage of each sample, the better the sound quality. During playback, the number representing the voltage of each sample is used to recreate the original waveform of a sound. The end result is a discrete stepped representation of a continuous waveform. The resulting sound, which may be played back through ordinary headphones or loudspeakers, is not the original sound, but a facsimile that resembles the original sound, to the extent that a digital system is capable of recreating the analog waveform structure.

Digital storage may be magnetic, optical, or solid state. Building on established techniques of analog tape recording, magnetic tape also has been used for linear digital recording, storing, and distributing. Both open-reel and cassette digital audiotape recorders (R-DAT) were popular in the early stages of digital technology, but these have been replaced by fixed, removable, and optical disc systems. Fixed and removable magnetic hard-disk records were still used as convenient random access devices for recording and storing digital files. Optical media use a laser to "burn" and "read" pits and flat (land) areas on a heat- or photo-sensitive layer of a reflective surface. A change in the reflected value of the laser striking a pit or land is interpreted as a zero or one, creating a string of digital numbers to represent individual samples. Various DVD (Digital Versatile [Video] Disc) formats have increased the storage capability of optical media.

Solid-state media, such as computers, digital audio recorders, MP3 players, iPods, and some cellular telephones use internal or removable memory or "flash" cards. These devices, which have a variety of sampling, bit depth, and memory capabilities, can store vast amounts of digital audio information. Digital audio formats may store and send information in unaltered sequential or raw formats. However, to save space, mathematical compression schemes called algorithms have been devised to reduce file size and the amount of space required for storage and data transmission. Digital compression is achieved by reducing the amount of redundant and unimportant information. Compression file formats exist for optical media and for streaming audio.

Digital Sound and the News Media

The development of digital sound technology for news is closely associated with applications. By the mid-1970s, digital recording machines appeared in music recording studios for mastering albums. Radio newsrooms soon followed the music industry with a number of digital audio devices, including stationary and rotary magnetic-head digital audio recorders. These reel-to-reel format machines were practical for recording long-form in-studio and remote programs. During

the 1980s, digital tape cartridge ("cart") machines, which worked very much like analog tape cart machines, were used to record and playback actualities (sound bites) during newscasts; and Digital Audio Tape (DAT), a linear cassette tape format, became the technology of choice for radio journalists for a brief period in the late 1980s. By the early 1990s, the professional MiniDisc (which combined magnetic and optical recording technologies), a shirt-pocket size portable device with random access and track mark capabilities, was readily adopted by broadcast journalists for recording speeches and interviews; and recordable and rewritable compact discs and hard-disk and solid-state recording devices were found to be useful by journalists for accessing multiple sources and organizing and manipulating audio elements. Proprietary digital audio systems called "workstations" made it possible for one device to perform all recording, editing, and processing functions of a fully equipped studio. Also, dedicated audio software programs, not tied to specific hardware systems, and accompanied by human interface devices, made computer-based digital audio convenient and affordable.

Distribution of Digital Sound

Digital audio may be transmitted and received in real-time online through a process called "streaming," an uninterrupted continuous digital signal made possible by front loading or "buffering" to compensate for variations in the rate of data transmission. "webcasting," a word used to describe Internet Radio, is the ability to stream audio over the web. Although Internet radio stations were streaming their signals by the mid-1990s, the Voice of America is believed to be the first, in 1994, to provide continuous news programming throughout the 24-hour news cycle. Audio files also may be downloaded to computers and other devices using "nonstreaming "digital formats. "Podcasting," a term that combines the words "pod," from the iPod personal media device, and "casting," as in broadcasting, is a popular online distribution application of this technology.

Digital audio can be distributed via satellite or over-the-air as a companion to existing analog radio broadcast signals. These digital systems not only offer better audio quality compared to analog transmissions, but they also make it possible to send multiple channels of programming, called "multicasting." The subscription satellite radio services, Sirius and XM Satellite Radio, beam digital audio directly to automobiles, portable and home receivers, and computers. "HD Radio" (high-definition radio), a system developed by the iBiquity Digital company, provides CD quality digital audio to listeners over existing AM and FM radio frequencies. Reception of this digital radio service, which does not interfere with existing analog signals, requires an HD receiver.

By the beginning of the twenty-first century, new digital audio delivery systems, such as podcasts, Internet radio, HD Radio, and satellite radio, competed with one another and traditional AM/FM sources in providing news. Although early studies do not indicate widespread use of new digital audio sources for news, that pattern is expected to change as on-demand and on-the-go listening habits change with shifting demographics and as digital devices become more affordable.

Digital Television

Digital television (DTV) enables television to offer consumers better picture and sound quality, expanded programming choices (such as multiple

channels of programs at a time), and enhanced closed captioning and interactive video options. By the early 2000s, digital television was having a growing impact on traditional television journalism by expanding the types of programming through multiplexing, changing how journalists appear on camera by modifying makeup techniques and improving news sets to hide imperfections, and modifying traditional camera angles and lighting techniques to hide flaws due to digital clarity.

In use since 1941, analog television displayed a picture with a 4:3 aspect ratio while digital television uses a 16:9 aspect ratio. The latter is similar to widescreen theatrical films and allows consumers to play DVD movies in their original widescreen formats without the letterbox, or black bars, at the top and bottom of the screen. Digital television also utilizes Dolby Digital sound which provides consumers with CD-quality audio.

Improved systems of television were discussed by the Department of Defense in the 1970s as a means of improving the visual resolution of military equipment. In the 1980s, some viewed digital television as a means to regain American consumer electronics market dominance. The first digital systems were modeled on computers in 1990, and in field testing by 1993. The Telecommunications Act of 1996 required the adoption of digital television technology by broadcasters working with the Federal Communications Commission (FCC).

The original date established by the FCC for television stations to broadcast only with digital signals was in May 2002, but due to many technical problems, few digital receivers in consumer hands, and complaints from broadcasters the date was pushed back. The Deficit Reduction Act of 2005 set February 17, 2009, as the date analog television signals would end; this date was later pushed back to June 12 of the same year out of concern that too many people were still not ready for the transition. Broadcasters and the government picked up their promotional efforts over the four months, and most viewers made it through the transition fine. As of that date, consumers required either a digital television receiver, digital cable or satellite service, or a digital-to-analog converter box to receive digital television signals. Television set manufacturers stopped making analog sets two years earlier.

U.S. government television transition policy focused on the millions of television homes using off-air television reception, or those not served by cable or satellite carriers. Converter boxes were made available to consumers to convert digital signals for compatibility with analog television sets. The National Telecommunications and Information Administration (NTIA) offered coupons to help offset the costs of purchasing converter boxes. The transition to digital television has been costly for stations, with some spending nearly 60 percent of their annual budgets on digital equipment. WRAL-TV, in Raleigh–Durham, North Carolina, was the first station to obtain an FCC license for digital operation and became the first to digitally broadcast from both the studio and in the field. The cost for a new television news set, a digital transmitter, and other required equipment totaled more than $10 million.

The digital television 16:9 aspect ratio is requiring more use of wide-angle camera shots. Stations are redesigning news sets (at an average cost of $200,000) to make them more conducive to the wide-screen format. Some stations have spent three times as much. Even news helicopters need digital cameras.

Just as the Internet allows consumers to access news immediately, so does digital technology have the same potential for television viewers. As consumers also time-shift their viewing and listening, digital television will add flexibility through multiplexing. As Neil Hickey points out in his 2004 article "The Digital Newsroom: Ready or Not," this is already changing the nature of television journalism, allowing "A CNN-style, twenty-four-hour channel for local news; a C-SPAN-style channel for coverage of the city council, the state legislature, and important committee hearings; all-day weather updates; stationary traffic cameras at major roadways; local news/talk and call-in programs; coverage of high school and college sports; debates by candidates for local and regional offices; [and] live coverage of court trials," as well as local school and business news and classified advertising.

The shift to digital television has hastened media convergence in newsrooms. The digital format allows for video and data to be easily transferred to the Internet and existing station websites. Hence, reporters of the twenty-first century are expected to be able to produce news stories for television, newspapers, and online. The Tampa News Center serves as one useful model for how

digital technology allows for platform crossover. At the Tampa News Center, reporters for WFLA television station share news stories with the *Tampa Tribune* and vice versa. Additionally, the online news portal TBO.com provides both print and video reports. All three news entities are headquartered in the same building. This sharing of news across platforms has the potential to improve both the quality and quantity of news stories.

Digital television has also enabled camcorder manufacturers to develop lightweight and user-friendly cameras. Despite being small, these digital cameras provide high-quality images, allowing a new type of journalist to emerge. Independent video journalists, using digital technology, now offer television (and newspaper) newsrooms an inexpensive way to cover news from around the world. Digital television technology enables journalists to shoot the video of a news event and then use nonlinear video editing software (such as Final Cut Pro) to edit together a complete news story that can then be sent via the Internet or satellite to newsrooms around the world. The digitally produced news story can be used by television, newspaper, and web-based newsrooms. To be fully effective, this requires journalists to modify both their storytelling techniques and editing principles to make them adaptable to the wider screens, clearer pictures, improved sound, and ease of transferability from one medium to another.

Digital television, through multiplexing, allows for television broadcasters to transmit upward of six channels. Analog television permitted only one signal per station, but digital compression techniques allow the transmission of several signals at once with different programming. This means that consumers have the ability to receive exponential sources of news when combined with the proliferation of new digital television channels and the continued growth of news on the Internet. Multiplexing has allowed television stations to offer more news coverage of local interest. In 2003, WRAL-TV in Raleigh, North Carolina, for example, offered live, continuous coverage of a local murder trial on one of its new digital channels. The same year, KFSN-TV in Fresno, California, offered live, continuous coverage and real-time results of the California governor's recall election. By using the additional channels offered through digital multiplexing, neither station had to preempt network programming. One result in the near term may be an increased emphasis on local news content.

A 2006 study by the Radio-Television News Directors Foundation (RTNDF) on the future of news indicated that more than 40 percent of the public preferred to assemble their own news based upon their individual interests. Digital television, through its ability to offer multiple channels simultaneously, will better address the consumer news interests. The study indicated consumers wanted to see not only *more* news, but also *better* or higher-quality news. Digital television permits journalists to offer both. As of 2006, with many of the nation's television stations already transitioned to digital signals, news directors who participated in the RTNDF study indicated they had improved and expanded their news content. The 2006 study indicated that consumers noticed the content changes in news.

Thanks to digital television's clarity, the way television talent is prepared to appear in front of the camera has changed. To hide skin blemishes, make-up artists now apply makeup foundation with airbrushes instead of with sponges or fingertips as has been done in the past. The clarity of digital television can even reveal if talent has had botox injections or plastic surgery. Makeup experts suggest, however, that extreme close-ups may end once digital television is in full use. Traditional lighting techniques are also modified to hide imperfections of television talent or sets. The traditional practice of having news anchors sit behind a news desk throughout an entire newscast is also rapidly changing. The improved news sets encourage anchors to stand and deliver the news and allow for movement and flexibility. An emphasis on digital graphics, virtual technology, and attractive furniture are all incorporated into the digital television news set design.

Accordingly, journalists and media managers must adhere to even higher standards of ethics as to not lower journalistic standards while attempting to produce enough programming to fill the new television channels created by digital television. Journalists need to continue serving as responsible gatekeepers and agenda setters for the general public. Above all, journalists must continue to maintain the role of accurate storytelling while at the same time utilizing new digital technology to its ultimate abilities.

Discussion Boards

Discussion boards, also known as electronic bulletin boards or message boards, are used to host Internet forums in which participants with shared interests exchange messages on a wide range of topics—from politics, the environment, education, and religion, to sports, fashion, video gaming, and parenting.

An ideal format for fostering virtual communities over the Internet, discussion boards have been extensively used in the movement toward enhancing a deliberative democracy—by providing the means for facilitating the exchange of online messages with users sharing experiences and ideas. They have also been used to increase the economic value of an organization's online presence by generating traffic and providing a source of entertainment. The democratic and economic potential of these Internet forums attracted news organizations which were early adopters of the technology.

Origins

A precursor to Internet-based discussion boards was the dial-up Bulletin Board System, or BBS, which is a computer system with software that allows its operator to download and archive data files and software programs. The first BBS was the Computerized Bulletin Board System in Chicago, created by Ward Christensen and Randy Suess; it launched on February 16, 1978. It was not long before other BBSs were appearing across the country.

Users could connect via a modem and phone line to the system to access the archive and exchange electronic messages with other users. BBSs grew in popularity, reaching their peak in the mid-1990s with over 60,000 in the United States alone. BBSs were seen as an ideal environment for online socializing and virtual-community building—from international social movements, such as PeaceNet and its work on international relations and human rights, to individuals communicating about health and parenting issues.

With the explosion of the World Wide Web in the mid-1990s, bulletin boards shifted to web-based applications to connect users and facilitate the exchange of messages. However, where there is limited access to the Internet, primarily outside the United States, dial-up BBSs continue to provide a venue for exchanging messages.

A notable example of an early BBS, the Whole Earth 'Lectronic Link (WELL) began in 1985 as one of the first virtual communities; in the early twenty-first century, it remains a major influence in the online world, and it continues to enjoy a reputation as a members-only gathering place for intelligent conversation. While the WELL was one of the original dial-up BBSs, it became an early web-based community when the Internet opened to commercial business in the early 1990s. The WELL, now owned by Salon Media Group, has a rich history as a meeting place for Grateful Dead fans and as the birthplace of craigslist. The community also quickly caught the attention of journalists, who became some of its early members, bringing media attention to the deliberative potential of virtual communities.

During the late 1980s and early 1990s, journalists began to adopt electronic discussion boards as one early stage of online journalism. *The Albuquerque Tribune*'s electronic newspaper, the Electronic Trib, *The Charlotte Observer*'s online site, the Observer, and *The Spokesman-Review*'s site, Minerva, are early examples of the use of discussion boards in journalism. Engaging citizens by fostering deliberation and community building was seen to fit nicely with journalism's mission and role in a democracy. By 1994, nearly 20 newspapers provided online services worldwide, with the majority using discussion boards.

Functions

However, the Internet and these new virtual formats have presented a major challenge to the traditional model of disseminating news. Prior to the Internet, journalism was based on a one-way communication model, with information flowing from the news organization to a wide and largely passive audience. The power to decide what is news was in the hands of news professionals.

Along with rapid innovation of web-based technologies came the means by which users can interact with a news organization and each other about shared interests. As a fundamental feature of online news, interactivity means that users are able to more actively participate in the production of news. Ordinary citizens now have the opportunity to participate in a number of communication activities, ranging from simply engaging in discussions with others around shared interests to actively deliberating solutions to common problems.

This multidirectional, interactive model of journalism, however, has been seen by some journalists as a threat to their professional domain. With online users more actively engaged in the news production process, often acting as sources of news, journalists have been grappling with ways to embrace this interactive format with its new definitions and practices of what "news" is. Journalists are moving beyond conventional news norms and routines—shifting from a reliance on elite and expert sources to include citizens as sources.

As an Internet forum for hosting online discussions and posting information, discussion boards are part of a larger category of online types of user-generated content (USG). It is, thus, important to understand the specific structure and functions of discussion boards that set them apart from other modes of Internet-based communication (e-mail lists, Usenet, newsgroups, Internet relay chat) and types of user-generated content (blogs, wikis, social networking sites), where ordinary citizens are given the means to publish content for public consumption.

To begin, e-mail lists represent a specialized mailing list organized around specific topics, with new messages posted to the list by members and transmitted to all subscribers via e-mail accounts. They can either be edited or not by a moderator. Discussion boards, on the other hand, are created

by organizations to host ongoing discussions on a range of topics of interest to registered users of their online sites. Unlike e-mail lists, discussion boards require users to actively seek out the host site to join the discussions. However, discussion board moderators have the option of using e-mail to invite users to visit the site by notifying them of new posts or encouraging them to post a topic of their own.

While similar in function to newsgroups, in which users post messages on a wide range of topics, discussion boards use different technology. Usenet newsgroups are hosted by a network of servers to store and forward messages; they require a special software program on a user's computer, called a newsreader, to participate in discussion. Discussion boards, on the other hand, require only a web browser for participation. (The distinction between discussion boards and Usenet newsgroups, however, has diminished since Google's 2001 acquisition of Deja News Research Service, a Usenet message archive. With its web interface, Google Groups service offers users the ability to access, post, and search the archive without a newsreader.)

The speed of communication provides another important distinction between various types of virtual communication strategies. Internet relay chat (IRC), in which messages are exchanged in real time, are a type of synchronous communication that occurs at a speed fast enough to simulate a face-to-face conversation. Discussion boards, on the other hand, provide the means for asynchronous communication, in which messages can be posted and retrieved at different times.

With asynchronous communication comes the need to organize messages and ease the process of following online discussions. Software applications help users read online discussions by applying specific organizing strategies. One method is to display messages in a flat, linear fashion organized by date and time in chronological order. Another method is to group messages hierarchically by topic in a threaded discussion, or "threads." Threads are effective because they help users grasp the structure of a particular discussion, especially a long and complex one, and identify participants to whom they want to respond.

Membership in Internet forums can range from anonymity to full disclosure of identity through a registration process. Forum moderators, usually either the webmaster or a select group of users, perform as gatekeepers by eliminating content considered illegal, abusive, disrespectful, insulting, foul language, obscene, or completely irrelevant to the discussion topic. While rules may vary between sites, moderators assure that users follow the forum's rules of etiquette, or netiquette.

As news organizations began to adopt discussion boards in their early years of developing an online presence, this practice was met with some resistance in newsrooms, as journalists saw the increase in user interactivity as a threat to their profession. There has been a healthy debate about the direction of the profession in journalism circles, with practitioners and academics s searching out the most effective and economically feasible ways to navigate this new media environment. In some circles, journalists are seen as ideal leaders of virtual communities, guiding citizens in their reflections and discussions on common problems of public life.

During the 1990s, news organizations practicing what became known as public or civic journalism, a reform movement to improve news practices and democratic potential, were early adopters of discussion boards. Newspapers, with circulation increasingly in decline, saw their online sites and use of Internet forums as a way to attract and engage news consumers and maintain economic viability.

As this new media environment continues to push journalism beyond its traditional practice of one-way communication to embrace a more conversational model of news, the nature of what is considered news continues to change. For example, with the emergence of user-generated content, citizens can contribute content for publication on the web. In 2004, OhmyNews International (OMNI), the English-language site of the South Korean online newspaper OhmyNews, began publishing news stories from citizen reporters around the world. With an extensive editing process and a strict code of ethics, the OMNI model approaches citizen journalism with the assumption that all citizens are potential reporters. What began as the practice of public journalism, originally conceived as a means to facilitate public discourse, has developed into citizen journalism, where former audiences play an active role in collecting, reporting, and disseminating information.

While not as prevalent in journalism as they once were, electronic discussion boards continue as a presence, especially in community-level news. For example, Outside.In, an online aggregator of neighborhood discussion boards, tracks news, opinion, and conversations in nearly 12,000 local communities across the United States. Launched in 2006 with a mission to build a virtual place where local residents become the experts on community life, the site invites and hosts citizen-generated stories about local happenings, from information on favorite restaurants and bars to more serious local news. Also, *The Washington Post*'s critically acclaimed online site, through its LiveOnline feature, serves as an example of how mainstream news media continue to take advantage of discussion boards to give readers a chance to communicate with writers, editors, and subjects of stories.

As an early software system that paved the way for the shift from a traditional one-way model of journalism to the current interactive model, discussion boards continue to provide a vital means for citizens to exchange ideas, engage in conversation, build community, and participate in the production of news.

DISTRIBUTION

Newspaper distribution evolved with urban growth and improving modes of transportation. *Acta Diurna,* the reports of the Roman Senate, were proclaimed in the Forum and delivered by courier to the homes of senators, then by horse and ship to officials throughout the empire. During Venice's war against Dalmatian pirates, scribes in the Kingdom of St. Mark (Venice) wrote news accounts that were posted on walls and sold in piazzas; a few individual copies were sold for a *gazetta,* the smallest coin.

Development

Johannes Gutenburg's printing press of the 1450s increased the number of copies produced in a day, allowing and encouraging wider distribution at lower cost. In 1611 Nathaniel Butter hired buxom "Mercurie women" to attract buyers for his paper on street corners. Street kiosks, booksellers, and postal systems became common methods. Ships brought European newspapers to American colonies and carried colonial newspapers back to Europe.

Benjamin Franklin, who began as a printer's devil and newspaper carrier for his brother's *New England Courant,* became a newspaper publisher and postmaster for the colonies. His reforms of the Royal Post improved newspaper distribution by cutting delivery times in half and by allowing newspapers to move between post offices at no charge. President George Washington authorized construction of all-weather "Great Post Roads" from Maine to Georgia and New York to Kentucky to unite the country by assuring speedy delivery of mail and newspapers. Newspaper subscribers reluctant to pay forced publishers to beg postal carriers to collect the fees. As the first U.S. postmaster,

Franklin added another reform: postal carriers paid publishers in advance for every subscription, and then had to collect from subscribers.

In 1833 Benjamin Day introduced the most significant changes in American newspaper distribution with his daily New York *Sun,* the first "penny paper." Day copied a London distribution method suited to a working class readership. Newsboys bought the *Sun* at wholesale rates (66 cents for 100 papers) and sold the papers for one penny. Enterprising newsboys sold the *Sun* on street corners and built routes of subscribers. By letting newsboys profit from distribution, Day enabled them to earn more than adult laborers.

Day's model (made possible because advertisers paid 80 percent of his production cost) spawned dozens of imitators. Philadelphia merchants insisted on knowing the names of a newspaper's subscribers before buying advertising space, so Philadelphia publishers required carriers to provide a current subscriber list. Adults, drawn by the potential profits to be made, began selling papers. Some became brokers, buying papers from every publisher and reselling them to newsboys and retailers. By 1850 such brokers controlled newspaper distribution in every major city, even negotiating wholesale rates with publishers and setting profit margins for carriers and retailers.

By the 1840s, railroads moved newspapers for both publishers and brokers, and newsboys began selling papers on commuter trains. As railroads pushed west, Horace Greeley introduced a *Weekly Tribune* distributed through the Midwest to the Rocky Mountains. A. S. Tuttle, the largest New York broker, had his own railroad cars to serve dealers. His company grew into American News Company which owned or controlled over 20,000 newspaper distribution agencies across the United States. Publisher James G. Bennett challenged the brokers' control by hiring his own distribution force and cutting the paper's price in half, but failed to break their dominance. Brokers controlled

distribution until 1922, when the U.S. Supreme Court ruled that they illegally constrained trade. Major newspapers regained control over their distribution and contracted with local brokers for distribution in other towns.

Newsboys, Social Changes, and Distribution Wars

After the Civil War, rapid growth of cities and the rise of labor unions prompted publishers to create the position of circulation manager. By 1875 the distribution process included newsboys and youth carriers, adult carriers, newsstands, booksellers and other retailers, railroads, and post offices. Distribution issues included understanding postal rates and regulations, setting press schedules to railroad timetables, building subscription drives, and negotiating annually with wholesalers, teamsters and other unions. The International Circulation Managers Association (ICMA), established in 1898, offered training and updates and lobbied Congress for favorable newspaper postal rates and regulations.

Social reformers periodically focused on newsboys in their campaigns against child labor. Newspapers defended their reliance on youth, but also solicited donations of winter clothing for newsboys and hosted summer picnics. Scripps newspapers required youth carriers to maintain passing grades in school and employed tutors. Newspapers pointed out that they taught their "Little Merchants" the fundamentals of business: buy wholesale, sell at retail, and serve customers. State legislatures responded in the early twentieth century by setting a minimum age for youth carriers, typically 10 or 11.

Because weeklies, including religious and non-English-language immigrant newspapers, largely were distributed by mail and retailers, they shared few of the distribution problems of dailies. Publishers of all newspapers considered circulation figures a trade secret until the U.S. Postal Act of 1912 required an annual circulation statement from every publication delivered through the postal system. In 1913 the Audit Bureau of Circulations was formed to provide standardized and audited figures. Even for weeklies, distribution now included careful accounting of each day's net paid circulation by subtracting from total circulation the unsold papers and those sold at less than half price.

By the early twentieth century, circulation competition became a war for survival. Improved printing presses pushed daily capacity beyond 100,000 copies. Advertisers preferred to place ad support with the newspaper with the largest circulation simply because it was more efficient. Subscription campaigns sent youth carriers door-to-door several times each year. New subscribers were offered silverware, china, life insurance, and hundreds of other gifts. To increase circulation, metro newspapers used trucks as well as trains to expand distribution into adjacent counties and states, competing with small daily and weekly newspapers. In Chicago, the circulation war turned violent when circulation managers hired thugs to disrupt their competitors' distribution. Trucks and newspaper bundles were stolen, newsstands set ablaze, dealers beaten up, and at least one youth carrier was shot (1916–20). Chicago American circulation manager Moe Annenberg was said to practice his distribution techniques in the newspaper's basement shooting range.

By 1932, "shopper" newspapers began to threaten dailies with a radically new distribution method. Shoppers were delivered free to every household in a defined geographic area. Advertisers gladly paid the low ad rates in return for 100 percent distribution. Daily publishers petitioned city councils for anti-littering ordinances limiting distribution of newspapers only to people who requested them. The ICMA successfully lobbied Congress for a postal regulation limiting the use of mailboxes to items delivered by postal carriers. As a result, the shoppers quickly disappeared. Many metro dailies opened radio stations in the 1920s to boost sales, but in 1933 the "Press-Radio War" broke out because publishers were upset by declining newspaper advertising. The newspapers quickly ended the confrontation when advertising failed to increase.

Mergers increased as publishers bought struggling competitors, consolidating printing and distribution. To increase profits, newspapers used their carrier force to deliver magazines such as *Saturday Evening Post*. Still, nearly 400 daily newspapers closed during the Great Depression, and another 200 dailies went bankrupt during America's involvement in World War II (1941–45) despite the freeze on circulation imposed by newsprint rationing.

Social changes after World War II brought serious new distribution problems. Foremost was the rapid growth of suburbs coupled with the rise of television. By 1955, television was the dominant entertainment medium, displacing both film and general magazines. Television news, however, grew more slowly. Live coverage of the aftermath of John F. Kennedy's 1963 assassination and funeral made it clear newspapers faced a serious competitor.

Suburbanization, Migration, and the End of the "Little Merchant"

Low mortgage rates for veterans combined with mass construction techniques created vast tracts of suburban homes on formerly rural land. Metro newspapers worked feverishly to build efficient distribution networks to reach and cover the suburbs; local weeklies and small town dailies had thousands of potential new readers to serve. The 1956 Interstate and Defense Highway Act authorized a freeway system that promised speedy distribution to suburbs and outlying towns, as well as among cities. Over the next two decades as they tore up and divided inner cities, freeways encouraged families to move farther from the central city and to commute by auto. Growing traffic congestion steadily diminished the ability of afternoon papers to provide timely distribution. As suburban commuters abandoned mass transit for automobiles, afternoon metro editions slowly faded into oblivion. Living in another county distant from the central city, suburbanites needed only a single daily newspaper to complement television and drive time news. Suburban growth allowed publishers to create newspaper "rings" surrounding big cities in the late 1960s. Distributed exclusively in suburbs through the postal system and retailers, the rings comprised weeklies in previously rural towns and new weeklies where needed. Metro newspapers responded by reworking distribution to insure delivery of new suburban news sections to the appropriate carriers and news dealers.

ICMA's Newspaper In Education program begun in the 1960s by several major dailies, sought to build present and future readership among school children. Teachers were paid to attend a summer training program on newspapers as a classroom supplement. Class sets of newspapers were delivered at wholesale rates, and experienced teachers were hired to teach new participants.

The Wall Street Journal began using space technology in the 1970s to provide timely delivery to its national readership. Page layouts were transmitted by satellite to regional printers who then distributed newspapers. Newly developed offset printing plants saved hundreds of weeklies from bankruptcy in the 1960s by creating jointly owned offset printing plants which could take advantage of cheap in-county postal rates.

A series of problems forced massive distribution changes among metro dailies in the 1970s. The elimination of daily transcontinental train service forced some to abandon distant subscribers. Disaster struck in 1974. Gasoline prices quadrupled almost overnight; shortages were common. The postal system substantially increased its rates. Skyrocketing costs forced newspapers to limit distribution to primary readers and eliminate distant "ego" circulation.

Youth carrier shortages became a crisis in the early 1980s. As family size declined with birth control, legal abortion, and dual income households, many families refused to complicate family life with a daily newspaper route. At first, girl carriers eased the shortage, but many parents refused to let their daughters deliver in predawn hours, particularly after a highly publicized kidnapping in Des Moines, Iowa, in 1980. The shortage of youth also crippled door-to-door sales campaigns because youth doubled as a potent sales force. Telephone sales efforts increased, but they could not match the effectiveness of youth carrier begging subscriptions at the front door. Reluctantly, even small city newspapers converted youth routes to motor routes run by independent contractors or contract delivery agents.

In the late 1970s and early 1980s, factory closings in the industrial Northeast and upper Midwest (the "rust belt") coupled with construction of new factories in the South, created a massive migration of laborers to warm weather states (the "sun belt") where they joined retirees. This aggravated the flight of white subscribers to the suburbs spurred by, urban race riots (1965–69). Inner cities became concentrations of poor and unskilled laborers living around abandoned factories and railroad yards—-and rarely reading newspapers.

Rust belt metro newspapers restructured delivery routes for their declining number of inner-city subscribers while simultaneously trying to follow their subscribers to the suburbs. Rising inner-city crime rates made carrier safety a priority. To prevent robbery, newspapers abandoned carrier collection, requiring prepayment by credit card or check. Steadily, motor routes replaced inner-city youth carriers.

Sun belt newspapers raced to build distribution networks for sprawling tract developments and planned communities of retirees. In Florida, the "Snowbirds," Northerners who moved there for the winter months, required special delivery routes and subscription packages. Dallas, for example, grew into a major financial center with large numbers of business professionals whose work took them out of the city from Monday through Friday. Special weekend home delivery subscriptions became part of the distribution for the *Times* and *Morning News*.

Late-Twentieth-Century Challenges

An array of problems arose from the changing pattern of urban life as gentrification replaced urban blight in the 1980s. High-security apartments, which attracted middle-class tenants, denied carriers access for delivery. Gyms, shopping malls, television, and evening recreation consumed free time formerly given to newspapers. Increasing numbers of single-copy boxes seemed the only reliable solution. Three Sigma, a major research study, found in 1983 that one in three readers had not seen the previous day's newspaper and were not likely to see the next day's. Young single males, the least frequent readers of weekday newspapers, were the most frequent readers of weekend editions. Every daily newspaper sought solutions to these problems.

In the late 1970s afternoon metro newspapers had begun shifting to morning distribution; others began disappearing through bankruptcy or merger. The *Philadelphia Bulletin,* which had pioneered the use of delivery trucks in 1898, found rush-hour traffic made it impossible to guarantee home delivery to suburban subscribers by 6:30 p.m.; it closed in 1982. In the sun belt, afternoon distribution proved futile, because readers preferred outdoor recreation and other activities. Afternoon distribution remained successful only in small cities and towns.

USA Today devised another distribution strategy in the early 1980s: offer bundles to hotels and airlines at a huge discount and flooded cities with single-copy boxes shaped like television sets. Created for business people, travelers, and occasional newspaper readers, it quickly became a staple in retail outlets. The paper promoted its total circulation, rejecting the Audit Bureau of Circulation's formula for paid circulation, a much more conservative figure. Like *The Wall Street Journal, USA Today* relied on a regional distribution system built around printers who received page layouts by satellite.

Shopper newspapers returned in the 1980s with a new distribution strategy. In cities, they gave away copies through single-copy boxes. In rural areas they placed their own delivery boxes next to rural mail boxes for motor route delivery. By guaranteeing 99 percent household penetration, shoppers competed for classified legal advertising and advertising inserts. Courts upheld shoppers' right to compete for legal classifieds because of their extensive distribution. Loss of advertising revenue forced dailies to build competitive distribution routes; many created a weekly edition delivered to nonsubscribers and rural boxes. The shopper model was mirrored in a host of free special interest and neighborhood newspapers delivered to homes, to open racks, and were left by the bundle in lobbies, skywalks, restaurants, and coffee shops. Metro newspapers devised methods for precise delivery of local sections to the neighborhood route level.

Around San Francisco Bay, weeklies and dailies experimented with distribution techniques to attract the affluent readers advertisers sought. In the "den mother" system, women trained and managed youth carriers who were paid to deliver to every home. These mothers trained carriers to put the paper on every porch in a prescribed fashion, spot-checked their performance weekly, and taught carriers how to go door-to-door seeking voluntary payment for the paper. Others saturated defined areas with free newspapers thrown on the driveways. Rows of single-copy boxes and open racks of free papers lined sidewalks in shopping centers, near restaurants, and wherever people congregated. Free copies were pressed into the hands of people attending events or returning to their cars in mall parking lots.

As newspaper readership declined in the late twentieth century, executives turned to marketing experts. Advertisers sophisticated in target marketing demanded specifics about readers and subscribers. Newspapers restructured to combine advertising and circulation in a marketing unit. As a sign of the times, in 1992 ICMA merged with six other trade groups (American Newspaper Publishers Association, Newspaper Advertising Bureau, Association of Classified Advertising Managers, International Newspaper Advertising and Marketing Executives, Newspaper Advertising Co-op Network, and Newspaper Research Council) to create the Newspaper Association of America.

Internet

The first online versions of newspapers in the mid-1990s delivered only headlines and text. Small newspapers began using online sites for advertising and subscriptions, though with minimal news. Metro newspapers, on the other hand, quickly developed a delivery vehicle for news and advertising with a worldwide audience. With advances in software and Internet speed, newspapers transformed one-way distribution to interactivity, soliciting readers' comments, photos, and videos. By 2006, online newspapers offered readers a richer, more comprehensive and up-to-the-minute package of news, features, and ads. Apart from *The Wall Street Journal,* whose readers were willing to buy a subscription for the latest updates on business news, online newspapers generated little or no revenue apart from charges for archived articles. Users balked at paying for access. Distribution revenue, historically important to newspaper profits, may yet become part of online sites. In 2005, advertisers, encouraged by the dramatic annual rise in online users, began to move advertising dollars from print to online. By 2008, shrinking advertising revenue, coupled with declining subscriptions and corporate pressure for profits of 20 percent or more, created an unprecedented cutback in newspaper staffs and distribution, with no expectation of future growth in traditional distribution.

In 2007 a consortium of newspapers partnered with Yahoo to gain access to the software link between search terms and targeted ads. A search produces local ads and headlines with links. Amazon created a portable reading device, Kindle, which uses cell phone technology to download the full edition of each day's major national and international newspapers along with magazine content and digital copies of purchased books. In 2008, a German factory began producing large format plastic video screens designed specifically for newspapers. Thin, flexible, and easy to read, this new technology seems likely to transform newspaper distribution even further from its ink-and-paper tradition.

Low readership among young adults led metro publishers to create special tabloid newspapers delivered free on subways, in open racks, and even home delivered in targeted neighborhoods. Written in the style and language of young adults, papers like the *Chicago Tribune*'s *RedEye* attract an audience reluctant to seek traditional newspapers.

Youth who today look first to the Internet for information seem far less likely than their parents or grandparents to adopt printed newspapers as they marry, buy a home, and raise children. This iPod and iPhone generation will likely find the new electronic page technology quite normal. Newspaper distribution faces additional challenges: newspapers and their distribution are energy and resource intensive; the issue of air pollution surrounds a distribution system built on diesel and gas engines; newsprint, increasingly expensive, is part of the recycling debate; except in smaller towns, youth carriers have faded into history, and increased reliance on telephone sales and heavy subscription discounts have not generated comparable sales success. In short, the newspaper distribution system, dependant as it is upon readership levels and the appeal of a hard-copy newspaper, seems likely to continue its evolution, even radical technological transformation, especially in major metropolitan areas.

Distribution, Online

For centuries, the dominant means of delivering the news was via print newspapers, magazines or newsletters. While radio and then television made serious inroads during the twentieth century, the biggest challenge to the dominance of print came at the turn of the twenty-first century with a widespread move to online distribution.

Origins

Inspired partly by European experiments with delivering textual information via telephone and television, several U.S. media companies flirted with electronic delivery of information in the late 1970s. These videotex and teletext services sent text and low-definition graphics to subscribers' television sets. The systems were costly and slow and found little reception among readers, though the Minitel system in France did see some level of success.

With the introduction of personal computers into the home in the 1980s, commercial dial-up services such as CompuServe, America Online, and Prodigy were developed, and some publishers experimented with delivering news over those services. But those experiments, such as proprietary services undertaken by *USA Today*, *The Washington Post*, and Time Warner, failed to gain much traction in the marketplace. There were a number of obstacles, many of them economic: early PCs cost as much as $3,000 or more, connection fees added up to another $100 or more each month (and long-distance charges, for those who did not have locally available Internet access, could add up to as much as $1 a minute in many cases). Meanwhile, each service offered access to content from only a handful of news outlets.

The World Wide Web

Only in the mid-1990s did electronic news delivery begin to attract serious attention, with the dawn of the World Wide Web and graphical web browsers, such as Mosaic and, later, Netscape Navigator. In contrast with earlier attempts at delivering news electronically, this new forum offered several advantages to the news consumer. Prices for personal computers began falling as they became more of a commodity Internet service providers began offering large blocks of connection time for a flat fee, often as little as $20 a month. In a rush to stake out their territory in the Internet medium, most news outlets offered their content at no charge. And finally, the World Wide Web offered the convenience of access to hundreds of different news sources.

Initially, news offered on most websites was primarily text based. Hypertext Markup Language (HTML), used to construct webpages, has always had the capability of including inline graphics as well as text. But slow (usually telephone-based) connection speeds made web readers reluctant to wait for graphics to load. In addition, many publishers devoted little effort to preparing web content, merely reprinting news stories online in a practice that came to be known derisively as "shovelware."

As HTML specifications evolved and Internet connection speeds increased, publishers began

incorporating more graphics into their Internet news feeds. Some sites also tried offering audio and even video content, but again connection speeds were a limiting factor. By the late 1990s, Real Networks developed a protocol that allowed audio and video content to be "streamed" with the audio or video starting to play almost immediately while the rest of the content was still being sent. While that theoretically provided a solution to waiting for long periods to download an audio or video file, the reality was that still modest connection speeds and Internet congestion meant that content suffered from low-fidelity audio with frequent pauses or jerky low-resolution video not much larger than a postage stamp. Nevertheless, some radio stations began streaming their programming and several television networks began offering limited video content, although it typically was the same as the broadcast content.

From the earliest days of using the web for news delivery, publishers have sought to increase the frequency and duration of time that users spend interacting with their content. That effort was largely driven by publishers' desire to sell more advertising; the more people accessing the content and the longer they used it, the more advertising revenue could be generated. In 1996, the PointCast Network offered the first means of "pushing" content to users' computers. Coming in the form of a screensaver, PointCast sent live news; all users had to do was set up their personal preferences. Despite initial excitement, however, the software was not long-lived, as it could not be effectively delivered over home dial-up connections, and many businesses banned it for using too much Internet bandwidth.

Bandwidth was, in fact, the prime limiting factor that hindered multimedia news delivery for the first several years of the web. While some businesses and educational institutions enjoyed connection speeds of as much as 1.5 Mbps (million bits per second), home connection speeds typically were around only 1 or 2 percent as fast, barely capable of delivering text at a reasonable rate. Even at their peak speeds of 56 Kbps (kilobits per second)—reached around 2,000—accessing anything more than small graphics over dialup connections was still a slow process. Widespread multimedia news delivery really became feasible only with the introduction of broadband technologies, a group that includes DSL (digital subscriber link, with a typical download speed of 768 Kbps), cable (1 to 6 Mbps), and fiber optic delivery (up to 5 Mbps).

Broadband

Yet, broadband service was slow to take off because of its high price and limited availability. By 2007, however, many countries reported that between 20 and 37 percent of the population had access to broadband connections at home. While the United States has typically led in sheer numbers of broadband users, it has not been one of the leaders in broadband penetration. In 2007, the United States had 21.9 percent broadband penetration, as opposed to a high of 32.8 percent in the Netherlands.

Widespread adoption of broadband access made it possible for content providers to deliver audio, video and other multimedia material without asking users to endure long waits. It also helped blur the lines between traditional news media, speeding convergence. For example, *The Washington Post*'s online division won the first Emmy award ever given for "outstanding achievement in content for non-traditional delivery platforms." (Along with *The New York Times* Online, the *Post*'s service managed to grab five of the seven nominations for the video award.) Widespread broadband access also led CNN to offer its Pipeline video news service, offering both live and on-demand video.

Speeding delivery even further was the widespread adoption of Adobe's Flash technology in 2002 to compress multimedia files, allowing users to enjoy high-quality video and photo slide shows. In 2007, *The Washington Post* marked an important milestone with its onBeing video series, which for the first time offered full-screen high-definition video.

Alternative Formats

News sites also began experimenting with other means of delivering content online. Weblogs—or blogs—gained notice as a tool for mainstream news delivery in 2002, but their use for news dates back to at least 1998. Video blogs (also called vlogs) attracted attention around 2005, and some (such as the one created by technology writer David Pogue of *The New York Times* and CNBC) proved extremely popular.

Another new delivery mechanism was the podcast, which offered users audio or video programming that could be downloaded to a portable music player or played on a personal computer. While initially embraced by the news media as an exciting tool for delivering content in a new way, enthusiasm waned fairly quickly and podcasts became used primarily as a mechanism for time-shifting radio and television content, designed to be accessed by users on the go.

In 2006, a technology known as Twitter made its debut. Designed to be used with mobile phones, Twitter allowed users to send brief messages of up to 140 characters. Interested parties could subscribe to individuals' Twitter feeds (known as following a feed). While at first largely used to convey the mundane details of personal life, users soon realized that Twitter was an effective tool for communicating during a breaking news event. News organizations took notice, and Twitter soon became the go-to tool for journalists looking to report in real time, whether covering politics, sports or court proceedings. Some news organizations also began using Twitter to deliver breaking headlines and links to stories.

News organizations finally began utilizing one of the primary advantages of the medium—its immediacy—and breaking stories online. Most news organizations had held out for more than a decade for fear of cannibalizing their existing print or broadcast services. Slowly it became clear that a web-first strategy was viable and competitive, with subsequent print and broadcast stories adding to and filling in the stories.

A new technology that became commonplace around the same time let news organizations make the most of their content. RSS, or Really Simple Syndication, allows news organizations to offer users the ability to subscribe to frequently updated content such as news headlines and blog entries. The RSS feeds can be viewed in a number of web browsers, e-mail programs, and feed readers.

With an eye toward reaching users away from their PCs, many news organizations also began offering news in formats appropriate for use on mobile phones. At their simplest, these efforts involved text and e-mail alerts. In addition, many news organizations offered access to top stories via special mobile websites. In the most ambitious cases, some news organizations also offered story updates, including full video and graphics, delivered to users' cell phones—in a sense coming full circle from the earliest experiments in electronic distribution.

Challenges

Perhaps the greatest challenges and opportunities came in response to shifts in how people not involved in the news media used electronic media to communicate. As more individuals, businesses and organizations used web and mobile technologies to produce and distribute news of importance to their own communities, news media looked for opportunities to become part of the phenomenon. Their actions trended in two directions: first, attempts to bring the audience into the process of distribution by encouraging audience members to comment on news stories and to submit their own photos and video, commonly referred to as user-generated content, and, second, efforts to establish a presence in social networking communities such as Facebook (as well as in the online virtual world Second Life), with the goal of drawing attention to their own content.

While the rise of online distribution was rapid, it was not without problems. The most persistent was lack of revenue. After initially putting content online for free, it became nearly impossible for news providers to charge users. And with much of traditional media advertising migrating to non-media sites such as eBay and craigslist, news organizations found it hard to generate the kind of revenue they were used to. The declining fortunes of traditional media—particularly daily newspapers—made many resort to cutbacks and layoffs to close some of the gap. The constant search for revenue also pushed some news sites toward emphasizing infotainment content to attract the most page views, a move critics said trivialized news content.

Online distribution continued to lag in at least two other areas as the first decade of the twenty-first century drew to a close. The first was making online products interactive. While news media had come a long way, for the most part, they had made little headway in moving the news into an engaging experience. Aside from offering an occasional role-playing game or letting users upload photos or search databases, most news media offered little in the way of interactivity.

Similarly, after more than a decade of offering their content online, few news organizations took advantage of the Internet's ability to let users customize their sites. Some news sites did offer users the ability to choose from a variety of RSS feeds to create custom home pages, but for the most part, everyone was offered the same content.

Still, despite those shortcomings, it was apparent that in less than 15 years online delivery had become a dominant mode of getting news to users. Users expect to have immediate access to the important news of the day virtually anytime and anywhere.

Diversity: Content

Although the 1968 Kerner Commission report was not the first criticism of mainstream news media for failing to fairly report on African Americans, it has endured as a benchmark for measuring diversity progress. Officially the *Report of the National Advisory Commission on Civil Disorders,* but informally cited as the Kerner report after its chairman, Illinois governor Otto Kerner, it partly blamed the news media for the riots that exploded in American urban centers during the summer of 1967 and reprimanded the press for its lack of diversity in both news coverage and newsroom employment.

After a comprehensive analysis, the Kerner report leveled numerous criticisms at the press, including failing to communicate the difficulties of being black in America, not understanding or appreciating black culture and history or the black perspective, and not reporting on race relations with "wisdom, sensitivity, and expertise." The report also scolded the journalism profession for its lack of employment of blacks, especially in positions of authority.

Unfortunately, biased news coverage and discriminatory hiring and promotion practices that the Kerner Commission addressed four decades ago, resonate today. In fact, one could apply many of the Kerner Commission's criticisms of the mainstream news media to any racial or ethnic group in the early twenty-first century, including African Americans, Latinos, Asian Americans, or Native Americans.

Defining Diversity

While a typical dictionary definition of diversity emphasizes distinct characteristics or traits without specifying racial or ethnic attributes, diversity for many has come to represent inclusion of different races and ethnicities, especially in the context of news coverage and newsroom employment.

In recognition of the central role that diversity plays in achieving quality journalism, this entry defines diversity as the inclusion of as well as accurate and fair reporting about groups that historically have been excluded, stereotyped, or devalued because they were born with certain enduring and discernable attributes that differ from the dominant

racial group. Diversity in news coverage (restricted to daily news reporting in this entry) requires that the definition of newsworthy be expanded to include issues, events, communities, and people who historically have been excluded from the news. It also means including sources, both experts and ordinary people, and experiences that represent people of color as well as angles that directly affect communities of color when reporting mainstream stories.

Diversity in News Coverage: From Exclusion to Inclusion

More than 15 years after the publication of the Kerner report, journalism scholars Clint Wilson and Felix Gutierrez (1985) asserted that historically mainstream media's news coverage of racial and ethnic groups involves five stages: (1) exclusionary, (2) threatening issue, (3) confrontation, (4) stereotypical selection, and (5) integrated coverage. In later editions of their book, the fifth stage was renamed "multiracial coverage." These five stages can also be thought of as two dimensions of news coverage with the exclusionary stage symbolizing a failure to include people of color in the news while the other four stages represent *how* news coverage includes and frames people of color.

A pre-Kerner picture of exclusion first emerged from a content analysis of three decades of *The New York Times, The Boston Globe,* the *Atlanta Constitution,* and the *Chicago Tribune.* Indeed, during the early 1950s at the dawn of the civil rights movement, the only newspaper out of four studied whose coverage of the black community accounted for as much as 1 percent of the entire available news space was the *Atlanta Constitution.* By the 1960s, news coverage of blacks had increased, though it still accounted for no more than 4 percent of the total news whole.

In addition to the dearth of African Americans in news coverage, other studies pointed to the exclusion of Latinos, Asian Americans, and Native Americans. One observed that Latinos have been excluded from the news so frequently that they are the "invisible minority" (Salwen and Soruco 1997). The invisible minority status of Latinos on network evening news was documented by the 2006 *Network Brownout Report* put out by the National Association of Hispanic Journalists, which found that only .83 percent of stories aired on the three major networks in 2005 were exclusively focused on Latinos or Latino-related issues.

Although the use of racial labels to segregate blacks in news and obituary pages is a thing of the past, more subtle types of segregation have been found in contemporary news coverage. For example, in a study of network news stories, expert sources were segregated by race. Thirty-three black experts compared to 27 white experts appeared in black-issue stories, but in non-black-issue stories, white experts outnumbered blacks by 94 to 15. Researchers have also found segregation in story assignments. For instance, when the reporter's race and the story's racial focus were compared, it was more than three times as likely that an African American would report a story with a black focus than a white reporter.

Stereotyping

A review of three decades of empirical results of journal articles, books, and convention papers that primarily examined news coverage of African Americans, Latinos, Asian Americans, and Native Americans found that not only is stereotyping a mainstay of news coverage but people of color have also been stereotyped in the news in a variety of ways, including two of the Wilson and Gutierrez (1985) stages, threatening and confrontational. Even though every racial and ethnic group throughout the history of the American mainstream press has been a victim of stereotyping, Native Americans may have been the first victims. Mary Ann Weston's 1996 examination of press coverage of Native Americans at critical junctures throughout American history found the press stereotyped Native Americans as threatening, confrontational, degraded, outsiders, historic relics, exotic, good and noble, bad and uncivilized, and as a vanishing race.

A qualitative analysis of *The Boston Globe* done by researchers Autumn Miller and Susan Dente Ross in 2004 found evidence that old stereotypes of Native Americans are still around. Both news and feature stories stereotyped Native Americans as outsiders, and editorials and feature stories framed them as historic relics "wearing bright feathers and colorful blankets." This was most apparent in news stories which used "unattributed narration" to make references to rampant alcoholism among the Native American population.

Poverty Stricken. Equating African Americans with poverty has been an enduring stereotype in news coverage. Despite census statistics showing 29 percent of poor people were African American, one analysis of photographs illustrating stories on poverty published in *Time, Newsweek,* and *U.S. News and World Report* found that 62 percent of the photographs used African Americans to represent poverty. According to Martin Gilens, the face of poverty was even more distorted in news broadcast on ABC, NBC, and CBS: 65 percent of the poor people depicted were black.

Criminal and Threatening. The stereotype of blacks as criminals and threatening not only rivals the stereotype of this same group as poor, but it may also be the most enduring stereotype since empirical evidence of it dates back to 1975 when news stories featuring blacks were concerned with possible crime or past criminal activity on the part of blacks. Similarly, when researchers sorted local television news stories by their racial focus, they found that stories focused on blacks (69 percent) were nearly two and a half times more likely than stories focused on whites (28 percent) to be about crime.

In a 1992 study of local television news in Chicago, blacks were more likely than whites to be shown wearing street or jail clothing and more likely to be shown being held by a restraining officer. The menacing image of blacks was underscored when comparing violent and nonviolent crime news stories as blacks were significantly more likely than whites to be shown in stories about rape, murder, robbery, and drug dealing. Similarly in studies conducted in the Los Angeles area in 2000, there was a gap between government crime statistics and local crime news reports. Blacks were more likely to be shown as suspects in murder stories despite the fact that they do not account for the largest number of murders, and blacks were likelier to be portrayed as felons on television news (44 percent) than to actually be arrested for felonies (25 percent).

Black leaders cannot escape the network news crime story. One analysis of ABC network news stories in 1994 found that among the 186 stories that mentioned a black leader, more than one-third (68 percent) included an allegation that the leader had committed a crime. The study also noted that network news shows white leaders in a positive light vastly more—both proportionally and absolutely.

Nor has the criminal stereotype in news coverage been limited to African Americans. A 1995 content analysis of 60 years of *New York Times* stories, for example, found similar stereotypes for Latinos and Asian Americans. According to the content analysis, the only topic that received regular attention throughout the time period studied was that of crimes committed by Asian Americans, particularly Chinese Americans. Similarly, according to other studies, news coverage emphasized Latinos committing crimes. But in newspapers based in small cities with large Latino populations, another study found crime news about Latinos ranked third behind other hard and soft news. The opposite was true in a study of the front pages of the local or metro sections in the *Los Angeles Times* and *Houston Chronicle.* Researchers found Latino-focused stories were more likely to be about crime. The 2006 *Network Brownout* Report has also found evidence that network news stereotypes Latinos as menacing, carrying images of day laborers standing in a parking lot or immigrants crossing the border.

Confrontational and Critical. Confrontational, another stage of news coverage identified by Wilson and Gutierrez in 1985, is treated here as a dimension of stereotyping. This type of coverage may be evident in news reports about black political figures, community activists, or even ordinary citizens. One 1990 analysis of local Chicago news noted how the sound bites used in such reports often depicted the black person talking loudly—even angrily—and employing emotional rhetoric rather than speaking in a calm, deliberative tone. Moreover, in contrast to this presentation of black leaders, during the week of local news analyzed, white political actors were rarely shown shouting or haranguing.

The image of black leaders in network news is that of the relentless critic, which leads to a negative contrast with the presentation of white leadership behavior: black leaders are routinely depicted as constantly complaining compared with the more balanced portrayal of powerful whites, who are shown offering both praise and reproach.

Problem People. Because of *The New York Times*' sparse coverage of Native Americans, the focus on problems may have been accentuated, making news

coverage take on dimensions of stereotyping. The most noticeable trend in the coverage of Native Americans, according to researcher Carolyn Martindale in her 1995 study of the *Times,* was the tendency to focus on the problems they face, which reinforces the belief of various researchers that the news media presents minorities as "problem people" who are outside the mainstream of American society. Coverage of this kind accounted for 27 percent of the total coverage of Native Americans, a larger share than the problem coverage of any other minority group.

Studies have found that in cities with large Latino populations, Latinos' inclusion in the news is consistent with their representation in the population. Yet Latinos are more likely than Anglos to be covered in the news because they are problems. Examples of problem-oriented news included coverage of crime and the judiciary, riots and demonstrations, and accidents and disasters. This 1989 finding confirmed an earlier study conducted in 1980 that found that news stories tended to focus on Latinos as "problem people" who are constantly causing or beset by problems.

Gang Member and Model Minority. Despite what appears to be mutually exclusive labels, the news media stereotype Asian Americans as both gang members and as model minorities. In contrast to both positive and negative stereotypes, Latinos have been portrayed as members of violent gangs. With gang violence a component of network news' focus on crime, the 2006 Network Brownout Report found that network news stories about violent crime linked the increase in gangs to the upsurge in undocumented immigrants in the United States.

Athletes and Entertainers. If they are not stereotyped as poor or criminals, African Americans are stereotyped as athletes and entertainers. When 3,200 news stories in ten Boston television, radio, and newspaper outlets were analyzed in 1987, a researcher found that most of the blacks featured in major-media news stories were celebrities who were famous for being entertainers or athletes or who had achieved notoriety as criminals or failing students.

Similarly, an examination of photographs of African Americans in *The New York Times, Chicago Tribune, New Orleans Times-Picayune,* and *San Francisco Chronicle* during the pre–civil rights era, civil rights era, and the period since found sports dominated all photographic images of blacks. As a result of an analysis of photographs of African Americans published in *Life, Newsweek* and *Time* magazines for the period 1978 through 1988, researchers determined that in addition to the athlete stereotype, African Americans were largely represented as entertainment figures.

Underrepresenting

By overrepresenting people of color in certain types of news stories such as crime and sports, the news media engage in stereotyping; by underrepresenting people of color in news stories where they should be included, the news media fall short of being inclusive and fail to attain integrated coverage. Whether overrepresenting or underrepresenting, the result is the same: the news is distorted and the press fails to serve the public and live up to its journalistic responsibility.

Black achievements in politics, banking, and education were found to be underrepresented in the news in one study conducted by Kirk A. Johnson in 1987; separate studies found that the everyday life of blacks and Latinos is absent from both the news and photographic images. Blacks and Latinos are even underrepresented as sources for news. Furthermore, studies found sparse news reporting on discrimination, race relations, and other issues and problems related to race and ethnicity. In other words, whether it is focusing on everyday life issues, individual achievements, or topics directly related to race and ethnicity, the news media still fall short of the Kerner Commission's recommendations from 1968.

The Future of News Diversity

Since the Kerner Commission first spotlighted the news media's diversity failures, multiple strategies have been implemented to make news coverage more diverse. Despite significantly improved news coverage and a commitment from the American Society of Newspaper Editors to make newsrooms mirror the racial diversity of American society, representative inclusion of African Americans, Latinos, Asian Americans, and Native Americans in newsrooms and news coverage remains an unachieved goal.

Diversity in news coverage depends on the news business continuing to press forward on strategies that have been successful and developing new initiatives that take a fresh approach to achieving diversity in an ever-changing news media landscape. Some examples of innovative diversity initiatives implemented during the past decade include ASNE's "The National Time-Out for Diversity and Accuracy" project; The National Association of Hispanic Journalists' "Parity Project"; and the Freedom Forum's "Diversity Institute."

The "Time-Out for Diversity and Accuracy" initiative is an annual opportunity to set aside time to focus on diversity. In addition to learning more about diversity in their communities, newspapers use this occasion to assess the quantity and quality of diversity in their news coverage, including how stories are written, which sources are used, and what stories and photographs are published on the front page. By linking diversity and accuracy, the "Time-Out" initiative, which was started in 1999 by the Associated Press Managing Editors' Diversity Committee, acknowledges that accuracy, an essential element of journalism, can only be achieved when a community's diversity is fully reflected in the pages of the newspaper.

The Parity Project, initiated in 2002 by the National Association of Hispanic Journalists (NAHJ), was designed to increase the number of Latino journalists. Cities that have significant Latino populations but lack parity in Latino representation in their newsrooms are identified, then targeted as ideal communities for introducing The Parity Project. NAHJ then works with journalism schools, foundations, and Latino leaders to increase the number of Latino journalists in that community.

The goal of the Diversity Institute, which was started by the Freedom Forum in 2002, is to develop a new pool of journalists of color. Local newspapers nominate non-journalism professionals or recent college graduates to attend the Diversity Institute, which is based at Vanderbilt University in Nashville, Tennessee. Once nominees have completed the 12-week intensive journalism training program, the newspapers that nominated them hire them as reporters, copy editors, page designers, or photographers.

Diversifying newsroom employment is one indispensable prerequisite to diversifying news content, but employment alone cannot do the job. Achieving the goal of news coverage diversity also depends on a commitment from owners, publishers, and editors and *all* journalists—not just journalists of color—at every level of the newsroom hierarchy to present a representative picture of all groups through quality journalism that serves the public good.

Diversity: Employment

For 40 years after diversity finally became a principal value of American journalism in the late 1960s, news institutions endeavored earnestly, but with only qualified success, to make news coverage and newsroom staffing representative of society's diversity.

The American Society of Newspaper Editors (ASNE) defined diversity in 1978 when its members vowed to increase the proportion of ethnic minorities in daily journalism equal to their percentage of the population by the end of the twentieth century. The editors' manifesto, formalizing diversity efforts ASNE had begun in early 1972, quickly was followed by similar actions within other press organizations and journalism education groups who set goals and adopted similar diversity standards for racial and ethnic representation in their ranks. The Radio and Television News Directors Association (RTNDA) began tracking minorities in broadcast news jobs in 1972. By 1978, minorities made up about 12 percent of the U.S. population, but only about 4 percent of daily newspaper journalists.

ASNE sought to ensure that its goal of fully inclusive journalism—known as the "Year 2000 Plan"—would endure by issuing a yearly progress report on the diversity drive over the next three decades. But journalism's diligence in measuring diversity far outstripped its effectiveness in meeting the widely publicized goal. By 1998, with press diversity at about 11 percent and the U.S. minority population totaling nearly 25 percent and rising, ASNE extended its projected employment deadline to 2025.

With rare exceptions, each year of the ASNE census did see a slight increase in minority newsroom employment, though gains were usually fractional. Yet on the eve of the 30th anniversary of its original pledge, ASNE's yearly census found diversity dipping from 13.9 percent in 2006 to 13.6 percent a year later, while the percentage of minority-group Americans had soared to nearly 35 percent.

By this time, broadcast journalism had labored for nearly a third of a century pursuing the goal of more representative newsrooms, with no more to celebrate than its print news counterparts. In July 2006, RTNDA reported nonwhite journalists in radio newsrooms had dropped by two-thirds, from 16 percent in 1998 to about 6.4 percent (albeit during a period when all radio journalism employment was in sharp decline). Television newsroom diversity showed a slight gain, rising by about one percentage point to 22.2 percent.

Origins

The challenge of press desegregation grew out of urban riots of the 1960s when mainstream news media, then 99 percent white, urgently needed black reporters to cover the violent uprisings in cities around the country. The outbursts were fueled by black Americans' frustrations over persistent injustices despite the significant gains of the civil rights movement.

The racial revolution of mid-1900s America promised an elimination of separate institutions for different racial groups. Yet just when it was most needed, the black press, a foremost proponent of racial integration, found itself ambling toward obsolescence. The mainstream white press was, however, not as eager to lose its racial exclusion practices as other institutions in society.

One 1970 observer saw the press as hypocritical:

> The strange phenomenon of the newspaper business is that regardless of the liberal editorials, regardless of the strong advocacy of equal rights in employment," James R. Smith said, "newspapers for the most part have the worst hiring record, or inclusion record of blacks than any other business institution. (Smith 1970, 7)

President Lyndon Johnson's 1967 riot investigation panel, the National Advisory Commission on Civil Disorders (the Kerner Commission), elevated press diversity to a major civic responsibility. Its report devoted a full chapter to the news media, blaming the riots partly on "a press that repeatedly, if unconsciously, reflects the biases, the paternalism, the indifference of white America. This may be understandable, but it is not excusable in

an institution that has the mission to inform and educate the whole of our society."

The Year 2000 Plan, adopted on the tenth anniversary of the 1968 Kerner report's official release, established both a definition and a timetable for press diversity. It sprang from the vision of Robert C. Maynard, a champion and leading icon of inclusive journalism for two decades before his death in 1993.

Maynard gained prominence as a Washington *Post* correspondent and ombudsman, as diversity chief for Gannett newspapers, and as the first black owner and publisher of a major daily newspaper, the Oakland *Tribune*. Starting in 1972, he built a parallel career in newsroom diversity. In an April 1972 speech at the ASNE convention, for example, he called for a fully representative press to serve not only black people but for the benefit of all Americans, saying, "It is impossible for all Americans to understand what they should about each other if only some kinds of Americans get to control the telling of the story." Within six years, Maynard had grown more strident, urging ASNE to adopt the Year 2000 goal in a 1978 speech: "Ten years after the death of Dr. King, at the end of this long, sorrowful decade, the American press has a long, long way to go. . . . You must desegregate this business."

A few months earlier, Maynard and a multiracial group of journalists had created the Institute for Journalism Education (IJE) in Berkeley, California. Over the next 30 years, IJE became the most prolific instrument of press employment diversity, advocating vigorously for more inclusive newsrooms and training hundreds of journalists of color. It was renamed in Maynard's honor when he died of cancer in 1993, leaving a vacuum in the leadership of press diversity that remained unfilled into the twenty-first century.

During the 40 years after the Kerner Commission's sharp rebuke of the press and 30 years after the newspaper and broadcast journalism business launched concerted efforts to increase their diversity, a vast and growing infrastructure had evolved to pursue the almost universally approved goals. Full-time diversity directors or officers were added, often as permanent positions to national professional organizations including ASNE, the National Association of Broadcasters, and National Public Radio. There were also public organizations such as Accuracy in Media and Freedom Forum.

More than two dozen media organizations devoted some or all of their energies to press diversity, according to a list posted at the Maynard Institute's website. Journalists of color wishing to advocate for themselves formed ethnic professional organizations to support their interests and advocate for more representative staffing, beginning with the National Association of Black Journalists in 1975 (NABJ), followed by the National Association of Hispanic Journalists (NAHJ), the Asian American Journalists Association (AAJA), and the Native American Journalists Association (NAJA).

The Asian American Journalists Association (AAJA) was created in 1981 by a few of Los Angeles print and broadcast journalists of Asian descent with three main goals: to encourage Asian Americans and Pacific Islanders to become journalists, to increase their numbers among news managers, and to pursue fair and accurate coverage of Asian Americans and Pacific Islanders. AAJA members include top journalists who are national network anchors, Pulitzer-winning reporters, editors, photographers, broadcast producers, and other news leaders. By its twenty-fifth anniversary, AAJA had more than 2,000 members in 20 chapters nationally and rapid growth of journalists around the globe. It had awarded more than $1 million in scholarships, developed an Executive Leadership Program that graduated 288 mid-career journalists, and advocated vigorously for better coverage of Asian American and Pacific Islander communities.

The National Association of Black Journalists (NABJ), with 3,300 members, is the oldest and largest organization of journalists of color in the United States. It was formed in 1975 by a group of 44 journalists gathered in Washington, D.C., to cover an annual convention. It was inspired partly by the frustration of black news professionals who had gained a foothold in the mainstream press by being hired to cover the racial uprisings ("riots") of the 1960s then struggled to expand their voice and presence. NABJ awards nearly 100,000 a year in scholarships to aspiring journalists. Its mission includes pursuit of workplace fairness for black journalists, strengthening ties among black journalists and increasing their numbers in news management positions, advancing excellence in coverage of black communities and the larger society, and encouraging students to pursue journalism careers.

Hispanic journalists and media workers formed several professional organizations that became forerunners to the National Association of Hispanic Journalists (NAHJ), incorporated in 1984. The first National Hispanic Media Professionals Conference was held in San Diego in 1982, and later contributions of the California Chicano News Media Association aided formation of NAHJ. The organization held its first national convention in San Francisco in 1990. Its mission includes providing the visibility and voice that Hispanic journalists previously lacked, bringing more Hispanics into newsrooms and strengthening professional opportunities for working Hispanic journalists. With more than 2,000 members by its twentieth anniversary, NAHJ provided professional development programs, an online job bank, scholarships and internships, and journalism awards.

The Native American press traces its roots to the founding of the bilingual Native newspaper, the *Cherokee Phoenix* in Georgia in 1828. The rise of modern technologies has expanded the native press from local to national and international vehicles to meet the community and tribal communications needs. NAJA grew out of a 1983 meeting of 30 Native American Journalists at Pennsylvania State University. The organization, first named the Native American Press Association, was launched at a subsequent meeting in 1984 at the Choctaw Nation of Oklahoma. The name was changed in 1990 to better reflect the organization's broader goals and the inclusion of radio and television professionals among its membership. NAJA serves and empowers Native journalists through programs and actions designed to enrich journalism and promote Native cultures. It emphasizes that Native Americans are distinct peoples based on tradition and culture; educates and unifies its membership through journalism programs that promote diversity; and defends challenges to free press, speech, and expression.

Inevitably, these groups found commonality and joined to create another entity, labeled Unity, Journalists of Color, founded in 1994. This structure enabled the units to address diversity issues as separate organizations or to speak collectively, as illustrated in its response to RTNDA's disappointing progress report of July 2006 by AAJA president Esther Wu, which, in its call for journalists to strive to reflect the diverse communities they serve, reverberated with the echo of Bob Maynard's call long before for an all-out effort to effect press diversity for the good of all Americans.

Diversity: Policy

Diversity policies at news media organizations are designed to increase the presence and influence of

those population groups who historically have been underrepresented or misrepresented in news reports and in the newsroom. These policies are often developed and explained in terms of journalism ethics, social responsibility, inclusiveness, or good business practice. As a business practice, the implementation of a sound diversity policy has a proven ability to increase a news medium's audience, market share, and profits. Nonetheless, news media organizations are much less likely than other organizations to publicly present their diversity policies as outgrowths of financial, political, or legal concerns.

Evolving Definition

Diversity in the news media is usually presented as a value based on principles of ethics and social responsibility. It has been a long-standing value in American journalism, but it has developed a broader interpretation since it was articulated in the first professional codes of journalism ethics created in the early 1900s. The earliest written ethics codes recognized and heralded diversity as a fundamental component of good journalism to encourage and assure the presentation of a variety of viewpoints on important public issues.

Nelson Antrim Crawford and Leon Nelson Flint, two major American scholars of journalism ethics in the early decades of the twentieth century, for example, advocated a diversity that was defined in terms of economic, political, moral, class, and social perspective. This was distinct from the meaning the term acquired during the latter half of the century when it was rooted primarily in race, ethnicity, and gender. The only references to race, ethnicity, and gender in Crawford's 1924 book *The Ethics of Journalism,* and Flint's 1925 book, *The Conscience of the Newspaper,* indicated journalists should eschew the use of offensive racist terms that might offend nonwhites, such as the Chinese. Some of the newspaper codes cited in the books addressed gender issues only to direct reporters and editors to avoid using terms or invoking images a gentleman would know are not appropriate in the presence of a girl or lady. When the Hutchins Commission, a private group of scholars led by educator Robert M. Hutchins, issued its landmark report on the shortcomings of American journalism in 1947, it cited a dearth of diversity in ideas and opinions expressed in the mass media. Among the commission's major recommendations was that journalists and other media professionals provide their publics with "a representative picture of the constituent groups in the society."

In each manifestation of the evolving meaning of diversity, it was seen as essential to providing a fuller, less biased, more accurate depiction of important truths. This basic orientation remains intact in the twenty-first century and is common among the professional associations of American journalists and the major news media companies. The Society of Professional Journalists, for example, has a policy that declares diversity is "essential to excellence and high standards in reporting. We incorporate diversity in our code of ethics because we believe journalists must make every effort to describe all aspects of the human experience, that we must avoid the stereotyping and limited vision that corrupt accuracy."

The 1960s Influence

The modern notion of diversity began to develop during the social and cultural upheavals that marked the 1960s, particularly the Civil Rights movement. During this period, journalists came to recognize that race and ethnicity dramatically influenced perspectives. They also realized that these perspectives determined which issues were considered newsworthy and were therefore sufficiently important to warrant a place on the public agenda. The news media are widely assumed to have the ability to influence development of the public agenda and to determine which issues are important enough to warrant public attention and action.

The news media's long-term failure to recognize issues of concern to African Americans and focus public attention on them led to one of the most pointed public condemnations of professional journalism in the twentieth century. This criticism came from the Kerner Commission, a presidential advisory group created to study the nature and causes of civil unrest and riots in black communities during the late 1960s. Formally known as the U.S. Commission on Civil Disorders, the group cited the news media's lack of racial diversity as a cause and indicator of the nation's lack of concern

for these issues and the failure to adequately address them before they boiled over into violence. Matters of concern to the African American community had not been placed prominently on the public agenda because, in part, black people had no significant role in the process that decided which issues were important. "If the media are to report with understanding, wisdom and sympathy on the problems of the cities and the problems of the black man—for the two are increasingly intertwined—they must employ, promote and listen to Negro journalists" (Kerner Commission Report 1968). Since then, diversity policies in journalism have evolved to focus largely, but not exclusively, on race, gender, and ethnicity. In the latter part of the twentieth century, diversity policies also included concerns about other racial and ethnic groups, women, homosexuals, and the disabled.

Affirmative Action and Law

By the 1970s, American broadcast radio and television stations were under orders from the Federal Communications Commission (FCC) to hire blacks and other minorities. Indeed, after a 16-year battle in courts and administrative hearings, the FCC rescinded the broadcast license of television station WLBT in Jackson, Mississippi, because it ignored or demeaned newsworthy issues of importance to its African American audience. This station and other white-owned stations in the South often did not report on the debates and physical confrontations of the ongoing civil rights movement or they excluded the perspectives of the movement's leaders and supporters. These were among the reasons cited when the FCC vacated WLBT's broadcast license and awarded it to a racially integrated group dedicated to including issues of importance to the black community in its broadcasts.

The FCC maintained an aggressive affirmative action and diversity policy for holders of broadcast licenses until the 1990s when federal court rulings began finding race-based hiring considerations constitutionally untenable. The U.S. Supreme Court took a major step in this direction with its ruling in *Metro Broadcasting, Inc. v. FCC* (1990). Eight years later, the federal Circuit Court for the District of Columbia similarly criticized the FCC in the case *Lutheran Church-Missouri Synod v. FCC* (1998) for unduly pressuring radio and television stations to hire blacks, Hispanics, and members of other minority groups.

As some news organizations were making efforts to diversify and broaden their pool of employees to report on race-driven issues during the late 1960s, members of minority groups were hired in news reporting jobs even though some had no prior formal training in journalism. Some of the new hires proved equal to the task and established long careers as respected journalists. Others failed. The earliest affirmative action-newsroom diversity conflicts can be traced to these early failures and the resentment some white journalists expressed when people with less formal training were hired and promoted before them.

Associations of Minority Journalists

As the social and cultural upheavals associated with the Civil Rights movement began to fade, newsroom diversity also began to ebb. A small group of African American journalists, 44 men and women, banded together in 1975 to form the National Association of Black Journalists—NABJ—for the explicit purpose of making sure blacks secured a larger, influential, and permanent place in American newsrooms. Similarly dedicated organizations of other minority group journalists also were formed. Among them were the National Association of Hispanic Journalists, the Asian American Journalists Association, the Native American Journalists Association, and the National Lesbian and Gay Journalists Association. This latter group, founded in 1990, saw its mission not only in terms of keeping its members in positions of influence in newsrooms but also in promoting fair and accurate coverage of lesbian, gay, bisexual, and transgender issues throughout the news media. These minority group journalism associations have similar missions and each works to monitor the profession's treatment of minority issues and the editorial choices made in these areas.

Wording choices have become closely monitored when they address minority-group people and issues and the associations readily offer guidance. Most, if not all, professional journalism organizations have written policies that ban the use of words that stereotype or unjustifiably convey negative implications about minority groups

and women. Such policies were rare during the early decades of the twentieth century. When the career of legendary African American boxer Joe Louis took flight in the 1930s, journalists routinely referred to him as the "Brown Bomber." Such a moniker would probably not be used today because it would be deemed inappropriate and a violation of diversity policy. Labels depicting nationality, ethnicity, and race were common in news reports of the 1920s and into the 1950s; Jewish, Italian, and Irish newsmakers also were subject to such labeling until it became proscribed as a matter of professional ethics. Racial and ethnic labeling are now considered unethical unless these identifications are particularly relevant to the news being reported. News organizations also have worked to make sure women and minorities are among the experts and leaders relied upon and publicly cited as sources, and they have taken steps to ensure that the overall depiction of them in the news is balanced, accurate and avoids stereotyping.

As a result of the efforts of advocates such as Robert C. Maynard, the first black owner-editor of *The Oakland Tribune,* and journalist Hodding Carter III, all of the major professional journalism associations and news companies have publicly embraced multifaceted diversity policies. Indeed, at Maynard's urging during the 1970s the American Society of Newspaper Editors began pushing and supporting progressive diversity policies throughout the United States and regularly monitors and reports its successes and failures. It has set benchmarks and timetables for hiring and promotion in an effort to have newsroom diversity reflect the diversity of the American population. As a result of this and other practices, diversity has become a synonym, in some sections of the newsroom, for an affirmative action policy that gives preferential treatment in newsroom hiring and promotion to members of minority groups or people who otherwise have been misrepresented or underrepresented in positions of power and influence.

Criticism of Diversity Policies

Diversity policy has been criticized for suppressing publication of unfavorable information about historically underrepresented groups. Veteran journalist William McGowan emerged in the early 1990s as one of the most articulate and respected critics of diversity policies in journalism. In an opinion piece published in 1993 in the *Columbia Journalism Review,* he criticized the implementation of newsroom diversity policies, claiming they undermined basic principles of good journalism and subverted venerable guiding principles of neutrality and objectivity. Among McGowan's complaints was the claim that diversity practices caused editors to ignore some newsworthy issues purely because they reflected negatively on some members of minority groups or women. His criticism culminated in a controversial book titled *Coloring the News, How Political Correctness Has Corrupted American Journalism* which won the National Press Club's 2002 Arthur Rowse Award for Press Criticism.

Conclusion

American news organizations have extolled the virtues of diversity in journalism from the outset of their formal efforts to professionalize their craft in the early years of the twentieth century. Nearly a hundred years later, the definition of diversity and the implementation of diversity policies have evolved significantly but remain faithful to the fundamental impetus to fully and accurately report the truth without ethnic, religious, or gender bias. That evolution reflects and projects similar political and social change in the United States.

Docudrama

A docudrama is a reenactment, or dramatization, of current or historical events. Docudrama combines fictional elements with the re-creation of events and with documentary. It is, as the word suggests, documentary drama, a hybrid of the real and the fictional. Docudrama has also been called nonfiction drama and reality-based drama.

Scholars, filmmakers, and critics disagree about many aspects of docudrama, including what it should be called. They also disagree about the definition of this hybrid. Some scholars argue that the docudrama has received insufficient study. There is, however, general agreement that whatever docudrama is, it is an immensely popular form of information and entertainment and it continues to find a large and avid audience.

It has been noted that, unlike documentary, there is no pure form of docudrama. Most docudramas might be categorized as reconstructions of dramatic stories, including investigative reconstructions. An important subgenre of docudrama is biography, or the biopic. Many analysts consider *Disraeli* (1929) to be the first biopic. However, there were others that came before, including a French cinematic depiction of the life of *Napoleon* in 1914.

During the 1930s, when the biographical film was first recognized as a genre in the United States, it became a Hollywood staple and a significant number of them were commercial and artistic successes. Among the films were *Alexander Hamilton* (1931), *Voltaire* (1933), *The Story of Louis Pasteur* (1935), *The Life of Emile Zola* (1937), and *Juarez* (1939). While many of Hollywood's earliest biopics did not depict Americans, that oversight was soon corrected. In the late 1930s, *Young Mr. Lincoln* and *Abe Lincoln in Illinois* began a decades-long trend in the American movie industry concentrating on the lives, deeds, and myths of American lives.

The biopic has always found a ready audience. Most docudramas on television today are biopics and appear on two cable networks, *E! Entertainment* and A&E's *Biography,* the latter devoted to biopics.

Origins

The origins of the film docudrama can be traced to the late 1800s when pioneering filmmakers exhibited in penny arcades. It was then common practice to include re-creations with real footage and recordings. This was particularly true for some of the filmmakers telling the story of the Spanish-American War. Certain incidents were reenacted, not to deliberately deceive the viewing public, but because filmmakers were not present at the scene of the action. One example was the use of tiny replicas of a Spanish fleet that had been defeated at Santiago. Film pioneer Edward H. Amet filmed the sinking of the "fleet" in a bathtub. Combined with actual war footage, the faked material was good enough to convince Spanish military archivists who later included it in a collection. An early example of a film docudrama based on actual events was *The Assassination of the Duke of Guise* (*La Mort du duc de Guise*), produced in Paris in 1907. The film was a re-creation of the circumstances surrounding the murder of a rival of King Henri III.

Early-twentieth-century examples of docudrama can be found in the work of British filmmakers Humphrey Jennings (1907–50) and Harry Watt (1906–87). Watt's 1938 film *North Sea* employed reconstructions of a dramatic rescue at sea. His work is credited with helping lay the groundwork for the documentaries that depicted events during World War II. Jennings's 1943 film *Fires Were Started,* for example, was a study of London firemen who helped save the city during the Blitz. Foregoing the use of actors, Jennings cast real firemen in the roles.

Radio Docudrama

Docudrama's American journalism antecedents were aural. *Time* magazine led the way with *NewsActing,* dramatic re-creations of news events incorporated into radio programs *Time* called *NewsCasts*. The *NewsCasts,* created in 1928 by *Time* executives Fred Smith and Roy Larsen, were carried by some 33 stations nationwide.

In 1931, the program became the *March of Time,* first heard on the stations affiliated with the Columbia Broadcasting System (CBS). The *March of Time* broadcasts closely mimicked newsreels, with actors playing, and imitating the voices of world figures such as Edward VIII and Adolph Hitler. The program's producers required the actors to study voice recordings in *Time*'s vast library.

The *March of Time* production process was extensive, requiring hundreds of hours of research, writing, rehearsal, and other preparations for each minute of programming. Production staffs were large and expensive. In that way, *Time* set the standard for the high quality of research that would follow in the *March of Time* theatrical newsreels and, considerably later, in CBS's *You Are There* radio and television series. By 1932, the high cost of producing the program brought about its demise, but the volume and the quality of the listener objections caused the magazine to reconsider. In June 1932, *Time* entered into an agreement with CBS to continue the program. Although the audience was a loyal one, the *March of Time* failed to attract advertisers and CBS shared the costs with the publisher.

The *March of Time* dramatizations came to an end as technology enabled the use of audio actualities. The early 1940s saw, especially in the reporting of Edward R. Murrow (1908–65) and his team of correspondents, emergence of the broadcast journalist as a respected news source. This trend helped make the use of actors and reenactments obsolete, and the *March of Time* left radio in 1945.

In the late 1930s and through World War II, Norman Corwin produced some of radio's most critically and artistically acclaimed dramas. In all of them, he melded words (often in the form of poetic verse), music, and sound effects to create the right mood for his listeners. In an interview with radio scholar Michael C. Keith, Corwin noted that "The term documentary is elastic, and certainly many of my works fall into that category, among them I would list my 'Bill of Rights' broadcast, as well as 'We Hold These Truths' [1941], 'This is War!'[1942], 'On a Note of Triumph' [1945], 'One World Flight' [1947] and scores of others." Many of these, most of which were aired over CBS (or all four national networks in some cases), used dramatic scenes or elements such as recreations or the inclusion of a narrator or actor talking with current or historical figures in American life. Their themes often centered on fascism and tyranny versus the valor and values of democracy.

March of Time Newsreel

The theatrical film version of the *March of Time* premiered on February 1, 1935, in 500 U.S. theaters and was instantly successful with moviegoers. Louis de Rochemont (1899–1978), a former assistant editor at Pathe News, was hired by *Time* in 1934 to produce the newsreels. De Rochmont decided to mix dramatic reenactments with location footage. For de Rochmont, who called this "pictorial journalism," it was not only a way to survive in the competitive world of theatrical newsreels but also a means of more clearly explaining global issues.

Like the *March of Time* on radio, the newsreels were expensive to produce, requiring a large staff and tens of thousands of dollars per episode. High production costs as well as the advent of television, brought the *March of Time* newsreels to an end in 1951. Before it ended, Louis de Rochmont had passed the series on to his brother Richard and had taken his docudrama technique to feature length films. He made several documentaries, two of which won Academy Awards. These included *The House on 92nd Street,* a docudrama about atomic spies and counter espionage (1945), and *Lost Boundaries* (1949), a true-life story about a black doctor and his family in rural New Hampshire who, for decades, passed for white.

CBS and *You Are There*

The radio and theatrical versions of the *March of Time* concentrated on current news events. At CBS, executives developed a different idea; to reenact history on the radio. The 30-minute
